# **Part II Competitiveness**

## **Outlook assessment:**

### **Western Balkan profiles**

# 20 Albania profile

## Key findings

Figure 20.1. Scores for Albania (2018 and 2021)

Note: Dimensions are scored on a scale of 0 to 5. Dimension scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Scoring approach section for information on the assessment methodology. Scores for Dimension 5 Competition Policy are not included in the figure due to different scoring methodology. See the Scoring approach for more information.

Albania has improved its performance since the publication of the Competitiveness Outlook 2018 report in 10 out of the 15 dimensions<sup>1</sup> scored in the assessment (Figure 20.1). Although this clearly indicates progress in the setting up of policies to enhance its competitiveness – at least in about two-thirds of the policy dimensions covered in this assessment – if they are to have a lasting impact then the effective and continuous implementation, monitoring and upgrading of those policies should remain a key priority. Albania achieves its highest average scores in the trade policy, education policy, energy policy, tax policy, investment policy and promotion, and employment policy dimensions. The following are some of Albania's major achievements in these areas:

- **Investment promotion and facilitation has seen notable progress.** A new strategy for investment promotion is underway which is expected to include the internationalisation of Albanian investments, outreach campaigns, aftercare programmes and strategies for attracting foreign direct investment (FDI) and the manufacturing of products in Albania. The Albanian Investment Promotion Agency (AIDA) has a broad mandate that is crucial for investment promotion, facilitation and retention and has started reinforcing its investor targeting actions. A wide range of incentives are provided for investors which can all be found on AIDA's website. Albania is also reinforcing its investment facilitation activities by accelerating the digitalisation of its public services. As of January 2020, 73% of all public services were available on line to citizens and businesses through the E-Albania Portal. Key improvements to investment procedures include the introduction of e-registration and electronic notification of balance sheets and financial reports.
- **The trade policy framework has been strengthened significantly.** The conclusion of Additional Protocol 6 on Trade in Services to the Central European Free Trade Agreement (CEFTA) in December 2019 created an important stimulus for reducing restrictions on services between parties

and for making services markets more attractive to third-country investors. Regulatory transparency has improved, as have public consultations on trade policy. Albania has reinforced its inter-institutional policy co-ordination by adopting new rules and procedures for the National Trade Facilitation Committee (NTFC). It has also established two working groups to explore reducing or eliminating import and export fees and charges. Dialogue with local stakeholders is now required at all stages of trade policy making. All draft laws are published electronically.

- **The education system is improving at a rapid pace.** Albania is one of the fastest-improving participants in the OECD Programme for International Student Assessment (PISA), although it still scores significantly below the European Union (EU) and OECD averages. Its mean score for student performance in mathematics increased by around 24 points between 2015 and 2018, compared to the OECD average 2-point increase. The gap between the highest and lowest-achieving students has also narrowed. Participation rates in school education are high: in 2019, net enrolment in primary education was 98%, and 96% in lower secondary education. The government has also introduced important policy reforms, such as a competency-based curriculum framework, decentralised school governance and a modernised vocational education and training (VET) sector.
- **Employment conditions have been broadly improved.** Advances have been made in tracing the employability of young people after they complete their education and Albania also conducts skills need surveys. It has seen significant progress in increasing women's employment rates, which have risen by 9 percentage points since 2015 to reach 54% in 2019, the highest in the region. Its public employment service (PES) has begun to modernise the delivery of its employment services, including a new information technology (IT) system, individual counselling and individual action plans, as well as the systematic introduction of employer services.
- **Alignment with EU standards has improved in the energy sector.** Albania has made significant progress transposing the Third Energy Package. It is well on track to establish and operate a competitive energy market – it has a strong independent regulator, is currently finalising the operational deployment of a power exchange and is unbundling the distribution system operator for electricity.
- **Tax policy has seen greater international co-operation and greater alignment with recent international tax trends.** In August 2019, Albania became a member of the Inclusive Framework on Base Erosion and Profit Shifting (BEPS), leading to several other initiatives. Its tax system alignment with the Action 5 minimum standard is currently under review by the Harmful Practices Secretariat. In September 2020, Albania ratified the Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS and work on treaty abuse and mutual agreement procedures has been scheduled. The OECD Global Forum Assessment team carried out a peer review of Albania and found it was “largely compliant” on the exchange of information on request (EOIR). Albania introduced a law in February 2020 on the automatic exchange of information (AEOI); the first exchanges should occur in the near future. Finally, Albania has transfer pricing legislation in force and its legislation is in line with the OECD Guidelines on Transfer Pricing.

### Priority areas

Although Albania has made significant progress, it needs to make more efforts in several areas. It scores below the WB6 average in the access to finance; science, technology and innovation; environment policy; and anti-corruption policy dimensions. Although in line with the WB6 average, Albania's performance in the state-owned enterprises and digital society policy dimensions has worsened since the last assessment (Figure 20.1). To improve its performance in these priority areas, Albania should consider the following:

- **Increase efforts to diversify access to finance.** Alternative financing sources remain very limited in Albania. Although factoring and leasing are available and backed by well-developed legal

frameworks, crowdfunding, venture capital and business angel networks are non-existent. Giving firms access to funding beyond traditional lending schemes, and meeting their needs at all stages of their development, would help to diversify Albania's currently bank-dominated financial sector.

- **Strengthen the institutional arrangements for state ownership.** Ownership of state-owned enterprises (SOEs) is spread across central government in Albania, being exercised by several other line ministries and central government bodies as well as the Ministry of Finance and Economy. These dispersed ownership responsibilities are not guided by a common ownership policy. This has led to a lack of clear performance expectations from the state, contributing to corporate inefficiencies. The authorities should move forward with their initiative to establish a central state ownership agency – or, if this is not possible, a co-ordination entity – to further harmonise state ownership practices and fully separate ownership and regulatory roles.
- **Strengthen science, technology and innovation through investment in public sector research and business-academia collaboration.** Albania's public scientific research sector remains systemically underfunded, with public spending in research amounting to only 0.06% of GDP in 2018. This may jeopardise its goal to increase investment in research to 1% of GDP by 2022. To achieve this goal, the government should consider expanding the range of financial incentives for collaboration between businesses and academia. Investment in the scientific research system would make the profession more attractive, leading to higher-quality research outputs in the medium to long term. Albania could also reintroduce innovation vouchers to create financial incentives for innovation.
- **Enhance the digital society by investing in digital skills and upgrading information and communication technology (ICT) in schools.** The development of digital skills for adults is not yet fully integrated into VET systems or lifelong learning programmes, despite the lack of digital skills in the economy. IT curricula should be designed with the support of the ICT sector to improve digital skill levels. Training programmes and lifelong learning policy frameworks should be guided by the need to address the digital skills gap in the labour market. Albania also needs to ensure that all schools and students have access to broadband, functioning computers and digital education aids. In 2020, only around 25% of schools had Internet connections at speeds above 10 Mbps, which is below the WB6 average.
- **Protect the environment through comprehensive land-use policies and improved wastewater treatment.** Albania is one of the economies in Europe most at risk for multiple natural hazards, as illustrated by damage wreaked by the 2019 earthquake. The government lacks an all-inclusive land-use policy framework to provide clear direction, focusing on modernising building codes, updating seismic hazard maps and combatting unregulated and illegal building. Meanwhile, wastewater treatment plants cater for only about 15% of Albania's population, and the system faces key concerns such as the lack of licensing and tariffs for wastewater treatment, insufficient operation budget and maintenance, and the negative impact on the environment from underdeveloped networks and connections. A clear mapping of the situation is needed to identify key investment priorities. The government should try to finance these projects as much as possible from the domestic budget and higher water tariffs.
- **Intensify anti-corruption efforts by improving whistle-blower protection and strengthening high-level corruption cases.** Analysis is needed to identify and tackle the factors behind the discrepancy between the large number of investigations and the small number of convictions (of the 90 cases against high-level officials sent for prosecution in 2019, only 5 people were indicted). A fair and transparent assessment should be carried out to identify the obstacles preventing indictment and to increase the effectiveness of the fight against high-level corruption. Albania's whistle-blower protection legislation lacks several important elements found in the EU Directive on whistle-blower protection, such as protection for whistle-blowers who resort to public disclosure.

Albania should provide protection for public disclosure and for people connected with the whistleblower, remove conditions preventing external reporting to the High Inspectorate for the Declaration and Audit of Assets and Conflicts of Interest (HIDAACI), and establish the right to protection in cases of mistaken identity.

1: Please note that Dimension 5 (Competition policy) is excluded from the key findings section as it uses different scoring model (Scoring approach).

## Economic context

### **Key economic features**

Albania is a small service-oriented economy with a sizable tourism sector, but also a large agricultural sector. Services, dominated by wholesale and retail trade, real estate, transport, and storage services, account for 48.6% of gross domestic product (GDP) and 43.4% of employment (INSTAT, 2021<sup>[1]</sup>; World Bank, 2021<sup>[2]</sup>). Industry, including construction, contributes 20.2% to GDP, with the highest contribution coming from the construction sector (10.8% of GDP) (INSTAT, 2021<sup>[1]</sup>). Meanwhile, the manufacturing sector is very small, contributing just 6.3% to Albania's GDP. Despite a significant decline over the past decade, agriculture, forestry and fishing remains a very important sector in Albania, accounting for 18.5% of GDP, 36.4% of formal employment and a significant share of informal employment (World Bank, 2021<sup>[2]</sup>). These contributions are well above the contributions in neighbouring economies, both in terms of value added and employment.

Albania's growth over the past decade has been moderated compared to the period prior to the global financial crisis (Table 20.1), and even though macroeconomic stability has since improved, significant imbalances still persist. The economy is still mainly consumption-driven and investment, including foreign direct investment (FDI), remains concentrated in a few key energy projects and in the real estate sector, which have limited productivity-enhancing potential. In this context, the growth of the tradable sector has been limited. At 31.6% of GDP, the contribution of exports was lower than regional leaders in 2019 (e.g. 62.1% of GDP in North Macedonia) even prior to the impact of the COVID-19 pandemic. Exports consist of goods and services with limited technological content and value added, including tourism, textiles and apparel, electricity, as well as metals and metal-based products (INSTAT, 2021<sup>[1]</sup>). Moreover, due to the importance of the electricity sector, exports and their contribution to GDP have also been relatively volatile as they depend on hydrologic conditions. Meanwhile the impact of the COVID-19 pandemic has been amplified by the high dependence on tourism exports (see section). In the context of highly import-dependent consumption (imports represented 45.4% of GDP in 2019), the trade and current account deficits have remained relatively large at 13.8% and 8.9% of GDP respectively (World Bank, 2021<sup>[2]</sup>; European Commission, 2020<sup>[3]</sup>).

This economic model has not been conducive to productivity growth. Over the past decade, growth has been mainly driven by labour and capital accumulation, while total factor productivity growth has either been low or negative (World Bank, 2019<sup>[4]</sup>). Labour productivity growth saw a marked decline in the post-crisis period due to more limited gains from labour reallocation between sectors, as well as weaker gains from within-sector productivity growth. As a result, labour productivity across all sectors remains very low, at less than a quarter of the EU average (World Bank, 2021<sup>[2]</sup>). And even though employment in Albania is higher than in most economies in the region, at 53%, most jobs are low-skilled and low-waged, including a high share of employment in subsistence agriculture (World Bank, 2019<sup>[4]</sup>; World Bank, 2021<sup>[2]</sup>).

Other labour market indicators point to notable outstanding challenges. Despite significant declines over the past decade, the unemployment rate remains elevated at 12.2% (Table 20.1). Moreover, the share of those who have been unemployed for one year or more was 64.3% in 2019, well above the OECD average

of 25.8% and the EU average of 40.4% (WIIW, 2019<sup>[5]</sup>; World Bank, 2021<sup>[2]</sup>). Meanwhile, the share of youth not in employment, education or training is also high at 25.8%, which is nearly double the OECD average of 13.6% and the EU average of 10% (World Bank, 2021<sup>[2]</sup>).

Albania's growth prospects over the coming decade and beyond will strongly depend on the strength of its reform efforts to upgrade human capital, boost investment and expand, diversify and upgrade its exports and modernise the agricultural sector. This will entail improving the quality and relevance of education at all levels, improving the business environment by tackling corruption and informality, strengthening contract enforcement and strengthening property rights, bridging the infrastructure gaps, and improving SMEs' access to finance.

**Table 20.1. Albania: Main macroeconomic indicators (2015-20)**

Indicator	Unit of measurement	2015	2016	2017	2018	2019	2020
GDP growth <sup>1</sup>	% year-on-year	2.2	3.3	3.8	4.1	2.2	-3.3
GDP per capita <sup>2</sup>	Current international \$	11 659	12 079	12 771	13 546	14 231	13 818
National GDP <sup>2</sup>	USD billion	11.4	11.9	13.0	15.1	15.3	14.8
Inflation <sup>1</sup>	Consumer price index, annual % change	1.9	1.3	2.0	2.0	1.4	1.6

## Sustainable development

Over the past decade, Albania has made progress towards reaching the targets of the 2030 Agenda for Sustainable Development, but considerable challenges still remain in meeting most Sustainable Development Goals (SDGs) (Table 20.2). Albania is only on track to achieve or has maintained the achievement of the SDGs in three main areas – quality education (SDG 4), affordable and clean energy (SDG 7), and climate action (SDG 13). Strong performance in the latter two SDGs reflects Albania's heavy reliance on hydropower and limited use of fossil fuels outside of the transport sector. Meanwhile, in the education dimension, the rates of net primary enrolment, lower secondary completion and literacy are above 92% and on track to reach the 100% SDG targets (Sachs et al., 2021<sup>[11]</sup>).

**Table 20.2. Albania's progress towards achieving the SDGs**

SDG	Current assessment	Trends
1 – No poverty	Challenges remain	Moderately improving
2 – Zero hunger	Significant challenges remain	Stagnating
3 – Good health and well-being	Significant challenges remain	Moderately improving
4 – Quality education	SDG achieved	On track or maintaining SDG achievement
5 – Gender equality	Significant challenges remain	Stagnating
6 – Clean water and sanitation	Significant challenges remain	Moderately improving
7 – Affordable and clean energy	Challenges remain	On track or maintaining SDG achievement
8 – Decent work and economic growth	Major challenges remain	Moderately improving
9 – Industry, innovation and infrastructure	Significant challenges remain	Moderately improving
10 – Reduced inequalities	Significant challenges remain	Information unavailable
11 – Sustainable cities and communities	Significant challenges remain	Stagnating
12 – Responsible consumption and production	Significant challenges remain	Information unavailable
13 – Climate action	SDG achieved	On track or maintaining SDG achievement
14 – Life below water	Major challenges remain	Stagnating
15 – Life on land	Significant challenges remain	Stagnating
16 – Peace, justice and strong institutions	Significant challenges remain	Stagnating
17 – Partnerships for the goals	Significant challenges remain	Moderately improving

Note: The order of progress (from greatest to least) is as follows: SDG achieved; challenges remain; significant challenges remain; major challenges remain.

Source: (Sachs et al., 2021<sup>[11]</sup>), *The Sustainable Development Report 2021: the Decade of Action for Sustainable Development Goals*, <https://s3.amazonaws.com/sustainabledevelopment.report/2021/2021-sustainable-development-report.pdf>.

Moderate improvement has been noted in many areas, though notable challenges persist. While extreme poverty – defined as people living on less than USD 1.90 per day – has been almost eradicated (0.2%), the share of people living on less than USD 3.20 per day is 8.5%, above the 2030 target of 0% (SDG 1). Health outcomes (SDG 3) have been improving, with mortality rates for mothers and children under 5 declining below the 2030 target levels. However, considerable progress needs to be made in improving universal health coverage. In the area of clean water and sanitation (SDG 6), more progress is needed to expand access to drinking water services (9% of the population still lacks access) and improve wastewater treatment. Significant challenges remain in the SDG related to industry, innovation and infrastructure (SDG 9), which partly reflect low spending on research and development (R&D) and innovation, low-quality higher education, and the weak quality of trade and transport infrastructure as measured by the logistics performance index (LPI) – for more see the Structural economic challenges). More progress is also needed in improving city life (SDG 11) by reducing air pollution and improving access to piped water, transport and other services; and in fostering a circular economy (SDG 12) through the collection and recycling of waste. In the area of peace and institutions (SDG 16), the biggest gaps lie in tackling corruption, improving the protection of property rights and strengthening the criminal justice system (Sachs et al., 2021<sup>[11]</sup>).

The most significant gaps vis-à-vis the SDG targets are in the areas of decent work and economic growth (SDG 8), and marine life (SDG 14). High unemployment remains an important challenge despite the progress achieved over the past decade. Likewise, stronger economic growth is needed for more and better jobs as well as higher incomes. Growth also needs to be more inclusive. At 41.7, the Gini coefficient measuring income inequality is still well above the target value of 27.5 (SDG 11). Last but not least, significant efforts are needed to reduce marine pollution and improve the sustainability of fishing practices in Albania's coastal regions (Sachs et al., 2021<sup>[11]</sup>).

### **Structural economic challenges**

Albania faces a number of key structural challenges that undermine its competitiveness, investment environment and integration into global value chains (GVCs):

*Weak knowledge and skills hinder economic diversification and upgrading*

- **Low-quality education** reflects both low spending on education, as well as poorly targeted spending that undermines education outcomes. In 2018, the Albanian Government spent 2.5% of GDP on education (World Bank, 2020<sub>[12]</sub>), well below the OECD average of 4.5% (OECD, 2019<sub>[13]</sub>). A significant share of this spending was on teaching staff, and as a result Albania has a high teacher-to-student ratio, especially at the primary school level (18 in Albania, compared to 13 in EU and 15 in the OECD). At the secondary school level, the number of students per teacher is in line with the EU average but below the OECD average (12 in Albania/EU and 14 in the OECD) (World Bank, 2021<sub>[2]</sub>). Nevertheless, lower teaching quality in Albania is reflected in considerably poorer learning outcomes. For example, in the latest Programme for International Student Assessment (PISA), fewer than 60% of Albanian students achieved the minimum level of proficiency across all testing subjects (reading, mathematics and science) compared to 76% for the OECD average (OECD, 2019<sub>[14]</sub>). In the case of reading, just 48% of students achieved the minimum proficiency. Although the latest testing results indicate considerable progress since the previous PISA assessment, more progress is needed to improve education quality over the coming years (OECD, 2019<sub>[14]</sub>).
- **Skills gaps.** Albania's labour market is characterised by predominantly low-skilled and low-waged employment; skills gaps are limiting the scope for economic upgrading and diversification. In the World Bank's employers' Skills Measurement Program (STEP) survey, more than 90% of firms requiring higher-level skills, including cognitive and socio-emotional skills, reported difficulties hiring staff. For most of these firms, the limited number of candidates was reported as the main obstacle, followed by a lack of experience. Over 50% of firms cited the lack of required skills as the main obstacle to filling available vacancies (Honorati, 2018<sub>[15]</sub>). In the 2019 Balkan Barometer survey, nearly 40% of respondents noted that the skills that they acquired during their education do not meet the needs of their job. The most deficient skills noted in the survey included foreign language skills (42% of respondents); communication skills (24%) and other cognitive skills, including ability to learn on the job (27%); and creativity, innovation and risk-taking (20%) (Regional Cooperation Council, 2019<sub>[16]</sub>).

*A challenging business climate undermines investment and private sector development*

Over the past decade, Albania has made progress in reducing the regulatory and administrative burden on businesses, especially in the area of judicial reform, trade, resolving insolvency and starting a business. However, Albania is still ranked 82<sup>nd</sup> out of 191 economies globally on the World Bank's Doing Business (DB) assessment, reflecting considerable outstanding challenges including corruption, weak contract enforcement, lengthy and costly processes for obtaining licences and permits, weak property rights, and high informality (World Bank, 2020<sub>[17]</sub>):

- **Corruption** remains an important cost of and obstacle to doing business in Albania. In the latest Business Environment and Enterprise Performance (BEEPS) survey, Albanian firms recorded greater depth and prevalence of corruption than firms in peer economies as well as globally. For example, 36.1% of firms experienced at least one bribe payment request, which is considerably higher than the Europe and Central Asia (ECA) average of 8.7% and the global Doing Business (DB) average of 17%. According to the BEEPS, nearly one-third of all public transactions include a request for a gift or informal payment. Furthermore, 34.6% of firms noted that they were expected to provide gifts when meeting with tax officials, compared to the 7.4% and 13.4% ECA and global averages respectively. Over 40% of firms identified corruption as a major constraint for their business (World Bank, 2020<sub>[18]</sub>). Reforms of recent years that have increased the availability and use of e-services should lead to a reduction in the frequency of meetings with tax officials and reduced incidence of corruption (European Commission, 2020<sub>[19]</sub>)
- **Contract enforcement** is slow, costly and unreliable. Contract enforcement takes on average 525 days, which is somewhat faster than the OECD average (590 days), but considerably longer than the

global leaders on the DB index (120 days). The process is slowed down by the overburdened court system, which has a significant backlog of cases (World Bank, 2019<sub>[4]</sub>). Contract enforcement is also quite costly: at 42.7% of the claim value, it is well above the OECD average of 21.5%. Finally, and perhaps most importantly, confidence is lacking in the judicial system's fair and impartial decision making. In the latest Regional Cooperation Council barometer survey, 71% of respondents stated that they do not trust the court system, and the same share stated that they do not believe that the judiciary is independent of political influence. Likewise, 76% of respondents do not believe that the law is applied equally to everyone (Regional Cooperation Council, 2019<sub>[16]</sub>). In the latest BEEPS, 40% of firms identified the courts as a major constraint (World Bank, 2020<sub>[18]</sub>).

- **Obtaining licences and permits** is a long and costly process in Albania. For example, obtaining a construction permit takes on average 324 days (compared to a 152-day average for the OECD), requires 19 procedures (compared to the OECD average of 13), and costs 6.8% of the warehouse value (compared to 1.5% for the OECD average). A very large part of the costs are two municipal taxes (on infrastructure and an examination fee) (World Bank, 2020<sub>[17]</sub>).
- **Inadequately defined property rights** are another important deterrent for investment. This is a problem with long historical roots, and has resulted in widespread competing claims over property ownership that are very difficult to resolve. The resulting uncertainty creates an important impediment for investment, particularly FDI.
- **Unfair competition**, particularly from the informal sector, represents an important constraint for businesses in Albania. In the BEEPS survey, 44.7% of firms stated that they compete against informal firms, while 37.2% of firms stated that informal competition is a major obstacle for their business (World Bank, 2020<sub>[18]</sub>). The share of informal employment is estimated at about 37.8% (WIIW, 2019<sub>[5]</sub>).

#### *Infrastructure deficiencies undermine investment, trade and GVC integration*

These deficiencies include the unreliable electricity supply and insufficiently developed transport infrastructure and connectivity:

- **The unreliable electricity supply** is an important obstacle to doing business in Albania. In the latest BEEPS survey, 58.7% of firms stated that they had experienced electrical outages over the past month and 43% of all firms identified electricity as a major obstacle. Nearly 50% of firms own or share a generator (compared to less than 20% for the ECA average), which produces on average about 12% of the total electricity used (World Bank, 2020<sub>[18]</sub>). Even though considerable progress has been made in recent years to improve the reliability of the electricity supply, more progress is needed on a few fronts. The heavy reliance on hydropower makes the electricity sector highly vulnerable to periods of low rainfall, when the sector has to rely on expensive electricity imports. Distribution losses are also an important challenge. They remain high at 21.5%, with 64% representing technical losses (INSTAT, 2018<sub>[20]</sub>). Therefore, further diversification of the energy supply, further infrastructure upgrades to reduce distribution losses and strengthening financial buffers against import-induced financial shocks are needed to improve the reliability of the electricity supply.
- **Deficiencies in transport infrastructure connectivity** also reduce the attractiveness of Albania as an investment destination. In terms of network size, Albania lags behind peer economies across all modes of transport. In road transport, the length of motorways is lower than peers of comparable size, as is the length of the overall road network (Eurostat, 2018<sub>[21]</sub>). In the rail sector, Albania also lags behind peers for freight transported through the network, even compared to economies that are considerably smaller and have a similarly sized manufacturing sector (as a share of GDP), such as Montenegro (Eurostat, 2018<sub>[22]</sub>). Limitations in transport policy and investment in transport infrastructure development and maintenance mainly account for these gaps – see Transport policy (Dimension 11).

### *Poor access to finance hinders SME investment, innovation and technology adoption*

Even though the banking sector has been stable, liquid and well-capitalised, credit to the private sector – at 34.4% (37% in February 2021) of GDP – is lower than in peers and advanced economies. This is the case despite a significant decline in non-performing loans, lending interest rates, and a strong growth in deposits. In fact, Albania has one of the lowest loan-to-deposit ratios among emerging economies, at 47% (IMF, 2019<sup>[23]</sup>). Credit is particularly constrained for SMEs, which face steep lending requirements from the banks. These include most notably the high collateral requirements, which exceed 177% of the value of the loan. And since over 90% of loans require collateral, the barrier for SMEs to access finance is high (World Bank, 2020<sup>[18]</sup>). Meanwhile, alternatives to bank financing are very limited – see Access to finance chapter (Dimension 3).

### *Cross-cutting and sector-specific constraints undermine the growth of key sectors*

Agriculture is mainly characterised by subsistence farming, and compared to peers, holdings are highly fragmented and small scale, the access and take-up of new technologies is low, compliance with standards is limited, and input costs are high (World Bank, 2019<sup>[4]</sup>). As a result, agricultural productivity is one of the lowest in Europe and agricultural exports are also very low, at just 15% (World Bank, 2021<sup>[2]</sup>; INSTAT, 2021<sup>[1]</sup>). Efforts to consolidate land and foster agricultural co-operatives are further hampered by lack of clearly defined property rights – see Agriculture policy (Dimension 14). Limited access to finance also constrains the growth of this sector – see Access to finance (Dimension 3).

- **Manufacturing** sectors and their GVC integration are constrained by gaps in infrastructure, customs and logistics, challenges in the business environment, skills gaps and firms' limited capacities for technology adoption, limitations in access to finance, etc. (OECD, 2019<sup>[24]</sup>). Upgrading and diversification of the manufacturing sector could play a key role in boosting exports and GVC integration. Analyses of Albania's product space reveal considerable long-term potential for growth in the automotive industry (vehicle and engine parts), machinery and metal processing. Short- to medium-term gains can also be achieved through the expansion of agri-food processing.
- **Tourism** is characterised by high seasonality and concentration in the coastal areas. Moreover, the value added of the sector is still relatively low, because Albania tends to attract mostly regional tourists and diaspora visitors with low spending power. Given the small size of the economy, the development of higher-end tourism would be beneficial. However, further development and upgrading of this sector is constrained by poor infrastructure, lack of quality standards, weak branding and marketing, high informality etc. (World Bank, 2019<sup>[4]</sup>). See Tourism policy (Dimension 15).
- **The ICT sector** is mainly constrained by infrastructure gaps, the low supply of skilled workers, weak collaboration between the sector and the relevant educational institutions, and lack of access to finance – particularly financing for start-ups and high-risk venture capital, etc. (World Bank, 2019<sup>[4]</sup>). Although the sector is still relatively small, it is growing very fast (computer programming and related services have been growing at nearly 30% annually over the past five years) with considerable potential to further boost Albania's service exports and GVC integration.

### *Weak management of public finances holds back long-term development*

- Albania faced the COVID-19 pandemic with a relatively limited fiscal space. Increased spending in the aftermath of the global financial crisis, coupled with weaker revenue performance, increased fiscal deficits and elevated public and publicly guaranteed debt from 57.7% in 2010 to 72.4% in 2016. Thanks to subsequent fiscal consolidation, public debt declined to 67.9% in 2019, but this trend was reversed by the pandemic which increased the expenditure needs while reducing revenues. As a result, at the end of 2020, public and publicly guaranteed debt rose to 77.4% of GDP, the second highest in the region (World Bank, 2021<sup>[25]</sup>). Improved performance in the fiscal sector will require addressing key

underlying structural constraints, including weak revenue performance (27.4% of GDP compared to 44.7% for the EU average) due to a low tax base, high informality, and high tax evasion, as well as inefficient allocation of expenditures (IMF, 2019<sup>[26]</sup>; OECD, 2021<sup>[27]</sup>). The latter requires limiting the rise of non-discretionary current expenditures, including high social transfers, thus creating more space for higher and better targeted expenditures on infrastructure, health, education, etc.

### *Environmental degradation threatens long-term development and well-being*

- **Air pollution** is an important challenge in cities across Albania. Transport is the main source of pollution due to the growing number of people and vehicles in the major cities. And with nearly 87% of private cars aged 10 years or older, and nearly 20% 20 years or older, the pollution burden is high (INSTAT, 2021<sup>[1]</sup>). Residential heating is another important source of air pollution, especially in the winter. Since there is no district heating infrastructure in Albania, a large proportion of the population uses old wood-burning stoves and fireplaces for residential heating (UNECE, 2018<sup>[28]</sup>), leading to high particulate matter (PM) pollution, especially during the winter. Although annual exposure to PM 2.5 is the lowest in the Western Balkan region (18 micrograms per cubic metre,  $\mu\text{g}/\text{m}^3$ ), it is still considerably higher than the EU and OECD averages of 13.1  $\mu\text{g}/\text{m}^3$  and 12.5  $\mu\text{g}/\text{m}^3$  respectively, and nearly double the World Health Organization (WHO) recommended maximum annual exposure level (10  $\mu\text{g}/\text{m}^3$ ) (EEA, 2020<sup>[29]</sup>) (World Bank, 2017<sup>[30]</sup>).

Albania is highly prone to natural disasters (floods, earthquakes, landslides, etc.) and has suffered significant economic and physical damage as a result of these disasters. It therefore needs to ensure better stewardship of its natural environment, which provides natural buffers against these disasters. This also ensures the preservation of the country's rich biodiversity. Improving water resource management is also important, being essential for the continued reliance on hydropower, as is providing reliable access to high-quality and safe drinking water to all citizens. Preserving natural resources is also critical especially in the context of climate adaptation. Finally, reducing solid waste and fostering a circular economy will contribute to Albania's sustainable development – see Energy policy (Dimension 12).

### *Inequality remains an important challenge*

- Even though living standards have improved substantially over the past decade, according to the latest European Income and Living Conditions Survey (EU-SILC), inequality in Albania is above the regional average and 40% of households are severely materially deprived (Eurostat, 2020<sup>[31]</sup>). There are considerable disparities across ethnic groups, with the Roma and Egyptian minorities lagging considerably behind on most well-being indicators, such as access to education, infrastructure, and public services. Regional disparities are strong as well. GDP per capita in Tirana is more than double that of the poorest province, Kukës. Likewise, health and social security coverage is up to five times as high in Tirana than in other regions (INSTAT, 2021<sup>[1]</sup>). In light of this, ensuring that the gains from prosperity are shared by all ought to be an important development priority for the Albanian economy. More inclusive growth will improve the incomes and well-being of all citizens.

### *COVID-19 has exacerbated structural challenges*

The COVID-19 pandemic has had a significant impact on the Albanian economy over the past year. The brunt of the impact was felt in the second quarter of 2020 when domestic and external demand were hit hard by COVID-related restrictions on movement, disruptions in value chains etc. Exports were hit the hardest, declining by 49.9% year-on-year (y-o-y), while investment fell by 11.1% y-o-y on account of the dual impact of the pandemic as well as the completion of major energy projects that had strongly contributed to investment in recent years. Private consumption also declined by 7.9% y-o-y, as did public consumption (0.6% y-o-y). The GDP decline was moderated by a fall in imports of 36% y-o-y. The output decline lessened in Q3 to -3.5% y-o-y, due to smaller declines in private and public consumption and

exports, a recovery in investment (4.1% y-o-y) and a further decline in imports (-23.9% y-o-y) (European Commission, 2020<sub>[31]</sub>; European Commission, 2020<sub>[32]</sub>).

The service and manufacturing sectors were most strongly affected by the crisis. Retail and wholesale trade, transport, and tourism and hospitality services were worst affected, declining by 27% y-o-y in Q2. Industrial output, meanwhile, fell by 13.1%, led by a decline in manufacturing of 19.1% y-o-y. The only sectors that saw an increase in output were agriculture and real estate (European Commission, 2020<sub>[31]</sub>; European Commission, 2020<sub>[32]</sub>).

The impact on the labour market was mitigated by government support measures, which included direct and indirect financial support to businesses affected by the pandemic-related closures, including subsidies for employee salaries, guarantees for loans, etc. (OECD, 2021<sub>[33]</sub>). Unemployment rose mildly in the second quarter, from 12% to 12.5%, but had returned to the pre-crisis level of 12.1% already by Q3 of 2020, while employment continued to decline in Q3 although at a more gradual pace (-1.2% y-o-y down from -3.9% y-o-y in Q2). Labour force participation also recovered to pre-crisis levels in Q3, though the recovery was more pronounced for men than for women (European Commission, 2020<sub>[31]</sub>; European Commission, 2020<sub>[32]</sub>).

Government support also helped to mitigate the impact on household incomes and poverty, which were strongly affected by the decline in remittances (-35% y-o-y in Q2 2020). These support measures included a one-off transfer to employees who had lost their jobs due to the pandemic, doubling of unemployment and social assistance payments, and additional support to the most vulnerable households (OECD, 2021<sub>[33]</sub>).

Many of the structural challenges described above have played a role in either amplifying the impact on the COVID-19 epidemic or limiting the scope of the policy responses to lessen its impact. The crisis has, therefore, provided important lessons on how to build more resilient economies and institutions:

- **Fiscal policy:** Albania has implemented a number of tax policies as part of its response to the COVID-19 pandemic:
  - Waiving 2020 CIT payments and pre-payments for taxpayers with an annual turnover up to ALL 14 million (EUR 113 000). Postponement of CIT payments and pre-payments concerning the period April-September 2020 to April-September 2021 for companies with an annual turnover above ALL 14 million (except for companies in the banking, telecommunication, pharmaceutical and food trade sectors).
  - Tax filing extension for the submission of the 2019 PIT tax returns, from 30 April 2020 to 31 July 2020. The extension concerns individuals with an annual income above ALL 2 million (EUR 16 200).
  - Deferring rent payments for small businesses, individuals who stopped working during the pandemic and students forced to leave their residence.
  - Wage subsidies paid directly to eligible companies, equivalent to the minimum wage.
  - One-off additional payment for beneficiaries of unemployment benefit or other economic assistance.
  - Series of ALL 40 000 (EUR 320) payments to employees of companies that were forced to close down due to the pandemic.
  - Introducing two sovereign guarantee funds, amounting to ALL 11 billion (EUR 88.5 million) and ALL 15 billion (EUR 120.7 million) each.

The fiscal response has been critical for avoiding significant economic fallout from COVID-19, especially on labour market outcomes. However, it has resulted in a significant narrowing of the fiscal space. In the context of weaker prospective revenues in the wake of the crisis, particularly if the recovery is slow, improving the efficiency of public spending will be crucial over the coming

months, as will be prioritising expenditures that can support the recovery and promote productivity growth and structural transformation for stronger and more resilient long-term growth. This also includes increasing public investment. The crisis has also highlighted the importance of rebuilding fiscal buffers in the post-crisis period. This goal will require tackling the structural constraints that undermine revenue performance.

- **Innovation and technology adoption:** The COVID-19 crisis has starkly demonstrated the importance of firm adaptability in meeting new challenges and changing circumstances. It has also revealed the advantages that firms which have embraced digitalisation and modern practices have over others. The resilience of the post-COVID recovery will therefore depend on addressing structural issues limiting firm innovation and technology – see Structural economic challenges section – and mainstreaming digitalisation and digital skills.
- **Access to finance:** The crisis highlights the significance of having a well-developed and diversified financial sector that can respond to the financing needs of enterprises, not only in times of crisis but also during the recovery phase. As in the rest of the region, the main instruments for providing additional liquidity for enterprises during the crisis came through government support for subsidised lending or lending guarantees. However, the resilience of the Albanian financial sector through the crisis has further reinforced the growing trust in the sector. Going forward, a robust financial sector made up of diversified financial institutions that can provide financing for riskier and innovative ventures, and not just established enterprises, will be very important in the recovery phase and beyond.
- **Informality:** The large size of the informal sector, and the significant share of informal employment even within the formal sector, have limited the scope of the measures to protect the income and employment of people in the worst-affected sectors. Informality is widespread in sectors affected highly by the crisis, including retail trade and tourism, and this segment was not able to benefit from government support measures to the same extent as the formal sector (some support was provided to the informally employed who lost their employment) (ILO, 2019<sup>[34]</sup>) (European Commission, 2021<sup>[35]</sup>). Developing a more resilient economy will also depend on enhancing incentives for formalisation and improving the oversight and sanctioning of non-compliance.
- **Health sector:** Spending on health care in Albania, at 5.3% of GDP in 2018, has been below spending in the other WB6 economies with available data, and the EU (9.9%) and OECD (12.5%) averages (World Bank, 2020<sup>[12]</sup>). This has resulted in relatively high out-of-pocket expenditures (44.6% of current health spending), which negatively impact everyone but particularly the low-income families (World Bank, 2020<sup>[12]</sup>). The private healthcare system is even more expensive, but as it provides faster and better-quality care, many people choose this option (Health Consumer Powerhouse, 2018<sup>[36]</sup>).

### ***EU accession process***

Albania's path to EU accession began in April 2009 with its application for membership and the subsequent entering into force of the Stabilisation and Association Agreement. In 2010, Albanian citizens were granted visa-free travel to all EU member states that are part of the Schengen area, and in 2014 Albania gained the status of EU candidate country. Following the EU's decision to open accession negotiations in March 2020 and the subsequent presentation of the draft negotiating framework to the Member States in July 2020, Albania is awaiting the start of the negotiations.

Advancing on the socio-economic reform agenda remains a critical priority in Albania's path to EU membership. The findings in this Competitiveness Outlook (CO) 2021 are relevant to a number of critical chapters of the *acquis*, while its recommendations provide the guidance needed to meet the accession requirements. The CO also provides a good basis for assessing the critical challenges that the economy faces as a starting point for developing the Economic Reform Programmes (Box 20.1).

### Box 20.1. Economic Reform Programmes

Since 2015, all EU candidate countries and potential candidates prepare Economic Reform Programmes (ERPs) which play a key role in improving economic policy planning and steering reforms to sustain macroeconomic stability, boost competitiveness, and improve conditions for inclusive growth and job creation. The ERPs contain medium-term macroeconomic projections (including for GDP growth, inflation, trade balance and capital flows), budgetary plans for the next three years and a structural reform agenda.

The structural reform agenda includes reforms to boost competitiveness and improve conditions for inclusive growth and job creation in the following areas:

1. Public Financial Management
2. Green transition
3. Digital transformation
4. Business environment and reduction of the informal economy
5. Research, development and innovation
6. Economic integration reforms
7. Energy market reforms
8. Transport market reforms
9. Agriculture, industry and services
10. Education and skills
11. Employment and labour market
12. Social protection and inclusion
13. Healthcare systems

The structural reforms part of the ERPs is organised in two parts:

- A first part identifies and analyses the three key challenges across those 13 areas. The identification and prioritisation of key challenges imply a clear political commitment at the highest level to address them and the ERPs should propose a relevant number of reform measures to decisively tackle each of them in the next three years.
- A second part provides an analysis of the remaining areas (not included as key challenges) and may propose additional reforms to address them.

The European Commission and the European Central Bank then assess these programmes, which form the basis for a multilateral economic policy dialogue involving the enlargement economies, EU Member States, the Commission and the European Central Bank. The dialogue culminates in a high-level meeting during which participants adopt joint conclusions that include economy-specific policy guidance reflecting the most pressing economic reform needs. The findings of the Competitiveness Outlook provide guidance to the six Western Balkans EU candidates and potential candidates in identifying the key obstacles to competitiveness and economic growth, and in developing structural reform measures to overcome them.

## ***EU financial and development support***

The EU is the largest provider of external financial assistance to Albania. Since 2007, the EU has provided EUR 1.25 billion in pre-accession funds aimed at strengthening democracy and the rule of law, reforming the public administration, strengthening competitiveness and improving environmental outcomes and food safety. A further EUR 464 million has been provided through lending from the European Investment Bank (EIB) since 1999. The Western Balkans Investment Framework (WBIF) has provided EUR 143.8 million in grants that have leveraged further investments of an estimated EUR 2.3 billion. Finally, the EU has provided much-needed grant financing of EUR 115 million to support Albania's reconstruction efforts in the aftermath of the 2019 earthquake (European Commission, 2021<sup>[39]</sup>).

In addition to the grant funding and lending, the EU also provides important support through guarantees for public and private investment to reduce the risks and costs associated with those investments. The new Western Balkans Guarantee Facility is expected to mobilise up to EUR 20 billion in investment over the coming decade (European Commission, 2020<sup>[19]</sup>).

The Connectivity Agenda seeks to support investments in sustainable transport and clean energy. Set up under the WBIF, the latest package, which was presented at the Western Balkans Summit in Sofia on 10 November 2020, completes the delivery of the EU's 2015 pledge to finance EUR 1 billion of investment to support better connectivity in the WB region. It also represents the first step in implanting the flagship projects under the Economic and Investment Plan for the region. Albania is expected to receive up to EUR 193.6 million between 2021 and 2026 under this programme (European Commission, 2021<sup>[40]</sup>).

The EU has also been instrumental in supporting Albania's response to the COVID pandemic. EUR 50.65 million in bilateral assistance from IPA 2014-2020 was provided to Albania to cover the urgent needs of the health sector and to support economic and social recovery in the crisis aftermath. A further EUR 180 million was approved, and EUR 90 million disbursed, in macro-financial assistance to support the economic recovery. Albania and other WB economies have also been recipients of the EU's regional economic reactivation package of EUR 455 million. In December 2020 the European Commission also adopted a EUR 70 million package to help WB economies gain access to COVID-19 vaccines. Moreover in February 2021, a joint EU/WHO project provided assistance of EUR 7 million to support vaccination readiness and health sector resilience in the region (European Commission, 2021<sup>[39]</sup>).

## **Scope and methods**

### ***Process***

Following the first two Competitiveness Outlook assessments, published in 2016 and 2018, the third Competitiveness Outlook assessment cycle for the WB6 economies was launched virtually (due to the COVID-19 pandemic) on 3 April 2020. The OECD team introduced Albania's Competitiveness Outlook Government<sup>1</sup> and Statistical Office Co-ordinators<sup>2</sup> to the new digitalised assessment frameworks (see the Assessment methodology and process chapter for details). The two primary documents for assessing each of the 16 policy dimensions – the qualitative questionnaire and statistical data sheet – were explained in depth, giving particular attention to new questions and indicators. The OECD team also explained digital solutions to be used to disseminate the material together with the detailed guidelines, tutorials and information on the assessment process, methodology and timeline.

Following the launch of the assessment, the Ministry of Finance and Economy disseminated the materials among all 16 Policy Dimension Co-ordinators and Statistical Office contact points in Albania. Where additional guidance was needed, the OECD team held teleconferences with Dimension Co-ordinators and Statistical Office contact points in April and May 2020.

All 16 Dimension Co-ordinators and Statistical Office contact points completed the assessment between April and May 2020. They assigned a score (see Scoring approach) to each qualitative indicator used to assess the policy dimension in question, accompanied by a justification. The completed assessments (qualitative questionnaires and statistical data sheets) were returned to the OECD team between May and July 2020.

The OECD reviewed the inputs and, where necessary, requested additional information from the Ministry of Finance and Economy, Policy Dimension Co-ordinators and Statistical Office contact points. The updated assessment materials were sent back to the OECD between July and September 2020. In addition, the OECD organised policy roundtable meetings between October and November 2020 to fill in any remaining data gaps, to get a better understanding of the policy landscape, and to collect additional information for indicators where necessary.

Based on the inputs received, the OECD compiled the initial key findings for each of the 16 policy dimensions. It then held consultations on these findings with local non-government stakeholders (including chambers of commerce, academia and NGOs) in November 2020. As a follow up, the OECD presented the preliminary findings, recommendations and scores to the Competitiveness Outlook Government Co-ordinator, Policy Dimension Co-ordinators and Statistical Office contact points at a virtual meeting on 29 January 2021. The draft Competitiveness Outlook economy profile of Albania was made available to the Government of Albania for their review and feedback from mid-February to mid-March 2021.

### **Scoring approach**

Each policy dimension and its constituent parts are assigned a numerical score ranging from 0 to 5 according to the level of policy development and implementation, so that performance can be compared across economies and over time. Level 0 is the weakest and Level 5 the strongest, indicating a level of development commensurate with OECD good practice (Table 20.3).

For further details on the Competitiveness Outlook methodology, as well as the changes in the last assessment cycle, please refer to the Assessment methodology and process chapter.

**Table 20.3. Competitiveness Outlook scoring system**

<b>Level 5</b>	Level 4 plus independent impact evaluation. Results of monitoring and impact evaluation inform policy framework design and implementation updates in line with OECD good practice
<b>Level 4</b>	Level 3 plus evidence that the framework is monitored and, if necessary, adjusted accordingly
<b>Level 3</b>	Level 2 plus some concrete indications that the policy framework is being implemented effectively
<b>Level 2</b>	Framework specifically addressing the policy area concerned is solidly in place, officially adopted by the government or parliament (where applicable). The framework includes policy features necessary for it to have an impact
<b>Level 1</b>	Existing draft or pilot policy framework with signs of government activity addressing the policy area concerned
<b>Level 0</b>	No framework (e.g. law, institution, project, initiative) exists for the policy topic concerned

### *Exceptions*

Unlike the other 15 policy dimensions, competition policy (Dimension 5) is assessed using yes/no answers to 71 questions in a dedicated questionnaire. A “yes” response (coded as 1) indicates that a criterion has been adopted, whereas a “no” (coded as 0) indicates the criterion has not been adopted. The overall score reflects the number of criteria adopted. Moreover, some qualitative indicators which have been added to this edition of the assessment for the first time, are not scored due to the recent character of the policy practice they capture and the unavailability of relevant data.

## Investment policy and promotion (Dimension 1)

### Introduction

Albania has slightly improved its performance in the investment policy and promotion dimension. The economy's score has increased from 2.6 in the 2018 Competitiveness Outlook to 3.1 in the 2021 assessment, with notable progress in enhancing its investment promotion and facilitation and implementing green investment strategies. Albania is the third-best performing economy in the Western Balkan region for investment policy and promotion, scoring above the regional average for investment promotion and facilitation and green investment, though trailing behind in its investment policy framework (Table 20.4).

**Table 20.4. Albania's scores for investment policy and promotion**

Dimension	Sub-dimension	Score	WB6 average
Investment policy and promotion dimension	Sub-dimension 1.1 Investment policy framework	2.9	3.2
	Sub-dimension 1.2 Investment promotion and facilitation	3.4	3.0
	Sub-dimension 1.3 Investment for green growth	2.8	2.0
Albania's overall score		<b>3.1</b>	<b>3.0</b>

### State of play and key developments

Albania has been increasingly successful in attracting FDI over the last decade, with average net FDI increasing from USD 484 million over 2000-09 to USD 1.2 billion from 2010-19 (

Figure 20.2). Net FDI inflows have represented on average 8.2% of the economy's GDP over the last five years, making Albania one of the best performers of the WB6 economies. This is also a better performance than the average for upper middle-income countries (2.0% of GDP) and OECD economies (2.4% of GDP) over the same period (World Bank, 2020<sub>[12]</sub>). FDI is concentrated in the energy sector, extractive industries, banking and insurance, telecommunications, and real estate, and comes from diverse sources, notably Austria, Canada, Greece, the Netherlands, Switzerland and Turkey

**Figure 20.2. Net FDI inflows to Albania (2015-19)**

### *Sub-dimension 1.1: Investment policy framework*

Overall, Albania's **legal framework for investment** and conduct of business is complex and lacking clarity. The economy does not have a stand-alone investment law; instead it has several laws governing investment activities, including the 1993 Law on Foreign Investment and the 2015 Law on Strategic Investments, as well as a number of sectoral laws and regulations.<sup>3</sup> In 2019, a new investment law that simplifies and unifies the legal framework for investment was drafted and consultations initiated. This new law merges the laws on foreign investment and strategic investment and is currently undergoing final preparations in co-ordination with the state advocacy. It is expected to be adopted within 2021.

Since 2017, the government has started modernising its ageing investment framework, though progress has been slow to materialise. The government has taken steps towards aligning its investment framework with modern international standards and good practice.

Despite the success of its investment regime in attracting FDI, investors in Albania often complain about the lack of clarity regarding the legal framework, as the government has introduced multiple changes and amendments to the investment framework and sectoral regulations in recent years. They also report a lack of transparency when dealing with the administration, as well as uneven enforcement of the law. These challenges are reflected in the economy's ranking in the 2020 Doing Business Index of 82<sup>nd</sup> out of 190 economies, scoring particularly poorly on enforcing contracts, at 120<sup>th</sup> out of 190 economies (World Bank, 2020<sub>[41]</sub>).

Public involvement in policy making remains limited despite the government's efforts to increase transparency and consultations. All legislation, including those on investment, are published on the website of the National Publication Centre (Ministry of Justice), but are not always systematically available in English. Public consultations with stakeholders on draft laws, national and international strategic draft documents, as well as policies of high public interest are regulated by law and draft legislations are published on a dedicated webpage. The Ministry of Finance organises online meetings with target groups regarding draft legal acts and the Albanian Investment Council provides a discussion forum to gather and discuss opinions. However, the consultation process is efficient as the reliance on online consultations tends to generate limited inputs (European Commission, 2020<sub>[19]</sub>).

Albania's market is open and **exceptions to national treatment** are limited. The economy's score on the OECD FDI Regulatory Restrictiveness Index, which assesses and benchmarks market access and exceptions to national treatment, was 0.057 in 2019, below the OECD average of 0.064 (a low score indicates a less restrictive regime) (OECD, 2020<sub>[42]</sub>). The economy maintains some minimal investment restrictions, notably for arms production, inland maritime transport, fishery, notary services and judicial enforcement service, indicating that foreign investment rules do not constitute impediments to FDI. The economy does not currently have a negative list of the sectors where foreign investment is prohibited or conditioned, or which outlines any discriminatory conditions. However, one is currently being prepared with the support of International Finance Corporation (IFC) experts under the Multi-annual Action Plan on Regional Economic Area in the Western Balkans (MAP REA) and is being evaluated internally. Albania places restrictions on ownership of agricultural land, as foreigners are not allowed to acquire agricultural land, forests, meadows or pastures unless they incorporate their businesses locally. Foreigners can, however, rent agricultural land for 99 years. Additionally, ownership of commercial properties is only possible if the proposed investment is worth three times the price of the land.

**Figure 20.3. FDI Regulatory Restrictiveness Index (2019)**

Restrictions are evaluated on a scale of 0 (open) to 1 (closed)

Source: (OECD, 2020<sup>[43]</sup>), FDI Regulatory Restrictiveness Index (database), <http://www.oecd.org/investment/fdiindex.htm>.

**Investor protection against expropriation** without fair compensation is enshrined in the constitution and the 2012 Law on Expropriation, which explicitly provides for the modalities and procedures of expropriation, and stipulates that expropriation can only occur when it is in the public interest. The law was amended in 2020, resulting in the establishment of the State Expropriation Agency. This new institution plans and handles expropriation claims and calculates the amount of compensation for each property affected. The Law on Foreign Investment provides for additional protection from expropriation for foreign investors.<sup>4</sup> The legal framework does not, however, explicitly recognise<sup>5</sup> the concept of indirect expropriation, which deprives investors of the certainty of compensation if the state interferes indirectly with their operations, impacts their benefits, investments or use (but without taking their property).

Albania has also signed a large network of bilateral investment treaties (BITs),<sup>6</sup> which constitute an additional layer of protection for foreign investors. The Government of Albania is also currently in the process of reforming its existing network of bilateral investment treaties and defining a new BIT model that will balance investor protection provisions and national strategic interests, while complying with EU standards and international good practices.

Administrative-judicial protection is available for parties dissatisfied with expropriation compensation as the Law on Expropriation recognises the right of appeal for the expropriated subject. However, this right is recognised only in relation to the amount of compensation, determined by the State Expropriation Agency, after the evaluation of the technical criteria. The law stipulates that the expropriated party must be notified on the Decision of the Council of Ministers by the State Expropriation Agency, after which the expropriated party only has the right to appeal to the court within 30 days regarding the amount of compensation determined in this decision.

Foreign investors have the same rights and remedies before the national court system as domestic investors when it comes to **dispute settlement**. The justice system is going through a comprehensive and thorough overhaul which, according to the EU, has “continued consistently, resulting in good progress overall” and that “justice reform is expected to contribute to strengthening the business environment and attracting investments” (European Commission, 2020<sup>[19]</sup>). The reform process is reinforcing the independence of the judiciary and limiting political interference. The justice system’s financial resources were increased by 14% in 2018 compared to the previous year. Overall, the court system is improving both in terms of efficiency and effectiveness for commercial procedures. However, due to these judicial reforms and vetting of judges, there have been delays to court proceedings, including the lack of a quorum in some specific courts. The Tirana District Court has a special division that judges commercial matters, known as

the Commercial Section. This section is composed of nine judges specialised in commercial matters. In 2019 the Tirana District Court adjudicated most of the commercial cases within one month from the date of registration: 50.8% of the cases were adjudicated within one month, 36.7% within one to six months, 10.3% within seven to twelve months and only 0.5% took more than two years to adjudicate.

Albanian legislation offers alternative dispute resolution mechanisms. Mediation is regulated by the Law on Mediation in Dispute Resolution<sup>7</sup> and applies to the resolution of all disputes in the field of civil and commercial law. Moreover, Albania has ratified the Convention on the Settlement of Investment Disputes between States and Nationals of Other States (ICSID Convention) and the 1958 Convention on the Recognition and Enforcement of Foreign Arbitral Awards (New York Convention). By virtue of their adherence to the New York Convention, foreign arbitral awards are recognised in the economy. However, according to the EU, the impact of alternative dispute resolution continues to be low as “the total number of cases referred to and solved through mediation was 2 077 compared with 1 260 in 2016” (European Commission, 2020<sup>[19]</sup>). It should be noted that the draft investment law should reinforce the role of international arbitration.

Albania has sound **intellectual property (IP) rights laws** and regulations. The economy is a member of the World Intellectual Property Organization and adheres to the main international treaties and conventions on IP rights, including the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). The economy’s IP rights are overall aligned with EU legislation, notably in the area of industrial property rights, as well as in improving the functioning of collective management agencies. Key advances include the adoption of secondary legislation on trademarks and the legal protection of designs in May 2018.

The General Directorate of Industrial Property (GDIP), under the supervision of the Ministry of Finance and Economy, is the public authority in charge of registration, protection and enforcement of IP rights. The GDIP operates in compliance with the most important international conventions and agreements on intellectual property ratified by Albania. Since 2018, the GDIP’s mandate and resources have been reinforced. It has undergone an institutional reform, and now consists of 39 employees, 15 more than previously. This increase in employees is to meet the objectives set out in the National Strategy on Intellectual Property 2016-2020 and highlights the economy’s engagement in reinforcing its IP policy.

The GDIP also co-ordinates with key stakeholders. These include the Copyright Directorate of the Ministry of Culture on respecting and promoting copyright and related rights in Albania, as well as the State Inspectorate for Market Surveillance (SIMS), which is responsible for inspection, control and enforcement of copyright and related rights.

Albania is lagging behind other Western Balkan economies in IP implementation and enforcement. However, the economy has been making some progress on IP implementation as indicated by the rise in applications for industrial property objects recorded by the GDIP: according to the EU, in 2018, the number of applications to register trademarks rose by 24.4% compared to 2017, and applications for patents and utility models increased by 11.7%. SIMS has improved its performance in all areas in comparison to 2019 (European Commission, 2020<sup>[19]</sup>). The number of complaints handled by the inspectorate increased by 280%, from 40 in 2019 to 152 in 2020; inspections increased by 26%, from 1 308 in 2019 to 1 649 in 2020; and the amount of administrative measures carried out by SIMS increased by 43.9%, from 221 in 2019 to 318 in 2020 (SIMS, 2020<sup>[44]</sup>). Mechanisms in place to resolve disputes include the Board of Appeals, Administrative and First Instance Court, Appeal Court, and the Supreme Court.

Additional resources for the GDIP have improved **IP rights awareness raising and access to information** in Albania. The Copyright Directorate offers various amenities and e-services, including an electronic help desk, Patlib (providing local access to patent information and related issues), information kits and other informative brochures, websites, and visual and social media. Since 2018, the GDIP has intensified its IP rights awareness-raising activities in conjunction with businesses, technical and scientific information centres through seminars and lectures in public and private universities as well as for interest groups.

### *Sub-dimension 1.2: Investment promotion and facilitation*

Albania has a solid **investment promotion agency structure and strategy**. Although its Business and Investment Targeting Strategy (BITS) 2014-2020 has now ended, the Ministry of Finance and Economy received technical assistance in 2020 to draft the new strategy for investment promotion (BITS 2021-2027), which is now underway. The strategy is expected to include the internationalisation of Albanian investments, outreach campaigns, aftercare programmes, and strategies for attracting FDI and manufacturing products to Albania. The ministry has been working closely with experts since September 2020 to adapt this strategy to help mitigate the impact of the pandemic.

The Albanian Investment Promotion Agency (AIDA) has a wide mandate that encompasses export promotion and SME development, in addition to investment promotion, facilitation and retention. AIDA co-ordinates and collaborates with several stakeholders at the local and central level to promote and facilitate business processes in order to enhance the development of investment and reinvestment opportunities. The organisation is a government entity under the auspices of the Ministry of Finance and Economy and reports directly to the organisation's board which is chaired by the Prime Minister of Albania.

The agency also hosts the secretariat for the Committee on Strategic Investment, which ensures the implementation of the Law on Strategic Investments. This committee is chaired by the Prime Minister of Albania and includes the Deputy Prime Minister and other line ministries such as the Ministry of Finance and Economy, the Ministry of Tourism and Environment, the Ministry of Agriculture and Rural Development, the Ministry of Infrastructure and Energy and the State Advocate. According to the Law on Strategic Investments, AIDA serves as a one-stop-shop for strategic investments and as an "assisting agent" for investors.

In addition, AIDA co-operates with Albanian embassies and consulates, as well as with the Ministry of Foreign Affairs and Diaspora, bilateral foreign chambers and foreign embassies, in order to attract foreign investment. One of its key objectives is to increase co-ordination within the Albanian network of domestic regional and local investment promotion agencies (IPAs).

AIDA plays an important role in developing linkages between local firms and multinational enterprises (MNEs). This was defined in the Business Investment and Strategy 2014-2020 and is expected to be included in the new strategy. The IPAs provide information and accompanying services both to local firms and international companies through the SME help desk and facilitates contacts by organising training courses, workshops and business-to-business (B2B) meetings. Other measures aimed at creating and deepening linkages include assistance in finding new local suppliers, technology transfer, and information exchange on AIDA's website (B2B online platform), as well as financial support through funds managed by AIDA.

AIDA has substantially increased its staffing, from 28 employees in 2018 to about 38 employees in 2020. In 2019 alone, the agency concluded 20 new employment contracts, confirmed 17 existing contracts and approved 9 departures at staff request or due to disciplinary measures (AIDA, 2019<sup>[45]</sup>). These changes are a direct result of an expanded mandate and aim to achieve the most effective division of tasks. The agency is organised into five directorates: investment (13 employees), SMEs and projects (8), marketing and research analysis (5), co-ordination (4), and support services (8). In comparison, the Development Agency of Serbia (RAS) has 29 staff members to carry out its more limited mandate, making AIDA the investment promotion agency with the highest level of staffing in the region. AIDA's funding comes from the state budget, via a special sub-programme of the budget of the Ministry of Finance that covers the economy and income generated by its activities and donations. In 2020, AIDA's budget was approximately ALL 64 million (about EUR 520 000).

Albania is also reinforcing its **investment facilitation services and activities**. It has accelerated the digitalisation of its public services and as of January 2020, 73% of all public services were available to citizens and businesses online through the e-Albania Portal. Key developments for investment procedures

include the introduction of e-registration and electronic notification of balance sheets and financial reports. Registration and licensing services are offered through a one-stop-shop model by the National Business Centre, streamlining the certification process by abolishing many licensing requirements and simplifying other licensing procedures. Starting a business has become easier, with forms and procedures published online, and taking 4.5 days on average (World Bank, 2020<sup>[41]</sup>).<sup>8</sup> Registration costs have been reduced and tax, health insurance and labour registration combined in a single application. AIDA also provides one-stop-shop services for strategic investments.

AIDA is reinforcing its **investor targeting** actions, by adopting a proactive approach involving outreach campaigns for the agriculture sector (2019) and car manufacturing (2020). AIDA evaluates its targeting missions and uses the results for future targeting activity. It keeps an investor tracking database, which is updated regularly. Investor targeting activities are co-ordinated through the use of e-invest software that is managed by the AIDA team. This system connects all government departments and institutions dealing with investments, including embassies, in order to co-ordinate leads and investments. A considerable share of AIDA's promotional budget is devoted to arranging meetings with foreign companies, attending conferences and trade fairs as well as undertaking missions abroad. However, this budget has decreased from EUR 115 000 in 2019 and EUR 72 000 in 2020 and, due to the COVID-19 pandemic, no funds were distributed to SMEs through various grant funding schemes. The support schemes under AIDA have been under revision and budgetary funds were instead used to finance part of the government support measures to mitigate the consequences of COVID-19.

Albania provides a wide range of **investor incentives**, all of which are listed on AIDA's website. Investors can also negotiate other incentives directly with AIDA. Additional incentives and special treatment are also provided for strategic investments, under the Law on Strategic Investments. The law identifies the following sectors as being strategic: 1) energy and mining; 2) transport, electronic communications infrastructure and urban waste; 3) tourism (tourist structures); and 4) agriculture (large agricultural farms) and fisheries. The law also outlines the criteria, rules and procedures that state authorities should use when approving a strategic investment. The government provides fiscal and administrative incentives for companies starting businesses in a Technical and Economic Development Area (TEDA).

Tax incentives for investment remain under the authority of the Ministry of Finance and Economy, which regularly monitors tax expenditures approved by parliament. Tax incentives are analysed and serve as government decisions on future projects. Information on them is publicly accessible through the annual report on tax included in the Budget Law.

**Aftercare services** are included in AIDA's mandate. The agency contacts and surveys foreign investors on a regular basis through a formal co-ordination mechanism and produces annual reports on investor feedback and perceived issues. AIDA also prepares frequent reports to highlight problems faced by investors. These are submitted to the Ministry of Finance and Economy in order to make the necessary policy or regulatory adjustments. Finally, AIDA conducts an annual investor satisfaction survey and organises on-site visits in order to listen to the concerns and needs of each sector.

### *Sub-dimension 1.3: Investment for green growth*

Albania has begun developing a sound **green investment policy and promotion** framework and has developed comprehensive legislation outlining its green growth priorities and objectives. Its General National Spatial Plan (PPKT), Albania 2030, provides a strategic reference framework for the sustainable development of the territory and a reliable and sustainable climate for domestic and foreign investment in long-term infrastructure projects (National Agency for Territorial Planning Albania, 2015<sup>[46]</sup>). It promotes the balanced economic and social development of the economy, the responsible management of its natural resources, environmental protection, and the rational use of land. The plan was developed using strategic environmental assessment to avoid or minimise any negative impacts. Tirana has aligned its green investment promotion strategies with national policies by incorporating Albania's Green Development

Agenda into its development plans. These include the General Local Plan for Tirana 2030, Tirana Masterplan, Sustainable Development Plan 2018-2022 (Box 20.2), The Green City Action Plan (GCAP) and the Sustainable Urban Mobility Plan, which is being developed.

### Box 20.2. A strategy for green investment in Tirana

Tirana adopted the Development Strategy for Growth 2018-2022 in 2018, which aims to achieve more sustainable economic, social and ecological development by encouraging eco-friendly businesses and farming, as well as by providing the financial means and technological ability for other businesses to be more energy efficient and innovative. The strategy contains four programmes aimed at promoting the green economy:

14. A programme that reinforces rural economic development by supporting eco-friendly business, drafting plans for forestry development and promoting local agricultural and livestock products.
15. A programme to increase infrastructure investments in the irrigation and drainage system, to promote efficient use of public assets and property registration (AMTP), and to strengthen its trade network by creating markets across the municipality's territory.
16. A programme to design two favourable fiscal and tax exemption packages for farmers and businesses to promote and expand their activities, facilitate market access and increase employment and self-employment.
17. A programme to create a Technology and Economic Development Area (TEDA) to promote further investment, job creation and revenue growth; introduce advanced technology; accelerate regional development; and expand national and international market economic ties.

Tirana is also hoping to launch another project in the future that would identify and create genuine industry clusters based on the most successful schemes in the region and Europe.

Source: (General Directorate of Strategic Planning of Tirana, 2018<sup>[47]</sup>), *Development Strategy of Growth of the Municipality Tirana 2018-2022*, [https://tirana.al/uploads/2019/3/20190304142936\\_szhqbt-2018-2022-30-e-miratuar-per-web-finale.pdf](https://tirana.al/uploads/2019/3/20190304142936_szhqbt-2018-2022-30-e-miratuar-per-web-finale.pdf).

Albania continues to respect core investment principles such as investor protection, intellectual property rights protection and non-discrimination in areas inclined to attract green investment. The laws on industrial property and the investment fund provide protection for investors and intellectual property rights, and non-discriminatory procedures in all investment domains. These laws also provide for the establishment of feed-in-premium tariffs through a non-discriminatory tender process for photovoltaic plants larger than 2 megawatts (MW). Albania is continuing to align its national and sub-national plans with international environmental and infrastructure standards by working on implementing the EU's recommendations on transitioning to a greener economy and infrastructure.

Albania has also developed a strong framework for **choosing public and private partnerships (PPPs) for green growth**. According to the laws on public procurement, public auction, and concessions and public-private partnership, the Public Procurement Agency<sup>9</sup> is the institution responsible for all public procurement and PPPs, including those for green projects. On the basis of this legal framework, the Albanian Government is conducting hybrid auctions and auctions for photovoltaic renewable energy. For instance, the 140 MW Karavasta photovoltaic park is being implemented by the bid winner, the French company Voltalia. The winning bid for the 100 MW hospital photovoltaic park will be announced later this year.

### ***The way forward for investment policy and promotion***

Though Albania has made substantial progress since the last CO assessment, improving the attractiveness of Albania as an FDI destination requires policy adjustments and reforms in the following areas:

- **Reduce the complexity of the legislative and regulatory framework for investment and increase its transparency.** Accelerating the adoption of the draft investment law would streamline the complex investment regime, improve the investment climate and boost the attractiveness of Albania as an investment destination. This should be complemented by harmonising and stabilising the various sectoral texts and laws governing investment in order to provide investors with a more stable and conducive environment. Finally, reinforcing private sector participation by establishing effective consultation mechanisms with businesses would bolster the transparency and predictability of investment legislation.
- **Reinforce further the independence, resources and capacity of the court system, especially for commercial disputes.** While the reform of the judiciary has progressed well in recent years, investors still complain about enforcing contracts and settling disputes in the economy. In order to improve the attractiveness of the economy, more focus should be placed on improving the efficiency of commercial disputes to reduce the case backlog, as well as building judges' capacity in commercial matters.
- **Increase public awareness and implementation of mediation mechanisms.** While Albania has a mediation law, it is rarely used. Mediation mechanisms are generally favoured by the business community and can help to reduce the backlog of commercial cases by facilitating the resolution of commercial disputes.
- **Align Albanian IP legislation further with international standards and reinforce the co-ordination, resources and capacity of IPR implementation and enforcement bodies.** An effective IPR system is a crucial component of a sound investment climate. While Albania has made important efforts to align its IP legislation with international standards, improve its registration systems as well as raise awareness of IP rights, enforcement remains a challenge. In order to strengthen IP rights, the capacity of the various enforcement agencies needs to be fortified, backed up with sound governance and co-ordination mechanisms.
- **Streamline the multiple investment incentives and reinforce mechanisms for evaluating their cost and benefits, appropriate duration, and transparency.** Simple and unified tax incentive regimes can make it easier for governments to evaluate the cost and benefits of these measures, and improve the allocation of resources and the clarity of the system for investors. In addition, to increase transparency and good governance, tax incentives should be included in the main body of the Tax Law and fall under the authority of the tax administration.
- **Reinforce AIDA's investment facilitation role, notably through better co-ordination with other government bodies and agencies.** IPAs play an important role in the facilitation and retention of investments through their services to accompany the investor through all the steps of a project. In order to fulfil this role effectively – even when the IPA is not the sole interlocutor with the investor – the agency should strengthen its co-operation with other agencies and bodies.

## Trade policy (Dimension 2)

### Introduction

Albania's performance on the trade policy dimension has improved since the last assessment. The economy's score has increased from 2.8 in the 2018 Competitiveness Outlook to 3.3 in the 2021 assessment (Figure 20.1 and Box 20.5), with progress made especially on regulatory transparency, improving public consultations in trade policy making and trade policy development and co-ordination. The economy's inter-institutional co-ordination mechanism has been strengthened through the adoption of new rules and procedures for the National Trade Facilitation Committee (NTFC)<sup>10</sup> and the setting up of two working groups focusing on the reduction and elimination of import and export fees and charges. Moreover, a regulatory framework for public-private consultations (PPCs) is in place, which mandates a dialogue with local stakeholders at all stages of trade policy making. All draft laws are published electronically. Channels of communication with the private sector and civil society are established through the NTFC. However, government consultations with local stakeholders are yet to be systematised. A formal process to monitor and evaluate public consultations mechanisms is yet to be fully integrated into the legislative process.

However, limited progress has been made in removing restrictions on an open market for trade in services. Except for the courier services sector, there has been no change or improvement to Albania's trade in services sector since 2014. On the other hand, while the COVID-19 pandemic has undermined the efforts of many states to lower barriers to trade (OECD, 2021<sup>[48]</sup>), Albania is one of the few economies not to have introduced trade restrictive measures. Albania, like other economies in the region, has become more open to foreign service providers since the previous round of analysis. Future efforts could be oriented towards improving the economy's company regulations and amending costly procedures for registering a company. Finally, the economy still has not reached its full potential in the effective use of e-commerce. Albania has a strong regulatory environment for e-commerce; however, a number of challenges still persist in its implementation. Some strong aspects of the law, such as consumer protection, are not sufficiently monitored and enforced. Similarly, the low use of credit and debit cards and the high use of cash, as well as the low capacity of telecommunication operators and Internet service providers, materially limit the development of e-commerce, even during the COVID-19 pandemic. Albania is fully aware of these difficulties and has recently drawn up an action plan to steer future activities.

**Table 20.5. Albania's scores for trade policy**

Dimension	Sub-dimension	Score	WB6 average
Trade policy dimension	Sub-dimension 2.1: Trade policy framework	3.5	3.5
	Sub-dimension 2.2: Services trade restrictiveness	n.a.	n.a.
	Sub-dimension 2.3: E-commerce and digitally enabled services	3.0	3.1
Albania's overall score		<b>3.3</b>	<b>3.4</b>

### State of play and key developments

Albania's exports of goods and services,<sup>11</sup> which had been growing steadily since 2015, stabilised in 2018. Overall trade in 2019 was 79.9% of GDP, roughly the same as in 2018 (in real terms), compared with 75.4% in 2014. Albania's goods exports reached EUR 2.4 billion in 2019, while imports grew more slowly, to reach EUR 5 billion. In 2019, Albania's exports of goods and services reached 31.6% of GDP while its imports were 45.3% (Table 20.1). Overall, the external trade deficit amounted to 13.8% of the economy's GDP in 2019.

Albania is mostly dependent on trade in services, which makes a larger contribution to the economy than the trade in goods. Albania is a net exporter of commercial services, which amounted to EUR 3.0 billion in 2020, compared to EUR 1.9 billion in imports in 2019. The European Union remains Albania's main trading

partner. In 2020, trade with EU countries represented 61.3 % of total trade. Exports to EU countries accounted for 74.4% of total exports (76.6% in 2019 and 76.3 in 2018) and imports from EU countries made up 58.5 % of total imports ( against 59% in 2019 and 58.4% in 2018). Italy is the largest trade partner for Albania, accounting for 61.9% of total exports (compared to 47.9% in 2019) and 43% of imports (25.3% in 2019).

Like all economies, Albania was heavily affected by the COVID-19 pandemic. Its GDP was already in decline following the 2019 earthquake. The pandemic-related export bans, restrictions on movement of people and closures of shops and services have seen a significant decline in trade, with imports down by 23% and exports by 34% in Q2 and Q3 2020, (INSTAT, 2021<sup>[49]</sup>) (Figure 20.4). In Q4 of 2020, trade picked up again. On December 2020 the value of exports increased by 5.4% compared with the same period of the previous year and decreased by 15.6% compared with November 2020. The value of imports increased by 10.5 % compared with the same period of the previous year and by 10.1% compared with November 2020 (INSTAT, 2021<sup>[49]</sup>).

The fall in demand from the EU, the destination of almost 75% of Albania's exports, has had the most significant effect on the economy's international trade.<sup>12</sup> The structure of Albania's export basket exposes it to variations in demand. Leather footwear alone accounts for 8% of all Albania's exports. The other sectors concerned are mainly crude oil, which represents 5% of exports, as well as chromium ore, agro-food products (vegetables, perfume plants and processed fish, among others) and metals (crude iron bars and ferro-alloys). The demand shock has had a significantly negative impact on trade in building materials, electrical equipment, plastics and the fashion sector. Decline in trade with Italy has been a large shock, given that Italy alone accounts for nearly 48% of exports and 25% of imports.

Overall, economies with a greater dependence on services trade, such as Albania, have suffered great losses due to the restrictions on movement of people implemented in response to the pandemic. Services such as tourism, education and health contribute a 48.6% share to Albania's GDP. Albania's tourism sector had been growing until 2020, especially in the previous three years, and the revenue from tourism alone exceeds 20% of the economy's GDP. The sector has been greatly affected by the movement and travel restrictions imposed due to the spread of COVID-19. The decrease of tourism has also damaged other

related industries such as food, entertainment and retail, as well as tourism-related investment (World Bank, 2020<sup>[52]</sup>).

### *Sub-dimension 2.1: Trade policy framework*

Albania has strengthened its trade-related institutional framework since the last assessment cycle. A National Plan for Trade Policy Coordination and Trade Facilitation (2017-2020), was adopted in 2017 – one element of the broader national development and integration strategies.<sup>13</sup> Its main objective is the medium-term integration of Albania into the European Union and is aligned with EU industrial policy and World Trade Organization (WTO) principles.<sup>14</sup> Two ad-hoc working groups have been established to work on the reduction or elimination of fees and charges for imports and exports. Since 2018,<sup>15</sup> the National Trade Facilitation Committee has aimed to enhance inter-ministerial co-ordination and improve the decision-making process on trade issues.

Albania has a solid **inter-institutional co-ordination mechanism** for trade policy formulation. The Ministry of Finance and Economy (MOFE) is responsible for co-ordinating trade policy with the National Trade Facilitation Committee (NTFC), the formal inter-ministerial co-ordination institution, itself composed of state institutions and private sector professionals, and chaired by the minister responsible for trade.<sup>16</sup> The 2018 Order of the Prime Minister “On the establishment of the inter-institutional working group for the trade facilitation and trade policy”<sup>17</sup> extended the scope of the representatives on the committee to include line ministries and the business sector. Moreover, the 2018 Order of the Prime Minister now mandates the NTFC to hold four meetings a year with all stakeholders, including business associations and Chambers of Commerce. In 2019, the NTFC approved the expansion of its scope to include trade in services.

An Inter-Institutional Working Group (IWG) within MOFE co-ordinates and implements public policies in line with the obligations of the EU accession process, including, but not limited to, trade policies. Its duties include ensuring inter-institutional technical co-operation and communication for implementing the commitments under EU integration policy documents.<sup>18</sup> Regular consultations take place through this group with all ministerial institutions working on the implementation of trade policy for Chapter 30 “External Relations” of the *acquis Communautaire*. The IWG consults closely with other working groups responsible for the free movement of goods, intellectual property law, agriculture, etc, as well as other ministries involved in trade through their sectorial policies (transport, health, environment, etc.)

However, evidence shows that these inter-institutional co-ordination mechanisms have yet to reach their full potential and the participation of the private sector needs to be enhanced. The NCFT should meet four times a year, but in the last three years it has met only six times in total, including twice in 2018 and once in December 2019. In 2020 and 2021 the NCFT seems to have increased its activity, in particular through electronic meetings.

A system of mandatory **public-private consultations** is firmly entrenched in the Albanian decision-making and regulatory process from a regulatory point of view. Public consultations are required for policy and legislative development. Inter-ministerial co-ordination and stakeholder consultation processes on trade issues are conducted in a complementary manner during all stages of policy making. The Investment Council was set up in 2015 to intensify the dialogue between the government and the private sector to improve the business climate. The private sector, especially the Chambers of Commerce, but also non-government organisations (NGOs) and academia, are involved in the different stages of trade policy making through NTFC meetings, which are scheduled and made public two weeks in advance. A variety of other stakeholders is also involved through ad-hoc consultation meetings on the measures and policies which were decided upon.

The Law on Public Notifications and Consultations<sup>19</sup> is in line with European standards. It regulates the process of notification and public consultations of draft legislative acts, including national and local strategic policies of high public interest.<sup>20</sup> Within this framework, the NTFC consults with the business community

and other stakeholders, discusses strategic documents and policies, proposes measures to facilitate trade and monitors trade policy by preparing annual reports on the progress of trade policy.

However, there are limitations to the existing framework and its implementation that should be highlighted. The scope of application of the Law on Public Notifications and Consultations does not extend beyond the legislative norms to government decisions. Moreover, even though the law suggests that every law and sub-law on free entrepreneurship, investment, business, production, employment and trade should involve public consultations in an open dialogue between the public and private sector, requests or incentives for consultations and dialogue are limited or lacking (though the government publishes the laws and sub-laws on a dedicated consultation website).<sup>21</sup> Furthermore, although it is compulsory to report on how the contributions by civil society organisations are taken into account, the effectiveness of the feedback mechanisms remains to be proven as there are no concrete data to show that their comments have been used in the decision-making process. Thus, although Albania has established consultation mechanisms, no major progress has been made and a methodology for public consultations has yet to be adopted. Finally, though the electronic web-portal for public consultations<sup>21</sup> is operational, its use by the public has been very limited and it focuses more on process than content (European Commission, 2020<sub>[19]</sub>). The monitoring process for public consultations is also ad hoc. The Law on Public Notifications and Consultations requires institutions that draft legal acts to publish annual reports on the consultations they have conducted.<sup>22</sup> However, the reports in question are only available for 2020 and not all institutions that conducted public consultations in that year have published their reports. In the area of trade, for example, the report of the Ministry of Finance and Economy is not available. Moreover, the system requires institutions to self-evaluate, which raises the question of harmonisation of approaches.

With regard to evidence-based policy and legislative development, Albania has developed guidelines for regulatory impact assessment (RIA). This has enabled more systematic impact assessments for legislative measures within ministries. Progress has also been made in establishing quality criteria for RIAs and in building capacity in the Prime Minister's Office to guide the process. These regulatory dossiers are made available on the NTFC website after publication or can be acquired on express request by users. This is a positive practice benefiting from a mandatory legal basis.<sup>23</sup>

Albania has extended its network of **bilateral and multilateral free trade agreements** since the last assessment cycle.

Albania joined the WTO in 2000, the first of the Western Balkan economies to do so. It first opened its economy to free trade agreements with the signing of the Stabilization and Association Agreement (SAA) with the European Community, granting preferential customs tariffs for industrial and agricultural products exported from Albania to EU countries.

Shortly after signing the SAA, in 2006 Albania became a founding member of the Central European Free Trade Agreement (CEFTA) with the aim of achieving full tariff liberalisation on trade in manufactured products and agricultural goods, and to establish a negotiating framework for eliminating non-tariff barriers (NTBs).

In terms of trade facilitation policies, Albania established a free trade agreement with European Free Trade Association (EFTA) member states in 2010/11, removing customs duties on industrial products, fish and other sea products as well as tariff concessions for processed agricultural products.

The economy recently reinforced its bilateral trade agreements' network by signing 12 new treaties. It now has 36, of which 13 are with EU Member States, the most recent being the Memorandum of Understanding with Croatia on co-operation in the field of entrepreneurship signed in 2019. Albania also has an extensive network of bilateral investment treaties, 45 in all, with another 7 under negotiation (with Canada, Iceland, Iran, Lebanon, Morocco, Saudi Arabia and the Slovak Republic) (European Commission, 2020<sub>[19]</sub>).

Negotiations are also ongoing with Turkey on the free trade agreement signed in 2008, focusing on trade in services and investment and on the implementation of rules of origin under the Pan-Euro-Med Convention (European Commission, 2020<sup>[19]</sup>).

### *Sub-dimension 2.2: Services trade restrictiveness*

Services contribute almost two-thirds of GDP in the WB6 economies, which illustrates how strongly economic growth, innovation and labour markets depend on effective policies on services that promote open and competitive service markets. Services contributed to 48.6% of GDP in Albania in 2019, a steady number compared to previous years (Figure 20.5), and account for more than 43% of employment.

Enhancing the openness of trade in services can improve domestic firms' efficiency and productivity, whereas restrictions such as regulatory barriers to trade can be harmful (Box 20.3). Trade in services allows countries to specialise according to their comparative advantages in services and skills. The potential gains from liberalisation in services trade are significant because increased domestic and foreign competition complemented by effective regulation can enhance performance.

**Figure 20.5. Services, value added (% of GDP) - Albania (2007-17)**

### Box 20.3. The costs of regulatory barriers to trade in services

Recent OECD analysis reveals that services trade restrictions significantly affect trade by raising the costs for firms to operate in the host economy (Rouzet and Spinelli, 2016<sup>[53]</sup>). Trade costs arise both from policies that explicitly target foreign suppliers, and more generally from domestic regulation that falls short of best practice in the area of competition and rule-making. The costs resulting from barriers to trade in services are much higher than those from trade in manufactured goods.

Trading services is costly. The studies show that policy-induced services trade costs are relatively high. Expressed as percentages of total trade value, average multilateral costs for cross-border services trade are around 57% for communication services and 54% for business services, around 60% for transport services, around 103% for insurance services, and around 255% for financial services. Even exporting to the most liberal countries still requires compliance with regulation at a cost that corresponds to around 30% of the export value in most sectors and nearly 90% for financial services. Within the European Single Market, however, services trade costs are significantly lower – policy-induced costs of cross-border services trade are at around 10% in most sectors and around 32% for financial services.

Source: (Benz and Jaax, 2020<sup>[54]</sup>), *The Costs of Regulatory Barriers to Trade in Services: New estimates of ad valorem tariff equivalents*, <http://dx.doi.org/10.1787/bae97f98-en>.

The OECD Services Trade Restrictiveness Index (STRI) was used to **analyse barriers to trade for 12 services sectors** in Albania. The OECD STRI project is a unique, evidence-based diagnostic tool that inventories trade restrictions in 48 economies,<sup>24</sup> allowing economies to benchmark their services regulations against global best practice, identify outlier restrictions, and prioritise reform efforts. For this CO assessment cycle, the 12 services sectors are grouped into four clusters: 1) transport and distribution supply chain (air transport, road transport, rail transport, courier); 2) market bridging and supporting services (commercial banking, insurance, legal services); 3) physical infrastructure services (construction, architecture, engineering); and 4) digital network services (computer services, telecommunications).

Information was collected from the WB6 economies' laws and regulations, and indices were calculated for seven years (2014-20). These composite indices quantify restrictions across five policy areas: foreign entry, movement of people, barriers to competition, regulatory transparency and other discriminatory measures. The indices quantify regulatory restrictions in each of the 5 policy areas for the 12 sectors by giving them a value between 0 and 1. Complete openness to trade in services gives a score of 0, while being completely closed to foreign service providers yields a score of 1.<sup>25</sup>

Each policy area is composed of a series of measures. These measures are called "horizontal" if they are present in all sectors, or "sector specific" if they only affect a particular sector.<sup>26</sup> The STRI measures the most-favoured-nation (MFN) restrictions and does not take into account any specific concessions, such as regional trade agreements or mutual recognition agreements (Geloso Grosso et al., 2015<sup>[55]</sup>).

Figure 20.5 shows the STRI indices for each of the sectors as well as the average scores for the WB6, EU and OECD. Like most economies in the WB6 region, Albania's services trade markets are in the more open range compared to the OECD and key partners' average STRI indices (represented by a "+" in Figure 20.6). Its least restrictive sectors (lowest STRI scores) relative to the WB6 average are telecommunication services, air transport and legal services. Those with the highest score relative to the WB6 average are road freight transport, rail freight transport and computer services.

**Figure 20.6. Services Trade Restrictiveness Index for Albania (2020)**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and therefore are not covered by STRI indices; key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.. Source: (OECD, 2020<sup>[56]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934255342>

Figure 20.7 displays the evolution of Albania's STRI indices by sector and period since 2014 in percentage terms. The economy's trade in services markets was already relatively liberal in the previous assessment cycle, which explains the limited amount of change since. The changes observed mainly reflect evolution in non-regulatory data incorporated in the STRI, such as the World Bank Doing Business indicators. One notable exception is the courier services sector, which benefitted from significant reform via the 2015 Law on Postal Services,<sup>27</sup> which has substantially opened the economy's postal market.

**Figure 20.7. Evolution of STRI scores by sector in Albania (2014-20)**

Percentage change over the periods 2014-16, 2016-19 and 2019-20

Note: Values are expressed as percentage change; negative values indicate a reduction in restrictiveness of the economy's trade regulatory environment.

StatLink  <https://doi.org/10.1787/888934255361>

The following analysis starts with the horizontal measures that are included in all sectors and that typically hamper services trade in the economy as a whole – especially in the area of general business regulations,

restrictions on the movement of service providers, standards for the cross-border transfer of personal data, the legal framework for public procurement and the screening of foreign investment. It then reviews each of the 12 sectors analysed, displaying the STRI scores, explaining what drives the results, and providing a brief description of the most common restrictions and good practices.

### Cumbersome horizontal measures affect firms' ability to operate

*General business regulations* affect firms' ability to operate in Albania. There are a number of areas in which Albania could improve its company regulations. This is the case for the acquisition or use of land and real estate by foreigners, which is limited by the law.<sup>28</sup> This mainly affects companies' ability to establish offices in the economy and operate a business, especially in the service sectors, which are highly dependent on the mode of supply. Box 20.4 presents the modes of supply of trade in services as defined by the General Agreement on Trade in Services (GATS) and used in the OECD STRI.

#### Box 20.4. Examples of the four services supply modes

The definition of trade in services under the General Agreement on Trade in Services (GATS) has four components, depending on the territorial presence of the foreign service provider and the consumer at the time of the transaction. Pursuant to Article I:2, the GATS covers services supplied.

**Mode 1: Cross-border:** Services are provided from the territory of one member into the territory of any other member.

*Example:* A consumer in economy A receives services from abroad through its telecommunications or courier infrastructure. These supplies may include any type of consultancy, legal advice, architectural services, or computer related services.

**Mode 2: Consumption abroad:** Services are provided in the territory of one economy to the service consumer of any other economy.

*Example:* Nationals of economy A have moved abroad as tourists, students, or patients to use respective services.

**Mode 3: Commercial presence:** Services are provided by a supplier of one economy, through commercial presence, in the territory of any other economy.

*Example:* The service is provided within A by a locally-established subsidiary, or representative office of a foreign-owned and controlled company (bank or insurance company, air company, construction firm, etc.).

**Mode 4: Movement of natural persons:** Services are provided by a foreign supplier, through the presence of natural persons of an economy in the territory of any other economy.

*Example:* A foreign national provides a service within A as an independent supplier (e.g., IT consultant) or employee of a service supplier (e.g. IT consultancy firm).

Source: (WTO, GATS, 1995<sup>[57]</sup>), Article I:2 ; (WTO, n.d.<sup>[58]</sup>), Trade in services modes of supply, [https://www.wto.org/english/tratop\\_e/serv\\_e/cbt\\_course\\_e/c1s3p1\\_e.htm](https://www.wto.org/english/tratop_e/serv_e/cbt_course_e/c1s3p1_e.htm).

The requirement of minimum capital in the form of a deposit that must be placed in a bank or notary's office to register a limited liability company further affects foreign companies.<sup>29</sup> The foreign company must submit the bank document certifying payment of a cash contribution of at least one quarter of the nominal value of its shares, together with the registration application. This restriction only applies for creating joint stock companies with a public or private offer, for which the law expressly provides for basic capital.

Starting a business has become easier (taking 4.5 days on average according to the WB Doing Business indicators (World Bank, 2020<sub>[41]</sub>). Forms and procedures are published online; registration costs have been reduced; and tax, health insurance and labour registration have been consolidated into a single application. AIDA also provides one-stop-shop services for strategic investments – see Investment policy and promotion (Dimension 1). With regard to the procedures for registering an entity/contractor, the law requires that they be finalised within 24 hours of submission of the completed documentation and accompanied by a payment of ALL 100 (approximately EUR 0.8). However, there is no payment required if the registration is done electronically. Nevertheless, the total cost of completing all the official procedures required to register a company in Albania is still 10.8% of income per capita (World Bank, 2020<sub>[41]</sub>). Although improved, this is still above the maximum best practice threshold of 2.8% within OECD member states and STRI key partners.

*Restrictions on the movement of people* are also an issue in Albania. Although significant progress has been made in easing the conditions for the movement of people between the CEFTA economies through the conclusion of Additional Protocol 6 to the CEFTA Agreement, people from economies outside CEFTA or the EU are subject to more restrictive requirements. Albania applies labour market tests for work permits issued to third-country nationals, although intra-corporate transferees are exempt.<sup>30</sup> This is in line with Directive 2014/66/EU of the European Parliament and of the Council of 15 May 2014, on the conditions of entry and residence of third-country nationals in the framework of an intra-corporate transfer. The length of stay of independent service suppliers (ISS), contractual service suppliers (CSS) and intra-corporate transferees (ICT) is limited to three months.<sup>31</sup> This duration is lower than those observed in the EU Member States participating in the STRI project, and much less than best practice elsewhere, which is more than 36 months (OECD, 2020<sub>[56]</sub>).

*Standards for the cross-border transfer of personal data* are set by the EU. Transfers to non-European Economic Area (EEA) economies may take place where these ensure an adequate level of data protection or, failing that, where appropriate safeguards (e.g. binding corporate rules or standard data protection clauses) are in place. These conditions are, however, stricter than recommended in the OECD Guidelines Governing the Protection of Privacy and Transborder Flows of Personal Data (OECD, 2013<sub>[59]</sub>).

Unlike some economies in the region, the *legal framework for public procurement* is generally in line with the 2004 EU Directives on public procurement, reflected in Albania's relatively low overall STRI scoring for these measures. The Public Procurement Act<sup>32</sup> does not impose domestic prices preferences or conditions on foreign contractors to source personnel and products locally when selecting tenders and awarding contracts. The procurement process explicitly refers to the principles of transparency, equal treatment and non-discrimination, although there is no explicit mention of non-discrimination towards third-country nationals – an additional protection found in the best public procurement regulatory frameworks and one that ensures legal certainty for foreign suppliers. The procurement process is determined by the estimated value of the procurement and is classified into two different categories in accordance with international good practice. A monetary threshold is used to determine whether the procurement requires an international procurement tender procedure or not. The law provides that procurement procedures with an estimated value above the “high threshold” (re-evaluated by a decision of the Council of Ministers every two years)<sup>33</sup> must be treated as an international tender. It does not exclude foreign economic operators from participating in procedures below this monetary threshold, nor are Albanian economic operators excluded from international procedures. The obligation set by the law for international procedures implies longer deadlines and requires contracting authorities to have all tender documents in English. For procurements below this monetary threshold there are shorter deadlines and no requirement to translate tender documents. However, in all types of procedures, whatever their estimated value, all economic operators (national or international) must submit tenders according to the criteria set.

With regard to *screening foreign investments*, Albania's laws and regulations aim to create a welcoming investment climate. Accordingly, Albania laws do not contain any elements restricting trade in services in

terms of investment screening. Screening of foreign investments refers to cases where laws or regulations enable governments or regulators to alter or prohibit foreign investment projects; the consideration of economic motives or economic interests is explicitly included in the criteria for approval. In Albania, regulations do not mandate that economic interests should be considered in the review of foreign investments. The economy does not set a threshold above which a foreign investment project is subject to screening.<sup>34</sup>

Albania is fully aware of the impact of horizontal measures on its economy and is therefore implementing reforms to remove unnecessary restrictions. Thus, in terms of entry of foreigners, the latest amendments to the law no. 108/2013, "On foreigners", which will enter into force in 2021 (and thus were not taken into consideration for the 2020 STRI scores) plan to ease some existing restrictions. These include 1) visa policy, to create the necessary mechanisms for issuing electronic visas online; 2) residence policy for foreigners in order to shorten the time limits for examining and issuing residence permits; 3) employment policy for foreigners to improve some provisions related to work permits and employment of foreigners by clarifying the time limits and procedures for obtaining a work permit and reducing unnecessary obstacles to the employment of foreign nationals in the territory of the Republic of Albania.

### **How restrictive are individual services sectors?**<sup>35</sup>

Beyond the regulatory measures that affect Albania's trade in services across the board, there are also a number of sector-specific restrictions in the 12 sectors analysed:

**Air transport services** are defined as passenger and freight air transport, carried domestically or internationally (code 51 under the International Standard Industrial Classification – ISIC – Revision 4). The STRI for this sector covers commercial establishments only. In light of the range of air transport subsectors, the approach in the STRI project is to focus on measures affecting carriers' transport of passengers and goods between points. Airport management and other aviation services are only relevant in so far as regulations enacted by relevant authorities affect the ability of foreign carriers to transport passengers and goods between points. The other aviation services are covered more fully in the STRI for logistics services.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.165 and 0.601 (where 0 signals a completely open sector and 1 indicates a sector closed to foreign service suppliers). Compared to the other WB6 economies, Albania is the least restrictive in the air transport services sector, with a score of 0.253. The economy scores lower than the EU (0.406), OECD (0.409) and WB6 (0.421) averages, reflecting its lack of restrictions in the sector.

Due to the regulatory structure of the sector, which is largely driven by a multilateral approach, there is limited variation across economies in STRI scores. Albania is no exception, although a few specificities should be noted. Freight and passenger transport by air is subject to a 2008 law amended in 2011. A 2019 draft law will bring the sector in line with European Commission regulations on common rules for the operation of air services in the community, but for the time being the law is not fully harmonised with the EU.

As regards *restrictions on foreign entry*, unlike many economies which limit foreign participation in the sector's capital to (at least) less than 50%, Albania does not apply any equity restrictions or specific limitations on the nationality of air carrier board members and managers. The leasing of foreign aircraft with crew (wet lease) is allowed, but subject to prior authorisation. Similarly, the leasing of foreign aircraft without crew (dry lease) is subject to prior authorisation.

*Barriers to competition* figure prominently in the results of Albania's STRI for air services. As with several countries, Albania maintains public ownership in the aviation sector through the national company Air Albania but does not limit foreign ownership in this company. The non-competitive allocation of slots contributes negatively to Albania's score in this sector. Like most economies, Albania allocates slots at airports with high demand on the basis of historical rights, prohibiting the commercial exchange of slots.

However, once historical slots have been allocated, half of the remaining slot pool is allocated to new entrants, which reduces the degree of restrictiveness in the sector.

**Road freight transport** (ISIC Rev 4 code 4293). The STRI for this sector covers commercial establishments only. Cross-border trade is governed by a system of bilateral and plurilateral agreements which provide for permits, quotas and other regulations.

The 2020 scores for all OECD member states and STRI partners in this sector range between a very low 0.124 and a high 0.624. Compared to the other WB6 economies, Albania is the most restrictive economy in the road freight transport sector, with a score of 0.284. The economy performs worse than the OECD (0.201), EU (0.184) and WB6 (0.225) averages. It should be borne in mind, however, that due to the wide dispersion of scores in this sector, Albania is still in the liberal bracket compared to the indices found in OECD member states, particularly among the worst performers.

Due to the specificity of this sector, the score is negatively affected by horizontal measures that affect the whole economy, particularly those related to movement of people and visa requirements, described above.

There are also sector-specific restrictions on the entry of foreigners, which account for about half of the total restrictions. Albania does not apply price regulation for transport services, nor does it have procedures in place to recognise certificates obtained in economies outside the scope of CEFTA and the EU, even though professional qualifications are paramount in this sector, particularly for truck drivers, who must obtain certificates demonstrating their professional competence.

**Rail transport** (ISIC REV 4 code 4912) is provided over a dedicated network where the market structure may take different forms, the two most common ones being: 1) vertically integrated rail services firms owning and managing both the infrastructure and the operation of freight services; and 2) vertical separation between the infrastructure management and operations. Regardless of the market structure, there are well-established best practice regulations that also take into account competition from other modes of transport, particularly road transport.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.129 and 1. With a score of 0.363, Albania is the most restrictive economy of the WB6 economies for the rail transport sector. It scores higher than the EU (0.210), OECD (0.260) and WB6 (0.316) averages.

The regulatory environment for foreign investment in rail freight companies is moderately open and non-discriminatory in Albania. As part of the alignment of the rail transport framework in the region with the EU rail transport *acquis*, vertical separation between the infrastructure manager and service providers has been gradually introduced. However, the implementation process is not yet fully complete.

In terms of *restrictions on movement of people*, the sector is negatively affected by the fact that diplomas and qualifications gained abroad are not recognised, apart from the application of preferential rules to EU Member States and CEFTA economies.

*Barriers to competition* are an important contributor to Albania's STRI performance in rail transport services. Competitiveness is reduced by the public ownership of the main rail transport operator. In addition, the government can also overrule decisions by the railway regulatory authority. Transfers and exchanges of infrastructure capacity are generally prohibited. Allowing exchanges of infrastructure capacity could help to reduce congestion on the network.

**The courier services sector** (ISIC Rev 4 code 53) includes postal and courier activities. While courier services have traditionally been important means for communication, the rise of modern information and communication technologies has contributed to the less frequent use of letters for communication between individuals.

The 2020 scores for all OECD member states and STRI partners range between 0.106 and 0.881. With a score of 0.223, Albania is the least restrictive economy for courier services in the WB6 region. The economy scores above the EU (0.181) but below the OECD (0.259) and WB6 (0.301) averages.

Since the previous cycle of analysis, the courier services sector has undergone the greatest transformation of all the sectors in terms of lowering the degree of restrictiveness. The score is, however, still affected by two sector-specific measures: the fact that 1) the universal service provider is the state-owned Albanian Post S.A.; and 2) the designated postal operator obtains preferential tax or subsidy treatment.

Overall, Albania's legislation is fully aligned with the EU postal *acquis* and the postal market has been fully open to competition since 2017. While Albanian Post is the universal service provider, there are a dozen other postal service providers. The Electronic and Postal Communications Authority (AKEP) is the independent national regulator.

While foreign entry restrictions represent the most significant component of performance in about three-fifths of the economies covered, Albania does not totally follow this trend. It does not impose equity restrictions on third-country foreigners, nor does it limit the ability of foreign investors to acquire shares in the incumbent national provider, Albanian Post. Similarly, while the provision of mail services is subject to licensing, as is the case in most STRI economies, licences are issued in a non-discriminatory manner and are not subject to any market test.

In terms of *barriers to competition*, until 2016 Albania had an imposed legal monopoly for a wide range of postal services, including letters and parcels up to 1kg. The designated postal operator (DPO) therefore enjoyed a privileged status which was partially abolished with the 2016 reform. However, residual preferential tax and subsidy treatments remain that favour the DPO. As a consequence, the public company, Albanian Post, retains a leading role in the sector.

*Regulatory transparency* also has a significant impact on the STRI scores for courier services. Although Albania has introduced pre-arrival treatment and a *de minimis* regime, lengthy customs clearance procedures are harming its STRI score. Albania uses transparent criteria for the decision-making process for licensing procedures and has in place an obligation to inform the operator of refusals and an appeal procedure.

**Legal services** (ISIC Rev 4 code 691) cover advisory and representation services in domestic and international law, and where relevant, measures are entered separately for each of them. International law includes advisory services in home country law, third-country law and international law, as well as a right to appear in international commercial arbitration. Domestic law extends to advising and representing clients before a court or judicial body in the law of the host country.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.141 and 1. With a score of 0.232, Albania is the second-least restrictive economy of the WB6 economies for the legal services sector. It scores below the EU (0.394), OECD (0.362) and WB6 (0.391) averages.

Although most economies limit the ownership of law firms to locally qualified lawyers, especially in the field of national law, such restrictions are not in place in Albania, which positively impacts its STRI score in this sector. Similarly, there are no ownership restrictions or requirements for the majority of the board of directors (or partners in the case of partnerships) or the director of law firms to be locally qualified.

However, Albania does apply restrictions on *the movement of people* in that a licensing requirement is necessary to provide legal services in the economy. All foreign lawyers in Albania must be registered in the Register of Foreign Lawyers. In order to obtain a licence to practise, a foreign lawyer must meet certain requirements, including passing the examination of the local bar association. With the new Law on the Bar Association of 2018, EU lawyers who have signed a co-operation contract with a law firm can practise law in Albania without preconditions, and thus enjoy more favourable treatment than their national counterparts from third economies. Nationality, citizenship, and previous or permanent residence are not required to

obtain a licence to practise. However, foreign lawyers do not have the option of obtaining a temporary licence to carry out a specific project or to give advice in certain areas of legal services. This has a negative impact on the STRI score in this sector as temporary licences greatly ease trade in legal services.

In the area of *barriers to competition*, Albania only provides for judicial remedies where business practices restrict competition. In addition, the STRI score is damaged by the imposition of a mandatory minimum capital and minimum and maximum fees for locally licensed lawyers, set annually by the Bar Association.

**Commercial banking** (ISIC divisions 64-66) includes deposit-taking, lending and payment services. Commercial banking services are traded business to business, as well as business to consumer for retail banking. Efficient banking services are one of the backbones of dynamic economies; they provide financing for investment and trade across productive activities and underly all value chains.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.131 and 0.517. With a score of 0.169, Albania is the second-least restrictive economy in this sector of the WB6 economies. It scores below the EU (0.180), OECD (0.205) and WB6 (0.239) averages.

*Restrictions on foreign entry* are often identified as the main contributors to restrictiveness in this sector. On this point Albania remains relatively open. The economy does not limit the share of foreign equity capital in local banks, nor does it restrict the establishment of branches of foreign banks. The licensing of foreign-owned banks is not restricted and is done based on objective and transparent principles applied on the same terms as domestic banks. Albania does not limit cross-border bank mergers and acquisitions. Foreign banks do not have to be established locally in order to provide services to residents. Finally, no restrictions are imposed on the members of the board of directors of a commercial bank.

Although *barriers to competition* generally contribute substantially to the scores for this sector, on this aspect Albania is among the most liberal third of the WB6 economies. Its scores are boosted by its adequate regulation of financial products, and the full operational, managerial and fiscal independence of its supervisory authority from the government. Finally, none of the largest commercial banks are state-owned.

As regards *regulatory transparency* in the licensing process, the authorities are mandated to provide reasons for the rejection of an applicant within a maximum of 15 days, which is in line with OECD good practice. However, the long time and high cost required to resolve a debtor's insolvency contributes negatively to Albania's scores.

Finally, in the category of *other discriminatory measures*, Albania's adherence to International Reporting Standards (IFRS) has positively contributed to its STRI score. However, Albania applies certain forms of restrictions for foreign banks when raising capital domestically.

**Insurance services** (ISIC REV 4 codes 651 and 652) comprise life insurance, property and casualty insurance, reinsurance, and auxiliary services. Private health insurance and private pensions are not covered.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.104 and 0.565. With a score of 0.155, Albania is the third-least restrictive of the WB6 economies in the insurance services sector. It scores lower than the EU (0.175), OECD (0.193) and WB6 (0.231) averages.

In terms of *restrictions on the movement of people*, the insurance sector follows the general logic of the financial sectors in Albania in its non-restrictive character. Thus, the main elements that contribute positively to the opening of the banking sector in Albania are to be found in the insurance sector. However, one restrictive element is that a residence is required in order to provide brokerage services.

**Construction services** (ISIC Rev 4 codes 41 and 42) covers the construction of buildings (residential and non-residential) as well as construction work for civil engineering.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.123 and 0.464. With a score of 0.230, Albania is the third-most restrictive of the WB6 for the construction services sector. It scores above the EU (0.207) and OECD (0.222) averages, but below the WB6 average (0.242).

Construction services is a labour-intensive sector (skilled and unskilled), which for most economies generally results in a higher share of employment than its contribution to GDP. Given the nature of construction, the potential for mechanisation and automation, and thus capital-intensive production, remains limited. Restrictions on the movement of people applied across all sectors in Albania therefore have a significant impact on the scores for this sector. In addition, it is affected by the measures applied to architecture and engineering services, outlined below.

**Architecture services** (ISIC Rev 4 code 711) cover architectural services and related technical consultancy. These services constitute the backbone of the construction sector, with key roles in building design and urban planning.

For 2020, OECD member states and STRI partners in this sector range from 0.113 to 0.684. With a score of 0.235, Albania is the third-most restrictive of the WB6 economies in the architectural services sector. However, it scores below the EU (0.260), OECD (0.244) and WB6 (0.265) averages.

*Restrictions to movement of people* reflect Albania's lack of progress in recognising higher degrees obtained in third economies, undermining its STRI score. Furthermore, licences or authorisation are required to practise and there is no temporary licensing system in place, meaning that foreign architects do not have the option to be given temporary entry to carry out a specific project or to advise on some areas of architecture services. On the positive side, a local examination is not needed to register on the list of architects and engineers and foreign architecture services suppliers are not required to redo their university degree in full, or to undergo local practice and an exam in order to be licensed.

Albania does not apply equity restrictions on third-country nationals and does not require that equity shares of architectural services firms be held only by licensed individuals or firms in the economy in question. Similarly, Albania does not restrict the form a business can take, and all kinds of businesses are permitted. There is no prohibition on commercial association with other professions. Foreign investors in Albania have the freedom to appoint board members and managers of their choice and there are no requirements in place that either the majority, or at least one, of the board members of an architecture services firm established in Albania be a national, resident or a licensed professional. The same is true for requirements relating to managers. There are no restrictions on the type of shares or bonds held by foreign investors.

*Barriers to competition* are only present to the extent that there is a minimum capital requirement for commercial and public joint-stock companies.

**Engineering services** (ISIC Rev 4 code 711) covers several related activities, such as engineering and integrated engineering services, and engineering related scientific and technical consulting services.

The 2020 scores for all OECD member states and STRI partners range between 0.118 and 0.575. With a score of 0.241, Albania is the second-most restrictive of the WB6 economies in the engineering services sector. It scores below the EU (0.246) and WB6 (0.244) averages, but above the OECD average (0.234).

Engineering services are the backbone of construction and supply. Engineers are involved in the construction of key infrastructure, such as buildings and roads. They also play an important role in the development of production processes and the adoption of new technologies. An important feature is the regulatory complementarity between engineering, architectural and construction services. The Albanian regulatory landscape reflects these similarities, with all three sectors having very similar STRI scores.

In engineering services, the results are mainly due *to restrictions on the movement of people*. This reflects the characteristics of these services, in particular their high intensity of skilled labour. Engineers from third countries are therefore mainly affected by economy-wide restrictions imposed on natural persons seeking to provide services on a temporary basis as intra-corporate transferees, contractual service providers or

independent service providers. In this respect, Albania's score is negatively affected as it applies various economy-wide limitations (as discussed above). The restrictions on the movement of people also take into account the fact that Albania does not have a process for the recognition of higher education qualifications obtained abroad, which plays a negative role in determining the economy's STRI score. In addition, a licence or permit is required to practise and there is no temporary licensing system, which means that foreign engineers cannot be allowed to enter Albania temporarily to carry out a specific project or to provide advice in certain fields. On the positive side, a local examination is not required to register as an engineer in Albania, and foreign engineering service providers are not required to retake their full university degree, local practice or in-country examination in order to obtain a licence.

**Computer services** (ISIC REV 4 codes 62 and 63) cover computer programming, consultancy and related activities and information services.

The 2020 scores for all OECD member states and STRI partners range between 0.123 and 0.448. With a score of 0.258, Albania is the third-most restrictive of the WB6 economies. It scores higher than the EU (0.211), OECD (0.221) and WB6 (0.239) averages.

Albania subjects computer services to general laws that apply to the economy as a whole; this sector is very rarely regulated by sectoral legislation. For this reason, the scoring is heavily affected by cross-sectoral limitations on duration of stay for contractual and independent services suppliers, as well as intra-corporate transferees that enter into the restrictions on the movement of people category. Those restrictions account for more than a half of the total scores in computer services. The skilled labour intensity of the sector together with the complementarity between cross-border trade and movement of natural persons explains why restrictions on movement of people feature prominently in this sector in Albania.

**The telecommunications sector** (ISIC Rev 4 codes 611 and 612) comprises wired and wireless telecommunications activities. These services are at the core of the information society and provide the network over which other services including computer services, audio-visual services, professional services and many more are traded.

The 2020 scores for all OECD member states and STRI partners range between 0.108 and 0.682. With a score of 0.117, Albania is the third-least restrictive of the WB6, scoring below the EU (0.151), the OECD (0.188) and the WB6 (0.231) averages.

In the telecommunications sector, the results depend on two policy areas: *restrictions on the entry of foreigners* and *restrictions on the movement of people*. In all STRI member states, barriers to competition account for 30% of the total STRI scores in the telecommunications sector. This reflects the particular characteristics of the sector, as well as the policy environment in which it operates. It is a capital-intensive network industry and its strategic importance has led many economies to restrict foreign investment and activity in the sector. This is not the case in Albania, where the EU accession process has benefited the sector through a rigorous review of its regulatory regime. The immediate consequence is the alignment of the regulation of the telecom sector with EU regulations and good practice in this field.

In order to ensure fair competition in the telecommunications market, Albania has an independent telecommunications regulator, AKEP, separate from stakeholders and the government. It operates without state intervention and without the presence of a state-owned enterprise (SOE) since the traditional provider has been privatised, in contrast to what is widely observed in this sector in OECD member states and STRI key partners. AKEP has sufficient powers to regulate the sector effectively through ex-ante regulation applied in accordance with EU precepts – but only in the case of the existence of an operator with significant market power (SMP), which is not the case in all telecom markets. *Ex ante* regulations are applied based on regular market analysis and are readily available on the AKEP website. In addition, Albania applies a "use-it-or-lose-it" policy to frequency bands – an important measure that prevents incumbent operators from over-holding valuable frequency licences as well as free tradable spectrum and telecom services.

In absolute terms, the regulatory framework for the telecommunication sector in Albania is competitive and constrained only by measures that apply to the economy as a whole – mainly the movement of people. Even though telecommunications lend themselves easily to cross-border trade from a technical point of view, restrictions on the movement of people account for a modest share of the total STRI score in this sector.

### *Sub-dimension 2.3: E-commerce and digitally enabled services*

E-commerce can bring about significant gains for businesses. It is positively related to firms' process innovation (OECD, 2018<sup>[60]</sup>). In addition, it enlarges businesses' market scope, reduces operational costs at various stages of business activities and lowers barriers to entry, thus intensifying competition (OECD, 2013<sup>[61]</sup>). E-commerce also benefits consumers by providing information on goods and services, helping consumers identify sellers and comparing prices, while offering convenient delivery and the ability to purchase easily via a computer or mobile device (OECD, 2013<sup>[61]</sup>).

In the context of the COVID-19 pandemic, e-commerce appears to have been essential for maintaining trade flows despite the restrictions put in place to preserve public health. Indeed, buying online rather than in person reduces the risk of infection and protects jobs. Finally, e-commerce increases the acceptance of prolonged physical distancing among the population while allowing them to maintain a certain level of consumption (World Bank, 2020<sup>[62]</sup>).

2020 will certainly be a turning point in electronic commerce. This digital transformation underlines the importance of adopting a more holistic approach to policies, as well as more international co-operation (Ferencz, 2019<sup>[63]</sup>; OECD, n.d.<sup>[64]</sup>).

Modern e-commerce regulations should focus on a number of key elements, including electronic documentation and signature, online consumer protection, data protection and privacy, cyber security, intellectual property regulations and intermediary liability. On the other hand, an attractive regulatory environment should refrain from maintaining disproportionately restrictive measures such as licensing requirements for e-commerce platforms, limitations on the type of goods that can be sold online (other than for generally accepted public policy considerations), and restrictions on cross-border data flows.

This sub-dimension assesses those policies which are implemented in parallel and in addition to those of Digital society (Dimension 10). However, it is mainly focused on the trade in digitally enabled services, given the rapid growth of trade in services in the region.

Albania has a solid and well-designed **e-commerce policy framework**, despite the fact that the actual use of e-commerce is rather limited compared to neighbouring economies. Low use of credit and debit cards and high use of cash, as well as low capacity of telecommunication operators and Internet providers, are among the reasons why e-commerce has not bloomed even during the COVID-19 pandemic.

Regulations related to e-commerce fall under the competence of the Commissioner for the Consumer Protection, under the Ministry of Finance and Economy (MOFE). Albania's institutional framework allows for effective institutional co-ordination of e-commerce across ministries and agencies. The MOFE and the Ministry of Energy and Infrastructure, under the CEFTA Chairmanship in 2019, organised two meetings with businesses operating in this area to identify their needs and potential improvements. Very recently, an action plan for e-commerce has been developed. Prime Minister's Order No. 104 of 10<sup>th</sup> September 2020 established an inter-ministerial working group on e-commerce, headed by the Deputy Minister of MOFE, to draft this e-commerce action plan, which aims to remove obstacles to the development of e-commerce and identify new challenges in five key pillars: digital business; logistics and customs issues; private sector capacity and capabilities for e-commerce; e-commerce and consumer protection legislation; and electronic payments. Currently, the action plan is being submitted to the line ministries for their opinion and will then be submitted to the Council of Ministers.

Albania has solid legislation that includes the main regulatory pillars of digital trade, while maintaining an open and non-discriminatory regime for foreign digital services. The Law on Electronic Commerce was adopted in May 2009 and amended in 2014 and 2016 and lays down the conditions for providing information services related to electronic activity and information society services, the protection of parties to such transactions, data privacy of consumers and of parties to such transactions, the free movement of information services and the responsibilities of service providers. The law is in line with the European Commission recommendations and with the EC Directives.

Favoured by Albania's willingness to gradually harmonise its framework with the EU *acquis*, most of the elements of a comprehensive regulatory framework are in place. Regulations on data governance, online consumer protection, electronic signature and intermediary liability are in line with international best practice and harmonised with the EU regulations.<sup>36</sup> The framework balances protecting individuals and consumers with limiting the costs and restrictions faced by digital businesses. As regards cybersecurity, regulation is still evolving, with a general framework complemented by sector-specific regulation – see Digital society (Dimension 10).

With the regulatory framework largely in place, adequate implementation remains a challenge due to Albania's institutional capacity constraints. There are no modern and effective independent regulatory bodies in the area of cyber security. Similarly, the consumer protection regime does not currently have an effective supervisory authority to monitor compliance, raise consumer awareness of their rights or resolve e-commerce disputes. Although progress has been made, areas where competent regulatory bodies are in place, such as electronic signatures and data privacy, could benefit from some improvement in practices and innovations. These issues are intended to be addressed by the new 2020 action plan when it comes into force.

Albania suffers from an underdeveloped e-commerce business community – there are only a very limited number of merchants who offer e-commerce and there is no nationally licensed operator yet to deal with e-commerce. Albania is still a cash-based economy and the use of credit cards, although increasing, is still limited<sup>37</sup> to the largest retailers or hotels. In practice, cross-border Internet shopping is in the early stages, and it's still not common, especially due to the low use of credit cards, low purchasing power and the high cost of shipping. In addition, many online merchants do not ship goods to Albania.

The OECD Digital STRI captures **the restrictiveness of digitally enabled services** by identifying cross-cutting barriers that inhibit or completely prohibit firms' ability to supply services using electronic networks, irrespective of the sector in which they operate. The regulatory data underlying the digital STRI were extracted from the existing OECD STRI database and data collected under public laws and regulations affecting digitally enabled services. Digital STRIs are the result of aggregating the identified barriers to trade into composite indices. The rating takes into account the specific regulatory and market characteristics as well as the links and hierarchies between regulatory measures affecting digitally enabled services (Ferencz, 2019<sub>[63]</sub>). Figure 20.8 shows Albania's score on the Digital STRI index.

**Figure 20.8. Digital services trade restrictiveness index: WB6 and CEEC economies**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; \*CEEC=Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovak Republic and Slovenia (Bulgaria, Croatia, and Romania are not OECD member states or OECD STRI Partner economies and therefore do not have calculated STRI indices); the absence of a category in the graph means that it is exempt from restrictions. Source: (OECD, 2020<sup>[56]</sup>), Services Trade Restrictiveness Index Regulatory Database, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934255380>

The 2020 scores in this sector are moderate to high, ranging from 0.043 to 0.488. The WB6 average is 0.183. With a score of 0.101, Albania is in the lower bracket of restrictiveness for its telecoms sector – one of the four-least restrictive WB6 economies.

Although results in most digital STRI economies are generally driven by the lack of effective interconnection regulation, this is not the case in Albania, whose regulation is relatively well-aligned with international good practice. Similarly, although Albania has stricter rules than the OECD guidelines in this area (OECD, 2013<sup>[59]</sup>), it does not impose excessive conditions on cross-border data flows (beyond those put in place to ensure the protection and security of personal data). However, like the 11 other digital STRI economies, Albania requires that some types of data are stored locally. The transfer of copies abroad is allowed as long as the authorities can have direct access to the data upon request.

Albania does not impose other restrictive regulations typically found in other jurisdictions, such as disproportionate licensing requirements for e-commerce platforms, or limitations on the type of goods or services that can be sold online (other than for generally accepted public policy considerations).

International standards for electronic contracts and key electronic authentication measures such as recognition of electronic signatures are generally in place.

Policy areas relating to intellectual property rights and payment systems account for a smaller share of scores for states participating in the digital STRI. Albania is relatively open in this category from a regulatory point of view, as it follows the principles of European regulations in this field. Thus, intellectual property protection regulations do not provide for less favourable treatment of foreigners and all the necessary regulations related to payment systems are in place, although their use is limited in practice (as mentioned above; and see Box 20.5 for OECD guidelines).

### Box 20.5. OECD policy guidance on mobile and online payments

A key component of a solid e-commerce regulatory policy is the establishment of sound measures for electronic payments and settlements. The main roles of a payment system are to provide a means of transferring value between different parts of the economy and to facilitate transactions at minimum cost. Its design will be optimal if it is organised in such a way as to allow rapid and efficient value transfers, while imposing minimum additional costs and risks. High costs for the payment process can seriously affect economic activity, making transactions too costly. Conversely, the lower costs of efficient payment systems can have a positive effect on economic growth.

Policy makers can help to encourage economic activity by promoting a framework for electronic settlements and payments. The OECD's Consumer Policy Guidance on Mobile and Online Payments (OECD, 2014<sub>[65]</sub>) provides an informative framework of policy measures to establish a regulatory environment for e-commerce that can be adapted to WB6 economies.

The framework is oriented around a number of pillars:

- Information on conditions and transaction costs. These principles focus on the accessibility and readability of payment information, the complexity of payment conditions, and the clarity and transparency of billing statements.
- The privacy implications of mobile and online payment: the collection and use of payment data.
- Security implications of mobile and online payment transactions: protecting the security of consumer payments.
- Confirmation process: issues that impede e-commerce transactions such as the uncertainty of transactions.
- Children: issues such as the costs incurred by children in accessing goods and services.
- Different levels of protection among providers and payment methods: this includes information on consumer protection and levels of payment protection.
- Fraudulent, misleading, deceptive and other unfair commercial practices: how to regulate inconsistent payment information, renewable contracts, renewable subscriptions and repeat purchases, unexpected charges and consumer confidence.
- Dispute resolution and redress: issues such as the roles and responsibilities of the parties and the cost of redress.

### ***The way forward for trade policy***

Albania has as a solid policy framework and inter-ministerial mechanism for trade, and has taken steps to improve these processes further, in particular through the new rules and procedures for the NTFC. Nevertheless, the Government of Albania can improve its competitiveness by paying attention to the following:

- **Monitor and evaluate trade policy-making co-ordination mechanisms** to guide policy makers in improving co-ordination and boosting consultation with an increased number of stakeholders. It should also ensure that the mechanisms can be adjusted based on evaluation results.
- **Establish mechanisms for evaluating and monitoring public-private consultations** to regularly assess their degree of openness and transparency. Ideally, an independent monitoring office with an adequate budget could be set up to allow for systematic evaluations. In addition, training could be provided in the use of various

quantitative and qualitative approaches for measuring compliance with the minimum standards set by regulatory frameworks for public consultations.

- **Implement a policy to increase stakeholder participation:** invite stakeholders who may be reluctant or unaware to become more involved in the legislative and regulatory process for trade, and build their capacity to participate. In doing so, Albania could follow the 2015 EU Better Regulation Guidelines (Box 20.6) to improve stakeholder involvement.
- **Broaden trade in services efforts beyond regional trade agreements.** Significant improvements have been made among the WB6 economies to open services trade through the conclusion of CEFTA Additional Protocol 6 in December 2016. Nonetheless, the STRI analysis in this section has provided some insights into where domestic reforms could help to attract new businesses and improve competitiveness.
- **Lift some of the stringent restrictions on services in trade:**
  - **Ease conditions on the temporary movement of natural persons** beyond regional trade agreements. This would further encourage innovation and knowledge transfer, and contribute to economic growth. A starting point could be to remove the remaining labour market tests which apply to third-country services suppliers. This is already addressed in a draft amendment to the Law on Foreigners – entry into force of this legislation will facilitate the provision of services by third country providers. Limitations on duration of stay for contractual and independent services suppliers, as well as intra-corporate transferees, could also be amended in order to make the economy more attractive to foreign services suppliers and investors.
  - **Reduce the remaining barriers to market entry and competition** in the road freight transport, rail freight transport and computer services sectors. Further efforts could be made to increase competitiveness, such as providing redress to firms in the road freight transport sector when business practices restrict competition in a given market. Moreover, the economy could consider providing some form of transit and access rights for international rail transport. Similarly, the licensing and permits which are subject to quotas for domestic traffic in the road freight transport sector could be lifted in order to decrease restrictions in the sector.
- **Finalise the e-commerce action plan.** Doing so will give Albania a much-needed solid e-commerce strategy. The action plan should go through the adoption process and enter into force as soon as possible in order to meet Albania's implementation challenges related to e-commerce, including establishing a consumer protection agency mandated to ensure safety on online transactions and online dispute resolution.

### Box 20.6. Stakeholder engagement throughout the European Commission policy cycle

Following the adoption of the 2015 Better Regulation Guidelines (European Commission, 2015<sup>[66]</sup>), the European Commission has extended its range of consultation methods to enable stakeholders to express their views over the entire lifecycle of a policy. It uses a range of tools to engage with stakeholders at different points in the policy process. Feedback and consultation input is taken into account by the commission when further developing the legislative proposal or delegated/implementing act, and when evaluating existing regulation.

At the initial stage of policy development, the public can provide feedback on the commission's policy plans through roadmaps and inception impact assessments (IIAs), including data and information they may possess on all aspects of the intended initiative and impact assessment. Feedback is taken into account by the commission services when developing the policy proposal further. The feedback period for roadmaps and IIAs is four weeks.

As a second step, a consultation strategy is prepared setting out consultation objectives, targeted stakeholders and the consultation activities for each initiative. For most major policy initiatives, a 12-week public consultation is conducted through the website “Your voice in Europe” and may be accompanied by other consultation methods. The consultation activities allow stakeholders to express their views on key aspects of the proposal and main elements of the impact assessment being prepared.

Stakeholders can also provide feedback to the commission on its proposals and accompanying final impact assessments once they are adopted by the College. Stakeholder feedback is presented to the European Parliament and Council in order to feed into the legislative process. The consultation period for adopted proposals is 8 weeks. Draft delegated acts and important implementing acts are also published for stakeholder feedback on the European Commission's website for a period of 4 weeks. At the end of the consultation process, an overall synopsis report should be drawn up presenting the results of the various consultation activities that took place.

Finally, the commission also consults stakeholders as part of the *ex post* evaluation of existing EU regulations. This includes feedback on evaluation roadmaps of existing initiatives, public consultations on evaluations of individual regulations and “fitness checks” (i.e. “comprehensive policy evaluations assessing whether the regulatory framework for a policy sector is fit for purpose”). In addition, stakeholders can provide their views on existing EU regulation at any time on the website “Lighten the load – Have your say”.

## Access to finance (Dimension 3)

### Introduction

Albania's access to finance score has increased slightly – from 2.4 to 2.5 – since the previous assessment, reflecting some new elements introduced in this cycle. There has been some improvement in access to bank finance, most notably the adoption of the new capital market law which will help to mobilise long-term financing. Moreover, Albania is the second-best performer across the region when it comes to access to bank financing (Table 20.6). However, with a score of 2.3 for the mobilisation of long-term financing, Albania is well below the regional average.

**Table 20.6. Albania's scores for access to finance**

Dimension	Sub-dimension	Score	WB6 average
Access to finance dimension	Sub-dimension 3.1: Access to bank finance	3.5	3.4
	Sub-dimension 3.2: Access to alternative financing sources	2.0	1.9
	Sub-dimension 3.3: Mobilisation of long-term financing	2.3	2.8
Albania's overall score		<b>2.5</b>	<b>2.6</b>

### State of play and key developments

#### *Sub-dimension 3.1: Access to bank finance*

The financial sector is bank dominated in Albania; banks account for about 90% of financial sector assets, considerably more than in the euro area (around 45%). There is no limit on the foreign ownership of banks, except for shell banks/companies, bearer shares and nominee shareholders. In 2020, there were four banks with local capital and eight banks with foreign capital operating in Albania. As of December 2020, local banks accounted for 30.6% of the market share in terms of total of assets. Over the decade 2010-20, five banks with foreign capital origin have ceased to operate: two Greek banks were sold to local shareholders due to restrictions of presence imposed by the European Commission; one Italian bank was merged with another Italian one following the merger of both parent banks in Italy; another foreign bank was sold to a local bank following the shareholders' decision; and another foreign bank was self-liquidated on the decision of shareholders.

Albania's regulatory framework for the **banking industry** is moderately well-developed. Basel II core principles are mostly implemented,<sup>38</sup> while Basel III requirements are partially implemented (implementation began in 2019).<sup>39</sup> In 2017, the Bank of Albania adopted the guidelines on the internal capital adequacy assessment process (ICAAP), which has partially aligned its regulations with the requirements of the second pillar of the Basel's Capital Accord. At the time of drafting, the Bank of Albania was drafting a document on the Supervisory Review and Evaluation Process (SREP). Its potential effects will be assessed in the next cycle. In 2019, the Bank of Albania approved the new guidelines on banks' stress tests, as well as the new regulation on the liquidity coverage ratio (LCR). Both entered into force on 1 March 2020, bringing the regulatory framework closer to international standards.

In 2017, a memorandum of co-operation to increase the use of the national currency (ALL) in the Albanian financial system and economy was signed between the Bank of Albania, Ministry of Finance and Economy and the Financial Supervisory Authority. Subsequently, the law on consumer credit and mortgage credit and the regulation on transparency for banking and financial products and services were both amended in 2018. These amendments add extra regulatory requirements for banks and consumers to mitigate exchange rate risks; however, they could make accessing loans more challenging for businesses.

As of December 2020, the banking sector's assets and liabilities in foreign currency accounted for around 50% of total values, while the share of loans in foreign exchange stood at 50% (Bank of Albania, 2020<sup>[69]</sup>).

Income and expenditure statements indicate that the banking sector has generated a significantly higher profit from foreign currency activity than from domestic currency activity. In 2018, of a profit of ALL 18 billion, around ALL 11 billion was from foreign currency activity. In 2019, foreign currency recorded a profit of around ALL 15 billion (compared to ALL 5 billion for domestic currency). A more detailed analysis of income and expenditure indicates that, despite the fact that domestic currency activity generates around 1.5 to 2 times more income than foreign currency activity, the latter ensures a higher profit for the banking sector due to the significantly lower value of operational and personnel expenditures compared with domestic currency activity (Bank of Albania, 2019<sup>[70]</sup>).

There is a cadastre in place to **register** all properties. Registration is compulsory and ownership changes are immediately registered. The Registry of Security Charges is the central register and covers the entire territory. Applications for cadastral services can be made online through the e-Albania platform and 100% of the ownership of pledges is documented. However, competing historical claims on properties need to be resolved and clearly defined.

As regards **collateral requirements**, Albania has already established an adequate legal structure for a secured financing system enabling creditors to claim their rights over the movable properties of businesses and individuals. According to the Law on Cadastres, mortgaging requires registration of immovable property, which is used as a security for the obligation. To secure loans, the legal framework identifies a wide range of movable properties (tangible and intangible) such as accounts, instruments, securities, goods, equipment, inventory, vehicle machinery, livestock, intellectual property patents, etc. In practice, it is up to the operators to determine whether or not to accept collateral and/or its minimum value. In addition, the legal framework does not fix a threshold under which collateral is flexible for small businesses, which could potentially make access to traditional lending more challenging for micro and small firms.

No major legal changes have occurred since 2017 to Albania's **credit information services**. The only credit information service is the Credit Register established and managed by the Bank of Albania. The register is available both for financial institutions and the public. All financial institutions providing loan services are required to report, and both positive and negative data are reported. Financial institutions can request online data on existing or potential borrowers providing that a written confirmation from the borrower is issued. Borrowers can require data on their own exposure. However, mandatory reporting is only limited to institutions providing loans, covering slightly more than half of the adult population in 2019 (56%). The Albanian Association of Banks has initiated a project to set up a credit bureau, however the project could not be completed due to legal barriers, notably the article limiting the transfer of information.<sup>40</sup>

Two **credit enhancement and risk mitigation schemes** exist in Albania. The first is the Credit Guarantee Scheme (CSG) for SME loans, for which the main donor is the Italian Agency for Development and Cooperation. The CGS covers up to 60% of loan default, with a maximum of EUR 200 000. The second is Albania Agrobusiness Support Facility<sup>41</sup> (AASF), financed by the European Bank for Reconstruction and Development (EBRD) in co-operation with the Albanian Government. The latter aims to enhance access to finance for Albanian agribusinesses through the commercial banks and non-bank microfinance institutions. It backs 20% of the loans to sub-borrowers disbursed by the financial institutions. Up until the end of 2019, a total of EUR 46.8 million had been granted under AASF, covering more than 6 000 SMEs.

### *Sub-dimension 3.2: Access to alternative financing sources*

Alternative financing sources remain very limited in Albania, creating a major hindrance for business that don't meet the traditional banking criteria. **Factoring and leasing** are available and backed by well-developed legal frameworks, but **crowdfunding, venture capital and business angel networks** are non-existent. However, from 2022, a project to develop crowdfunding platforms, venture capital and business angel networks for entrepreneurs and start-ups that are not eligible for traditional bank lending will be launched by the Albanian Government, in co-operation with German Federal Ministry for Economic Cooperation and Development (GIZ) and the Swedish International Development Cooperation Agency

(Sida) under the EU for innovation programme.<sup>42</sup> The impacts of the project will be assessed in the next CO assessment cycle.

Leasing volumes have been increasing since 2015, from a total value of ALL 5.91 million to ALL 8.85 in 2019 (Bank of Albania, 2020<sup>[71]</sup>). Factoring and invoice discounting decreased from ALL 0.48 million to ALL 0.27 million over the same period. Of the leasing portfolio, 56% is concentrated on vehicles for personal use and 28% on work vehicles. The remainder (around 16%) is principally for product lines and work equipment.

**Factoring** is regulated by the Law on Granting of Licences to Non-bank Financial Institutions and the regulation on Risk Management in the Activity of Non-bank Financial Institutions. Both regulations were amended in July 2019, adding new requirements for factoring institutions. To prevent money laundering, these requirements cover not only the integrity of shareholders/partners, but also family relations or close personal, working or business relationships with persons with criminal records. In addition, the amendment requires that an internal audit function/unit is established in all institutions subject to the law. The Albanian Government has also put in place several incentives to promote the use of factoring – most notably allowing the interest on factoring to be deducted by up to 20% and exempting factored invoices from stamp taxes.

**Leasing** is mainly regulated by the Law on Financial Leasing; however, both of the laws mentioned above also include requirements for leasing institutions. The financial leasing law clarifies the definitions of lessor and lessee, the main rights and duties of a leasing relationship, how the process can be instigated and all the procedures to follow. The regulatory framework does not impose any limitations on the leasing market development; capital requirements and other criteria for licensing leasing activities are the same as for other non-bank financial institutions. The leasing regulatory framework is regularly revised by the Bank of Albania to comply with the latest market developments. The impact on the market of the regulatory framework is measured, either through off-site analysis or on-site inspections.

On 1 September 2020, the Law on Financial Markets based on Distributed Ledger Technology (DLT) came into force. This regulates the issuance and licensing of entities that are engaged in the distribution, trading and custody of digital tokens and crypto currencies, including **blockchain** as a specific form of this technology. The implementation and monitoring of the law are supervised by both the Albanian Financial Supervisory Authority (AFSA) and the National Agency of Information Society (AKSH). Chapter IV of the law clearly sets out the rules that should apply to security token offerings (STOs) and **initial coin offerings** (ICOs). It requires a white paper<sup>43</sup> to be published in case of ICOs and also defines the responsibilities of the issuer, safeguards for investors and the criteria for advertising STOs and ICOs. The law provides a clear framework for the protection of investors, such as the option of imposing administrative sanctions (Article 98) and in the event of a criminal offence, sending the case for prosecution in accordance with the procedures of the penal code of the Republic of Albania.

### *Sub-dimension 3.3: Mobilisation of long-term financing*

Albania has a well-established legal framework for **public-private partnerships** (PPPs). The law on Concession and Public Private Partnership regulates PPPs in mobilising long-term financing, covering a broad range of sectors. The Concession Treatment Agency (ATRAKO), created in 2007, assists the contracting authorities in preparing and negotiating concessions and PPPs.

In May 2020, Albania adopted a dedicated Law on Capital Markets,<sup>44</sup> drafted in partnership with the World Bank. It promotes the development and integrity of **capital markets**, and regulates **institutional investors**. Both domestic and foreign capital institutional investors are allowed to operate in Albania. Local asset management businesses only started in 2012; as of 2019 only three out of four licensed asset management businesses active in investment funds were operating in the territory. That same year, the total assets under management were ALL 70 billion (around EUR 572 million, or 4.5% of GDP). The regulation on the Operation of Collective Investment Undertakings, Fund Management Companies and

Depositaries, drafted by the Albanian Financial Supervisory Authority, was approved in January 2021. Its impacts will be assessed in the next CO cycle.

Albania has one operational privately owned Securities Exchange (ALSE) under the supervision of the Albanian Financial Supervisory Authority (AFSA). It was created in 2017 and trades government securities. In addition, the new law on Capital Markets allows other corporate securities to be traded. The ALSE had an initial capital of ALL 50 million (around EUR 400 000) and the company has three shareholders: Credins Bank (42.5% of total capital), the American Investment Bank (42.5%) and AK Invest (15%). In September 2019, the AFSA's board approved the increase of ALSE's capital through the issuance of additional shares. The new capital amount is ALL 85 million (around EUR 690 000) and the shareholder structure was changed as follows: Credins Bank 45.59%, American Investment Bank 45.59% and AK Invest 8.82%. The securities exchange started trading securities officially in February 2018 and by October 2019 the turnover on the exchange amounted to ALL 2.8 billion (around EUR 23.2 million).

The Law on Capital Markets increases transparency and investor protection. As result, it has aligned Albania's framework with the EU Markets in Financial Instruments Directive (MiFID) and forms the legal basis to potentially broaden access to the stock market. The **bonds** market issued by joint-stock companies with private placement has been active since 2011. However, there is still no corporate bond market with bonds open to the public. Currently there are six bonds issuers – mainly banks and microcredit institutions – and in 2019 the total outstanding bonds issued with private placement to institutional investors or up to 100 individuals was approximately ALL 7.45 billion (about EUR 61 million).

### ***The way forward for access to finance***

To enhance the banking industry and support businesses' access to finance, policy makers should:

- **Continue efforts to align Albania's banking regulations with international standards.** Monitoring recent regulatory reforms, and bringing the banking regulatory framework further into line with internationally agreed norms, would help build the resilience of the banking sector to withstand potential external shocks, such as the COVID-19 pandemic.
- **Continue efforts to diversify the financial sector.** While the regulatory framework for factoring and leasing is in place with incentives to promote their use, the financial sector remains bank-dominated. Albania needs to continue its efforts to implement the EU for Innovation programme while benefiting from the expertise of GIZ and SIDA to provide funding to firms from outside of the traditional lending schemes and meet their needs at various stages of their growth trajectory and development.
- **Review the blockchain legislative framework regularly** to quickly and efficiently adapt the sector to the needs of domestic firms and international market trends.
- **Facilitate market-based long-term debt financing for businesses.** A solution to increase the liquidity of the bond market and a way round the dependence on bank financing could be to establish a special framework coupled with technology platforms such as crowdfunding for private bond placements by smaller companies. One recent successful example is the Italian mini-bond market framework (Box 20.7).

### Box 20.7. Italy's "mini-bond" market

In 2012 the Italian Government introduced a series of laws<sup>1</sup> to initiate a mini-bond framework for unlisted companies to enable them to issue corporate bonds. The mini-bond framework provides a simplified process whereby unlisted companies with more than 10 employees and an annual turnover and/or assets in excess of EUR 2 million (except micro-enterprises and banks), can issue bonds that are available only to qualified investors. Firms are not required to publish a public prospectus – an admission document is sufficient.

In response to this new regulatory framework, Borsa Italiana introduced the ExtraMOT PRO segment in 2013, dedicated to the listing of bonds whose trading is only permitted to professional investors. Since its introduction, the mini-bond market has seen steady growth, with the number of issuances increasing from 16 in 2013 to 171 in 2018. The cumulated proceeds during this period amounted to EUR 10.6 billion, 25% of which was raised in 2018. Moreover, mini-bonds have also been securitised through special purpose vehicles which have created a diversified pool of mini-bond issuers available for institutional investors.

In 2019 the government introduced mini-bond placements on equity crowdfunding platforms. In October 2019, the operating rules for equity crowdfunding platforms willing to place mini-bonds were published by the competent authority (Consob). These include that the offers must be published on specific sections of the platforms; the issuers are limited to joint stock companies; and eligible investors are required to hold financial assets of at least EUR 250 000, invest at least EUR 100 000 in the mini-bond, or be client of an asset management company. The first offerings were published on crowdfunding platforms in January 2020.

1: Law Decree No.83/2012 and its subsequent amendments (Law Decree No. 179/2012; Law Decree No. 145/2013), Law Decree No: 91/2014; Law Decree No: 157/2019, (Fiscal Decree 2020) and Law Decree No: 160/2019 (Budget Law 2020) which created the possibility for unlisted companies to issue corporate bonds through the so-called mini-bond framework.

## Tax policy (Dimension 4)

### Introduction

Table 20.7 shows Albania's scores for the two tax policy sub-dimensions, and compares them to the Western Balkan (WB) average. Albania has the highest score (along with North Macedonia) of the WB6 economies for the tax policy framework sub-dimension, driven by its slightly above-average ratings for each indicator. However, it scores below the WB6 average for the tax administration sub-dimension – explained by its low score for the “independence and transparency” indicator (the lowest of the WB economies).

**Table 20.7. Albania's scores for tax policy**

Dimension	Sub-dimension	Score	WB6 average
Tax policy dimension	Sub-dimension 4.1: Tax policy framework	3.0	2.6
	Sub-dimension 4.2: Tax administration	2.7	3.3
	Sub-dimension 4.3: International tax co-operation	n.a.	n.a.
<b>Albania's overall score</b>		<b>2.8</b>	<b>3.0</b>

Note: For comparability with the previous assessment, the new sub-dimension (4.3) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 4.1: Tax policy framework*

**Tax revenues** as a share of GDP are relatively low in Albania. In 2019, the economy's tax-to-GDP ratio was 25.3% (Table 20.8), having risen from 24.1% in 2015. This ratio is below both the WB6 (30.6%) and OECD (33.8%) 2019 averages. While Albania raises less tax revenue as a percentage of GDP than other WB economies, it has a more balanced tax mix overall. For example, taxes on goods and services and social security contributions (SSCs) combined account for 66.3% of total tax revenues, which is significantly below the 80% WB average for 2019. Albania's lower reliance on these taxes reflects the balance found in OECD countries (58.4% of total tax revenues in 2018). Consequently, other taxes play a greater role in Albania than in other WB economies. While 14.5% of WB economies' total tax revenues originate from personal income tax (PIT) together with corporate income tax (CIT), Albania raises 20.1% of its revenues from these direct taxes. This is below the 33.5% average for OECD countries in 2018. Although Albania's tax structure is more balanced than in other WB economies, increasing its revenues from direct taxes would further diversify the tax mix.

**Table 20.8. Albania's tax revenues as a percentage of GDP**

	CIT	PIT	SSCs	Goods and services	Tax/GDP ratio
Albania	2.3%	2.7%	5.0%	11.7%	25.3%
WB6	1.8%	2.7%	9.3%	15.9%	30.6%
OECD	3.1%	8.1%	9.0%	10.9%	33.8%

Note: CIT: corporate income tax; PIT: personal income tax; SSC: social security contributions.

Source: (OECD, 2020<sup>[74]</sup>) OECD.Stat, <https://stats.oecd.org/> 2019 for overall tax/GDP ratio, 2018 for specific tax/GDP ratio); CO 2021 questionnaire for WB6 average and Albania (2019).

Corporate income tax is levied at a rate of 0% or 15% depending on the taxpayer's total annual income. Businesses with a total annual income below ALL 14 million (EUR 113 200) are subject to a 0% rate, while those whose total annual income exceeds this amount are subject to a 15% rate (Table 20.9). In addition, a reduced 5% rate is provided for specific activities. Albania's top CIT rate is the highest of the WB6, alongside Serbia. As a comparison, the average rate in four WB economies with a flat CIT rate was 9.8%

in 2020. CIT revenues account for 2.3% of Albania's GDP (Table 20.8), which sits between the 1.8% WB average (in 2019) and the 3.1% OECD average (in 2018). Dividend income is excluded from the CIT base if distributed by a company subject to CIT. Capital gains, on the other hand, are included in the tax base. When dividends are distributed, companies pay an 8% dividend withholding tax rate. Furthermore, a 15% withholding tax applies to interest payments sourced in Albania. Concerning taxation of international business income, Albania operates a worldwide taxation system whereby resident companies pay taxes on domestic and foreign-sourced income and non-resident companies are liable for taxes on income originating from Albania. A worldwide taxation system is currently adopted in all of the WB economies. However, such systems are increasingly less common in the OECD, particularly in small open economies. Albania may wish to re-evaluate the advantages and disadvantages of worldwide taxation systems.

**Table 20.9. Selected tax rates in Albania**

	CIT	PIT	SSCs	VAT
Albania	15.0%	23.0%	27.9%	20.0%
WB6	11.5%	12.8%	28.6%	19.0%
OECD	23.3%	42.8%	26.9%	19.3%

Note: CIT: corporate income tax; PIT: personal income tax; SSC: social security contributions; VAT: value-added tax. CIT and PIT averages for WB and OECD are based on top statutory rates. CIT for Albania is the top statutory rate. PIT in Albania is levied following a progressive rate schedule - the rate displayed in the table is the top rate.

Source: (OECD, 2020<sup>[74]</sup>) OECD.Stat, <https://stats.oecd.org/> (2020 for CIT and VAT, 2019 for PIT and SSCs).

Albania lacked **investment incentives** in its tax system until 2018, when it introduced CIT profit-based incentives. Several profit-based incentives – which generally reduce the effective tax rate – have been implemented. For example, companies operating in the sectors of software production/development, agricultural co-operation, agro-tourism or the automotive industry are eligible for a reduced 5% CIT rate. Furthermore, companies established in so-called areas of technology and economic development are exempt from 50% of their CIT liability for a five-year period. A CIT exemption for 10 years is also granted to hotels certified as “brand name” (four or five star hotels) at the beginning of their economic activity. Cost-based incentives – which lower the cost of investment and increase with the size of the investment – are also available for companies in these technology and economic development areas. For these companies, expenses for scientific research and staff development or training can be deducted from a company's CIT liability at double the value of the investment undertaken (for a 10-year period). These companies can also benefit from cost-based incentives – annual capital expenses may receive a 20% deduction from CIT liability in their first three years of economic activity. However, research has shown that profit-based incentives are more likely to lead to high redundancy of expenditure since the investment may have proceeded anyway (UNCTAD, 2015<sup>[75]</sup>). Albania may wish to assess empirically whether the current set of profit-based incentives are surplus to requirement and may create unnecessary redundancy.

Following a **PIT reform** in January 2019, personal income in Albania is taxed according to a progressive rate schedule which includes three rates on personal labour income: a 0% rate for taxable income under ALL 30 000 annually (EUR 240), a 13% rate for taxable income up to ALL 150 000 annually (EUR 1 200) and a 23% rate for income over ALL 150 000 (Table 20.9). The 2019 reform increased the threshold from ALL 130 000. PIT revenues in Albania account for 2.7% of GDP, which aligns with the regional average (2.7% in 2019) and the second-highest of the WB economies after Serbia (Table 20.8). However, this level remains significantly below the OECD average (8.1% in 2018). With regards to the taxation of personal capital income, a 15% flat rate applies to income such as interest, royalties, rental income and **capital gains**, including from the sale of immovable property. For **dividend income**, an 8% rate now applies (previously it was 15%). This low taxation of capital income, particularly of dividends, creates an incentive for entrepreneurs to incorporate their businesses and receive income in the form of capital rather than salaries.

Despite yielding the economy's second-highest tax revenues, Albania is less reliant on **social security contributions** than the other WB economies. While revenues from SSCs account for one-fifth of Albania's total tax revenues, they represent only 5.0% of its GDP (Table 20.8). This ratio is the second lowest in the region (after Kosovo) and below the OECD (9.0% in 2018) and WB (9.3% in 2019) averages. The total SSC rate on gross salaries is 27.9%, which sits between the 29.4% WB average (in 2020) and the 26.9% OECD average (in 2019) (Table 20.9). Despite this average rate, Albania's low SSC revenues suggest a narrow SSC base. Ensuring that more workers are active in the formal labour market should be a priority for future tax policies. The total SSC liability split is 16.7% for employers and 11.2% for employees. While OECD countries tend to levy higher employer SSCs than employee SSCs, WB economies on average do the opposite (9.5% for employers and 19.9% for employees in 2020). With regards to the self-employed, the total SCC rate is 26.4%, which is slightly below the WB average (29.7% in 2020). Contrary to other WB economies, which tend to impose high SSC rates on employees, Albania's taxation of labour income is more balanced. High employee SSCs reduce workers' disposable income, undermining their incentives to work in the formal economy, in particular those on low income with low skill levels. The relatively low employee SSC rate, combined with Albania's progressive PIT rate schedule (which shifts the tax burden from low incomes to higher incomes), limits these unwanted spillover effects.

In terms of the **design and functioning of VAT and environmentally related taxes**, Albania relies heavily on revenues from taxes on goods and services, though to a lesser extent than other WB economies. In 2019, revenues from these taxes were 11.7% of GDP (Table 20.8), which makes Albania the least reliant WB6 economy on taxes on goods and services. Though below the WB average (15.9% in 2019), this ratio broadly aligns with the OECD average (10.9% in 2018). Albania levies a standard 20% VAT rate, which is slightly above the averages for the OECD (19.3% in 2020) and WB6 (19.0% in 2020). Since June 2017, the VAT base has been narrowed by the introduction of a reduced 6% rate, which applies to a list of goods and services that includes tourism accommodation services, advertising services in visual media, public transport services and books. However, OECD research has found that reduced rates are not an effective way to help people on low incomes, and can be regressive in some instances (OECD, 2018<sup>[76]</sup>). The VAT registration threshold was increased in January 2021 to ALL 10 million (EUR 81 000) – a substantial increase from the previous threshold (ALL 2 million or EUR 16 200) and one of the highest of the WB economies. As regards other taxes on goods and services, excise duties are levied on gasoline and diesel, accounting for 2.2% of GDP. Albania has also implemented three other environmentally-related taxes (amounting to 1.1% of GDP): a circulation tax, an annual tax on used vehicles and a tax on plastic material and packaging.

Albania has an aggregated **tax revenue forecasting** model for all major types of taxes. In 2019, several micro-simulation models were implemented in co-operation with the World Bank. They are available for VAT, excise duties, PIT and CIT. Based on tax return data, these models can estimate the effects of alternative tax regimes in terms of revenues, and analyse effects across sectors. Albania is currently working in collaboration with the IMF to develop new models for VAT, PIT and CIT. These models are still being tested.

Albania is the only WB economy that implements a **tax expenditure report**. In 2019, the economy instigated a regular and systematic tax expenditure report for the first time. This report will be published every two years. Previously, a limited set of basic tax expenditure information was published alongside the annual budget. The introduction of a regular tax expenditure report in Albania should help the economy to manage efficiently its new set of investment incentives and other tax expenditures. This reform is welcome, and brings Albania's public finance management system closer to international best practice.

#### *Sub-dimension 4.2: Tax administration*

With regards to the **functions and organisation** of the tax administration, direct and indirect taxes are collected and administered by the General Tax Directorate (GTD), including VAT for domestic transactions

and social and health security contributions. Customs duties and VAT on imports are collected and administered by the General Directorate of Customs. Both institutions are part of the Central Tax Administration of Albania. The Central Tax Administration mixes a functions and taxpayer approach. The GTD, as well as the regional directorates, are organised on a functional basis. There is also a Large Taxpayer Directorate. Regular training courses are available for employees of the tax administration, notably through the Albanian School of Public Administration.

Concerning **compliance assessment and risk management**, tax audits are carried out by the Regional Directorate of Taxation through their audit division. Taxpayers are selected for audits through a risk-based approach. A monthly audit plan is established, 70% of which is based on recommendations from an IT system of risk modules. The remaining 30% are determined from proposals by the regional directorates. Three types of audits are carried out: 1) comprehensive audits (covering all types of tax and fiscal years since the last audit); 2) fiscal visits (focused on a single type of tax and fiscal year); and 3) field verifications (focused on issues such as registration of taxpayers or use of non-cash register for businesses). Albania has a comprehensive regulatory framework guaranteeing taxpayer rights during tax audits, including the right to appeal, the right to data confidentiality and the right to representation. Within its tax administration, the economy has created a special unit that monitors audit reports vis-à-vis its implementation plan. The Albanian tax administration uses segmentation models by sectors. It is currently designing sectoral plans for the bar/restaurant and construction industries. In January 2021, Albania launched a new fiscalisation process that aims at raising additional revenues and curbing tax fraud without raising any new taxes. By using a mobile application, the new system will enable each citizen to verify immediately if an invoice issued by a business is reported to the tax administration. Once the tax administration receives the information, it can verify the registration of the invoice and take action accordingly.

The **independence and transparency** of Albania's tax administration could be strengthened. While a Law on Tax Procedures defines the functioning and organisation of the tax administration, the administration lacks an independent management board. This might be one area for reform. The GTD's operational budget depends on annual budgeting procedures. A legal framework provides sanctions for misconduct by tax administration employees. The director of the GTD prepares an annual transparency programme.

In Albania, **electronic filing** is available for all taxpayers and is mandatory for all taxes. Tax filing procedures have been simplified and streamlined following a 2016 reform. This reform focused on compliance issues and building a stable declaration system for companies. Among other initiatives, filing guidelines are now attached to tax returns. The software needed for tax compliance is available for free.

Various **taxpayer services** are offered by the GTD and its regional directorates, including online access to information, electronic communications and in-person inquiries. Taxpayer services are accessible to all taxpayers across the economy through the 14 regional directorates, each equipped with a Taxpayers Services Unit. The Taxpayers Services Unit in the GTD monitors the effectiveness of the work carried out by regional directorates. Albania's tax legislation also provides for a Tax Advocate, who protects the rights of taxpayers.

#### *Sub-dimension 4.3: International co-operation*

Similar to other WB6 economies, Albania has become increasingly involved in the international tax dialogue and reforms since the last report. It became a member of the Inclusive Framework on BEPS (Base Erosion and Profit Shifting) in August 2019, which led to several initiatives. The Harmful Practices Secretariat is currently reviewing whether Albania's tax system is aligned with the Action 5 minimum standard. With the ratification of the Multilateral Convention (MLI) in September 2020, work on treaty abuse and mutual agreement procedures is scheduled to start shortly. Albania has also signed the Convention on Mutual Administrative Assistance in Tax Matters in 2013. With regards to exchange of information, Albania has been subjected to a peer review for its exchange of information on request (EOIR), carried out by the OECD Global Forum assessment team. Its overall rating is "largely compliant". Albania introduced

a law in February 2020 on the automatic exchange of information (AEOI); the first exchanges should occur in the near future. Finally, Albania has transfer pricing legislation in force and its legislation is in line with the OECD Guidelines on Transfer Pricing.

Albania has carried out some initiatives in the field of **digital taxation**, but would benefit from deeper involvement. With regards to VAT, Albania introduced international VAT/GST guidelines in 2014 (the first to do so of the WB6). Albania levies VAT on cross-border digital services and follows the destination principle. Concerning taxation of income from digital platforms, this income is not currently included in the PIT tax base. However, Albania's tax administration has requested from Airbnb the list of individuals who rent their real estate through their platform. Once this information is obtained, it will be cross-referenced with the individuals' tax returns, which should allow it to be included in the PIT tax base in the future. With regards to the OECD's Tax Challenges Arising from Digitalisation project, Albania might be less affected by Pillar 2 and its global minimum tax than other WB6 economies, as its top CIT rate is the highest in the region (along with Serbia). However, Albania's generous profit-based incentives might bring effective rates on corporate profits below the expected minimum rate. If a consensus is reached on a global minimum tax, Albania could be faced with the choice of either redesigning its set of investment incentives or risk forgoing tax revenues to foreign jurisdictions. Albania is encouraged to carefully assess its position on this issue and draft an action plan if consensus is reached among members of the Inclusive Framework on BEPS.

Regional co-operation is relatively modest in Albania. It has signed a memorandum of understanding on tax matters with Kosovo, focused on training programmes for tax administration employees and co-operation over tax fraud. Overall, Albania has signed 42 conventions for the prevention of double taxation, including with all other WB6 economy.

### ***The way forward for tax policy***

To enhance Albania's tax policy framework and achieve their objectives, policy makers may wish to:

- **Continue to support the economy in light of COVID-19.** Albania has implemented a comprehensive set of measures to mitigate the effects of COVID-19. The economy may wish to continue its efforts, while focusing on measures that could spark an economic recovery.
- **Increase tax revenues while maintaining a balanced tax mix.** Albania's 2019 tax-to-GDP ratio remains below regional and international levels. Scope exists to increase tax revenues. This increase should maintain the balance in Albania's tax mix, which resembles the balance found in OECD countries.
- **Continue to strengthen capacities to measure and report tax expenditures.** Albania's new regular tax expenditure report reform is welcomed. It should be maintained and possibly deepened, perhaps by issuing annual reports instead of every two years.
- **Evaluate the scope to broaden the VAT base by reducing the goods and services taxed at the reduced VAT rate.** VAT reduced rates are an ineffective way to support those on low incomes, while those with higher incomes benefit more from the reduced rate. Targeted cash support, reduced employee SSC rates and progressive PIT rates are better tools to support low-income households and make the tax system more progressive.
- **Expand the use of micro-simulation models to forecast tax revenues and to assess the distributive effects of tax reforms.** In 2019, Albania implemented several micro-simulation models and is currently working on new models with the IMF and the World Bank. These initiatives should be strengthened and Albania is encouraged to make wider use of micro-simulation models in the future.
- **Weigh the advantages and disadvantages of the differentiated taxation of capital and labour income.** Taxing capital and labour income differently allows for more targeted tax policies. However, it may create distortive spillover effects and encourage business owners to incorporate and receive

income in the form of capital rather than labour income. Albania may wish to assess its position on this issue.

- **Maintain the balanced taxation of labour income between SSCs and PIT.** Most WB economies levy high SSC and low PIT rates, which negatively impacts labour market outcomes and discourages the registration of informal businesses and workers. Albania's more balanced taxation of labour income provides better incentives for people to enter the formal economy.
- **Prepare an action plan in the case of consensus on Pillar's 2 global minimum tax amongst members of the OECD/G20 Inclusive Framework on BEPS.** The global minimum tax will likely be lower than the current statutory CIT rate in Albania. However, Albania's generous profit-based incentives could lower effective tax rates on corporate income to a level below the expected global minimum rate. Albania may need to choose whether to redesign its investment tax incentives or risk losing tax revenues to foreign jurisdictions. The economy should evaluate its position on this issue and prepare an action plan accordingly.
- **Establish an independent management board for the tax administration.** Independence and transparency are important features of a well-developed tax administration, if the tax system is to be seen as a legitimate public authority with the necessary safeguards in place when collecting money from taxpayers. The policy to establish an independent management board should be supported with strong procedural safeguards to guarantee its independence.
- **Continue to engage with the international tax community and implement international best practice.** Since the last CO report, Albania has strengthened its involvement in international tax matters; this approach is welcome.
- **Carry out a cost-benefit analysis on the merits of a worldwide taxation system for resident corporations.** For small open economies such as Albania, worldwide taxation may entail high administrative costs without raising significant revenues.
- **Foster co-operation and co-ordination on common tax issues within the WB region.** Albania shares common challenges with other WB economies; greater collaboration might be favourable for all economies involved. Areas such as tax compliance, training for tax administration staff and exchange of information would greatly benefit from a co-ordinated regional approach.

## Competition policy (Dimension 5)

### Introduction

Albania's legal and institutional framework for competition shows a remarkable degree of alignment with international good practice.

Unlike the other dimensions, where indicators are allocated a score from one to five, the Competition policy dimension assesses four policy areas (i.e., scope of action, anti-competitive behaviour, probity of investigation and advocacy, plus a new area: implementation). Scoring is based on yes/no (coded as 1/0) answers to the 71 questions in the questionnaire administered by the OECD. Where a response to a question is yes (coded as 1), then we refer to this as an adopted criterion. Each of the four policy areas has a different number of possible criteria that can be stated as having been adopted. Each policy area is assessed through data collected from the questionnaire indicators and by measuring the number of criteria adopted. The new fifth policy area (implementation) is not scored, but is a quantitative analysis of how many competition decisions have been adopted by the competition authorities. The anti-competitive behaviour and implementation policy areas are discussed together below.

Figure 20.9 reports the number of positive (alignment with good practices) and negative answers to a questionnaire on alignment administered by the OECD for each of the four policy areas listed.

**Figure 20.9. Albania's legal and institutional competition framework**

Source: Based on the OECD assessment.

### State of play and key developments

#### *Sub-dimension 5.1: Scope of action*

Albania's Law no. 9121/2003 on Competition Protection and the implementing secondary legal framework are largely aligned with the relevant provisions of the Treaty on the Functioning of the European Union, namely Article 101 on restrictive agreements and Article 102 on abuses of dominant position, as well as the related EU regulations and European Commission guidelines.

The Law on Competition Protection also provides for prior control of mergers, in line with the EU Merger Regulation. In 2018, the Albanian Competition Authority (ACA) also approved guidelines on restrictions directly related and necessary to concentrations, implementing the related European Commission Notice of 2005.

The ACA is an operationally independent authority, responsible for implementing the Law on Competition Protection. It reports to the Albanian Parliament, which appoints the ACA chair and its four board members.

The administrative capacity of the ACA is above average in the WB region, both in terms of budget and number of staff. Furthermore, the level of staff expertise has been strengthened over the last few years through training courses.

In 2020 the Competition Commission approved the guideline “To empower the competition authority to be a more effective enforcer of the law no. 9121/2003 “On competition protection”, as amended “and to ensure the proper functioning of the market”. This is approximated with the EU ECN+ Directive (EU) 2019/1 of the European Parliament and of the Council of 11 December 2018, to empower the competition authorities of Member States to be more effective enforcers and to ensure the proper functioning of the internal market.

Chapter VII “Mutual Assistance” and Chapter VIII “Limitation Periods” of the ECN+ Directive, that deal with co-operation with homologue competition authorities of EU Member States, will enter into force and be implemented when Albania joins the EU as a member with full rights.

Albania is closely aligned with international best practice for the scope of action of its competition authorities and their powers to fight anticompetitive behaviour. As shown in Figure 20.9, discrepancies with good practice are almost negligible for this policy area.

The decision-making body of the ACA is the commission, which consists of a chairperson and four members elected by parliament, while the secretariat is the executive body, managed by the Secretary General. Following a structural reorganisation in 2017 approved by the Albanian Parliament, employees are now divided into six directorates: Production Markets Surveillance, Non-Production/Services Markets Surveillance, Market Analysis and Methodologies, Legal and Judicial Affairs, Integration and Communication, and Support Services. The total number of staff has been steadily increasing between 2015 (37 employees) and 2019 (46 employees). This figure compares well with other OECD and non-OECD countries listed in the OECD CompStats database.<sup>45</sup> For example, in 2019 the average total staff of the 15 competition authorities in small economies (with a population lower than 7.5 million) was 114, of whom 43 were working on competition.

Parliament approves the ACA’s annual budget, which has grown from approximately EUR 470 000 in 2015 to EUR 645 000 in 2018 and EUR 628 000 in 2019. However, it is very low by international standards. In 2019 the average financial resources of the 15 competition authorities in the small economies listed in the OECD CompStats database were EUR 5.4 million.

The Albanian Law on Competition Protection ensures competitive neutrality. In particular, the **competences** of the ACA encompass any national or foreign undertakings and associations of undertakings that have or may have an influence on the markets in the territory of the Republic of Albania. These include public undertakings and undertakings entrusted with services of general economic interest, as long as their activity is not obstructed.

The ACA has appropriate **powers to investigate** and **powers to sanction** possible anti-trust infringements, e.g. restrictive horizontal and vertical agreements and exclusionary or exploitative practices by dominant firms. The authority can impose cease and desist orders and remedies on firms that have committed anti-trust infringements. It can also adopt interim measures if the alleged competition breach poses a risk of irreparable damage on its initiative or following a request by the parties. In addition, it can accept commitments offered by the parties to remove the competition concerns and close the investigation.

The ACA can compel investigated firms and third parties to provide relevant information and can perform unannounced inspections of parties’ premises. The assessment of alleged anti-competitive conduct follows a thorough scrutiny of the evidence collected, which typically includes an economic analysis of the competitive effects of vertical agreements or possible exclusionary conducts. The authority has the power to impose fines of up to 10% of the aggregate turnover of the undertaking.

The Law on Competition Protection also allows for a leniency programme, which grants total or partial immunity from sanctions to firms that report to the authority the existence of the agreement and submits

appropriate evidence. The law also provides for *ex ante* control of **mergers**, following the principles of the EU Merger Regulation. The ACA must prohibit concentrations that significantly restrict effective competition, in particular as a result of creating or strengthening a dominant position. It can authorise the transaction subject to structural and/or behavioural remedies – i.e. divestiture of assets and/or obligations to act or refrain from acting in a certain way – suitable for addressing the competition concerns. The assessment of notified mergers must follow a thorough scrutiny of the evidence, which includes an economic analysis of the restrictive effects and of possible efficiencies stemming from the concentration. In the course of the investigation, the ACA can compel merging firms and third parties to provide relevant information and may perform unannounced inspections of parties' premises.

Regarding **private enforcement**, individuals, firms and consumers – either collectively or through consumer associations – can bring a legal action to seek damages from firms that have committed anti-trust infringements.

#### *Sub-dimensions 5.2 and 5.5: Anti-competitive behaviour and implementation*

The anti-competitive behaviour and implementation policy areas together gauge the use of powers and resources in terms of decisions adopted and fines imposed for horizontal agreements, vertical agreements and exclusionary conduct. They also explore the actual activity of the competition authority on reviewing mergers. Over the last five years the ACA has taken 34 **horizontal agreement** (cartel) decisions and 45 infringement decisions concerning abuse of dominance. It has not conducted any cases on **vertical agreements** (Figure 20.10).

**Figure 20.10. Competition decisions in Albania (2015-19)**

Source: Data provided by the authorities.

The cases conducted by the ACA have mostly related to the agro-food and the energy sectors, insurance, liquid gas, telecommunication and ports, as well as bid rigging in public procurement. Most of them were opened *ex officio* by the authority. No leniency application has been submitted to the authority.

The total amount of fines imposed on participants in anti-competitive agreements over the last five years is EUR 2.2 million. In 2015-17 no fines were imposed on infringers. In 2018 the ACA sanctioned seven undertakings: five undertakings that participated in prohibited agreements and two undertakings for abuse of dominant position (**exclusionary conduct**). In 2020 the Competition Commission took 11 decisions with a total fine amount of EUR 16 256.

Despite the positive increase in sanctions, it should be highlighted that the average annual fines for cartel infringers in 2015-19 for the 15 competition authorities in smaller jurisdictions that participated in CompStats was EUR 2.7 million.

The Albanian Competition Authority performed an appreciable number of unannounced inspections in 2019: 5 cases in 2019, 7 cases in 2018, 5 cases in 2017, 5 cases in 2016 and 6 cases in 2015.

The **merger** notifications received by ACA range from a minimum of 11 in 2015 to a maximum of 30 in 2018. In 2019, the ACA adopted 24 merger decisions. Approximately 40% of the annual merger notifications received by the ACA refer to extra-territorial transactions. The sectors affected by the most relevant transactions were mobile telecom services and banking and insurance.

All mergers were unconditionally cleared in the so-called Phase I (i.e., without the need for an in-depth review in Phase II), except one in the banking sector, which was approved with remedies in 2019 (Figure 20.10). Another transaction was eventually cleared with conditions and obligations in 2020 (Decision of Competition Commission no. 676, dated 07.02.2020 on the authorisation with conditions and obligations, on the acquisition of control of ABCom SHPK from Vodafone Albania SHA).

### *Sub-dimension 5.3: Probity of investigation*

The Albanian Competition Authority is a public, **independent** institution established in 2004, as foreseen by the Law on Competition Protection. It is **accountable** to the Albanian Parliament, to which it regularly submits an annual activity report; in turn, every year parliament issues a resolution on the activity of the competition authority, in which it recommends the main areas of work and sectors of the economy that the ACA should focus on in the following year.

In terms of **procedural fairness**, the ACA must give notice of its decision to open formal proceedings in the Authority Official Bulletin. This notice must state the purpose of the investigation and the parties concerned, while encouraging interested third parties to come forward if they wish to take part in the investigation. All final decisions regarding alleged competition infringements and mergers are published.

Prior to the adoption of a final anti-trust decision, the ACA must inform the party of the relevant facts, evidence and other elements on which the decision is based, and enable the party to submit a defence. The parties have the right to be heard before the commission takes a final decision. At every stage of the proceedings, the parties may consult with the case team.

Likewise, if the ACA intends to prohibit a merger transaction, it must inform the merging parties about the evidence and conclusions on which the decision would be based and enable them to submit their remarks and possible remedies. The parties can participate in the process that leads to the determination of conditions and obligations and can consult with the ACA during the entire procedure.

The authority's decisions can be appealed before the Administrative Court of Tirana within 30 days of the date of notification. The appeal does not have suspensory effect on the decision. The judgements of the Administrative Court of First Instance can be further appealed before the Administrative Court of Appeal.

Every year, the ACA issues its annual report and the annual bulletin of decision, which contains all the decisions taken during the year. Furthermore, the ACA has adopted and published several regulations and guidelines, concerning *inter alia* the investigative procedure, the procedure for concentrations of undertakings, the assessment of dominant position and abuse of dominant position, the assessment of horizontal and vertical agreements and the calculation of fines, which is in full alignment with the EU notice on fines and EU guidelines on fines.

### *Sub-dimension 5.4: Advocacy*

The ACA can formulate opinions on national or local laws or regulations that affect or may affect competition. The competition issues analysed by the authority include restrictions on trading and market access, granting exclusive rights and imposing uniform practices in sales terms and conditions. The authority must assess the degree of restriction or prevention of competition brought by draft normative acts.

The ACA can also assess possible barriers to competition in economic and administrative regulations aimed at pursuing general economic interests. In performing this duty, the authority must co-operate with regulatory institutions and may issue appropriate recommendations.

Pursuant to a specific article of the Albanian Law on Competition Protection, public institutions are obliged to submit their normative acts to the ACA if competition assessment is needed. Since not all public institutions were complying with this provision, in 2015 the ACA issued a decision on the obligation to obtain a preliminary assessment by the Competition Authority when granting exclusive or special rights through concessions.

The legal department of the ACA is entrusted with the analysis and assessment of normative acts. In complex cases, a working group is created. The procedure followed by the ACA to carry out its assessment is illustrated in the guidelines Assessment of the Consequences of Legislation on Competition, which also provide a concrete example.

The authority issued 25 formal opinions in 2019 – a substantial increase on 17 in 2018 and even lower figures in previous years. The sectors addressed by recommendations on draft regulations include water, energy, media and telecommunications. Recommendations provided by the ACA were eventually implemented by the Bank of Albania, the Water and the Energy Regulatory Body, the Ministry of Infrastructure and Energy and the Ministry of Health. In 2020, the authority issued 37 formal opinions which included sectors such as energy, water, media and telecommunications, insurance etc.

The ACA co-operates closely with the Public Procurement Agency and exchanges views on investigations into bid rigging. The ACA has also given recommendations to the Public Procurement Agency on the prevention and detection of bid rigging. In 2011, the authority issued a guideline on Fighting Prohibited Agreements in Bids in Public Procurement (based on the OECD guidelines) and a leaflet, Hints of prohibited agreements in bids in public procurement, which are available on its website. In 2019, the ACA signed a memorandum of understanding with the Public Procurement Agency in order to facilitate co-operation between both institutions to protect competition in public procurement through exchange of information, as well as joint meetings and training, etc.

The ACA can conduct a general inquiry in any sector of the economy, on its own initiative or following a request by parliament or other regulators, if price patterns or other circumstances suggest that competition might be restricted or distorted. In the period 2015-19, the ACA concluded an average of four general inquiries a year, addressing key sectors such as higher education, banking, healthcare and liberal professions.

In 2019 and 2020 ACA concluded the following general investigations:

- In the area of liberal professions such as public notaries, attorneys and real estate evaluators in which it made some recommendations to the Ministry of Justice, National Attorney Office and National Public Notary Office related to the profession of attorney and public notary; and to the Ministry of Infrastructure and Energy and to the Real Estate Association, for real estate evaluators. It also made some recommendations to second-level banks on transparent and competitive procedures that should be followed in selecting real estate evaluators.
- In the higher education sector, it made some recommendations to the Ministry of Education, Sport and Youth, National Institute of Statistics, Public and Private Higher Education Institutions, and also gave some conditions and obligations to private higher education institutions.
- In the banking sector, the ACA concluded an investigation, resulting in some recommendations for the second-level banks under investigation.

Furthermore, the ACA organises a number of workshops, training courses, campaigns, and events for consumers, companies and ministries aimed at developing a competition culture. The staff of the ACA have benefited from a series of training courses organised with the European Commission through the EU

Technical Assistance and Information Exchange instrument (TAIEX); IPA Twinning Project (2019-2020) on Further Strengthening the Competition Authority's capacities to protect the free and effective competition in the market, funded by the European Union in co-operation with the Spanish National Commission of Markets and Competition (CNMC); as well as other international projects, including the EBRD Project (2019-2020) on Capacity Building for the Albanian Competition Authority (ACA) - Promoting Advocacy of Competition and Strengthening the Institutional Capacities of the Albanian Competition Authority, in co-operation with the consultancy firm Lear.

### ***The way forward for competition policy***

The ACA demonstrates good enforcement capacity and an appreciable record of formal proceedings tackling prohibited agreements and abuses of dominant position. In addition, the ACA has engaged in a set of advocacy initiatives to promote competition principles and foster competition culture. Nonetheless, there is still scope for improvement, particularly on prioritising competition enforcement and increasing the sanctions for cartels. Furthermore, the challenges brought about by the COVID-19 pandemic suggest the need for some further recommendations aimed at expanding the role that the ACA can play to contribute to a quick economic recovery:

- **Provide the ACA with adequate financial resources, in line with international standards.** Despite an increase over the last few years, a substantial growth in the budget appears necessary to enable the ACA to further develop its potential for competition enforcement and advocacy. In fact, adequate financial resources are crucial not only to recruit but also to retain and motivate officials with high competition skills (see Box 20.8 for an example from Italy).
- **Give priority to boosting cartel enforcement and impose high fines.** Cartels are the most clear-cut and undisputedly harmful competition infringements and affect every economy. The efforts of the ACA should be focused on detecting cartels and imposing heavy fines on infringers, in order to deliver a strong message that firms that engage in collusion risk being severely punished. Fines that exceed the illicit gains can deter offences even when the probability of paying a fine is low. The concern about fines is also a key driver of leniency applications, fostering the effectiveness of the leniency programme and further boosting detection. The ACA might engage in expanding its detection skills, for example by further strengthening the fight against bid rigging (see point below on public procurement).
- **Pay specific attention to public procurement, particularly during the COVID-19 crisis.** Public procurement is a key sphere of action both for cartel enforcement and for competition advocacy. Bid rigging results in significant harm for public budget and taxpayers, dampening of innovation and inefficiencies. The ACA has a fruitful co-operation in place with the Public Procurement Agency and the publication in 2011 of guidelines and a leaflet based on the OECD Guidelines on Fighting Bid Rigging in Public Procurement (OECD, 2009<sup>[77]</sup>), was a valuable initiative to reduce the risks of bid rigging through careful design of the procurement process and to detect bid-rigging conspiracies during the procurement process. Figure 20.11 shows how co-operation between competition and procurement authorities can help detect and avoid bid rigging. Albania's efforts in this domain could be repeated, particularly in times of crisis and emergency procurement. The OECD can also provide assistance through a project aimed at assessing the main rules governing procurement of public works as well as procurement practices of major public buyers. It can provide recommendations for designing competitive procurement and fighting bid rigging in accordance with international good practices. It can also offer training to both competition and public procurement officials based on the Guidelines on Fighting Bid Rigging in Public Procurement.

Figure 20.11. How co-operation between competition and procurement authorities could work

- Advocate strongly for competitive neutrality, to make sure that all enterprises face the same set of rules, irrespective of their ownership or nationality.** Competitive neutrality occurs where no entity operating in an economic market is subject to undue competitive advantages or disadvantages. In other words, it is a framework within which all enterprises, irrespective of their ownership (state-owned or privately owned) or nationality (domestic or foreign). In most jurisdictions, the state has a dual role as policy maker/sector regulator and supplier or purchaser of goods and services. Consequently, in markets open to competition the state also acts as a market participant and interacts with private businesses, most often indirectly, through SOEs. Governments may be tempted to grant SOEs certain advantages, e.g. privileged market position, soft loans, outright subsidies, regulatory exemptions or tax benefits. Given the importance of SOEs in Albania and the increased role of the state in the economy that will likely result from the COVID-19 crisis, the ACA can make a decisive contribution to promoting competitive neutrality. The authority might need to discourage the government from granting selective aid to SOEs and resist political pressure to adopt a more lenient approach when investigating SOEs' conduct.
- Expand international co-operation and training.** In the face of increasingly complex anti-trust issues and the frequent cross-border nature of competition infringements, the management and staff of the ACA should have frequent opportunities to meet and participate in policy discussions. International organisations like the OECD, the International Competition Network (ICN) and United Nations Conference on Trade and Development (UNCTAD) offer valuable opportunities to this end. The OECD-GVH Regional Centre for Competition in Budapest also provides an ideal forum for capacity building and sharing of good practices with colleagues from other jurisdictions, focusing on the specific challenges of Eastern European and Central Asian countries. The ACA is already a regular participant in the centre's events and would benefit from actively continuing.

### Box 20.8. Financial independence for the Italian Competition Authority

Until 2012, the financing of the Italian Competition Authority (AGCM) was based on two main sources: annual funding from the state and fees paid by companies subject to merger notification requirements.

Legislative Decree no. 1/2012 modified the AGCM's funding system, which is now based on mandatory contributions imposed on companies incorporated in Italy whose turnover exceeds a threshold of EUR 50 million. The revenues from these contributions replace all previous forms of funding. The level of contribution, originally fixed at 0.06 per thousand, has been gradually lowered by the AGCM to 0.055 per thousand. The authority's financial statements have to be approved by 30 April of the following year, and are subject to auditing by the Court of Auditors.

This funding system can be regarded as an indirect recognition of the positive role played by AGCM in supporting a healthy and level competition field, which justifies the imposition of a small contribution on the largest businesses incorporated in Italy.

Importantly, the previous funding system entailed the risk of possible fluctuations in the amount of the annual budget, due to unpredictability in the number of notified mergers and levels of state funding. The new system shelters the AGCM from that risk, thus allowing for more stable and forward-looking recruitment planning.

Source: (OECD, 2016<sup>[78]</sup>), Independence of competition authorities: from designs to practices, [https://one.oecd.org/document/DAF/COMP/GF\(2016\)5/en/pdf](https://one.oecd.org/document/DAF/COMP/GF(2016)5/en/pdf).

## State-owned enterprises (Dimension 6)

### Introduction

State ownership responsibilities for Albania's approximately 78 central SOEs are exercised by the Ministry of Finance and Economy as well as several other line ministries and central government bodies. These dispersed ownership responsibilities are not subject to a common ownership policy. The resulting absence of clear performance expectations from the state contributes to corporate inefficiencies, including many insolvent SOEs, leading to a score on the lower end of the spectrum in the sub-dimension for SOE efficiency and governance (Table 20.10). Albanian SOEs are subject to sound financial disclosure requirements, including a mandate for external audits of their financial statements, resulting in a slightly above-average score for SOE reporting practices. Albania achieves an average score for ensuring a level playing field between state-owned and private companies (sub-dimension 6.3), reflecting the fact that most SOEs are subject to the same laws and regulations as private competitors, but that competitive distortions still exist. These are created, for example, by structural inefficiencies that lead many SOEs to underperform. Albania's performance in the state-owned enterprise dimension has not changed significantly since the last CO 2018 (Figure 20.1). Although the Ministry of Finance and Economy has proposed establishing a central ownership agency, which would have the potential to strengthen SOEs' ownership arrangements, there is currently no consensus within the government on the need for such an entity.

**Table 20.10. Albania's scores for state-owned enterprises**

Dimension	Sub-dimension	Albania	WB6 average
<b>State-owned enterprises dimension</b>	Sub-dimension 6.1: Efficiency and performance through improved governance	1.6	2.2
	Sub-dimension 6.2: Transparency and accountability practices	2.8	3.0
	Sub-dimension 6.3: Ensuring a level playing field	2.8	2.8
	Sub-dimension 6.4: Reforming and privatising state-owned enterprises	n.a.	n.a.
<b>Albania's overall score</b>		<b>2.3</b>	<b>2.6</b>

Note: For comparability with the previous assessment, the new sub-dimension (6.4) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 6.1: Efficiency and performance through improved governance*

Albania's state-owned enterprise portfolio consists of approximately 78 SOEs held by the central level of government, and an additional 73 companies – mainly water supply and sewage companies and local football clubs – owned by municipalities.<sup>46</sup> Of the 78 SOEs held by the central government (the focus of this assessment), 36 are under the sole purview of the Ministry of Finance and Economy. The remaining 42 are overseen by sectoral line ministries, including the Ministry of Energy and Infrastructure which oversees Albania's four economically important state-owned energy companies as well as the state railway company; and the Ministry of Culture, which oversees Alba Films. While the Ministry of Finance and Economy, in undertaking its state budgetary role, is legally responsible for state ownership rights in all SOEs, the administration of 42 SOEs is in practice delegated to line ministries. Some ownership decisions, notably board nominations, in these 42 SOEs are subject to some degree of inter-ministerial co-ordination. By international comparison, the number of SOEs in Albania is overstated, since it includes about 30 entities that are either public agencies, or entities such as universities and hospitals, that in many other countries would not be corporatised and simply operate as entities of the general government. The Albanian state also holds minority shares in 28 companies.

Concerning their sectoral distribution, central government SOEs in Albania are particularly concentrated in transportation (25% of all SOEs by employment and 13% by number of enterprises), electricity and gas (39% by employment and 4% by number of enterprises) and the primary sector (9% by employment and 4% by number of enterprises) (Figure 20.12 and Figure 20.13). The state also owns several real estate and manufacturing companies, accounting, respectively, for 23% and 11% of all SOEs. At the sub-national level of government, 58 of Albania's 73 municipal SOEs are water supply and sewage companies, while the remaining 15 are local football clubs wholly owned by municipal governments. Additionally, municipal governments hold minority shares in 12 football clubs that are majority owned by private investors.

**Figure 20.12. Sectoral distribution of SOEs by number of enterprises**

Note: The relatively large proportion of "other activities" SOEs comprises enterprises operating in the following sectors: accommodation and food services; professional, scientific and technical activities; administrative and support services; public administration and defence; education; and arts, entertainment and recreation.

Source: Calculations based on figures provided by the Albanian authorities concerning enterprises majority or fully owned by the central level of government.

**Figure 20.13. Sectoral distribution of SOEs by employment**

Source: Calculations based on figures provided by the Albanian authorities concerning enterprises majority or fully owned by the central level of government.

Some illustrative examples of individual SOEs operating in Albania include, in the primary sector: the petroleum production company *Alb Petrol*; in the electricity and gas sector: Electricity Corporation of

Albania (ECA), Electricity Distributor of Albania (EDA), Transmission System Operator (TSO) and the gas transmission company Albgaz; in the transportation sector: Albanian Railways, Albanian Post, Albanian Air and the Airport “Mother Theresa” Tirana, as well as a few port operator companies. Some less commercially important SOEs (some of which are either not operational or are undergoing prolonged liquidation procedures) also include, in the primary sector: the copper ore extraction company *Alb Copper Tiranë* and the chromium ore extraction company *Alb Chrom Tiranë*, and in the manufacturing sector: the wooden furniture manufacturing company Furniture Manufacture Tirana and Tobacco Producer of Albania located in the city of Shkodër.<sup>47</sup> While many of Albania’s sectors have been liberalised since the early 1990s, SOEs remain dominant in the energy sector: approximately three-quarters of national electricity consumption is provided by SOEs (European Commission, 2019<sub>[79]</sub>). Concerning SOEs’ general economic importance, central government SOEs account for an estimated 1.6% of total national employment.<sup>48</sup> A 2019 IMF report estimated that SOEs at all levels of government account for between 6 and 7% of total national employment (IMF, 2019<sub>[80]</sub>).<sup>49</sup>

The Albanian authorities do not gather aggregate financial performance data on SOEs, making it difficult to draw general conclusions about their efficiency. However, a 2019 review of the 36 SOEs under the Ministry of Finance and Economy’s purview undertaken by a government working group, found that of the 36 SOEs in the ministry’s portfolio, 12 enterprises no longer pursued activities in accordance with their original objectives and 8 were in the process of being liquidated (European Commission, 2019<sub>[79]</sub>). The Albanian authorities also indicated that several SOEs were “inactive”. This points to significant structural issues and inefficiencies in the state’s SOE portfolio. As mentioned earlier, the state also holds minority shares in 28 companies, often pointing to failed or stalled privatisations for which the rationale for continued state ownership is not clear. Investments in the state-owned energy sector have historically been insufficient and efforts to liberalise the sector have not been entirely successful (European Commission, 2019<sub>[79]</sub>).

Concerning the **clarification of ownership policy and rationales**, the Albanian authorities have not developed an overarching state ownership policy defining the objectives of state ownership or describing how ministries should exercise their shareholding function. Line ministries do have policies concerning the functioning of the SOEs under their remit, but these policies do not clearly stipulate the basic rationales for maintaining enterprises in public ownership or what the state expects in terms of the performance of the enterprises in its portfolio. In the absence of clearly expressed reasons and objectives for state ownership, ownership practices inevitably vary across the public administration. Additionally, the authorities report that the objectives of individual SOEs are decided upon by their general managers, subject to approval by responsible line ministries, which, in the absence of overarching guidelines, points to an ad hoc system of objective-setting with an unclear division of responsibilities between the state as owner, SOE boards and management. The Albanian authorities reported, in the context of this assessment, that the rationales for state ownership include: supporting national economic and strategic interests; ensuring continued national ownership of enterprises; supplying specific public goods or services; and supporting social objectives. There is, however, no evidence that these rationales are clearly set out in a policy or legislative document. The possibility that “social objectives” include activities that are not necessarily in the interest of corporate efficiency, or even in the public interest, introduces some risk of SOE under-performance.

In the context of its predominantly decentralised ownership arrangements, Albania has not established a co-ordinating body to **professionalise state ownership** practices and introduce consistency across ownership ministries. In many cases the division of responsibilities for state ownership decisions is not clear in the applicable legislation. Under the Law on the Corporatisation of State Enterprises, the Council of Ministers is accorded certain explicit decision-making responsibilities concerning SOEs, such as defining board remuneration and approving SOEs’ articles of association, as well as the possibility to reassign its responsibilities to line ministries. The law further establishes that the Ministry of Finance and Economy is primarily responsible for exercising the state’s ownership rights in SOEs and that sectoral line ministries are granted “administrative” roles, but there is no clear overview of how these arrangements should

translate into practice and the Albanian authorities report that the law does not sufficiently define the differences between the two roles (ownership and administrative roles).

There are nonetheless some elements in place to introduce a degree of harmonisation in certain ownership decisions, for example the fact that the Ministry of Finance and Economy nominates one-third of board members of SOEs that are under the administrative purview of other ministries, who nominate the remaining two-thirds. Decisions by the Council of Ministers, for example concerning the composition of SOE boards, also introduce some consistency in ownership decisions. Finally, a concern that is usually associated with decentralised ownership arrangements – namely, an insufficient separation of ownership and regulatory roles – is partly remediated by the fact that ownership ministries have established SOE monitoring units that are separate from their sectoral policy-making units. This helps clarify institutional division of functions.

Albania has taken some basic initial steps to establish a **board nomination framework**, notably through the aforementioned Council of Ministers' decision on the composition and competencies of SOE boards of directors. This policy document establishes that all SOEs must have boards of directors – with six members for strategic SOEs and three members for non-strategic, small and medium-sized SOEs – and accords line ministries and the Ministry of Finance and Economy shared responsibilities for nominating their members. However, there is limited evidence that the process relies on transparent and merit-based appointment criteria, leading to a high risk of political influence in appointing board members.

Albania has not taken any significant measures to **promote independent and professional boards** in SOEs. In general, SOEs are perceived to operate as arms of their ownership ministries, who exercise a strong role in company oversight, despite the fact that the company law accords boards authority over certain corporate decision making. In practice, SOE boards are often staffed by public officials, which include in some cases politically affiliated individuals such as vice-ministers or advisors to ministers, introducing the risk that corporate decision making is influenced by political concerns. Experts interviewed for this assessment indicated that remuneration for SOE board service (which can reach up to four times that of a civil servant salary) can make multiple board positions attractive for civil servants and that, in some cases, public officials serve on many SOE boards. This could make it difficult for these board members to devote sufficient time to their board duties. SOE board and management positions are often perceived to be accorded to individuals based on their personal and/or political affiliations, rather than their professional qualifications.<sup>50</sup> Together, these factors contribute to the perception that SOE boards in Albania do not have sufficient political independence or professional qualifications to adequately fulfill their corporate board duties.

Concerning the legal framework for boards, many supervisory board decisions must subsequently be approved by the General Assembly (i.e. the state shareholder), meaning that boards do not really fulfill the standard role of corporate decision-making entities, at least when compared to stock-exchange listed companies. On the contrary, supervisory boards mainly exist to ensure that decisions of the General Assembly are properly implemented by SOE management. All SOE boards in Albania are two-tier structures: the top-tier supervisory board (comprising only non-executive members) and the lower tier administrative board, which in SOEs is usually composed of a single person “administrator”. Concerning board member duties and liabilities, the company law, which is applicable to SOEs by virtue of their status as joint-stock or limited liability companies, does establish that board members must act in good faith in the interest of the enterprise and are liable for any damages to the company resulting from not performing their fiduciary duties. This constitutes sound basic legislation to ensure that board members act in the best interest of the enterprises that they oversee. However, there are no requirements for SOE boards of directors to include independent (outside) or non-executive directors, which introduces the risk that SOE board members may have material interests in the company or related entities that could introduce conflicts of interest and jeopardise their ability to make independent judgements in the interest of the enterprise. The Albanian authorities have not taken steps to encourage gender diversity on SOE boards of directors, reflecting broader limitations in the required professional qualifications of SOE board members.

### *Sub-dimension 6.2: Transparency and accountability practices*

Concerning **financial and non-financial reporting**, SOEs are, like all companies, required to submit annual financial statements to the National Registration Centre, which subsequently publishes them. It appears that at least most large SOEs comply with this requirement, but a conclusive assessment would require a more in-depth review. There are no parallel requirements concerning non-financial reporting. As an EU candidate, Albania will be expected to ensure that all large companies, including large SOEs, are required to publish non-financial information on their policies for environmental impact, employee relations, human rights, anti-corruption and bribery and board diversity (under EU Directive 2014/95/EU). Given that several of Albania's large SOEs undertake activities in the public interest, improved disclosure on the nature and funding arrangements of these non-commercial activities is warranted. Currently the state does not produce an annual report on the performance of the SOE sector as a whole or how well SOEs perform the activities that they undertake in the public interest. Just as financial reports are a crucial source of information that shareholders in listed companies need to make ownership decisions, transparency regarding SOEs' public policy activities is important for the public to understand what SOEs are doing in their interest.

Concerning **auditing practices**, all SOEs (i.e. all enterprises in which the state holds at least 51% of shares) are required to have their financial statements audited by an external auditor, in line with good practice. Companies in which the state is a minority shareholder only undergo external audits of financial statements if they exceed a certain size threshold (determined by a mixture of criteria related to their asset valuation, net income and number of employees).<sup>51</sup> Several large SOEs regularly have their financial statements audited by large international audit firms, which suggests a certain quality and credibility of their audit reports.<sup>52</sup> The state as shareholder is responsible for appointing external auditors, in line with standard corporate practices. SOEs are additionally required to establish internal audit committees, but the authorities report that compliance is low. Separately, the Supreme State Audit body also audits some SOEs' financial statements, in particular large SOEs of strategic national importance. The authorities report that the audits undertaken by the Supreme State Audit body focus primarily on ensuring that the activity of each company conforms with relevant legislation, whereas the audits performed by external auditors focus on ensuring that the financial statements have been prepared in accordance with applicable accounting standards. In sum, SOEs are subject to different types of audits at four levels: internal audits by departments within each enterprise (departments which are required for all SOEs, but are reportedly not always established); ministerial audits conducted by the internal audit departments of ownership ministries; audits by the Supreme State Audit body; and external audits of SOEs' financial statements.

Only three of Albania's SOEs have non-state minority shareholders, none of which are listed, since the public stock exchange was shut down in 2014.<sup>53</sup> There are sound basic laws in place to ensure the **protection of minority shareholders** – i.e. basic provisions calling for shareholders' equitable treatment – and no recent publicly reported cases of abuse of minority shareholder rights in favour of the state. Still, it is possible that weaknesses in the judicial system, which are common across the region, could make it more difficult for minority shareholders to obtain redress if their rights have been violated. And good practice calls for the state to take targeted measures, beyond just legal protections, to ensure that minority shareholders are actively involved in corporate decision making so that their interests are consistently taken into account. The SOEs with non-state minority shareholders are as follows: Alb Control Durrës, which undertakes quality control for import-export goods (97% state-owned), the Share Registration Centre of Albania (SRC) Tiranë, which maintains national shareholder account data (84.94%) and the tobacco and cigarette manufacturing company Tobacco Producer of Albania, Shkodër (89.65%).<sup>54</sup> The Albanian state is itself a minority shareholder in 28 companies, most of which were originally slated for privatisations that have since been delayed (the authorities intend to privatise these companies in the medium term). It is possible that these companies would in fact be considered SOEs, if the state holds the highest concentration of shares and thus exercises control over corporate decision making, but more information on the shareholding structure of these companies would be necessary to draw a conclusion about this.

### *Sub-dimension 6.3: Ensuring a level playing field*

According to data provided by the Albanian authorities, all SOEs are incorporated following the company law (as either joint-stock or limited-liability companies) and face broadly the same **legal and regulatory treatment** as their private competitors. The Albanian company law was adopted in 2008 to align national legislation with the EU *acquis*. The Law on Corporatisation of State Enterprises, adopted in 1995 and subsequently amended, also applies to SOEs but is reportedly subsidiary to the company law. It sets out complementary requirements concerning, for example, the capital of SOEs, their statutes and their boards of directors. The authorities report that SOEs do not benefit from any exemptions from tax, competition, environmental or zoning rules. Nonetheless, a 2019 IMF study found that Albania was one of eight countries that reported granting some legal preferences to SOEs, indicating that SOEs may still benefit from some operational advantages owing to their state ownership (IMF, 2019<sup>[80]</sup>). As an example of regulatory issues associated with state ownership in certain sectors, the state-owned oil company Alb Petrol has been the subject of some criticism owing to its simultaneous role as a market player and as a regulatory authority with responsibility for granting oil-extraction licenses in some of Albania's oil fields.<sup>55</sup>

Concerning **access to finance**, Albania's large SOEs often obtain debt financing on the commercial marketplace, with a strong possibility of receiving favourable terms owing to their state ownership. In the context of the COVID-19 crisis, an explicit state guarantee was issued to large SOEs to allow them to access bank credit at a fixed rate of 2.85% for the purpose of maintaining employment levels. Beyond the conditions for commercial debt financing, there are some broader issues related to funding support from the state. Firstly, the existence of several insolvent SOEs under the MOFE indicates that many SOEs do not earn economically significant rates of return, which amounts to a cost of equity capital that is not market consistent. The economic downturn associated with the COVID-19 pandemic has exacerbated existing profitability problems for SOEs. The authorities report that the majority of SOEs posted losses in 2020 and will therefore not distribute dividends to the state. Many SOEs also benefit from state subsidies from their responsible line ministries. In the absence of evidence from the authorities that the amount of these state subsidies corresponds to the approximate cost of SOEs' public policy (non-commercial) objectives, it can be concluded that subsidies may constitute a distortion to the level playing field with private competitors, by granting SOEs operational funding advantages. Even if subsidies are merely keeping low-performing SOEs from going insolvent (rather than fuelling market expansion), in this context they would still constitute an inefficient use of economic resources that is not conducive to improving the performance of SOEs. Clarifying the costs of SOEs' non-commercial objectives, and ensuring that state subsidies correspond to these costs, would be important to ensure that SOEs do not hinder the efficient allocation of resources.

### *Sub-dimension 6.4: Reforming and privatising state-owned enterprises*

**Recent SOE reform** initiatives in Albania have mostly consisted of efforts to assess and restructure insolvent SOEs. In 2019, the Ministry of Finance and Economy notably assessed all the SOEs under its remit and made the decision to merge eight insolvent companies with other SOEs. One of the reported rationales for merging these insolvent companies with solvent SOEs was to avoid the costs associated with bankruptcy and liquidation, pointing to broader issues regarding the efficiency of insolvency procedures in Albania. Separately, the Ministry of Finance and Economy formally proposed to the Council of Ministers the establishment of a central Agency for Public Property Administration, but the proposal was ultimately not approved by the government. If such an institution were established and granted ownership rights for Albania's largest SOEs, it could provide a sound institutional foundation for further professionalising state ownership practices and improving the performance of SOEs. At the current juncture, however, there does not appear to be a consensus within the government on the need to establish such an entity.

The legislative framework for **privatisation** in Albania includes two foundational laws: on the privatisation of SOEs operating in strategic sectors and on the privatisation of SOEs operating in non-strategic sectors.

These laws are complemented by several formal published decisions by the Council of Ministers outlining, among others, the institutional responsibilities and procedures for privatisation. Albania has established a special process, involving heightened inter-governmental oversight, for privatisation cases involving SOEs of strategic importance. The process involves the establishment of a Consultation and Transparency Committee, comprising representatives of several departments within the Ministry of Finance and Economy to ensure that the privatisation procedures established by law are respected; make recommendations regarding the legislative, fiscal or economic situation to support the success of planned privatisations; and propose a schedule for privatisations to the Council of Ministers' Committee on Economic Policies.<sup>56</sup> For the privatisation of individual shareholdings in companies, the Ministry of Finance and Economy is primarily responsible for related procedures.

Concerning recent privatisations, in 2016, the previously 100% state-owned insurance company INSIG was fully privatised and the state's remaining 30% shareholding in the construction company *Euroteorema Peqin* was relinquished to private investors. An earlier privatisation of the economy's energy distribution network operator was reversed sometime after 2013. (In 2009 the state sold 76% of its shares in the Electricity Distributor of Albania (EDA) to the Czech majority state-owned company ČEZ, with the aim of boosting needed investments in the electricity distribution system. In 2013, the Albanian state removed ČEZ's license to operate in the economy and ultimately retook ownership of the power distribution company, which is currently under the purview of the Ministry of Infrastructure and Energy.) At the time of writing, the Ministry of Finance and Economy did not have any short-term plans to privatise any of the SOEs or minority shareholdings in its portfolio. However, the authorities did report an expectation that the 28 companies in which the state holds minority shares would eventually be privatised in the medium term. At the time of writing, a proposal by the Ministry of Culture to privatise the state-owned Alba Films was under consideration by the Council of Ministers.

### ***The way forward for state-owned enterprises***

As for most economies in the Western Balkans, ensuring that SOEs in Albania operate efficiently, transparently and on a level playing field with private companies will necessitate reforms in multiple policy areas that cannot be done all at once. Choosing the appropriate sequencing of reforms is just as important as their content and depends in large part on the national political climate and current reform priorities.

This being said, the OECD Guidelines on Corporate Governance of State-Owned Enterprises provide a guidepost for reforms that the Albanian authorities can use to inform their policy efforts in this domain (OECD, 2015<sup>[81]</sup>). Based on the state of play of SOE policy development in Albania, the following priority reform areas – which are in line with the OECD SOE Guidelines – could offer a basis for discussions with the authorities:

- **Strengthen the institutional arrangements for state ownership.** Albania has already taken some steps to separate SOE ownership and regulatory functions, by placing a large number of SOEs under the sole purview of the Ministry of Finance and Economy (which is not a sectoral regulator) and requiring that the SOE board nomination process for other SOEs involves both the MOFE and sectoral line ministries. The authorities should move forward with the initiative to establish a central state ownership agency – or, if this is not possible, a co-ordination entity – to further harmonise state ownership practices and fully separate ownership and regulatory roles. The state ownership or co-ordination entity could be charged with developing an overarching ownership policy, gathering performance and other data on Albanian SOEs and establishing clearly defined performance indicators for SOEs.
- **Increase the independence and operational autonomy of SOE boards of directors.** The presence of politically affiliated individuals on Albanian SOE boards points to a boardroom culture in which decision making is strongly linked to political goals rather than corporate efficiency. The absence of clear performance expectations from the state as an owner exacerbates this potential for politicisation.

As a first step, the authorities should establish SOE board membership criteria that minimise these and other conflicts of interest and ensure that SOE boards are staffed with a sufficient number of qualified professionals. The experience of some OECD countries in establishing inter-ministerial board nomination committees, and involving private recruitment agencies in the process, may be useful for the Albanian authorities.

- **Improve SOEs' efficiency so that they create economic value alongside private companies.** This assessment has highlighted that many SOEs in Albania do not earn economically significant rates of return, meaning that economic resources are not channelled to the economy's most productive actors. When SOEs operate efficiently and on a level playing field with private companies, they create value to the ultimate benefit of the general public, who are the "owners" of SOEs. The Albanian authorities should consider structural reforms within the most economically important SOEs to improve their productivity. Also related to broader market efficiency, the authorities should address any barriers to effective competition in markets where SOEs compete with private companies. Related issues appear to be particularly acute in the electricity sector, where the development of a competitive market is apparently hindered by preferential access contracts granted to state-owned electricity suppliers.<sup>57</sup> The Albanian authorities should move forward with removing barriers to market liberalisation in sectors where the establishment of a competitive market is a stated policy goal, with a view to maximising economic efficiency to the benefit of end consumers.
- **Gather and publish financial performance data on SOEs.** Differing figures regarding the total number of SOEs in Albania, as reported by both the national authorities and by external assessments, point to the need for a clear central overview of how many companies the government owns, including an indication of which companies are "active" and which are insolvent and/or undergoing bankruptcy proceedings. Such a central overview of SOEs could be enriched with employment figures, as well as financial performance data to provide the authorities with a clear understanding of how the SOE portfolio is performing. A mechanism is already in place to ensure the submission of SOEs' financial statements to a central authority (the National Registration Centre), which could provide the data necessary to calculate financial performance figures. Information on SOEs' performance could ultimately provide a point of departure for developing performance indicators (e.g. rate-of-return expectations) that are applicable to individual SOEs and benchmarked against industry standards. Lithuania's state ownership co-ordination body publishes financial performance data on SOEs, and could provide useful inspiration for the Albanian authorities (see Box 20.9). In cases where information for individual SOEs is insufficient, the authorities could develop targeted measures to improve SOEs' compliance with existent reporting requirements.

### Box 20.9. Gathering performance data on state-owned enterprises in Lithuania

Lithuania's Governance Co-ordination Centre (GCC) is a state ownership monitoring and co-ordinating entity which takes the lead in developing annual reports on the performance of the state's SOE portfolio. It also calculates three-year targets for the state's rate-of-return expectations for individual SOEs and comments on SOEs' yearly strategy documents. The annual aggregate report produced by the GCC notably includes the following financial performance data and other quantitative information on SOEs:

- Aggregate financial information on the entire SOE portfolio, including a profit-loss statement and a balance sheet.
- Market value of the state portfolio and explanations of changes compared to previous periods.
- Price-to-earnings ratios for SOEs with shares listed on the stock exchange, with comparisons to foreign industry peers.
- Portfolio returns to the state, including value of dividends, value of taxes and rates of return on both assets and equity.
- Information on SOEs' capital structure: debt-to-equity ratios for the portfolio and for individual SOEs.
- Number of employees overall and per sector, with year-on-year comparisons.
- Detailed related figures on large individual SOEs, together with explanations for significant changes.

Note: This overview is based on the 2017 annual aggregate report. More recent reports are also available, but only in Lithuanian.

## Education policy (Dimension 7)

### Introduction

Table 20.11 shows Albania's scores for the four education policy sub-dimensions and the cross-cutting dimension on system governance, and compares them to the Western Balkan six (WB6) average. Albania scores above the WB6 average in all sub-dimensions. Indeed it has the highest score of the WB6 economies for the early childhood and school sub-dimension, driven by its above-average ratings for each of the sub-dimension's three indicators. Likewise it scores joint highest (along with North Macedonia) for the tertiary education sub-dimension.

**Table 20.11. Albania's scores for education policy**

Dimension	Sub-dimension	Score	WB6 average
Education policy dimension	Sub-dimension 7.1: Early childhood and school education	3.3	3.0
	Sub-dimension 7.2: Teachers	3.5	2.7
	Sub-dimension 7.3: Vocational education and training	3.3	3.1
	Sub-dimension 7.4: Tertiary education	3.0	2.8
	Cross-cutting dimension: System governance	3.5	3.3
Albania's overall score		<b>3.3</b>	<b>3.0</b>

### State of play and key developments

Since the last CO assessment, Albania has implemented its competency-based curriculum across all grade levels, developed an assessment framework for pre-school education that aligns with contemporary child development theories and created a manual for monitoring children at risk of school dropout. As of 2019, net enrolment in Albania was nearly universal for primary (98%) and lower secondary (96%) education. However, net enrolment at the upper secondary level was only 82%, lower than the OECD and EU averages (UIS, 2020<sup>[83]</sup>).

In terms of learning outcomes, Albania's average scores in the Programme for International Student Assessment (PISA) are slightly above the Western Balkan average but much lower than the EU and OECD averages (Figure 20.14). Albania also has a large share of students who have not achieved baseline levels of proficiency in reading (52%) and maths (42%); much higher shares than the OECD average (around 23% and 22% respectively) (OECD, 2020<sup>[84]</sup>). These findings have implications for Albania's long-term economic development, as students without basic skills are less likely to attain well-paid and rewarding jobs. A positive trend is that improvements in the bottom of Albania's PISA performance distribution are outpacing improvements at the top in every subject, closing the gap between the highest and lowest-achieving students. Nevertheless, there is evidence that children in Albania from socio-economically disadvantaged backgrounds, those living in rural areas and those from Roma and Egyptian Balkan communities continue to face barriers to educational access and are more likely to have lower educational outcomes (Maghnouj et al., 2020<sup>[85]</sup>).

StatLink  <https://doi.org/10.1787/888934255399>

Albania has experienced major challenges recently that have had important consequences for the education system, as well as the economy and society at large. First, the November 2019 earthquake that struck the north-western part of the country displaced many students who attended one of the 52 damaged schools and kindergartens. Reassigning these students to other education institutions exacerbated issues of overcrowding in urban schools, some of which were already operating on multiple shifts to accommodate demand. Then, similar to countries around the world, Albania closed schools on 9 March 2020 to help slow the spread of COVID-19.

This crisis has delayed several policy developments in Albania, including the finalisation of the new education strategy. However, at the onset of the pandemic, the Ministry of Education, Sports and Youth, with support from international donors, was proactive in rapidly implementing remote learning across the country by broadcasting television and online lessons and providing teachers and schools with digital tools like Google classroom and Zoom to connect with students. A platform – academia.eu – was also created. While in-person instruction started in September 2020, the effects of the COVID crisis have pushed the ministry to emphasise the importance of digital competencies and it is working to develop online teaching methodologies across all levels of instruction. The creation of three learning scenarios, respectively in-presence learning, mixed online and in-presence learning, and full online learning, allows for the government to maintain flexibility in its response as the health situation evolves. Additionally, separate guidelines were created for organising online learning for students in VET (National Agency for Education, Vocational Education and Training of Albania, 2020<sup>[86]</sup>).

There has also been an effort to recruit psycho-social support staff to support student well-being. The government has reported that the number of psycho-social staff has doubled due to the employment of psychologists. To maintain Albania's recent progress in the education sector, enhanced and targeted spending is needed to ensure continuity of learning for all students, especially the most vulnerable (World Bank, 2020<sup>[87]</sup>).

### *Sub-dimension 7.1: Early childhood and school education*

Albania's performance in the **early childhood education (ECE) indicator** is slightly higher than the regional average (Table 20.11). There is a strong strategic and legal framework for the sector and while gross enrolment in pre-primary education (80.5% in 2018) is lower than the OECD (81%) and EU (98%)

averages, it is significantly higher than other Western Balkan economies, which on average have a gross enrolment ratio of around 53% (UIS, 2020<sub>[83]</sub>). However, pre-primary education is not compulsory in Albania and the government has not met targets to raise participation to 90% by 2020 (Wort, Pupovci and Ikonimi, 2019<sub>[88]</sub>). There is also evidence that some children, especially those from ethnic minority groups, continue to face barriers to access (Psacharopoulos, 2017<sub>[89]</sub>). In terms of ECE quality, in 2018 Albania introduced a series of curriculum programmes for different age groups<sup>58</sup> and an assessment framework to help monitor early child learning and development. There are also educational requirements and standards for pre-school teachers and principals; however, attracting quality teaching staff remains a key challenge in some regions (UNESCO, 2017<sub>[90]</sub>). While ECE is not exclusively donor-funded in Albania, donor-led initiatives still play an important role in implementing policy and monitoring and evaluating the sector.

The Albanian **instruction system**<sup>59</sup> rates among one of the highest performers in the region for this indicator. The Pre-University Education Strategy 2014-2020 sets out a vision for education and a series of policy priorities.<sup>60</sup> Since 2019, implementation of the competence-based curriculum has been rolled out to all grade levels and learning standards have been established to serve as a baseline for syllabuses, teacher guides, and other materials that support teaching and learning. These materials are being adapted to respond to new blended and digital learning environments as a result of recent challenges, such as the earthquake in late 2019 and the COVID-19 pandemic. Albania has taken steps to align the curriculum with its national examinations, which respectively certify the completion of basic (in Grade 9) and upper secondary education (in Grade 12), although the latter also serves as a university entrance exam. Both examinations are fit for purpose and Albania continuously works to increase their reliability. Another notable feature of Albania's instructional system is the Assessment of Primary Education Pupils' Achievement (VANAF),<sup>61</sup> which marks the only system-wide learning assessment in the Western Balkans. While the VANAF has the potential to help identify and address achievement gaps and support teachers' classroom assessments, the lack of standardised marking procedures do not support system monitoring and comparisons (Maghnouj et al., 2020<sub>[85]</sub>).

Albania established its school evaluation framework in 2011, setting out school quality standards that cover teaching and learning, in addition to serving as the main reference for external and internal school evaluation. However, the State Inspectorate of Education was dissolved in 2019 and Regional Directorates of Education now have responsibilities for school evaluation. The goal of this reform was to conduct more school evaluations and provide improvement-focused support to schools. As a result, Albania no longer has a single body with a mandate to assure the integrity of external school evaluations – a common feature in many European education systems (Maghnouj et al., 2020<sub>[85]</sub>). Nevertheless, the school system has seen many positive developments over the last two years. In particular, the ministry's Quality Assurance Agency is now reviewing the School Performance Card (a set of indicators used to rank individual schools) to ensure this data reflects contextual factors and is relevant to instructional quality. Another positive development is the establishment of the Centre for School Leadership<sup>62</sup>, which aims to support the preparation and professional development of school leaders. These types of initiatives are likely to further Albania's progress in strengthening its instructional system.

The **early school leaving** rate in Albania has declined over the last decade, but at over 16% in 2019, remains higher than the Western Balkan (8.5%) and EU average (10.2%) (Eurostat, 2019<sub>[91]</sub>). The Ministry of Education, Sports and Youth has identified several factors that contribute to Albania's high rates of school abandonment, which often start earlier in the education pipeline. Distance between school and home; pressure to contribute to family income; household obligations (e.g. caring for children and elders, etc.); early marriage; and factors such as disability, ethnicity, migration and poverty are all associated with school dropout (MoESY, 2017<sub>[92]</sub>). While Albania's Pre-University Education Strategy 2014-2020 calls for a specific strategy to deal with dropout and early school leaving, this issue is only covered indirectly through policy documents, such as the National Action Plan for the Integration of Roma and Egyptian Population 2016-2020 and the School as a Community Centre Framework. Without an explicit strategy on early school leaving or dropout and accompanying budget allocations, Albania may struggle to further reduce its share

of early school leavers. Nevertheless, donor agencies have helped develop indicators and collect data to better monitor students at risk of early school leaving and in July 2019, Albania published a manual for monitoring children outside education institutions and at risk of school dropout with support from UNICEF.

### *Sub-dimension 7.2: Teachers*

Albania's score for the sub-dimension on teachers is above the Western Balkan average (Table 20.11), largely because of the economy's high standards for entering the teaching profession and clear regulations on the professional management and development of teachers. All primary and secondary school teachers are required to have a master's degree at International Standard Classification of Education (ISCED) level 7; however, national data suggest that only 79% of teachers had attained this level of education as of 2019. Over the last ten years, teachers in Albania have benefitted from salary increases and average salaries are comparable to other public sector professionals (Council of Ministers, 2017<sup>[93]</sup>). In 2019, the average annual gross salary of a full-time public school teacher (ISCED 1-3) in Albania was slightly over EUR 6 000. This average is lower than most European countries (European Commission/EACEA/Eurydice, 2019<sup>[94]</sup>).

While Albania has a general accreditation process for higher education institutions, there are no programme-specific accreditation criteria for **initial teacher education (ITE)**. As a result, ITE providers do not have to demonstrate how their programmes help candidates develop the specific competencies needed to teach. However, Albania has taken several steps to ensure the most qualified students enter the teaching profession. For example, ITE candidates must have a minimum grade point average of 7.5, which gradually increased between 2018 and 2020. Candidates must also complete a nine-month teaching internship, pass a state examination and take a separate recruitment test before they can start working in schools. In 2019, Albania also introduced an online portal<sup>63</sup> to manage teacher recruitment nationally. However, there is a general oversupply of teachers, as well as shortages in some specific subjects and regions, especially in rural parts of the country (European Commission, 2018<sup>[95]</sup>). While Albania has tried to attract teachers to work in rural areas (by offering a transportation bonus), declines in the student population and other demographic changes will likely require a more comprehensive and proactive approach to teacher recruitment policies (Maghnouj et al., 2020<sup>[85]</sup>).

Albania has a clear regulatory framework for the **professional management and development** of teachers. A specific institution, the Commission for Accreditation of Training Programmes, is responsible for accrediting programmes. And the Agency for the Assurance of Quality in Pre-University Education studies teacher professional development needs using a range of sources, such as teacher self-assessment surveys, appraisals conducted by schools and external experts, results from teacher qualification tests and student results in assessments and exams. Teachers benefit from established professional learning networks and the state budgets pay for professional development activities; however, partnerships with donor agencies supplement delivery. There are three categories of teachers in Albania (qualified, specialist and master), which align with years of work experience and salary increases. Importantly, teachers at different qualification categories are not expected to demonstrate different levels of competency, as teachers' standards are not differentiated by competency level, unlike a growing number of OECD countries.

### *Sub-dimension 7.3: Vocational education and training*

Albania's score in the sub-dimension on vocational education and training (VET) is on par with the Western Balkan average (Table 20.11). Professionally oriented education starts at the upper secondary level, when students are allocated into either general (gymnasium), vocationally oriented programmes. While students in Grade 9 take the National Basic Education Examination to certify their completion of compulsory education, unlike most economies in the region, results from this exam are not typically used to sort students into an upper secondary track because most attend gymnasium<sup>64</sup> (Maghnouj et al., 2020<sup>[85]</sup>). Moreover, while data from PISA find that vocational students tend to have weaker literacy and numeracy

skills than their peers in general education, Albania has the narrowest learning gap in the region between general and VET education programmes (25 score points) (OECD, 2020<sup>[84]</sup>).

Responsibility for the **governance of VET** in Albania is centralised in the Ministry of Finance and Economy and, which oversees a state-funded system composed of two types of providers: vocational schools (for young people) and vocational training centres (mainly for adults). The ministry works with several government agencies to manage the VET sector, such as the National Agency for Employment and Skills and the National Agency of Vocational Education Training and Qualifications. Policy coherence at the central level is ensured by the National VET Council and a wide range of stakeholders can engage in the sector's development through regional governing committees and steering committees within VET institutions. Despite efforts to involve social partners, there is evidence that Albania's VET system remains traditionally classroom-based and struggles to respond to local needs, contributing to a mismatch between skills supply and demand (UNDP, 2018<sup>[96]</sup>). Albania's National Employment and Skills Strategy 2019-22 sets out clear implementation plans, budgets and timelines for offering quality VET to youth and adults. The 2017 Law on VET regulates the sector and aims to modernise qualification standards and framework curricula for VET programmes. However, there is evidence that implementation has been limited since providers often lack appropriate teaching skills and equipment (European Commission, 2020<sup>[19]</sup>).

Despite the challenges in modernising the overall VET system, Albania has given a new impetus to promoting **work-based learning** (WBL) in recent years, largely driven by a donor-led roadmap for a dual VET scheme (Eurydice, 2021<sup>[97]</sup>). There are also broad public awareness campaigns, presentations to social partners and dedicated career placement services that help match learners with WBL places. A range of data, such as rates of enrolment and completion of VET programmes and the number of learners who are hired after WBL placements, is collected to further support the sector's development and inform career paths. However, there is no official incentive scheme to encourage employer participation in WBL; nor is there information on the earning outcomes of recent graduates. Moreover, the government reports that engaging businesses to provide internships and WBL places is often a challenge.

#### *Sub-dimension 7.4: Tertiary education*

Albania's score in the tertiary education sub-dimension is on par with the Western Balkan average (Table 20.11). School life expectancy (from primary education through tertiary education) has increased in recent decades and was similar to the Western Balkan average (around 14 years) in 2018, but still lower than the average in the EU (16.6 years) and OECD (17 years) (UIS, 2020<sup>[83]</sup>). While national data show that the share of adults who have attained some form of tertiary education is on the rise, Albania has the lowest rate (24%) of tertiary-educated young adults (30-34 year-olds) in the Western Balkans (European Commission, 2020<sup>[19]</sup>). Gross enrolments in tertiary education also decreased between 2014 and 2018 (UIS, 2020<sup>[83]</sup>). These findings can be partly explained by migration outflows driven by the pursuit of education and career opportunities abroad (i.e. brain drain), as well as the closure of private universities<sup>65</sup> which reportedly awarded low-quality degrees (Maghnouj et al., 2020<sup>[85]</sup>; European Commission, 2020<sup>[19]</sup>).

There is no overall strategy for tertiary education, although this topic is expected to be included in Albania's future education strategy, which is currently under development. As a result, the sector is regulated by legal frameworks, in particular the 2015 Higher Education Law,<sup>66</sup> and in recent years, the government has been working to develop bylaws. The 2015 law introduced several changes to the higher education system, including greater institutional autonomy for universities, accountability measures and programme diversification to better align with labour market needs (EACEA, 2017<sup>[98]</sup>). The law also led to an increase in tuition fees that sparked widespread student protests in late 2018 (Erebara, 2018<sup>[99]</sup>).

Albania has established transparent processes for selection into higher education,<sup>67</sup> and student loans and scholarships are available<sup>68</sup> to support more **equitable access to higher education**. Moreover, a quota system provides a 50% reduction in tuition fees for students facing economic and social difficulties, such as those with disabilities, the blind, Roma and Balkan-Egyptian minorities and orphans. While access to

higher education for these groups is improving, they are still much less likely to participate in higher education; some evidence suggests that the quota system and other equity measures have not been fully implemented (European Commission, 2020<sub>[19]</sub>).

There have been studies on factors that contribute to higher education participation, and Albania's National Statistics Institute (INSTAT) collects some disaggregated data that can help monitor equity in the tertiary sector.<sup>69</sup> However, the Ministry of Education, Sports and Youth does not analyse this information to identify and address equity issues. Collecting data on the quality and labour market relevance of higher education is the task of individual institutions, which submit annual reports on graduate employment rates to the Ministry of Education, Sports and Youth. However, this information is only based on interviews with a selection of tracked students and there are no centralised definitions. As a result, it is impossible for the government or individuals to rigorously monitor and compare tertiary providers and programmes.

Despite somewhat limited information, Albania meets several of the higher level criteria for the indicator on **labour market relevance of higher education**. For example, there are a number of policies and programmes to promote the internationalisation of students and staff, quality assurance bodies align with the standards and guidelines of the European Higher Education Area, and each higher education institution has an academic senate<sup>70</sup> responsible for developing new study programmes and planning academic and scientific research activities. The 2015 Higher Education Law also considers student employability as a parameter for funding and ranking universities (EACEA, 2017<sub>[98]</sub>). While Albania continues to face high rates of unemployment and large shares of youth who are not in employment, education or training (NEET) compared to EU and OECD averages – see Employment policy (Dimension 8) – these rates have been steadily decreasing in recent years. Public expenditure on tertiary education in Albania as a percentage of GDP (0.68%) was lower than the regional (1.67%), EU (1.12%) and OECD (1.95%) averages in 2017 (UIS, 2020<sub>[83]</sub>). Further improvements will likely require a combination of greater investment in tertiary education, as well as increases in the demand for skills to use the economy's human capital and discourage emigration (especially by youth), which currently hinders competitiveness.

#### *Cross-cutting dimension: System governance*

Albania's score for this cross-cutting dimension is similar to the Western Balkan average (Table 20.11), as some system governance features align with the policies and practices found in European and OECD education systems. For example, there is an established national education strategy and a national assessment system that respectively provide a vision for education and monitor student learning outcomes. Albania also has a national qualifications framework that was introduced in 2010. However, the Albanian qualifications framework does not clearly align with the European Qualifications Framework, making it difficult to recognise Albanian's qualifications internationally. To address this issue, the Albanian Ministry of Education, Sports and Youth and the Ministry of Finance and Economy created a joint task force in 2015 to align the two frameworks with support from the European Training Fund. The task force was expected to complete its mandate by 2022 but disruptions caused by COVID-19 have delayed progress.

The Albanian Pre-University Education Development Strategy 2014-20 sets out policy objectives to improve the governance, inclusion, quality assurance and teacher professional development in the pre-tertiary sector. This strategy does not cover higher education or VET, although the latter is addressed by the National Employment and Skills Strategy 2019-22. Albania developed the pre-university education strategy in consultation with a range of stakeholders and the document includes an implementation plan outlining the main activities, expected outcomes and timelines. However, an external evaluation of the strategy<sup>71</sup> found a 43% gap between the planned education budget in 2019 and what was approved (Wort, Pupovci and Ikonimi, 2019<sub>[88]</sub>). Considering that government expenditure on education as a share of GDP in Albania (3.6%) is much lower than the OECD (5.2) and EU (4.9%) averages, it is crucial that the country's next education strategy establishes a realistic budget to use available resources most effectively (UIS,

2020<sub>[83]</sub>). Prioritising investments will be especially important given that the draft education strategy plans to cover the whole education sector, from ECE through to tertiary.

Albania collects information on the education system's inputs, outputs and outcomes. In particular, data on student learning outcomes is collected through regular participation in international assessments and the Assessment of Primary Education Pupils' Achievement (VANAF), which is currently the only fully operational national assessment in the Western Balkans. The majority of EU and OECD countries already administer some sort of national assessment to monitor student learning (OECD, 2013<sub>[100]</sub>). Albania is also developing a new education management information system (EMIS), which is a positive development for system governance since administrative data and information on student results and the VET sector were all previously stored in separate databases (Maghnouj et al., 2020<sub>[85]</sub>).

### ***The way forward for education policy***

In today's increasingly global and fast-changing world, achieving inclusive and quality education in Albania can help increase regional competitiveness and create opportunities for more individuals to develop the competencies needed for sustainable development and social cohesion. Albanian officials will need to reflect on the economy's political, social and fiscal environment to determine how best to achieve their education goals. While the 2020 OECD review on evaluation and assessment in Albania's education system (Maghnouj et al., 2020<sub>[85]</sub>) provides detailed recommendations on how to strengthen the equity and quality of the education sector, the following considerations in particular can provide insights for discussions on the way forward:

- **Develop Albania's new education strategy with a clear set of priorities and a strong monitoring framework.** The development of Albania's next education strategy will cover a critical period for national development and potential accession to the EU, highlighting the importance of directing the education sector towards supporting more students to achieve good and excellent outcomes. It will therefore be important to focus on priorities that are clear and measurable to help mobilise stakeholders across the system. These priorities should be translated into financially viable implementation plans that can be measured through a monitoring framework. For example, Ireland includes specific indicators to measure progress towards national goals for education in its 2018 Action Plan for Education (Department of Education, 2018<sub>[101]</sub>).
- **Conduct forward planning exercises to identify teacher demand.** Albania has taken several steps to make entry into initial teacher education more competitive and collects a range of data on the skills and preferences of teacher candidates as well as teacher vacancies. However, there is still a general oversupply of teachers and shortages in some specific subjects and regions. The ministry should review and refine its teacher forecasting model and labour market data to inform further adjustments to initial teacher entry requirements and quotas. For example, Scotland (United Kingdom) adjusts admissions quotas to initial teacher education on an annual basis to project teacher supply and demand (Maghnouj et al., 2020<sub>[85]</sub>).
- **Ensure integrity in external school evaluation.** Since Albania has dissolved its State Inspectorate of Education as part of the education reform, the ministry should take steps to ensure that evaluators have objectivity and distance from responsibility for a school's performance. One way to do this is to supplement regional evaluation teams with contracted evaluators, a common practice found in OECD and European systems (Box 20.10) (Maghnouj et al., 2020<sub>[85]</sub>).
- **Continue to strengthen the collection and management of data.** Albania has already taken several important steps to modernise the collection and management of education data in recent years and is working to link various databases. These efforts should be continued so the system can more effectively analyse education inputs, processes and outcomes.

### Box 20.10. Contracted school inspectors in Scotland, United Kingdom

In Scotland (United Kingdom), school inspection teams include:

- full-time inspectors employed by Education Scotland, the central inspection body
- contracted associate assessors (i.e. high-performing principals, deputy principals and local education unit staff) who join inspection teams three times a year
- individuals with diverse backgrounds who are selected and trained for their role.

## Employment policy (Dimension 8)

### Introduction

Advances have been made in the regulatory framework of the labour market since the last assessment; however, improvements are more limited when it comes to implementing the regulations. The capacities of relevant institutions (in particular labour inspectorates and social partners), as well as co-operation between agencies, need to be strengthened. Progress has been made to strengthen work-based learning in the education and training system and to detect employers' skills needs, but progress in upskilling low-skilled adults and in encouraging continuous training of adults is limited. Progress has been made to modernise public employment services (PES), as well as in the evidence-based design of active labour market programmes, although financial resources remain too low given the scale of labour market challenges. There have been limited improvements in tackling informal employment and overall average wages remain low.

Table 20.12 shows Albania's scores for the employment policy dimension and each of the four sub-dimensions, comparing them to the WB6 average. Albania scores higher than the WB6 average in all four sub-dimensions, thus achieving an above-average score overall. Albania's score is particularly high in the job quality sub-dimension, making it top in the region for this sub-dimension.

**Table 20.12. Albania's scores for employment policy**

Dimension	Sub-dimension	Score	WB6 average
Employment policy dimension	Sub-dimension 8.1: Labour market governance	2.8	2.6
	Sub-dimension 8.2: Skills	2.8	2.2
	Sub-dimension 8.3: Job quality	2.8	2.4
	Sub-dimension 8.4: Activation policies	3.0	2.9
Albania's overall score		<b>2.8</b>	<b>2.6</b>

### State of play and key developments

The activity rate of the population aged 15-64 in Albania has increased by 5.4 percentage points since 2015, to reach 69.6% in 2019. This rate is higher than the WB6 average, but still below the EU average (Table 20.13).<sup>72</sup> Real GDP and employment have grown over the assessment period. The employment rate of the 15-64 age group increased by 8.3 percentage points since 2015 reaching 61.2% in 2019 (INSTAT, 2020<sub>[102]</sub>). Jobs have mostly been created in the service sector and in industry. The activity and employment rates have also increased among those aged 65 and above<sup>73</sup> (INSTAT, 2020<sub>[102]</sub>) (WIIW and World Bank, 2020<sub>[103]</sub>). The employment rate increased from 55.5% in 2015 to 68.3% in 2019 among young adults aged 25-29 (INSTAT, 2020<sub>[102]</sub>) (WIIW and World Bank, 2020<sub>[103]</sub>). The unemployment rate (15-64) has decreased continuously from 2015 to 2019, falling to 12%. This is one of the lowest rates in the region, though still markedly above the EU unemployment rate and the 4.1% average for Bulgaria, Romania, Hungary, Slovenia and Croatia (WIIW and World Bank, 2020<sub>[103]</sub>; INSTAT, 2020<sub>[102]</sub>; Eurostat, n.d.<sub>[104]</sub>).

**Table 20.13. Key labour market indicators for Albania (2015 and 2019)**

	Albania		WB6 average	EU average
	2015	2019	2019	2019
Activity rate (15-64)	64.2%	69.6%	61.0%	74.1%
Employment rate (15-64)	52.9%	61.2%	51.5%	69.3%
Unemployment rate (15-64)	17.5%	12.0%	16.3%	6.4%

Note: WB6 average rates are based on author's own calculations using simple averages.

Source: (INSTAT, n.d.<sub>[105]</sub>), *Statistical Database*, <http://databaza.instat.gov.al/pxweb/en/DST/?rxid=caba46dc-9b6f-4a2a-bf84-02693c7b3076>; (Eurostat, n.d.<sub>[104]</sub>), *Labour Force Survey Database*, <https://ec.europa.eu/eurostat/web/main/data/database>.

As a result of the COVID-19 pandemic, registered unemployment rose by 30% between March and September 2020, with both men and women equally hit. About 32% of registered jobseekers applied for unemployment benefit (formal employment) over this time period. The average monthly number of unemployment benefit recipients during the first nine months of 2020 was 50% higher than in 2019 and the number of unemployed jobseekers that were employed during the period January-October 2020 declined by 22% compared to the same period in 2019. The unemployment risk was significantly higher for the low-skilled; those performing trade, services and elementary occupations; as well as the informally employed. This led to a 19% increase in the number of financial aid recipients between March and September 2020. Linked to their low skills level and presence in the informal economy, the Roma were the most hit by unemployment (+34%), according to administrative data.

During the pandemic the Agency of Employment and Skills handled the registration of new jobseekers as usual and PES offices remained open. However, the agency does not have the capacity to rapidly implement the newly introduced employment incentive measures targeted at dismissed workers and informal workers who lost their jobs due to the pandemic (in this case the formalisation of employment relationship is supported). This points to the urgent need to increase the capacity of the Agency for Employment and Skills. Measures targeted at specific vulnerable groups include transportation subsidies, financial support to single parents for childcare, a 12-month subsidy for employing people with disabilities as well as subsidies for workplace adaptation.

#### *Sub-dimension 8.1: Labour market governance*

In 2017, the Albanian Government took the drastic decision to reduce the number of ministries in the cabinet. After 25 years of existence, the government shut down the Ministry of Labour and Social Welfare without prior consultation with social partners and distributed its work on labour and professional education to the Ministry of Finance and Economy and the social welfare component to the Ministry of Health. This reflects a reduced political commitment to employment and social issues. Capacities for employment policies have been reduced and the need for co-ordination between the two different line ministries lengthens decision-making processes.<sup>74</sup> The National Employment Service was renamed the National Agency for Employment and Skills in 2019 (Council of Ministers, 2019<sub>[106]</sub>). It offers opportunities and aims to fulfill the rights of citizens to gain profitable employment, receive professional counselling and qualifications for any such employment and also receive financial income support through its network of employment offices around the country.

As regards the **regulatory framework**, the Employment and Skills Strategy 2019-2022 is the key policy document for labour market governance. It intends to align the relevant Albanian legislation with the relevant EU Directives. An assessment of legal and institutional gaps is still underway. Most progress so far has been made in aligning occupational health and safety (OHS) regulations.

Improving working conditions is a key challenge. A working conditions survey by Eurofound conducted in 2015 showed that 44% of Albanians were not very or not at all satisfied with their working conditions, while this was the case for only 12% of respondents in the EU (Eurofound, n.d.<sub>[107]</sub>). The results of the working conditions survey conducted in 2020 will shed light on progress on working conditions. Working time is one important element of working conditions. In 2019, half (56.6%) of those employed worked between 40 and 48 hours a week, while 20.4% worked for more than 49 hours a week (INSTAT, 2020<sub>[102]</sub>).<sup>75</sup> In 2018, most occupational accidents occurred in the mining (23%), manufacturing (23%) and construction (15%) sectors. While self-reporting of companies on accidents at work has improved recently – an online reporting and a system of e-inspections was introduced – data are still too poor to get an overview of improvements in working conditions. For example, the reduction of fatal accidents at work could be recorded. Linked to the reduced economic activity in the context of the COVID-19 pandemic, the number of fatal accidents fell by 26% between January and August 2020 compared to the previous year. It remained rather constant between 2016 and 2019.

Self-employment is one of the causes of in-work poverty (Jorgoni, 2019<sup>[108]</sup>). The share of self-employed among the employed increased substantially between 2015 and 2016, but decreased slightly thereafter. In 2018, 34% of all employed were self-employed (32.3% in 2019) – substantially above the WB6 average (23.1% in 2019).<sup>76</sup> Many self-employed people work in the agricultural sector, often in a context of subsistence.<sup>77</sup> There is no evidence of clear regulation of labour rights or social protection of gig workers.

The Employment Promotion Law of 1995 introduced quotas and levies for public and private employers of people with disabilities, while the new Employment Promotion Law adopted in December 2018 regulates the setting-up of an employment fund for the employment and skills development of people with disabilities. However, the levies have never been enforced, and the envisaged national employment fund has not been established. The law should be implemented effectively to use the fund for vocational rehabilitation. Some progress has been achieved by using the management information system for disabled beneficiaries, which is still in the pilot phase (European Commission, 2019<sup>[79]</sup>).

Child labour remains a concern. It is assessed that in 2018, 4.6% of children aged 5-14 were working (mainly in agriculture, as well as “street children”, especially those from Roma communities). Previous data based on a 2010 survey conducted by the International Labour Organization (ILO) and CRCA (Child Rights Centre Albania) show that 7% of children up to 14 years of age were working (ILO and INSTAT, 2012<sup>[109]</sup>). As the two sources are not comparable, it is not possible to state that child labour has been reduced. A legislative framework<sup>78</sup> sets 16 as the minimum working age, and changes were introduced in 2017.<sup>79</sup> In 2020, a new practical guide was issued to help labour inspectors identify and control forms of child labour and respond appropriately. The guide was drafted by the Organisation for Security and Co-operation in Europe Presence in Albania, in close co-operation with the State Inspectorate of Labour and Social Services, the State Agency for the Rights and Protection of the Child and the Office of the National Anti-Trafficking Co-ordinator at the Ministry of Interior.<sup>80</sup> The pandemic situation in Albania has affected orientations and planning, but nevertheless training of labour inspectors to use this guide has been a priority. Although the number of Child Protection Units increased recently, co-operation with the State Labour Inspectorate and Social Services could be improved (US Department of Labor, 2018<sup>[110]</sup>). There is also a need to strengthen the system for monitoring child labour (European Commission, 2019<sup>[79]</sup>).

Only small improvements have been made in recent years to increase the institutional capacity of **labour inspectorates** to make sure OHS regulations are implemented, informal employment reduced and child labour detected. Only 7% of companies are inspected annually and labour inspectors have difficulty accessing all sites where there are potentially poor working conditions (e.g. mining). Labour inspectorates lack the financial resources to travel to all inspection locations, and equipment is out of date.<sup>81</sup> The number of labour inspectors has remained nearly constant since 2014 (the number of staff was 154 in 2019, 98 of whom worked as inspectors). The average caseload for each inspector is around 12 600. By way of comparison, in Germany inspectors concerned only with the detection of informal and illegal employment have an average caseload of around 6 000, and in addition there are dedicated inspectorates dealing with OHS issues (ZOLL, 2020<sup>[111]</sup>). Deficiencies in implementing the regulations are also linked to the lack of clear rules and guidelines. There is no curriculum or specific training for acquiring the skills needed to be a labour inspector and there is also no legally defined certification procedure. However, ILO is providing regular training.<sup>82</sup>

There are plans to improve and refine the risk assessment for planning the activities of the inspectorates based on improved data on the sector and previous non-compliance by companies. During the summer months inspections are also done in co-operation with tax authorities to detect informal employment in the trade and service industries. More efforts are needed to intensify this co-operation between entities throughout the year. The share of fined companies and workers is low given the number of inspections, pointing to the low capacity of labour inspectorates and potentially highlighting corruption.<sup>83</sup> A new procedure has been introduced recently to contain corruption. It introduces the principle of imposing the same fines for the same type of companies.<sup>84</sup> These rules are necessary as the law does not specify any rates for fines.

Transparency has been improved through more detailed reporting. The platform MATRICA has been launched on the State Labour Inspectorate website which aims to ensure the transparency of labour inspectors' decision making and allows companies to self-correct by issuing warnings. This service is designed for setting standards in business relations. By the end of November 2019, the platform contained 26 000 registered inspections including all the details of the visit, findings, evidence and decisions for every case. Of this number, 6 000 were re-inspections. The site revealed that about 3 000 legal provisions had never been implemented by the inspectors (Seferaj, 2019<sup>[112]</sup>). This platform should be assessed regularly for the quality of monitoring activities of State Labour Inspectorates, progress should be monitored regularly and policy conclusions drawn.

The implementation of OHS regulations in companies also appears to be weak. The Labour Code was adopted in July 2015 and has since been amended. Experts note that it is not fully implemented, with implications for the labour market and the enforcement of the OHS directives and capabilities (according to stakeholder statements collected by the independent expert). Only roughly one-fifth of companies have OHS councils in place. In some cases, though they exist formally they are not active and do not meet three times a year as foreseen by law, especially in SMEs. In particular, the setting up and effective operation of OHS in SMEs is problematic. There are deficiencies in the implementation of inter-subject (or cross-sectoral) advice on safety and health at work for small enterprises.<sup>85</sup> While the State Labour Inspectorate participates in OHS meetings to provide information, it has not been contacted if health and safety issues arise. The Employment and Skills Strategy 2019-2022 sets out ambitious plans to strengthen the capacities of all key actors in labour market governance, including inspectorates, line ministries and regional actors. The effective implementation of these plans remains to be seen. The ILO will support the government by tackling these implementation issues when drafting the new OHS strategy in 2021.<sup>86</sup>

A **social dialogue** framework exists; however, social partners in particular trade unions have rather weak capacities, despite capacity-building efforts by international donors (Dragoshi and Pappa, 2015<sup>[113]</sup>). In 2019, the Confederation of Trade Unions (KSSH) reported having 110 000 members and the Union of the Independent Trade Unions of Albania (BSPSH) counts 84 000 members. Together this corresponds to a trade union density of roughly 20%,<sup>87</sup> which is low compared to Austria (28%), but similar to or even higher than some other transition economies (e.g. Lithuania, Hungary) (OECD, 2019<sup>[114]</sup>). Currently, there is an initiative to draft a law on the trade unions in Albania, but preparations are still in the preliminary stages. There are only two paragraphs in the current Labour Code on how trade unions should function, but not much on their duties, responsibilities or representation in decision-making process.<sup>88</sup>

Collective bargaining at sector level is almost non-existent. Collective agreements are mainly concluded at company level, as with some private sector companies, e.g. in the construction and energy sectors (Dragoshi and Pappa, 2015<sup>[113]</sup>). In 2017, the overall coverage of collective bargaining in Albania was 25.1%, significantly lower than in Austria (Eurofound, 2019<sup>[115]</sup>). Although newer monitoring data are not available, there are no signs that the situation has improved. Most collective bargaining agreements are concluded in the public sector, often without fixing higher labour standards than those fixed by law.<sup>89</sup> Workplace representatives are limited to health and safety councils and these are often not active (see above). Dispute conflict regulation and the implementation of mediation offices needs to be improved.

The National Labour Council is an institution for **tripartite** dialogue, and there are other tripartite institutions. Significant efforts are still needed, however, to transform the National Labour Council into an effective social dialogue forum at both national and regional levels and to implement the tripartite action plan (European Commission, 2019<sup>[79]</sup>; ABC News Albania, 2020<sup>[116]</sup>). Some decisions are still taken without prior consultation of all National Labour Council members (e.g. for the latest increase of minimum wage in 2020).

### *Sub-dimension 8.2: Skills*

Albania still employs the highest share of low-educated people in the Western Balkans (56.9% in 2018) (WIIW and World Bank, 2020<sub>[103]</sub>); this low level of skills is associated with poor employment conditions and in-work poverty (Jorgoni, 2019<sub>[108]</sub>). Another key challenge is the persistently high share of young people aged 15-24 who are not employed or in education or training (NEET) (25.5% in 2018 and 26.5% in 2019, compared with the EU NEET rate of 10.1% in 2019) (INSTAT, n.d.<sub>[117]</sub>) (Eurostat, n.d.<sub>[104]</sub>).

Results from a STEP employer survey conducted in 2017 indicate that more than half of companies faced difficulties recruiting both routine and non-routine workers, pointing to skills shortages, although companies in other economies in the region encountered even larger recruitment difficulties. In particular, innovative firms, larger firms (100+ employees) and foreign-owned companies faced problems in finding non-routine workers in Albania (WIIW and World Bank, 2020<sub>[103]</sub>). This points to the need to modernise curricula, as well as to equip adult workers with the skills needed in the labour market in order to reduce the **skills mismatch**.

In recent years employment growth has been highest among the highly skilled (World Bank and WIIW, 2020). Employment has also grown amongst the low-skilled, although at a slower pace. The slight decrease of employment of medium-skilled workers may be partly linked to raising enrolment rates of young people in tertiary education over the past decade. In the school year 2019/20, 18 200 students were enrolled in VET (out of a population of 197 333 in the 15-19 age group), while 130 300 were enrolled in tertiary education (out of 226 400 people in the 20-24 age group) (INSTAT, 2020<sub>[118]</sub>). The ratio of VET to tertiary students slightly deteriorated between 2015 and 2019. Albania marked considerable progress between 2010 and 2015, with 22% of adults aged 30-34 having completed tertiary education (university level), a growth of 10 percentage points. In 2018, 34.7% of women had completed higher education compared to 23.3% of men (INSTAT, 2020<sub>[102]</sub>).

The number of VET students is lower than other WB6 economies. VET is the least attractive option at upper secondary education level (Government of Albania, 2019<sub>[119]</sub>). The National Employment and Skills Strategy aims to modernise VET and to promote work-based learning, laws have been adapted accordingly and there is an action plan and a budget attached to promote work-based learning, which is welcome. However, other challenges and weaknesses of the VET system need to be addressed as well, such as skills mismatches, poor-quality or irrelevant training, unequal access, and weak linkages to the private sector (Jorgoni, 2019<sub>[108]</sub>); see also Sub-dimension 7.3: Vocational education and training. Workplace-based professional practice modules recently introduced in curricula in VET and tertiary education cannot always be completed, as it is not possible to find enough companies willing to offer work-based training opportunities.

Since 2017, the employability of all VET graduates (both secondary education VET students and trainees) has been traced through an annual tracer study conducted by the National Agency for Employment and Skills (NAES). The results indicate that in 2019, 52% of 2018 graduates were employed and 12% were concurrently working and studying, giving a total employment rate of 64% (Jorgoni, 2019<sub>[108]</sub>). The NAES is responsible for the administration of VET providers. Tripartite bodies co-ordinate stakeholders, such as the National VET Council and Steering Committee of NAES. Although the NAES periodically conducts a skills needs analysis to steer training offers, skills mismatches persist, and more efforts could be made to use skills needs assessments to improve the quality of training offers.

There is a system in place for validating and certifying **adult learning**. As experience from other countries shows (e.g. Portugal), linking upskilling measures to validation and recognition of prior learning increases its effectiveness (Düll et al., 2018<sub>[120]</sub>). Improvements have been made to address skills mismatches at the local level. Since August 2019, the Skills for Work project has started supporting key providers of education and training (vocational and university, public and non-public) to set up a structured dialogue platform for collaborative skills development with companies and employers in the WB6 region.

One of the findings of the skills needs survey of 2017 was the lack of digital skills and soft skills (Rama and Cabiri, 2018<sub>[121]</sub>). Therefore the Start Smart package was launched in 2018 by the PES to develop basic job search skills and social skills of long-term unemployed jobseekers and provide training exercises. Exercises are of a practical nature and involve trainees in the training process. At the end of the two-week training, work-related social skills are assessed and communicated to the PES. The scheme has been piloted in five districts, and was planned to be extended across Albania in 2019 to provide training to over 20 000 unemployed jobseekers (which would represent 12% of the unemployed and 28% of registered unemployed according to Labour Force Survey data) (Prime Minister's Office, 2019<sub>[122]</sub>). Facilities and IT equipment have been provided and staff trained. In 2019, NAES started to implement the Start Smart package in all Vocational Training Centres with GIZ support. In 2019, 12 327 unemployed jobseekers, mainly young people, participated in Start Smart courses, a strong increase from 2018 but below the announced objective.<sup>90</sup>

Participation in continuous training for work-related or non-work related issues stood at 10% in 2016, well below the EU average of 30% (Eurofound, 2019<sub>[123]</sub>).<sup>91</sup> While 32% of highly-skilled people participated in such training, only 2% of the low-skilled did (INSTAT, n.d.<sub>[124]</sub>). Participation rates in formal and non-formal training are highest among the 25-34 age group. More efforts could be made to upskill the low-skilled and to increase continuous training among prime age and older workers.

### *Sub-dimension 8.3: Job quality*

In terms of **quality earnings**, the Ministry of Finance and Economy is responsible for setting the minimum wage nationwide for full-time workers; social partners are only consulted, whereas in EU countries, social partners are generally equal partners (Country Economy, 2021<sub>[125]</sub>). The minimum wage was ALL 26 000 per month or EUR 213 in 2019, which was 50% of the average wage, up from 46% in 2015 (INSTAT, n.d.<sub>[126]</sub>). The minimum wage is increased only sporadically, but increases are significant each time. In 2019, the real minimum wage was increased by 8.3% (WIIW, World Bank, 2020<sub>[127]</sub>). In 2019, Albania and Serbia had the highest ratio of minimum wage to average wage in the region.<sup>92</sup> It would be advisable to carry out a study of the potential impact of the minimum wage on informality, and on its potential to prevent poverty in low wage sectors – such as manufacturing, construction, trade and agriculture (where the minimum wage represents between 58% to 70% of the sector's average wage) – and occupations, such as plant and machine operators, crafts workers, elementary occupations, service and sales workers, and skilled agricultural workers (the minimum wage represents between 79% and 87% of wages earned in these occupations).<sup>93</sup> The percentage of workers earning a gross monthly wage 60% below the average gross income in Albania was 44.7% in 2017 (Jorgoni, 2019<sub>[108]</sub>). Labour inspections carried out in 2018 indicate that 26% of employees are declared as being paid the minimum wage, which is a relatively high level. Albania relies on administrative tax data on wages. Although the Labour Force Survey (LFS) does contain questions on wages, INSTAT does not publish any wage data based on the LFS or make them widely available except for empirical research. INSTAT does not show rural and urban disparities either (Jorgoni, 2019<sub>[108]</sub>; European Commission, 2019<sub>[79]</sub>).

Despite the high minimum-to-average wage ratio, wages can be considered to be low and Albania risks getting trapped in a low wage-low productivity cycle (EBRD, 2020<sub>[128]</sub>). A key challenge is to increase productivity further. Low wages are also a factor contributing to in-work poverty. While in-work poverty declined between 2012 and 2018, it is still high at 38.7% in 2018 (Jorgoni, 2019<sub>[108]</sub>). Data indicate that individuals with low educational attainment, those in informal or part-time employment, those residing in large households with young children, and those in low-wage jobs face a significantly higher risk of in-work poverty (Borgen Project, 2020<sub>[129]</sub>; Macrotrends, 2021<sub>[130]</sub>).

In terms of **policies to promote female employment**, Albania has made substantial progress in increasing women's activity and employment rates over the past decade. The employment rate of women aged 15-64 years increased from 45.5% in 2015 to 54.4% in 2019 (INSTAT, 2020<sub>[102]</sub>), which is 11.9

percentage points above the WB6 average, though still 8.9 percentage points below the EU average. While in 2019 women's activity rate was the highest in the region (10 percentage points above the WB6 average), it was still 7 percentage points below the EU average and 3.7 percentage points below the average of the five south-eastern EU countries which may serve as a reference for Albania (Bulgaria, Croatia, Hungary, Romania and Slovenia).

In 2019, the employment rates were highest for highly skilled (69.0%) and low-skilled women (52.9%), pointing to labour market segmentation for female employment as well (WIIW and World Bank, 2020<sup>[103]</sup>; INSTAT, 2020<sup>[102]</sup>). Despite the high unemployment rate of highly educated women (13.6% in 2019), their employment prospects are better than for medium educated women (15.5%) (INSTAT, n.d.<sup>[131]</sup>). Nevertheless, the unemployment risk for female graduates from tertiary education is a major concern, in particular in the light of reported skills shortages.

The employment gap, measured as the difference between the male and female employment rate, decreased between 2015 and 2019 from 15 to 13.8 percentage points. The Ministry of Health and Social Protection and Institute of Statistics of the Republic of Albania have prepared a gender equality index, a measure for monitoring progress in gender equality, following the European Institute for Gender Equality (EIGE) methodology (EIGE, 2017<sup>[132]</sup>). **Albania scored 60.4 points in the gender equality index, which is below the score for North Macedonia (62), but above the scores for Montenegro (55) and Serbia (55.8).** The 2019 EU average is 67.4 (MoHSP, 2020<sup>[133]</sup>).

In 2019, Albania's gender wage gap was 10.1%, and thus below the EU average (14.1% in 2018).<sup>94</sup> A study of women's position in the construction industry, a largely male-dominated industry, shows that women typically work either in elementary occupations or as professionals, while men typically work as skilled crafts workers.<sup>95</sup> The share of women with tertiary education in the industry was much higher than for men. Despite the higher educational level of women within the construction sector, in 2018 the gender pay gap was 10.6% (INSTAT, 2020<sup>[134]</sup>). One possible explanation for this above average wage gap is the fact that a high share of men are self-employed, while women tend to be employees. Another explanation is that women tend to be overqualified in elementary occupations. A higher share of women than men are employed in the agricultural sector, many of whom work as unpaid family members. Poor working conditions for women in the textile and footwear industries, where they lack proper labour protection and social protection, is an issue (90% of those employed in this industry are women) (European Commission, 2018<sup>[135]</sup>).

In order to guarantee the implementation of labour legislation with a special focus on women, the State Inspectorate of Labour and Social Services signed a memorandum of co-operation with the Public Procurement Agency on 14 June 2019. It aimed to guarantee the implementation of the Labour Code, respect for gender equality in employment, women's rights in labour relations and awareness by economic operators who submit bids in the public procurement process.

The main policy area to promote women's employment is the active labour market policy implemented by the PES. Progress has been made to train staff of labour offices in gender equality issues.<sup>96</sup> Half of the registered unemployed are women, as well as 62% of participants in active labour market programmes. The National Agency for Employment and Skills also implements one targeted programme, the employment promotion programme for single mothers with dependent children and child-mothers (MoHSP, n.d.<sup>[136]</sup>). Civil society organisations specialised in providing services to specific groups of women play an important role in improving women's role in employment and paid work.<sup>97</sup> For example, they facilitate information provision, and provide vocational training courses in the workplace as well as employment mediation.<sup>98</sup> Here, co-ordination with government institutions has improved. A key remaining challenge is the lack of childcare facilities. Recent changes to the Labour Code aim to support work-life balance for working parents but there is no monitoring of the implementation of these changes (European Commission, 2019<sup>[79]</sup>).

Legislative amendments have been adopted to improve the employment and workplace environment for women, defining and reversing the burden of proof in cases of sexual harassment (European Commission, 2019<sup>[79]</sup>). However, implementation of the law remains questionable. Few cases of sexual harassment are reported and there is a lack of knowledge and awareness about harassment, a lack of trust in institutions, and a lack of training for employers and managers of institutions (People's Advocate, 2017<sup>[137]</sup>).

An advisory group for co-ordinating and monitoring the implementation of the Action Plan for Women Entrepreneurs (2014-2020) was mandated to bring together and co-ordinate women's entrepreneurship actions among public, private and non-government institutions. In practice, however, the advisory group – which consists of seven ministries, the Institute of Statistics and the Bank of Albania – has convened only four times and has not met since the lead ministry, the Ministry of Economic Development, Tourism, Trade and Entrepreneurship was dissolved in September 2017. Only small-scale programmes have been implemented in recent years to promote women's entrepreneurship (OECD, n.d.<sup>[64]</sup>).

#### *Sub-dimension 8.4: Activation policies*

The modernisation of the **public employment services (PES)** and a reorganisation of services provided at local and regional level is underway, as set out in the Employment and Skills Strategy 2019-2022. According to the strategy, the new system of employment services will begin operating in the course of 2021. The objectives of the strategic document are in line with international good practice, although important details need to be defined, such as key performance indicators, the concrete design of the performance management and human resources development plans, and concrete plans for the provision of services through various channels. A new information system for job matching is under construction based on skills related to the profession (European Skills/Competences, qualifications and Occupations ESCO), and a manual for jobseekers and employers on how to use related tools is being drafted. Work has started to design and implement a statistical profiling tool of the unemployed (taking into account factors such as age, gender, educational level, job qualification, literacy skills, etc.). The intensity of counselling will be based on segmenting the unemployed by their difficulty of being placed (with interviews varying between 25 and 60 minutes) and potentially lead to drawing up individual action plans. These are important steps in moving towards a more advanced **active labour market programme (ALMP)**. The number of registered job vacancies increased between 2017 and 2018 but declined between 2018 and 2019 (according to registered data provided by the PES).

While efficiency gains can be expected through a new IT system, individualised counselling and follow-up of the unemployed – who often face severe and multiple employment barriers – requires sufficient staff capacities, as do services provided to employers. As the number of registered unemployed has fallen significantly, caseloads for employment counsellors have improved since 2013. However, the caseload of nearly 300 registered unemployed people per counsellor is still high, given that roughly two-thirds of the unemployed are long-term unemployed (64.3% in 2019 according to LFS data – although only 48% of registered unemployed were long-term unemployed in August 2019).<sup>99</sup> Recent improvements have been made, more than doubling the number of staff at the central level in 2020. Staff capacities need to be increased at local level as well, and staff trained in the skills needed for comprehensive guidance and follow-up for jobseekers with employment barriers, for conducting skills assessment (which is for now largely based on occupational categories) and for providing employer related services.

The strategy envisages dedicated employer services being set up. It would be important for these employer services to be proactive and offer not only placement services but also a range of counselling services to employers, e.g. to reduce their staff fluctuation, identify skills needs and support SMEs that lack human resource management skills. The reforms should be implemented rapidly and progress assessed regularly in order to improve service delivery.

Target groups for active labour market programmes are in principle well defined. There is a strong focus on youth, vulnerable groups and groups on the margin of the labour market (including Roma and Egyptian

communities), which is relevant given the high level of poverty and exclusion of vulnerable groups in Albania. It seems that progress in the implementation of vocational rehabilitation is being made with a more comprehensive approach, although the number of participants is low. ALMPs have been continuously introduced, but only a limited percentage of the unemployed participate in these schemes (5.5% in 2017) and funding has remained low and has not increased since 2015 (ILO, n.d.<sup>[138]</sup>). Objectives of training programmes include developing the basic skills (reading and writing) of unemployed jobseekers with low qualifications. Progress in implementing training for low-skilled adults should be regularly monitored and the scale and scope of the programmes assessed.

A number of ALMPs are targeted at young people, including employment incentives such as 12-month social security exemption for converting an informal employment relationship into a formal employment contract, and 6-month wage subsidies for helping young graduates to enter the labour market; a new public works programme (“community employment”, paying half the minimum wage); on-the-job training programmes and apprenticeships; and a new training programme for self-employment. The outcomes of these new programmes should be thoroughly monitored.

An unemployment benefit scheme is in place, but only 1.6% of the unemployed receive benefits (WIIW and World Bank, 2020<sup>[103]</sup>). The duration of unemployment benefit depends on previous contribution history, with a maximum of 12 months for those having contributed for 10 years or more and for the older unemployed. The unemployment benefit level is however not linked to previous earnings – instead a lump sum is set at 50% of the minimum wage and supplements are paid for families with children. The unemployment benefit level is low compared to the OECD average of 66% of previous in-work income (OECD, 2020<sup>[139]</sup>). This limits the effectiveness of unemployment benefits in rendering formal employment attractive, and could in principle make “envelope wages”<sup>100</sup> appear attractive. Most registered unemployed receive income support, including coverage by health insurance, which is another incentive to register with the PES.

The number of jobseekers registered at the PES receiving either unemployment benefit (around 10%) or social assistance (economic aid, 90%) more than halved between 2015 and August 2019 (from 65 456 to 24 401), according to administrative data provided by the government. Yet the number of unemployed decreased only by 25% over the same period (from 224 000 in 2015 to 165 000 in 2019 according to Labour Force Survey data). The reasons for the stronger fall in the number of registered unemployed should be analysed, and could be linked to improved placement, increased sanctioning, or increased underemployment. In 2019, 64.3% of the unemployed were long-term unemployed and this situation had not changed much since 2017; in previous years decreases in the numbers of long-term unemployed were more significant (WIIW and World Bank, 2020<sup>[103]</sup>) and (INSTAT, n.d.<sup>[140]</sup>).

Among the registered jobseekers who were placed into employment in 2018, only roughly 10% were, or had been, beneficiaries of the economic aid schemes. Some progress has been made in placing jobseekers from the Roma and Egyptian communities into ALMPs and into jobs, but more progress is needed overall. Although placing vulnerable groups is not an easy task, this outcome indicates that activation efforts for economic aid beneficiaries need to be improved. Integrating vulnerable groups into the labour market requires a comprehensive approach and close co-operation between employment and social services, as good practice from EU countries shows (Konle-Seidl, 2020<sup>[141]</sup>; Duell et al., 2018<sup>[142]</sup>). The co-ordination between social welfare agencies and local PES is poorly developed and would need to be improved. Most importantly, social care services remain insufficient and underdeveloped.

Supported by the World Bank, a reform of social assistance (economic aid) was rolled out economy-wide at the beginning of 2018, introducing in-work benefits by extending social assistance eligibility to people in low-paid employment, those receiving a modest income from household agricultural activity in rural areas, or those receiving other forms of social protection benefits (such as pensions or disability benefits) (Jorgoni, 2019<sup>[108]</sup>). While the introduction of in-work benefits reflects international good practice (Immervoll and Scarpetta, 2012<sup>[143]</sup>; Jimeno et al., 2012<sup>[144]</sup>), the level of social assistance, currently at less than one-third

of the minimum wage, remains low. It is recommended to evaluate the impact of this reform. A recent act foresees welfare benefits for the self-employed who lost their jobs due to the COVID-19 pandemic, in line with praxis of some EU Member States (Duell, 2020<sup>[145]</sup>).

The employment promotion programmes (EPPs) implemented in 2015-16 were evaluated in 2018, highlighting the need to revise EPPs and change how they are implemented. A working group has been set up to improve ALMP design. Future evaluations should also pay attention to the quality of employment in order to design strategies for sustainable labour market integration. For instance, linking the level of wage subsidies to the minimum wage may see jobseekers placed mainly in low-wage jobs (Jorgoni, 2019<sup>[108]</sup>).

#### *Cross-cutting sub-dimension: Informality*

The share of informal employment among the 15-64 age group was 37.5% in 2019 (including specific forms of solo self-employment or self-employment in micro-enterprises) (INSTAT, 2020<sup>[134]</sup>).<sup>101</sup> While informal employment had decreased between 2015 and 2018, the incidence of informal employment increased by 1.5 percentage points between the second quarters of 2018 and 2019 (WIIW and World Bank, 2020<sup>[103]</sup>). Albania is the only economy in the WB6 region to have seen such an increase in informal employment during this period. Labour inspectorates only identified about 3 000 cases of informal employment. There has been no proper campaign since 2017 to fight informality. The whistle-blower directive for informality in the private sector that was announced by the government in 2017 was heavily criticised by all stakeholders, and was also raised as an issue by employers in the National Labour Council as it creates a conflictual situation between employers and employees.<sup>102</sup>

In 2014, the pension system was reformed to strengthen the contribution-based pension element. This should increase the incentives to be formally employed. A new active labour market programme has been introduced recently to set incentives to convert informal employment contracts into formal ones (providing exemption from social security contributions for 12 months – see above). However, it is too early to assess the impact of this measure. Salaries below ALL 30 000 are exempt from income tax.<sup>103</sup> This should in principle lower the incentive for workers to take up informal employment, yet informal employment is still widespread.

#### *Cross-cutting sub-dimension: Brain drain*

Within the WB6 region, the outflow of populations is highest in Albania, with 2.2% (62,000 people) of the economy's overall population migrating mainly to the EU, mostly to Italy and Greece (WIIW and World Bank, 2020<sup>[103]</sup>). Between 2015 and 2019, the number of emigrants increased by 6%.<sup>104</sup> In 2018, 38 703 people emigrated (INSTAT, 2021<sup>[1]</sup>). Emigration rates for both high-skilled and low-skilled people are high, and above the average for the region (Herbert, Capuano and Marfouk, 2013<sup>[146]</sup>). A survey of the emigration potential of young people indicates that Albania has the highest rate of the WB6: 43% of young people responded that they would like to move to another country within the next six months (Lavric, 2021<sup>[147]</sup>). Employment opportunities and higher earnings are by far the main reasons for young people to emigrate.

The World Bank LinkedIn Digital Data for Development show that Albania has mainly lost technical skills through migration in the area of computer networking, web development, data storage technologies and telecommunications, affecting not only the ICT sector but also banking, higher education and international affairs. Within the region, Albania is the economy that has experienced the largest losses of business management, people management and problem-solving skills (WIIW and World Bank, 2020<sup>[103]</sup>). These skill sets are vital for running modern businesses. Brain drain is currently reported to be an issue also for the healthcare occupations (doctors, nurses, physiotherapists).<sup>105</sup>

Albania implemented the Brain Gain Programme from 2006-2011, which aimed to integrate the highly skilled and scientific diaspora into Albania's socio-economic development through their involvement in the

transformation of public administration, higher education, science, and the business sector, as well as to instigate the return of diaspora professionals (Predojević-Despić, 2021<sup>[148]</sup>). However, the impact of that programme was limited (Gëdeshi and King, 2018<sup>[149]</sup>; UNDP Albania, n.d.<sup>[150]</sup>). Experience from India shows that it may take quite some time for the links to the diaspora to result in brain circulation and brain gain (ILO, 2019<sup>[151]</sup>). Currently, the only policy in place is to include return migrants as a target group for ALMPs, but this mainly relates to the low-skilled.

In 2018, remittances contributed to nearly 10% of GDP. As a consequence of the COVID-19 pandemic, remittances are likely to diminish due to travel restrictions preventing the return of migrants (World Bank, 2020<sup>[152]</sup>; OECD, 2020<sup>[153]</sup>; World Bank, 2019<sup>[154]</sup>).

### ***The way forward for employment policy***

Key efforts needed to advance in the employment dimension relate mainly to strengthening the institutional capacities of a variety of government and other actors at both the national and local level to implement regulations effectively, to increase transparency in monitoring of working conditions and wages and to deepen labour market analysis. In particular:

- **Do more to strengthen social partners' role in tripartite social dialogue, including on setting the minimum wage.** This would also include making a regular assessment of labour inspectorates' capacity to detect remuneration below the minimum wage and informal employment. An assessment of the impact of the minimum wage on informal employment and on poverty reduction should be conducted.
- **Increase the capacity of labour inspectorates to detect informal employment and child labour and tackle poor working conditions.** This includes training labour inspectorate staff, issuing clear guidelines, increasing the number of labour inspectors, increasing resources for making on-site visits across the territory, modernising equipment, making use of monitoring results to steer activities and improving methods of risk assessment. Labour inspectorates should also expand their implementation of preventive measures. The activities foreseen in the employment and skills strategy related to labour inspectorates should be implemented. A comprehensive and publicly available monitoring system is needed of working conditions, including child labour, the results of which can feed into policy. Improved co-operation between relevant stakeholders is also key for detecting poor working conditions (Box 20.11).
- **Evaluate the implementation of the cross-sectoral Strategic Document for Occupational Safety and Health 2016-2020 and its action plan, which aim to strengthen institutional capacities.** Draw conclusions on measures that were effective and those which were not, as well as on challenges and gaps remaining.
- **Launch awareness-raising activities targeted at employees and employers to pursue continuing training and to set adequate financial incentives for continuing education and upskilling of the medium and lower skilled.** This would involve offering adequate financial incentives and targeting low-skilled, prime age and older workers as well as SMEs for participation in adult learning. Other OECD countries have introduced individual learning accounts (OECD, 2019<sup>[155]</sup>), have set in place an infrastructure for guiding adults in their upskilling pathway (see e.g. Qualifica centres in Portugal), and implemented programmes to upskill low-skilled adults and supported companies to do so (OECD, 2019<sup>[156]</sup>). In order to increase the employment of women, more efforts are needed to implement flexible working time schemes to reconcile work with family lives and to expand quality child care facilities. Efforts to co-ordinate activities with civil society organisations should be continued.
- **Continue efforts to improve local social services for vulnerable groups and to develop close co-operation between social and employment services.**

- **Do more to understand the drivers of informality among workers (differentiated by men and women) and employers in order to design adequate policy responses.**
- **Co-ordinate policies to encourage the return of medium and high-skilled people to Albania**, to promote start-ups and open up business branches, and to encourage ties with the highly skilled abroad, e.g. through co-operation in research. At the same time, it is necessary to offer employment opportunities, in particular to higher educated young people and to improve the quality of jobs. Encourage investments into the economy using remittances. Help skilled workers who have gained experience abroad to find good living and working conditions when coming back.

### Box 20.11. Strategies for combating undeclared work

In Norway, co-operation among relevant agencies has been formalised to detect and combat undeclared work. An internal database to facilitate information exchange between joint offices was created in December 2016. In addition, a National Interagency Centre for Analysis and Intelligence was set up to undertake national threat assessments for joint strategic measures against economic crime, for example by delivering intelligence reports, which should help decision makers to analyse cross-national trends.

In the Netherlands, the “chain approach” tackles labour exploitation in the cleaning sector. It involves a two-fold strategy, including raising awareness among businesses who hire cleaning companies, and a prevention strategy focused on changing attitudes to undeclared work in the sector. It has resulted in a decline of cleaning companies working undeclared in the Netherlands.

Note: Economic crime, also known as financial crime, refers to illegal acts committed by an individual or a group of individuals to obtain a financial or professional advantage. The principal motive in such crimes is economic gain **Invalid source specified.**

## Science, technology and innovation (Dimension 9)

### Introduction

Albania has made substantial progress in this dimension since the previous assessment (Figure 20.1). With an average score of 1.8 (Table 20.14), it performs somewhat better than some regional peers, such as Bosnia and Herzegovina and Kosovo, but scores below the Western Balkan six average, falling significantly behind the regional innovation leaders. Improvements have been made in particular with regards to the overall STI system, but further efforts are needed to consolidate recent policy changes and generate real long-term impact.

**Table 20.14. Albania's scores for science, technology and innovation**

Dimension	Sub-dimension	Score	WB6 average
Science, technology and innovation dimension	Sub-dimension 9.1: STI system	2.2	2.4
	Sub-dimension 9.2: Public research system	1.9	2.0
	Sub-dimension 9.3: Business-academia collaboration	1.1	1.6
Albania's overall score		<b>1.8</b>	<b>2.1</b>

### State of play and key developments

Overall, science, technology and innovation in Albania could benefit from significant improvements. The Government of Albania has taken several steps to improve the overall performance of the sector in recent years. However, despite some increases, the overall investment in research and development (R&D) remains systemically low, at 0.06% of GDP. Lack of reliable and systematically collected statistics on STI outputs makes it challenging to assess the progress and impact of policy measures.

#### *Sub-dimension 9.1: STI system*

Albania has a well-developed **STI strategy**. The National Strategy for Scientific Research, Technology and Innovation (2017-2022) is well designed and meets international best practice, setting policy objectives for improving the regulatory and institutional framework for STI, supporting business-academia collaboration and enhancing international co-operation. A Smart Specialisation Strategy (S3) is in the process of being defined. The roadmap for the S3 process was drafted and the mapping phase is ongoing with EU support, with the quantitative phase almost completed and the qualitative one to be launched soon. However, there is little evidence that much progress has been made in achieving the objectives of the national STI strategy as a number of structural, financial and staffing issues identified during the previous assessment cycle remain unaddressed.

The **institutional framework** to oversee and implement STI policy remains a key obstacle to effective policy implementation. Following major restructuring in 2017, the National Agency for Scientific Research and Innovation (NASRI) was established, which is mainly responsible for implementing STI policies jointly with the Albanian Investment Development Agency (AIDA), Albanian SME Agency, and Innovation Fund. Focus and collaboration between the two implementation agencies, NASRI and AIDA, remain somewhat uncoordinated. In addition, three ministries are responsible for overseeing various aspects of the STI framework, but without a formal co-ordinating mechanism in place. This has resulted in overlapping responsibilities, inefficient budgeting and a lack of clear ownership of the implementation of STI policies and goals.

STI policy is embedded in a comprehensive **regulatory framework**. Legislation to regulate intellectual property (IP) was developed with EU assistance, and additional reforms to strengthen IP legislation are expected to enter into force at the end of 2020. While there is evidence that the regulatory framework is being implemented, a number of key commitments have not been met. For example, although the

intellectual property strategy includes commitments to establish technology transfer centres and a legal framework governing business-academia collaboration, neither have been achieved. Similarly, administrative activities and programmes still lack adequate funding to achieve their objectives within the policy framework, limiting the capacity of government officials to fulfil their duties in an effective and co-ordinated way. Therefore, enforcement of STI legislation, and IP in particular, remains questionable.

Promoting **international collaboration** is a key aspect addressed in the STI framework, which actively encourages participation in international research facilities and other initiatives. However, there is little evidence of concrete actions supporting these objectives or of significant progress in this policy area since the previous assessment cycle. While Albania has participated in the Horizon 2020<sup>106</sup> framework since its founding, very few Albanian firms (including just one SME) have participated in the programme successfully. Indeed, applicants from Albania have the lowest success rate (8.72%) of any economy participating in Horizon 2020, though there has been a more positive trend in recent years (European Commission, 2020<sub>[158]</sub>). Although Albania is not a full member of Eureka,<sup>107</sup> it participates in the network through a national information point (NIP) and appears to be making progress in formalising its membership in the programme. Finally, Albania's continued participation in the Western Balkans Enterprise Development and Innovation Facility (WBEDIF) has helped to further efforts to support international technology acquisition among Albanian firms. However, further efforts are needed to strengthen the knowledge economy to support uptake of more sophisticated international innovation financing products.

Albania has identified **alignment with EU STI policy** and the EU *acquis communautaire* as strategic priorities and incorporated them into its relevant STI strategies. The economy has formally adopted the European Research Area<sup>108</sup> (ERA) roadmap and is making efforts to achieve ERA priorities, such as gender equality in scientific research and innovation, among others. Although Albania participates in EURAXESS<sup>109</sup> and has an operational country page, national job listings are not currently published on the platform and only one higher education institution (University of Vlore) has adopted the EURAXESS charter and code. Albania is already actively engaged in European Cooperation in Science and Technology (COST),<sup>110</sup> however, further efforts could be made to improve networking with European partners to facilitate international collaboration. Albania does not participate in the European Innovation Scoreboard due to the limited availability of STI-related statistics, and initiatives to actively promote open science are limited.

### *Sub-dimension 9.2: Public research system*

The public research system in Albania has seen moderate gains since the previous assessment, and the STI policy framework explicitly promotes scientific excellence. Specifically, the **institutional structure of the public research system** has benefitted from stronger institutional co-ordination and oversight. A new Law on the Academy of Sciences was adopted in September 2019, aiming to increase the integrity of the scientific research system. However, it has not yet been decreed by the President of Albania. Similarly, a new Law on Scientific Research and Innovation has been finalised but is still pending adoption. The establishment of a new Quality Assurance Agency for Higher Education (ASCAL) in 2017 has strengthened quality assurance at higher education institutes (HEIs) and research and development institutes (RDIs), which undergo regular self-assessment based on a harmonised methodology and a new Quality Code. There is solid institutional co-ordination between ASCAL and sub-national government bodies to ensure the consistent application of public research regulations and initiatives. However, the economy reports that ASCAL and other relevant government agencies lack sufficient funding and resources to achieve their objectives and execute their responsibilities. Likewise, despite an initiative to conduct an initial mapping of Albania's research infrastructure in 2018, the economy has not yet developed a roadmap to develop a research infrastructure.

The STI framework includes the explicit goal to increase investments in scientific research and development to 1% of GDP by 2022, compared to just 0.06% of GDP in 2018. Despite a significant three-

fold increase in **public research funding** between 2018 and 2020 (to reach approximately EUR 1.8 million), the public research system remains systemically underfunded and Albania still lacks a clear methodology for funding for research, development and innovation. Albania does not currently collect data on gross domestic expenditure on research and development (GERD), although the system is funded from a combination of institutional and performance-based sources. A new Financing Model of Public Institutions of Higher Education and Scientific Research, approved in 2018, introduced an updated but incomplete funding system for HEIs and RDIs. According to the system, institutional funding is allocated based on an institution's national ranking and through competitive grants, with the latter being distributed through NASRI in line with international best practice. However, insufficient evidence was provided to demonstrate that they are fully operational (this would require estimates of the number of competitive grants, the percentage of successful applications for competitive grants and other key indicators).

Albania is increasingly affected by brain drain. Since the previous assessment cycle, the government has implemented measures to foster **human resources for research and innovation**. Nevertheless, the actions taken remain scattered and insufficient to overcome major shortcomings in the development of human resource capacity in research and innovation. A range of programmes has been established since the previous assessment cycle to develop researchers' skills, including on proposal writing, applying for research programmes, and project management, which is an important step in recognising and addressing shortcomings in this policy area. Notably, efforts to leverage the Albanian research diaspora are increasing and initial work is underway to create a platform for brain circulation. In addition, in 2020, the decision was made to re-accredit doctoral programmes, which had previously been suspended for five years due to their poor academic quality and widespread plagiarism. There is currently no initiative in place to make research careers more attractive, yet programmes supporting young researchers that facilitate participation in international research are seeing growing uptake, leading NASRI to develop increasingly ambitious targets for the desired number of researchers and institutions benefitting from such programmes. In contrast, there is little support for domestic researcher mobility, either within academia or between research institutions and the business sector, and Albania's participation in the Marie Skłodowska-Curie Actions (MSCA)<sup>11</sup> continues to be limited, with only three Albanian research organisations having benefitted to date.

### *Sub-dimension 9.3: Business-academia collaboration*

The promotion of business-academia collaboration is incorporated in Albania's National Strategy for Scientific Research, Technology and Innovation (2017-2022), yet little progress has been made to date to implement this. Financial incentives remain limited, with no innovation vouchers or competitive grants available to spur business-academia collaboration. Likewise, human resource policies in HEIs provide no incentives for researchers to participate in collaborative initiatives with the business sector. There is little evidence that the economy has acted to change the incentive structure to encourage business-academia collaboration since the previous assessment cycle.

The overall **collaboration promotion framework** is weak, most notably due to the absence of clear or measurable objectives for co-operation between the business community and academia, as well as substantial budgetary limitations. However, a collaboration-promotion framework is currently being developed, with policy makers consulting stakeholders and conducting a pilot programme. This is expected to be complemented by a Law for Scientific Research and Innovation, scheduled to come into effect in 2021. In addition, there have been some efforts to improve communication and raise awareness of available tools and opportunities among relevant stakeholders in business and academia, particularly with regards to opportunities under Horizon 2020 and on intellectual property. However, the impact of these measures is yet to be shown. Albania has also participated in regional networking events to establish a technology transfer office.

Overall, incentives for business-academia collaboration remain underdeveloped and ineffective due to inadequate funding and demand from relevant stakeholders. Although national STI strategies, particularly

the OECD-led Triple Helix Action Plan, contain well-designed provisions to strengthen **financial incentives for collaboration**, the vast majority of these provisions have not been implemented since the previous assessment cycle. The voucher scheme was suspended in 2016 due to a lack of funding. Furthermore, while the introduction of innovation vouchers was envisaged under the Triple Helix plan, the initiative was again abandoned amid lack of buy-in from local stakeholders. AIDA, which hosts Albania's Innovation Fund, has operated a voucher scheme assisting SMEs to innovate since 2018. However, the scheme does not explicitly focus on business-academia collaboration. Likewise, there are no competitive co-operative grants available, and a focus on research is not prioritised within Albania's public procurement process. Some HEIs recognised as innovation support organisations have benefited from donor funding for innovative or collaborative projects, such as business incubators, although such financial incentives remain limited.

Similarly, **non-financial incentives for collaboration** remain largely nascent, and there is no clear governance framework in place to develop any policies or measures. Despite mobility schemes being included in the 2017-2021 Action plan to support the development of innovative policies based on the Triple Helix approach, efforts to develop targeted mobility schemes to increase exchanges between academia and businesses are still needed. Likewise, there are no incentives for researchers to collaborate with businesses during research activities, as performance is purely based on conventional assessment criteria such as the number of publications and citations. While the General Directorate of Industrial Property (GDIP) provides services that support patent counselling and commercialisation of intellectual property, and discussions with the European Patent Office to facilitate patent applications by Albanian SMEs are ongoing, there is no support available for patenting or commercialisation through research-industry co-operation. Commitments to draft a legal framework specifying the rights and obligations of actors participating in business-academia collaboration have previously been made. However, no evidence of such a framework was provided by the economy. Despite these shortcomings, Albania has increased efforts since the previous assessment cycle to support communication and awareness raising of business-academia collaboration. Educational and networking events are reportedly organised regularly for a broad range of stakeholders from across society.

There have been no major changes to **institutional support for business-academia collaboration** since the previous cycle, when Albania reported having no key action plans or policy frameworks in place. There is little evidence that the economy has taken concrete action to develop such a policy framework. Since the previous assessment cycle there have also been no activities to monitor or expand the physical or institutional infrastructure to support business-academia collaboration, though Albania is in the initial stages of developing a first Technology Transfer Office with EU support. Currently, there are no other facilities in place to bring about greater business-academia collaboration. Previous research suggests that there are currently five technology transfer services operating in the agricultural sector, and one technology institution operating in Tirana.

### ***The way forward for science, technology and innovation***

Albania is striving to improve its national STI system and has taken important steps forward. However, ambitious plans must be informed by reliable data and supported by cohesive cross-government co-ordination and funding. Measures to further enhance STI policy implementation may include the following:

- **Prioritise implementation of the existing STI policy framework.** Albania has a well-designed STI strategy and action plan informed by international best practice that target important policy objectives. However, little progress has been made to implement these ambitious goals. Streamlining the governance of the STI framework and defining roles and responsibilities of implementation bodies could help achieve meaningful progress towards meeting its STI policy objectives.

- **Finalise the development of the Smart Specialisation Strategy.** If designed well and linked to a targeted action plan and funding, the S3 strategy would be an important tool to complement and accelerate implementation of the existing STI framework.
- **Increase investment in public sector research.** In line with its own goal to increase investments in research to 1% of GDP, Albania should consider expanding the range of financial incentives for business-academia collaboration. Investments in the scientific research system would make the profession more attractive, leading to higher quality of research outputs in the medium to long term.
- **Expand data collection to support evidence-based STI policies.** Current statistical collection practices leave key gaps in STI-related data that limit the extent to which policy implementation can be monitored effectively. This prevents Albania from participating in key international initiatives such as the European Innovation Scoreboard. Participation in the OECD's STIP Compass database would be an important opportunity to develop statistical data collection through expert guidance to meet international best practice.
- **Improve the incentive structure to encourage academia and businesses to seek co-operation with each other.** Organising more events to bring the various communities together and raise awareness is an important step. Likewise, the economy could re-introduce innovation vouchers to create financial incentives for innovation.

## Digital society (Dimension 10)

### Introduction

As shown in Table 20.15, Albania scores slightly above the Western Balkan average for digital society indicators. With increased efforts to develop broadband infrastructure and a solid regulatory framework, the economy has achieved an above-average score for the access sub-dimension. It also ranks third among the WB economies for use, and second for the society sub-dimension. However, Albania has an average score for the trust sub-dimension, and scores below average for jobs.

**Table 20.15. Albania's scores for digital society**

Dimension	Sub-dimension	Score	WB6 average
Digital society dimension	Sub-dimension 10.1: Access	3.2	2.9
	Sub-dimension 10.2: Use	2.5	2.4
	Sub-dimension 10.3: Jobs	2.0	2.3
	Sub-dimension 10.4: Society	2.5	2.1
	Sub-dimension 10.5: Trust	2.2	2.2
Albania's overall score		<b>2.5</b>	<b>2.4</b>

### State of play and key developments

In 2018 the ICT industry's contribution to GDP was 2.9%, which increased further during 2019.<sup>112</sup> However, the industry faces a deficit of highly skilled ICT professionals, which is linked to the gap between the skills developed by the education system in Albania and those needed by the labour market. In 2017, the Ministry of Innovation and Public Administration, which had covered the entire spectrum of IT development and information society services in Albania, ceased to exist and its responsibilities were transferred to the National Agency for the Information Society (NAIS) for digitalising the public administration, and to the Ministry of Infrastructure and Energy for broadband development. Since then, the NAIS has been transformed into the focal point for e-government development in Albania, directly managing and supporting all IT staff across the public sector. The implementation of the Digital Agenda 2015-2020 has demonstrated positive results, particularly in terms of public administration digitalisation and proliferation of e-services on the e-Albania portal. A revised Digital Agenda action plan for the next period was approved by the Council of Ministers in December 2020. The government's interoperability platform supports 53 public institutions to deliver e-services and exchange data. In 2019, the platform registered a 35% activity increase, a trend that was boosted by the COVID-19 pandemic, resulting in a 100% increase in 2020. While current use rates of e-Albania services are increasing, low computer literacy amongst the over 60s and the fact that 40% of the population resides in rural areas where Internet penetration is still very low, create a digital divide that needs to be urgently addressed.

#### *Sub-dimension 10.1: Access*

**Broadband infrastructure** has been significantly improved through the implementation of the National Broadband Plan (NBP) for 2013-2020, although the fixed broadband penetration rate in 2019 was still low at 15.6% of the population and 58% of households, as compared to more than 35% of population in the EU (ITU, 2019<sub>[159]</sub>). While the number of fixed broadband subscribers increased by 20% from 2018 to 2019, a significant urban-rural divide exists (penetration is 36% in Tirana but only 7% in rural Shkodra) (AKEP, 2019<sub>[160]</sub>). Broadband speeds can now reach 1 Gigabit per second (Gbps), but the majority of subscribers (55%) have speeds of 4-10 Megabits per second (Mbps). On the other hand, the NBP 2013-2020 promoted 4G investment in mobile network infrastructure, leading to a 56% increase in investment to reach the record figure of about ALL 6.35 billion (approx. EUR 51 million) in 2019. This demonstrates that policy implementation over the last few years has improved the relevant legal and regulatory framework, creating

an enabling environment for private sector investments. The new NBP for 2020-2025 was approved in June 2020 to continue the economy's work towards its ambitious broadband connectivity targets. The NBP 2025 foresees strengthening the capacities of the institutions responsible for developing broadband at the central and local (municipality) level. It aims to close the digital divide in Albania, not only through broadband infrastructure development, but also through ensured affordability and proliferation of e-services. It also promotes the establishment and operation of a Broadband Competence Office (BCO), taking into consideration that a Thematic Group on Telecommunications and Broadband was created in February 2019 to provide horizontal co-ordination among public bodies and relevant external stakeholders.

The NBP 2025 was based on a feasibility study and cost-benefit analysis (CBA) performed by the Ministry of Infrastructure and Energy, with the support of an EU and Western Balkans Investment Framework (WBIF) technical assistance programme, the Regional Broadband Infrastructure Development project,<sup>113</sup> which was completed in July 2020.<sup>114</sup> The study illustrates the needs, options, and financing structure for rural network development in Albania. Based on the feasibility study, the government will secure a EUR 24 million loan from the European Investment Bank (EIB) for implementing the NBP, which includes further regulatory and organisational reforms to improve the existing framework for broadband infrastructure development. The Ministry of Finance and Economy has already adopted the guidance for state aid for broadband infrastructure development, in accordance with the EU framework, during Q4 of 2019. The broadband ATLAS was created by the national regulator, the Electronic and Postal Communications Authority (AKEP), and is continuously updated to ensure an extensive and realistic visual mapping of the existing backbone infrastructure and backhaul, including existing ducts and other passive elements. The ATLAS supports the implementation of the right of way in electronic communications, facilitating broadband infrastructure investments, promoting the co-ordination of civil works and sharing existing infrastructure of (other) utilities to reduce the cost of broadband deployment. The Ministry of Infrastructure and Energy is also implementing a second project, the Digital Balkan Highway, which is supported by the World Bank and aims to investigate whether it is possible to improve regional interconnectivity in the Western Balkans through infrastructure sharing of the optical fibre ground-wire installed over the years by local energy utilities (World Bank, 2017<sup>[161]</sup>). The ministry has also developed a draft 5G Roadmap and Strategy for Albania (the Expert Report: 5G Strategy for Albania).

Albania has fully aligned its **ICT regulatory policy framework** with the EU 2009 regulatory framework. The regulator AKEP is fully staffed and has the resources to perform its responsibilities, which is reflected in the active improvement of the regulatory framework through adjustments that support private sector investments in communications infrastructure development. For example, the Law on the Development of High-Speed Electronic Communication Network of 2016 promotes shared use of existing physical infrastructure and a more efficient development of new physical infrastructure (other utility networks included). The Regulation on the Implementation of the General Authorization Regime of 2017 promotes competition, encourages investment in networks and services for electronic communications, and enables the protection of subscribers' and users' rights. Albania also signed the Regional Roaming Agreement in April 2019, progressively reducing roaming charges among WB economies by July 2019 and eventually leading to the elimination of roaming charges by July 2021 (European Commission, 2020<sup>[162]</sup>). AKEP regularly monitors the market, publishes reports with data and relevant indicators, and implements regulatory impact assessments of each proposed regulation.

Albania developed a policy framework for **data accessibility** in 2015, but since then implementation has proceeded at a relatively slow pace. The Policy Document for the Implementation of Public Open Data and the Creation of the Open Data Portal, adopted in 2015, promotes data openness and re-use of public sector data, as well as basic legislation on creating open data portals. However, the Law on Open Data and the Re-use of Public Sector Information, which transposes Directive (EU) 2019/1024, is still pending adoption.<sup>115</sup> The National Agency for Information Society (NAIS) has created the government open access portal - the Open Government Data Portal of Albania<sup>116</sup>, where data sets are being published by public institutions, as well as the Partnership for Open Government Initiative (PQH/OGP) portal.<sup>117</sup> On a positive

note, the number of datasets available in the former have increased from 17 in 2018 to 101 in 2020. The NAIS provides co-ordination and technical for support interoperability, which is delivered via the so-called Government Gateway that enables data exchange among all public institutions. Albania has been actively implementing the Open Government Partnership<sup>118</sup> (OGP) action plans, but the dissolution of the Ministry of State for Innovation and Public Administration in September 2017 greatly affected continuity of implementation of the 2016-2018 action plan (Vurmo, 2019<sub>[163]</sub>). (Vurmo, 2019<sub>[163]</sub>) also observed that public participation in the implementation of the OGP action plans was weak or even completely absent, while the multi-stakeholder forum, OpenAlb, that facilitated civil society participation in the 2016-2018 OGP action plan, has been inactive since December 2016. However, a new OGP Action Plan 2020-2022 has been developed through a consultative process co-ordinated by the Deputy Prime Minister and the Development and Good Governance Unit within the Office of the Prime Minister. A regulatory impact assessment (RIA) “light system” was adopted in 2018 with a formal requirement for implementation for every legislative proposal, but its implementation has been progressing slowly (European Commission, 2019<sub>[79]</sub>). Some practical implementations are now appearing, such as the RIA prepared for the new law on open data, which was reviewed by independent experts. However, there was no realistic participation by citizens and businesses in the process.

### *Sub-dimension 10.2: Use*

Albania embarked on **digital government** development in 2013 and has demonstrated strong commitment to transforming public administration through digitalisation and other significant reforms. Aiming to reduce the enormous bureaucracy of the state, the government pledged not only to digitalise its services, but also to reduce the number of associated documents required to complete any citizen’s application by re-engineering government processes. It now ranks 59<sup>th</sup> out of 193 countries monitored by the UN in the e-Government Survey 2020 (United Nations, 2020<sub>[164]</sub>). To underpin this transformation, the government re-organised the National Agency for Information Society (NAIS) in 2017 (Box 20.12). With NAIS spearheading its digital government transformation, the e-Albania portal was created and connected to the Government Interoperability Platform which allows interaction between 53 public institutions’ electronic systems. An action plan for 2020 was agreed with these institutions, aiming to eliminate over-the-counter public services, replacing them with complete online-only public services with a single application point on e-Albania.

The e-Signed Documents Circulation System was also set up for document exchange between public institutions (more than 139 institutions were interconnected in 2020). As of December 2020, 1 021 online public service applications were working (out of around 1 400 services in total). All documents required to complete these services, except personal declarations and private sector documents, are gathered in e-sealed format by the institutions themselves. Although the government planned to provide more than 90% of all public services online on the e-Albania portal by the end of 2020, achieving this promise will require further work during 2021 (United Nations, 2020<sub>[164]</sub>). While 373 e-services currently enable the entire administrative procedure to be completed online, 648 only enable application submission, while the actual document or licence needs to be picked up by the citizen or business over the counter. As of December 2020, the e-Albania platform counted more than 1.7 million registered users, of which almost 760 000 were new users added during the COVID-19 pandemic.

### Box 20.12. Co-ordinating a whole-of-government digital transformation

The National Agency for Information Society (NAIS) is the core institution in Albania for the digitalising the government and its services to citizens, businesses and public sector employees. It is responsible for co-ordinating government work in the information and communication technology (ICT) area and the e-services government portal (e-Albania.al). NAIS promotes new technologies, connecting systems to the Governmental Interoperability Platform, and drafts strategies and policy implementation plans for e-Government and the information society. It is the co-ordinating regulatory authority responsible for the state databases and electronic signature services in Albania.

Since 2017, based on the Decision on the Reorganization of the National Agency for Information Society (NAIS), the information technology (IT) staff of line ministries and institutions are under the organisational chart of NAIS, although they are physically employed in the premises of those institutions. Their role is to support the employees of the respective institutions in their daily IT activities, namely in using the IT systems and tools for public administration and managing the e-services provided by their institution. This close co-ordination mechanism that directly connects centralised NAIS staff to all decentralised IT staff across the economy, has enabled service standardisation and boosted e-service quality.

NAIS is primarily state funded and employs more than 330 people, more than 90% of whom are highly skilled technical staff. The main challenge that they face is modernising the legal and regulatory framework and changing public officials' mindsets while they attempt to redesign and reform public administration processes through ICTs. The top-level government and high-ranking public officials have been strong supporters of online services and digitalisation. In 2018, NAIS prioritised the list of ICT projects needed to improve the e-government infrastructure in Albania and during 2019, approximately 30 systems were either created or upgraded in collaboration with the respective institutions.

Source: National Agency for Information Society (NAIS).

NAIS has performed extensive capacity building for public sector officials, primarily to change mindsets towards the new digital government system. It has trained 2 000 civil servants working over the counter on how to use the new systems and how to assist citizens on the e-Albania portal. NAIS maintains all information systems and digital government portals, and evaluates and acts on anonymised surveys conducted by external stakeholders on the quality of services on the e-Albania portal. It has also implemented the Public Consultations Portal,<sup>119</sup> where all draft legal acts are published for open consultations; and the co-governance platform Albania We Want,<sup>120</sup> which assists and supports citizens stuck in the bureaucratic labyrinth. This has proved to be an effective tool for combating the lack of transparency and accountability in public administration. Reports are published on individual institutions' websites, and NAIS provides centralised reports on the progress of digital government development.

Programmes to support **private sector ICT adoption** have not been prioritised, although policy documents like the Digital Agenda and the National Strategy for Development in principle promote SMEs' adoption of ICTs. Some indirect support for buying ICT equipment has been provided through the Innovation Fund. Under the scope of the fund's main objective to foster innovation and support innovative start-ups, it co-finances technology audits, purchase of software and hardware, and capacity building in ICT. However, the impact of this type of support, and other innovation funding programmes, is limited by the small number of beneficiary companies (e.g. only 62 companies are Innovation Fund beneficiaries). There are no programmes promoting e-commerce or e-business in Albania to boost ICT adoption by companies. According to a 2020 survey by the Albanian Institute of Statistics, although 28% of enterprises employ an ICT specialist, which is higher than the EU average (19% in 2019), only 45% of enterprises had a website (the EU average was 77% in 2019) and the majority (89%) used it mainly to publish product catalogues or price lists (INSTAT, 2021<sub>[165]</sub>). Also, 12.8% of enterprises were involved in e-commerce activities in 2020.

As the EU average in 2018 was 20%, this indicates that the e-commerce environment is still underdeveloped (INSTAT, 2021<sub>[165]</sub>).

### *Sub-dimension 10.3: Jobs*

Basic **digital skills for students** are developed in the primary and secondary education system, in line with relevant objectives in the Digital Agenda 2015-2020 policy framework. The National Pre-University Curriculum Framework, developed by the Institute of Educational Development, identifies digital competence as one of seven key competencies to be developed in general education and vocational programmes. The Institute for the Development of Education is the main government body for developing ICT curricula for schools, as well as teacher training and qualification testing on ICT curricula and competencies. Indicators of digital skills for students are not systematically monitored or reported. Although a minimum level of digital skills is required to pass to the next level in secondary education, the main hindering factor is the low level of broadband Internet connections in schools and the lack of computers for students. According to Regional Cooperation Council (RCC) data, availability of Internet connections in schools was as low as 4.8% of schools in 2017 in Albania, although recent efforts have improved the situation (RCC, 2020<sub>[166]</sub>). In 2020, 1 255 schools (approximately 25%) have Internet connections at speeds slightly above 10Mbps.

The lack of digital skills in the economy negatively affects both the demand and supply of digital products. It also undermines the potential of digitalisation to create employment and generate positive spillovers to other sectors of the economy, in particular services such as tourism. The development of **digital skills for adults** is not yet fully integrated into VET systems or lifelong learning programmes. Although the Digital Agenda makes specific reference to digital skills, and the National Employment and Skills Strategy 2019-2022 emphasises the development of skills that match labour market needs in its specific objectives, there is still a wide gap between youth skills and market needs. The National Agency for Education, Vocational Training and Qualifications (NAVETQ) is responsible for promoting the Electronic Platform for Adult Learning in Europe (EPALE) as well as matters related to the National Qualifications Framework and VET information management system. The donor-funded Skills Development for Employment (SD4E) Programme (UNDP, 2020<sub>[167]</sub>) has implemented a complete skills' needs analysis (including 2 560 enterprises covering all sectors of the economy) and supported the Ministry of Finance and Economy on the new VET Law and related regulatory framework in an effort to improve the overall quality of VET services and the development of skills for employment. A decision on the criteria and procedures for inclusion of lifelong learning qualifications in the levels of the Albanian Qualifications Framework was adopted in 2019. During the COVID-19 pandemic, VET schools were instructed to conduct online distance learning through various commercial or free platforms and guidelines were developed to support administrative issues for the online teaching process and tips on distance learning and student assessment.

Albania has not allocated sufficient resources to **ICT sector promotion**, particularly for the IT sub-sector, despite its recognised growth potential. Although policy documents like the Digital Agenda 2015-2020 and the National Strategy for Development and Integration 2014-2020 focus on re-using open public data, developing electronic services and digitalising public administration, no specific focus is placed on strengthening the domestic IT industry, even though it could support the effective implementation of these strategies. On the other hand, the growth of the communications sub-sector is realistically supported through the National Broadband Plan and the improved legal and regulatory framework that facilitates private sector investments in network infrastructure development. The ICT industry can benefit from government-funded programmes common to all sectors of the industry, like the Competitiveness Fund, the Innovation Fund, other programmes for innovation start-ups (e.g. TechSpace<sup>121</sup>) and R&D grants provided by the National Agency for Scientific Research and Innovation. However, aside from financial support programmes, ICT industry stakeholders report that finding or training highly skilled ICT professionals is difficult and retaining them is even harder, since brain drain heavily impacts this industry. On the upside,

ICT sector companies benefit from a reduced profit tax rate (5% instead of a 20% nominal tax for all other sectors). The ICT industry suggests that tax incentives and social security reliefs would also be beneficial for retaining talent.

#### *Sub-dimension 10.4: Society*

Although there is no specific policy document that provides a **digital inclusion framework**, some aspects are addressed by the Digital Agenda 2020 and the new National Broadband Plan for 2020-2025, which includes a strategic objective to reduce the digital divide through rural broadband infrastructure projects. On top of increasing broadband penetration, the digital transformation of the public administration and e-government services development also provide a realistic opportunity for increasing digital inclusion. Provisions have been made for citizens who are unable to apply online for e-services to get support from trained employees at local post offices or ADISA<sup>122</sup> counters. Moreover, the Strategy for Social Protection 2015-2020 included a target for developing an integrated information system for financial aid and social services for people with disabilities.

Obligations for web presentation of public sector bodies based on e-accessibility standards were enacted in 2019 and evidence suggests that progress has been made with its practical implementation (e.g. functionalities based on World Wide Web Consortium standards for e-accessibility are now embedded in ministries' websites). However, the framework doesn't adequately promote certification schemes based on accessibility requirements and standards for ICT product and services. On the positive side, several multi-user information systems (MISs) have been created for social services during the last few years, such as the MIS for Economic Aid (application and eligibility process for the economic aid and disability payment), the National Register for Persons with Disabilities, the Integrated MIS for Social Services (application and eligibility process for social service payment), the Rome Alb (the database system which includes inter-sectorial data for the Roma people) and the Revalb (electronic system operated at the local level which records domestic violence). The implementation of most of these MISs was supported by donors. A database for digital inclusion indicators has not been created, but some data on Internet use by age, gender and location are monitored by the Institute of Statistics, while broadband penetration indicators are monitored by the Electronic and Postal Communications Authority (AKEP).

#### *Sub-dimension 10.5: Trust*

The framework for digital **privacy protections** is not completely aligned with the current EU framework. The existing Law on Personal Data Protection (PDP) was originally adopted in 2008, and the preparation of a new law that transposes the EU General Data Protection Regulation (EU 2016/679) started in October 2020 through an IPA-funded project.<sup>123</sup> The new law, which will also transpose the Police Directive (EU 2016/680), will be ready for adoption in the last quarter of 2021. The Law on Electronic Communications also includes a chapter on e-privacy based on the Privacy and Electronic Communications Directive (2002/58/EC). The existing framework includes several by-laws and regulations for online privacy protections, including the most recent Instruction on certification of information security management systems, personal data and their protection, which was adopted in 2018. The Information and Data Protection Commissioner (IDP Commissioner) has prepared a draft law on ratifying the 2018 Protocol amending the Convention for the Protection of Individuals with regard to Automatic Processing of Personal Data, which is not yet adopted. Moreover, the draft act on amendments to the Law on the Right to Information, including the European Commission's recommendations to transform the Commissioner's decision to an executive title, obliging its execution by all public administration officials, has been prepared but is still to be submitted to parliament. While the IDP Commissioner's office publishes annual reports on data protection activities on their website (including data on PDP, complaints, inspections and objections), they have insufficient resources for public awareness raising and professional training and depend on donor support for such activities. On a positive note, in November 2020, the Commissioner's Office was approved to employ 7 new staff members, raising the total number to 44.<sup>124</sup> In its annual report for 2019,

the Commissioner confirms that public authorities are becoming more transparent (voluntary data disclosure), even though more work is required in terms of information content and quality.

The Commissioner's office has organised the Privacy App competition to design a smart phone application that enables individuals to file a complaint from their smart phones in case of any violation or misuse of personal data. The IDP Application (for Android OS) is already available. The Commissioner's Office also continued implementing various awareness-raising activities on the right to information and data protection in 2020. In the context of measures to address the COVID-19 pandemic, the IDP Commissioner has strengthened the personal data protection framework by adopting three guidelines in 2020:

1. Guidelines on the protection of personal data in the context of measures taken against COVID-19 (20.03.2020).
2. Guidelines on the processing of personal data in specific sectors within the measures against COVID-19 (06.04.2020).
3. Guidelines on the processing of personal data in accordance with the COVID-19 Hygiene and Sanitary Protocols (04.05.2020).

These contain important guidance for employers on complying with the principles and legal criteria for processing personal data in the context of emergency measures taken against the spread of the coronavirus that require continuous monitoring of employees' health conditions. These instructions aimed to regulate employees' personal health data processing in quantity and qualities that – reasonably – exceed the usual processing of data during normal working conditions. Processing includes not only collecting and storing processed health data, but also transmitting it to law enforcement bodies tasked with combatting the pandemic, including bodies authorised by law to conduct epidemiological surveillance. The IDP Commissioner stipulated that the processing of personal data of the respective data subjects may last only as long as the purpose of the processing exists. Consequently, with the disappearance of the coronavirus pandemic, any controller (including employers and law enforcement bodies) is obliged to delete or destroy the personal data processed in this framework. Personal data controllers must remain aware of the importance of respecting the principles of proportionality and data minimisation when processing personal data. In the case at hand, this means that information processed should be adequate, relevant and limited to what is necessary to achieve the specific purpose of preventing or mitigating the spread of the virus.

Despite the guidelines and efforts of the IDP Commissioner, there have been complaints that the media has repeatedly breached privacy rules on citizens' personal health data during this period, including releasing names of deceased persons and pictures from the morgue of Tirana during late 2020. Such actions have often been the subject of debate and discussion on social media platforms. The Office of the IDP Commissioner has examined 315 complaints since the pandemic began, namely between March 2020 and February 2021.

Insufficient legislation on **consumer protection in e-commerce** and its lack of promotion by the government hinder the development of e-commerce in Albania. Internet purchases are not popular among the population, either due to the low use of credit cards, low purchasing power or the high cost of shipping. Additionally, many online merchants do not ship to Albania. The ICT survey by the Institute of Statistics indicated that only 10.1% of individuals ordered or bought products and services online during 2019, compared to an EU average of 60% (INSTAT, 2019<sup>[168]</sup>). In 2016, the government lowered the duty-free amount from EUR 150 to 22, which significantly reduced cross-border online shopping. Recently, efforts have been made to prepare the transposition of the EU regulation on cross-border parcel delivery services (2018/644/EU), which is expected around June 2021. The basic framework for consumer protection in e-commerce consists of a number of laws and regulations that require improvement, including the law on e-commerce and the law on consumer protection, which is aligned to the EU Directive on consumer rights (2011/83/EU). The inter-sectoral Strategy on Consumer Protection and Market Surveillance 2020 contains some elements regarding e-commerce. The Consumer Protection Commission (CPC) is the competent

authority for law enforcement in e-commerce, but according to their reports, very few complaints about e-commerce have been filed. There are no indicators on consumer protection in e-commerce that are regularly monitored by a state body. Some e-commerce indicators are collected within ICT use surveys by the Institute of Statistics, but they do not address consumer protection. The implementation of the framework is weak in offering opportunities to consumers to access consumer education information and advice, as well as how to file complaints related to e-commerce. The draft Action Plan for Development of Electronic Commerce 2021-2024, still to be adopted by the Council of Ministers, is expected to address some of the current issues in the field of e-commerce, including consumer protection.

The **digital security risk management** framework is based on the Digital Agenda and the National Strategy for Cybersecurity 2020-2025, adopted in December 2020; as well as the Law on Electronic Signatures (2008); the Law for Electronic Identification and Trusted Services (2015), which partly transposes the eIDAS Regulation (EU 910/2014),<sup>125</sup> and the law on Cybersecurity (2017), which partly transposes the NIS Directive (EU 2016/1148). The Authority for Electronic Certification and Cybersecurity (AKCESK) supervises the implementation of the legal framework. The AKCESK has been the national computer emergency response team (CERT) since 2017, and maintains the central registry of cybersecurity incidents and the list of Critical Information Infrastructure (CII). It also incorporates the former National Authority for Electronic Certificates, performing supervision and control of the provision of e-signatures services, meaning that it registers, accredits and supervises the Certificate Service Providers. It is currently in the process of becoming a Full Member of the global Forum of Incident Response and Security Teams (FIRST) and has acquired accredited member status in Trusted Introducer. It has already signed MoUs for co-operation with other CERTs in the Western Balkans. AKCESK is also responsible for monitoring and collecting data on cybersecurity. However, AKCESK is challenged by a lack of human, technical and financial resources, which has kept the national CERT, AL-CSIRT, from becoming fully operational and has only marginally allowed for capacity building and cybersecurity exercises to be conducted. On a positive note, the new structural organisation of AKCESK was approved in January 2020, which formally established the AI-CSIRT and opened the way for hiring seven new staff members, two of whom were hired by the end of 2020. Another welcome development was a wide Internet safety awareness campaign<sup>126</sup> during 2018 and 2019 in 15 schools in 7 regions, in which 312 children were trained as peer educators and an additional 15 000 children took part. This activity falls under the adopted National Action Plan of Child Online Safety 2017-2020.

### ***The way forward for digital society***

Despite some important steps to improve the digital society policy framework, the government of Albania should pay more attention to the following aspects:

- **Accelerate the adoption of open data and data re-use legislation and strengthen the demand for open data innovation through inclusive co-creation processes.** Although the policy framework and open data platforms are in place, proliferation of published datasets is slow, the general public has not been widely engaged and the level of informed public debate on data-driven issues remains low. The government would need to raise public awareness, build capacities of public officials and develop public-private partnerships on open data innovation for the creation of e-services and applications for citizens and businesses.
- **Improve the legal framework on e-commerce and e-business and promote private sector ICT adoption through financial support programmes.** Design targeted programmes for SMEs to enable digitalisation of a large number of companies from all industry sectors. Chambers of Commerce could help assess the type of support needed and select appropriate financial schemes (such as subsidies or tax relief) for purchasing software/hardware and staff IT training, while promoting business process transformation through e-commerce and e-business development.

- **Provide adequate public investment for developing the digital skills of students and adults, in parallel to increasing Internet connectivity and ICTs for schools.** Access to broadband communication services, functioning computers and digital education aids need to be ensured for every school and every student in the economy. IT curricula, progressing from basic to advanced digital skills, need to be designed with support from the ICT industry. VET education and IT curricula also need to be updated to improve quality and improve students' digital skills for employment. Employment services could work with the ICT industry to design training programmes that address the needs of the labour market. Public capacity-building programmes at municipality level should also be implemented to empower citizens, so that they can fully enjoy the benefits of digitalisation in public administration.
- **Adopt accessibility requirements in public procurement of ICT products and services and create corresponding certification schemes.** Digital inclusion policies need to ensure that an ICT product or service is considered accessible when it can be used by all its intended users, given that a person's ability to use technology may be impaired by various physical, sensory, emotional or cognitive disabilities. Related policies need to ensure accessible ICTs as a powerful enabler of people's ability to participate in every aspect of modern life.
- **Design a programme for consumer protection in e-commerce that realistically promotes consumers' education or guidance and builds trust in e-commerce.** Consider conducting widespread awareness campaigns that educate the public on their rights and how to exercise them in e-commerce transactions. Provide online guides for consumers and e-traders and build consumer trust in e-commerce. The programme would also need to address legal and regulatory shortcomings (e.g. regarding e-payments, taxation and banking sector practices), improve protection against fraudulent or misleading practices and privacy abuse issues, and introduce dispute resolution and redress mechanisms in e-commerce. The programme would also need to prescribe regular monitoring of e-commerce and consumer protection indicators.

## Transport policy (Dimension 11)

### Introduction

Since the last Competitiveness Outlook (CO) assessment (2018), the main transport policy improvements made by Albania concern transport vision and transport project selection. Only moderate efforts have been observed in road safety, even though Albania declared 2020 as the Year of Road Safety. Policy progress in the railway sector has stagnated. Albania's performance in the transport dimension is the second best in the region and above the Western Balkan six (WB6) regional average (Table 20.16), but further efforts are still needed to achieve the EU average. Sub-dimension 11.1 on planning scores above the WB6 average, and Albania has the most developed transport project selection system of all economies in the WB region. Sub-dimension 11.2 on governance and regulation is in line with the WB6 average, while sub-dimension 11.3 on sustainability has a low score both for Albania and the other WB6 economies, which is explained by the low scoring for the road safety strategy, environmental sustainability and combined transport strategy indicators.

**Table 20.16. Albania's scores for transport policy**

Dimension	Sub-dimension	Score	WB6 average
Transport policy dimension	Sub-dimension 11.1: Planning	3.3	2.3
	Sub-dimension 11.2: Governance and regulation	2.5	2.6
	Sub-dimension 11.3: Sustainability	1.5	1.3
Albania's overall score		<b>2.5</b>	<b>2.0</b>

### State of play and key developments

#### *Sub-dimension 11.1: Planning*

Since the last CO assessment, Albania has continued to follow its **transport vision** in the Sectorial Strategy for Transport (SST) and its action plan for 2016-2020. It takes a holistic policy-making approach that considers the transport model, multimodality and tourism policy. Various consultations with public institutions, implementation agencies and NGOs were held during the strategy development process. Roles and responsibilities are clearly allocated amongst institutions. The SST is aligned with the National Development and Integration Strategy 2015-2020, which has also identified priority transport projects. In total 43 priority actions were identified in the SST across all transport modes for the five-year period, including 144 tasks, with implementation plans and allocated budgets, covering a balance between soft measures and investments, and meeting the criteria of relevance, effectiveness, efficiency, consistence, coherence, utility, sustainability, and monitoring defined within the SST. Implementation is proceeding well. According to the SST's latest monitoring report (MIE, 2019<sub>[169]</sub>) and additional data provided by the government, over 80.5% of the tasks have been completed, 10.7% have not been completed and the remaining 8.8% have not started yet.

In February 2019 the Technical Secretariat and Thematic Groups on transport, energy, telecommunication and broadband were established; their human and financial capacities are sufficient to execute their tasks to identify, select and prioritise projects for the development of the transport strategy. This accomplishes one of the very important tasks defined within the SST action plan. They are responsible for implementing the SST and its action plan, as well as renewing the Single Project Pipeline (SPP).<sup>127</sup> The Technical Secretariat is made up exclusively of Ministry of Infrastructure and Energy (MIE) representatives, which is not an ideal setup when the SST covers so many different fields (environmental, social, tourism, budgeting, etc.). It is recommended that representatives from the other relevant ministries be involved in this secretariat too. Meanwhile, some other high-level decision groups (Integrated Policy Management Group, formed in 2015, and the inter-institutional working group for monitoring the implementation of the SST) do

include representatives from different ministries (Ministry of Finance and Economy, and other implementation agencies depending on the agenda). Until 2019, transport-related strategic documents were always aligned with the European Commission Staff Working Document (CSWD) on EU Enlargement Policy. With a new CSWD issued in October 2020 (European Commission, 2020<sub>[19]</sub>), it is expected that the new SST (as the existing strategy expired in 2020) will have to also be fully aligned with the latest CSWD. The MIE has secured the necessary financial support from the EU Delegation in Tirana to develop the SST and its action plan for the period 2021-26, which is expected to be finalised by mid-2021.

The Albanian National Transport Plan (ANTP) serves as a transport master plan, and was adopted by the government in 2017 (MIE, 2017<sub>[170]</sub>). It is updated every four years. The second revision of the ANTP, i.e. the 3<sup>rd</sup> ANTP covering the period 2019-2023 (MIE, 2020<sub>[171]</sub>), was approved in 2020, prioritising the projects from the SST (i.e. SPP) using the transport model. The new SST for the period 2021-2026 should be aligned with all the latest strategies and plans (e.g. ANTP3, and the Strategy for Application of Intelligent Systems in the Road Transport adopted in June 2020 – a new multimodal strategy that is expected to be finalised in 2021, etc.). The new national transport strategy should incorporate lessons learned from the monitoring of the previous SST implementation and ensure all activities are implemented. However, it remains to be seen to what extent such lessons will be used to inform future strategy updates.

A new governance tool developed in 2020 to support integrated policy, strategy implementation and monitoring,<sup>128</sup> should be implemented in each spending department of the institutions funded by the state budget, such as financing and economy, procurement, information technology (IT), etc. Its current implementation level is not entirely known, however. Some legislation has been adopted as a result of the strategy (as presented for each of the transport modes below), but it is not clear to what degree it is harmonised with the EU's Transport Community Treaty (TCT) (EUR-Lex, 2017<sub>[172]</sub>) since the data are not available for all required fields. The exception is the trans-European Transport Network (TEN-T) development (50% transposed and implemented, and 50% partially transposed and implemented).<sup>129</sup>

There has been co-operation with other WB economies (Greece, Kosovo, Montenegro and North Macedonia) to exchange experiences on transport planning, as per the previous CO's recommendations, especially through cross-border co-operation programmes for transport facilitation, tourism promotion in border areas, employment, etc. Co-operation also occurred during the development and review of the ANTP (with Croatia, Greece, Italy and Slovenia). The exchange of good practice included joint planning through the Transport Community Permanent Secretariat's (TCPS's) Technical Committees. All these activities need to be expanded to other WB economies on a regular bilateral basis and intensified, as the proper development of transport vision and planning leading to a single and competitive regional transport market can only be ensured through regular regional discussion involving the implementation agencies.

Since the last CO assessment, Albania has significantly progressed in developing the legislation needed to improve **transport project selection** and project implementation, supported by the financial management information system. New guidelines for procedures, preparation, presentation and reporting of annual financial content in general government units have been adopted. In addition, a Decision for procedures for public investment management has been adopted; the methodology sets out comprehensive, weighted criteria for project selection. The brand-new horizontal governance tool, described above, is expected to improve institutional co-ordination across ministries and implementing agencies, with the main purpose of following up implementation of the SST, and monitoring expenditure. Within the project selection process, each project in the SPP process has to be developed based on the EU Guide to Cost-Benefit Analysis of Infrastructure Projects (European Commission, 2013<sub>[173]</sub>), including assessing the environmental and social impacts and safety. A prioritisation process is applied to all projects in the SPP process. The government claims that affordability is taken into account within the prioritisation framework, but clear explanations with good practice examples of transportation affordability were not available. A straightforward methodology is needed for assessing whether projects are affordable to the wider population and to Albania's economy.

*Ex post* monitoring is conducted annually by the technical assistance services contracted by the Delegation of the European Union in Albania within the last five years, and the prioritisation framework is updated based on this monitoring. According to the government, *ex post* monitoring by local institutions is also planned, but there were no reports available at the time of writing. Results of monitoring and evaluation analysis inform policy framework design and implementation updates as per OECD good practice, and the methodology based on the OECD Development Assistance Committee (DAC) Rio Markers for Climate Handbook<sup>130</sup> has been applied.

Since the last CO assessment, the Law on Public Procurement (2018) has been upgraded, with some amendments to tackle corruption,<sup>131</sup> and is partially aligned with the EU Directive for improving the effectiveness of review procedures concerning the award of public contracts (Directive 2007/66/EC). The amendments to the Law on Concessions (2019) prescribe the unification of award procedures for road concessions/PPPs with all other concession/PPP procedures. The procurement process is applied to all transport projects funded through the state budget. Both **implementation and procurement** processes are followed through the financial management information system. *Ex post* evaluation of the implementation and procurement processes is done for projects funded from both national and international funds, and the lessons learnt have been incorporated into amended legislation mentioned above. The amendments cover flexibility, self-initiated tariff raising by the concessionaire for container terminals, and withdrawal of the procurement procedure due to unfair and discriminatory processes for road construction and airport concession processes. These help to create a favourable legal framework to attract foreign investors.

The roles and responsibilities of the government bodies involved in procurement and implementation procedures are well-defined, and human and financial capacities are adequate for the tasks assigned to the institutions and implementing agencies carrying out the activities. National bodies (e.g. national audit offices) oversee the procurement and monitoring of PPPs. The MoF and the ATRAKO are responsible for concession/PPP projects. Co-operation with other WB economies is established in project implementation and procurement, and good practices are being shared and applied where possible (e.g. the development of one-stop shops<sup>132</sup> at the railway border crossing point with Montenegro, and at the road border crossing points with Montenegro and Kosovo). Implementation strategies for all transport modes exist and are followed according to the mid-term budget programme. If the project is funded through international financial institution (IFI) funds, IFI procurement procedures are applied. The procurement procedures are consistently monitored.

Albania still has much to achieve in developing an **asset management system** (OECD, 2001<sub>[174]</sub>),<sup>133</sup> though very good progress has been noted in the road sector since the last CO assessment (see below). An asset management system does not exist for every transport mode. Some efforts have been made to establish an asset management system as described in the Preparation of Maintenance Plans 2018-2022 for Road/Rail TEN-T indicative extensions to WB6 (CONNECTA, 2018<sub>[175]</sub>), which represents the strategic framework for roads and railways. However, the asset management system has not been successful (e.g. the GIS and database were not being updated regularly). This Maintenance Plan has been adopted in 2020 and represents the strategic framework for roads and railways.

A successful action for the asset management system was to develop the road database (RDB) in 2000-02, which was populated with inventory data collected through visual surveys and GPS co-ordinates (for the roads' axes).<sup>134</sup> However, this was only updated until 2009 and again in 2016, so it cannot be used as the main reference to assess the areas where the return on investment will be the greatest. The World Bank Project Results-based Road Maintenance and Safety Project (World Bank, 2017<sub>[176]</sub>) has entered into its third year of implementation. The project covers routine and periodic maintenance of about 1 333 kms of Albania's main roads through Output and Performance-based Maintenance and Rehabilitation (OPRCs). Once the assignment is complete Albania will have established a road asset management system (RAMS\_ portal), road database, reference system, pavement management system (PMS), bridge management system (BMS), and road maintenance management system (RMMS). It will also have

prepared an annual network roughness and surface distress data collection plan, determined average vehicle fleet characteristics, and evaluated current features of the road database related to the management and evaluation of recurrent maintenance activities and proposed improvements. When complete, it will equip Albania with all the necessary tools to plan road asset management comprehensively. Once the system is developed, national financial sources for the sustainability of the system should be secured.

Railway infrastructure asset (RIA) inventory data should be collected by the Infrastructure Manager, but they are either non-existent, not stored in a digital format or often outdated. The RIA inventory should include periodic monitoring of the conditions of infrastructure assets. An ongoing project funded by the EBRD to develop the railway asset management system was launched in February 2020.

The asset values have been incorporated into the new Albanian Financial Management Information System (AFMIS), which is quite innovative as it is the only single information system in the region that will contain all asset values.

Traffic flow data are not regularly monitored. An IFI-funded survey in 2006-10 used 1 000 traffic counters. These data are related only to the primary road network.

### *Sub-dimension 11.2: Governance and regulation*

Since the last CO assessment, regulatory reforms have continued at a steady pace in the field of **aviation regulation**. The Single European Sky (SES) I package has been fully transposed and implemented, though SES II regulations have not been fully transposed yet. Albania is an associated member of the BLUEMED Functional Airspace Block (FAB), which aims to avoid national fragmentation as it affects safety, limits capacity, and above all, adds to cost. The Airport Charges Directive is an important piece of EU legislation guiding the way charges should be set and monitored. They should be based on non-discrimination and transparency principles set by the EU, and quality standards related to the service-level agreements for services provided at the airport. The Airport Charges Directive has been transposed and implemented in Albania.<sup>135</sup> The market is monitored regularly by the Albanian Civil Aviation Authority (ACAA), but information on the monitoring scope, depth and frequency is not available. An air traffic management plan has been developed and monitored regularly through the Local Single Sky Implementation Monitoring (LSSIP) (EUROCONTROL, 2019<sub>[177]</sub>).<sup>136</sup> Safety culture,<sup>137</sup> covering safety risk assessment and safety assurance, has been adopted.

Air traffic is growing in Albania. The total number of passengers transported from all airports increased in the period 2017-19 by approximately 27%, amounting to 3.34 million passengers. This is a very good achievement in comparison with the global and EU averages, which increased respectively by 11.7% (IATA, 2020<sub>[178]</sub>) and 4% (EUR-Lex, 2014<sub>[179]</sub>) over the same period. Given the significant growth of this transport mode and its projected importance for the economy, it is important that Albania continues regulatory reforms and brings the governance of the aviation sector closer to European standards and international best practices. The Albanian Government is ready to promote higher tourism growth, and its impact will be assessed in the new national transport strategy for the period 2021-2026. The Sustainable Tourism Strategy (2019), promoting stronger economic growth and easier access to accommodation infrastructure, was recently adopted. Therefore, a positive trend in air passenger transport is expected due to potential tourism growth.

Some positive alignment efforts have been noticed in the **railway regulation** sector in Albania since the last CO assessment, but significantly more efforts are needed to align legislation with the TCT. The Law on the Railway Code has initiated rail reforms in accordance with the TCT. Structural reforms have been adopted, as well as proposals to establish national bodies, such as the Railway Regulatory Agency, National Safety Agency (NSA), National Accident and Incident Investigation Authority (NAIIA), Railway Licencing Agency (RLA), and an independent Infrastructure Manager (IM) from Railway Undertakings (RU), the entity in charge of maintaining rail vehicles. The RLA has been in existence since 2018, but its

funds are limited. The proposed NSA will take over the operations of the Railway Inspection Directorate. The budget for this transformation already exists. Rail reforms are monitored on a quarterly basis and monitoring reports are published annually. The latest available is for 2019, and covers network inspection, legal framework, controls for the infrastructure manager and railway undertakings, inspector monitoring, rail safety, as well as administrative and financial fields. The new NAIIA is proposed to jointly cover the rail and sea sectors. It was proposed in 2019 to unbundle operations from the IM but is yet to happen. Draft legislation for the access reforms was prepared but not yet adopted by the government due to institutional and financial issues (budgets for the new institutions are not approved through the medium-term budget plan).

The SST defines the framework for rail freight corridors but Regulation (EU) 913/2010 on Rail Freight Corridors has not yet been transposed. Regulation (EU) 1371/2007 on Rail Passenger's Rights and Obligations has been partially transposed through the new Railway Code. There is a new regional Rail Action Plan (TCPS, 2020<sub>[180]</sub>), endorsed by the Ministerial Council of the TCPS in October 2020, covering the period 2020-23. However, the actions related to rail market opening, passenger rights, border/common crossing operations, interoperability, governance and modernisation are not yet available. An overview of the results achieved on alignment is expected soon. A Network Statement (NS) was issued for 2019, but only for infrastructure – not for service facilities. Directive (EU) 2012/34 on establishing a single European railway area states that operators of service facilities that are not controlled by the infrastructure manager must supply information on charges for gaining access to the facility and for providing services. Interoperability Directive EU 2016/797 (EUR-Lex, 2016<sub>[181]</sub>) is partially transposed into the Law on Railway Code. Albania has already advanced bilateral co-operation in the railway sector by signing a border crossing agreement with Montenegro for an OSS at the Tuzi border crossing point (BCP); this is working well. This is the only railway BCP so there are no similar activities with other WB economies.

The National Register of Railway Vehicles was established in 2020, which is very positive. It will consist of a single database of all used vehicles, owners, entities in charge of vehicle maintenance and vehicle technical information, as well as limitations on vehicle use. However, by 2024 this new national vehicle register will be transformed into a centralised registry for European Vehicle Register (EVR) vehicles in line with Commission Implementing Decision 2018/1614. The Railway Inspection Directorate regularly inspects the rail network and legal framework, and publishes annual reports which set out maintenance planning.

A significant downward trend has been noticed in passenger railway transport, and fleet utilisation is low compared to the EU average (Table 20.17). There are many steps to be taken to revive railway passenger transport. On the other hand, the high modal share of railway fleet utilisation shows that the market is progressing in the right direction. The only railway connection from Albania to Europe is through Montenegro and Serbia via railway Route 2 and Route 4 (European Commission, 2015<sub>[182]</sub>). Given the current rehabilitation and modernisation of railway Route 4 between Bar (Montenegro) and Belgrade (Serbia), the railway share is likely to increase in the coming years, and especially in the coming decade when the rehabilitation of 210 kms of railway is completed between the Montenegro/Serbia border and Belgrade. At the same time, construction and reconstruction works need to be continued in Albania as planned in the national transport strategy and the action plan. In addition to this, positive movements have been noticed in the funds allocated for railway infrastructure since the last CO assessment, with investment increasing approximately five-fold, amounting to EUR 0.55 million in 2019. However, this is still below the average for the last decade and several times lower than the EU average.

**Table 20.17. Trends in rail transport in Albania (2017-19)**

Rail network utilisation	Change over 2017-19 (%)	2019 (million)	Share of the EU-28 average (2017) (%)
Passengers (passengers*km/km of track)	+71.8	0.008	2.8
Freight (tonnes*km/km of track)	+14.3	0.055	6.6
Rail fleet utilisation	Change over 2017-19 (%)	2019	Share of the EU-28 average (2017) (%)
Passengers (passengers*km/train*km)	-58.1	9.6	7.1%
Freight (tonnes*km/train*km)	+151	696	124%
Mode share	Change over 2017-19 (%)	Share of total transport (%)	Share of the EU-28 average (2017) (%)
Passenger transport (passengers*km)	-16	2.06	6.8%
Freight transport (tonnes*km)	+70	42.94	18.3%

Source: Inputs provided by the government as part of the quantitative questionnaire (CO2021); (Eurostat, 2021<sup>[183]</sup>), Victims in road accidents by NUTS 2 regions, [https://ec.europa.eu/eurostat/databrowser/view/tran\\_r\\_acci/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/tran_r_acci/default/table?lang=en); (INSTAT, n.d.<sup>[184]</sup>), Albanian Institute for Statistics, <http://www.instat.gov.al/>.

Some progress has been made in **road market regulation**, with significant efforts undertaken since the last CO assessment to harmonise legislation with the TCT. Specifically, legislation has been further aligned with Regulations 1071/2009/EC on preparing policy for an integrated intermodal transport system, harmonising passenger and freight transport legislation and strengthening regional co-operation by integrating the national core network into the TEN-T. Albania continues to participate in the European Conference of Ministers of Transport (ECMT) multilateral quota system (ITF/IRU, 2014<sup>[185]</sup>), which enables hauliers to undertake an unlimited number of multilateral freight operations in the 43 European member countries participating in the system. However, road network performance is only assessed occasionally and only for some indicators.<sup>138</sup> There is still scope to significantly improve measurement of other indicators<sup>139</sup> to monitor the road market sector.

The COVID-19 outbreak is affecting the entire transport and mobility market across the world, and the WB economies are no exception. In the second quarter of 2020 Albania introduced measures at border and customs control to enable the provision of essential goods and medical equipment. These consist of “green lane” measures on its major corridors for transporting emergency goods. Passing through these green lane border crossings should not exceed 15 minutes (including any checks and screenings), and so procedures should be minimised and streamlined, etc. The implementation of these measures could have a direct impact on how the border crossing is treated in the future. These include installing measures which minimise crossing times, such as the OSS at the Preševo/Tabanovce road BCP between Serbia and North Macedonia (which is similar but more advanced than the one at the Sukobin/Muriqan road BCP between Albania and Montenegro); automating customs procedures; and traffic management measures which convert physical queues into virtual queues, such as through the electronic queuing management system (e-QMS) installed in Baltic countries. These are currently being developed by the CONNCETA team along the Corridor X through Hungary, Croatia, Serbia, North Macedonia, and Greece, etc.).<sup>140</sup>

The existing legislation for **inland waterways (IWW) and maritime market regulation** is either fully transposed (e.g. flag state, port state control, international safety management code, ship-generated waste, minimum safety and health requirements on boat fishing vessels, enhancing ship and port facility security, and enhancing maritime port security) or needs to be amended or replaced to be aligned with international conventions and agreements and with the EU *acquis* and TCT (e.g. access to the market, international relations, international agreements, vessel traffic monitoring and information systems, etc.). The IWW sector is limited to two lakes (Skadar Lake shared with Montenegro and Ohrid Lake shared with North Macedonia), both regulated by bilateral agreements. According to the Maritime Code of the Republic of Albania, transport related tariffs are defined by the Ministry of Infrastructure and Energy and the Ministry of Finance. The project Enhancing the Development of Albanian Maritime Sector through Technical

Assistance and Increased Partnership (UNDP Albania, 2018<sup>[186]</sup>) is funded by the IFIs and started in 2018. It aims to provide a baseline assessment of the institutional and financial setup in the maritime transport sector, as well as to develop the institutional and legal framework to support maritime sector development, all based on the Norwegian experience (one of the leading maritime countries worldwide). It is expected to be finalised at the end of 2021. There are no specific incentives prescribed for shifting to the use of maritime transport. Indicators to measure performance of maritime transport have not been established yet. Statistical data are collected periodically and published every year in the Statistics Bulletin of the Statistic Institute of Albania. The total tonnes transported using maritime transport in Albania increased by 10.7% in the period 2017-19 and amounted to 4.5 million tonnes in 2019. The total number of passengers transported increased by 4.4% in the same period, amounting to 1.57 million passengers in 2019.

Indicators to assess the performance of all transport modes are either non-existent or not properly established (missing indicators include average user costs, travel time satisfaction level-reliability, value of assets, market research and customer feedback, quality of user information, audit programmes, etc.). Data surveys are not conducted regularly or planned soundly (planning should include a clear purpose, the level of data needed, and budgets need to be allocated); they tend only to be conducted for the purposes of the specific projects. Therefore, there is no basis for a quality assessment of transport network performance.

### *Sub-dimension 11.3: Sustainability*

Further efforts are required to improve **road safety** in Albania (Table 20.18). The National Road Safety Strategy<sup>141</sup> (NRSS) 2011-2020 has ended and was not in line with the relevant EU legislation (European Commission, 2019<sup>[187]</sup>; EUR-Lex, n.d.<sup>[188]</sup>; EUR-Lex, 2018<sup>[189]</sup>; Road Safety Sweden, 2020<sup>[190]</sup>; United Nations, 2020<sup>[191]</sup>). Areas not aligned include road infrastructure safety management, the safe system approach, and "forgiving" roads, etc.). Alignment is expected only after 2021 as the new strategy needs to be adopted but the government is still trying to find sources to finance it. The main law resulting from the NRSS is the amended Road Code of the Republic of Albania (2015), covering many new regulations.<sup>142</sup> The speed management plan, establishing a traffic management centre, and public awareness campaigns have not been implemented yet due to insufficient human and financial capacity within the ministry and respective implementing agencies. An important area not well developed so far in the road safety sector is an update of the strategy and legislation based on the monitoring report. The monitoring report for 2016 is more detailed than the one from 2019 due to a lack of human resources. An impact assessment of the NRSS has not been conducted.

Based on the Road Code and its sub laws, the Road Crash Database is administered by the Traffic Police in co-operation with other institutions.<sup>143</sup> The actual road accident data system is updated every month and the data are available from the traffic police. The database seems very limited in its expansion capacity.<sup>144</sup> The current technical assistance project for maintenance and road safety is expected to recommend a new road accident information system.<sup>145</sup> The Draft Road Safety Regional Action Plan, developed by the TCPS in 2019, was approved in April 2020, and the regional Road Safety Action Plan (TCPS, 2020<sup>[192]</sup>) was endorsed by the TCPS Council of Ministers in October 2020. Albania needs to align the national plans to achieve the goals set within this plan.

**Table 20.18. Road safety trends in Albania (2010-20)**

	2010-20 (%)	2017-20 (%)	2020
Change in the number of fatalities (Albania)	-48.6	-18.5	181
Change in the number of fatalities (EU-27)	-23*	-2.5*	-
Number of fatalities per million inhabitants (Albania)	-	-	63.3
Number of fatalities per million inhabitants (EU-27)	-	-	51**

\* Covering the period 2010-2019.

\*\* 2019.

Source: (European Commission, 2020<sub>[193]</sub>), 2019 Road Safety Statistics: What is behind the figures?, [https://ec.europa.eu/commission/presscorner/detail/en/qanda\\_20\\_1004](https://ec.europa.eu/commission/presscorner/detail/en/qanda_20_1004); (INSTAT, n.d.<sub>[184]</sub>), Albanian Institute for Statistics, <http://www.instat.gov.al/>.

The goal of the EU Policy Orientation on Road Safety 2011-2020 (European Commission, 2010<sub>[194]</sub>) is to reduce road fatalities by 50% between 2010 and 2020 as part of the Decade of Action for Road Safety 2011–2020 officially proclaimed by the UN General Assembly in March 2010. Albania's NRSS is aligned with the EU document and this goal has been almost achieved as Albania decreased the number of fatalities in the period 2010-2020 by 48.6% (Table 20.18). However, it will need to make additional efforts to reach the new goal in the European "Vision Zero" Strategy for 2050 of a 50% further decrease in road fatalities in the decade 2021-2030. As there is no strategy yet developed for the new decade, then expectations should not be high. Since the last CO assessment, stagnation has been noticed in the road safety strategy indicator in comparison with the previous part of the decade. The reasons for this are unknown. The indicators presented above show some positive signs, and Albania has declared 2020 as a Road Safety Year, but much more effort is needed not only to harmonise the legislation with the TCT, but also in the areas of education, awareness campaigns, enforcement, etc.

Albania does not have an environmental sustainability strategy for the transport sector. **Environmental sustainability** is partially covered in the SST and its Action Plan for the period 2016-2020, which is linked to the Sustainable Transport Plan (STP) prepared in 2015 with the assistance of the EBRD and accepted by the Albanian Ministry of Transport and Infrastructure. The STP is a key document to meet the energy savings targets for the transport sector through 1) the quantitative assessment of past, existing and projected levels of energy use and greenhouse gas (GHG) emissions by transport mode; 2) increased use of more sustainable materials to reduce GHG emissions; 3) climate change adaptation; 4) reduction of other harmful emissions; and 5) improvements in transport's impact on biodiversity, the local environment, etc. In addition to this, the SST sets objectives for environmental protection. A shift from road to other transport modes, as well as incentives for e-mobility, are considered through the ANTP3.

The legal and regulatory framework to support **combined transport**<sup>146</sup> is not yet defined even though the national transport strategy set some priority actions. Co-modality is proposed through the ANTP3, approved in 2020, and the Intermodal Transport Strategy was finalised in January 2021, setting out strategic actions<sup>147</sup> for the development of intermodal transport in Albania.

The World Bank's Logistics Performance Index (LPI) (Düll et al., 2018<sub>[120]</sub>) is a multi-dimensional assessment and international benchmarking tool focused on trade facilitation. In the latest ranking (2018), Albania is 88<sup>th</sup> of 160 ranked countries, with an LPI score of 2.66. This is slightly below the world average (2.85) and far below the EU average (3.52). Albania's best score is for the timeliness indicator<sup>148</sup> (ranked 73) while the worst score is for infrastructure<sup>149</sup> (ranked 110).

Data collection is key for assessing the performance of all sustainability areas. A strategy for data collection needs to be established as a basis for the assessment of the transport sector, as it will directly influence the prioritisation processes within the transport policy in general.

## ***The way forward for transport policy***

Albania has taken some important steps forward to develop a competitive transport sector, as presented above, but special attention should be paid to the following challenges:

- **Enhance implementation, monitoring and readjustment of the approved policy framework.** The transport policy framework is only periodically revised based on monitoring reports. Adapting the policy framework based on regular monitoring is key to keeping it up to date, relevant and effective. Monitoring reports need to be developed for each strategy and other strategic documents, and should also be publicly available.
- **Develop national cost-benefit analysis (CBA) guidelines and tailor them specifically to Albania, ensuring they cover all transport modes.** It is very important for each economy to develop its own CBA guidelines with accompanying national technical instructions. The guidance needs to be updated often, at least every two years. A good example is the United Kingdom's Transport Analysis Guidance (UK Government, 2019<sup>[195]</sup>), which provides information on the role of transport modelling and transport project appraisal tailored to the UK market. To ensure consistency amongst the discount rates used for similar projects in the same economy, it is necessary to develop an economy-specific benchmark for all technical and economic parameters, including the financial and economic discount rate in the national guidance documents, and then to apply it consistently in project appraisal at the national level. Empirical research needs to be conducted at the national level to generate input data for calculating externalities.
- **Continue rail reforms.** The basic reforms have started (e.g. structural reforms have already been adopted by the central government and commenced, access reforms are drafted but not yet approved, and the SST has set one of the priority actions for freight corridor reforms). These reforms should be continued, especially those to promote competition, and access reforms which will allow for an efficient system with better performance. Freight corridor management reforms are needed as a prerequisite for the next steps related to high-quality capacity and a competitive modal shift to rail. Passengers' rights and obligation reforms should be directed to meeting passenger expectations so as to promote rail travel. Interoperability reforms should be done gradually as they take time and funds, but they are very important for developing international railway transport.
- **Prioritise road safety.** The monitoring results of the existing road safety strategy, including lessons learnt, should be used to develop the new strategy. Further efforts are required to align national legislation with the TCT and EU *acquis*. All actions proposed in the new strategy need to include the implementing agency responsible, the timeline for implementation, the budget, and monitoring indicators. An impact assessment of the new strategy also has to be carried out. A road safety agency needs to be established with the appropriate staffing and funding resources, to undertake activities (e.g. education, awareness campaigns, development of road safety coordination bodies in local communities) to follow-up the implementation of the strategy and increase safety on Albanian roads. Box 20.13 contains an idea from Montenegro that could act as inspiration.
- **Maintain transport facilitation as a key priority.** More OSSs are needed, and other measures in the newly endorsed regional Action Plan for Transport Facilitation (Transport Community, 2020<sup>[196]</sup>). Measures include improving and upgrading existing information and communication technology infrastructure, constructing or modernising infrastructure to remove physical and technical barriers and increasing existing capacities, capacity building to improve performance efficiency, etc. Implementing these measures will be a key trigger for increasing the competitiveness and connectivity of the WB region, and driving its deeper integration in the European market. Very good examples could be emulated from the region – North Macedonia and Serbia have recently introduced a well-developed OSS system and are currently in the initial stages of implementing a pilot project for an electronic queuing management system.

- **Develop an Integrated Environmental and Transport Action plan.** This plan needs to integrate the existing indicators and to include any missing ones in a framework for environmental sustainability in the transport sector. A good example was developed by the European Environmental Agency in the form of the Transport and Environment Reporting Mechanism (European Environment Agency, 2020<sub>[197]</sub>), which prescribes indicators for tracking transport and environmental performance in the EU.<sup>150</sup>

#### Box 20.13. Innovative ideas in road safety: Road safety social impact bonds in Montenegro

In 2018, the UNDP in Montenegro, in co-operation with the key national players in road safety, developed a new idea related to road safety social impact bonds. These are an innovative alternative performance-based public financial instrument, which shifts the policy framework from inputs and outputs to outcomes and value for money. The idea is to involve the private sector in investing in road safety improvements with the main aim of strengthening sustainability jointly with the public sector. The public partner commits to paying outcome payments to the investor if and only if the predefined and measurable social goals are met. This idea has great potential for other economies in the region (and beyond) to replicate and scale up the model.

## Energy policy (Dimension 12)

### Introduction

Albania has made significant progress since the last Competitiveness Outlook. Together with North Macedonia, Albania is a regional leader in all most all sub-dimensions and indicators for the energy dimension. Its score has risen from 2.0 to 3.2 (Table 20.19). While it has made significant progress in all sub-dimensions, its most important advances are in regard to the regulator, deployment of a power exchange, working towards establishing a natural gas market, and unbundling.

**Table 20.19. Albania's scores for energy policy**

Dimension	Sub-dimension	Score	WB6 average
Energy policy dimension	Sub-dimension 12.1: Governance and regulation	3.5	3.1
	Sub-dimension 12.2: Security of energy supply	2.9	2.9
	Sub-dimension 12.3: Energy markets	3.3	3.0
Albania's overall score		<b>3.2</b>	<b>3.0</b>

### State of play and key developments

#### *Sub-dimension 12.1: Governance and regulation*

The energy sector is guided by a comprehensive **energy policy, legal and institutional framework**. This framework is closely aligned to the EU Third Energy Package, which can be seen as a benchmark for good practice to be applied in the Western Balkans (Box 20.14). However, there is a divergence in opinion over the extent to which the Albanian framework reflects the Third Energy Package. The government states that transposition and implementation ranges from 58% to 85% across the various sub-sectors. Meanwhile, the Energy Community rates transposition to be at 47%, with an additional 44% needing improvement and 8% being completely untransposed, while implementation ranges between 28% and 77% across the various sub-sectors (Energy Community Secretariat, 2020<sub>[199]</sub>). Despite the differences in the range, it should be stressed that Albania has made strides since the last assessment (Energy Community Secretariat, 2019<sub>[200]</sub>). Moreover, Albania is amongst a select few WB6 economies to have transposed some, and possibly all, of the network codes—including all codes on network connections. Moreover, the government has stated that Albania is also working to transpose the first elements of the EU's Clean Energy Package (Box 20.14).<sup>151</sup> Meanwhile, the sector is guided by an extensive set of policies, with up to 50% of the policies having been implemented so far. The sector has state entities with specific and clearly defined roles. Finally, a variety of indicators and data are collected and published at regular intervals, supporting a comprehensive approach to monitoring and to policy design for the sector.

Furthermore, Albania has extensive legislation that assures comprehensive consideration of externalities such as greenhouse gases and air quality within the energy sector. For example, the sector is guided and governed by UN targets known as the National Determined Contributions (formalised in the Decision of the Council of Ministers No. 762 from 16.9.2015), which provide the energy sector with a carbon dioxide emissions reduction target of 11.5% between 2016 and 2030. This is equivalent to reducing annual carbon dioxide emissions by 708 000 tonnes by 2030, or a reduction of 2 tonnes of annual emissions per capita by 2030. Furthermore, the new drafts of the Law on Climate Change contain articles that should allow a European Union-style emission trading scheme to be implemented in Albania in the future.<sup>152</sup>

### Box 20.14. The EU's Third Energy Package

In 2007, the European Commission proposed a new legislative package, the Third Energy Package, in an effort to further enhance and harmonise the EU's Energy Union and internal energy market. This package entered into force in September 2009 and consisted of several important directives and regulations.<sup>1</sup>

The Third Energy Package largely rests on four pillars: 1) transparency; 2) non-discrimination; 3) a strong, independent national regulator; and 4) sustainability.

Together, these pillars represent EU best practice and aim to establish a fair and level-playing field for competitive energy markets that seek to optimise scarce resources. For example, the first two pillars drive the need for unbundling the transmission and distribution system, combined with guaranteed, non-discriminatory and open access to those networks to all users backed by transparent rules and prices. Without such unbundling requirements and third-party access, it is very possible that the system operators, which are natural monopolies, could prohibit market entry and lead to sub-economic market outcomes.

In addition to these pillars, the Third Energy Package also seeks to enhance international co-operation within the EU by establishing an international regulatory agency (the Agency for the Co-operation of Energy Regulators – ACER) and promoting regional integration. Regulation (EC) No 714/2009 contains clauses that open and allow for further regulation to be drafted to enhance harmonisation in the form of network codes.

In 2019, the EU introduced the Clean Energy Package, which supplements and in part replaces the Third Energy Package. That is, while the Clean Energy Package retains the key legislative aspects of the Third Energy Package, it expands measures for sustainability and green energy growth, as well as consumer rights and protections. Despite this, the Third Energy Package remains a good starting point for all of WB economies as many of its key pillars have so far not been introduced or implemented in their entirety in the region. Aligning with it is also a requirement for the WB economies, as members of the Energy Community, whose *acquis* reflects most of the Third Energy Package. Moreover, with many WB economies aspiring to become EU members, the transposition and implementation of the Third Energy Package and subsequent Clean Energy Package are part of the accession requirements.

To conclude, the Third Energy Package provides for the implementation of good international best practice for competitive markets, and is also a firm requirement for the Western Balkan economies.

1: Directive 2009/72/EC concerning common rules for the internal market in electricity and repealing Directive 2003/54/EC; Directive 2009/73/EC concerning common rules for the internal market in natural gas and repealing Directive 2003/55/EC; Regulation (EC) No 714/2009 on conditions for access to the network for cross-border exchanges in electricity and repealing Regulation (EC) No 1228/2003; Regulation (EC) No 715/2009 on conditions for access to the natural gas transmission networks and repealing Regulation (EC) No 1775/2005; Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators.

However, there are some shortcomings that need to be overcome in order to truly state that the energy market is compliant with international good practices. For example, while the establishment of the power exchange is a positive development, it is not expected to start operation until sometime in 2021. Moreover, while market liberalisation has moved forward for customers on the 35 kV (and up) lines, customers in the retail market are still tied to the universal suppliers with regulated prices. This is supplemented by a policy through which supply side liquidity from the wholesale market is diverted through an agreement between Korporata Elektroenergjitike Shqiptare (the largest generator in Albania) and the universal supplier and distribution system operator to provide them with priority supply. Similarly, there has been progress in unbundling Operatori i Shpërndarjes së Energjisë Elektrike SH.A (the former distribution system operator);

however, the operational unbundling is still outstanding—for more details please see Sub-dimension 12.3: Energy markets.

Meanwhile, **the energy regulator**, the Energy Regulatory Entity (ERE), is established as an independent regulator in line with international good practice. This independence is reflected in its autonomous decision making on its work activity, human resources management – including salaries – and financial activity. Moreover, ERE follows international good practice for monitoring and the accountability of its work package. Nonetheless, there are some minor shortcomings. First and foremost, the legislation governing ERE lacks some requirements, including a rotation scheme for board members, a requirement for reporting on compliance of supply prices with public service obligation limits, a requirement for ERE to design and implement steps to promote competition and liquidity, as well as a requirement for ERE to request transmission and distribution system operators to change their terms and conditions.<sup>153</sup>

Finally, the Energy Community Secretariat has raised some concerns regarding the fines that ERE can impose (Energy Community Secretariat, 2020<sub>[201]</sub>; Energy Community Secretariat, 2019<sub>[200]</sub>). More precisely, Article 107 of the Albanian Energy Law limits fines to between 0.1% and 3% of annual revenue. Meanwhile, Article 37 of EU Directive 2007/72/EC and Article 41 of EU Directive 2009/73/EC stipulate that regulators should be able to “impose effective, proportionate and dissuasive penalties on electricity undertakings not complying with their obligations under this Directive or any relevant legally binding decisions of the regulatory authority” and limits this to 10%. In other words, while Albania’s provision is compliant with EU directives, the Energy Community Secretariat is concerned that the Albanian upper limit of 3% is well below the 10% set out in the EU directives. Nonetheless, the Energy Community Secretariat ranks ERE to be amongst the top three regulators in the Western Balkans (Energy Community Secretariat, 2020<sub>[199]</sub>).

Regarding the **management of energy infrastructure**, Albania has an advanced and comprehensive infrastructure management policy in place, of which at least 75% has been implemented. However, Albania’s performance is being held back by having only partially transposed the EU Regulation 347/2013 on guidelines for trans-European energy infrastructure. The Energy Community Secretariat notes that the following key aspects of the European Union Regulation have not been transposed (Energy Community Secretariat, 2019<sub>[200]</sub>; Energy Community Secretariat, 2020<sub>[201]</sub>):

1. A methodology and criteria used to evaluate investments in infrastructure projects, particularly for high-risk infrastructure.
2. Publication of a procedures manual for granting permits to projects of Energy Community interest.

Moreover, while roles and responsibilities are clear, the overshadowing aspect of unbundling muddies the waters a little. Nonetheless, the system entails a clear strategy and guidance for enhancing Albania’s infrastructure and regional integration. This is further backed by a comprehensive system for collecting indicators and monitoring, as well as an asset registry and management system.

### *Sub-dimension 12.2: Security of energy supply*

While Albania does not have a natural gas market at the moment, it is seeking to establish a **natural gas supply framework**. Since the end of 2020, Albania is connected to and receiving natural gas extracted from Azerbaijan via the Trans Adriatic Pipeline.

As it stands today, the Albanian natural gas sector is governed by an extensive legislative and policy framework, including emergency plans. Nonetheless, while the transposition of the Energy Community *acquis* with regard to natural gas is complete,<sup>154</sup> implementation is rated at 42%. This low score reflects two aspects. The first is that the natural gas market in Albania is very nascent and currently lacks a wholesale market. The second is that there are serious issues with unbundling and a lack of natural gas

market rules (see unbundling section in Sub-dimension 12.3: Energy markets). On a positive note, the gas network codes, supply rules and customer protection laws have been adopted.

Meanwhile, the policy framework provides for comprehensive guidance to the sector, including on a supply framework and increasing the penetration of natural gas in the Albanian energy mix. To this end, the National Sectorial Plan for the Albanian Gas Sector (commonly referred to as the Albanian Gas Master Plan) identifies key infrastructure investment projects to be implemented over the short, medium and long term (Table 20.20).

**Table 20.20. Key infrastructure investment projects**

Short term	
Development of the TAP pipeline, Vlora TPP development of the gas distribution system in the city of Vlora	Development of transmission system to supply customers in Fier and Ballsh and the development of local gas distribution systems in the areas of Fier and Ballsh
Medium term	
Development of transmission system to supply industrial areas in Elbasan, and the development of gas storage areas in Dumre	Development of transmission system for the supply of industrial and commercial customers in the area of Durrës and Tirana
Long term	
Development of gas transmission system near Korça, to supply the planned Korça TPP, and further in Pogradec Development of Alkogap project Development of the transmission system in Shkodra	Development of the transmission system from Ballshi to Tepelena and Gjirokastra Development of the transmission system from Pogradec to Prenjas and further to North Macedonia Development of transmission system for TPP planned in Kuçova

Albania is actively participating in expanding the regional natural gas pipeline network, such as the Trans-Adriatic natural gas Pipeline (TAP) project,<sup>155</sup> Ionian Adriatic natural gas Pipeline (IAP) project,<sup>156</sup> and the Albania-Kosovo natural gas interconnection. However, there is no comprehensive monitoring system as the absence of a natural gas market means there are limited opportunities to measure, collect, and analyse indicators and information.

The **electricity supply framework** is governed by a comprehensive legislative and policy framework including possible supply distribution, which is governed by Article 90 of the Law on the Power Sector. The electricity supply framework is guided by state entities with clearly defined roles and is monitored based on extensive data and indicators that are collected and published at varying frequencies.

**Renewable energy** accounts for a significant share of Albania's energy mix—approximately 35% of its domestic energy supply (Eurostat, 2020<sub>[202]</sub>; Eurostat, 2020<sub>[203]</sub>). However, it should be noted that most, but not all, of renewable energy in Albania is derived from hydro generation and subject to significant annual fluctuations due to hydrological changes. That is, of the 2 162 megawatts (MW) of total renewable installed capacity in 2019, 14 MW was from non-hydro sources—up from 1 MW in 2018 and 2017 (Eurostat, 2020<sub>[204]</sub>). Therefore, an urgent task facing Albania both from an optimisation and risk minimisation perspective is to increase and diversify the renewable energy mix. While Albania is well advanced and well placed for non-hydro renewable energy growth, implementation is not finalised and is patchy in some areas. Albania's annual renewable generation potential is 10 733 gigawatt hours (GWh) (by 2030), and it generated around 8 000 GWh of renewable energy in 2018—or around 80% (Eurostat, 2020<sub>[203]</sub>). By virtue of having extensively developed its hydro power generation, Albania still holds significant potential for wind and solar generation. (IRENA, 2019<sub>[205]</sub>) estimates Albania's technical total potential at 3.7 terawatt hours (TWh) for solar and 13.7 TWh for wind.

Overall, the renewable energy sector is guided by extensive policy, contained in the updated National Renewable Energy Action Plan, although this guidance extends only till the end of 2020; as well as the National Consolidated Renewable Energy Action Plan (NCREAP 2019-2020), and the Law on the Promotion of the Use of Energy from Renewable Sources. According to information provided by the government, around 50% of the Law on Renewable Energy and more than 75% of the NCREAP have been implemented. The main outstanding tasks to implement the law fully are the adoption of secondary

acts in order to enable a conducive investment framework for investors in renewable energy. In particular, the stability and predictability of the renewable energy framework, as well as its transparency and non-discrimination for investors, still need to be enhanced.

Project allocation is assigned in theory via competitive auctions with the use of feed-in premiums or contract-for-difference (instead of feed-in tariffs). However, despite this theoretically positive position, Albania has postponed the auction and use of feed-in premiums/contract-for-difference until 2021. The delay in the switch to feed-in premiums is also reflected in the execution of a recent solar project which will partially employ feed-in tariff support—although the contract has not been finalised. Continuing this theme of partial implementation, while the law recognises the principles and concepts of guaranteed integration/connection to the grid and priority dispatching of renewable energy, when it comes to implementation the associated secondary legislation and the rules setting the cost of connection are absent. Moreover, the balancing responsibility of renewable energy generators is enshrined in the law, but this has been suspended until 2022—although transitory non-discriminatory balancing rules are being introduced. Another positive step to note is that the law recognises the role of distributed small-scale self-consumption producers (prosumers) in combination with net metering—although some taxation questions are still to be resolved.

As already mentioned, one current issue at hand is the continued dominance of feed-in tariffs, a subsidisation approach no longer favoured in most of Europe due to the disconnect it creates between incentive-driven renewable energy generation behaviour and market realities (Box 20.15). However, for now it appears as if feed-in tariffs will remain the dominant subsidisation approach in Albania.<sup>157</sup>

Another negative aspect to be noted is that the cost associated with renewable support subsidies is being levied only on consumers connected to the distribution grid and not on consumers directly connected to the transmission grid, such as large industrial consumers.

**Energy efficiency** in Albania is still in its early stages. Although it has an extensive primary legislative framework for energy efficiency,<sup>158</sup> the transposition of the EU Third Energy Package is not complete, including the adoption of bylaws and secondary acts (Energy Community Secretariat, 2020<sub>[201]</sub>). As a result, the Energy Community Secretariat rates Albania's implementation at 56%<sup>159</sup> (Energy Community Secretariat, 2019<sub>[200]</sub>) which also agrees with the government's perception of implementation of 58%. However, it should be noted that Albania is actively working on increasing the transposition. A new version of the Energy Efficiency Law has been finalised and awaits adoption. Moreover, the legislation for energy certification of building systems is being drafted and at the time of writing was expected to be adopted and deployed sometime towards the end of 2020.

In addition to the legislative framework, the sector is guided by an energy efficiency policy in the form of the Third National Energy Efficiency Action Plan (DCM No. 709 dated 01.12.2017), of which around 50% has been implemented. While the plan provides targets to 2020, it does not contain targets beyond 2020 apart from expected developments. It is therefore important that new policy guidance with a vision beyond 2020 is released soon. To this end, Albania is drafting the National Energy and Climate Plan which will contain new targets to 2030 (Energy Community Secretariat, 2021<sub>[206]</sub>; Energy Community Secretariat, 2021<sub>[207]</sub>). There is no dedicated energy efficiency strategy for industry, although the first considerations have been made.

The sector is guided by two state entities: the Ministry of Infrastructure and Energy and the Energy Efficiency Agency. The latter was established in 2018 and is in the process of being fully staffed. In other words, there is currently a shortage of human resources in public entities. There is no dedicated government-funded energy efficiency fund—although energy efficiency investment opportunities are realised as part of a project funded by the international financial institutions or commercial banks. Additionally, the government has initiated various projects to refurbish government buildings (and dormitories).

Albania does have a system in place for data collection and monitoring of energy efficiency. It collects information in the context of its responsibility as an Energy Community member and has published four progress reports between 2018 and 2020.<sup>160</sup> One indicator collected is the energy intensity of the economy. This was 0.22 thousand tonnes oil equivalent per million Euros in 2014 and is expected to drop to 0.21 in 2020 (a 0.7% decline per annum) and to 0.18 in 2030 (a 1.4% decline per annum). However, there are some issues with regard to data collection. The data are based on top-down estimates and are supposed to be collected by the Energy Efficiency Agency. However, the following four issues prevent the Energy Efficiency Agency from collecting accurate/actual data:

1. the absence of energy auditors to provide data
2. shortcomings in the Law on Energy Efficiency (absence of an identification mechanism for large energy consumers)
3. delayed secondary legislation (governing areas such as minimum energy performance requirements, national calculation methodology, and energy performance certification)
4. the absence of a bottom-up methodology for data collection (currently being development with IFI assistance).<sup>161</sup>

### *Sub-dimension 12.3: Energy markets*

Albania has also made significant progress in introducing competitive **market operations**. However, as Albania does not have a natural gas market, this section will almost exclusively focus on the power sector.

Albania's energy market is guided by an extensive set of legislation and policy. One positive aspect is that Albania has finalised the shareholder structure of the new power exchange together with Kosovo, and has formally formed the power exchange, ALPEX. It is expected that the power exchange will be operational sometime in 2021. Furthermore, a dry run for the balancing market has begun, with the balancing market expected to start operating sometime in 2021. This is a significant step towards a competitiveness-driven balancing market in which imbalances are paid for and compensation paid to balancing service providers.

However, some key issues remain, especially until the power exchange becomes active. First and foremost, the universal supplier of electricity, FSHU, and the distribution system operator for electricity, OSSH, continue to receive electricity for the supply of customers under universal supply and distribution losses on a preferential regulated price basis from the largest generator, Korporata Elektroenergjitike Shqiptare. Korporata Elektroenergjitike Shqiptare also has to compensate FSHU and OSSH for any electricity that had to be purchased at unregulated prices from the wholesale market (bilateral market)—or at least the difference between the contract/regulated and unregulated price. Connected to this issue is that all consumers in the retail market and wholesale consumers connected to lines below 35 kV are still tied to the universal suppliers and are thus paying regulated prices. Moreover, European Union Regulation No 1227/2011 on the wholesale energy market integrity and transparency is currently not transposed or adopted. This does not mean that market manipulation is rampant, but suggests that Albanian regulation does not reflect good practice and the price outcome of the future power exchange platform could misrepresent the economic situation.

The state of **unbundling** in Albania, much like market operation, is on the right track to align with best practices, but it is not quite there yet. Starting with natural gas, the two transmission system operators have been unbundled and certified. Nonetheless, their certification was conditional on the Trans Adriatic Pipeline and Albgaz (which is also the distribution system operator) implementing certain steps. However, in both cases, not all conditions have been met so far. In the case of Albgaz, the outstanding issue relates to Albgaz not being in a position to make its own investment decisions. This power currently still rests with the Ministry of Infrastructure and Energy. Nonetheless, both companies have adopted their network codes which grant third party access, in line with the primary legislative environment for third parties and following

the practices set out the EU's Third Energy Package. Moreover, the codes set out the standard entry-exit tariff approach in line with the Third Energy Package.

In the case of electricity, the transmission system operator, Operatori i Sistemit të Transmetimit, has been unbundled and certified as such. The unbundling of the distribution system operator is in progress. More precisely, Operatori i Shpërndarjes së Energjisë Elektrike SH.A has been restructured into a holding company with three subsidiaries: the distribution system operator OSSH, the universal service supplier FSHU and the electricity market supplier/trader FTL. However, the functional unbundling, or in other words the operational independence of the OSSH, is still in progress. The functional unbundling encompasses various areas: the unbundling of accounts; the separation of assets; the separation of management; finalising relevant service-level-agreements between the Operatori i Shpërndarjes së Energjisë Elektrike SH.A companies; independent communication and branding of the restructured companies to avoid any potential confusion; adoption of a compliance programme; and giving independent and effective decision-making rights to OSSH. While some of these have been completed, the majority have not. Therefore, the Energy Community Secretariat has not yet issued a positive opinion on the state of unbundling of OSSH (Energy Community Secretariat, 2019<sup>[200]</sup>; Energy Community Secretariat, 2020<sup>[201]</sup>).

**Third-party access** is enshrined in the legislation. Nonetheless, the Energy Community Secretariat notes that third-party access to the new electricity interconnector between Albania and Kosovo is still not ensured (Energy Community Secretariat, 2020<sup>[201]</sup>).

The power sector's **regional integration** is guided by extensive policy and legislation that aim to establish a competitive power market and expand the interconnections with neighbours. The government notes that more than 50% of the policy for regional integration has been implemented.<sup>162</sup> A positive development is that the capacity for Albania's interconnectors is assigned using joint auctions via the Coordinated Auction Office in South East Europe. The exception to this approach is the use of split auctions with Serbia's JSC Elektromreža Srbije. Albania has adopted all three network connection network codes, as well as the capacity allocation and congestion management and the rule for the nominated electricity market operator.

Finally, although today Albania has no market coupling, one of its key hurdles, the lack of a power exchange, has been overcome. While the exchange is not yet in operation, the expectation is that it will be soon. Significant progress is expected as a result. Moreover, with KOSTT SH.A. and Operatori i Sistemit të Transmetimit (OST) joining forces to establish the power exchange, they have signed an agreement to establish a new load frequency control (LFC) block, Albania-Kosovo (AK).<sup>163</sup> Implementation will commence once the KOSTT system is established as a separate control area. This is expected to be the first step towards Albania's broader integration with organised regional electricity markets (Energy Community Secretariat, 2020<sup>[201]</sup>). However, market integration could be improved, especially with regard to natural gas, and to a lesser extent electricity.

#### *Cross-cutting dimension: Energy incentives – direct and indirect subsidies in the energy sector*

The issue of subsidisation is, as in other Western Balkans economies, a key topic and is present in Albania in various forms.

First and foremost, as detailed in the energy market section above, the continued use of Korporata Elektroenergjitike Shqiptare as a source of electricity (or payment) for various activities – including universal supply – is not only a form of subsidisation but also undermines competitive price formation as it withholds some of the lowest marginal cost energy generation from the market.<sup>164</sup> This also holds true for the issue raised above regarding consumers being bound to regulated prices and one supplier. Unlike with Korporata Elektroenergjitike Shqiptare, which is about supply side liquidity, the lack of retail liberalisation and price deregulation means that significant demand side liquidity is withheld from the market.<sup>165</sup>

Another form of subsidisation in Albania's energy market is the existence of outstanding payments among energy stakeholders and between energy stakeholders and the government. Firstly, there is a significant volume of arrears owing between key entities which remain unsettled as some entities refuse to accept the retroactive imbalance cost associated with their activities. All in all, the arrears between Operatori i Shpërndarjes së Energjisë Elektrike SH.A (former distribution system operator), Operatori i Sistemit të Transmetimit, and Korporata Elektroenergjitike Shqiptare (transmission system operators) amount to around ALL 18 billion. Meanwhile, Korporata Elektroenergjitike Shqiptare (the state and largest generator) and Operatori i Shpërndarjes së Energjisë Elektrike SH.A (former distribution system operator) owe ALL 5.47 billion in taxes to the government—down from ALL 8.36 billion in 2018. These outstanding payments are a form of subsidisation as the result is that these entities had lower operational costs than other non-state entities.

Finally, a similar form of subsidisation is the existence of a different payment ethic on the part of public entities, including water supply companies, towards Operatori i Shpërndarjes së Energjisë Elektrike SH.A (former distribution system operator). In 2020, the total debts of all state-owned entities – including water supply companies, all the other state-owned companies, the budgetary and non-budgetary entities – amounted to ALL 27.3 billion, of which ALL 16.2 billion was racked up by water supply companies.

While Albania is working on tackling these issues, including paying arrears, these subsidisations need to cease and be settled as they push the market away from competitiveness-driven equilibrium and the associated optimised distribution of scarce resources to the highest value-added consumers.

### ***The way forward for energy policy***

Overall, it can be concluded that Albania has made strides in deploying a competitive energy market based on international good practice and that a strong foundation is in place. Nonetheless, there are some outstanding steps to be taken before Albania is truly there:

- **Complete the transposition and implementation of the EU Third Energy Package.** Its full transposition and implementation would help Albania lay the foundations of an energy market based on international good practice (Box 20.15). Moreover, Albania should now consider transposing and implementing the EU's Clean Energy Package, which reflects the latest lessons learned by the European Union with regard to legislation and policy for a sustainable and low-carbon energy sector (see Box 20.14).
- **Finalise the power exchange and unbundling of the distribution system operator.** Both factors will contribute to the transparent and non-discriminatory operation of the market, which should attract participants and lead to a competitive market in which prices are optimised and economic rent distributed efficiently. In other words, resources would be more efficiently allocated using economic forces and in line with international good practice. Moreover, these steps should be coupled with the **liberalisation and regulation of the retail market** to further enhance the competitive market forces.
- **Finalise and implement the non-hydro renewable energy support scheme.** Renewable energy projects should be allocated via competitive auctions and the support scheme should be switched to feed-in premiums to promote renewable energy generation. By attracting investors, these measures should support a liquid market with generation at a lower marginal variable cost in the long run. For good practice on support schemes see Box 20.15.
- **Terminate the preferential contract between Korporata Elektroenergjitike Shqiptare and other public service/universal suppliers.** The current approach is withdrawing important liquidity from the market that would otherwise have led to stronger price pressure and thus to a more competitive energy market and overall economy.
- **Support the development of energy efficiency** to harness its competitive benefit for Albania's economy. Together with the expansion of renewable energy, energy efficiency minimises the cost of

energy to the economy while creating a sustainable and climate-resilient energy market in which energy demand is more muted both with respect to future growth and variability over time.

- **Aggressively pursue regional integration and market coupling.** International trade is a great source of market pressure that will support a fair, transparent, and non-discriminatory market and thus lead to economic gains for both the energy market and wider economy.
- **Design and implement a greenhouse gas pricing mechanism that eventually transforms into a greenhouse gas certificate market/trading scheme** in line with international good practice and as stipulated in the new draft of the Law on Climate Change. This step should support efforts to achieve a sustainable and climate-resilient energy market that is efficiently decarbonised in a competitive and efficient manner using economic market forces.

### Box 20.15. A new approach to subsidising renewable energy

Feed-in tariffs were the dominant form of financial support for renewables within the EU at the beginning of the 21<sup>st</sup> century. In this system, power plant operators receive a fixed payment for each unit of electricity generated independent of the electricity market price (Banja et al., 2017, p. 15<sub>[208]</sub>).

Feed-in tariff schemes offer several advantages, but mainly they insulate new market entrants from market price risks, which lowers their capital costs and enables private investment. The simplicity of feed-in tariffs makes them suitable for markets with a large number of non-commercial participants such as households or local community-based initiatives (CEER, 2018, p. 12<sub>[209]</sub>).

However, feed-in tariff schemes exclude producers from actively participating in the market, which hinders efforts to develop large, flexible and liquid electricity markets as the share of renewable energy grows. This limits growth to certain technologies and sizes of installations, and creates difficulties in setting and adjusting appropriate tariff levels (European Commission, 2013, pp. 12-13<sub>[173]</sub>). The latter has been a problem especially as costs of renewable generators have fallen rapidly in recent years.

The European Commission suggests switching from feed-in tariff to feed-in premium schemes (European Commission, 2013<sub>[173]</sub>). In these, plant operators sell the electricity generated directly on the electricity market and earn an additional payment on top of the electricity market price. This is received as a fixed payment or one adapted to changing market prices, thereby limiting price risks for plant operators, as well as the risks of providing windfall profits (Banja et al. 2018). Feed-in premium schemes are beneficial because they force renewable energy producers to find a seller on the market. They also ensure that renewable energy operators are exposed to market signals. A well-designed premium scheme can limit costs and drive innovation by using a competitive process to allocate support. Such schemes also include automatic and predictable adjustments to cost calculations, which give investors the information and confidence necessary to invest (European Commission, 2013, p. 8<sub>[173]</sub>).

The European Commission suggests using a feed-in premium scheme in combination with the following good practice recommendations (European Commission, 2013<sub>[173]</sub>):

- Do not pay premiums for production in hours where the system price is negative or above the level of remuneration deemed necessary.
- Assign renewable project and associated premiums using competitive allocation mechanisms such as auctions.
- Make planned volume-based premium reductions for new installations dependent on when they are approved, connected or commissioned.
- Conduct regular, planned and inclusive reviews of premiums for new installations.

However, the Council of European Energy Regulators reports that in 2016/17, 17 of the 27 European Union member countries still used some form of feed-in tariff, although mainly for small projects, while around 16 used feed-in premiums, including to complement feed-in tariffs (European Commission, 2014<sup>[210]</sup>).

For further and more detailed exploration of renewable energy subsidies and best practice please see the sources below. Meanwhile, for more information on the different renewable support schemes employed across Europe please see <http://www.res-legal.eu/home/> and for an overview of auctions and outcomes (including databases on auctions) see <http://aures2project.eu/>.

## Environment policy (Dimension 13)

### Introduction

Albania has only slightly improved its performance in the environmental policy dimension (Figure 20.1). Its overall score has improved from 1.8 in the 2018 Competitiveness Outlook to 1.9 in the 2021 assessment, with some progress noted in the natural asset base sub-dimension. Albania's scores in the resource productivity and environmental quality of life sub-dimensions, as well as its average score, are lower than the regional averages (Table 20.21). Albania ranks fifth of the six Western Balkan (WB6) economies for environmental policy.

**Table 20.21. Albania's scores for environment policy**

Dimension	Sub-dimension	Score	WB6 average
Environment policy dimension	Sub-dimension 13.1: Resource productivity	1.8	2.0
	Sub-dimension 13.2: Natural asset base	2.2	2.1
	Sub-dimension 13.3: Environmental quality of life	1.8	2.3
Albania's overall score		<b>1.9</b>	<b>2.1</b>

### State of play and key developments

#### *Sub-dimension 13.1: Resource productivity*

As a Non-Annex-I signatory to the United Nations Framework Convention on Climate Change (UNFCCC) and its Paris Agreement, and as a party to the Kyoto Protocol, Albania has committed to an 11.5% reduction of carbon dioxide (CO<sub>2</sub>) emissions compared to the baseline for the period 2016 to 2030, and to limit global warming. A GHG emissions inventory exists online and emission reduction targets have been set, but the target of a 38% share of renewable energy sources in gross final energy consumption by 2020 has not been attained.

**Climate change mitigation and adaptation policies** have nevertheless advanced in Albania since the last assessment. Most notably, the Law on Climate Change was adopted in January 2021 and establishes the institutional framework and rules for monitoring, reporting and verifying greenhouse gas emissions, in line with EU regulations and *acquis*. It provides, among others, a legal basis for adopting a National Energy and Climate Plan (NECP) for 2021-2030. Moreover, a Strategy on Climate Change, and related Action Plans on Mitigation and Adaptation (2019-2030), were adopted in 2019, and represent a general cross-cutting strategy with policy objectives and concrete actions to: 1) reduce GHG emissions; and 2) make Albania resilient to climate change. The strategy focuses on energy, transport, agriculture, land use and forestry, with a revised 32% renewable energy target by 2030 (European Commission, 2020<sup>[19]</sup>). As nearly two-thirds of Albania's total CO<sub>2</sub> emissions come from transport (60% in 2014), with road transport by far the main contributor, Albania has made efforts to decrease the sector's environmental footprint through the Sustainable Transport Plan (2016-2020),<sup>166</sup> adopted to help meet the targets of reducing energy consumption and improving overall sustainability. Other sectoral strategies aimed at mitigating climate change include the Inter-sectoral Strategy for Agriculture and Rural Development (2014-2020), which is expected to help tackle climate change by promoting resource efficiency through investments in energy-saving physical assets in agriculture. In addition to climate change mitigation measures, this strategy aims to reinforce adaptation to climate change (e.g. through measures on landscape restoration and reforestation).

Albania has started updating its Nationally Determined Contributions (NDCs) for the period after 2020, for which it received technical expertise and capacity building from the NDC Partnership and its Climate Action Enhancement Package, which Albania joined in 2019. In parallel to this, the economy has started

developing its National Energy and Climate Change Plan (to be finalised in the first trimester of 2021), which will be aligned with the updated NDCs, the Strategy for Climate Change Mitigation and Adaptation and the new law on Climate Change. Measures to align the legislative framework with the EU *acquis* on establishing monitoring and reporting mechanisms for GHG emissions have been undertaken (mostly through the new Law on Climate Change). Harmonisation measures covering GHG emission reductions, especially the EU Emissions Trading System (ETS), are planned under the new law but have not yet been undertaken. As an UNFCCC signatory, Albania has submitted three National Communications (in 2002, 2009 and 2016) and was preparing the Fourth National Communication and the First Biennial Update Report at the time of drafting; these are the only monitoring mechanisms existing in this field.

As far as climate change adaptation is concerned, some improvements have been noted since 2017. Although major climate change-related risks have not been identified further since the Third National Communication, a Disaster Risk Reduction strategy was being prepared in 2021. Albania has put efforts into raising awareness and increasing capacity at central and local levels to adapt to climate change. Several projects are currently being implemented, such as a school programme that teaches environmental issues, recycling, climate change, renewable energy and similar; and a reforestation project (Clean and Green), which aims at planting 20.2 million seedlings by the end of 2020. Actions have also been taken to establish early warning systems for water-related disasters.<sup>167</sup> However, other natural hazards, such as earthquakes,<sup>168</sup> have not yet been taken into consideration.

**Circular economy** legislative and policy frameworks are still non-existent in Albania, although some positive developments on recycling have been recorded over the last couple of years. The recycling rate for municipal waste has grown slightly, from 17.2% in 2016 to 18.5% in 2018 (INSTAT, 2020<sup>[211]</sup>), which is the highest in the Western Balkans region. However, 76.4% of waste is landfilled. The new National Waste Management Strategy and its Action Plan (2020-2035) envisage a gradual transition from a linear to a circular economy by encouraging waste diversion through waste reuse and recycling. The government also plans to revise the legislative framework in this area, such as through the new Law on Extended Producer Responsibility, which is planned to be adopted during 2021 and which will promote a circular economy, in particular through establishing markets for secondary materials. In addition, Albania was planning to ban the production, import and use of plastic bags by the end of 2020. COVID-19 has delayed this but it is expected to be finalised in 2021.

**Municipal waste management** is generally underdeveloped in Albania. Municipal waste generation per capita (462 kg) is still lower than in the EU (492 kg per capita in 2018). It is collected in most cities and towns, but rarely in rural areas (Eurostat, 2020<sup>[212]</sup>; EEA, 2018<sup>[213]</sup>). In addition, waste is primarily deposited at disposal sites that do not comply with any sanitary standards, and are sometimes alongside rivers (UNECE, 2018<sup>[214]</sup>). Even when the waste is disposed of at one of the three existing sanitary landfills, it is rarely treated first.

Albania's legislative framework covers all types of waste, whereas the Decisions of Council of Ministers (DCMs) cover specific waste streams. No major changes have been recorded to the legislative framework since 2017. Two main strategy documents have been adopted since the last assessment, in 2019 and 2020 respectively: the aforementioned Waste Management Strategy (WMS) with related Waste Management Plan (WMP) (2020-2035) and the National Sectorial Plan for Solid Waste Management (NSPSWM) (2019-2035). The WMS is a result of the revised National Waste Management Strategy and National Waste Management Plan (2010-2025), whose main measures and targets have largely not been implemented or achieved. The reason lies in its ambitious goals (e.g. increase the amount of waste collected by local authorities that is recycled or mixed to 55% by 2020, starting from a very low base and with underdeveloped separation-at-source infrastructure) and the overall lack of staff and financial sources to ensure fuller enforcement. The main objectives of the WMS are to bring the legal framework into line with EU directives, increase government capacities at national and local level and mobilise finance to achieve the targets – mainly through public-private partnerships (PPP). Its action plan specifies measures, timelines and budget, and monitoring and evaluation are set to be conducted annually. The NSPSWM is

a detailed investment plan for local and regional solid waste management infrastructure (waste collection and transport, reduction and recycling of waste, treatment and disposal facilities) for the period 2019-2032.

The government estimates that about 200 large uncontrolled dumpsites and various small sites were in operation in 2020 in Albania. The WMP plans to replace these with 10 regional controlled landfill sites by 2028.<sup>169</sup> According to the NSPSWM, Albania was constructing the landfill of Maliq/Korca at the time of drafting. Like the other WB economies, investment in waste collection and treatment infrastructure has largely been donor-supported. One incinerator plant with energy recovery has been built in Elbasan since the last assessment, and two incinerators with energy recovery were being built in Fier and Tirana (to be finalised by mid-2021), financed through public-private partnerships. However, the construction of new incinerators poses concerns in terms of compliance with the EU waste *acquis*, including the waste hierarchy principle and the recycling targets<sup>170</sup> (European Commission, 2020<sub>[19]</sub>). The government's shift in prioritisation towards a waste incineration strategy has weakened the recycling industry (only one of the five recently established recycling plants is currently operational) and is seen by local stakeholders as a way to develop a more lucrative waste management industry.<sup>171</sup> Measures are taken to combat unregulated burning and illegal dumping of waste and inspections are normally carried out following a plan approved at the beginning of the year. However, the inspectorate is being reorganised and this mechanism no longer seems to work.

Waste collection and treatment services are funded from waste collection fees, but their amount remains low and insufficient for this purpose. A DCM on the methodology to calculate waste management costs from 2018 specified that each municipality can calculate and change the tariffs and costs. As a result, waste tariffs have increased in certain municipalities, leading to an improved waste service. However, the most vulnerable social groups have not received any kind of special treatment in terms of fees. Waste separation at source is almost non-existent in Albania,<sup>172</sup> despite a legal obligation to do it. The 2014 DCM on the separate collection of waste at source states that local authorities must organise this using a three-bin system (UNECE, 2018<sub>[214]</sub>). The new WMS (2020-2035) envisages its systematic introduction in the medium to long term.

### *Sub-dimension 13.2: Natural asset base*

Albania is a relatively water-rich country, harbouring far larger per-capita quantities of renewable internal freshwater resources than its WB peers (9 362 m<sup>3</sup> of water annually) (World Bank, 2017<sub>[215]</sub>). Major water demand comes from agriculture – mainly for irrigation (64% in 2017), followed by households (20%) and industry (16%) (Düll et al., 2018<sub>[120]</sub>). Almost all of Albania's nationally produced electricity comes from hydropower. In addition to the big hydropower plants (HPPs) situated within the Drin, Mati and Vjosa river basins, there are around 70 small HPPs, 38 of which have been operational since 2018 (UNECE, 2018<sub>[214]</sub>). It is important to highlight that water is not consumed in the process of hydropower generation (i.e. water is extracted but it returns to its source) and the overall water balance remains unchanged.

The legislative framework for **freshwater management** was amended in 2018. Amendments to the basic legal act in this field – the Law on Water Resources Integrated Management – delegated new responsibilities to the Water Resource Management Agency (established under the Prime Minister's Office), which previously served as the technical secretariat of the National Water Council. The provisions of this law apply to all surface and groundwater, prevention of pollution at source, emissions control and water quality standards, as well as the prevention of and protection against flood risks. However, mapping of hazards and flood risks is still at an early stage. Moreover, the recently approved DCM in December 2020 on the Content, Development and Implementation of the National Strategy of Water Resources Management, Water Basin Management Plans and Flood Risk Management Plans improved the transposition of EU directives on water policy, chemical analysis and monitoring of water status, the protection of groundwater and management of flood risks.<sup>173</sup> Obtaining licences for constructing hydropower plants is regulated by the law as well, which requires detailed environmental impact

assessments and strategic impact assessments to be conducted. However, it seems that this procedure has been largely circumvented: no cumulative impact assessment of HPPs in protected areas has been made and there are also cases in which licences for HPPs were given before an EIA report was issued, or of the EIA report not being taken into account when issuing a licence (UNECE, 2018<sup>[214]</sup>).

As for the policy framework, Albania adopted the new National Strategy for Integrated Water Resources Management (NSIWRM) (2018–2027) in 2018, which serves as the overarching framework document for water management. NSIWRM covers five pillars: 1) improving water quality; 2) enhancing water quantity; 3) managing water risks; 4) building an information system on water; and 5) efficient and effective water management. The strategy is however not aligned with the sectoral strategies, such as agriculture or irrigation. Activities to raise awareness of water-related risks are also envisaged in the NSIWRM. Implementation began in 2019 through a three-year action plan. However, many of the activities foreseen in the plan lack financial support and their timelines are unrealistic. A number of bodies<sup>174</sup> are responsible for water management in Albania and vertical and horizontal co-ordination works well. Nevertheless, they all lack the financial and human resources to conduct their roles, and capacity-building is not organised regularly.

Some progress has been made on river basin management plans. A river basin management system is in development and there is co-operation with neighbouring economies, although this co-operation should be renewed. The Special Commission on Transboundary Water Management, chaired by the Deputy Minister of the Ministry of Foreign Affairs was established in December 2019. In February 2020, the National Water Council endorsed the Drini-Buna and Seman river basin management plans and started the procedure for their adoption by the Council of Ministers.

Even though some data and projections are collected on water demand from agriculture, industry (including energy) and households, there are still no modelling tools for the realistic projection of water demand, especially in climate change scenarios. Therefore, these are not guiding decisions on handling competing uses now and in the future. Water information systems and databases have been created but are not regularly updated. Data on water risk management seem not to be collected, even though there is an obligation to publish them in the Water Cadastre – however, technical issues impede its appropriate functioning.

Albania's **biodiversity and forest management framework** has been slightly modified since the last assessment, with the adoption of the Forest Policy Document (2019-2030) being a major change (discussed below). The Law on Protected Areas was amended in 2018 to put greater emphasis on the planning and development of these areas, and the Law on Biodiversity was amended in 2020 to increase alignment with the EU Regulation on compliance with the Nagoya Protocol.<sup>175</sup> The Biodiversity Strategy is valid until 2020 and a new one, covering the period 2021-2030, was being developed at the time of drafting. There is no implementation report as such, but Albania's Sixth National Report to the Convention on Biological Diversity (CBD) assesses the implementation of the biodiversity strategy up until mid-2019, including progress towards the Aichi targets (Box 20.16). Programme outputs are monitored at the end of each year, in line with the medium-term budget process co-ordinated by the Ministry of Finance and Economy. Moreover, a DCM created a special fund for protected areas in January 2021.

The biodiversity strategy is evaluated annually in the framework of the implementation of the National Sustainable Development Goals. Systematic monitoring of biodiversity takes place, led by the National Environment Agency (as defined by the 2009 DCM on environmental monitoring). Since the last assessment, the government has developed a national platform for biodiversity (BioNNA), which is currently the largest aggregator of primary biodiversity data in Albania and is planned to grow further by aggregating new datasets. A national database on wild fauna species data (WIMS) has also been created in 2018.

### Box 20.16. The status of the Aichi 2020 biodiversity targets in Albania

The CBD's Strategic Plan for Biodiversity 2011-2020, including the Aichi Biodiversity Targets, provided an overarching framework on biodiversity – not only for the biodiversity-related conventions, but for the entire United Nations system and all other partners engaged in biodiversity management and policy development. Parties agreed to translate this overarching international framework into revised and updated national biodiversity strategies and action plans within two years, which are intended to define the current status of biodiversity, the threats leading to its degradation and the strategies and priority actions to ensure its conservation and sustainable use within the framework of the socio-economic development of the country. There are 20 Aichi biodiversity targets grouped around 5 strategic goals: A: Address the underlying causes of biodiversity loss by mainstreaming biodiversity across government and society; B: Reduce the direct pressures on biodiversity and promote sustainable use; C: Improve the status of biodiversity by safeguarding ecosystems, species and genetic diversity; D: Enhance the benefits to all from biodiversity and ecosystem services; and E: Enhance implementation through participatory planning, knowledge management and capacity building.

Albania's Sixth National Report to the CBD notes several areas of progress in implementing the Biodiversity Strategy. Most notably, the status of Aichi 2020 biodiversity targets in Albania, in line with the national targets, is as follows:

- Protected area coverage: Albania has already exceeded the Aichi target of 17% of its terrestrial area being protected, as the coverage has reached 18.5%. More limited progress has been made on marine and coastal protected areas (3%), with the target being 6% by 2020.
- A national legal framework for the Nagoya Protocol on access and benefit sharing of genetic resources has been approved.
- Management plans for protected areas have been approved and implemented.
- An endangered species action plan has been adopted.

Source: (CBD, 2020<sup>[216]</sup>), *Aichi Biodiversity Targets*, <https://www.cbd.int/sp/targets>; (Ministry of Tourism and Environment of Albania, 2019<sup>[217]</sup>), *Sixth National Report to the Convention on Biological Diversity of the Republic of Albania*, <https://www.cbd.int/doc/nr/nr-06/al-nr-06-en.pdf>.

Although forests make up a smaller share of the total land area of Albania (28%) than its regional peers (42%), the Ministry of Tourism and Environment estimated that almost one-third of forests (8.2%) were of high nature value<sup>176</sup> in 2018 (Düll et al., 2018<sup>[120]</sup>). The new Law on Forests was adopted in 2020 and established the organisation and functioning of the National Forest Agency. Moreover, the new Forest Policy Document (2019-2030) aims to make forest management more effective, mainly through improving the institutional framework. This is particularly important as municipalities have been responsible for sustainable management of forests since 2016, but they receive little assistance from the government, which impedes their effectiveness. Monitoring of the forest document's results is set to be conducted annually and conclusions should be shared with the relevant stakeholders – however, no reports had been produced at the time of drafting.

The national forest inventory system was finalised in 2021 and a national forest programme was being established at the time of drafting. There is no system in place for systematic monitoring of the condition of forests – this is conducted only indirectly through the climate change adaptation and mitigation actions. The National Real Estate Register has been established through the Immovable Property Registration Offices. This means it is now possible to register forests on the unified data system (forests in the southern part of Albania are currently being registered). The Law on Forests regulates and oversees forest fire prevention measures and sets clear penalties for illegal logging.

**Land-use legal and policy frameworks** remain underdeveloped in Albania and have not advanced since 2017. The main strategic document is still the National Strategy for Land Consolidation (2016), but no comprehensive land-use planning policy has been developed to date.

Various national and local bodies are responsible for land-use management, but they all lack qualified staff and financial resources. So far, horizontal and vertical institutional co-operation seem to be functioning well, although there are no permanent co-ordination bodies for spatial planning. No capacity building or training have been conducted for the responsible bodies.

Some of the major land-use issues in Albania relate to outdated building codes and illegal construction. This is a problem across the entire territory, but particularly the coastal areas. Tackling these challenges is especially important in light of the economy's proneness to geophysical hazards, such as earthquakes. In addition, the legislation on strategic investment raises concerns for the protection of biodiversity, as it may allow large tourism and industrial investments in protected areas, e.g. the proposed airport in the Vjosa-Narta area<sup>177</sup> (European Commission, 2020<sub>[19]</sub>). On a positive note, the Agency for Territorial Planning and Development developed local plans in 2018 together with local municipalities. These aim for the sustainable development of the territory and the rational use of land. Priority was given to the preservation of the agricultural land fund and only a small area of agricultural land was planned for the construction of agricultural facilities.

Key indicators related to land-use management are not frequently collected nor are they available online. In addition, they are not georeferenced or harmonised across government bodies like property tax and forest management.

### *Sub-dimension 13.3: Environmental quality of life*

**Air quality** in Albania has improved over the last decade and is the best in the WB6. Albania's mean annual exposure to PM<sub>2.5</sub> of 18.2 µg/m<sup>3</sup> is the lowest in the WB region,<sup>178</sup> which averaged 25.77 µg/m<sup>3</sup> in 2016. However, it is still higher than the EU and OECD averages (13.1 µg/m<sup>3</sup> and 12.5 µg/m<sup>3</sup> respectively in 2017) (EEA, 2020<sub>[29]</sub>) (World Bank, 2017<sub>[30]</sub>). Air pollution is still a concern, especially the high concentrations of PM and carbon monoxide (CO) in winter months, largely stemming from the predominant type of residential heating (i.e. wood and coal). Moreover, levels of nitrogen oxides (NOx) exceed recommended limits as a result of vehicle emissions, especially in the capital city and other urban areas. Local experts report that emissions from incomplete combustion by vehicles is an important concern, exacerbated by the large share of old or malfunctioning engines and missing catalytic systems, mostly caused by illegitimate vehicle check-up procedures.

Some changes have been made to the legislative and policy framework in Albania since the last assessment. The main Law on Protection of Ambient Air Quality entered into force in July 2018, harmonising further the national legislation with the EU *acquis*. A new DCM on emissions from mobile sources has also been adopted, aiming to strengthen air pollution measures and reduce emissions from motor vehicles. In 2019, the government approved the National Plan on Air Quality Management (NPAQM) (2019-2026), which along with the National Strategy on Ambient Air Quality (NSAAQ) (2014-2024), represent major strategic documents in this area.

The NPAQM aims to restore air quality in areas which exceed limit values of air pollutants or where there is a high risk of exceeding them. It focuses mainly on measures to contain and reduce emissions from traffic and industry. It does so by dividing the territory into three air quality zones and outlining specific measures for each of them:

- Zone A (focusing on traffic pollution): the agglomerations of Tirana and Elbasan, where air quality is endangered, and it is necessary to ensure compliance with the daily and annual limit values for particulate matter (PM<sub>10</sub> and PM<sub>2.5</sub>) and nitrogen dioxide (NO<sub>2</sub>).<sup>179</sup>

- Zone B (focusing on industrial pollution): the municipal units of Fieri, Durrësi, Vlora, Shkodra, Korça, Patosi and Ballshi, where air quality standards for at least one pollutant are already exceeded, or there is a high risk of exceeding them due to industrial pollution and traffic.
- Zone C: the rest of the country, where air quality standards are unlikely to be exceeded (91.8% of the Albanian territory and 65% of the total population).

However, the NPAQM mostly focuses on transport measures. It does not provide for improving the monitoring system or making it fully and continuously functional (European Commission, 2020<sup>[19]</sup>). Both the NPAQM and NSAAQ envisage preparing local air quality plans and short-term action plans, but not until 2021. When it comes to monitoring implementation, this is not conducted regularly and it is not clear how frequently it will be done.

There are several institutions<sup>180</sup> dealing with air quality, but they all suffer from limited administrative and technical capacity and financial resources, primarily for monitoring and inspections. There is also a lack of relevant legal acts regulating co-ordination, implementation and immediate action if air pollution safe thresholds are exceeded. Thus immediate action is not ensured. Urban air quality is monitored by the National Environment Agency (NEA), mostly through a network of six fixed automatic stations, in addition to one mobile station in Tirana. However, lack of funding means that air monitoring equipment is not being maintained or calibrated, and all stations have been turned off (European Commission, 2020<sup>[19]</sup>). Furthermore, the monitoring process does not cover air quality assessment in rural or rural background locations. Current ambient air quality monitoring practices, including data collection and reporting, are not fully in line with the EU requirements. A national air emission inventory is prepared each year and the data compiled into annual reports as part of the State of the Environment Report, published on the NEA's official website.

Management of the **water supply and sanitation system** remains undeveloped in Albania. Although some improvement has been made in the water supply coverage of population in urban and rural areas since the last assessment, the situation is still far from satisfactory. The overall sewerage coverage remained about 51% in 2018, with a significant discrepancy between urban (79.8%) and rural areas (only 15%) (UNECE, 2018<sup>[214]</sup>). Wastewater treatment plants cater for only about 15% of the population, and face key concerns such as lack of licensing and tariffing for wastewater treatment, insufficient operation and maintenance and negative environment impact due to underdeveloped networks and connections (European Commission, 2020<sup>[19]</sup>). Despite the construction of new urban wastewater treatment plants (eight were built in 2016 and three were being built at the time of drafting), lack of funding and limited technical capacities mean three are idle, and their long-term operational arrangements are unclear. Changing investment priorities as a result of the COVID-19 pandemic might reduce funding further, especially as the main sources of funds for infrastructure are the state budget (which is largely insufficient as underlined by the government) and donor support, though to a much lesser extent. The current water service fees are inadequate to cover or complement infrastructure investments as well as water supply and services, although these are partly being funded by transfers from the municipalities and taxes.

The legislative and policy framework was being developed at the time of drafting: a Law on Water Supply and Sewerage Sector and the new Sectoral Strategy for Water Supply and Sewerage Services (SSWSSS) (2020-2030). The latter aims to improve the quality of water supply and sewerage data; improve access to water supply and sewerage (WSS) services for the population; strengthen the financial sustainability and affordability of WSS services; build WSS workforce capacities; and improve the governance and regulatory framework of the sector. Although the legislative and policy framework are not fully aligned with the EU *acquis* in the area of wastewater management, monitoring mechanisms are envisaged by the MIE and the Monitoring and Benchmarking unit and concrete objectives, budget, measures and timelines have been set.

No major changes to the **industrial waste management** legislative framework have been made since the last assessment. However, the newly adopted Waste Management Strategy (2020-2035) tackles industrial

waste management as well (see Sub-dimension 13.1: Resource productivity). Alignment with the EU legislation on industrial pollution and risk management is still at an early stage (European Commission, 2020<sup>[19]</sup>).

By law, any chemicals produced in or imported to Albania need to be registered on an electronic chemical register. However, the national chemicals register has not been established yet as the responsible institution – the Chemicals Office – only became operational in July 2020 and the secondary legislation defining the procedures for establishing and maintaining the register is not yet in place. A Pollutant Release and Transfer Register (PRTR) system has been functioning since 2015 and is maintained by the NEA. As regards managing and controlling industrial risks and accidents, the Seveso-III Directive (Directive 2012/18/EU) has not been fully transposed yet.

There is no policy or legislative basis for soil protection, or the identification and management of contaminated sites in Albania and very little has been done to identify and clean up contaminated sites since the last assessment. There are plans for cleaning up the old PVC plant in Vlora and improving the capacities for storage and treatment of the Centre of Dangerous Chemicals Collection and Treatment in Elbasan, but their realisation might be impeded by budgetary constraints.

### ***The way forward for environment policy***

Definite progress has been made in Albania since the last assessment, especially in the legal and policy framework for climate change, biodiversity and air pollution. However, performance on a number of dimensions needs to be improved further and planned activities need to be fully implemented. Some of the priorities are as follows:

- **Direct more investment into improving wastewater systems and treating more wastewater.** Although Albania has taken some action to renovate and update its water supply and sanitation system, the activities are limited in scope and decisions on where to invest have not always been supported with concrete data. It is therefore important to conduct a clear mapping of the situation and identify key investment priorities. The government should try to finance these projects as much as possible from the domestic budget and higher water tariffs (at rates that take into account the needs of poor and vulnerable groups in the population). Where donor support is provided, the government should make sure these finances flow regularly to ensure the sustainable maintenance of the water supply and sanitation system.
- **Develop adequate capacities to forecast, monitor, warn and inform the population of the risks from multiple hazards and ensure suitable and timely responses to hazardous events.** Albania is one of the most at-risk economies in Europe from multiple hazards. The 2019 earthquake revealed the weaknesses of its systems, hence its resilience to hydro-meteorological and geophysical hazards urgently needs to be improved (Reliefweb, 2017<sup>[218]</sup>). Albania should invest in modern equipment, focus on guidance and clear procedures as well as on building skilled human resources to efficiently and effectively respond to hazards. Box 20.17 gives examples from Turkey and Australia.
- **Develop a comprehensive land-use policy framework to ensure effective land-use planning, preserve land and foster resilience to natural hazards, such as earthquakes.** The government of Albania lacks an all-inclusive land-use policy framework to provide a clear direction in this area. It should focus on modernising the building codes, updating seismic hazard maps and combatting unregulated and illegal building activities. As for the latter, measures such as creating a register of buildings without permits and conducting legalisation procedures (where possible) might be taken into consideration.

### Box 20.17. Managing natural disasters: Case studies from Turkey and Australia

The Marmara Earthquake in 1999 shed light on **Turkey's** challenges in dealing with natural disasters. With the establishment of the Disaster and Emergency Management Authority (AFAD) in 2009, Turkey has shifted its disaster management approach from crisis management to risk management. AFAD is in charge of preventing disasters and reducing disaster-related damage in Turkey. It plans and coordinates post-disaster response and promotes co-operation among various government agencies. It operates through a central agency and its 81 provincial branches, which manage local emergency action. AFAD also has 11 regional special search and rescue brigades and 23 regional logistics warehouses. AFAD's budget comes from the central government and special international emergency and humanitarian funds. AFAD's Strategic Plan acknowledges the growing risks posed by climate change. Disaster risk management and climate change adaptation complement one another. Therefore, they have been integrated into different levels of governance and across sectors. As part of building capacity for managing climate-related natural hazards, AFAD is identifying best practices around the world and also working to learn lessons learned from recent floods in Turkey.

With the goal of building local capacity and capability, the state of **South Australia** has formed 11 metropolitan and regional Zone Emergency Management Committees responsible for strategic emergency management planning within their zone. Each of these committees is chaired by local government and includes additional local government representation as well as representatives from the South Australian Police, State Emergency Service and a dedicated Zone Recovery Planner.

A key activity undertaken in each of the zones is to develop all-hazard risk studies (one per zone) with a comprehensive assessment of risks. These follow a standardised zone emergency management planning framework, based on the International Standard for Risk Management and National Emergency Risk Assessment Guidelines. As part of these all-hazards risk studies, a number of risk assessment workshops were conducted involving stakeholders such as state government agencies, key experts and civil society organisations from the respective zones) This ensures that accurate and relevant information is collected and partnerships among local stakeholders are created, further reinforcing community resilience.

The zone emergency management planning framework and its assessment tools are linked with the state emergency risk assessment processes and registers, as well as those of local government. This consistent measurement of risks helps in information and data sharing, contributing to better informed communities.

## Agriculture policy (Dimension 14)

### Introduction

Albania has slightly improved its performance in the agriculture dimension. The economy's score has increased to 2.8 in the 2021 assessment (Figure 20.1), with the most progress made in agro-food system capacity (Table 20.22). However, Albania still scores lower than the other Western Balkan economies averages in Sub-dimension 14.4: Agricultural innovation system.

**Table 20.22. Albania's scores for agriculture policy**

Dimension	Sub-dimension	Score	WB6 average
Agriculture policy dimension	Sub-dimension 14.1: Agro-food system capacity	3.2	2.8
	Sub-dimension 14.2: Agro-food system regulation	3.0	2.9
	Sub-dimension 14.3: Agriculture support system	2.8	2.7
	Sub-dimension 14.4: Agricultural innovation system	2.0	2.6
Albania's overall score		<b>2.8</b>	<b>2.7</b>

### State of play and key developments

Agriculture in Albania is an important economic industry, accounting for 20.3% of total GDP (Figure 20.15) and almost 41% of employment (INSTAT, 2020<sub>[134]</sub>). The sector remains the largest provider of employment for women, with 51.3% of employed women working in agriculture compared to 35.2% of men. The production of fruit and vegetables represents 20% of agriculture production value; however, it represents 36%<sup>181</sup> of total agricultural exports and has been consistently increasing over the past decade (INSTAT, 2020<sub>[221]</sub>).

Favourable climatic conditions and continuous improvement to regulatory standardisation means that Albania's agricultural products are becoming more competitive in regional markets. Fresh vegetable production in 2019 was 832 732 tonnes, up by 7.9% from 2018. Vegetable production in greenhouses represented 21.3% of total vegetable production in 2019, up 5.5% from 2018.

Olive production was heavily subsidised by the state in the period 2009-15, and consists of around nine million trees. This made Albania the leading olive oil producer in the Western Balkans, though its current production still represents only 0.6% of EU production levels.

Small ruminants are another important sub-sector in Albania. The annual milk production from sheep and goats amounts to about 87 000 tonnes for each category, although with some differences in productivity per head. Most meat and milk are destined for the local and national market. The main products, other than processed milk, are cheese, cottage curd and butter.<sup>182</sup>

Fishery and aquaculture production has increased in the period 2014-19, with the total quantity of fish increasing from 11 022 tonnes to 15 011 tonnes. Sea fishing production has remained stable, but aquaculture production increased from 1 500 tonnes to 5 229 tonnes.

**Figure 20.15. Agriculture's contribution to GDP in Albania (2016-19)**  
(in %)

StatLink  <https://doi.org/10.1787/888934255418>

#### *Sub-dimension 14.1: Agro-food system capacity*

Albania's **rural infrastructure policy framework** involves several comprehensive programmes. Its National Regional Development and Cohesion Programme was harmonised with EU standards in 2019 and continues to address the needs of the sector and its producers. Its approach includes policies and strategies at the national level, planning at the regional level, and implementation of a seven-year programme. The current Rural Development Programme 2014-2020 was updated in 2019 to harmonise with EU standards.

The Albanian Development Fund (ADF) continues to implement large-scale rural infrastructure programmes. The Local and Regional Infrastructure Programme (2019-2021) aims to promote socio-economic development through regional infrastructure projects focusing on improving tourism, accessibility between communities, access to basic services, and encouraging co-operation among local government units. Meanwhile, the Local Roads Connectivity Project (2018-2022) is improving access to select agricultural and tourism centres and strengthening municipalities' capacity to manage their road assets, in turn allowing farmers better access to markets and agriculture processing centres. The funding of regional projects managed by ADF, apart from the national budget, is heavily supported by a number of financial institutions through loans and donations, namely the World Bank, Instrument for Pre-Accession Assistance, Central European Bank, International Bank for Reconstruction and Development, and the European Investment Bank.

The ADF has developed a strong administrative capacity for planning, implementation and monitoring of programmes and provides regular and timely annual reports on programme monitoring which are submitted to all national institutions. However, access to information for farmers, such as market developments, technical options and weather remains limited. Thus information sharing capacity needs improvement.

Irrigation infrastructure in Albania is disorganised and inefficient due to a decentralised system with an unclear division of responsibilities. By the end of 2019, irrigation capacity had only reached 245 000 hectares (ha) of a target 360 000 ha by 2029. This represents an improvement of around 20 000 ha since the end of 2017 when irrigation capacity was at 225 000 ha.

However, modernising irrigation infrastructure has been recognised as one of the top priorities of the Government of Albania. In 2018, the Strategy for Irrigation and Drainage in Albania (2019-2031) was prepared by the Ministry of Agriculture and Rural Development (MARD) in consultation with stakeholders

and with technical assistance from the Water Resources and Irrigation Project (WRIP) financed by the World Bank. The strategy identifies the main strengths, weaknesses, opportunities and threats to irrigation, drainage, dams and reservoirs, and flood protection. It includes an action plan that lists the activities, implementation responsibilities, implementation timeframe, expected results, and performance against strategic objectives and costs.

In terms of **the irrigation policy framework**, the management of irrigation and drainage systems, including building capacity, was transferred from national to municipal control in 2016. The Water Users Organisations (WUOs) that were responsible before 2016 for the operation and management of secondary and tertiary canals under the national administration are now inactive as they were unable to manage the water systems effectively due to a lack of knowledge, technical skills and financing. The Law on Administration of Irrigation and Drainage has therefore only deemed WUOs as optional structures for delivering irrigation services if the municipalities decide their involvement is necessary. If WUOs demonstrate that they can function satisfactorily, both by technical and financial standards, then municipalities can transfer management responsibilities to them. For the period 2016-20, municipalities were supported with around EUR 42 million, 84% of which was allocated for rehabilitating irrigation infrastructure. The other 16% provided each of the 61 municipalities with an excavator to help them maintain irrigation and drainage channels.

Irrigation infrastructure is monitored quarterly by the MARD and the results have a large impact on policy making and its improvement. For example, the decision to transfer part of the irrigation and drainage responsibilities to municipalities was made based on these assessments.

The current **agricultural education system** in Albania remains underfinanced and the number of agriculture students continues to decrease due to a lack of reach and quality of vocational training programmes. The education policy framework is based on the National Strategy for Employment and Skills 2014-2020. The strategy describes the current challenges, strategic areas and proposed measures for creating a skilled workforce that can respond to market demand (including in agriculture). While the strategy foresees a number of measures to address agricultural development bottlenecks, no specific measures have been dedicated to improving agriculture education and training.

Currently, there are very few agricultural vocational schools and the number of agricultural vocational high school graduates is decreasing (Table 20.23). The Agricultural University of Tirana and the Faculty of Agriculture at the University of Korça are the only higher education agricultural institutions in Albania. While the majority of university graduates still work in agricultural and related sectors, the number of students continues to decrease. In 2019, the number of students enrolled in the first year of agriculture studies was 30% less than in 2017 (Figure 20.16).

**Table 20.23. Agricultural vocational training institutions in Albania**

Vocational training focus	Number of schools
Crop production	8
Agri-business	5
Veterinary science	3
Agricultural machinery	2
Animal production	1
Silviculture, forestry and furniture production	1

Source: (INSTAT, 2020<sub>[221]</sub>), *Agriculture Statistics 2019*, <http://www.instat.gov.al/media/7202/press-release-agriculture-statistics-2019.pdf>.

The integration between vocational education and training systems is still weak and the curricula offer little scope for practising the skills learned, a crucial component of agricultural work. The education and training system remains underfinanced, offering limited incentives for businesses in offering training places. Although the agriculture sector largely employs the working poor and low-skilled workers, the vocational

education and training services do not reach rural areas, where education levels are generally lower than urban areas and where most of the Albanian population currently resides.

**Figure 20.16. Enrolments in the first year of agriculture degrees (2017-19)**

Number of students

#### *Sub-dimension 14.2: Agro-food system regulation*

While human and financial resources for **regulating natural resources** are adequate, monitoring of policy objectives and public investment has not reached its full potential. National water sector reforms in Albania are still being implemented. There are several regulations and strategies for natural resources, governing access to and use of water and the environmental impact of agro-food activities. The National Strategy for Integrated Water Resources Management 2018-2027 (NSIWRM) sets the framework for the development of policies in spatial planning, environmental protection, biological and landscape diversity, agriculture, forestry, fishing, transport and tourism (for details see Sub-dimension 13.2: Natural asset base).

The governance of water resources in Albania is highly centralised. The main decision-making authority is the National Water Council (NWC), composed of several ministers and chaired by the Prime Minister. However, in 2018 the Technical Secretariat of the NWC was transformed into the Agency of Water Resource Management,<sup>183</sup> which is now under the direct responsibility of the Prime Minister rather than the Ministry of Agriculture and Rural Development. It is responsible for the administration and management of water resources, including water management in inter-regional and national plans and projects in agriculture, urban planning and industrial and territorial development.

The national water cadastre has increased information sharing and integration with the various institutions concerned with water management and use in Albania.<sup>174</sup> Since 2016, river basin management plans are being prepared for all rivers that are important for agricultural productivity, covering water quantity for irrigation, structural works for irrigation and drainage, wastewater purification, environmental protection, water quality etc.

The **regulations on seeds and propagation** material in Albania are strongly harmonised with EU directives and protocols, including consistent monitoring and evaluation on a quarterly basis following EU guidelines. The regulations on seeds and propagation material cover agricultural production, environmental protection and consumer health. There is institutional co-ordination among government agencies with clear divisions of responsibilities and mandates.

The legislation on registration of plant varieties in the National Catalogue and their maintenance is aligned with EU protocols. The new Law on Fertiliser Products was approved in 2020 and harmonises the rules for production, registration, trade, import, export, use, quality control, traceability, information, advertising and inspection of activities related to fertiliser products, as well as the organisation and operation of relevant structures.

### *Sub-dimension 14.3: Agricultural support system*

Albania's **agricultural policy framework** is harmonised with EU policies and implementation is monitored regularly by the Ministry of Agriculture and Rural Development. Agriculture policy is covered by the Law on Agriculture and Rural Development and complemented by the Inter-Sectoral Strategy on the Development of Agriculture and Rural Development 2014-2020 (ISARD).<sup>184</sup>

The ISARD outlines the strategic interventions needed for Albanian agriculture and rural areas to meet the challenges of the EU single market and to adapt Albanian agricultural and rural development policies to the Common Agricultural Policy (CAP). The ISARD is harmonised with the main principles of the EU policies, the CAP and the Instrument for Pre-accession Assistance for Rural Development policies (IPARD), and focuses on addressing the specific problems in Albanian agriculture and rural areas. While institutional responsibilities for agricultural support policies and IPARD implementation are clearly and effectively divided among national and regional government agencies,<sup>185</sup> the national programme has only used 25% of the IPARD budget, hindering further development.

Ambitious indicators were set in the 2014-2020 ISARD to measure policy implementation. These indicators include real economic growth of the agriculture sector, an increase in labour productivity in agriculture and processing, full compliance by formal agriculture holdings with EU standards, an increase in the average farm size, an increase in the export-to-import ratio, and creation of new jobs, new micro-enterprises, and new producer groups. However, the targets set within these indicators for the period 2014-20 are rather high, so will most likely not be met. For example, real economic growth of the agriculture sector was targeted at 5% per year until 2020, whereas the real average by the end of 2019 was 2.4%, (Albanian Institute of Statistics, 2020<sub>[222]</sub>). Additionally, the export-to-import ratio was set at 1:3 for 2020, while the actual ratio is far from this objective (around 1:2), proving that planning needs to be more realistic and annual reviews of the indicators are necessary.

MARD publishes an annual report that provides information on its monitoring activities at two levels for producer support spending, as well as challenges and recommendations for future implementation. Financial monitoring includes evaluating the procedures in place, whether the procedures were followed and criteria respected, the number of beneficiaries, the annual budget and annual spending. The physical monitoring system conducts random checks with producers on how support from the ministry was implemented.

**Domestic support instruments** in Albania are in line with IPARD support and financing measures and have made substantial progress on introducing preventative measures for natural disaster mitigation. The instruments for agriculture producers include investments for modernising and standardising agricultural production. In 2020, the measures included support for breeding animals, bee-keeping, replacing plastic sheeting in greenhouses, organic production, implementation of standards and certification (Global GAP) and support for establishing or reconstructing rural tourism capacities.

The current support measures are divided into National Support Schemes and IPARD II Programme (2014-2020) support. The national support schemes for 2019 were granted to 4 009 beneficiaries for a total amount of EUR 6.5 million. While the budget of the IPARD programme for the period 2014-20 is EUR 71 million, by the end of 2019 only EUR 16 million had been used due to the IPARD agency's limited capacities for full implementation of the measures, as well as overly demanding criteria for applicants. Domestic support instruments complement the IPARD programme and there is no overlap of support measures or

financing. While there are no agri-environmental measures similar to those under CAP agri-environmental scheme in place yet, these measures are being formulated.

The Law on Civil Protection was updated in 2019 and introduced new national and local strategies, harmonised urban planning at local and national level, and regional strategies for risk assessment. According to the new law, the state is responsible for the damage caused by natural disasters. As each ministry is responsible for allocating a portion of its annual budget to reducing the risk of disasters and civil protection, the MARD allocates around 2% to 4% of its total annual budget to natural disaster mitigation.

Albania has a liberal **trade regime** and has followed guidelines set by the EU and the World Trade Organization (WTO) since 2000. Customs procedures reflect the Customs Tariff Nomenclature that is based on the Harmonized Commodity Description and Coding System (HS). Legislation for agricultural trade relies on the Customs Code of the Republic of Albania, the Nomenclature of Goods and Free Trade Agreements.

Albania implements preferential tariffs on agriculture products originating from member countries of the EU, CEFTA, EFTA and Turkey. There are import tariffs and tariff-rate quotas for agricultural commodities (crops and livestock) and inputs (fertiliser and pesticides). The base tariff rates are defined in the Combined Nomenclature of Goods 2020. Preferential tariff rates and tariff-rate quotas for agricultural commodities are also based on free trade agreements. Albania does not apply export credit support, export duties and/or export prohibitions for agricultural commodities (crops and livestock). As the United Kingdom has left the EU, Albania and the United Kingdom have negotiated a Trade Partnership Agreement which foresees tariff-rate quotas and preferential tariff rates, but this agreement has not yet been signed.

The **taxation system** for the agriculture sector remains unified and imposes few taxes on farmers. Tax on agricultural land is paid by hectare, with the exclusion of farms planted with orchards and vineyards, for the first three years from the moment of planting. The taxes are paid to the municipal budget according to the location of the land. A profit tax is obligatory for all legal entities that conduct economic activities according to law. In agriculture its rate is 5%. For entities that carry out certified agro-tourism activities, according to the legislation in force in the field of tourism, the profit tax rate is 5%. This rate applies for a period of 10 years for legal entities that benefit from certified agro-tourism status obtained before December 31, 2021.

VAT exemptions in agriculture include the supply of agricultural inputs, such as chemical fertilisers, pesticides, seeds and seedlings, except for hormones; as well as supply of veterinary services, with the exception of veterinary services for pets. A compensation scheme applies to agricultural producers at a rate of 6%: agricultural producers benefit from the right to compensation if their annual turnover does not exceed the minimum registration limit for VAT, or if the producer supplies goods or services originating from their work in one of the activities defined.

Albania's **sanitary and phytosanitary (SPS) framework** is partially compliant with international standards and EU requirements, but both the food safety and veterinary services fields continue to face capacity limitations in terms of technical support, training and policy. While Albania is a member of the FAO-WHO Food Code, WTO SPS Agreement, World Organization for Animal Health (OIE), International Plant Protection Convention (IPPC), and European and Mediterranean Plant Protection (EPPO) and has established functional national contact points for each organisation, little progress has been made in bringing the national SPS framework in line with international guidelines.

A reference laboratory for food safety, phytosanitary and veterinary network exists but as the law does not oblige accreditation of tests, only a limited number of specific tests on food safety are recognised by international certificates, preventing the recognition of the procedures abroad. In the phytosanitary field, tests are partly recognised and there is an ongoing process for their recognition amongst CEFTA members. The preparation of secondary legislation for food safety rules has continued, with the exemption of small food operators from applying HACCP procedures;<sup>186</sup> however, the area continues to face capacity

limitations such as lack of technical support and expertise, scarce resources and specific training, as well as a lack of written procedures on quality assessment, limiting compliance with international standards.

While the National Food Authority carries out regular controls under a risk-based plan approved at the beginning of the year, the standard operating procedures to ensure compliance with the legislation have yet to be approved and there is little effort to bring the practices in line with international guidelines. Duplicate inspections continue at the farm level by inspectors of the Regional Veterinary Service and Plant Protection Agencies and the National Food Authority due to unclear divisions of responsibilities and mandates. While inspections and their financing are based on a risk approach, there is no clear legislative plan for risk approach procedures.

As regards veterinary policy, the Regional Veterinary Service and Plant Protection Agencies (RVSP) were established in 2018/19. A reform of the veterinary service was started in 2018 but has not yet been completed and the sector faces problems with staffing, animal waste management and farm biosecurity and fishery products (European Commission, 2019<sup>[79]</sup>).

#### *Sub-dimension 14.4: Agricultural innovation system*

The **research and development framework** is based on the National Strategy for Scientific Research, Technology and Innovation for 2017-2022, along with the Action Plan for the Support of Development of Innovative Policies. The action plan aims to improve links between academic, industry and government institutions. Although the research strategy aims to increase investments for scientific research, technology and innovation to up to 1% of GDP by 2022, the share of public spending on scientific research in 2018 only reached 0.06% of GDP. The research strategy aims to increase practical projects involving research institutes and farmers, improving production technology and the competitiveness of Albanian producers. While under review as of 2020, the strategy also aims to continue working with the EU Horizon 2020 programmes that support Albania's research institutes in developing new methodologies and techniques in agricultural research.

There are numerous institutions involved in Albania's agriculture research and development sector,<sup>187</sup> but it remains underfunded and poorly organised in its division of responsibilities and administrative capacities. Albania has become increasingly aware of gaps in agricultural research and has begun prioritising and targeting the exact areas where more research and innovation support is needed for further harmonisation with EU processes. The National Inter-Sectoral Strategy for Agriculture and Rural Development (NISARD) 2014-2020 action plan aims to further develop the agricultural innovation system. But progress has been slow and there is little co-ordination or information sharing among the academic institutions and regional agencies responsible for agriculture research and development.

Albania's **agriculture extension services** have made progress on intra-institutional co-operation but lack administrative and human capital capacities. There are five regional Agricultural Technology Transfer Centres (ATTC) in Albania, with the role of enabling the smooth transfer of agricultural technology according to the needs and regional priorities within the ATTC's jurisdiction. The ATTC has 153 employees offering training and educational material to farmers and agribusinesses. These National Extension Agency Services are partly or fully free of charge for all farmers, and each regional office adapts to the needs of farmers in the most prominent agricultural sectors in the area. The ATTCs are widely used by farmers and producers. However, their programme frameworks could improve by including services that farmers request and adapting to emerging market needs and requirements.

Access to information for farmers, such as market developments, technical options and weather, remains limited, and is only provided through a personal phone call with the representative of the extension service office. Moreover, the administrative and human capital capacities of Albania's extension services do not meet the needs of agricultural producers. The level of information sharing primarily depends on how active the advisors are within the regional extension service offices, which differs from region to region.

### ***The way forward for agriculture policy***

The following suggestions for future efforts and priorities of the Albanian Government could help improve agriculture policy:

- **Enhance rural infrastructure policy capacity by replicating Albanian Development Fund (ADF) good practices in planning and management of large-scale projects.** The experiences of ADF should be transformed into operational mechanisms and practices that can be used in implementing the next Agriculture and Rural Development Programme (2021-2027). From 2019, the needs of the sector have been addressed in the framework of the regional development and cohesion programme in harmonisation with the EU approach, which is why replication of good practices and further building of the administrative capacity is necessary.
- **Complete the monitoring and evaluation system for irrigation water management.** This will allow the MARD to follow up on the progress of developing and managing irrigation systems across the territory. The M&E system will be an important tool for municipalities to undertake self-assessments of their annual progress on irrigation and drainage activities.
- **Increase the capacity of the IPARD agency.** Efforts are necessary to ensure the agency's administrative capacity is adequate to fully implement available IPARD II funding. Staff need to be further trained and prepared for allocating the remaining measures under the IPARD II programme as well as forthcoming ones.
- **Improve the performance of the agricultural education system.** Institutions and businesses should increase networking, as well as the practice and training hours for students. Financial remuneration or other rewards should be used to motivate businesses to offer students practice hours.
- **Upgrade the SPS system and fully harmonise it with EU requirements.** Restructuring the veterinary sector and building the necessary technical and administrative capacity in the field of food safety and phytosanitary services is necessary. The food safety standardisation and accreditation of laboratories should be considered a priority.
- **Increase the funding and enforce the implementation of the National Strategy for Scientific Research.** There is a need to increase investment in research, in line with market demand, stimulate the links between producers and researchers and support innovation projects in targeted agriculture sub-sectors. Extension services need to be further supported by increasing the expertise of advisors through continuous training.

## Tourism policy (Dimension 15)

### Introduction

Table 20.24 shows Albania's scores for the five tourism sub-dimensions and compares them to the WB6 average. Albania has the third highest score in the tourism dimension (after Montenegro and Serbia). Albania scores above the WB6 average in four sub-dimensions, scoring highest in the tourism branding and marketing sub-dimension. Albania scores below the WB6 average in sustainable and competitive tourism, which is mainly due to its low score in promoting sustainable development and operations within the tourism sector. Since 2018, Albania has mainly progressed in improving partnerships with stakeholders (part of Sub-dimension 15.1), accessibility and accommodation capacity (Sub-dimension 15.2), quality assurance and VET frameworks (Sub-dimension 15.3), and tourism branding and marketing (Sub-dimension 15.5).

**Table 20.24. Albania's scores for tourism policy**

Dimension	Sub-dimension	Score	WB6 average
Tourism policy dimension	Sub-dimension 15.1: Governance and co-operation	2.4	2.3
	Sub-dimension 15.2: Destination accessibility and tourism infrastructure	2.5	2.2
	Sub-dimension 15.3: Availability of a qualified workforce	1.8	1.8
	Sub-dimension 15.4: Sustainable and competitive tourism	1.3	1.6
	Sub-dimension 15.5: Tourism branding and marketing	2.8	1.6
Albania's overall score		<b>2.1</b>	<b>2.0</b>

### State of play and key developments

Tourism has become one of Albania's most important economic sectors. In 2019, international tourist arrivals reached 6.4 million, which is higher than the WB6 average (INSTAT, 2020<sup>[223]</sup>). Average annual tourist arrivals in the last 10 years have increased by 13%, which is the second highest growth in the region, just behind Kosovo (14%). This fast increase in international tourist arrivals has contributed to tourism's growing share in GDP and employment. In 2019, the total (direct and indirect) contribution of tourism to GDP was 21.2% (USD 3.26 million and an 8.3% increase on 2017) (WB6-CIF, 2020<sup>[224]</sup>), while the direct contribution of tourism to GDP was 8.8%. Its total contribution to employment was 22.2% or 254 300 jobs, while its direct contribution was 8% or 91 500 jobs (WEF, 2019<sup>[225]</sup>). Moreover, tourism in Albania contributes 38% of total exports, which is again the second highest share among the Western Balkan economies. The growth of tourism is partly driven by the overall growth in investments, as well as the improvement in promotion and marketing on international markets. This significant improvement is reflected in Albania's improved ranking in the World Economic Forum's Competitiveness Index. It has risen by 24 places (ranking 48<sup>th</sup>) in the effectiveness of marketing and branding to attract tourists indicator, and by 71 places (ranking 35<sup>th</sup>) in the country brand strategy indicator. Although Albania has improved its overall position by 12 places, its ranking at 86<sup>th</sup> place indicates that further efforts should be made to improve its competitiveness (WEF, 2019<sup>[225]</sup>).

Despite these remarkable improvements, some challenges still hamper Albania's tourism sector. The key challenges are strong seasonality (with the peak season in July and August) (Figure 20.17), the concentration of tourism in the coastal areas, the large informal economy and the low average receipts per arrival (only USD 390, the lowest in the WB region). These challenges are enhanced by the lack of high-quality tourist products and services, limited human resource capacity and the lack of effectiveness and efficiency of governance at national and local levels.

**Figure 20.17. Seasonality of Albanian tourism (2019-20)**

Number of tourists and overnight stays by quarters (in thousands)

StatLink  <https://doi.org/10.1787/888934255456>

In order to address these challenges, Albania has set out strategic goals and policy measures in its new National Strategy for Sustainable Tourism Development (2019-2023).<sup>188</sup> The strategy aims to diversify the tourism offer (coastal, natural and thematic tourist products); increase the added value of tourism for the economic and social development of the economy; develop new, high-quality tourist products and services; and improve the economy's image through local products. However, some key challenges are not sufficiently considered in the new strategy. These include poor governance at national and local levels and the lack of sustainable tourism promotion.

The biggest current challenge is the COVID-19 pandemic, which put the development of the tourism industry on hold in 2020. Tourism was one of the sectors most affected by the pandemic. In order to mitigate the impact of the virus, Albania closed its borders in March 2020 (with a few exceptions, mainly transport of goods and diplomatic corps). Tirana International Airport closed to air traffic except for state, military, medical and emergency flights. As a result, in the third quarter of the year 2020, the number of tourists arrivals decreased by 43.3% compared to the same period in 2019 (INSTAT, 2020<sub>[223]</sub>), and by 47% on annual level compared to 2019. In terms of accommodation occupancy, the number of nights spent in the third quarter of 2020 decreased by 45% in comparison to the third quarter of 2019 and by 50,7% on annual level compared to 2019 (INSTAT, 2021<sub>[226]</sub>) (Figure 20.17).

The Albanian Government has established the national tourism recovery programme, which includes incentives to local businesses, establishing partnerships with airlines, promoting blue tourism, online promotion of Albania as a safe tourist destination, organising events and reorienting public investments.

A Decision of the Council of Ministers (in April 2020) introduced a financial assistance package corresponding to ALL 7.04 billion for the period April-June 2020 to employees of entities (physical/juridical persons) in the accommodation sector. In addition, 176 000 workers, 10 000 of whom were employees in the tourism sector benefited from a monthly USD 400 payment in April 2020 (WB6-CIF, 2020<sub>[224]</sub>).

Constant dialogue has been established between the Ministry of Tourism and Environment (MTE) and the stakeholders of the tourism industry in order to assess the situation and the ongoing challenges. This co-operation has helped to develop recommendations to address the current crisis in the best and most efficient way in order to minimise the impact of COVID-19 on Albanian tourism, protect travellers and restore trust. The MTE, in collaboration with the Sustainable Rural Development (SRD) programme,<sup>189</sup> has developed a questionnaire to identify the issues currently faced by accommodation structures in order to target support. In collaboration with the Ministry of Health and Social Protection the MTE has drafted a

protocol for anti-COVID-19 measures for the 2020 tourism season. This document aims to guide and regulate the necessary preconditions for tourism enterprises to guarantee the successful continuation of their activity while avoiding spreading the virus inside and outside accommodation structures. This draft proposal will be implemented once the government relaxes some measures (WB6-CIF, 2020<sup>[224]</sup>).

### *Sub-dimension 15.1: Governance and co-operation*

Albania's tourism **governance and institutional set up** is defined by the Law on Tourism, adopted in 2015. The Law on Tourism (2015) establishes the responsibilities of central and local governments and outlines the institutions involved in the tourism sector both at national and local levels. Tourism development is overseen by the Ministry of Tourism and Environment, which is responsible for the development, management, co-ordination and implementation of the tourism strategy. The National Tourist Agency of Albania is the central organisation responsible for tourism branding and marketing. The new Strategy for the Sustainable Development of Tourism (2019-2023) clearly defines the strategic objectives, policy measures and actions to be implemented by different ministries, the budget allocation and the implementation timeframe. Due to the crosscutting nature of the tourism sector, it is included in other national strategies (Table 20.25). In December 2019, the Thematic Group on Tourism and Culture Development and the Prefectures of the Regions was established, headed by the Deputy Minister of the Ministry of Tourism and Environment, in order to ensure joint policy, cross-sectoral co-operation and decision making at the highest level.<sup>190</sup> The thematic group consists of representatives from the MTE, the Ministry of Culture and subordinate institutions, according to the area of responsibility. The work of the Thematic Group is included in the annual progress reports on Competitiveness and Investments. However, there is still no formal government body which also includes other ministries and public institutions to co-ordination of tourism development at the government level.

**Table 20.25. Albania's cross-cutting tourism strategies**

<b>Title</b>	<b>Key focus area</b>
The General National Territorial Plan 2015-2030	Sustainable tourism based on natural resources
Integrated Cross-Sectoral Plan for the Coast 2015-2030	Coastal as well as urban tourism
Sectorial Strategy of Transport and Action Plan 2016-2020	Focus on connectivity and accessibility
Cross-Cutting Strategy Digital Agenda of Albania 2015-2020	Development of connected tourism/ e-tourism
Cross-Sectoral Strategy for Rural and Agricultural Development 2014-2020	Development of rural tourism as well as tourism related to culture, nature, mountains, etc

A 2019 progress report on the implementation of the tourism strategy has been published and the 2020 report is being drafted, which are positive steps. Since implementation of the six previous tourism strategies<sup>191</sup> was weakened by inefficient governance and patchy implementation due to government changes (Ciro A., 2019<sup>[227]</sup>), special attention is needed to strengthen implementation. This is even more important in a context of weak inter-ministerial co-operation, which is evident in the conflicting sectoral development priorities (such as promoting the construction of small hydropower plants in natural protected areas rather than sustainable tourism and development of nature/adventure tourism). Additionally, the government reports that lack of knowledge and capacities of public officials are key challenges for effective and efficient governance of the tourism development in the economy.

**Partnerships with stakeholders** are established through the Private Sector Advisory Committee of Tourism (KKSPT). This advisory body is chaired by the Minister of Tourism and includes representatives of national enterprise associations, higher education institutions, chambers of commerce, associations and NGOs operating in the field of tourism, as well as representatives of international institutions/donors. The main tasks of KKSPT are to advise the Minister of Tourism by designing tourism development strategies, legislation and regulations to report on the progress of the private sector and propose policy measures for issues related to tourism. However, the efficiency of this body is rather weak, and private tourism stakeholders report that their recommendations are often not taken into account. The Investment Council

platform was set up in 2015 by the Albanian authorities with support from the EBRD to intensify the dialogue between the government and the private sector, improve the business climate and promote good governance. The Investment Council is composed of high-level government officials, representatives from business associations and multilateral agencies. The government regularly takes into account the council's recommendations, particularly since the November 2019 earthquake and the COVID-19 pandemic.<sup>192</sup>

Regional Committees for Tourism Development are established in each prefecture to co-ordinate the work of central institutions and local government units (**vertical co-operation**). These committees include representatives of local government units, district representatives, representatives of local associations in the field of tourism, educational and training institutions for tourism, and representatives of the MTE. Territorial tourism branches have been established as administrative structures of the MTE to co-ordinate the implementation of tourism product development policies and tourist destination management. At the local level they are responsible – among other things – for inventorying the main tourism resources and businesses, supporting the infrastructure and activities in the tourism sector, and ensuring compliance by local businesses with the Law on Tourism and relevant policies. However, the efficacy of local level governance remains a key challenge. Most municipalities are not able to fulfil all the responsibilities defined in the Law on Tourism (for example, the certification of accommodation facilities), due to the shortage of competent public officials (in many cases tourism is only an additional task for local officials), and the lack of financial resources for tourism development. Besides, there is not yet any regular monitoring or evaluation of policy measures implemented at the local level.

Albania's **tourism data collection and sharing system** is still at an early stage of development. Only limited progress has been achieved since 2017, including new tourism data and surveys published since 2018. A tourism data collection and sharing framework is formally in place and the Law on Official Statistics was adopted in 2018. The National Statistics Institute (INSTAT) is the leading institution for data collection and sharing. Moreover, a tourism statistical working group brings together all the main institutions that can provide reliable tourism data (i.e. INSTAT, Central Bank, Customs Office, and General Directory of State Police). Some improvements should be seen with the implementation of the newly adopted mandatory categorisation of accommodation facilities. However, the reliability of statistical data is very low due to the large informal economy in tourism (Ciro A., 2019<sub>[227]</sub>). Overall, Albania lacks a comprehensive data collection framework that would provide a clear methodology for data collection and analysis.

#### *Sub-dimension 15.2: Destination accessibility and tourism infrastructure*

As mentioned in the previous assessment, Albania's Sector Strategy for Transport and action plan 2016-2020 take tourism and **connectivity** into consideration by including measures to improve connectivity, safety and security at border crossing points. Since 2017, Albania has improved its destination accessibility for tourists by reducing visa requirements. In addition, electronic visas are now available for entering Albania and an e-Visa Internet portal was launched in November 2020.<sup>193</sup> The development of bilateral agreements with all WB economies, allowing travellers to cross borders with only an identity card or passport and with only one customs point (entrance), has also facilitated border crossing.

An **accommodation capacity and quality assurance framework**, which increases the availability and quality of accommodation, is in place and several policy measures have been implemented. However, most of the policy measures, such as a reduction of VAT and income tax for accommodation facilities, were already adopted before 2017. The promotion of private and public investment in tourism remains a priority policy goal in the new National Strategy for Sustainable Tourism Development 2019-2023. It includes measures for promoting private strategic investment and attracting well-known international brands in the hotel industry, defining priority areas for tourism development, and orienting private and public investments to improve basic public infrastructure first. This is a positive approach to ensure the efficient use of limited financial resources. However, for this approach to be fruitful, Albania needs to focus on putting in place high-level inter-ministerial co-operation and adopting a public infrastructure investment

programme or action plan to ensure compliance with overall public infrastructure development goals (see also Sub-dimension 15.4: Sustainable and competitive tourism). Moreover, the lack of clearly defined property rights along with other cross-cutting challenges in the business environment further hamper investment in tourism. Although policy measures have been implemented, no information on their effectiveness in terms of impact on accommodation facilities is available.

In 2016, Albania started to set up more comprehensive quality assurance by adopting a consistent accommodation quality standard framework. In 2019, the MTE started the process of categorising accommodation structures<sup>194</sup> and established a register of accommodation facilities. All types of accommodation must be registered, apart for private apartments and rooms. The legal basis for including these two accommodation types in the mandatory categorisation is currently going through the approval process<sup>195</sup>. The main remaining challenge is to empower the Tourism Inspectorate to undertake regular inspections.

**The tourist information system** provides information on tourist destinations, accommodation, attractiveness and tourist services. Information is provided via websites, road signs and at tourist information centres. It is available in multiple foreign languages and is regularly updated by the National Tourist Agency. However, a tourist information system framework that connects the current tourist information system to a comprehensive national information database is still lacking, thus impeding further improvement in this field.

#### *Sub-dimension 15.3: Availability of a qualified workforce*

A qualified workforce is an important element in developing tourism in Albania further. In 2019, Albania made progress in its **skills supply framework**, improving its position on the WEF Competitiveness Index human resources and labour market indicator by 8 places (ranking 31<sup>st</sup>). It improved even more in the ease of finding skilled employees indicator, moving up 17 places. However, its 78<sup>th</sup> place overall in the ranking in this indicator shows that further actions are still required (WEF, 2019<sup>[225]</sup>). The National Tourism Development Strategy envisages establishing a Regulatory and Institutional Framework for the development of vocational education and qualifications in tourism, as well as training of human resources engaged in the sector. Assessing skills gaps and training needs is also planned.

Albania's overall **VET framework** is well advanced, with good co-operation with private stakeholders and the National Agency for Vocational Education, Training and Qualification being established, well equipped and with a sufficient budget and staff for implementing its activities. A monitoring system has been set up under the National Employment and Skills Strategy 2019-2022 (NESS) and the budget for VET programmes has been rising continuously over the last four years. In 2019 it was four times higher than in 2015. It seems that this progress is the result of donor projects in the economy and across the region. However, Albania still needs a sector-specific human resources strategy, including clear measures to fill the gap between supply and demand by adapting the curricula to the needs of the market.

Although there is no **higher education framework**, Albania has developed the so-called dual programme for catering/tourism management, which is a three-year educational programme prepared and implemented in close co-operation between universities and private sector stakeholders. Established in 2006, 50% of the programme consists of practical training in companies.

#### *Sub-dimension 15.4: Sustainable and competitive tourism*

A **comprehensive natural and cultural heritage enhancement framework** is being developed, though progress has been limited in this field since 2017. Natural and cultural heritage is included in the National Strategy for Sustainable Tourism Development 2019-2023 and is characterised as a resource for the development of nature-related and thematic cultural tourism products. In 2019, the National Strategy for Culture 2019-2025 was adopted by the government and includes the main policies and specific objectives

for cultural heritage. However, modest progress has been made in managing natural heritage. Despite being included in the Policy Document on Biodiversity and Law on Protected Areas,<sup>196</sup> a more comprehensive framework is needed for drawing on natural heritage for tourism. Although co-operation among the responsible ministries has been established to co-ordinate policy measures and activities in the field of natural and cultural heritage, the policy measures are defined in several policy documents, and are not brought together in a separate tourism policy that would allow for regular monitoring and evaluation.

The principles of **sustainable tourism development** are defined in the National Tourism Development Strategy and in the Law on Tourism. However, specific measures for the actual promotion of sustainable tourism development are not defined. A policy framework is needed to promote sustainable tourism and operations within the tourism sector that includes clear measures to help tourism stakeholders develop sustainably. In 2019, the European Union and the European Bank for Regional Development launched a EUR 40 million Programme for Sustainable Tourism in Albania to improve the contribution of quality sustainable tourism to economic growth and the competitiveness of Albanian regions. This is an opportunity for Albania to make progress in sustainable tourism development.

Albania has made some progress in establishing a comprehensive **tourism investment policy framework**, though a **tourism innovation policy framework** is not yet in place. Policy measures for promoting investment in the tourism sector are included in the action plan of the National Strategy on Sustainable Tourism Development 2019-2023. The strategy supports the implementation of three specific objectives: 1) promoting private strategic investments to attract well-known international brands in the hotel industry; 2) defining priority areas for tourism development and orienting private investment towards them; and 3) orienting public investment towards improving basic infrastructure. The promotion of investment in tourism infrastructure is also included in the Strategic Investment Manual, issued by the Albanian Investment Development Agency and dealing with facilitating and supporting direct investments in Albania. In addition, several measures in the form of fiscal incentives (see Box 20.18) and tourism investment incentives are available.

Despite these clear indications that the promotion of investment in tourism is a priority for Albania, the effectiveness of these policy measures could not be assessed as there is no monitoring or evaluation conducted. While the first monitoring was planned to be implemented in 2020, no evaluation framework is planned to be developed.

#### Box 20.18. Fiscal incentives to boost the tourism industry in Albania

In order to boost the tourism industry, Albania has created several fiscal incentives:

- 6% VAT for accommodation structures (bed + breakfast)
- 6% VAT on any supply within “hotel/resort 5\*, special status” structures (brand name)
- exemption from building tax and impact tax on infrastructure
- hotel/resort 5\*, special status (brand name), support by administrative procedures
- exemption from profit tax for 10 years for “hotel/resort 4 \* and 5\*, special status” eligible for special status until December 2024
- 6% VAT for certified entities in agro-tourism (sleeping + restaurant but not drinking)
- infrastructure impact tax exemption for agro-tour operators who invest in this area
- income tax decreased from 15% to 5% for certified entities in agro-tourism from January 1, 2018.

Source: (Invest in Albania, n.d.<sup>[228]</sup>), *Invest in Albania*, <https://invest-in-albania.org>.

### *Sub-dimension 15.5: Tourism branding and marketing*

According to the Travel & Tourism Competitiveness Index 2019, Albania has improved its ranking in the effectiveness of marketing and branding to attract tourists indicator, moving from 72<sup>nd</sup> to 48<sup>th</sup> place (WEF, 2019<sup>[225]</sup>). The National Tourist Agency of Albania is the central national organisation responsible for **tourism branding and marketing**. Since 2015, the National Tourism Agency has managed the promotion brand of Albanian tourism "Albania go your own way". In 2019, the development of a new marketing brand was begun, but the process has been slowed down by the COVID-19 crisis. There is no monitoring or evaluation of the brand image and no marketing strategy. Key public and private stakeholders are involved in implementing the marketing plan, although a formal marketing co-ordination body is not established yet. The budget allocated for tourism promotion and marketing for 2019 is rather low (EUR 700 000), and is nearly 43% lower than in 2015, which could have a negative impact on future tourism development.

A **digital tourism marketing framework** is not yet formally established. However, some digital marketing activities are included in the overall tourism marketing strategy and were implemented in 2019. Moreover, a few digital marketing activities – such as the Marketing of Albanian Tourism campaign through sponsored advertisements on Google Ads and social networks – have been implemented. This approach includes regular monitoring of the progress of digital marketing campaigns, which is a positive development for an efficient digital marketing framework. Currently, the main weakness in this area is the lack of policy measures for building the capacity of tourism stakeholders, including providing incentives for them to implement digital marketing strategies and tools.

### ***The way forward for tourism policy***

To ensure further successful development of tourism, policy makers should:

- **Strengthen the governance structure at the central level by establishing efficient inter-ministerial co-operation.** This is essential to harmonise tourism policy priorities with other national sectoral policies priorities.
- **Involve private sector stakeholders more actively** in decision making to better address their needs and support them in implementing their development projects.
- **Introduce regular monitoring and independent evaluation** of implemented policy measures.
- **Move away from developing more mass tourism in coastal areas**, and start developing new, high-quality and personalised tourist experiences based around natural and cultural sites. Bookings should be available on short notice. Albania should also prepare a new marketing strategy and related action plan, with an objective to attract more domestic tourists in the context of COVID-19 – an area which has been relatively neglected so far but could help to disperse tourist arrivals over the year.
- **Develop a comprehensive training programme for public officials at national, regional and local levels** to impart the relevant skills and competencies to manage tourism development effectively.
- **Enable municipalities to implement their legally assigned tasks for tourism development.** Prepare an in-depth analysis of the main constraints and bottlenecks to implementing their assigned responsibilities. Define a special programme of policy measures and other actions to improve their ability to cope with tourism development efficiently.
- **Develop a comprehensive framework for promoting sustainable development within the tourism sector.** It should include the mandatory consideration of sustainability criteria in all investments in tourism infrastructure. It should also be supported by public incentives, awareness raising and training for tourism stakeholders and use best practice from other countries.<sup>197</sup>

- **Do more to improve tourism data collection and sharing** by introducing digital collection of data (see Box 20.19), and by developing Tourism Satellite Accounts to empower policy makers with reliable information when designing policy measures.
- **Conduct a comprehensive analysis of the informal economy in tourism and prepare a programme** with clearly defined measures for its systematic reduction.

#### Box 20.19. Croatia's eVisitor initiative

The Croatian National Tourist Board, together with local tourist boards and other stakeholders, have developed the eVisitor check-in and check-out initiative as a unique information system connecting all tourism offices in the country. The system also includes about 60 000 accommodation providers.

As of 2016, all domestic tourism boards have access to all the data on accommodation providers and their facilities, as well as the tourist arrivals and departures in their area. This system simplifies the process of checking in and out, helps to control tourist tax payments, and provides a unified national platform for the collection and processing of data on accommodation providers and their facilities. It also enables all accommodation providers (natural and legal persons) to independently and at any time check their guests in and out and calculate their current tourist tax obligations. Importantly, the collected data allow tourist movements to be analysed and categorised according to multiple criteria, such as length of visit, location, gender, age, country or place of residence. This is expected to significantly improve data collection and facilitate tourism marketing and promotion activities.

The system also fosters co-operation with other public authorities, such as the customs administration, the Ministry of the Interior and the State Attorney's Office, to access and use the collected data via remote access to the database.

## Anti-corruption policy (Dimension 16)

### Introduction

Table 20.26 shows Albania's scores for the Anti-corruption policy dimension and compares them to the Western Balkan (WB) average. Albania has the highest score (along with Montenegro) of the WB6 economies for the anti-corruption public awareness and education indicator. The other indicators are below the WB6 average, although there is a potential of swift progress regarding anti-corruption law enforcement bodies considering the implementation of institutional reforms at the time of this assessment. Albania has an elaborate legal framework in several areas of prevention of corruption. Compared to the previous Competitiveness Outlook, Albania has intensified its anti-corruption awareness-raising activities. A track record for the investigation, prosecution and adjudication of high-level corruption cases has been established, but the effectiveness of specialised anti-corruption bodies still needs to be fully developed.

**Table 20.26. Albania's scores for anti-corruption policy**

Dimension	Sub-dimension	Score	WB6 average
Anti-corruption policy dimension	Sub-dimension 16.1: Anti-corruption policy framework	1.0	2.1
	Sub-dimension 16.2: Prevention of corruption	4.0	3.3
	Sub-dimension 16.3: Independence of the judiciary	n.a.	n.a.
	Sub-dimension 16.4: Business integrity and corporate liability	n.a.	n.a.
	Sub-dimension 16.5: Investigation and prosecution	2.5	2.8
Albania's overall score		<b>2.1</b>	<b>2.5</b>

Note: For comparability with the previous assessment, the two new sub-dimensions (16.3 and 16.4) have not been scored but are discussed in the text below.

### State of play and key developments

#### *Sub-dimension 16.1: Anti-corruption policy framework*

The Inter-Sectoral Anti-Corruption Strategy (ISACS) 2015-2020 (extended until 2023) provides the anti-corruption policy framework and its **policy documents, co-ordination and implementation** includes the classic components of anti-corruption policies: prevention, repression and awareness raising. The Inter-Sectoral Reform Strategy in Public Administration 2015-2020 and the Mid-Term Strategy 2018-2020 of the Public Prosecutor's Office also envisaged anti-corruption activities.

Anti-corruption policy planning includes funding needs. The latest action plan (2020-2023) defines funding amounts for most activities. In terms of monitoring, responsible institutions have been asked to report the amounts of financial disbursements for the activities performed. According to the government, in 2017-19, the annual financial disbursement for these activities fluctuated around ALL 200-350 million. The share of international donor funding in this amount varied from approximately one-third in 2017/18 to around one-fifth in 2019. International support remains significant in 2020 and is expected to continue.

The Minister of Justice fulfils the role of the National Co-ordinator Against Corruption (NCAC). Albania has developed an advanced system of performance monitoring. The ISACS itself includes general and specific performance indicators, and the action plan contains so-called passports of indicators. The monitoring is organised into two stages, whereby each implementing institution reports the level of implementation of its activities, the budget allocated, problems encountered, etc. while the NCAC reports on overall progress. In quantitative terms, by the end of 2019, 11 objectives had been achieved, with implementation of 6 objectives in progress. Only one objective had not been realised (improving the legal framework for the prosecution of economic and financial crimes and, in particular, the establishment of the asset recovery office) (NCAC, 2020<sub>[230]</sub>). In terms of monitoring by civil society, the Institute for Democracy and Mediation

conducts an annual survey. This continually reveals sceptical public opinion; for example, in the 2019 survey, 71% of respondents indicated having no confidence in the prosecution of grand corruption cases, with no substantial change on previous years (Vrugtman and Bino, 2020<sup>[231]</sup>).

In view of the decision to draft a new action plan for 2020-2023, the Ministry of Justice requested the Organisation for Security and Co-operation in Europe (OSCE) Presence in Albania to conduct an external mid-term review of the ISACS for the period 2015-2018. The review report does not seem to be published online, but according to the government, one of the general conclusions of the review was that sanctions for corruption were not yet delivering results.

The NCAC engages in regular consultations with civil society. It submits draft monitoring reports of the ISACS for public review and solicits comments through online calls for consultation. According to the government, relevant comments and suggestions are reflected in the drafts before approval. Repeated online consultations and in-person discussions took place regarding drafts of the 2020-2023 action plan. While drafts and adopted planning documents, as well as monitoring reports, are regularly published on the Ministry of Justice website,<sup>198</sup> in the past the NCAC did not publish overviews of any received, accepted, or rejected proposals. While such feedback may have been provided in a less formal manner, it was reportedly not provided systematically (European Commission, 2020<sup>[19]</sup>). However, recently Albania has started the practice of publishing reports of consultations on the ISACS monitoring reports.

There is no obligation for public agencies to carry out **corruption risk assessments** and no systematic engagement in this activity yet. However, the Action Plan 2020-2023 for the ISACS envisages the development of integrity plans (including risk assessment) by all ministries and subordinate institutions. Several public entities have already identified and assessed risks and drafted consolidated risk registers. In 2020, the Ministry of Justice published the Integrity Risk Assessment Methodology for Institutions of Central Government (Sulstarova, Met'hasani Cani and Bezhani, 2020<sup>[232]</sup>), carried out a risk assessment and published the integrity plan for the ministry. Eight subordinate institutions of the Ministry of Justice have started risk-assessment processes. Several municipalities have also approved integrity plans.

Laws do not envisage **corruption proofing of legislation**. According to the government, a document on corruption proofing has been drafted but it is not yet publicly available. In the past, Albania has engaged the Institute for Development Research and Alternatives (IDRA) think tank to establish a system of corruption proofing but there is no evidence that this co-operation has continued.

### *Sub-dimension 16.2: Prevention of corruption*

Albania's institutional structure contains several **corruption prevention bodies** and arrangements.

The Directorate of Programs and Projects in the Anti-Corruption Field in the Ministry of Justice and the Network of Anti-Corruption Co-ordinators play the key role in policy planning, co-ordination and monitoring. Established in 2019, the directorate co-ordinates activities with the implementing institutions, drafts policy documents and monitoring reports, proposes activities, etc. The network comprises 17 co-ordinators across the public sector and serves to collect, analyse and co-ordinate information on corruption incidents and anti-corruption activities.

Two institutions play a central role in inspections and administrative investigations. Established in 2018 and headed by the NCAC, the Inter-Institutional Anti-Corruption Task Force is responsible for inter-institutional inspections and, as of early 2020, had recommended 118 dismissals and produced 38 criminal referrals (European Commission, 2020<sup>[233]</sup>). The Special Anti-Corruption and Anti-Evasion Unit (SACAEU), established by the Council of Ministers in February 2020 under the Prime Minister, is responsible for supervising inspection activity; co-ordinating the initiation of administrative investigations and audits; carrying out verifications, controls, and inspections in ministries, central institutions, prefect administrations, and companies with state capital; and following up and implementing tasks set by the National Committee against Corruption and Evasion headed by the Prime Minister, etc. At the time of

preparing this Competitiveness Outlook assessment, no data were available on the performance of the SACAEU.

These bodies are placed under direct or indirect control of the political leadership and have no special safeguards for their independence. The Minister of Justice, in his/her role as the NCAC, directly heads the Network of Anti-Corruption Co-ordinators and the Inter-Institutional Anti-Corruption Task Force. The Directorate of the Ministry of Justice is headed by a director – a civil servant selected and appointed under the general civil service rules. The Prime Minister appoints the Director General of the SACAEU, who has no fixed term in office. In terms of staff, these anti-corruption bodies are small institutions. As of June 2020, the directorate had six staff members and five vacancies (three vacancies on 3 March 2021). The SACAEU had 7 employees, as well as 12 full-time and 5 part-time employees attached to other institutions.

The High Inspectorate for the Declaration and Audit of Assets and Conflicts of Interest (HIDAACI) is a legally independent institution, established in 2003 and headed by the Inspector General. Parliament appoints the Inspector General and oversees the body. To safeguard the independence of the HIDAACI, support from three-fifths of all Members of Parliament is required to appoint the Inspector General. However, only a simple majority is necessary if the first vote fails (SELDI, 2019<sup>[234]</sup>). The HIDAACI is a growing institution. From 2003-19, its employees increased from 35 to 70 (including inspectors, whose number increased from 12 to 28).

The HIDAACI is the central authority responsible for implementing and enforcing the Law on Prevention of **Conflict of Interest** in the Exercise of Public Functions (adopted in 2005). The law defines actual, potential and apparent conflicts of interest as well as different kinds of pecuniary and non-pecuniary private interests. The rules apply in a comprehensive manner to officials and employees of central and local state institutions, including enterprises and organisations controlled by the state. The key obligation in the system for managing conflicts of interest is a case-by-case self-declaration where a public official him/herself assesses whether his/her private interests may lead to a conflict of interest. The superior official or superior institution may also request such a declaration. The law prescribes in detail the measures that officials and their superiors may take to prevent and resolve conflicts of interest.

As the central institution for managing conflicts of interest, the HIDAACI advises officials and their superiors on specific cases of suspected conflicts of interests and questions of ethics. It also carries out verifications of and administrative investigations into conflicts of interest and checks compliance with prohibitions and restrictions of private interests (such as restrictions on entering contracts with public institutions). It applies administrative sanctions, initiates legal actions with the competent public institutions to declare invalidity and regulates the consequences of acts and contracts issued under conflict of interest circumstances. Units responsible for implementing the law on prevention of conflict of interest in public institutions are required to report annually to the HIDAACI on activities carried out, including cases of conflict of interests, actions taken to prevent or process them, and outcomes. Based on the reports, the Inspector General prepares evaluations and recommendations. The HIDAACI has published several guides on preventing conflicts of interest.<sup>199</sup> According to the government, the HIDAACI is engaged in developing further legal changes in the area of conflict of interest.

Official statistics on administrative fines applied by the HIDAACI merge several types of violation into a single category (non-declaration of private interests, conflict of interest, and violations of the law on whistleblowing). There has been a decrease in the number of fines issued – from 436 in 2017 to 54 in 2019. The information provided does not reveal the causes of this declining trend. The HIDAACI does not make public its reasoned decisions in these cases.

Albania has a track record of effectively enforcing **asset and interest disclosure** based on declarations submitted upon taking office, on annual basis thereafter, and after leaving the office. The Law on the Declaration and Audit of Assets, Financial Obligations of the Elected Persons and Certain Public Officials (adopted in 2003) applies to a generally comprehensive circle of high/mid-level officials. A few categories are missing which could be considered for inclusion in the future, such as members of regional councils

(currently only heads of councils are covered by the declaration) and executives of all state-owned enterprises (currently only administrators of joint-stock companies with over 50% participation of state capital and more than 50 workers are covered). In terms of data relevant for monitoring the economic situation and interests of officials, the contents of the declarations do not cover unpaid outside activities (however, officials must disclose them within the institutions where they are employed); beneficial ownership unless visible through declared profit; trusts (only the trustee should be declared as a related person); or virtual assets such as cryptocurrencies. Data on spouses, cohabitants and adult children must also be declared but not for other individuals residing in the same household as the official. The Inspector General may also request declarations from other people considered to be related to a declarant.

The HIDAACI administers the declaration system and carries out auditing. A complete audit of the declared data must be carried out every two, three, four or five years for specified categories of officials, in cases when data from legitimate sources lead to questioning the authenticity and accuracy of the declared information, and in cases when arithmetic and logical checks reveal discrepancies. According to government data, the number of cases referred to law enforcement based on the verification of the declarations has been increasing (32 in 2017, 53 in 2018, 115 in 2019). There is a sustained track record of referring cases of high-level public officials for prosecution (27 cases in 2018, 7 cases in 2019) (European Commission, 2020<sup>[233]</sup>). The cases referred for prosecution in 2018 resulted in six convictions and seven dismissals; among those referred in 2019, one resulted in a conviction and a dismissal (European Commission, 2020<sup>[19]</sup>). However, there is evidence that a significant share of the cases forwarded by HIDAACI are not followed up adequately (GRECO, 2020<sup>[235]</sup>).

The HIDAACI is working towards launching an electronic system for declarations in 2021. Public access to the declarations has been based on requests for information. The electronic system is expected to ensure publication by default. Currently, the website Open Spending Albania provides access to searchable data on the declarations.<sup>200</sup>

The Law on Whistle-blowing and Whistle-blower Protection (adopted in 2016), and several auxiliary documents, provide **whistle-blower protection**. The law protects whistle-blowers in both the public and private sectors with the presumption of good faith in the whistle-blower unless the contrary is proven. The whistle-blower is entitled to confidentiality (including about his/her information sources) and protection from any retaliation measures, including but not limited to those listed in the law. The law invalidates any rules or private agreements which exclude or limit the rights of a whistle-blower.

The law deviates in several ways from EU Directive 2019/1937 on the protection of persons who report breaches of European Union law. Only corruption can be the subject of whistleblowing under the Albanian law. Whistleblowing can be internal and external (to the HIDAACI), but external whistleblowing is subject to conditions such as well-grounded reasons to be sceptical about the integrity and impartiality of the responsible unit within the organisation, etc. These conditions for external whistleblowing may act as a deterrent and are more restrictive than those envisaged in the EU Directive. The law is restrictive regarding public whistleblowing and strips the whistle-blower of the right to protection once he/she announces publicly the alleged act or practice of corruption. This is an important deviation from the directive, which envisages protection for a person who makes a public disclosure if certain conditions are fulfilled. According to the Albanian law, a whistle-blower may choose to remain anonymous, but he/she must justify reasons for the anonymity.

There are several means of protecting whistle-blowers, such as the invalidity of retaliatory measures and the possibility to seek compensation for harm. However, the law envisages no protection for people connected to the whistle-blower and no right to protection due to the mistaken identity of a whistle-blower. There are also no specific provisions for free legal aid for whistle-blowers. The whistle-blower alleging that he/she is the subject of an act of retaliation submits a request for protection to the responsible unit within the organisation. If the responsible unit exceeds the deadline for taking measures, the request is submitted to the HIDAACI, which must investigate the allegations. There is no explicit mention of the possibility of

applying for protection immediately to the HIDAACI or of provisional protection before the administrative investigation is completed. No evidence is available on how effective the protection measures are in practice.

As the central authority for whistle-blower protection, the HIDAACI has ensured the establishment of responsible units within public authorities with more than 80 employees (168 responsible units in total) and within private sector entities with more than 100 employees (444 responsible units in total). Nevertheless, whistle-blowing activity has been relatively low. According to the government, the HIDAACI received 8 whistle-blowing reports in 2017, 16 reports in 2018, 14 reports in 2019 and 9 reports in 2020. Over 2017-20, the HIDAACI received 5 requests for protection. In all these instances, no direct or indirect acts of retaliation were found. The number of internal whistle-blowing reports was 7 in 2017, 3 in 2018, and 3 in 2019. No evidence is available on the number of criminal cases started as result of whistle-blower reports.

Despite awareness-raising activities, monitoring by the Albanian Helsinki Committee found that lack of information about the law and reporting mechanisms among potential whistle-blowers and responsible units is one of the main causes of the small number of whistleblowing reports in Albanian ministries. Other reasons are lack of confidence that the reports will be received and treated with professionalism, impartiality and independence; in some cases, fear of revenge; preference for other reporting channels; and negative experiences of reporting in the past (Komiteti Shqiptar i Helsinkit, 2019<sup>[236]</sup>).

Albania highly prioritises public **awareness raising and education** on corruption-related matters. The ISACS envisages a range of awareness-raising campaigns and trainings. Moreover, the Ministry of Justice has its own communication plans for anti-corruption-related activities.

Public outreach activities organised by the authorities include “runs against corruption” around the lake of Tirana in 2018 and 2020, anti-corruption film festivals, and the Integrity Weeks in February and December 2020. These and other activities have involved international and domestic partners such as the Delegation of the EU to Albania, embassies of partner countries, the International Chamber of Commerce in Albania, etc. In 2018-19, five consultative forums took place on topics such as the implementation of whistle-blower protection, internal audit, freedom of information, and conflicts of interest among high-ranking officials. In February 2020, the NCAC launched the forum of civil society organisations on anti-corruption, which formally strengthens partnerships with civil society. It is envisaged that every government anticorruption initiative should be discussed in this forum.

Extensive and varied training activities have taken place, including training of the trainers of the School of Public Administration. In 2018, the HIDAACI held several training sessions for responsible authorities on prevention of conflict of interest (about 350 participants). In 2019, 14 training sessions were provided for the responsible units of the public sector on their duties and responsibilities under the Law on Whistle-blowing and Whistle-blower Protection (217 participants). Other institutions (the Ministry of Justice, the School of Public Administration) have also provided training on anti-corruption topics. Moreover, a variety of guidance materials have been prepared. The national budget has been the source of funding for multiple activities.

### *Sub-dimension 16.3: Independence of the judiciary*

The High Judicial Council (HJC) appoints judges for life. The Constitution and the Law on the Status of Judges and Prosecutors in the Republic of Albania determine criteria for admission to the initial training of candidates, the procedure for application and preliminary assessment, asset and background checks, ranking of graduating candidates, appointment of candidates, and assignment of the appointed magistrates to positions. Judges are selected and promoted through competitive procedures. The HJC and the School of Magistrates ensure transparency by announcing vacancies for judges on their websites.<sup>201</sup> According to the government, the School of Magistrates publishes the dates of all stages of competitions for the

recruitment of magistrates, candidates who will participate in the competitions, and the winners of each stage.

The HJC appoints court chairpersons following the promotion process. The mandate of court presidents lasts three years with the right to one re-appointment. When a chairperson resigns or an application for re-appointment is rejected, the HJC publishes a vacancy announcement. The procedure is described in detail, including the ranking of candidates, and the HJC publishes information on the appointment process online.

The HJC has been operational since December 2018 and comprises 11 members. The general assembly of judges elects 6 members, and parliament elects 5 members who are representatives of civil society, academia and the bar association. The HJC appoints, evaluates, promotes and transfers judges of all levels; decides on disciplinary measures for judges of all levels; proposes to the President of Republic candidates to the High Court; approves the rules of judicial ethics and monitors their observation, etc. CSOs have been monitoring the performance of the HJC. The Institute for Political Studies found that the HJC displayed many more elements of transparency than the previous High Council of Justice (ISP, 2020), though an earlier report by the Albanian Helsinki Committee found less consistent practice in terms of transparency (Komiteti Shqiptar i Helsinkit, 2019<sup>[236]</sup>).

The Law on the Status of Judges and Prosecutors in the Republic of Albania determines the disciplinary liability of judges. The recently created office of High Justice Inspector is responsible for initiating disciplinary proceedings. Guarantees of due process include the rights of the magistrate subject to the proceedings to submit a written defence, attend any hearing, call witnesses, present documents, take other measures for providing evidence, be represented under the provisions of the Code of Administrative Procedures, and recover his/her legal costs where no disciplinary measure is imposed. The magistrate has the right to appeal a decision imposing a disciplinary measure.

Albania has been undergoing a fundamental justice reform since 2016. A vetting process started in 2016 for all judges and prosecutors as a single extraordinary measure overseen by the International Monitoring Operation. The vetting process is stipulated in the Constitution of Albania as amended in 2016 and detailed in the Law on the Transitional Re-evaluation of Judges and Prosecutors in the Republic of Albania. More than 286 dossiers were processed, resulting in 62% being dismissed (mostly due to matters concerning unjustified assets) or resigning (European Commission, 2020<sup>[19]</sup>). As a result of the judicial reforms, judges' salaries have been increased significantly. However, the vetting process has also placed a strain on the judiciary from an increase in vacancies. For a certain period, the High Court and the Constitutional Court became practically dysfunctional (Venice Commission, 2020<sup>[237]</sup>).

According to the government, the allocation of court cases is done by lot electronically, and the High Inspector of Justice must regularly inspect the division of cases. Once anonymised, judicial decisions delivered in open proceedings are reportedly available on the court websites.

#### *Sub-dimension 16.4: Business integrity and corporate liability*

The non-binding Corporate Governance Code defines the responsibility of company boards for risk oversight and the creation of a sound system of internal control to safeguard the company's interests and shareholders' investments (Principle 6). Little evidence is available on the implementation of the code, other concrete **business integrity** practices, or incentives for companies to improve the integrity of their operations. Albania participates in the Extractive Industries Transparency Initiative (EITI), which represents a global standard of transparency and accountability in the management of natural resources, and the economy is considered to have achieved meaningful progress towards meeting the EITI Standard.<sup>202</sup>

In July 2020, Albania adopted the Law on the Register of Beneficial Owners. The register should be established in 2021. The law implements the 5th Anti-Money Laundering Directive (2018/843), requiring that access be provided to any member of the general public to data on beneficial owners. The definition of a beneficial owner in the law reflects the definition in the anti-money laundering directives. According to

the Law on Prevention of Money Laundering and Financing of Terrorism, those subject to the law, including designated non-financial businesses and professions, must identify beneficiary owners and take measures to verify their identities before and during the establishment of business relationships.

According to information provided by the Minister of State for Protection of Entrepreneurship (MSPE), in a dialogue between the private entrepreneurship and the governmental institutions, the MSPE addresses complaints from an administrative perspective, including those on corruption. The MSPE handles individual complaints and deals with them either through meetings with the relevant parties or through written communication with the respective institutions.

Albania has established the **liability of legal persons** for all criminal offences. According to the Penal Code and the Law on Penal Liability of Legal Persons (adopted in 2007), a legal person will be held accountable for criminal offences that have been committed in its name or for its benefit, by its bodies and representatives, by a person who is under the authority of the person representing, directing and administering the legal person, or due to the lack of control or supervision by the person who directs, represents and administers the legal person. The law does not explicitly state that the corporate liability is autonomous, i.e. can be applied independently of the liability of the perpetrator – physical person.

The law envisages the main penalties to be fines and the termination of the legal entity. The upper limit of fines for offences, which carry the maximum prison sentence of seven years (as for all active corruption offences), is approximately EUR 45 000, which is extremely low given the possible scale of large corruption transactions. Together with the main sentence, one or more additional penalties can be handed down, including closing one or more of the legal entity's activities or structures; placing the legal entity in controlled administration; a ban on participating in procurement funded by public funds; revoking the right to obtain or use licences, authorisations, concessions or subsidies; a ban on publicly seeking funds and financial resources; removing the right to exercise one or more activities or operations; and an obligation to publish the court decision. The law recognises compliance as a mitigating circumstance, i.e. the elimination of the organisational shortcomings which resulted in the criminal offence by applying organisational models suitable for preventing the criminal offence.

There have been few convictions of legal persons for corruption offences. According to the government, one sanction was applied in 2016, two in 2017, and two in 2018. The implementation of the legal framework for corporate liability would benefit from guidance on anti-corruption compliance (prevention measures) that legal entities should ensure in order not to be accused of failure to exercise due control or supervision.

#### *Sub-dimension 16.5: Investigation and prosecution*

The level of **investigation activity regarding high-level corruption** has by far exceeded the levels of indictment and conviction. While 102 cases against high-level officials were sent for prosecution in 2018, and 90 cases in 2019, the numbers of indicted persons were respectively 7 and 5 (European Commission, 2019<sup>[79]</sup>; European Commission, 2020<sup>[233]</sup>). The statistics provided by the government indicate five convictions for high-level corruption in 2017 and three convictions in 2018. According to information provided by the government, as of October 2020, prominent cases handled by the institutional anti-corruption structure (abbreviated as SPAK; see below) included an investigation launched into the former Prosecutor General, as well as proceedings against 10 former judges in the High Court and the Constitutional Court.

Courts have reached convictions in a few prominent cases, such as the conviction for passive bribery of a judge of the Appeals Court by the Serious Crime Court of first instance in 2018 (confirmed by the instance of appeal in 2019). He was sentenced to imprisonment of 2.5 years, and the prosecution has requested confiscation of his assets EUR 144 810, USD 1 000, and ALL 9.3 million (Exit News, 2020<sup>[238]</sup>). Other high-profile convictions in 2019 concerned a former Minister of Interior, three judges of the Durres Appeals Court, and a judge of the High Court (European Commission, 2019<sup>[79]</sup>; European Commission, 2020<sup>[233]</sup>).

In terms of **specialised anti-corruption investigative and prosecutorial bodies**, the Constitution and the Law on Organisation and Functioning of Institutions to Fight Corruption and Organised Crime (adopted in 2016) have created the Special Anti-Corruption Structure (in Albanian: Struktura e Posaçme Anti-Korrupsion, SPAK). The SPAK consists of the Special Prosecutor's Office (SPO), which is independent from the Prosecutor General, and the National Bureau of Investigation (NBI), subordinate to the SPO.

The SPO was established in 2019, and it presents indictments in the anti-corruption and organised crime courts of first instance and appeal as well as in the High Court. In the period 9 March 2020-30 April 2020, 42 criminal proceedings were registered and 37 completed by the SPO.<sup>203</sup> The NBI is to become fully operational in 2021.

The legal framework contains safeguards for the independence of the SPO and the NBI. Based on competitive procedures, the High Prosecutorial Council (HPC) elects the Chief Special Prosecutor for a three-year term without the right to reappointment, and the Director of the NBI for a five-year term with the right to reappointment once. The Chief Special Prosecutor of the SPO should be elected from the ranks of the prosecutors of the SPO. Based on pre-defined rules of ranking, the HPC should appoint the best-ranked candidate. After an open and transparent recruitment process, a committee consisting of the Chief Special Prosecutor and the two special prosecutors with the most years of service should recommend a candidate for the position of the Director of the NBI to be appointed by the HPC. The HPC may dismiss the Chief Special Prosecutor and the Director of the NBI in cases established by law. The SPO carries out its functions independently, and the higher prosecutor may not instruct a special prosecutor on the merits of an investigation or case. Special prosecutors supervise the NBI and give directions to its investigators.

The SPAK has an independent budget as a separate item in the state budget. The Head of the SPO prepares the draft budget. When the Council of Ministers proposes a different budget proposal, the Head of the SPO has the right to participate in parliamentary proceedings to defend his/her own proposal.

In terms of staffing, as of July 2020, the SPO had 13 prosecutors (the minimum number according to the Constitution is 10 prosecutors). According to the law, the SPO is supported by several administrative units such as the Expertise Sector, the Financial Investigation Sector, and the Sector for International Cooperation and Liaison for Joint Investigations. However, according to information provided by the authorities in consultations in October 2020, the administrative staff of the SPO had not been fully recruited yet. In July 2020, the HPC appointed the Director of the NBI. Investigators of the NBI were selected based on competition, and the staffing was reportedly close to completion as of January 2021. According to law, the NBI will receive support from a commission of criminal justice experts appointed by the missions of the European Union and the US Government.

The Constitution envisages specialised courts with the competence to adjudicate corruption and organised crime as well as criminal offences committed by current and former high-level officials as defined by the Constitution and law. These specialised courts have been in operation since the end of 2019.

### ***The way forward for anti-corruption policy***

To strengthen the anti-corruption policy framework and its implementation, policy makers should:

- **Establish legal obligations to carry out corruption risk assessments, develop integrity plans and implement corruption proofing of legislation.** The practice of risk assessment should be monitored and analysed to ensure that public institutions carry it out with sufficient thoroughness. Corruption risk assessment allows vulnerabilities to corruption to be detected even before corrupt acts happen. If carried out with commitment, due resources and skill, risk assessment is one of the most potent prevention tools. In Albania several public institutions have carried out risk assessments and used them to develop risk registers. Albania should make efforts to ensure that this practice becomes universal in the entire public sector. Including the relevant obligation in the law, providing necessary methodological support, and ensuring centralised monitoring of the quality of the assessments would

ensure an effective approach. Establishing the legal basis for systematic corruption proofing of legislation would be a key step to limit corruption risks arising from deficiencies in the legal framework.

- **Ensure effective operation of the new electronic system for declarations of public officials** to allow for automatic analysis, exchange of data and public disclosure. The Western Balkan Recommendation on Disclosure of Finances and Interests by Public Officials recognises monitoring by the general public as one of the most effective tools, and recommends making income and asset declarations available online. According to the recommendation, a useful public database of declarations requires electronic and free access, and data in searchable, machine-readable format (EIN, 2014<sup>[239]</sup>).
- **Further develop legislation to protect whistle-blowers**, including by providing protection for public disclosure and for persons connected with the whistle-blower, removing conditions for external reporting to the HIDAACI, and establishing the right to protection due to the mistaken identity of a whistle-blower. According to the relevant EU directive, a person who makes a public disclosure qualifies for protection if, inter alia, the person has reasonable grounds to believe that the breach may constitute an imminent or manifest danger to the public interest or, in the case of external reporting, there is a risk of retaliation or there is a low prospect of the breach being effectively addressed. The directive also envisages mandatory and optional measures of support for whistle-blowers, such as comprehensive and independent information and advice, which is easily accessible to the public and free of charge, on procedures and remedies available, on protection against retaliation, and on the rights of the person concerned; effective assistance from competent authorities before any relevant authority involved in their protection against retaliation; legal aid, counselling or other legal assistance; financial assistance and support measures, including psychological support, for reporting persons in the framework of legal proceedings.
- **Strengthen corporate liability for corruption offences** by significantly increasing the maximum applicable fines. International standards do not define what sufficient sanctions look like, but the OECD Working Group on Bribery in International Business Transactions recommends that monetary sanctions should be sufficiently severe to affect large multinational corporations. In certain economies, statutory sanction ceilings of a few million euros have even been found to be insufficient (OECD ACN, 2015<sup>[240]</sup>). While such high levels of fines may not appear relevant given the limited size of many companies in Albania, the law should provide the option of applying adequate sanctions in the event of a large business player engaging in corruption.
- **Monitor and analyse the investigation, prosecution and adjudication of high-level corruption cases** to identify and mitigate the factors behind the discrepancy between the large number of investigations and the small number of convictions. Several factors may lead to the failure of the majority of investigations to result in prosecutions and convictions, including inadequate qualifications or numbers of investigators and/or public prosecutors, inefficiencies stemming from procedural and/or substantive law, obstacles in international legal co-operation, weak case management and poor prioritisation of work, or even deliberate obstruction by some enforcement or prosecutorial officials, etc. The scope of this analysis does not allow specific conclusions to be drawn on the impact of these or other factors on combatting high-level corruption in Albania. However, a fair and transparent assessment of the obstacles is essential for raising the efficiency of the fight against corruption in the future. Box 20.20 gives some examples from other countries.

### Box 20.20. Performance monitoring and measuring of public prosecution bodies

In Portugal, statistical indicators are used to assess the quantity and quality of the work performed by public prosecutors. Regarding criminal investigation, data are available on the number of cases lodged, the number of cases closed, the number of cases leading to accusation or to dismissal, and cases where one of the simplified and consensual forms of proceedings, as laid down in the Criminal Procedure Code, has been used. There is also an overall control of all criminal inquiries highlighting those where a criminal investigation took longer than eight months. It is possible to ascertain the number of lodged and closed cases according to the complexity and type of crime and how many of them were against unknown perpetrators.

In Finland, the government has a performance guidance system. This means that the parliament grants a common operating budget appropriation to certain operations, e.g. the prosecution service, and sets general targets that the operations should achieve. Both qualitative and quantitative targets are set for the prosecution service. The most important quantitative targets are related to the time it takes to consider charges. Charges should be considered quickly and no case should remain under consideration for more than six months or a year. Qualitative targets relate to co-operation between the prosecutor and pre-trial investigation authority during pre-trial investigations, increasing the level of knowledge on certain criminal phenomena.

In Sweden, information management in the judicial system involves 11 authorities. The government uses several indicators to assess the performance of the authorities, presented in the annual Budget Bill. Indicators for crime investigation and prosecution directly concerning the prosecution services are:

- the number and percentage of suspected crimes resulting in prosecution (or summary imposition of a fine)
- the number and percentage of suspects being prosecuted (or receiving a summary imposition of a fine)
- case handling time.

## Notes

<sup>1</sup> A person from the Ministry of Finance and Economy who co-ordinates the whole assessment in Albania.

<sup>2</sup> Staff from the Institute of Statistics of Albania (INSTAT) who co-ordinate the statistical data collection.

<sup>3</sup> Key legislation regulating businesses include the Entrepreneurs and Commercial Companies Law, the Bankruptcy Law, the Environmental Law, Law on Corporate and Municipal Bonds, Transport Law, Maritime Code, Secured Transactions Law, Taxation Procedures Law, Banking Law, Insurance and Reinsurance Law, Mining Law, Energy Law, etc.

<sup>4</sup> Article 9 of the Foreign Investment Law.

<sup>5</sup> The Law on Expropriation introduces the concept of temporary use of private property for works and services in the function of the public interest, as well as for coping with needs and emergencies in events of force majeure, state of emergency or war. As with expropriation, the temporary use of private property must be respected and compensated for in value by-third parties.]

<sup>6</sup> Albania has signed 45 international investment agreements (IIAs).

<sup>7</sup> The law is aligned with Directive 2008/52/EC "On certain aspects of mediation in civil and commercial matters".

<sup>8</sup> Albania ranks 53<sup>rd</sup> on the starting a business dimension of the World Bank's Doing Business Index, while ranking 82<sup>nd</sup> out of 190 economies overall.

<sup>9</sup> A state-funded central body operating under the auspices of the Prime Minister.

<sup>10</sup> National Plan for Trade Policy Coordination and Trade Facilitation (2017-2020).

<sup>11</sup> Goods and services tax is the broad category, which includes VAT and excise taxes.

<sup>12</sup> Unlike some other WB6 economies that were more integrated into global value chains, which have had to cope with supply shortages due to broken supply chains.

<sup>13</sup> Economic Reform Program 2018-2020 and Economic Reform Program 2020-2022.

<sup>14</sup> These principles include avoiding quantitative restrictions on imports and exports, export subsidies, and all kinds of export taxes and export bans.

<sup>15</sup> Prime Minister's Order No.25, dated February 2<sup>nd</sup> 2018 "On the establishment of the inter-institutional group for coordination of trade policy and trade facilitation".

<sup>16</sup> The committee's main objectives as outlined in the law are to act as a forum for improving trade policies and their implementation, facilitating trade, and defining the main directions of trade facilitation. It is organised and functions based on the following principles: The principle of transparency by publishing on the committee's website any decision of the committee or any recommendation addressed to the Prime Minister or special ministers; The principle of conflict-of-interest prevention in any decision by the committee according to the provisions of Law no. 9367 dated April 7<sup>th</sup> 2005 "On the prevention of conflict of interest in the exercise of public functions"; The principle of protecting the public interest and business rights, encouraging involvement and enabling the business voice to be heard by decision-making and executive bodies in the country; The principle of proportionality and non-discrimination, by treating equally the interest and demands of the business community.

<sup>17</sup> Prime Minister's Order No.25.

<sup>18</sup> The Working Group has monthly meetings on trade policy. Its members include the Ministry of Europe and Foreign Affairs, Ministry of Agriculture and Rural Development, Ministry of Energy and Industry, General Directorate of Customs, Ministry of Defence and the Institute of Statistics.

<sup>19</sup> Law No. 146/2014.

<sup>20</sup> The public has access to draft and final trade documents. The law states that 1) institutions must publish all draft legal acts on the ministry's website; and 2) every draft legal act affecting the business community can be consulted 60 days prior to its approval in formal meetings. The time, place and manner in which the interested parties can submit recommendations are specified in the notice of commencement of the public consultation process.

<sup>21</sup> <https://www.konsultimipublik.gov.al/>

<sup>22</sup> Article 20 of Law no. 146/2014.

<sup>23</sup> Law no. 146/2014 "On public notification and consultation"; law no. 119/2014 "On the right to information"; and the Regulation of the Council of Ministers approved by decision no. 584, dated August 28<sup>th</sup> 2003 of the Council of Ministers.

<sup>24</sup> OECD Member states and partner economies: Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

<sup>25</sup> The full set of OECD STRI indices and comparison tools as well as policy simulators for OECD member states and partners states that have undertaken the OECD STRI are available on the dedicated OECD website <https://www.oecd.org/trade/topics/services-trade>.

<sup>26</sup> The complete list of measures sector by sector is available on the OECD STRI website <http://www.oecd.org/trade/topics/services-trade>.

<sup>27</sup> Ligj nr. 46/2015 "On Postal Services in the Republic of Albania".

<sup>28</sup> Ligj nr.7980, datë 27.07.1995, "Për shitblerjen e trojeve", Official gazette 1995/18, last updated 26.11.1997, articles 5,6.

<sup>29</sup> Ligji Nr. 9901, datë 14.04.2008, « Për tregtarët dhe shoqëritë tregtare », Official gazette 2008/60, last updated 02.10.2014. Articles 115, 118.

<sup>30</sup> Law 108/2013 "On foreigners", Article 85 d). The entry of foreign nationals into the labour market in the economy is subject to a labour market test. Foreign nationals transferred within the enterprise according to letter d) of article 85 of law 108/2013 "On foreigners", as amended, are exempt from this obligation.

<sup>31</sup> Ligj Nr.108/2013 « Për të huaj », Official gazette 2013/48, last updated 30.03.2020, articles 22.

<sup>32</sup> Ligj Nr. 9643, datë 20.11.2006, « Për prokurimin publik », Official gazette 2006/133, last updated 13.12.2018.

<sup>33</sup> Currently, the thresholds are established by the Council of Ministers' decision on the application of rules of public procurement, nr. 914, of 29.12.2014 « Per miratimin e rregullave te prokurimit publik », official gazette 2014/208.

<sup>34</sup> In general, foreign investments are subject to the same regulations as domestic investments. There are no thresholds in place. However, Law no. 55/2015 "On Strategic Investment in the Republic of Albania" (Article 8) establishes the criteria that must be met for investments to be considered strategic. The Strategic Investment Law, as amended by Law No. 102/2018 2018 "On some additions to law no. 55/2015 "On Strategic Investments in the Republic of Albania ", added additional prudential conditions, none of which are discriminatory towards foreign suppliers and all follow good prudential practice.

<sup>35</sup> In order to facilitate comparison with OECD Member States that have undergone the Services Trade Restrictiveness Index exercise, the paragraphs below have been drafted in accordance with the methodology of the STRI project publications. The OECD Member's Country Notes, as well as the Sector Notes, are available on the STRI web page: <https://www.oecd.org/trade/topics/services-trade/>

<sup>36</sup> Directive 2000/31/EC on electronic commerce.

<sup>37</sup> Only 40% of upper-middle class households have a bank account in Albania. This figure drops to 28% for the poorest households.

### **Notes: Access to finance (Dimension 3)**

<sup>38</sup> Basel II is an international business standard developed prior to the 2008/09 crisis by the Basel Committee on Banking Supervision. It requires financial institutions to maintain enough cash reserves to cover risks incurred by operations.

<sup>39</sup> Basel III is a set of measures developed by the Basel Committee on Banking Supervision in response to the 2008/09 crisis. It has been agreed internationally and aims for a more resilient banking system. It underpins the regulatory and supervisory framework and strengthens banks' risk management.

<sup>40</sup> Article 127 of the Banking Law of Albania from 2006 – the article stipulates that "The Bank of Albania maintains the Credit Registry".

<sup>41</sup> At the time of drafting, the AASF was in the process of becoming the Agro-Tourism Facility, awaiting ratification from the parliament. To increase the uptake it is foreseen that the EU will provide for the EBRD an investment incentive grants for a total EUR 3 million to cover 10% reimbursement of investment values in agri-tourism related businesses.

<sup>42</sup> For details see <http://euforinnovation.al/>.

<sup>43</sup> A white paper is created by the founders and/or developers to guide investors with charts and technically focused information on how to address and solve issues that might be encountered in the chain.

<sup>44</sup> Law no. 62/2020 on Capital Markets.

<sup>45</sup> The OECD Database on General Competition Statistics (OECD CompStats) contains general statistics about competition agencies, including data on enforcement and information on advocacy initiatives. In 2020, it included data from competition agencies in 56 jurisdictions, including 37 OECD countries (36 OECD countries and the European Union), i.e. Argentina, Canada, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Mexico, Peru, United States (Americas): Australia, Brazil, Chinese Taipei, India, Indonesia, Japan, Korea, New Zealand (Asia-Pacific); Austria, Belgium, Bulgaria, Croatia, Czech Republic, Denmark, Estonia, European Union, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Romania, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, United Kingdom (Europe); Egypt, Israel, Kazakhstan, Russian Federation, South Africa, Turkey, Ukraine (Other). See (OECD, 2020<sup>[407]</sup>).

<sup>46</sup> The SOE figures included in this profile are based on data provided by the Albanian authorities for this assessment. The figures were gathered by a working group comprising representatives of the Albanian Institute of Statistics (INSTAT), the Ministry of Finance and Economy and the Bank of Albania. The national authorities included in their reporting all public entities classified, in national nomenclature and in line with the European System of Accounts, as extra-budgetary units, public non-financial corporations and public financial corporations. Several entities reported by the authorities as SOEs have been excluded from this profile's figures because they are only minority-owned by the central or municipal governments, and thus not considered SOEs according to OECD definitions.

<sup>47</sup> The English names for SOEs in Albania are unofficial translations employed to facilitate an understanding of the types of companies that are state-owned.

<sup>48</sup> This estimate is based on a reported total number of SOE employees in 2020 of 19 667 and a total employed population in 2018 of 1 230 000 as reported in INSTAT (2018), <http://www.instat.gov.al/en/Home.aspx>

<sup>49</sup> SOEs' estimated share of total national employment in Albania for SOEs at all levels of government is as illustrated in (IMF, 2019<sup>[80]</sup>), page 8 "Figure 4. Evolution of SOE Footprint (2005-2016)".

<sup>50</sup> For example, media reports in 2019 highlighted that three individuals with close personal connections to the mayor of Tirana had been accorded positions on the boards of SOEs. His spouse was serving on the board of OSSHE (the Public Operator for the Distribution of Energy) and two journalists with alleged close personal connections to the mayor were serving on the board of Tirana Water Supply Directorate.

<sup>51</sup> According to the law regulating audit and accounting practices in Albania, an external audit of financial statements must be performed for companies which exceed two of the following indicators for two consecutive years: balance sheet assets of ALL 50 million (~EUR 400 000); income of ALL 100 million (~EUR 800 000); or an average of 30 employees during the accounting period.

<sup>52</sup> The information concerning audit practices in several large SOEs is based on the independent assessment conducted for the 2018 edition of the *Competitiveness Outlook* (OECD, 2018<sup>[60]</sup>).

<sup>53</sup> The privately-owned Albanian Stock Exchange is operational, but only sells government securities.

<sup>54</sup> A fourth SOE, the *Fruit Market of Shkodër* is 67.21%-owned by the central government, but the remaining shares are owned by the municipality, so the enterprise is considered 100% state-owned.

<sup>55</sup> See, for example, (US Department of State, 2019<sub>[408]</sub>).

<sup>56</sup> The Consultation and Transparency Committee is established by the Minister of Finance and Economy and comprises the following representatives of departments within the ministry: the Deputy Minister of Finance and Economy (who serves as Chairman of the Committee); one representative of the General Directorate of Regulation and Compliance; two representatives of the General Directorate of Economy Affairs and Support Services and a representative of the Audit Directorate.

<sup>57</sup> The information on impediments to competition in the energy is drawn largely from a European Commission staff document dated 29 May 2019 (European Commission, 2019).

<sup>58</sup> The new curriculum includes programmes for children aged 3-4, 4-5 and 5-6 years old.

<sup>59</sup> For the purpose of this profile, instruction system refers to teaching and learning processes that takes place in school education. It generally consists of curriculum, standards for schools and student learning, assessment and evaluation frameworks and other elements that support instruction.

<sup>60</sup> The policy priorities in the Albanian Pre-University Education Development Strategy 2014-2020 are: improving leadership and management capacities of pre-university education system resources; quality and inclusive learning; quality assurance based on comparable standards with EU countries; and modern teacher training and development.

<sup>61</sup> Introduced in 2015-16, the VANAF serves as Albania's national assessment instrument and is taken each year by all Grade 5 students.

<sup>62</sup> The Ministry of Education, Sport and Youth established the Centre for School Leadership in 2018, with the support of the Albanian-American Development Foundation.

<sup>63</sup> The Teachers for Albania portal. <https://mesuespershqiperine.al/>

<sup>64</sup> In 2017, the pass rate for all tests of the National Basic Education Examination was 99.2%, which indicates that the National Basic Education Examination is not a barrier for entry into upper secondary education

<sup>65</sup> According to data provided for this assessment, the number of private universities in Albania grew rapidly in the early 2000s, reaching a peak of around 45 institutions in 2012. Today, Albania has 26 private and 14 public universities. Only around 18% of tertiary students are enrolled in private institutions – a share that is slightly lower than the Western Balkan average (UIS, 2020<sub>[83]</sub>).

<sup>66</sup> Law No. 80/2015, On Higher Education and Scientific Research in Higher Education Institutions in the Republic of Albania.

<sup>67</sup> Selection into higher education requires successful completion of upper-secondary education, a minimum grade point average and score on the State Matra examination. Specific requirements are set by individual higher education institutions.

<sup>68</sup> Financial aid to students in Albania is based on academic merit, students who plan to study in areas of national priority and students from disadvantaged social groups (as defined by the Council of Ministers).

<sup>69</sup> Examples of disaggregated data include enrolment and completion by age, gender and socio-economic background.

<sup>70</sup> Academic Senates within higher education institutions are comprised mainly of faculty members and students, although other representatives may participate if allowed for by the institutions statute, which determines the number of members, modes of operation and representation (Government of Albania, 2015<sub>[335]</sub>).

<sup>71</sup> The 2019 evaluation of Albania's pre-university education strategy was supported by UNICEF. While there are no comprehensive annual reports on the performance of the education system, there is a statistical yearbook on education, sports and youth and technical agencies prepare annual reports based on their respective programmes of work. Albania also produces thematic reviews and evaluations of specific policies.

<sup>72</sup> (WIIW, World Bank, 2020<sub>[127]</sub>) (INSTAT, n.d.<sub>[105]</sub>) and (Eurostat, n.d.<sub>[104]</sub>). Activity rate was 71.2% on average in Bulgaria, Croatia, Hungary, Romania and Slovenia.

<sup>73</sup> The activity rate of those aged 65+ was 11.7% for women and 19.8% for men in 2019.

<sup>74</sup> Stakeholder assessment collected by the independent expert.

<sup>75</sup> Updates provided by Instat.

<sup>76</sup> Updates provided by the Government of Albania.

<sup>77</sup> Information provided by external expert.

<sup>78</sup> Law nr.7961 dated 12.07.1995 "Labor Code of the Republic of Albania".

<sup>79</sup> DCM No.108, dated 15.2.2017 "On the approval of the regulation on the protection of children at work".

<sup>80</sup> The framework of the project "Measures to Protect Children from Trafficking, Exploitation for Work and Unsafe Migration" is funded by the governments of Italy, Germany and France.

<sup>81</sup> Government answer to questionnaire.

<sup>82</sup> Information provided by independent expert.

<sup>83</sup> During 2019, the Labour Inspectorate undertook more than 14 000 labour inspections; 357 inspected entities were fined and 160 main administrative fines were imposed. This means that less than 5% of labour inspections resulted into fines in 2019. As a comparison in Austria irregularities have been detected in nearly half of all inspections. See <https://www.arbeitsinspektion.gv.at/Service/Taetigkeitsberichte-Unfallberichte/Taetigkeitsberichte.html>

<sup>84</sup> The State Labour Inspectorate is evaluating the historical data of inspections, the frequency of inspections per entity, the type of economic activity that the entity carries out, the reasons for previous inspections, etc. By assessing the coefficients for data from the inspection it aims to generate the "Penalty matrix", the level of risk for each subject (information provided by the government).

<sup>85</sup> With less than 50 employees.

<sup>86</sup> Information provided by independent expert.

<sup>87</sup> According to our calculations.

<sup>88</sup> According to stakeholders' assessment.

<sup>89</sup> Government response to the questionnaire.

<sup>90</sup> Information received by Albania.

<sup>91</sup> Similarly, the Adult Skills Survey of 2017 shows a participation in formal and non-formal learning of 9.2%.

<sup>92</sup> World Bank and WIIW, 2020: Jobs Gateway Database, based on data provided by national statistical offices and Eurostat, WIIW (own calculations).

<sup>93</sup> Highest wages are earned in the information and communication sector and in the financial services. Wages in public administration and defence; compulsory social security; education; human health and social work activities are 6% higher than wages in real estate activities; professional, scientific and technical activities; administrative and support service activities. (INSTAT, n.d.<sup>[126]</sup>)

<sup>94</sup> Instat and Eurostat (unadjusted gender pay gap). There are no data available for the EU gender pay gap in 2019.

<sup>95</sup> According to administrative data from the tax office, women's employment in the construction sector is 14% whilst the Labour Force Survey reports only 3%. The very low figure identified by the LFS might be due to under-reporting in the survey as a result of either technical survey issues or women's self-perception. A large share of women employed in the construction sector work as accountants, economists, HR specialists, or lawyers, and therefore might not identify with the notion of being engaged in "construction" as such.

<sup>96</sup> Government's response to questionnaire.

<sup>97</sup> For example, the organisation Different and Equal helps integrate the victims of human trafficking into the labour market, the Centre for Human Rights in Democracy promotes victims of domestic violence in the labour market, as well as Women's Center Light Steps, etc.

<sup>98</sup> An important role here is played also by the Community Development Center "Today for the Future", through its projects it has supported 1 391 beneficiaries in the districts of Shkodra, Lezha and Korça, starting from 2014; 67% of them are integrated and re-integrated into the formal labor market (through employment and self-employment.); 139 women and girls on the Durres region are supported with formalisation of work, especially in the field of services and manufacturing enterprises, where a focus was given to the provision of salaries, especially in cases where informal payments were provided to them below the minimum wage and the coverage of social insurance, making them moving from informal work and payment under the minimum wage (Information provided by Albania).

<sup>99</sup> In France and Germany, for comparison, the average caseload of hard-to-place jobseekers is around 70 jobseekers per employment counsellor, though the caseload may vary in these countries between 100 and 350, depending on how many jobseekers need individual guidance and their autonomy in using self-help guidance tools (OECD, 2015<sup>[342]</sup>; Manoudi et al., 2014<sup>[343]</sup>; Pôle emploi, n.d.<sup>[344]</sup>).

<sup>100</sup> Envelope wages occur when an employee receives an official declared salary based on a formal written contract and an additional undeclared (“envelope”) wage. This envelope wage is based on an unwritten verbal contract, which supersedes the formal written contract.

<sup>101</sup> Instat uses the following definition of informal employment: The informal employment is the sum of employed in agriculture and non-agricultural sector. Informal employment in non-agricultural sector include: employees who do not benefit from paid annual leave; employees who benefit from paid annual leave but do not benefit from paid sick leave in case of illness; employees who benefit from paid annual leave and paid sick leave, but their employers do not pay social security contributions for them; contributing family workers; self-employed persons who work in small enterprises with five or less persons employed (including employer), their workplace is alternatively their own home, the client's/employer's home, a structure attached to their home, a fixed stall in the market or on the street, or a changing location. Informal employment in agricultural sector includes contributing family workers.

<sup>102</sup> Information provided by independent expert.

<sup>103</sup> Government’s response to the questionnaire.

<sup>104</sup> INSTAT estimates the number of emigrants and immigrants based on the integrated migration module in the Labour Force Survey since 2015. [http://databaza.instat.gov.al/pxweb/sq/DST/START\\_MM/EM\\_01/?rxid=dddc8d19-1d0a-4cc4-aa83-2674b798872e](http://databaza.instat.gov.al/pxweb/sq/DST/START_MM/EM_01/?rxid=dddc8d19-1d0a-4cc4-aa83-2674b798872e).

<sup>105</sup> Government’s answers to questionnaire.

<sup>106</sup> Horizon 2020 is the European Union's biggest framework programme for research and innovation. It provides funding for multi-national collaboration projects as well as for individual researchers, and supports SMEs with a special funding instrument. (<https://ec.europa.eu/programmes/horizon2020/en/what-horizon-2020>; <https://www.euneighbours.eu/en/east/stay-informed/projects/horizon-2020>).

<sup>107</sup> Eureka is the largest intergovernmental network for co-operation in R&D and innovation in the world. It is present in over 45 economies, where it provides access to public funding, promotes collaboration and innovation and offers advice through various programmes (such as EUREKA Clusters, Globalstars, InvestHorizon) (<https://www.eurekanetwork.org/>).

<sup>108</sup> The European Research Area (ERA) reflects an ambition to create a unified research area open to the world, based on the EU Internal Market, that enables free circulation of researchers, scientific knowledge and technology ([https://ec.europa.eu/info/research-and-innovation/strategy/era\\_en](https://ec.europa.eu/info/research-and-innovation/strategy/era_en)).

<sup>109</sup> EURAXESS - Researchers in Motion is a pan-European initiative delivering information and support services to professional researchers, backed by the EU Member States and associated countries. It supports researcher mobility and career development and enhances scientific collaboration (<https://euraxess.ec.europa.eu/>).

<sup>110</sup> European Cooperation in Science and Technology (COST) is a is an EU-funded, intergovernmental framework, currently comprising 38 Members and 1 Cooperating Member. It is a funding organisation for the creation of research networks (COST Actions), which offer an open space for collaboration among scientists across economies. COST funding is intended for collaboration activities and complements national research funds (<https://www.cost.eu/who-we-are/about-cost/>).

<sup>111</sup> Marie Skłodowska-Curie Actions (MSCA) is an EU programme which provides grants to support research careers and encourages transnational, intersectoral and interdisciplinary mobility. (<https://ec.europa.eu/programmes/horizon2020/en/h2020-section/marie-skłodowska-curie-actions>; [https://ec.europa.eu/research/mariecurieactions/msca-actions\\_en](https://ec.europa.eu/research/mariecurieactions/msca-actions_en)).

<sup>112</sup> Only quarterly data for 2019 and 2020 have been released by the Albanian Institute of Statistics at the time of writing this text (26/01/2021).

<sup>113</sup> The project includes an initial grant of EUR 520 000 followed by a potential investment loan of more than EUR 18 million from WBIF and another EUR 24 million from the European Investment Bank (EIB) (<https://wbif.eu/project/PRJ-ALB-DII-001>).

<sup>114</sup> The results of the Feasibility Study and CBA were presented during the closing workshop of the project on 28 July 2020 ([https://eeas.europa.eu/delegations/albania/83464/regional-broadband-infrastructure-development-albania-closing-workshop\\_en](https://eeas.europa.eu/delegations/albania/83464/regional-broadband-infrastructure-development-albania-closing-workshop_en)).

<sup>115</sup> The draft Law on Open Data was prepared by the Ministry of Infrastructure and Energy in co-operation with the Commissioner for the Right to Information and Protection of Personal Data. The legal package includes the draft law, an explanatory report, a compliance chart and a Regulatory Impact Assessment. The draft law has already passed through the consultation process and has been approved by the Council of Ministers. At the time of writing, it had been passed to the National Assembly for adoption (October 2020) and will come into force two years after its adoption. Regulations delineating how the law will be implemented are planned for after its adoption.

<sup>116</sup> The Open Government Data Portal of Albania (<http://opendata.gov.al/>).

<sup>117</sup> Portal of the Partnership for Open Government Initiative (PQH/OGP) (<http://ogp.gov.al/>).

<sup>118</sup> Open Government Partnership (OGP) is an international agreement aiming to increase transparency, civic participation and the use of new technologies in achieving a more open, effective and accountable government. Currently, 78 governments are members of the partnership (<https://www.opengovpartnership.org/about/approach/>).

<sup>119</sup> The Electronic Register of Public Notifications and Consultations (<https://konsultimipublik.gov.al/>)

<sup>120</sup> See <https://www.shqiperiaqeduam.al/>.

<sup>121</sup> TechSpace was launched in February 2019 and by mid-2020 it had more than 1100 registered young people and more than 100 startup-business ideas in the field of ICT (<https://techspace.al/>).

<sup>122</sup> The Agency for the Delivery of Integrated Services Albania (ADISA) is an agency of the Albanian Government under the supervision of the Prime Minister's Office. ADISA was created to provide Albanian citizens with efficient, high-quality and transparent public services (<https://adisa.gov.al/>).

<sup>123</sup> European IPA Twinning project “Institution-building for alignment with the EU acquis and enhanced ability to meet economic criteria”. Twinning activity will be performed with the Italian Personal Data Protection Authority, in co-operation with the “Institute of Human Rights” Austria and the “Consorzio per il Sistema Informativo”, Italy. The beneficiary is the Office of the Commissioner for Right of Information and Data Protection (IDP). The project started implementation on 1st October 2020.

<sup>124</sup> Pursuant to the Law No. 137, dated 16.11.2020 "On 2021 budget", with the Decision of the Parliament of the Republic of Albania no. 84/2020 "On some addenda and amendments to Decision no. 86/2018 "On the approval of the structure, organization and classification of salaries of the Information and Data Protection Commissioner" the amended structure and organization of the Office of the Commissioner was approved and became effective on 1 January 2021. Out of 11 new staff members requested by the Commissioner's Office since 2016, only 4 were approved until 2020.

<sup>125</sup> Full transposition of the eIDAS Regulation (EU 910/2014) is planned for 2022.

<sup>126</sup> The Internet Safety Awareness Campaign for children was conducted by AKCESK and the Ministry of Education, Sports & Youth in co-operation with UNICEF (<https://www.unicef.org/albania/press-releases/children-albania-lead-internet-safety-awareness-campaign>).

<sup>127</sup> A single project pipeline (SPP) is a list of projects developed based on a strategic tool for project planning to avoid an ad-hoc approach to planning preparation and implementation of investment projects. The SPP helps to ensure strong project prioritisation, to enable systematic and timely planning of resources, to provide a reliable basis for defining the proper sequencing of the priority axis and actions per sector, and to help link investment planning and programme budgeting.

<sup>128</sup> This information system consists of the following components: the Albanian Financial Management Information System (AFMIS), the Financial Information system of the Government (SIFQ), the Electronic Notice Register and Public Consultations (RENNKP), the Archive System of the Centre of Official Publication (BQZ System), and the Database of Statistical Data.

<sup>129</sup> The government has provided the following information on 46% of the legislation needed to be harmonised with the TCT: 7% is fully transposed and implemented, 13% is partially transposed and implemented, 25% has not been transposed and implemented yet, and 1% is currently not applicable to the Government of Albania. The government has not provided responses for the remaining 64% of legislation. At the same time, responses have been fully provided for TEN-T development (50% transposed and implemented, and 50% partially transposed and implemented), and for railway transport (0% fully transposed and implemented, 14% partially transposed and implemented and 86% not transposed yet).

<sup>130</sup> The Rio markers were originally designed to help members prepare their National Communications or National Reports to the Rio Conventions, by identifying activities that mainstream the Conventions' objectives into development co-operation. For more information, please see: [https://www.oecd.org/dac/environment-development/Revised%20climate%20marker%20handbook\\_FINAL.pdf](https://www.oecd.org/dac/environment-development/Revised%20climate%20marker%20handbook_FINAL.pdf).

<sup>131</sup> It covers disqualification or conviction by a final court decision for any of the following criminal offences: a) participation in a structured criminal group, criminal organisation, armed gang, terrorist organisation; b) corruption; c) fraud; c) money laundering or terrorist financing; d) acts with terrorist intent or criminal offenses related to terrorist activities; dh) organization, direction or financing of the activity of production and sale of narcotics, as well as of the activity of narcotics trafficking; e) forging; e) Exploitation of the work of minors and other forms of trafficking in human beings. Conflict of interest, confidential information and bid security have been also amended in 2017 to the Law.

<sup>132</sup> A one-stop shop (OSS) is a business or office where multiple services are offered; i.e., customers can get all they need in just "one stop." The term originated in the United States in the late 1920s or early 1930s to describe a business model offering customers the convenience of having multiple needs met in one location, instead of having to "drive all over town" to attain related services at different stores. A one-stop shop is a way of facilitating trade.

<sup>133</sup> An appropriate definition of “asset management” for the roads sector is that proposed by the OECD in 2001: “A systematic process of maintaining, upgrading and operating assets, combining engineering principles with sound business practice and economic rationale, and providing tools to facilitate a more organized and flexible approach to making the decisions necessary to achieve the public’s expectations”. (OECD, 2001<sup>[357]</sup>).

<sup>134</sup> The first survey took place only in the regions of Tirana and Korçe and covered a network of about 780 kms. The second survey (2008-09) covered about 1 570 kms in various regions. In total, the two inventory surveys covered about 2 350 km (of a total of about 3 700 km of national roads). The inventory included 11 road features such as: carriageway, shoulder, road markings (lines), protection walls etc. as well as road characteristics such as horizontal curvature, surrounding area etc.

<sup>135</sup> Through implementation of the Guideline of the Minister No. 1362, dated 2016, on rules for setting airport charges in accordance with relevant provisions of the Concession Agreement signed between the Council of Ministers of the Republic of Albania and the concessionaire “Tirana Airport Partners”.

<sup>136</sup> The Local Single Sky Implementation (LSSIP) documents are the yearly expression of commitment of civil and military national organisations (regulators and national supervisory authorities), service providers and airport operators, towards the implementation of the European ATM Master Plan.

<sup>137</sup> Safety culture is a civil aviation safety programme. The State Safety Program (SSP) is an integrated set of regulations and activities aiming to improve safety (e.g. safety risk management, safety assurance).

<sup>138</sup> Some of the indicators include traffic flows, IRI coefficient for heavy goods vehicles (daily traffic divided by axis/axle weight), and data for populating the new asset management system being developed for the road sector.

<sup>139</sup> Additional indicators that would be useful to measure road network performance include average user costs, travel time satisfaction level i.e. reliability, value of assets, market research and customer feedback, forecasted value of assets, audit programme, quality of user information, allocation of resources, long-term programmes for investment, maintenance and operations, lowering of overhead percentage, etc.

<sup>140</sup> For more details see (Transport Community / CEFTA, 2020<sup>[358]</sup>), (Transport Community, 2020<sup>[196]</sup>), (Government of Serbia, 2019<sup>[359]</sup>), (Estonia Border, n.d.<sup>[360]</sup>), and the border queue management system in Baltic countries (example from Estonia) at <https://www.estonianborder.eu/yphis/index.action>.

<sup>141</sup> Adopted by the Decree of the Council of Ministers No. 125, dated 23 February 2011.

<sup>142</sup> Regulations resulting from the strategy are related to driving licences, tunnel safety, crash data system, tachographs, blood alcohol concentration, usage of narcotics, seatbelts, helmets for motorcycles and pedestrians including children, etc.

<sup>143</sup> The main sources of information on road accidents in Albania are the Albanian Traffic Police (data collection in the field) and the Ministry of Health (collection of information on injured persons).

<sup>144</sup> It consists of a standalone, Microsoft Office Access database. It also lacks a data linking capability with other databases in Albania, such as those of the Ministry of Health, Road Authorities, etc.

<sup>145</sup> The form to be used by Traffic Police will especially be compliant with the minimum set of standardized data elements of the Common Accident Data Set (CADaS) recommended by the European Commission.

<sup>146</sup> Combined transport refers to the transport of goods between Member States where the lorry, trailer, semi-trailer (with or without tractor unit, swap body or container of 20 feet or more) uses the road on the initial or final leg of the journey and rail or inland waterway or maritime services on the other leg, where this section exceeds 100 km as the crow flies (Combined Transport Directive 92/106EC, amended by the Directive 2013/22/EU).

<sup>147</sup> These include: 1) establishing a National Intermodal Centre in Tirana and two affiliated interoperation centres; 2) a strategic project in the Albanian Port of Saranda; 3) Integration of APD2 programme at Romano port area; 4) an intermodal project for linking the ports of Durres to the port of Piraeus with CB Railways; 5) deployment of the pilot intelligent transport system; 6) a railway and combined transport project linking Ports of Vlora s.a. and Petrolifera to the Energetic park at Romano port, through a logistic Interport project; 7) digitalisation of master plans for Shengjini port; 8) an integrated master plan for the AL landlord ports; 9) promotion of IWW and Railway in TEN-T MED through the Shkoder and Prespa and Ohrid lakes; 10) promoting a MOU on Milot-Kosovo railways (PPP); 11) a National R & I Railways Strategy for Albania; 12) Digitalisation rail and maritime training centre; 13) a sustainable smart mobility strategy for Albania, including the municipalities and line ministries; 14) a smart specialisation strategy for railways as in the SST; 15) an integrated storm awareness system and railways and maritime joint investigation body; and 16) 20 priority actions for competitiveness.

<sup>148</sup> Timeliness of shipments in reaching destination within the scheduled or expected delivery time.

<sup>149</sup> Quality of trade and transport related infrastructure (e.g. ports, railways, road, information technologies).

<sup>151</sup> This is based on a government response to an enquiry to question 1.1.4 within the Competitiveness Outlook assessment questionnaire.

<sup>152</sup> At this stage it is too soon to state when this emission market will be in place. The deployment of such a market is complex as it will require an extensive monitoring, verification and reporting system as well as training for stakeholders.

<sup>153</sup> Furthermore, ERE has not been able to unbundle Operatori i Shpërndarjes së Energjisë Elektrike SH.A (see the unbundling section), which would suggest an inability to use its independence to implement legislation and regulation in line with international best practice.

<sup>154</sup> Apart from the area governing the wholesale market, which is currently absent (Energy Community Secretariat, 2020<sup>[199]</sup>; Energy Community Secretariat, 2020<sup>[201]</sup>).

<sup>155</sup> The TAP pipeline is a natural gas pipeline running from the Turkish border, through Greece and Albania and eventually ending in Italy. For more information, please see <https://www.tap-ag.com/about-tap>.

<sup>156</sup> The IAP pipeline is a project intended to connect Croatia and Montenegro via Albania with the TAP pipeline, opening these countries to international supply of natural gas. For more information, please see <https://www.energy-community.org/regionalinitiatives/infrastructure/PLIMA/Gas16.html>.

<sup>157</sup> The current tariffs are: EUR 50.35 per MWh for hydropower (for plants with a capacity of up to 15 MW), EUR 100 per MWh for solar (with capacity of up to 2MW), and EUR 76 per MWh for wind (with capacity of up to 2 MW).

<sup>158</sup> For a list of laws on energy efficiency please see <https://www.infrastruktura.gov.al/ligje/>.

<sup>159</sup>This score reflects sustainability, which encompasses energy efficiency. Since this assessment was made by the Energy Community Secretariat, Albania has made progress by adopting several important regulations. Moreover, it is expected that this year Albania will adopt the Rules on the approval of Minimum Energy Performance Requirements on buildings and its elements, the Rules on the approval of the National Calculation Methodology for energy performance in building, and the Rules on the approval of the procedures and conditions for energy performance certification of buildings, as well as creating a database on building stock and energy performance.

<sup>160</sup> For the reports, please see <https://www.energy-community.org/implementation/Albania/reporting.html>.

<sup>161</sup> A regional project funded by the GIZ-ORF fund for South East Europe aims to support the deployment of a Monitoring and Verification Platform. For more details, please see <https://www.giz.de/en/worldwide/31746.html>.

<sup>162</sup> It is too early to assess the state of regional integration for the natural gas market as without a natural gas market, integration can only progress so far. Nonetheless, there is positive development with regard to regional pipeline network (as part of the TAP, IAP; and Albania-1244 interconnector) in which Albania is a central stakeholder.

<sup>163</sup> “A CONTROL BLOCK comprises one or more CONTROL AREAS, working together in the SECONDARY CONTROL function, with respect to the other CONTROL BLOCKS of the SYNCHRONOUS AREA it belongs to” (ENTSOE, 2004<sup>[409]</sup>). An alternative explanation can be found under Emission-EUETS (Emissions-EUETS, 2019<sup>[410]</sup>).

<sup>164</sup> Lowest cost refers to that Korporata Elektroenergjitike Shqiptare operates a hydro power generation fleet that has been depreciated substantially and that hydro power generation does not have variable fuel cost associated with the generation of electricity.

<sup>165</sup> Whereby consumers would look for and sign contracts with supply companies that can obtain electricity from the wholesale market.

<sup>166</sup> The plan includes nine measures, some of which focus on reducing energy consumption and developing environmentally-friendly transport modes. Some measures have direct on energy savings and pollutant reduction (e.g. renewal of the car fleet stimulated by efficiency-based fees and incentives).

<sup>167</sup> These measures comprise: identification and implementation of adaptation response measures in the Drin-Mati river deltas; strengthening local communities living nearby the Kune-Vain Lagoon System to adapt to the adverse effects of climate change using ecosystem-based adaptation approaches; water and irrigation reserve project aimed at preparing the National Strategy for Integrated Water Resources Management; vulnerability assessment and adaptation plan for the city of Tirana, which sets the basis for mainstreaming climate change adaptation into the city planning processes; and Flood Risk Management Plan for Shkodra Region.

<sup>168</sup> In November 2019 Albania was hit by one of the most devastating earthquakes in the last several decades with a magnitude of 6.3 on the Richter scale at a depth of 38 km. The earthquake affected a total of 202 291 people, with 17 000 citizens displaced due to the loss of their homes, and caused EUR 985.1 million damage, equivalent to 6.4% of the 2018 GDP in damage and to 1.1% of GDP in losses (EU, UN and World Bank, n.d.<sup>[372]</sup>). The extent of the damage demonstrated the main issues related to the preparedness for natural hazards, such as the lack of modern and homogenous equipment for the operational forces, the lack of skilled human resources, as well as the insufficient training in emergency co-ordination (Ibid.).

<sup>169</sup> The Government of Albania approved a Master Plan in January 2020 that outlined the creation of 10 waste areas, created as a result of closing most of the illegal dumpsites, rehabilitating other sites (where there is only one site in the municipality it must be rehabilitated) and building new landfills.

<sup>170</sup> More information on EU waste policy and legislation at [https://ec.europa.eu/environment/legal/law/6/pdf/02\\_aile\\_eU\\_waste\\_legal\\_framework\\_speakers\\_notes.pdf](https://ec.europa.eu/environment/legal/law/6/pdf/02_aile_eU_waste_legal_framework_speakers_notes.pdf).

<sup>171</sup> In August 2020, Nisma Thurje, a civil society organisation, filed a report with the Special Anti-Corruption Prosecutor's Office (SPAK) against the Fier waste incinerator, concerning allegations that the "principle of equality in public procurements" had been breached in the deals. <https://balkaninsight.com/2020/09/28/the-incinerator-how-a-politically-connected-albanian-built-an-empire-on-waste/>

<sup>172</sup> Separate collection has only been introduced to date within the frame of several pilot projects funded by intergovernmental and non-governmental organisations (UNECE, 2018<sup>[214]</sup>).

<sup>173</sup> The DMC transposes the following EU directives: Directive 2000/60/ EC of the European Parliament and of the Council of 23 October 2000 "Establishing a legal framework for community action in the field of water policy", as amended by Decision 2455/2001 / EC, Directive 2008/32 / EC and Directive 2008/105 / EC; Directive 2009/90/ EC laying down, pursuant to Directive 2000/60/EC of the European Parliament and of the Council, technical specifications for chemical analysis and monitoring of water status; Directive 2006/118/ EC "On the Protection of Groundwater against Pollution and Deterioration"; and Directive 2007/60 / EC "On the Assessment and Management of Flood Risks".

<sup>174</sup> The Water Resources Management Agency is responsible for designing and implementing policies, strategies, plans, programmes and projects aimed at the integrated management of water resources, quantitative and qualitative conservation, as well as their further consolidation. The Ministry of Agriculture and Rural Development is in charge of managing irrigation and drainage activities. The Ministry of Infrastructure and Energy (MIE) prepares policies and strategies for the water supply sector and for the collection and treatment of wastewater. The National Water Supply and Sewerage Agency is an institution that reports to MIE, and specialises in drinking water supply, collection and treatment of wastewater. The Ministry of Health is also responsible for co-designing and implementing quality policies and strategies related to drinking water supply. The Ministry of Defence oversees the Agency of Civil Emergencies, which implements the National Plan for Civil Emergencies. The National Environmental Agency (NEA), under the auspices of the Ministry of Tourism and Environment, is responsible for quality and quantitative monitoring of water resources. Finally, the Albanian Geological Survey, National Regulatory Authority for Water Supply and Wastewater Treatment, National Agency for Protected Areas, River Basin Administration Offices, and local municipalities are all also in charge of water-related matters.

<sup>175</sup> EU Regulation (EU) 511/2014 "On compliance measures for users of the Nagoya Protocol on access to genetic resources and fair and equitable sharing of derived benefits from their use in the EU ", which provides the provisions for the implementation of the Nagoya Protocol in the European Union.

<sup>176</sup> High nature value (HNV) forestry is a comparatively new term used to describe some of the oldest and most biodiversity rich forestry systems in Europe, many of which are now under threat. On this HNV land, for hundreds or even thousands of years, semi-natural habitats and wild species have been interdependent with low-intensity management by local communities (Düll et al., 2018<sub>[120]</sub>).

<sup>177</sup> Vjosa-Narta is a protected landscape area in southwestern Albania. Vjosa is considered to be Europe's last wild river. The International Union for Conservation of Nature (IUCN) has listed the park as Category VI. It is also listed as an important Bird and Plant Area, because it supports significant bird and plant species (Düll et al., 2018<sub>[120]</sub>).

<sup>178</sup> Fine particulate matter (PM<sub>2.5</sub>) is the air pollutant that poses the greatest risk to health globally, affecting more people than any other pollutant. This becomes of even greater concern in the context of the COVID-19 pandemic knowing that exposure to ambient and indoor air pollution increases the risk of cardiovascular, respiratory and developmental diseases, as well as premature death, thus making individuals even more vulnerable to COVID-19 (OECD, 2020<sub>[74]</sub>).

<sup>179</sup> Although data quality could be improved on various levels, the NPAQM states that "there is no doubt that traffic is by far the most important source of air pollution in Tirana" and recommends that the measures to improve air quality in Zone A should concentrate on traffic.

<sup>180</sup> Key government bodies include the Ministry of Tourism and Environment, line ministries responsible for infrastructure and energy, urban development, transport and industry (MIE), agriculture and rural development, health and social protection (MHSP), finance and economy, the National Environment Agency and its regional agencies of environment in 12 districts, the State Inspectorate of Environment.

<sup>181</sup> Vegetables constitute about 21% of all agri-food exports, marking a significant increase on 2005 when it was less than 3%. However, low prices for vegetable products remain a crucial issue for producers. One of the main reasons is that Albanian products are not standardised and are rarely certified (e.g. with Global GAP certification is made up of interlinking mechanisms that ensure the proper development, implementation, improvement, integrity, transparency and harmonisation of our certificates).

<sup>182</sup> Safety, hygienic and quality standards are lacking in most of the livestock producers. Cooperation between the actors of the value chain and other stakeholders is limited and weak. Product diversification and introduction of new products, together with marketing, labelling and other marketing tools are lacking or are very sporadic, which have inhibited the growth of the sector.

<sup>183</sup> The responsibilities of the Agency of Water Resource Management are 1) the implementation of international agreements and conventions on national water resources and transboundary waters to which the Republic of Albania is a party and 2) the coordination and control of local water management bodies.

<sup>184</sup> Together they cover 1) rural development interventions; 2) national interventions related to income support to farmers, development of rural infrastructure and ensuring equal opportunities; and 3) institutional development, regulation and enforcement.

<sup>185</sup> The responsibilities for the agricultural support policy are divided among the: 1) MARD, responsible for drafting and implementing policies for the sustainable growth of agricultural and livestock production; 2) Managing Authority responsible for preparing and implementing the IPARD programme; 3) Agricultural and Rural Development Agency/IPARD Agency responsible for implementing (including financial disbursement) agricultural policies and rural development; and 4) Regional Agricultural Extension Agencies responsible for providing information and assisting farmers to benefit from national support schemes, IPARD and other projects in the field of agriculture and rural development.

<sup>186</sup> HACCP is a United States-based system that identifies, assesses and controls significant biological, chemical and physical hazards with regard to food safety and determines critical points for their control.

<sup>187</sup> The key players in the agriculture innovation system are the: 1) Academy of Sciences, which contributes and promotes the achievements of scientific research and proposes new scientific and study fields in line with the economy's development priorities; 2) Agricultural University of Tirana, whose research institute conducts basic and applied scientific research in agriculture; 3) Agriculture Faculty of Korca that offers teaching and some applied research projects in management and marketing of agricultural and livestock products; and the 4) Agricultural Technology Transfer Centres (ATTC), responsible for farm level research and testing for problems raised by farmers in the region.

<sup>188</sup> Available at: <https://turizmi.gov.al/wp-content/uploads/2019/12/National-Tourism-Strategy-2019-2023-EN.pdf>.

<sup>189</sup> SRD is a programme implemented by GIZ, funded by BMZ (German Federal Ministry of Economic Cooperation and Development), which aims to diversify the rural economy, especially sustainable tourism development and growth of competition in the agricultural sector. The programme identifies issues faced by businesses and companies in the tourism industry related to the COVID-19 pandemic and emergency situation in Albania.

<sup>190</sup> The Thematic Group was established by the Order of the Prime Minister, dated 22.10.2018.

<sup>191</sup> The first tourism development strategy was prepared in 1992.

<sup>192</sup> More information at <https://www.investment.com.al/investment-council/>.

<sup>193</sup> The Republic of Albania launched electronic visas on 2 November 2020. Electronic visa are now functional in addition to the stamp visa currently in use. The e-Visa can be accessed through <https://e-visa.al/> portal.

<sup>194</sup> Pursuant to Order no. 267, dated 24.07.2019 "On the approval of the regulation on the manner, criteria, and procedures for categorization of accommodation structures", as amended.

<sup>195</sup> Under the Economic Reform Program 2019-2021, Albania committed itself towards standardisation of tourism services, including registration of all types of accommodation (including private apartments and rooms).

# **21 Bosnia and Herzegovina profile**

## Key findings

Figure 21.1. Scores for Bosnia and Herzegovina (2018 and 2021)

Note: Dimensions are scored on a scale of 0 to 5. Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See Scoring approach section for information on the assessment methodology. Scores for Dimension 5 (Competition policy) are not included in the figure due to different scoring methodology (see Scoring approach).

Since the 2018 Competitiveness Outlook, Bosnia and Herzegovina has improved its performance in 11 of the 15 policy dimensions<sup>1</sup> scored in the assessment (Figure 21.1). Although this clearly indicates progress in the design of policies to enhance its competitiveness – at least in about two-thirds of the dimensions covered in this assessment – if they are to have a lasting impact then their effective and continuous implementation, monitoring and upgrading should remain a key priority. The biggest improvement in scores since the previous assessment have been in the dimensions of tax policy, trade policy, investment policy and promotion, education policy, and energy policy, for which Bosnia and Herzegovina also achieved the highest scores. These improved scores are explained by the following key achievements:

- Tax policy has been strengthened, with greater international co-operation and easier administrative procedures.** Bosnia and Herzegovina has increased its international co-operation on tax matters by joining international instruments such as the OECD/G20 Inclusive Framework on Base Erosion and Profit Shifting (BEPS), the Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS, and the Convention on Mutual Administrative Assistance in Tax Matters. Both entities – the Republika Srpska (RS) and the Federation of Bosnia and Herzegovina (FBiH) – have adopted laws on free zones, providing investors with substantial tax incentives. Authorities at all levels have made efforts to digitalise filing procedures for taxpayers (e-filing). At the state level, e-filing has been mandatory for value-added tax (VAT) and excise duties since 2019. In the entities, the share of electronically filed taxes seems to be increasing. For example, in the RS 57% of tax returns were filed electronically over January-April 2020, compared to 43% in 2019. This should help increase the efficiency of the tax administration and speed up procedures for taxpayers.

- **Trade policy has also seen greater regional co-operation and stronger public consultation procedures.** Bosnia and Herzegovina signed the Central European Free Trade Agreement (CEFTA) Additional Protocol 6 along with the other WB6 economies in December 2019, thereby committing to liberalising trade in services with the other parties. Co-ordination between the public and private sectors over trade has also been improved, most notably through the establishment of the state-level Trade Facilitation Committee in 2018, as well as an e-consultations website in 2017, where the public can comment on draft legislation before it is adopted.
- **The investment climate for foreign investors has improved,** though significant challenges to attracting foreign investment remain. The complex legal and regulatory system is difficult for foreign investors to navigate, though some progress has been made in this area. At the entity level, the RS has established district commercial courts to improve local contract enforcement. This saw the case backlog fall to 3 935 in 2019, down from 7 910 in 2017. The RS has also eased business registration procedures, reducing the time needed from 23 days to 3 and the number of procedures from 11 to 5, as well as reducing the cost. Both state-level and entity-level institutions have been targeting foreign investors through proactive campaigns. There have also been efforts to encourage investment for green growth, such as the adoption of the Law on the Use of Renewable Energy Sources and Efficient Cogeneration at the state level in 2014, which encourages private investment in electricity production. The entities have also been active in this area, with the FBiH adopting several laws and regulations, including the Law on Electricity and the Regulation on Incentive Fees to Promote Electricity from Renewable Energy Sources, while the RS has used the state-level law to strengthen its green growth framework.
- **Frameworks for developing pre-university education have been improved.** Most notably, Bosnia and Herzegovina developed a common core curriculum for pre-university education in 2018, which should provide a common framework for the development of curricula across the economy. A new state-level strategy on vocational education and training (VET) is being developed. Its adoption is greatly needed since the last VET strategy expired in 2015. It would provide for policies to strengthen VET curricula and standards to be co-ordinated across the economy's education systems. Another significant positive development was Bosnia and Herzegovina's participation in the 2018 Programme for International Student Assessment (PISA), providing essential information to measure student learning outcomes and the performance of the education system.
- **Efforts have been made to improve energy security and promote renewables.** By investing in key natural gas infrastructure expansion projects, Bosnia and Herzegovina aims to increase energy security by diversifying its import routes for natural gas, reducing its reliance on a single route. The economy has also strengthened its legislative and policy frameworks for developing non-hydro renewable energy generation, for which it has significant potential. New wind and solar projects were connected to the grid for the first time in 2018 and 2019 and are expected to increase the share of non-hydro renewables in the electricity generation mix. This should further strengthen energy supply security by increasing domestic generation. Progress reports monitoring the implementation of the National Renewable Energy Action Plan (adopted in 2016) were published in 2017 and 2019 and Bosnia and Herzegovina is in the process of drafting its National Energy and Climate Plan. This should integrate energy and climate objectives and ought to be adopted by the end of 2021.

### Priorities

Despite these achievements, Bosnia and Herzegovina has made the least progress since the previous assessment and its performance is the lowest overall of all the WB6 economies. Priority dimensions for improvement are tourism policy; environment policy; science, technology and innovation; transport

policy; and digital society. In order to improve its performance in those areas Bosnia and Herzegovina should consider the following:

- **Improve tourism governance frameworks.** Tourism is becoming increasingly important for Bosnia and Herzegovina – its direct and indirect contribution to GDP increased by 6.85% from 2017 to 2019. The authorities will need to undertake key reforms to make the sector more competitive and to capitalise on its rapid growth. Vertical co-ordination and co-operation between the state level and entities in tourism policy making is weak, despite efforts to improve it (i.e. the creation of the Tourism Working Group in 2007). Many municipalities lack the financial resources to fully exploit their tourism potential and engagement with private sector stakeholders remains insufficient both at the state and local levels. Lack of policy co-ordination also means that the economy lacks an overall international tourism marketing strategy, reducing its global visibility as a tourist destination. The availability of a qualified workforce is also a challenge, contributing to Bosnia and Herzegovina’s low rank in the Travel and Tourism Competitiveness Index (for example it fell six places in the human resources and labour market category in 2019). Tourism policy should thus also focus on education, specifically strengthening VET for tourism.
- **Do more to improve the environmental quality of life.** Even though Bosnia and Herzegovina has made some progress in the environment policy dimension since the last assessment, it continues to underperform and has the lowest score of the WB6 economies. Quality of life is affected by outdated water infrastructure, sometimes containing hazardous materials. Air quality is also poor; Bosnia and Herzegovina has one of the highest concentrations of air pollution in Europe. The mean annual exposure to particulate matter (PM<sub>2.5</sub>) of 30 micrograms per cubic metre (µg/m<sup>3</sup>) is more than twice the World Health Organization’s recommended highest levels (10 µg/m<sup>3</sup>), and higher than the averages in the EU (13.1 µg/m<sup>3</sup>), the OECD (12.5 µg/m<sup>3</sup>) and the WB6 economies (25.77 µg/m<sup>3</sup>). These factors have a negative impact on the health and general well-being of the population, and should be urgently addressed. The energy and transport sectors are heavy polluters, as well as the primary sources of Bosnia and Herzegovina’s greenhouse gas emissions (70% and 23% of CO<sub>2</sub> emissions respectively). Reducing emissions from these sectors will thus be key to improving the environmental quality of life for Bosnia and Herzegovina’s residents, as well as meeting its international commitments under the Paris Agreement.
- **Improve co-ordination on science, technology and innovation across all levels of government.** A variety of factors explain Bosnia and Herzegovina’s underperformance in this policy dimension, but most notable is the lack of co-ordination and co-operation across the various government levels (state, entities and cantons). This factor also hampers the public financing of research and innovation as the absence of a clear co-ordinated policy framework makes it difficult to identify and optimise public investment opportunities. Overall, gross domestic spending on research and development has remained low, at 0.2% of GDP, in recent years. Increased co-operation between the entities and the state level should help to better co-ordinate international co-operation efforts and improve the allocation of funding. Brain drain is reducing human capital for research and development and efforts to counter this should be increased, including additional funding incentives.
- **Develop a tool to identify, select, prioritise and implement transport investment projects.** Although Bosnia and Herzegovina has a single project pipeline for transport projects, it needs further development, as it has not been updated since 2018. There are no economy-wide cost-benefit analysis guidelines for transport projects, or any accompanying survey, analysis and technical instructions. These need to be developed and updated every few years to help prioritise and control investment.

- **Increase digitalisation efforts.** The information and communication technology (ICT) sector in Bosnia and Herzegovina has significant potential but is challenged by a lack of qualified professionals. While this can partly be attributed to brain drain, the authorities should ensure that education curricula include relevant ICT skills and competencies. Bosnia and Herzegovina has done little to align with the EU's digital competence framework for students and professionals. There is also a lack of policy documents and support programmes for ICT promotion by the private sector. In order to stimulate the economic potential of the ICT sector, the authorities should look to develop such strategies and support programmes.

1: Please note that Dimension 5 (Competition policy) is excluded from the key findings section as it uses different scoring model (See the Scoring approach section for information on the assessment methodology).

## Economic context

### Key economic features

Bosnia and Herzegovina (BiH) is a small open economy with a diversified production and export base. Services account for the largest share of the Bosnian economy, contributing 55.7% to gross domestic product (GDP) and responsible for 50.3% of employment. Wholesale and retail trade dominate the services industry, along with public administration. At nearly 9.4% of GDP, the public sector in BiH is the largest in the region (United Nations, n.d.<sup>[1]</sup>). Industry contributes 23.9% to GDP and is responsible for 31.7% of employment, with the highest contribution coming from the manufacturing sector (15.3% of GDP and 17.7% of employment) (United Nations, n.d.<sup>[1]</sup>; ILO, 2020<sup>[2]</sup>). Agriculture, forestry and fishing contributed only 5.6% to GDP in 2019, but still account for 18% of employment, which shows there is significant scope to boost agricultural productivity and achieve economy-wide productivity gains through the reallocation of labour from agriculture to other more productive sectors (World Bank, 2020<sup>[3]</sup>).

Over the past decade, the growth drivers of Bosnia and Herzegovina's economy have diversified, but the economy remains mostly consumption driven, with strong contribution from the public sector. Between 2010 and 2020, the contribution of exports to GDP grew from 29.7% to 32%, driven by the growth in machinery and power exports, as well as higher service exports, including construction and tourism (European Commission, 2019<sup>[4]</sup>; United Nations, n.d.<sup>[1]</sup>). This led to a decline in the current account deficit from 9.5% of GDP in 2011 to 3% in 2019. The high growth in exports also led to a decline in consumption's share of GDP, although it remained high compared to regional and global peers, with public consumption accounting for 19.5% of GDP and private consumption 76% of GDP in 2019 (World Bank, 2021<sup>[5]</sup>). The large public sector, inflated by the complex political and economic structure and the still significant state-owned enterprise (SOE) sector, represents a drag on the economy (see Structural economic challenges).

Over the past decade, the contribution of investment to GDP has been stagnant at below 20%, lower than most economies in the region. Bosnia and Herzegovina was also the lowest recipient of foreign direct investment (FDI) in the region over the past five years (2% of GDP between 2015 and 2019). The largest share of FDI inflows went into the non-tradable sector, including financial services, wholesale and retail trade, energy, and real estate; while export-oriented FDI went mainly to raw materials with limited value-added (Central Bank of Bosnia and Herzegovina, 2020<sup>[6]</sup>). Moreover, most FDI inflows in recent years have been reinvested earnings into existing FDI investments, while greenfield investment has been very low and concentrated mainly in the tourism sector (European Commission, 2019<sup>[4]</sup>). As a result, the structural transformation of the economy has been relatively limited over the past decade.

Bosnia and Herzegovina's economy is characterised by relatively weak productivity. Across all sectors, labour productivity, measured as output per worker, is less than one-third of the European Union (EU) average (World Bank, 2020<sup>[3]</sup>). Moreover, the growth in productivity has slowed down considerably, reflecting limited gains from the reallocation of labour from less to more productive sectors, as well as

weaker sector productivity growth. This shows that significant structural constraints are preventing the flow of capital and other inputs to the most productive sectors and firms. These constraints include a fragmented market and challenging business environment, lack of skills, infrastructure gaps, and limited access to finance (see Structural economic challenges). Low productivity combined with high wage growth in the public and private sector have resulted in the weakening of labour cost competitiveness.

**Table 21.1. Bosnia and Herzegovina: Main macroeconomic indicators (2015-2020)**

Indicator	Unit of measurement	2015	2016	2017	2018	2019	2020
GDP growth <sup>1</sup>	% year-on-year	4.1	3.4	3.0	3.1	2.9	-4.5
GDP per capita <sup>2</sup>	Current international \$	12.0	13.1	13.8	14.9	15.8	15.6
National GDP <sup>2</sup>	USD billion	16.2	16.9	18.1	20.2	20.2	<b>19.8</b>
Inflation <sup>1</sup>	Consumer price index, annual % change	-1.0	-1.1	1.3	1.4	0.6	-1.1
Current account balance <sup>1</sup>	% of GDP	-4.9	-4.6	-4.7	-3.3	-3.0	-3.1
Exports of goods and services <sup>1</sup>	% of GDP	34.2	35.0	39.3	41.5	39.8	32.1
Imports of goods and services <sup>1</sup>	% of GDP	51.7	51.0	54.9	55.9	54.3	45.9
Net FDI <sup>1</sup>	% of GDP	1.7	1.8	2.2	2.9	1.9	1.8
Public and publicly guaranteed debt <sup>3</sup>	% of GDP	41.9	42.3	37.7	35.6	34.5	39.6*
External debt <sup>4</sup>	% of GDP	62.9	63.8	72.0	64.5	65.4	...
Unemployment <sup>1</sup>	% of total labour force	27.7	25.4	20.5	18.4	15.7	<b>18.0</b>
Youth unemployment <sup>2</sup>	% of total labour force ages 15-24	63.2	55.0	46.5	39.3	34.0	...
International reserves <sup>1</sup>	in months of imports of G&S	6.8	7.2	7.1	7.3	7.8	10.0
Exchange rate (if applicable local currency/euro) <sup>1</sup>	Value	1.96	1.96	1.96	1.96	1.96	1.96
Remittance inflows <sup>2</sup>	% of GDP	11.1	10.9	11.2	11.2	11.2	<b>9.2</b>
Lending interest rate <sup>5</sup>	% annual average	5.79	5.24	4.38	3.79	3.29	3.07
Stock markets (if applicable) <sup>1</sup>	Average index	701	692	627	621	772	769

Note: G&S = goods and services; \*estimates for 2020.

1. (EC, 2021<sup>[7]</sup>) EU Candidate Countries' and Potential Candidates' Economic Quarterly (CEEQ) Q1 2021, [https://ec.europa.eu/info/sites/default/files/economy-finance/tp048\\_en.pdf](https://ec.europa.eu/info/sites/default/files/economy-finance/tp048_en.pdf).

2. (World Bank, 2021<sup>[8]</sup>) World Bank WDI data <https://databank.worldbank.org/source/world-development-indicators>.

3. (World Bank, 2020<sup>[9]</sup>) World Bank Western Balkans Regular Economic Report <https://www.worldbank.org/en/region/eca/publication/western-balkans-regular-economic-report>.

4. (EBRD, 2020<sup>[10]</sup>) *Transition Report 2020-21*, <https://2020.tr-ebd.com/countries>.

5. (IMF, n.d.<sup>[11]</sup>) IMF Data <https://data.imf.org/regular.aspx?key=61545855>.

Labour market performance has been improving in Bosnia and Herzegovina, but the outcomes are still weak relative to OECD and EU benchmarks. Employment remains low at just 38.5%, particularly for women (30.4%), whose labour force participation is also very limited at 37.44%. Unemployment (18%) is one of the highest in the region, and there is a very high share of long-term unemployed (76% as of 2019). Meanwhile, the share of youth not in education, employment or training (NEET) is 21.2% (World Bank, 2020<sup>[3]</sup>). Weak job creation and limited opportunities are fuelling significant emigration, especially of young and highly educated people, which is further exacerbating skills gaps and limiting long-term growth perspectives.

To create more robust, sustainable and inclusive growth over the coming decade, Bosnia and Herzegovina needs to address the significant structural challenges that undermine domestic and foreign investment, global value chain (GVC) integration, and innovation. This includes reducing the fragmentation of the domestic market, improving the business climate, strengthening the skills of the population and reducing outstanding infrastructure gaps.

## Sustainable development

Over the past decade, Bosnia and Herzegovina has made progress in reaching the targets of the United Nations' Sustainable Development Goal (SDG) Agenda 2030, but considerable challenges remain (Table 21.2). On the positive side, Bosnia and Herzegovina has achieved the 2030 SDG target in one area: poverty (SDG 1), where the headcount ratios (the proportion of the population living below the poverty threshold, which are set at USD 1.90 and USD 3.20 per day in BiH) below the 2030 targets. In all other areas, moderate or significant progress is still needed to reach the SDG targets by the end of this decade (Sachs et al., 2021<sup>[12]</sup>).

**Table 21.2. Bosnia and Herzegovina's progress towards achieving the SDGs**

SDG	Current assessment	Trends
1 – No poverty	SDG achieved	On track or maintaining SDG achievement
2 – Zero hunger	Significant challenges remain	Stagnating
3 – Good health and well-being	Significant challenges remain	Moderately improving
4 – Quality education	Information unavailable	Information unavailable
5 – Gender equality	Significant challenges remain	Moderately improving
6 - Clean water and sanitation	Significant challenges remain	Moderately improving
7 - Affordable and clean energy	Significant challenges remain	Moderately improving
8 - Decent work and economic growth	Significant challenges remain	Moderately improving
9 - Industry, innovation and infrastructure	Significant challenges remain	Stagnating
10 - Reduced inequalities	Significant challenges remain	Information unavailable
11 - Sustainable cities and communities	Major challenges remain	Stagnating
12 - Responsible consumption and production	Significant challenges remain	Information unavailable
13 - Climate action	Significant challenges remain	Stagnating
14 - Life below water	Challenges remain	Moderately improving
15 - Life on land	Significant challenges remain	Stagnating
16 - Peace, justice and strong institutions	Significant challenges remain	Moderately improving
17 - Partnerships for the goals	Challenges remain	On track or maintaining SDG achievement

Source: (Sachs et al., 2021<sup>[12]</sup>), *Sustainable Development Report 2021: the Decade of Action for the Sustainable Development Goals*, <https://s3.amazonaws.com/sustainabledevelopment.report/2021/2021-sustainable-development-report.pdf>.

Moderate challenges remain in two SDG areas: life below water (SDG 14) and partnerships for the goals (SDG 17). While marine biodiversity has improved, progress is needed to reduce marine pollution and improve the sustainability of fishing practices. With respect to partnerships for the goals, moderate progress is also needed to strengthen Bosnia and Herzegovina's national statistical system (Sachs et al., 2021<sup>[12]</sup>).

Significant gaps remain in all other areas. This includes the SDG on hunger (SDG 2), where more progress is needed to reduce high and rising obesity levels and the high use of nitrogen fertiliser in crop production. In the area of health and well-being (SDG 3), performance is impacted by, for example, gaps in health coverage, the high prevalence of non-communicable diseases, high death rates attributable to air and ambient air pollution, and high traffic-related deaths. Regarding the SDG on clean water and sanitation (SDG 6), significant progress is needed to improve wastewater treatment, and some progress is needed to achieve universal access to basic drinking water services. In the area of affordable and clean energy (SDG 7), significant gaps remain regarding access to clean fuels and the emissions associated with the production of electricity and heating for households. Relatedly, the high emissions associated with energy consumption have a significant negative impact on sustainable cities and communities (SDG 11) and the climate-related SDG (SDG 13). High unemployment limits performance regarding the SDG on decent work and economic growth (SDG 8), while the SDG on industry, innovation and infrastructure (SDG 9) is negatively impacted by weaknesses in the trade and transport infrastructure, as well as low investment in research and development (R&D). Inequality (SDG 11), as measured by the Gini coefficient and the Palma ratio, remains above the SDG target (Sachs et al., 2021<sup>[12]</sup>).

## Structural economic challenges

Bosnia and Herzegovina faces a number of key structural challenges that undermine its competitiveness, investment and GVC integration.

*Better skills are needed to foster economic upgrading and a competitive export-oriented economy*

Bosnia and Herzegovina's economy suffers from deficiencies in human capital, which reflect weaknesses in the quality of education and its relevance to labour market needs.

- **Low education quality** is exemplified in student performance on international assessments such as the Programme for International Student Assessment (PISA), where Bosnia and Herzegovina is in the bottom quartile of participating economies (62 out of 78 economies). Fewer than half of BiH students attained the minimum level of proficiency across the three testing subjects (only 46% for reading, 42% for mathematics and 43% for science), which is well below the OECD average of over 75% for all three subjects (OECD, 2018<sup>[13]</sup>).
- **High spending on education and very low student-to-teacher ratios** have not led to improved education quality. There is also high spending on non-teaching staff, who account for one-third of all staff in primary schools (World Bank, 2020<sup>[14]</sup>). Therefore, more efficient and better targeted spending on education is needed to improve education outcomes.
- **Low enrolment rates relative to peer economies across all education levels**, from early childhood education to tertiary education, also negatively affect outcomes (Agency for Statistics of Bosnia and Herzegovina, n.d.<sup>[15]</sup>).
- **There is a lack of alignment of education with labour market needs.** In the latest Business Environment and Enterprise Performance Survey (BEEPS), 24% of firms identified an inadequately educated workforce as a major constraint (World Bank, 2019<sup>[16]</sup>). Meanwhile, in the 2019 Balkan Barometer survey, 30% of respondents noted that the skills acquired during their education did not meet the needs of their job. The most deficient skills noted in the survey included digital skills (32% of respondents), communication skills (30%) and other cognitive skills, including the ability to learn on the job (27%), and creativity, innovation and risk taking (27%) (Regional Cooperation Council, 2019<sup>[17]</sup>). These gaps reflect deficiencies in education quality and relevance, especially in vocational education and training (VET) and tertiary education, as well as an underdeveloped adult education system to support the upskilling and reskilling of the population.
- **High emigration and brain drain** exacerbate skills gaps challenges, as does **low labour force participation** among certain groups, such as women and youth.

*The fragmented market and complex business environment undermine investment and increase the costs of doing business*

Over the past decade, BiH has made progress in reducing the regulatory and administrative burden on businesses; however, there are still many outstanding challenges that result in the relatively low ranking in the World Bank's Doing Business assessment relative to peer economies (90 out of 191 economies globally) (World Bank, 2020<sup>[18]</sup>):

- **The fragmentation of the market** creates considerable additional administrative and operational burdens for businesses in Bosnia and Herzegovina. If a business wants to operate at the level of the entire economy, it must be registered in both entities – the Federation of Bosnia and Herzegovina (FBiH) and Republika Srpska (RS) – and the Brčko District. Depending on the business, it may also need to obtain the same type of licence or other documentation multiple times to meet the legal and regulatory requirements of each entity. Doing business is further complicated by differing legislation across cantons within the same entity. For example, each of the ten cantons

in the FBiH have different regulations and administrative procedures (World Bank, 2017<sup>[19]</sup>). Different quality control rules and procedures also make it more challenging to trade between entities, and progress on creating a single economic area has stalled due to political disagreements (European Commission, 2019<sup>[4]</sup>).

- **The difficulties involved in starting a business and obtaining licences and permits** reflect the complexities of the market fragmentation described above. Starting a business in BiH is much more cumbersome and costly than in most economies in the world. According to the latest World Bank Doing Business assessment, where BiH is ranked 184 out of 190 economies on the indicator for starting a business, it takes on average about twice as many procedures to register a business in BiH than in peer economies in the Europe and Central Asia (ECA) region. Starting a business also takes eight times as long in BiH (80 days in BiH compared to 12 days for the ECA) and costs three times as much as in the average ECA economy (14% of income per capita in BiH compared to 4% in the ECA). Likewise, obtaining a construction permit is lengthier and costlier in BiH than in most global economies, and as a result BiH is ranked 173 out of 190 economies on this indicator in the Doing Business index (World Bank, 2020<sup>[20]</sup>).
- **Contract enforcement is slow, costly and unreliable.** Contract enforcement takes on average 595 days, which is slower than the ECA average (495 days), and well behind global leaders (120 days). The process is slowed down by the overburdened court system, which has a significant backlog of cases, as well as the lack of specialised commercial courts (European Commission, 2019<sup>[4]</sup>). The lack of alternative methods of dispute resolution also negatively impacts the speed and cost of enforcement. The cost of enforcement is high in BiH at 36% of the claim value, compared to the ECA average of 26.6% (World Bank, 2017<sup>[19]</sup>).
- **Confidence is lacking in the judicial system's fair and impartial decision making**, which raises uncertainty in contract enforcement. In the latest Regional Cooperation Council (RCC) barometer survey, 60% of respondents stated that they do not trust the court system, while 70% stated that they do not believe that the judiciary is independent of political influence. Likewise, 76% of respondents stated that they do not believe the law is applied equally to everyone (Regional Cooperation Council, 2019<sup>[17]</sup>).

#### *Transport infrastructure deficiencies undermine investment, trade and GVC integration*

- **Road and railway density is low compared to regional peers and the EU**, and the quality of infrastructure in both transport modes is relatively weak due to considerable underinvestment and inadequate maintenance (Eurostat, n.d.<sup>[21]</sup>). Road infrastructure projects have been poorly selected and implemented (Atoyán et al., 2018<sup>[22]</sup>). Underinvestment in the expansion, maintenance and upgrading of the outdated rail infrastructure is partly due to the lack of unbundling, whereby the two highly indebted, overstaffed and inefficient publically owned railway companies remain in charge of both the infrastructure and operations of the railways. The poor infrastructure also prevents the opening of the market for private operators (European Commission, 2019<sup>[4]</sup>).
- **Access to finance** remains a significant obstacle to the investment, innovation and internationalisation of small and medium-sized enterprises (SMEs), as in most economies in the region. Over the past decade, improvements in macroeconomic and financial sector stability have helped credit growth in the private sector; however, although large enterprises and established SMEs are well served by the banking sector and have benefitted from lower interest rates and better lending conditions, most micro and small enterprises, as well as start-ups, remain underserved. Thus, even though over 95% of SMEs in Bosnia and Herzegovina own a bank account, only about 50% have a bank loan. The financing gap is particularly large for micro-enterprises, nearly 50% of which need, but are unable to get, external financing (World Bank, 2018<sup>[23]</sup>). These enterprises usually cannot meet banks' stringent loan requirements, including high collateral requirements at over 212% of the loan amount (World Bank, 2020<sup>[24]</sup>). Meanwhile, alternatives to bank lending are either very limited or non-existent – see Access to finance (Dimension 3).

*Cross-cutting and sector-specific constraints undermine the growth of key sectors*

- **Agriculture:** Agriculture is an important sector in Bosnia and Herzegovina, but its contribution to GDP is undermined by weak productivity. Agriculture, forestry and fisheries account for just 5.6% of GDP, but 18% of employment. As a result, output per agricultural worker in BiH is just over one-fifth of the output per worker in the EU. Productivity is undermined by high land fragmentation, limited access to technology and inadequate (rural) infrastructure – see Agriculture policy (Dimension 14).
- **Manufacturing:** Upgrading and diversifying the manufacturing sector could play a key role in boosting exports and GVC integration. Analyses of the capabilities embodied in the current export basket reveal considerable long-term potential for growth in the automotive industry (vehicle and engine parts), machinery and metal processing. Over the short to medium term there is growth potential in boosting exports of agro-food, chemicals, metal, and wood and paper products (OECD, 2019<sup>[25]</sup>). The growth of the manufacturing sector is constrained by, for example, gaps in infrastructure, customs and logistics, lack of skills, and the business environment.
- **Information and communication technology (ICT) services:** This sector is relatively small, contributing just 5% to BiH's GDP, but has strong potential for further growth. As in other regional economies, it is constrained by, for example, the limited size of the domestic market, insufficient supply of skilled workers, weak collaboration between the sector and relevant educational institutions, and lack of access to finance, particularly financing for start-ups and high-risk venture capital.

*The well-being of current and future generations is strongly impacted by environmental factors*

- **Air pollution** is a critical challenge in urban centres in Bosnia and Herzegovina. Citizens are exposed to the second highest level of air pollution in the Western Balkan region, after North Macedonia, and Sarajevo suffers from one of the highest levels of air pollution in Europe. Air pollution is particularly acute in the winter months when heating from burning solid fuels compounds the polluting effects from other sources. The large share of old vehicles on the road further contributes to the pollution problem (OECD, n.d.<sup>[26]</sup>).
- **Climate change** exacerbates the natural hazards to which Bosnia and Herzegovina is vulnerable. It is also expected to have a significant economic impact on the agriculture, water and hydropower sectors. However, the transition to a low-carbon economy is slow. Despite high potential in numerous renewable energy sources, including hydro, solar and wind power, Bosnia and Herzegovina remains highly dependent on fossil fuels for its energy supply. In 2017, coal accounted for over 60% of total primary energy generation. Moreover, the efficiency of energy consumption is relatively low, and estimates indicate that energy consumption could be reduced by 60% through energy efficiency related refurbishments in public and commercial buildings (World Bank, 2020<sup>[14]</sup>).

*More inclusive growth is needed to improve the well-being of all citizens*

- Despite robust growth and poverty reduction over the past two decades, Bosnia and Herzegovina still faces many well-being challenges. Inequality has increased and poverty remains an important issue, with 17% of the population living below the national poverty line (World Bank, 2020<sup>[3]</sup>). Regional disparities in poverty, access to services and well-being outcomes are also quite stark. Certain minority groups, such as the Roma, face considerable gaps in, for example, access to education and educational outcomes, access to health and public services, and adequate housing (UNICEF, n.d.<sup>[27]</sup>).

### *COVID-19 has exacerbated structural challenges*

Bosnia and Herzegovina's economy has been strongly impacted by the COVID-19 pandemic. In 2020, real GDP declined by 4.5%, driven by a sharp decline in exports (-7.6%), investment (-6.0%) and private consumption (-4.0%). The contraction was moderated by the decline in imports (-13.3%) and higher government spending (European Commission, 2021<sup>[28]</sup>). The sectors most critically affected by the pandemic include wholesale and retail trade, transport, and accommodation services (Agency for Statistics of Bosnia and Herzegovina, 2020<sup>[29]</sup>).

The labour market was also strongly affected by the crisis, even if the impact was moderated by fiscal support measures implemented by the government. The unemployment rate rose from 15.4% in 2019 to 18% in 2020 reversing almost entirely the gains of the previous year. Employment, meanwhile, declined by 2.8% due to the impact on the trade, accommodation and manufacturing sectors, continuing the decline of the previous year (European Commission, 2021<sup>[28]</sup>).

Many of the abovementioned structural challenges have played a role in either amplifying the impact of the COVID-19 pandemic or limiting the scope of the policy responses to assuage its impact. The crisis has, therefore, provided important lessons on how to build more resilient economies and institutions:

- **Fiscal policy:** Governments around the world have taken rapid and unprecedented action to address the health crisis and the fall in economic activity caused by the outbreak of COVID-19. Containing and mitigating the spread of the virus has been the priority of many governments. With containment measures in place, immediate policy reactions have focused on alleviating hardships and maintaining the productive capacity of the economy (OECD, 2020<sup>[30]</sup>). Among its responses to the COVID-19 pandemic, Bosnia and Herzegovina carried out a number of tax policies:
  - Flexible tax debt payments for companies that experienced more than a 20% drop in revenue as a result of COVID-19.
  - Wage subsidy scheme paid to the employer of BAM 245 (Bosnian mark; EUR 120) per month, per employee. To benefit from this scheme, businesses must have suffered a 20% drop of revenue as a result of COVID-19.
  - Exemption of corporate income tax (CIT) and personal income tax (PIT) payments for 2020.
  - Deferral of the interest rate for late payments of tax debts and suspension of enforcement proceedings until 30 July 2020.
  - Support for individuals and businesses that encounter difficulties for loan repayments due to COVID-19. Measures include a moratorium until the end of the state of emergency, a six month grace period and the approval of additional amounts to overcome liquidity difficulties.
  - Establishment of a public loan guarantee scheme with initial reserves of up to BAM 80 million (EUR 40 million).
  - Exemption of value-added tax (VAT), customs duties and other indirect taxes for imported vaccines, medicines and medical material.
  - Social security contribution (SSC) subsidy scheme of BAM 244 per employee for companies until the end of the state of emergency.
  - When comparing the six Western Balkan (WB6) economies, Bosnia and Herzegovina implemented a relatively wide set of responses to COVID-19. Its comprehensive COVID-19 response package broadly aligns with practices of OECD/G20 countries (OECD, 2020<sup>[30]</sup>), which widely implemented wage subsidy schemes, public loan guarantee schemes or deferral of loan payments. This fiscal response has been critical in preventing a significant economic fallout from COVID-19, especially on labour market outcomes, but has resulted in considerable narrowing of the fiscal space. In the context of weaker prospective revenue in the wake of the crisis, particularly if recovery is slow, the need to improve the efficiency of public spending will be critical over the coming months, as will be the prioritisation of expenditure that can support

recovery and promote productivity growth and structural transformation for stronger and more resilient long-term growth. This includes increasing public investment, which has suffered significantly due to high and rising current expenditure. The crisis has also highlighted the importance of rebuilding fiscal buffers in the post-crisis period, which will involve the better management of expenditure and tackling some of the structural constraints that undermine revenue performance.

- **Innovation and technology adoption:** The COVID-19 crisis has starkly demonstrated the importance of firm adaptability to meet new challenges and changing circumstances. It has also revealed the advantages that firms have when they embrace digitalisation and modern practices. The resilience of the post-COVID-19 recovery will therefore depend on the extent to which the structural issues limiting firm innovation and technology adoption are addressed (see Structural economic challenges), and how much digitalisation and digital skills become mainstreamed.
- **Access to finance:** The crisis has highlighted the significance of having a well-developed and diversified financial sector that can respond to the financing needs of enterprises not only in times of crisis, but also during the recovery phase. As in the rest of the region, the main instruments for providing additional liquidity for enterprises during the crisis came via support from the government through subsidised lending or lending guarantees. A robust financial sector comprised of diversified financial institutions that can provide financing for riskier and innovative ventures, not just established enterprises, will be very important during the recovery phase and beyond.
- **Informality:** The large size of the informal sector, and significant informal employment within the formal sector, have limited the scope of the measures aimed to protect the income and employment of those in the most affected sectors (ILO, 2020<sup>[31]</sup>). Informality is widespread in the sectors most affected by the crisis, including retail trade and tourism (ILO, 2020<sup>[31]</sup>), and those involved have not been able to benefit from government subsidies, favourable loan terms and loan guarantees, and other support measures. Developing a more resilient economy also depends on how incentives for formalisation can be enhanced, and the oversight and sanctioning of non-compliance can be improved.

### ***EU accession process***

Bosnia and Herzegovina began the process of EU accession in July 2008 with the signing of the Stabilisation and Association Agreement (SAA) and the entry into force of the Interim Agreement on Trade. The SAA entered into force in June 2015, and Bosnia and Herzegovina submitted its EU membership application in February 2016. Bosnia and Herzegovina currently holds the status of “potential candidate country for EU accession”.

The European Commission adopted its Opinion on Bosnia and Herzegovina’s EU membership application in May 2019, identifying 14 key priorities for the economy to fulfil to open EU accession negotiations. The EU Council endorsed the Opinion and key priorities in December 2019. The Opinion constitutes a comprehensive roadmap for deep reforms in the areas of democracy/functionality, the rule of law, fundamental rights and public administration reform (European Commission, n.d.<sup>[32]</sup>). The EU and BiH authorities meet annually to discuss a wide range of policy issues and agree on follow-up actions. Progress reports assess the readiness of BiH to move closer to the EU. The findings and recommendations published in this Competitiveness Outlook provide the monitoring and guidance needed for Bosnia and Herzegovina to prepare and meet the requirements of its candidate status, and provide a good basis for assessing the critical challenges that the economy faces as a starting point for the development of its Economic Reform Programme (Box 21.1).

### Box 21.1. Economic reform programmes

Since 2015, all EU candidate countries and potential candidates prepare Economic Reform Programmes (ERPs) which play a key role in improving economic policy planning and steering reforms to sustain macroeconomic stability, boost competitiveness, and improve conditions for inclusive growth and job creation. The ERPs contain medium-term macroeconomic projections (including for GDP growth, inflation, trade balance and capital flows), budgetary plans for the next three years and a structural reform agenda.

The structural reform agenda includes reforms to boost competitiveness and improve conditions for inclusive growth and job creation in the following areas:

1. Public Financial Management
2. Green transition
3. Digital transformation
4. Business environment and reduction of the informal economy
5. Research, development and innovation
6. Economic integration reforms
7. Energy market reforms
8. Transport market reforms
9. Agriculture, industry and services
10. Education and skills
11. Employment and labour market
12. Social protection and inclusion
13. Healthcare systems

The structural reforms part of the ERPs is organised in two parts:

- A first part identifies and analyses the three key challenges across those 13 areas. The identification and prioritisation of key challenges imply a clear political commitment at the highest level to address them and the ERPs should propose a relevant number of reform measures to decisively tackle each of them in the next three years.
- A second part provides an analysis of the remaining areas (not included as key challenges) and may propose additional reforms to address them.

The European Commission and the European Central Bank then assess these programmes, which form the basis for a multilateral economic policy dialogue involving the enlargement economies, EU Member States, the Commission and the European Central Bank. The dialogue culminates in a high-level meeting during which participants adopt joint conclusions that include economy-specific policy guidance reflecting the most pressing economic reform needs. The findings of the Competitiveness Outlook provide guidance to the six Western Balkans EU candidates and potential candidates in identifying the key obstacles to competitiveness and economic growth, and in developing structural reform measures to overcome them.

## *EU financial and development support*

The EU represents the largest source of external financial assistance in Bosnia and Herzegovina. Since 2007, the EU has provided EUR 1.19 billion in assistance aimed at, for example, strengthening democracy and the rule of law; competitiveness, innovation, agriculture and rural development; and education, employment and social policy. EUR 2.4 billion has also been provided through loans from the European Investment Bank (EIB) since 1999. The Western Balkans Investment Framework (WBIF) has provided EUR 284.3 million in grants that have leveraged investments of an estimated EUR 3.6 billion (European Commission, 2021<sup>[35]</sup>).

In addition to grant funding and lending, the EU also provides important support through guarantees that support public and private investment by reducing the risks and costs associated with those investments. The new Western Balkans Guarantee Facility is expected to mobilise up to EUR 20 billion in investment over the coming decade (European Commission, 2020<sup>[36]</sup>).

The EU's Connectivity Agenda seeks to support investments in sustainable transport and clean energy. Set up under the WBIF, the latest package, which was presented at the Western Balkans Summit in Sofia on 10 November 2020, completes the delivery of the EU's 2015 pledge to finance EUR 1 billion of investment in support of better connectivity in the Western Balkan region. It also represents the first step in the implementation of the flagship projects under the EU's Economic and Investment Plan for the region, from which Bosnia and Herzegovina is expected to receive up to EUR 144.3 million between 2021 and 2024 (European Commission, 2020<sup>[37]</sup>).

The EU has also been instrumental in supporting Bosnia and Herzegovina's response to the COVID-19 pandemic. EUR 80.5 million in bilateral assistance from the Instrument for Pre-Accession Assistance (IPA) 2014-2020 was provided to BiH to cover the urgent needs of the health sector and to support the economic and social recovery following the crisis. EUR 455 million was also provided to support economic recovery through the regional economic reactivation package. BiH and other Western Balkan economies have also received aid to access COVID-19 vaccines (EUR 70 million), as well as EUR 7 million of European Commission/World Health Organization joint assistance to support vaccination readiness and health sector resilience (European Commission, 2021<sup>[35]</sup>).

## Scope and methods

### **Process**

Following the first two Competitiveness Outlook assessments, published in 2016 and 2018, the third Competitiveness Outlook assessment cycle for the WB6 economies was launched virtually (due to the COVID-19 pandemic) on 3 April 2020. The OECD team introduced Bosnia and Herzegovina's Competitiveness Outlook State-level, Entity and Statistical Office Co-ordinators<sup>2</sup> to the new digitalised assessment frameworks (see Assessment methodology and process chapter for details). The two primary documents for assessing each of the 16 policy dimensions – the qualitative questionnaire and statistical data sheet – were explained in depth, giving particular attention to new questions and indicators. The OECD team also explained digital solutions to be used to disseminate the material together with the detailed guidelines, tutorials and information on the assessment process, methodology and timeline.

Following the launch of the assessment, the Ministry of Foreign Trade and Economic Relations disseminated the materials among all Policy Dimension Co-ordinators and Statistical Office contact points at the state level, in the FBiH and the RS. Where additional guidance was needed, the OECD team held teleconferences with Dimension Co-ordinators and Statistical Office contact points in April and May 2020.

All Dimension Co-ordinators and Statistical Office contact points completed the assessment between April and May 2020. They assigned a score (see Scoring approach) to each qualitative indicator used to assess

the policy dimension in question, accompanied by a justification. The completed assessments (qualitative questionnaires and statistical data sheets) were returned to the OECD team between May and July 2020.

The OECD reviewed the inputs and, where necessary, requested additional information from the Ministry of Foreign Trade and Economic Relations, Policy Dimension Co-ordinators, and Statistical Office contact points. The updated assessment materials were sent back to the OECD between July and September 2020. In addition, the OECD organised policy roundtable meetings between October and November 2020 to fill in any remaining data gaps, to get a better understanding of the policy landscape, and to collect additional information for indicators where necessary.

Based on the inputs received, the OECD compiled the initial key findings for each of the 16 policy dimensions. It then held consultations on these findings with local non-government stakeholders (including chambers of commerce, academia and NGOs) in November 2020. As a follow up, the OECD presented the preliminary findings, recommendations and scores to the Competitiveness Outlook State-level Co-ordinator, Entity Co-ordinators,<sup>3</sup> Policy Dimension Co-ordinators and Statistical Office contact points at a virtual meeting on 10 February 2021. The draft Competitiveness Outlook economy profile of Bosnia and Herzegovina was made available to the authorities in Bosnia and Herzegovina for their review and feedback from late-February to mid-March 2021.

### **Scoring approach**

Each policy dimension and its constituent parts are assigned a numerical score ranging from 0 to 5 according to the level of policy development and implementation, so that performance can be compared across economies and over time. Level 0 is the weakest and Level 5 the strongest, indicating a level of development commensurate with OECD good practice (Table 21.3).

For further details on the Competitiveness Outlook methodology, as well as the changes in the last assessment cycle, please refer to the Assessment methodology and process chapter.

**Table 21.3. Competitiveness Outlook scoring system**

<b>Level 5</b>	Level 4 plus independent impact evaluation. Results of monitoring and impact evaluation inform policy framework design and implementation updates in line with OECD good practice
<b>Level 4</b>	Level 3 plus evidence that the framework is monitored and, if necessary, adjusted accordingly
<b>Level 3</b>	Level 2 plus some concrete indications that the policy framework is being implemented effectively
<b>Level 2</b>	Framework specifically addressing the policy area concerned is solidly in place, officially adopted by the government or parliament (where applicable). The framework includes policy features necessary for it to have an impact
<b>Level 1</b>	Existing draft or pilot policy framework with signs of government activity addressing the policy area concerned
<b>Level 0</b>	No framework (e.g. law, institution, project, initiative) exists for the policy topic concerned

### *Exceptions*

Unlike the other 15 policy dimensions, competition policy (Dimension 5) is assessed using yes/no answers to 71 questions in a dedicated questionnaire. A “yes” response (coded as 1) indicates that a criterion has been adopted, whereas a “no” (coded as 0) indicates the criterion has not been adopted. The overall score reflects the number of criteria adopted. Moreover, some qualitative indicators which have been added to this edition of the assessment for the first time, are not scored due to the recent character of the policy practice they capture and the unavailability of relevant data.

## Investment policy and promotion (Dimension 1)

### Introduction

Bosnia and Herzegovina's performance in the investment dimension has improved since the last assessment (Figure 21.1). The economy's score has increased from 2.2 in the 2018 Competitiveness Outlook to 2.7 in the 2021 assessment, with progress made on both investment policy and investment promotion and facilitation. However, Bosnia and Herzegovina still scores low in comparison to the other WB6 economies, ranking fifth before Kosovo (Table 21.4).

**Table 21.4. Bosnia and Herzegovina's scores for investment policy and promotion**

Dimension	Sub-dimension	Score	WB6 average
Investment policy and promotion dimension	Sub-dimension 1.1: Investment policy framework	2.9	3.2
	Sub-dimension 1.2: Investment promotion and facilitation	2.7	3.0
	Sub-dimension 1.3: Investment for green growth	2.0	2.0
Bosnia and Herzegovina's overall score		2.7	3.0

### State of play and key developments

In 2019, Bosnia and Herzegovina attracted USD 390 million in net FDI inflows, representing 1.9% of its GDP (Figure 21.2). In relative terms, this performance is well below other WB6 economies: Montenegro (8.4%), Serbia (8.3%), Albania (8.2%), and Kosovo and North Macedonia (3.8%). However, the performance of BiH remains slightly better than similar "upper middle-income" economies,<sup>4</sup> which average 1.6% of GDP, and the OECD average of 1.5%. The stock of portfolio investment in 2019 totalled USD 8.8 billion. Manufacturing (34% of total FDI stock) and banking (25%) are the largest beneficiaries of FDI, followed by telecommunications and trade (12% each). In terms of the origin of FDI, most investment originates in Austria, Croatia, Serbia, Slovenia and the Netherlands (World Bank, 2020<sub>[3]</sub>).

**Figure 21.2. Net FDI inflows to Bosnia and Herzegovina (2015-19)**

StatLink  <https://doi.org/10.1787/888934255475>

### *Sub-dimension 1.1: Investment policy framework*

Overall, Bosnia and Herzegovina's **legal framework for investment** activities and conduct of business is complex and lacking clarity. The economy is decentralised and entities have a high degree of autonomy in setting their own investment policies, regulations and institutions. The economy's framework for attracting FDI is harmonised and coherent overall, as the Law on Foreign Direct Investment in Bosnia Herzegovina and the entities' foreign investment laws are aligned on key principals, and the three laws are virtually uniform (UNCTAD, 2015<sup>[38]</sup>). Entity-level foreign investment laws provide more detailed provisions to facilitate implementation. However, secondary legislation and regulations affecting business activities can differ at the entity and canton levels for both local and foreign investors.

The economy is trying to improve the regulatory framework at both the state and entity level. At the state level, the Ministry of Foreign Trade and Economic Relations (MoFTER) implements FDI policy reforms, undertakes activities to remove regulatory and administrative barriers to doing business, monitors FDI flows, and undertakes activities to improve the investment climate in order to create a more favourable business environment for foreign investors. At the entity level, the Ministry of Economy and Entrepreneurship of Republika Srpska, which is also responsible for activities aimed at stimulating foreign investment, is notably implementing a regulatory impact assessment procedure for its legislation that includes the impact of legislation on the business environment.

Public involvement in policy making varies, as the legal framework is uneven across the economy and is not applied consistently. The meaningful and systematic participation of stakeholders in policy making is hindered by the absence of a strategic framework for co-operation with civil society. Although public consultations and debates are organised for each law to enhance public oversight in Republika Srpska, the European Commission reports that transparency and access to information are lacking in the general economy, as "the legislative framework does not fully establish standards for monitoring and reporting on key government planning documents at each level of government, thus preventing public scrutiny over government work" (Bosnia and Herzegovina, EU report, 2020) (European Commission, 2020<sup>[39]</sup>).

In Bosnia and Herzegovina, the market is open and **exceptions to national treatment** are limited. The economy's score in the OECD FDI Regulatory Restrictiveness Index (Figure 21.3), which assesses and benchmarks market access and exceptions to national treatment, was 0.037 in 2019, below the OECD average of 0.064 (a low score indicates a less restrictive regime). The economy's rules regarding foreign investors are unlikely to constitute a major impediment to attracting investments. The economy maintains some restrictions, primarily for arms production in the military and in the media sector, where foreign ownership should not exceed 49% of equity. However, if the government finds that investment in these sectors has not violated the economy's security, the amount of investment may go over 49%. Real estate remains another restrictive sector, as the economy maintains discriminatory restrictions to real estate ownership by legal entities established abroad. Foreigners must register as a local company to purchase property, or be a citizen of an economy with a reciprocal land ownership agreement. The ownership of agricultural land is not permitted for either domestic or foreign investors.

The state and the entities do not provide a negative list of activities that are restricted or conditioned for foreign investors, and the economy could benefit from clarifications and improvement of the legibility of the legal framework for foreign investors that outline which discriminatory conditions apply. Foreign investors still need to review many sectoral laws and regulations to understand the applicable market access and treatment conditions, and English versions of legislation are not always available on the official websites.

**Figure 21.3. FDI Regulatory Restrictiveness Index (2019)**

Restrictions are evaluated on a scale of 0 (open) to 1 (closed)

Source: (OECD, 2020<sup>(40)</sup>), *FDI Regulatory Restrictiveness Index (database)*, <http://www.oecd.org/investment/fdiindex.htm>.

**Investor protection against expropriation** without fair compensation is guaranteed at the state level by the Law on the Policy of Foreign Direct Investment of Bosnia, which stipulates that expropriation can occur only when in the public's interest. Additional protection is also enshrined in the Constitution of Republika Srpska and its Law on Foreign Investment, and the Law on Foreign Investment for the Federation of Bosnia and Herzegovina.<sup>5</sup> The economy has also signed a large number of bilateral investment treaties that constitute an additional layer of protection for foreign investors.

Expropriations are under the competence of the entities, which provide additional details on the execution of expropriation, compensation fees and judicial resources in their legislation. The laws on expropriation<sup>6</sup> at the entity level clearly define the modalities and procedures of the expropriation, as well as the calculation of compensation and recourses. For instance, in the FBiH the Law on Expropriation stipulates that before making a decision on expropriation, the body in charge of the expropriation shall hear the owner of the real estate about the related facts. It also provides for a two-month deadline to agree on a compensation fee before the matter is transferred to a competent court. Meanwhile, RS recognises the concept of indirect expropriation in its Law on Expropriation and its Law on Out-of-Court Procedure, which regulates the procedure for determining compensation for expropriated real estate if the parties do not reach an agreement on the amount of compensation in accordance with the Law on Expropriation.

The business community does not perceive unlawful expropriation to be a major concern in Bosnia and Herzegovina. Risks for companies are mostly related to the unpredictability of the legal framework, the inconsistent application of laws and, at times, the modification of existing contracts with foreign companies by the authorities. Concerns have been raised over land or property ownership, where disputes can arise due to the lack of clarity of titles and cadastres. While this does not lead to expropriation risks, it weakens the overall environment for property protection and sends a less reassuring signal to prospective investors. However, relevant institutions in Republika Srpska are making additional efforts to reduce inconsistencies and clarifications on ownership and real estate through the establishment of a single, reliable and up-to-date record on real estate and ownership rights. Although efforts have been made to establish a single register since the adoption of the Law on Survey and Cadastre of Republika Srpska in 2012, there is no update on implementation progress for this assessment cycle.

Foreign investors have the same rights and remedies before the national court system as domestic investors. The justice system has been going through a comprehensive and thorough overhaul to align with EU standards. A 2014-2018 strategy for justice reform was adopted that included reforms aimed at supporting economic growth by improving the effectiveness, efficiency and transparency of the judiciary to ensure the faster registration of business entities and resolution of disputes between business entities, as

well as the improvement of areas defining issues of bankruptcy and liquidation of business entities and protection of property rights. However, progress implementing this strategy has been difficult as it has encountered resistance from political actors and the judiciary itself.

Commercial courts and justice departments often lack sufficient resources and adequately trained judges to handle specialised commercial cases. Procedures for enforcing contracts remain overly bureaucratic and cumbersome, and contract disputes are often not resolved quickly or cost effectively. This is illustrated by the economy's ranking in the enforcing contracts dimension of the 2020 Doing Business index (93 out of 190 economies) (World Bank, 2020<sup>[3]</sup>). The judiciary also suffers from a substantial backlog in court cases and problems establishing property rights, in particular real estate registration in some areas (European Commission, 2020<sup>[39]</sup>).

Some progress at the entity level to improve contract enforcement has been recorded. For instance, Republika Srpska has established six district commercial courts that, among other things, have jurisdiction over property rights and SMEs in the entity. Meanwhile the Law on Civil Procedure regulates the small claims procedure if the claim does not exceed BAM 5 000 (approximately USD 3 000) in cash. In 2019, the number of backlogged cases in the business department of the district commercial courts was 3 935, down from 6 240 in 2018 and 7 910 in 2017. The percentage of unresolved cases in relation to the total number of pending cases in 2019 was 33.3%. Republika Srpska states that judges in commercial district courts must have at least five years' experience as a judge, prosecutor, lawyer or other relevant legal experience after passing the bar examination. Judges and public prosecutors are regularly trained at a public institution, the Centre for Education of Judges and Public Prosecutors, on the topic of commercial disputes.

Bosnia and Herzegovina's legislation offers **dispute settlement** options including alternative dispute resolution mechanisms and has shown a pro-arbitration stance, which is likely to reassure foreign investors that they can easily enforce their rights and contracts in the event of a dispute. The economy has ratified the Convention on the Settlement of Investment Disputes between States and Nationals of Other States (ICSID Convention), and the 1958 Convention on the Recognition and Enforcement of Foreign Arbitral Awards (New York Convention), which means that foreign arbitral awards are recognised in the economy. There have only been four cases of investor-state dispute being brought before international arbitration, mainly involving large investors.

Bosnia and Herzegovina has 39 bilateral investment treaties in place, most of which were concluded around 15-20 years ago and do not contain modern provisions such as the right of the state to regulate, more precise definitions of fair and equitable treatment or indirect expropriation, transparency in arbitral procedures, exceptions from free transfers, standards of labour, health and environment, corporate social responsibility, and promotion of foreign investment (UNCTAD, 2020<sup>[41]</sup>). The Council of Ministers has set up a moratorium on the conclusion of new investment treaties until the model treaty is revised to reflect modern provisions, including those related to the investment-state dispute mechanism (in line with EU standards and international best practice). Bosnia and Herzegovina has also established a Permanent Negotiating Body for the Peaceful Resolution of International Investment Disputes, prior to which the economy attempted to address the problems and concerns of investors in aftercare programmes, or ad hoc.

At the entity level, additional measures are provided for alternative dispute mechanisms, but their use remains very low. In Republika Srpska, foreign courts, foreign commercial courts and foreign arbitrations are recognised by the competent district courts. In addition to the Law on Civil Procedure, the Law on the Chamber of Commerce established the Foreign Trade Arbitration, the Arbitration and the Court of Honour to handle investor disputes. Moreover, Article 25 of the Law on Foreign Investments of Republika Srpska stipulates that foreign investment disputes should be resolved before these competent courts unless it is otherwise agreed to use arbitration or substitute courts. However, the overall use of alternative dispute mechanisms in the economy remains low, and further alignment with EU standards and best practices is necessary (European Commission, 2020<sup>[39]</sup>).

Bosnia and Herzegovina has a sound **intellectual property (IP) rights legal framework**. It is a member of the World Intellectual Property Organization (WIPO) and adheres to the main international treaties and conventions on IP rights, such as the Patent Co-operation Treaty, the Paris Convention, the Madrid Protocol and the Hague Agreement. It has progressively introduced IP-specific legislation over the past ten years to align with EU standards and requirements. Regarding copyright and neighbouring rights, the legislative framework is largely aligned with the EU *acquis* (European Commission, 2020<sup>[39]</sup>). The Institute for Intellectual Property of Bosnia and Herzegovina (IIP) operates as an independent administrative body and is the main body responsible for IP implementation and promotion. The institute has a large mandate that includes IP registration, participation in IP policy, legislation making and awareness raising. It is also tasked with the co-ordination of IP implementation and enforcement in the economy. The IIP operates in compliance with the main international conventions and agreements on intellectual property ratified by the economy, and its operations are comparable to international standards. For example, a patent can be obtained within 2.5 to 4 years from the date of filing, the registration of the trademark right is 18 months and the time for the registration of industrial designs is below 6 months. The institute operates an online platform available in English for submitting applications and payments of fees and costs, a help desk, and a database for searching. Its website also contains key legislation, the necessary information related to intellectual property protection procedures, and examples of patent applications. The IIP keeps a separate register for each of the publicly available industrial property rights.

**IP implementation and enforcement** remains challenging in Bosnia and Herzegovina. IP enforcement is particularly problematic as enforcement agencies and the judicial system have insufficient capacity and resources, and there is limited co-operation. In 2019, the economy adopted the Strategy for the Enforcement of Intellectual Property Rights in Bosnia and Herzegovina for the period 2018-2022, which sets out guidelines and measures to reinforce the development and improvement of the legislative and institutional framework for IP enforcement, as well as the establishment of inter-institutional co-operation. In February 2020, the Council of Ministers adopted a decision to establish an Inter-agency Co-operation Body for the Acquisition and Enforcement of IP Rights. However, progress to mobilise the body has been slow as the strategy has yet to be implemented, and prosecutors, judges and court panels handling cases involving intellectual property law need to be more specialised to handle them more efficiently and consistently (European Commission, 2020<sup>[39]</sup>).

**Intellectual property rights awareness raising and access to information** is lacking in the economy. There is generally little awareness of IP rights and obligations in Bosnia and Herzegovina. The IIP regularly organises ad hoc awareness-raising workshops on IP rights and protection matters, but lacks the resources and capacity to do so on a systematic or far-reaching basis.

### *Sub-dimension 1.2: Investment promotion and facilitation*

Bosnia and Herzegovina's **investment promotion agency structure and strategy** needs streamlining, and there needs to be better inter-institutional co-operation between the entities. The Foreign Investment Promotion Agency of Bosnia and Herzegovina (FIPA) is a state agency mandated with investment promotion. According to the law that established FIPA, the agency reports to the Council of Ministers. The FIPA Steering Board is composed of nine members: two representatives of the Council of Ministers, one member of each entity, one representative of the foreign trade chamber, two representatives of the business community of each entity and two representatives of foreign investors. It proposes the strategic goals of the agency in co-operation with the Ministry of Foreign Trade and Economic Relations of Bosnia and Herzegovina, entity governments, and the Brčko District. The board also proposes business and action plans and oversees strategy implementation. FIPA prepares medium-term plans and annual work plans with specific goals and objectives, and reports on the realisation of planned activities. These plans and reports are approved by the Council of Ministers.

FIPA is understaffed, with only seven staff members working on investment promotion activities. Staff report that the top three challenges they face in the execution of their mission are inadequate resources,

lack of political support and inadequacy/instability of mandate. The agency's work also suffers from the absence of formal co-ordination mechanisms between the relevant and numerous bodies involved in FDI attraction activities, including the Ministry of Foreign Affairs, MoFTER, the foreign trade chamber, and entity governments and ministries. The Ministry of Economy and Entrepreneurship of Republika Srpska also lacks sufficient resources to cover its investment promotion duties; however, it is a member of the FIPA steering board and regularly submits updated information on reform projects, promotion projects and promotional materials.

Investment promotion activities are conducted at state and entity levels. For instance, the Ministry of Economy and Entrepreneurship of Republika Srpska conducts investment promotion and export promotion activities that include attracting foreign investment, post-investment care, monitoring and evaluation of realised investments, and the creation and maintenance of a single database with resources (projects/locations) attractive to foreign investors.

FIPA assists foreign investors seeking partnerships with local firms or local suppliers on an ad hoc basis. It provides investors with useful sectoral information and data, and organises events connecting foreign and local firms. However, creating and reinforcing linkages between foreign affiliates and local enterprises is primarily conducted at the entity level. For instance, the Strategy for the Development of Small and Medium Enterprises of Republika Srpska for the period 2016-2020 supports cluster development through the identification of potential cluster initiatives,<sup>7</sup> and supports their development and functioning by reinforcing linkages with foreign firms and universities.

**Investment facilitation services and activities** can improve the relatively complex business environment in Bosnia and Herzegovina, but there are challenges involved as regulations differ among the entities and between cantons. This is reflected in the 2020 World Bank's Doing Business Index, which ranks BiH 90 out of 190 economies, well behind other WB6 economies. Establishing a business in BiH can be an extremely burdensome and time-consuming process for investors. Based on the Index, the economy is among the most difficult environments in the world with regards to starting a business (ranking 184 out of 190 economies) (World Bank, 2020<sub>[3]</sub>). For example, it takes 80 days to start a business in Bosnia and Herzegovina compared to 15 days in North Macedonia, 7 days in Serbia and 4.5 days in Albania. Investors also report difficulties dealing with construction permits and registering property, as entities, cantons and municipal levels of government each establish their own laws and regulations on business operations, which creates redundant and inconsistent procedures that lead to inefficiencies and corruption.

At the state level, government efforts have included the recent reduction of costs related to the establishment of businesses, as well as the acceleration of the creation of one-stop shops in all administrative units. FIPA has a limited investment facilitation role as it does not have a mandate to register a company for an investor or obtain permits and licences, but acts as an intermediary body to help investors navigate the economy's complex administration system. The agency does, however, play an important role in promoting and maintaining public-private dialogue and collecting private sector feedback, notably regarding the business environment and the challenges faced by businesses.

Key efforts and investment facilitation activities are operated by the entities. For instance, Republika Srpska has operated a business registration one-stop shop at the Agency for Intermediary, IT and Financial Services since 2013, and through its 11 regional offices. Ongoing reforms have led to a significant reduction in the time necessary for business registration, from 23 to 3 days, as well as a reduction in the number of procedures from 11 to 5. The cost of starting a business has also been reduced. For instance, for a single-member limited liability company, registration costs range from EUR 50 to 100, down from EUR 600 to 750. The online registration of business entities (for limited liability companies and entrepreneurs) is in the final stage of development. Republika Srpska has also developed a comprehensive electronic database of administrative procedures and formalities for business activities, and all legislation is subject to a regulatory impact assessment process, which, since 2019, pays attention

to administrative burdens for business entities and invites the Ministry of Economy and Entrepreneurship to provide an opinion on the implementation of regulation in this context.

Bosnia and Herzegovina has developed solid **investor targeting** strategies and actions plans. FIPA focuses primarily on promoting the image of the economy as an attractive investment destination for foreign investors. Using the network of embassies and representations, FIPA conducts missions abroad aimed at economy branding and promoting key economic sectors in general, while initiating contacts with potential investors. In co-operation with the International Financial Corporation and the World Bank, FIPA and the FBiH launched an outreach programme in 2016 targeting investment in the agriculture and automotive industries. At the state level, Bosnia and Herzegovina has successfully conducted three outreach missions to Italy, Germany and the Netherlands, with one more postponed due to COVID-19. FIPA aids the FBiH with the implementation of investor targeting programmes and aftercare support, while RS conducts outreach missions independently.

Investor targeting activities are more actively conducted at the entity level. For instance, Republika Srpska defined key sectors for attracting foreign investment, namely agriculture and food, industry, renewable energy, tourism and ICT, in its Investment Strategy 2016-2020. In 2017, it began a more targeted approach through outreach campaigns, for example in the fruit and vegetable processing sector, where it targeted German companies in 2017 and Austrian companies in 2018. The Ministry of Economy and Entrepreneurship also organised training for local self-government units in investor outreach and proactive investor aftercare in 2018, and is co-operating with World Bank training in this area.

Bosnia and Herzegovina's **investor incentives** regime is complex and multi-layered. At the state level, incentives provided to investors are limited and primarily concern customs exemptions on the import of foreign investors' equipment<sup>8</sup> as part of shared capital. Most incentives are managed at the entity level. Tax incentives for investment are not consolidated under the authority of one government body, as incentives related to indirect taxation are at the state level of responsibility and incentives for direct taxation are under the competence of the entities. The economy has nevertheless established some mechanisms aimed at avoiding overlaps and inconsistencies in the application of tax incentive policies. At the state level, the State Aid Council publishes information on the amount of state aid provided every year, but statements on the individual names or companies of the largest beneficiaries are not available.

At the entity level, the Federation of Bosnia and Herzegovina provides tax incentives for investors in its four active free economic zones, which function as fully private organisations. Free trade zones are part of the customs territory of FBiH and have the status of a legal entity. The users of free zones do not pay taxes and contributions, except those related to salaries and wages. Investors are free to invest capital in the free zone, transfer their profit and re-transfer capital with no charge. To ensure the development objective of existing free zones, investors must submit annual reports on operations to the entity ministries and MoFTER. The ministries check if companies based in the free zones meet the requirement that the percentage of exported goods must be over 50%.

In Republika Srpska, the Law on Free Zones was adopted in February 2021. In addition to this law, Republika Srpska provides a wide range of investment incentives to investors. All incentives are listed on the website of the Ministry of Economy and Entrepreneurship and include: 1) funds for the development of the economy, including incentives for increasing the salaries of employees in business entities and incentives for direct investments; 2) incentives provided through the programme of support for employment; 3) tax incentives provided in the Law on Income Tax and the Law on Corporate Income Tax; 4) banking privileges, including subsidised loans; 5) sectoral incentives provided by line ministries; and 6) municipal-level incentives. The Ministry of Finance evaluates the cost and benefits of investment incentives when they are proposed, and this evaluation is part of the mandatory clarification before the incentive is adopted by the government and the National Assembly. A register of incentives that aims to provide a clear and comprehensive overview of planned, approved and implemented incentives for the economy of Republika Srpska, is being developed.

Overall, the incentive regime remains overly complex, and distinct incentives are applied in the different entities. This makes the overall incentive scheme confusing for investors and may lead to harmful internal and regional tax competition. It should also be noted that the renewal of incentives is often permitted without appropriate scrutiny.

FIPA has an active but limited role in providing **aftercare services**, and seems more focused on policy advocacy and high-level public-private partnership (PPP) dialogue than direct firm assistance. Post-investment investor support is recognised as a key component of the agency's mandate, along with policy advocacy and drafting proposals for legislation and legal measures aimed at promoting investment conditions. The agency plays an active role in maintaining public-private dialogue, and in conducting surveys and visits to firms to evaluate their needs and report the problems they face. Under the aftercare programme, FIPA has provided post-investment support since 2013. Through the programme, existing investors are provided with an integrated mechanism to systematically support their business on a long-term basis. The feedback from investors is used to inform policy development, design and implementation. FIPA prepares the "Proposals for Improving the Business Environment and Investment Conditions in Bosnia and Herzegovina" report every year, with suggestions for changes to existing legislation and recommendations for resolving business barriers. This report is submitted to the BiH Council of Ministers, the entities and the canton governments.

Substantial aftercare support is also provided at the entity level. For instance, the Ministry of Economy and Entrepreneurship of Republika Srpska has been implementing the Post-Investment Support Programme for investors since 2013. Ten local self-government units have joined the programme and there are currently 28 members in the Collaborative Network, which is a system of representatives at the canton level that exchanges experience and information regarding the identification of issues, and potential solutions, related to investors. The network holds four annual meetings. Through this network, several training courses for self-government units on attracting and retaining investors have been organised. Between 2016 and 2019, joint teams including representatives from ministries and local self-government units visited around 135 companies and discussed the difficulties that investors face, some of which are solved immediately while others are addressed in co-operation with the competent institutions and ministries. The government of Republika Srpska is presented with information on aftercare activities annually, including the problems that investors face in their business. The government then instructs line ministries to systematically approach and find solutions to these issues.

### *Sub-dimension 1.3: Investment for green growth*

Bosnia and Herzegovina is reinforcing its **green investment policy and promotion** activities, notably in the context of aligning its energy and environment standards with the EU. The economy has developed multiple strategies and action plans over the past decade to promote green economic growth, including low-carbon development, affordable energy from clean sources, green economic growth, health and well-being, industrial growth, and climate protection. For example, the National Action Plan for the Use of Renewable Energy in BiH (NREAP BiH) included ambitious targets such as a 40% share of renewable energy sources in gross final energy consumption for all energy resources, and a 10% share of biofuels in transport for 2020. The National Action Plan for Energy Efficiency aims to reduce primary energy consumption by 12%.

MoFTER has initiated activities related to the development of the Integrated Energy and Climate Plan of Bosnia and Herzegovina (NECP BiH) for the period 2021-2030. By drafting this document, BiH is applying, for the first time, an integrated approach to drafting a document as it includes the electricity sector in the parts related to market security, supply, energy efficiency, renewable energy sources, innovation, development, competitiveness and emissions. The plan includes an innovative financing strategy and mechanisms for climate adaptation investments to be developed and tested in four to five selected municipalities.

The framework for green investment respects core investment principles such as investor protection, intellectual property rights protection and non-discrimination in areas likely to attract green investment. However, it is overly complex and difficult to navigate for investors, who must go through numerous sectoral laws and regulations, as well as the authorisation systems and incentive regimes at national and entity levels. The legal framework for green investment is regulated at the state level by the Law on the Use of Renewable Energy Sources and Efficient Cogeneration that was adopted in 2014 and encourages private investment in electricity production. At the entity level, in the FBiH the framework for green growth has been reinforced by the adoption of several laws and regulations, including the Law on Electricity and the Regulation on Incentive Fees to Promote Electricity from Renewable Energy Sources. Meanwhile, the Law on Renewable Energy Sources and Efficient Cogeneration has strengthened the green growth framework in Republika Srpska.

Bosnia and Herzegovina remains only partially harmonised with EU regulations due to its complex constitutional structure. The economy lacks clear and standardised legislation on green investments, and there is little transparency regarding the publication of summary information. The legal protection system concerning green investments is inconsistent, which may create legal security concerns for private investors.

Making and implementing the choice of **public and private partnerships for green growth** is only partially encouraged in Bosnia and Herzegovina. At the state level, there are no dedicated PPP laws, and while Republika Srpska and each canton of FBiH have adopted their own laws separately, they do not explicitly define investment in green growth but rather contain principles of environmental protection that define PPP criteria. In addition, the choice of PPP procurement for green projects is limited by the absence of an institutional arrangement with solid political backing and multidisciplinary capacity, whereby responsibilities are clearly assigned for promoting, implementing, monitoring and managing PPP projects.

### ***The way forward for investment policy and promotion***

Bosnia and Herzegovina is not yet fulfilling its potential in attracting FDI as its investment climate is still hampered by complexities. Improving the investment climate requires the following reforms:

- **Improve the clarity and predictability of the legal frameworks for investment, including for foreign investors.** The key prerequisites for investment policy include respect for the rule of law, quality regulation, transparency and openness, and integrity. Effective action across these dimensions will encourage investment and reduce the costs of doing business. Strong institutions with clear mandates will also help maintain a predictable and transparent environment for investors.
- **Improve the transparency and inclusiveness of policy making.** More open and inclusive policy-making processes help ensure that policies better match the needs and expectations of citizens and businesses. The greater participation of stakeholders in policy design and implementation leads to better targeted and more effective policies. Potential actions include improving access to information by developing a portal that gathers all business-related legislation at different levels of government and providing versions in English. Improving the consultation process and mechanisms with stakeholders, including foreign investors, through raising awareness of consultation methods in the economy would also prove useful.
- **Accelerate justice reform efforts, particularly those related to commercial matters, and dedicate more effort to improving the rule of law and easing the process of enforcing contracts.** This also requires providing judges with sufficient resources and adequate training to help them understand the specificities of commercial cases. The effectiveness and independence of the judicial systems are a prerequisite for creating a business-friendly environment, building trust and promoting investment. A justice system that ensures appropriate and timely contract enforcement and reduces the backlog in court cases could positively impact the investment climate, as well as the productivity and competitiveness of businesses in Bosnia and Herzegovina.

- **Promote arbitration as a recognised alternative dispute resolution mechanism.** Bosnia and Herzegovina could consider introducing arbitration and mediation laws that are aligned with international standards. These mechanisms can help alleviate the pressure on the judiciary system, build trust and create a more business-friendly environment for conflict resolution. State- and entity-level laws should ensure that domestic courts recognise and enforce these decisions in accordance with applicable international standards.
- **Enforce IP rights and raising IP awareness.** Enforcing institutions should be adequately staffed and trained and a co-ordinating body should be established. More resources should also be allocated to IP awareness-raising activities and access to information. A strong IP system can promote innovation and reinforce linkages between multinational firms and local companies, as the strength of the intellectual property regime influences the willingness of foreign technology holders to invest and transfer technology and proprietary knowledge to local SMEs.
- **Reinforce FIPA's resources and capacity so that it can effectively fulfil its mandate and establish stronger co-ordination mechanisms to avoid overlaps and conflicts in investment promotion and facilitation activities.** Success in attracting investment requires a whole-of-government approach to investment promotion and facilitation. Effective co-ordination among various authorities with investment promotion mandates must be built, including at local government levels and with implementing agencies. It is therefore crucial to have an investment promotion agency with strong capacity and the resources to co-ordinate investment promotion tasks and ensure consistency with state- and entity-level development plans.
- **Improve investment facilitating activities, including those related to starting a business.** Uncoordinated institutional frameworks make it complicated and cumbersome for investors to become established, as well as increases their transaction costs. FIPA could play a crucial role in providing investors with much needed clarity regarding public administration and policies.
- **Promote and unify legislation encouraging green investment,** while increasing transparency through the publication of summary information in one place. Bosnia and Herzegovina should also develop a solid and harmonised PPP legal and institutional framework that encourages promoting, implementing, monitoring and managing green PPP projects.

## Trade policy (Dimension 2)

### Introduction

Bosnia and Herzegovina's performance on the trade policy dimension has improved, albeit moderately, since the last assessment (Figure 21.1). The economy's score has increased from 2.2 in the 2018 Competitiveness Outlook to 2.5 in the 2021 edition (Table 21.5). This is largely due to the establishment of the Trade Facilitation Committee of Bosnia and Herzegovina in 2018, which aims to aid and improve the adoption of reforms through an effective co-operation mechanism between the public and private sectors. The climate in which the private sector operates has continued to improve. There is, however, room for improvement regarding legislation on public consultations, which is uneven across the economy in terms of implementation and consolidation, despite efforts such as the adoption of new legislation at the state level on public consultation standards and the introduction of the eConsultation website, which allows the public to submit remarks and comments on all draft regulations.

Significant improvements have been made to open services trade through the signing of Central European Free Trade Agreement (CEFTA) Additional Protocol 6 in December 2019. Bosnia and Herzegovina is, however, still the most restrictive economy in the WB6 region. Nevertheless, some small progress has been made in improving economic policies. The economy has not reported any protectionist legal changes. This is particularly important in a context where recent OECD studies on member economies have tended to show a growth in the number of regulations restricting services in 2020 (OECD, 2020<sup>[42]</sup>). Restrictions are especially present in the areas of the movement of people, foreign entry and company regulations, which negatively affect foreign entities wishing to invest and operate in Bosnia and Herzegovina.

In terms of the digital trade in goods and services, the e-commerce framework in the economy is not evolved enough as no new laws on electronic communication and electronic media have been implemented and little progress has been made on implementation (Table 21.5).

**Table 21.5. Bosnia and Herzegovina's scores for trade policy**

Dimension	Sub-dimensions	Score	WB6 average
Trade policy dimension	Sub-dimension 2.1: Trade policy framework	2.8	3.5
	Sub-dimension 2.2: Services trade restrictiveness	n.a.	n.a.
	Sub-dimension 2.3: E-commerce and digitally enabled services	2.0	3.1
Bosnia and Herzegovina's overall score		<b>2.5</b>	<b>3.4</b>

### State of play and key developments

Bosnia and Herzegovina's exports of goods and services have been steadily growing since 2015, before decreasing slightly in 2019. Overall foreign trade declined from 99.2% of GDP in 2018 to 95.2% in 2019 (in real terms), after having continuously grown since 2015, when it was 88.2%.

BiH's exports of goods reached EUR 5.5 billion in 2019, while imports reached EUR 9.4 billion. The external deficit on trade in goods and services accounted for 15.6% of the economy's GDP (World Bank). Bosnia and Herzegovina's exports of goods and services account for 40.06% of GDP and imports represent 55.8% of GDP. The economy is a net exporter of commercial services, with commercial exports accounting for EUR 1.9 billion vs. EUR 622 million in imports.

In 2018 and 2019, BiH's main export partner was Germany, which accounted for 14.9% of the economy's total exports, followed by Croatia (11.5%) and Italy (11.4%). Bosnia and Herzegovina's main suppliers are Germany (11.9%), Italy (11.4%) and Serbia (11%).

In November 2018, Kosovo imposed a 100% tariff rate on goods originating from Bosnia and Herzegovina, which severely impeded bilateral trade between the two economies. These tariffs were lifted in April 2020 and the flow of goods is in the process of resuming.

Like all economies, Bosnia and Herzegovina was heavily affected by the COVID-19 pandemic. The low level of new import and export orders prior to the crisis, combined with pandemic-related export bans, restrictions on the movement of people, and closures of shops and services, led to a significant decline in imports and exports, and a sharp decline in consumption and investment in Q2 and Q3 2020. Bosnia and Herzegovina was not the most severely affected WB6 economy, but faced a decline of -6% in imports and -7% in exports, which is below the average fall seen in OECD member states.

Industry in the WB6 economies was affected by the supply shock caused by COVID-19 and the resulting slowdown in trade flows. The decline in exports from Bosnia and Herzegovina was primarily a consequence of the breakdown of GVCs. WB6 economies with a higher level of integration into GVCs and an existing share of manufacture, such as Bosnia and Herzegovina, felt the immediate effects more severely, but have also seen trade flows decline less than the OECD average, as displayed in Figure 21.4.

**Figure 21.4. Impact of COVID-19 on trade, Bosnia and Herzegovina versus the OECD (2019-20)**

% change, y-o-y

StatLink  <https://doi.org/10.1787/888934255494>

The region's relatively low level of development and sophistication limits most economies to backwards linkages, mainly as assembly centres (IMF, 2020<sub>(43)</sub>). For BiH in particular, the leading cause of the decline in exports is the disruption of supply chains resulting from the manufacturing slowdown in China and reduced demand in the United States and notably the EU, its main trading partner. In the region, and particularly in Bosnia and Herzegovina, GVCs are concentrated in a few sectors (automotive, electrical equipment, machinery, chemicals and metals) and are located around a few European economies (OECD, 2019<sub>(25)</sub>). In Bosnia and Herzegovina, those most affected by the slowdown are the producers of machinery and equipment, and machinery and mechanical appliances, which are the most integrated in trade with Europe through GVCs. However, given the relatively high import content of Bosnia and Herzegovina's goods exports, the volume of trade in the economy is expected to recover once production resumes, in parallel with the revival of GVCs and demand, especially in the EU.

The closure of EU borders to non-EU citizens and other regulatory responses to the pandemic, combined with the existing logistical challenges of the Western Balkans, have particularly affected freight transport services. The WB6 set up the CEFTA co-ordinating body to exchange information on trade in goods at the

beginning of the pandemic. They also set up priority "green lanes" with the EU and "green corridors" within the WB6 to facilitate the free movement of essential goods through priority "green" border/customs crossings (within the WB6 and with the EU). At the peak of the crisis (April to May 2020), most road transport in WB6 economies passed through these green lanes and corridors. These have helped to maintain a certain degree of international trade in goods in the region. In fact, only about 20% of the goods benefitting from the green lanes and corridors regimes were basic necessities, the rest being regular trade. Such inclusive regional co-operation has proven to be very efficient in mitigating the consequences of the COVID-19 pandemic and helping the region's economies to recover.

### *Sub-dimension 2.1: Trade policy framework*

Improvements have been made regarding **institutional co-ordination mechanisms** for trade policy development in Bosnia and Herzegovina since the last cycle of assessment. Trade policy development falls under state competency in the FBiH, whereas RS has its own mechanism under its Law on Trade (Invest in Srpska, 2020<sup>[45]</sup>). MoFTER is the key institution involved in formulating and implementing Bosnia and Herzegovina's foreign trade policy.<sup>9</sup> The ministry includes two administrative organisations: the Veterinary Office and the Plant Health Administration, and eight departments responsible for individual areas of trade policy.<sup>10</sup> Each department is responsible for co-ordinating and supervising the formulation and implementation of sectoral policies that fall under the competence of the state level of BiH. In RS, the Ministry of Trade and Tourism is responsible for trade policy development.

Some improvements have been made in aligning BiH with its trade-related international obligations.<sup>11</sup> BiH state-level institutions created the Trade Facilitation Committee of Bosnia and Herzegovina in 2018. The committee's board consists of 20 members from various institutions of Bosnia and Herzegovina involved in the implementation of customs and other border procedures related to international cross-border trade in goods. Representatives of the private sector, and their associations, engaged in activities related to imports, exports or the transit of goods are also members. The primary role of the committee is to improve the preparation and implementation of trade facilitation reforms through a co-ordination mechanism between the public and private sectors.

Although efforts to co-ordinate trade-related initiatives and strategies exist at state and entity levels, a formal inter-ministerial co-ordination mechanism has yet to be adopted at the state level, and no progress has been made in this regard since the previous Competitiveness Outlook publication. There is a formal inter-ministerial co-ordination mechanism framework in RS, which has been strengthened since the last reporting cycle with the introduction of new regulations in 2018.<sup>12</sup> At the state level, all draft laws, regulations or international agreements being drafted or negotiated upon must go through legal procedures that involve the establishment of an ad hoc working group. These working groups consist of representatives of all relevant institutions from all levels of the state government. Moreover, all BiH agencies/bodies are obliged to submit annual reports to the Council of Ministers on the implementation of existing regulations, as well as their programmes of work for the next year, in co-ordination with the relevant MoFTER department. The main difficulty with this mode of operation is its ad hoc nature, which is not systematised by solid regulations. Consequently, and in the absence of *ex post* analysis, it is impossible to establish the quality and uniformity of the work of the working groups. At the entity level, RS's Ministry of Trade and Tourism holds constant consultations with other ministries, agencies and stakeholders involved in the trade sector during the development of strategic documents, laws and by-law acts.<sup>13</sup> However, a concrete procedure for monitoring trade policy making is yet to be implemented in both entities or at the state level to improve *ex post* impact assessments.

Legislation on **public consultations** is uneven across the economy, and there is no strategic framework for co-operation with civil society at the state level or in either entity. However, progress has been made in adopting regulations for the implementation of public consultation standards at the state level. The 2017 Regulation of Consultations in Legislative Drafting<sup>14</sup> contains a provision on the minimum obligations for conducting consultations from the earliest stage of drafting. According to the regulation, BiH institutions

at the state level are obliged to post preliminary draft regulations and acts on a dedicated website (eKonsultacije, 2020<sup>[46]</sup>) (eConsultation) that enables the public to submit proposals and remarks. This procedure is the only part of the adoption process that allows direct public comments. The eConsultation website has been increasingly used by the institutions of BiH in recent years, and all institutions have appointed consultation co-ordinators and deputies.<sup>15</sup> There is no similar mechanism in Republika Srpska, but the regulatory framework mandates that relevant institutions must make draft regulations and all related documents publicly available.<sup>16</sup> At the state level, acts are posted on the website for 15 or 30 days, depending on the significance of public interest, which is determined in a pre-assessment of impact. This regulation does not include a mandated maximum time for the relevant institution to respond to comments; however, acts cannot be submitted for further procedure without all questions or comments being answered by the proponent.<sup>17</sup> To participate in the consultation process, the public needs to register as a user of the eConsultation website and register for the specific consultation.<sup>18</sup> If the regulations are adopted through the Parliamentary Assembly procedure the public can also provide comments as part of the amendment procedure. Despite the web platform being operational since 2017, it is still not widely used by the private sector,<sup>19</sup> and there is potential to raise awareness about various forms of consultation. Chambers of commerce are the most active institutions involved in direct consultations; however, there is no access to statistics regarding other stakeholders involved in this process. In Republika Srpska, the Ministry of Trade and Tourism does not have accurate information regarding participation in the legislative process. The use of fast-track or emergency procedures not subject to public consultation remains a widespread issue in the legislative process at all levels, especially in the FBiH, which affects the trade decision-making process.<sup>20</sup>

Regarding **bilateral and multilateral free trade agreements**, no progress has been made in Bosnia and Herzegovina's World Trade Organization (WTO) accession since the last review cycle. While the economy has been a member of CEFTA since 2007, it has yet to ratify Additional Protocol 5 and 6 to the agreement. Both the European Free Trade Agreement (EFTA) and the Stabilisation and Association Agreement (SAA) were ratified by Bosnia and Herzegovina in 2015.

Bosnia and Herzegovina has only one bilateral trade agreement, with the Republic of Turkey, which entered into force in 2003. A revised free trade agreement with Turkey was signed in 2019 and the ratification process is underway, after which the previous agreement and protocol will cease to be valid.

### *Sub-dimension 2.2: Services trade restrictiveness*

Services contribute close to two-thirds of GDP in WB6 economies, which highlights how strongly economic growth, innovation and job creation depend on effective policies on services that promote open and competitive markets. In Bosnia and Herzegovina, services account for 55.5% of GDP (Figure 21.5) and more than 52.5% of employment.

Figure 21.5. Contribution of services to Bosnia and Herzegovina's GDP (2007-17)

Source: (World Bank, 2020<sub>[3]</sub>), *World Development Indicators (database)*, <https://databank.worldbank.org/source/world-development-indicators>.

StatLink  <https://doi.org/10.1787/888934255513>

Enhancing the openness of trade in services can improve domestic firms' efficiency and productivity (OECD, 2018<sub>[47]</sub>). Trade in services allows economies to specialise according to their comparative advantages in services and skills. The potential gains from liberalisation in services trade are significant because increased domestic and foreign competition, complemented by effective regulation, can enhance performance and lower costs related to trade in services (Box 21.2).

### Box 21.2. The costs of regulatory barriers to trade in services

Recent OECD analysis reveals that services trade restrictions significantly affect trade by raising the costs for firms to operate in the host economy (Rouzet and Spinelli, 2016<sub>[48]</sub>). Trade costs arise both from policies that explicitly target foreign suppliers, and more generally from domestic regulation that falls short of best practice in the area of competition and rule-making. The costs resulting from barriers to trade in services are much higher than those of trade in manufactured goods.

Trading services is costly. The studies show that policy-induced services trade costs are relatively high. Expressed as percentages of total trade value, average multilateral costs for cross-border services trade are around 57% for communication services and 54% for business services, around 60% for transport services, around 103% for insurance services, and around 255% for financial services. Even exporting to the most liberal economies still requires compliance with regulation at a cost that correspond to around 30% of the export value in most sectors and nearly 90% for financial services. Within the European Single Market, however, services trade costs are significantly lower – policy-induced costs of cross-border services trade are at around 10% in most sectors and around 32% for financial services.

Source: (Benz and Jaax, 2020<sub>[49]</sub>), *The costs of regulatory barriers to trade in services: New estimates of ad valorem tariff equivalents*, <http://dx.doi.org/10.1787/bae97f98-en>; (Rouzet and Spinelli, 2016<sub>[48]</sub>), *Services Trade Restrictiveness, Mark-Ups and Competition*, <https://dx.doi.org/10.1787/5jln7dlm3931-en>.

The OECD Services Trade Restrictiveness Index (STRI) was used to **analyse barriers to trade for 12 services sectors** in Bosnia and Herzegovina.<sup>21</sup> The OECD STRI project is a unique, evidence-based diagnostic tool that inventories trade restrictions in 48 economies,<sup>22</sup> allowing economies to benchmark their services regulations against global best practice, identify outlier restrictions and prioritise reform efforts. For this Competitiveness Outlook assessment cycle, the 12 services sectors are grouped into four clusters:

1) transport and distribution supply chain (air transport, road transport, rail transport, courier); 2) market bridging and supporting services (commercial banking, insurance, legal services); 3) physical infrastructure services (construction, architecture, engineering); and 4) digital network services (computer services, telecommunications).

Information was collected from the WB6 economies' laws and regulations, and indices were calculated for seven years (2014-20). These composite indices quantify restrictions across five policy areas: foreign entry, movement of people, barriers to competition, regulatory transparency and other discriminatory measures. The indices quantify regulatory restrictions in each of the 5 policy areas for the 12 sectors by giving them a value between 0 and 1. Complete openness to trade in services gives a score of 0, while being completely closed to foreign service providers yields a score of 1.<sup>23</sup>

Each policy area is composed of a series of measures. These measures are called "horizontal" if they are present in all sectors, or "sector specific" if they only affect a particular sector.<sup>24</sup> The STRI measures the most-favoured-nation (MFN) restrictions and does not take into account any specific concessions, such as regional trade agreements or mutual recognition agreements (Geloso Grosso et al., 2015<sup>[50]</sup>).

Figure 21.6 shows the STRI indices for each of the sectors, as well as the average scores for the WB6, EU and OECD. Compared to the STRI project member states, Bosnia and Herzegovina is in the high range in terms of the degree of restrictiveness of its services sectors. This has a negative impact on the attraction of investment and competition in the economy. Within the WB6 region, Bosnia and Herzegovina has a lower STRI score than the WB6 average in 2 out of 12 sectors. Air transport services and rail freight transport services are the two sectors with the lowest score relative to the WB6 average. Courier services and Legal services are the two sectors with the highest score relative to the WB6 average.

It is important to note that although some relevant competencies in the following sectors might be shared between the state level and the entity level in Bosnia and Herzegovina, BiH is scored as a single economy for the purposes of the STRI.

**Figure 21.6. Services Trade Restrictiveness Index for Bosnia and Herzegovina (2020)**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and therefore are not covered by STRI indices; key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand. Source: (OECD, 2020<sup>[51]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934255532>

The economy has made regulatory efforts to reduce its degree of restrictiveness by introducing policies to open its market to foreign service providers. However, although the economy has not increased its degree of restrictiveness, the limited number of concrete sectoral reforms to open up the services sectors since the last evaluation round has meant that the variation in degrees of openness has been small. This is

particularly important given that recent OECD studies on member economies have tended to show a growth in the number of regulations restricting services sectors in 2020 (OECD, 2021<sup>[52]</sup>).

Figure 21.7 displays the evolution of Bosnia's STRI indices by sector and period in percentage changes.

### Figure 21.7. Evolution of STRI scores by sector in Bosnia and Herzegovina (2014-20)

Percentage change over the periods 2014-16, 2016-19 and 2019-20

Note: Values are expressed in percentage change, with negative values indicating a reduction in restrictiveness of the economy's trade regulatory environment.

Source: (OECD, 2020<sup>[51]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934255551>

The following analysis starts with the horizontal measures included in all sectors that hamper services trade in the economy as a whole, particularly in the areas of general business regulation, restrictions on the movement of service providers, standards for the cross-border transfer of personal data, the legal framework for public procurement and the screening of foreign investment. The STRI scores are then explained by sector with information on what drives the results and a brief description of the most common restrictions and good practices.

#### General business regulations affect firms' ability to operate in Bosnia and Herzegovina

There are a number of areas in which Bosnia and Herzegovina could improve its company regulations, such as in the acquisition or use of land and real estate by foreigners, which is restricted. This restriction mainly affects foreign companies' ability to establish offices in the economy and operate a business, and particularly affects the services sectors, which are highly dependent on 3 modes of supply (commercial presence) (see Box 21.3).

For a commercial company to be constituted and registered, a minimum capital requirement must be paid, which further affects foreign companies and consequently makes BiH less competitive compared to economies that do not impose such a requirement. This is the case even if the obligation is applied regardless of whether the company is local or foreign. Extremely lengthy procedures for obtaining business visas and cumbersome, lengthy and costly procedures for registering a company also limit investment opportunities.

### Box 21.3. Examples of the four services supply modes

The definition of trade in services under the GATS has four components (modes), depending on the territorial presence of the foreign service provider and the consumer at the time of the transaction. Pursuant to Article I:2, the GATS covers services supplied.

**Mode 1: Cross-border:** Services are provided from the territory of one member into the territory of any other member.

*Example:* A consumer in economy A receives services from abroad through its telecommunications or courier infrastructure. Such supplies may include any type of consultancy, legal advice, architectural services or computer related services.

**Mode 2: Consumption abroad:** Services are provided in the territory of one economy to the service consumer of any other economy.

*Example:* Nationals of economy A have moved abroad as tourists, students or patients to use the respective services.

**Mode 3: Commercial presence:** Services are provided by a supplier of one economy, through commercial presence, in the territory of any other economy.

*Example:* The service is provided within economy A by a locally established subsidiary, or representative office of a foreign-owned and controlled company (bank or insurance company, air company, construction firm, etc.).

**Mode 4: Movement of natural persons:** Services are provided by a foreign supplier through the presence of natural persons of an economy in the territory of any other economy.

*Example:* A foreign national provides a service within economy A as an independent supplier (e.g. IT consultant) or employee of a service supplier (e.g. IT consultancy firm).

Source: (WTO, 1995<sup>[52]</sup>), Article 1.3: Definition of Services Trade and Modes of Supply, [https://www.wto.org/english/tratop\\_e/serv\\_e/cbt\\_course\\_e/c1s3p1\\_e.htm](https://www.wto.org/english/tratop_e/serv_e/cbt_course_e/c1s3p1_e.htm).

*Restrictions on the movement of people* are an issue in Bosnia and Herzegovina. Although significant progress has been made in easing the conditions for the movement of persons between the CEFTA economies through the conclusion of Additional Protocol 6 to the CEFTA agreement, persons from economies outside CEFTA or the EU are subject to restrictive requirements. Bosnia and Herzegovina applies quotas for work permits issued to third-country nationals, although intra-corporate transferees are exempted. Contractual and independent services suppliers, including intra-corporate transferees, are subject to labour market tests. The length of stay of these categories of foreigners is limited to 12 months for contract and independent services suppliers, and 36 months for intra-corporate transferees. Procedures for obtaining business visas and registering a company are all considerably more numerous, costly or time-consuming than is best practice.

Standards for the *cross-border transfer of personal data* are set at the EU level. Transfers to non-European Economic Area economies may take place when an adequate level of data protection is ensured or, failing that, where appropriate safeguards (e.g. binding corporate rules or standard data protection clauses) are in place.

*Restrictions on public procurement* include a local price preference regarding tenders that applies a reduction for local suppliers, which affects negatively the STRI score of BiH. Furthermore, the economy's public procurement regulation does not contain an explicit reference to the prohibition of discrimination towards foreigners. The procurement law includes thresholds above which a tender is mandated, but there is no procurement regime applied to foreign suppliers below the value thresholds.

In terms of the *screening of foreign investments*, the laws and regulations of Bosnia and Herzegovina do not mandate the consideration of economic motives or interests in the review of foreign investments, although it is not explicitly ruled out.

Box 21.3 presents the modes of supply of trade in services as defined by the World Trade Organization's General Agreement on Trade in Services (GATS) and used in the OECD STRI.

### **There are several restrictions in specific services sectors**

Beyond regulatory measures that affect Bosnia and Herzegovina's trade in services in a horizontal manner, there are a number of sector-specific restrictions in the 12 sectors analysed, which are explored below.<sup>25</sup>

**Air transport services** are defined as passenger and freight air transport carried domestically or internationally (code 51 under the International Standard Industrial Classification – ISIC - Revision 4). The STRI for this sector covers commercial establishments only. Given the range of air transport subsectors, the approach in the STRI project is to focus on measures affecting carriers' transport of passengers and goods between points. Airport management and other aviation services are only relevant in so far as regulations enacted by relevant authorities can have an impact on the ability of foreign carriers to transport passengers and goods between points.

The STRI scores can range from 0 to 1, with 0 signalling a completely open sector and 1 indicating a sector closed for foreign service suppliers. The 2020 scores for all OECD member states and STRI partners in this sector range between 0.165 and 0.601. With a score of 0.258, Bosnia and Herzegovina is the second-least restrictive WB6 economy. It scores lower than the EU (0.407), OECD (0.409) and WB6 (0.421) averages.

*Regarding restrictions on foreign entry*, unlike most economies, Bosnia and Herzegovina does not impose foreign equity restrictions, which facilitates the entry of foreign capital in this sector. There is no limit to the maximum equity share allowed. There are also no regulatory limits to the proportion of shares that can be acquired by foreign investors in publicly controlled firms. There are no prohibitions or restrictions on the lease of foreign aircraft either with or without crew (wet or dry lease). The lack of such restrictions makes the economy very attractive in this sector.

Bosnia and Herzegovina again differs from other economies regarding *barriers to competition* as there is no public ownership in the aviation sector through a national airline. Air carriers are not allowed to retain allocated slots from one season to the next. Operational centres of airports are responsible for allocating slots using discretionary authorisation based on transparent, unbiased and non-discriminatory rules. However, air carriers are not allowed to commercially exchange slots and there is no schedule for airport use, which contributes negatively to Bosnia's score in this sector, although marginally.

**Road freight transport** (ISIC Rev 4 code 4293). The STRI for this sector covers commercial establishment only. Cross-border trade is governed by a system of bilateral and plurilateral agreements that provide for permits, quotas and other regulations.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.124 and 0.624. With a score of 0.266, Bosnia and Herzegovina is the second most restrictive WB6 economy. It performs worse than the EU (0.184), OECD (0.201) averages, but lower than the WB6 average (0.421).

Due to the specificity of this sector, the score is negatively affected by horizontal measures that affect the whole economy, particularly those related to the movement of people and visa requirements. In Bosnia and Herzegovina, the procedures for registering a company are much more costly, lengthy and cumbersome than international best practice, which contributes to the sector's restrictiveness.

There are few restrictions regarding sector specific regulations, as Bosnia and Herzegovina does not impose many sector specific laws that would hamper the given sector. As regards *foreign entry restrictions*, licensing/permits are subject to quotas for domestic traffic, which is the main contributor to Bosnia and Herzegovina's negative score. In the area of barriers to competition, fees are set by the

government for transportation, management certification, issuing of licences, licence copy statements, licences for international carriage of goods, and special permits for foreign carriers. The ministry, at the proposal of the Association of Carriers at the Chamber of Commerce of the Federation of Bosnia and Herzegovina, has established minimum prices for road freight transport services.

**Rail transport** (ISIC Rev 4 code 4912) is provided over a dedicated network where the market structure may take different forms, the two most common being: 1) vertically integrated rail services firms owning and managing both the infrastructure and the operation of freight services; and 2) vertical separation between infrastructure management and operations. Regardless of the market structure, there are well-established best practice regulations that also consider competition from other modes of transport, particularly road transport.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.129 and 1. With a score of 0.290, Bosnia and Herzegovina is the second-most restrictive WB6 economy. It scores higher than the EU (0.210) and OECD (0.260) averages, but lower than the WB6 average (0.316). In terms of foreign entry restrictions, unlike many economies, Bosnia and Herzegovina provides transit rights for international rail transport, as well as access rights for international combined transport and rail transport, which positively affects the STRI score. However, under Republika Srpska law, a local establishment is required to obtain a licence to operate rail transport services.

*Regarding restrictions on the movement of people*, licences are required to practice, and laws have established a process for recognising qualifications gained abroad. The Railway Regulatory Board (RRB) of BiH operates within the Ministry of Communications and Transport of Bosnia and Herzegovina, and the law gives it powers to issue instructions for the safety and interoperability of the railway system according to the EU-Bosnia Stabilization and Association Agreement and its Protocol 3.

*Barriers to competition* significantly contribute to Bosnia and Herzegovina's STRI performance in rail transport services. Access to railway infrastructure is mandated at the national level, and access fees are regulated. Republika Srpska law explicitly prohibits the transfer and trading of infrastructure capacity. FBiH law makes no distinction between private and public railway infrastructure, but RS law does. However, in practice, the public company operates the infrastructure.

Following the Dayton Peace Accords of 1995, the state railway company was divided into two entity-owned companies, *Zeljeznice Federacije Bosne i Hercegovine* (ZFBH) and *Zeljeznice Republike Srpske* (ZRS). Maintaining a state-owned enterprise in this sector negatively affects its STRI scoring.

**The courier services sector** (ISIC Rev 4 code 53) includes postal and courier activities. While courier services have traditionally been important means for communication, the rise of modern ICT has contributed to a less frequent use of letters between individuals for communication.

The 2020 scores for all OECD member states and STRI partners are between 0.106 and 0.881. With a score of 0.674, Bosnia and Herzegovina is the most restrictive WB6 economy. It is considerably more restrictive than the EU (0.182), OECD (0.259) and WB6 (0.301) averages. The degree of restrictions in the courier sector in Bosnia and Herzegovina is particularly visible when benchmarked against top European performers like Slovenia (Box 21.4). However, the restrictiveness could be largely lessened as it appears to be concentrated in a series of particularly limiting regulatory measures.

In terms of restrictions on the movement of people, a licence is required to practice as a postal operator. To obtain a licence from the regulator, postal operators need to provide proof of having a "sufficient number of qualified employees".

### Box 21.4. Identifying regulatory bottlenecks and increasing the attractiveness of courier services in Bosnia and Herzegovina

The joint use of STRI tools helps to identify the regulatory elements that affect the restrictiveness index, and consequently the degree of openness of a sector. The comparative study of the STRI 2020 indices of Slovenia and BiH highlights certain elements that could help to identify regulatory bottlenecks and increase the attractiveness of courier services in Bosnia and Herzegovina.

Figure 21.8. STRI courier services – comparison between Bosnia and Herzegovina and Slovenia

Note: 0=no restrictions, 1=fully restricted; average represents the WB6 average for 2020

Source: (OECD, 2020<sup>[51]</sup>); *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934255570>

Bosnia and Herzegovina has a high score in the courier services sector compared to other OECD STRI participants. The economy is also the most restrictive WB6 economy, with a score higher than the EU, WB6 and OECD averages. In contrast, Slovenia has a very open and liberal courier services market, scoring among the lowest STRI indices in this sector. The Postal Act of 1997 brought Slovenian legislation in the postal sector partially in line with the EU *acquis*. The complete liberalisation of postal services was achieved with the adoption the new Postal Services Act in April 2002 and secondary acts in 2003. Currently, courier services are Slovenia's least restrictive STRI sector. The economy maintains only a small number of sector-specific restrictions, such as the existence of a state-owned designated postal operator and limits to the proportion of shares that can be acquired by foreign investors.

Upon comparing both economies using the STRI policy stimulator, only a limited number of regulatory measures appear to dictate the weight difference between Slovenia and BiH STRI scores. This suggests that Bosnia and Herzegovina could substantially reduce its restrictiveness index to the average levels found in the STRI by focusing on lifting the following specific restrictions:

In the area of restrictions to movement of people, the score of both economies is largely impacted by quotas on foreign services suppliers. Additionally, both economies maintain a very short duration of stay for foreign service providers. However, Slovenia and Bosnia and Herzegovina have aligned their regulatory environments with international good practice regarding the length of stay of intra-corporate transferees. Overall, lifting limitations on the movement of people could decrease the BiH courier restrictiveness index value by 0.052.

In the barriers to competition category, Slovenia does not apply any preferential tax or subsidy treatment to the national DPO, a limitation still present in the Bosnian regulatory framework. Lifting this restriction could decrease BiH's courier index value by 0.011.

Slovenia has incorporated a specific dispute resolution system into its regulatory environment governing the postal sector. In Bosnia and Herzegovina, such a mechanism is absent from the legislation. By creating such a procedure, BiH could lower its degree of restrictiveness by 0.011.

In its 2002 reform of the postal market, Slovenia abolished all reserved services in the sector. This regulatory change is the most significant difference with Bosnia and Herzegovina, which maintains certain postal services reserved under the universal postal services. Following Slovenia's example, the removal of these restrictions could potentially reduce BiH's index value by 0.468.

Source: (OECD, 2017<sup>[53]</sup>), *Services Trade Policies and the Global economy*, <https://doi.org/10.1787/9789264275232-en>.

*Foreign entry restrictions* contribute significantly to performance in many economies, including Bosnia and Herzegovina. The economy imposes limits on the proportion of shares that can be acquired by foreign investors in publicly controlled firms. Local presence is required for the cross-border supply of courier services through registration to the court registry. Restrictions are also present in the form of a licence requirement to enter the market. Designated postal operator (DPOs), which are publicly controlled, have a monopoly on letters weighing up to 1 kg and parcels weighing up to 10 kg. The law designates three publicly owned DPOs: the Postal Traffic Company RS AD Banja Luka, JPBH Post d.o.o. Sarajevo, and HP Mostar d.o.o.

*Regarding barriers to competition*, there is no dispute resolution mechanism available. The three DPOs provide universal and other services in the economy, but there is at least one other dominant provider in the courier services market. The regulator establishes a unified price policy for reserved services. The law enables the state or entity governments to subsidise the DPOs if they cannot finance their activities. These subsidies are limited to the reserved postal services, and cross-subsidising is prohibited.

**Legal services** (ISIC Rev 4 code 691) cover advisory and representation services in domestic and international law. International law includes advisory services in home country law, third-country law, international law, as well as the right to appear in international commercial arbitration. Domestic law extends to advising and representing clients before a court or judicial body in the law of the host country.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.141 and 1; the OECD average is 0.360, the EU average is 0.394 and the WB6 average is 0.391. With a score of 0.517, Bosnia and Herzegovina is the most restrictive WB6 economy. However, it must be noted that the legal services sector in BiH is not completely closed to foreign legal services providers, as is the case in some EU member states (OECD, 2020<sup>[51]</sup>).

*Restrictions on the movement of people* have a considerable negative effect on the STRI score of Bosnia and Herzegovina as there are many restrictions in place in the legal sector, for example a licence is required to practise domestic law. Regarding international law, foreign citizens in FBiH who are registered as lawyers in their home country may give legal advice on matters concerning the law of their economy. In Republika Srpska, the use of foreign lawyers is unrestricted in arbitration courts dealing with matters of international law. RS law allows for exemptions to the nationality requirement that a licence is needed to practise domestic law; however, FBiH law provides for these exemptions on the basis of reciprocity, which negatively affects the STRI scoring. Foreigners do not have an option to obtain a temporary permit as there is no temporary licensing system in Bosnia and Herzegovina, which further restricts foreign lawyers' ability to operate in the economy.

*Regarding restrictions on foreign entry* into Bosnia and Herzegovina, both local and commercial presence is required for the cross-border supply of legal services. There are also localisation requirements in place for professional liability insurance. Under RS law, a foreign lawyer registered in the Bar Association's B

register (register of Foreign Lawyers) must practice with a local lawyer for at least three years after registration. In FBiH, the Bar Association's Code of Ethics explicitly prohibits lawyers from being permanent representatives of foreign law firms. There is also a restriction on the acquisition and use of land and real estate by foreigners, which negatively impacts the economy's STRI score. However, this law includes a reciprocity clause for the successor states of the former Yugoslavia.

*Regarding barriers to competition*, both FBiH and RS provide a recommended minimum and maximum fee for locally licensed lawyers. The two entities take different approaches to restrictions on law advertising. Under RS law advertising is prohibited, whereas FBiH law provides conditions for permitted advertising determined by the Statute of the Federal Bar Association.

**Commercial banking** (ISIC Rev 4 divisions 64-66) includes deposit-taking, lending and payment services. Commercial banking services are traded business to business, as well as business to consumer for retail banking. Efficient banking services are one of the backbones of dynamic economies as they provide financing for investment and trade across productive activities, which underly all value chains.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.131 and 0.517; the OECD average is 0.205, the EU average is 0.180 and the WB6 average is 0.239. With a score of 0.409, Bosnia and Herzegovina is the most restrictive WB6 economy. In terms of foreign entry restrictions, in RS the branch network of a foreign bank cannot be established if it undermines the ability of local banks to operate. However, a subsidiary may be established as a separate legal entity, subject to prior approval by the Banking Agency of Republika Srpska. Only banks registered in Republika Srpska and branches of banks registered in FBiH (that operate on RS territory, if approved by the regulator) can establish an ATM network in Republika Srpska.

A bank must be registered in BiH and operate under a licence by the regulator. Only banks can undertake deposit-taking, lending and other activities prescribed by the law. Banks may establish representative offices to deal with non-banking activities. According to FBiH and RS laws, banks from one entity can open branches in the other entity upon approval of the relevant banking agency. There is no mention of branches of foreign banks in the laws of either entity. The criteria to obtain a licence are more stringent for foreign companies, which has a negative impact on the STRI score. For example, the regulator can refuse a licence request if the performance of the supervisory function of the Agency could be hindered or impeded by the connection of the bank with other legal or natural persons established, domiciled or domiciled in another economy. Since 2017 there has been a requirement that at least one member of the Supervisory Board must have active knowledge of one of the languages in official use in BiH and residency in one of the entities or in BiH in general. As mentioned above in legal services, BiH imposes a restriction on the legal form as the law defines a bank as a joint-stock company.

Although BiH is not a member of the Basel Committee on Banking Supervision, which is the main global standards setter for banks, significant provisions on risk weighting exist within both entities' banking laws. Credits in foreign currency are forbidden, except for legal persons and entrepreneurs seeking to pay to import goods from abroad. To take deposits in foreign currency the bank may open a non-resident account in convertible marks, i.e. foreign currency, on which convertible marks or foreign currency acquired by the non-resident in accordance with the law are kept. A non-resident deposit account can be on-demand or term, with or without notice, with special purpose or without purpose. It is forbidden to grant non-residents financial loans with a maturity of less than one year, except for the granting of loans from banks and residents for the purpose of establishing lasting economic relations. Lending in local currency between a resident and a non-resident is not allowed.

*Regarding barriers to competition*, default interest rates on loans are regulated, and the licence strictly regulates the services a bank may provide. The Ministry of Finance in the FBiH owns a majority share of Union Banka, which is a major firm in the sector. While the law provides an extensive list of reasons for declining a licence application, there is no explicit requirement to inform the applicant of the reason for denial. Moreover, the law allows the regulator to define additional reasons for refusal at its discretion. This form of legal uncertainty heavily affects the scoring in this sector.

**Insurance services** (ISIC Rev 4 code 651 and 652) include life insurance, property and casualty insurance, reinsurance, and auxiliary services. Private health insurance and private pensions are not covered.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.104 and 0.565. The WB6 average is 0.231, EU and OECD averages are lower at 0.175 and 0.193, respectively. With a score of 0.334, Bosnia and Herzegovina is the most restrictive WB6 economy. Restrictions to the movement of people are visible in the form of licence requirements, but criteria to obtain a licence are not more stringent for foreign companies. While the law provides no condition on residency, it requires the passing of a professional exam that does require residency in Bosnia and Herzegovina. In RS, foreign professional exams are recognised.

*Regarding restrictions to foreign entry*, RS law restricts cross-border mergers and acquisitions for non-life insurance and reinsurance. Both RS and FBiH laws require that foreign insurance and reinsurance companies establish branches that have the quality of legal persons. Furthermore, the laws of both entities include a local availability test for cross-border trade in the field of non-life insurance. As part of the licensing process, foreign companies must appoint a local representative, which negatively affects the STRI score. As of 2017, the FBiH law only mentions the possibility of foreign insurance companies opening branches, there is no mention of reinsurers. There are legal form restrictions on the cumulative activity of a branch of a company practising both non-life and life insurance. RS law includes a reciprocity clause for the establishment of branches of foreign insurance companies. Until 2017, the FBiH law also had such a clause, and its removal facilitates the activity of foreign insurers on FBiH jurisdiction. FBiH law, however, imposes various restrictions on managers. Such categories of foreigner must have a work permit, and at least one manager must be a resident of the economy.

*Regarding barriers to competition*, there are restrictions on asset holdings. The new FBiH Insurance law empowers the regulator to approve new insurance premiums. However, this is not the case in RS. The FBiH maintains a certain form of state-owned enterprise in the sector as the largest shareholder of the Sarajevo Insurance JSC, which provides both life and non-life insurance. RS has no shares in life insurance companies, but it does hold a minority share of 34.9% in Krajina Insurance. However, this company only provides non-life insurance and has a market share of 2.3%. RS provides no restrictive laws on insurance advertising; however, BiH is still scored as restrictive in this area due to the new law in FBiH, which mandates that the advertiser must submit advertising material containing information about the company's financial and market situation for review before publishing.

**Construction** includes buildings (residential and non-residential) and construction work for civil engineering (ISIC Rev 4 codes 41 and 42). Construction services have historically played an important role in the functioning of economies, providing the infrastructure for other industries. These services account for a significant share of GDP and employment in most economies. Public works, such as roads and public buildings, account for about half of the market for construction services. Therefore, the STRI for construction services covers detailed information on public procurement procedures.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.123 and 0.464. The WB6 average is 0.242, the OECD average is 0.222 and the EU average is 0.207. With a score of 0.365, Bosnia and Herzegovina is the most restrictive WB6 economy.

*The movement of people* is restricted by the imposition of licensing requirements that need to be respected to provide engineering services in Bosnia and Herzegovina. While RS regulation recognises an acquired amount of ECTS in engineering studies as a possible precondition for passing the licensing exam, there is no such mention in FBiH regulation. At least one engineer must be licenced for the issuance of construction permits in the economy.

*Regarding restrictions on foreign entry*, the STRI score is negatively affected by the existence of restrictions on cross-border mergers and acquisitions. If a company is fully merged with a foreign entity it will lose its incorporated status and thus its licence to operate. Construction services must be performed by licenced

and registered companies, meaning that they must be incorporated in BiH. Given the federal structure of FBiH, the STRI methodology uses the Sarajevo canton for reference whenever there is no federal law or regulation applicable to the measure in question. Local presence is also required, and foreign branches are prohibited.

*Barriers to competition*, as defined by the STRI, include cases in which public authorities hold control (i.e. at least a blocking minority or a preferred share) in one of the 10 largest companies in the service sector analysed. It is believed that the presence of an SOE in a given sector could distort competition and act as a deterrent to market entry by foreign operators. In the construction sector, the FBiH maintains the ownership of FBiH Motorways, considered the largest construction company in terms of revenue.

**Architecture services** also include related technical consultancy (ISIC Rev 4 code 711). These services constitute the backbone of the construction sector, with key roles in building design and urban planning. An important feature is the regulatory complementarity between architecture, engineering and construction services, which are often combined into projects offered by one company, and sometimes subsumed into the building and construction sector.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.113 and 0.684. The WB6 average is 0.265, the EU average is 0.260 and the OECD average is 0.244. With a score of 0.275, Bosnia and Herzegovina is the second-most restrictive WB6 economy, scoring marginally higher than the WB6 average.

*Restrictions on the movement of people* mean that a licence or authorisation is required to practice in BiH, and there is no temporary licensing system in place. Qualified foreign physical and legal persons can request a licence for producing architecture documents from the ministry.

*Regarding restrictions on foreign entry*, both local and commercial presence is required for the cross-border supply of architecture services. Foreign suppliers must have a registered business unit in BiH to obtain a licence. Although it is not clearly stated in the company laws, the alien laws state that a foreign natural person may perform work in the territory only based on their work permit. To obtain a work permit, a foreign natural person must first be granted a residence permit. Given that managers are registered with the court registry and may perform work only upon the employment agreement with the employer (for foreign persons a work permit is mandatory), a manager must have registered residence in BiH.

**Engineering services** (ISIC Rev 4 code 711) covers several related activities, such as engineering and integrated engineering services, and engineering related scientific and technical consulting services.

The 2020 scores for all OECD member states and STRI partners range between 0.118 and 0.575. The WB6 average is 0.244, the EU average is 0.245 and the OECD average is 0.233. With a score of 0.274, Bosnia and Herzegovina is the most restrictive WB6 economy.

*Restrictions on the movement of people* are present in the form of licensing requirements to provide engineering services in Bosnia and Herzegovina. RS regulation recognises an acquired amount of ECTS in engineering studies as a possible precondition for passing the licensing exam, but there is no such mention in the FBiH regulation. At least one engineer must be licensed for the issuance of construction permits in the economy.

*Regarding restrictions on foreign entry*, the STRI score is negatively affected by the restrictions on cross-border mergers and acquisitions. If a company is fully merged with a foreign entity, it will lose its incorporated status and thus its licence to operate. Engineering services must be performed by licensed and registered companies, meaning that they must be incorporated in BiH. Given the federal structure of FBiH, the STRI methodology uses the Sarajevo canton for reference wherever there is no federal law or regulation applicable to the measure in question. Local presence is also required, and foreign branches are prohibited.

**Computer services** are defined as computer programming, consultancy and related activities and information service activities (ISIC Rev 4 codes 62 and 63).

The 2020 scores for all OECD member states and STRI partners range between 0.123 and 0.448. The WB6 average is 0.239, the EU average is 0.211 and the OECD average is 0.221. With a score of 0.355, Bosnia and Herzegovina is the most restrictive WB6 economy.

This sector is very rarely regulated by sectoral legislation; instead, Bosnia and Herzegovina subjects computer services to general laws that apply to the whole economy. The sector also requires highly skilled workers who are often sought after in third countries, which means that measures affecting the mobility of service providers have a significant impact on the degree of openness in this sector. For this reason, horizontal restrictions on the movement of people account for one-third of the total score in computer services (Figure 21.7).

**The telecommunications sector** comprises wired and wireless telecommunications activities (ISIC Rev 4 codes 611 and 612). These services are at the core of the information society and provide the network over which other services including computer services, audio-visual services and professional services are traded.

The 2020 scores for all OECD member states and STRI partners range between 0.108 and 0.682. The WB6 average is 0.231, the EU average is 0.151 and the OECD average is 0.188. With a score of 0.270, Bosnia and Herzegovina is the most restrictive WB6 economy.

In the telecommunications sector, the results are mostly affected by two policy areas: restrictions on foreign entry and barriers to competition. In all STRI economies, barriers to competition account for 30% of the STRI score in the telecommunications sector. This reflects the characteristics of the sector, as well as the policy environment in which it operates. It is a capital-intensive network industry and its strategic importance has led many economies to restrict foreign investment and activity.

In order to ensure fair competition in the telecommunications market, Bosnia and Herzegovina has an independent telecommunications regulator, the Communications Regulatory Agency (RAK), which operates at the state level. RAK has published a regulation setting out the requirement of number portability and regulated time and conditions for porting. It also regulates interconnection. Bosnia and Herzegovina is restricted in this sector partly because it does not apply a "use-it-or-lose-it" policy to frequency bands, which can prevent incumbent operators from over-holding valuable frequency licences and free tradable spectrum and telecom services. Mtel a.d. Banja Luka, BH Telekom d.d. Sarajevo and HT d.o.o. Mostar were declared the significant market power operators in the leased lines market in 2012.

*Ex ante* regulations on granting access, price control and publication of reference offers apply, which is in-line with best practice and EU regulations. All reference interconnection offers and licensing agreements are published on RAK's website. The FBiH is the majority shareholder of both BH Telecoms d.d. and JP HT d.d. Mostar, both of which operate fixed and mobile networks. As in most sectors, maintaining SOEs is a competition liability in the telecommunications sector.

*Regarding restrictions to foreign entry*, both commercial and local presence are required to provide cross-border services in the telecommunications sector. Furthermore, a licence is required to practise. RAK appoints a service provider for universal services. While this appointment procedure must adhere to the principles of objectivity, transparency, non-discrimination and proportionality, the description of the procedure is not elaborate enough to qualify it as competitive.

In absolute terms, the regulatory framework of the telecommunications sector in Bosnia and Herzegovina is competitive and constrained only by some sector-specific measures and horizontal regulations that apply to the economy as a whole, most notably the movement of people. Cumbersome procedures to obtain visas and register companies also negatively affect the sector to some extent.

### *Sub-dimension 2.3: E-commerce and digitally enabled services*

E-commerce can bring about significant gains for businesses, and is positively related to firms' process innovation. It enlarges businesses' market scope, reduces operational costs at various stages of business

activities and lowers barriers to entry, thus intensifying competition (OECD, 2020<sup>[42]</sup>). E-commerce also benefits consumers by providing information on goods and services, helping consumers identify sellers and comparing prices, while offering convenient delivery and the ability to purchase easily via a computer or mobile device (López González and Jouanjean, 2017<sup>[55]</sup>).

In the context of COVID-19, e-commerce appears to have been essential for maintaining trade flows despite the restrictions put in place to preserve public health. Indeed, buying online rather than in person reduces the risk of infection. Continuing to sell in locked down economies preserves jobs, despite the demands of social distancing and movement restrictions. E-commerce increases the acceptance of prolonged physical distancing among the population and allows them to maintain a certain level of consumption.

2020 will be a turning point in e-commerce. The digital transformation underlines the importance of adopting a more holistic approach to policies, as well as more international co-operation (Ferencz, 2019<sup>[54]</sup>; OECD, 2020<sup>[55]</sup>). This sub-dimension assesses the policies implemented in parallel and in addition to those of the Digital society (Dimension 10). It is mostly focused on the trade in digitally enabled services given its rapid growth in the region.

Modern e-commerce regulations should focus on several key elements such as electronic documentation and signature, online consumer protection, data protection and privacy, cyber security, intellectual property regulations, and intermediary liability. An attractive regulatory environment should refrain from maintaining disproportionately restrictive measures such as licensing requirements for e-commerce platforms, limitations on the types of goods that can be sold online (other than for generally accepted public policy considerations), and restrictions on cross-border data flows.

The **e-commerce framework** in Bosnia and Herzegovina is underdeveloped. BiH citizens and business people generally do not shop or conduct business on the Internet, and ordering online remains very rare. The financial sector, however, leads the way as it is generally in line with good international practice in terms of the regulations necessary to operate e-commerce. Many commercial banks offer e-banking to their clients.

The regulatory policy framework on e-commerce in Bosnia and Herzegovina is still at an early stage of preparation. There have not been any substantive changes in the framework since the last assessment cycle, and very little progress has been made on implementation.

E-commerce falls under the jurisdiction of the state's MoFTER and Republika Srpska's Ministry of Trade and Tourism. The economy has made no progress in adopting a new law on electronic communications and electronic media in line with the 2018 EU regulatory framework. Regulations currently in force are the Law on Electronic and Legal Business Transactions (2007) at the state level and the Law on Electronic Business (2009 amended 2016) in Republika Srpska. In Republika Sprska, certain aspects of e-commerce are also regulated by the Law on Trade (2019) and the Rulebook on the Ways and Forms of Conducting Distance Selling, which was last updated in 2021.<sup>26</sup> Different ministries, such those in charge of finance, education or science development, are responsible for the implementation of the laws related to e-commerce. At the state level, the Office for Supervision and Accreditation was established in October 2019 within the Ministry of Communication and Transport of Bosnia and Herzegovina, and regulates the conditions for the application of the Law on Electronic Signatures and the issuance of verified electronic signatures in Bosnia and Herzegovina.

Bosnia and Herzegovina adopted the 2017-2021 Policy for Development of the Information Society in May 2017 (Sluzbenilist BiH, 2017<sup>[56]</sup>); however there has been no progress made in adopting a state-wide strategy and associated action plans on e-commerce related matters. Only Republika Srpska has implemented a legal framework addressing consumer protection in e-commerce.

The OECD Digital STRI captures the **restrictiveness of digitally enabled services** by identifying cross-cutting barriers that inhibit or completely prohibit firms' ability to supply services using electronic networks, irrespective of the sector in which they operate. The regulatory data underlying the Digital STRI were

extracted from the existing OECD STRI database and data collected under public laws and regulations affecting digitally enabled services. Digital STRIs are the result of aggregating the identified barriers to trade into composite indices. In accordance with OECD STRI methodology, Digital STRI scoring uses a binary system. Scores are assigned with a value of 0 when there are no trade restrictions and a value of 1 when restrictions are in place. The rating takes into account the specific regulatory and market characteristics, as well as the links and hierarchies between regulatory measures affecting digitally enabled services (López González and Jouanjean, 2017<sup>[57]</sup>). Figure 21.9 shows Bosnia and Herzegovina's score on the Digital STRI index.

**Figure 21.9. Digital services trade restrictiveness index: WB6 and CEEC economies**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; \*CEEC=Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovak Republic and Slovenia (Bulgaria, Croatia, and Romania are not OECD member states or OECD STRI Partner economies and therefore do not have calculated STRI indices); the absence of a category in the graph means that it is exempt from restrictions. Source: (OECD, 2020<sup>[51]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934255589>

The 2020 Digital STRI scores for all OECD member states in this sector range between 0.043 and 0.488; the WB6 average is 0.183. With a score of 0.361, Bosnia and Herzegovina is the most restrictive WB6 economy in the digital sector. The economy's score has not changed since 2014.

Results in most Digital STRI economies are regularly driven by infrastructure and connectivity measures due to the lack of effective interconnection regulation. Although BiH has stricter rules than the OECD guidelines in this area, it does not impose excessive conditions on cross-border data flows beyond those put in place to ensure the protection and security of personal data. However, the economy, like the other 11 Digital STRI economies, requires that some types of data are stored locally, although copies can be transferred abroad if the authorities can have direct access to the data upon request.

No specific licences or authorisations for e-commerce activities, beyond ordinary commercial licences, are required. However, there must be a local presence to operate an e-commerce business.

The implementation of international standards for electronic contracts and key electronic authentication measures, such as recognition of electronic signatures, are generally in place; however, BiH lacks a proper dispute settlement mechanism to resolve litigations arising from cross-border digital trade.

Policy areas relating to intellectual property rights and payment systems account for a smaller share of the scores of economies participating in the Digital STRI. BiH is relatively open in this category from a regulatory point of view as it follows the precepts of European regulations in this field.

Regulations are in place which state that foreigners should be treated no less favourably than nationals in terms of intellectual property protection. Moreover, all necessary regulations related to payments systems are in place, although their use is limited in practice.

### ***The way forward for trade policy***

Some important steps have been taken to improve institutional co-ordination mechanisms for trade, especially in the area of public consultations. However, Bosnia and Herzegovina could improve its competitiveness by paying attention to the following:

- **Create a formal inter-ministerial co-ordination mechanism** based around a specific action plan on improving overall trade performance to boost co-operation between different ministries and government bodies.
- **Collect data on stakeholders involved in consultations for monitoring and evaluation purposes.** This will allow for adjustments depending on the results and the broader participation of stakeholders on the eConsultation website (Box 21.5). More effort is also needed to raise awareness of various forms of public consultation.
- **Set up a process for regularly reviewing consultation frameworks** according to established goals of effectiveness, efficiency, inclusiveness and transparency, as well as performance indicators. Create mechanisms for evaluating public-private consultations to regularly assess the degree of openness and transparency of consultations. Ideally, a monitoring programme with adequate budget and an independent office would be introduced to allow for systematic evaluations. Training could be provided on the use of various quantitative and qualitative approaches to measure compliance with the minimum standards set by regulatory frameworks for public consultations.
- **Broaden trade in services beyond regional trade agreements.** Significant improvements have been made among the WB6 economies to open services trade through the conclusion of CEFTA Additional Protocol 6 in December 2019. Nonetheless, the STRI analysis in this section has provided some insights into where domestic reforms could help attract new businesses and improve competitiveness:
  - **Ease conditions on the temporary movement of natural persons.** This would further encourage innovation and knowledge transfer, and contribute to economic growth. A starting point could be to remove the remaining quotas and labour market tests for foreign services suppliers.
  - **Reduce the remaining barriers to market entry and competition in the courier, commercial banking and insurance sectors.** Regarding the courier sector, as presented in Box 21.4, abolishing the limits on the proportion of shares that can be acquired by foreign investors in publicly controlled firms would attract investment. In addition, a dispute resolution mechanism should be established. Regarding commercial banking, the restrictions on legal form and local presence requirements to provide cross-border services should be reconsidered to make the sector less restrictive. For the insurance sector, existing restrictions on cross-border mergers and acquisitions should be lifted, along with restrictions on the cumulative activity of a branch of a foreign company.

### Box 21.5. Stakeholder engagement throughout the European Commission policy cycle

Following the adoption of the 2015 Better Regulation Guidelines, the European Commission has extended its range of consultation methods to enable stakeholders to express their view over the entire lifecycle of a policy. It uses a range of different tools to engage with stakeholders at different points in the policy process. Feedback and consultation input is taken into account by the Commission when further developing the legislative proposal or delegated/implementing act, and when evaluating existing regulation.

At the initial stage of policy development, the public has the possibility to provide feedback on the Commission's policy plans through roadmaps and inception impact assessments (IIA), including data and information they may possess on all aspects of the intended initiative and impact assessment. Feedback is taken into account by the Commission services when further developing the policy proposal. The feedback period for roadmaps and IIAs is four weeks.

As a second step, a consultation strategy is prepared setting out consultation objectives, targeted stakeholders and the consultation activities for each initiative. For most major policy initiatives, a 12-week public consultation is conducted through the website “Your voice in Europe” and may be accompanied by other consultation methods. The consultation activities allow stakeholders to express their views on the key aspects of the proposal and main elements of the impact assessment under preparation.

Stakeholders can provide feedback to the Commission on its proposals and their accompanying final impact assessments once they are adopted by the College. Stakeholder feedback is presented to the European Parliament and Council and aims to feed into the further legislative process. The consultation period for adopted proposals is 8 weeks. Draft delegated acts and important implementing acts are also published for stakeholder feedback on the European Commission's website for a period of 4 weeks. At the end of the consultation work, an overall synopsis report should be drawn up covering the results of the different consultation activities that took place.

Finally, the Commission also consults stakeholders as part of the ex post evaluation of existing EU regulation. This includes feedback on evaluation roadmaps for the review of existing initiatives, and public consultations on evaluations of individual regulations and “fitness checks” (i.e. “comprehensive policy evaluations assessing whether the regulatory framework for a policy sector is fit for purpose”). Stakeholders can also provide their views on existing EU regulation at any time on the website “Lighten the load – Have your say”.

Source: (OECD, 2017<sup>[58]</sup>), *OECD Best Practice Principles on Stakeholder Engagement in Regulatory Policy*, [www.oecd.org/gov/regulatory-policy/public-consultation-best-practice-principles-on-stakeholder-engagement.htm](http://www.oecd.org/gov/regulatory-policy/public-consultation-best-practice-principles-on-stakeholder-engagement.htm); (OECD, 2016<sup>[59]</sup>), *Pilot database on stakeholder engagement practices in regulatory policy: Second set of practice examples*, [https://one.oecd.org/document/GOV/RPC/RD\(2016\)5/en/pdf](https://one.oecd.org/document/GOV/RPC/RD(2016)5/en/pdf); (European Commission, 2015<sup>[60]</sup>), *Better Regulation Guidelines*, [https://ec.europa.eu/info/law/law-making-process/planning-and-proposing-law/better-regulation-why-and-how/better-regulation-guidelines-and-toolbox\\_en](https://ec.europa.eu/info/law/law-making-process/planning-and-proposing-law/better-regulation-why-and-how/better-regulation-guidelines-and-toolbox_en).

- **Reinforce the regulatory framework on e-commerce** by finalising the drafting of the Law on Electronic Communication and Electronic Media and adopting new legislation on electronic identification and trust services for electronic transactions (e-signature). Overall, BiH needs to do more to align e-commerce legislation with the European e-commerce directive.<sup>27</sup> A good step could be to establish a national online dispute resolution (ODR) platform based on the model of the EU ODR platform (see Box 21.6). The platform should be designed to resolve disputes over the online purchase of goods and services without the intervention of a national court. This resolution process is known as alternative dispute resolution and, as such, is faster and cheaper than a court case. The ODR platform should not be affiliated with any merchant but should provide an independent body that could be called upon at any time to deal with a complaint from any party regarding an e-commerce contract. The dispute resolution body should be an impartial organisation or person that helps consumers and online traders and is independent of, but approved by, the authorities. It should meet the quality standards of fairness, transparency, efficiency and accessibility.

### Box 21.6. The European Online Dispute Resolution (ODR) platform

The EU ODR platform is provided to make online shopping safer and fairer through access to quality dispute resolution tools. Regulation (EU) 524/2013 provides the framework for online dispute resolution, the creation of the EU ODR platform and the date (1 September 2016) by which every e-shop in the European Union must provide a link to the platform on its website so that European consumers can electronically submit their complaints to an alternative dispute resolution entity. All online retailers and traders in the EU, Iceland, Liechtenstein and Norway must provide an email address and an easily accessible link to the ODR platform.

The EU ODR platform can be used to solve the problem directly with the trader, and initially acts as an intermediary between the parties in the dispute by informing the trader of the notification. If the requested trader is willing to discuss, the platform allows the exchange of messages directly via a dashboard. Attachments such as product photos can be sent using the dashboard, and an online meeting can be scheduled. If the dispute cannot be resolved amicably within 90 days, or if requested by the parties involved, the ODR platform refers the dispute to a dispute resolution body. Although the model is mainly aimed at disputes initiated by a consumer, some European economies allow traders to file a complaint against a consumer if they reside in Belgium, Germany, Luxembourg or Poland.

## Access to finance (Dimension 3)

### Introduction

Bosnia and Herzegovina has made progress in the access to finance dimension due to the harmonisation of the legal framework in both entities (Figure 21.1). The biggest progress has been recorded under the sub-dimension on access to alternative financing sources, and in particular regarding factoring with the adoption of new regulations in the FBiH (2017) and Republika Srpska (2020). Overall, the economy's performance has increased from 1.9 to 2.3 since the previous assessment (Table 21.6).

**Table 21.6. Bosnia and Herzegovina's scores for access to finance**

Dimension	Sub-dimension	Score	WB6 average
Access to finance dimension	Sub-dimension 3.1: Access to bank finance	3.1	3.4
	Sub-dimension 3.2: Access to alternative financing sources	1.6	1.9
	Sub-dimension 3.3: Mobilisation of long-term financing	3.0	2.8
Bosnia and Herzegovina's overall score		2.3	2.6

### State of play and key developments

#### *Sub-dimension 3.1: Access to bank finance*

Bosnia and Herzegovina's financial sector is dominated by banks, which account for around 89% of overall financial sector assets, considerably more than in the euro area (around 45%). At the end of 2019, 23 commercial banks were operating in the economy. One bank is majority state-owned, while foreign banks own more than 80% of the banking sector. Two supervising bodies operate in the territory, one in each entity: the Banking Agency of the FBiH and the Banking Agency of Republika Srpska. According to the regulations in both entities, the screening and approval procedures are the same for all banks regardless of ownership, and banks are subject to the same supervisory and regulation rules.

In Bosnia and Herzegovina, regulation for the **banking industry** falls under the competence of the entities' banking supervisory authorities. The regulation authorities in both entities have been harmonising their regulatory frameworks with EU regulations since the last assessment. Notably, the minimum capital adequacy ratio was transposed in both entities in 2018, meaning that Bosnia and Herzegovina's regulatory framework is largely compliant with Basel III<sup>28</sup> requirements.

In the FBiH and RS, the law on foreign exchange operations encourages local currency lending. Banks are not allowed to lend in foreign exchange to a resident, except to enable a resident legal person or entrepreneur to pay for imported goods and services. Banks are obliged to have a methodology in place to calculate internal capital requirements for foreign exchange credit risk.

In Bosnia and Herzegovina, each entity administers its own cadastres to **register** properties, and both are accessible online. Property registration is compulsory. The ownership of pledges on registered fixed assets are fully documented, and both cadastres provide full coverage of the territory. However, in practice the land plot numbers in the Cadastral Books and the land plot numbers in the Land Registry do not appear to often match; moreover, the data are not harmonised among entities as the registries are not linked and verified systematically. Consequently, as a follow-up to the Land Registration Project, implemented between April 2007 and June 2012 in co-operation with the World Bank, a project to support the development of a sustainable real estate registration system with harmonised land registry and cadastre records in urban areas of both the FBiH and the RS was signed in March 2020.

**Collateral requirements** remain strict, meaning that access to bank loans is challenging for businesses in Bosnia and Herzegovina. Around 67% of loans require collateral, higher than the OECD average (58%), while 212% of the borrowed amount is required as collateral in Bosnia and Herzegovina, more than double the average in OECD economies (88%) and the highest in the Western Balkan region (World Bank,

2019<sup>(16)</sup>). In both entities, regulations are largely harmonised and allow the use of fixed and non-fixed assets by businesses to secure loans. However, the list of non-fixed assets is limited to specific machinery and passenger and freight vehicles, which means that the haircuts<sup>29</sup> imposed by the regulatory framework remain relatively high at 60% for passenger vehicles, and between 70% and 90% for machinery. This limits the number of potential businesses that can apply for a bank loan.

A public **credit information** system is in place, governed by the Central Bank of Bosnia and Herzegovina. In 2019, a new decision on the Central Registry entered into force which implements the International Financial Reporting Standards (IFRS) 9 norms.<sup>30</sup> Credit data are collected directly by the Central Bank from all banks, leasing companies, microcredit organisations and other financial institutions operating in BiH. Both negative and positive information is collected and made available to financial institutions and the public on request. In both entities, legislation provides consumer rights and procedures for correcting mistakes. In the FBiH there is also an operational private credit information system. However, there is no specific regulation that regulates the operation of private credit bureaus in Bosnia and Herzegovina.

**Credit guarantee schemes** fall under the competence of entities. There were no credit guarantee schemes in the FBiH before the COVID-19 pandemic; however, in May 2020 the authorities established a guarantee fund under the law on the mitigation of the negative economic consequences of the pandemic. Consequently, the FBiH Development Bank set up a guarantee fund with initial reserves of up to BAM 80 million (~EUR 40 million) to maintain and improve the liquidity of companies. Republika Srpska amended the Law on Guarantee Funds in 2019 and 2020 to expand its competences due to the COVID-19 pandemic. The fund targets entrepreneurs, businesses operating in agriculture and manufacturing sectors, and activities focused on exports and preserving employment. It can issue individual and portfolio guarantees. Individual guarantees are issued for up to 50% of the amount (70% in specific situations), while the limit for portfolio guarantees is 25%. Up to May 2020, a total of EUR 17.6 million had been issued as guarantee to 145 companies operating in Republika Srpska.

### *Sub-dimension 3.2: Access to alternative financing sources*

The **factoring** market is still in an early stage of development in Bosnia and Herzegovina and is regulated at the entity level. A dedicated law on factoring in the FBiH was adopted in 2017. The legal treatment of factoring services is clearly defined; however, foreign factors cannot operate directly in the local market, which limits their potential penetration. According to the Law on Corporate Income, interest on factoring is deductible, and value-added tax (VAT) is only applied on service fees, which reduces the cost of factoring.

In Republika Srpska, the Ministry of Finance adopted a new law on factoring in December 2020 and six by-laws in 2021 to improve the factoring market. Before the adoption of this law, two regulations, the Law on Obligatory Relations and the Banking Law, explicitly recognised factoring activities and allowed only banks to perform such activities. The potential effects of the new law and by-laws will be assessed in the next assessment process.

The **leasing** market is relatively small but has been growing since 2017 in terms of nominal value. Notably, the total assets value increased by 24.4% between 2017 and 2019 to reach BAM 323.7 million (around EUR 165 million), which represents 0.9% of total financial assets (0.8% in 2017). Financial leasing accounts for 85% of the value of lease agreements.

In Bosnia and Herzegovina, leasing is regulated by two laws: The Law on Leasing of the FBiH and The Law on Leasing of the RS. Both clearly define information on the subjects of the leasing contract, the lease terms, the contract value and leasing time, the total leasing amount, the possibilities of redemption or renewal of the leasing contract, and the right to lease the subject to another entity. At the end of 2019, five leasing companies were operating in Bosnia and Herzegovina under the supervision of the banking agencies of each entity. In 2019, leasing in the RS was mainly used by the business sector, mainly for vehicles (70% of the total financial leasing) and machinery and equipment (29%). No such information has been provided by the FBiH or a national body, and it remains unclear to what extent this data is collected.

There is no dedicated legislation targeting **private equity investment funds, venture capital and business angel networks** in Bosnia and Herzegovina. Nevertheless, the laws on investment funds in the FBiH and RS allow venture capital operations. Neither entity government performs any review of the regulatory framework to address the needs of private venture capital funds, and there are no plans nor any initiatives from institutions to stimulate creation or establish venture capital schemes. Similarly, there are no business angel networks operating in Bosnia and Herzegovina. Some minor initiatives exist in RS, such as the Innovation Centre Banja Luka, which is a full-time member of the European Banking Angels Network; however, no activity could be identified during the assessment period. Overall, there are no initiatives to develop this form of financial support in Bosnia and Herzegovina.

No activity has been reported on **crowdfunding and initial coin offering** during the assessment period. In March 2016, the RS Securities Commission and in February 2018 the Banking Agency of Republika Srpska issued official warnings for interested investors to be aware of risks related to cryptocurrency investments as they are not regulated. Meanwhile, the purchase of cryptocurrency remains legal in Bosnia and Herzegovina.

### *Sub-dimension 3.3: Mobilisation of long-term financing*

**Public-private partnerships** (PPPs) are underdeveloped and legally not unified, which prevents the investment in infrastructure projects required to develop the economy. In Bosnia and Herzegovina, legislation related to PPPs is adopted at the entity and/or canton level. There is a dedicated law on PPPs in the RS, while in the FBiH all ten cantons have adopted (non-concession) PPP laws.

At the national level, the Law on Concessions of Bosnia and Herzegovina governs concessions. The two entities also have separate laws on concessions. The Law on Public Procurement from 2014 clearly states that non-concession and concession PPP contracts are awarded in-line with PPP/concession legislation; however, in practice co-ordination remains challenging, which potentially leads to overlapping and conflicting implementation solutions due to the very complex legal system. In FBiH, data on the total number of PPPs are not centralised at the federation level and not publicly available. Only data from three cantons could be gathered through publicly available sources during the assessment period.<sup>31</sup>

In 2020, Republika Srpska amended the law to facilitate the use of PPPs and clearly regulate that the working relationship between public and private partners should be intended to fulfil a public need. The law also includes provisions on rights allocation and obligations of both contracting parties, including the obligation to provide a guaranteed service to users and dispute settlement mechanisms. Since 2010, a limited number of PPP projects have been awarded in Bosnia and Herzegovina.<sup>32</sup> Most of these projects are in the fields of energy, transport, and social and health. However, no concession has been awarded at the national level nor in the Republika Srpska since 2015. Thus, data regarding the number and value of the aforementioned PPP projects is unknown. Due to the lack of projects, the effectiveness of the laws cannot be fully assessed. A better transactional record is required to assess the functionality of the legal framework for PPPs (EBRD, 2018<sub>[63]</sub>).

Bosnia and Herzegovina's domestic **institutional investor** base remains underdeveloped, which limits capital market development. The regulatory framework is under the entities' competences. Both entities have adopted a dedicated legal framework on securities market and investment funds, and both have a securities market regulator called the Securities Commission. The legal framework is well-developed in the RS and covers conditions for institutional investors to exercise voting rights attached to the share held on behalf of their clients, conflict of interest, and prohibitions related to insider trading and market manipulation. The legal framework in the FBiH does not cover provisions such as the voting rights attached to the share held on behalf of their clients, transparency of fees nor prohibitions related to insider trading.

As of January 2020, 36 investment funds were operating in BiH: 23 open-end investment funds and 13 closed-end investment funds. The total value of net assets of investment funds represented around BAM 852 million (~EUR 426 million) at the end of 2019, around 4% less than the previous year. In the RS,

19 investment funds were operating out of the top five firms, representing a total asset under management of EUR 183 million (1.6% of GDP). One development and investment bank operating in the RS is fully owned by the RS government. In the FBiH, 17 investment funds are operating; however, no further statistical information was reported during the assessment period.

**Capital markets** have been in place in Bosnia and Herzegovina since 2001. Both entities have their own **stock markets**: the Sarajevo Stock Exchange (SASE) in FBiH and the Banja Luka Stock Exchange (BLSE) in the RS. Both stock exchanges joined the SEE Link in 2017, which is the regional platform for cross-market trading supported by the European Bank for Reconstruction and Development. The stock market is more active in FBiH, while the bond market records higher turnovers in RS. However, in both entities the contribution of capital markets to financing the economy is limited. In 2019, with a 3.6% increase compared to 2018, the SASE registered a total turnover of securities in amount of BAM 144 million (~EUR 72 million), from which the turnover of shares totalled BAM 136 million (~EUR 68 million) (94.4% of total securities), while bonds totalled BAM 7.35 million (~EUR 3.65 million) (5.1% of total securities). Over the same period, with an increase of 10.3% compared to 2018, the BLSE registered a total turnover of securities of BAM 472 million (~EUR 236 million), from which the turnover of shares totalled BAM 76.6 million (~EUR 36.1 million) (16.2% of total securities), while bonds totalled BAM 355.6 million (~EUR 181.8 million) (75.3% of total securities).

Overall, the legal frameworks related to capital markets are aligned in both entities. The listing procedures for companies operating in both entities are clearly defined in their respective laws on securities markets and are organised on the same regulatory principles, while the listing rules slightly differ (Table 21.7). Neither entity offers a separate market for low capitalisation firms.

**Table 21.7. Listing rules in Bosnia and Herzegovina**

	Federation of Bosnia and Herzegovina	Republika Srpska
Minimum business operations	3 years	2 years
Financial statements	Audited financial report for the minimum last 3 years	Positive or unqualified audit report
Minimum amount of market capitalisation	BAM 1 million	BAM 1 million
Number of shareholders	150	50

In 2019, 17 bond offerings were recorded on both stock exchanges and the treasury bills sector, while in 2018, 5 issuings were recorded on the same basis. In 2019, the FBiH government issued six long-term bonds with a nominal value of BAM 200 million, a maturity of three to ten years and interest rates ranging from 0.05% to 0.80%. It also organised an auction of treasury bills with a total nominal amount of BAM 20 million, a maturity of nine months and an interest rate of -0.1950%. Over the same period the RS government issued eight bonds for a total amount of BAM 271.8 million, a maturity of five to ten years and interest rates between 2.3% and 4%. It also realised two treasury issue bills of BAM 40 million with a maturity of six months and interest rates ranging from 0.0% to 0.0993%.

The regulatory framework is in place in both entities concerning **bond markets**; however the market is shallow and illiquid, especially in terms of corporate bonds. The legal framework of both entities allows the emission of treasury securities, municipal bonds, corporate bonds and zero-coupon bonds. Both regulations clearly stipulate the maturity of the obligation of the issuer and the manner of exercising the right to interest; however, bond ratings are not published. Both entities have no plans nor any specific incentives to facilitate the use of the bond market.

### ***The way forward for access to finance***

To enhance the banking industry and support businesses' access to finances, policy makers should:

- **Continue efforts to align banking regulation with international standards.** Given the economic shock caused by the COVID-19 pandemic, the resilience of the banking sector to absorb shocks has become even more vital. Therefore, regularly monitoring and revisiting the respective

regulation in line with internationally agreed norms would further enhance the capacity of the banking sector.

- **Continue efforts to build a business environment by diversifying financing sources.** Given the limited success of business angel networks and venture capital, adopting dedicated legal frameworks to crowdfunding such as the Lithuanian model (Box 21.7) would help to increase the number of potential financing sources, especially for smaller companies.
- **Enhance the transactional record to assess the functionality of the PPP legal framework.** The economy's needs and current institutional context should be taken into account to enhance transactional records.
- **Facilitate market-based long-term debt financing for businesses.** Firms need access to fit-for-purpose financing that meets their needs at various stages of their growth trajectory and development. This will be even more important to recover from the COVID-19 crisis in the long term. Considering the dependence on bank financing, a more extensive use of corporate bond financing could help lengthen maturities, increase resilience and facilitate long-term investments in Bosnia and Herzegovina. This could be achieved by creating an appropriate credit rating mechanism. Models such as those where central banks play a key role in providing rating services could be assessed as a credible and reliable mechanism. The government could also consider introducing a special framework for private bond placements by smaller companies, following a recent and successful example of creating alternative financing options for SMEs in the Italian mini-bond market framework (Box 21.8).

### Box 21.7. The Lithuanian crowdfunding model

While Lithuania's crowdfunding market is smaller than other European fintech hubs, the economy is only one of 11 EU Member States with dedicated domestic legislation for crowdfunding platforms and boasts a mature and comprehensive regulatory framework for crowdfunding. Although its crowdfunding is in its infancy, Lithuania currently has 15 registered crowdfunding platforms. There has been a positive increase in the total value of crowdfunding platform loan portfolios, from EUR 6.6 million in 2019 to EUR 9.13 million in the first half of 2020 (Bank of Lithuania, 2020<sup>[64]</sup>).

Lithuania adopted its Law on Crowdfunding in 2016 with the aim of providing a hospitable, clear and transparent setting for cross-border crowdfunding platforms. The law adopted all aspects of the European Commission's Regulation for European Crowdfunding Service Providers, allowing for a seamless transition once the EU Directive<sup>1</sup> comes into force. It was established through a multiple stakeholder consultation process and provides better protection and guarantees for investors through information disclosure obligations, governance rules, risk management and a coherent supervision mechanism. The law covers equity, real-estate and debt-based crowdfunding models, while donation and rewards models continue to fall under the Civil Code of the Republic of Lithuania.

Transparency regulations for crowdfunding platforms help mitigate misinformation and legal risk to better protect investors. Platforms must be included on the Public List of Crowdfunding Platform Operators and subject to an efficient reliability assessment conducted by the Bank of Lithuania's supervisory authority within 30 days. Platform operators, board members and significant stakeholders also undergo a criminal record check, while platforms must instate measures to avoid, identify and address any conflicts of interest that would prejudicially benefit the funder or project owner.

In addition to the EUR 40 000 minimum capital requirement, platform owners are required to put up 10% of starting capital themselves. In the case of offerings between EUR 100 000 and EUR 5 million, platform operators are obligated to publish a light prospectus, while offerings over EUR 5 million require a full prospectus detailing the project and project owner characteristics, proportion of own funds used, details of the offering, security measures, and the existence of secondary markets.

In all cases, Lithuania’s crowdfunding regulations require platforms to publish wide-ranging information on their websites for investors, including data on the company, risks associated with investment, project selection criteria, conditions and procedures for repayment of funds, disclaimers on tax and insurance information, and monthly and yearly progress reports.

Lithuania is continuously improving its innovative business environment to give financial institutions and crowdfunding platforms more investment opportunities. In 2016, the economy began allowing the use of remote identity verification via qualified electronic signatures and video streaming/transmission, and is harmonising itself with the EU Regulation on electronic identification. Lithuania has also recently amended its Law on the Legal Status of Aliens to include an e-residency programme that allows foreigners to set up companies, open bank accounts and declare taxes through digital identification. This will further financing opportunities for its fintech platforms.

Note: Please note that the European Commission’s Regulation for European Crowdfunding Service Providers refers to the European Commission (2018), Impact Assessment of the Council on European Crowdfunding Service Providers. In October 2020, the EU adopted the ECSP Regulation 2020/1503 on European crowdfunding service providers for business.

### Box 21.8. The Italian “Mini-bond” market

In 2012, the Italian Government introduced a series of laws<sup>1</sup> to initiate a mini-bond framework for unlisted companies to enable them to issue corporate bonds. The mini-bond framework provides a simplified process whereby unlisted companies with more than 10 employees and an annual turnover and/or assets in excess of EUR 2 million (except micro-enterprises and banks) can issue bonds that are available only to qualified investors. Firms are not required to publish a prospectus – an admission document is sufficient.

In response to this new regulatory framework, Borsa Italiana introduced the ExtraMOT PRO segment in 2013, dedicated to the listing of bonds whose trading is only permitted to professional investors. Since its introduction, the mini-bond market has seen steady growth, with the number of issuances increasing from 16 in 2013 to 171 in 2018. The cumulated proceeds during this period amounted to EUR 10.6 billion, 25% of which was raised in 2018. Moreover, mini-bonds have also been securitised through special purpose vehicles which have created a diversified pool of mini-bond issuers available for institutional investors.

In 2019, the government introduced mini-bond placements on equity crowdfunding platforms. In October 2019, the operating rules for equity crowdfunding platforms willing to place mini-bonds were published by the competent authority (Consob). These rules include that offers must be published on specific sections of the platforms; issuers are limited to joint stock companies; and eligible investors are required to hold financial assets of at least EUR 250 000, invest at least EUR 100 000 in the mini-bond, or be a client of an asset management company. The first offerings were published on crowdfunding platforms in January 2020.

1: Law Decree No.83/2012 and its subsequent amendments (Law Decree No. 179/2012; Law Decree No. 145/2013), Law Decree No: 91/2014; Law Decree No: 157/2019, (Fiscal Decree 2020) and Law Decree No: 160/2019 (Budget Law 2020) which created the possibility for unlisted companies to issue corporate bonds through the so-called mini-bond framework.

## Tax policy (Dimension 4)

### Introduction

Table 21.8 shows Bosnia and Herzegovina's scores on two tax policy sub-dimensions and compares them to the WB average. Regarding the first sub-dimension, the tax policy framework, Bosnia and Herzegovina scores below the WB6 average due to its low score for the "tax expenditure reporting" indicator. On the second dimension, tax administration, Bosnia and Herzegovina scores below the WB6 average due to its low score for the "independence and transparency" indicator.

**Table 21.8. Bosnia and Herzegovina's scores for tax policy**

Dimension	Sub-dimension	Score	WB6 average
Tax policy dimension	Sub-dimension 4.1: Tax policy framework	2.9	2.6
	Sub-dimension 4.2: Tax administration	2.4	3.3
	Sub-dimension 4.3: International co-operation	n.a.	n.a.
Bosnia and Herzegovina's overall score		2.6	3.0

Note: For comparability with the previous assessment, the new sub-dimension (4.3) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 4.1: Tax policy framework*

Bosnia and Herzegovina raises significant tax revenue relative to its GDP (Table 21.9). Tax revenue as a share of GDP was 36.3% in 2019, which exceeds the OECD average (33.8%) and the average of other WB6 economies (28.3%). Bosnia and Herzegovina's tax mix is highly concentrated on SSCs and taxes on goods and services, which accounted for 88.1% of total tax revenue in 2019 (the highest joined total among WB6 economies). This ratio is above the WB6 average (80% in 2019) and the OECD average (58.4% in 2018). Consequently, other taxes play a smaller role. Among OECD economies, CIT and PIT account for a third of total tax revenue, on average (33.5% in 2018). However, in Bosnia and Herzegovina these taxes combined accounted for only 10.4% of total tax revenue in 2019. There is therefore scope to rebalance the tax mix. SSCs account for 43% of total tax revenue, which is far above the WB6 average (32% in 2019). The heavy reliance on SSCs supports the direct funding of the welfare system and prevents the need for social welfare funds to be funded partly from general tax revenues, which would create challenges from a budgeting perspective. However, high SSCs can place a significant tax burden on labour income, reducing incentives to work and making it expensive for employers to hire workers, especially low-income and low-skilled workers (OECD, 2018<sup>[47]</sup>). Bosnia and Herzegovina has a relatively large informal economy, estimated at 25-35% of GDP (European Commission, 2020<sup>[39]</sup>), which may partly be linked to the high labour tax cost. Revenue from taxes on goods and services as a share of total taxes is 45.1%, which is slightly below the WB6 average (48% in 2019). The economy could rebalance the tax mix by strengthening taxes on personal or corporate income, as well as environmental taxes and recurrent taxes on immovable property.

**Table 21.9. Bosnia and Herzegovina's tax revenue as a percentage of GDP**

	CIT	PIT	SSCs	Goods and services	Tax/GDP ratio
Bosnia and Herzegovina	1.8%	2.7%	15.6%	16.4%	36.3%
WB6	1.8%	2.7%	9.3%	15.9%	30.6%
OECD	3.1%	8.1%	9.0%	10.9%	33.8%

Note: The ratios for Bosnia and Herzegovina were calculated on the basis of data received in the CO2021 questionnaire for the Federation of Bosnia and Herzegovina and Republika Srpska, with complementary data from the Agency of Statistics of Bosnia and Herzegovina for the Brčko District. Based on the Brčko District's share of Bosnia and Herzegovina's GDP, tax revenues were computed under the assumption that tax/GDP ratios in the Brčko District were similar to the combined average ratios found in the other entities. With the tax revenues computed under this assumption, tax/GDP ratios were then calculated for the integrated economy.

Source: (OECD, 2020<sup>[69]</sup>) OECD.Stat, <https://stats.oecd.org/> (OECD average on overall tax/GDP ratio, 2018 for specific tax/GDP ratio.)

The standard CIT rate is levied at 10%, which is below the WB6 average (11.5% in 2020) and the OECD average (23.3% in 2020). This relatively low CIT rate is reflected in BiH tax revenue: CIT revenue accounted for 1.8% of GDP in 2020, which is similar to the WB6 average (1.8% in 2019) but below the OECD average (3.1% in 2018). Despite a low CIT rate, Bosnia and Herzegovina has a similar ratio of CIT revenue to GDP compared to other WB6 economies (Table 21.10). Regarding the taxation of capital income, capital gains are considered as business income and are taxed at a rate of 10%, while dividend income is excluded from the CIT base. Upon dividend distribution, no withholding tax is paid by the company if dividends are distributed to a resident individual. However, withholding taxes are levied on income generated by a non-resident business and paid to a foreign entity.<sup>33</sup> Concerning the taxation of international business income, Bosnia and Herzegovina operates a worldwide taxation system in which resident corporations are liable for taxes on their worldwide income, while non-residents only pay taxes on domestically sourced income. A worldwide taxation system is currently adopted in all WB6 economies. However, such systems are increasingly less common among OECD economies, particularly for small, open economies. The economy may wish to re-evaluate the advantages and disadvantages of worldwide taxation systems, possibly in collaboration with other WB6 economies.

**Table 21.10. Selected tax rates in Bosnia and Herzegovina**

	CIT	PIT	SSCs	VAT
Bosnia and Herzegovina	10.0%	10.0%	37.1%	17.0%
WB6	11.5%	12.8%	28.6%	19.0%
OECD	23.3%	42.8%	26.9%	19.3%

Note: CIT and PIT averages are based on top statutory rates.

Source: (OECD, 2020<sup>[69]</sup>), OECD.stat, <https://stats.oecd.org/> (Statistics on OECD average for CIT and VAT (2020), PIT and SSCs (2019).)

Corporate investment in Bosnia and Herzegovina is incentivised through profit-based and cost-based **tax incentives**. Cost-based tax incentives lower the cost of investment, and the value of the benefit increases with the size of the investment undertaken. The value of profit-based tax incentives increases with the profits made by the business, and depends less on the amount of investment. In the FBiH, a number of such incentives exist. For example, companies investing their resources in production equipment may benefit from a 30% CIT relief, and companies undertaking a minimum investment in production equipment for five consecutive years benefit from a 50% CIT tax relief for five years.<sup>34</sup> The FBiH also provides a full CIT deduction for business expenses used for R&D activities. An employment incentive scheme provides CIT relief that is double the amount of gross salaries paid for companies employing new workers.<sup>35</sup> FBiH also allows provisions for future expenses aimed at environmental protection that are up to 30% of taxable income. Following a 2019 CIT reform, Republika Srpska provides a CIT reduction that is equivalent to the value of the investment undertaken for taxpayers investing in manufacturing equipment. In general, cost-based incentives are better targeted at stimulating investment than profit-based tax incentives, which favour companies with high profits (UNCTAD, 2015<sup>[70]</sup>). Given the economy's competitive CIT rate, profit-based incentives may not be needed. Overall, Bosnia and Herzegovina has a mix of cost-based and profit-based tax incentives that are aligned with practice in other WB economies. Whether these tax incentives

create significant “additional” investment beyond what would have taken place without the tax incentives requires further empirical analysis.

Regarding **tax revenue**, PIT revenues as a share of GDP are relatively low in Bosnia and Herzegovina, which is common in the region. In 2019, PIT as a share of GDP was 2%, slightly below the 2.2% average of WB6 economies and significantly below the 8.1% OECD average in 2018. The relatively low PIT revenues are partly explained by the economy’s low PIT rate. In Bosnia and Herzegovina, PIT is levied at a 10% flat rate, which broadly aligns with the 9.8% average rate found in other WB6 economies that implement a flat-rate PIT system. Similar to most OECD economies, a minimum amount of income is exempt from PIT through an annual personal basic tax allowance. This allowance equals BAM 3 600 (EUR 1 840) in the FBiH and BAM 6 000 (EUR 2 560) in Republika Srpska. These allowances are relatively high, at 31% of the average net wage in FBiH and 43% in the RS (FIPA, 2021<sup>[71]</sup>). Under a reform proposed for 2021, the FBiH plans to move from the current flat PIT rate to a progressive PIT rate schedule, with rates at 0%, 10% and 13%. Introducing a progressive PIT rate schedule in Bosnia and Herzegovina would increase tax progressivity and, depending on the tax brackets and income distribution, could contribute to raising more PIT revenue. This would help rebalance the tax mix away from SSCs and towards PIT. Regarding the taxation of personal capital income, dividends and interest are tax exempt, while capital gains, royalties or rental income are included in the PIT base. The tax exemption of dividends and interest creates an incentive for entrepreneurs to incorporate and receive income in the form of capital income rather than salaries.

Bosnia and Herzegovina relies heavily on revenue from SSCs, to a greater extent than other WB6 economies. In 2019, SSC revenue amounted to 15.6% of Bosnia and Herzegovina’s GDP, which is by far the highest ratio among WB6 economies (9.3% on average, second highest is Serbia with 12.5%). This reliance on revenue from SSCs also exceeds average levels found in OECD economies (9% in 2018). The high SSC revenues are a result of high SSC rates. In the FBiH, employee SSC rates are currently 31%, while employer SSC rates are 10.5%, leading to a total SSC rate of 41.5%. In Republika Srpska, only employees are liable for SSC payments at a rate of 32.8%. These rates are high compared to the rates levied on average in the OECD (9.8% for employees and 17.8% for employers in 2020). Compared to regional averages, the total SSC rate exceeds the average rate in other WB6 economies (29.4% in 2020). OECD research shows that high SSC rates can place a significant tax burden on labour income, which can reduce incentives to work and make it expensive for employers to hire workers, especially low-income and low-skilled workers (OECD, 2018<sup>[47]</sup>). As SSCs are levied at the same rate for all income levels, they do not contribute to making the taxation of labour income more progressive (OECD, 2018<sup>[47]</sup>). As part of the aforementioned proposed reform, the FBiH plans to lower the SSC rate from 41.5% to 32.5% in 2021.

Taxes on goods and services as a share of GDP are relatively high in Bosnia and Herzegovina. Revenue from these taxes accounted for 16.4% of Bosnia and Herzegovina’s GDP in 2019, which is above the WB6 average (14% in 2019) and OECD average (10.9% in 2018). VAT revenue is relatively high, linked to a relatively high VAT rate of 17%. Nevertheless, this rate is the lowest among WB6 economies and below average levels found in OECD (19.3%) and WB6 economies (19%) in 2020. Bosnia and Herzegovina does not have a reduced VAT rate, which is atypical in the region (it does have a zero VAT rate, but this only applies to exports). However, activities in the public interest are exempted from VAT.<sup>36</sup> OECD research generally does not recommend adopting reduced VAT rates as they are an ineffective way to provide support to those on a low income, as those on a higher income benefit more from the reduced rate. The VAT registration threshold is BAM 50 000 (EUR 25 600), which is relatively low compared to levels found in other WB6 economies. Regarding other taxes on goods and services, Bosnia and Herzegovina levies excise duties on gasoline and diesel fuel. The economy does not levy a carbon tax or other environmental taxes. This high reliance on taxes on goods and services and SSCs suggests a low level of progressivity in Bosnia and Herzegovina’s tax system.

Despite its extensive set of tax incentives, Bosnia and Herzegovina does not publish an annual **tax expenditure report**, unlike several other WB6 economies. For example, Albania published a tax expenditure report in 2019, while Montenegro and North Macedonia are currently in the process of publishing such a report. Bosnia and Herzegovina should publish a regular tax expenditure report to increase transparency and accountability and allow the economy to monitor the use and effectiveness of tax incentives, along with forgone tax revenue (OECD, 2010<sup>[72]</sup>). The report should identify, measure and report the cost of tax expenditure in a way that enables the comparison of the monetary value of tax incentives with that of direct spending programmes (IMF, 2019<sup>[73]</sup>). A cost-benefit analysis could also be conducted to evaluate whether specific tax incentives meet their stated objectives and, if not, whether they should be abolished or replaced.

Regarding **modelling and forecasting**, the Ministry of Finance of Bosnia and Herzegovina uses macro-simulation models to forecast aggregated tax revenues for all types of tax. This function is carried out by the Macroeconomic Analysis Unit, which produces estimates of budgetary revenue trends on a yearly basis, as well as the medium-term forecasting of all public revenue. In both entities, micro-simulation models are used to analyse the impact of taxes and tax reforms, including their distributional impact, for CIT, PIT and SSCs.

#### *Sub-dimension 4.2 Tax administration*

Bosnia and Herzegovina does not have a unified administrative body that oversees all taxes. The **functions and organisation** of the tax administration is divided between the two entities and the Brčko District, which are each responsible for collecting direct taxes at their level. The Indirect Taxation Authority is responsible for all indirect taxes at the state level. In the FBiH, tax administration uses a mixture of taxpayer and functions approaches – tax registration, submission and processing of tax returns, payment of investigation and services rendered to the taxpayer are based on a functions approach, while supervision/audit is based on a taxpayer group approach, with separate units for large taxpayers and other taxpayers. In Republika Srpska, the tax administration head office is in charge of co-ordination, surveillance and control over operations, as well as the unified implementation of tax policy. RS tax administration regional centres are in charge of a wide range of functions including desk and field audits, taxpayer assistance with the application of tax regulations, tax collection, and the management of tax arrears. RS tax administration local offices receive and process documents received from taxpayers, including tax declarations. They also formally check the information provided and calculate tax liability.

With regards to **compliance assessment and risk management**, Bosnia and Herzegovina follows a risk-based approach. At the state level, the Risk Analysis and Management Department within the Ministry of Finance and Economy prepares a monthly control plan based on a parametric risk model that ranks taxpayers according to risk points. In Republika Srpska, a monthly audit plan has been developed with a focus on large taxpayers, and an automated system for the selection of high-risk taxpayers is currently under development. For the FBiH, an annual audit plan has been developed that has a wide set of criteria,<sup>37</sup> including the business activity of the taxpayer, the time passed since the last audit and the number of employees. OECD research shows that risk-based selection is a key element of effective and efficient compliance programmes as it allows administrations to make effective trade-off decisions and make the best use of scarce resources (OECD, 2018<sup>[47]</sup>). Tax administrations at the state and entity level in BiH carry out similar audit tasks, ranging from simple checks to in-depth inspections of taxpayer premises.<sup>38</sup> Both RS and the FBiH have special audit divisions for large taxpayers. With regards to VAT compliance, Bosnia and Herzegovina has implemented the Indirect Tax Compliance Strategy 2019-2021, which includes specific programmes for addressing the various risks of tax compliance.<sup>39</sup>

In Republika Srpska, the **transparency and independence** of tax administration is established by the Law on Tax Procedure; however, the FBiH has not adopted a policy to establish an independent management board of the tax authority. In both RS and the FBiH, the operational budget of the tax administration is fixed by annual budgetary procedures and does not depend on the amount of collected revenue. In RS, a

regulatory framework is in place to guarantee sanctions in case of misconduct by a member of the tax administration, which is not the case in the FBiH. OECD research suggests that corruption among tax administration employees may deter individual taxpayers from paying taxes, or may lead to them opting to pay a bribe or enter the informal economy (OECD, 2018<sup>[47]</sup>). Implementing strong procedural safeguards that guarantee the independence of the tax administration is therefore crucial for tax collection purposes.

Regarding **tax filing and payment procedures**, e-filing has been mandatory for VAT and excise duties since 2019 (the state level is only responsible for indirect taxes). In the FBiH, e-filing is possible for CIT, PIT and SSCs, but only 55% of tax returns are filed electronically. In RS, e-filing is available for all taxes, and seems to be increasing: 43% of tax returns were filled electronically in 2019, compared to 57% from January to April 2020. The Audit Office of Bosnia and Herzegovina, an independent body, performs regular audits of the functioning of the Indirect Taxation Authority. In 2018, the process was assessed by the independent body of the Tax Administration Diagnostic Assessment Tool (TADAT), but the results are not publicly available. The RS tax administration submits semi-annual and annual reports to the government of Republika Srpska. In the FBiH, the tax administration reports once a year to the entity-level Ministry of Finance.

Various **taxpayer services** are at the public's disposal in Bosnia and Herzegovina. State and entity levels all provide online access to information, electronic communications and in-person enquiries. The Federation of Bosnia and Herzegovina has an Ombudsman, which is an independent state body available for all citizens that taxpayers can refer to. Its mission is to protect the rights of citizens and control the work of administrative bodies.

#### *Sub-dimension 4.3: International co-operation*

Similar to most WB6 economies, Bosnia and Herzegovina has strengthened its involvement with the **international tax** community and carried out several initiatives to align its tax system with recent international tax trends since the last CO assessment. It became a member of the OECD/G20 Inclusive Framework on Base Erosion and Profit Shifting (BEPS) in July 2019 and has been proactive in implementing initiatives regarding the four BEPS minimum standards: harmful tax practices (Action 5); prevention of tax treaty abuse (Action 6); economy by economy reporting (Action 13); and mutual agreement procedures (Action 14). Furthermore, Bosnia and Herzegovina signed the Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS in October 2019 and the Convention on Mutual Administrative Assistance in Tax Matters at the 10<sup>th</sup> Global Forum plenary meeting in November 2019. Both conventions entered into force in January 2021. With regards to exchange of information, a peer review by the OECD Global Forum on exchange of information on request is scheduled for the second half of 2022. The economy's transfer pricing legislation has been drafted based on OECD transfer pricing guidelines.

Bosnia and Herzegovina could strengthen its efforts with regards to **digital taxation**. While the economy has not formally implemented international guidelines on VAT or goods and services tax (GST), it levies cross-border digital services at the place where the service recipient is established. This resembles the destination principle, which is the "cornerstone" of international VAT/GST guidelines. However, the economy has indicated that its VAT legislation is not fully compliant with the EU VAT Directive. Personal income received from digital platforms is excluded from the PIT base. Bosnia and Herzegovina has appointed representatives to the OECD's Tax Challenges Arising from Digitalisation project, which aims to find a consensual solution to specific tax challenges through two pillars focused on nexus and profit allocation (Pillar 1), and a global minimum tax (Pillar 2). These developments taking place at the OECD level, especially those under Pillar 2 and the expected global minimum tax on corporate profits, might have an impact on the economy's taxation of corporate income. While a global minimum tax rate has not been set and depends on ongoing discussions, Bosnia and Herzegovina's 10% CIT rate is low, below both WB6 and OECD averages. If the global minimum rate were set higher than 10%, Bosnia and Herzegovina would be faced with the choice of either raising its rate to the minimum tax rate or risk forgoing tax revenue to

foreign jurisdictions. Pillar 2 might also incentivise the economy to redesign its investment incentives to offer attractive tax rates. Bosnia and Herzegovina may wish to carefully assess its position on this issue and draft an action plan in case consensus is reached among BEPS members.

Bosnia and Herzegovina is engaged in modest **regional co-operation** with other WB6 economies. At the state level, the Ministry of Finance and the Treasury of Bosnia and Herzegovina participate in workshops organised by the Centre for Excellence in Finances, which have been delivered as part of the Supporting Capacity Development of Tax Administrations in South East Europe Project.<sup>40</sup> Republika Srpska is also engaged in independent initiatives and signed an agreement on mutual co-operation in March 2011 with Slovenia, Montenegro, Serbia and the FBiH. Republika Srpska also joined the Intra-European Organization of Tax Administrations in June 2004.

### ***The way forward for tax policy***

To enhance Bosnia and Herzegovina's tax policy framework and achieve objectives, policy makers should:

- **Continue to support the economy in light of COVID-19.** Bosnia and Herzegovina implemented a comprehensive set of measures to mitigate the effects of COVID-19 on its economy and citizens. It may wish to continue its efforts, while focusing on measures that could spark an economic recovery.
- **Diversify the tax mix and increase progressivity in the tax system.** Bosnia and Herzegovina levies 88.1% of its total tax revenue from taxes on goods and services and SSCs, which means that most revenue is levied at the same rate across income levels. PIT and CIT, also currently levied at flat rates, could be redesigned to diversify the tax mix and introduce progressivity in the tax system.
- **Rebalance the taxation of labour income by shifting revenue away from SSCs and towards PIT.** The high tax burden on labour income could distort the functioning of the labour market, in particular for low-income and low-skilled workers, and create tax-induced incentives to operate in the informal economy. Lowering SSC rates and redesigning PIT by introducing a progressive rate schedule could be explored as a policy option.
- **Evaluate whether the imbalance between the tax burden on capital and labour income distorts the economy and creates tax-induced incentives for entrepreneurs to incorporate.** The incentive for entrepreneurs to incorporate allows them to shift highly taxed labour income to lower taxed capital income.
- **Strengthen tools and capacities to assess the effects of tax policies on the economy.** Tax transparency and accountability could be strengthened through the annual publication of a tax expenditure report. Micro-simulation models should be used to assess the distributive effects of tax reforms and forecast tax revenue.
- **Turn profit-based tax incentives into cost-based tax incentives.** Evaluate whether tax incentives create “additional” investment or just provide windfall gains to investors.
- **Strengthen the use of e-filing.** The use of e-filing remains low in Bosnia and Herzegovina compared to other WB6 economies. BiH should consider mandatory e-filing as used in some economies, such as Albania.
- **Implement a policy that guarantees the independence of all tax administrations.** Although there is a law that establishes the independence and transparency of Republika Srpska's tax administration, the Federation of Bosnia and Herzegovina has not established an independent board for its tax administration. An independent and transparent tax administration is crucial for taxpayer trust in the tax system, which is in turn crucial for tax collection.
- **Define an action plan regarding BEPS Pillar's 2 global minimum tax rate in case consensus on this rate is found among members of the OECD/G20 Inclusive Framework on BEPS.** The global minimum tax rate, if agreed, is likely to be lower than the current statutory CIT rate in BiH.

However, the economy's set of CIT investment incentives could lower effective tax rates on corporate profits to a level below the expected minimum rate. In this case, Bosnia and Herzegovina would be faced with a choice of either redesigning its investment tax incentives or risk forgoing tax revenue to foreign jurisdictions. The economy should evaluate its position on this issue and prepare an action plan accordingly.

- **Continue to engage with the international tax community and implement international best practices.** Since the last CO report, Bosnia and Herzegovina has strengthened its involvement in international tax matters, and this approach should be continued.
- **Carry out a cost-benefit analysis on the merits of a worldwide taxation system for resident corporations.** For small open economies such as Bosnia and Herzegovina, worldwide taxation may entail high administrative costs without raising significant revenue.
- **Foster regional co-operation and co-ordination on common tax issues within the WB6 region.** Bosnia and Herzegovina shares common challenges with other WB6 economies, and enhanced collaboration might be favourable for all economies involved. Areas such as tax compliance, the training of tax officials and the exchange of information would greatly benefit from a co-ordinated regional approach.

## Competition policy (Dimension 5)

### Introduction

The legislative framework on anti-trust and mergers is broadly aligned with EU competition rules and has not been significantly modified in recent years. The Law on Competition of Bosnia and Herzegovina largely mirrors the relevant provisions of the Treaty on the Functioning of the European Union in terms of restrictive agreements (Article 101) and the abuse of dominant position (Article 102). It also provides for the *ex ante* control of the effects on competition of mergers above certain turnover thresholds, in line with the principles of the EU Merger Regulation.

Responsibility for implementing the Law on Competition, approved in 2001, rests with the Competition Council (CC), an operationally independent public body established in 2004 that has exclusive competence and decision-making power in competition matters. The CC is composed of six members appointed from legal and economic experts by the Council of Ministers and entity governments to reflect the ethnic composition of the economy.

Unlike the other dimensions, where indicators are allocated a score from one to five, the Competition policy dimension assesses four policy areas (i.e., scope of action, anticompetitive behaviour, probity of investigation and advocacy, plus a new area: implementation). Scoring is based on yes/no (coded as 1/0) answers to the 71 questions in the questionnaire administered by the OECD. Where a response to a question is yes (coded as 1), then we refer to this as an adopted criterion. Each of the four policy areas has a different number of possible criteria that can be stated as having been adopted. Each policy area is assessed through data collected from the questionnaire indicators and by measuring the number of criteria adopted. The new fifth policy area (implementation) is not scored, but is a quantitative analysis of how many competition decisions have been adopted by the competition authorities. The anti-competitive behaviour and implementation policy areas are discussed together below.

Figure 21.10 shows the number of positive (aligned with good practice) and negative answers to the questionnaire for each policy area.

**Figure 21.10. Bosnia and Herzegovina's legal and institutional competition framework**

Source: Based on the OECD assessment.

Regarding the implementation of competition rules, the impact of anti-trust and merger cases carried out by the CC is still limited, and the related fines do not seem to ensure strong deterrence. The leniency system is not effective in supporting cartel detection.

Advocacy action could be expanded to embed competition principles in the legislation and spread a competition culture.

## State of play and key developments

### *Sub-dimension 5.1: Scope of action*

The Competition Council implements the Law on Competition in Bosnia and Herzegovina. It consists of six members appointed for a six-year term of office, with the possibility of one reappointment. Three members are designated by the Council of Ministers of Bosnia and Herzegovina, two members by the Government of the Federation of Bosnia and Herzegovina and one member by the Government of Republika Srpska. Every year the Council of Ministers of Bosnia and Herzegovina appoints one CC member as the President of the CC for a one-year term. Decisions can be taken by majority rule, but at least one member from each of the three constituent ethnic groups must vote in favour.

In addition to the headquarters in Sarajevo, the CC holds two smaller offices in Mostar and Banja Luka. There are 20 staff in total, in addition to the council members. All employees deal with competition matters and are not organised into departments specialised by sector or type of infringement.

It is possible to compare the CC with other competition authorities using the OECD CompStats database,<sup>41</sup> which has data from competition agencies in 56 jurisdictions. Of particular use are the 15 competition authorities operating in small economies (with a population lower than 7.5 million). In 2019, the average total number of staff in these 15 competition authorities was 114, of whom 43 were working on competition.

The budget of the CC has decreased, as in several other national public institutions, from EUR 700 000 in 2017 to EUR 650 000 in 2019. Even considering the small size of the economy, this amount is very low when compared internationally. In 2019, the average budget of the 15 competition authorities in small economies that participated in the OECD CompStats database was EUR 5.4 million.

The Law on Competition of Bosnia and Herzegovina ensures competitive neutrality insofar as it stipulates that the **competences** of the CC encompass any natural and legal persons active in the production, sale or trade of goods and services, or involved in the trade of goods and services that have or may have an influence on competition in BiH. This includes public bodies, regardless of ownership, seat or residence.

The CC has appropriate **powers to investigate** and **powers to sanction** possible anti-trust infringements, i.e. restrictive horizontal and vertical agreements and exclusionary or exploitative practices by dominant firms. It can impose cease and desist orders and remedies on firms that have committed anti-trust infringements. It can also adopt interim measures in case the alleged competition breach poses a risk of irreparable damages, either on its own initiative or following a request by the parties involved. It can accept commitments offered by the parties to remove the competition concerns and close the investigation.

The CC can compel investigated firms and third parties to provide relevant information and can perform unannounced inspections (dawn raids) on the premises of the parties, subject to a warrant by the competent court. The assessment of alleged anticompetitive conduct follows a thorough scrutiny of the collected evidence, which may include an economic analysis of the competitive effects of vertical agreements or possible exclusionary conduct. The CC can impose fines of up to 10% of the aggregate turnover of the undertaking.

The Law on Competition provides for a leniency programme that grants total or partial immunity from sanctions to firms that report to the CC the existence of an agreement and submit appropriate evidence. The Law on Competition also provides for the *ex ante* control of mergers, following the principles of the EU Merger Regulation.

The CC must prohibit concentrations that significantly restrict effective competition, in particular by creating or strengthening a dominant position. It can authorise the transaction subject to structural and/or behavioural remedies suitable to address the competition concerns, such as divestiture of assets and/or obligations to act or refrain from acting in a certain way.

The investigative powers of the CC for merger review are similar to those related to anti-trust proceedings; namely, it can compel merging firms and third parties to provide relevant information, and may perform

unannounced inspections on the premises of the parties. The assessment of notified mergers must follow a thorough scrutiny of the evidence, which includes an economic analysis of the restrictive effects and of possible efficiencies stemming from the concentration.

In Bosnia and Herzegovina, **private enforcement** cannot be actioned to seek damages from firms that have committed anti-trust infringements.

#### *Sub-dimensions 5.2 and 5.5: Anti-competitive behaviour and implementation*

The anti-competitive behaviour and implementation policy areas together gauge the use of powers and resources in terms of decisions adopted and fines imposed for horizontal agreements, vertical agreements and exclusionary conduct. They also explore the actual activity of the competition authority on reviewing mergers. The impact of competition enforcement in Bosnia and Herzegovina is limited, despite a high number of decisions adopted by the CC in recent years (Figure 21.11).

**Figure 21.11. Competition decisions in Bosnia and Herzegovina (2015-19)**

Source: Data provided by the authorities.

In 2019 the CC took six decisions on **horizontal agreements** and four decisions on **vertical agreements**. These figures were even higher in 2017 and 2018, when there was eight horizontal decisions and five vertical decisions. However, it should be noted that most decisions have been related to the non-opening of formal proceedings, and no significant fines have been imposed over the last five years for prohibited agreements.

In 2019 the CC also adopted four decisions on **exclusionary conduct** (abuse of dominance), down from nine decisions in 2018. Again, these figures include several decisions not to pursue or to drop the case, which means that sanctions following infringement decisions were negligible. One fine was imposed in 2018 following an investigation on the delivery of heating energy which meant that the amount of fines peaked at around EUR 230 000; however, it dropped close to zero again in 2019.

No leniency application has been submitted to the CC, which has never performed an unannounced inspection.

In the period 2015-2019, the CC received a limited number of **merger** notifications, from a minimum of 15 in 2016 to a maximum of 35 in 2018. In 2019, the CC took 21 merger decisions, with all mergers unconditionally cleared in Phase I (i.e. without the need for an in-depth review in Phase II).

### *Sub-dimension 5.3: Probity of investigation*

The CC is an **independent** public body mandated to ensure implementation of the Law on Competition. It has exclusive competence to decide on competition infringements in Bosnia and Herzegovina. Nevertheless, as mentioned the appointment of CC members and the decision-making process is influenced by ethnic-based procedures, which risk introducing other considerations to decisions that should solely rely on a technical assessment.

The CC is **accountable** to the Council of Ministers, to which it submits a performance report and an annual report for adoption.

In terms of **procedural fairness**, the Law on Competition stipulates that the decisions of the CC must be submitted to the parties to the proceedings and published in the national Official Gazettes. The decisions must indicate the parties to the proceedings, the main contents and the outcome of the investigation, while specifying the relevant legal basis.

In line with EU rules, the decisions of the Competition Council can be challenged and an appeal can be launched before the Court of Bosnia and Herzegovina. Unlike in most jurisdictions, there are not two levels of appeal.

Prior to the adoption of a final anti-trust decision, the CC must inform the party on the relevant facts, evidence and other elements on which the decision is based and enable the party to submit a defence. The parties have the right to be heard before the CC takes a final decision. In managing confidential data or business secrets, the CC has the duty to protect the legitimate business interests of the economic entities involved, in accordance with the relevant regulations.

If the CC intends to prohibit a merger transaction, it must inform the merging parties about the evidence and conclusions on which the decision is based and enable them to submit their remarks and possible remedies.

The CC has not published guidelines to clarify substantive or procedural issues.

### *Sub-dimension 5.4: Advocacy*

The CC is entrusted by the Law on Competition to provide opinions and recommendations on competition issues and principles, either *ex officio* or upon request of the state authorities, economic entities or companies. The CC is also empowered to issue opinions on drafts laws and regulations that have an impact on competition. Proponents are required to submit the drafts to the CC and verify their compliance with the Law on Competition.

Between 2015 and 2019 the CC did not issue any formal opinions to the government or parliament on draft or existing laws or regulations. However, the CC co-operates with public institutions on competition matters and expresses its views on industry practices that may restrict competition. For example, in 2019 the CC made observations on general conditions for the supply of thermal energy and on price setting for driving lessons. Upon request by the Agency for Public Procurement, the CC has also been analysing the rules on public tenders.

It should be highlighted that unlike most competition authorities, the CC cannot conduct market studies, which represent a key tool to gain an in-depth understanding of restrictions to competition in crucial sectors.

The CC has organised some advocacy events aimed at developing competition culture. A project for summer courses on competition policy, in co-operation with the Faculty of Law of the University of Sarajevo, was suspended due to COVID-19.

### ***The way forward for competition policy***

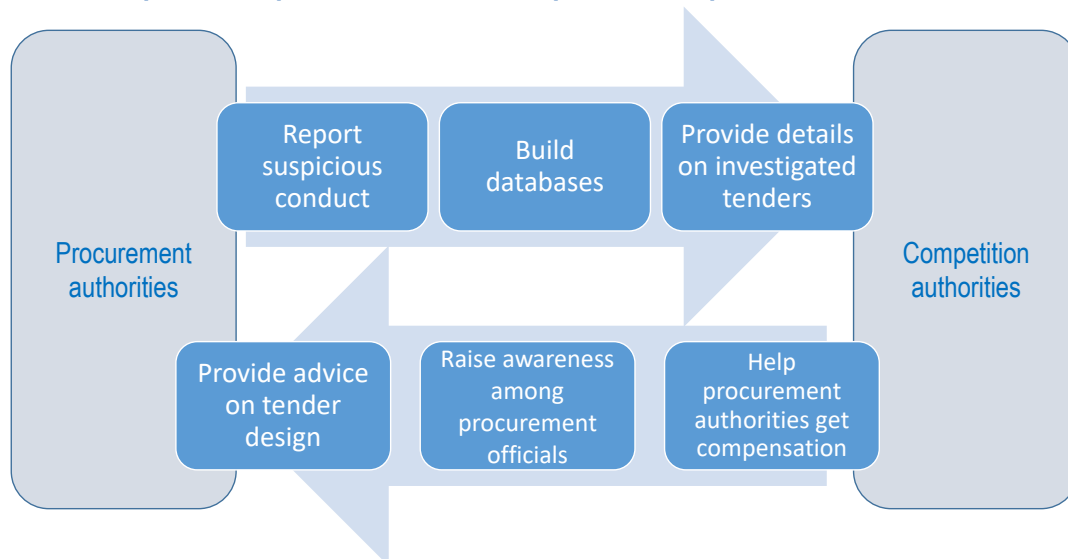

Despite a legal framework on competition broadly aligned with international standards, there is still room for improvement regarding competition enforcement in Bosnia and Herzegovina. The efforts of the CC in tackling prohibited agreements and the abuse of dominant positions have not resulted in strong decisions with significant fines, which are necessary to ensure deterrence and encourage competition compliance by firms.

The CC should engage in a set of advocacy initiatives to promote competition principles and foster competition culture. Importantly, the CC cannot carry out market studies. To enhance Bosnia and Herzegovina's competition framework and achieve objectives, policy makers should:

- **Prioritise boosting cartel enforcement and imposing high fines.** Cartels are the most clear-cut and undisputedly harmful competition infringements and affect every economy. CC efforts should be focused on detecting cartels and imposing heavy fines on infringers to deliver a strong message that firms engaging in collusion risk severe punishment. If the fine amount sufficiently exceeds illicit gains, offences can be deterred even when the probability of paying a fine is low. Concern of fines is also a key driver for leniency applications, thus fostering the effectiveness of the leniency programme – which has been unproductive in Bosnia and Herzegovina so far – and further boosting detection. The CC could expand its detection skills by, for example, further strengthening the fight against bid rigging (see below), and start using its power to perform on-site inspections to collect evidence.
- **Pay specific attention to public procurement, particularly during the COVID-19 crisis.** Public procurement is a key sphere of action both for cartel enforcement and for competition advocacy. Bid rigging results in significant harm to the public budget and taxpayers, dampening innovation and creating inefficiencies. The CC should extend its co-operation with the Agency for Public Procurement and with procurement bodies to carefully design the procurement process so that it reduces the risks of bid rigging and detects bid-rigging conspiracies. The Recommendation of the OECD Council on Fighting Bid Rigging in Public Procurement (OECD, 2012<sup>[74]</sup>) calls for governments to assess their public procurement laws and practices at all levels of government in order to promote more effective procurement and reduce the risk of bid rigging in public tenders. The Guidelines on Fighting Bid Rigging in Public Procurement (OECD, 2009<sup>[75]</sup>), which form part of the recommendation, are designed to reduce the risks of bid rigging and detect bid rigging conspiracies through the careful design of the procurement process. Figure 21.12 shows how co-operation between competition and procurement authorities can help detect and avoid bid rigging. The OECD could also provide assistance to Bosnia and Herzegovina through a project aimed at assessing the main rules governing the procurement of public works and the procurement practices of major public buyers and providing recommendations to design competitive procurement and fight bid rigging in accordance with international good practice. Training to both competition and public procurement officials based on the Guidelines on Fighting Bid Rigging in Public Procurement could also be offered.

Figure 21.12. Example of co-operation between competition and procurement authorities

- **Ensure that the CC regularly speaks out against laws and regulations that restrict competition.** Competition authorities can help governments eliminate barriers to competition by identifying unnecessary restraints on market activities and developing alternative, less restrictive measures that still achieve government policy objectives. The OECD's Competition Assessment Toolkit is a practical methodology that supports competition authorities in this task (OECD, 2015<sup>[76]</sup>). Where a detrimental impact is discovered, the toolkit helps to develop alternative ways to achieve the same objectives, with minimal harm to competition. In the past, OECD economy projects have proved very helpful in boosting competition advocacy and competition assessment in several jurisdictions, including in Eastern Europe. On top of establishing a competition mindset and culture within an economy, competition advocacy would strengthen the CC's standing and reputation when it enforces against anti-competitive restrictions by private firms.
- **Give the CC the power to perform market studies, as in most competition authorities in the world.** Market studies are a tool used to assess how competition in a sector or industry is functioning, detect the source of any competition problems, and identify potential solutions. Competition problems that can be uncovered in market studies include regulatory barriers to competition and demand-side factors that impair market functioning. Because market studies are a versatile tool that allow the examination of a broader set of issues than competition enforcement, their use is growing. International organisations, notably the OECD and the International Competition Network (ICN), have developed a wide range of documents on market studies, including the OECD Market Studies Guide for Competition Authorities (OECD, 2018<sup>[77]</sup>). The OECD's Competition Division could also assist competition authorities, regulators, ministries and policy makers with market study projects. This could be particularly valuable in Bosnia and Herzegovina, where the CC and policy makers have limited experience with such tools.
- **Increase international co-operation and targeted training initiatives to successfully address a fast-moving economic environment.** In the face of increasing complexity of anti-trust issues and the frequent cross-border nature of competition infringements, the management and staff of the CC should have frequent opportunities to meet and share good practices with international competition experts and colleagues from other jurisdictions. International organisations such as the OECD, the ICN and the United Nations Conference on Trade and Development (UNCTAD) offer valuable opportunities to this end, including the OECD-GVH Regional Centre for Competition in Budapest. The CC is already a regular participant in the centre's events and would benefit from actively continuing. Additional training initiatives would further enable CC staff to reach their full potential.

## State-owned enterprises (Dimension 6)

### Introduction

Responsibilities for Bosnia and Herzegovina's approximately 80 SOEs are dispersed across the public administration and often exercised by line ministries also involved in sectoral development policy. Some elements of centralisation are in place for SOEs as part of the Share Fund of Republika Srpska. External assessments of SOEs' financial statements point to low profitability and insufficient investments in infrastructure, among other performance issues (Parodi and Cegar, 2019<sup>[78]</sup>). As a result of weak ownership arrangements and underperformance, Bosnia and Herzegovina achieves a relatively low score in terms of governance and efficiency. A higher score is accorded for transparency and accountability, reflecting the fact that most SOEs are required to prepare annual financial statements that are often publicly available. Bosnia and Herzegovina achieves a below average score in terms of ensuring a level playing field with private companies, which reflects legal differences for SOEs incorporated as statutory entities, as well as the fact that SOEs' overall under-performance distorts market efficiency (Table 21.11). Bosnia and Herzegovina's performance in the state-owned enterprise dimension has not changed significantly since the 2018 Competitiveness Outlook, reflecting the absence of significant state ownership reforms since then (Figure 21.1). However, both the Federation of Bosnia and Herzegovina and Republika Srpska have announced plans to establish central co-ordinating units to monitor SOEs, which, if implemented, could improve the economy's score going forward.

**Table 21.11. Bosnia and Herzegovina's scores for state-owned enterprises**

Dimension	Sub-dimension	Score	WB6 average
<b>State-owned enterprises dimension</b>	Sub-dimension 6.1: Efficiency and performance through improved governance	1.6	2.2
	Sub-dimension 6.2: Transparency and accountability practices	2.5	3.0
	Sub-dimension 6.3: Ensuring a level playing field	2.0	2.8
	Sub-dimension 6.4: Reforming and privatising SOEs	n.a.	n.a.
<b>Bosnia and Herzegovina's overall score</b>		<b>2.0</b>	<b>2.6</b>

Note: For comparability with the previous assessment, the new sub-dimension (6.4) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 6.1: Efficiency and performance through improved governance*

The national-level entities of Bosnia and Herzegovina together own approximately 80 SOEs (53 owned by the FBiH and 27 owned by the Share Fund of RS).<sup>42</sup> In addition, the FBiH's 10 cantons and 80 municipalities own approximately 128 SOEs, while the municipalities of Republika Srpska own over 100 SOEs.<sup>43</sup> This assessment will focus mostly on entities held by the central levels of FBiH and RS rather than cantons and municipalities.

There is no publicly available dataset presenting the overall size and sectoral distribution of SOEs in Bosnia and Herzegovina, and authorities did not provide comparable sectoral data for this assessment. However, an assessment by an International Monetary Fund (IMF) team published in 2019 sheds light on the characteristics of a selection of 414 enterprises owned by all levels of government in Bosnia and Herzegovina (Parodi and Cegar, 2019<sup>[78]</sup>).<sup>44</sup> The underpinning data are not limited to the portfolios of the central levels of government, which this assessment focuses on, meaning that the figures presented are therefore simply provided to give a general idea of the characteristics of SOEs in BiH. According to the IMF assessment, SOEs in Bosnia and Herzegovina, as measured by employment, are highly concentrated in the primary sector (27% of all SOE employees), followed by electricity and gas (23%), transportation (16%), and other public utilities including water supply, sewage and waste management companies (14%) (Figure 21.13, Figure 21.14).<sup>45</sup> SOEs are also present in sectors with a

less obvious state-ownership rationale. For example, state-owned manufacturing enterprises account for 6% of all SOE employment, while SOEs classified in the “other activities” sectors – including construction, accommodation and food services – similarly account for 6% of all SOE employment.

In addition to enterprises that are majority or wholly owned by the state (which are considered SOEs), the FBiH holds minority shares in four enterprises, while the Share Fund of RS holds minority shares in 13.

**Figure 21.13. Sectoral distribution of SOEs by number of enterprises (2017)**

Source: Author calculations based on data provided in (Parodi and Cegar, 2019<sup>[78]</sup>), *State-Owned Enterprises in Bosnia and Herzegovina: Assessing Performance and Oversight*, <https://www.imf.org/en/Publications/WP/Issues/2019/09/20/State-Owned-Enterprises-in-Bosnia-and-Herzegovina-Assessing-Performance-and-Oversight-48621>. The figures used in the IMF study have been transferred into a different sectoral classification system, to allow for an alignment with the OECD's recurrent SOE data collection exercise (OECD, 2017<sup>[79]</sup>), *The Size and Sectoral Distribution of State-Owned Enterprises*, <https://doi.org/10.1787/9789264280663-en>.

**Figure 21.14. Sectoral distribution of SOEs by employment (2017)**

Source: Author calculations based on data provided in (Parodi and Cegar, 2019<sup>[78]</sup>), *State-Owned Enterprises in Bosnia and Herzegovina: Assessing Performance and Oversight*, <https://www.imf.org/en/Publications/WP/Issues/2019/09/20/State-Owned-Enterprises-in-Bosnia-and-Herzegovina-Assessing-Performance-and-Oversight-48621>. The figures used in the IMF study have been transferred into a different sectoral classification system, to allow for an alignment with the OECD's recurrent SOE data collection exercise (OECD, 2017<sup>[79]</sup>), *The Size and Sectoral Distribution of State-Owned Enterprises*, <https://doi.org/10.1787/9789264280663-en>.

SOEs in Bosnia and Herzegovina employ approximately 80 000 people, accounting for an estimated 11% of national employment (Parodi and Cegar, 2019<sup>[78]</sup>). This is above OECD average and high compared to other WB economies. However, the size is overstated through the inclusion of sub-national SOEs in this figure, as internationally comparative data are mostly limited to central-level SOEs (OECD, 2017<sup>[79]</sup>). The prevalence of SOEs in systemically important sectors – notably electricity and gas, transportation, and public utilities – gives them a decisive influence on broader market efficiency. A review of the financial statements of 414 SOEs found that they have very low returns overall, for example they averaged a -0.3% return on equity for the 2015-17 period (Parodi and Cegar, 2019<sup>[78]</sup>).

Concerning the **clarification of ownership policy and rationale**, neither the FBiH nor RS have developed an ownership policy that outlines the rationale for the state ownership of enterprises. Although this may be implicitly gleaned from other government policy documents, there is a problematic absence of any overarching policy explaining why the government owns companies and what it expects those companies to achieve. The rationale for state ownership is implicitly presented in the Law on Public Enterprises in force in each entity. In FBiH, the Law on Public Enterprises establishes that a “public enterprise” is one that performs “public interest activities in the field of energy, communications, utilities, management of public resources and other public interest activities”. This implies that the purpose of state ownership in FBiH is to serve the public interest by offering public goods and services in these, and possibly other, sectors. Similarly, in RS the Law on Public Enterprises establishes that a “public enterprise” is any joint-stock or limited-liability company that is at least majority owned by Republika Srpska or local government units and is established to perform “activities of common interest”. This implies that the purpose of state ownership in Republika Srpska is to serve the “common interest”. However, many SOEs in both FBiH and RS do not have an obvious public interest activity, which underscores the lack of clarity regarding why the state owns certain companies. In a similar vein, in RS the state maintains ownership in 42 largely inactive companies that have not been registered as companies in accordance with applicable legislation. In these companies, the rationale for continued state ownership is particularly unclear.

At the time of writing, the FBiH government was in the process of preparing an ownership policy for the SOEs under its remit, which is expected to clarify the entity’s rationale for owning companies and its expectations of the SOEs in its portfolio.

Efforts to **professionalise state ownership** practices are relatively limited in BiH, as ownership responsibilities are often exercised in a decentralised manner by various line ministries, subject to almost no central co-ordination. In both BiH government entities, while the government as a whole is by law responsible for exercising state ownership rights, in practice SOEs are mostly under the jurisdiction of line ministers who play a strong role in their operational oversight. This is problematic for several reasons, partly because it leads to a mixing of the state’s roles – ownership roles, regulatory roles and policy development roles – which can lead to conflicting or unclear objectives.

Concerning specific practices at the level of each entity, the FBiH government is by law accorded state ownership rights, which it can exercise directly or through federal authorities, including ministries. In practice, many state ownership decisions are made directly by the government (e.g. appointing and dismissing board members). All of the FBiH’s 53 SOEs are under the explicit jurisdiction of several individual line ministries, according to a list provided by the authorities. This indicates that there is limited co-ordination of ownership practices and limited separation of ownership from regulatory functions. Independent regulators, notably in the energy sector, establish some degree of separation of functions, but this is not the case in all sectors. The authorities report that an informal co-ordinating unit is in place in the Prime Minister’s Office, but additional steps are needed to give this unit the formal authority to co-ordinate ownership decisions across the FBiH.

Similarly, in RS the government is by law responsible for exercising ownership rights in fully state-owned enterprises, with these rights delegated by decisions of the government either to the Share Fund (which is managed by the Investment Development Bank of Republika Srpska) or to line ministries. Although the Share Fund’s ownership responsibilities would seem to indicate a stronger separation of ownership and

regulatory functions in RS, in practice the SOEs in the Share Fund's portfolio are also subject to oversight by relevant line ministries, indicating a mixing of the state's ownership and regulatory roles among these SOEs. The Share Fund's portfolio includes all SOEs in RS that are incorporated as joint-stock or limited-liability companies. SOEs incorporated under the separate legal form of "public enterprise" are held by the government as a whole and are under the jurisdiction of individual line ministries. In these companies, the government makes ownership decisions at the annual general meeting (AGM) based on recommendations and information provided by the responsible line ministries.

Concerning the SOE **board nomination framework**, and in the context of BiH's predominantly decentralised ownership arrangements, there are minimal elements of a common approach to board nominations, namely that they are subject to general requirements set forth in legislation applicable to governmental appointments in both entities. However, these general requirements cannot really be considered to constitute an SOE board nomination framework as they apply to all governmental appointments and not specifically to SOEs. This also indicates the broader issue that SOEs often appear to be run as arms of the public administration, rather than as corporate entities operating under independent boards of directors with private sector expertise. Even if strong corporate boards with private sector expertise were put in place in BiH, the current level of SOE policy development would make it difficult for boards to effectively oversee enterprise strategy and management decisions given the absence of clear financial and non-financial performance objectives communicated by the state.

Concerning the basic board nomination frameworks in place in each entity, in FBiH the Law on Ministerial, Governmental and Other Appointments outlines the general requirements for SOE board member nominations, notably establishing that an open competitive procedure must be carried out to fill relevant positions. Dedicated qualifications criteria are defined for each board vacancy; however, in the absence of a public document outlining the necessary professional qualifications for SOE board members, the procedure can be considered as lacking transparency.

Similarly, in RS the Law on Ministerial, Government and Other Appointments establishes that board nominations must be subject to a public competition. The law covers basic requirements, including that such appointments can only be made to persons aged over 18 who have not been dismissed from the civil service as a result of a disciplinary measure. The authorities of RS also reference the Law on Companies and the Law on Public Enterprises as setting forth information on the board nomination process, pointing to a complexity of requirements and the likelihood of a piecemeal approach to SOE board nominations. The Law on Public Enterprises only sets forth minimal elements regarding the legal responsibilities for board nomination, such as stating that the general meeting of shareholders is responsible for appointing supervisory board members, and that the aforementioned Law on Ministerial, Government and Other Appointments must be respected in the process. Specific requirements are developed for individual board nominations, but no formal documents exist on how those criteria are established, so the process can be considered as lacking transparency.

The authorities have not established criteria to promote **independent and professional boards** in SOEs. In both entities, boards are generally perceived to operate as arms of ownership ministries, rather than as independent corporate oversight organs. In the worst cases, there is also a perception that individual SOEs are essentially under the control of political parties, which increases risks of corruption and mismanagement (US Department of State, 2019<sup>[80]</sup>). This perception was confirmed by stakeholders interviewed for this assessment, as well as by several local media reports, for example by the Centre for Investigative Reporting. One such report indicated a perception that executive director appointments in one of the economy's largest SOEs, BH Telecom, are accorded based on political affiliations rather than professional qualifications (CIN, 2018<sup>[81]</sup>). Despite these shortcomings, it should be highlighted that SOE boards are not staffed predominantly by civil servants but by experts appointed via dedicated nomination procedures. In this sense, BiH differs from many economies around the world, where SOE boards are often predominantly composed of civil servants who may not have the appropriate private sector expertise to oversee corporate strategy.

In FBiH, the state's strong role in SOE corporate oversight is evidenced by the requirement that the chair of the supervisory board submits three-monthly reports to the government on its work, indicating the state's strong involvement in SOE management oversight. There does not seem to be any practice of requiring independent members on boards, although some basic requirements confer independence from management, for example the chief executive officer (CEO) cannot also be the chair of the supervisory board. Concerning duties and liability, SOE board members in FBiH are required by company law to act in the best interest of the enterprise, with specific legislative provisions stipulating that any damages to the company brought about by the CEO or a supervisory board member owing to "non-performance or disorderly performance of their duties" must be compensated. The company law also establishes fines in case the chair or CEO does not perform certain duties such as convening the AGM. Separately, a Government Decree on Executing Authorities in Companies with State Capital Share establishes that the CEO and supervisory board members must act in the interests of the capital owner (the state shareholder). This is supported by the requirement that the supervisory board chair submits at least once every three months a written report on the work of the supervisory board. This document applies equally to fully state-owned enterprises and to those with minority shareholders, pointing to weaknesses in the equal treatment of all shareholders. If SOE boards are explicitly expected to act (only) in the interests of the state shareholder, then there may be instances when corporate decisions are made to serve the state's interests at the expense of minority shareholder interests. This could include politically expedient decisions that may jeopardise the commercial viability of SOEs.

The state's strong role in SOE management oversight – and the concomitant weakness of SOE boards of directors – is similarly evident in RS, where SOEs operate primarily under the Law on Public Enterprises and are subject to close direct oversight by the public administration, including the state audit office. In RS, the strong role of the state in corporate decision making is somewhat mitigated by the fact that SOE boards are reportedly not predominantly staffed with civil servants but with experts in relevant fields, including law, economics and technical sciences.<sup>46</sup> The authorities report that civil servants can serve on SOE boards in exceptional cases, but that it is not common practice. There are no requirements for non-executive or independent members on SOE boards (except for stock-exchange listed companies whose boards must comprise a majority of non-executive directors, of which two must be independent). However, the Law on Public Enterprises of RS – which also sets forth SOE board duties – establishes the principle that board members must avoid any conflicts of interest that could go against the interest of the enterprise or prevent them from fulfilling their duties.

### *Sub-dimension 6.2: Transparency and accountability practices*

Concerning **financial and non-financial reporting**, SOEs in both entities are required, by various laws, to submit financial reports to various state entities. According to the IMF study, SOEs do not consistently comply with related reporting requirements, for example several do not make their financial statements available in a timely manner (Parodi and Cegar, 2019<sup>[78]</sup>). A local media organisation representative interviewed for this assessment echoed the conclusion that many SOEs do not publish financial statements and are in general not transparent about their activities or performance. Limited information was provided by the authorities concerning SOEs' non-financial reporting practices for this assessment, indicating that producing annual reports with non-financial information is either not required of SOEs or is not a widespread practice. Nonetheless, the RS authorities report that SOEs regularly include some non-financial information in their annual reporting to the government.

Concerning the precise requirements and practices in place in each entity, in FBiH SOEs are required by the Law on Public Enterprises to prepare accounting records and financial reports in accordance with the Law on Accounting and Audit. It is not clear whether financial statements must be made publicly available; the Law on Public Enterprises requires that the AGM of SOEs submits "reports on their operations" to the municipal council, cantonal assembly or parliament at least once a year, and that these reports are made publicly available, but these are not financial statements. The authorities report that approximately two-thirds of SOEs are required by various laws to publish annual reports, but limited information was

provided on the content of these annual reports and whether they discuss SOEs' public policy activities or other non-financial information.

In RS, SOEs' reporting requirements are also mostly established through the Law on Public Enterprises, which notably requires that SOEs prepare financial reports in accordance with applicable laws on accounting and auditing, as well as three-year "business plans" that are submitted to both the Auditor General and the competent ministry. According to the Law on Public Enterprises, SOE management boards are responsible for drafting and supervising the implementation of these business plans, which include some basic non-financial reporting, for example concerning issues related to environmental protection and labour force trends. However, they are not required to be made publicly available, so do not constitute the "annual reports" traditionally produced by companies.

Concerning **auditing practices**, certain categories of SOE in BiH are required to have their financial statements audited by an independent external auditor. In FBiH, independent external audits are only required for SOEs that exceed certain size thresholds, in accordance with the Law on Accounting and Audit. Audited financial statements should be presented to the AGM with an external audit report. In RS, SOEs' financial statements are, according to the Law on Public Enterprises, adopted by the AGM along with an independent auditor's report. The independent auditor must submit a statement of independence with the audit report. In RS, SOEs are also subject to close oversight by the Auditor General, which reviews SOEs' three-year business plans. This indicates a general financial oversight system that mirrors more closely the public administration system (e.g. through public budget planning processes) rather than the systems of privately owned corporations. There is limited information on the quality and credibility of SOEs' financial statements in both entities, which, alongside the limited compliance of many SOEs' with existing reporting requirements, indicates that an in-depth review of SOEs' reporting practices may be warranted.

The **protection of minority shareholders** of SOEs is particularly pertinent in BiH, given the significant proportion of SOEs that have minority non-state shareholders. In FBiH, approximately half of the SOEs held by the central government have non-state minority shareholders and are listed on the national stock exchange.<sup>47</sup> Similarly, In RS nearly half of the companies in the Share Fund's portfolio include non-state minority shareholders (12 out of 27 companies). Some of these SOEs are systemically important, such as the postal services operator (Pošta Srpske, 65% state-owned), RS Railways (Željeznice Republike Srpske, (63.92% state-owned) and RS airport (Aerodromi RS, 64.69% state-owned). Separately, in FBiH the state is itself a minority shareholder in 4 enterprises where full privatisations have been unsuccessful, while the Share Fund of RS is a minority shareholder in 13 companies.<sup>48</sup> As is the case in most WB economies, SOEs are not exempt from the application of basic company law provisions to protect minority shareholders, including the right to equitable treatment and the possibility for redress through the courts in case of alleged violations of those rights. However, external assessments indicate that there is room to improve these basic legal protections accorded to minority investors in BiH, with the World Bank's Doing Business 2020 report according BiH a lower score than its Western Balkan neighbours for the protection of minority shareholders (World Bank, 2020<sub>[82]</sub>). Some elements of the company law in both entities do accord minority shareholders specific potential channels to participate in corporate decision making, for example shareholders that hold at least 5% of capital have the right to appoint one supervisory board member, which could help ensure that corporate decision making takes into account all shareholders' interests (and not just the state's interests). According to FBiH authorities, minority shareholders with over 5% capital in SOEs do usually exercise this right. The RS authorities report that in some cases, minority shareholders are less active in this respect and do not propose board representatives at the AGM. Limited information was provided by the authorities on recent disputes involving minority shareholders, but FBiH authorities indicated that the state and minority shareholders do sometimes disagree on corporate decisions, for example whether to reinvest profits or distribute them as dividends.

### *Sub-dimension 6.3: Ensuring a level playing field*

Concerning **legal and regulatory treatment**, most SOEs in both entities are incorporated according to general company law (as joint-stock or limited-liability companies), although 11 SOEs in FBiH and 6 SOEs in RS have not been incorporated as companies (they are “public enterprises”, *javno preduzeće*/JP) and operate primarily subject to enterprise-specific legislation and the Law on Public Enterprises. The authorities of both entities report that SOEs are generally subject to the same tax, competition and other regulatory treatment as private enterprises. While a separate Law on Public Enterprises regulates SOEs in both entities (meaning that SOEs operating as joint-stock or limited-liability companies are subject to a company law and an SOE-specific law), it does not appear to introduce major differences in legal treatment that would create specific advantages or disadvantages in the competitive marketplace. In fact, the SOE-specific law in each entity establishes several basic principles related to ensuring fair competition in the marketplace.

Concerning the legislative framework in each entity, in FBiH the Law on Public Enterprises establishes some basic principles aimed at ensuring a level playing field between SOEs and private competitors. It notably establishes that there must be sufficient supervision of state aid to ensure that it does not distort fair competition. In this sense, although a separate law applicable to SOEs may create different legal treatment, it does take steps towards minimising differences in treatment between SOEs and private companies. In RS, the Law on Public Enterprises similarly establishes several principles related to avoiding distortions to fair competition in the marketplace, such as prohibiting abuses of dominant positions, liberalising services of general interest to prevent monopolies, and prohibiting agreements by public enterprises that could prevent, distort or restrict competition in the marketplace.

However, the presence of a separate legal form (“public enterprises”) for some SOEs raises concerns regarding their operational treatment. In general, it is considered good practice to ensure that SOEs undertaking predominantly commercial activities are incorporated according to the general company law. Information provided by the authorities of FBiH also points to some potential disadvantages that SOEs face owing to their state ownership, which may be shared by SOEs operating in RS. These disadvantages include the fact that SOEs are by law subject to the same public procurement procedures applicable to government bodies, which can create an operational burden that private competitors do not face. Such issues can be particularly acute in sectors that were previously monopolistic but where competition has been introduced (e.g. the postal services and telecommunications sectors). SOEs may also face advantages in such situations due to their historically dominant market share and regulatory leniency owing to their state ownership. SOEs’ competitive position in markets where competition has been recently introduced should be continuously assessed to minimise market distortions.

Concerning **access to finance**, the authorities of both entities have limited formal information on whether SOEs benefit from favourable terms in accessing commercial credit. It is likely that as in other economies around the world, SOEs in BiH benefit from at least an implicit state guarantee that many commercial lenders use to justify more favourable credit terms. It does not appear that explicit guarantees on SOEs’ commercial debt are commonplace, but FBiH authorities report that they are sometimes accorded to SOEs, particularly when engaged in large infrastructure projects that often receive financing from international financial institutions. The Law on Debt requires that such guarantees are approved by parliament. In RS, the authorities report that there have been cases where the government issued explicit guarantees on SOE debt, but that this is no longer common practice. SOEs in BiH often do not earn economically significant rates of return, which effectively constitutes a cost of equity capital that is not market consistent. For example, persistent losses posted by RS Railways – which is currently undergoing a restructuring process – has led the company to incur large unpaid debts to the tax office. External assessments have found that many SOEs have similar unpaid debts to state authorities, including for example health and pension contributions (US Department of State, 2020<sup>[83]</sup>). It is likely that SOEs face some leniency concerning unpaid debts owed to the relevant authorities, pointing to their unequal treatment compared to private enterprises. Overall, SOEs’ underperformance creates a situation where economic resources are not

channeled into the most productive activities, which in the long term can crowd out private sector activity and lead to inefficient market outcomes.

#### *Sub-dimension 6.4: Reforming and privatising state-owned enterprises*

Concerning recent **SOE reform**, the current FBiH government reform agenda includes a section devoted to SOEs that focuses on improving their performance, depoliticising management, and strengthening their transparency. As mentioned earlier, at the time of writing the FBiH government was in the process of developing an ownership policy expected to be completed in 2020. There are also plans to formalise the Prime Minister's Office's (currently informal) SOE monitoring unit to strengthen central monitoring of SOEs and harmonise ownership practices across the FBiH. In RS, recent reforms have mostly involved the financial and organisational restructuring of individual large SOEs such as RS Railways to create a self-sustaining company. The restructuring process has so far led to staff reductions of over 800. RS authorities have recently established an SOE working group to undertake an analysis of SOE operations and reform priorities, with the support of the World Bank.<sup>49</sup> Similar to developments in the FBiH, RS authorities intend to establish a state ownership monitoring unit within the Cabinet of the Prime Minister.

Concerning the impact of the COVID-19 pandemic, FBiH authorities reported that several companies under the purview of the Ministry of Energy, Mining and Industry have suffered losses due to the crisis, and that the ministry is currently working on an overview of the financial state of its SOEs for the FBiH government. RS authorities did not report any specific measures taken for SOEs related to COVID-19.

**Privatisation** efforts continue in both entities, although some recent planned privatisations have been unsuccessful in RS. According to external assessments, SOEs can often be unattractive investments to potential private buyers due to, for example, their high unpaid debts that must be paid post-privatisation and/or requirements to maintain staff contracts after privatisation (US Department of State, 2020<sup>[83]</sup>). At the time of writing, eight SOEs had recently been transferred to the FBiH Privatisation Agency for planned privatisation. The privatisation list in FBiH emerged from a 2015 review of all SOEs that classified companies into three broad categories: 1) strategic companies that should remain in state ownership and not be privatised; 2) companies with business difficulties that should be restructured; and 3) companies that should be privatised. On the basis of this list, the government instructed the FBiH Privatisation Agency to prepare a Privatisation Plan, with proposals for models and methods of privatisation for eight companies. Privatisations undertaken by the agency are in accordance with the Law on Privatisation of Companies, which also regulates privatisations undertaken by ten cantonal privatisation agencies. Since 2010, 24 SOEs owned by the FBiH have been privatised, all operating in the manufacturing sector. The latest privatisations took place in 2016, when the state relinquished its remaining minority ownership shares in the Sarajevo Tobacco Factory and the pharmaceutical company Bosnalijek.<sup>50</sup> In RS, the Investment-Development Bank adopts a privatisation plan as part of its annual work plan, which lists the companies slated for privatisation, together with the current state ownership share. The 2020 plan includes three SOEs lined up for privatisation. These SOEs undertake activities related to radar and missile systems, manufacturing parts for aircraft engines, and chemical corn processing. Recently, some planned privatisations in RS were not successful, including the planned stock-exchange auction of Ljubija a.d. Prijedor and a tender for the sale of Novi mermer a.d. Šekovići. The planned stock-exchange auction of the state's 65% shareholding in Ljubija a.d. Prijedor was reportedly unsuccessful due to the absence of qualified investors interested in the purchase, while the tender for the fully state-owned Novi mermer a.d. Šekovići resulted in only one bid, the terms of which the government determined unsatisfactory.

#### ***The way forward for state-owned enterprises***

SOEs operate at the nexus of the public and private sectors and, as such, their operations are affected by both the quality of public governance and the prevailing corporate and boardroom culture. As in most Western Balkan economies, ensuring that SOEs in Bosnia and Herzegovina operate efficiently, transparently and on a level playing field with private companies will necessitate reforms in multiple policy

areas that cannot be undertaken all at once. Choosing the appropriate sequencing of reforms is just as important as the content of the reforms, and largely depends on the political climate and current reform priorities.

The OECD Guidelines on Corporate Governance of State-Owned Enterprises (OECD, 2015<sup>[84]</sup>) provide a guidepost for reforms that the BiH authorities can use to inform their policy efforts in this domain. Based on the state of play of SOE policy development in BiH, the following priority reform areas – which are in line with the OECD SOE Guidelines – could offer a basis for discussions with the authorities.

- **Develop a state ownership policy and improve the central monitoring of SOEs.** In the context of BiH’s decentralised ownership arrangements, a state ownership policy should be elaborated to guide ownership decisions and practices. It should clearly outline why the government owns companies and what it expects those companies to achieve. The ownership policy could provide a useful foundation for eventually developing enterprise-specific financial and non-financial performance objectives, the implementation of which could be monitored and used to guide structural changes to improve SOE efficiency. The authorities of both entities should centralise data on SOEs to ensure that the development of policy priorities and performance objectives are evidence based.
- **Strengthen SOE board competencies by improving the nomination framework.** There is a perception that many SOE board seats in BiH are granted to individuals based on their personal or political connections, rather than professional merit. While the legislation in place seeks to ensure that boards are not subject to conflicts of interest, there appears to be scope to improve their professionalism and private sector expertise. The authorities should consider strengthening and publishing the professional criteria applicable to SOE board appointees with a view to ensuring that members have a sufficient diversity of expertise (e.g., financial, corporate strategy and industry-specific expertise) to effectively oversee necessary strategic and structural decision making within SOEs. The board nomination framework should be transparent and merit based.
- **Ensure a level playing field when SOEs compete in the marketplace.** While some SOEs are tasked primarily with public policy objectives, others operate commercially and compete with private companies in the marketplace. In some cases, SOEs operating commercially may face competitive advantages, such as their dominant market share coupled with public support, while in other cases they may face disadvantages, such as public-procurement procedures that private competitors do not face.<sup>51</sup> The authorities should review SOEs’ operational requirements to identify any regulatory or operational differences that hinder healthy competition in the markets in which they operate. The authorities should also consider fully corporatising SOEs that undertake primarily commercial activities but are still organised under the separate legal form of “public enterprise”. In a similar vein, the authorities should move forward with the necessary liquidations of SOEs that are no longer active, in particular in Republika Srpska, where 32 SOEs are currently undergoing bankruptcy/liquidation and 42 are not registered as companies in accordance with applicable legislation and are reportedly no longer undertaking commercial activities.
- **Review minority shareholder rights and participation in SOE decision-making bodies.** A significant proportion of SOEs in BiH are partly owned by minority private investors, underscoring the need to ensure that their interests are credibly and consistently taken into account in corporate decision making so that SOEs can continue to benefit from needed private capital. An in-depth review of the strength of minority shareholder protections in practice goes beyond the scope of this assessment but would be a useful undertaking for the authorities to consider as they seek to continue broadening SOE ownership to include private investors. According to a recent review of implementation of the OECD SOE Guidelines in 31 economies, many have recently taken steps to strengthen the rights of SOE minority shareholders, for example through updates of corporate governance codes (which are applicable to listed SOEs), SOE-specific codes or guidelines (OECD, 2020<sup>[85]</sup>). These practices, summarised in the aforementioned report, could provide useful inspiration for the BiH authorities.

- **Improve transparency at the level of SOEs and the state as owner.** The authorities of both entities in BiH have established basic financial reporting requirements for SOEs, but compliance is not consistent across the SOE sector. There is also scope for SOEs to go beyond financial reporting and produce more detailed reports on their non-financial performance, particularly SOEs engaged in public interest activities. The authorities should undertake an in-depth review of SOEs' reporting practices to identify and address weaknesses in their financial and non-financial reporting practices. The state as an owner should begin producing publicly available reports on the performance of the SOE sector as a whole using the information collected from individual SOEs.

## Education policy (Dimension 7)

### Introduction

Table 21.12 shows Bosnia and Herzegovina's scores for the four education policy sub-dimensions and the cross-cutting dimension on system governance, and compares them to the WB6 average. Bosnia and Herzegovina scores below the WB6 average in all sub-dimensions except for the tertiary education sub-dimension. However, it has seen modest improvements in its scores since the 2018 Competitiveness Outlook assessment (for indicators that allow for comparisons) (Figure 21.1). Despite these signs of progress, Bosnia and Herzegovina's complex education governance system, whereby responsibilities for education are shared among actors at the state, entity, canton and district level, continue to create challenges in terms of setting strategic objectives, policy co-ordination and reform implementation. As a result, the scores in this policy profile should be interpreted with caution as they represent a composite, with the scores for the state and its entities often varying.

**Table 21.12. Bosnia and Herzegovina's scores for education policy**

Dimension	Sub-dimension	Score	WB6 average
Education policy dimension	Sub-dimension 7.1: Early childhood and school education	2.2	3.0
	Sub-dimension 7.2: Teachers	1.5	2.7
	Sub-dimension 7.3: Vocational education and training	2.0	3.1
	Sub-dimension 7.4: Tertiary education	2.8	2.8
	Cross-cutting dimension: System governance	1.5	3.3
Bosnia and Herzegovina's overall score		2.1	3.0

### State of play and key developments

Similar to economies around the world, Bosnia and Herzegovina was faced with a rapid shift from classroom to remote learning in 2020 to help slow the spread of COVID-19. Working with donor agencies, education authorities introduced a variety of distance-learning opportunities for the different education levels; however, some children and youth, especially those from Roma communities, have not had adequate access to ICT and the Internet. Education authorities in different jurisdictions opted for local-specific quality assurance mechanisms during the COVID-19 pandemic and developed a diversity of approaches to distance learning (United Nations, 2020<sup>[86]</sup>).

One major achievement since the 2018 assessment has been the introduction of the common core curriculum for pre-university education in 2018, which established a common framework for curriculum development. Since the last CO assessment, Bosnia and Herzegovina has received its first results from PISA, filling a notable gap in available information about student learning outcomes.<sup>52</sup> These results reveal that overall performance was around the regional average in reading, mathematics and science, but lower than the EU and OECD averages (Figure 21.15). PISA 2018 findings also show that around 41% of students in Bosnia and Herzegovina did not achieve the minimum skills (Level 2) in all three PISA subjects, which is higher than the average among OECD economies (13.4%) and the Western Balkan average (38.7%) (OECD, 2018<sup>[87]</sup>). These results suggest that basic learning outcomes are still not achieved by many students in BiH, which has implications for its long-term economic development, as students without basic skills are less likely to attain well-paying and rewarding jobs.

**Figure 21.15. Performance in reading, mathematics and science in Western Balkan education systems, 2018**

### *Sub-dimension 7.1: Early childhood and school education*

Bosnia and Herzegovina's score in this sub-dimension is slightly lower than the Western Balkan average, and there are significant score differences across the entities and the state level. According to data from the Agency for Statistics of Bosnia and Herzegovina, the economy's net enrolment rate was around 85% for primary and 82% for lower secondary education in 2019. These rates have been generally declining since 2014, partly as a result of demographic decline. At the upper secondary level, net enrolment was nearly 79% (UIS, 2021<sup>[88]</sup>).<sup>53</sup> There are signs that participation in education is inequitable in Bosnia and Herzegovina, especially for children from Roma communities and those from poor and rural backgrounds (World Bank, 2019<sup>[89]</sup>).

Participation in **early childhood education** (ECE) in Bosnia and Herzegovina is low, as it was in 2018, with the gross enrolment ratio in pre-primary education standing at 25%, the lowest in the WB6 region<sup>54</sup> (UIS, 2021<sup>[88]</sup>). This could be due to a lack of infrastructure and limited funding directed at ECE institutions, especially in urban areas where demand is high. For example, there are waiting lists for preschool matriculation in urban areas such as Sarajevo, Banja Luka, Brčko and Mostar; and 30 of BiH's 143 municipalities do not have a school that offers preschool programmes (World Bank, 2019<sup>[89]</sup>).

Bosnia and Herzegovina has taken steps to raise the quality of ECE. Notably, the Agency for Preschool, Primary and Secondary Education (APOS0) developed Quality of Work Standards for educators, pedagogues and principals in preschool education. In 2018 it also introduced curriculum guidelines based on learning outcomes to help ensure continuity in children's transition from ECE to primary education. There are also several strategies and legal frameworks that establish goals for the sector. In particular, the state-level Platform for the Development of Preschool Education for 2017-2022 aims to harmonise preschool policies with international standards and sets out activities related to increasing coverage, quality assurance, financing and inclusion. However, entities and cantons are responsible for determining their own laws and budgets to operationalise ECE policy, which leads to inconsistencies. For example, the Framework Law on Preschool Education requires competent authorities to harmonise their legislation to provide compulsory and free preschool education; however, several years after entering into force not all cantons in the FBiH have made one year of preschool preparatory education compulsory, and it is only recommend in the RS, which risks undermining the goal of ensuring that all young children have access to ECE. Donor-led initiatives continue to play an important role in implementing policy initiatives and monitoring and supporting the ECE sector in Bosnia and Herzegovina.

The **instructional system**<sup>55</sup> in Bosnia and Herzegovina rates slightly below the regional average for this indicator. This is primarily because of the significant differences across education authorities, which contribute to fragmented education policies and resource inefficiencies. There is a Framework Law for Primary and Secondary Education, which require various education authorities to coordinate and align policies with EU standards and principles but unlike the ECE Platform, there is no comprehensive state-level education strategy for the school sector. Instead, the FBiH and some individual cantons have policies regarding instructional quality and equity but the RS is the only authority that has prepared a comprehensive strategic document.<sup>56</sup> School quality standards and evaluations, in addition to school leader policies also vary across entities and cantons.

Despite Bosnia and Herzegovina's rather fragmented approach to school education, an important achievement since the 2018 assessment is the introduction of the common core curriculum, which sets out a framework for learning outcomes that competent education authorities can use to develop their own curricula. The curriculum aims to strengthen students' knowledge and skills, as well as the acquisition of attitudes that will help them in their daily lives and work. However, the extent to which authorities have implemented the common core curriculum varies, and there are no state-level assessments or examinations to help determine the extent to which students are achieving learning standards. At the same time, there are examples of student assessment policies within Bosnia and Herzegovina that align with policies in EU and OECD countries. For example, *Matura* exams that mark the end of secondary education can be found in RS and some cantons (e.g. Tuzla). Unlike many other economies, however, these various tests are managed by their respective education authorities rather than a central examination centre. Bosnia and Herzegovina's state-level evaluation centre, APOSO, manages the economy's participation in international assessments such as PISA and the Trends In International Mathematics And Science Study (TIMSS), which since 2018 have filled a major void in the instructional system by generating information on student learning outcomes.

Responsibilities for **preventing early school leaving** in Bosnia and Herzegovina are under the remit of entity and cantonal ministries of education. As a result, prevention and intervention measures vary. While there is no state-level strategy or policy that explicitly addresses early school leaving, the Ministry of Civil Affairs adopted the Recommendations for Inclusive Education in Bosnia and Herzegovina in 2019, which calls for measures and activities aimed at keeping (retaining) children and young people in education. APOSO also developed state-level guidelines for inclusive education in 2020. Respective authorities collect their own data to monitor early school leaving, and the FBiH, which has studied this issue in-depth, found that Roma children are especially vulnerable to leaving school early. Overall, the data available are limited and not collected using consistent definitions across jurisdictions, which makes it difficult to accurately report on this issue and understand contributing factors. Nevertheless, the Agency of Statistics reports that Bosnia and Herzegovina's early school leaving rate was around 4% in 2019.

### *Sub-dimension 7.2: Teachers*

Teacher policy in Bosnia and Herzegovina is under the responsibility of each entity and canton government, and the overall score in this sub-dimension is below the Western Balkan average. While the RS education strategy identifies improving **initial teacher education (ITE)** as a goal, the FBiH does not have a strategy or policy that addresses ITE, as related policies are managed at the canton level. Nevertheless, both entities report that improvements to working conditions have been adopted to help increase the competitiveness of the profession; the RS also has increased teacher salaries and professional autonomy to make teaching a more attractive career option. Some features of Bosnia and Herzegovina's ITE system are similar to those of EU and OECD economies. For example, most teachers are required to pass a professional examination before working in schools, and all education systems require candidate teachers to undergo a one-year teaching internship under the supervision of a mentor. However, none of the jurisdictions have minimum requirements for selecting candidates for ITE because higher education institutions across the economy have full autonomy to determine these criteria.

There is also a lack of programme-specific accreditation processes, meaning that providers do not have to demonstrate how they help candidates develop competences specific to teaching.

Despite entity and canton governments having responsibility for teacher policy, there have been some efforts at the state-level (via APOSO) to assess the **professional development and management** of teachers in Bosnia and Herzegovina and provide steps for improving the systems involved. Professional development is required in both entities; however, the duration and forms of training vary, and teachers sometimes have to pay for training out of pocket, which implies issues around access. Positively, the Ministry of Education and Science (FBiH) has implemented annual programmes since 2017 to finance or co-finance projects related to supporting the professional development and lifelong learning of teachers. However, this programme was not implemented in 2020 because of budget cuts related to COVID-19. Similar to many OECD and EU countries, some education authorities in Bosnia and Herzegovina have different categories of teacher that align with passing an appraisal process; however, these do not seem aligned with professional teacher standards. Actors in Bosnia and Herzegovina report using a range of sources to determine teacher professional development needs, but there are no accreditation processes to help ensure the quality of training providers.

### *Sub-dimension 7.3: Vocational education and training*

Bosnia and Herzegovina's score in the sub-dimension on vocational education and training (VET) is below the Western Balkan average. Professionally oriented education starts at the secondary (ISCED 3) level, when students attend schools offering either a general, vocational, arts, religious or other type of curricular programme. As of 2019, some 77% of all upper secondary students in Bosnia and Herzegovina were enrolled in VET programmes, which is similar to Serbia (around 74%) but much higher than other Western Balkan economies with available data, as well as higher than the EU average (48.4% in 2018) (ETF, 2020<sup>[90]</sup>). Despite the high share of participation in VET, there is evidence that programmes do not align with labour market needs (World Bank, 2019<sup>[89]</sup>). As in other economies, data from PISA 2018 show that students in Bosnia and Herzegovina's VET programmes are more likely to be low performers<sup>57</sup> than their peers in general education. Improving the foundational skills of students who pursue VET will be important if Bosnia and Herzegovina is to raise the quality and relevance of the sector and support individuals in the transition from school to work.

As with the broader political and governance structure of Bosnia and Herzegovina, the **governance of VET** is complex and involves a wide range of actors. There has been no state-level VET strategy since the previous one expired in 2015, but a new strategy for the sector is being developed. The Framework Law on Secondary Vocational Education and Training regulates the VET system by defining basic principles and standards, based on recommendations from the EU, and requiring competent education authorities to adjust their own regulations in accordance. However, how governments engage social partners and provide career guidance for learners varies across the economy. In some jurisdictions, VET providers are subject to regular evaluations or inspections, which is positive; however, there are currently no formal accreditation processes for VET providers at the entity or state level. Effective VET governance needs reliable data to inform programme development and balance the supply and demand of skills. While some state-level bodies collect data on the completion rates of VET, and basic information on schools, students and programmes, more robust and comparable sector-level data is limited.

The new state-level VET strategy is expected to recognise the importance of **work-based learning** (WBL) in all forms. There are no clear regulations that determine the structure of WBL at the state level, and access to WBL and practical training in companies has not been harmonised throughout Bosnia and Herzegovina. Guidelines and supporting documents (checklists and forms) have been developed to support actors in the preparation, execution, evaluation, monitoring and improvement of WBL, but schools and companies usually organise WBL arrangements on their own. Neither entity has dedicated career service or placement centres to help match learners with WBL places, but both use broad public awareness campaigns as a matching mechanism, with RS organising presentations to social

partners and posting WBL opportunities on an online portal. There are only sporadic incentives for employers to provide WBL, which are organised at the level of local communities. However, RS reports having a rulebook that sets out possible employer incentives. In terms of data, there are no mechanisms for tracking and collecting information about WBL at the state nor FBiH entity level. RS collects information about the location and type of WBL opportunities, completion rates from WBL programmes and the number of learners hired after completing an apprenticeship, but information about the earnings of VET graduates and WBL participants is limited.

#### *Sub-dimension 7.4: Tertiary education*

Bosnia and Herzegovina's score in the tertiary education sub-dimension is similar to the Western Balkan average. The sector is mostly private, with 10 public and around 38 private tertiary institutions. The share of Bosnia and Herzegovina's labour force (aged 15+) who have attained some form of tertiary education (ISCED 5-8) has been relatively stable since 2015 at around 15-16%; however, this is the lowest rate among Western Balkan economies and is below the EU average (33.6% in 2019) (ETF, 2020<sup>[90]</sup>). Participation in higher education is increasing as higher educational attainment is correlated with higher earning potential in Bosnia and Herzegovina; however, the economy faces substantial "brain drain", and graduates face a difficult transition into the labour market (World Bank, 2019<sup>[89]</sup>; ETF, 2018<sup>[91]</sup>). In 2019, the share of youth not in employment, education or training (NEET) was around 21%, more than double the EU average (around 10%), although this share has been decreasing steadily since 2010 (ETF, 2020<sup>[90]</sup>).

At the state level, the Framework Law on Higher Education stipulates basic principles and standards of higher education in Bosnia and Herzegovina, which are in accordance with internationally recognised legal instruments and prevent discrimination on the basis of characteristics such as sex, disability or language. While this law can help facilitate more **equitable access to higher education**, there are limited comparable and disaggregated data to monitor and address access. State level agencies, in addition to entity and cantonal governments, collect some relevant data (e.g. enrolment by age and gender); however, only RS has proxies for socio-economic background and other factors that may impact an individual's access to higher education. In terms of student selection, higher education institutions typically determine entry requirements drawing on examinations and school results. Some of this information is also used to award merit-based loans and scholarships. Both entities and cantons provide financial support to vulnerable individuals, including those with disabilities and those from the Roma community.

Bosnia and Herzegovina's Priorities for Higher Education Development 2016-26, which was developed with IPA funding from the European Union, sets out key strategic goals for the sector, including strengthening connections between higher education institutions and the labour market. The economy has several features that support the **labour market relevance and outcomes** of higher education. For example, there are several initiatives to support the internationalisation of higher education, both at the state level, such as participation in the EU Erasmus Plus programme, and at the level of entities and individual institutions.

Some mechanisms also help align higher education with labour market demands, such as allocating scholarships for in-demand areas or involving industry stakeholders in the design of curricula. However, there is some information that such mechanisms are not effective, which together with longstanding disputes between the two higher education accreditation agencies (one at the state level and one in RS) has a negative impact on the overall quality and relevance of higher education programmes (European Commission, 2020<sup>[39]</sup>). While there are data that can help inform higher education programmes about the needs of the labour market, neither entities use quantitative forecasting models to better understand the supply and demand of skills. Moreover, there is limited research to help align the learning outcomes, curricula and assessment methods of higher education with the labour market.

### *Cross-cutting dimension: System governance*

It is difficult to assess Bosnia and Herzegovina in the area of **system governance** given the economy's complex political structure. While there has not been a state-level education strategy since 2015, there are several framework laws that aim to harmonise education systems and align them with EU standards and principles. Bosnia and Herzegovina has a Baseline Qualifications Framework that is being aligned with European qualifications, and several education authorities within the economy have governance features resembling those of other European economies. For example, RS has its own education strategy and an online platform to share information about the performance of the education system. However, at the state level, Bosnia and Herzegovina performs below the Western Balkan average for this cross-cutting dimension, mainly because of challenges related to policy co-ordination. The complex governance structure perpetuates inefficiencies and inequities across levels of education (World Bank, 2019<sup>[89]</sup>).

A major challenge to system governance in Bosnia and Herzegovina is the limited amount of comparative data about the education sector. While several actors collect education data, they may use different definitions of indicators, which undermines the reliability of the data and limits Bosnia and Herzegovina's presence in international education datasets. The economy's recent participation in PISA and TIMSS filled an important gap in information about student learning outcomes, but there are no local standardised assessments that help monitor implementation of the new common core learning outcomes and provide more timely and contextualised results to inform education policy. Finally, there are some assessments and evaluations of the education system that can inform system governance, but these are often supported by donor agencies rather than an internal demand for research to systematically monitor, identify and address challenges facing the education system.

### ***The way forward for education policy***

In today's increasingly global and fast-changing world, achieving inclusive and quality education in Bosnia and Herzegovina can help increase regional competitiveness and create opportunities for more individuals to develop the competences needed for sustainable development and social cohesion. Officials will need to reflect on the economy's political, social and fiscal environment to determine how best to achieve their education goals. While deeper analysis of education policies is needed to provide more detailed recommendations for Bosnia and Herzegovina, the following considerations can provide insights for discussions on the way forward to enhancing education:

- **Strengthen evaluation and assessment policies across the system.** Education authorities across Bosnia and Herzegovina already have education management information systems, but these are mainly used for administrative purposes rather than to support education policy reforms and inform decision making. Republika Srpska produces quarterly reports on progress towards its education goals and has platforms to communicate information with the general public. Some cantons within FBiH also conduct analysis for their respective jurisdictions. However, there are limited internationally comparable statistical data and analysis at the state level. Bosnia and Herzegovina should consider producing a regular analytical report on system-wide progress that pulls together individual work programmes and statistics into a prominent state of education report. Germany and Canada provide such reports, along with other reporting materials, for their education systems (Box 21.9). Such efforts could build on the initiatives of individual authorities at the entity and canton level to help analyse and review state-level education data and policy initiatives, such as the implementation of the common core curricula.
- **Establish a technical accreditation system for initial teacher education.** Both entities in Bosnia and Herzegovina could benefit from setting out specific accreditation criteria and quality standards that require providers of initial teacher education to demonstrate how they help candidates develop competencies specific to teaching. In particular, Republika Srpska's Ministry of Education and Culture should work with the Ministry of Scientific and Technological Development, Higher Education and Information Society, which is responsible for ITE, to develop

standards of professional competencies for teachers and integrate these into an accreditation process. While the FBiH already has accreditation procedures for higher education institutes, there are no specific criteria for ITE programmes, which should be considered to help raise the quality of teacher preparation.

- **Prioritise supporting students, especially those in the VET sector, to achieve basic numeracy and literacy skills.** Considering that students who struggle to master basic skills are more likely to attend vocational programmes in Bosnia and Herzegovina (OECD, 2020<sup>[92]</sup>), governments should take steps to prioritise reducing the number of low performers – both within VET programmes but also earlier in the education system when achievement gaps start to appear. This will help ensure that students are equipped with the skills they need to succeed in further studies or in the labour market.
- **Consider developing a state-level standardised assessment and set targets for improving student learning outcomes.** Many Western Balkan education systems have, or are developing, standardised assessment systems to help monitor the implementation of curricula and focus actors across the system on improving student learning standards. While it is important for Bosnia and Herzegovina to continue participating in international assessments such as PISA, TIMSS and PIRLS, which produce valuable information about the education system that can also be disaggregated to capture entity-level results, developing a state-level assessment instrument would provide more timely and contextualised data to help ensure that all students are achieving the common core learning standards. The data generated by assessments should be used to conduct research on the quality of educational processes and institutions.

### Box 21.9. Annual analytical reports on the education system: Germany and Canada

Every two years, Germany produces a national report on education that covers the entire German education system, from early childhood education and school education to vocational training, higher education and adult education. The data compare developments over time broken down by federal state (*Länder*) and compared internationally. Each report provides information about the general conditions, features, results and output of education processes. While these reports do not include assessments of the data and recommendations for system improvement, they are a valuable tool that provide consistent and reliable information across Germany's decentralised education system.

In Canada, the Pan-Canadian Education Indicators Program provides statistical portraits of the elementary, secondary and postsecondary education systems. Through a series of public materials, including tables, factsheets and reports, education data from Canadian education systems is brought together to summarise key trends data and compare provincial and territorial systems with state-level averages and international peers.

## Employment policy (Dimension 8)

### Introduction

Bosnia and Herzegovina's central government does not have competency over labour, employment and social policy, or social protection, which according to the Constitution fall under the remit of the two entities and the Brčko District. The Ministry of Civil Affairs of Bosnia and Herzegovina is assigned only a co-ordinating role when representing the economy's interests abroad. The possibility of working groups to

develop strategies at the state level has been discussed, as has the possibility of developing and adopting employment strategies at the level of both entities. In this dimension the state level and the two territorial entities are looked at separately. In the Federation of Bosnia and Herzegovina, the 10 cantons are highly autonomous in policy areas concerning employment (employment policy, education policy, welfare policies, etc).

Since the last Competitiveness Outlook assessment in 2018, progress has been uneven in the territories. Both entities have started to harmonise their regulatory framework for employment, but major efforts are still needed. RS has made moderate progress in tackling skills mismatches, while the FBiH has not made significant progress in this area. RS has made significant progress in the area of women's employment. Moderate progress has been made in strengthening the capacity of the public employment service (PES). Compared to other economies in the region, the regulatory and policy framework and the institutional capacity to address employment-related issues remain weak (Table 21.13).

**Table 21.13. Bosnia and Herzegovina's scores for employment policy**

Dimension	Sub-dimension	Score	WB6 average
Employment policy dimension	Sub-dimension 8.1: Labour market governance	2.1	2.6
	Sub-dimension 8.2: Skills	1.1	2.2
	Sub-dimension 8.3: Job quality	1.9	2.4
	Sub-dimension 8.4: Activation policies	2.4	2.9
Bosnia and Herzegovina's overall score		<b>2.0</b>	<b>2.6</b>

### State of play and key developments

**Table 21.14. Key labour market indicators for Bosnia and Herzegovina (2015 and 2019)**

	Bosnia and Herzegovina		WB6 average	EU average
	2015	2019	2019	2019
Activity rate (15-64)	54.6%	55.5%	61.0%	74.1%
Employment rate (15-64)	39.2%	46.4%	51.5%	69.3%
Unemployment rate (15-64)	27.7%	16.4%	16.3%	6.4%

Note: WB6 average rates are based on author's own calculations using simple averages. Unemployment rate in 2015 refers to the 15+ age group.

Source: (Agency for Statistics of Bosnia and Herzegovina, 2020<sup>[95]</sup>), *Labour Force Survey 2019*, [http://www.bhas.ba/data/Publikacije/Bilteni/2019/LAB\\_00\\_2019\\_TB\\_0\\_HR.pdf](http://www.bhas.ba/data/Publikacije/Bilteni/2019/LAB_00_2019_TB_0_HR.pdf); (World Bank and WIIW, 2020<sup>[96]</sup>), *Western Balkans Labour Market Trends 2020*, <https://wiiw.ac.at/western-balkans-labor-market-trends-2020-dlp-5300.pdf>; (Eurostat, 2020<sup>[97]</sup>), *Labour Force Survey data base*, <https://ec.europa.eu/eurostat/web/main/data/database>.

The activity rate of the population aged 15-64 was 55.5% in 2019, which was below the EU average and WB6 average (Eurostat, 2020<sup>[98]</sup>; World Bank and WIIW, 2020<sup>[96]</sup>).<sup>58</sup> In contrast to most economies in the region, the activity rate did not increase between 2015 and 2018 (World Bank and WIIW, 2020<sup>[96]</sup>). Over the same period the number of employed aged 15-64 increased constantly (by 13% between 2015 and Q2 2019) (World Bank and WIIW, 2020<sup>[96]</sup>). Between 2015 and 2019, the employment rate of those aged 15-64 increased by 7.2 percentage points, but remained well below the EU average (Eurostat, 2020<sup>[99]</sup>). In 2019, the employment rate in BiH was the second lowest in the region (after Kosovo). The activity rate and employment rate were higher in RS than in the FBiH (by 8.7 and 10.3 percentage points, respectively), and the unemployment rate was lower (by 6.7 percentage points) (Agency for Statistics of Bosnia and Herzegovina, 2019<sup>[100]</sup>).<sup>59</sup>

As a result of the COVID-19 pandemic, GDP in Bosnia and Herzegovina fell by 9.3% between Q1 and Q2 2020. The impact on the labour market has been sizeable, although less dramatic than the fall in GDP. The level of registered employed fell by 2.2% in Q2 2020 (equating to 18 500 fewer employed people) compared to Q2 2019, while in Q1 2020 employment grew by 1.1% compared to the previous year. Employment in Q2 2020 fell mainly in retail trade, manufacturing and accommodation, and food

services. In contrast, employment rose slightly in the health and construction sectors. The pandemic has reversed the previous trend of shrinking unemployment, and in July 2020 the number of registered unemployed had risen by 4.7% compared to the previous year. This brought the unemployment rate (according to administrative data) to 34.7% in July 2020, compared to 32.4% at the end of Q1 2020, the highest since December 2018. Youth unemployment remains about twice as high as the overall unemployment rate, while the share of long-term unemployed (those without employment for more than 12 months) is still around three-quarters of the total number of unemployed individuals (European Commission, 2018<sup>[101]</sup>).

The International Labour Organization (ILO) estimates that the COVID-19 pandemic constitutes an employment risk for 88% of informal workers. High-risk sectors in terms of exposure to the employment impact of COVID-19 are wholesale and retail trade, repair of motor vehicles, manufacturing, accommodation and food services, real estate, and administrative activities. In these sectors, the share of informal employment is 13%. The informal employment rate is highest (32%) in medium- to high-risk sectors, which include arts, entertainment, domestic workers, transport storage and communication. Some 14.4% of female informal workers and 37.2% of male informal workers work in these sectors. Most informally employed women (66.6%) work in the agricultural sector, which is at low-medium risk, as well as education, health, social services and public administration, which are also considered as low-medium risk (ILO, 2019<sup>[102]</sup>).

Measures were put in place to mitigate the impact of the crisis on workers. The FBiH covered minimum salary contributions from March 2020 until one month after the end of the emergency measures. In June, the FBiH adopted a Programme of Economic Stabilisation 2020-2021, which included measures to preserve jobs. The RS reserved funds from its Solidarity Fund to support employees directly affected by COVID-19. In both entities, one of two employed parents (as well as single parents) with children under the age of 10 could be released from work during the crisis period as a justified absence.<sup>60</sup>

### *Sub-dimension 8.1: Labour market governance*

As stressed by the European Commission in 2019, Bosnia and Herzegovina does not have a programme for the adoption of the *acquis*, or similar strategic document, as required under the SAA. This should be developed as a priority. BiH also does not have sufficient horizontal and vertical mechanisms to ensure that approximation with EU directives is properly made (European Commission, 2019<sup>[103]</sup>) The state level has no overview on how well legislation in the economy is aligned with EU directives.

The **regulatory framework** in FBiH consists of the Labour Law of 2016 and latest amendments from 2018.<sup>61</sup> This reflects the start of the harmonisation of domestic legislation with EU directives, mainly in the area of working time, pregnant women, workers' rights in case of mergers and acquisitions, and some health and safety issues.<sup>62</sup> There is still a long way to go to align the whole legislative framework in the area of employment. There is no legislative framework for temporary agency work.

A new Law on Occupational Safety<sup>63</sup> was adopted in FBiH on 1 October 2020 to replace a law enacted over 30 years ago, and to comply with EU law.<sup>64</sup> The new legislation foresees the establishment of a tripartite Council for Occupational Safety<sup>65</sup> to monitor, analyse and evaluate the occupational health and safety system and policy, as well as monitor the effects of the application of the law and feedback to the government of FBiH. The related strategy for occupational health and safety has not been adopted at the time of writing.

The Law on Labour of 2016 and 2018,<sup>66</sup> as well as the Law on Safety at Work of 2008 and 2010<sup>67</sup> and related rulebooks, form the pillars of the regulatory framework for employment conditions in Republika Srpska. Safety legislation is periodically updated to decrease (fatal) injuries at work.

The process of harmonising RS law with EU directives has begun, but it is not clear how close RS is to aligning with the EU *acquis* in the area of labour. The government considers that the *acquis* is stricter in many areas than current RS rules and has concerns over harmonisation given the different economic

contexts.<sup>68</sup> The new Labour Law of 2016 has reduced rigidity in hiring procedures and eased dismissals, although employers have still complained that the labour legislation is not sufficiently flexible (Bosnia and Herzegovina, 2019<sub>[104]</sub>). The share of those temporarily employed can be used as an indicator of the strictness of employment protection legislation (employers may prefer using temporary contracts to evade costs of rigidity). In BiH, the share of those temporarily employed is 16.1%, which is well below WB6 average (22.1%) in Q2 2019. The share constantly increased in FBiH between 2010 and 2018, but fell in the first half of 2019 (World Bank and WIW, 2020<sub>[96]</sub>). As there are no data for RS it is difficult to assess whether the change in law has had a positive impact on concluding permanent employment contracts. The labour legislation does not define the legal status of solo self-employed individuals and there is no regulation that would prohibit bogus self-employment. The self-employed need to register as entrepreneurs according to local rules. They must also be registered with the social security system (health insurance, pension and disability insurance, unemployment insurance). It is not clear how many self-employed individuals are actually registered as data on non-standard forms of employment are not collected.

Regarding **labour inspectorates**, in FBiH the federal administration and the cantonal administrations for inspection affairs – Labour and Occupational Safety Inspectorates – have the competence<sup>69</sup> to supervise implementation of the Law on Occupational Safety, as well as the regulations, technical regulations and standards related to occupational health and safety and general acts in the field of safety and health at work.<sup>70</sup> Federal labour inspectorates visit companies of interest to the FBiH, while cantonal inspectors carry out inspections in all other companies and entities. In addition to inspections at the employers' premises, labour inspectors consult employers and workers on the implementation of the law. The Ministry of Labour and Social Policies does not have insights into the budget of the federal and cantonal labour inspectorates, the co-ordination of different agencies at the federal and local level, nor access to monitoring data. The inspectors must inform the competent administrative bodies of deficiencies not specifically defined by existing legal regulations, and the inspectorates must co-operate with other administrative bodies, employers and employers' and workers' associations; however, there is no information on whether co-operation happens and is effective. In cases of misconduct and infringement of the labour law, inspectors can impose fines. The imposing of fines should be monitored, and activity reports published. Labour inspections are confronted with the challenge of a very high share of small and micro enterprises in both entities (like in other economies in the region). In 2017, there were around 30 000 SMEs (99.1% of all businesses) operating in BiH, with most (77.7%) micro enterprises (OECD, 2019<sub>[105]</sub>).

In RS, the labour inspectorate is one of 13 inspectorates within the administration for the inspection of jobs (Republika Srpska Inspectorate, 2021<sub>[106]</sub>).<sup>71</sup> There is no separate budget for labour inspectors. In 2019, there were 32 employees working as labour inspectors,<sup>72</sup> which equates to one labour inspector for 8 600 employees. Labour inspectorates carry out controls in the area of occupational health and safety (OHS) and employment conditions according to the labour legislation. They also keep records. Inspectors can give warnings and impose fines. Monitoring data indicate that irregularities are found in around 30% of inspections, while 10% involve sanctions for a minor offence.<sup>73</sup> There is no assessment or monitoring of the influence of labour inspectorates on employment and working conditions. There is also no evidence of systematic co-operation and file sharing with tax authorities, which are also key actors in reducing informal employment. There is no key strategy or action plan for labour inspectorates, but there are plans to set up a strategy.<sup>74,75</sup> In FBiH, there is no publicly available monitoring of the activities and results of labour inspectors.

Regarding the **employment policy framework**, an FBiH Employment Strategy (2018-2021) was prepared in 2018 but had not been adopted by parliament at the time of writing. However, in RS there is a policy framework through the Employment Strategy 2016-2020 and previous employment strategies.<sup>76</sup> The main focus of employment policies relate to public employment services and active labour market programmes (ALMPs) for the unemployed. In this area some progress has been made. Action plans from 2017 and 2018 included the objective to prepare reforms and to redefine the role of PES, which resulted in the formation of an inter-departmental working group that actively includes representatives of social partners. The reform process has stopped as it would also imply reforming the healthcare system for unemployed

individuals. However, progress on the draft law on health insurance could not be made (Bosnia and Herzegovina, 2019<sup>[104]</sup>). Progress has been made in creating partnerships between key stakeholders relevant for employment at the local level. The National Action Plan for 2019 aims to improve the link between education and employment (see Sub-dimension 8.2: Skills).

In RS, the statutory retirement age is 65 for men and 58 for women. The retirement age for women is fairly low by European standards (OECD, 2020<sup>[42]</sup>). To be eligible for an old-age pension a person needs to have been insured for 15 years. A full pension is available for those insured for 40 years. Combining work, old-age and disability pension is only possible until age 65 in RS. In the FBiH, a new Law on Pension and Disability Insurance entered into force in 2018, which gradually reduces the possibility of retiring early. An insured person is entitled to an old-age pension when they reach 65 years of age and have at least 15 years of insurance service. In 2018, an insured man was also entitled to an old-age pension when he reached 35 years and 6 months of pensionable service and was at least 60 years and 6 months old. The number of required pensionable years and minimum age are being increased to 39 years and 6 months and 64 years and 6 months by 2026. For women, the respective minimum length of pensionable service is being increased from 30 years and 6 months in 2018 to 61 years and 6 months by 2030, and the minimum age from 55 years and 6 months to 61 years and 6 months.

There is a social dialogue framework in both entities, but implementation is weak. In FBiH there is a legal framework on employees' rights to join a trade union and on employee councils.<sup>77</sup> The Law on Labour stipulates that collective agreements may be concluded as general (for FBiH), branch (for cantons or FBiH) and at the level of the employer. The Ministry of Labour and Social Policy is responsible for keeping a register of collective agreements concluded in the FBiH. At the time of writing, four collective agreements had been concluded at this level (in mining, electricity industry, postal traffic, and administrative bodies and judicial authorities). Information on collective agreements concluded at the cantonal level is not collected at the FBiH level.

**Tripartite social dialogue** in the FBiH takes place through the Economic and Social Council (at the territorial level and the level of the cantons) as an institutionalised form of social dialogue.<sup>78</sup> The most important issues previously discussed at the council include the need to conclude a new general collective agreement, and determining the minimum wage, taxes and social security contributions. The ILO is supporting BiH in strengthening the peaceful mediation of labour disputes (ILO, 2021<sup>[107]</sup>).

In RS, collective bargaining is conducted by representative trade unions and employers' associations<sup>79</sup> at company and sector levels.<sup>80</sup> A collective agreement has been concluded for the administration, health, education and culture, and social protection sectors, as well as for judges and municipal services. Social partners have failed to conclude a general collective agreement at the entity level. The Works Council Act<sup>81</sup> of 2001 foresees the possibility of establishing works councils at the company level in companies with 15 or more employees.<sup>82</sup> Collective agreements can be concluded only by trade unions.

Collective bargaining also takes place at the entity level within the Economic and Social Council. The law on the Economic and Social Council<sup>83</sup> and the Law on Labour regulate the role of the council in tripartite social dialogue in RS. The government and social partners are members of this council,<sup>84</sup> and there are two permanent working groups and an ad hoc working group. The Economic and Social Council has a network at local levels, and the social partners are experts in the area of employment.

One key task of the Economic and Social Council involves proposing the minimum wage level for the next year. The government then fixes the minimum wage on this basis. If the council cannot agree on a minimum wage, the government of Republika Srpska fixes the minimum wage unilaterally, considering wage development, economic growth and inflation.

### *Sub-dimension 8.2: Skills*

**Skills mismatch** represents a serious challenge for the BiH economy and labour market. The World Bank conducted its Skills Toward Employment and Productivity (STEP) employer survey in BiH between

September 2016 and March 2017.<sup>85</sup> More than half of the interviewed firms stated that general education systems do not equip students with workplace skills (e.g. attitude, discipline), nor the practical skills needed to satisfactorily perform a job. Students from science, technology, engineering and mathematics (STEM) fields at post-secondary and tertiary levels are overall better evaluated than the general education system at large; nevertheless, between 40% and 50% of firms found STEM graduates lacking the necessary skills. In BiH, the highest rated students are from the technical and VET (TVET) system; however, more than a quarter of the firms still found that TVET students lacked the necessary skills (World Bank and WIIW, 2020<sub>[96]</sub>). Firms also pointed to the lack of skills preventing them from hiring: 62% of surveyed companies reported difficulties in hiring due to lack of skills or experience when looking for workers in “non-routine” jobs, and 52% when looking for “routine” jobs (World Bank and WIIW, 2020<sub>[96]</sub>).<sup>86</sup> Thus deficits in the quality of the education system harms the employability of the working-age population and creates skills shortages, which prevents companies from growing.

The NEET rate among young people in Bosnia and Herzegovina declined from 27.7% in 2015 to 21.6% in 2018, slightly below the WB6 average (22.1% in 2018) (World Bank and WIIW, 2020<sub>[96]</sub>). The decline was stronger than on average in the Western Balkans, but still roughly twice the EU average of 10.5% (Eurostat, 2021<sub>[108]</sub>).

Lower education levels lead to a higher risk of in-work poverty. A European Commission report found that 36.1% of people in Bosnia and Herzegovina with a low education level were at risk of in-work poverty. The in-work poverty risk of those with tertiary level education was only half this rate, but still high at 18.8% in 2015 (Obradović, Jusić and Oruč, 2019<sub>[109]</sub>).

Skills governance is within the competence of the entities and the Brčko District of Bosnia and Herzegovina. FBiH has implemented some measures for young people to access the labour market. For example, to ease the school-to-work transition, the PES implements ALMPs aimed at helping young people gain their first work experience. In FBiH the Federal Employment Agency is not involved in conducting a skills needs survey among employers, as is done in other economies of the region, and little progress has been made to improve skills governance.

In RS, the Education Development Strategy for 2016-2021 aims to strengthen research-oriented higher education and better link higher education and the labour market. It identifies the perspectives and key obstacles for co-operation between higher education institutions and the business sector. To improve the employability of students, the accreditation of study programmes and higher education institutions is based on an analysis of employment opportunities and on employer surveys about the knowledge and competencies of graduates. When creating a plan for enrolling students in higher education institutions, the Ministry of Scientific and Technological Development, Higher Education and Information Society is guided by data from the Chamber of Commerce of Republika Srpska, the PES and the expressed needs of employers, and data on the number of students in individual study programmes. According to legislation in force since October 2020, employers are represented on the management boards of public universities. This represents an opportunity to better link curricula and the number of study places by educational field to the needs of employers in the future.

In RS, progress has been made in some areas of skills governance. The employment action plan for 2019 included activities to 1) improve the system for vocational guidance and career counselling through providing vocational guidance to pupils (implemented by the PES)<sup>87</sup>; 2) develop local councils for education and employment (including the PES and municipalities; this activity has been implemented<sup>88</sup>; 3) establish partnerships through direct co-operation with associations of employers, the economic chamber, trade unions, some ministries and units of local governments; and 4) develop an internship scheme in middle and high schools. Related activities involve providing necessary equipment to middle schools, training teachers, including companies in the provision of practical training, and the training of instructors from companies to work with pupils. The internship scheme is in the process of being implemented.

According to the World Bank’s STEP employer survey, about 31.9% of non-routine workers participated in on-the-job training: 28% in internal and 19.7% in external training. Participation in continuous training for

these workers was higher in BiH than in Albania, Kosovo and Serbia. The participation in training of routine workers (32.3% participated in on-the-job training, 30.2% in internal training and 11.6% in external training) was also higher than in Albania, Kosovo and Serbia (World Bank and WIW, 2020<sup>[96]</sup>).

To further **adult learning**, at the state level the Strategic Platform for Adult Education in the Context of Lifelong Learning 2014-2020 presents the strategic basis for the planning and operation of education and other competent authorities at all levels of government. The document is used to initiate, implement and co-ordinate activities in the field of adult education, in line with EU priorities, standards and trends in this area.<sup>89</sup> A strategic platform for a lifelong education approach was first adopted in 2014.

According to data provided by the competent education authorities in 2019, all competent education authorities in Bosnia and Herzegovina (Republika Srpska, ten cantons in the FBiH and the Education Department of the Government of the Brčko District) have enacted their own laws on adult education, thus completing the legislative framework in this area. This indicates the commitment of the competent education authorities to progress in adult education, and the acceptance and implementation of the concept of lifelong learning. There has also been progress regarding the development of strategic documents in the field of adult education. Most competent education authorities have either adopted or are in the process of developing their own strategy, or adult education has been integrated into the development strategies of their administrative units.<sup>90</sup>

Every competent education authority has adopted its own Law on Adult Education and appropriate bylaws. At the state level, the Council of Ministers of Bosnia and Herzegovina adopted two documents in 2014: Principles and Standards in the Field of Adult Education<sup>91</sup> and, as mentioned previously, the Strategic Platform for Adult Education in the Context of Lifelong Learning 2014-2020.<sup>92</sup> Due to a complex constitutional setup, implementation is uneven and varies across educational authorities depending on priorities, capacities, budget, etc.

In RS, an adult education strategy for 2021-2031 was developed in 2019 and is in the consultation process.<sup>93</sup> The proposed strategy is targeted at young people and adults aged 18 and above who have not completed primary education, which is highly relevant as a low level of formal qualification, and therefore an assumed low level of basic competences, increases the risk of being in poor quality or informal employment, or of being unemployed or inactive.

The RS Law on Adult Education<sup>94</sup> sets the framework for the certification and validation of informal and non-formal learning. Adults can take an exam at an examination centre to prove their knowledge, skills and competencies, regardless of how they were acquired. The law also foresees that an employer can organise various forms of training and additional training for employees to help them adjust to market demands and changes, and to new technological and work processes.

The PES of RS is implementing adult learning measures for unemployed individuals through co-operation with the Institute for Adult Education, set up in 2010. Professional training programmes for 46 occupations<sup>95</sup> were defined in 2010, and there is a commission at the Institute for Adult Education composed of representatives of the Chamber of Commerce, the Ministry of Labour, the Ministry of Education and Culture, and employers.

### *Sub-dimension 8.3: Job quality*

Regarding **quality earnings**, the overall in-work-poverty<sup>96</sup> rate was estimated at 24.5% in 2015, meaning that 237 943 employed persons earned less than EUR 104.60 per month and were at risk of in-work poverty. The at-risk-of-poverty threshold is about half of the minimum wage amount in RS and just over half in the FBiH. The in-work poverty rate of self-employed individuals (many of whom are informal workers) was 39%. The public sector offers higher wages and better working conditions than the private sector. According to a survey conducted for the Regional Cooperation Council in 2018, 40% of respondents would prefer to work for the public sector and 41% would prefer to work for public companies, while only 14%

would prefer to work for the private sector. There are no key strategies and action plans addressing very low incomes in BiH.

The average monthly gross wage in BiH was EUR 697 in 2018 (EUR 1 400 in purchasing power parity) which is higher than the WB6 average of EUR 656 (EUR 1 162 in purchasing power parity) (World Bank and WIIW, 2020<sup>[96]</sup>). There is no available analysis of the wage structure and its link with labour productivity. In FBiH, the government determines the minimum wage after consultations with the Economic and Social Council.<sup>97</sup> Similarly, in RS the minimum wage is fixed upon decision of the Government of Republika Srpska on proposal of the Economic and Social Council. The minimum wage was set at BAM 520 per month in 2020.

The employment rate of women increased from 29.5% in 2015 to 33% in 2018 and 35.6% in Q2 2019. The activity rate of women increased from 42.9% in 2015 to 44.4% in Q2 2019. There was a strong drop in the unemployment rate of women (aged 15+) from 30.7% in 2015 to 20.3% in 2018 and 18.8% in Q2 2019. Despite these recent improvements, the employment rate of women is still very low, at 10.2 percentage points below the WB6 average and 27.7 percentage points below the EU average. The employment rate for women was 19.1 percentage points lower than the rate for men in Q2 2019, while it was 17.5 percentage points lower than the WB6 average (World Bank and WIIW, 2020<sup>[96]</sup>). The share of women employed on a part-time basis increased from 8% in 2015 to 8.7% in 2018 and 10.3% in Q2 2019.

In terms of **policies to promote female employment**, the third Gender Action Plan 2018-2022 was adopted in 2018 and contains a wide range of highly relevant measures.<sup>98</sup>

In the FBiH there is no comprehensive strategy to promote the employment of women, and there has been no study on the employment barriers that women face, as has been carried out in RS. Nevertheless, women are targeted in some programmes. For example, women aged 40+ are a target group for the Federal Employment Agency, and there is a small entrepreneurship programme 2019 for women.<sup>99</sup> The participation of women in ALMPs is uneven and differs by type of programme. Within the Entrepreneurship for Youth 2019 programme (407 young participants in total), 34% were women, within the Entrepreneurship for All 2019 programme, women represented 22% of participants (out of 672 participants), and in the Second Chance 2019 programme, 48% of participants were women (out of 127 participants).

The FBiH Law on Labour contains certain provisions regarding maternity rights (e.g. the right to work part time until the child reaches the age of 2, for twins and for the third and each subsequent child), while other issues related to reconciliation of work and family life are not within the competence of the Ministry of Labour and Social Policy, but federal and cantonal ministries of education. Therefore, no information was provided for this assessment.

The FBiH Law on Labour contains provisions on the prohibition of discrimination on the grounds of sex in relation to employment conditions, recruitment, working conditions and all employment rights, education, training and advancement, promotion, and termination of employment contracts. However, it is not known how this law is implemented, and whether barriers exist for women to bring discrimination issues to court, nor whether there are specific legal procedures in the case of sexual harassment.

The Gender Centre of Republika Srpska conducted research on gender inequalities throughout the life course in 2016 (Gender Centre, 2016<sup>[110]</sup>). It addressed the recognition of unpaid house and care work in the home and pointed to strong patriarchal patterns of sharing housework and family care in RS. Women and men do not share equal parental responsibilities, which are largely undertaken by mothers, especially when children are small.<sup>100</sup> Almost half (44.3%) of fathers do not take on any obligation for a small child. In an effort to harmonise family responsibilities with workplace responsibilities, mothers with young children are most exposed to stress and fatigue. While there has been a shift in values for the new generation, a number of inequalities persist, and the double burden for women remains an issue for all age groups. The research highlights sectoral and occupational gender segregation in RS and, linked to that and to career breaks, a wage gap. There are also indications that female children in rural areas are particularly vulnerable to child labour.

Significant efforts have been made in RS to co-ordinate measures and programmes to reduce gender inequality across ministries.<sup>101</sup> A special report on the findings of the above-mentioned research, adopted by the Government of Republika Srpska in 2016,<sup>102</sup> contains wide-ranging and highly relevant recommendations on encouraging the take-up of paternal leave, increasing the supply of affordable family support services, and adapting gender sensitive school curricular and extracurricular activities to reduce stereotypes. These recommendations are in line with EU and OECD good practice and have led to the adoption of the Programme for Early Childhood Growth and Development 2016-2020, which aims to increase quality and access to preschool education in both urban and rural areas. Important progress has been made in tackling gender segregation through vocational guidance, which is a key approach for reducing gender segregation and the gender pay gap.<sup>103</sup>

In RS, the Law on Labour specifically regulates the employment relationship with domestic workers, as well as the minimum salary for this work in cash in the amount of at least 50% of the salary of the employees. This type of work arrangement prescribes the obligation to conclude a contract that regulates the rights and obligations of the contracting parties. While this law forms the legal basis for preventing informal employment in private households, it may be difficult to implement without additional incentives.

Women in Republika Srpska own around 30% of businesses.<sup>104</sup> In 2019, the Strategy for the Development of Women's Entrepreneurship of Republika Srpska for the period 2019-2023 was adopted. The strategy, backed by the Law on the Development of Small and Medium Enterprises, envisages financial support for women's education, as well as support for women's associations, women in crafts and women in rural areas.<sup>105</sup> The Strategic Plan for the Development of Agriculture and Rural Areas of Republika Srpska 2016-2020 incorporates a commitment to the promotion of gender equality, to the visibility of its principles and to the consistent application of these principles by the line ministry.<sup>106</sup>

Regarding employment policies for jobseekers, women are regarded as a vulnerable group and are targeted by the RS Employment Strategy 2016-2020. The Action Plan 2018 specifically introduced a measure targeted at female victims of domestic violence, women aged 55 (three years before reaching retirement age) and women from rural areas. Targeted measures have reached a low number of participants.<sup>107</sup>

#### *Sub-dimension 8.4: Activation policies*

**Public employment services** are organised at entity and Brčko District levels, and further decentralised at the cantonal level in the FBiH. The Employment Institute of FBiH co-ordinates the activity of the 10 cantonal PES, which are under the responsibility of the cantonal assembly. In Republika Srpska, the Employment Institute has 7 regional offices and 59 local branch offices. In the Brčko District, the Employment Institute is a department affiliated to the mayor's office. Entity-level PES are involved in the overall co-ordination and methodological development, while local offices are mainly responsible for the implementation of ALMPs and passive labour market policies. The Labour and Employment Agency of BiH co-ordinates the activities of employment institutes in the two entities and the Brčko District.

Some Bosnian regions have a local partnership for employment, which is formal co-operation between labour market actors, schools and key employers who share a common vision of local labour market development (Schärle, 2018<sub>[111]</sub>). These partnerships are important for implementing approaches to integrate vulnerable groups.

The high share of long-term unemployed in BiH is a key challenge. In 2015, 81.2% of those unemployed were long-term unemployed. This share had fallen to 76% in Q2 2019, but is still above the WB6 average of 67.4% and the EU average of 41.8% (Eurostat, 2020<sub>[112]</sub>; World Bank and WIIW, 2020<sub>[96]</sub>). Across the economy there are weaknesses regarding vacancy collection. Moreover, information on vacancies and jobseekers are not shared across the entities, which reduces the potential for effective matching and constrains labour market analysis (Schärle, 2018<sub>[111]</sub>).

In FBiH, the regulatory framework for the activities of the PES consists of the Law on Mediation in Employment and Social Security of Unemployed Persons<sup>108</sup> and the rulebook on records in the field of employment.<sup>109</sup> These fix the objectives of PES activities and the division of responsibilities between the federal level and the cantons. The cantons have autonomy in running the PES and implementing employment policies, while the main task at the federal level is to ensure that there is a mechanism for employment mediation in place that ensures the establishment of an unemployment benefit system.<sup>110</sup> The federal Employment Agency is tasked with co-ordinating employment services at the federal level. Cantonal employment services are responsible for collecting, exchanging and publishing data on employed persons seeking a change of employment, as well as other data that may be relevant for the performance of the basic activities of the employment service. The Ministry of Labour and Social Policies does not have an overview of the budgets of the federal Employment Service and the cantonal employment services, as determined by their financial plans. The number of actors in the field of employment policy in FBiH, and the variety of adopted policies, reduces the overall efficiency of the labour and employment sector and makes the whole system expensive and dysfunctional.

A strategy for strengthening the mediation function in PES in the FBiH has been formulated. Its main objectives are 1) the separation of active jobseekers from those registered solely for access to health care but who do not report to the PES every 45 days; 2) ensuring adequate counselling intensity and optimising the triage process, developing effective active employment measures, and improving co-operation with employers and other institutions; 3) the development of human resources, improving the performance management system, the development of modern IT support, and the positioning of public employment services as professional and relevant institutions in the labour market.

A profiling system was developed and fixed in the rulebook of 2018 that enables distinguishing three groups of jobseekers according to their employability and distance from the labour market, in line with OECD good practice.<sup>111</sup> An individual action plan is established for those who are unemployed. The Employment Service reassesses and classifies the level of employability of an unemployed person after every 12 months of continuous unemployment. It is advisable to look at longer periods of work history and to take a more differentiated view on employment barriers.

Regulations on the unemployment benefit system in FBiH have been adopted in 2001, 2005 and 2008, but there have been no recent changes. The right to cash benefits is acquired by an unemployed person who, at the time of termination of employment, has at least eight months of uninterrupted work or eight months with interruptions in the last 18 months. The amount of the cash benefit is 40% of the average net salary paid in the FBiH in the last three months before the termination of employment, as published by the Federal Bureau of Statistics, which is a rather low replacement rate. The duration of unemployment benefit receipt varies between 3 months (for those who have worked for less than 5 years) and 24 months (for those who have spent over 35 years in work). Health insurance for unemployed people is provided in accordance with the regulation on health insurance,<sup>112</sup> which sets incentives for inactive and informal workers to register with the PES. This would in principle call for implementing activation requirements for inactive and informal workers, and would require developing measures to support the transition from informal to formal employment, as well as measures to activate inactive workers. In the absence of a clear strategy to reach out to inactive and informal workers it would be better to move to a system of universal basic healthcare coverage. The strategy does not systematically offer activation services to inactive and informal workers, which is in conflict with the objective to raise employment rates and contradicts the principle of mutual obligation. Unemployment benefit recipients need to meet activation requirements, otherwise they get sanctioned. Activation requirements include the obligation to report monthly to the employment service, and to participate in group information sessions and job-search training. It would be advisable to monitor sanctioning. Unemployed people not receiving unemployment benefits, but receiving health insurance through their registration, need to report every 45 days. Unemployed people not receiving any benefit need to report every 120 days. Out of 323 600 unemployed people in 2020, 13 100 received unemployment benefit and 224 700 received health insurance (Employment Agency of FBiH, n.d.[113]).

In FBiH, pension and disability insurance are provided to an unemployed person who lacks up to three years of pension experience until the conditions for an old-age pension are met, in accordance with the relevant regulations. This contradicts OECD recommendations on reducing incentives for early retirement and eliminating early retirement elements in the unemployment benefit scheme (OECD, 2020<sup>[42]</sup>).

Social assistance in FBiH is provided on the basis of cantonal regulations. No information is provided on the level of social assistance nor on the implementation of the **mutual obligation principle** for social assistance recipients. There is no evidence, strategy nor plan for an integrated approach to the delivery of employment and social services for jobseekers with severe employment barriers. This approach is considered good practice in other EU Member States (Konle-Seidl, 2020<sup>[14]</sup>), and attempts have been made in some economies of the region.

**Active labour market programmes** are measures to help unemployed people find work. They include employment incentives, support for self-employment, training measures to increase employability (i.e. preparation for work training, vocational training, and advanced training for the needs of the labour market or a specific job), as well as the provision of appropriate information for unemployed persons and employers. In 2020, the main target groups for ALMPs in FBiH included young people, women over the age of 40, the long-term unemployed and other categories of unemployed such as people with disabilities, demobilised combatants, those from the Roma community, and families where no one is employed. However, the monitoring report of the PES for 2019 does not show a strong targeting of young people and women aged over 40. Moreover, the number of participants is low: in 2019, around 9 000 unemployed individuals participated in ALMPs,<sup>113</sup> and 6% of LFS unemployed (149 000 in Q2 2019<sup>114</sup>). Some 10% of ALMP funds are allocated to vocational rehabilitation for people with disabilities. There is an increase in the planned budget for 2020.

The Employment Strategy of Republika Srpska 2016-2020<sup>115</sup> is the key policy document that defines the basic activities and active policy measures of the Employment Institute of Republika Srpska (EIRS).<sup>116</sup> The number of staff in the EIRS has increased since 2015,<sup>117</sup> but the caseload is still extremely high, with more than 1 000 registered unemployed person per PES counsellor in 2019, approximately ten times higher than EU good practice when dealing with vulnerable groups.<sup>118</sup>

Progress has been achieved in developing and implementing new tools in RS. A profiling tool has been developed and is implemented via a 45-minute interview with all unemployed people. However, given the very high caseload it is not clear how this can be effectively implemented. The profiling is based on the following indicators: acquired qualifications, special knowledge and skills, work experience, personal characteristics, social and health opportunities, job search period, professional interests, motivation for active job search, and career management skills. Unemployed people are then segmented into three groups<sup>119</sup> depending on their assessed level of employability, and an individual action plan is developed. A follow-up is made after six months and the plan is revised if necessary. It would be advisable to have a more intense follow-up for those groups with severe employment barriers.

The IT system in RS has been improved to help follow-up on the progress of unemployed people. An application, Calendar of counselling and individual employment plan IPZ, was developed to monitor the effects of new methods of work. In September 2019, the customer relation management application was launched that aims to register unemployed people and employers' needs. Job-search clubs have also been carried out, in line with international good practice.

The number of collected vacancies in RS increased from 2 301 in 2015 to 3 458 in 2019<sup>120</sup>; however, this is still extremely low given the high number of registered unemployed. The Action Plan for Employment 2019 includes activities to establish an annual plan of co-operation with employers and to increase the quality and quantity of collected vacancies in the private sector. However, there is no evidence to show if employer services and the active collection of vacancies have been improved.

Some progress has been made in improving horizontal co-ordination between relevant stakeholders at the local level in RS. Seventeen local councils were formed covered by seven branch offices of the EIRS, with

support of the ILO.<sup>121</sup> These councils hold regular meetings with the aim of improving education and employment. One challenge will be to ensure sustainability after the end of the ILO project.

The RS Action Plan for Employment 2019 foresees activities to intensify counselling services for hard-to-employ jobseekers and to improve co-operation with social services at the local level. In 2019, support from international donors was also received to improve activities to support start-ups and entrepreneurship,<sup>122</sup> as well as youth employment programmes.<sup>123</sup> It will be a challenge to continue these activities and to ensure sustainable financing once donor support ends.

In RS, an unemployed person is entitled to unemployment benefits if their employment has been terminated without his/her request, consent or guilt in terms of labour regulations, and if they have worked at least eight months continuously with unemployment insurance contributions in the last 12 months, or 12 months with interruptions in the last 18 months. They need to register within 30 days to receive benefits. This contradicts international good practice of early intervention, where registration is required within a few days after becoming unemployed, or even when receiving dismissal notification. Benefit duration depends on the previous contribution period and varies between 1 month (12 months of previous employment) and 24 months (over 34 years of previous employment). Compared to international good practice, 24 months is a long period to receive unemployment benefit. There is a danger that this will be used as an early retirement tool or to pave the way to long-term unemployment if not combined with strict job-search requirements. The income replacement rate is 45% for those with less than 15 years of work experience, and 50% for those with more than 15 years of work experience. In 2019, there were 25 721 unemployment benefit recipients, an increase on 2015 and 2017 figures. Those receiving benefits represented 29.4% of all registered unemployed.

Unemployment benefits cannot be lower than 80% of the minimum wage in RS (based on full-time employment). Social protection is determined by the Law on Social Protection and is financed from public revenue provided in the budget of the entity and local self-government units. Certain social services in the mixed social protection system can be financed by donor funds, funds of legal persons or individuals, and contributions from citizens. There are no job-search requirements linked to the receipt of social protection, which contradicts good practice in the EU and OECD (OECD, 2015<sup>[115]</sup>; Konle-Seidl, 2020<sup>[114]</sup>). The number of social assistance recipients was 55 415 in 2018, with 51 727 receiving war disability benefits and 2 713 civil disability benefits.<sup>124</sup> It is not known how many of these are registered with the PES and how many have remaining working capacities.

In RS, those registered as unemployed were covered by health insurance until November 2019, when this scheme was reformed.<sup>125</sup> Since January 2020 the right to health insurance of unemployed persons who declare themselves not actively searching for work has been provided through the Health Care Fund.

Expenditure on ALMPs in RS has increased since 2017, from 0.11% of GDP to 0.27% in 2019.<sup>126</sup> However, this is below the OECD average of 0.36%. In 2019, there were 5 664 participants in ALMPs and a budget of BAM 25.4 million, representing only 6.4% of all unemployed. Between 2018 and 2019 the budget for ALMPs increased considerably (BAM 16.3 million for 5 136 participants in 2018).

In 2019, the main target groups of ALMPs in RS were children of fallen soldiers, unemployed demobilised soldiers, disabled war veterans, persons over 40 years of age, women victims of domestic violence and war torture, women from rural areas, persons in the unemployed register for more than six months, children of killed fighters with a university degree without work experience, other persons with a university degree without work experience, young people up to 35 years of age regardless of their level of education, Roma, and active jobseekers with secondary education. Activities undertaken include the promotion of self-employment, employment incentives and training measures. In total, about half of participants participated in programmes earmarked for target groups, although some groups saw low participation, for example the number of participants in the specific project for the employment of Roma people was very low in 2019 (33 people). In addition, only a small part of the budget was directed at training measures, and low-educated individuals seem particularly underserved.

The EIRS analyses and monitors the achieved effects of ALMPs, such as how many persons employed under the programme remained employed after the expiration of the mandatory employment period of 12 months, which is good practice. This is undertaken by checking the status of people employed under the programme in the tax administration database after the end of the subsidised period of employment. All data are publicly available (annual work reports are published on the EIRS website).

The Employment Strategy of RS 2016-2020 aims to strengthen the capacities of social enterprises to integrate unemployed individuals into the labour market. Objectives include the creation and adoption of a platform for social entrepreneurship to strengthen social cohesion and integrate vulnerable groups into the labour market, the adoption of a corresponding law, and concrete support for the establishment of social companies.

#### *Cross-cutting policy areas: Informality*

The share of informal employment in total employment was 30.5%, and 17.4% if excluding agriculture, in 2019 (ILO, 2020<sup>[31]</sup>). Among women informally employed, 16% were employees, 55% were own-account workers, 19% were contributing family members and the rest were employers. Among men, 27% were employees, 51% were own-account workers, 5% were contributing family members and the rest were employers.

In FBiH, the reformed Law on Labour<sup>127</sup> introduced the rule that work contracts must be fixed in a written form, that employment needs to be registered and that proof of social security contributions must be provided within 15 days of signature of contract. In 2016, the rulebook for the implementation of Labour Law was adopted.<sup>128</sup> In order to limit the use of informal work, the rulebook sets the obligation to keep daily records of workers and those engaged in work with the employer. This should help detect informal work and in particular “envelope wages”, which involves workers working and being paid for more hours than they are contracted for to avoid minimum wage and/or social security contributions. In Germany for example, according to the minimum wage law, there is an obligation for daily time records for each employee and these are controlled during labour inspections (General Customs Directorate of Germany, 2021<sup>[116]</sup>).

In RS, no strategy addressing an informal employment reduction framework was established during the review period. The government has argued that wage increases were intended to increase the incentive to work in the private sector. It should however be considered that this only works if productivity is increased accordingly, otherwise higher wages may set incentives for employers to offer envelope wages, which increases informal employment. The RS government amended the Law on Income Tax in 2016 to increase the non-taxable salary threshold to 500 BAM per month.<sup>129</sup> The main intention of this measure is to reduce the tax burden on work and to direct the funds available through the application of this regulation to increase the net salaries of employees. On 13 June 2019, the Law on Incentives<sup>130</sup> was approved, which enables employers to receive a refund of paid contributions of up to 70% of the paid amount for a possible increase of the non-taxable part of the salary.

#### *Cross-cutting policy areas: Brain drain*

Well-educated individuals are most likely to migrate from Bosnia and Herzegovina, and their emigration rate was over 40%, higher than the rate in Serbia, Montenegro and Albania. Migration was also high among low-educated individuals, while medium-educated individuals are significantly less likely to migrate (World Bank and WIIW, 2020<sup>[96]</sup>).

For RS, labour mediation abroad is realised according to the established procedure and regulations, in co-operation with the BiH Labour and Employment Agency, for economies with which an interstate employment agreement has been signed. The PES in Bosnia and Herzegovina places workers abroad, and employment agreements have been signed with Slovenia, Serbia and Qatar. There is also a signed agreement on mediation regarding the employment of workers from Bosnia and Herzegovina in Germany

for a certain period of time, which applies only to the employment of medical staff (caregivers). Most of the mediation for foreign economies in 2018 and 2019 was related to Slovenia and Germany.<sup>131</sup>

The EIRS assumes that migration negatively affects the labour market. However, there is no strategy in place to mitigate the negative effects of migration.

### ***The way forward for employment policy***

The following recommendations are made for all entities and the state level, according to the area of responsibility:

- **Continue efforts to align labour law and OHS regulation to EU directives.** Develop the regulatory framework for non-standard forms of employment (including self-employment, and platform work).
- **Implement adult learning programmes for low-skilled adults.** This includes measures for remedial education. Set incentives for companies to promote continuing training at the company level, in particular at the mid-skills level, to help employees adapt to technological change. Measures implemented in other economies include subsidies to employers, financed study leave, tax credits and individual learning accounts (OECD, 2019<sub>[117]</sub>). The strategy for adult learning should foresee counselling activities for employees and employers, in particular for SMEs, as in Portugal through the Qualifica Centres (OECD, 2019<sub>[118]</sub>).
- **Regularly conduct analyses of wages by sector, gender, educational level and occupation.** Improve labour market monitoring data and include data on poverty, the employment situation of specific vulnerable groups (e.g. Roma), informal employment, migration and working conditions, and wage development. Labour productivity should be part of a wider monitoring system. Collect information on non-standard forms of employment.
- **Activate disability pension recipients who have the capacity to work and include them in vocational rehabilitation measures.** Carry out an analysis regarding to what extent social protection supports inactivity. In OECD economies, activating people who receive welfare benefits, including those with reduced work capacities, and designing welfare benefits accordingly has been a central policy area (OECD, 2015<sub>[115]</sub>; Konle-Seidl, 2020<sub>[114]</sub>).<sup>132</sup>
- **Strengthen the capacities of the PES** to align with EU and OECD good practice by:
  - Reducing the caseload of PES workers by increasing the number of staff.
  - Continuing efforts to co-operate with relevant stakeholders, in particular chambers and employers at local levels.
  - Furthering efforts to improve employer services and vacancy collection.
  - Increasing efforts to integrate vulnerable groups into the labour market.
  - Carrying out regular surveys on the employability of participants after programme participation.
  - Developing a concept for adult vocational guidance for adults. This could be done by the PES and/or other relevant institutions.
- **Continue efforts to increase the employment rates of women.** Increase access to affordable and quality childcare and implement measures to reduce gender stereotypes in education and the workplace.
- **The FBiH should increase the transparency of the work of labour inspectors at entity and cantonal levels.** It should establish a strategy for the whole FBiH and bring cantons together. Given the administrative complexity, to increase transparency FBiH should also intensify the exchange of practices between cantons and introduce a benchmarking system of inputs and outputs of labour inspections at the entity and canton level.
- **The Federal Employment Agency of FBiH should report to the Ministry of Labour on the budgets for running the PES and for ALMPs at the entity and cantonal level.** A good practice

example can be found in Switzerland, where cantons have a great deal of autonomy, and where the State Secretary for Labour and the Economy (SECO) takes a co-ordinating role. SECO decides on common ALMPs, which can be supplemented by cantonal programmes. A benchmarking exercise is used to help with performance management in the context of the decentralised PES in Switzerland (Eftheia, Budapest Institute and Icon Institut, 2018<sup>[119]</sup>; Duell et al., 2010<sup>[120]</sup>).

- **RS should strengthen co-operation between labour inspectorates and tax authorities.** Good practice from other economies shows the benefits of close co-operation and file sharing. In Norway for example, co-operation between different agencies has been formalised, and an internal database to facilitate information exchange between joint offices was created in December 2016. A National Interagency Centre for Analysis and Intelligence was also set up to undertake threat assessments for joint strategic measures against economic crime, for example by delivering intelligence reports, and help decision makers analyse cross-economy trends (European Commission, 2020<sup>[121]</sup>).
- **Increase incentives to work longer.** Good practice in EU and OECD economies shows that policy reforms seek to lengthen working lives, often up to the age of 67 for both men and women, and set incentives for people to work even longer (OECD, 2020<sup>[42]</sup>).
- **Support social security contributions for household and care workers employed by private households.** Other economies, such as France, have a voucher system for employing household and care workers and support for their social security contribution (Box 21.10).

#### Box 21.10. Universal Service Employment Voucher (Chèque Emploi Service Universel, CESU) in France

The CESU was launched in 2006 as part of a plan for the development of personal services. It replaces the service employment voucher set up in 1994, which was limited to traditional personal services such as housework, childcare in the home and care for the elderly. One major objective of this voucher is to assist in the fight against undeclared work in these services.

There are two formats of CESU:

- The CESU declaration (simply known as “CESU”) is a tool (paper or online) for the declaration of employment to be completed by a personal household service user/employer. The personal household user worker is paid via cash, bank cheque etc., or a pre-financed CESU.
- The pre-financed CESU (“CESU *préfinancé*”) is a voucher that is totally or partially prepaid by a company, local authority etc., and used by the service user/employer as a means of paying a personal household service worker.

The CESU also enables the user to receive a tax benefit, which was extended to non-taxable active persons from 2007 and to inactive persons from 2017. The list of services eligible for tax reduction (small maintenance tasks, yard work, study help, ICT or administrative assistance, etc.) were also broadened in 2017.

## Science, technology and innovation (Dimension 9)

### Introduction

Bosnia and Herzegovina continues to underperform in the area of science, technology and innovation, and, together with Kosovo, has the lowest overall score in the region (Table 21.15). In particular, business-academia collaboration remains nascent, whilst some improvements have been made in the overall STI framework.

**Table 21.15. Bosnia and Herzegovina's scores for science, technology and innovation**

Dimension	Sub-dimension	Score	WB6 average
Science, technology and innovation dimension	Sub-dimension 9.1: STI system	1.7	2.4
	Sub-dimension 9.2: Public research system	1.2	2.0
	Sub-dimension 9.3: Business-academia collaboration	0.9	1.6
Bosnia and Herzegovina's overall score		1.3	2.1

### State of play and key developments

The policy framework for science, technology and innovation in Bosnia and Herzegovina remains at an early stage and is highly fragmented across the different entities. The lack of consistent statistical data adds to the complexity in assessing the overall performance of the sector. Some progress has been made in aligning the STI framework with EU standards, which may result in more comprehensive policy measures in the medium term. The public sector research system remains chronically underfunded, and few incentives are provided to foster business-academia collaboration. However, some efforts have been made to broaden the institutional support structure.

#### *Sub-dimension 9.1: STI system*

In line with the constitutional set-up of Bosnia and Herzegovina, **STI strategy** development predominately falls within the competency framework of Republika Srpska, the Brčko District and the cantons, while the Federation of Bosnia and Herzegovina mainly exercises a co-ordinating role. This has led to a scattered and decentralised approach to STI policy making without clearly identified and harmonised policy priorities. Private sector consultation is not the norm in STI policy development and there are no systemic and comprehensive monitoring and evaluation practices in place.

At the state level, the Revised Strategy on Scientific Research (2017-2022) provides the fundamentals of scientific research and the co-ordination of internal and international co-operation, but falls short of addressing academia-industry collaboration or innovation. In Republika Srpska, STI policy is defined in the 2017-2022 Strategy of Scientific and Technological Development; however, implementation progress of the strategy remains unclear. In FBiH, a draft STI strategy prepared in 2012 has never been adopted. There are plans to prepare a smart specialisation strategy in BiH; however, development remains at an early stage. In November 2020, the Council of Ministers approved the composition of the working group in charge of preparing the strategy.

The **institutional framework** is highly decentralised. At the state level, the Ministry of Civil Affairs co-ordinates STI policy across Bosnia and Herzegovina and represents the economy internationally. There are dedicated ministries in charge of STI policy making at the entity and canton level, as well as a competent department in the Brčko District. However, co-ordination of STI policy remains limited given the lack of a single body accountable for STI policy development. There is also no dedicated innovation or technology agency supporting STI policy implementation. However, in RS there are preliminary plans to establish an Innovation and Science Fund, and assessment studies are currently being planned.

Legislation on the fundamentals of scientific research activity and the co-ordination of scientific research co-operation, which has been in place since 2009, provides the overarching **regulatory framework** for

STI in Bosnia and Herzegovina. Republika Srpska adopted its own STI legislation in 2017, as have three cantons within the FBiH since the last assessment. In contrast, a legislative framework defining STI policy at the FBiH entity level has been pending adoption since 2017. Unified legislation regulating intellectual property (IP) is in place and broadly in line with EU standards, but it is not designed to encourage business-academia collaboration or the commercialisation of IP. While the law enforcement of IP has been strengthened in recent years, co-operation across institutions remains ad hoc, and capacity is limited.

The Ministry of Civil Affairs co-ordinates Bosnia and Herzegovina's **international collaboration** with regards to STI, co-financing (in close co-ordination with entities and cantons), researcher mobility and applications for international research programmes. BiH participates in the EU's Horizon 2020 programme,<sup>133</sup> and shows relatively good performance: by the end of 2020, 67 projects involving 113 Bosnian entities had been approved, receiving EUR 8.56 million in funding, with a rate of retained proposals of 12.3% (only slightly below the Horizon 2020 associated countries' average of 13.5%) (European Commission, 2021<sub>[123]</sub>). BiH also participates in the Western Balkans Enterprise Development and Innovation Facility (WBEDIF), which has made two investments through the Enterprise Expansion Fund (ENEF) to Bosnian entities. BiH is a full member of European Cooperation in Science and Technology (COST)<sup>134</sup> and has "national information point" status in Eureka,<sup>135</sup> with the application for full membership expected to be submitted soon.

Bosnia and Herzegovina participates in the European Research Area and its policies are broadly **aligned with EU STI policies**. It also participates in the European Strategy Forum on Research Infrastructures (ESFRI), but only Republika Srpska has developed a roadmap for research infrastructure to date. In addition, most BiH higher education institutions have endorsed the EURAXESS<sup>136</sup> Code of Conduct, and three universities have adopted the EURAXESS Human Resources Strategy for Researchers. In contrast, Bosnia and Herzegovina does not participate in the European Innovation Scoreboard due to weak statistical data collection. However, efforts have been made to intensify data collection, which is expected to improve the monitoring and evaluation of STI-supportive policy measures across entities going forward.

### *Sub-dimension 9.2: Public research system*

The **institutional structure of the public research system** remains fragmented, and the lack of a unified and comprehensive framework has hindered the development of a functioning system. The institutional and legal framework governing higher education institutions (HEIs) and research and development institutes (RDIs) predominately rests at the entity and canton level, with the Ministry of Civil Affairs co-ordinating international collaboration. Amid disputes over competencies regarding HEIs and RDIs, there is no harmonised approach to performance management in the sector, and no cross-entity accreditation of HEIs is in place.

The public sector research system remains significantly underfunded, and gross domestic expenditure on research and development (GERD) has remained unchanged at around 0.2% of GDP in recent years (UIS, 2021<sub>[124]</sub>). **Public research funding** is predominately based on institutional funding. Within the FBiH, funding is evenly allocated across HEIs in all cantons, resulting in significantly underfunded HEIs in key urban areas with larger numbers of students. In addition, budget allocations have been significantly cut amid the outbreak of the COVID-19 pandemic. In both entities, some progress has been made in introducing competitive performance-based funding for the public scientific research sector, albeit small-scale at around EUR 250 000 in the FBiH and EUR 800 000 in the RS in 2019. However, in 2020 funds were re-allocated due to COVID-19. Some competitive project-based funding is available to researchers, which is positive; however, the methodology for project selection does not reflect international best practice of a two-stage, independent evaluation process.

Fostering research excellence does not prominently feature in any of Bosnia and Herzegovina's strategic STI frameworks. Despite increasing brain drain in the sector, there are no measures in place to stimulate the involvement of the diaspora. As a result, **human resources for research and innovation** remain at low capacity. With 667 researchers per 1 million inhabitants, Bosnia and Herzegovina significantly

underperforms compared to regional peers, and a trend of brain drain has become evident in recent years. Particularly in important disciplines such as medical and health, the number of researchers has dropped significantly (UIS, 2021<sub>[125]</sub>), while no targeted measures have been developed to counterbalance this development. However, there are some support measures to strengthen the capacity of researchers at both entity levels, primarily in the form of financial support to facilitate researchers' participation in international programmes or study visits. In contrast, opportunities provided for researchers to develop their technical skills are limited. Efforts have increased to raise awareness and promote scientific research as a profession. For instance, in 2018 RS introduced financial rewards for “best in class” scientific research published in international journals. It also celebrates a Science Festival each year. There are initial preparations underway to develop a Scientific Research Information System in BiH, which will contribute to enhancing scientific research.

### *Sub-dimension 9.3: Business-academia collaboration*

Integration of scientific research and the private sector is limited in BiH, and the **collaboration promotion framework** remains at a nascent stage. The STI policy framework recognises the need to stimulate academia-industry collaboration but falls short of a comprehensive and concrete set of measures across all institutional levels. As a result, investment in research and development by the private sector is significantly below regional peers, and technology absorption capacity is low.

There have been no innovation voucher schemes or competitive collaboration grant schemes implemented in Bosnia and Herzegovina, and the scope of **financial incentives for collaboration** remains low. Some support mechanisms for the development of a knowledge economy exist; however, these are predominately geared towards the private sector and do not require the participation of academia. In Republika Srpska, the pilot Synergy Programme, aimed at increasing technology transfer and absorption and raising awareness about the potential of academia-industry collaboration, is currently underway. During the first call of this programme in 2019, five projects received financing of around EUR 25 000 each. There are no other financial incentives, such as STI-conducive procurement practices. Similarly, **non-financial incentives for collaboration** are under-developed. There is no legislation in Bosnia and Herzegovina to encourage technology transfer and commercialisation by defining the ownership of intellectual property and the royalty split for publicly funded research, although some centrally co-ordinated support is provided for patent application. Researchers are still assessed against conventional performance criteria and there are no dedicated researcher mobility schemes in place, other than support to participate in international networks and scholarships to facilitate doctoral and post-doctoral research. Nevertheless, by 2019, 41 Bosnian researchers had benefitted from the support provided under the MSCA.

Bosnia and Herzegovina has made progress in developing an infrastructure of **institutional support for collaboration**. A number of science and technology parks operate throughout the FBiH. Most recently, the Posušje Technology Park Foundation was established in 2019, but is not yet fully operational. In Republika Srpska there are plans to build a science and technology park in line with the roadmap for scientific infrastructure, and the Innovation Centre Banja Luka continues to play an important role in supporting innovation more broadly. Whilst the expansion in the number of science and technology parks is a welcoming trend, in reality they often primarily serve as incubation centers for companies not always linked to scientific research. However, a good example of public-private-academia collaboration is the Coordinate Measuring Machine (CMM) Competence Centre in Mostar, which was established in 2019 (Box 21.11).

### Box 21.11. Coordinate Measuring Machine (CMM) Competence Centre

The Coordinate Measuring Machine (CMM) Competence Centre was established in 2019 with support from the United Nations Industrial Development Organization (UNIDO), Slovenia and a Slovenian private company. Located at the Faculty of Mechanical Engineering, Computing and Electrical Engineering of the University of Mostar, the centre provides internationally recognised calibration and testing services, and advanced research in the field of product quality control in collaboration with local industrial companies. The CMM will enable the University of Mostar to build capacity in the area of quality control and precise measurements of complex geometries, and provide expertise sought after by local industries. Inspecting the quality of products and services by using co-ordinate measuring machines is of crucial importance for some of key BiH industries, such as the automotive, aviation, pharmaceutical and metal industries, which suffer from a lack of precise geometrical measurements. Therefore, the new centre is expected to benefit the entire economy in terms of providing new opportunities and enabling access to EU and international markets through internationally recognised measurements and calibrations.

Source: (UNIDO, 2020<sup>[126]</sup>), *Strengthening the quality system of technology and industrial products and services in Bosnia and Herzegovina: Coordinate Measuring Machine Competence Centre*, <https://open.unido.org/projects/BA/projects/160112>.

### ***The way forward for science, technology and innovation***

Bosnia and Herzegovina's STI policy framework remains below potential, and absorption capacity for technology and innovation is limited amid a highly fragmented institutional set-up, the absence of a clear co-ordination mechanism that would help identify policy priorities, and a lack of investment. Some positive steps include an emerging strategic framework to develop STI policy and several pilot schemes to stimulate collaboration between academia and the private sector.

Specifically, Bosnia and Herzegovina should consider the following priorities:

- **Align strategic priorities and co-ordinate implementation.** Bosnia and Herzegovina should look to harmonise its strategic framework for STI across all institutional levels to identify joint priorities and develop action plans for implementation. Timely and co-ordinated preparation of the economy's first Smart Specialisation Strategy will be imperative to address existing obstacles to STI development.
- **Increase investment in the public sector research system.** Funding availability to strengthen the capacity of scientific research needs to be increased significantly to enable Bosnia and Herzegovina to attract contributions from the research community. An increased focus on performance-based funding will further increase the quality and outcomes of the public research system. In the long term, such measures are expected to pre-empt increasing brain drain in the research sector.
- **Integrate the private sector.** Increased participation of the business community in STI policy development will contribute to the development of more targeted policy measures aimed at academia-industry collaboration. If coupled with well-designed incentive mechanisms, Bosnia and Herzegovina could leverage its existing institutional support structure to stimulate co-operation between research and business communities.

- **Strengthen the enforcement of IP legislation.** Steps should be taken to increase the capacity of enforcement institutions, including by providing specialised training. Awareness-raising activities about the importance of IP among the general public and the research community will further help encourage patenting.
- **Improve the collection of statistical data on science, technology and innovation.** Streamlining data collection and capacity across all institutional levels will improve the monitoring of the progress of STI policy implementation. Bosnia and Herzegovina should also work towards inclusion in the European Innovation Scoreboard.

## Digital society (Dimension 10)

### Introduction

Bosnia and Herzegovina scores below the Western Balkan six average across all digital society indicators, and has the lowest overall score among the six economies, as shown in the Table 21.16. The economy has been working to improve its broadband development framework since 2018, moving closer to the adoption of a broadband strategy agreed upon by all government members, which is expected to conclude during 2021. The adoption of the strategy, if coupled with a budgeted action plan, could deliver the promise of an enabling environment that stimulates private sector investment in network infrastructure, and help to leverage donor financing to support rural broadband development, as in other WB6 economies. BiH has achieved consensus among state and entity governments on the adoption of the Strategic Framework for Public Administration Reform 2018-2022 (SFPAR), which is the first significant step towards digital government development. However, agreement on a budgeted action plan is also required to make tangible progress, as the economy is lagging behind the EU and the WB region by only offering a small number of non-transactional e-services to its citizens and businesses. The absence of an overarching ICT strategy has been flagged in this assessment, as much as in the previous round, as a factor holding back ICT sector development. Despite the fact that ICT companies in Bosnia and Herzegovina have significant potential to grow and open new workplaces, they are challenged by the deficit of highly skilled ICT professionals. The situation is exacerbated by the weaknesses of the BiH educational infrastructure, especially when compared to the educational systems in some neighbouring economies, which are gradually increasing their output of ICT professionals. BiH has done little to align with the EU's digital competence framework for students and professionals, and opportunities for practical ICT training and lifelong learning are limited. Progress has also been slow in improving the legal framework and changing public mindsets in matters of personal data protection, e-commerce consumer protection and digital security risk management. Relevant legislation and regulations are perpetually under preparation, and there are no resources set aside for a domestic computer emergency response team and international collaboration in the fight against cybercrime.

**Table 21.16. Bosnia and Herzegovina's scores for digital society**

Dimension	Sub-dimension	Score	WB6 average
Digital society dimension	Sub-dimension 10.1: Access	1.8	2.9
	Sub-dimension 10.2: Use	1.8	2.4
	Sub-dimension 10.3: Jobs	1.7	2.3
	Sub-dimension 10.4: Society	1.5	2.1
	Sub-dimension 10.5: Trust	1.7	2.2
Bosnia and Herzegovina's overall score		1.7	2.4

### State of play and key developments

#### *Sub-dimension 10.1: Access*

Bosnia and Herzegovina has not made significant progress in improving the policy framework for **broadband infrastructure** development since the 2018 assessment cycle. The Policy on the Electronic Communications Sector for 2017-2021, which is aligned with the Digital Agenda of Europe, was adopted in 2017 by the BiH Council of Ministers, but not formally implemented in practice. Given that a concrete action plan was never agreed among the entities and the state, the policy remained a high-level, visionary document. In the meantime, the development of broadband networks across Bosnia and Herzegovina is fuelled by private sector investment based on market competition. Fixed broadband penetration in Bosnia and Herzegovina was 22.6% in 2019, which is the second highest in the region next to Montenegro (28.47%), but still lagging behind EU Member States (ITU, 2019<sub>[127]</sub>). However, the existing framework does not facilitate network infrastructure investment in rural and remote areas. Additionally, rules and

procedures across entities and different levels of local administration, especially in the FBiH, are not fully harmonised, and network infrastructure development cost reduction models are not yet in place, in accordance with the EU directive on measures to reduce the cost of deploying high-speed electronic communications networks (2014/61/EU). The development of a broadband strategy remains one of the most pressing issues for Bosnia and Herzegovina's broadband development. A working group was formed in 2017 to prepare such a strategy, which is currently in the phase of final adjustments at the level of participating institutions. Positively, representatives of all government entities were invited to take part in this working group and appointed by the Decision of the Ministry of Transport and Communications of BiH, which increases the potential for the practical implementation of the strategy once adopted.

The Communications Regulatory Agency (RAK) has developed a Strategic Development Plan for 2019-2021, as set out in the Policy on the Electronic Communications Sector for 2017-2021, which describes several projects (RAK, 2019<sup>[128]</sup>). The agency has planned a broadband mapping study to identify "white, grey and black areas"<sup>137</sup> in BiH, in collaboration with relevant stakeholders (i.e. network infrastructure providers). The plan also includes a needs' assessment for financing the development of broadband infrastructure in rural and remote areas. The agency intends to launch a public call to identify and select the most suitable financing model for broadband infrastructure development in "white" areas.

The **ICT policy regulatory framework** is not completely aligned with the EU Regulatory framework. The existing Law on Electronic Communications is outdated, and the new Law on Electronic Communications is still under preparation with an undefined adoption timeframe. Major legislative and regulatory activities are needed to align Bosnia and Herzegovina's regulatory framework with the EU framework.

A TAIEX mission was organised that involved experts from Belgium and Lithuania working with the BiH Ministry of Communications and Transport and RAK to help harmonise the Law on Electronic Communications with EU legislation. The harmonisation process prioritises the transposition of the European Electronic Communications Code into BiH legislation. Republika Srpska's government nominated a working group representative for the preparation of the new law, but this person was not designated by the Decision on Appointment of the Working Group for the Drafting of the Law on Electronic Communications. RS claims that entities' participation in the adoption of important legislation, such as the new Law on Electronic Communications, through an e-consultation process with stakeholders does not ensure the applicability and implementation of the law.

RAK enjoys institutional independence, but its financial independence is not yet fully ensured, despite improvements. The director of RAK is appointed by the Council of Ministers, which does not ensure transparency and openness, nor provide sufficient safeguards against political and economic interference (European Commission, 2019<sup>[4]</sup>). In March 2019, the Council of Ministers adopted the decision on the conditions for the provision of 4G network services in the economy, and the respective licences were issued by RAK for the three mobile operators in BiH, who launched the service in April 2019 (ITU, 2020<sup>[129]</sup>). Given the late adoption of 4G and the expected delay in adopting 5G regulations, the assignment of a spectrum for 5G is not expected soon.

Bosnia and Herzegovina has made some progress in adopting a framework for **data accessibility**. RAK has responsibility for the adoption of any regulatory obligation concerning online communication and data related to alignment with the EU *acquis*. The SFPAR, adopted by all members of government, and the Open Government Partnership (OGP) Action Plan for 2019-2021 both refer to data accessibility and openness. While the SFPAR is not yet being implemented, the OGP Action Plan stipulates opening official statistics by the Agency for Statistics of Bosnia and Herzegovina and opening data on public procurement by the Public Procurement Agency. Under this commitment, the Agency for Statistics has increased the availability, openness and use of official statistical data, ensuring that all data published by the agency are free, in a machine-readable format under the open licence, and constantly available on the agency's website.<sup>138</sup> BiH has also launched a National Summary Data Page<sup>139</sup> for publishing essential macroeconomic data in both human and machine-readable formats, which is hosted by the Central Bank of BiH on its website. In December 2019, the RS government adopted the Strategy for the Development

of e-Government 2020-2022, which also includes objectives on data accessibility and the obligation of public sector institutions to exchange data or provide their data for re-use and e-service creation. The implementation of this strategy, however, has not begun as financial resources have not yet been allocated. The PAR Co-ordinator's Office conducted an online survey in June 2020, in which 57 state institutions participated. The survey findings showed that the average fulfilment of proactive transparency standards (publishing all data and information of public importance) is 64.04% among participating institutions; 11 institutions met 80% of the standards and only 4 institutions met 100% of the standards (one of which was the Agency for Statistics).

### *Sub-dimension 10.2: Use*

**Digital government** has been developing unevenly across the two entities in Bosnia and Herzegovina. The Policy of the Information Society Development (2017-2021), adopted by the Council of Ministers in 2017, outlines the principles of information society development, but does not specifically address the promotion of digital government and the development of e-services by the public sector. Some aspects of digital government development are included in the SFPAR, which was created by the PAR Co-ordinator's Office and adopted by the Council of Ministers in June 2018. The SFPAR was a condition for Bosnia and Herzegovina's EU membership application and is donor funded through the Public Administration Reform Fund.<sup>140</sup> The FBiH adopted the PAR and its Action Plan on 8 October 2020, while RS adopted it two years later, in June 2020 (European Commission, 2020<sub>[39]</sub>). The entity government of FBiH instructed the Institute for Public Administration of the Federal Ministry of Justice to engage in follow-up activities with the cantons to harmonise legislation regarding the civil service, and to draft the Rulebook on Internal Organisation. In the meantime, the entity government of RS has been implementing its own policy document for e-government since 2009, and recently adopted the Development Strategy of e-Government for 2019-2022, which is not yet budgeted. Despite the adoption of these policies, the economy-wide implementation of public administration reforms and service digitalisation is hampered by the lack of political ownership and co-ordination among different levels of the government, which also leads to the allocation of insufficient budgetary resources for implementation (European Commission, 2020<sub>[39]</sub>).

The lack of interoperable information systems across entities and different levels of government in Bosnia and Herzegovina is a major obstacle to developing economy-wide digital government services, which adds considerable burden to citizens and businesses in their domestic and international exchanges. It also hampers interconnection with EU information systems, and thus the EU integration process, as noted in the latest European Commission report evaluating BiH's application for EU membership.<sup>141</sup> The National Interoperability Framework was adopted by the Council of Ministers in June 2018, but is not fully implemented as consensus was not reached among entities. A number of enacted laws at the state and entity levels are affected by the adoption of the interoperability system.<sup>142</sup> The FBiH has adopted the interoperability framework at the entity level and established a co-ordinator for its implementation. The co-ordinator has developed a long-term implementation plan for the Interoperability Framework that contains 12 projects in the field of e-government development and modernisation of FBiH registers; however, without sufficient budget allocation the plan's implementation depends on identifying donor support. The lack of interoperability, and even the development of digital government, is also reflected in the monitoring of relevant indicators, which is weak and insufficiently systematised.

Bosnia and Herzegovina has developed an eConsultation<sup>143</sup> portal, where all regulatory proposals should be uploaded by state-level institutions for public consultation. Some e-services are already available for citizens and businesses in BiH for issuing residence permits, identification documents, passports and drivers' licences; for the registration of business entities in RS; and for the payment of contributions with tax administrations. Particularly for tax related e-services, enhanced co-operation and data exchange between tax administrations of the entities and the Brčko District is required to improve the quality of services offered throughout BiH. One-stop shop services exist only in RS. The one-stop shop business registration system in RS became operational in 2013, alongside a reform package comprising 13 laws

and a series of bylaws.<sup>144</sup> In the FBiH, provisions regarding the delivery of submissions in person are incomplete or outdated, making e-submissions practically impossible.

There are no policy documents that directly promote **private sector ICT adoption** in BiH, and the uneven development of e-business and e-commerce legislation across entities affects the pace of the digital transformation of businesses. At the state level, the Law on Electronic Business and Legal Traffic was adopted in 2007. RS has the most developed e-commerce framework, based on the 2009 Law on Electronic Commerce, which was amended in 2016. The RS government considers that private sector ICT adoption is sufficiently encouraged through the updated e-commerce framework, one-stop shop e-registration of businesses, and the new Development Strategy for e-Government, adopted in 2020. Additionally, the RS Chamber of Commerce has been offering training services<sup>145</sup> (webinars) on e-commerce to companies registered in Republika Srpska. Moreover, during 2019 the RS government adopted the Law on Incentives in the Economy and the Decree on the Procedure for Granting Incentives for Direct Investments to support business growth. This legislation promotes financial support measures aimed at improving business efficiency through the introduction of new technologies, including ICT. Private sector companies can submit investment projects following a public call. The FBiH has not yet adopted an e-commerce framework. However, the Ministry of Trade and Ministry of Transport and Communications are working on a draft Law on e-commerce for FBiH. It has been identified that 50 existing laws across all cantons require amendment to create a one-stop shop e-registration service for businesses. The adoption of the SFPAR and its action plan by the FBiH government is expected to accelerate this process and stimulate private sector ICT adoption. Despite the under-developed framework, e-commerce is rising in Bosnia and Herzegovina. According to the Agency for Statistics of BiH, 19.2% of enterprises received orders for products or services through a website or mobile application (excluding email) during 2019 (Agency for Statistics of Bosnia and Herzegovina, 2020<sub>[130]</sub>).

### *Sub-dimension 10.3: Jobs*

While all stakeholders declare that **digital skills for students** are of great importance for education and training in Bosnia and Herzegovina, the framework is still under development. The Policy of the Information Society Development (2017-2021) includes a pillar on strengthening digital literacy and skills, but an action plan with specific measures and budget on the development of digital skills for students has not been adopted. Digital skills are also one of the key competencies in the Guidelines for the Implementation of the Common Core Curricula in Bosnia and Herzegovina. The state-level working document, Priorities in Integrating Entrepreneurial and Digital Competence into Education Systems in Bosnia and Herzegovina (2019-2030), aims to bring digital skills development in line with the European Digital Competence Framework, with a short-term goal of integrating digital skills into ISCED levels 1, 2 and 3 (ETF, 2019<sub>[131]</sub>). This working document is meant to be used as the basis for the development of policy and reference documents at the entity or local administration level to become effective.

The governance of education in Bosnia and Herzegovina is complex, with more than 14 ministerial-level institutions involved at the state and entity level.<sup>146</sup> At the state level, the Agency for Preschool, Primary and Secondary Education supports the development and implementation of IT systems in schools. Internet access and computers for students are not yet available in all schools, and IT curricula are not harmonised or co-ordinated across education levels. Some subjects deal with informatics in the final grades of primary school and as elective subjects in secondary school. Positively, the Framework Law on VET of BiH and legislation at each level of governance include references to digital skills for VET students. In 2019, the RS government launched a reform of education aimed at modernising its VET framework to make it more responsive to labour market needs. The reform includes the digitalisation of teaching and learning materials and the purchase of IT equipment for 500 schools (ETF, 2019<sub>[131]</sub>). In response to the COVID-19 pandemic, the RS Ministry of Scientific and Technological Development, Higher Education and Information Society implemented the project 1000 for the Future, which distributed 1 000 Raspberry Pi mini computers (fourth generation) to primary school students from 20 under-developed municipalities in RS. During this period, the RS government also installed Microsoft Office 365 tools in schools and trained teachers in using

a variety of modern educational tools, including Google classroom and Moodle, and how to exploit the e-Teaching portal for access to instructions and online lessons. These tools and platforms are planned to be permanently integrated into the teaching process. However, there are still problems with Internet connectivity in primary schools in RS, with only 14% of primary schools in remote areas having access to the Internet, compared to all schools in central, densely populated areas. Positively, all high schools in RS are connected to the Internet. The computer-to-student ratio in RS primary schools is around 1/5, which is quite high for the WB region, while the same ratio for high schools is just over 1/14.

The ICT industry supports the development of digital skills for students in BiH. The Bit Alliance, an IT industry association, organises the CoderDojo programming school at 16 locations in 11 cities across BiH. Over 700 primary and secondary school students have attended the free coding programme so far. At the same time, IT Girls, a United Nations initiative that aims to make girls and women more visible in ICT, organises Arduino workshops (ETF, 2019<sub>[131]</sub>). Based on research conducted by the Bit Alliance, there is a need for approximately 6 000 new employees in the IT industry, which the current education system cannot produce.

There is no economy-wide framework for **digital skills for adults** in BiH. The Labour and Employment Agency, the Federal Employment Agency and the RS Institute for Adult Education provide adult learning courses through a donor-supported portal,<sup>147</sup> and some of these courses target the development of digital skills. In 2019, 100 individuals with university diplomas who had not found a job in their profession attended the first IT adult training programme organised by the RS Ministry of Science and Technology Development, Higher Education and Information Society, and the Innovation Centre in Banja Luka.

Higher education institutions provide IT study programmes, and some provide digital and online learning solutions to the wider community (e.g. University of Sarajevo, Tuzla University, International University of Sarajevo, Logos Centre Mostar, Vitez University Travnik). Informal education providers also offer various ICT courses and educational programmes, including programming, web design and graphic design. The Bit Alliance maintains a list of these courses on a portal dedicated to the ICT sector and developing ICT careers.<sup>148</sup> Some training centres offer online learning platforms, such as Akademika (online basic and advanced ICT courses), IT Academy (online learning platform and a distance-learning programme) and SmartLab (online and offline training) (Bit Alliance, 2019<sub>[132]</sub>). The need for highly skilled ICT professionals is clearly identified by market stakeholders. According to the Agency for Statistics of BiH, 15.2% of enterprises employed ICT professionals in 2020. However, a skills mismatch has been identified, with the education system not meeting the demands of the labour market in terms of ICT professionals. According to the European Training Foundation, 67.5% of IT companies in BiH rely on in-house training, and 9% provide various adult training courses (ETF, 2019<sub>[131]</sub>).

Bosnia and Herzegovina has not adopted a policy framework that targets **ICT sector promotion** at any level of government. The Policy of the Information Society Development (2017-2021) includes a pillar on supporting the software industry as a subsector of the ICT sector, but an action plan with specific measures and budget on ICT sector promotion has not been adopted. There are also no measures providing tax incentives or tax relief to support ICT sector companies. The key actors of the IT industry in BiH are united as the Bit Alliance, which includes 58 companies employing around 80% of IT personnel in the economy. The Bit Alliance undertakes initiatives and implements projects targeting the strategic strengthening of the IT industry in BiH in co-operation with authorities, academia and international donors. According to Bit Alliance research, IT industry income has been growing continuously by approximately 25% annually for the past ten years. The total income of the 382 registered software development companies was over EUR 400 million in 2017 (Bit Alliance, 2019<sub>[132]</sub>). The Bit Alliance has adopted the IT Manifesto, which is a model for the Strategy for the Development of the IT Industry in BiH. The IT Manifesto defines three pillars as the most significant for the further development of the industry: 1) education; 2) legislation; and 3) economy. These are in line with the EU 2020 Strategy. Among several other strategic objectives, the IT Manifesto proposes the initiation of new legal solutions that support the digitalisation of business and education; reforms in taxation policy that support the IT industry; support for the IT start-up ecosystem by strengthening IT clusters, start-up hubs, technology incubators and similar systems; and support for the

application of IT in the modernisation of business operations in all branches of industry (Bit Alliance, 2019<sub>[133]</sub>).

#### *Sub-dimension 10.4: Society*

Bosnia and Herzegovina has not made notable progress in improving its **digital inclusion framework** since 2018. However, the Policy of the Information Society Development (2017-2021) includes a pillar promoting e-inclusion and a vision to address the digital divide, although this has not been translated into specific budgeted activities. The existing legal framework at the state level includes the 2009 Guidelines on the Construction and Maintenance of Official Websites of Institutions in Bosnia and Herzegovina that aims to promote e-accessibility by ensuring that public bodies are presented online in accordance with international standards. Every public procurement process for products and services at state or entity levels, including the ICT domain, has to be published on the e-procurement portal<sup>149</sup> of the Public Procurement Agency and the Procurement Review Body of Bosnia and Herzegovina, according to the 2014 Public Procurement Law. Measures to ensure the inclusion and participation of the public in the design, implementation and monitoring of strategic plans, public policies and regulations are included in the SFPAR. These obligations are partially implemented (for state-level institutions) through the eConsultation portal. To promote innovation in the public sector, the United Nations Development Program (UNDP) will support the piloting of policy innovation clinics, which will provide the opportunity for policy makers to apply innovative, people-centred and inclusive approaches to policy making related to the digital transformation. The UNDP (BiH) officially launched the Accelerator Lab in BiH in October 2019, as part of the UNDP Accelerator Labs network. Civil society organisations in BiH are also implementing projects, mostly donor funded, to promote digital inclusion for marginalised groups (e.g. women), such as the project by non-governmental organisation (NGO) Amica Educa, Digital inclusion of marginalized women.<sup>150</sup> However, the impact from these programmes is limited by the relatively small number of beneficiaries. Indicators on digital inclusion are not systematically monitored by any institution in BiH.

#### *Sub-dimension 10.5: Trust*

The current framework on digital **privacy protections** in Bosnia and Herzegovina is largely outdated. The framework on Personal Data Protection (PDP) is not yet aligned with the EU's General Data Protection Regulation (GDPR) and Police Directive on personal data processing by competent authorities investigating criminal offences. A new Law on PDP was drafted in 2018 but has not been adopted. The framework on PDP includes the 2013 Law on the Protection of People who Report Corruption (whistle-blowers) in the Institutions of Bosnia and Herzegovina, as well as subsequent secondary legislation. The Agency for Personal Data Protection is responsible for the implementation of the PDP framework in BiH. It publishes annual reports on data protection activities, but its resources are insufficient to perform its tasks effectively, especially given the SAA obligation to comply with the GDPR by 2021. The Agency for Personal Data Protection employed only 24 staff members at the end of 2018, although staff have received training on the GDPR through TAIEX, which is positive. The Ministry of Security of BiH in co-operation with other ministries and NGOs, has prepared the Action Plan for Child Protection and Prevention of Violence against Children through ICT (2014-2015), which addressed online privacy protection for children. However, the practical implementation of this action plan has not received due attention, and there have been no updates. The RS government is preparing a law on information security that will also cover digital privacy issues.

Development of the framework on **consumer protection in e-commerce** in Bosnia and Herzegovina is uneven. At the state level, consumer protection in e-commerce is only partially covered by the 2007 Law on Electronic Business and Legal Traffic, which is aligned with the Electronic Commerce Directive. However, this law is not fully operational as the e-signature legislation (adopted in 2006) is outdated and not being implemented (European Commission, 2019<sub>[4]</sub>). Other regulations concerning consumer protection are under the jurisdiction of the Institution of Ombudsman for Consumer Protection in BiH and the Market Surveillance Agency of Bosnia and Herzegovina, under the Law on Consumer Protection

(adopted in 2006), which does not address consumer protection in e-commerce. The RS Law on Consumer Protection was adopted in 2012 and amended in 2017, and relevant legislation on e-commerce and e-signature have also been recently updated and are under implementation. The FBiH government has not yet adopted a framework for e-commerce and consumer protection in e-commerce. Indicators on consumer protection in e-commerce are not being monitored by any institution in Bosnia and Herzegovina, with the exception of general indicators on Internet use by the Agency for Statistics.

Bosnia and Herzegovina has made limited progress in creating an effective **digital risk management framework** since the CO2018 assessment. It has not yet adopted a strategic framework for information systems security and for combating cybercrime. Cybersecurity and cybercrime related provisions are dispersed across four criminal codes and laws on criminal procedure (one at the state level and three at the entity level). Bosnia and Herzegovina is obligated to adopt legislation and other necessary measures for combating cybercrime to harmonise its framework with the other signatories of the Convention on Cybercrime in terms of felony treatment, data acquisition, processing and storage. The Ministry of Communication and Transport is planning to draft the new law for information security and security of networks and information systems, in line with the EU's Network and Information Security (NIS) Directive, but the adoption timeframe has not been announced. The Ministry of Security of BiH adopted a strategy for the establishment of a computer emergency response team (CERT) in 2011, but this was never implemented, which has left BiH without state-level co-ordination of cybersecurity incident response and management. There is no economy-wide accepted definition of domestic critical information infrastructure (CII) and no formal categorisation of CII assets in BiH. However, the Ministry of Defence has developed its own cyber-defence strategy to establish a secure cyber environment for its information systems. While the FBiH depends on state-level authorities to tackle digital security risk management, the RS government is preparing a Strategy for Information Security and a new Law on Information Security to replace the existing 2011 law. Republika Srpska also established the only operational CERT in 2015, which became an organisational unit of the Ministry of Scientific and Technological Development, Higher Education and Information Society in 2018. Indicators on digital risk management and information security are not regularly monitored by any institution in BiH. It is evident that cybersecurity is not yet instilled in public and private sector mindsets in Bosnia and Herzegovina, and public and private sector stakeholders have an overall low level of awareness of the values, attitudes and practices necessary for a healthy cybersecurity ecosystem (GCSCC, 2019<sup>[134]</sup>).

The adoption of a new law on electronic identification and trust services for electronic transactions in compliance with the EU *acquis* is still pending. Although state-level e-signature legislation from 2006 has not been practically implemented in Bosnia and Herzegovina, the Ministry of Communication and Transport established the Office for Supervision and Accreditation of Certifiers at the state level to supervise and inspect certifiers' compliance with the Law on Electronic Signature and related regulations, and to maintain the electronic register of accredited certifiers. In October 2019, the Office for the Supervision and Accreditation of Certifiers registered the first trusted service provider to introduce qualified e-signatures in BiH (European Commission, 2020<sup>[39]</sup>). In Republika Srpska, the updated e-signature framework is under implementation, supervised by the Ministry of Finance, the Ministry of Science and Technology, and the Agency for Information Society. The RS government has also adopted bylaws related to the accreditation and certification of qualified e-signatures and issuers of services, including the unique register of service issuers, the use and protection of e-signatures, means of drafting e-signatures, and the obligatory insurance of service issuers.

### ***The way forward for digital society***

Despite some important steps taken to improve the digital society policy framework in Bosnia and Herzegovina, the government should pay more attention to the following aspects:

- **Accelerate the adoption of the broadband strategy and ensure consensus and sufficient budgetary allocation for its implementation. Prioritise network infrastructure development in rural and remote areas.** Develop a budgeted action plan for broadband infrastructure development that will be agreed by all competent institutions at all levels of government. Seek donor financing, following the example of neighbouring WB economies, and secure sufficient funding from loans that will support private sector investment in scarcely populated areas. Improve the broadband infrastructure development framework, align state aid rules with the EU framework, and investigate the practical and financial feasibility of proposed network investment projects.
- **Accelerate the adoption of the new Law on Electronic Communications to complete alignment with the EU regulatory framework, and implement the broadband mapping exercise.** The alignment of the electronic communications regulatory framework with the EU *acquis* is the first step towards the creation of an enabling broadband investment framework that facilitates co-usage and co-deployment and reduced costs for broadband deployments. The broadband mapping exercise is a valuable tool for monitoring network availability and development progress, as well as promoting infrastructure sharing, particularly in under-served areas.
- **Prioritise sufficient budgetary allocations for implementation of the Strategic Framework for Public Administration Reform 2018-2022 (PAR) and implement economy-wide interoperability** for the exchange of data between institutions to deliver effective e-services to citizens. Economy-wide interoperable information technology systems are a prerequisite for joining the EU and exchanging data with other states. Transposing the relevant EU Interoperability Directive into domestic legislation would ensure the compatibility of information systems and processes, and would lead to unified, high-quality services for citizens and businesses across Bosnia and Herzegovina. Reforms across all levels of the government outlined in the SFPAR action plan will need to be accelerated, and practical implementation of the e-signature framework will need to be expedited across the state.
- **Design programmes promoting the digitalisation of businesses in collaboration with chambers of commerce and other industry stakeholders.** Programmes could provide capacity building for e-commerce development, consulting services for assessing digitalisation needs, and support or incentives for buying ICT equipment. International and regional good practices could be considered when designing these programmes, such as Serbia's Digital Transformation Support Programme for micro, small and medium-sized enterprises implemented by the Development Agency of Serbia.<sup>151</sup>
- **Adopt an ICT sector strategy aimed at improving the legal framework, align the education system with ICT industry needs and stimulate ICT innovation.** Research and regional experience show that the ICT sector can become a driver for economic growth if provided with highly skilled ICT professionals, support for innovation and an enabling ICT legal framework. The ICT strategy would need to align with the SFPAR and ensure consensus across all levels of government. This strategic document will need to be a product of collaboration between all competent institutions, the ICT industry and academia. The process could benefit from strategic proposals outlined in the Bit Alliance IT Manifesto.
- **Accelerate the adoption of a new Law on Personal Data Protection to transpose the EU's GDPR and Police Directive into domestic legislation.** The Agency for Personal Data Protection would need to be strengthened with financial and human resources to be able to perform its tasks effectively, particularly regarding implementation of the new law. The agency would need to develop a plan for delivering the necessary training on the new law to data protection officers from the public and private sector.

- **Adopt a strategic framework for information security and cybercrime, and accelerate the establishment of a domestic CERT with sufficient resources.** The state will need to adopt a framework for information and network security, in accordance with the NIS Directive, to fight cybercrime and to align with commitments under the Convention on Cybercrime. BiH will need to establish a domestic CERT tasked with co-ordinating international co-operation for the fight against cybercrime, define CII and the formal categorisation of CII assets in BiH, and promote economy-wide efforts to establish a network of computer security incident response teams (CSIRTs) in the public and private sector.

## Transport policy (Dimension 11)

### Introduction

Since the last CO assessment, the main improvements in Bosnia and Herzegovina concern aviation operations and inland waterways (IWW) policy. Moderate development has been observed in the railway sector. There has been stagnation in asset management and slow progress in other fields. Bosnia and Herzegovina's performance in the transport dimension is significantly below the Western Balkan regional average across all sub-dimensions (Table 21.17).

**Table 21.17. Bosnia and Herzegovina's scores for transport policy**

Dimension	Sub-dimension	Score	WB6 average
Transport policy dimension	Sub-dimension 11.1: Planning	1.5	2.3
	Sub-dimension 11.2: Governance and regulation	1.9	2.6
	Sub-dimension 11.3: Sustainability	0.8	1.3
Bosnia and Herzegovina's overall score		1.3	2.0

### State of play and key developments

#### *Sub-dimension 11.1: Planning*

Regarding **transport vision**, since the last CO assessment Bosnia and Herzegovina has identified a set of measures to improve the transport sector through the Framework Transport Strategy (FTS) (2016-2030) (Ministry of Communication and Transport, 2016<sup>[135]</sup>), which consists of transport strategies in the two entities and the Brčko District. The FTS takes into consideration various other policy documents at both state and entity levels,<sup>152</sup> but is currently not aligned with the tourism policy and other relevant strategies (e.g. those related to the environment), which shows the lack of a holistic policy-making approach. The level of harmonisation with the EU's Transport Community Treaty (TCT) (EUR-Lex, 2017<sup>[136]</sup>) in the RS only covers 6% of the legislation prescribed by the TCT, of which only 4% is presented as fully transposed and 2% as partially transposed.<sup>153</sup> Some legislation has been adopted as a result of the FTS (as presented in transport modes below), but the level of adoption is not fully known.

Since the last CO assessment, the monitoring reports for FTS implementation in RS were prepared for 2016-2018; such reporting is not available for the FBiH. The Ministry of Communications and Transport is responsible for the development of the monitoring reports for FTS implementation. The FTS covers all transport modes with very clear overall and specific objectives, but intermodal transport is covered only partially within the railway transport mode.

The priority projects presented in the FTS were adopted after a wide range of consultation processes with the relevant stakeholders (transport ministries, implementing agencies for all transport modes, non-governmental sector, etc.). The strategic actions have been proposed to achieve specific and general objectives of the strategy without the use of any state-of-the-art methodologies (transport models) to assess proposed transport infrastructure measures and prioritise them accordingly. Strategic actions are presented through measures and indicators, which must be followed by the Ministry of Communications and Transport as prescribed in the FTS. The implementation timeline is defined in the strategy as short-term (2016-2020), mid-term (2021-2025) and long-term (2026-2030). The budgets to meet the objectives were assessed for each listed project within the FTS. The proposed 15-year implementation timeline is long for there to be no update, and the strategy does not propose any update before it expires. The planning framework and transport vision are set out in the strategy, but some important fields need to be upgraded, such as the development of the transport model, which should be used in the prioritisation process for the measures proposed within the FTS (if the concrete projects are set there) and through the state-level Transport Master Plan and Single Project Pipeline (SPP).<sup>154</sup> Proposed measures and actions

through the transport strategy should be assessed and evaluated through the outputs of the transport model, otherwise the transport model developed as part of the strategy would not be useful.

The methodology applied for **transport project selection** is not presented through the FTS nor through domestic legislation. There is an SPP for Bosnia and Herzegovina, developed in December 2018, that includes the scoring of projects and shows that prioritisation is in place; however, the SPP, including the methodology for scoring, is not publicly available. The Annual Programme of the Government of the RS,<sup>155</sup> which represents an input for the SPP, is in line with the FTS. The SPP should be updated every six months, but it has not been updated since 2018. The Annual Programme of the RS is updated every six months, but currently only for roads and for railways. Responsibility for the project prioritisation process between the state and the FBiH is not clear as the division of responsibility is not clearly defined. There are no cost-benefit analysis (CBA) guidelines for transport projects, including all accompanying survey, analysis and technical instructions. These need to be developed and updated every few years to help prioritise and control funds. A good example of the procedure for the identification of projects, as well as their pre-selection, financing, implementation, monitoring, *ex post* monitoring, and impact assessment, can be seen in other WB economies (e.g. Albania and Serbia) (Box 21.12).

Co-operation with the WB economies to exchange experiences regarding a common approach to transport planning could be improved. Such co-operation has so far been conducted mainly through participation in thematic working groups organised by the transport community and cross-border co-operation programmes,<sup>156</sup> as well as through projects related to transport facilitation at the border crossing points with Croatia, Montenegro and Serbia. Co-operation and exchange of good practice with WB economies needs to be enhanced and intensified and take place regularly. Such regular regional discussion would help pave the way for a single and competitive regional transport market.

The level of harmonisation of the procurement rules applicable to the transport sector with the TCT is not available. Based on the Law on Public Procurement,<sup>157</sup> alternative procurement processes are allowed for some specific groups<sup>158</sup> defined within the law. The roles and responsibilities of the government bodies within the transport sector are defined, but there is no established department within the transport ministry responsible for combined transport. The institutions and implementing agencies carrying out activities related to procurement and implementation procedures do not have sufficient human and financial capacity to carry out their tasks. Projects and grants funded by international financial institutions are subject to the domestic procurement procedure, as per the Law on Public Procurement. There has been no exchange of good practices related to the lessons learned for the **implementation and procurement** of public-private partnership (PPP) projects in the region. National bodies have not been given oversight roles for the procurement and monitoring of PPPs. There is no clear evidence of procurement procedures or project outputs being consistently monitored, and no evidence of *ex post* evaluation of procurement procedures. A good example of a project implementation and monitoring tool can be seen in other WB economies, as stated above.

Bosnia and Herzegovina is in the early stages of developing an **asset management**<sup>159</sup> system in the transport sector, which so far only covers the road and railway sectors. Such a system is not mandatory for every transport mode based on current legislation in force. Some efforts have been made in recent years to establish an asset management system, as presented in the report, Preparation of Maintenance Plans 2018-2022 for Road/Rail TEN-T indicative extensions to WB6 (CONNECTA, 2018<sub>[137]</sub>). However, these efforts have not been successful. The main obstacles are related to the legal framework, implementation capacities, and funds for frequent and costly updates. Some data on assets are surveyed occasionally, but without regular updates, and the level of development is not co-ordinated throughout BiH and its entities. To follow and implement regional asset management plans (rail and road maintenance plans, performance-based maintenance contracting, road asset management system, railway infrastructure asset management system, etc.), more efforts are needed from the government side (e.g. Albania and Kosovo have adopted railway and road maintenance plans).

The road asset management system needs to be institutionalised so that it can effectively continue with efforts in this field. The key objective of a well-developed asset management system is to provide justification for the maintenance budget and to help direct limited funds to areas with the greatest return on investment. Such a developed system should be considered an integral component of the above-mentioned transport planning, identification, prioritisation, implementation and monitoring processes. A good example recently established in the region is the Albanian financial management system, which includes asset values. Other good examples (road asset database, bridge asset databases, etc.) can be found in North Macedonia and Serbia.

### Box 21.12. Effective tools to manage transport projects in Albania and Serbia

Albania and Serbia are the only two economies with a sound tool for transport project identification, selection, prioritisation and implementation in the WB region.

In 2018, Albania adopted the Decision on the Public Investment Management Procedures. For the purpose of budget planning on investment expenditure, the projects are divided into two groups: 1) capital administrative expenditure on equipment, furniture, computers, IT, etc; and 2) expenditure on investment projects, including capital expenditure on infrastructure such as new constructions, reconstructions, rehabilitation with design costs, expropriation costs, purchase of larger technological equipment, implementation of works and supervision; and capital expenditure for capacity development, including research projects, technical assistance and capacity building.

The following project management cycle is applied:

1. Project identification based on an analysis of the public's needs.
2. Project evaluation and preparation, including an evaluation of the economic and financial justification.
3. Project approval and financing.
4. Project implementation.
5. Monitoring of project implementation, which should ensure that project activities are in line with planned activities.
6. Evaluation and audit, including implementation-related reporting and financial audit through the project performance indicators.

The following steps are applied based on the project cycle presented above:

1. Identify the project idea.
2. Review the draft idea (done by the project management team leader and responsible authorities).
3. Prepare detailed project and evaluation, and a shortlist of alternatives.
4. Submit investment project proposal to the ministry responsible for investment projects.
5. Review the proposal (done by the Council of Ministers).
6. Final approval, after the approval of investment projects within the annual budget.

As per Decision No. 290 of 11 April 2020, a financial management information system has been installed in every spending unit, including in all ministries, and is integrated into various departments to be used for all steps in the project management cycle.

In Serbia, the procedure for project identification, analysis of relevance, pre-selection, funding, implementation and monitoring is clear and publicly available, and co-ordinated through the Ministry of Finance. This procedure was adopted in 2019 through the Rulebook on the Management of Capital Projects.

The prioritisation process, which is applied to all projects, applies a CBA, an environmental and social impact analysis, and a safety assessment, among other things. Once the project is approved for financing there is a special procedure, similar to the one in Albania, that forms the preparation of a plan for project implementation. During project implementation there are specific procedure forms for reporting. One type of report is the interim report for the presentation of the current project status, which covers the activities carried out and the plan to execute the remaining project activities. At the end of the project, a final report needs to be developed.

There are three categories of project: 1) less than EUR 5 million; 2) between EUR 5 and 25 million; and 3) over EUR 25 million. *Ex post* monitoring is conducted for the third category three years after completion, which is a significant advancement on local legislation.

### *Sub-dimension 11.2: Governance and regulation*

Since the last CO assessment, regulatory reforms have continued<sup>160</sup> in the field of **aviation regulation**. Bosnia and Herzegovina's Air Navigation Services Agency (BHANSA) took over responsibility for air traffic control of BiH skies in December 2019 from Croatia, Montenegro and Serbia, which had undertaken air traffic control for BiH since 1992. This means that BiH will have full air control over its territory, and all charges will be now paid directly to Bosnia and Herzegovina. The Single European Sky (SES) I package has been fully transposed into domestic law, while the SES II provisions have been partially transposed (the exact extent of transposition is not available). Bosnia and Herzegovina's Directorate for Civil Aviation (BHACA) is a member of the Functional Airspace Block Central Europe,<sup>161</sup> which identifies that domestic fragmentation negatively impacts on safety, limits capacity and adds to cost. The mission of the National Supervisory Authority is to ensure the supervision of the air traffic management regulatory framework; however, it does not have adequate staff or capacity to fulfil its obligations.

The Airport Charges Directive has not yet been transposed. The market is not monitored as per Air Service Regulation, which provides the economic framework for air transport in terms of granting and overseeing the operating licences of community air carriers, market access, airport registration and leasing, public service obligations, traffic distribution between airports, and pricing. The Air Traffic Management Plan<sup>162</sup> was developed within the Bosnia and Herzegovina Air Traffic Management Strategy and is monitored regularly through Local Single Sky Implementation Monitoring (EUROCONTROL, 2021<sup>[142]</sup>). A safety culture programme, including safety risk assessment and safety assurance, has not yet been adopted. The State Safety Programme, designed as an integrated set of regulations and activities aiming to improve safety (e.g. safety risk management, safety assurance), is in progress.

Air traffic is growing in Bosnia and Herzegovina, with the total number of transported passengers from all airports increasing in the period 2016-2018 by approximately 38%, which amounted to 1.7 million passengers annually in 2018. This is an excellent achievement in comparison with the world average, which increased by 14.7% over the same period (Statistica, 2020<sup>[143]</sup>), and shows how the air transport industry in BiH has grown in importance. Given the significant growth of this transport mode and its projected importance for the economy, Bosnia and Herzegovina must continue regulatory reforms and bring the governance of the aviation sector closer to European standards and international good practices.

In FBiH there has been moderate development in the **railway regulation** sector since the last CO assessment, with rail reforms initiated. In RS, the public enterprise Railways of Republika Srpska is due to complete restructuring at the end of 2021. The FBiH has not yet begun the harmonisation process with the TCT, while the RS has partially aligned its legislation<sup>163</sup> (as explained in Sub-dimension 11.1: Planning). The level of implementation of the regional Rail Action Plan (Transport Community, 2020<sup>[144]</sup>) is not currently available. Network statements are prepared in BiH but not published. According to an EU directive,<sup>164</sup> such statements should be published to ensure transparency and non-discriminatory access to rail infrastructure, and to services in service facilities. Market access has not yet been approved, which means that foreign companies cannot access the rail infrastructure and service facilities. Infrastructure management has not yet been separated from railway undertakings in both entities. The Railway Accident Investigation Body is operational and issues investigation reports. There is no Rail Freight Corridor Regulation, which is a prerequisite for a high-capacity and competitive modal shift to rail, and no Technical Specifications for Interoperability, which are an important component of the development of international railway transport. Regulations regarding passengers' rights and obligations, which prescribe the framework to safeguard users' rights and to improve the quality and effectiveness of rail passenger services in order to increase the share of rail transport in relation to other modes of transport, have not yet been transposed.

Table 21.18 presents current trends in the railway transport of passengers and goods in Bosnia and Herzegovina, with 77.6% of railway traffic (train\*km travelled) taking place in the FBiH and 23.4% in Republika Srpska.

**Table 21.18. Trends in rail transport in Bosnia and Herzegovina (2017-19)**

Rail network utilisation	Change over 2017-19 (%)	2019 (million)	Share of the EU average (2017) (%)
Passengers (passengers*km/km of track)	+87.4	0.054	1.34
Freight (tonnes*km/km of track)	+12.8	1.237	56.60

Source: Inputs provided by the government as part of the quantitative questionnaire (CO2021); (Eurostat, 2021<sup>[145]</sup>), *Eurostat database*, <https://ec.europa.eu/eurostat>; (Agency for Statistics of Bosnia and Herzegovina, n.d.<sup>[15]</sup>), *Agency for Statistics of Bosnia and Herzegovina homepage*, <http://www.bhas.ba/?lang=en>.

The rail sector in Bosnia and Herzegovina is not reaching its full potential, even though there has been an increase in railway transport. Examples of activities that would help achieve the numbers necessary for a cost-effective rail network and rail fleet utilisation in BiH, and help reach the EU average level of network utilisation, include the full opening of the market, incentives for shifting transport from road to rail, development of rail freight corridors and development of multimodal facilities.

Limited progress has been made regarding **road market regulation** in BiH since the last CO assessment, with some efforts undertaken to harmonise legislation with the TCT (as explained in Sub-dimension 11.1: Planning). Many other fields require further work to ensure full harmonisation (e.g. tachographs, enforcement of social legislation, intelligent transport systems). BiH continues to participate in the multilateral quota system of the European Conference of Ministers of Transport (ITF, 2014<sup>[146]</sup>), which enables hauliers to undertake an unlimited number of multilateral freight operations in 43 participating European countries. The regulation complies with the road haulage qualifications standards for companies, managers, and drivers under the Quality Charter for Road Haulage (ITF, 2015<sup>[147]</sup>). The implementation of market access agreements and EU legislation is not monitored in BiH. Domestic limits on the maximum weights and dimensions for road vehicles have been harmonised with EU requirements.

In 2019, the average age of passenger cars in BiH was 16.5 years, which is almost 60% higher than the EU average (10.6 years) in 2018 (ACEA, 2019<sup>[148]</sup>).

**Table 21.19. Trends in road transport in Bosnia and Herzegovina (2017-19)**

Road network utilisation	Change over 2017-19 (%)	2019 (million)	Share of the EU average (2017) (%)
Passengers (passengers*km/km of road)	+3.8	0.20	18.9
Freight (tonnes*km/km of road)	+2.8	0.47	126.3

Source: Input provided by the government as part of the quantitative questionnaire (CO2021); (European Commission, 2019<sup>[149]</sup>), *Statistical Pocketbook 2019*, [https://ec.europa.eu/transport/facts-fundings/statistics/pocketbook-2019\\_en](https://ec.europa.eu/transport/facts-fundings/statistics/pocketbook-2019_en); (Agency for Statistics of Bosnia and Herzegovina, n.d.<sup>[15]</sup>), *Agency for Statistics of Bosnia and Herzegovina homepage*, <http://www.bhas.ba/?lang=en>.

The freight mode share of road transport is higher than that of rail transport with shares of 88.7% and 21.3% respectively. The 2018 EU averages for freight transport are 75.3% carried by road, 18.7% carried by rail and 6% carried by inland waterways (Eurostat, 2021<sup>[150]</sup>). Such a high road freight share points to negative effects on air pollution and climate change, and the incentives for shifting from road to rail could have a positive impact on reducing air pollution and climate impact. Recent trends show slight increases in road network utilisation (Table 21.19).

The COVID-19 outbreak is affecting the global transport and mobility market, including those in WB economies. Bosnia and Herzegovina introduced measures at border and customs control in the second quarter of 2020 to enable the provision of essential goods and medical equipment. These measures include “green lanes” in the major corridors for the transport of emergency goods, which require that freight vehicles and drivers are treated in a non-discriminatory manner. Passing through these green lane border crossings (including any checks and screenings) should not exceed 15 minutes, and procedures should be minimised and streamlined. The implementation of the above measures could directly impact how border crossings in the region are treated in the future by installing measures that minimise crossing time (Transport Community and CEFTA, 2020<sup>[151]</sup>; Transport Community, 2020<sup>[152]</sup>; Government of Serbia, 2019<sup>[153]</sup>; Estonia Border, n.d.<sup>[154]</sup>).

**Maritime and inland waterway (IWW) market regulations** are in the early stage of preparation in BiH, and a very little has been done so far. Since the last CO assessment, Republika Srpska adopted the Law on Inland Waterways, which has fully aligned only a part of the prescribed legislation with the TCT. The institutional, legal and regulatory set-up of waterway transport in BiH should be further developed. A framework on market access to port services and the financial transparency of ports, in line with EU regulations, has not yet been transposed. Both IWW and maritime transport are not considered a priority in BiH, and there are no specific incentives prescribed for shifting to the use of IWW and maritime transport. BiH should consider developing a roadmap for institutionalisation and the creation of a policy and operational framework regarding IWW and maritime transport.

Monitoring indicators to assess the performance of all transport modes either do not exist, are not properly established or are not properly updated (missing indicators include average user costs, travel time satisfactory level reliability, value of assets, market research and customer feedback, quality of user information, and audit programmes). Regular data surveys are neither planned soundly (including the purpose, level of data needed and budget allocated) nor conducted regularly. Surveys conducted have only been for the purposes of the specific project and not for general transport infrastructure assessment and planning. Therefore, the basis for assessing the quality of transport network performance is lacking.

### *Sub-dimension 11.3: Sustainability*

Since the last CO assessment there has been moderate improvement within the field of **road safety** in RS, and stagnation in the FBiH. Bosnia and Herzegovina needs to enhance institutional, administrative and financial capacities to improve road safety. Implementation of the existing road safety framework and related measures remain a concern. The establishment of the Road Safety Council was approved by the Council of Ministers in 2019. There is a Road Traffic Safety Strategy (RTSS) in RS for the period 2013-2022, but it does not provide a budget for measures and actions proposed (TSA, 2013<sup>[155]</sup>). The FBiH has not yet adopted such a strategy. The monitoring report of RTSS implementation in RS for the period

2015-2018 has been issued, as has the new implementation plan for the period 2019-2020, but it is not clear if the lessons learnt from the previous monitoring report have been implemented. Based on the previous monitoring report of RTSS implementation in RS, approximately over 50% of the RTSS has been implemented. The RTSS is not fully aligned with the TCT and EU *acquis* to ensure harmonisation (outstanding areas include road infrastructure safety management, safe system approach, "forgiving" roads). The Traffic Safety Agency of the RS is a member of the European Council for Transport Safety, which means that it can participate in international co-operation on road accident data and analysis, including the promotion of effective measures to reduce transport crashes and casualties, based on international scientific research and good practices. The draft Road Safety Regional Action Plan, developed by the Transport Community Permanent Secretariat (TCPS) in 2019, has been neglected, and there is no monitoring body to co-ordinate its implementation. The Regional Action Plan (Transport Community, 2020<sup>[156]</sup>) has been endorsed by the Council of Ministers of the TCPS in October 2020, and Bosnia and Herzegovina needs to align its domestic plans to achieve the goals set within this plan (strengthening road safety management, promoting safe infrastructure, protecting road users, enhancing co-operation and exchange of experience). Data on road safety are collected by the Ministry of the Interior of the RS.

The goal of the EU publication, Policy Orientation on Road Safety for 2011-2020 (European Commission, 2010<sup>[157]</sup>), was to reduce road fatalities by 50% between 2010 and 2020, as per the Decade of Action for Road Safety 2011-2020 officially proclaimed by the UN General Assembly in March 2010. This goal has been difficult for BiH to achieve, and it has seen approximately only a 2% annual decrease in road fatalities between 2010 and 2019 (Table 21.20). Therefore, significant additional efforts are needed to meet the newly defined goal of the European Vision Zero strategy for 2050 (European Commission, 2019<sup>[158]</sup>), which also aims for a 50% decrease in road fatalities in the decade 2020-2030. As there is no developed clear framework for road safety at the state level in Bosnia and Herzegovina, and no strategy in RS for the new decade beyond 2022, expectations for the new goal are not high. In addition to Vision Zero, the RTSS in Republika Srpska also aims to decrease the number of fatalities by 50% in the period 2011-2022. This will only be possible if significantly more efforts (road safety campaigns, enforcement of legislation, etc.) are undertaken by the government. However, RS has made a good start, with the annual number of fatalities decreasing by approximately 37% between 2011 and 2019, from 163 in 2011 to 102 in 2019. Innovative practices to promote and incentivise road safety could be taken over from projects being implemented in Montenegro (Box 21.13).

**Table 21.20. Road safety trends in Bosnia and Herzegovina (2010-19)**

	Change over 2010-19 (%)	Change over 2017-19 (%)	2019
Number of fatalities (Bosnia and Herzegovina)	-18	-13.6	261
Change in the number of fatalities (EU)	-23	-2.5	-
Number of fatalities per million inhabitants (Bosnia and Herzegovina)	-	-	74.6
Number of fatalities per million inhabitants (EU)	-	-	51

Source: (European Commission, 2019<sup>[159]</sup>), *Press Corner: 2019 Road Safety Statistics: What is behind the figures?*, [https://ec.europa.eu/commission/presscorner/detail/en/ganda\\_20\\_1004](https://ec.europa.eu/commission/presscorner/detail/en/ganda_20_1004). (TSA, n.d.<sup>[160]</sup>) Traffic Safety Agency, <https://absrs.org/>. (Agency for Statistics of Bosnia and Herzegovina, n.d.<sup>[15]</sup>) Agency for Statistics of Bosnia and Herzegovina homepage, <http://www.bhas.ba/?lang=en>. Information provided by the government for this assessment.

Some of the **environmental sustainability** goals<sup>165</sup> related to the transport sector are addressed in other strategies,<sup>166</sup> and as such are difficult to monitor. It is necessary to integrate a clear chapter dealing with sustainability in all transport modes through state and entity-level transport strategies, or through transport sector strategies for each specific mode. There is no evidence that the governments in BiH are preparing environmental sustainability strategies.

The legal and regulatory framework to support **combined transport**<sup>167</sup> as a transport mode that has the best cost efficiency and that decreases environmental pollution and increases co-operation between freight

forwarding network companies still needs to be developed. There is no combined transport strategy in place or planned, with intermodal transport addressed in the railway chapter in the FTS, which proposes incentive schemes for shifting to intermodal transport and the construction of intermodal terminals throughout BiH. The total amount of transported freight using combined transport is not presented though the official statistics of Bosnia and Herzegovina.

The World Bank's Logistics Performance Index is a multi-dimensional assessment and international benchmarking tool focused on trade facilitation. The Index's most recent scoring (2018) ranked BiH 72 out of 160 with a score of 2.81, which is slightly below the world average (2.85) and far below the EU average (3.52). The best score given to Bosnia and Herzegovina was for the logistics competence indicator<sup>168</sup> (ranked as 65) while the worst score was for infrastructure indicator<sup>169</sup> (ranked as 97) (World Bank, 2020<sub>[161]</sub>).

Data collection, which is currently weak, needs to be one of the key actions for the assessment of performance in all sustainability areas, and a strategy for data collection needs to be established as a basis for the assessment of the transport sector and to directly influence the prioritisation processes within transport policy in general.

### ***The way forward for transport policy***

BiH has taken some important steps in the development of a competitive transport sector, as presented above, but special attention should be paid to the following areas:

- **Update the state-level transport strategy every four years.** An update of the existing strategy is not proposed within the FTS. However, one should be carried out based on the monitoring reports for the implementation of the FTS. The lessons learnt should be applied in the updated strategy and implementation plans.
- **Develop domestic CBA guidelines for all transport modes.** Economies should develop and regularly update their CBA guidelines with accompanying technical instructions. The guidance needs to be updated at least every two years. A good example is the United Kingdom's Transport Analysis Guidance (UK Government, 2019<sub>[162]</sub>), which provides information on the role of transport modelling and transport project appraisal tailored to the UK market. Develop a benchmark for all technical and economic parameters to ensure consistency in the discount rates used for similar projects in the same economy, including the financial and economic discount rate in the state guidance documents. Apply the benchmark consistently in project appraisal at the state level. Empirical research needs to be conducted at the state level to generate input data for the calculation of externalities.
- **Develop/update a tool for project identification, selection, prioritisation and implementation.** This tool should be applied to all transport projects in BiH. Good examples could be taken from other economies in the region, such as Albania and Serbia (Box 21.12), which have recently introduced well-developed systems that are currently in the initial stage of implementation. These systems comprise all processes, from identification to *ex post* monitoring of implemented projects to the financial management of an information technology system planned to be implemented in all spending departments of governmental institutions and implementing agencies.
- **Continue rail reforms in RS, and begin rail reforms in the FBiH.** Structural and access reforms that started in RS need to be continued, while at the same time parallel reforms should take place in the FBiH. Reforms in the FBiH should cover at least structural reforms to promote competition. Access reforms are key as they enable efficient systems with better performance. Freight corridor management reforms are also key as they are a prerequisite for the next steps to achieving high-quality capacity and a competitive modal shift to rail (which is also related to the lack of a logistics strategy). Reforms regarding passengers' rights and obligations, as well as interoperability reforms, should be undertaken gradually as they take time and funds, but are very important for the development of international railway transport.

- **Develop a study on the institutional, legal and operational framework for maritime and IWW transport to define the roadmap for this transport mode.** Maritime and IWW transport are at the early stage of development in BiH. As a result, a detailed needs assessment should be conducted, accompanied by a roadmap for institutionalisation and a policy and operational framework that includes the responsible institutions and agencies, timelines for implementation and budget allocation.
- **Ensure that transport facilitation remains a priority.** Implement one-stop shops<sup>170</sup> and other measures as per the regional Action Plan for Transport Facilitation (Transport Community, 2020<sub>[152]</sub>) endorsed in October 2020, which includes an electronic queuing management system, improvement and upgrade of existing ICT infrastructure, construction or modernisation of infrastructure to remove physical and technical barriers and to increase existing capacities, and capacity building to improve performance efficiency. The implementation of these measures will be key for increasing the competitiveness and connectivity of the WB region to help it further integrate into the European market. Good examples could be taken from other economies in the region, such as North Macedonia and Serbia, which have recently introduced a well-developed one-stop shop system and are currently in the initial stage of implementing a pilot project for an electronic queuing management system.
- **Implement asset management principles in the transport sector in line with the domestic inventory system.** Developing sound asset management practices<sup>171</sup> enables economies to collect data (through annual data collection planning and budget allocation) and to manage and analyse conditions across all the transport modes. This information will then be used to optimise transport sector maintenance strategies and justify maintenance budgets by directing funds to areas with the greatest return on investment. Performance-based maintenance contracts, although not extensive, are already implemented in some WB economies such as Albania, BiH and Serbia (CONNECTA, 2018<sub>[137]</sub>). These are an essential component of the road asset management system and, if well-developed, lead towards predefined good road conditions at relatively low cost.
- **Develop an Integrated Environment and Transport Action plan.** This plan needs to integrate existing indicators and develop additional indicators through the development of a framework for environmental sustainability in the transport sector. Measures and indicators should be applied in the relevant strategies, including the new transport strategy. A good example was developed by the European Environmental Agency in the form of the Transport and Environment Reporting Mechanism, which prescribes indicators for tracking transport and environment in the EU (EEA, 2000<sub>[163]</sub>).

**Box 21.13. Innovations in road safety: Road safety social impact bonds, Montenegro**

In 2018, the United Nations Development Program (UNDP) in Montenegro, in co-operation with the key domestic players in road safety, developed the idea of road safety social impact bonds as an innovative and alternative performance-based public financial instrument that shifts the policy framework from inputs and outputs to outcomes and value-for-money. This innovative idea involves the private sector investing in road safety improvements to strengthen sustainability together with the public sector. The public partner commits to paying the outcome payments to the investor if (and only if) the predefined and measurable social goals are met. This idea has great potential to help other economies in the region (and beyond) replicate and scale-up the model.

## Energy policy (Dimension 12)

### Introduction

Bosnia and Herzegovina has made some progress since the last Competitiveness Outlook, with its score rising from 1.4 to 2.1 (Figure 21.1). The most pronounced progress has been in the security of supply sub-dimension, where Bosnia and Herzegovina has shown progress in building a more robust energy market, in part due to seeking to expand supply routes and supply diversification in natural gas. Good progress has also been made in the energy markets sub-dimension, where Bosnia and Herzegovina has made progress regarding unbundling key public monopolies in electricity, and a small amount of progress within the natural gas sector (Table 21.21). Nonetheless, despite progress in the deployment of a Third Energy Package (Box 21.14) compliant legislative framework for the natural gas market in some of BiH's jurisdictions, FBiH's natural gas market continues to not even be compliant with the Second Energy Package. Moreover, bundled monopolies are still present in some jurisdictions, and the natural gas market remains closed to competition.<sup>172</sup>

**Table 21.21. Bosnia and Herzegovina's scores for energy policy**

Dimension	Sub-dimension	Score	WB6 average
Energy policy dimension	Sub-dimension 12.1: Governance and regulation	1.7	3.1
	Sub-dimension 12.2: Security of energy supply	2.6	2.9
	Sub-dimension 12.3: Energy markets	1.8	3.0
Bosnia and Herzegovina's overall score		2.1	3.0

### State of play and key developments

#### *Sub-dimension 12.1: Governance and regulation*

The **energy policy, legal, and institutional framework** reflects the complicated constitutional set up of Bosnia and Herzegovina, with differentiated approaches between the entities. However, not only is there a fundamental difference between state-level BiH, and the FBiH and RS, there are also significant differences across the different energy markets.

Although an energy policy, legal and institutional framework is in place, there is significant room for improvement. The Energy Community Secretariat<sup>173</sup> judges that Bosnia and Herzegovina has transposed 22% of the EU's Third Energy Package (Box 21.14), with a further 47% transposed but requiring adjustment, and 31% not transposed at all (Energy Community, 2020<sub>[165]</sub>). This is mirrored in terms of implementation, where the Energy Community Secretariat rates average implementation to be around 39%, ranging between 20% and 55% across the different sub-sectors (Energy Community, 2020<sub>[165]</sub>).

Considering the electricity sector, although there is a legislative and policy framework that works towards some transposition of the Third Energy Package, the state of legislation differs across entities. There is more unison regarding policy, as although there are different policy documents in the different entities, there is also a state policy framework based on the entities' respective policies. However, the policy framework for the electricity sector needs to be refreshed, as such there is ongoing work to jointly draft a National Energy and Climate Plan. Moreover, it should be stressed that there is also ongoing work to adjust the legislative framework to increase compliance. Electricity markets are mostly deregulated, and consumers are free to choose their supplier (see Sub-dimension 12.3: Energy markets).

### Box 21.14. The EU's Third Energy Package

In 2007, the European Commission proposed a new legislative package, the Third Energy Package, in an effort to further enhance and harmonise the EU's Energy Union and internal energy market. This package entered into force in September 2009 and consisted of several important directives and regulations.<sup>1</sup>

The Third Energy Package largely rests on four pillars: 1) transparency; 2) non-discrimination; 3) a strong, independent national regulator; and 4) sustainability. Together, these pillars represent EU best practice and aim to establish a fair and level-playing field for competitive energy markets that seek to optimise scarce resources. For example, the first two pillars drive the need for unbundling the transmission and distribution system, combined with guaranteed, non-discriminatory and open access to those networks to all users backed by transparent rules and prices. Without such unbundling requirements and third-party access, it is very possible that the system operators, which are natural monopolies, could prohibit market entry and lead to sub-economic market outcomes.

In addition to these pillars, the Third Energy Package also seeks to enhance international co-operation within the EU by establishing an international regulatory agency (the Agency for the Co-operation of Energy Regulators, ACER) and promoting regional integration. Regulation (EC) No 714/2009 contains clauses that open and allow for further regulation to be drafted to enhance harmonisation in the form of network codes.

In 2019, the EU introduced the Clean Energy Package which supplements and in part replaces the Third Energy Package. That is, while the Clean Energy Package retains the key legislative aspects of the Third Energy Package, it expands measures for sustainability and green energy growth, as well as consumer rights and protections. Despite this, the Third Energy Package remains a good starting point for all of the WB economies as many of its key pillars have so far not been introduced or implemented in their entirety in the region. Aligning with it is also a requirement for the WB economies as members of the Energy Community, whose *acquis* reflects most of the Third Energy Package. Moreover, with many WB6 economies aspiring to become EU members, the transposition and implementation of the Third Energy Package and subsequent Clean Energy Package are accession requirements. To conclude, the Third Energy Package provides for the implementation of international best practice on competitive markets, and is also a firm requirement for the Western Balkan economies.

1: Directive 2009/72/EC concerning common rules for the internal market in electricity and repealing Directive 2003/54/EC; Directive 2009/73/EC concerning common rules for the internal market in natural gas and repealing Directive 2003/55/EC; Regulation (EC) No 714/2009 on conditions for access to the network for cross-border exchanges in electricity and repealing Regulation (EC) No 1228/2003; Regulation (EC) No 715/2009 on conditions for access to the natural gas transmission networks and repealing Regulation (EC) No 1775/2005; Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators.

The largest difference between entities is within the natural gas sector, where there is no basis for state-level reform and entities have very divergent policies and natural gas markets. RS introduced a legislative package in 2018 that approximates significant elements of the Third Energy Package, while the FBiH continues to follow outdated legislation that is not even compliant with the Second Energy Package.

There are also significant differences in the approach to **energy regulations** between the entities, cantons and state. While stakeholders surveyed for this assessment suggested that all relevant regulatory entities are independent and conform with the European Union's Third Energy Package requirements, the Energy Community Secretariat perceives that Bosnia and Herzegovina's energy regulator is the least compliant regulator within the Western Balkans due to non-compliance of the governing legislative framework and lack of regulatory competences (Energy Community, 2020<sup>[165]</sup>).

The non-compliance, and thus low score in this sub-dimension, are due to a number of reasons. The regulator is not established as a single regulatory authority with economy-wide competences across natural gas and electricity. Bosnia and Herzegovina's regulatory structure includes three institutions: the State Electricity Regulatory Commission (SERC), the Regulatory Commission for Energy in the FBiH (FERK) and the Regulatory Commission for Energy of the RS (RERS). These three regulatory authorities have different areas of competence and are not equipped with all the competences prescribed in the Third Energy Package. Furthermore, in the past there have been political interventions related to the operation of the regulatory authorities, which brings into question their independence, and so far no actions have been taken to limit such political intervention in the future. The autonomy of the regulatory authorities has been limited in terms of staff management, with salaries limited to general civil servant salary schemes. The energy sector is highly competitive, which means that regulatory agencies could find it difficult to find and retain key staff if they are bound by public salary limitations.

There are significant deficiencies regarding the regulators' governing board, the Board of Commissioners. The appointment of new commissioners is subject to considerable delays, which has resulted in some commissioners overstaying their terms in office without a renewed mandate. The delays are partly due to an overly complicated selection process in which criteria are not limited to standard requirements such as education, experience and neutrality, but also include, for example, strong ethnic requirements. The process is also subject to significant political influence. Regarding the dismissal of commissioners, reasons for dismissal are not limited to cases of criminal offence, non-compliance with independence requirements, illness rendering person incapable to perform the duties, violation of the Code of Ethics or non-performance of duties (failure longer than six weeks to participate in proceedings). Also, all SERC decisions need to be taken in unanimity, which limits the capacity to take timely decisions.

Nonetheless, the Energy Community Secretariat has noted that despite issues, the regulators, particularly SERC, co-operate internationally and try to implement as much as possible of the Third Energy Package within their limited scope. Moreover, information provided by stakeholders states that regulators have sufficient staff and training opportunities. The monitoring of regulatory activities is also in line with international good practices.<sup>174</sup> Furthermore, despite the negative assessment by the Energy Community Secretariat regarding compliance, there is a legislative framework in place, although as stressed above key regulatory competences are missing (Energy Community, 2020<sub>[165]</sub>).

The **management of energy infrastructure** is guided by a variety of legislation and policy documents. However, this framework needs to be improved, with the Energy Community Secretariat assessing the transposition of the elements of the Third Energy Package pertaining to infrastructure management as not complete, and implementation at just 8% (Energy Community, 2020<sub>[165]</sub>).

There is therefore significant room for improvement regarding the legislative and policy framework and implementation. One of the most pressing issues is the final transposition and implementation of EU regulation 347/2013 on guidelines for trans-European energy infrastructure. This regulation promotes infrastructure management within an economy and aims to promote a regional co-operative approach. Connected to this is the lack of a Manual of Procedures, which has not been published in BiH. Article 9 of the EU regulation 347/2013 on guidelines for trans-European energy infrastructure also states that all economies need to publish a procedure on the permitting process for projects of common interest. This procedure facilitates cross-border projects and is currently missing in BiH. Some guidelines for investors were published in 2018, but these did not fully comply with the requirements set forth by the aforementioned EU regulation.

Related to the issue of cross-border projects, BiH has not designated a competent authority in line with Article 8 of EU regulation 347/2013 on guidelines for trans-European energy infrastructure. The role of such an authority is to support the granting of regional infrastructure projects, and thus support the management of infrastructure and regional integration. The regulator should publish the methodology or criteria used for the evaluation of investment in infrastructure projects, in particular with reference to impact on tariffs. These methodologies are needed to provide more certainty for investors regarding the projects

they are investing in and the recovery of their investment. It should be highlighted that BiH is aware of these shortcomings and plans to tackle them with the help of a working group established to transpose and implement EU regulations.

Power and natural gas Ten-Year Network Development Plans (TYNDP) for 2018-2027 have been drafted and adopted in BiH. However, some new versions of the TYNDPs are outstanding, with one of the plans for 2021-2030 having been drafted by Elektroprenos BiH, but not yet consulted on or approved, although this is expected to happen soon. While the lack of or non-timely adoption of plans is currently a small issue, it could signal a systemic issue going forward as the lack or non-timely adoption of such plans reduces the sector's guidance in infrastructure development.

One issue regarding infrastructure management connected to the electricity supply framework is network losses. Western Balkan economies, including BiH, are in line with the European average in terms of transmission losses; however, they are lagging behind in terms of distribution losses – although Bosnia and Herzegovina performs better than most of its neighbours (Table 21.22).<sup>175</sup> Urgent action is needed to upgrade infrastructure to avoid wasting energy.

**Table 21.22. Distribution losses as a share of final electricity consumption**

	2014	2015	2016	2017	2018
EU	10.7%	8.0%	7.8%	7.6%	6.7%
BiH	10.7%	10.4%	10.2%	9.8%	9.3%
CEEC	5.9%	5.8%	5.5%	5.3%	5.2%

Note: EU and CEEC exclude Bulgaria and Romania.

Source: (CEER, 2020<sup>[166]</sup>), *2nd CEER Report on power losses*, <https://www.ceer.eu/documents/104400/-/-/fd4178b4-ed00-6d06-5f4b-8b87d630b060>.

On a positive note, FBiH and RS have an infrastructure project list that includes additional interconnection to Serbia for natural gas. Moreover, the FBiH pursues some form of active monitoring and data collection, and has indicated that it has an asset management system in place that includes the monitoring of the condition of existing infrastructure.

### *Sub-dimension 12.2: Security of energy supply*

The **natural gas supply framework** is governed by a legislative and policy framework. While the legislation is drawn up by the entities, the policy side encompasses both state policy<sup>176</sup> and entity-level policies.<sup>177</sup> These policies largely reflect EU standards and are defined along five key strategic goals:

1. Efficient use (exploitation) of resources.
2. Safe and affordable energy.
3. Efficient use of energy.
4. Energy transition and environmental responsibility.
5. Development and harmonisation of the regulatory institutional framework.

The policy recognises the importance from a supply security perspective of further enhancing and expanding the natural gas infrastructure (see Table 21.23 below for a list of projects).

**Table 21.23. List of strategic natural gas infrastructure projects**

Level	Gas project	Commercial operation date				Focus
		By 2020	By 2025	By 2030	By 2035	
FBiH	Southern interconnection (Zagvozd - Imotski – Posušje – Novi Travnik / Travnik with branch towards Mostar)		✓			●
	Northern interconnection (Slobodnica – Brod – Zenica)		✓			●
	Western interconnection (Rakovica – Tržac – Bosanska Krupa with section towards Bihać & Velika Kladuša as part of phase I.)		✓	✓		●
	Western interconnection – extension (B. Krupa – Ključ as part of phase II. and Ključ – B. Petrovac i Pećigrad – Bužim as part of phase III.)			✓	✓	●
	LNG supply via Port of Ploče by railway or trucks		✓			●
	Gasification of Gornje Podrinje			✓	✓	●
	Network expansion Travnik – Gornji Vakuf and Jajce			✓	✓	●
	Gasification of Orašje			✓	✓	●
	Underground gas storage Tetima with connection pipeline			✓	✓	●
	Kladanj – Tuzla – Tetima					●
RS	Gasification of Bijeljina	✓				●
	Interconnection with Serbia in the area of Bijeljina (Novo Selo)		✓	✓		●
	Main gas pipeline (Bijeljina - Banja Luka - further)		✓	✓		●
	Gasification of Gornje Podrinje			✓		●
	Gasification of Trebinje from IAP		✓	✓		●
BD BiH	Connection with Croatia (Gradiška and Brod)			✓		●
	Gasification of Brčko District of Bosnia and Herzegovina		✓	✓	✓	●

Source: Information provided by BiH authorities as part of this assessment.

The entities of BiH have undertaken energy security stress tests to test the supply framework,<sup>178</sup> and natural gas security of supply plans are in place.<sup>179</sup> Extensive monitoring and indicator collection is also being undertaken by the different entities.

However, there are some concerns, notably regarding the legislative framework. As mentioned above, each entity has its own framework in place, with no mandate for a state legislative framework or reform. The entities' frameworks have evolved at different speeds. The legislative package adopted in 2018 in RS approximates the Third Energy Package, while the FBiH is governed by a decree from 2007 that is not even compliant with the Second Energy Package and does not transpose key aspects like third party access or market liberalisation.

Also of concern is that natural gas supplies are being priced based on oil indexation, which often leads to supply not being reactive to market signals, especially as natural gas is largely sold as an independent product from oil (both from a supply and demand perspective).<sup>180</sup> Another area of concern is the fact that supply is imported exclusively from Russia via one key route through Ukraine, Hungary and Serbia. This exposes BiH to key supplier and route risks. Although BiH is not the only Western Balkan economy subject to this risk, it is important that it seeks diversification. BiH is working on importing natural gas via alternative routes for Russian supplies (through Turkey and Serbia) and alternative sources (via the Ionian Adriatic Pipeline that uses natural gas sourced from Azerbaijan).

The **electricity supply framework** includes legislative policies drawn from all entities. Broadly speaking, the policies conform with good practices and focus on four goals:

1. Harmonisation with EU directives.
2. Upgrading of regulatory mechanisms to encourage efficiency and quality and relationships with market stakeholders.
3. Reduction of network losses and increased supply quality.
4. Flexible and technologically modern Distribution System Operators as a basis for energy sector modernisation.

Monitoring and data collection relating to electricity is being undertaken based on good practices.

Despite there being some good practices in place in BiH, there are also some concerns. For example, BiH intends to continue its reliance on coal-fired generation within its power mix as it is seeking to build new coal plants to replace older coal-fired power plants. Information provided by the authorities suggests that the lack of a natural gas supply and limited growth in renewable generation is a key driver behind this decision. However, although BiH does have coal resources, unless it invests in additional natural gas infrastructure and renewable generation it will continue to perpetuate the problem of there being insufficient alternatives to coal. Moreover, pursuing the expansion of natural gas and renewable generation would not prohibit the future use of coal, but rather extend the diversification of energy generation, thus increasing the security of supply across different energy types. Accordingly, alternative sources should be pursued aggressively.<sup>181</sup> Although environmental factors were considered in the decision to build new coal plants,<sup>182</sup> it appears that BiH did not factor in the explicit pricing of greenhouse gas emissions. This also reflects the fact that there are no plans in BiH to introduce an emissions market aligned with the EU Emissions Trading Scheme.<sup>183</sup> BiH is a signatory of the Sofia Declaration, which involves signatories committing to “continue alignment with the EU Emissions Trading Scheme, as well as work towards introducing other carbon pricing instruments to promote decarbonisation in the region” (Berlin Process, 2020, p. 2<sub>[167]</sub>). However, at the state level there is currently no concrete plan or action taken to deploy a carbon tax or other kind of greenhouse emission pricing scheme. Moreover, the legislative and regulatory framework for the monitoring and reporting of greenhouse gas emissions is not complete and will need to be finalised before any pricing of greenhouse gas emissions will be possible.<sup>184</sup>

Bosnia and Herzegovina generated around 35% of its energy from **renewable energy** sources in 2018 (Eurostat, n.d.<sub>[168]</sub>). Moreover, nearly all renewable energy is generated from hydro generation, with wind and solar accounting for only around 2% of electricity: wind generated 103 gigawatt hours (GWh) and solar generated 21 GWh in 2018 (Eurostat, n.d.<sub>[168]</sub>), although this share is expected to expand as new projects were connected for the first time in 2018 and 2019. BiH has considerable potential for renewable energy generation, particularly beyond hydro generation. The International Renewable Energy Agency estimates that Bosnia and Herzegovina has a renewable energy potential of 23 gigawatts (GW) of installed capacity, out of which only 2.3 GW is being currently utilized, with 110 megawatts (MW) from non-hydro renewable energy sources (IRENA, 2017<sub>[169]</sub>; IRENA, 2019<sub>[170]</sub>; Energy Community, 2020<sub>[165]</sub>; Eurostat, n.d.<sub>[171]</sub>). Moreover, out of the 23 GW, only 6.1 GW is hydro and 17.1 GW is other renewable energy sources (IRENA, 2017<sub>[169]</sub>; IRENA, 2019<sub>[170]</sub>).

As in the other sub-dimensions, there are multiple legislative and policy frameworks for renewable energy across the state and entities in BiH. The Energy Community Secretariat rates the transposition of the Third Energy Package as not complete due to issues relating to simplified administrative procedures, operational deployment, and the functioning of the system for the issuing, transfer and cancellation of guarantees of origin (Energy Community, 2020<sub>[165]</sub>). Overall, the Energy Community Secretariat rates the implementation of the Third Energy Package at 49% in BiH (Energy Community, 2020<sub>[165]</sub>). BiH has a National Renewable Energy Action Plan that guides the sector,<sup>185</sup> and has established a 40% target for the share of renewable energy in gross energy consumption and a 10% target in transport, although the share of renewable energy in transport was only 0.44% in 2019 (Energy Community, 2020<sub>[165]</sub>). Moreover, BiH has published two out of three progress reports – one in 2017 and one in 2019. BiH is also in the process of drafting the National Energy and Climate Plan, which is expected to be completed by the end of 2021. Legislation grants renewable generators priority dispatch and connection to the distribution network, and there are clear

guidelines for connection to the transmission system to facilitate the speedy connection of renewable energy generators.

There are, however, some challenges regarding renewable energy in BiH. There is currently no competitive assignment of renewable projects, which means that the competitive forces of, for example, an auction are not harnessed to choose and allocate projects that represent best value added. In addition, apart from RS which uses feed-in-premiums, a feed-in tariff scheme is currently being used, which is a subsidisation approach that has fallen out of favour as it creates a disconnect between renewable generator incentives and market signals. However, it should be noted that legislation for the competitive assignment of renewable projects and the use of a feed-in premium (with a feed-in tariff for small-scale renewable energy projects) has been drafted but not yet adopted. Similarly, the concept and importance of small-scale distributed renewable (self-) consumers (prosumers) are recognised in new draft legislation that has not yet been adopted. Although the entities recognise the importance of Guarantee of Origins,<sup>186</sup> there is no system for issuance, transfer and cancellation. Guarantee of Origin is a key channel for further monetising generated renewable energy both within the state subsidisation scheme (where the state can benefit from product differentiation and higher paying margin customers) or for renewable projects outside the state support scheme (where the project owner can increase the income stream). The Energy Community Secretariat has also noted that renewable energy generators within a support scheme have limited imbalance responsibilities, which is a significant market distortion as it encourages generators to deviate from optimal behaviour based on market signals and good practices for forecasting.

BiH has a partial legislative and policy framework in place for **energy efficiency**.<sup>187</sup> However, energy efficiency legislation is still lacking, and further action is necessary to achieve full compliance with international good practice.<sup>188</sup> There has been no progress since 2018 regarding adjusting product labelling regulation, despite a Ministerial Council decision adopted in November 2018 that required adjustments. The Energy Community Secretariat assesses Bosnia and Herzegovina's transposition of energy efficiency legislation related to the Third Energy Package as not complete, measuring it at 48% (Energy Community, 2020<sup>[165]</sup>).

Energy efficiency strategies in BiH are out of date, with the National Energy Efficiency Action Plan 2019-2021 and a long-term building renovation strategy drafted but not adopted. Furthermore, energy efficiency laws in the FBiH and RS have not transposed the Third Energy Package, and implementation is far from complete. For example there has been no implementation of an energy efficiency obligation scheme nor a comprehensive energy management and information system. Additionally, human resources within public institutions dedicated to the topic of energy efficiency need to be enhanced.

Some monitoring and data collection is in place, but it could be systematically improved. For example, there is no inventory of buildings, which means that it is difficult to assess the extent to which energy performance has been deployed and what remains to be done with regards to BiH building stock.

Positively, both entities have established energy efficiency funds, and the concept of an Energy Service Companies market (ESCO) has been established within the legislative framework, although it is currently not operational due to a variety of issues regarding public procurement and the lack of model ESCO contracts. BiH has been publishing regular progress reports on implementation of the National Energy Efficiency Plan. The fourth progress report was published on 31 August 2020. BiH is also working on drafting the National Energy and Climate Plan. Both entities have implemented an energy efficiency audit and certification scheme for all new buildings and buildings undergoing major renovations.

### *Sub-dimension 12.3: Energy markets*

Regarding energy **market operations**, there is a wide divergence between natural gas and electricity, as well as between the entities of BiH.

The wholesale electricity market is largely deregulated, except within RS, where electricity generation prices remain regulated, although price regulation is being phased out. There is no legislation or target to

establish and deploy a power market and associated day-ahead market<sup>189</sup> (i.e. an organised market). Moreover, BiH does not have the required legislative text that allows for the mutual recognition of trading licences with other economies. However, Transparency (REMIT) Regulation<sup>190</sup> and Connection Network Codes<sup>191</sup> have been transposed and implemented. The balancing market<sup>192</sup> has been operating since 2016 as an efficient market covering the energy needed for balancing the system and the acquisition of reserve capacity.

The electricity retail market is formally deregulated, with only households and small consumers allowed to use the Universal Supplier at a regulated price. Supplier switching is codified but remains low, and as a result so does market liquidity.

The situation is less favourable in the natural gas market where, as mentioned above, the FBiH is not even compliant with EU's Second Energy Package. The wholesale market is dominated by the incumbent BH-Gas, which also has a monopoly in the retail market. There is a more positive situation in RS, which has a wholesale market, although the virtual trading point is not operational, which means that transactions are done on a bilateral basis. Switching rules are in place, and only a small portion of consumers are supplied under regulated public supply conditions. However, the market remains highly centralised, with the incumbent GAS RES which has a market share of more than 85%.

The complexity of the constitutional set up in BiH is also reflected in the successes and failures of **unbundling and third-party access**.

Regarding electricity, Bosnia and Herzegovina's transmission system is operated by the independent system operator NOS BIH, which is involved in the management of the transmission network, the day ahead and intraday markets, the balancing market, security analysis, cross-border mechanisms, development of long-term plans, and the transmission company Elektroprenos BIH, which owns the transmission network and associated facilities and is responsible for electricity transmission. They are owned by the two entities and controlled by the Council of Ministers of BiH. However, the ownership is such that they are part of an ownership structure in which there is also control over the generation and supply of electricity. Accordingly, the transmission network in BiH is not unbundled in the sense of the Third Energy Package. The legal basis for unbundling at the state level is missing, and is unlikely to be resolved anytime soon.

Concerning electricity distribution system unbundling, the legal unbundling requirement according to the Third Energy Package is reflected in the legislation of both entities. Functional unbundling is also covered in legislation, but only in RS. Nonetheless, the distribution system operators in both entities continue to operate as legal and functionally bundled companies. In the FBiH there is no legal requirement for compliance programmes, as there should be in line with international good practice.

Positively, third-party access is enshrined in legislation and, as mentioned, Transparency (REMIT) Regulation and Connection Network Codes are transposed and implemented.

Regarding the natural gas sector, BiH is operating outside of the EU *acquis*, and is not even in line with the Second Energy Package. In the absence of a state-level approach, the entities have implemented divergent regulatory frameworks.

The most promising actions have taken place in the RS, which in 2018 transposed Third Energy Package legislation regarding natural gas. As part of this legislative package, the RS established the basis for unbundling. One of the three natural gas transmission system operators in BiH, Gas Promet Pale a.d. is currently seeking unbundling certification and which was granted by the RS energy regulator, RERS. However, the Energy Community Secretariat has not yet given its positive opinion regarding this certification. Gas Promet Pale a.d. operates as a transmission system under network system rules that do not conform with the EU Capacity Allocation and Congestion Management Regulation. The other two transmission system operators have no legal basis for unbundling and thus have not attempted to be certified as unbundled transmission system operators.

Third-party access is only enshrined in legislation in the RS, and even there third-party access to pipelines is granted under regulated tariffs for only some parts of the network. In the FBiH there is no legal basis for guaranteed non-discriminated third-party access, which is only granted on bilateral negotiated contracts. However, the FBiH is currently working on implementing an Energy Sector Restructuring Programme that would address some of the shortcomings and establish the legal basis to move ahead with unbundling and third-party access. However, so far, this programme has not been adopted.

**Regional integration** is governed at the state level in BiH and is subject to a legal framework.

Regarding natural gas, the sole interconnector with Serbia is governed by an agreement that conforms with EU Regulation 2015/703 on establishing a network code on interoperability and data exchange rules. For electricity, the capacity of the interconnectors is allocated using good practice in the form of the joint auction facilities of the Co-ordinated Auction Office in South East Europe – except for the interconnector with Serbia where bilateral joint auctions are used. Positively, there is balancing co-operation between Bosnia and Herzegovina and its fellow load frequency bloc members, Croatia and Slovenia, as well as with Montenegro and Serbia on bilateral agreement basis.

The Energy Community Secretariat notes that day-ahead market integration and coupling has ceased (Energy Community, 2020<sub>[165]</sub>). This largely reflects that there is no power exchange, and any progress is conditioned on yet to be adopted state-level laws. BiH does not have the required legislative text that allows for the mutual recognition of a trading licence with other economies, which represents a hurdle for regional integration as it means that any trader from neighbouring economies would need to seek an additional licence in BiH. Also concerning is the use of congestion income/revenue, with information provided suggesting that income is used as cross-subsidisation to lower network tariffs. While not prohibited by Article 16 Paragraph 6 of EU regulation 714/2009 on conditions for access to the network for cross-border exchanges in electricity, it does encourage the use of income to guarantee the availability of capacity or to maintain or increase interconnection capacity in an attempt to further the interconnection of the economy, rather than to lower transmission costs domestically.

*Cross-cutting policy area: Energy incentives – direct and indirect subsidies in the energy sector*

In addition to the use of congestion revenues, there are several instances of subsidisation and cross-subsidisation in BiH. Another form of subsidisation appears to take place between households supplied by the Universal Supplier and commercial consumers, where the prices for households supplied by the universal supplier are below the market cost, and compensated by commercial consumers. However, this issue is currently being tackled by the regulator, which aims to reduce and eventually eliminate this form of cross-subsidisation.<sup>193</sup>

BiH is also subsidising coal production, with a cascading effect onto power via the five coal-fired power plants. A study by Miljević (2020<sub>[172]</sub>) estimates that between 2015 and 2019 BiH provided direct annual subsidisation to coal/lignite electricity producers amounting to EUR 166.6 million, or roughly EUR 33 million per year. Miljević (2020<sub>[172]</sub>) estimated that this subsidisation amounted to an indirect subsidisation of electricity generated from coal of about EUR 2.1/MWh, meaning that coal-fired generation was around EUR 2.1/MWh cheaper than it would have been without direct subsidisation. This subsidisation has market distorting effects that lead to higher consumption due to cheaper electricity consumption away from market equilibrium and optimal outcome, while also making it harder for renewable energy to compete as it lowers prices. This is especially counterproductive as the public financial support mechanism for renewable energy will have to compensate for lower fossil fuel prices.

Regarding thermal generation, another subsidisation concerns BiH's support in the form of state guarantees for a loan to Elektroprivreda BiH d.d. Sarajevo for the Tuzla 7 project, a thermal power plant. This constitutes state aid and thus the subsidisation of a coal-fired power plant as it mitigates the risk of investment via state funds.<sup>194</sup>

## ***The way forward for energy policy***

The following are recommendations for actions to be taken by BiH to improve its energy markets and align with good practices:

- **Harmonise energy policy frameworks across energy sectors and markets, and between the entities.** This would facilitate the internal efficiency of energy markets and cross-entity operations by stakeholders.
- **Undertake wide-ranging reforms to finalise the transposition and implementation of the Third Energy Package (and possibly start on the Clean Energy Package),** particularly in the areas of natural gas, unbundling and third-party access. Finalisation of the transposition and implementation of the Third Energy Package will move BiH's energy market into a position where international good practices are used to drive a competitive energy market where economic forces such as liquidity and competition are used to achieve the greatest benefit for the people and economy of Bosnia and Herzegovina. This is particularly an issue with natural gas, where bundled natural monopolies and the lack of third-party access means that markets are closed and dominated by monopolies. This largely means that no competitive forces are harnessed, and economic rent is not necessarily fairly distributed.
- **Develop and implement a strategy for the introduction of EU-style organised markets in electricity and natural gas markets** (i.e. power exchanges and associated day-ahead markets). Such markets contribute to the efficient allocation of scarce resources and the distribution of economic rent between producers and consumers. They also minimise transaction costs as market transactions are centralised.
- **Pursue a reinvigorated reform to increase market integration and market coupling.** International trade flows are a useful tool to promote market liquidity and competition, and thus limit the market powers of dominant domestic incumbents.
- **Introduce the competitive assignment of renewable projects in combination with good practice subsidisation schemes** (Box 21.15) **and simplified procedures.** This will support the growth of renewable energy as it reduces costs and minimises risk, while assuring the best value for money for Bosnia and Herzegovina. Competitive renewable energy will also contribute and support the consideration of coal phase out as renewable energy costs are reduced.
- **Consider designing a strategy and deploying a greenhouse gas pricing scheme** (either as a tax, trading scheme, a combination or a sequential introduction). This would support the phasing out of coal and the decarbonisation of the power sector, and shift the entire economy to a more environmentally friendly and sustainable state. A greenhouse gas pricing scheme will support the power sector to decarbonise as it shifts the explicit cost function in favour of renewable energy by introducing the environmental and climate impact of fossil fuels as an explicit cost factor. Moreover, the scheme would offer income flows for the government and companies. The government would benefit through sales of emission certificates, and companies would be rewarded for efficiently reducing emissions. The consideration of the introduction of a scheme becomes more pressing as the EU is considering introducing a carbon border tax.
- **Expand and pursue a policy to advance energy efficiency.** While energy efficiency is a good tool to minimise the cost burden of energy within the economy, it also supports efforts to decarbonise the power sector, and thus support environmental and climate goals.

### **Box 21.15. A new approach to subsidising renewable energy**

Feed-in tariffs were the dominant form of financial support for renewables within the EU at the beginning of the 21st century. In this system, power plant operators receive a fixed payment for each unit of electricity generated, independent of the electricity market price (Banja et al., 2017<sup>[173]</sup>).

Feed-in tariff schemes offer several advantages, but mainly they insulate new market entrants from market price risks, which lowers their capital costs and enables private investment. The simplicity of feed-in-tariffs makes them suitable for markets with a large number of non-commercial participants such as households or local community-based initiatives (European Commission, 2013<sub>[174]</sub>).

However, feed-in tariff schemes exclude producers from actively participating in the market, which hinders efforts to develop large, flexible and liquid electricity markets as the share of renewable energy grows. This limits growth to certain technologies and sizes of installations, and creates difficulties in setting and adjusting appropriate tariff levels (European Commission, 2013<sub>[174]</sub>), which is a particular problem as costs of renewable generators have fallen rapidly in recent years.

The European Commission suggests switching from feed-in tariff to feed-in premium schemes (European Commission, 2013<sub>[174]</sub>). In these, plant operators sell the electricity generated directly on the electricity market and earn an additional payment on top of the electricity market price. This is received as a fixed payment or one adapted to changing market prices, thereby limiting price risks for plant operators, as well as the risks of providing windfall profits (Banja et al. 2018). Feed-in premium schemes are beneficial because they force renewable energy producers to find a seller on the market. They also ensure that renewable energy operators are exposed to market signals. A well-designed premium scheme can limit costs and drive innovation by using a competitive process to allocate support. Such schemes also include automatic and predictable adjustments to cost calculations, which give investors the information and confidence necessary to invest (European Commission, 2013<sub>[174]</sub>).

The European Commission (2013<sub>[174]</sub>) suggests using a feed-in premium scheme in combination with the following good practice recommendations:

- Do not pay premiums for production in hours where the system price is negative or above the level of remuneration deemed necessary.
- Assign renewable projects and associated premiums using competitive allocation mechanisms such as auctions.
- Make planned volume-based premium reductions for new installations dependent on when they are approved, connected or commissioned.
- Conduct regular, planned and inclusive reviews of premiums for new installations.

The Council of European Energy Regulators (2018<sub>[175]</sub>), reports that in 2016/17, some 17 of the 27 EU Member States still used some form of feed-in tariff (although mainly for small projects), while around 16 used feed-in premiums, including to complement feed-in tariffs.

For more information on the different renewable support schemes employed across Europe please see <http://www.res-legal.eu/home/> and for an overview of auctions and outcomes (including databases on auctions) see <http://aures2project.eu/>.

## Environment policy (Dimension 13)

### Introduction

With an overall score of 1.7 in the environment policy dimension, Bosnia and Herzegovina is the lowest performing Western Balkan economies (Table 21.24). Nevertheless, several initiatives have been undertaken, and the economy slightly increased its performance since the previous assessment, particularly in the environmental quality of life sub-dimension (Figure 21.1).

**Table 21.24. Bosnia and Herzegovina's scores for environment policy**

Dimension	Sub-dimensions	Score	WB6 average
Environment policy dimension	Sub-dimension 13.1: Resource productivity	1.7	2.0
	Sub-dimension 13.2: Natural asset base	1.7	2.1
	Sub-dimension 13.3: Environmental quality of life	1.8	2.3
Bosnia and Herzegovina's overall score		1.7	2.1

### **State of play and key developments**

#### *Sub-dimension 13.1: Resource productivity*

Bosnia and Herzegovina has committed to combat climate change by undertaking activities to reduce greenhouse gas emissions and limit global warming to a maximum of 2°C by the end of this century, as a Non-Annex-I signatory to the United Nations Framework Convention on Climate Change (UNFCCC) and its Paris Agreement, and a party to the Kyoto Protocol. However, these efforts have been rather limited so far. The energy production sector remains the main carbon dioxide (CO<sub>2</sub>) emitter, contributing to around 70% of total CO<sub>2</sub> emissions, followed by the transport sector that contributes around 23% (World Bank, 2016<sub>[177]</sub>).

Major changes have occurred regarding the legislative **framework for climate change** in BiH since the last assessment in terms of adopted amendments in the RS to laws on water and renewable energy sources, and the new Law on Energy Efficiency in the FBiH. BiH is currently developing enhanced nationally determined contributions (NDCs), required under the Paris Agreement, which will state that 1990 emissions should be reduced by 37% by 2030 and by 61% by 2050. It is planned that NDCs will be adopted and submitted by mid-2021. There is a greenhouse gas inventory that is made publicly available, and measures regarding energy efficiency (renovation of public buildings and more energy efficient public lighting) and renewable energy sources (share in total energy mix increased to 38.7% in 2019) have been undertaken to align with the EU *acquis* regarding greenhouse gas emission reductions.

BiH was working on an adaptation plan at the time of drafting that will identify the necessary resources and set timelines for implementing climate change related policies and strategies. The Climate Change Adaptation and Low Emission Development Strategy (CCALEDs) of BiH was also under revision with an aim to be fully harmonised with the NDCs and the overarching Environmental Protection Strategy and Action Plan of BiH by the end of 2021. The CCALEDs will encompass sub-sector strategies for waste and water management, air quality and nature protection. The main energy strategies<sup>195</sup> are aligned with climate change mitigation goals and long-term low-emission development strategies in BiH, but this is still not the case for transport and industry or agriculture policies, although certain changes in this regard are expected once the revision of the CCALEDs is complete. Although no systematic monitoring and evaluation of the strategies is conducted, active policy implementation, as measured by programme inputs and outputs of the approved climate change adaptation and mitigation policy framework, has been recorded.<sup>196</sup>

Competences for environment and climate change rest with the two entities and the Brčko District. In the FBiH, competence is shared between the federation and the ten cantons. At the state level, the Ministry of Foreign Trade and Economic Relations (MoFTER) is responsible for defining policies and basic principles, co-ordinating activities, and consolidating entity plans with those of international institutions in the area of energy, agriculture, protection of environment and use of natural resources, and tourism. Entity-level institutions are responsible for the strategic framework, policy setting, data exchange and reporting.<sup>197</sup>

Administrative capacities and inter-sectoral co-operation need to be significantly improved to systematically address climate change and go beyond the current project-by-project approach to ensure further alignment with and effective implementation of the climate *acquis*. Regarding vertical and horizontal co-ordination, representatives of relevant state- and entity-level institutions participate in working groups and consultative meetings and contribute to the development of strategic/policy documents. However,

institutional capacities are limited, vertical and horizontal co-ordination for planning and implementation are weak (caused by a complex administrative structure and top-down approach), and stakeholder participation in strategic planning is limited. Capacity building is mainly ensured through project-based initiatives and the activities of NGOs. There are also financial constraints and a lack of local financial mechanisms to address climate change adaptation and mitigation issues.

Regarding climate change adaptation, major climate-related risks have been identified as a temperature increase (drought, heat waves) and a change in annual precipitation patterns. As mentioned, adaptation measures have been implemented, in particular those regarding landscape restoration and reforestation actions,<sup>198</sup> more secure facility locations and infrastructure,<sup>199</sup> and early warning systems in connection to water-related disasters.<sup>200</sup>

Bosnia and Herzegovina's municipal waste generation per capita of 356 kg is much lower than the EU average (492 kg per capita in 2018), and among the lowest in the Western Balkans (386 kg per capita on average in 2018) (Eurostat, 2018<sub>[178]</sub>). A total of 36 municipal landfills have been registered in the RS, 44 in FBiH, and 1 in Brčko District, with few categorised as controlled landfills (Republika Srpska Institute of Statistics, 2019<sub>[179]</sub>), (EEA, 2018<sub>[180]</sub>). Households in rural areas with no available waste collection service need to organise their own collection and transport, which means that the majority of collected waste ends up disposed in illegal dumpsites (EEA, 2018<sub>[180]</sub>). The problem of the unregulated incineration of waste, especially of plastic, waste tyres and agricultural waste, is also present throughout the economy, and no specific sanctions are taken in this regard.

Some steps have been taken in relation to developing a **circular economy framework** and **municipal waste management** in Bosnia and Herzegovina (especially in the RS) since the last assessment, although it remains underdeveloped. The RS Waste Management Strategy (2017-2026) is in force, in accordance with which the RS Waste Management Plan (2019-2029) has been adopted that outlines a comprehensive list of short (2019-2024) and long-term objectives (2024-2029).<sup>201</sup> In the FBiH, with the exception of amendments to the Law on Waste Management in 2017 there have been no changes in the policy framework following the expiration of the FBiH Environmental Strategy 2008-2018 that indirectly covered waste management. The new overarching Environmental Protection Strategy of BiH (to be adopted by the end of 2021) will indirectly cover these aspects.

Although there is no systematic monitoring and evaluation of the environment related policy documents in the two entities, evidence of policy implementation has been recorded in the RS, with the following measures completed since 2017:

- Harmonisation of the legal framework with EU regulations.
- Establishment of a packaging waste management system and introduction of the extended producer responsibility.<sup>202</sup>
- Promotion of environmentally friendly waste management through the introduction of recycling islands,<sup>203</sup> and organised waste collection carried out as part of various awareness-raising activities.<sup>204</sup>
- Improvements in the municipal waste collection system and the rehabilitation and closure of municipal and illegal landfills.<sup>205</sup>
- Establishment of a system of joint landfill sites for the management of remaining municipal and non-hazardous industrial waste.<sup>206</sup>

Activities on waste prevention were also undertaken in RS in 2020 through the introduction of a fee for plastic bags. In addition, food waste has been recognised as an issue in the RS Waste Management Plan, particularly through the measure on “improvement of the data collection system on food waste”, which calls for identification of the types and quantities of food waste generated as a first step. The development of a feasibility study for the functioning of a food bank and the development of a guide for food donation is planned, but no concrete timeline had been set at the time of drafting.

In the FBiH, waste separation at source is conducted in certain municipalities, and measures are undertaken regarding resource efficiency along product life cycles (i.e. extended producer responsibility schemes), which has led to an increase in the share of recycled packaging, electronic and electric waste in the total electronic and electric waste.<sup>207</sup> In 2018, the FBiH established the Waste Management Information System (WMIS) within the Environmental Protection Fund of FBiH to serve as an overall waste database. However, it is at the initial operational stage and the waste operators who are supposed to share or upload their information on waste to the WMIS are not properly informed about its existence.

The civil society organisation, Centers for Civic Initiatives, is planning activities for the coming period in co-operation with local governments, competent cantonal and federal ministries, the tax administration, and experts to develop guidelines for implementing regulations to treat illegal landfills<sup>208</sup> and illegal waste disposal. This process has however been slowed due to the COVID-19 pandemic.

Similar to other WB economies, waste collection and treatment infrastructure in BiH is financed through waste collection fees, budget and donor funds, while waste collection and treatment services are funded from waste collection fees. Waste disposal tariffs have not changed since the last CO assessment. Certain investments in new waste treatment facilities have been undertaken in the FBiH, but they were of a small scope due to the overall lack of financial resources. In the RS there is a plan to invest in new waste treatment facilities using government funds and some donor support. Illegal dumping and the unregulated burning of waste have been recognised as challenges in both the FBiH and RS – around 15% of illegal dumpsites have recently been closed – and inspections have been taking place according to the annual plan for inspection visits. However, local stakeholders report poor inspection supervision and the insufficient prosecution of perpetrators in this regard.

### *Sub-dimension 13.2: Natural asset base*

Bosnia is water-rich, with total renewable freshwater of 10 592 m<sup>3</sup> per year per capita in 2017. However, there is uneven distribution across the territory and noticeable seasonal amplitudes, sometimes with extreme hydrological phenomena. The major users of water are households (approximately 82%) followed by industry (16%), with the remainder used in agriculture (UNECE, 2018<sub>[181]</sub>; World Bank, 2017<sub>[182]</sub>).

Bosnia and Herzegovina has a relatively well established **freshwater management framework**, but lacks investment plans on water management that would include implementing legislation and monitoring. There have been no major changes in the legislative and policy framework regarding freshwater management in BiH since the last CO assessment. The legislative framework in this area is based on EU water framework directives, which apply to all surface and groundwater, the prevention of pollution at source, emissions control, water quality standards, and prevention and protection against flood risks. At the time of drafting, flood hazards and risks were being mapped for the economy through the IPA project, Support to Flood Protection and Flood Risk Management (2016). Planning of hydropower conforms with the relevant EU legislation; however the strategic environmental assessment, environmental impact assessment, nature protection and water-related provisions of the EU *acquis* need to be better enforced to adequately address growing environmental concerns (European Commission, 2020<sub>[39]</sub>). There is a system for prior regulations and/or specific authorisation for water extraction from groundwater and/or from surface waters, and a river basin management system has been developed. Co-operation with neighbouring economies in this regard has been established, especially with those at the Sava and Danube River Basins.

The main strategic document in RS is the Strategy of Integrated Water Management (2015-2024),<sup>209</sup> but implementation remains limited as no related action plan was adopted, no measures or targets were set, and it is not aligned with sectoral strategies. Key policies in the FBiH are the Water Management Strategy (2010-2022) and the Action Plan for Flood Protection and Water Management (2014-2021).<sup>210</sup> Local stakeholders report that the implementation record of both documents remains modest, although regular monitoring is conducted (once every four years for the Water Management Strategy and annually for the Action Plan for Flood Protection and Water Management).

Numerous institutions regulate freshwater management in BiH,<sup>211</sup> but they all lack the necessary financial and human resources to conduct their roles, and there are no regular capacity building activities. Vertical and horizontal co-ordination are also lacking. Data and projections on water demanded from agriculture, industry (including energy) and households are only partially available, and thus not guiding decisions about handling competing uses now and in the future. No data on water risk management are collected, and activities to raise awareness of water-related risks are lacking.

In terms of **biodiversity**, Bosnia and Herzegovina is one of the richest economies in Europe due to its specific environmental, climatic and geomorphological conditions. The large variety of land, freshwater, marine and underground habitats has resulted in an abundance of species and subspecies, including endemic species. However, its ecosystem is threatened by the unsustainable use of land and forests, habitat conversion, vegetation succession and invasive alien species, overexploitation of natural resources, waste mismanagement, inadequate fire protection, illegal hunting and fishing, and climate change as well as inappropriate integration of land, water and biodiversity concerns into development planning (UNECE, 2018<sub>[181]</sub>). **Forests** make up a large share of the total land area of Bosnia and Herzegovina (around 43% in 2016), which is around the WB average of 42% (World Bank, 2016<sub>[183]</sub>).

There have been no major changes in the legislative or policy framework since the last CO assessment. The Strategy on Nature Protection of the RS (2011-2017) expired and was not updated. In the FBiH, the Environmental Protection Strategy, which contained the Federal Nature Protection Strategy, expired in 2018 (the new strategy should be adopted by the end of 2021). The draft state-level Environmental Protection Strategy covers biodiversity aspects and outlines the following objectives: protection of biological, pedological and geodiversity of the economy through establishing and strengthening an institutional framework for the realisation of efficient measures for nature protection; sustainable use of natural resources; equal distribution of revenue from use of natural resources; reduction of pressure on biological and geodiversity in the economy; and establishment of financial mechanisms for the sustainable management of biological and geodiversity.

Although no reports were produced regarding the implementation of the RS Strategy on Nature Protection, certain activities in this field have been conducted. In particular, the government order on strictly protected and protected wild species was adopted in 2020, and an information system for nature protection was established in 2018 within the Institute for Protection of Natural and Cultural Heritage of the RS. In the FBiH, major activities relate to the adoption of a list of invasive species in 2019, the proclamation of five additional nature protected areas, and the establishment of an information system of nature protection in 2018. Aichi Biodiversity Targets<sup>212</sup> have not been achieved, although certain progress has been made towards objectives 11 and 12, and at some level on Target 1. No biodiversity monitoring system is in place to provide quality data on the status of biodiversity in the economy as there is no institution tasked with monitoring the state of biodiversity. The entities lack the capacity to establish the monitoring systems stipulated in their respective laws on nature protection.

Although several bodies regulate biodiversity in BiH,<sup>213</sup> human and financial resources (mostly government funded) are not adequate to execute their main responsibilities. Vertical and horizontal co-ordination appears non-existent, and capacity building activities are not being conducted.

In the framework document of the Strategic Plan for Rural Development of Bosnia and Herzegovina (2018-2021), the forestry sector is listed only through general data on the area and structure of forests in total and in each entity, without specific measures and plans for the development of forests and their important role in rural development.

The Forestry Strategy for RS (2011-2021) is in line with the entity's forest management plans and includes preventive and reactive measures for forest fires; fire protection is included in the forest management plans and specific plans for fire protection. According to the Information on Forest Management in the FBiH in 2019 and forest management plans for 2020, and considering that there is no Law on Forests or related regulatory instruments, the current legislation in the FBiH relates, among other things, to fire protection.<sup>214</sup> A forest inventory system for Bosnia and Herzegovina has been compiled but not officially published. The

Research and Development Project Centre in Banja Luka compiles annual reports on the health of forests. The Forest and Hunting Inspection of the RS oversees the monitoring and enforcement framework to combat illegal logging, and carries out control measures for both public and privately owned forests based on forest management plans. In the FBiH, the Inspection Service and forestry offices at the cantonal level are responsible for monitoring and combating illegal logging. The FBiH Forestry Inspection (FFI) performs all inspection services regarding the implementation of activities related to the Law on Inspection. Local stakeholders report the relatively small number of FFI staff in Sarajevo and the lack of co-ordination with the Cantonal Forestry Inspection.

There are no data on the range of penalties for illegal activities in the timber trade in both entities, and the levels of detection, reporting and sanctioning for illegal logging are reported to be low (European Commission and UNEP-WCMC, 2020<sup>[184]</sup>).

**The land-use legal and policy framework** has remained almost unchanged since the last CO assessment in the RS, with the exception of the adoption of the Amendment of Law on Agricultural Land in 2019, which introduced and defined the term “soil and land degradation” and outlined the methods of soil protection. Four municipalities in the RS are in process of drafting local strategic document for land use planning.

On the policy side, the Council of Ministers adopted an Action Programme to Combat Land Degradation and Mitigate the Effects of Drought in BiH (APCLDMED) in 2017. During the land degradation neutrality (LDN) target setting process (2016-2018), the main land degradation drivers were identified in the RS, and LDN targets with associated measures were created until 2030. Although no implementation reports have been produced, some evidence of effective policy implementation has been recorded under the APCLDMED. These mostly relate to the development and adoption of an LDN report for the RS in 2019, the preparation of the Drought Management Plan for the RS at the time of drafting, the implementation of measures to protect the land and remediate degraded land (the hot spot regions of Bijeljina, Gradiška, Trebinje), as well as awareness-raising activities and enhancing the role of education in combating land degradation and the effects of drought.

Institutions responsible for land-use management in the RS include the Ministry of Agriculture, Forestry and Water Management, the Ministry of Spatial Planning, Civil Engineering and Ecology, and the Republic Administration for Geodetic and Property-Legal Affairs. In the FBiH, the leading institution in this area is the Ministry of Agriculture, Water Management and Forestry. All of these institutions in RS and the FBiH have qualified staff, but financial resources are lacking. So far, horizontal and vertical co-ordination have had an ad hoc and case-by-case nature. There has been limited capacity building and training activities for the responsible bodies. Regarding land-use indicators, very little data are collected in BiH, and when collected are mostly ad hoc on a project basis.

### *Sub-dimension 13.3: Environmental quality of life*

Poor **air quality** is one of the major concerns regarding environmental quality of life in BiH. This becomes an even greater issue in the context of the COVID-19 pandemic given that exposure to ambient and indoor air pollution increases the risk of cardiovascular, respiratory and developmental diseases, as well as premature death, thus making individuals even more vulnerable to the virus (OECD, 2020<sup>[185]</sup>). BiH has one of the highest concentrations of air pollution in Europe, with mean annual exposure to particulate matter (PM<sub>2.5</sub>) of 30 µg/m<sup>3</sup>, which is triple the World Health Organization recommended highest levels (10 µg/m<sup>3</sup>), and higher than the averages in the EU (13.1 µg/m<sup>3</sup>), the OECD (12.5 µg/m<sup>3</sup>) and the WB region (25.77 µg/m<sup>3</sup>) (OECD, 2020<sup>[186]</sup>), (World Bank, 2020<sup>[187]</sup>). Power generation, heating, industry and transport are the main sources of air pollution in BiH (UNECE, 2018<sup>[181]</sup>).

The air quality framework remains underdeveloped in the FBiH. In RS, air quality management is regulated by the Law on Air Protection and relevant by-laws, and is almost fully aligned with EU directives.<sup>215</sup> Although there has been little change in the legislative framework since the last assessment, the policy

framework has been modified. In particular, the Swedish Environmental Protection Agency's IMPAQ Programme<sup>216</sup> (2017-2021) is being conducted to build capacities of the key government institutions in BiH to manage air quality, improve air quality data collection, and consequently enhance air quality throughout the economy. The project is run by a steering committee that includes relevant institutions in BiH, with MoFTER as the co-ordinating ministry. Monitoring of the IMPAQ programme is set to be conducted at the state level twice a year through steering committee meetings.

The entities are exclusively responsible for the adoption and implementation of regulations in the field of air protection. Several institutions at the entity and cantonal level are responsible for air quality management, but the lack of financial resources and institutional capacity impedes effective management in this area, although training courses have been conducted to build capacity. Horizontal co-ordination is ensured through the inter-entity body and the main vertical co-ordination tool is the Environment Partnership Programme for Accession (EPPA) Air Quality Working Group.<sup>217</sup>

Air pollution monitoring in Bosnia and Herzegovina is operated at the entity level, the cantonal level, by public health institutes and by companies. In the FBiH and RS, hydrometeorological institutes are responsible for the verification of air quality data and reporting. Although the air monitoring system has improved over the last ten years, it is still insufficient for a well-functioning economy-wide air monitoring regime. Monitoring is not co-ordinated and is undertaken according to different methodologies in both entities,<sup>218</sup> which results in a lack of air quality data available for the entire economy. This is aggravated by the low number of monitored locations (ten), which mainly cover urban areas (UNECE, 2018<sub>[181]</sub>).

When limit values and the alarm threshold are exceeded in RS, the competent authority informs the public and takes the necessary ad hoc measures. Immediate action is also undertaken in the FBiH. As stipulated in cantonal intervention plans, cantonal authorities conduct ad hoc measures depending on the type of air pollutant exceeded – PM, SO<sub>x</sub>, nitrogen oxide (NO<sub>x</sub>), etc. Information on air quality is promptly made available via the websites of the hydrometeorological institutes of FBiH and RS, and distributed via radio and television.

Around 88% of the BiH population has access to a piped **water supply**, and around of one-third of the population in each entity is covered by **the sewerage system** (33% in the FBiH and 36% in RS in 2015) (UNECE, 2018<sub>[181]</sub>). The main issues regarding water supply and sanitation relate to outdated infrastructure that causes significant water losses (usually more than 50% or even 70% in exceptional cases), infrastructure made up of hazardous material such as asbestos, which requires specific attention in rehabilitation works, and the overall lack of wastewater treatment plants (WWTPs) (in 2015 only 3% of the population in the FBiH and 5% in RS were connected to a WWTP, with no WWTP in the Brčko District) (Eurostat, 2018<sub>[188]</sub>).

No major changes have been recorded regarding legislative and policy frameworks in this area since the last CO assessment, and it remains relatively undeveloped.

The main sources of investment in infrastructure are the state budget in the RS. Current water service fees do not seem sufficient to cover operational and maintenance costs and necessary investments to renew and enhance the water supply assets. Prices set by local government units and applied by the Public Utilities Cooperation (PUC) are based on social criteria, with little opportunity for the PUC to ensure the reimbursement of service costs through its operating revenue, and thus the viability of the business. The state does not have defined criteria for determining investments, which means that investments in water supply infrastructure are generally ad hoc. In the FBiH, water supply and sanitation infrastructure is funded by local budgets, cantonal budgets, donations, loans by international financial institutions, etc. The water supply and sanitation service is funded by water tariffs and local budgets.

Regarding investments in the updated water infrastructure, the Water and Sanitation Infrastructure Project (WATSAN) has been implemented in the FBiH and the RS. Overall objectives of the WATSAN project (to be finalised by the end of 2021) relate to improving the current living conditions of the population, securing adequate hygienic conditions in the area of water supply and sanitation, and implementation of

environmental protection measures in line with the obligations of EU accession and harmonisation with EU legislation, particularly the Water Framework Directive, the Drinking Water Directive and the Urban Waste Water Directive. Very little has been done to decrease water losses in the system, although this issue has been recognised by the government. Some additional investments in wastewater treatment plants were planned at the time of drafting, but did not consider contaminants of emerging concern (e.g. micro plastics).

**Industrial waste management legislative and policy frameworks** have not changed since the last assessment – the same policies apply to municipal and industrial waste management in RS (Waste Management Strategy 2017-2026 and a Waste Management Plan 2019-2029). There are no similar strategies in the FBiH (as mentioned the draft Environmental Protection Strategy 2020-2030 should cover these aspects).

In the FBiH, the Ministry of Environment and Tourism and the Environment Protection Fund regulate waste management, but they both lack the financial resources to effectively conduct their role. In RS, several institutions regulate this area.<sup>219</sup> Co-ordination and capacity building activities are largely lacking in both entities, although some indirect activities in this regard have been recorded as part of the EU's EPPA programme.

In RS there is a system of prior regulations and/or specific authorisation for the storage and handling of substances endangering or potentially endangering waters, in accordance with the Law on Chemicals and the Law on Biocides. There is also an official register of chemicals on the market – all imported chemicals need to be registered in accordance with the laws and regulations related to the management of chemicals. There are classification, packaging and labelling rules for chemicals (for both substances and mixtures), and the Ministry of Health and Social Welfare of the RS keeps the register of chemicals where all "new" chemical substances are identified and noted.

The Pollutant Release and Transfer Register (PRTR) system has been established in both the FBiH and RS but is still not fully operational. In particular, the obligation to report to the economy-wide PRTR, enabling public access to and integration of collected data, and the transmission of data to EU institutions are still lacking. Regarding managing and controlling industrial risks and accidents, BiH is not aligned with the EU directive on the control of major-accident hazards involving dangerous substances (Seveso III) (European Commission, 2020<sup>[39]</sup>). There are no hazardous waste disposal facilities and hazardous waste is exported for final treatment.

Regarding soil protection and provisions for the identification and management of contaminated sites, there is no policy and legislative basis for soil protection in RS and the FBiH, and no soil monitoring system in BiH.

### ***The way forward for environment policy***

Although there have been some improvements since the last assessment cycle, further efforts are needed in several areas, mostly regarding implementation. The priorities are as follows:

- **Improve the wastewater system** by:
  - Replacing the outdated water and sanitation infrastructure, especially those made from toxic materials such as asbestos. Although there have been some advances in this regard, such as through the WATSAN project, efforts need to be stepped up as BiH is one of the WB economies facing the greatest level of water losses (up to 70%).
  - Increase the number of wastewater treatment plants. Despite some newly constructed WWTPs, most wastewater in BiH ends up in the rivers untreated, resulting in high pollution levels. In particular, a very small number of the population are connected to WWTPs as there are so few in BiH. New investment in WWTPs is therefore needed, preferably financed from the domestic budget and water tariffs and complemented by donor funds.

- Apply the water-user and polluter-pays principles for all water users and dischargers, paying attention to the vulnerable social groups in the economy, and ensure regular maintenance of the existing water supply and sanitation network.
- **Enhance air quality by reducing emissions from the transport sector, industry and domestic heating.** As highlighted above, these three sectors represent the main sources of air pollution in Bosnia and Herzegovina. The per capita mortality rate in BiH attributed to household and ambient air pollution is 79.8 per 100 000 inhabitants, which is one of the highest rates in Europe (World Bank, 2016<sup>[189]</sup>). More effort is therefore needed, such as the following:
  - Investment in the reconstruction and insulation of residential buildings and private houses to improve their energy efficiency. Effective financial mechanisms, for example through subsidised loans from the banking system to improve domestic heating systems (moving from the use of firewood or coal, which is currently much cheaper than other sources) and overall energy efficiency. Seeking financial support from the international donor community is recommended.
  - Measures to prevent air emissions from industry, such as those described in the EU Best Available Technique Reference Documents (BREFs) (Box 21.16) need to be more regularly included in the environmental permits for industrial facilities in Bosnia and Herzegovina.
  - Introduction of economic incentives to promote a shift to cleaner and newer vehicles, such as the "feebate" system for new cars introduced in France in 2008, which imposes a tax on the buyer if the CO<sub>2</sub> emissions of the vehicle exceed a certain threshold and allocates bonuses if they are below a certain level. Supporting local governments in improving their public transport system, in particular by promoting the use of clean and energy efficient transport modes. Encouraging the use of other transportation means, such as bicycles for shorter distances, followed by the construction of an appropriate cycling infrastructure (Manea et al., 2019<sup>[190]</sup>).

### Box 21.16. EU Best Available Technique Reference Documents (BREFs)

The BREFs are a series of reference documents covering, as far as practicable, the industrial activities listed in Annex 1 of the EU's integrated pollution prevention and control (IPPC) directive. The BREFs provide descriptions of a range of industrial processes and, for example, their respective operating conditions and emission rates. Member States are required to consider these documents when determining the best available techniques for industrial activities generally or in specific cases. They also serve as a good basis for potential candidates.

The BREFs were developed to exchange information between industrial sectors and NGOs in different Member States and the European Integrated Pollution Prevention and Control Bureau.

The documents cover:

- Common Waste Gas Treatment in the Chemical Sector
- Emissions from Storage
- Ferrous Metals Processing Industry
- Industrial Cooling Systems
- Large Combustion Plants
- Refining of Mineral Oil and Gas
- Waste Incineration and Treatment

## Agriculture policy (Dimension 14)

### Introduction

Bosnia and Herzegovina's performance has been stable in the area of agriculture between 2018 and 2020 (Figure 21.1), with the economy achieving a score of 2.0 for the latest CO assessment. Some progress has been made; however, Bosnia and Herzegovina still scores low compared to other WB6 economies, falling below the WB6 region averages in all sub-dimensions, particularly the sub-dimension on agro-food system capacity (Table 21.25).

The rural infrastructure policy in Bosnia and Herzegovina has recently been updated, but budget allocations and utilisation remain limited. BiH's new Rural Development Strategy for 2018-2021 prioritises irrigation infrastructure, and the World Bank project supporting irrigation development has significantly increased the capacity of irrigation infrastructure.

However, BiH has made little progress in harmonising regulations on agricultural registers, the parcel identification system, the common market organisation and the accreditation of a payment agency, in line with the EU's Common Agricultural Policy (CAP) and other policies.

Finally, while BiH has made progress in harmonising its sanitary and phytosanitary (SPS) procedures with EU regulations, implementation of legislation on SPS measures is limited and varies between economic sectors.

**Table 21.25. Bosnia and Herzegovina's scores for agriculture policy**

Dimension	Sub-dimensions	Score	WB6 average
Agriculture policy dimension	Sub-dimension 14.1: Agro-food system capacity	1.5	2.8
	Sub-dimension 14.2: Agro-food system regulation	2.3	2.9
	Sub-dimension 14.3: Agriculture support system	2.1	2.7
	Sub-dimension 14.4: Agricultural innovation system	2.0	2.6
Bosnia and Herzegovina's overall score		<b>2.0</b>	<b>2.7</b>

### State of play and key developments

The territory of Bosnia and Herzegovina measures 51 209 km<sup>2</sup> (5 120 900 hectares, ha), 50.4% of which is agriculture land and 48.3% forest land. Total arable land is 2.2 million ha, (MoFTER, 2018<sub>[192]</sub>) or 62% of all agricultural land and 30.95% of total land. Although the largest part of agricultural land, in particular arable land, is privately owned, its distribution among around 350 000 rural households makes the land highly fragmented, which negatively impacts agricultural productivity.

The structure of sowing areas has remained unchanged for years, dominated by cereals with a share of 58%, fodder crops at 26%, vegetables at 14% and industrial crops at 2%. Fruit production in BiH is represented by the production of plums, apples and pears, with a strong expansion in the production of raspberries and strawberries in recent years. Bosnia and Herzegovina's dominant portion of meadows and pastures allows for high cattle breeding, which is currently at a moderate level but with a solid basis for further development.

More than half of the total population (3.5 million) live rurally. In 2018, 15.4% of households listed agriculture and fishery as their main field of activity (Figure 21.16). Agriculture is an important pillar of the economy of Bosnia and Herzegovina, both in terms of its contribution to GDP and overall employment. While the contribution of agriculture to GDP in 2020 was 6.1%, 18% of BiH's workforce were employed in this sector, making it the third-most important employment sector, after services and industry.

**Figure 21.16. Contribution of agriculture, services and industry to GDP in Bosnia and Herzegovina**

Source: (Agency for Statistics of Bosnia and Herzegovina, 2020<sub>[193]</sub>), *Agriculture statistics*, <http://www.bhas.gov.ba/Calendar/Category/23>.

As displayed in Table 21.26, Agriculture represents 2% of total exports and 3.8% of imports in BiH. However, agriculture exports have been decreasing over the last four years, and agricultural imports have begun to decrease more recently due to increased substitution with domestic production.

**Table 21.26. Value of exports and imports of the agriculture, forestry and fisheries sector (2016-19)**

	Exports				Imports			
	2016	2017	2018	2019	2016	2017	2018	2019
Total (million EUR)	4.815	5.652	6.084	5.876	8.262	9.298	9.854	9.969
Agriculture, forestry and fisheries (million EUR)	1.42	1.46	1.29	1.18	3.89	4.21	3.82	3.85
Percentage share of agriculture, forestry and fisheries	2.96%	2.59%	2.13%	2.02%	4.72%	4.53%	3.88%	3.86%

Source: (Agency for Statistics of Bosnia and Herzegovina, 2020<sub>[193]</sub>), *Agriculture statistics*, <http://www.bhas.gov.ba/Calendar/Category/23>.

The potential of agricultural production in BiH is reflected in favourable agro-climatic conditions, preserved agricultural land and a large number of autochthonous varieties. However, agricultural production in BiH still faces low productivity, unfavourable structure and farm sizes, insufficient and poor technological equipment, and high dependence on imports of agriculture inputs, equipment and agricultural mechanisation.

#### *Sub-dimension 14.1: Agro-food system capacity*

**Rural infrastructure policy** and strategies in Bosnia and Herzegovina have been updated since the last CO assessment and provide comprehensive priorities; however, implementation is uneven across the entities. MoFTER is responsible for the co-ordination of agricultural policy creation at the state level. Its jurisdiction is to define the framework of policies in co-operation with the competent institutions of the entities and the Brčko District. The ministries of the entities and the Brčko District are responsible for the management and implementation of policies, programmes and measures in their respective territories.

Rural infrastructure policy in BiH is primarily based on the Strategic Plan for Rural Development of Bosnia and Herzegovina (2018-2021), (MoFTER, 2018<sub>[192]</sub>) which was prepared by MoFTER in close co-operation with relevant ministries from the entities in a participatory process that involved all relevant stakeholders. The strategic plan was drafted and then widely discussed in several public debates and through the online platform for consultations ([e-consultation.gov.ba](http://e-consultation.gov.ba)). A total of 133 representatives from the public administration, businesses and the civil sector participated in the public debates. In 2019,

MoFTER, in collaboration with relevant institutions at the entity level, began activities for implementation monitoring.

The strategic plan envisages support for road infrastructure, field roads, anti-hail protection, water supply, Internet, radio and television signal, electricity supply, and infrastructure for waste management.<sup>220</sup> There is a provisional budget for the objectives at the state level, but implementation mechanisms are decided at the entity level.<sup>221</sup>

The total amount dedicated to rural infrastructure was less than EUR 2 million, out of which EUR 1.28 million is allocated to RS. RS has supported the installation of an anti-hail security system, a priority measure of the strategy, at a cost of EUR 31 000, while the Brčko District spent EUR 63 000 on the same measure and an additional EUR 72 500 on the construction and repair of field roads. The Ministry of Agriculture of the FBiH has made no expenditure on rural infrastructure during this period.<sup>222</sup>

Since 2013, the network of roads in BiH has increased by 18.7% to 10 758 km in 2018, local roads have increased by 1 008 km to 4 787 km, and regional roads have increased 444 km to 5 173. Motorways account for 198 km of the road network. In 2019, 76.9% of households in urban areas had an Internet connection, while 68.3% of households in rural areas maintained a connection, a 4% increase from 2018 and a 7% increase from 2017 (Agency for Statistics of Bosnia and Herzegovina, 2019<sub>[194]</sub>).

The potential of **irrigation infrastructure** in BiH is high, but the current system is limited, covering around 3 600 ha in FBiH and around 10 000 ha in RS. There are no monitoring and evaluation systems. Most investment in new irrigation systems and the rehabilitation of existing systems have been part of the Irrigation Development Project in Bosnia and Herzegovina 2013-2020 and funded by a World Bank loan of USD 40 million. The project supported new irrigation infrastructure investment, including the preparation of technical documentation and construction of an irrigation system in around 4 784 ha of land, as well as the preparation of technical documentation (preliminary or main designs) for new irrigation systems in around 20 000 ha of land. Support for the construction of irrigation and drainage infrastructure was also identified as a priority for development in the Strategic Plan for Rural Development.

According to a 2018 report on the Strategic Plan for Rural Development, the Ministry of Agriculture, Forestry and Water Economy of RS financed the procurement of 483 pumps, typhoons and pool tanks totalling around EUR 46 250. In the same period, the Brčko District's agriculture authority approved and provided small incentives for five applications. The FBiH Ministry of Agriculture, Water Economy and Forestry has not approved any applications regarding irrigation. Entities and the Brčko District should report to the BiH parliament annually as part of the framework report of the strategic plan, but there are currently no mechanisms for monitoring established at any entity level.

**Agricultural education policies** have been updated and enhanced, but the number of students enrolled in agriculture programmes has been slightly decreasing. The Constitution of BiH states that the education sector is regulated by entities, cantons and districts. RS has the Ministry of Education and Culture within its centralised government, but the FBiH has a decentralised government consisting of 10 cantons, each with its own ministry of education. The Brčko District has a centralised government with a single Department of Education. There is a Ministry of Education at the state level, but it primarily plays a co-ordination role over the 12 institutions responsible for education in BiH.

The agriculture education framework in BiH is based on the Strategy of Development of Science in BiH 2017-2020<sup>223</sup> and the Strategic Plan for Rural Development.<sup>224</sup> The actions foreseen by the plan are implemented in a very heterogeneous way in the different entities. As part of Measure 3 of the plan, which involves support for vocational training, knowledge development, and providing advice and information, the Ministry of Agriculture in RS approved five project applications for a total of EUR 260 000 in 2018, while FBiH and the Brčko District recorded no activity on the implementation of agriculture education that year.

Secondary education is represented by both general and vocational secondary education schools in BiH, with only vocational secondary education providing agriculture curricula. In FBiH, the number of students enrolled in the first year of agricultural secondary education slightly decreased from 973 (1.4% of the total

number of students) in 2018/19 to 951 (1.3% of the total number of students) in 2019/20. The number of students who completed education in the field of agriculture and livestock breeding also slightly decreased, from 403 students in 2018 to 368 students in 2019 (Bureau of Statistics FBiH, 2020<sub>[195]</sub>). In RS, the numbers are higher but have also slightly decreased. The number of enrolled students in the field of agriculture, forestry and veterinary in secondary education decreased from 2 158 (5.6% of the total number of students) in 2018/19 to 1 948 (5.2% of the total number of students) in 2019/20 (Bureau of Statistics Republika Srpska, 2020<sub>[196]</sub>).

Differences between the entities are less pronounced at the university level. Public university education in the area of agriculture is represented by eight faculties throughout the economy.<sup>225</sup> In RS, 2 371 students enrolled in a first year course in the field of agriculture, forestry, fishery and veterinary at the university level in 2019/20 (Bureau of Statistics Republika Srpska, 2020<sub>[196]</sub>). Meanwhile, 1 830 students enrolled in a course in the field of agriculture, forestry and fishery at the university level in FBiH in 2019/20, or 3.6% of the total number of enrolled students (Bureau of Statistics FBiH, 2020<sub>[195]</sub>).

#### *Sub-Dimension 14.2: Agro-food system regulation*

Several **regulations on natural resources** in RS have been updated in the last two years, but land consolidation remains weak for all entities in Bosnia and Herzegovina. As the regulation of natural resources is the responsibility of the entities in BiH, both RS and the FBiH have specific laws in the area of natural resources management. The Law on Waters in RS was last amended in 2012 and regulates the protection, use and management of water, while the Law on Water in FBiH was adopted in 2006. Regulations in RS improved with amendments to the Law on Agriculture Land in 2019 regarding soil and land degradation and additional measures for soil protection. The Law on Agriculture Land in FBiH was adopted in June 2009. To reform agricultural policy in the FBiH, a mid-term strategy for development of the agricultural sector in the FBiH (2015-2019) was developed, and the FBiH government adopted one decree in 2019 (no. 1389/2019) and one in 2021 (no. 267/2021) to extend the implementation period of the strategy until the end of 2020 and 2021, respectively.

The Strategic Plan for Rural Development<sup>226</sup> provides an in-depth interpretation of the state of land, climate and water in BiH. Regarding agro-ecology it identifies land degradation, waste management, agro-ecological policy, and protection of the biodiversity of animal and plant genetic resources as priorities for improvement. Water management in the FBiH is based on the FBiH Water Management Strategy 2010-2022, which defines the objectives for sustainable water management and the necessary activities to be implemented as part of the action plan. In 2020, RS improved its co-operation and co-ordination between the water management and agriculture departments and irrigation users through the establishment of a new irrigation department within the public agency, Vode Srpske.

While both entities have defined the land consolidation process and provided a legal framework for its implementation, land consolidation remains an unresolved issue in BiH. There has been little progress in this area, and capacity and budget support are limited. There is also a lack of knowledge and awareness among farmers.

**Regulations on products** in Bosnia and Herzegovina are generally in line with international standards, and the economy made progress in updating laws in 2019. Regulations on products fall under the auspices of the BiH Administration for Plant Health Protection (PHPO), a department of MoFTER. The PHPO is the central authority for plant health protection in BiH and for the exchange of information with official international authorities. The PHPO performs administrative and related technical tasks in line with the Law on Plant Health Protection and other substantive regulations that make up the legal framework. The PHPO co-operates, informs and exchanges information with official international plant protection authorities and organisations. Based on substantive regulations, phytosanitary competences are shared between the PHPO and the entities. The PHPO, in collaboration with competent inspection bodies of the entities, works on a co-ordinated multi-annual control programme to ensure compliance with maximum

residue levels of pesticides, and to assess consumer exposure to pesticide residue in and on food of plant and animal origin.

Regulations on products are based on the Law on Plant Health Protection, which was harmonised with the International Plant Protection Convention in 2015. Also relevant are the Law on Agricultural Seeds and Propagating Material, the Law on Protection of New Plant Varieties, the Law on Mineral Fertilisers, and the Law on Phyto-pharmaceutical Products. Regulations on pesticides are defined by Rulebook on the Maximum Level of Pesticides Residues in and on Food and Feed of Plant and Animal, last updated in 2019. The rulebook determines the maximum residue level of pesticides in and on food and feed for animals of plant and animal origin for insurance purposes, in accordance with general principles prescribed by the Law on Food and regulations at the entity level that refer to pesticide residue.

The Law on Mineral Fertilisers regulates conditions for the composition, quality and marking of mineral fertilisers placed in the market; their use; and supervision of the implementation of this law and by-laws adopted based on this law, and other regulations adopted for the application of this law. The list of active substances permitted for use in plant protection products is updated continuously.

### *Sub-dimension 14.3: Agricultural support system*

**The agriculture policy framework** has been updated recently at all entity levels; however, BiH has still not implemented mechanisms that would ensure its eligibility for EU Instrument for Pre-accession Assistance for Rural Development (IPARD) funding. The legislative framework for measures to support agriculture and rural development at the state level consist of the Law on Agriculture and the Law on Food and Rural Development of BiH. In RS, the framework is made up of the Law on Agriculture and the Law on the Provision and Directing of Funds for the Promotion of Agriculture and Rural Development, and in FBiH it is the Law on Agriculture and the Law on Financial Support in Agriculture and Rural Development.

The agriculture policy framework of Bosnia and Herzegovina at the state level is based on the Strategic Plan for Rural Development.<sup>227</sup> At the entity level, the framework consists of the Mid-term Development Strategy of the Agricultural Sector in the FBiH (2015-2019) and the Strategic Plan for Development of Agriculture and Rural Areas in RS (2016-2020).

Harmonisation with the EU's CAP is a priority for all strategies related to agriculture policy at all levels in BiH. The Office for Harmonisation and Co-ordination of Payment Systems in Agriculture within MoFTER is in charge of the harmonisation of payment systems in agriculture and rural development in BiH, as well as the gradual harmonisation of the payment system with the EU system. The office is also responsible for developing a legal framework to establish and develop institutional structures for the implementation of EU funds.

Budgetary support for agriculture in BiH is implemented at the level of entities and cantons. In FBiH, support is implemented based on the adopted programme of funds expenditure with allocation criteria for incentives for agriculture. In RS, financial support for agriculture is carried out in accordance with the adopted plan allocation of resources to support agriculture, all of which are adopted annually. Funding for agricultural policy is provided by state and entity budgets, as well as through EU and international projects. Bosnia and Herzegovina is not yet eligible for IPARD funding as the mechanisms for implementation are still not ready. According to MoFTER data, in 2019 approximately 70 000 producers were supported by available measures at the state level.

**Domestic producer support instruments** in Bosnia and Herzegovina are well structured as part of rural development strategies in both entities; however, there are no monitoring and evaluation mechanisms. Domestic producer support instruments are implemented at the entity level. In RS, support responsibilities fall under the Ministry of Agriculture, Forestry and Water Management, which adopts the Rulebook on Conditions for Incentives for the Development of Agriculture and Rural Areas annually. Domestic support instruments are laid out in the Strategic Plan of the Development of Agriculture and Rural Areas of RS (2016-2020), which includes support for current production,<sup>228</sup> capital investments,<sup>229</sup> rural development

and systemic support.<sup>230</sup> The agriculture support budget for 2020 was EUR 37.5 million, implemented by the Agricultural Payment Agency of RS.

The legislative framework for domestic support measures in agriculture and rural development in the FBiH are regulated and implemented through the Law on Agriculture and the Law on Subsidies in Agriculture and Rural Development. Cantonal sectoral ministries also provide support. In the FBiH, agricultural support measures are based on the principles of the Mid-Term Strategy for the Development of the Agricultural Sector (2015-2019). In 2019, the cantons supported agriculture with more than BAM 22 million (EUR 11.09 million), an increase of 10% from 2018. Cantonal support accounts for 24.9% of the total FBiH budget for agriculture. Compared to 2018, the share of cantonal support in agriculture support measures has increased by 2.7%.

The 2020 budget of the FBiH for the support of agriculture was EUR 43.5 million. The FBiH government, as part of the Public Investment Programme (2020-2022), runs the Rural Development Programme worth EUR 104.5 million. Farmers are also eligible for International Fund for Agricultural Development grant funds and EU funds of over EUR 10 million. Part of the funds are directed towards investments to increase the competitiveness of agricultural products and reduce the large trade deficits in the sector. The implementation of agriculture support programmes is relatively high in both entities; however, there are no consistent data within annual monitoring reports on the outcomes of the programmes, and impact assessments are not conducted regularly at either the entity or state level.

**Agricultural trade policy** of Bosnia and Herzegovina is aligned with EU customs tariff nomenclature, and tariff rates benefit from regular reports and analyses on agriculture trade development. Trade policy in BiH remains under the auspices of the Council of Ministers, which annually adopts a decision on the Determination of the Customs Tariff in accordance with the Law on Customs Tariffs. BiH is a member of CEFTA and has ratified the Stabilisation and Association Agreement (SAA) and the European Free Trade Agreement (EFTA). BiH also maintains a free trade agreement with the Republic of Turkey. Bosnia and Herzegovina does not have export subsidies, export credit support, export duties or export prohibitions for agricultural commodities (crops and livestock). The customs tariff nomenclature of goods is aligned with the harmonised system and the combined nomenclature used by the EU.

Goods imported into Bosnia and Herzegovina and placed in free circulation are subject to payment of VAT at the rate of 17%. There are import quotas for agriculture products under the trade agreement between the EU and BiH, notably for cattle, swine, sheep, live animals and meat. Customs duties on all commodities imported into BiH are paid according to the value at rates of 0%, 5%, 10% and 15%. These rates apply to commodities originating from economies that have concluded an agreement with a “most favoured nation” clause with BiH, or from economies that apply the same clause on commodities originating in BiH. Upon accession of BiH to the WTO, most-favoured nation status will be granted to all WTO members, some alterations to tariff protection for agricultural products in BiH will then be expected, subject to negotiations.

Regulations on customs tariffs are adopted based on an analysis of the previous situation to make implementation as enforceable as possible. Although there is no exact assessment, transparency is guaranteed based on publicly available regulations and procedures, which are published on the MoFTER website. Annual reports are prepared, including the level of implementation of strategies, action plans and legislation. No impact assessments are conducted in the agriculture sector specifically, but various documents are regularly prepared that provide analysis, such as annual reports in the field of agriculture, food and rural development; analysis of the foreign trade of agricultural and food products of BiH; and analysis of the milk and dairy product market in BiH.

**Agricultural tax policy** in Bosnia and Herzegovina is relatively standardised across the entities; however, only a small number of agricultural products benefit from VAT exemptions. Tax policy falls under the remit of the Tax Authority of FBiH, the Tax Authority of RS and the Indirect Taxation Authority of BiH. Tax policy, including agricultural tax policy, is based on the Law on Value Added Tax, the Law on Tax Procedure and Tax Administration of RS, and the Law on Income Tax of FBiH, which is currently undergoing parliamentary approval.

Personal income tax in Bosnia and Herzegovina is 10%, with no exclusions for agriculture at the state or entity level. Social contributions depend on the entity.

Standard VAT in Bosnia and Herzegovina is 17%, but there is no VAT on the export of goods for agriculture in general. The exclusion of VAT for certain agricultural products depends on the entity and mostly cover machinery and the provision of agricultural inputs such as seeds and seedlings. Both entities can defer, which is done on annual basis by the governments of the respective entities based on analysis of the ministries of finance and agriculture.

The **sanitary and phytosanitary system** in Bosnia and Herzegovina is well organised with a clear division of responsibilities and strong alignment with EU regulations. The SPS system and measures are governed by the Law on Food and fall under the auspices of MoFTER and the Food Safety Agency of BiH (FSA), an independent administrative organisation established by the Decision on the Establishment of the Food Safety Agency of Bosnia and Herzegovina. The FSA provides scientific advice and scientific and technical assistance regarding the legislation and policies of BiH in all areas that have a direct or indirect impact on food and feed safety. It provides independent information on all issues within these areas and transmits risk information. The FSA collaborates with competent authorities to improve the effective connection between risk assessment, risk management and risk disclosure functions.

The FSA does not have its own inspection body, but inspections are carried out through the Veterinary Border Inspection and Inspections of the Veterinary Office of Bosnia and Herzegovina. The Veterinary Office is under the direct jurisdiction of MoFTER and works in accordance with the operative activities of entity veterinary services.

The FSA, in collaboration with competent inspection bodies, prepares a co-ordinated multi-annual control programme, funded by the state budget, to assess consumer exposure to pesticide residue in and on food of plant and animal origin. Food control laboratories in BiH are authorised by the entities to undertake their work, in accordance with EU regulation. The FSA, in co-operation with the competent bodies of the entities and the Brčko District, has initiated, prepared and proposed over 100 regulations adopted by the Council of Ministers of BiH since 2006.

The Plant Health Administration of Bosnia and Herzegovina is an administrative organisation within MoFTER responsible for phytosanitary measures. It was established by the Decision on Establishment of the Administration of Bosnia and Herzegovina for Plant Health Protection in 2014.

There is a strict division between legislative and executive authorities at all levels of governments, and no duplications of inspections. The system is well organised, and each institution in the system has designated contact points and officials responsible for the flow of information and the efficient handling of notices consistent with the assessed risks. The FSA generally proposes regulations in line with relevant EU legislation, prepares amendments according to EU legislation and aligns regulations through co-operation with the BiH Directorate for European Integration.

#### *Sub-dimension 14.4: Agricultural innovation system*

Bosnia and Herzegovina has enhanced its **agriculture research and innovation** legislation to some extent, but research and development remains limited. The government has increased its efforts to upgrade research and innovation policies and related activities through the preparation and adoption of the Strategy for the Development of Science and related action plan in 2010 for a five-year period. The strategy sets the basis for the future development of research in all areas. The programme was later extended to 2019 and its implementation is still under way. The government has also increased its use of funds under the EU Horizon 2020 Programme.

The Strategic Plan for Rural Development of Bosnia and Herzegovina (2018-2021) emphasises the need to increase institutional co-operation and improve partnerships between scientific research advisors and producers. The strategy calls for further support for the improvement of experimental educational and

development centres, the introduction of technological innovations in agriculture, the improvement of laboratories, and the preservation of indigenous breeds and strains of domestic animals.

The number of research projects and applications has increased in recent years in RS. In FBiH, there are limited data regarding research projects and applications, with two new laws regarding the funding of agro-innovation apparently in the preparation phase. These laws should define the use of funds in the field of innovation, scientific research and development.

Agriculture research and development remains an important area for further planning, support and organisation to provide expected results and improve the performance of the agriculture sector.

**Agricultural extension services** in BiH continue to lack administrative capacities and funding to improve advisory services, and impact assessments are still not conducted. Extension services in agriculture at the state level fall under the auspices of MoFTER, which is responsible for the co-ordination and guarantee of the quality of private and public rural development and agricultural advisory services. It is part of the support of the implementation of rural development and agricultural policies and programmes throughout BiH. Advisory services at the entity level are organised and implemented by all entities, benefitting predominantly small agricultural producers. The legislative framework for agricultural extension services is based on the Law on Agriculture and the Law on Agricultural Extension Services of FBiH. Both laws regulate the goals and approaches of agricultural extension activity, who can perform an extension activity, and how to organise extension services.

The Strategy for Rural Development of BiH emphasises the role and importance of improving the system for providing extension services in terms of strengthening human, material and technical capacities; improving the planning, programming and provision of advisory services; and improving breeding and selection work in animal husbandry.

Advisory services in BiH are free and mainly deal with agriculture production, processing and marketing (i.e. vegetables and fruit growing, animal husbandry, processing and quality of agro-food products, agro-economy). The BiH public agricultural extension service is strongly focused on production techniques, while farm management, markets and marketing, regional rural development and the promotion of producer organisations are only partially served.

Agricultural extension services in BiH are severely impacted by a lack of human resources, limited funding, a lack information sharing between advisory services and other stakeholders, and a lack of specialised research institutions. Private extension services are present on a small scale and only operate on a commercial basis by charging farmers for their services. Monitoring of implemented activities is undertaken through annual reports, but impact assessments for policies and programmes are not conducted. Currently, activities within the extension service are planned according to the needs of farmers, and the training of farmers is determined by the annual working plan of the extension service.

### ***The way forward for agriculture policy***

- **Increase investment and improve the implementation of rural infrastructure policy.** There is a continuous need to improve rural infrastructure and boost the use of current programmes and support schemes, especially in the FBiH.
- **Harmonise rural development programmes across the economy.** BiH needs to effectively implement the Strategic Plan for Rural Development (2018-2021) at all levels. The harmonisation of rural development programmes and support measures throughout the economy should be enhanced and the new strategic plan for 2021 should reflect the harmonised measures and approach to implementation.
- **Implement a common market organisation regulatory framework.** The finalisation of the registers of farms and agriculture cadastres needs to be implemented. Furthermore, statistics need to be more reliable and harmonised across entities.

- **Set up the institutional framework for IPARD funding.** BiH needs to make further efforts in the process of an integrated administration and control system as a prerequisite for IPARD funding, the land parcel identification system and the farm accountancy data network. Furthermore, strengthening administrative capacity at all levels of government, as well as the full functionality of the payment agency, should be a priority for further harmonisation with the CAP and the use of EU funds.
- **Speed up the process of the preparedness of domestic reference laboratories.** Further efforts to increase the accreditation of laboratory methods used in hygiene, veterinary and phytosanitary controls are needed. State reference laboratories would improve food and safety policy, thus increasing the competitiveness of the agriculture sector overall.

## Tourism policy (Dimension 15)

### Introduction

Table 21.27 shows Bosnia and Herzegovina's scores for the five sub-dimensions and compares them to the WB6 average. Bosnia and Herzegovina has a very complex tourism policy framework and responsibilities are highly fragmented between different administrative levels. In all five sub-dimensions, Bosnia and Herzegovina scores below the WB6 average, with the lowest scores in the region in the sub-dimensions of governance and co-operation, destination accessibility and tourism infrastructure (along with Kosovo), and tourism branding and marketing. Although limited, some progress has been made in the tourism policy framework since the 2018 CO assessment (Figure 21.1), mainly regarding the availability of a qualified workforce sub-dimension, driven solely by improvements in the VET framework for tourism. Moderate progress has been made in the destination accessibility and tourism infrastructure sub-dimension, driven by improvements regarding accommodation capacity and the quality of the tourism offer with the adoption of mandatory accommodation categorisation standards and the development of quality standards for other tourist products and destinations in Republika Srpska. Progress in all other sub-dimensions is relatively low.

**Table 21.27. Bosnia and Herzegovina's scores for tourism policy**

Dimension	Sub-dimension	Score	WB6 average
<b>Tourism policy dimension</b>	Sub-dimension 15.1: Governance and co-operation	1.3	2.3
	Sub-dimension 15.2: Destination accessibility and tourism infrastructure	1.5	2.2
	Sub-dimension 15.3: Availability of a qualified workforce	1.3	1.8
	Sub-dimension 15.4: Sustainable and competitive tourism	1.3	1.6
	Sub-dimension 15.5: Tourism branding and marketing	0.5	1.6
<b>Bosnia and Herzegovina's overall score</b>		<b>1.2</b>	<b>2.0</b>

### State of play and key developments

The tourism industry in Bosnia and Herzegovina has been growing significantly over the last ten years, and BiH has the highest average annual growth of international tourist arrivals (14%) in the Western Balkan region. In 2019, the number of tourist arrivals reached 1.6 million (25.6% growth since 2017), and the number of tourist overnight stays was 3.4 million (25.9% growth since 2017). This is the result of increased foreign tourist visits (increase of nearly 30%) and foreign tourist overnight stays (increase of 26%) (Agency for Statistics of Bosnia and Herzegovina, 2020<sup>[95]</sup>). In 2019, the direct and indirect contribution of tourism to GDP was 9.3% (USD 1.8 million), which is 6.85% higher than in 2017. Bosnia and Herzegovina reached the highest average receipt per arrival (USD 950) in the WB region in 2019. Tourism contributes 13% to total exports and directly creates 25 700 jobs (3.2% of total employment), contributing 9.6% to total employment (79 100 jobs) (WEF, 2019<sup>[197]</sup>). Tourism is consequently becoming one of the most important sectors in the economy.

Although the tourism industry has significantly increased in recent years, BiH's share of international arrivals among the WB region was only 3.3% in 2019. According to the World Economic Forum's (WEF) Travel and Tourism Competitiveness Index 2019 (WEF, 2019<sup>[197]</sup>), BiH has increased its ranking by eight places since 2017; however, it is the least competitive economy in the region, ranking 105<sup>th</sup> out of 140 economies in 2019. This indicates that the tourism policy framework in BiH is not competitive enough compared to its regional peers, and that the tourism sector faces several challenges that need to be addressed.

The main challenges in the tourism industry are the low visibility of BiH as a tourist destination internationally and the low quality of tourist products, services and infrastructure. Moreover, finding qualified workers is pressured by high seasonality (BiH ranks 105<sup>th</sup> on the WEF Index for the indicator

“ease of finding skilled workforce”), which affects the quality of tourist products and services (WEF, 2019<sub>[197]</sub>). Nevertheless, BiH’s rich cultural and natural heritage is an opportunity to develop unique and authentic touristic products, thus increasing its competitiveness in the global market and bringing economic and social benefits to local populations. To lower seasonality one solution would be to disperse the tourist offer to rural areas and less known tourist destinations and prolong tourist stays in the destinations. In the short term, this will also help the tourism sector recover from the COVID-19 pandemic, adapt to new circumstances and attract visitors to BiH.

The COVID-19 pandemic stalled the development of the tourism industry in 2020 with the implementation of measures to limit the spread of the virus (Figure 21.17). Tourist arrival numbers were promising at the beginning of 2020 but started to drastically decrease from March in BiH and globally. The easing of restrictions and the lifting of lockdown led to slow signs of recovery in June 2020 that lasted until September 2020 when the second wave of the pandemic occurred. Accordingly, the consequences of the pandemic have been significant.

**Figure 21.17. Tourist arrivals and overnight stays Bosnia and Herzegovina (2018-20)**

Monthly

Source: (Agency for Statistics of Bosnia and Herzegovina, 2020<sub>[95]</sub>), *Tourism statistics*, <http://www.bhas.ba/Calendar/Category/19>.

StatLink  <https://doi.org/10.1787/888934255627>

The share of foreign tourists decreased from 75% in 2019 to 44% in 2020 due to the pandemic. According to the Directorate of Civil Aviation of BiH, airports in BiH recorded a decline in passenger traffic of 71% between January and September 2020 (400 000 passengers compared to 1.3 million in the same period in 2019). Sarajevo Airport had 78% fewer passengers than the previous year, Mostar Airport had a 96% decrease, Banja Luka Airport had a 62% decrease and Tuzla Airport had a 59% decrease.

Bosnia and Herzegovina followed instructions from the UN World Tourism Organization (UNWTO) and entity governments took measures to support the tourism sector. Notably, in RS a compensation fund was established to pay minimum wages, taxes and contributions for workers in sectors affected by the pandemic. A plan to issue 50 000 tourist vouchers to stimulate domestic tourist consumption was also established. In the FBiH, a similar compensation fund was established, along with a specific allocation of BAM 2.5 million (~EUR 1.25 million) for the tourism sector.

In October 2020, guidelines and protocols for health care regarding COVID-19 in tourism in BiH were issued, and BiH received the “safe travel country” label from the World Tourism and Travel Council (Ministry of Environment and Tourism FBiH, 2020<sub>[198]</sub>). The guidelines set out the principles to be followed in carrying out tourism activities during the COVID-19 pandemic, as well as protocols for tourism and hospitality businesses. The purpose of the guidelines is to protect tourists and the workforce, while respecting health regulations and measures to limit physical contact (Ministry of Environment and Tourism FBiH, 2020<sub>[198]</sub>), and to reinforce the trust of tourists to travel to BiH.

In November 2020, the FBiH government allocated BAM 6 million (~EUR 3 million) to Sarajevo, Tuzla, Mostar and Bihac airports to support their liquidity and maintain the employment of airport workers following reduced activity as a consequence of the pandemic. In December 2020, the FBiH government allocated a BAM 30 million (~EUR 15 million) fund to organisations in the tourism and hospitality sectors. The assistance for businesses was intended for salaries and business expenses from 1 July to 31 December 2020 (Ministry of Environment and Tourism FBiH, 2020<sup>[199]</sup>).

#### *Sub-dimension 15.1: Governance and co-operation*

In Bosnia and Herzegovina, the multi-layered constitutional and political system demands a specific **tourism governance structure and institutional set up**. At the state level, the Tourism Department within MoFTER is in charge of co-ordinating activities and harmonising plans with the entities' authorities and international institutions in charge of tourism. At the entity level, the FBiH Ministry of Environment and Tourism, the Ministry of Trade and Tourism of RS and the Brčko District's Department of Economic Development, Sports and Culture are responsible for the legislative framework, the adoption of tourism strategies and the development of tourism in general. In the FBiH, a draft Tourism Strategy for 2008-2018 was prepared but never adopted, and in RS a new Tourism Strategy is being prepared after the strategy adopted for the period 2010-2020 expired. The entities have adopted their own governance structure and institutional set up, which is different in each entity. The tourism governance framework in RS is similar to most commonly established governance frameworks in other economies,<sup>231</sup> whereas the governance structure and institutional set up in the FBiH is more complex, with tourism development management divided between the Ministry of Environment and Tourism and cantons' ministries responsible for tourism. Cantons have also adopted their own legislation and regulations as the FBiH Law on Tourism was cancelled in 2014 and a new one has not yet been adopted. The key challenge for the FBiH is to establish a legislative and regulatory framework at the entity level to improve the governance framework and harmonise tourism development at the local level.

In 2007, the Tourism Working Group was established by MoFTER to co-ordinate tourism activities among the entities and the Brčko District. Its main activities are to regulate the tourism sector in BiH in accordance with EU directives and standards, to improve the organisation and regulations in order to harmonise activities and establish a single economic space in BiH, and to establish an effective regulatory framework in the tourism sector by strengthening the competencies of existing institutions and identifying the competencies of tourism associations. Members of the working group are representatives of the ministries responsible for tourism in both entities and the Brčko District, and of the Foreign Trade Chamber of BiH. The complex governance structure and institutional set up require considerably more human and financial resources in comparison with other economies in the region.

Due to the complex governance structure, **partnership with stakeholders** at the state level is relatively weak. Except for the Foreign Trade Chamber of BiH, no other private stakeholders are involved in the established Tourism Working Group. The private sector is involved in different working groups in both entities and meetings are organised with the ministries; however, private sector stakeholders report that more active co-operation and dialogue is still needed, especially when preparing new legislation and regulations as no consultations with the private sector are currently required. There has been no monitoring or evaluation to assess the level of actual public-private co-operation at the destination level. However, recently implemented donor projects<sup>232</sup> have contributed to the improvement of public-private co-operation at the destination level by providing support for the development of tourism clusters. The experiences of these clusters are a good basis for building public private co-operation in the other main tourist destinations in the economy.

**The vertical co-operation and co-ordination framework** from the state to the local/destination level is relatively weak. Although the ministries of both entities co-operate with their sub-entities (the cantons in the FBiH and local tourist organisations in RS), there is no formal co-operation body. The tourism governance structure at the local level still needs to be improved, particularly as many municipalities lack

the financial resources and qualified staff to manage tourism development. Moreover, local stakeholders report that the private sector's readiness to co-operate at the local level and its understanding of the benefits of co-operation at the destination level are weak, which hinders the successful implementation of tourism policy measures.

BiH has established a **tourism data collection system** as a baseline for statistics on tourism. The Agency for Statistics of Bosnia and Herzegovina is responsible for the production and development of statistics on tourism in accordance with the Law on Statistics.<sup>233</sup> Currently, the Agency for Statistics is producing data on accommodation statistics, and in 2019 it introduced a new survey on demand-side tourism. RS and the FBiH also have entity statistical institutions, namely the RS Institute of Statistics and the FBiH Institute for Statistics. However, since 2017 progress on improving tourism data collection has been limited. The key challenge is the lack of electronic data collection methods (e-questionnaires, web surveys) that would contribute to the higher reliability of collected tourism data. Positively, the development of Tourism Satellite Accounts (TSA) is planned as part of the IPA 2019 programme (European Commission, 2020<sub>[2001]</sub>) and will serve as a good start for the overall improvement of the tourism data collection system.

#### *Sub-dimension 15.2: Destination accessibility and tourism infrastructure*

Since 2017, BiH has not improved its **connectivity framework** as no further reductions of visa requirements nor any other measures to ease border crossings have been introduced.

There are **accommodation capacity and quality assurance frameworks** at both entity levels that foster availability and quality improvements of all types of accommodation, and certain policy measures have been implemented. These frameworks, which are in line with international standards, have facilitated investments in high-quality tourism accommodation facilities by ensuring the consistent quality of accommodation. The categorisation of accommodation is now mandatory for all types of accommodation, registers of accommodation facilities have been established in both entities and monitoring is conducted regularly. RS has quality standards for tourist destinations and municipalities in addition to accommodation quality standards. In 2019, in co-operation with Serbia and Montenegro, bike friendly standards for accommodation facilities and other tourist service providers were also developed. Despite this progress, the regular monitoring and evaluation of policy measures is still lacking, and would facilitate further investment in accommodation facilities.

In BiH, **the tourist information system** is established at the entity level. In both entities, information is provided via websites and mobile applications, road signage and in tourist information centres. Information is mainly available in English and local languages and is regularly updated. No major progress has been reported since 2017 in this field. RS has a well-established tourism information system, managed and co-ordinated by the Tourist Organisation of Republika Srpska and implemented by local tourist organisations. In the FBiH, tourist information is provided by the tourist boards of destinations and is not co-ordinated at the entity level. The absence of a tourist organisation at the FBiH level results in a lack of management and co-ordination of the tourism information system. Moreover, the absence of a tourist organisation at the state level hinders the creation of a comprehensive tourism information system and the visibility of BiH as a tourist destination in the global market.

#### *Sub-dimension 15.3: Availability of a qualified workforce*

BiH has a complex education system, with competences split at the entity level. In the FBiH, education is under the jurisdiction of the cantons. According to information provided by the authorities, no progress has been made since 2017 in the development of the **skills supply framework** nor in **the tourism VET and higher education framework**. Moreover, BiH worsened its position in the 2019 WEF Competitiveness Index: it went down six places in the "human resources and labour market" category (ranking 106<sup>th</sup> out of 140), with its worst rankings in the categories of "labour market" (134<sup>th</sup>), "ease of hiring foreign labour" (132<sup>nd</sup>), "ease of finding skilled employees" (130<sup>th</sup>), and "extent of staff training" (133<sup>rd</sup>) (WEF, 2019<sub>[2011]</sub>).

Improving the human resources development framework thus remains one of the main challenges for the development of tourism in the economy.

In 2020, there were 22 secondary/vocational schools in RS and 13 in FBiH with tourism and hospitality courses. Secondary/vocational schools (three- or four-year programmes) have been educating students in recent decades in the following professions: waiter, chef, hospitality technicians, culinary technicians and tourism technicians. All programmes involve mandatory practical training, which is organised in co-operation with the private sector. In 2018, curricula were updated with the development of new occupational qualification standards using donor support. However, private stakeholders reported that they are not actively involved in the modernisation of curricula, especially regarding subjects increasingly relevant to the tourism industry (such as ICT, digital marketing, foreign languages). Moreover, curricula are reported to be outdated and too general, which leads to the insufficient practical skills of secondary school graduates. Private stakeholders also noted that vocational schools are not perceived as prestigious and therefore do not attract the best students. This is evident in the decreasing number of students in VET programmes in RS (from 2 887 in 2016 to 2 537 in 2019). The lack of adequate equipment in VET schools also hinders the quality of the teaching process.

Bosnia and Herzegovina does not have a specific two-year long **higher education framework** dedicated to tourism. However, the study of tourism is included in higher education programmes at universities. At the university level, ten high schools or universities (eight in the FBiH and two in RS) provide tourism studies, hotel management, catering and tourism marketing courses. Nevertheless, Bosnia and Herzegovina should also consider establishing a two-year long higher education framework in tourism that is focused on training middle management staff in the tourism industry. These programmes should be more practice-oriented than programmes at universities, and include obligatory practical training.

#### *Sub-dimension 15.4: Sustainable and competitive tourism*

Although BiH is making efforts to include its rich cultural and natural heritage when developing tourism, a **natural and cultural heritage enhancement framework in tourism** is still in the early stage of development. Natural and cultural heritage is included in several strategic documents at the state and entity level, such as in the Strategy of Cultural Policy in Bosnia and Herzegovina (adopted in 2008), the Biodiversity Strategy and Action Plan for the period 2015-2020 (adopted in 2016) and the Tourism Development Strategy of RS 2011-2020. The Environmental Protection Strategy 2020-2030 of Bosnia and Herzegovina is currently being developed that will provide a long-term planning framework and allow for coherent environmental practices and actions across the economy. The enhancement of natural and cultural heritage in tourism should be included in the new tourism development strategies planned to be developed in the coming years.

There is no policy framework that includes clear measures for the **promotion of sustainable tourism and operations**. Although sustainable development in BiH has become an important objective that is strongly supported by the World Bank and the EU, the integration of the concept of sustainability in tourism strategies and policies is still absent. Consequently, sustainability assessment and monitoring have not yet been established. Given the lack of a strategic framework for sustainable development and assessment, sustainability in tourism arises from individual business initiatives, destinations and NGOs. Thus, the main pillars of sustainable tourism development in BiH are linkages between private, public and non-governmental actors in the tourism sector and their co-operation in implementing projects, particularly transnational projects. Nevertheless, both entities plan to include the promotion of sustainable tourism development in their new tourism development strategies, which are in preparation. There are also several donor projects that focus on the development of sustainable tourism development frameworks in BiH. For example the “Tailor-made model for a BiH ‘Green Scheme’” will support the sustainable development of tourism in the economy using the best practice example of Slovenia.<sup>234</sup> The findings of this and other projects implemented in this field should be included in the new tourism development strategies, along with clear policy measures to facilitate the sustainable operations of public and private tourism actors.

BiH is developing a comprehensive **tourism investment and innovation policy framework**. Investments in tourism are included in the annual action plan for the promotion of FDI, managed by the Foreign Investment Promotion Agency of Bosnia and Herzegovina (FIPA). The promotion of tourism investment will also be included in the new FDI strategy. Both entities are implementing policy measures to facilitate investment in public and private tourist infrastructure, with EUR 1.25 million per year in FBiH and EUR 1.5 million in RS allocated as grants for tourism projects and investments. However, in both entities monitoring is implemented only at the level of supported projects, and the evaluation of implemented policy measures has not yet been carried out. Moreover, private sector stakeholders report a lack of transparency regarding local development strategies, local spatial plans and investment policy, and the lack of a clear strategy for investment in transport infrastructure to reach the destinations.

#### *Sub-dimension 15.5: Tourism branding and marketing*

Due to the current legislative arrangement of tourism, BiH does not have a **tourism branding and marketing strategy** at the economy level, which lessens the visibility of BiH as a tourist destination in the global market. In 2019, BiH went down four places in the WEF Competitiveness Index regarding “effectiveness of marketing and branding to attract tourists”, ranking 118<sup>th</sup> (WEF, 2019<sub>[201]</sub>).

The development of tourism branding and marketing differs among the entities. In RS, the Tourist Organisation of Republika Srpska is responsible for tourism branding and marketing. There is a marketing strategy adopted and implemented in RS, and public-private co-operation is well established. The monitoring of the marketing strategy is implemented regularly and the strategy is adapted according to new circumstances in the market. The main challenge in RS is the introduction of an evaluation process of implemented marketing activities. In FBiH, there is no tourism organisation established at the entity level, with tourism marketing activities implemented by the tourist boards of the main tourist destinations. As there is no monitoring and evaluation of implemented marketing activities in place, a more detailed assessment is not possible.

The **digital tourism marketing framework** is in the early phase of development. In RS, digital marketing is included in the marketing strategy, and in FBiH digital marketing tools are used in the marketing activities of tourist destinations. The main weaknesses are the lack of a common approach to the development of a digital tourism marketing framework at the state level, the lack of financial resources, and the lack of capacity for using digital marketing tools among public officials and private tourism companies.

### ***The way forward for tourism policy***

To ensure the further successful development of tourism, policy makers should:

- **Ensure that new tourism development strategies clearly define a governance structure and institutional set up at the entity level.** Such strategies should include policy measures to strengthen public-private co-operation at the entity and tourist destination level, and define a timeframe and clear budget allocation for implementation. A monitoring and evaluation model should also be included (Box 21.17). When drafting new tourism development strategies, Bosnia and Herzegovina should aim to move away from further developing mass tourism and start developing new, high-quality and personalised tourist experiences around natural and cultural sites. Bookings should be available at short notice.
- **Further develop destination management, using best practice examples from the economy** (such as the tourism clusters of Unasana and Herzegovina). Focus on awareness raising and training private and public stakeholders on the benefits of co-operation at the destination level, as this has been recognised as a challenge for the successful development of destination management.
- **Develop a human resources development strategy in tourism,** or include human resources in the Tourism Strategy. The strategy should include a skills gap assessment, a programme for

strengthening the tourism educational system in close co-operation with tourism industry representatives, and policy actions to promote jobs and careers in tourism.

### Box 21.17. Harnessing potential synergies through a national platform for tourism in Switzerland

In Switzerland, numerous political bodies at both national and regional levels, as well as various industry organisations, influence the delivery of tourism policy. Federal tourism policy and its levers are subsidiary to the work of the cantons, local authorities and tourism-related industries. Maintaining dialogue within the federal administration, between the cantons and with tourist actors and associations is fundamental to the development of the industry. Tourism Forum Switzerland (TFS) was established to provide a platform for dialogue and co-ordination and to allow co-operation across the sector. Broadly diversified and often temporary working groups consisting of representatives of the private sector, cantons, communes and the federal administration meet regularly to discuss current challenges and potential improvements.

At the forum's main event in November 2020, the results of the working groups were gathered and presented, and the priorities for the following year were discussed. Since 2012, the State Secretariat for Economic Affairs (SECO), which is responsible for the development and implementation of Switzerland's tourism policy, has organised one forum event each year. The topics have included "Re-positioning Switzerland in summer tourism", "Structural change as the key to success in Swiss Tourism" and "Tourism product development: basis for successful marketing".

Presentations from renowned national and international experts are combined with smaller group discussions. The integration of international know-how is essential for the success of the TFS. The findings and feedback generated by the TFS are evaluated and published and serve as an important basis for the continual development and improvement of Switzerland's tourism policy.

## Anti-corruption policy (Dimension 16)

### Introduction

Table 21.28 shows Bosnia and Herzegovina's scores for the anti-corruption policy dimension and compares them to the Western Balkans average. All scores of Bosnia and Herzegovina are below the WB6 average, but the scores for corruption risk assessment and anti-corruption public awareness and education reflect the strongest relative progress. Bosnia and Herzegovina has several elements of a legal framework for the prevention of corruption and has strengthened awareness-raising and education activities since the last assessment. However, the investigation and prosecution of high-level corruption remains limited, and there is evidence of insufficient capacity and independence of prosecutorial institutions.

**Table 21.28. Bosnia and Herzegovina's scores for anti-corruption policy**

Dimension	Sub-dimension	Score	WB6 average
<b>Anti-corruption policy dimension</b>	Sub-dimension 16.1: Anti-corruption policy framework	1.5	2.1
	Sub-dimension 16.2: Prevention of corruption	3.0	3.3
	Sub-dimension 16.3: Independence of the judiciary	n.a.	n.a.
	Sub-dimension 16.4: Business integrity and corporate liability	n.a.	n.a.
	Sub-dimension 16.5: Investigation and prosecution	2.0	2.8
<b>Bosnia and Herzegovina's overall score</b>		<b>2.0</b>	<b>2.5</b>

Note: For comparability with the previous assessment, the two new sub-dimensions (16.3 and 16.4) have not been scored but are discussed in the text below.

### State of play and key developments

Since the previous assessment, Bosnia and Herzegovina has undertaken noteworthy initiatives in the fight against corruption (Box 21.18).

### Box 21.18. Recent initiatives in the fight against corruption in Bosnia and Herzegovina

- **An Action Plan for the Prevention of Corruption in the Institutions in BiH during the COVID-19 pandemic**, developed by the Agency for the Prevention of Corruption and Coordination of the Fight against Corruption (APIK) in 2020. It contains five main measures, namely:
  - supervision and control of securing financial and material donations, incentives and assistance
  - supervision and control of the employment process in BiH institutions
  - monitoring and control of the public procurement process
  - reporting corruption and protecting whistle-blowers during the COVID-19 pandemic
  - coordination of anti-corruption activities during the COVID-19 pandemic.
- **The Council of Ministers** unanimously approved a draft proposal amending the **Law on Public Procurement** in February 2021, harmonising it with the EU *acquis*. The proposed law enables the publication of procurement plans, and of contractual implementation terms within the Public Procurement Portal, which makes public procurement more transparent and easier to monitor.
- APIK issues **awards during the international anti-corruption day** every year for the best artistic and literary work on anti-corruption topics prepared by primary and secondary school students in BiH. The topic of 2021 is “I am worth more than money.”

Source: (OECD, 2021<sup>[203]</sup>), *The OECD and South East Europe: Fair Market Conditions for Competitiveness in the Adriatic Region*, <https://www.oecd.org/south-east-europe/programme/fair-market-conditions-adriatic.htm>; (APIK, 2021<sup>[204]</sup>), *Agency for the Prevention of Corruption and Coordination of the Fight against Corruption*, <http://apik.ba/kontakt/default.aspx?id=51&langTag=en-US>.

#### *Sub-dimension 16.1: Anti-corruption policy framework*

Due to its complex constitutional structure, Bosnia and Herzegovina has several anti-corruption **policy planning documents**. At the state level, the expired Anti-Corruption Strategy for 2015-2019 and related action plan envisaged the highest strategic measures and set a broad framework for the harmonisation of strategies and action plans at other levels of government. The new strategy and action plan had been prepared but not adopted at the time of writing (APIK, 2020<sup>[205]</sup>).

There are 13 strategies and 14 action plans at the levels of the state, entity, Brčko District and FBiH cantons. The anti-corruption policies of the state, the FBiH and RS do not have dedicated budgets. The state-level strategy assumes that for most activities additional funds are not required. According to the government, the Agency for Prevention of Corruption and Co-ordination of the Fight against Corruption (APC) has requested the approval of dedicated budget funding for anti-corruption policy in the new planning period 2020-2024.

The APC ensures the overall **co-ordination of anti-corruption policy**, provides explanations regarding the implementation of certain measures and opinions on whether measures planned by authorities are in line with the strategy and the principles of law, and proposes new activities or changes to implementation. It carries out annual reviews of implementation of the state-level strategy and action plan. Three monitoring reports have been published by the APC, with the fourth report prepared but not publicly available, according to the government. At the entity level there are no established bodies but instead co-ordination arrangements: the Anti-Corruption Team in the FBiH and the Commission for Implementation of the Anti-Corruption Strategy in RS.

The APC has encountered difficulties in enforcing the requirement for institutions to report on progress regarding **implementation** of the Anti-corruption Strategy (OECD, 2018<sup>[47]</sup>). The third monitoring report (published in October 2018) notes continuing challenges of non-compliance with deadlines for submitting

information, discrepancies in data, and uneven quality of information. However, the APC also claims that it has been able to overcome these flaws with an adequate methodological and systematic approach (APIK, 2018<sup>[206]</sup>). According to the government, 48% of action plan measures have been implemented, 43% have been partially implemented and 9% have not been implemented.

According to information provided by the Agency for the Prevention of Corruption and Co-ordination of the Fight against Corruption, in 2019 an external consultant (hired by the Organization for Security and Co-operation in Europe, OSCE) analysed progress made in the fight against corruption in Bosnia and Herzegovina to inform the drafting of a new anti-corruption strategy. The participatory engagement of non-governmental stakeholders took place in the preparation of the Anti-Corruption Strategy and Action Plan 2020-2024 of BiH and the Anti-Corruption Strategy and Action Plan 2018-2022 of RS. At the state level, an interdepartmental working group was set up to prepare these documents, with 27 public institutions of different levels involved, as well as the non-governmental sector and academia. However, published documents do not reflect how the proposals by stakeholders were handled, i.e., what was accepted, what was rejected and why. The Anti-Corruption Strategy and Action Plan 2020-2024 had also not been published on the website of the APC at the time of writing.

In April 2020, the APC disseminated a framework action plan for the prevention of corruption during the COVID-19 pandemic to governments and anti-corruption bodies at all levels and called upon all competent institutions to engage teams in developing individual action plans for anti-corruption action. In terms of implementation, according to the APC most institutions have focused on publishing information online, especially regarding the supervision and control of recruitment processes and public procurement.

Bosnia and Herzegovina has no legislation on **corruption risk assessment**. The law stipulates the responsibility of the APC to prescribe a uniform methodology and guidelines for making integrity plans and help all public institutions with their implementation, but institutions are not legally obliged to carry out the assessment. Anti-corruption action plans envisage the creation of a legal basis for the preparation and adoption of integrity plans, which have not been implemented. Several guiding documents envisage corruption risk assessment as one of the stages in the preparation of integrity plans, for example the handbook *Rules for the Elaboration and Implementation of Integrity Plans in the Institutions of Bosnia and Herzegovina* (APIK, 2018<sup>[207]</sup>), guidance on integrity plans in judiciary institutions (VSTV BiH, 2016<sup>[208]</sup>), and rules on the elaboration and implementation of integrity plans in RS (2015).

Evidence regarding the adoption of integrity plans is fragmented, and no comprehensive and up-to-date data are available regarding the extent and quality of the practice. As of mid-2018, 73 public institutions at the state level had adopted integrity plans (APIK, 2018<sup>[206]</sup>). According to the 2019 report of the FBiH Anti-corruption Team, 78 institutions had adopted integrity plans, which is 91% of the targeted number (FBiH Anti-Corruption Team, 2020<sup>[209]</sup>). According to the government, several institutions in RS have conducted ad hoc risk assessments, with one performed for the preparation of the Anti-Corruption Strategy 2018-2022.

**Corruption proofing of legislation** is not mandatory according to law. The Unified Rules for Legislative Drafting in the Institutions of Bosnia and Herzegovina prescribe the methodology for assessing the impact of regulations (including on corruption and conflict of interest). The rules are mandatory for state-level institutions and recommendatory for other levels of authority. They designate the APC as one of the control bodies whose opinion must be obtained for impact assessments. The methodology for assessing corruption risks in regulations has been published, sponsored by the Austrian Development Co-operation (Hoppe, 2017<sup>[210]</sup>). According to the government, in 2019 the APC examined and gave opinions on seven regulations, but no information is available about any modifications based on the opinions. There is no evidence of the corruption proofing of legislation at the entity level.

### *Sub-dimension 16.2: Prevention of corruption*

The APC has been Bosnia and Herzegovina's main **corruption prevention body** since 2013, when it was introduced as part of the law of the APC. However, it has limited direct powers. Its mandate includes developing the anti-corruption strategy and action plan and monitoring implementation, designing methodologies, co-ordinating the work of public institutions, monitoring the implementation of anti-corruption legislation and instances of conflict of interests, taking action upon receiving information on corruption-related acts, and developing educational programmes. The FBiH and RS do not have established prevention bodies; however, Sarajevo canton has a prevention body, the Office for Combatting Corruption and Quality Management.

In law, the APC has certain independence and accountability provisions. It reports to the Parliamentary Assembly (PA) of Bosnia and Herzegovina, which appoints the director of the APC and two deputies upon proposal of the Selection and Monitoring Committee of the Agency, following open competition. The director's term is five years with a possibility of another reappointment. The committee can submit a proposal to dismiss the director if there are grounds as stated in the law. The committee comprises nine members (three from each of the chambers of the PA, two from the academic community and one from civil society). The committee may not interfere in the daily work of the APC nor request information on individual cases. Meetings of the committee should be open to public.

In practice, the mandate of the committee expired in 2018, and no evidence is available regarding its renewed activity, except for information from September 2020 about the appointment to the committee of someone included in the US sanctions list for corruption (Transparency International BiH, 2020<sup>[211]</sup>). According to the law, the committee should review reports on APC operations at least twice a year; however, the annual reports for 2018 and 2019 have not yet been considered and approved for publication. The director of the APC submits a budget proposal, but the APC does not have any guarantees of a certain level of funding. With 30 employees, the APC is one of the smallest prevention agencies in the region.<sup>235</sup> Given that many prevention tasks are carried out at the entity level, the institutionalisation of prevention of corruption and safeguards against undue interference in the fulfilment of this function are limited in Bosnia and Herzegovina overall.

At the state level, the Law on Conflict of Interest in Governmental Institutions of Bosnia and Herzegovina has been the central act governing matters of **conflict of interest**. There are also equivalent laws in the FBiH (not implemented since 2013) and RS. The state-level law applies to elected officials, holders of executive functions and advisors, which is similar to the scope of the entity-level laws. In other respects, the laws differ and lead to a diversity of approaches. For example, the RS law defines a conflict of interest in terms of an actual or apparent conflict, while the state-level law does not cover an apparent conflict. Laws on civil service at the state and entity levels regulate conflicts of interest of civil servants. In January 2021, the House of Representatives (the lower house of the PA) adopted a new law on conflicts of interest, which has not been assessed in this analysis.

The law stipulates that the oversight institution at the state level is the Commission for Deciding on Conflicts of Interest (CDCI), which comprises three members from each of the chambers of the PA as well as the director and two deputy directors of the APC. The Republican Commission for Determining Conflicts of Interest in Public Bodies of RS is the oversight body in RS. The membership rules of the two commissions differ regarding political neutrality. At the state level, members of the PA sit on the commission, whereas in RS members may not engage in party political activities. However, in neither case safeguards for political independence appear particularly strong. Bosnia and Herzegovina has not implemented the Group of States Against Corruption (GRECO) recommendations to, among other things, harmonise "the legislation on conflicts of interest throughout the national territory" and ensure the independence and timeliness of the advisory, supervisory and enforcement regime regarding conflicts of interest (GRECO, 2018<sup>[212]</sup>).

According to the law, the CDCI may initiate proceedings based on a credible, well-founded and non-anonymous application, or by virtue of the office held in cases where an individual has information on

a possible conflict of interest. In terms of sanctions, the CDCI may suspend payment of part of the net monthly salary, propose a dismissal from office and call for resignation. According to the government, the CDCI has imposed 10 sanctions (9 monetary). Sessions of the CDCI should be open to the public and decisions published on its website.<sup>236</sup> The mandate of the CDCI expired in 2018 and it resumed activity only in mid-2020. Civil service agencies at the state level and in the FBiH have organised training on conflict of interest, but effective and stable oversight in this area is yet to be developed.

Regarding **asset and interest disclosure**, elected officials, executive office holders and advisors are required to submit financial reports to the CDCI within 30 days of the assumption of office, followed by annually and then within 30 days of the expiration of six months after the termination of duty. The CDCI decides the form and content of the financial report, which covers the personal data of officials and close relatives, information on public functions, current revenue and sources of income, assets, liabilities and data on other positions, and the positions of their close relatives but not of their assets and income. The CDCI checks but does not publish the accuracy of the content of the statements. In RS, officials submit financial reports to the Republican Commission for Determining Conflicts of Interest. In the FBiH, no general functional system of disclosure is in place, although the Sarajevo canton maintains an online public register of data on the property of public officials. Notwithstanding some good practice at the sub-entity level, there is generally little evidence of effective implementation of asset and interest disclosure.

The Election Law of Bosnia and Herzegovina obliges all candidates elected at all levels of authority to submit a signed asset declaration form to the Central Election Commission (CEC). Elected persons must also submit declarations after the termination of their tenure. The CEC makes the statements available to the public, with restrictions concerning personal information. The CEC is not legally competent to verify the accuracy of the data, and hence the system is conducive to failures in fully disclosing assets (CIN, 2020<sub>[213]</sub>).

Bosnia and Herzegovina is yet to establish a comprehensive and fully functional framework of asset and interest disclosure in line with, among other things, the recommendations of GRECO regarding the publication and control of disclosure reports (GRECO, 2018<sub>[212]</sub>).

At the state level, the Law on Whistle-blower Protection in the Institutions of Bosnia and Herzegovina (adopted in 2013) provides **protection for whistle-blowers**. The law applies only to the public sector at the state level. Whistle-blower reports and identities constitute an official secret. If the APC establishes that a detrimental action has been taken against the whistle-blower in relation to the reported case of corruption, it can issue an instruction to the director of the institution to remove the consequences of the detrimental action. If the director claims that the action would have been taken even without whistleblowing having taken place, they must prove this is the case. The law envisages internal reporting as the default option, with external reporting to investigation/prosecution authorities, the APC or the public subject to conditions, such as when the whistle-blower has reasons to believe that the recipient of the internal report is associated with the act of corruption. The law is short of providing many elements set out in EU Directive 2019/1937 on the protection of persons who report breaches of Union law, for example it is not applicable to the private sector; does not cover several categories of reporting persons who are not current employees of the institution, as well as persons connected with whistle-blowers; it imposes specific mandatory preconditions for external reporting; and it envisages a narrower set of forms of retaliation. The law does not envisage provisional protection before the decision on granting whistle-blower status and free legal assistance (according to the government, civil society organisations provide such assistance).

The Law on Protection of Persons Reporting Corruption of the Republika Srpska (adopted in 2017) is in several important ways more comprehensive than the state-level law. For example, it protects reporting persons in both the public and private sectors, envisages protection to persons connected with the whistle-blower, does not set mandatory preconditions for external reporting, envisages a broad set of forms of retaliation, and provides the right to free legal assistance. There is no whistle-blower protection law in the FBiH.

The APC and the Ministry of Justice are the oversight bodies for the implementation of the law at the state level. The APC has supported implementation by, among other things, developing unified regulations on internal reporting and whistle-blower protection, supervising and co-ordinating the adoption of the respective internal acts in public institutions, preparing an instruction for the implementation of the law, establishing a toll-free number for reporting persons, preparing promotional materials, and conducting training and lectures.

The government provided no up-to-date statistics on whistle-blower activity for this assessment, and it is therefore impossible to understand the effectiveness of implementation of the laws. According to the APC, there have been instances of denied whistle-blower status due to reporting persons not being employees of state institutions covered by the law, not having acted in good faith, or failing to have concrete evidence for the allegations. Anecdotal evidence suggests that a whistle-blower may be subject to sanctions in practice despite having received whistle-blower status (Rovcanin, 2020<sup>[214]</sup>), but the overall extent of the challenges is uncertain.

The APC and certain other public bodies have actively engaged in **public awareness raising and education**. The APC gives awards for the art and literary works of school students on anti-corruption topics through an annual campaign. The best works have been included in a promotional film and printed in the APC's calendars. The authorities have also produced easily accessible information materials, with both the APC and the RS Ministry of Interior having published leaflets on reporting corruption.

The Civil Service Agency of Bosnia and Herzegovina (CSA) regularly organises training for civil servants on anti-corruption topics (funded from the CSA's own budget and other institutions and donors), and the RS Ministry of Justice has been organising training for public sector institutions. The APC has made online training available on its website. It has also analysed training and, based on the data and the needs of institutions, developed harmonised programmes for all public institutions in co-operation with state-level civil service agencies, the FBiH and RS. The APC has been co-ordinating a major programme of ethics and integrity in the education system across Bosnia and Herzegovina, and its website contains a collection of education materials.<sup>237</sup> According to the FBiH, its authorities have not engaged in other anti-corruption campaigns or educational activities.

### *Sub-dimension 16.3: Independence of the judiciary*

The judicial authority at all levels is governed in a partially centralised manner. The High Judicial and Prosecutorial Council appoints judges for life and relieves judges from duties based on grounds set out in the law on the HJPC. The appointment of judges is based on a competitive procedure. The Law on the HJPC (adopted in 2004) sets basic qualification requirements and criteria for determining the competences required for judicial office. According to rules of the HJPC, the competition procedure includes entrance exams and written tests, candidate interviews, the ranking of candidates, and proposals for appointment. Selection procedures differ for candidates whose appointment represents entry into the judiciary and for those already in the judiciary, for whom qualification is determined based on performance results for the past three years and interviews. The HJPC announces judicial vacancies in the Official Gazette and online as public calls, and posts appointment decisions. It also elects court presidents based on a public competition among judges appointed to the respective court. Appointment proceedings are reportedly fraught with flaws such as deviations from the rankings of candidates, insufficient transparency, insufficient motivation of appointment decisions, excessive weight of ethnic criteria, and the annulment by court of the criteria on performance appraisal for judges and prosecutors in May 2020 (European Commission, 2020<sup>[39]</sup>).

Out of 15 members of the HJPC, 10 are judges and prosecutors elected by their colleagues. The House of Representatives of the PA, the Council of Ministers, the Judicial Commission of the Brčko District and bar chambers of the two entities each elect one member. The HJPC publishes detailed minutes of its meetings. The legal and institutional framework of judges' careers through the Law on the HJPC provides certain guarantees of judicial independence. However, the system is affected by the lack of an explicit

constitutional status of the HJPC, incompatibility of RS legislation, which envisages an entity-level HJPC, and certain other deficiencies of the Law on the HJPC. In 2018, the HJPC submitted an initiative to amend the law comprehensively with a view to implementing European Commission recommendations to improve appointment, performance appraisal, integrity, and disciplinary and other procedures (European Commission, 2019<sup>[4]</sup>). The initiative has been discussed within the Ministry of Justice. According to information provided by authority representatives during consultations in September 2020, certain parts of the draft may be selected for speedier adoption, such as the introduction of a strengthened mechanism for the verification of financial reports of judges and prosecutors. Reforms of the HJPC are also needed regarding the recommendations of GRECO to, among other things, provide for separate judicial and prosecutorial sub-councils, avoid an over-concentration of powers, ensure that decisions of the HJPC are subject to appeal before a court, and develop an effective system for reviewing annual financial statements (GRECO, 2018<sup>[212]</sup>).

The HJPC conducts disciplinary proceedings, imposes disciplinary measures on judges and publishes the decisions in an anonymised format. Procedural guarantees of due process for a judge in disciplinary proceedings include the right to be duly notified of the allegations and evidence and to respond, the right to a fair and public hearing, the right of defence with legal counsel of choice, and the right to appeal adverse decisions (although the right to judicial review applies only in cases of dismissals). Concerns have been raised regarding the excessive dominance of HJPC members in disciplinary commissions; obstacles to the disciplinary liability of members of the HJPC themselves and the perceived unwillingness to hold the former chairperson of the HJPC to account for alleged corruption in 2019; alleged inconsistencies in decisions, which reject disciplinary action or impose disciplinary measures; excessive discretion of the HJPC and the disciplinary commissions; lenient sanctioning policy made even less effective by the anonymisation of published decisions; and bias due to the fact that the HJPC has full access to records of the Office of the Disciplinary Prosecutor, which is also placed within the HJPC (Delegation of the European Union to Bosnia and Herzegovina and EUSR, 2019<sup>[215]</sup>; Omerović, 2020<sup>[216]</sup>; Transparency International BiH, 2020<sup>[217]</sup>). Despite these concerns, by default the media and representatives of the public may be present at disciplinary hearings, which represents a high standard of transparency. The distribution of cases among judges is random and automatic in accordance with predefined parameters in all courts, although the possibility of reassignment without a specific justification exists at least in small courts (European Commission, 2020<sup>[39]</sup>). There is no universal practice of publishing court decisions, but the HJPC publishes decisions selected either by the highest courts or in accordance with general criteria (war crime, corruption, organised crime cases, etc.). Some decisions are available at the websites of individual courts. Overall, it appears that the judiciary in Bosnia and Herzegovina adheres to at least certain minimum standards of transparency.

#### *Sub-dimension 16.4: Business integrity and corporate liability*

Bosnia and Herzegovina does not have a distinct policy for promoting **business integrity**. Company laws in the FBiH and RS do not explicitly envisage the responsibilities of boards of directors to include overseeing the management of corruption risks, apart from general fiduciary duties. The APC held several training courses on ethics and integrity in companies for private sector representatives in 2019, in co-operation with the Foreign Trade Chamber of Bosnia and Herzegovina.

According to the government, information on beneficial owners of legal entities in FBiH is not disclosed in a central register. The Law on Registration of Business Entities in RS requires the submission of data on beneficial owners to the court register of business entities. The definition of a beneficial owner (founder with a 20% or more share) is narrower than envisaged in EU anti-money laundering directives. Data from the Register of Business Entities are available to all interested parties without proving a legal interest, in accordance with regulations governing personal data protection. Moreover, identification of the beneficial owner (in accordance with a significantly broader definition) is one of the elements of customer due diligence under the Law on Prevention of Money Laundering and Financing of Terrorist Activities that should be carried out by both financial institutions and designated non-financial businesses and

professions. The government provided no evidence regarding the level of compliance with these requirements.

No designated institution such as a business ombudsman is responsible for receiving complaints from companies about corruption-related matters.

Bosnia and Herzegovina, the FBiH and RS each have a Criminal Code and Law on Criminal Procedure,<sup>238</sup> which means that provisions regarding the **liability of legal persons** are multiple but generally similar. According to the Criminal Code of Bosnia and Herzegovina, for a criminal offence perpetrated in the name of, for account of or for the benefit of the legal person, the legal person shall be liable: 1) when the purpose of the criminal offence is arising from the conclusion, order or permission of its managerial or supervisory bodies; 2) when its managerial or supervisory bodies have influenced the perpetrator or enabled them to perpetrate the criminal offence; 3) when a legal person disposes of illegally obtained property gain or uses objects acquired in the criminal offence; or 4) when its managerial or supervisory bodies failed to carry out due supervision over the legality of work of the employees. Thus, for a legal person to be liable, apart from the case of illegally gained property/objects, managerial or supervisory bodies must be involved or must have failed to act.

The liability of legal persons is general (liability possible for any criminal offence) and autonomous (the legal person shall be liable for a criminal offence even when the physical person is not guilty of the perpetrated criminal offence). However, the physical perpetrator apparently has to be identified. Sanctions include fines, confiscation of property and dissolution of the legal person. Security measures include forfeiture, publication of judgement and a ban on performing a certain activity. Legal consequences following the conviction of a legal person include the prohibition of work based on a permit, authorisation or concession. The law does not allow due diligence (compliance) defence to exempt legal persons from liability or mitigate sanctions, nor does it allow the court to defer the application of sanctions on legal persons if they comply with organisational measures to prevent corruption as determined by the court.

The legal framework for corporate liability would benefit from guidance on anti-corruption compliance that managerial and supervisory bodies of legal persons should ensure. The effectiveness of the corporate liability framework for combatting corruption could not be assessed due to the absence of relevant statistics.

### *Sub-dimension 16.5: Investigation and prosecution*

Little data are available on the **investigation and prosecution of high-level corruption**. In 2018, the HJPC adopted the definition of high-level corruption. According to the European Commission, the track record of convictions for high-level corruption is extremely limited in Bosnia and Herzegovina (final conviction of two persons in 2017 and no final conviction in 2018) (European Commission, 2019<sup>[41]</sup>). According to data provided by the HJPC, a notable example in 2019 was the conviction of the former Minister of Agriculture, Water Management and Forestry of the FBiH who was sentenced to a prison term and subject to confiscation of illicit gain in the amount of EUR 333 000. In January to June 2020, prosecutors filed indictments in four cases of high-profile corruption, while courts reached verdicts in three cases (two convictions and one acquittal). Reportedly, only a minority of corruption investigations initiated by the State Investigation and Protection Agency (SIPA) in 2019 were finalised (European Commission, 2020<sup>[39]</sup>).

Monitoring by the OSCE found that in 2017-18 two out of six defendants in high-level corruption cases were convicted, i.e., the conviction rate was 33%, and the sentences were imprisonment converted into fines (OSCE Mission to BiH, 2019<sup>[218]</sup>). It is common to employ plea bargain agreements, and sanctions tend to be lenient. Moreover, it is reportedly technically impossible to retrieve statistical data on final convictions (European Commission, 2020<sup>[39]</sup>). To strengthen the recovery of corruption proceeds, since 2018 the HJPC has imposed mandatory financial investigation in all corruption cases, but no data are available on the recovered amounts.

Among **specialised anti-corruption investigative bodies**, SIPA, which is within the Ministry of Security, is the only institutionally separate body tasked with combating several categories of serious crime, including corruption. Within SIPA's Criminal Investigation Department, there is the Section for Prevention and Detection of Financial Crime and Corruption. Investigators responsible for the prevention and detection of financial crime and corruption work within SIPA's regional offices. SIPA's Internal Control Department is responsible for, among other things, internal investigations into allegations of misconduct by SIPA employees and investigations of actions involving the use of force, corruption, and abuse of authority by police officials.

SIPA is the only specialised enforcement body that has certain special guarantees of independence. The law defines SIPA as an operationally independent administrative organisation. The Council of Ministers appoints the director and deputy director, upon proposal of the Minister of Security who selects the candidate from a list submitted by an independent board. The tenure of the director is four years, with the possibility of a second consecutive term. The Council of Ministers dismisses the director and deputy director under conditions and through procedures implemented by the independent board. For the appointment and dismissal of heads of internal units, the general procedures of the police apply. The director adopts the Rulebook of SIPA with the consent of the Council of Ministers. SIPA's budget is adopted in a standard procedure, and it does not have specific guarantees of a certain level of funding. The general rules of the police determine the salaries of SIPA staff. The director submits reports on the work of SIPA and the situation in the areas of competence to the Minister of Security of Bosnia and Herzegovina. Upon request, the director also submits reports to the PA, the Council of Ministers and the Presidency of Bosnia and Herzegovina.

In RS, several organisational units of the Ministry of Interior, such as the Department for Economic Crime and Corruption, are responsible for investigating corruption. The FBiH has not established specialised anti-corruption investigation units.

Bosnia and Herzegovina has no organisationally independent **specialised anti-corruption prosecutorial and judicial bodies**. Anti-corruption specialisation is ensured through internal sections and departments of the prosecutor's offices at the state level, in the FBiH (envisaged in law but not established in practice) and in RS. At the state level, corruption cases are assigned to prosecutors in the Section for Corruption within the Special Department for Organised Crime, Economic Crime and Corruption of the Public Prosecutor's Office. The Chief Prosecutor selects and appoints the head of the section, who has no fixed term in office. The Section for Corruption has four prosecutors and four legal associates (two legal advisors on financial investigation). In the FBiH and RS, laws on the suppression of corruption and organised crime define key elements of the specialised departments. The Special Department of the Prosecutor's Office of RS is competent for 36 categories of crime, including corruption-related offences, but in practice most corruption cases are low level (OSCE Mission to BiH, 2019<sup>[218]</sup>).

In 2019, the European Commission reiterated the need to substantially enhance the capacity to investigate economic, financial and public procurement-related crime in terms of staff numbers, equipment, autonomy, specialisation and co-operation (European Commission, 2019<sup>[4]</sup>). Data available for this analysis are too limited for a full assessment of the capacities. An independent assessment carried out in 2018 and 2019 found that indictments in corruption cases frequently contained no or unclear identification of one or more of the elements of the offence; the poor quality of indictments resulted in a low rate of convictions in corruption cases. There are also reportedly flaws concerning the process of gathering and presenting evidence (OSCE Mission to BiH, 2019<sup>[218]</sup>).

### ***The way forward for anti-corruption policy***

To strengthen the anti-corruption policy framework and implementation, policy makers should:

- **Ensure effective and impartial implementation of rules and oversight in the areas of conflict of interest and asset disclosure.** According to the Western Balkan Recommendation on

Disclosure of Finances and Interests by Public Officials, declarations need to be subject to control by an oversight mechanism, which includes compliance with declaration obligations, the accuracy of submitted information, and the possibility of conflicts of interest or undeclared cash-flows (EIN, 2014<sup>[219]</sup>). At the time of writing, Bosnia and Herzegovina remained largely non-compliant with this standard.

- **Develop and adopt new whistle-blower protection laws at the state level and in the FBiH in line with international standards.** BiH should take measures to encourage and support the sustained practice of whistle-blowing. The relevant EU directive envisages the protection of whistle-blowers in both public and private sectors and applies protection measures to whistle-blowers, facilitators of whistle-blowing, and physical and legal persons connected with the whistle-blowers. In line with the directive, state and entity levels in Bosnia and Herzegovina should provide the following support for whistle-blowers: comprehensive and independent information and advice that is easily accessible to the public and free of charge on procedures and remedies available, on protection against retaliation, and on the rights of the person concerned; effective assistance from competent authorities before any relevant authority involved in their protection against retaliation; legal aid, counselling or other legal assistance; and financial assistance and support measures, including psychological support, for reporting persons in the framework of legal proceedings. Bosnia and Herzegovina has made certain efforts in this area, but the degree of progress is highly uneven at the state level and in the entities.
- **Ensure the registration and disclosure of the beneficial ownership of legal entities in line with international standards.** This applies in both the FBiH and RS, where the authorities do not ensure disclosure in a central register. A register does exist in RS, but certain elements, such as the definition of a beneficial owner, are not fully in line with international standards. The EU Anti Money Laundering Directives envisages that beneficial ownership information is held in a central register and is accessible in all cases to competent authorities and financial intelligence units without any restriction, to obliged entities within the framework of customer due diligence, and to any member of the general public. It is also required that the information held in the central register of beneficial ownership information is adequate, accurate and current, and that states put in place mechanisms to this effect. Box 21.19 shows a good-practice example of collecting beneficial-ownership information from different sources.

### Box 21.19. Databases containing information on beneficial ownership in Spain

A combination of different sources can ensure the comprehensiveness and enhanced reliability of data on beneficial ownership. Spain has three databases that hold information on beneficial ownership of companies, each based on information collected by different obliged entities (notaries, registrars and credit institutions). All are accessible on line to law enforcement agencies. The network of overlapping mechanisms secures the availability of beneficial ownership information of all commercial entities operating in Spain:

- The Single Notarial Computerised Index contains beneficial ownership information obtained by notaries through their customer due diligence.
- The Business Registry collects information on beneficial ownership as reported by the authorised representatives of companies. All companies, except those publicly listed, must annually submit a form that identifies their beneficial owners to the Business Registry.
- The Spanish financial intelligence unit, Sepblac, holds the Financial Ownership File. Credit institutions submit monthly reports about their opened or held accounts to Sepblac, which identifies the beneficial owners of the account holders.

Source: Abridged from (FATF, 2019<sup>[220]</sup>), *Best Practices on Beneficial Ownership for Legal Persons*, <https://www.fatf-gafi.org/media/fatf/documents/Best-Practices-Beneficial-Ownership-Legal-Persons.pdf>.

- **Continue efforts towards amending the Law on the HJPC and other legislative acts to bring the judiciary in line with EU standards.** Judicial independence is a fundamental principle enshrined in international standards such as the European Convention on Human Rights, according to which “everyone is entitled to a fair and public hearing within a reasonable time by an independent and impartial tribunal established by law” (European Court of Human Rights, n.d.<sup>[221]</sup>). In 2020, the European Commission emphasised the adoption of the new Law on the HJPC as a key priority to strengthen the HJPC as a guarantor of the independence of the judiciary (including changes regarding the composition of the HJPC; the election and disciplinary responsibility of its members; the appointment, promotion, performance appraisal, disciplinary responsibility, conflict of interests and integrity of judicial office holders; and a judicial remedy against all final decisions of the HJPC).
- **Strengthen capacity to investigate and prosecute high-level corruption** and consider setting up independent specialised anti-corruption prosecutorial bodies that focus on serious offences and are adequately protected from outside interference. The United Nations Convention against Corruption sets the standard that a body or bodies or persons specialised in combating corruption through law enforcement shall be granted the necessary independence, in accordance with the fundamental principles of the legal system of the State Party, to be able to carry out their functions effectively and without any undue influence (Article 36) (UN, 2004<sup>[222]</sup>). This CO assessment did not evaluate in-depth the work of SIPA, the specialised organisational units of the Ministry of Interior of the RS, and internal sections and departments of the prosecutor’s offices, and therefore does not argue whether any undue influence on their activities has taken place. However, Bosnia and Herzegovina should consider introducing additional means to safeguard the independence of the institutions as appropriate to their status through the more public and competitive selection of management, strengthened protection against arbitrary dismissal, and guarantees of dedicated budget funding. The FBiH should set up the specialised bodies envisaged in law.

## Notes

<sup>1</sup> Please note that Dimension 5 (Competition policy) is excluded from the key findings section as it uses different scoring model (See the Scoring approach section for information on the assessment methodology).

<sup>2</sup> Staff from the Agency for Statistics of Bosnia and Herzegovina and entity statistical offices who co-ordinate the statistical data collection.

<sup>3</sup> A person from the Ministry of Foreign Trade and Economic Relations who co-ordinates the state-level assessment in Bosnia and Herzegovina and from the Ministry of European Integration and International Co-operation of the Republika Srpska and Prime Minister's Office of the Federation of Bosnia and Herzegovina who each co-ordinate the assessment in their respective entities.

<sup>4</sup> World Bank classification.

<sup>5</sup> The Foreign Investment Law of the Federation of Bosnia and Herzegovina states that: "Foreign investment will not be nationalized, expropriated or subjected to similar measures consequences except in the public interest and in accordance with applicable laws and other regulations. Foreign investors are entitled to adequate, prompt and appropriate compensation, which they are free to use dispose of any damage resulting from nationalization, expropriation or other measures that have similar consequences." (Government of Bosnia and Herzegovina, n.d.<sup>[293]</sup>)

<sup>6</sup> Law on Expropriation (Official Gazette of the FBiH, Nos. 70/07, 36/10 and 25/12); Law on Expropriation (Official Gazette of the Republika Srpska, Nos. 112/06, 37/07, 66/08, 110/08 and 79/15); Law on Expropriation (Official Gazette of the Brcko District of BiH, Nos. 26/04, 19/07, 2/08, 19/10 and 15/11).

<sup>7</sup> Currently, the most active clusters in the Republika Srpska are the wood industry and auto services, as well as a cluster dedicated to research and technological development in the field of medicine and health sciences.

<sup>8</sup> With the exception of passenger vehicles, and slot and gambling machines.

<sup>9</sup> According to the Law on Administration of BiH (Official Gazette of BiH, No. 32/02, 102/09 and 72/17) and the Law on Ministries and Other Administrative Bodies in BiH (Official Gazette of BiH, No. 32/02).

<sup>10</sup> Customs policy, technical regulations and standards, market surveillance, competition, state aid, intellectual property, agriculture, and energy and environmental protection.

<sup>11</sup> Mainly the obligations arising from the Agreement on Trade Facilitation of the World Trade Organization (WTO) and CEFTA's Additional Protocol 5.

<sup>12</sup> Rules of Procedure of the Government of Republika Srpska (Official Gazette of RS, no 123/18); Guideline for the Republic Administrative Bodies Conduct Regarding the Participation of the Public and Consultations in Developing the Law (Official Gazette of RS, no 123/08 and 73/12).

<sup>13</sup> Those consultations include the active participation of stakeholders (private companies and civil society) in all phases during the enactment of law and bylaw acts and strategic documents related to trade policy.

<sup>14</sup> Regulations on Consultations in Legislative Drafting (Official Gazette of BiH, no. 5/17).

<sup>15</sup> According to the 2019 Annual Report on Public Consultations, the eConsultation website was used by 63 institutions, compared to 56 institutions in 2018. Moreover, in 2019, the institutions of BiH conducted a total of 539 consultations in the drafting of legal regulations and published 445 reports on the conducted consultations, which is also a significant increase in the ratio of 2018 when there were 281 total consultations conducted and 234 published reports on consultations [http://www.mpr.gov.ba/web\\_dokumenti/default.aspx?id=10631&langTag=bs-BA](http://www.mpr.gov.ba/web_dokumenti/default.aspx?id=10631&langTag=bs-BA).

<sup>16</sup> Guidelines for the Republic administrative bodies regarding the participation of the public and consultations in developing the law (Official Gazette of RS, no 123/08 and 73/12)

<sup>17</sup> According to the 2019 Annual Report on Public Consultations, 17 institutions were surveyed regarding the acceptance rate of comments during consultation processes. Two institutions stated that they accepted more than 80% of proposals and comments, one institution stated that it accepted 50-80% of proposals and comments, seven institutions accepted 20-50% of proposals and comments, and four institutions accepted below 20% of comments and suggestions.

<sup>18</sup> Article 2 of the Regulations on Consultations in Legislative Drafting (Official Gazette of BiH, no. 5/17).

<sup>19</sup> According to the 2019 Annual Report on Public Consultations, the response of users in the consultation process and the number of submitted proposals and comments were still small: 47 out of 56 surveyed institutions reported that the response rate in the consultation process was poor or unsatisfactory, and 10 institutions reported that the response was better in live consultations. Most institutions stated that they did not receive any suggestions or comments during the consultation processes.

<sup>20</sup> Since 2019, the FBiH parliament has adopted the majority of its laws under emergency procedure (89%). In the Republika Srpska, the National Assembly has adopted about a third (36%) of its laws under a fast-track procedure since the last reporting cycle. These procedures, in principle reserved for exceptional cases, have been taken without any form of public consultation.

<sup>21</sup> The regulatory databases set up for the partial OECD STRI for the WB6 were created thanks to co-operation with the WTO and CEFTA, which is gratefully acknowledged. They are based on the WTO/World Bank I-TIP Services regulatory databases, updated in November 2020 and to which the OECD STRI methodology has been applied. For more information on the methodology see the Methodology and assessment process chapter.

<sup>22</sup> OECD member states and partner economies: Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

<sup>23</sup> The full set of OECD STRI indices and comparison tools, as well as policy simulators for OECD member and partner states that have undertaken the OECD STRI, are available on the dedicated website <https://www.oecd.org/trade/topics/services-trade>.

<sup>24</sup> The complete list of measures sector by sector is available on the OECD STRI website <http://www.oecd.org/trade/topics/services-trade>.

<sup>25</sup> In order to facilitate comparison with OECD member states that have undergone the Services Trade Restrictiveness Index exercise, the paragraphs below have been drafted in accordance with the

methodology of the STRI project publications. The OECD members' country notes and sector notes are available on the STRI web page: <https://www.oecd.org/trade/topics/services-trade/>.

<sup>26</sup> Official Gazette of RS, no 14/2.

<sup>27</sup> EU Directive (2000/31/EC).

<sup>28</sup> Basel III is a set of measures developed by the Basel Committee on Banking Supervision in response to the 2008/09 crisis. It has been agreed internationally and aims for a more resilient banking system. It underpins the regulatory and supervisory framework and strengthens banks' risk management.

<sup>29</sup> The term haircut is used to reference the percentage difference between an asset's market value and the amount that can be used as collateral for a loan.

<sup>30</sup> IFRS 9 is published by the International Accounting Standards Board's (IASB) in response to the financial crisis. It aims to improve the accounting and reporting of financial assets and liabilities. It contains three main topics: classification and measurement of financial instruments, impairment of financial assets, and hedge accounting.

<sup>31</sup> Zenica- Dobož Canton (2019-21), 67 projects with an estimated value of BAM 381 million (~EUR190 million) (Federation of Bosnia and Herzegovina, n.d.<sup>[296]</sup>); Tuzla Canton (2018-20), 44 projects with an estimated value of BAM 339 million (~EUR170 million) (Federation of Bosnia and Herzegovina, 2018<sup>[294]</sup>); and Central Bosnia Canton (2018-20), 30 projects with an estimated value of BAM 95 million (~EUR 47 million) (Government of Central Bosnia Canton, 2018<sup>[295]</sup>).

<sup>32</sup> Some of the projects financed under the non-concession PPP model are the EFT Stanari Coal Plant and the Dobož to Vukosavlje motorway in 2012, Corridor 5c between Karuše and Poprikuše in 2013, the Haemodialysis Project in 2014 and the District Heating System project in Sokolac in 2016

<sup>33</sup> Applicable rates are either 5% for dividend income or 10% for other types of income (interest, royalties, etc). However, no withholding tax is levied on dividends paid to foreign entities holding more than 10% of a domestic entity's share.

<sup>34</sup> For a minimum of BAM 20 million (EUR 10.2 million) invested over five years.

<sup>35</sup> Provided the employment contract is granted on a full-time basis for a minimum of 12 months and the employee has not been already employed by the corporation or a related entity in the last 5 years.

<sup>36</sup> List of activities of public interest: public postal services, medical and health care services, social security services, education, services performed by registered religious organisations, services in the field of culture, and services of public radio and television bodies

<sup>37</sup> The current Annual Audit Plan uses 19 criteria.

<sup>38</sup> Four types of audit are carried out: comprehensive field audits, desk control, control of non-registered entities and special controls.

<sup>39</sup> This programme is organised around four pillars: entry in the taxpayer registry, tax return submission, accurate registration and payment obligation.

<sup>40</sup> This project is supported by the Dutch Ministry of Finance, the Centre of Excellence in Finance (CEF), the International Monetary Fund (IMF) and the Assistance Technique France (Adetef). The overall objective of the project is to contribute to the strengthening of beneficiary institutions' capacity in accordance with EU recommendations.

<sup>41</sup> The OECD Database on General Competition Statistics (OECD CompStats) is a database with general statistics about competition agencies, including data on enforcement and information on advocacy initiatives. In 2020, it included data from competition agencies in 56 jurisdictions, including 37 OECD economies (36 OECD economies and the European Union): Argentina, Canada, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Mexico, Peru, United States (Americas); Australia, Brazil, Chinese Taipei, India, Indonesia, Japan, Korea, New Zealand (Asia-Pacific); Austria, Belgium, Bulgaria, Croatia, Czech Republic, Denmark, Estonia, European Union, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Romania, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, United Kingdom (Europe); Egypt, Israel, Kazakhstan, Russian Federation, South Africa, Turkey, Ukraine (Other) (OECD, 2020<sup>[297]</sup>).

<sup>42</sup> The 27 SOEs under the purview of the RS Share Fund does not include enterprises undergoing bankruptcy or liquidation. It also excludes companies that “have not registered in accordance with the legislation”, which refers to SOEs that have not been transformed into limited liability companies or joint-stock companies, as required by applicable legislation. According to RS authorities, 42 SOEs are undergoing bankruptcy or liquidation and 34 are not fully incorporated as companies. The authorities report that most enterprises in the latter category have not been conducting business activities for a number of years and should be liquidated in accordance with the Law on Registration of Business Entities.

<sup>43</sup> The central levels of government in Bosnia and Herzegovina (FBiH and RS) do not maintain centralised data on SOEs held by the subnational levels of government (cantons and municipalities). The figure of 128 SOEs held by subnational levels of government in FBiH is based on data gathered by the authorities for the purpose of the current assessment. Separately, an IMF team conducted an independent study of SOEs at all levels of government in Bosnia and Herzegovina, based on 2017 data, which concluded that approximately 550 enterprises are in state ownership at all levels of government (Parodi and Cegar, 2019<sup>[78]</sup>).

<sup>44</sup> The figures presented in IMF (Parodi and Cegar, 2019<sup>[78]</sup>) concern SOEs at all levels of government (FBiH, RS, 10 cantons and 145 municipalities). The 414 enterprises were those for which financial statements were publicly available.

<sup>45</sup> The sectoral classification used in the referenced IMF study has been modified to align with the sectoral classification used in the OECD's recurrent SOE data collection exercise (OECD, 2017<sup>[79]</sup>). The “Electricity and gas sector” includes steam and air conditioning supply enterprises.

<sup>46</sup> Information on SOE board composition in RS is as reported by the authorities in the context of this assessment.

<sup>47</sup> This is based on information provided by the authorities in the context of this assessment. Separately, of the 181 SOEs held by all levels of government in FBiH, 19% (34 companies) have non-state minority shareholders.

<sup>48</sup> The FBiH Government is a minority shareholder in the following companies: Aluminij, Sarajevo Osiguranje, Energopetrol and ArcelorMittal Zenica.

<sup>49</sup> The World Bank is providing technical support in the context of the “BEST-SOE project” that focuses on “Support for Better, Effective, Sustainable and Transparent Public Enterprises in Bosnia and Herzegovina”,

<http://documents1.worldbank.org/curated/en/223291604413419904/Concept-Project-Information-Documents/PID-Bosnia-and-Herzegovina-Forest-Economy-Development-Project-BiH-FEDEP-P171513.docx>

<sup>50</sup> Figures on the number of privatisations in FBiH are based on data provided by FBiH authorities for assessment. The identification of the two SOEs privatised in 2016 is based on (US Department of State, 2019<sub>[80]</sub>).

<sup>51</sup> The OECD SOE Guidelines recommend that public procurement procedures applicable to general government are applied to SOE activities intended to fulfil a governmental purpose (OECD, 2015<sub>[84]</sub>).

<sup>52</sup> Prior to PISA 2018, the last time BiH had comparable results on student learning was in 2007 when it participated in the Trends In International Mathematics And Science Study (TIMSS).

<sup>53</sup> Internationally reported data for BiH is only available for 2019, while regional averages are only available for 2019.

<sup>54</sup> In 2018, the gross enrolment ratio in pre-primary education was on average around 53% in the Western Balkans and 98% in the EU (UIS, 2021<sub>[88]</sub>).

<sup>55</sup> For the purpose of this profile, the instruction system refers to teaching and learning processes that take place in school education. It generally consists of curriculum, standards for schools and student learning, assessment and evaluation frameworks, and other elements that support instruction.

<sup>56</sup> The Strategy of Education Development for Pre-university Education 2016-2021.

<sup>57</sup> The PISA 2018 reading assessment in Bosnia and Herzegovina revealed that general/modular programmes had an average of 19% low performers, while vocational programmes had 61% (OECD, 2018<sub>[87]</sub>).

<sup>58</sup> For five economies that could serve as peers for Bosnia and Herzegovina (Bulgaria, Croatia, Hungary, Romania and Slovenia) the average activity rate was 71.2%.

<sup>59</sup> Note that data for the entities do not specify the age group.

<sup>60</sup> Around EUR 27.5 million is dedicated to cover minimal salary, contributions and taxes for around 70 000 employees directly affected by COVID-19 in April, and possibly May (OECD, 2020<sub>[298]</sub>).

<sup>61</sup> Official Gazette of the Federation of Bosnia and Herzegovina, No. 26/16 and 89/18.

<sup>62</sup> The Labour Law has been harmonised with the following: Directive 2003/88/EC of the European Parliament and of the Council of 4 November 2003 on certain forms of organisation of working time; Council Directive 92/85/EEC of 19 October 1992 on the introduction of measures to encouraging the improvement of safety and health at work of pregnant workers and workers who have recently given birth or are breastfeeding (tenth individual Directive within the meaning of Article 16 (1) of Directive 89/391/EEC); and Council Directive 2001/23/EC of 12 March 2001 on the approximation of the laws of the Member States relating to the protection of employees' rights in respect of transfers of undertakings, establishments or parts of undertakings or establishments.

<sup>63</sup> Official Gazette of SRBiH, No. 22/90. The new law came into force on 8 November 2020.

<sup>64</sup> Direct-executable Council Directive 89/391/EEC of 12 June 1989 on the introduction of measures to encourage improvements in the safety and health of workers at work.

<sup>65</sup> It will consist of BiH government representatives, representatives of employers' associations, trade unions and prominent experts in occupational safety and health.

<sup>66</sup> Official Gazette Republika Srpska 01/16 and 66/18.

<sup>67</sup> Official Gazette Republika Srpska 1/08 and 13/10.

<sup>68</sup> Responses of government to OECD questionnaire.

<sup>69</sup> As laid down in the Law on Inspections in the Federation of Bosnia and Herzegovina (Official Gazette of the Federation of BiH, No. 73/14).

<sup>70</sup> Authorised healthcare institutions have the authority to conduct specific health care for workers and occupational medicine. Authorised organisations for performing professional work in the field of occupational safety have the authority to draft an act on risk assessment, conduct periodic inspections and tests in the field of occupational safety (means of work, harmfulness and microclimate in the work environment), and train workers for safe and healthy work. The worker, trade union, employer or employee council may submit a request to the labour inspector to conduct an inspection.

<sup>71</sup> Official Gazette Republika Srpska 18/20.

<sup>72</sup> In March 2021, the total number of employees within the RS administration for the inspection of jobs was 398, among whom 258 were inspectors and 32 labour inspectors.

<sup>73</sup> Information provided by BiH-RS. In 2019, labour inspectors executed 5 369 inspection controls (4 140 were regular planned controls and 1 229 were as part of an extraordinary process). There is no indication about the share of companies visited and controlled.

<sup>74</sup> Information provided by BiH-RS.

<sup>75</sup> Information provided by BiH-RS.

<sup>76</sup> The Ministry for Labour, War Veterans and Disabled persons protection, Economic and Social Council and other ministries have periodic meetings within working groups related to creation strategies, annual action plans for implementation strategies and draft laws

<sup>77</sup> The Law on Employee Councils (Official Gazette of the Federation of BiH, No. 38/04) provides for the possibility of forming an employee council at company level. The employer has the obligations to inform, consult and obtain prior consent when it comes to making certain decisions important for workers' rights. In case there is no employee council, the trade union undertakes its tasks. According to Article 22, the employer must inform the employee council at least every six months about issues that affect their interests in workplace relations, particularly those regarding the condition and results of operations, development plans and their impact on the economic and social position of employees, movements and changes in salaries, safety at work and measures to improve working conditions, and other issues important for the rights and interests of employees. Article 23 determines consultation rights on issues such as the adoption of work regulations; the intention of the employer to terminate the employment contract by more than 10% for economic, technical or organisational reasons; employment plan, relocation and dismissal; measures related to health and safety at work; significant changes or introduction of new technology; vacation plan; working hours; night work; fees for inventions and technical improvements; other decisions for which the collective agreement provides for consultation; employee councils in their adoption. See <http://www.advokat-prnjavorac.com>.

<sup>78</sup> The provision of Article 158 of the Law on Labour stipulates that it should be consulted in order to promote and harmonise economic and social policy, and encourage the conclusion and application of collective agreements. Each delegation (trade unions, employers and the federation) has seven members.

<sup>79</sup> Representative Trade Unions of Republika Srpska include the Alliance of Trade Unions of Republika Srpska and the Confederation of Trade Unions of Republika Srpska. The Union of Association of employers of Republika Srpska is the only employers' association.

<sup>80</sup> In addition to wage levels and principles of wage development, collective agreements fix issues such the organisation of working time, shift and night work, overtime, annual leave, years of work, reimbursements of costs for hot meal, anniversary award, working conditions at the work place, and rights and obligations of trade union representatives. The latter are usually fixed by law in EU economies.

<sup>81</sup> Official Gazette of RS, no 26/01.

<sup>82</sup> One third of employees, as well as trade unions (representing at least 20% of the workforce), have to agree.

<sup>83</sup> Official Gazette of RS, no. 110/10 and 91/17.

<sup>84</sup> Through participation in working groups the council provides its opinion on work and employment, the economic reforms of Republika Srpska, and on law proposals and the budget.

<sup>85</sup> Wave 3 of the Skills Toward Employment and Productivity (STEP) survey (World Bank, 2018<sub>[299]</sub>).

<sup>86</sup> Note: "Non-routine" jobs refer to managers, professionals and higher-level technicians whose job descriptions usually contain non-routine cognitive and socio-emotional tasks. This corresponds to Type A occupations in STEP methodology. "Routine jobs" refer to all other occupations, which are Type B occupations in STEP methodology. This methodology was slightly adapted.

<sup>87</sup> Information, Counselling and Training Centres (CISO) were established in 2011 within seven branch offices of Employment Institute of Republika Srpska (EIRS). These centres provide professional information services for pupils. During the 2018/19 school year, professional information and orientation services were provided for 2 813 pupils in 141 high school graduation classes. Data were taken from the reports of schools that carried out this activity. In 2018/19 this measure was provided for 8 129 pupils in primary and secondary schools (information provided by BiH-RS).

<sup>88</sup> Information provided by BiH-RS.

<sup>89</sup> The main strategic objectives are: 1) improving adult education legislation in the context of lifelong learning and harmonising with the EU reference framework; 2) establishing effective ways of participating with relevant social partners in the adult learning process in the context of lifelong learning; 3) developing programmes and institutional capacity and improving the accessibility of adult education in the context of lifelong learning; and 4) ensuring and improving the quality of adult education in the context of lifelong learning (Official Gazette of BiH, No. 96/14).

<sup>90</sup> Information provided by BiH.

<sup>91</sup> Official Gazette of BiH, No. 39/14.

<sup>92</sup> Official Gazette of BiH, No. 96/14.

<sup>93</sup> It was expected that the government would provide its comments by the end of June 2020. At the time of writing there has been no advancements.

<sup>94</sup> Official Gazette of RS, 59/09 and 1/12.

<sup>95</sup> Including craft occupations for shoe production, agricultural occupations, care occupations, mining occupations and hospitality sector occupations.

<sup>96</sup> In line with the EU-agreed definition, a person (15-64) is at risk of in-work poverty if they are in employment and live in a household that is at risk of poverty. A household is at risk of in-work poverty if its equivalised disposable income is below 60% of the national median. However, the authors of this study counted as employed all individuals aged 18-64 who had declared themselves to be working, rather than those who had worked more than half of the income reference year as required by the EU methodology.

<sup>97</sup> According to the law, the government of the FBiH at the proposal of the Federal Ministry of Finance in co-operation with the Federal Institute for Development Programming, and with prior consultation with the Economic and Social Council, should fix the level of the minimum wage. At the time of writing, the above-mentioned FBiH act had not yet been adopted.

<sup>98</sup> Ministry of Human Rights and Refugees of Bosnia and Herzegovina, Gender Equality Agency of Bosnia and Herzegovina, Gender Action Plan of Bosnia and Herzegovina (GAP) (Agency for Gender Equality of Bosnia and Herzegovina, 2018<sub>[326]</sub>). It includes the following planned measures:

- Identification of priority laws, strategies, action plans and programmes with the aim of introducing international and domestic standards for gender equality.
- Conducting gender analyses of strategies, policies, programmes and projects in the field of labour market, employment and access to economic resources to identify shortcomings, strengths, real needs and opportunities regarding gender equality.
- Regular collection, analysis and publication of gender-disaggregated data on women's and men's participation in the labour market and economic life, including participation in decision-making positions, career advancement, income, wages, indefinite/fixed-term work, business contract terms and access to credit.
- Development and implementation of programmes of measures and activities to eliminate gender discrimination in the field of labour, employment and access to economic resources, including strengthening institutional capacity to apply international and domestic standards in this area, introduction of gender responsive budgets, and establishment of appropriate institutional mechanisms for gender equality to co-ordinate the implementation of these measures.
- Support for research and programmes to increase women's participation in the labour force and reduce unemployment, the development of women's entrepreneurship, as well as representation in agricultural production and the informal sector, and the economic and social empowerment of women.
- Support for research and programmes aimed at improving social protection that address the specific position of women in the labour market and in social and economic life, for example: casual work, career breaks and lower average wages.
- Support for research and programmes related to the advancement of women in the field of rural development, as well as the integration of gender issues into programmes related to sustainable development and environmental protection.
- Organising training programmes for women to help them seek, select and obtain adequate employment, including retraining and self-employment, and starting and developing entrepreneurship.
- Improving measures to reconcile business and private life, including maternity and paternity protection, improving the provisions on paid maternity leave, paid parental leave for both parents, as well as special measures that make it easier for employees to reconcile professional and family obligations.
- Conducting promotional activities, information campaigns and campaigns to raise public awareness of the right of women and men to have equal access to employment, the labour market and economic resources in the field of environmental protection and sustainable development.

- Monitoring progress and reporting on the representation of women and men in the field of labour, employment and access to economic resources, as well as in the field of women's entrepreneurship.

Responsibility holders for the implementation of these measures are legislative and executive institutions and bodies at the state and entity level, cantonal bodies and bodies of local self-government units, in accordance with the sectorial competencies prescribed by applicable legal regulations. Corresponding budgets are adopted budgets of responsible institutions at all levels of authority, with the possibility to combine it with the use of IPA and other donors' funds.

<sup>99</sup> 325 women participate in this programme. Information provided by FBiH.

<sup>100</sup> In families with small children, women perform on average 33.89 hours a week more housework than men (almost another full-time job).

<sup>101</sup> Horizontal co-ordination for the implementation of Gender Action Plan of BiH 2018-2022 in RS is provided through Co-ordination Committee, appointed by the Government of Republika Srpska. The Co-ordination Board of Republika Srpska (CBRS) is led by the Gender Centre and its members are appointed representatives of all ministries in the government. The CBRS has a rulebook and regular meetings (every quarter), proposes annual operational plan for gender equality and annual reports in Republika Srpska within the implementation of GAP BiH 2018-2022, and follows implementation. One of the priority areas is labour, employment and access to economic resources.

Vertical institutional co-ordination is provided through the Management Board: Agency for Gender Equality of BiH, Gender Centre of Federation BiH and Gender Centre of Republika Srpska. The Management Board meets periodically and follows the implementation of the GAP BiH, proposes strategic activities, proposes annual plans and reports, and develops co-operation with international organisations interested in supporting the implementation of GAP BiH.

<sup>102</sup> Conclusion No. 04/1-012-2-2716/16.

<sup>103</sup> The Gender Centre celebrates International Girls in ICT Day in Republika Srpska every April to stimulate the interest, visibility and participation of girls and women in education and professional careers involving innovation, technical, technological and ICT. Various promotional campaigns and events are organised across a week. On the initiative of Gender Centre, primary and secondary schools in RS organise school children and youth education institutions, institutions, companies, faculties and research centres. The Gender Centre has also developed a close partnership with the ICT company LANACO Banja Luka, which every year helps celebrate this day by offering different courses for girls. These courses are certified at the global level and give students the opportunity to enter the labour market in a job related to ICT. This type of co-operation enables the economic empowerment of women, as well as further training in one of the highest paid professions. This model of co-operation has proved to be useful and significant not only in the form of promotional activities, but also in terms of concrete actions for the direct involvement of women in the labour market. The Gender Centre's campaign is recognised internationally by the International Telecommunication Union (ITU), with the Gender Centre and Republika Srpska included in the calendar and map of all economies in the world that organise activities to celebrate the day. A 2016 government report foresees implementing programmes to stimulate young women and girls to choose education in technical and mathematical areas that provide better employment and contribute to development (Gender Centre, 2019<sub>[300]</sub>).

<sup>104</sup> Information provided by BiH-RS.

<sup>105</sup> The main objective is to strengthen the competitiveness of business entities led by women entrepreneurs and improve the accessibility and attractiveness of entrepreneurship and business for women. Financial resources for the realisation of activities from the Action Plan 2018-2022 amount to BAM 4.5 million, most

COMPETITIVENESS IN SOUTH EAST EUROPE 2021 © OECD 2021

of which relates to loan support from the Investment and Development Bank of Republika Srpska, while the remaining funds are from the government and local budgets, as well as international projects and programmes. The Investment and Development Bank of Republika Srpska will work to further reduce the basic interest rate to encourage women's entrepreneurship and help women improve their businesses and to become stronger economically.

<sup>106</sup> Based on the recommendations from the implementation of the first Action Plan for Improving the Position of Rural Women in Republika Srpska, the RS government adopted the second Action Plan for 2019-2020. For the initial action plan, measures developed were special temporary measures for rural women within the framework of the Strategic Plan for Rural Development 2009-2015. The action plan was a targeted public policy based on field indicators. It encompassed various measures in the field of economic empowerment, education, training, improvement of quality of life and access to basic services, protection from violence, social strengthening of the role of rural women, and women's participation in decision making

<sup>107</sup> EIRS has allocated BAM 1.73 million (around 9.5% of the 2019 ALMP budget) for employment and self-employment of these target groups within the project Supporting Employment and Self-employment of target categories in the Economy of Republika Srpska in 2018. Some 396 women from rural areas participated in the programme, and most of the budget was spent (more than 80%). Female victims of war torture were also included as a target group for ALMPs (Information provided by BiH-RS).

<sup>108</sup> Official Gazette of the Federation of BiH, No. 55/00, 41/01, 22/05 and 9/08.

<sup>109</sup> Official Gazette of the Federation of BiH, No. 74/18.

<sup>110</sup> Federal Employment Agency responsibilities:

a) monitor and propose measures to improve the employment and social security of unemployed persons; b) monitor and ensure the implementation of the established policy and measures in the field of labour and employment on the territory of the FBiH and inform the competent bodies thereof; c) manage funds for ensuring material security during unemployment, in accordance with this law; d) monitor and co-ordinate the work of employment services in the implementation of established policies and measures in the field of employment and social security of unemployed persons within the competence of the Federation; e) monitor and propose measures to improve the employment of disabled persons and their professional rehabilitation, and ensure the fulfilment of conditions for their employment in co-operation with employment services; f) provide assistance in the implementation of vocational guidance, training and retraining programmes for the unemployed and their re-employment in appropriate jobs; g) consolidate and keep summary records in the field of labour and employment of interest to the FBiH and propose measures and necessary resources for the development and functioning of a single information system in this field; h) monitor the implementation of international agreements and agreements in the field of labour and employment related to the FBiH; i) represent employment services in relations with bodies and services of Bosnia and Herzegovina, the FBiH and RS; j) approve the employment of foreign citizens and stateless persons at the proposal of the Employment Service, in accordance with the Law on Employment of Foreigners (Official Gazette of the Federation of BiH, No. 8/99); k) monitor and take measures to create conditions for the return of citizens of the FBiH from temporary work abroad and their employment; l) perform other tasks determined by the law, the statute and acts of the Federal Bureau and the ILO Conventions and Recommendations related to the field of labour, employment and social policy; m) submit to the Parliament of the Federation of Bosnia and Herzegovina an annual report on its work and n) submit the consolidated annual financial plans of the Federal Bureau and Employment Services to the federal ministry responsible for labour affairs, in accordance with the Law on Budgets of the Federation of Bosnia and Herzegovina;

Cantonal employment services responsibilities:

a) employment mediation; b) collecting and submitting data on unemployed persons to the Federal Bureau; c) information on employment opportunities; d) co-operation with educational institutions in order to harmonise educational programmes with the staffing needs of employers; e) implementation of programmes of professional orientation, training and retraining of unemployed persons and their re-employment in appropriate jobs; f) determining the rights of persons in case of unemployment; g) issuing work permits to foreign citizens and stateless persons; h) adoption and implementation of programmes of measures for faster employment of certain categories of unemployed persons whose employment is difficult; i) other activities determined by this and other laws.

Information provided by FbiH.

<sup>111</sup> Information on the vocational profile, employment status within the 60 days before registering, social and health characteristics, and motivation for work is collected. Those unemployed are classified into three groups, according to their degree of employability: 1) easily or directly employable persons (employable within the next 9 months according to counsellor's judgement); 2) medium or conditionally employable persons (assessed to be employable within the next 18 months); 3) hard-to-employ persons (assessed to be not employable within the next 18 months, have skills which are not in demand, have health problems and have a low job-search motivation).

<sup>112</sup> Information provided by FBiH.

<sup>113</sup> According to administrative data provided by FBiH. The budget spent for ALMPs amounted to roughly BAM 27.6 million in 2019.

<sup>114</sup> The percentage is in fact lower, as the number of participants are cumulated over the year. In Q2 2019, 76% of unemployed were long-term unemployed.

<sup>115</sup> Official Gazette of RS, No. 90/16.

<sup>116</sup> The legal framework is formed by the Law on Mediation in Employment and Unemployment benefits (RS Official Gazette, No. 30/10, 102/12) and the Law on changes and amendments to the Law on Mediation in Employment and Unemployment benefits (RS Official Gazette, No. 94/19); regulations on conditions, criteria, and manner of implementation of active employment policy measures (RS Official Gazette, No. 94/19); and regulations on active job search (RS Official Gazette, No. 94/19). The EIRS consists of 1 central office, 7 branch offices and 59 bureaus. It employs 334 employees, of whom 83 are counsellors serving 87 000 registered unemployed and 3 485 registered vacancies.

<sup>117</sup> Information provided by RS.

<sup>118</sup> In France and Germany for example, the caseload of for hard-to-place jobseekers is around 70 jobseekers per employment counsellor. The caseload may vary in these economies between 100 and 350, depending on how much jobseekers need individual guidance and how autonomous they are to use self-help guidance tools (OECD, 2015<sup>[301]</sup>; Manoudi et al., 2014<sup>[302]</sup>; Pôle emploi, n.d.<sup>[303]</sup>).

<sup>119</sup> Easily or directly employable, conditionally employable and difficult-to-employ persons.

<sup>120</sup> Information provided by BiH-RS.

<sup>121</sup> Labour market analysis was undertaken by the bureaus located in the local communities. Local councils proposed a plan for secondary school enrolment in accordance with the needs of the economy at the local level. Representatives of employment bureaus took active participation in these activities. In January 2019, the ILO project ended, leaving 9 local partnerships in 15 local communities in RS still running. The objective is to continue co-operation with the key labour market actors through conferences, meetings and advisory bodies in local communities.

<sup>122</sup> In 2019, the EIRS participated in the EU4Business Entrepreneurship Development project, implemented

by the ILO. The aim of the project was to promote the establishment and development of micro, small, medium and newly registered companies by designing mechanisms to provide financial and non-financial (technical/professional) assistance to end users (new and existing entrepreneurs from the target categories of unemployed) and further entrepreneurship development. Within the EU4Business project, training was organised for project partners from PES on the topic "How to start and improve business".

<sup>123</sup> During 2019, significant co-operation regarding improving the work of the bureaus through the implementation of the reform package was achieved with the "Youth Employment Project - YEP" (Phase III) supported by the Swiss Embassy and implemented by the German company GOPA. The emphasis was on the implementation and development of the methodology for monitoring and evaluating individual employment plans, increasing customer satisfaction with services, expanding the network of job search clubs, creating a basis for developing social entrepreneurship, and strengthening partnerships in the labour market.

<sup>127</sup> Official Gazette of the Federation of BiH, No. 26/16 and 89/18.

<sup>128</sup> Official Gazette of the Federation of BiH, No. 92/16.

<sup>129</sup> Official Gazette of RS No. 60/15 and 5/16, amendments refer to Article 10.

<sup>130</sup> Official Gazette of the RS, No. 52/2019. The law entered into force on July 1, 2019.

<sup>131</sup> In Slovenia, in 2018 the most requested occupations were welders, masons and cooks. The public call for the employment of healthcare workers in Germany is permanently open, and in 2018 the necessary activities were undertaken in BiH in accordance with the announced call. The employment office received 94 applications from medical workers during 2018. In the same year, 149 healthcare professionals from RS received work permits as carers in Germany, according to the procedure for employment with known employer. In 2019 the number was 57.

<sup>132</sup> See European Commission, Peer review on "Employer service delivery", 26-28 October 2020 (online), The Peer Review was hosted by the Dutch PES (UWV WERKbedrijf) and focused on PES employer services design and delivery regarding employment of disabled jobseekers. Report available at: <https://ec.europa.eu/social/main.jsp?catId=1070&langId=en&newsId=9528&furtherNews=yes>.

<sup>133</sup> Horizon 2020 is the biggest EU framework programme for research and innovation. It provides funding for multi-national collaboration projects as well as for individual researchers, and supports SMEs with a special funding instrument (<https://ec.europa.eu/programmes/horizon2020/en/what-horizon-2020>; <https://www.euneighbours.eu/en/east/stay-informed/projects/horizon-2020>).

<sup>134</sup> European Cooperation in Science and Technology (COST) is an EU-funded, intergovernmental framework that currently gathers 38 Members and 1 Cooperating Member. It is a funding organisation for the creation of research networks (COST Actions), which offer an open space for collaboration among scientists across economies. COST funding is intended for collaboration activities and complements national research funds (<https://www.cost.eu/who-we-are/about-cost/>).

<sup>135</sup> Eureka is the largest intergovernmental network for co-operation in R&D and innovation in the world. It is present in over 45 economies, where it provides access to public funding, promotes collaboration and

innovation or offers advice through various programmes (such as EUREKA Clusters, Globalstars, InvestHorizon) (<https://www.eurekanetwork.org/>).

<sup>136</sup> EURAXESS – Researchers in Motion is a pan-European initiative delivering information and support services to professional researchers, backed by the EU, member states and associated economies. It supports researcher mobility and career development and enhances scientific collaboration (<https://euraxess.ec.europa.eu/>).

<sup>137</sup> EU distinction between competitive areas ("black" areas) where no state aid is necessary, and unprofitable or under-served areas ("white" and "grey" areas) where state aid may be justified if certain conditions are met. This distinction is then adapted to the situation of next generation access (NGA) networks (whose deployment is still at an early stage) by requiring EU Member States to take into account not only existing NGA infrastructures, but also concrete investment plans by telecom operators to deploy such networks in the near future (European Commission, 2013<sub>[304]</sub>).

<sup>138</sup> BiH Agency for Statistics (<http://www.bhas.gov.ba>).

<sup>139</sup> National Summary Data Page (<https://cbbh.ba/Content/Read/1133>).

<sup>140</sup> The extension of Annex VI. Memorandum for the establishment of the Public Administration Reform Fund is not yet approved as the government of RS has not adopted the document, in contrast to the Council of Ministers of BiH, the Government of the FBiH and the Government of the Brčko District. Given the possible closure of the fund, donors (Sweden and Denmark) have requested the return of their funds (approx. BAM 5.2 million) due to the perceived lack of commitment in the PAR demonstrated by BiH authorities (Public Administration Reform Coordinator's Office, 2020<sub>[305]</sub>).

<sup>141</sup> The importance of interoperability is also underlined in the European Interoperability Framework (EIF) network, which was adopted by the European Commission in 2017. The EIF makes 47 concrete recommendations for how public administrations can improve their interoperability activities, establish cross-organisational relationships, streamline processes supporting end-to-end digital services, and ensure that both existing and new legislation do not compromise interoperability efforts (European Commission, 2017<sub>[306]</sub>).

<sup>142</sup> Law on Electronic Signature of BiH, Official Gazette of BiH, 91/06; Law on Amendments to the Law on Identity Card of BiH Citizens, Official Gazette of BiH, 18/12; Decision on the basics of the use of electronic signatures and the provision of verification services, Official Gazette of BiH, no. 21/09; Decision on electronic commerce and e-government in the Council of Ministers of BiH, Official Gazette of BiH, no. 7/10; Law on Electronic Business and Legal Traffic, Official Gazette of BiH, no. 88/07; Law on Electronic Document, Official Gazette of BiH, no. 58/14; Law on Protection of Personal Data, Official Gazette of BiH, no. 49/06, 76/11 and 89/11; Law on Electronic Document of FBiH, Official Gazette FBiH, 15/13; Law on Electronic Signature of the Republika Srpska, Official Gazette of RS, no. 106/15; Law on Electronic Commerce of the Republika Srpska, Official Gazette of the Republika Srpska, no. 59/09, 33/16; Law on Electronic Document of the Republika Srpska, Official Gazette of the Republika Srpska, no. 106/15; Law on Information Security, Official Gazette of the Republika Srpska, no. 70/11.

<sup>143</sup> The eConsultations portal was created by the Ministry of Justice with support from the project "Capacity Building of Government Institutions for Participation in Dialogue with Civil Society" (CBGI), funded by the European Union. Some 64 state-level institutions are registered in the portal and have started to publish their draft legal acts for public consultation (<https://ekonsultacije.gov.ba/>).

<sup>144</sup> The Law on Registration of Business Entities in RS defines that the process of a one-stop shop system for the registration of business entities from 1 December 2013 is performed at the counters of the RS Agency for IT and Financial Services and at 11 locations of business units.

<sup>145</sup> RS Chamber of Commerce webinars: Electronic sales (e-commerce), IT tools for remote work, electronic books of incoming and outgoing invoices (KUF and KIF), and the impact of social networks on business (<https://komorars.ba/>).

<sup>146</sup> In accordance with the BiH Constitution there are 12 responsible institutions for education in BiH (the Ministry of Education and Culture of RS, ten cantonal ministries of education in FBiH and the Department for Education of the Brčko District). The Federal Ministry of Education and Science has only a co-ordination role. At the state level, the Ministry of Civil Affairs co-ordinates activities within all education institutions, performing harmonisation of plans of entity bodies and defining strategies at the international level, including for education. At the state level, the Agency for Development of Higher Education and Quality Assurance, the Centre for Information and Recognition of Qualifications in Higher Education, and the Agency for Preschool, Primary and Secondary Education have been established.

<sup>147</sup> Under the auspices of the Adult Education Project (2010-2016), the German GIZ, the Swiss Development Cooperation and the USAID-Sida FIRMA Project, in collaboration with the Federal Employment Agency, the Labour and Employment Agency, the RS Institute for Adult Education and the SPEKTAR Agency, created a registry of adult education providers (<http://www.obuke.ba/>).

<sup>148</sup> ITkarijera.ba is a portal that offers comprehensive information on the IT sector of BiH to help young people become part of one of the most promising sectors in BiH (<https://itkarijera.ba/>).

<sup>149</sup> Public procurement portal, managed by the Public Procurement Agency of BiH (<http://www.ejn.gov.ba/>).

<sup>150</sup> The Digital inclusion of marginalised women project by Amica Educa focuses on reducing existing gender inequalities in BiH society by involving women in the process of lifelong learning and active participation in the highly computerized society. Some 48 women were involved in the activities of the project (<https://www.amicaeduca.com/digital-inclusion-of-marginalized-women.php>).

<sup>151</sup> Digital Transformation Support Programme for MSMEs. Programme implemented by the Development Agency of Serbia in co-operation with the Centre for Digital Transformation and co-funded by the GIZ (<https://ras.gov.rs/javni-poziv-za-ucescu-u-programu-podrske-digitalnoj-transformaciji-mmssp>).

<sup>152</sup> The FTS considered the following: the Development Strategy for Railways in the RS (2009-2015); the Road Traffic Safety Strategy in RS, including implementation plan (2014-2018) (the new implementation plan for 2019-2022 has been developed but the FTS has not been updated so far); the three-year plans of FBiH ministries and institutions; a study on the market and transport demand for river navigation; and various studies for intermodal transport in Bosnia and Herzegovina, including legislation and spatial plans in force and other available sectorial studies and reports.

<sup>153</sup> Railway transport: interoperability, market access, passengers' rights and obligations. Road transport: road charging infrastructure, annual vehicle taxes.

<sup>154</sup> A single project pipeline (SPP) is a list of projects developed based on a strategic tool for project planning that aims to avoid an ad hoc approach to planning preparation and implementation of investment projects. The SPP helps to prioritise projects, enables the systematic and timely planning of resources, provides a reliable basis for defining the proper sequencing of the priority axis and actions per sectors, and helps link investment planning and programme budgeting.

<sup>155</sup> Annual Programme of the Government of the RS, [http://vladars.net/sr-SP-Cyrl/Vlada/Premijer/Documents/Ekspoze\\_171218.pdf](http://vladars.net/sr-SP-Cyrl/Vlada/Premijer/Documents/Ekspoze_171218.pdf).

<sup>156</sup> European Commission, Instrument for Pre-Accession Assistance, IPA Cross-border Co-operation Programmes, [https://ec.europa.eu/regional\\_policy/en/funding/ipa/cross-border/](https://ec.europa.eu/regional_policy/en/funding/ipa/cross-border/).

<sup>157</sup> The Law on Public Procurement, <https://www.paragraf.ba/propisi/bih/zakon-o-javnim-nabavkama.html>.

<sup>158</sup> Projects of state importance, state secrets, projects funded by international financial institutions or donor institution/country, etc.

<sup>159</sup> An appropriate definition of “asset management” for the roads sector was proposed by the OECD in 2001: “A systematic process of maintaining, upgrading and operating assets, combining engineering principles with sound business practice and economic rationale, and providing tools to facilitate a more organized and flexible approach to making the decisions necessary to achieve the public’s expectations” (OECD, 2001<sub>[307]</sub>).

<sup>160</sup> The rulebook laying down framework for the creation of the Single European Sky was adopted in 2020 (Official Gazette No 40/20); Rulebook on Search and Rescue services in the event of an aircraft accident in Bosnia and Herzegovina (Official Gazette of BiH, No 52/19); Rulebook on air traffic flow management (Official Gazette of BiH, No 20/19); Rulebook on approval of exemptions and derogations from the application of by-laws enacted by the Bosnia and Herzegovina Directorate of Civil Aviation (Official Gazette of BiH, No 88/18); Rulebook on the procedure for avoidance of mid-flight collision (Official Gazette of BiH, No 79/18); Rulebook on harmonisation of Bosnia and Herzegovina with International Civil Aviation Organization requirements (Official Gazette of BiH, No 65/18); Rulebook on flight approval (Official Gazette of BiH, No 53/18); Rulebook on NOTAM office of Bosnia and Herzegovina (NOF) (Official Gazette of BiH No 9/18); Rulebook on oversight in civil aviation (Official Gazette of BiH, No 22/16, 55/18 and 5/19)

<sup>161</sup> The Functional Airspace Block Central Europe is a joint initiative of seven states and air navigation service providers from Central Europe: Austria, Bosnia and Herzegovina, Croatia, Czech Republic, Hungary, Slovakia and Slovenia (<https://www.fab-ce.eu/>).

<sup>162</sup> An air traffic management plan must define the operational air traffic management concept, strategic airspace management, tactical airspace management, air traffic service, air traffic flow management, flight operation, functional integration, crisis management, search and rescue, and regional air navigation plans and supplementary procedures.

<sup>163</sup> Law on railways of Republika Srpska (Official Gazette of RS, 19/17, 28/17, 100/17); Regulation (EC) No 1371/2007 of the European Parliament and of the Council of 23 October 2007 on rail passengers’ rights and obligations (OJ EU L 315, 3.12.2007, p. 14).

<sup>164</sup> Directive 2012/34/EU of the European Parliament and of the Council of 21 November 2012 establishing a single European railway area (Text with EEA relevance): <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32012L0034>.

<sup>165</sup> Modal shift from road, standards for energy efficiency, standards for noise emission, reduction of greenhouse gas emissions, vehicle labelling for emissions and fuel efficiency, introduction of carbon footprint calculators, eco-driving and speed limits, intelligent transportation system applications, co-modality in transport, urban mobility solutions, etc.

<sup>166</sup> Modal shift through FTS, measures related to the reduction of emissions to stimulate new and more ecologic vehicles through FTS, improvement of transport infrastructure and promotion of bio-fuels and other renewable fuels through the Strategy for Environmental Protection of the FBiH, etc.

<sup>167</sup> As per the Combined Transport Directive 92/106EC, amended by the Directive 2013/22/EU: “combined transport” means the transport of goods between Member States where the lorry, trailer, semi-trailer, with or without tractor unit, swap body or container of 20 feet or more uses the road on the initial or final leg of the journey and, on the other leg, rail or inland waterway or maritime services where this section exceeds 100 km as the crow flies and make the initial or final road transport leg of the journey” (EUR-Lex, 1992<sub>[350]</sub>).

<sup>168</sup> Competence and quality of logistic services (e.g. transport, operations, customs, brokers).

<sup>169</sup> Quality of trade and transport related infrastructure (e.g. ports, railways, road, information technologies).

<sup>170</sup> A one-stop shop is a business or office where multiple services are offered; i.e. customers can get all they need in just "one stop." The term originated in the United States in the late 1920s or early 1930s to describe a business model offering customers the convenience of having multiple needs met in one location, instead of having to "drive all over town" to attain related services at different stores. One-stop shop is a way of facilitating trade.

<sup>171</sup> Periodical and regular measurements to monitor infrastructure asset conditions, assessment of the value of assets and costs for non-maintained assets, adoption of asset management strategies, consistent approach in the identification of the mix and timing of asset operation and construction strategies, etc.

<sup>172</sup> For more information on the Second Energy Package and the different Energy Packages within the EU, please see [https://www.europarl.europa.eu/factsheets/en/sheet/45/internal-energy-market\\_in](https://www.europarl.europa.eu/factsheets/en/sheet/45/internal-energy-market_in) particular Section A. Liberalisation of gas and electricity markets.

<sup>173</sup> The Energy Community is an international organisation that works to integrate the European Union and neighbouring energy markets into a pan-national energy market. For more information please see <https://www.energy-community.org/aboutus/howweare.html>.

<sup>174</sup> More precisely, the monitoring of the regulatory authorities is performed by an independent auditor based on international good practices and standards. The reports are released for public consumption. The latest report for SERC can be viewed at: <https://www.derk.ba/DocumentsPDFs/Skraceni-revidirani-fin-izvj-DERK-a-za-2019.pdf>.

<sup>175</sup> For a more detailed exposition of the issue of losses in the transmission and distribution of electricity please see (CEER, 2020<sub>[166]</sub>).

<sup>176</sup> Framework Energy Strategy of Bosnia and Herzegovina until 2035.

<sup>177</sup> Republika Srpska: Energy Development Strategy of Republika Srpska until 2035, adopted in 2018. Federation of Bosnia and Herzegovina: Framework Energy Strategy of the Federation of BiH until the year 2035.

<sup>178</sup> Document named STRESS TEST has been made in case of the possible scenario of the interruption of natural gas supply. (Official gazette of FBiH, No. 25/20). Government of FBiH adopted the report on Stress Test for possible disruption of natural gas supply in the FBiH and based on the adopted a finding (Official gazette of FBiH, No. 69/14).

<sup>179</sup> Regulation on security of supply and delivery of natural gas ('Official Gazette of RS', No. 17/11), complied with the guidelines of EU Directive 67/2004/EC.

<sup>180</sup> Oil indexation was once the dominant pricing format for natural gas in Europe. This largely reflected the fact that natural gas spot markets were not liquid enough at the time to provide good price signals. Moreover, when natural gas was competing with oil for power generation and heating, oil indexation was a good approach to ensure that natural gas was competitive with the main alternative fuel. Oil indexation is often also justified by natural gas being produced as a by-product from oil exploration or because natural gas competes with oil for capital investment. However, in the current market situation, oil indexation means that price of natural gas price does not reflect the supply and demand realities, which are largely now disconnected from oil, both in terms of alternative demand and production. Furthermore, Europe has a variety of liquid natural gas spot markets that offer good pricing and indexation points, especially considering the interconnected natural gas markets, including those based on the European natural gas pipeline network. Extensive literature discusses the benefit and drawbacks of the oil indexation of natural gas pricing, examples include (Dubreuil, Gergely Molnar and Jeon, 2020<sup>[351]</sup>), (European Commission, 2015<sup>[352]</sup>)—with regard to legality of oil indexation, (Melling, A.J. (2010), Natural gas pricing and its future—Europe as the battleground, 2010<sup>[353]</sup>) (IEA, 2020<sup>[355]</sup>) --for the current split in pricing approach in Europe, see (Stern, 2007<sup>[354]</sup>)

<sup>181</sup> It should be noted that deficiencies such as the lack of a harmonised legislative framework for natural gas limits its potential.

<sup>182</sup> Although there is an active Energy Community *acquis* infringement case, which stipulates that environmental impact assessments for the construction of a thermal power plant did not conform with *acquis* requirements. See <https://www.energy-community.org/legal/cases/2015/case0115BH.html>.

<sup>183</sup> The EU Emission Trading Scheme is a construct for the internalisation of externalities relating to the emission of greenhouse gasses of certain economic activities. For further information please see [https://ec.europa.eu/clima/policies/ets\\_en](https://ec.europa.eu/clima/policies/ets_en).

<sup>184</sup> For more information on greenhouse gas pricing in Bosnia and Herzegovina and the Western Balkan economies please see (Energy Community, 2021<sup>[308]</sup>).

<sup>185</sup> The National Renewable Energy Action plan (NREAP) was adopted at the 50th session of the Council of Ministers of Bosnia and Herzegovina held on 30 March 2016. It is based on the adopted Action plans of the Federation of BiH and Republika Srpska.

<sup>186</sup> Guarantee of Origin (GO) is a tracking instrument defined in Article 15 of the European Directive 2009/28/EC on the promotion of the use of energy from renewable sources and amending and subsequently repealing Directives 2001/77/EC and 2003/30/EC. GO are certificates used to identify and certify that specific consumed electricity was sourced from renewable energy. A certificate is issued per MWh generated from renewable energy to the generator and then transferred to and cancelled by a consumer or supplier who would like to certify that their consumed energy comes from renewable energy. For more information on GO and their use and implementation, see (Association of Issuing Bodies, 2020<sup>[356]</sup>) or (Umweltbundesamt, 2021<sup>[357]</sup>).

<sup>187</sup> There is no energy efficiency law at the state level, but there are laws in the two entities and the Brcko District.

<sup>188</sup> In particular Directive 2012/27/EU on Energy Efficiency; Directive 2010/31/EU on the Energy Performance of Buildings; Directive 2010/30/EU on Indication by Labelling and Standard Product Information of the Consumption of Energy and Other Resources by Energy Related Products; and Regulation 2017/1369/EU Setting a Framework for Energy Labelling and Repealing Directive 2010/30/EU.

<sup>189</sup> A day-ahead market is an organised market space in which interested parties can buy and/or sell energy for the next day in the form of putting in bids/offers that are algorithmically matched.

<sup>190</sup> The Regulation on Wholesale Energy Market Integrity and Transparency (REMIT) aims to establish a fair and transparent playing field for all stakeholders involved in the trading of energy through establishing a common transparency requirement. As such, REMIT prohibits insider trading and market manipulation. For more information please see <https://acer.europa.eu/en/remit>.

<sup>191</sup> Network Codes were established under Article 6 of EU Regulation 714/2009 and are secondary acts, in many cases of a technical nature, that aim to overcome legislative gaps and barriers to a non-discriminated, open internal EU energy market by establishing uniform regulation. In essence they overcome barriers and friction in order to promote competition. In some sense, they represent lessons learned over time that aim to perfect the legislative framework for the EU internal energy market and represent EU best practices and standards.

<sup>192</sup> Balancing markets are an integral part of any energy market. Most markets are settled in advance of physical delivery, as in an organised market forecasted supply is matched with forecasted demand (i.e. the market is cleared). However, to maintain the actual system stability at the moment of delivery, it is essential that the same amount of actual energy is fed into the system as is taken out. To this end, the balancing market is used in as close to real time as possible to correct for any mismatch between what is actually generated and fed into the system and what is taken out of the system for consumption. It is essential that all generators, including renewable energy generators, are “imbalance responsible” as this means that they are liable for any mismatch between their forecasted and generated/delivered electricity. If they were not imbalance responsible, other entities or the consumer would need to cover the cost arising from the imbalance caused by the generator, which would also disincentive the generator to be precise with their forecast. For more detailed explanations of balancing market and design options please see (Van der Veen and Hakvort, 2016<sup>[360]</sup>), (Pinson, 2020<sup>[361]</sup>), (Bundesnetzagentur, 2020<sup>[362]</sup>), and (50hertz, 2020<sup>[363]</sup>) and (ACER, 2020a<sup>[364]</sup>) for an overview of the relevant EU legislation for electricity balancing.

<sup>193</sup> According to information presented by the government: “In electricity tariffs for universal service there is cross subsidising between households and commercial customers in favour of households. Regulators seek to correct tariff values for universal service in order to eliminate cross subsidising. Cross subsidies are being reduced.”

<sup>194</sup> This support is currently central to an ongoing case at the Energy Community (Energy Community Case ECS-10/18: Bosnia Herzegovina/State aid). For more information, please see <https://www.energy-community.org/legal/cases/2018/case1018BH.html>.

<sup>195</sup> The Energy Strategy of Bosnia and Herzegovina until 2035 was approved in 2018 and the Energy Development Strategy of RS until 2035 was adopted in 2018.

<sup>196</sup> Main measures implemented relate to climate change adaptation measures, especially as regards early warning systems and flood risk management, awareness-raising activities and capacity building for state- and entity-level authorities responsible for various aspects of climate change policies.

<sup>197</sup> Ministry of Spatial Planning, Construction and Ecology RS; Ministry of Agriculture, Forestry and Water Management RS; Ministry of Agriculture, Water Management and Forestry FBiH; Ministry of Environment and Tourism FBiH; Department of Agriculture, Forestry and Water Management; Department for Spatial Planning, Proprietary and Legal Affairs Brčko District.

<sup>198</sup> Such an adapted agroforestry scheme for flood risk management was designed and piloted in the Srbac

municipality. Trees were planted along a 5 400 metre stretch of riparian area, with the total area covered being approximately 1 325 hectares of agricultural land.

<sup>199</sup> In particular, 20 non-structural measures were realised in 11 municipalities in the Vrbas River Basin from August 2017 to November 2019. Interventions included regulation of torrential streams, cleaning of riverbeds, strengthening of embankments, bolstering riverbank protection with stone embankments and gabion systems, constructing stormwater drainage systems and reinforcing riverbanks with vegetation, including under an agroforestry management system. The total value of implemented projects is estimated at more than USD 2 million. In addition to the transfer of modern technologies in flood risk management and improvements in legislative and institutional framework, the project contributed to better preparedness to floods and increased awareness of over 200 000 citizens in 11 municipalities in the Vrbas River Basin.

<sup>200</sup> A Flood Forecasting Early Warning System established for the Vrbas River Basin and a signed protocol on warning information exchange between key institutions is expected to have significant effects on the advancement of flood risk management in the RS and BiH, which could ultimately lead to the reduction of losses and damage for more than 200 000 citizens situated in the Vrbas River Basin. This system might be extended to the entire BiH; however, no concrete steps were planned at the time of drafting.

<sup>201</sup> **Short-term objectives (2019-2024):** increase the percentage of separately collected waste for recycling from municipal waste through primary selection to reach 10% of the total amount of collected municipal waste, i.e. 25% of paper and cardboard, plastic, glass and metal from the total amount of collected waste; achieve a share of 2% of treated municipal waste by 2024 by increasing the coverage of organised waste collection services and building infrastructure for the separate collection of municipal waste components. **Long-term objectives (2024-2029):** increase the coverage of the population with organised waste collection and disposal services on an annual basis (the goal of 100% by 2029 is set); complete the construction of all regional landfills, transfer stations, and extra facilities for treatment or recycling of special and hazardous types of waste; continue the separate collection of recycling waste from municipal waste (paper and cardboard packaging, plastic and glass packaging, and metal packaging) to achieve the goal of 15% of the total amount of collected municipal waste, or about 37% of paper and cardboard, plastic, glass and metals from the total amount of waste material produced and collected; rehabilitate the remaining areas of contaminated land ("black spots") in accordance with the prepared remediation plans and create the space for treatment or disposal of hazardous waste by amending the Spatial Plan of the RS.

<sup>202</sup> According to the Law on Amendments of the Law on Waste Management (Official Gazette of RS 70/20), the system of management of special waste streams (e.g. waste tyres, batteries and accumulators, vehicles, waste electric and electronic products, oils and lubricants) has been established and the key principles of extended producer responsibility have been legally introduced.

<sup>203</sup> The operator of the packaging waste management system has set up "green islands" in the following municipalities: Prijedor, Trebinje, Laktasi, Kozarska Dubica, Mrkonjic Grad, Ribnik, Prnjavor, Banja Luka and in the area of Olympic Center "Jahorina". Through these activities, containers for the separate collection of waste for recycling through green islands in public areas have been installed. However, separate collection remains in its infancy, and most packaging waste comes from companies in the system, rather than citizens.

<sup>204</sup> Educational promotional videos, education through primary and secondary school activities, distribution of advertising material, sending info-material with utility bills, and similar.

<sup>205</sup> This measure relates to the preparation of the necessary study documentation for the remediation and closure of municipal landfills in the municipalities of Pelagićevo, Čelinac, Srbac, Kotor Varoš, Bratunac, Šekovići, Vlasenica, Doboj and Trebinje.

<sup>206</sup> This measure consists of the preparation of the necessary study and project documentation for the construction of a joint landfill in the municipality of Prijedor (regional landfill) covering local governments: Kozarska Dubica, Kostajnica, Krupa na Uni, Novi Grad, Ostra Luka and Prijedor.

<sup>207</sup> Since the introduction of the Extended Producer Responsibility scheme in 2012, 35% of total packaging waste and 35% of total electric and electronic waste had been recycled in the FBiH, and the set targets have been reached.

<sup>208</sup> The Centers for Civic Initiatives conducted a campaign “Mapping of illegal landfills – Contribution to soil remediation”. According to the results of this campaign, which were presented in mid-2019, about 1 300 illegal landfills were recorded throughout the FBiH.

<sup>209</sup> In addition to this strategy there is the Sava River Basin Management Plan of the RS (2018-2021) and the Trebišnjica River Basin Management Plan of the RS (2018-2021).

<sup>210</sup> The River Basin Management Plans (RBMPs) for the Sava River Basin and the Watershed of Adriatic Sea in the FBiH (2016-2021) complement the aforementioned strategic documents.

<sup>211</sup> The Ministry of Agriculture, Forestry and Water Management of the RS and the public institution Waters of Srpska are responsible for water management in the RS. At the state level MoFTER is in charge of international co-operation, co-ordination of entity level institutions, harmonisation of River Basin Management Plans and harmonisation of Flood Risk Management Plans. The Food Safety Agency of Bosnia and Herzegovina defines conditions to ensure the health protection of people from the negative effects of drinking polluted water. In the FBiH there is the Federal Ministry of Agriculture, Water Management and Forestry; the Federal Ministry of Environment and Tourism; Sava River Watershed Agency Sarajevo; the Agency for Watershed of the Adriatic Sea Mostar; the Federal Hydro Meteorological Institute; federal water inspection; cantonal ministries for water management; cantonal ministries of environment; cantonal inspections and local authorities (cities and municipalities).

<sup>212</sup> At the tenth meeting of the Conference of the Parties to Convention on Biological Diversity, held in October 2010, in Nagoya, Aichi Prefecture, Japan, a revised and updated Strategic Plan for Biodiversity was adopted, including the Aichi Biodiversity Targets, for the 2011-2020 period. This Plan provided an overarching framework on biodiversity, not only for the biodiversity-related conventions, but for the entire United Nations system and all other partners engaged in biodiversity management and policy development. Parties agreed to translate this overarching international framework into revised and updated biodiversity strategies and action plans within two years, which are intended to define the current status of biodiversity, the threats leading to its degradation, and the strategies and priority actions to ensure its conservation and sustainable use within the framework of the socio-economic development of the economy. There are 20 Aichi biodiversity targets grouped around 5 strategic goals: 1) address the underlying causes of biodiversity loss by mainstreaming biodiversity across government and society; 2) reduce the direct pressures on biodiversity and promote sustainable use; 3) improve the status of biodiversity by safeguarding ecosystems, species and genetic diversity; 4) enhance the benefits to all from biodiversity and ecosystem services; and 5) enhance implementation through participatory planning, knowledge management and capacity building (Convention on Biological Diversity, 2020<sub>[283]</sub>).

Aichi Target 11 states: “By 2020, at least 17% of terrestrial and inland water, and 10% of coastal and marine areas, especially areas of particular importance for biodiversity and ecosystem services, are conserved through effectively and equitably managed, ecologically representative and well-connected systems of protected areas and other effective area-based conservation measures, and integrated into the wider landscapes and seascapes.” (Convention on Biological Diversity, 2020<sub>[283]</sub>).

<sup>213</sup> In the RS, the Ministry for Spatial Planning, Construction and Ecology is responsible for activities in the area of nature protection. Activities in the area of nature protection within the competence of local self-government units are performed by bodies of local self-government units and by departments responsible for protection of the environment of local self-government unit. Expert activities in the area of protection of nature and natural resources are performed by Institute for Protection of Cultural, Historical and Natural Heritage of the RS. In the FBiH, the Federal Ministry of Environment and Tourism, Federal Ministry of Agriculture, Water Management and Forestry, Federal Forest Administration and all ministries at the cantonal level dealing with environment are responsible bodies. The Institute for Nature Protection has not been established yet, and there is no professional institution that assists and directs the processes of nature protection.

<sup>214</sup> Relevant documents are the Law on Protection and Rescue of People and Material Goods from Natural or other Disasters (Official Gazette of the FBiH, No. 39/03 and 22/06); Assessment of the Vulnerability of the FBiH to Natural or Other Disasters (Official Gazette of the FBiH, No. 41/05); Plan for Protection and Rescue of the Federation of BiH from Natural or Other Disasters (Official Gazette of the FBiH, No. 40/08); Law on Fire Protection and Firefighting (Official Gazette of the FBiH, No. 64/09).

<sup>215</sup> Air protection and air quality management in the RS is regulated by the Law on Air Protection (Official Gazette of RS No. 124/11 and 46/17) and subordinate legislation. Regulations in the field of air protection in the RS are almost fully harmonised (about 94%) with two EU directives: 2008/50/EC and 2004/107/EC. Alignment with the requirements of the directives relating to emissions from large combustion plants was carried out during 2017 in accordance with Annex II of the Energy Community Treaty.

<sup>216</sup> Improving Air Quality and Air Quality Management in Bosnia and Herzegovina (IMPAQ). The following targets have been set as part of the IMPAQ programme: 1) data hosting infrastructure and capacity; 2) reference laboratory infrastructure and capacity; 3) source apportionment study in six major cities (three in each entity); 4) cost-effective and scalable air quality improvement activities; 5) information campaigns regarding air quality and public health; and 6) implementation of legislation via inspectors.

<sup>217</sup> Main tasks of this working group are: 1) strengthening of capacities for the improvement of air quality monitoring, air quality management and reporting, air quality assessment methodologies and development of air quality improvement plans according to the Air Quality Directive; 2) assistance on capacity building related to emissions inventories, projections, reporting, and reduction strategies according to the National Emission Ceilings Directive (NEC), and facilitation of the ratification of the Gothenburg Protocol; 3) strengthening of capacities for monitoring sulphur emissions in maritime transport and enforcing EU and International Maritime Organisation (IMO) requirements on sulphur; and 4) assistance on capacity building related to managing permits in accordance with BAT and BAT conclusions developed under the Industrial Emissions Directive (IED), setting emission limit values for pollutant emissions and monitoring requirements in accordance with the principles and provisions of the IED.

<sup>218</sup> the Hydrometeorological Institute of the Federation of Bosnia and Herzegovina uses the CORINAIR methodology, while the Hydrometeorological Institute of Republika Srpska uses the IPCC methodology

<sup>219</sup> These are the same bodies that are in charge of municipal waste management: Ministry of Physical Planning, Civil Engineering and Ecology, which is a focal point for the UNFCCC and the ministry responsible for environmental protection/in charge of the overall waste management; Ministry of Health and Social Welfare, which is in charge of addressing medical waste and ionised radiation; Environmental Fund of the RS, which is in charge of collecting data on waste; RS Statistical Service, which is in charge of waste data collection and processing; local governments and utility companies in charge of waste shipment; regional sanitary landfills in charge of communal waste management; and local system operators of packaging waste.

<sup>220</sup> Measure 4: Support for rural infrastructure development and the improvement of availability of services to the rural population was enacted to improve the availability of rural services and the general living conditions in rural areas. The increasing levels of migration of the rural population towards urban areas and abroad in search of new employment opportunities are recognised as indirect consequences of underdeveloped physical rural infrastructure and limited availability of public services in rural areas.

<sup>221</sup> Funding is provided to support infrastructure investment needed for the development of rural areas, including facilities for agriculture related activities (e.g. green markets in the communities, buy-out centres, venues for exhibition and fairs); local roads important for local economic development; access to agricultural and forest land; electrical energy supply, waste and water management; local access to IT; venues for educational, sport and other activities of the local population; and rural services of common interest for groups of villages (IT centres, training centre, fire protection units).

<sup>222</sup> Report for the implementation of the Strategic Plan for Rural Development of Bosnia and Herzegovina (2018-2021). The Ministry of Agriculture of the FBiH managed to include the Rural Development Programme of the FBiH in the Public Investment Programme of the FBiH 2018-2020, which created the preconditions for securing credit funds for financing projects under rural development measures in the FBiH. The Federal Ministry of Finance should initiate the procedure of external borrowing with the government of the FBiH, after which the loan agreement could be accepted by the FBiH parliament.

<sup>223</sup> The Strategy of Development of Science defines the priorities in the development of agriculture sciences as including: 1) biorational use, fertility increase, remediation and soil protection; 2) raising the productivity of agricultural production and processing, ensuring the quality and safety of food; 3) creation of new high-yielding and quality varieties/hybrids/breeds; 4) development of new technologies in agricultural and forestry production; and 5) research that supports rural development, which supports innovation in agriculture and the creation of additional income on farms and rural communities (use of agricultural waste – renewable energy, new insulation materials, compost, etc.).

<sup>224</sup> Measure 3: Support for vocational training, knowledge development and providing advice and information to help farmers, forest holders and SME's to improve the sustainable management, economic and environmental performance of their holdings and/or businesses.

<sup>225</sup> Faculty of Agriculture and Food Sciences at the University of Sarajevo; Faculty of Biotechnology at the University of Tuzla; Faculty of Agriculture at the University of Banja Luka; Faculty of Agriculture in East Sarajevo; Faculty of Agriculture and Food Technology in East Sarajevo; Faculty of Agriculture and Food Technology at the University of Mostar; Agro-Mediterranean Faculty at the University of "Džemal Bijedić" of Mostar; Faculty of Biotechnology at the University of Bihac.

<sup>226</sup> The strategy foresees: 1) promotion and strengthening of good agricultural practices; 2) equalisation of business conditions in areas with natural constraints and preservation of valuable landscapes; 3) strengthening the water management system in agriculture; 4) strengthening awareness of climate change, its consequences and methods for mitigating or protecting the sector from such changes; 5) promoting the use of renewable energy sources and using waste from agriculture; 6) revitalisation and preservation of pasture areas; 7) establishing and strengthening the mechanisms of sustainable land management.

<sup>227</sup> The plan defines seven main strategic goals for the development of agriculture and rural areas in BiH for 2018-2021, including: 1) ensuring income stability and harmonising business conditions with the region; 2) strengthening competitiveness of agriculture, forestry and rural areas; 3) increasing the level of investment and improving the transfer of knowledge and promotion of innovation; 4) improving the marketability of agri-food products by increasing value-added activities, improving quality and safety standards and strengthening linkages within value chains; 5) sustainable management of natural resources and climate change adaptation; 6) improving quality of life in rural areas through new income generating sources and the improvement of physical infrastructure, social inclusion and accessibility of public services; and 7) improving institutional systems and capacities and harmonisation of the legal framework in agriculture and rural development at all governmental levels with the aim of gradual approximation to the EU CAP.

<sup>228</sup> Support for current production encourages primary livestock and crop production through the allocation

of incentives for produced/sold fruits, vegetables, herbs, seeds and planting material; for organic production and sowing and planting; and through encouraging plant health programmes.

<sup>229</sup> Long-term development measures and incentive funds for capital investments include support for capital investments, procurement of agricultural machinery, investments in livestock and crop production, irrigation and support for processing capacities. These measures include agricultural and non-agricultural activities in rural areas, enabling increased employment opportunities for the rural population, improved access of the rural population to the market and public services, reduction of population outflow, preservation of cultural and historical heritage, sustainable use of natural resources, and preservation of the environment and biodiversity.

<sup>230</sup> Systemic support measures include market intervention measures, emergency assistance related to repairing damage from natural disasters, the purchase of market surpluses, and market regulation through purchasers or processors of food products.

<sup>231</sup> The ministry responsible for tourism manages overall tourism development, and the tourist organisation is responsible for the promotion of tourism and marketing in the global market.

<sup>232</sup> The tourist cluster of Unasava seems to be a good practice case of public-private co-operation at the destination level. The cluster was developed with the support of the Swedish International Development and Co-operation Agency, or Sida and implemented by the World Wide Fund for Nature. More information available at: <https://www.unasana.ba/en/turisticki-klaster-una/>. The tourist cluster of Herzegovina, which is also established as a public-private organisation for the promotion of tourism, is another example of good practice. More information available at: <http://www.tkh.ba/?lang=en>.

<sup>233</sup> Official Gazette of Bosnia and Herzegovina, No. 26/04 and 42/04.

<sup>234</sup> The project is a part of the EU4Business initiative under IPA 2016 Support in the Sector of Competitiveness and Innovation. It is co-financed by the EU and the German Federal Ministry for Economic Cooperation and Development (BMZ) and implemented by Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) as the lead organisation. The UNDP and ILO are co-delegates under the Co-Delegation Agreement with the EU.

# 22 Kosovo profile

## Key findings

Figure 22.1. Scores for Kosovo (2018 and 2021)

Note: Dimensions are scored on a scale of 0 to 5. Dimension scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicator. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See the Scoring approach section for information on the assessment methodology. Scores for Dimension 5 Competition Policy are not included in the figure due to different scoring methodology. See the Scoring approach for more information.

Kosovo has improved its performance since the publication of the Competitiveness Outlook 2018 report in 9 of the 15 policy dimensions<sup>1</sup> covered in the assessment (Figure 22.1). Although this clearly indicates progress in the setting up of policies to enhance its competitiveness – at least in about half of the dimensions covered in this assessment – if they are to have a lasting impact then their effective and continuous implementation, monitoring and upgrading should remain a key priority. Kosovo achieved its highest average scores in the trade, tax, education and energy policy dimensions, with scores all over 3.0 and all above the WB6 average. Kosovo's main achievements since the last assessment are as follows:

- **The trade policy framework includes better public consultations, fewer restrictions in trade in services and an e-commerce policy reform is underway.** Public consultations for trade-related regulatory policies have been strengthened through new legislation, a centralised consultation platform and regular monitoring by a single and independent public institution. Not only is Kosovo the least restrictive economy in the WB6 for trade in services – it also one of the most attractive in comparison to OECD members states and key partners. The signing of the Additional Protocol 6 to the Central European Free Trade Agreement (CEFTA) on trade in services in December 2019 has prompted reforms to remove restrictions on the movement, recognition of qualifications and activities of CEFTA service providers. Kosovo is also working to make its markets more attractive to foreign investors, notably through sectoral reforms based on EU regulations, such as in the courier sector. Finally, Kosovo is continuing its efforts to adapt its trade framework to the new challenges of e-commerce.
- **The tax administration is increasingly efficient.** The Tax Administration of Kosovo (TAK) continues to unify tax collection and all core tax administration functions. It now carries out all the main tax administration functions, including tax fraud investigations (generally carried out by

special police departments in other WB economies). TAK also oversees tax compliance assessment and risk management using a risk-based analysis which identifies taxpayers with certain abnormalities against a predetermined set of risk criteria. In terms of independence and transparency, TAK has full operational autonomy within the Ministry of Finance. Most taxes can be filed and paid electronically or manually, and information can be accessed on line or through regional services. TAK is regularly assessed by several domestic and international institutions.

- **Early childhood education (ECE) framework is more strategic and early school leaving is falling.** Kosovo's strategic ECE framework has clear objectives to increase inclusion and participation at this level of education, and is backed by an implementation timeline and budget. Kosovo has made progress in implementing new early learning and development standards for children aged 0-6, and is developing infrastructure to better monitor and respond to early school leaving. Policies have contributed to a decline in the early school leaving rate from more than 18.4% in 2013 to 9.6% in 2018, thus achieving the EU's 2020 target of less than 10%.
- **Energy markets reform is progressing, and energy efficiency and security are increasing.** The unbundling of network monopolies and third-party access in the energy sector are almost fully aligned with international good practice, notably the EU's Third Energy Package. Kosovo has made significant progress in unbundling the ownership of the transmission system operator (TSO), and fully unbundling the distribution system operator (DSO). Both are unbundled and separate from generation and supply activity, in line with EU directives. Compliance programmes and officers are in place and non-discriminatory third-party access is established and guaranteed by legislation. Kosovo has also made progress in energy efficiency, adopting a new Law on Energy Efficiency in 2018 as well as the relevant policy documents. In 2018 it simplified the administrative procedure for renewable energy projects and regulations to create a one-stop shop for renewable energy sources. These measures should help strengthen Kosovo's energy security by increasing domestic generation capacity and reducing losses from inefficient energy consumption.

### Priority areas

Despite these significant achievements, there are a number of areas in which Kosovo still needs to step up its efforts. These include the dimensions on employment; investment policy and promotion; science, technology and innovation; transport; agriculture; and environment, where Kosovo scores the lowest and below the WB6 average (Figure 22.1). The priority actions for these six areas are as follows:

- **Reduce youth unemployment and skills mismatches and introduce employment support policies.** Youth unemployment is extremely high, indicating severe problems with the school-to-work transition. Deficiencies in the education system and mismatches between the labour market and field of study mean Kosovo suffers skills shortages despite high unemployment rates for people of all skill levels. Kosovo should use its whole education and training infrastructure, including vocational education and training (VET), to provide adults with remedial education and improve their vocational skills. In order to build on the working population's existing skills and knowledge, and given high levels of informality, the authorities should develop a framework that can combine the recognition of prior learning with upskilling activities. Kosovo currently has no unemployment benefit system, although benefits were exceptionally allocated during the COVID-19 pandemic. Reforms to the social protection system are planned and will introduce unemployment benefits – they should introduce both an unemployment benefit scheme and a general healthcare scheme, and should ensure the social assistance scheme better targets the poor.
- **Further improve investment promotion and facilitation.** Kosovo lacks a comprehensive strategy framework for attracting foreign direct investment (FDI), or solid inter-agency or inter-ministerial co-ordination mechanisms, and council meetings are irregular. The Kosovo Investment

and Enterprise Support Agency (KIESA) lacks the capacity and resources to execute its very wide and extended mandate. This limits its ability to foster linkages between the FDI it is striving to attract and the small and medium-sized enterprises it is supporting. A clear strategy to attract FDI and proactively target investors would enable KIESA to focus its resources more efficiently.

- **Establish an overarching strategic vision for science, technology and innovation (STI).** Kosovo's performance is constrained by a lack of system-level STI priorities, limited implementation of relevant policy initiatives, and a lack of monitoring and evaluation activities. In order to develop and prioritise targeted policy measures, it should start by identifying and mapping the research and development infrastructure to gather economy-wide data on labs and researchers, increase investment in public sector research, and encourage research excellence.
- **Improve transport project selection tools and the governance of road and rail transport.** Kosovo still uses inefficient and suboptimal processes for selecting important transport infrastructure projects, with no progress since the last assessment. Although there has been progress in opening the railway market and unbundling rail monopolies, no positive improvements to road market regulation have been achieved and substantial additional efforts are needed to align local road market legislation with the EU and Transport Community *acquis*. Moreover, the high share of freight carried by road, around 88.4%, has clear negative effects on air pollution and climate change. Incentives to shift freight from road to rail could speed up harmonisation with the EU *acquis* and have a positive impact on the environment. Enhancing the human and financial capacities of the regulatory authorities should be one of the first priorities. In addition, interoperability activities are very important for the development of international railway transport and should be continued, but gradually, as interoperability takes time and funds.
- **Boost agricultural productivity by improving irrigation water management.** Although Kosovo has implemented several plans to improve irrigation infrastructure since the last assessment, it remains underdeveloped and inefficient. Only 32 237 hectares are irrigated (17.3% of Kosovo's arable land), while water network losses and lack of water storage facilities hinder efficiency. The productivity of agriculture in the economy largely depends on irrigation, as well as a functional water management system. Kosovo should increase investment in maintaining the existing irrigation network while bringing new areas under irrigation. Kosovo also needs to reduce illegal irrigation systems, improve monitoring and control, and increase the payments for irrigation services.
- **Advance environmental policies, in particular air quality and waste management.** Kosovo has one of the highest concentrations of air pollution in Europe with an annual mean exposure to particulate matter (PM<sub>2.5</sub>) of 27 micrograms per cubic metre (µg/m<sup>3</sup>). This is almost three times the World Health Organization recommended highest levels (10 µg/m<sup>3</sup>). Kosovo can improve air quality by reducing its energy dependence on fossil fuels (particularly coal and lignite), improving household heating systems and reducing emissions from transport. Although some actions on waste management and the circular economy have already been planned in the former Waste Management Strategy, implementation has been limited, with most actions simply rolled over to the new strategy. Kosovo should focus on offering incentives at the municipal level for the separation of municipal waste at source, i.e. before it is collected and recycled or converted to energy, (e.g. rewarding households for sorting waste, decreasing utility bills) together with regular awareness-raising activities on waste prevention and recycling (brochures and information campaigns).

1: Please note that Dimension 5 (Competition policy) is excluded from the key findings section as it uses different scoring model Scoring approach.

## Economic context

### **Key economic features**

Kosovo is a small open economy with a limited but growing productive base. Services account for the largest share of the Kosovar economy, making up 47.5% of gross domestic product (GDP) and 65% of employment (World Bank, 2021<sup>[1]</sup>; Kosovo Agency of Statistics, 2021<sup>[2]</sup>). Wholesale and retail trade, real estate, transportation and storage, and financial services are the largest service sectors in the economy (Kosovo Agency of Statistics, 2021<sup>[3]</sup>). Industry accounts for 26.4% of GDP, with the highest contribution coming from the manufacturing and the construction sectors (11.7% and 8.5% of GDP, respectively) (Kosovo Agency of Statistics, 2021<sup>[3]</sup>). The contribution of agriculture, forestry and fishing to Kosovo's GDP has declined considerably over the past decade, from 15% in 2008 to 6.9% in 2019, although it still accounts for a significant share of employment – 5.5% of formal employment and an estimated 35% of informal employment (World Bank, 2021<sup>[1]</sup>; Cojocar, 2017<sup>[4]</sup>).

Over the past decade, the growth of Kosovo's economy has been relatively strong, on the back of consumption growth supported by high inflows of remittances (over 18% of GDP), as well as credit from the expanding financial sector. However, given the economy's limited production base, the consumption-driven growth model has relied strongly on imports, which accounted for 56.1% of GDP in 2019. In combination with the relatively weak export base – 29.1% of GDP – this has resulted in the build-up of significant external imbalances, including high trade and current account deficits, which in 2019 reached 43.8% and 5.6% of GDP, respectively (European Commission, 2021<sup>[5]</sup>) (World Bank, 2021<sup>[1]</sup>).

Investment in Kosovo has been high; however, most of this investment, including foreign direct investment (FDI), has not supported the growth of the domestic production base or the tradable sector. Over the past decade, investment has mainly gone into the wholesale and retail trade, construction, transport, and financial service sectors. These sectors support domestic consumption and, with the exception of financial intermediation, have limited impact on the growth of domestic productive capacities or on productivity enhancing spillovers. Similarly, FDI has been mainly market-seeking, with the largest share allocated to the real estate and construction sectors (nearly 60% over the past decade) (Kosovo Agency of Statistics, 2021<sup>[3]</sup>). Thus, unlike in many peer economies in the Western Balkan region or aspirational Central and Eastern European peers, FDI in Kosovo has not been a significant driver of structural transformation, particularly towards more export-oriented growth.

Kosovo's economy is also characterised by relatively weak productivity, with growth slowing down considerably over the past five years. Across all sectors, labour productivity – measured as output per worker – is less than a quarter of the European Union (EU) average (World Bank, 2021<sup>[1]</sup>). The limited reallocation of labour from less to more productive sectors has resulted in lower productivity gains. Growth within sector productivity has declined over the past decade. In the context of strong investment growth this points to weaknesses in investment allocation, as outlined above, as well as significant frictions in the market preventing the reallocation of capital and other inputs to the most productive sectors and firms (World Bank, 2017<sup>[6]</sup>). These frictions stem from numerous structural challenges, including inadequate access to finance, significant infrastructure gaps, inadequate competition (including from the large informal sector) and high levels of corruption (see Structural economic challenges section below).

**Table 22.1. Kosovo: Main macroeconomic indicators (2015-20)**

Indicator	Unit of measurement	2015	2016	2017	2018	2019	2020
GDP growth <sup>1</sup>	% year-on-year	4.1	4.1	4.2	3.8	4.9	-3.9
GDP per capita <sup>2</sup>	Current international \$	9 576	10 062	10 530	11 157	11 972	11 368
Domestic GDP <sup>2</sup>	USD billion	6.4	6.7	7.2	7.9	7.9	7.6
Inflation <sup>1</sup>	Consumer price index, annual % change	-0.5	0.3	1.5	1.1	2.7	0.2

In the context of weak productivity growth, a strong increase in wages has weakened labour cost competitiveness. Over the past decade, Kosovo has seen a significant increase in the average wage, driven primarily by the growth in public sector wages, which have more than tripled since 2008 (Kosovo Agency of Statistics, 2021<sup>[3]</sup>). In conjunction with high remittance income, this has contributed to higher reservation wages and growing wage-to-productivity ratios in the private sector. This has significant policy implications. In light of the limits on monetary and exchange rate policy imposed by the unilateral adoption of the euro, competitiveness gains will need to be achieved internally through contained wage growth and higher productivity.

Labour market performance has been improving in Kosovo, but the outcomes are still weak relative to OECD and EU benchmarks. At 30.1%, the employment rate in Kosovo is among the lowest in the world, and the unemployment rate remains high at 24.6% (as of Q3 2020), despite a significant decline over the past decade (European Commission, 2021<sup>[7]</sup>). Furthermore, 60% of the working age population are inactive, with the activity rate among women especially low at roughly 21%. Meanwhile, the share of youth not in employment, education or training (NEET) is 37.7% (Kosovo Agency of Statistics, 2021<sup>[2]</sup>). Given its relatively young population, Kosovo's weak job growth and high youth inactivity limits the prospects of a demographic-dividend driven boost in growth and development. The high pace of emigration is further undermining growth prospects, even if it temporarily relieves labour market pressures from the growing labour force. On the flip side, however, diaspora remittances support poverty reduction and thus remain an important source of income for the economy (Table 22.1).

Looking ahead to the next decade, Kosovo will need to strengthen its business and institutional environment, reduce infrastructure gaps, and strengthen the skills of its population in order to lay the foundations for sustained and job-creating economic growth. Nurturing and strengthening the linkages with the diaspora can help in this process as they have been an important driver of FDI investment and a significant source of remittances. Fostering the competitiveness and growth of the domestic private sector will also require limiting the growth of wages, particularly in the public sector, in order to help better align worker compensation with productivity across the economy, and make private sector employment more attractive and competitive.

### ***Sustainable development***

Kosovo has committed to implementing the 2030 Agenda for Sustainable Development, which includes 17 Sustainable Development Goals (SDGs) and 169 targets, many of which were reflected in Kosovo's National Development Strategy (NDS) 2016-2021. However, considerable progress is still needed to meet the 2030 targets and ensure that Kosovo's development path is sustainable and inclusive. Better aligning SDG goals with all strategic documents would help in this process, as would better data collection to monitor progress on the goals: a 2019 study found that out of 231 SDG-related indicators applicable to Kosovo, only 33 indicators were readily available from official sources (Institute for Development Policy, 2019<sub>[11]</sub>).

Regarding well-being (SDG3), considerable progress is needed to improve outcomes across several dimensions. Extreme poverty has not yet been eradicated in Kosovo: about 5% of the population is estimated to be living on less than USD 1.90 per day. While the overall poverty rate has declined, faster progress is needed to reach the 2030 targets. More progress is also needed to create economic opportunities. As noted earlier, Kosovo's economy is characterised by very low employment and labour force participation. There are also significant inequalities between men and women, as well as young people – see Employment policy (Dimension 8). Significant disparities in various aspects of well-being are also noted across regions and ethnic groups (see discussion on inclusive growth below).

Vast progress is particularly needed in the area of health (SDG3), with Kosovo lagging behind not only the EU average, but also the averages of all its regional peers in many critical health indicators, such as infant mortality (Eurostat, 2021<sub>[12]</sub>). The sector is strongly impacted by a lack of financing for infrastructure, equipment, medications, etc. (see discussion on health below).

Significant progress is also needed on the environment. Kosovo's energy consumption is highly dependent on fossil fuels, and renewable energy contributes only 6% to the total energy mix. If the planned construction of a new coal-fired power plant is approved, Kosovo's reliance on the highly polluting lignite coal will remain a major obstacle to achieving SDG13, and may even lead to a regression in the goal of reducing emissions and developing a low-carbon economy. However, some progress has been made in the area of waste collection (Institute for Development Policy, 2019<sub>[11]</sub>) – see Environment policy (Dimension 13).

Regarding peace and institutions (SDG16), Kosovo needs to make considerable progress in tackling corruption and improving the efficiency and effectiveness of public institutions at the central and local level.

### ***Structural economic challenges***

Kosovo faces a number of key structural challenges that undermine its competitiveness and attractiveness, as well as its integration into global value chains (GVCs).

*Weak human capital reduces the scope for profiting from the demographic dividend*

As the youngest economy in Europe, with nearly 40% of the population aged 19 or younger, Kosovo could reap significant growth and development benefits if it put its growing labour force to work in high productivity jobs. However, weaknesses in the quality and relevance of education undermine these prospects:

- **Education quality:** The shortcomings in education quality are exemplified in student performance on international assessments such as the Programme for International Student Assessment (PISA), where Kosovo is the third-lowest performer of all participating economies. Less than a quarter of students attained the minimum level of proficiency across the three testing subjects (21% for reading, 23% for mathematics and 23% for science), which is well below the OECD average of over 75% for all three subjects (OECD, 2018<sub>[13]</sub>). The outcomes are especially worrying in the context of Kosovo's relatively high spending on education compared to regional peers: at 4.4% of GDP, education spending is on par with the OECD average. This points to the inefficient allocation of spending, with a high share going on teacher salaries but without translating into high-quality teaching. This in turn reflects limited resources for, and implementation of, evaluation and other quality assurance processes across all levels of the education system. It also highlights the poor implementation of competency-based curricula, reflecting in part weak teacher training and outdated textbooks.
- **Mismatches between education with labour market needs:** The challenges in the education system also reduce its alignment with labour market needs. In the latest Business Environment and Enterprise Performance Survey (BEEPS), 44% of firms identified an inadequately educated workforce as a major constraint (BEEPS, 2018<sub>[14]</sub>). This reflects significant challenges in the vocational education and training (VET) system and tertiary education. Kosovo's VET system is organised by specialised profiles; however, these do not align with labour market needs, which is particularly concerning as enrolment in the VET system has increased significantly in recent years, and is considerably higher than in the OECD and other Western Balkan (WB) economies – see Education policy (Dimension 7). Although other significant reforms have been introduced, including new curricula frameworks that include work-based learning, career guidance in higher education institutions and a National Qualification Framework, the lack of effective implementation, monitoring and evaluation negatively impacts educational outcomes. Various agencies collect data on labour market and education; however, initiatives to link and analyse the data in order to inform policy making have been delayed by a lack of funding and insufficient stakeholder engagement – see Education policy (Dimension 7).
- **Poor labour market participation and employment outcomes for youth and women:** Kosovo's employment rate is one of the lowest in the world, at 30.1%. Young people are particularly strongly affected by the lack of job prospects, with the unemployment rate of those aged 15-24 at 46.9%. Given Kosovo's relatively young population, weak job creation, especially in the private sector, creates significant labour market pressures, provides high incentives for youth emigration and weakens long-term growth prospects. Such prospects are also weakened by the underutilisation of women's productivity potential. The participation of women in the labour force is very low: about 20% of women are active in the labour market compared to about 60% of men. The weak participation of women is constrained by economic considerations, limited childcare options and cultural norms (Kosovo Agency of Statistics, 2021<sub>[21]</sub>).

*A poor business environment hampers private sector development and investment*

Over the past decade, Kosovo has made progress in reducing the regulatory and administrative burden on businesses, especially for starting a business, and has improved the overall business environment. As a result it is currently ranked 57 out of 191 economies globally on the World Bank's Doing Business index

(World Bank, 2020<sup>[15]</sup>). Nevertheless, many outstanding challenges in this area undermine the competitiveness, investment and growth of enterprises:

- **Obtaining licences and permits takes much longer and is considerably costlier than in peer economies.** For example, obtaining a construction permit in Kosovo takes on average 273 days (compared to an OECD average of 152 days), requires 18 procedures (OECD average of 13) and costs 5.2% of the warehouse value (OECD average of 1.5%).
- **Contract enforcement is slow, costly and unreliable.** Contract enforcement takes on average 330 days, which is considerably faster than the OECD average (590 days), but much longer than the global leaders in the Doing Business Index (120 days). The process is slowed down by the overburdened court system, which has a significant backlog of cases (World Bank, 2017<sup>[6]</sup>). Contract enforcement is also quite costly: at 34.4% of the claim value it is well above the OECD average of 21.5%. Perhaps most significantly, confidence is lacking in the judicial system's fair and impartial decision making, which elevates uncertainty in contract enforcement. In the latest Regional Cooperation Council barometer survey, 50% of respondents stated that they do not trust the court system, 54% stated that they do not believe that the judiciary is independent of political influence, and 60% stated that they do not believe that the law is applied equally to everyone (Regional Cooperation Council, 2019<sup>[16]</sup>). In the latest BEEPS, 43% of firms identified the courts as a major constraint to doing business (World Bank, 2020<sup>[17]</sup>).
- **Unfair competition, particularly from the informal sector, represents a significant constraint for businesses in Kosovo.** In the latest BEEPS, 63.4% of firms stated that competition from informal enterprises represents a notable obstacle for their business. The high and persistent levels of informality are mainly due to weak enforcement rather than the prohibitive costs of doing business in the formal sector, as tax rates in Kosovo are relatively low compared to regional peers and EU and OECD averages (World Bank, 2021<sup>[11]</sup>). High tax evasion is instead linked to corruption among politicians and the tax and customs administrations (World Bank, 2017<sup>[6]</sup>).

#### *Infrastructure deficiencies undermine investment, trade and GVC integration*

- **Unreliable electricity supply:** The reliability of the electricity supply is a significant obstacle for doing business in Kosovo. In the latest BEEPS, 63% of all firms, and 78% of manufacturing firms, identified electricity as a major issue. Firms in Kosovo report more frequent and more costly outages than firms in peer economies (World Bank, 2020<sup>[17]</sup>). Challenges in the electricity sector reflect a combination of factors, including insufficient and unreliable supply from the old and outdated coal-fired power plants, inefficient energy consumption, limited scope for importing electricity, and underdeveloped alternative sources of domestic electricity generation or energy supply (e.g. natural gas) (World Bank, 2017<sup>[6]</sup>).
- **Transport infrastructure:** Deficiencies in transport infrastructure connectivity harms the attractiveness of Kosovo as an investment destination. In terms of network size, Kosovo lags behind peer economies across all modes of transport. In road transport, the length of motorways is lower than peers of comparable size, as is the length of the overall road network (Eurostat, 2018<sup>[18]</sup>). In the rail sector, Kosovo lags behind peers in terms of the size of the network and the freight transported, particularly compared to economies with similar sized manufacturing sectors (as share of GDP), such as North Macedonia and Serbia (Eurostat, 2018<sup>[19]</sup>). Limitations in transport policy and a lack of investment in transport infrastructure development and maintenance mainly account for these gaps.
- **Limited access to finance:** This remains a significant obstacle to the investment, innovation and internationalisation of small and medium-sized enterprises (SMEs) in Kosovo. Although credit growth has been strong over the past decade, supported by the expansion of the mainly foreign-owned banking sector, declining interest rates, and low and declining non-performing loans,

enterprises still face constraints in accessing credit from the banking system. This is particularly the case for micro and small enterprises, which cannot meet banks' stringent loan requirements. For example, over 90% of loans in Kosovo require collateral, the value of which is well above regional and global peers, at 267% of the loan amount (World Bank, 2020<sup>[17]</sup>). Meanwhile, with the exception of leasing, which has grown considerably in recent years, financing alternatives to bank lending are very limited or non-existent.

#### *Cross-cutting and sector-specific constraints undermine the growth of key sectors*

- **Agriculture:** Agriculture is an important sector in Kosovo, accounting for 6.9% of GDP. The share of agriculture in formal employment is 14%, and the sector also accounts for a significant share of informal employment (World Bank, 2021<sup>[1]</sup>; Kosovo Agency of Statistics, 2021<sup>[3]</sup>). Given that 60% of the population live in rural areas and depend directly or indirectly on agriculture, this sector also plays an important role in poverty reduction. However, it is characterised by low productivity and limited internationalisation, which are hampered by high fragmentation, low access to finance and technology, and limited market links (World Bank, 2017<sup>[6]</sup>).
- **Manufacturing:** Upgrading and diversifying the manufacturing sector could play a key role in boosting exports and global value chain integration. Analyses of the capabilities embodied in the current export basket reveal considerable long-term potential for growth in the automotive industry (vehicle and engine parts), as well as in various other machinery and metal products. In the short to medium term there is growth potential in boosting exports of car seats, chemical products, metals and metal-based products, wood-based products, and agro-processing products (OECD, 2019<sup>[20]</sup>). The growth of this sector is constrained by factors such as gaps in infrastructure, customs and logistics, lack of skills, and weaknesses in the business environment. The attraction of FDI to this sector is also constrained by the limited capacities of Kosovo's investment promotion agency, the Kosovo Investment and Enterprise Support Agency (KIESA) – see EU accession process.
- **Information and communication technology (ICT) services:** This sector has contributed notably to service exports in recent years and has strong potential for further growth. The sector is constrained by factors such as the limited size of the domestic market, insufficient supply of skilled workers, weak collaboration between the sector and relevant educational institutions, and lack of access to finance, particularly for start-ups and high-risk venture capital (World Bank, 2017<sup>[6]</sup>).

#### *Poor public finance management undermines long-term development*

Despite Kosovo's success in keeping fiscal deficits and the public debt at relatively low levels over the past decade, fiscal performance has been relatively weak in terms of impact on the sustainable growth of the economy. High informality and tax evasion has had a significant negative impact on revenue collection. In addition, high and rising current expenditure, notably highly generous and poorly targeted social transfers, have increased non-discretionary fiscal spending. This has crowded out public investment in infrastructure and spending on critical sectors such as health and education (IMF, 2018<sup>[21]</sup>).

#### *Environmental degradation could affect the well-being of current and future generations*

- **Air pollution has become a critical challenge** in all major cities in Kosovo, as in the rest of the Western Balkan region. Air pollution is particularly acute in the winter months, when heating from burning solid fuels compounds the polluting effects from other sources. In Kosovo, annual exposure to most air pollutants – particulate matter (PM), carbon monoxide (CO), carbon dioxide (CO<sub>2</sub>), nitric oxide (NO) and nitrogen dioxide (NO<sub>2</sub>) – exceeds OECD and EU averages, and in many cases by a significant margin. For example, the annual exposure to PM<sub>2.5</sub> is 27 micrograms per cubic metre (µg/m<sup>3</sup>) in Kosovo, which is slightly above the WB6 average (25.77 µg/m<sup>3</sup>), but more than double the EU and OECD averages of 13.1 µg/m<sup>3</sup> and 12.5 µg/m<sup>3</sup>, respectively. It is

nearly triple the World Health Organization (WHO) recommended maximum annual exposure level of 10 µg/m<sup>3</sup> (EEA, 2020<sup>[22]</sup>).

- **Kosovo is vulnerable to the impacts of climate change**, but the transition to low carbon growth is slow. The energy sector is highly dependent on fossil fuels, including for power and heat generation and transport. The efficiency of energy consumption also remains low: the energy consumed per unit of GDP is nearly double the EU average (IEA Statistics, 2018<sup>[23]</sup>). Climate adaptation is a priority. For example, Kosovo has more limited water resources than other WB economies; however, due to increasing economic, environmental, climatic and demographic pressures, all river basins in Kosovo are expected to be water stressed in 20 years (World Bank, 2018<sup>[24]</sup>). More sustainable water management will therefore be critical to strengthen Kosovo's resilience to the impacts of climate change and to secure its long-term development.

### *Regional inequalities are undermining inclusive growth and well-being*

Although living standards have improved considerably in Kosovo over the past decade, the prosperity gains have not been shared evenly by all citizens. Inequality, as measured by the Gini coefficient, has increased since 2016. Regional disparities are also quite striking, with many rural areas lacking connections to piped water, sewage systems and reliable power supply. These gaps are even more pronounced in some regions – for example, in Mitrovica, only about 42% of villages are connected to piped water, compared to over 85% in Pristina (European Commission, 2018<sup>[25]</sup>). Considerable disparities also exist among ethnic minorities: Roma, Ashkali and Egyptian communities have considerably lower education, health, poverty and employment outcomes compared to the rest of the population (UNICEF, 2014<sup>[26]</sup>).

### *COVID-19 has exacerbated structural challenges*

Kosovo's economy has been strongly affected by the COVID-19 pandemic. In the first nine months of 2020, real GDP declined by 5.9% year on year (y-o-y), driven largely by a sharp decline in service exports (-63% y-o-y in quarter 2 and -60% y-o-y in Q3 of 2020), which were mainly tourism services to the diaspora, and a decrease in investment (-41% y-o-y in Q2 and -10.2% y-o-y in Q3 of 2020). The contraction was moderated by the decline in imports and increased government spending. Private consumption also bounced back in Q3 of 2020 following the removal of lockdown restrictions. The sectors most critically affected by the pandemic included construction, wholesale and retail trade, and accommodation services. Meanwhile, the growth in industry and ICT sectors moderated the decline in economic activity (European Commission, 2020<sup>[27]</sup>; 2019<sup>[28]</sup>).

The impact of COVID-19 on the labour market in Kosovo was mitigated by government support measures. The brunt of the fallout from the crisis was borne in Q2 of 2020, but some recovery has taken place since, and as of Q3 2020, labour market indicators have mostly been in line with their values in the previous year. Unemployment remained roughly the same at 24.6% (after increasing to 27.2% in Q2 of 2020), while the labour force participation rate declined from 42.9% in Q3 to 40% y-o-y (after declining to 33.2% in Q2). The impact on youth has been mixed. Youth unemployment decreased from 48.9% to 46.9% y-o-y in Q3, but the share of NEET youth increased from 36.3% to 37.6% over the same period (Kosovo Agency of Statistics, 2021<sup>[2]</sup>; European Commission, 2020<sup>[27]</sup>; 2019<sup>[28]</sup>).

Government support has helped to mitigate the impact of COVID-19 on household income and poverty. The main support measure was to allow citizens to withdraw 10% from their pension fund savings over a period of four months from August 2020. Citizens were also relieved from the repayment of loan instalments for a period of three months from April to June 2020. The government provided additional funding to support those who had the most difficulty in finding employment (OECD, 2020<sup>[29]</sup>).

Many of the abovementioned structural challenges have played a role in either amplifying the impact of COVID-19 or limiting the scope of the policy responses to lessen its impact. The crisis has, therefore, provided important lessons on how to build more resilient economies and institutions:

- **Fiscal policy:** The fiscal response has been critical in preventing a significant economic fallout from COVID-19, especially on labour market outcomes, but has resulted in a significant narrowing of the fiscal space. In the context of weaker prospective revenues in the wake of the crisis, particularly if recovery is slow, improving the efficiency of public spending will be critical in the coming months, as well as the prioritisation of expenditure that can support recovery and promote productivity growth and structural transformation for stronger and more resilient long-term growth. This includes increasing public investment, which has suffered significantly due to high and rising current expenditure. The crisis has also highlighted the importance of rebuilding fiscal buffers in the post-crisis period. In addition to better management of expenditure, this goal will require tackling some of the structural constraints that undermine revenue performance.
- **Innovation and technology adoption:** The COVID-19 crisis has starkly demonstrated the importance of the ability of firms to adapt to meet new challenges and changing circumstances. It has also revealed the advantages that firms which have embraced digitalisation and modern practices have over others. The resilience of the post-COVID recovery will therefore depend on the extent to which the structural issues limiting firm innovation and technology adoption are addressed (see Structural economic challenges), and to what extent digitalisation and digital skills become mainstreamed.
- **Access to finance:** COVID-19 has highlighted the significance of a well-developed and diversified financial sector that can respond to the financing needs of enterprises in times of crisis and during the recovery phase. As in the rest of the region, the main instruments for providing additional liquidity for enterprises during the crisis were in the form of subsidised lending or lending guarantees. However, a robust financial sector comprised of diversified financial institutions that can provide financing for riskier and innovative ventures, not just for established enterprises, will be essential during the recovery phase and going forward.
- **Informality:** The large size of the informal sector, as well as significant informal employment within the formal sector, have limited the scope of measures aimed at protecting the income and employment of people in the most affected sectors. As informality is widespread in the sectors most affected by the crisis, including retail trade and tourism, they have not been able to benefit from measures such as government subsidies, favourable loan terms or loan guarantees. Developing a more resilient economy also depends on the extent to which incentives for formalisation can be enhanced, and how much the oversight and sanctioning of non-compliance can be improved.
- **Health sector:** The health sector in Kosovo faces many challenges linked to insufficient funding. Healthcare expenditure is 1.6% of GDP (as of 2016), which is the lowest in the region. This represents only about 40% of the annual requirements for public health care, and translates into a lack of basic resources, including beds, equipment and medication. As a result, many people must seek quality health care in private institutions. In the absence of publicly available health insurance, citizens' out-of-pocket healthcare expenses are an estimated 40% of total healthcare costs. This is considerably higher than the OECD average of 13% (Kosovo Women's Network, 2016<sup>[30]</sup>).

### ***EU accession process***

Kosovo has been a potential candidate for EU accession since 2008. The Stabilisation and Association Agreement (SAA) with Kosovo was initiated in July 2014 and came into force in April 2016. In November 2016, Kosovo also adopted the European Reform Agenda, which set out priorities until the end of 2017. The agenda's primary objective was to prioritise specific areas under the SAA such as good

governance and rule of law to boost the implementation of activities that fulfilled these areas. In 2018, the European Commission (EC) confirmed that Kosovo had fulfilled all outstanding criteria for the visa liberalisation regime and proposed lifting visa requirements for its citizens. The decision on this proposal is still pending with the European Parliament and the European Council (European Commission, 2020<sup>[31]</sup>).

The importance of making progress on the socio-economic reform agenda remains a critical priority for Kosovo's path to EU membership. As Kosovo negotiates its accession to the EU, the findings in this Competitiveness Outlook 2021 offer monitoring relevant to a number of critical chapters of the *acquis*, while its recommendations provide the guidance needed to meet the accession requirements. The Competitiveness Outlook also provides a good basis for assessing the critical challenges that the economy faces as a starting point for the development of Economic Reform Programmes (Box 22.1).

### Box 22.1. Economic Reform Programmes

Since 2015, all EU candidate countries and potential candidates prepare Economic Reform Programmes (ERPs) which play a key role in improving economic policy planning and steering reforms to sustain macroeconomic stability, boost competitiveness, and improve conditions for inclusive growth and job creation. The ERPs contain medium-term macroeconomic projections (including for GDP growth, inflation, trade balance and capital flows), budgetary plans for the next three years and a structural reform agenda.

The structural reform agenda includes reforms to boost competitiveness and improve conditions for inclusive growth and job creation in the following areas:

1. Public Financial Management
2. Green transition
3. Digital transformation
4. Business environment and reduction of the informal economy
5. Research, development and innovation
6. Economic integration reforms
7. Energy market reforms
8. Transport market reforms
9. Agriculture, industry and services
10. Education and skills
11. Employment and labour market
12. Social protection and inclusion
13. Healthcare systems

The structural reforms part of the ERPs is organised in two parts:

- A first part identifies and analyses the three key challenges across those 13 areas. The identification and prioritisation of key challenges imply a clear political commitment at the highest level to address them and the ERPs should propose a relevant number of reform measures to decisively tackle each of them in the next three years.
- A second part provides an analysis of the remaining areas (not included as key challenges) and may propose additional reforms to address them.

The European Commission and the European Central Bank then assess these programmes, which form the basis for a multilateral economic policy dialogue involving the enlargement economies, EU

Member States, the Commission and the European Central Bank. The dialogue culminates in a high-level meeting during which participants adopt joint conclusions that include economy-specific policy guidance reflecting the most pressing economic reform needs. The findings of the Competitiveness Outlook provide guidance to the six Western Balkans EU candidates and potential candidates in identifying the key obstacles to competitiveness and economic growth, and in developing structural reform measures to overcome them.

### *EU financial and development support*

The EU represents the largest source of external financial assistance in Kosovo. Since 2007, the EU has provided EUR 1.21 billion in assistance aimed at strengthening democracy, the rule of law, competitiveness, innovation, education, climate action and other critical priorities for Kosovo's sustainable and inclusive development. A further EUR 229 million has been provided since 1999 through lending from the European Investment Bank (EIB). The Western Balkans Investment Framework (WBIF) has provided EUR 148.4 million in grants that have leveraged investments of an estimated EUR 1.3 billion (European Commission, 2021<sup>[34]</sup>).

The EU also provides guarantees that support public and private investment by reducing the risks and costs associated with those investments. The new Western Balkans Guarantee Facility is expected to mobilise up to EUR 20 billion in investment over the coming decade (European Commission, 2020<sup>[35]</sup>).

The latest package of the Connectivity Agenda, which was set up under the WBIF, seeks to support investments in sustainable transport and clean energy. This package was presented at the Western Balkans Summit in Sofia on 10 November 2020 and completes the delivery of the EU's 2015 pledge to finance EUR 1 billion of investment for better connectivity in the WB region. It also represents the first step in the implementation of the flagship projects under the Economic and Investment Plan for the region. Kosovo is expected to receive up to EUR 204.7 million between 2021 and 2024 under this programme (European Commission, 2021<sup>[36]</sup>).

The EU has been instrumental in supporting Kosovo's response to the COVID-19 pandemic. EUR 68 million in bilateral assistance from the Instrument for Pre-Accession Assistance (IPA) 2014-2020 was provided to Kosovo to cover the urgent needs of the health sector and to support the economic and social recovery following the crisis.<sup>1</sup> A further EUR 100 million was provided in macro-financial assistance to support the economic recovery. Kosovo and other Western Balkan economies have also been recipients of the EU's regional economic reactivation package of EUR 455 million, as well as EUR 7 million of EC/WHO joint assistance to support vaccination readiness and health sector resilience. The EIB has provided a further EUR 1.7 billion in financing to the region (European Commission, 2021<sup>[34]</sup>).

## Scope and methods

### **Process**

Following the first two Competitiveness Outlook assessments, published in 2016 and 2018, the third Competitiveness Outlook assessment cycle for the WB6 economies was launched virtually (due to the COVID-19 pandemic) on 3 April 2020. The OECD team introduced Kosovo's Competitiveness Outlook public authority<sup>2</sup> and Statistical Office Co-ordinators<sup>3</sup> to the new digitalised assessment frameworks (see

Methodology chapter for details). The two primary documents for assessing each of the 16 policy dimensions – the qualitative questionnaire and statistical data sheet – were explained in depth, giving particular attention to new questions and indicators. The OECD team also explained digital solutions to be used to disseminate the material together with the detailed guidelines, tutorials and information on the assessment process, methodology and timeline.

Following the launch of the assessment, Kosovo Investment and Enterprise Support Agency (KIESA) disseminated the materials among all 16 Policy Dimension Co-ordinators and Statistical Office contact points in Kosovo. Where additional guidance was needed, the OECD team held teleconferences with Dimension Co-ordinators and Statistical Office contact points in April and May 2020.

All 16 Dimension Co-ordinators and Statistical Office contact points completed the assessment between April and May 2020. They assigned a score (see Scoring approach) to each qualitative indicator used to assess the policy dimension in question, accompanied by a justification. The completed assessments (qualitative questionnaires and statistical data sheets) were returned to the OECD team between May and July 2020.

The OECD reviewed the inputs and, where necessary, requested additional information from KIESA, Policy Dimension Co-ordinators and Statistical Office contact points. The updated assessment materials were sent back to the OECD between July and September 2020. In addition, the OECD organised policy roundtable meetings between October and November 2020 to fill in any remaining data gaps, to get a better understanding of the policy landscape, and to collect additional information for indicators where necessary.

Based on the inputs received, the OECD compiled the initial key findings for each of the 16 policy dimensions. It then held consultations on these findings with local non-government stakeholders that included chambers of commerce, academia and non-governmental organisations (NGOs) in November 2020. As a follow up, the OECD presented the preliminary findings, recommendations and scores to the Competitiveness Outlook public authority Co-ordinator, Policy Dimension Co-ordinators and Statistical Office contact points at a virtual meeting on 17 December. The draft Competitiveness Outlook economy profile of Kosovo was made available to Kosovo's public authorities for their review and feedback from mid-January to mid-February 2021.

### **Scoring approach**

Each policy dimension and its constituent parts are assigned a numerical score ranging from 0 to 5 according to the level of policy development and implementation, so that performance can be compared across economies and over time. Level 0 is the weakest and Level 5 the strongest, indicating a level of development commensurate with OECD good practice (Table 22.2).

For further details on the Competitiveness Outlook methodology, as well as the changes in the last assessment cycle, please refer to the Methodology chapter.

**Table 22.2. Competitiveness Outlook scoring system**

<b>Level 5</b>	Level 4 plus independent impact evaluation. Results of monitoring and impact evaluation inform policy framework design and implementation updates in line with OECD good practice
<b>Level 4</b>	Level 3 plus evidence that the framework is monitored and, if necessary, adjusted accordingly
<b>Level 3</b>	Level 2 plus some concrete indications that the policy framework is being implemented effectively
<b>Level 2</b>	Framework specifically addressing the policy area concerned is solidly in place, officially adopted by the government or parliament (where applicable). The framework includes policy features necessary for it to have an impact
<b>Level 1</b>	Existing draft or pilot policy framework with signs of government activity addressing the policy area concerned
<b>Level 0</b>	No framework (e.g. law, institution, project, initiative) exists for the policy topic concerned

### *Exceptions*

Unlike the other 15 policy dimensions, competition policy (Dimension 5) is assessed using yes/no answers to 71 questions in a dedicated questionnaire. A “yes” response (coded as 1) indicates that a criterion has been adopted, whereas a “no” (coded as 0) indicates the criterion has not been adopted. The overall score reflects the number of criteria adopted. Moreover, some qualitative indicators which have been added to this edition of the assessment for the first time, are not scored due to the recent character of the policy practice they capture and the unavailability of relevant data.

## Investment policy and promotion (Dimension 1)

### Introduction

Kosovo's performance in the investment dimension has slightly worsened since the last Competitiveness Outlook (OECD, 2018<sup>[37]</sup>), decreasing from 2.6 in the 2018 assessment to 2.0 in the 2021 assessment (Figure 22.1). Progress has been made on investment policy, but there has been declining development in investment promotion and facilitation. Table 22.3 shows Kosovo's scores for the investment policy and promotion sub-dimensions for the 2021 assessment.

**Table 22.3. Kosovo's scores for investment policy and promotion**

Dimension	Sub-dimension	Score	WB6 average
Investment policy and promotion dimension	Sub-dimension 1.1: Investment policy framework	2.4	3.2
	Sub-dimension 1.2: Investment promotion and facilitation	2.4	3.0
	Sub-dimension 1.3: Investment for green growth	0.0	2.0
Kosovo's overall score		<b>2.0</b>	<b>3.0</b>

Note: No information was provided or available regarding green investment practices in Kosovo, thus, the economy received a score of zero for sub-dimension 1.3.

### State of play and key developments

In 2019, Kosovo attracted USD 304 million in net FDI inflows, which represented 3.8% of its GDP (Figure 22.2) (Kosovo Agency of Statistics, 2019<sup>[38]</sup>). This performance is well below the best performers of the WB6, where FDI inflows represent 8.4% of GDP for Montenegro, 8.3% for Serbia and 7.9% for Albania. However, it is similar to North Macedonia (3.8%) and higher than Bosnia and Herzegovina and "upper middle-income countries",<sup>4</sup> which average 1.6% of GDP. However, it should be noted that FDI has been mostly market seeking, with a significant share going to real estate, and mostly from the diaspora. The stock of portfolio investment in 2019 totalled USD 2.05 billion. Real estate and leasing activities are the largest beneficiaries of FDI, followed by financial services and energy. Food, ICT, infrastructure and energy are growing sectors. Most FDI came from the diaspora located in Albania, Germany, Switzerland, Turkey and the United Kingdom.

**Figure 22.2. Net FDI inflows to Kosovo (2015-19)**

Note: BoP refers to balance of payments in million current USD.

### Sub-dimension 1.1: Investment policy framework

Kosovo has a clear and comprehensive **legal framework for investment activities** and for conducting business; however, it does not have a stand-alone investment law. The main laws<sup>5</sup> governing investment are the 2014 Law on Foreign Direct Investment, the 2017 Law on Strategic Investments<sup>6</sup> and the 2018 Law on Business Organisations. The Law on Foreign Direct Investment gives equal and fair treatment, offers protection for foreign investors and provides a clear definition of foreign investors. The Law on Strategic Investments describes investment activities and the conditions under which investors can receive the status “strategic investor”. The Law on Business Organisations covers the registration and closure of a company, and the rights and obligations of shareholders. All investment legislation is available in English on the official Kosovo Gazette website.<sup>7</sup>

Public consultations are organised according to the 2016 regulation, the Minimum Standards for Public Consultation Process. Kosovo has set up an online platform for public consultations, and draft laws are published on the Kosovo Assembly’s website. In 2017, the government adopted the 2017-2021 Better Regulation Strategy 2.0,<sup>8</sup> which aims to improve the design of policies and legislation by ensuring that they are based on evidence (data and statistics), encouraging consultations with stakeholders and contributing to inclusive growth. However, the minimum standards for public consultations are not being applied consistently (European Commission, 2020<sup>[39]</sup>).

Kosovo’s market is open, and **exceptions to national treatment** are very limited. Kosovo had the lowest score (0.001) of the WB6 economies in the 2019 OECD FDI Regulatory Restrictiveness Index, which assesses and benchmarks market access and exceptions to national treatment, scoring well below the OECD average (0.064) (Figure 22.3) (OECD, 2019<sup>[40]</sup>). This low score indicates that Kosovo has very limited restrictions to foreign investment, and that foreign firms operating in Kosovo are not subject to screening mechanisms and are granted the same privileges as local businesses. In other words, foreign investment rules do not constitute impediments to FDI. However, Kosovo does not have a negative list that delimits the sectors where foreign investment is prohibited or conditioned, and which outlines which discriminatory conditions apply.

**Figure 22.3. FDI Restrictiveness Index (2019)**

Note: Restrictions are evaluated on a scale which goes from 0 (no restrictions) to 1 (maximum restrictions).

Source: (OECD, 2019<sup>[40]</sup>), *FDI Regulatory Restrictiveness Index*, <https://data.oecd.org/fdi/fdi-restrictiveness.htm>.

**Investor protection against expropriation** without fair compensation is guaranteed by Articles 7 and 8 of the Law on Foreign Investment. Article 7 clearly stipulates that direct or indirect expropriation measures

are taken only in a non-discriminatory manner, for a public purpose, under due process of law, and against “immediate, adequate and effective compensation”. Article 8 indicates the compensation modalities and the timely compensation payment based on fair market prices. Additional protection and modalities are provided by the Law on Expropriation, which covers judicial and administrative appeal mechanisms for reviewing or contesting decisions on expropriation, as well as the amount of compensation. Kosovo also has a network of bilateral investment treaties that constitute an additional layer of protection for foreign investors.

Foreign investors have the same rights and remedies as domestic investors. However, the functioning of the judiciary remains a key weakness in Kosovo. While the laws and regulations are consistent with international benchmarks for supporting and protecting investment, their implementation suffers from high levels of interference from the executive, as well as limited resources and capacity. Kosovo introduced constitutional amendments in 2016 to improve the independence of the judiciary and align it with EU standards. The government has also implemented reforms which have improved court efficiency and reduced the case backlog. However, the administration of justice is deemed slow and inefficient (European Commission, 2020<sup>[39]</sup>). In addition, the judiciary lacks the capacity to deal with complex commercial and economic cases, as Kosovo does not yet have dedicated commercial courts,<sup>9</sup> and cases are examined by a designated department for commercial matters within the Pristina Basic Court.

Regarding **dispute settlement**, Kosovo is stepping up its efforts to offer alternative dispute resolution mechanisms. Its courts recognise international arbitration awards, as Kosovo has ratified the Convention on the Settlement of Investment Disputes between States and Nationals of Other States (ICSID Convention), and the Convention on the Recognition and Enforcement of Foreign Arbitral Awards (New York Convention). It has a pro-arbitration stance and hosts private arbitration centres in the Kosovo Chamber of Commerce and the American Chamber of Commerce in Kosovo.

Kosovo is striving to improve its mediation mechanisms in order to reduce the backlog of cases. In 2018 it adopted a new mediation law, which is being completed with secondary legislation, and organised awareness-raising events and training courses on mediation. Positive first steps towards online mediation were taken in early 2020. In 2019, the courts referred 2 846 cases to mediation, and prosecution offices referred 2 244 cases, a significant increase on 2018 figures (European Commission, 2020<sup>[39]</sup>). However, public awareness and familiarity with alternative dispute resolution tools remain low.

Kosovo has a sound **intellectual property rights (IPR) legal framework**,<sup>10</sup> which is partly harmonised with EU legislation<sup>11</sup> and contain minimum requirements of the Trade-Related Aspects of Intellectual Property (TRIPS) agreement. Kosovo is not party to international treaties related to IPR or organisations such as the World Intellectual Property Organization (WIPO), but abides by the multilateral conventions on intellectual, industrial and commercial property rights.<sup>12</sup>

**IPR enforcement** and implementation in Kosovo have improved overall, but remain challenging. The Agency for Industrial Property (AIP), a central administrative body of the Ministry of Trade and Industry, is responsible for the legal protection of intellectual property rights. It offers IPR registration conforming to regional and international practices<sup>13</sup> using efficient WIPO software. It has made good progress in reducing the backlog of applications for patents, trademarks and industrial designs. In 2020, the agency recruited 3 new staff members, bringing the total to 21 (European Commission, 2020<sup>[39]</sup>). On the enforcement side, the State Intellectual Property Council and the Task Force against Piracy and Counterfeiting are the main bodies responsible for co-ordination. However, their actions are restricted by limited institutional co-operation and capacity, a lack of resources within enforcement agencies, a lack of specialised prosecutors and judges, and poor public awareness.

Kosovo has also reinforced **IPR awareness raising and access to information**. The AIP, the Copyright Office under the Ministry of Culture, Youth and Sport, and the Kosovo Council on Intellectual Property Rights continuously organise awareness-raising activities, albeit on a low scale due to lack of resources.

It is noteworthy that the AIP publishes a monthly bulletin on IP applications and maintains a regularly updated online trademark and patent database.

### *Sub-dimension 1.2: Investment promotion and facilitation*

Kosovo has a clearly defined **investment promotion agency structure and strategy**, however, the Kosovo Investment and Enterprise Support Agency (KIESA) lacks the capacity and resources to execute an extended mandate. KIESA continues to have a large mandate that includes investment and export promotion, as well as support to SMEs and managing special economic zones. Under the economy's National Development Strategy 2016-2021, its staffing increased from 21 staff in 2016 to 28 in 2020, while its budget expanded from EUR 510 000 in 2016 to EUR 3.1 million in 2020. However, despite this expansion, its staff and resources are still insufficient to execute its very large mandate (European Commission, 2020<sup>[39]</sup>).

KIESA reports directly to the National Council for Economic Development (NCED).<sup>14</sup> The NCED is chaired by the Prime Minister of Kosovo and is composed of ministries with an economic orientation, and economic business associations. It organises and co-ordinates the activities of state institutions and aims to eliminate barriers and address the challenges of doing business in Kosovo, thus having an impact on improving the environment of business and investment in the economy. Nevertheless, Kosovo does not seem to have a comprehensive strategy framework for attracting FDI, or solid inter-agency or inter-ministerial co-ordination mechanisms, and council meetings are irregular. KIESA's budgetary and capacity limitations also limit its ability to foster linkages between the FDI it is striving to attract and the SMEs it is supporting.

Regarding IPA mapping indicators, KIESA does not have a clear **investor targeting** strategy or actions. The Law on Strategic Investments provides a list of priority sectors, namely: energy with infrastructure and mining, transport and telecommunication, tourism, processing industry, agriculture and food industry, health, industrial and technological parks, and wastewater and waste management. While KIESA provides dedicated information on key sectors<sup>15</sup> on its website, it does not have a clear strategy targeting these sectors. The agency promotes Kosovo as an investment destination through participation in international fairs, the organisation of FDI conferences abroad, and information sessions<sup>16</sup> targeting the diaspora. It also promotes the emergence of industrial clusters in the special economic zones.

Unlike the rest of the WB6 economies, Kosovo does not offer **investor incentives** to attract investments. It does, however, provide an attractive taxation regime and support measures for strategic projects. Kosovo has a flat corporate tax rate of 10%, and grants firms VAT (value-added tax) advantages including deferments and exemptions, such as for imports of raw materials and machinery. The Law on Strategic Investments provides additional advantages to businesses, including the provision of state-owned immovable property and supported access to basic infrastructure. The government can also issue guarantees or jointly finance FDI projects. KIESA supports investment in the special economic zones according to the Law on Economic Zones.<sup>17</sup>

Kosovo has improved its **investment facilitation services and activities**. This is illustrated by its ranking of 12 out of 190 economies in the starting business dimension of the Doing Business Index (World Bank, 2020<sup>[41]</sup>). Registering a business in Kosovo is simple, with minimal fees involved. The Ministry of Trade and Industry's Business Registration Agency offers 29 one-stop shops for registration at the municipal level. KIESA provides the necessary information during the pre-investment phase and facilitates interactions with other government agencies/departments in the process of obtaining all the necessary licences and permits. It also provides assistance dealing with the one-stop shop services.

However, it is worth noting that the overall ranking of Kosovo in the Doing Business Index regressed from 44 in 2019 to 57 in 2020. This regression is due to problems regarding electricity, protecting minority investors and obtaining construction permits (World Bank, 2020<sup>[41]</sup>). The quality of the business environment is also hampered by the size of the informal sector, which is estimated to be 31% of Kosovo's GDP (European Commission, 2020<sup>[39]</sup>).

KIESA provides **aftercare services** aimed at keeping investors satisfied and collecting their feedback. The function is included in the agency's official mandate, which requires maintaining a foreign investor registry and conducting regular visits to foreign investors. KIESA organises regional conferences with the private sector in different municipalities to ensure public-private dialogue. It also visits 300 to 350 foreign investors each year to understand their perception of the investment climate and business in Kosovo, and submits a report to the Kosovo Economic National Council so they can take required measures.

### ***The way forward for investment policy and promotion***

Kosovo has a very open economy and a clear pro-investment stance. However, improving its attractiveness as an FDI destination requires policy adjustments and reforms in the following areas:

- **Adopt and develop a clear strategy to attract FDI and proactively target investors.** Although Kosovo participates in events aimed at attracting foreign investors, a clear strategy for target sectors would enable KIESA to focus its resources more efficiently.
- **Reinforce the independence, resources and capacity of the court system, notably for commercial disputes.** As commercial cases are currently redirected to a small division of the basic court system, Kosovo should focus on establishing a dedicated commercial court to handle business disputes effectively.
- **Increase public awareness and implementation of the recently adopted mediation mechanisms.** Although some awareness-raising campaigns are in place, Kosovo should focus on increasing businesses access to information on alternative dispute resolution to ease the court system's burdensome caseload.
- **Reinforce the co-ordination between IPR implementation and enforcement bodies, increase IPR agency capacity and resources, and step up IPR awareness-raising efforts.** IPR bodies currently only have the capacity to conduct low-level awareness-raising campaigns, and lack the capacity to train and allocate specialised judges and prosecutors to handle IPR disputes.
- **Reinforce KIESA's investment facilitation role, notably through better co-ordination with other government bodies and agencies.** As KIESA has a large mandate, a clear division of responsibility between departments and agencies, as well as greater inter-institutional co-ordination, should be enforced to avoid repetitive and overlapping objectives.
- **Ensure adequate capacity and resources for KIESA to allow it to fully implement its comprehensive mandate.** As KIESA's authority extends to several sectors and divisions, it is crucial that it receives more resources to promote linkages effectively between SMEs and multinational enterprises, as well as to establish an aftercare unit to boost aftercare services.
- **Integrate green growth priorities into the National Development Strategy.** Kosovo's NDS already includes a base for the promotion of FDI and promoting competitive industries which could be expanded on to include green growth objectives such as renewable energy and energy efficiency projects as a priority sector to develop. Additionally, the economy may include the green sectors in the Law on Strategic Investments, elaborating on the existing energy with infrastructure sector.

## Trade policy (Dimension 2)

### Introduction

Kosovo has made significant progress in all sub-dimensions since the last assessment, and has increased its score for trade policy from 2.3 in 2018 to 3.5 in 2021 (Figure 22.1; Table 22.4).

Kosovo has particularly strengthened its regulatory transparency by improving public consultations and increasing their number. The inter-institutional co-ordination mechanism in Kosovo has proven effective, and progress has been made in the implementation of public consultation standards through new legislation and a dedicated platform where all documents are published. The new communication channels, which are made available on the website of the Ministry of Trade and Industry (MTI), have increased the number of consultations with institutions and stakeholders on trade-related issues. The consultation mechanism is regularly evaluated and annual reports are prepared according to a specific methodology for the implementation of the standards, which is relatively rare in the Western Balkans and justifies Kosovo's high score of 3.8 for the sub-dimension on trade policy framework.

Regarding trade in services, significant progress has been made in lifting restrictions hindering trade in Kosovo with the conclusion of Additional Protocol 6 to the Central European Free Trade Agreement (CEFTA) in December 2019. Kosovo continues to make great strides in increasing the attractiveness of its economy through the modification and adoption of sound policies on trade in services. Significant steps have been taken to open markets in some services sectors, such as the courier sector, which has seen the most significant decrease in the degree of restriction since 2018. Further efforts could be directed towards improving business regulation and changing cumbersome procedures for obtaining business visas. Kosovo is the most open economy for trade in services in the WB6 region. Compared to OECD economies, it is also one of the most attractive in terms of lack of restrictiveness towards service providers

Regarding e-commerce and digitally enabled services, Kosovo has a strong policy framework for e-commerce that is in line with the EU *acquis*. In September 2020 it launched a draft Law on Electronic Identification on Trusted Services in Electronic Transactions to stimulate e-commerce. This initiative could bolster the existing fragile e-commerce flows and justifies the rating of 3.0 for this sub-dimension.

**Table 22.4. Kosovo's scores for trade policy**

Dimension	Sub-dimension	Score	WB6 average
Trade policy dimension	Sub-dimension 2.1: Trade policy framework	3.8	3.5
	Sub-dimension 2.2: Services trade restrictiveness	n.a.	n.a.
	Sub-dimension 2.3: E-commerce and digitally enabled services	3.0	3.1
Kosovo's overall score		<b>3.5</b>	<b>3.4</b>

### State of play and key developments

Trade represents 82% of Kosovo's GDP. Its trade with CEFTA parties represented 43% of total exports in 2019 (a drop from 47.2% in 2018), and its trade with the EU represented 36% (against 30.2% in 2018).

In 2019, the EU supplied 50% of Kosovo's total imports (against 47.2% the previous year). Imports from CEFTA fell to 14.3% (from 25.5% in 2018) as a direct result of the 100% import tariffs imposed by Kosovo on goods originating from Serbia and Bosnia and Herzegovina. In April 2020, the 100% tariffs were lifted and replaced by gradual trade reciprocity measures, which were finally abolished in June 2020.

Kosovo has a small domestic market and limited industrial production, and consequently a relatively high trade deficit. According to the Kosovo Agency of Statistics, Kosovo's trade deficit was EUR 2.97 billion in 2018, up from EUR 2.5 billion in 2017, with imports rising to EUR 3.34 billion from EUR 3.05 billion.

Exports fell to EUR 367 million in 2018 from EUR 596 million in 2017. According to the World Bank, Kosovo's overall trade deficit, which includes trade in both goods and commercial services, was an estimated 29.1% of GDP in 2018.

In terms of percentage share of GDP, in 2019, exports of goods and services represented 29.2%, and imports of goods and services represented 56.25%.

Like all economies, Kosovo has been heavily affected by the COVID-19 pandemic. The relatively low level of new import and export orders prior to the COVID-19 crisis, combined with pandemic-related export bans, restrictions on the movement of people, and closures of shops and services, led to a significant decline in imports and exports in Q2-Q3 2020. Although Kosovo was not the most severely affected economy in the region, it faced a decline of -2% in imports and -14% in exports (Figure 22.4).

**Figure 22.4. Impact of COVID-19 on trade, Kosovo versus the OECD (2019-20)**

% change, y-o-y

Source: (IMF, 2020<sup>[10]</sup>), *World Economic Outlook*, <https://www.imf.org/en/Publications/WEO/weo-database/2020/October>; (OECD, 2020<sup>[42]</sup>), *OECD Economic Outlook, Volume 2020 Issue 1*, <https://dx.doi.org/10.1787/0d1d1e2e-en>.

StatLink  <https://doi.org/10.1787/888934255665>

Kosovo is mostly dependent on trade in services, which contributes to trade openness more than trade in goods. In 2020, all WB6 economies, except Kosovo, were foreseen to experience a decline of FDI inflows. Before the outbreak of the pandemic, significant investments were made in energy and mining, which makes Kosovo the only economy likely to see an increase in FDI.

Overall, economies with a high dependency on trade in services, such as Kosovo, have suffered great losses due to the restrictions on movement of people implemented in response to the pandemic. Kosovo's current account deficit was projected to increase from 5.5% of GDP in 2019 to about 5.7% in 2020 and 2021 (World Bank, 2020<sup>[41]</sup>; World Bank, 2021<sup>[43]</sup>). Tourism, which is a key economic driver of the economy, was expected to contract by 8.8% in 2020 and lead to a severe recession. However, this sector might recover faster in Kosovo than in the other WB6 economies as 80% of travel services exports concern the diaspora.

The closure of EU borders to non-EU citizens, as well as other regulatory responses in the Western Balkans, have particularly affected freight transport services. The Western Balkan economies set up a CEFTA co-ordinating body to exchange information on trade in goods at the beginning of the pandemic. They also set up priority "green lanes" with the EU and "green corridors" within the WB6 to facilitate the free movement of essential goods through priority "green" border/customs crossings (within the WB6 and with the EU). At the peak of the crisis (April to May 2020), most road transport in WB6 economies passed through these green lanes and corridors, and they have helped to maintain a certain degree of international trade in goods in the region. Only about 20% of the goods that benefited

from the green corridor regime (i.e. within the WB6) were basic necessities, with the rest regular trade. Such inclusive regional co-operation has proven very efficient in mitigating the consequences of the COVID-19 pandemic and is helping economies to recover.

### *Sub-dimension 2.1: Trade policy framework*

The importance of transparent legislative procedures has increased in priority for governments in recent years. A fundamental aspect of regulatory transparency is that the legislative process is open to all relevant stakeholders through formal and informal public-private consultation (PPC) channels, before and after the adoption of new regulations (OECD, 2019<sup>[44]</sup>). These consultation mechanisms increase the efficiency of economic activities and the degree of market openness as they can improve the quality and enforceability of regulations (OECD, 2012<sup>[45]</sup>). Governments in many economies are also adopting cross-cutting policies and/or guidelines to further improve the consultation process. The first sub-dimension of the trade policy dimension assesses the government's effectiveness in formulating, evaluating and implementing trade policy through two separate but complementary indicators: institutional co-ordination on trade policy formulation, and public-private consultation and transparency.

Kosovo has a functioning **inter-institutional co-ordination mechanism** for trade policy formulation. The MTI is responsible for trade policy development and works alongside the National Council for Economic Development (NCED), which acts as the main advisory and decision-making platform for economic policy making and reforms, including trade policy. The MTI established a co-ordinating body in 2016, the National Trade Facilitation Committee (NTFC), to handle and co-ordinate trade activity between different ministries, the private sector and civil society. The NTFC is also in charge of CEFTA harmonisation and standardisation of procedures, and the implementation of international agreements. NTFC meetings are organised at least twice a year and related reports are made public. The MTI has also established three sectorial working groups on agriculture, industry and services. Kosovo has made efforts to adapt its co-ordination framework to relevant issues, with the National Committee for Trade in Services recently established as an advisory body with the purpose of proposing trade policies in services.<sup>18</sup> It is common practice that the MTI's Secretary General establishes new trade policy working groups and creates channels of communication with the private sector and civil society whenever new laws are drafted. Currently, the trade department of the MTI is drafting its new work programme for the period 2020-2023. (Government of Kosovo, 2019<sup>[46]</sup>).

Targeted sectoral co-ordination and transparency initiatives are being put in place in Kosovo, and at the end of 2020 the Contact Point on Services (CPS) platform was launched. The CPS is a database to facilitate stakeholder access to the regulatory framework that governs service activities in Kosovo, helping those already in the market and entrepreneurs who want to start providing services.<sup>19</sup>

Inter-ministerial co-ordination and stakeholder consultation processes are conducted in a complementary manner during all stages of policy making (initiation, formulation, implementation, evaluation and monitoring). The private sector, including the different chambers of commerce, are included in all stages of policy making through working groups, the NTFC and the NCED. Chambers of commerce and civil society also participate in public consultations. NGOs, academia, EU offices and other institutions are also regularly involved in trade-related consultations.

Clear progress has been made in implementing **public consultation** standards. Since the Minimum Standards for Public Consultation Process regulation, entered into force in 2017, the fulfilment of these standards has increasingly become part of the MTI's work, and it has been consulting with more institutions and stakeholders. The MTI's website has been set up to enable free access to draft and final trade measures, and allows the private sector to comment on draft laws in a transparent manner.<sup>20</sup> All materials and documents (draft laws, calls for consultations) are made available on the website, and there has been an increase in the number of participants consulting these documents. According to the 2020 report (Government of Kosovo, 2018<sup>[47]</sup>; Government of Kosovo, 2020<sup>[48]</sup>), between 2018 and 2019, MTI's

website saw an 18% increase in the number of consultations of published draft regulations. In 2019, 100% of published drafts were consulted; however, the number of consultations per draft was not disclosed. The regulation allows any citizen concerned or potentially affected by a regulation to provide comments before a measure is adopted. The public consultation system was extended to all municipalities in 2018.

Monitoring the quality and shortcomings of PPCs is not yet conducted systematically in the WB6 economies, and there exist few public bodies that supervise the implementation of consultations and monitor their quality. However, Kosovo is somewhat of an exception, and has the most developed consultation evaluation mechanisms among WB6 economies. PPCs, promotion tools and timelines of consultations are evaluated annually by the Office on Good Governance to determine whether an open, transparent and non-discriminatory form of PPC was used throughout the legislative process. Moreover, the Office on Good Governance annually reports and monitors public consultation implementation based on defined goals of effectiveness and inclusiveness.

The Office of Good Governance is tasked with preparing an annual report on the public consultation process, and checks whether draft proposals comply with public consultation requirements before the proposals are submitted to the government. Kosovo's annual reports on the PPC process have so far presented results for 2017 and 2019. (Government of Kosovo, 2018<sup>[47]</sup>; Government of Kosovo, 2020<sup>[48]</sup>)

The Office for Good Governance established co-ordination structures in 2017 that introduced public consultation co-ordinators in each ministry. It also carried out capacity building activities, such as two rounds of on-the-job training on PPCs, training on using the electronic PPC platform and numerous information workshops. Introducing the electronic public consultation platform was one of the most important steps the government has taken to facilitate PPCs.

The reports produced by the Office for Good Governance show that 274 documents were drafted by all ministries in 2019, with 100% of the acts approved by government open to public-private consultation (compared to 90% in 2017). These documents were made up of 5 concept documents, 31 draft laws, 77 draft regulations, 129 draft administrative directives, 6 strategies, 5 programmes, 7 action plans and 14 "other". Some 272 documents were consulted via the platform, with 2 consulted on by other tools including e-mail communication, stakeholder workshops and public meetings.

The total number of participants in the consultation process was 3 577 in 2019, representing an increase of 143% from 2018, when there were 1 469 participants (there were 2 104 in the first report of 2017). A total of 1 339 comments were received, among which 688 (51%) were accepted and implemented by the drafting institutions, 97 (7.2%) were partially accepted and 543 (40%) were rejected. There is no information for 6 comments.

The minimum standards provided for in the regulations were met by 67% of documents submitted to PPC (compared to 52% in 2017), while 33% did not meet all the minimum standards (compared to 48% in 2017). All documents submitted by the MTI met the minimum standards in 2019. (Government of Kosovo, 2018<sup>[47]</sup>; Government of Kosovo, 2020<sup>[48]</sup>).

In terms of **bilateral and multilateral free trade agreements**, Kosovo joined CEFTA in 2007 and signed the Stabilisation and Association Agreement (SAA) with the EU in 2016. Kosovo also signed a Joint Declaration on Cooperation with the economies of the European Free Trade Agreement (EFTA) in 2018, and the first virtual meeting of the joint committee between Kosovo and EFTA was held in November 2020. Kosovo is at an early stage in its application for observer status at the World Trade Organization. In this context a memorandum on the foreign trade regime has been prepared, but not yet implemented.

In June 2019, Kosovo ratified its free trade agreement with Turkey (signed in 2013), which provides for the progressive elimination of customs duties on a list of products within a decade. The agreement also sets out a commitment to negotiate provisions on the facilitation of trade in services. In July 2019, Kosovo signed an Economic Cooperation Agreement with the Czech Republic, and in December 2019 it was the

first economy to sign a Partnership, Trade and Cooperation Agreement with the United Kingdom (in anticipation of the United Kingdom's withdrawal from the EU-Kosovo SAA).

### *Sub-dimension 2.2: Services trade restrictiveness*

Services contribute almost two-thirds of GDP in WB6 economies on average, which illustrates how strongly economic growth, innovation and labour markets depend on effective policies that promote open and competitive service markets. In 2019, services accounted for 74% of GDP in Kosovo, which represents a 6.22 percentage point increase from 2009. Services accounted for 85.2% of employment in 2019 and 83.4% of new businesses registered. Services exports have seen an annual average growth rate of 12.9%, while services imports have seen an annual average growth rate of 8.1%, resulting in a growing surplus. Enhancing the openness of trade in services can improve the efficiency and productivity of domestic firms. Trade in services allows countries to specialise according to their comparative advantages in services and skills (OECD, 2021<sup>[49]</sup>). The potential gains from lifting stringent restrictions on services trade are significant, as increased domestic and foreign competition complemented by effective regulation can enhance performance (OECD, 2018<sup>[37]</sup>). Moreover, unbalanced regulatory restrictions on services significantly affect trade by raising the costs for firms to operate in the host economy (Box 22.2).

#### **Box 22.2. The costs of regulatory barriers to trade in services**

OECD analysis reveals that services trade restrictions significantly affect trade by raising the costs for firms to operate in the host economy (Rouzet and Spinelli, 2016<sup>[50]</sup>). Trade costs arise both from policies that explicitly target foreign suppliers and from domestic regulation that falls short of best practice in the area of competition and rule-making. The costs resulting from barriers to trade in services are much higher than those of trade in manufactured goods.

Trading services is costly. Studies show that policy-induced services trade costs are relatively high. Expressed as percentages of total trade value, average multilateral costs for cross-border services trade are around 57% for communication services, 54% for business services, 60% for transport services, 103% for insurance services and 255% for financial services. Even exporting to the most liberal countries still requires compliance with regulations at a cost that corresponds to around 30% of the export value in most sectors, and nearly 90% in financial services. Within the European Single Market, however, services trade costs are significantly lower: policy-induced costs of cross-border services trade are around 10% in most sectors and around 32% in financial services.

Source: (Benz and Jaax, 2020<sup>[51]</sup>), *The costs of regulatory barriers to trade in services: New estimates of ad valorem tariff equivalents*, <https://dx.doi.org/10.1787/bae97f98-en>; (Rouzet and Spinelli, 2016<sup>[50]</sup>), *Services Trade Restrictiveness, Mark-Ups and Competition*, <https://dx.doi.org/10.1787/5jln7dlm3931-en>.

The OECD Services Trade Restrictiveness Index (STRI) was used to **analyse Kosovo's policies and barriers to trade for 12 services sectors**. The OECD STRI project is a unique, evidence-based diagnostic tool that inventories trade restrictions in 48 economies,<sup>21</sup> allowing economies to benchmark their services regulations against global best practice, identify outlier restrictions, and prioritise reform efforts. For this CO assessment cycle, the 12 services sectors are grouped into four clusters: 1) transport and distribution supply chain (air transport, road transport, rail transport, courier); 2) market bridging and supporting services (commercial banking, insurance, legal services); 3) physical infrastructure services (construction, architecture, engineering); and 4) digital network services (computer services, telecommunications).

Information was collected from the WB6 economies' laws and regulations, and indices were calculated for seven years (2014-20). These composite indices quantify restrictions across five policy areas: foreign entry, movement of people, barriers to competition, regulatory transparency and other discriminatory

measures. The indices quantify regulatory restrictions in each of the 5 policy areas for the 12 sectors by giving them a value between 0 and 1. Complete openness to trade in services gives a score of 0, while being completely closed to foreign service providers yields a score of 1.<sup>22</sup>

Each policy area is composed of a series of measures. These measures are called “horizontal” if they are present in all sectors, or “sector specific” if they only affect a particular sector.<sup>23</sup> The STRI measures the “most-favoured-nation” restrictions and does not take into account any specific concessions, such as regional trade agreements or mutual recognition agreements (Geloso Grosso, 2015<sup>[52]</sup>).

Figure 22.5 shows the STRI indices for each of the sectors, as well as the average scores for the WB6, EU and OECD. Compared to the OECD and key partners’ average STRI indices (represented by a “+”), Kosovo is in the low range in terms of the degree of restrictiveness of its service sectors. Overall, it also has the least restrictive regulatory environment in the region. This makes it a preferred candidate for foreign service providers. The four sectors with the lowest score relative to the WB6 average are telecommunication services, road freight transport, insurance and architecture services. The three sectors with the highest score relative to the WB6 average are courier services, legal services and air transport.

**Figure 22.5. Services Trade Restrictiveness Index for Kosovo (2020)**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and therefore are not covered by STRI indices; key partners to the STRI project are Brazil, the People’s Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand. Source: (OECD, 2020<sup>[53]</sup>) *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934255684>

Kosovo shows a continued regulatory willingness to lower restrictions affecting trade in services, as shown in Figure 22.6. The economy has maintained a steady flow of reforms in the period 2014-2020, with a notable highlight being the opening of its courier market in 2019. The slowdown in reforms to open services markets in the period 2020-2021 is explained by regulatory efforts around the world to solely mitigate the negative effects of the COVID-19 pandemic. Nevertheless, the absence of an increase in the degree of restrictiveness in all WB6 economies for the period 2019-2020 is important, and contrasts with the marked overall increase observed in OECD economies for the same period (OECD, 2021<sup>[49]</sup>).

**Figure 22.6. Evolution of STRI scores by sector in Kosovo (2014-20)**

Percentage change over the periods 2014-2016, 2016-2019 and 2019-2020

Note: Negative values indicate a reduction in restrictiveness of the economy's trade regulatory environment.

Source: (OECD, 2020<sup>[53]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934255703>

The following analysis starts with the horizontal measures that are included in all sectors and that typically hamper services trade in the economy as a whole. In particular, in the area of general business regulations, restrictions on the movement of service providers, standards for the cross-border transfer of personal data, the legal framework for public procurement and the screening of foreign investment. It then reviews each of the 12 sectors analysed, displaying the STRI scores, explaining what drives the results, and providing a brief description of the most common restrictions and good practices.

*General business regulations and barriers to the movement of people* affect the ability of firms to operate in Kosovo. The requirement of minimum capital in the form of a deposit that must be placed in a bank or notary's office to register a limited liability company affects foreign companies,<sup>24</sup> and cumbersome procedures for obtaining business visas limit the search for investment opportunities. However, significant progress has been made in easing conditions for the movement of people between CEFTA economies through the conclusion of Additional Protocol 6 to the CEFTA Agreement, although there are still some restrictive requirements for those from economies outside CEFTA or the EU.

A common practice in STRI participant economies is to apply labour market tests (LMTs) to determine whether suitably qualified local workers are available (or could easily be trained to do the work). LMTs typically involve seeking advice from industry representatives and government agencies to determine current skill shortages. In Kosovo, the update of the Law on Foreigners in 2017 lifted LMTs for work permits issued to third economy nationals, and no quotas are applied on the same categories of workers. This greatly improved the attractiveness of the economy compared to other WB6 economies. However, the initial authorised length of stay of foreign services providers (12 months) falls short of international best practice (36 months), and therefore mitigates the positive effects of the 2017 policy change (OECD, 2021<sup>[49]</sup>).

There is also a low degree of restrictiveness of applied *standards for the cross-border transfer of personal data* in Kosovo. These standards are set at the EU level. Transfers to non-EEA (European Economic Area) economies may take place when standards ensure an adequate level of data protection or, failing that, where appropriate safeguards (e.g. binding corporate rules or standard data protection clauses) are in place.

Kosovo's *legal framework for public procurement* is largely aligned with the 2004 EU Directive. The Public Procurement Act explicitly refers to the principles of transparency, equal treatment and non-discrimination, although there is no explicit mention of non-discrimination towards third country nationals. Kosovo has also prepared implementing legislation that includes rules and guidelines to assist contracting authorities in managing *public procurement* and the award of contracts. Kosovo has a strategy (covering the period 2017-2021) and an action plan (2017-2019) to improve the public procurement system, but does not yet assess its implementation. The 2020-2021 action plan is currently under preparation.

The lack of burdensome *screening of foreign investment* eases such investment. In this regard, Kosovo is very attractive for foreign service providers. Laws and regulations in Kosovo do not mandate that economic interests should be considered in the review of foreign investments, although such consideration is not explicitly ruled out. Kosovo does not set a threshold above which a foreign investment project is subject to screening.

Beyond the regulatory measures that affect Kosovo's trade in services horizontally, there are a number of sector-specific restrictions in the 12 STRI sectors analysed, discussed in turn below.<sup>25</sup>

**Air transport services** are defined as passenger and freight air transport carried domestically or internationally (code 51 under the International Standard Industrial Classification – ISIC). The STRI for this sector only covers commercial establishments. Given the range of air transport subsectors, the approach of the STRI project is to focus on measures affecting carriers' transport of passengers and goods between points. Airport management and other aviation services are only relevant where regulations affect the ability of foreign carriers to transport passengers and goods between points. The other aviation services are covered more fully in the STRI for logistics services.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.165 and 0.601. With a score of 0.404, Kosovo is the third-most restrictive WB6 economy, and scores lower than the WB6 (0.421), EU (0.406) and OECD (0.409) averages.

The air transport sector is the archetype of a service industry where the legal environment is regulated through international agreements. The WB6 region tends to harmonise its regulations with standards in force in the EU, which has several consequences. On the one hand, the sector has very little variation in scores between WB6 economies and the EU. On the other hand, the EU legal influence means that the sector is one of the most restrictive compared to other STRI sectors, which is justified by its nature as it combines legal and safety issues. In absolute terms, Kosovo's air transport regulations are open and highly harmonised with the EU. However, given that there is very little or no exchange of freight by air, as most imports from Kosovo are by land, some measures that raise the economy's STRI score may appear to be disproportionately restrictive compared to the actual size and structure of the market in Kosovo.

*Restrictions on foreign entry* figure prominently in the results of Kosovo's STRI for air services. Like 40 other OECD and STRI key partners (OECD, 2020<sup>[54]</sup>), the economy limits to 49% the share of capital that foreign natural or legal persons can hold in an air transport service company in Kosovo. This restriction is dictated and justified under EU regulations, but in absolute terms it affects Kosovo's STRI score compared to the limited size of the economy's air transport sector. The leasing of foreign aircraft is allowed, subject to prior authorisation, but only for dry leases (without a crew). The leasing of foreign aircraft with crew (wet leasing) is prohibited.

The other major category that influences the degree of restriction concerns *barriers to competition*. As in several OECD, STRI key partner and WB6 economies, Kosovo maintains public ownership in the aviation sector through two domestic airlines, Kosovo Airlines and Air Prishtina. The maintenance of state-owned enterprises (SOEs) in the sector is generally regarded as a restriction to trade in services, as traditional domestic airlines usually enjoy a competitive advantage over foreign companies. However, none of the airlines in Kosovo have a fleet of aircraft. The domestic airlines continue to work with other airlines serving Pristina and to sell excursion trips. This situation is relatively rare and negatively affects the STRI score in

this sector, even though the impact of Kosovo's domestic carriers on competition is limited due to their size and corporate structure.

The regulation of slots allocated at airports in different economies often has a strong influence on the degree of openness of the sector. In Kosovo, slots are allocated in a fair, non-discriminatory and transparent manner, according to the principle of equal opportunities for all airlines. However, there are some elements that have a negative impact on the STRI score in this area. The general principle in Kosovo concerning slot allocation is that an air carrier that has operated at least 80% of its slots during the summer/winter scheduling period is entitled to the same slots for the equivalent scheduling period of the following year (so-called grandfather rights). To mitigate the anti-competitive nature of this technique, slots not sufficiently used by air carriers are reallocated (the so-called "use it or lose it" rule). However, Kosovo prohibits the commercial exchange of slots, which limits trade in this area.

**Road freight transport** (ISIC Revision 4 code 4293). The STRI for this sector only covers commercial establishment. Cross-border trade is governed by a system of bilateral and plurilateral agreements that involve permits, quotas and other regulations.

The 2020 scores for all OECD member states in this sector range between 0.105 and 0.624. With a score of 0.106, Kosovo is one of the least restrictive economies among all STRI participants, and therefore the least restrictive economy in this sector within the WB6. It scores considerably lower than EU (0.184), OECD (0.201) and WB6 (0.225) averages.

This is of utmost importance for Kosovo, as the road freight sector largely dominates the other transport sectors in the economy. Kosovo does not impose any sector specific regulations that would restrict the sector. Unlike in most STRI participant economies, there is no restriction on foreign entry in the form of limitations on acquisition and use of land and real estate by foreigners. The movement of people is also very unrestrictive, as there is no imposition of quotas or LMTs. There is no firm in the sector that would be controlled by the government. Registering a company is significantly less lengthy, costly and burdensome in comparison to the other WB6 economies.

**Rail transport** (ISIC code 4912) is provided over a dedicated network where the market structure may take different forms, the two most common being: 1) vertically integrated rail services firms owning and managing both the infrastructure and the operation of freight services; and 2) vertical separation between infrastructure management and operations. Regardless of market structure, there are well-established best practice regulations that also consider competition from other modes of transport, particularly road transport.

The 2020 scores for all OECD member states in this sector range between 0.129 and 1. With a score of 0.202, Kosovo is the least restrictive economy among WB6 economies in the rail transport sector. It scores lower than EU (0.210), OECD (0.260) and WB6 (0.317) averages.

In terms of *foreign entry restrictions*, the sector is negatively affected by limits to the proportion of shares that can be acquired by foreign investors in publicly controlled firms. According to the Law on Publicly Owned Enterprises, a private person can only own up to 50% of the SOE shares. Existing railway operations in Kosovo are organised and managed by the publicly owned Trainkos. The legal framework also lacks in transit rights for international rail transport, which limits the sector.

Kosovo shares borders with four economies, but is only connected by railroad with Serbia and North Macedonia. There is no bilateral agreement with Serbia, and the bilateral agreement with North Macedonia is only applicable for the railroad sector from the border to the station located nearest to the border in both economies. Railway services can only be supplied if there is commercial presence in Kosovo. A licence is required to enter the rail freight transport market, which also has a negative effect on the STRI score.

Regarding *restrictions on the movement of people*, certain professions in the sector, such as train drivers, need a licence to practise. Only train driver licences granted in an EU member state are considered valid in Kosovo. Licences issued by the authorities of third economies are only recognised through mutual recognition agreements established bilaterally. Although better than a complete lack of recognition procedures, mutual-based recognitions still involve legal uncertainty for foreign service providers.

*Barriers to competition* are an important contributor to Kosovo's STRI performance in rail transport services. Access to railway infrastructure is mandated at a domestic level. The Ministry of Transport establishes the method for calculating the access costs that the infrastructure manager should charge for railway operators seeking access to the network. The transfer and trading of infrastructure capacity are both prohibited. Railway infrastructure is solely managed by a public company, Infracos.

The **courier services sector** (ISIC Rev 4 code 53) includes postal and courier activities. While courier services have traditionally been important means of communicating, the rise of modern ICT has contributed to the less frequent use of letters between individuals for communication.

The 2020 scores for all OECD member states in this sector range between 0.106 and 0.88. With a score of 0.323, Kosovo is the third-least restrictive WB6 economy. It scores higher than the EU (0.182) and OECD (0.259) averages, but lower than the WB6 average (0.301). Compared to the previous assessment cycle, the courier services sector has undergone a substantial transformation in terms of reducing its restrictiveness. However, the score is still mainly affected by two sector-specific measures: 1) the universal service provider is the state-owned Post of Kosovo JSC; and 2) the designated postal operator (DPO) who performs the universal postal services obtains preferential tax or subsidy treatment.

A 2019 reform has opened the market to foreign service providers and has lowered the economy's restrictiveness index by more than 70%. The main regulatory reason for this change lies in the abolition of monopolies on delivery. In terms of restrictions to the movement of people, authorisations provided by the Regulatory Authority of Electronic and Postal Communications (ARKEP) are required for all courier services practising in Kosovo. As the courier profession is regulated, the fact that there are no laws or regulations establishing a process for recognising qualifications gained abroad contributes negatively to the economy's STRI score in this area.

*Foreign entry restrictions*, such as licence requirements to enter the market, play a significant role in many economies' STRI performance, including Kosovo. ARKEP is the only institution able to authorise the provision of postal services. Prior to 2018, Kosovo, like many other economies, had a monopoly in two reserved areas – letters and parcels. In the 2018 law, the public postal operator was entitled to offer reserved services including acceptance, transport and delivery of local and international shipments with a weight up to 100 grams in order to meet the universal postal service request. Since 2019, reserved services have been provided by the company that receives the status of DPO and bears the responsibility of providing universal postal services. Reserved postal services include the receipt, transportation and delivery of simple shipments weighing up to 100 grams. The public postal service provider can nevertheless continue to exercise its entitlement to provide reserved services until the end of 2021.

Regarding *barriers to competition*, in 2020 the Post of Kosovo JSC was designated as a universal postal service provider for a period of five years. The Post of Kosovo JSC is the only public postal operator in the economy. With the new 2019 Postal Services Law, the universal postal service provider can be compensated by the government if universal services provision incurs additional net costs that may constitute an unreasonable burden, and if the provider cannot cover these costs from other postal or business services. ARKEP determines the level of compensation on a net cost basis.

**Legal services** (ISIC Rev. 4 code 691) cover advisory and representation services in domestic and international law. Measures are entered separately into the STRI database for each, when relevant. International law includes advisory services in domestic law, third-economy law and international law, as

well as a right to appear in international commercial arbitration. Domestic law involves advising and representing clients before a court or judicial body in the law of the host economy.

The 2020 scores for all OECD member states and OECD partners in this sector range between 0.141 and 1. Kosovo is the third-least restrictive WB6 economy with a score of 0.412, higher than the EU (0.394), OECD (0.362) and WB6 (0.391) averages. In comparison to 2014, Kosovo became less restrictive in the legal services sector. The score is mostly a result of restrictions on the entry of foreigners and restrictions on the movement of people, such as the requirement for a licensed foreign lawyer to act as a co-lawyer with a local and licensed lawyer, and other restrictions described in detail below.

Unlike a number of OECD, STRI key partners and WB6 economies, Kosovo does not restrict the temporary movement of natural persons by imposing quotas or LMTs. Restrictions, however, are present in the form of a licence required to provide legal services in the economy. All licences for foreign lawyers are granted by the Kosovo Bar Association (KBA), and all foreign lawyers must be registered by the KBA in the register for foreign lawyers. Two types of licence are possible: a temporary licence for matters of international law, and a permanent license that enables foreign lawyers to practice domestic law. A foreign lawyer can only obtain a licence to practise domestic law if they enter into a contractual relationship with a local lawyer as a co-lawyer, a restriction which negatively affects the STRI score. However, the presence of the temporary licence greatly limits the degree of restrictiveness of this sector, and places Kosovo in the lower bracket of restrictiveness in the WB6 region, as well as compared to OECD member states. Finally, locally licensed lawyers are obliged to declare an address for correspondence within a defined geographical area of their local bar association.

Regarding *restrictions on foreign entry* in Kosovo, partners and shareholders of law firms have to be licenced and registered professionals in order to practice domestic law. Practice or cross-border legal advice on international law is not subject to an equity restriction. Commercial association is only possible between lawyers and other licensed professionals, other law firms, joint law offices, or local and foreign bar associations. Restrictions on the board of directors has a negative effect on the STRI score. In both domestic and international law, all founding partners and shareholders of law firms must be licensed and registered lawyers.

In the area of *barriers to competition*, freely set fees by legal professionals are considered to promote better competition in legal services. In this respect, the STRI considers the imposition of fees as a barrier to trade. Kosovo's laws require the KBA to regulate state lawyers' fees for cases related to domestic law. There is no distinction made between foreign and local lawyers. All fees are mandatory and listed in the regulations for lawyers.

**Commercial banking** (ISIC Rev 4 divisions 64-66) is defined as deposit-taking, lending and payment services. Commercial banking services are traded business to business, as well as business to consumer for retail banking. Efficient banking services are one of the backbones of dynamic economies as they provide financing for investment and trade across productive activities and underlie all value chains.

The 2020 scores for all OECD member states and key partners in this sector range between 0.131 and 0.517. With a score of 0.123, Kosovo is the least restrictive WB6 economy in the commercial banking sector, and scores lower than the EU (0.180), OECD (0.205) and WB6 (0.239) averages. Kosovo is also less restrictive than the Czech Republic, which is the best CEEC<sup>26</sup> performer with a score of 0.127. In comparison to 2014, Kosovo became less restrictive in the commercial banking services sector. The STRI score in this sector is especially affected by restrictions on extending loans or taking deposits in foreign currency, as well as Kosovo's deviation from international risk weighting standards (Basel standards).

The results are mainly due to three policy areas: restrictions on foreign entry, barriers to competition and regulatory transparency. These results reflect the particular characteristics of the sector, as well as the policy environment in which it operates. As the banking sector plays a key role in each economy, but can

pose risks to financial stability, restrictions on entry and competition have sometimes been used as a means for authorities to maintain control over operations in the absence of effective prudential regulation.

*Restrictions on foreign entry* are often identified as the main source of restrictiveness in the commercial banking sector; however, Kosovo remains relatively open in this regard. It does not limit the share of foreign equity capital in local banks, nor does it restrict the establishment of branches of foreign banks. The licensing of foreign-owned banks is not restricted and is undertaken according to objective and transparent principles applied in an undifferentiated manner to domestic banks. Kosovo does not restrict cross-border bank mergers and acquisitions. Foreign banks do not have to be established locally in order to provide services to residents. No restrictions are imposed on the members of the board of directors of a commercial bank.

Although *barriers to competition* generally contribute substantially to economy scores, Kosovo is positioned in the liberal third of the WB6 economies. Its scores are positively influenced by the adequate regulation of financial products, and the full operational, managerial and fiscal independence from the government of its supervisory authority. None of the largest commercial banks is state owned.

Regarding *regulatory transparency* in the licensing process, the authorities are obliged to provide reasons for the rejection of an applicant within a maximum of 15 days, in line with OECD good practice. However, the burdensome length and cost related to resolving a debtor's insolvency contributes negatively to the indices in Kosovo.

In terms of *other discriminatory measures*, Kosovo's adherence to International Financial Reporting Standards (IFRS) has helped its STRI score. However, the compliance of its regulations with international standards differs to some extent, in particular the application of Basel standards (Sub-dimension 1.1: Investment policy framework). Kosovo also applies certain forms of restrictions on foreign banks for raising capital domestically.

**Insurance services** (ISIC Rev. 4 codes 651 and 652) comprise life insurance, property and casualty insurance, reinsurance, and auxiliary services. Private health insurance and private pensions are not covered.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.1 and 0.565. With a score of 0.101, Kosovo is the least restrictive WB6 economy in the insurance services sector. It scores lower than the EU (0.175), OECD (0.193) and WB6 (0.231) averages. This sector is mostly affected by the requirement that managers must be resident in Kosovo for providing life and non-life insurance, and reinsurance services.

The STRI results of Kosovo's insurance sector are mainly due to three policy areas: restrictions on foreign entry, restrictions on the movement of people and regulatory transparency. These results reflect the particular characteristics of the sector and the policy environment in which it operates. The insurance sector follows the general logic of the financial sector in Kosovo in its non-restrictive character. Kosovo underwent a redesign of insurance regulations in 2015, lifting most of the restrictions in its insurance legal framework. The sector is now among the three least restrictive services sectors in the economy.

There are, however, some elements that influence the score in this sector. There are still *restrictions on the movement of people* in the form of licence requirements. Licence to practise, which is delivered by the Central Bank of Kosovo (CBK), is required for both insurance and reinsurance intermediaries, and all actuaries need to be appointed by the CBK. For foreign insurer applicants, a statement must be provided by the home economy supervisory authority that there is no objection to the start of proposed activities in Kosovo. One of the criteria for licensing agents as insurance intermediaries is that they must be a resident of Kosovo. Residence is also required for managers of insurance companies in order to exercise their activity. The same limitation applies to brokerage services.

Regarding *barriers to competition*, the insurer, which has a licence to conduct certain classes of insurance and can request the exercise of activities in other classes of insurance, must obtain a licence for activity expansion. The CBK has exclusive responsibility for the licensing, supervision and regulation of insurers. Approval by the regulatory authority is required for new rates or fees and for new products or services.

**Construction services** (ISIC Rev 4 codes 41 and 42) covers the construction of buildings (residential and non-residential) and construction work for civil engineering. Construction services play an important role in the functioning of economies by providing the infrastructure for other industries. These services account for a significant share of GDP and employment in most economies. Public works, such as roads and public buildings, account for about half of the market for construction services. The STRI for construction services therefore covers detailed information on public procurement procedures.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.123 and 0.464. With a score of 0.162, Kosovo is the least restrictive WB6 economy. It scores lower than the EU (0.207), OECD (0.223) and WB6 (0.242) averages. The scoring for this sector is mostly affected by the lack of public procurement regulation to explicitly prohibit the discrimination of foreign suppliers.

There are *restrictions on the movement of people* through Kosovo's imposition of licensing requirements to provide engineering services. Furthermore, at least one engineer must be licensed for the issuance of construction permits. To apply for a construction permit, copies of the professional licences of the project designers who prepared the construction documentation are required. However, the law specifies that this requirement is mandatory only when the licences are available through relevant legal acts; until then, applicants must ensure that project designers are qualified with the relevant diploma.

**Architecture services** (ISIC Rev 4 code 711) cover architectural services and related technical consultancy. These services constitute the backbone of the construction sector, with key roles in building design and urban planning. An important feature is the regulatory complementarity between architecture, engineering and construction services, with all three sectors having very similar STRI scores. Architectural and engineering activities are often combined into projects offered by one company, and are sometimes subsumed in the building and construction sector.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.113 and 0.684. With a score of 0.119, Kosovo is the least restrictive WB6 economy. It scores lower than the EU (0.261), OECD (0.244) and WB6 (0.266) averages. The sector's score is mostly affected by licensing requirements and the lack of a temporary licensing system.

*Restrictions on the movement of people* are caused by the fact that a licence or authorisation is required to practice, and there is no temporary licensing system, which means that foreign architects do not have the option to be temporarily authorised to carry out a specific project or to advise in some areas of architecture services but must go through the whole process of being licensed in Kosovo.

**Engineering services** (ISIC Rev 4 code 711) covers several related activities, such as engineering and integrated engineering services, and engineering related scientific and technical consulting services.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.118 and 0.575. With a score of 0.130, Kosovo is the least restrictive WB6 economy. It scores lower than the EU (0.246), OECD (0.234) and WB6 (0.244) averages. As in the architecture services sector, the engineering sector's score is mostly affected by licensing requirements and the lack of a temporary licensing system.

Engineering services are the backbone of construction and supply. Engineers are involved in the construction of key infrastructure, such as buildings and roads, and play an important role in the development of production processes and the adoption of new technologies.

In engineering services, the results are mainly affected by *restrictions on the movement of people*. A licence or permit is required to practice and there is no temporary licensing system, which means that

foreign engineers cannot enter Kosovo temporarily to carry out a specific project or to provide advice in certain fields. However, Kosovo does have a procedure for recognising foreign qualifications. An applicant with a qualifying licence in their home economy must take the general part of the professional exam and fulfil the conditions prescribed in the law. Candidates willing to take the professional examination to carry out tasks in construction must present a variety of documents, including a certificate from the Ministry of Education, Science and Technology (MEST) if academic qualification is achieved abroad. Moreover, those applying for registration on the list of architects and engineers in Kosovo can submit, among other documents, a nostrified (i.e. recognised) diploma by the ministry if they graduated outside the economy.

**Computer services** (ISIC Rev 4 codes 62 and 63) include computer programming, consultancy and related activities, and information service activities.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.123 and 0.448. With a score of 0.160, Kosovo is the least restrictive WB6 economy in the computer services sector. It scores lower than the EU (0.211), OECD (0.222) and WB6 (0.239) averages. The scoring is heavily affected by horizontal limitations on duration of stay for contractual and independent services suppliers, as well as intra-corporate transferees.

This sector is very rarely regulated by sectoral legislation, but is still subject to general laws that apply to the economy as a whole. Restrictions on the movement of people therefore account for one-third of the total score in computer services. The skilled labour intensity of the sector, together with the complementarity between cross-border trade and the movement of natural persons, explains why restrictions on the movement of people feature prominently in this sector in Kosovo. It also explains why this sector is the most open compared to similar sectors in the other WB6 economies. Kosovo has the most attractive horizontally applicable regime for foreign service providers, and therefore its computer services sector is the most liberal.

**The telecommunication sector** (ISIC Rev 4 codes 611 and 612) comprises wired and wireless telecommunications activities. These services are at the core of the information society, providing the network over which other services such as computer services, audio-visual services and professional services are traded.

The 2020 scores for all OECD member states and STRI partners in telecommunications services range between 0.108 and 0.682. With a score of 0.079, Kosovo is not only the least restrictive WB6 economy in the telecommunications sector, but also the least restrictive economy among all STRI participants for this sector. Therefore it scores lower than the EU (0.151), OECD (0.188) and WB6 (0.232) averages.

The results for the telecommunications sector are affected by two policy areas: restrictions on the entry of foreigners and barriers to competition. On average in all STRI participating economies, barriers to competition account for 30% of the total STRI scores in the telecommunications sector. This reflects the fact that it is a capital-intensive network industry, and its strategic importance has led many economies to restrict foreign investment and activity in the sector. This is not the case in Kosovo, however, where EU support has benefitted the sector through a rigorous review of its regulatory regime. The immediate consequence is that the regulation of the telecom sector is aligned with EU regulations and good practice.

In order to ensure fair competition in the telecommunications market, Kosovo has an independent telecommunications regulator, ARKEP, which is separate from stakeholders and the government and operates without state intervention. ARKEP has sufficient regulatory powers to effectively regulate the sector through *ex ante* regulation applied in accordance with EU principles, but only in the case of an operator with significant market power, which is not the case in all telecoms markets. *Ex ante* regulations are applied based on regular market analysis, and are readily available on the ARKEP website. Kosovo applies a "use-it-or-lose-it" policy to frequency bands, which is an important measure that prevents incumbent operators from over-holding valuable frequency licences and free tradable spectrum and

telecom services. The fact that Kosovo also maintains the presence of an SOE<sup>27</sup> negatively affects its STRI score, but is widely observed in this sector.

In absolute terms, the regulatory framework of the telecommunications sector in Kosovo is competitive and constrained only by horizontal measures that apply to the economy as a whole, mainly the movement of people. Although telecommunications lend themselves easily to cross-border trade from a technical point of view, restrictions on the movement of persons account for a modest share of the total STRI score in this sector.

### *Sub-dimension 2.3: E-commerce and digitally enabled services*

E-commerce can bring about significant gains for businesses and is positively related to firms' process innovation. It enlarges businesses' market scope, reduces operational costs at various stages of business activities and lowers barriers to entry, thus intensifying competition (OECD, 2013<sup>[55]</sup>). E-commerce also benefits consumers by providing information on goods and services, helping identify sellers, and comparing prices, while also offering convenient delivery and the ability to purchase easily via a computer or mobile device (OECD, 2013<sup>[55]</sup>).

Digital trade is therefore becoming an increasingly interlaced platform for the exchange in digital services integrated into trade of goods. These implications of the digital transformation underline the importance of adopting a more holistic approach to policies, as well as more international co-operation (Ferencz, 2019<sup>[56]</sup>).

An e-commerce law ideally ensures the proper functioning of the digital market by facilitating the establishment of digital services and their free movement within the region, if co-ordinated. Its aim should be to provide legal certainty for business and consumers by establishing harmonised rules on issues such as transparency and information requirements for online service providers, commercial communications, electronic contracts, and the liability limitations of intermediary service providers. Examples of what the EU Directive on Electronic Commerce<sup>28</sup> covers include shopping, newspapers, databases, financial services, professional services (such as lawyers, doctors, accountants, real estate agents), entertainment services, direct marketing, advertising and internet intermediary services (such as hosting and search engines). Modern e-commerce regulations should focus on, among other things, electronic documentation and signature, online consumer protection, data protection and privacy, cyber security, intellectual property regulations, and intermediary liability. An attractive regulatory environment should refrain from maintaining disproportionately restrictive policies such as licensing requirements for e-commerce platforms, limitations on the type of goods that can be sold online (other than for generally accepted public policy considerations), and restrictions on cross-border data flows. This sub-dimension analyses the content and implementation of existing legislation in the WB region. It then uses the OECD Digital STRI to quantify the performance of the WB6 economies in trade in digital services by identifying the restrictive elements that hamper digital trade.

Kosovo has a solid **e-commerce policy framework** within the Law on Information Society Services, adopted in 2012. This law transposes the EU e-commerce directive<sup>29</sup> and includes chapters on electronic signatures, electronic contracts and electronic payments. The purpose of this law is to establish convenient possibilities for the development of electronic trade and the use of electronic transactions, and to reduce potential problems and abuse during electronic transactions. The Law on Electronic Identification on Trusted Services in Electronic Transactions (transposing the EU regulation on electronic identification and trust services for electronic transactions in the internal market – the eIDAS regulation) has been approved and is now in the final stages of adoption by parliament. This law will supplement the Law on Information Society Services and will create an enabling legal environment for e-commerce and other electronic services.<sup>30</sup> All public, private, NGO and academic stakeholders were consulted during the drafting process.

Regulations on e-commerce fall under the competence of several institutions. The Ministry of Economy and Environment (MEE) is responsible for e-commerce legislative and policy development, while the MTI

and ARKEP are responsible for implementing the law. The MTI is supported in its role by the European Commission through the Instrument for Pre-Accession Funds (EUR 4 million). A working group has been established to steer the e-commerce regulations and funds and consists of representatives of the government, the banking and financial sector, the private sector, NGOs and academia. The new law will repeal Chapter XIII of the Law on Information Society Services on the use of signatures. According to the draft law, the MTI will have the main roles and responsibilities in addressing e-commerce, and will co-operate with the Agency for Personal Data Protection, the Ministry of International Affairs, the CBK, the Kosovo Banking Association, and others. Co-ordination tools are regulated by the draft law.

The Working Group's work started in September 2020 with the aim to significantly boost e-commerce in Kosovo. It comes in a context of clear evidence of a booming e-commerce sector. The number of online purchases is increasing inside and outside of the economy, and there has been a significant increase in the companies and platforms providing e-commerce in Kosovo. Among the enterprises surveyed by the Kosovo Agency of Statistics in 2018, 11.4% made sales through a website or other computer application; this number rose to 22.7% in 2019. Moreover, based on a consultation with the Kosovo Association of Information and Communication Technology (STIKK), there is evidence that during the COVID-19 pandemic there has been a significant increase in the use of e-commerce solutions by all STIKK member companies as a means of development. This is revealed by the sharp increase in demand for e-commerce solutions addressed to STIKK member companies by customers from different sectors and markets during 2020. COVID-19 has favoured the digitalisation of many companies in Kosovo.

Despite improvements in the legal framework, e-commerce is still very limited, and some regulatory aspects are not yet fully operational. Kosovo lacks an online shopping culture and the related legal environment (63.6% of the population have never ordered or purchased products online, according to 2018 data) (Kosovo Agency of Statistics, 2018<sup>[57]</sup>). E-commerce suffers from the regulatory shortcomings of the electronic payment system and the lack of consumer confidence in e-commerce: Banks in Kosovo mostly do not support online payment processes, and if they do, the fees per transaction are very high. As a result, the use of e-commerce is difficult. Businesses have had to adapt to this in different ways, the most common solution being "cash payment" upon delivery of goods/services. Unfortunately, there are no reports estimating the size of the e-commerce market in Kosovo.

The OECD digital STRI captures **the restrictiveness of digitally enabled services** by identifying cross-cutting barriers that inhibit or completely prohibit firms' ability to supply services using electronic networks, irrespective of the sector in which they operate. The regulatory data underlying the digital STRI were extracted from the existing OECD STRI database and data collected under public laws and regulations affecting digitally enabled services. Digital STRIs are the result of aggregating the identified barriers to trade into composite indices. The rating takes into account the specific regulatory and market characteristics as well as the links and hierarchies between regulatory measures affecting digitally enabled services (Ferencz, 2019<sup>[56]</sup>). Figure 22.7 shows Kosovo's score on the digital STRI index.

**Figure 22.7. Digital services trade restrictiveness index: WB6 and CEEC economies**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; \*CEEC=Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovak Republic and Slovenia (Bulgaria, Croatia, and Romania are not OECD member states or OECD STRI Partner economies and therefore do not have calculated STRI indices); the absence of a category in the graph means that it is exempt from restrictions. Source: (OECD, 2020<sup>[53]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934255722>

The 2020 Digital STRI scores for all OECD member states in this sector range from 0.043 to 0.488. The WB6 average is 0.183. Kosovo is in the lower bracket in terms of the restrictiveness of its telecommunications sector with a score of 0.101, which places it among the four least restrictive WB6 economies. Since 2014, Kosovo has become less restrictive in the digital services sector.

Results in most Digital STRI economies are regularly driven by infrastructure and connectivity measures. This is due to the lack of effective interconnection regulation, which is not the case in Kosovo where regulation is relatively well-aligned with international good practice. Similarly, although Kosovo has stricter rules than the OECD guidelines in this area (OECD, 2013<sup>[58]</sup>), it does not impose excessive conditions on cross-border data flows beyond those put in place to ensure the protection and security of personal data. No specific licences or authorisations for e-commerce activities, in addition to ordinary commercial licences, are required.

International standards for electronic contracts and key electronic authentication measures, such as the recognition of electronic signatures, are generally in place.

Policy areas relating to intellectual property rights and payment systems account for a smaller share of the scores of Digital STRI participating economies. Kosovo is relatively open in this category from a regulatory point of view as it follows the principles of European regulations. Regulations are therefore in place that provide for the treatment of foreigners that is no less favourable than that accorded to nationals in terms of intellectual property protection. All necessary regulations related to the payments systems are in place, although their use is limited in practice (as mentioned above).

### ***The way forward for trade policy***

Kosovo has taken important steps to improve its trade policy framework, especially in the areas of public consultations on new legislation and evaluation mechanisms. Nevertheless, the government of Kosovo could improve its trade policy framework by considering the following:

- **Strengthen public consultation mechanisms and make them more transparent.** The authorities responsible for public consultation mechanisms should be mandated to publish consultation summaries on the dedicated website. Kosovo should also consider increasing the number of stakeholder comments in the consultation process, for example through the use of methods for public consultation other than electronic platforms (such as informal meetings).
- **Broaden trade in services efforts beyond regional trade agreements.** Significant improvements have been made among WB6 economies to open services trade through the conclusion of CEFTA Additional Protocol 6 in December 2019. Nonetheless, the STRI analysis in this section has provided some insights into where domestic reforms could help to attract new businesses and improve competitiveness:
  - **Ease conditions on the temporary movement of natural persons** beyond regional trade agreements to further encourage innovation and knowledge transfer and contribute to economic growth. A starting point could be to amend the limitation on the length of stay of foreign services providers as it falls short of international best practice; OECD good practice recommends a minimum initial length of stay of foreign service providers of 36 months.
  - **Reduce the remaining barriers to market entry and competition in courier services, legal services and air transport sectors.** Further efforts could be made to increase competitiveness. There are improvements to be made in the courier sector, such as amending the preferential subsidy treatment available to the designated postal provider. In the air transport services sector, Kosovo could consider lifting the interdiction of the lease of foreign aircraft with crews. It could also depart from the slot allocation process that gives priority to historic slots, which has a negative effect on competition. The regulation in the legal services sector that requires foreign lawyers obtaining a licence to act as co-lawyer with a local and licensed lawyer could also be reconsidered, and potentially abolished.
  - **Continue to monitor and promote services.** Maintain the momentum of initiatives such as the services database and dedicated website, but also develop additional means to estimate the potential of the economy's services sector. A start could be to systematise statistics collection on services activities by generating more disaggregated data at the sectoral level. Regarding trade in services there is a need to begin generating more detailed data on the different services categories and on foreign affiliate trade statistics (FATS).
- **Strengthen the regulatory regime for e-commerce.** Kosovo should bring into force as soon as possible the new Law on Electronic Identification on Trusted Services in Electronic Transactions that will replace the existing Law on Information Society Service to make up for the current regulatory shortcomings, particularly in the area of payment systems. For this, Kosovo can rely on the recommendations of the OECD's Policy Guidance on Mobile and Online Payments (Box 22.3).

### Box 22.3. OECD policy guidance on mobile and online payments

A key component of a solid e-commerce regulatory policy is the establishment of sound measures for electronic payments and settlements. The main roles of a payment system are to provide a means of transferring value between different parts of the economy and to facilitate transactions at minimum cost. Its design will be optimal if it is organised in such a way as to allow rapid and efficient value transfers, while imposing minimum additional costs and risks. High costs for the payment process can seriously affect economic activity, making transactions too costly. Conversely, the lower costs of efficient payment systems can have a positive effect on economic growth.

Policy makers can help to encourage economic activity by promoting a framework for electronic settlements and payments. The OECD's Policy Guidance on Mobile and Online Payments (OECD,

2014<sup>[59]</sup>) provides an informative framework on policy measures to establish a regulatory environment for e-commerce that can be adapted to WB6 economies.

The framework is oriented around a number of pillars:

- **Information on conditions and transaction costs.** These principles focus on the accessibility and readability of payment information, the complexity of payment conditions, and the clarity and transparency of billing statements.
- **The privacy implications of mobile and online payment.** These guidelines focus on the collection and use of payment data.
- **Security implications of mobile and online payment transactions.** These guidelines focus on protecting the security of consumer payments.
- **Confirmation process.** These guidelines focus on issues that impede e-commerce transactions, such as the uncertainty of transactions.
- **Children.** This includes issues such as the costs incurred by children in accessing goods and services.
- **Different levels of protection among providers and payment methods.** This includes information on consumer protection and levels of payment protection.
- **Fraudulent, misleading, deceptive and other unfair commercial practices.** These guidelines focus on how to regulate inconsistent payment information, renewable contracts, renewable subscriptions and repeat purchases, unexpected charges and consumer confidence.
- **Dispute resolution and redress.** These include issues such as the roles and responsibilities of the parties and the cost of redress.

## Access to finance (Dimension 3)

### Introduction

Kosovo has made progress in certain indicators that facilitate access to finance (Figure 22.1). With an overall score of 2.1, Kosovo is performing below the WB6 average (Table 22.5). However, it should be noted that this is mainly linked to the absence of a stock market in the economy, which negatively impacts the score for the mobilisation of long-term financing and lowers the overall score. Kosovo has made progress regarding access to alternative financing sources since the previous assessment, increasing its score from 1.4 to 1.8.

**Table 22.5. Kosovo's scores for access to finance**

Dimension	Sub-dimension	Score	WB6 average
Access to finance	Sub-dimension 3.1: Access to bank finance	3.4	3.4
	Sub-dimension 3.2: Access to alternative financing sources	1.8	1.9
	Sub-dimension 3.3: Mobilisation of long-term financing	0.5	2.8
Kosovo's overall score		2.1	2.6

### State of play and key developments

#### *Sub-dimension 3.1: Access to bank finance*

Kosovo's financial sector is bank-dominated. Banks account for around 66% of overall financial sector assets, which is a lower share than other Western Balkan economies. As of August 2020, ten commercial banks were operating in the economy, eight of which were foreign owned, accounting for 86.7% of total banking assets (CBK, 2020<sup>[60]</sup>). As of 2019, no bank had ceased its activity and no bank has been sold since 2010. Of the ten operating banks, the cumulative share of the top three banks has constantly decreased from 77.8% in 2010 to 56.9% in 2019, showing an increase of competition in the banking sector. This could also be associated with the parallel decrease of effective interest rates from 14.4% in 2010 to 6.5% in 2019.<sup>31</sup> However, the level of competition should also be carefully monitored, as too much competition in the banking sector increases the possibility of excessive risk taking by banks, potentially leading to failures (Thorsten Beck, 2003<sup>[61]</sup>; World Bank, 2018<sup>[62]</sup>).

Kosovo has moderately developed its regulation for the **banking industry**. Some progress has been made since the previous assessment in implementing legislation on banking supervision that aims to strengthen corporate governance and the management of credit risk. This legislation was adopted in March 2019 by the Central Bank of Kosovo (CBK). Some progress has also been made on aligning with the Basel III recommendations,<sup>32</sup> with the CBK implementing the definition of capital and the leverage ratio, as well as the Internal Capital Adequacy Assessment Process for banks as a Pillar 2 requirement<sup>33</sup>. However, in order to be compliant with Basel II requirements<sup>34</sup> from January 2020, Kosovo needs to revise its regulations on credit risk, market risk and operational risk. The CBK is drafting new regulation on liquidity requirements, but no further information on this could be identified during the assessment period.

No major changes have occurred to the **register** since the previous assessment. A cadastre is available online, with all records fully digitalised; however, only authorised intermediaries such as lawyers can obtain information on land ownership. In addition, there is no independent mechanism for filing complaints related to immovable property registration. In 2020, the Kosovo Cadastral Agency launched the testing phase of an online module for mortgage registration and communication with banks and credit non-bank financial institutions. The results are expected to be analysed in the next assessment period.

In February 2020, the CBK approved new instructions on credit registry and established the Credit Registry of Kosovo. It is mandatory for loan providers to use the system and to be monitored by the CBK. The

instructions establish the procedure for reporting the collection and distribution of positive and negative information regarding active loans and the credit history of natural and legal persons. The aim is to improve the credit rating process of credit clients and the performance of CBK's supervisory function. The registration system for security rights over movable assets is also online and publicly accessible. However, it requires a personalised login, after which users can also register pledges through the system. The pledge registry of movable assets covers the entire economy and is open to all interested natural and legal persons. The information is regularly updated and covers the entire economy.

The registration of fixed assets is mandatory and needs to go through the cadastre office. Only fixed assets can be used to secure loans, which potentially limits the options for borrowing money. There is no unique threshold under which **collateral requirements** are flexible for small businesses, this depends on banks' internal policy, however the regulations specify which type of collateral could be used. Although domestic credit lending to the private sector is increasing, banks are increasingly risk averse, which means that they impose high collateral requirements (close to 270% of the loan value and relying on fixed assets), making it difficult for many SMEs to qualify for loans (World Bank, 2019<sup>[63]</sup>).

Kosovo is one of the few economies in the Western Balkans region that established a **credit guarantee** fund prior to COVID-19 (AECM, 2020<sup>[64]</sup>). The Kosovo Credit Guarantee Fund (KCGF) is fully operational and covers up to 50% of the risks of principal loans for micro, small and medium-sized enterprises (MSMEs) operating in the industrial sector, up to a maximum guarantee of EUR 250 000. For businesses operating in the agricultural sector the maximum guarantee is fixed at EUR 100 000. The total amount of the loan in both sectors cannot exceed EUR 1 million. The loan maturity under the guarantee is fixed at 84 months. There is also a guarantee fund under the EU's Competitiveness of Enterprises and Small and Medium-sized Enterprises Programme (COSME), through which the KCGF has transferred benefits to the financial sector to support MSMEs operating in the field. The maximum loan amount is fixed at EUR 150 000, and 50% is covered under the guarantee. The minimum loan maturity is fixed at 12 months while the maximum is 120 months. Up to December 2019, approximately 3 500 businesses had benefitted from both programmes, representing a guarantee value of EUR 75 million.

At the end of 2020, the KCGF signed a subsidiary agreement with the Ministry of Finance for around EUR 22 million. This agreement, the result of a financing agreement between Kosovo and the World Bank under the Financial Sector Strengthening Project, aims to increase the capital of the KCGF to further support the private sector's need for short-term liquidity. It will also promote investment by creating guarantees for certain market segments such as women in business, young entrepreneurs, and the manufacturing and agriculture sectors. The KCGF, through support from the Millennium Foundation Kosovo, also foresees supporting the acceleration of project finance investments from private investors in renewable energy and energy efficiency projects.

### *Sub-dimension 3.2: Access to alternative financing sources*

There are limited alternatives to banks as a source of finance in Kosovo; however, **leasing** has become a growing financing resource for businesses, increasing from EUR 20.8 million in 2012 to EUR 52.7 million in 2019. Leasing has been regulated since August 2009 under the supervision of the CBK. The leasing law includes clear definitions and ownership rights, as well as information on how the process should be instigated, the steps to follow and guidance on any required involvement of third parties.

The law on **factoring**, drafted in co-operation with the European Bank for Reconstruction and Development (EBRD) and the CBK, entered into force in October 2018. The regulation establishes the general legal and regulatory requirements for the exercise of factoring by entities licensed/registered by the CBK. It defines and governs types of factoring, factoring contracts, the rights and obligations of the parties to a factoring transaction, as well as the reporting and supervision of licenced/registered entities. However, as of January 2020 no factoring activity had been reported.

There are no government supported **private equity** or **venture capital** activities in Kosovo. The Enterprise Innovation Fund (ENIF), which is a stand-alone venture capital fund covering the Western Balkans region under the Western Balkans Enterprise Development and Innovation Facility (WBEDIF), invested EUR 200 000. In addition, EUR 1 million in equity finance was invested in one company under the Enterprise Expansion Fund (ENEF), which is the second investment fund under the WBEDIF's equity instrument pillar (WB EDIF, 2019<sup>[65]</sup>).

**Business angel networks** are relatively active in Kosovo and involve smaller investments. One active network saw 15 separate investments in 2018 with a cumulative amount of EUR 250 000; however, the invested amount had decreased by around 50% compared to 2016 (EBAN, 2018<sup>[66]</sup>).

No activity has been reported on **crowdfunding** or **initial coin offering** during the assessment period. At the time of drafting, the EBRD is assessing the possibility of developing a crowdfunding donation/reward-based system with a financial institution that supports start-ups. The platform is planned to be launched in 2021.

### *Sub-dimension 3.3: Mobilisation of long-term financing*

The Law on Public Private Partnership is the main legislative act that sets out the policies, procedures and institutional framework for **public-private partnerships** (PPP) in Kosovo. The PPP law clearly defines the rights of all parties involved, including investors. It refers to the Law on Public Procurement for tendering procedures. Dispute mechanisms are regulated by the law and the standard PPP agreement, which foresees: 1) amicable resolution; 2) mediation by an independent expert; and 3) arbitration. Several PPP projects have been approved by the PPP Committee, and contracting authorities have awarded six contracts<sup>35</sup> since 2016 following competitive tendering procedures.

Savings rates are generally low in Kosovo (39%) compared to the euro area (67%). Despite a constant increase, from 5% in 2011 to 9% in 2017, household savings within financial institutions are even lower (49% in the euro area in 2017) (World Bank, 2018<sup>[62]</sup>). Savings generally reflect households' disposable income, general economic conditions and the rate of poverty. Savings in financial institutions reflect the income of households plus the level of trust in these institutions. The lower the rate, the lower the potential liquidity that could be used by **institutional investors or asset management firms** for potential local investments. Therefore, the low level of savings could also explain the lack of such operators in the economy.

Although there is still no **stock market** operating in Kosovo, the primary government **bonds market** is open to banks. However, non-financial institutions are not allowed to access the market, which limits the number of potential investors and financial resources that could be raised by the government.

### ***The way forward for access to finance***

To enhance the banking industry and support businesses' access to finances, policy makers should:

- **Support crowdfunding by adopting dedicated legal frameworks.** Targeting the large diaspora may be more successful than attracting venture capital, given the lack of such investment thus far. Such initiatives would increase the number of potential financing sources, especially for smaller companies, as well as expand the sources of private financing and boost foreign direct investment. Lithuania offers a good example (Box 22.4).
- **Make use of the new factoring legislation by introducing new factoring services as an additional source of finance from financial institutions.** Since the law entered into force in 2018 no factoring activity has been recorded. A review of the market could help to identify the needs of the private sector and further stimulate the use of factoring services.

- **Consider a review of the business angel network.** A comprehensive assessment of existing business angel investments could help the government to better capture the requirements of business angel networks. Based on the results, which would hopefully clarify the fall in investments in the last four years, the government could consider developing a strategic plan for the development of business angel networks. Additional policy tools, including tax incentives, could be deployed to promote further interest.
- **Diversify equity financing by supporting foreign stock listing.** As there is no operational stock market in Kosovo, and given the relatively small size of the market, foreign stock listing could increase access to finance for large and medium-sized enterprises. Although a listing on a foreign stock exchange might increase reporting and disclosure requirements, which could add additional pressure on executives, the government could increase corporate governance standards by targeting qualified enterprises and facilitate the transition of firms to the new jurisdictions. This could also help businesses attract investors who would otherwise be reluctant to invest. Such government actions might help enterprises overcome liquidity problems following the COVID-19 crisis.

#### Box 22.4. Lithuania's crowdfunding legislation

While Lithuania's crowdfunding market is smaller than other European fintech hubs, the economy is only one of 11 EU Member States with dedicated domestic legislation for crowdfunding platforms and boasts a mature and comprehensive regulatory framework for crowdfunding. Although its crowdfunding is in its infancy, Lithuania currently has 15 registered crowdfunding platforms. There has been a positive increase in the total value of crowdfunding platform loan portfolios, from EUR 6.6 million in 2019 to EUR 9.13 million in the first half of 2020 (Bank of Lithuania, 2020<sup>[67]</sup>).

Lithuania adopted its Law on Crowdfunding in 2016 with the aim of providing a hospitable, clear and transparent setting for cross-border crowdfunding platforms. The law adopted all aspects of the European Commission's Regulation for European Crowdfunding Service Providers, allowing for a seamless transition once the EU Directive comes into force (European Commission, 2018<sup>[68]</sup>). It was established through a multiple stakeholder consultation process and provides better protection and guarantees for investors through information disclosure obligations, governance rules, risk management and a coherent supervision mechanism. The law covers equity, real-estate and debt-based crowdfunding models, while donation and rewards models continue to fall under the Civil Code of the Republic of Lithuania.

Transparency regulations for crowdfunding platforms help mitigate misinformation and legal risk to better protect investors. Platforms must be included on the Public List of Crowdfunding Platform Operators and subject to an efficient reliability assessment conducted by the Bank of Lithuania's supervisory authority within 30 days. Platform operators, board members and significant stakeholders also undergo a criminal record check, while platforms must instate measures to avoid, identify and address any conflicts of interest that would prejudicially benefit the funder or project owner.

In addition to the EUR 40 000 minimum capital requirement, platform owners are required to put up 10% of starting capital themselves. In the case of offerings between EUR 100 000 and EUR 5 million, platform operators are obligated to publish a light prospectus, while offerings over EUR 5 million require a full prospectus detailing the project and project owner characteristics, proportion of own funds used, details of the offering, security measures, and the existence of secondary markets.

In all cases, Lithuania's crowdfunding regulations require platforms to publish wide-ranging information on their websites for investors, including data on the company, risks associated with investment, project selection criteria, conditions and procedures for repayment of funds, disclaimers on tax and insurance information, and monthly and yearly progress reports.

Lithuania is continuously improving its innovative business environment to give financial institutions and crowdfunding platforms more investment opportunities. In 2016, the economy began allowing the use of remote identity verification via qualified electronic signatures and video streaming/transmission, and is harmonising itself with the EU Regulation on electronic identification. Lithuania has also recently amended its Law on the Legal Status of Aliens to include an e-residency programme that allows foreigners to set up companies, open bank accounts and declare taxes through digital identification. This will further financing opportunities for its fintech platforms.

## Tax policy (Dimension 4)

### Introduction

Table 22.6 compares scores for Kosovo with the Western Balkan average for two tax policy dimensions: tax policy framework and tax administration. Kosovo scores above the WB6 average for both dimensions. Scores for both dimensions are driven by slightly above-average performance in most indicators.

**Table 22.6. Kosovo's scores for tax policy**

Dimension	Sub-dimension	Score	WB6 average
Tax policy dimension	Sub-dimension 4.1: Tax policy framework	2.8	2.6
	Sub-dimension 4.2: Tax administration	4.0	3.3
	Sub-dimension 4.3: International tax co-operation	n.a.	n.a.
Kosovo's overall score		3.4	3.0

Note: For comparability with the previous assessment, the new sub-dimension (4.3) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 4.1: Tax policy framework*

**Tax revenue** as a share of the economy is relatively low in Kosovo. As for most WB6 economies, Kosovo's tax-to-GDP ratio has increased in recent years, from 21.8% in 2015 to 23.4% in 2019 (Table 22.7). However, this ratio remains below both the OECD (33.8% in 2019) and WB6 (30.6% in 2019) averages. Kosovo's tax mix is highly concentrated on taxes on goods and services, which accounted for 74.2% of total tax revenue in 2019. This share is considerably higher than the OECD average of 32.7% in 2018 and the WB6 average of 51.9% in 2019. Consequently, other taxes play a smaller role in Kosovo. In OECD countries, personal income tax (PIT) and corporate income tax (CIT) combined account for a third of total revenue, on average (33.5% in 2018). In Kosovo, these taxes only account for 14.1% of total tax revenue, in alignment with regional trends (14.9% WB6 average in 2019). The high level of VAT concentration is likely to leave Kosovo exposed to a potential decline in VAT revenue, which largely comes from VAT levied on imports. Kosovo could rebalance the tax mix by strengthening taxes on labour income, environmental taxes and recurrent taxes on immovable property. It could also raise additional revenue from social security contributions (SSCs) to provide supplementary funding for the welfare system. Kosovo yields the least revenue by far from SSCs among the WB6 (10% of total tax revenue in 2019 compared to a 28.8% WB6 average). However, SSC rates raises should be designed carefully and balanced against other policy objectives – an increase in SSCs may raise labour costs and further increase the large informal economy, which is a significant issue for Kosovo and other WB economies.

**Table 22.7. Kosovo's tax revenues as a share of GDP**

	CIT	PIT	SSCs	Goods and services	Tax/GDP ratio
Kosovo	1.3%	2.3%	2.6%	19.3%	23.4%
WB6	1.8%	2.7%	9.3%	15.9%	30.6%
OECD	3.1%	8.1%	9.0%	10.9%	33.8%

Note: CIT= corporate income tax; PIT= personal income tax; SSCs= social security contributions.

Source: OECD (2019<sup>[71]</sup>), OECD.stat <https://stats.oecd.org/> (2019 for overall tax/GDP ratio and 2018 specific tax/GDP ratio).

Kosovo levies a standard 10% rate for CIT (Table 22.8), which broadly aligns with the 11.5% WB average (2020). This rate is significantly below the 23.3% OECD average (2020). This low CIT rate is also to some extent reflected in Kosovo's tax revenue. For instance, CIT revenue accounts for 1.3% of GDP in Kosovo, which is below WB6 (1.8% in 2019) and OECD (3.1% in 2018) averages. Kosovo introduced a CIT reform

in 2019 that restricted the companies that can benefit from a special turnover tax in certain sectors. In particular, the turnover eligibility threshold for small taxpayers was reduced from EUR 50 000 to EUR 30 000. Under this preferential regime, taxpayers with an annual gross income of up to EUR 30 000 can opt for preferential rates applied to gross income – 3% on income from trade, transport and other activities, 9% on income from services and entertainment activities, and 10% on income from rental activities.

Capital gains are considered as business income and taxed at the standard 10% rate. Interest and royalty payments made to resident companies are subject to a withholding tax at the rate of 10%. However, dividend income is excluded from the CIT base, and no tax is withheld upon payment to resident and non-resident shareholders. Concerning the taxation of international business income, Kosovo operates a worldwide taxation system in which resident corporations pay taxes on domestic and foreign-sourced income, while non-resident companies are liable only for taxes on income originating in Kosovo. A worldwide taxation system is currently adopted in all WB economies. Such systems have become increasingly less common among OECD countries in recent years, particularly for small open economies.

**Table 22.8. Selected tax rates in Kosovo**

	CIT	PIT	SSCs	VAT
Kosovo	10.0%	10.0%	10.0%	18.0%
WB	11.5%	12.8%	28.6%	19.0%
OECD	23.3%	42.8%	26.9%	19.3%

Note: CIT= corporate income tax; PIT= personal income tax; SSCs= social security contributions. CIT and PIT averages for WB and OECD are based on top statutory rates. PIT for Kosovo is the top statutory rate.

Source: (OECD, 2020<sup>[72]</sup>), OECD.stat, <https://stats.oecd.org/>, (2020 for CIT and VAT, 2019 for PIT and SSCs).

Corporate **investment incentives** in Kosovo involve both cost and profit-based incentives. Profit-based incentives (which generally reduce the tax rate applicable to taxable income) are targeted at small companies and include amortisation, special allowances and loss-carry forward. As mentioned above, Kosovo also implements profit-based incentives through special turnover tax rates applied to the gross income of small companies in specific sectors. It also implements a series of targeted cost-based incentives, which lowers the cost and increases the size of the investment. These incentives include depreciation across different categories,<sup>36</sup> a research and development incentive for investment in the exploration and development of natural deposits of minerals and other natural resources, and the full deduction of expenses paid by an employer to an educational institution for its employees. Research shows that cost-based incentives are preferable to profit-based incentives, which risk leading to high redundancy of expenditure as the investment may have proceeded anyway (UNCTAD, 2015<sup>[73]</sup>). Overall, Kosovo provides an attractive corporate tax environment for investment through a low standard CIT rate, special turnover tax rates and several corporate tax incentives. However, these measures also come at some cost to tax revenue. As a result, Kosovo may wish to investigate empirically whether the use of profit-based tax incentives involve redundancy of expenditure and continue to be value for money.

PIT revenue is low in Kosovo, which is common in the region. PIT revenue as a share of GDP was 2.3% in 2019, in line the 2.7% WB6 average (2019), but drastically below the 8.1% OECD average (2018). Kosovo currently operates a progressive PIT rate schedule, with four different rates: 0% for annual taxable income under EUR 960, 4% between EUR 960 and EUR 3 000, 8% between EUR 3 000 and EUR 5 000, and 10% over EUR 5 000. While Kosovo raises PIT revenue in similar proportion to regional levels, these rates are low compared to other WB economies. The other WB economies with a progressive rate schedule, Serbia and Albania, have a top rate of 18% and 23% respectively, while economies with a flat PIT rate had an average rate of 9.8% in 2020. Furthermore, input from local stakeholders indicates that the top PIT threshold is slightly below the average wage in Kosovo (EUR 5 400). This low and progressive taxation of labour income may encourage informal workers to enter the formal economy. However, the informal economy remains large, estimated at 31% of GDP (European Commission, 2018<sup>[74]</sup>). To further

help the registration of informal workers, one option for PIT reform could be to redesign the PIT rate schedule to more effectively target high earners. This shift in the tax burden could help provide additional relief for low earners as well as an incentive to leave the informal sector. It would also help Kosovo increase wealth redistribution in its economy, as other taxes on labour income, such as SSCs, are mostly levied at the same rate across income levels.

Regarding the taxation of personal capital income, although **capital gains** are subject to PIT at the general progressive rates, other types of passive income are taxed at special rates: **interest** and royalties paid to resident individuals are subject to a 10% withholding tax, and rental payments to a 9% withholding tax.<sup>37</sup> **Dividends** are excluded from the PIT tax base, and in general exempt from any tax liability. The diverse tax rates on personal income create a difference between the taxation of labour income and the taxation of capital income. This difference, mostly fostered by the absence of dividend taxation, incentivises entrepreneurs to incorporate and receive income in the form of capital rather than salaries. Limiting these distortive effects by harmonising the taxation of labour and capital income could be explored as a policy option.

Contrary to most WB economies, funds from **social security contributions** are relatively low in Kosovo. In 2019, SSCs as a share of GDP were 2.6%, which is significantly lower than the 9.3% WB average (2019) and the 9.0% OECD average (2018) (Table 22.6). Kosovo is by far the least reliant of the WB economies on SSC funds – the second least reliant (Albania) levies twice as much revenue from SSCs proportionally. In principle, such low reliance on SSC funds may pose some challenges in funding welfare payments. The size of SSC funds in Kosovo could partly be explained by the economy's low SSC rates. Employers and employees are both liable for a 5% SSC payment on gross salary. Further voluntary contributions of up to 10% are possible for taxpayers. A maximum contribution of 15% of gross salary is therefore possible for both employees and employers. The total mandatory SSC liability amounts to 10% of gross salary, which is slightly above a third of the OECD and WB averages (26.9% and 29.4% in 2020, respectively). This is by far the lowest combined rate among WB economies (the second lowest is Albania with 27.9%). In addition to this below-average rate, the balance between employer and employee SSC is atypical by regional and international standards. While Kosovo levies the same rate for employers and employees, OECD countries tend to place a higher average SSC burden on employers (17.8% for employers and 9.8% for employees in 2020), and WB economies tend to do the opposite (9.5% for employers and 19.9% for employees in 2020). This trend in OECD countries is possibly linked to the fact that PIT rates are higher on average than in the WB6. Self-employed individuals are liable for a 10% minimum contribution, with an additional voluntary contribution of up to 20% (30% maximum overall contribution). The minimum contribution rate is far below the average rate for self-employed individuals in WB economies (29.7% in 2020). There is scope to redesign the current SSC framework by replacing part of the voluntary contributions with mandatory contributions.

Tax revenue from consumption is high in Kosovo. In 2019, taxes on goods and services as a share of GDP were 19.3%, the second highest among WB economies (15.9% WB average in 2019) (Table 22.6). This ratio is also above the OECD average (10.9% in 2018). The standard VAT rate in Kosovo is 18%, which is slightly below the 19.3% OECD average (2020) and the 19% WB average (2020). This rate is the second lowest of the WB economies (after Bosnia and Herzegovina). Kosovo also has a reduced 8% VAT rate for certain goods and services, including the supply of electricity and water, some food products, textbooks and medicine supplies. OECD research has found that reduced rates are generally not an effective way to target individuals on low incomes, and in some cases may even be regressive (OECD, 2018<sup>[75]</sup>). The threshold required to register for VAT in Kosovo was reduced in 2015 from EUR 50 000 to EUR 30 000, which aligns with the CIT thresholds introduced after the 2019 CIT reform. However, the VAT threshold is relatively low compared to the average threshold found in OECD countries. The reduction in the VAT registration threshold could also be complemented by VAT simplification measures, such as the less frequent filing of VAT returns and simplified accounting methods. As for **environmental taxes** in Kosovo,

excise duties are levied on gasoline and diesel, but not on carbon emissions. An “ecology tax” mandates that vehicle owners must pay EUR 10 or 30 each year, depending on the vehicle type.

Kosovo’s official economic **modelling and forecasting** is carried out using the Kosovo Macro Projection Model, which forecasts future tax revenue using macroeconomic indicators and effective tax rates from the previous year. It has been developed for most taxes, with the exception of property tax. Currently, the Tax Administration of Kosovo (TAK) does not use micro-simulation models, unlike many other WB economies that are currently implementing (or implemented recently) such models. Kosovo would benefit from a more disaggregated approach to its revenue forecasting, which micro-simulation models would foster.

Kosovo does not currently operate a regular **tax expenditure report**, unlike several other WB economies. For example, Albania implemented a tax expenditure report in 2019 and North Macedonia and Montenegro are currently in the process of implementing them. The development of a regular tax expenditure report would allow Kosovo to monitor the use and effectiveness of tax incentives along with tax revenue forgone (OECD, 2010<sup>[76]</sup>). To do this, the cost of tax expenditure must be identified, measured and reported in a way that enables the comparison of the monetary value with direct spending programmes (IMF, 2019<sup>[77]</sup>). Cost-benefit analysis could also be conducted to evaluate whether specific tax incentives meet their stated objectives and, if not, whether they should be abolished or replaced.

Governments have taken rapid and unprecedented action to address the health crisis and the fall in economic activity caused by the outbreak of COVID-19. Containing and mitigating the spread of the virus has rightly been the first priority of public authorities. With containment measures in place, the immediate policy reactions focused on alleviating hardships and maintaining the productive capacity of the economy (OECD, 2020<sup>[78]</sup>).

Among its responses to the COVID-19 pandemic, Kosovo carried out a number of tax policies, including:

1. Tax filing and payment extensions for all tax types and pension contributions.
2. An exemption from VAT on imports of raw materials used in the production of bread and its products.
3. The calculation of interest and fines for the non-payment of property tax was suspended until 31 December 2020.
4. Wage subsidy scheme for employees affected by the pandemic.
5. Public loan guarantee scheme.

Kosovo has implemented a relatively narrow set of responses to COVID-19 compared to other WB economies. For example, it did not introduce a direct cash transfers to households, or the deferral of households’ and businesses’ fixed costs.

#### *Sub-dimension 4.2: Tax administration*

The TAK is responsible for all main taxes, while the Customs Service collects customs duties and VAT on imports. The TAK carries out all the main **tax administration functions**, including tax fraud investigations that are generally carried out by a special police department in other WB economies. Its internal organisation matches the various functions of a tax administration (such as tax collection or audits), while special divisions exist for large taxpayers and SMEs. OECD research shows that a unified body that covers all taxes and all core tax administration functions is an important factor in strengthening the efficiency of the tax administration (OECD, 2018<sup>[37]</sup>). The TAK is regularly assessed by several domestic and international institutions. The Office of the Auditor General in Kosovo, as well as the International Monetary Fund (IMF) and the European Commission, carry out annual assessments leading to periodic strategic plans.

**Tax compliance assessment and risk management** is overseen by the TAK using a risk-based analysis which identifies taxpayers showing certain abnormalities regarding a predetermined set of risk criteria. This function is supported by the Division of Tax Audits Procedures and the Division of Risk Management within the tax administration. The analysis leads to the issuance of a Risk Response Plan, which classifies taxpayers into different revenue risk groups. OECD research shows that risk-based selection is a key element of effective and efficient compliance programmes as it allows administrations to make effective trade-off decisions and make the best use of their resources (OECD, 2018<sup>[37]</sup>). No legal framework has been implemented to guarantee procedural justice during tax audit procedures, which could be an area for improvement moving forward. The Division of Tax Audits Procedures monitors the audit implementation plan. Segmentation models are also used by the Division of Risk Management.

In terms of **independence and transparency**, the TAK has full operational autonomy within the Ministry of Finance. A legal framework establishes its legal status and defines its duties and responsibilities, as well as the procedures linked to its functions. While its budget is not independent from annual budgeting procedures, which fix the level of resources, the TAK has autonomy over its yearly expenditure. The director general of the TAK presents an annual report to the Ministry of Finance. As mentioned above, the TAK is regularly audited by the Office of the Auditor General in Kosovo, which produces annual reports on its performance, including independence and transparency. These reports provide recommendations that are mandatory for the management board to implement.

Concerning **tax filing and payment procedures**, most taxes can be filed and paid electronically or manually. Only e-filing is available for VAT, wage withholding tax and pension contributions. Most taxes are filed quarterly or annually. Taxes for which e-filing is mandatory are declared monthly. Overall, e-filing is widely used in Kosovo: 95% of declarations are undertaken electronically, and this figure has been constantly increasing since e-filing was introduced for the 2011 fiscal year. The whole tax filing procedure is regularly assessed by external auditors, including the IMF and the TAK itself.

Various **taxpayer services** are offered by TAK and its regional services, and online access to information, electronic communications and in-person inquiries are at the public's disposal. Kosovo's tax legislation also provides for a taxpayer advocate that protects the rights of citizens against the tax administration. The monitoring and assessment of taxpayer services is carried out in co-operation with relevant stakeholders. Surveys assessing taxpayer satisfaction are conducted every two years.

#### *Sub-dimension 4.3: International tax co-operation*

Kosovo has not engaged extensively in **international tax** reforms since the last report. As it has not joined the Inclusive Framework on Base Erosion and Profit Shifting (BEPS), it has not formally launched any related initiatives. However, it is using the OECD Model Tax Convention as a basis for its double-tax treaties, which informally leads to the implementation of some BEPS minimum standards. Kosovo has yet to engage in administrative co-operation or exchange of information initiatives, but indicates that it is in the process of reviewing domestic legislation to determine necessary actions in these fields. In 2016, Kosovo drafted its Administrative Instruction on Transfer Pricing, based on OECD Transfer Pricing Guidelines and recommendations from the BEPS project. Kosovo would benefit from closely following OECD developments in these areas. This would allow Kosovo to align its tax system with international standards and facilitate potential adhesion in the future.

Kosovo has launched some limited initiatives in the field of **digital taxation**. Although it levies VAT on cross-border digital services, it has yet to implement international VAT/GST (goods and services tax) guidelines. In Kosovo, VAT is levied in the place where the service supplier is established, which differs from the "destination principle" – the cornerstone of international VAT/GST guidelines. Furthermore, Kosovo does not include individuals' income received from digital platforms in the PIT tax base, and thus fails to capture a growing revenue from the digital economy. Kosovo has not participated in the discussions on Pillars 1 and 2 of the OECD's Tax Challenges Arising from Digitalisation proposal. These developments

taking place at the OECD level could have a great impact on the taxation of corporate income in Kosovo, especially under Pillar 2. The Global Anti-Base Erosion Proposal (GLoBE) intends to define the minimum taxation of corporate profits. Although the final rate will depend on ongoing discussions, Kosovo has a low CIT rate, one of the lowest in Europe, and is at great risk of being impacted by GLoBE. If the minimum rate is set higher than 10%, Kosovo would be faced with a choice of either raising its rate or risk forgoing tax revenue (other jurisdictions would collect revenue from economic activity that has its source in Kosovo). The GLoBE proposal might also restrict Kosovo's use of tax incentives, particularly those which are profit-based. This topic will have great importance in the near future, and Kosovo may wish to evaluate its position and prepare an action plan accordingly.

Kosovo is engaged in moderate **regional co-operation** with its WB neighbours, usually through memoranda of understanding or double taxation agreements. Kosovo is also part of the Regional Cooperation Council's SEE Strategy 2020 implementation programme. Its main regional co-operation partners are Albania and North Macedonia, with which Kosovo exchanges best practices on taxation and staff training.

### ***The way forward for tax policy***

To enhance the tax policy framework and achieve objectives, policy makers may wish to:

- **Broaden its support for economic recovery in light of COVID-19, with targeted tax and subsidy measures.** Kosovo has implemented a relatively narrow set of measures to mitigate the effects of COVID-19 on its economy and citizens. Policy makers may wish to broaden existing efforts, while focusing on measures that could spark an economic recovery.
- **Increase tax revenue and diversify the tax mix by strengthening the role of CIT, PIT and SSCs.** Kosovo is heavily reliant on taxes on goods and services, and there is scope to diversify the tax mix. Additional funds from SSCs would help to finance the welfare system. Increased CIT and PIT could bring more progressivity into the tax system and raise additional revenue. Developing other taxes, such as property taxes or environment related taxes, could also be explored as a policy option.
- **Assess the design of the PIT rate schedule to bring more targeted progressivity into the tax system.** Kosovo's current PIT design places the top income threshold just below the average wage. The design could be strengthened to further target high earners and enable more wealth redistribution in the tax system.
- **Reinforce efforts to curb the informal economy and encourage businesses to register in the formal economy.** Kosovo has a significant informal economy, which reduces its tax base. Increasing efforts to curb the informal economy could bring additional tax revenue.
- **Consider making voluntary SSCs mandatory to widen the scope of welfare protection.** Of the WB6 economies, Kosovo yields the least revenue by far from SSCs in proportion to its economy. Redesigning the SSC system by replacing part of the voluntary contributions with mandatory contributions could be explored as a policy option. However, such an option should be balanced against the effect of high SSC rates, particularly for employees, on labour market outcomes (which could deter the registration of informal workers and businesses).
- **Assess the merits of differentiated taxation of labour and capital income.** Such differentiated taxation creates a considerable incentive for entrepreneurs to incorporate and receive income in the form of capital rather than salaries.
- **Avoid the use of profit-based tax incentives.** Kosovo's CIT is competitive through its low rate, which excludes the need for overly generous profit-based tax incentives which may create redundancies.

- **Strengthen capacities and tools to assess the effects of tax policies on the economy.** Kosovo has limited capacity in tax expenditure reporting and forecasting tax revenue. Instigating a regular and systematic tax expenditure report, and developing the use of micro-simulation models, should be encouraged to assess tax measure and reforms.
- **Re-evaluate the merits and disadvantages of worldwide taxation for resident companies.** For small open economies such as Kosovo, worldwide taxation may entail high administrative costs without necessarily raising significant revenue.
- **Follow the discussions of the OECD/G20 Tax Challenges Arising from Digitalisation project, in particular the work on Pillar 2 that aims to introduce a global minimum tax.** This reform would incentivise Kosovo (and other WB economies) to increase its CIT rate and redesign CIT incentives.
- **Strengthen engagement with the international tax community and implement international best practices.** Since the last CO assessment Kosovo has not carried out significant measures to align its tax system with recent international tax trends. It would benefit from closely following developments in the OECD concerning the BEPS project and its minimum standards. This would allow Kosovo to align its tax system with international standards and facilitate potential adhesion in the future.
- **Foster regional co-operation and co-ordination on common tax issues within the WB region.** Kosovo shares common challenges with other WB economies, and enhanced collaboration might be favourable for all economies involved. Areas such as tax compliance, training of tax administration staff and exchange of information would greatly benefit from a co-ordinated regional approach.

## Competition policy (Dimension 5)

### Introduction

Kosovo is in the process of aligning its legislative framework on competition with international best practice, and particularly with the EU competition *acquis*. Although this requires further steps, the main provisions on prohibited agreements and abuse of dominance, as well as the criteria for *ex ante* merger control, reflect EU rules. Furthermore, over the last few years Kosovo has adopted several pieces of secondary legislation to address gaps that hinder the implementation and enforcement of competition rules.

The Kosovo Competition Authority (KCA), established in 2008 as an independent authority, is responsible for implementing the Law on Protection of Competition in Kosovo. It may initiate investigations, conduct onsite inspections, impose fines and remedies, and prohibit anti-competitive mergers. It has adopted its Strategic Plan for 2020-2023. The KCA did not operate between 2013 and 2016 as the members of the commission had not been appointed.

Unlike the other dimensions, where indicators are allocated a score from one to five, the Competition policy dimension assesses four policy areas (i.e., scope of action, anticompetitive behaviour, probity of investigation and advocacy, plus a new area: implementation). Scoring is based on yes/no (coded as 1/0) answers to the 71 questions in the questionnaire administered by the OECD. Where a response to a question is yes (coded as 1), then we refer to this as an adopted criterion. Each of the four policy areas has a different number of possible criteria that can be stated as having been adopted. Each policy area is assessed through data collected from the questionnaire indicators and by measuring the number of criteria adopted. The new fifth policy area (implementation) is not scored, but is a quantitative analysis of how many competition decisions have been adopted by the competition authorities. The anti-competitive behaviour and implementation policy areas are discussed together below.

Figure 22.8 reports the number of positive (alignment with good practices) and negative answers to a question on alignment for each of the four policy areas listed.

**Figure 22.8. Kosovo's legal and institutional competition framework**

Source: Based on the OECD assessment.

## **State of play and key developments**

### *Sub-dimension 5.1: Scope of action*

The Kosovo Competition Authority, the public institution responsible for applying competition rules in Kosovo, was established in 2008 by the Law on Protection of Competition. The KCA is governed by the Commission for Protection of Competition. The members of the commission, including the chairman, are granted a five-year mandate, with possibility of extension.

There are 19 staff in the KCA, in addition to the 5 council members, with the number of employees steadily increasing between 2015 and 2019. The organisational structure includes two departments: 1) the market surveillance department handles competition issues and consists of three divisions specialising in agreements, abuse of dominance and mergers; and 2) the administration and legal affairs department deals with administrative matters. Five employees work on administrative issues, while the others exclusively focus on competition issues.

The budget of the KCA has increased from EUR 233 000 in 2017 to EUR 350 000 in 2019. The budget is determined annually by the Ministry of Finance and then approved by parliament. The salary of KCA staff recently increased to compensate for the risks borne by officials in carrying out their duties.

In terms of competitive neutrality, the competences of the KCA encompass both private and public undertakings. The Law on Protection of Competition stipulates that its provisions apply to all forms of competition restriction by firms in Kosovo, or outside if those actions have impacts in Kosovo, irrespective of ownership, seat or residence.

The KCA has appropriate powers to investigate and powers to sanction possible anti-trust infringements, i.e. restrictive horizontal and vertical agreements, and exclusionary or exploitative practices by dominant firms.

The KCA may impose cease and desist orders and remedies on firms that have committed anti-trust infringements. It may also adopt interim measures in case the alleged competition breach poses a risk of irreparable damages. It can do this on its own initiative or following a request by the parties involved. It may also accept commitments offered by the parties to remove the competition concerns and close the investigation.

The KCA may compel investigated firms and third parties to provide relevant information, and may perform unannounced inspections on the premises of the parties to the proceedings, subject to a warrant by the competent court. The assessment of alleged anti-competitive conduct follows a thorough scrutiny of the collected evidence, which may include an economic analysis of the competitive effects of vertical agreements or possible exclusionary conduct.

The KCA has the power to impose fines of up to 10% of the aggregate turnover of the undertaking.

The Law on Protection of Competition also contemplates a leniency programme, which grants total or partial immunity from sanctions to firms that report to the KCA the existence of the agreement and submit appropriate evidence.

The law also covers the *ex ante* control of mergers, following the principles of the EU Merger Regulation. The KCA can prohibit concentrations that significantly restrict effective competition, particularly as a result of the creation or strengthening of a dominant position. It may authorise the transaction subject to structural and/or behavioural remedies suitable to address the competition concerns – i.e. divestiture of assets and/or obligations to act or refrain from acting in a certain way.

In the course of the investigation, the KCA may compel merging firms and third parties to provide relevant information and may perform unannounced inspections of the parties' premises. The assessment of

notified mergers should follow a thorough scrutiny of the evidence, which includes an economic analysis of the restrictive effects and of possible efficiencies stemming from the concentration.

Regarding private enforcement, individuals, firms and consumers – either collectively or through consumer associations – can bring a legal action before the courts to seek damages from firms that have committed anti-trust infringements.

#### *Sub-dimensions 5.2 and 5.5: Anti-competitive behaviour and implementation*

The anti-competitive behaviour and implementation policy areas together gauge the use of powers and resources in terms of decisions adopted and fines imposed for horizontal agreements, vertical agreements and exclusionary conduct. They also explore the actual activity of the competition authority on reviewing mergers. The implementation of the provisions mentioned above through competition enforcement is still very limited in Kosovo (Figure 22.9).

**Figure 22.9. Competition decisions in Kosovo (2015-19)**

Source: Data provided by the authorities.

From 2016 to 2019 the KCA investigated very few **horizontal and vertical agreements** (two in 2018 and one in the other years), without imposing any fines. It accepted commitments and closed the cases given the limited awareness of competition rules in domestic firms. However, in 2020 the KCA concluded a major investigation regarding a horizontal agreement on prices by 13 oil companies and imposed overall sanctions of more than EUR 1 million. The KCA has carried out four investigations into alleged abuses of dominant position (**exclusionary conduct**), one in 2017, two in 2018 and one in 2019, but without finding infringements.

No leniency application has been submitted to the authority, and the KCA has never performed unannounced inspections.

In the period 2015-19, the KCA received a total of 10 **merger** notifications. All mergers were unconditionally cleared in phase 1, as the KCA did not identify possible competition concerns that would require an in-depth review.

#### *Sub-dimension 5.3: Probity of investigation*

The KCA is independent from the government and accountable to the Assembly of the Republic of Kosovo, pursuant to Article 24 of the Law on Protection of Competition. The government cannot give binding directions to the KCA. The Commission for Protection of Competition, which governs the KCA, is composed of five members who are proposed by the government and approved by the Kosovo Assembly.

Nevertheless, it should be highlighted that the KCA was not operational in the period 2013-16 because the Members of the Commission had not been appointed.

In terms of procedural fairness, the Law on Protection of Competition stipulates that the decisions of the KCA must be notified to the parties to the proceedings and published in the domestic Official Gazette. A non-confidential version of the decision is also published on the KCA webpage.

The KCA must deliver the decision to initiate formal proceedings to the parties. For investigations on both alleged competition infringements and merger reviews, the parties have the right to be heard and present evidence before a decision is adopted. Prior to scheduling a hearing, the KCA must provide the parties with a written notification covering the facts of the case.

The KCA publishes annual reports which are submitted to the Commission of Economy and Trade and then approved by parliament. Every three months the KCA reports to the Ministry of European Integration, and its recommendations are incorporated into the Kosovo EU Progress Report.

The decisions of the KCA may be appealed at the administrative court and eventually before the appeal court.

The KCA has published guidelines to clarify substantive or procedural issues, including the Regulation on Procedural Fairness, administrative instructions on horizontal and vertical agreements, as well as on the review of mergers. All documents are available on the KCA website.

#### *Sub-dimension 5.4: Advocacy*

According to the Law on the Protection of Competition, the KCA may provide opinions to the Parliament and Government of the Republic of Kosovo on laws, regulations and other bylaws that significantly affect competition, as well as to central and local bodies of public administration. It may also provide opinions to promote awareness of competition and its role.

The KCA has actively engaged in competition advocacy in several sectors, particularly in the last few years. For example, it has issued opinions and recommendations to the Central Bank of Kosovo to ensure that insurance companies compete in terms of the prices and quality of services they provide, to the Ministry of Health on price regulation for medicinal products and equipment, and to the Tax Administration of Kosovo on administrative barriers to the provision of cash register equipment.

The KCA can also conduct market studies, for example in 2019 it published an analysis of the telecommunications sector and an analysis of the energy sector. Market studies are a tool used to assess how competition in a sector or industry is functioning, detect the source of any competition problems, and identify potential solutions. Competition problems that can be uncovered in market studies include regulatory barriers to competition and demand-side factors that impair market functioning. Market studies are a versatile tool that allow the examination of a broader set of issues than competition enforcement, and therefore their use is growing. International organisations, notably the OECD and the International Competition Network (ICN), have developed a wide range of documents on market studies, including the OECD Market Studies Guide for Competition Authorities (OECD, 2018<sup>[13]</sup>).

In 2019, the KCA concluded memoranda of understanding with the Energy Regulatory Office, Kosovo Railways, the Electronic and Postal Communications Regulatory Authority, the Water Services Regulatory Authority and the Central Bank of Kosovo. It has also discussed the scope for possible co-operation with several regulators and drafted a number of additional memoranda of understanding that are expected to be finalised soon. Notably, the KCA has been in contact with the Public Procurement Regulatory Commission, the Central Procurement Agency and the Public Review Body.

In the framework of the EU funded IPA,<sup>38</sup> specific activities have been planned to offer training to judges.

The KCA has organised many advocacy events aimed at developing competition culture, including with the Ombudsperson, the State Aid Commission, ministries, municipalities and chambers of commerce. Other advocacy initiatives have involved universities, the media and other stakeholders.

### ***The way forward for competition policy***

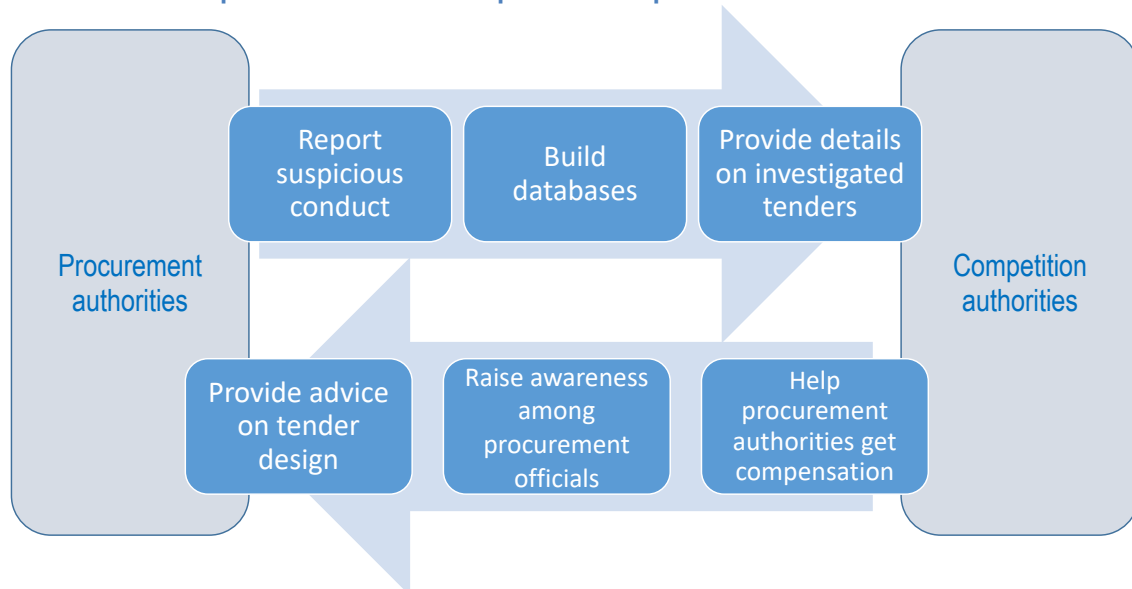

The priority concern of the KCA in recent years has been the promotion of competition principles and the spread of competition culture. The KCA has engaged in a broad set of advocacy initiatives to address competition restrictions in existing and draft law, and to increase awareness about the role and objectives of competition policy.

These efforts are commendable, particularly by such a young agency, but should be complemented with proactive competition enforcement and the imposition of severe fines to tackle infringement, ensure deterrence and encourage competition compliance by firms. Competition enforcement by the KCA has been weak to date, although the case concluded in 2020, which for the first time led to the imposition of high fines on cartelists, is a promising sign for the future. Policy makers in Kosovo may wish to consider the following:

- **Shelter the KCA from political influence, and carefully preserve its independence.** OECD Competition Committee research has found that it is an ongoing challenge to ensure that a competition agency enjoys the requisite levels of independence, remains transparent and receives appropriate resourcing. Even well-established regimes may deviate from these standards, with detrimental consequences for the quality of competition enforcement, law and policy; however, it is essential that such standards are maintained. As indicated, the KCA was not operational between 2013 and 2016 as the members of the commission had not been appointed. This shows that political action or lack of action can have a strong impact on competition policy.
- **Prioritise strengthening cartel enforcement and increasing fines.** Cartels are the most clear-cut and undisputedly harmful competition infringements and affect every economy. The efforts of the KCA should be focused on detecting cartels and imposing heavy fines on infringers to deliver a strong message that firms engaging in collusion risk severe punishment. If the fine amount sufficiently exceeds illicit gains, offences can be deterred even when the probability of paying a fine is low. The fear of fines is also a key driver of leniency applications, thus fostering the effectiveness of the leniency programme – which has been unproductive in Kosovo so far – and further boosting detection. The KCA might engage in expanding its detection skills, for example by further strengthening the fight against bid rigging (see point below on public procurement), and start using its power to perform on-site inspections to collect evidence.
- **Pay specific attention to public procurement, particularly during the COVID-19 crisis.** Public procurement is a key sphere of action both for cartel enforcement and for competition advocacy. Bid rigging results in significant harm to the public budget and to taxpayers, dampening innovation and causing inefficiencies. The KCA should work closely with the Public Procurement Regulatory Commission and the Central Procurement Agency to reduce the risks of bid rigging through careful design of the procurement process, and to detect bid-rigging schemes during the procurement process. Figure 22.10 shows how co-operation between competition and procurement authorities can help detect and avoid bid rigging. The Recommendation of the OECD Council on Fighting Bid Rigging in Public Procurement (OECD, 2012<sup>[79]</sup>) calls for governments to assess their public procurement laws and practices at all levels of government in order to promote more effective procurement and reduce the risk of bid rigging in public tenders. The Guidelines on Fighting Bid Rigging in Public Procurement (OECD, 2009<sup>[80]</sup>), which form a part of the recommendation, are designed to reduce the risks of bid rigging through the careful design of the procurement process and to detect bid-rigging conspiracies during the procurement process. The OECD can also provide assistance through helping to assess the main rules governing the procurement of public

works and the procurement practices of major public buyers. It can provide recommendations to design competitive procurement and fight bid rigging in accordance with international good practices. It can also offer training for both competition and public procurement officials, based on the Guidelines on Fighting Bid Rigging in Public Procurement.

**Figure 22.10. How co-operation between competition and procurement authorities could work**

- **The KCA should make wider use of its power to perform market studies.** The OECD's Competition Division can assist competition authorities, regulators, ministries or other policy makers with market study projects. This could be particularly valuable in Kosovo, where the KCA and policy makers have limited experience with such tools.
- **Expand international co-operation and training.** International co-operation and targeted training initiatives are necessary in a fast-moving economic environment. In the face of increasing complexity of anti-trust issues and the frequent cross-border nature of competition infringements, the management and staff of the KCA should have regular opportunities to meet and share good practices with international competition experts and colleagues from other jurisdictions. International organisations such as the OECD, the ICN and the United Nations Conference on Trade and Development (UNCTAD) offer valuable opportunities in this regard. The OECD-GVH Regional Centre for Competition in Budapest provides an ideal forum to explore competition related issues. The KCA is already a regular participant in the centre's events and would benefit from actively continuing its participation. Additional training initiatives would further enable KCA staff to reach their full potential.

## State-owned enterprises (Dimension 6)

### Introduction

State ownership responsibilities for Kosovo's main portfolio of 17 SOEs are exercised by an inter-ministerial government commission whose work is supported by an SOE monitoring unit in the Ministry of Economy and Environment (MEE). Despite these ownership arrangements, several SOEs are loss-making, which indicates that there is scope to clarify SOE performance expectations and address structural shortcomings. Nevertheless, Kosovo achieves an above-average score in the governance and efficiency sub-dimension (Table 22.9), reflecting its strongly centralised ownership arrangements and the separation of ownership and regulatory functions. Kosovar SOEs are subject to high standards of financial disclosure, resulting in an above-average score in Sub-dimension 6.2. Kosovo also performs better than other WB6 economies when maintaining a level playing field with private companies (Sub-dimension 6.3), reflecting the fact that all SOEs operate as joint-stock companies and are thus subject to general company law. However, many SOEs do not earn economically significant rates of return and many benefit from state guarantees, which may result in an uneven playing field with private companies. Kosovo's performance on the state-owned enterprise dimension has not changed significantly since the 2018 Competitiveness Outlook (Figure 22.1), but the authorities report plans to update the Law on Publicly Owned Enterprises in 2021, which could lead to changes in scores depending on the direction of the planned reforms.

**Table 22.9. Kosovo's scores for state-owned enterprises**

Dimension	Sub-dimension	Score	WB6 average
<b>State-owned enterprises dimension</b>	Sub-dimension 6.1: Efficiency and performance through improved governance	3.1	2.2
	Sub-dimension 6.2: Transparency and accountability practices	3.2	3.0
	Sub-dimension 6.3: Ensuring a level playing field	3.0	2.8
	Sub-dimension 6.4: Reforming and privatising SOEs	n.a.	n.a.
<b>Kosovo's overall score</b>		<b>3.1</b>	<b>2.6</b>

Note: For comparability with the previous assessment, the new sub-dimension (6.4) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 6.1: Efficiency and performance through improved governance*

Kosovo's state-owned enterprise portfolio consists primarily of 17 SOEs (Table 22.10). At the local level, Kosovo's municipalities own 43 local enterprises, mostly in the transport and public utilities sectors.

**Table 22.10. Kosovo's main state-owned enterprises**

Name of enterprise	Main sector/activities	Number of employees
KEK	Electricity	4 145
Telekomi i Kosoves	Telecommunications	2 289
Posta e Kosoves	Telecommunications	1 013
NKEC	Electricity	3
KRU Mitrovica	Water supply and sewage	246
KRU Prishtina	Water supply and sewage	560
KRU Gjakova	Water supply and sewage	265
Hidroregjioni Jugor	Water supply and sewage	324
KMDK	Waste	82
Trainkos	Transport	233
Infrakos	Transport	315

Name of enterprise	Main sector/activities	Number of employees
HE Iber Lepenc	Multi-sectoral	274
Radoniqi Dukagjini	Irrigation	65
Drini I Bardhe	Irrigation	36
Hidro Drini	Water supply and sewage	216
Hidro Morava	Water supply and sewage	153
Trepça Mine	Mining	1 217
KOSST	Electricity transmission	340
<b>Totals</b>	<b>18 enterprises</b>	<b>11 776 employees</b>

Note: Enterprise names, sectors of operation and employee numbers are as reported by the Kosovo authorities for this assessment, with the exception of the employment figure for KOSST, which is based on online disclosures.

The Privatisation Agency of Kosovo (PAK) – by its own online disclosure – also holds administrative rights for over 500 previously “socially owned” enterprises (whose ownership was considered shared social property under the former Yugoslavia regime). Legally, the PAK holds these enterprises “in trust”, with responsibility for administering legal claims on their ownership and overseeing their eventual privatisation or liquidation. The PAK’s establishing legislation allows it to exercise a wide range of functions with respect to the enterprises, including appointing board members and senior management, approving business and investment plans, and revising corporate by-laws. Although legally the PAK may not “own” these enterprises directly, it has legal authority to exercise several important ownership rights, which makes it a *de facto* owner of a large portfolio of SOEs. According to the OECD definition, enterprises owned by the state, even if slated for privatisation, are considered SOEs and should thus be governed according to high standards of corporate governance until they are privatised.

Figure 22.11. Sectoral distribution of SOEs by employment

Note: Employment figures are for 18 companies, including the main centrally managed portfolio, plus the electricity transmission operator KOSTT, which is owned directly by parliament.

Source: Calculations based on information provided by the authorities of Kosovo.

SOEs in Kosovo account for an estimated 3.3% of domestic employment, which is slightly above the OECD average and in between the share for neighbouring Serbia (2.9%) and Montenegro (3.3%).<sup>39</sup> SOEs’ estimated share of domestic employment increased slightly (from 2.9%) when the state took majority ownership of the Trepça Mine in 2016. SOE assets in Kosovo account for the lowest share of GDP compared to other WB6 economies, based on estimates by the EBRD (EBRD, 2020<sub>[81]</sub>).<sup>40</sup> Although these estimates show that SOEs in Kosovo do not constitute a particularly large share of the economy, their presence in structurally important sectors such as electricity, telecommunications and transportation makes their efficient operation important for broader economic outcomes Figure 22.11.

Some of Kosovo's most prominent SOEs have suffered losses in recent years, indicating structural issues that impede their performance. For example, Kosovo Telecom was recently on the brink of bankruptcy owing to EUR 26 million of unpaid debts (BalkanInsight, 2020<sup>[82]</sup>). In 2017, Kosovo Railways operator, Trainkos, cut some of its domestic passenger services for two months, stating that revenue was not sufficient to cover operating costs and citing EUR 5 million of accumulated losses over the previous five years (IRJ, 2017<sup>[83]</sup>). SOE losses appear to sometimes stem from under-compensated public policy objectives (as may be the case for the aforementioned passenger rail service), or from broader structural issues such as overstaffing.<sup>41</sup>

Concerning the **clarification of ownership policy and rationales**, Kosovo adopted a state ownership policy in 2008 that clearly outlines the rationales for state ownership and establishes several basic principles for the state to follow in its role as shareholder. The first overarching objective for state ownership is to maximise value for shareholders by achieving sustainable positive income and ensuring the appropriate involvement of the private sector. The establishment of value maximisation – which can include both financial value and societal value – as an objective of state ownership is in line with the good practice guidance of the OECD Guidelines on Corporate Governance of State-Owned Enterprises (OECD, 2015<sup>[84]</sup>). Additional principles set forth in Kosovo's policy include the following: SOEs should implement sound corporate governance and transparency practices; their capital structures should maintain SOEs' financial discipline and minimise their dependence on the state budget; state capital provisions for major investments should be decided through the standard public budget process; and the private sector should be included in SOE operations where needed to increase efficiency and quality of services. The ownership policy states that government ownership should only be maintained in enterprises to protect the public interest and not purely as a result of historical factors.

While Kosovo's state ownership policy provides a sound foundation to support professional ownership practices and includes several good practice principles, more information on the success of its implementation would be useful, particularly as it was adopted 12 years ago. One shortcoming of the policy is that in its emphasis on the ownership responsibilities of the Government of Kosovo as a whole it does not provide detailed information on the roles of subsidiary state bodies in implementing the ownership policy. Stakeholders interviewed for this assessment communicated a general perception that Kosovo's ownership policy has been successful in introducing more professional governance arrangements and attracting some additional private capital (e.g. the public-private partnership with the domestic airport) to Kosovo's 17 main SOEs; however, the board member selection process (outlined in the state ownership policy) remains problematic in practice, with politicisation hindering the commercial performance of SOEs in many cases.

Kosovo has established predominantly centralised state ownership arrangements, wherein the Government of Kosovo has exclusive responsibility for ownership decisions, which are agreed upon by an inter-ministerial committee by simple majority vote. Efforts to **professionalise state ownership** practices in Kosovo are underpinned by the state ownership policy and the Publicly Owned Enterprise (POE) Monitoring Unit. The POE Monitoring Unit's main roles are to collect SOEs' annual financial statements, prepare a consolidated report on SOE financial operations, and review the performance of SOE boards of directors to help inform government decisions on the continuity and composition of each board. These arrangements are set out in the Law on Publicly Owned Enterprises, which also establishes some basic criteria for the composition of the inter-ministerial committee, notably that it must always include the Minister of Economy and Environment (who leads the committee), the Minister of Finance, the Minister of Trade and Industry, the Minister of Infrastructure and the Minister of Regional Development. There are subsidiary regulations for the rules of procedure of the inter-ministerial committee.

By establishing a central monitoring unit and ensuring that state ownership decisions are taken by the whole of government (and not individual line ministers), Kosovo has taken steps to harmonise ownership practices and separate ownership decisions from regulatory decisions. However, there is one SOE, the electricity transmission system operator KOSTT, that operates outside of these prevailing arrangements,

as it is owned by parliament. The current ownership arrangements also mean that according to the authorities there is no process in place through which the state shareholder sets performance objectives for individual SOEs. Dividend expectations from certain individual SOEs are decided through the annual public budget process, but the process for setting other quantitative performance targets varies across the SOE sector and seems to be mostly driven by SOE management rather than by the state as shareholder. In particular, SOE business plans developed by senior management and subsequently approved by the board include financial and operational performance targets.

Kosovo has taken some initial steps to establish an SOE **board nomination framework**, but the process and criteria used for appointing (and in some cases dismissing) individual SOE board members is not particularly transparent. According to the Law on Publicly Owned Enterprises, SOE board recruitment procedures are led by recommendation committees established for each SOE, which are made up of seven individuals and must comprise senior civil servants or qualified external experts with relevant industry, financial or corporate governance expertise. The composition of these recommendation committees is decided by the Permanent Secretary of the Prime Minister's Office. Final decisions on SOE board nominations are made by the Government of Kosovo, but all board appointees must be among those preselected by the relevant recommendation committee. Although the general process for SOE board recruitment is clearly established by law, there is limited transparency regarding the criteria and procedures used by each recommendation committee to identify, vet and agree on candidates. For example, it is not clear if all board vacancies are subject to an open and competitive procedure, although the authorities report that board vacancies are indeed publicly announced. Regarding professional qualifications, SOE boards (which must comprise five to seven members) are required to include at least two individuals with adequate knowledge of accounting and must meet certain independence criteria, discussed below. There is scope to strengthen the professional qualifications criteria applicable to all SOE board members so that boards have adequate professional competencies and are clearly selected on merit.

External stakeholders interviewed for this review indicated a recurring practice, often following political cycles, of dismissing SOE boards and appointing "temporary boards" in their place. The interviewees noted several recent SOE board dismissals perceived to be politically motivated. The government maintains that the boards in question were dismissed owing to their non-compliance with requests to postpone the appointment of senior management to allow for the participation of an external professional advisory entity. Given that senior management appointments are legally the responsibility of SOE boards in Kosovo, these recent disagreements point to an inadequate or unclear separation of responsibilities between the state as shareholder and SOE boards of directors.<sup>42</sup>

Although Kosovo has established some criteria to **promote independent and professional boards** in SOEs, several media reports indicate a perception that board appointments are sometimes made on the basis of personal connections, for example with the ruling political parties.<sup>43</sup> Interviews with stakeholders conducted for this assessment echo this perception, which means that SOE corporate decision making, for example related to procurement or recruitment of senior management, is frequently subject to political influence. This practice contrasts sharply with the apparently sound formal criteria for SOE board membership, which emphasises independence and the absence of conflict of interest. According to the Law on Publicly Owned Enterprises, all SOE board candidates must not have had any business relationships with the SOE in question or have been elected officials, political appointees or decision makers in any political party for the three years preceding their application. Concerning their fiduciary duties, SOE board members are required to act in the best interest of the enterprise according to both the company law (the Law on Business Organisations) and the Law on Publicly Owned Enterprises. The law also states that when SOEs do not meet their performance targets set out in annual business plans for two years in a row, the state shareholder must consider board dismissal. SOE board members are subject to the Code of Ethics and Corporate Governance in Publicly Owned Enterprises, according to which all board members should ensure that sufficient procedures are in place to protect the assets, reputation and long-term interests of the enterprise. Despite the existence of these formal requirements, the apparent

perception that SOE board seats are not consistently based on professional merit indicates shortcomings in SOE board recruitment criteria and procedures. Authorities in Kosovo also report that SOEs are expected to comply with the Law on Gender Equality, which sets the ambition of 50% representation of each gender in decision-making bodies in all legislative, executive and judiciary bodies. The authorities report that SOEs fall under the scope of this law, but that no SOE complies with its requirements, demonstrated by the very low number of female applicants to related positions.

### *Sub-dimension 6.2: Transparency and accountability practices*

Concerning **financial and non-financial reporting**, SOEs are required to submit their annual financial statements, audited by an external auditor, to the POE Monitoring Unit housed in the MEE. Financial statements are subsequently made available online, creating a channel for public accountability. Most SOEs appear to respect these disclosure requirements. For example, the websites of the Ministry of Finance and the MEE publish enterprise-specific reporting documents for all 17 SOEs that include annual reports on financial statements, business plans and corporate statutes. There are sometimes delays in making annual reports available online.<sup>44</sup> While SOEs are subject to apparently high standards of financial reporting, there is limited information available on their non-financial reporting requirements and practices. Although the requirement for SOEs to make their business plans available online might be considered a means of increasing corporate accountability, there is also a risk that it could jeopardise their commercial situation, for example if information on plans to expand in competitive markets is made public. Regarding disclosure at the state level, Kosovo appears to be the only WB6 economy to produce a consolidated financial report on SOEs, which is prepared by the POE Monitoring Unit and presented to parliament annually. The latest example of this report was produced in 2016 and is available online.<sup>45</sup> The authorities report that they are currently preparing a 2018/19 annual aggregate report; however, publication of this report, which is subject to parliamentary approval, has been postponed due to the COVID-19 pandemic and changes in the government and parliament.

Concerning **auditing practices**, as mentioned above all SOEs are required to have their financial statements audited by an external auditor in accordance with internationally accepted standards of auditing. However, in practice the state audit office sometimes performs SOE financial audits instead of external firms, which is not consistent with relevant OECD recommendations. Kosovo's related requirements are set forth in the Law on Publicly Owned Enterprises, which also establishes strict criteria for ensuring the independence of the audit firm selected to undertake the external audit. The audit firm is selected by the SOE's procurement officer, with assistance from the board audit committee. The Law on Publicly Owned Enterprises also establishes that both the National Audit Office and parliament can undertake additional audits of individual SOEs as deemed necessary. The authorities report that in cases where the National Audit Office undertakes an audit of an SOE's financial statements, an audit by an external audit firm is not required or undertaken, which is not consistent with OECD guidelines. As an example of such ad hoc audits, the National Audit Office audited Kosovo Telecom for the 2018 financial year, which assessed the credibility of the company's financial statements and the robustness of internal controls and the internal audit function (National Audit Office, 2019<sup>[85]</sup>). The Office of the Auditor General concluded that the 2018 financial statements did not present a true and fair view of the company's financial situation. A similar public audit of Kosovo Railways (Trainkos) was undertaken in 2019, and also concluded that the company's 2018 financial statements did not present a fair and accurate view of its financial situation. While this only concerns two SOEs, it points to scope for investigating the quality of other SOE financial statements to address any weaknesses and ensure that these statements can reliably inform the state's efforts to address structural problems that may limit SOE efficiency.

Concerning the legislative framework for the **protection of minority shareholders** – which will be relevant if the state decides to broaden the ownership of SOEs to include private investors – external assessments by the World Bank indicate that Kosovo has some basic legal requirements in place on the extent of shareholder rights.<sup>46</sup> However, the absence of an active stock market excludes Kosovo from receiving a

score from the World Bank in some of the indicators related to minority shareholder protections. Broader issues related to weaknesses in the judicial system, highlighted by an example of the US Department of State (US Department of State, 2020<sup>[86]</sup>), could make it difficult for minority shareholders to obtain redress if their rights are violated, even if basic rights are adequately enshrined in law. Currently, only one of Kosovo's SOEs, the Trepča Mine, has non-state minority shareholders as it is 20% owned by employees and 80% owned by the Government of Kosovo.<sup>47</sup> As mentioned, the state took ownership of the mine in 2016 by a decision of the parliament just before it was due to initiate bankruptcy proceedings. The legislation applicable to Trepča Mine establishes that the supervisory board is elected by shareholders in proportion to their shareholdings and in accordance with the Law on Publicly Owned Enterprises. It is not clear from these two pieces of publicly available legislation how exactly the employees of Trepča Mine participate in the nomination of board members in proportion to their 20% shareholding; stakeholders interviewed for this assessment highlighted that the related procedures may be detailed in the enterprise's corporate statutes, but that these are not publicly available.

### *Sub-dimension 6.3: Ensuring a level playing field*

Concerning **legal and regulatory treatment**, all SOEs in Kosovo are incorporated as joint-stock companies, and thus subject to the company law also applicable to privately owned companies. The authorities in Kosovo also confirm that SOEs are subject to the same regulatory treatment as private companies. This provides a sound initial foundation for establishing a level playing field with private companies. However, a recent dispute between state-owned Kosovo Telecom and the privately owned Z-mobile points to some potential competition barriers where SOEs control the network infrastructure used by competitors. The dispute involved claims by the private mobile services operator that Kosovo Telecom was not respecting its contractual responsibilities to provide access to network infrastructure.<sup>48</sup> The dispute went to international arbitration, which concluded in favour of the private operator. This case illustrates that aligning SOE legislation with that of private companies is often not sufficient to ensure fair competition between SOEs and their private competitors.

Concerning **access to finance**, most SOEs obtain financing from the commercial marketplace, and some SOEs benefit from explicit state guarantees of their commercial debt. While such advantageous conditions for SOEs distorts the playing field, the fact that several SOEs are loss-making arguably constitutes a much more problematic structural issue. Just as advantageous operational conditions can favour SOEs and crowd out private sector competition, disadvantages faced by SOEs – such as under-compensated public policy objectives or employment expectations that impede efficiency – also distort the playing field and lead to inefficiencies in companies and markets. A 2015 external assessment by the GAP Institute for Advanced Studies identified overstaffing as a crucial structural problem in the SOE sector, often the result of political influence (GAP Institute, 2015<sup>[87]</sup>). In terms of responses to the COVID-19 pandemic, the authorities report that some SOEs have received funding from an emergency fund, and that state aid rules have been relaxed in the context of the pandemic.

### *Sub-dimension 6.4: Reforming and privatising state-owned enterprises*

Concerning **recent SOE reform**, in 2015 the Kosovo authorities amended the Law on Publicly Owned Enterprises to establish a new local SOE and set forth additional regulations for the state-owned Trepča Mine. The authorities report that there are plans to further amend this law, with parliamentary consideration of new amendments foreseen in 2021. The planned amendments span a wide range of issues, including developing a state strategy for SOEs; board member nomination, duties, remuneration and sanctions; strengthening SOE financial and operational reporting; and criteria for the mandatory restructuring of SOEs.

The government does not currently have any announced plans to **privatise** any of the 17 SOEs under the MEE. It had previously announced its intention to privatise Kosovo Telecom in 2019, but this did not take

place and the authorities report that its performance will need to improve prior to privatisation to increase its attractiveness to potential investors.<sup>49</sup> Separately, PAK maintains a portfolio of over 500 formerly socially owned enterprises, for which privatisation or liquidation efforts continue. PAK is an independent public institution established in 2008 as the successor to the former Kosovo Trust Agency. It is mandated to privatise enterprises primarily through corporate spin-offs and/or liquidation.<sup>50</sup> According to the legislation establishing PAK, many of the enterprises under its remit are subject to conflicting ownership claims. PAK is legally tasked with ensuring that any individuals claiming to hold ownership or creditor rights in the enterprises receive due process and, as relevant, adequate monetary compensation.<sup>51</sup> Concerning the legislative framework for the potential privatisation of the 17 SOEs under the MEE, the Law on Publicly Owned Enterprises regulates the process, notably requiring the establishment of a government commission for privatisation. The commission is not a standing body, but rather established if the government adopts plans to privatise any of the 17 centrally managed SOEs, which it has reportedly not done in the past few years.

### ***The way forward for state-owned enterprises***

SOEs operate at the nexus of the public and private sectors, and their operations are affected by both the quality of public governance and the prevailing corporate and boardroom culture. As is the case in most Western Balkan economies, ensuring that SOEs in Kosovo operate efficiently, transparently and on a level playing field with private companies will necessitate reforms in multiple policy areas that cannot be undertaken all at once. Choosing the appropriate sequencing of reforms is just as important as their content, and largely depends on the domestic political climate and current reform priorities.

The OECD Guidelines on Corporate Governance of State-Owned Enterprises (OECD, 2015<sup>[84]</sup>) provide a guidepost for reforms that the authorities of Kosovo can use to inform their policy efforts in this domain. Based on the state of play of SOE policy development in Kosovo, the following priority reform areas – which are in line with OECD guidelines – could offer a basis for discussions with the authorities:

- **Update the state ownership policy.** The state ownership policy was drafted in 2008 and has not been updated since. The policy contains several sound principles to underpin professional state ownership practices, but it is unclear how well public authorities and SOEs have implemented its principles. The state should assess implementation of the ownership policy and use the results of this assessment to inform an update of the policy, in consultation with all relevant government bodies. In line with the OECD guidelines, the ownership policy should clearly articulate the rationales for state ownership of commercial enterprises, outline the state's role in the governance of SOEs and define the respective responsibilities of all state bodies involved in its implementation. Key elements of Norway's ownership policy, as outlined on the state's website, are provided in Box 22.5 as an example.
- **Ensure that SOE board member recruitment is transparent and merit based.** While the state has established a general framework for SOE board nominations, which involves setting up SOE-specific "recommendation committees" to lead recruitment procedures, the criteria applicable to the recruitment of individual board members are not transparent. There is a perception that SOE board seats are often not accorded based on merit, pointing to shortcomings in the criteria used and/or the transparency of the process. Strong qualifications criteria are necessary to ensure that SOE boards are equipped with the right mix of professional competencies to effectively oversee corporate strategy, with a view to maximising their commercial efficiency. The authorities could also consider the use of professional staffing agencies to improve the efficiency and professionalism of the process.
- **Strengthen monitoring and reporting on SOE performance.** Kosovo has established a sound mechanism for developing a central overview of the financial performance of SOEs through the POE Monitoring Unit's collection of SOE annual financial statements. The functions of the POE

Monitoring Unit could be expanded to include more in-depth reviews of individual SOE performance, with a view to identifying the structural weaknesses limiting their efficiency. The results of such in-depth assessments could also be made public to strengthen accountability and incentivise improvements. The two recent public audits of Trainkos' and Kosovo Telecom's financial statements, which resulted in qualified opinions that the statements did not present a fair and accurate view of the financial situation, point to weaknesses in the quality and credibility of SOE financial reports. The authorities should take steps to address these weaknesses so that SOE financial reports can be relied upon to for identifying structural shortcomings that hold back SOE performance.

### Box 22.5. Norway's state ownership policy

The website of the Norwegian Government provides clear information to the public on the state's policy positions regarding state ownership, including explanations of why the state owns enterprises, what its portfolio contains and how state ownership is exercised by public authorities. Excerpts from the website are provided below:

- **Why the state is an owner:** "The Government believes that private ownership should be the main rule in Norwegian business and industry. The state should only have ownership interests in companies when this is the best means of meeting the state's needs."
- **What the state owns:** "The state has direct ownership, managed through the ministries, in 72 companies. [...] The state regularly assesses the rationale for its ownership and its goal as an owner in each company, to ensure that they are updated and relevant, and to help the state to efficiently solve different tasks or safeguard different needs."
- **How state ownership is exercised:** "The Government's ambition is that the Norwegian state's exercise of ownership shall be in accordance with best international practice [...] Together, the state's principles for good corporate governance and the state's goal as an owner form the basis for how the state exercises its ownership. The key elements of the framework for the state's exercise of ownership – about which there has been a broad political consensus over time – are included in the state's ten principles for good corporate governance."

## Education policy (Dimension 7)

### Introduction

Table 22.11 shows Kosovo's scores for the four education policy sub-dimensions and the cross-cutting dimension on system governance, and compares them to the WB6 average. Kosovo has the highest score (along with Serbia) of the WB6 economies for the early childhood and school sub-dimension, driven by its above-average ratings for the indicators on early childhood education and early school leaving prevention. It also scores highest (along with North Macedonia) for the system governance cross-cutting dimension. However, it scores below the WB6 average for the sub-dimension on teachers.

**Table 22.11. Kosovo's scores for education policy**

Dimension	Sub-dimension	Score	WB6 average
Education policy dimension	Sub-dimension 7.1: Early childhood and school education	3.5	3.0
	Sub-dimension 7.2: Teachers	2.3	2.7
	Sub-dimension 7.3: Vocational education and training	3.3	3.1
	Sub-dimension 7.4: Tertiary education	2.8	2.8
	Cross-cutting dimension: System governance	4.0	3.3
Kosovo's overall score		<b>3.2</b>	<b>3.0</b>

### State of play and key developments

Kosovo has several well-designed education policies that are similar to many European and OECD economies, including a sophisticated system for reducing early school leaving, and learning standards for each level of pre-university education. While Kosovo's education policy scores have remained generally stable since the 2018 Competitiveness Outlook, there have been some improvements in specific sub-dimensions. Kosovo's overall performance is slightly above the regional average in the education policy dimension (Table 22.10), but there are signs that policy implementation remains a major challenge. Data on the education system are very limited compared to other Western Balkan economies. Moreover, student learning outcomes in Kosovo, as measured by PISA, remain low, and a significant share of students do not achieve baseline proficiency levels in reading and mathematics (OECD, 2020<sup>[89]</sup>). Considering that Kosovo has one of the youngest populations in Europe, strengthening the education system will be crucial if future generations are to support the economy's long-term development and competitiveness.

Similar to economies around the world, Kosovo was faced with a rapid shift from classroom to remote learning in 2020 to help slow the spread of COVID-19. Working with donor agencies, including Microsoft, UNICEF and Save the Children, Kosovo's government introduced distance-learning opportunities for each education level. In the area of early childhood education it launched the online platform, Distance Education – Care, Development and Early Childhood Education for 0-6 year-olds, in April 2020. The platform provided learning and information materials for educators and parents, as well as guidance on how to explain the COVID-19 pandemic to children. To leverage the platform's potential, MEST, in co-operation with UNICEF, organised online training that reached 1 543 educators working in preschool institutions and at the pre-primary level across Kosovo. For the reopening of preschools, MEST, in co-operation with donors, issued the "Protocol for facilitation measures to resume the work of preschool institutions in Kosovo". Even after preschools reopened, the Distance Education platform continued to be active, and its content has also been broadcast on radio and television since October 2020 to provide equal access to all children at the pre-primary level.

Beyond the preschool level, Kosovo rolled out the online Learning Passport, which has provided digital curriculum materials and open-source content to support and guide learners. Other organisations working in Kosovo have also introduced initiatives to address the educational challenges presented by the

pandemic. For example, the Organization for Security and Co-operation in Europe started a project to train teachers on how to support the mental health of students during the crisis.

### *Sub-dimension 7.1: Early childhood and school education*

Kosovo's score in this sub-dimension is slightly above the Western Balkan average, largely because of its policies to address early school leaving. Since the last CO assessment, Kosovo has made progress in implementing new Early Learning and Development Standards for children aged 0-6, and developing infrastructure to better monitor and respond to early school leaving. Although internationally comparable data on Kosovo's education system are limited, the economy reports universal participation in primary education. However, the share of students enrolled in lower secondary and upper secondary education has been decreasing over recent years, and in 2018 was 90.5% and 86.8%, respectively. This trend is similar to what is observed in other WB6 economies.

In terms of learning outcomes, Kosovo's average performance is much lower than other Western Balkan and European economies (Figure 22.12). Only 21% of students in Kosovo attained baseline levels of proficiency in reading, compared to the OECD average of 77% (OECD, 2020<sub>[89]</sub>). This share was similar in mathematics, where 23% of students achieved at least baseline proficiency, compared to the OECD average of 76%. These findings suggest that there is a significant learning crisis in Kosovo that is not being addressed by the economy's well-designed education policies. These results also have implications for Kosovo's long-term development, as students without basic skills are less likely to attain better paying and more rewarding jobs. However, it is positive that Kosovo has managed to maintain performance levels in reading and mathematics across PISA cycles<sup>52</sup> while simultaneously increasing its coverage index by 13 percentage points<sup>53</sup> (OECD, 2020<sub>[90]</sub>).

**Figure 22.12. Performance in reading, mathematics and science in Western Balkan education systems (2018)**

PISA 2018 mean scores

StatLink  <https://doi.org/10.1787/888934255741>

Kosovo's performance in the **early childhood education** indicator is above the regional average. There is a strong strategic framework for early childhood education (ECE) with clear objectives, and an implementation timeline and budget that aims to increase inclusion and participation at this level of education. The sector is also recognised as a core element of Kosovo's broader development strategy, and there is a high level of engagement by international donor agencies. Kosovo's Early Learning Development Standards for children aged 0-6, which describe expectations for child behaviour and

performance in different areas of development and learning, is a key strength of the system, and there is some variety in the data available to monitor and evaluate the sector. However, data on ECE staff are limited, making it difficult to support ECE educators and therefore improve the quality of provision. Despite an impressive ECE policy framework, Kosovo reports that as of 2018/19, the gross enrolment ratio of children in early childhood education and development (International Standard Classification of Education, ISCED, level 0) was only around 20%. While this is slightly lower than North Macedonia's reported enrolment rate (24%), other Western Balkan economies with available data reported at least 48% enrolment at this level. Research suggests that Kosovo's low levels of ECE participation are in part caused by the inadequate number of public kindergartens, which are distributed unevenly across the economy, and a limited number of subsidised ECE places for children from vulnerable groups (UNICEF, 2017<sup>[91]</sup>). At the time of this review, Kosovo was revising its Law on Early Childhood Education, which is expected to help make ECE more inclusive.

The **instruction system**<sup>54</sup> in Kosovo performs slightly below the regional average, despite several positive policy features. For example, the Quality Assurance Strategy for Pre-University Education 2016-20 sets out objectives for improving educational quality and equity with clear and measurable targets, allocations of responsibilities, and a budget and timeline for proposed activities. However, there have been no comprehensive evaluations of the entire instructional system. Since 2016, Kosovo has been implementing a competency-based curriculum framework and core curriculum, which describe learning standards. Kosovo uses a combination of continuous, formative and summative classroom assessments, in addition to external examinations, to assess students against the curriculum. External examinations are administered to students at the end of lower secondary education (Grade 9) for selection into either general or vocational pathways, and at the end of upper secondary (i.e. the Matura in grade 12) to certify the completion of upper secondary school. Positively, Kosovo is developing a centre for assessment that will become responsible for managing all central-level assessment instruments. The development of this centre would align with many OECD countries and other education systems in the region that have specialised bodies to manage student assessments.

Kosovo has a strategy for quality assurance in school education, and the curriculum framework sets out a list of indicators for measuring teaching and learning. These indicators are monitored by municipal and regional inspectors and by school directors, who mainly have managerial and administrative responsibilities. Although Kosovo has established processes for external school evaluations, there does not seem to be a clear set of school quality standards. In many OECD and European education systems, these standards define the vision and dimensions of quality schooling and serve as the main reference for evaluation (OECD, 2013<sup>[92]</sup>). Without such standards, it may be difficult for actors in Kosovo to identify the strengths and areas of improvement for individual schools.

Kosovo has sophisticated systems to tackle **early school leaving**. These have contributed to a decline in the early school leaving rate from more than 18.4% in 2013 to 9.6% in 2018, thus achieving the EU target of less than 10% by 2020 (Eurostat, 2021<sup>[93]</sup>). While Kosovo does not have a specific strategy for early school leaving, several policies and initiatives to address the issue include work plans developed and reviewed every two years to support schools and municipalities in dealing with dropouts. There are also targeted initiatives to support students at risk of early leaving, such as needs-based scholarships for upper secondary school, career guidance programmes and efforts to engage parents and other actors. Kosovo also collects a range of information about early school leaving and its contributing factors, which is centrally stored within the Education Management Information System (EMIS). Since 2017, the EMIS system has included an early warning system of abandonment, and in 2019/20 Kosovo introduced a rewards system to encourage schools to report data accurately. Kosovo analyses its early school-leaving data to inform policy decisions. For example, students transferring from one school to another made it difficult to track attendance and other early school-leaving factors. In response, the government has started changing the procedures around school transfers so that this does not create a problem for tracking early school leaving.

### *Sub-dimension 7.2: Teachers*

Kosovo's score in the sub-dimension on teachers is slightly below the average for Western Balkan economies (Table 22.11). While there are a number of administrative instructions and laws that regulate initial teacher education and their professional development and management, data on the profession are very limited and it is difficult to determine the extent to which policies have been implemented. As a result, Kosovo was unable to provide data on the educational background and experience of practising teachers.

Despite the challenges of collecting data on teachers, Kosovo is building the legislative framework to strengthen **initial teacher education (ITE)**. There is an accreditation process for ITE programmes based on professional teacher standards, which are defined by the Teachers Professional Development Strategy 2017-2021 and the curriculum framework. This means that ITE providers must demonstrate how their programmes help candidates develop the specific competencies needed to teach. In 2018, Kosovo also introduced a new administrative instruction that requires new teachers to complete an internship during their studies, pass a professional examination and complete one year of work in a school (i.e. a probation period). Following the successful evaluation by the school director, they can officially be contracted as a teacher. While these are positive practices found in many European education systems, Kosovo does not have minimum entry requirements for selecting ITE candidates, and there are no targeted efforts to recruit teachers into the profession.

Kosovo's clear strategy for the **professional development and management** of teachers defines the standards of the teaching profession and breaks down the competencies required at different stages of the teaching career. The 2017 administrative instruction on the licensing system and teacher development sets out a progressive career structure linked to financial incentives. There are four categories of licensed teacher in Kosovo: career teacher, advanced teacher, mentor teacher and merit teacher. The categories (depending on the level) consider years of work experience, professional development requirements and passing an appraisal process. While there is some variety in the type of professional development activities and programmes available in Kosovo, there are no observations or visits to other schools or professional learning networks/communities. Moreover, there is evidence that Kosovo's budget allocation for professional development is insufficient, and that the uneven implementation of relevant policies has not contributed to improvements in the quality of professional development, nor to a "change in teachers' approaches to their professional practice" (Mehmeti, Rraci and Bajrami, 2019<sup>[94]</sup>). It will likely be difficult for Kosovo to improve teaching practices without more comprehensive and meaningful evaluation and support to help teachers improve.

### *Sub-dimension 7.3: Vocational education and training*

Kosovo's score in the sub-dimension on vocational education and training (VET) is similar to the Western Balkan average (Table 22.11). Professionally oriented education typically starts in upper secondary school, when students are allocated into either a general (gymnasium) or vocational or professional school. Kosovo's VET system is organised by specialised profiles, but there are general concerns that these do not align with labour market needs (World Bank, 2019<sup>[95]</sup>). Available data suggest that enrolment in VET has increased in Kosovo in recent years, and as of 2017/18 the majority of upper secondary students (53%) attended VET schools (Kosovo Agency of Statistics, 2021<sup>[3]</sup>). While caution should be used when comparing different data sources, international data suggest that VET participation in Kosovo is much higher than Western Balkan (29%), EU (27%) and OECD (23.5%) averages (UIS, 2020<sup>[96]</sup>). Similar to other economies, data from PISA 2018 found that boys are more likely to attend vocational programmes than girls in Kosovo (OECD, 2020<sup>[89]</sup>).

A range of public bodies are responsible for the **governance of VET** in Kosovo, which is guided by the Kosovo Education Strategic Plan 2017-2021 and the broader development strategy (2016-21). Key institutions include the MEST, the Agency for Vocational Education and Training and Adult Education,<sup>55</sup> the National Qualification Authority,<sup>56</sup> the Council of Vocational Educational and Training and for Adults

(CVETA), as well as municipalities and VET schools that implement policy decisions on VET. Social partners participate in the advisory boards of the central VET agencies and participate in drafting standards, curricula and teaching materials. While legislative acts regulate the roles of various VET actors in this complex governance system, there is occasionally overlap in the allocation of responsibilities. To ensure the quality of VET, Kosovo has clear processes for accrediting VET programmes, and providers are subject to regular evaluation and inspection. Although the government collects information on the completion rates of VET programmes, Kosovo did not report having information on employment rates, hiring after work-based learning or the earnings of VET graduates. As a result, Kosovo cannot undertake analysis to provide adequate career guidance and support learners in making informed decisions about their futures.

Kosovo's comprehensive education strategy identifies harmonising the VET system with labour market requirements as one of seven strategic objectives. It recognises the importance of **work-based learning** (WBL) by calling for "all students...to carry out practical learning in school and professional practice outside the school" (MEST, 2016<sup>[97]</sup>). Kosovo's new curriculum framework sets out the amount of WBL for each grade level. An administrative instruction for WBL also provides guidelines for VET schools and companies on the implementation of WBL, quality assurance and safety standards. In April 2020, the government raised the budget for VET to cover the costs of equipment, insurance and travel for students in an effort to encourage participation in apprenticeships and other forms of WBL. The MEST and municipal education directorates provide scholarships for women and socio-economically disadvantaged students to encourage their participation in WBL, with 140 women supported through these scholarships in 2020. Kosovo uses broad public awareness campaigns, presentations to social partners and companies, and dedicated career placement services to help match learners with WBL places. There are also online portals listing WBL opportunities. Although these are positive features, donor agencies continue to play an important role in developing and implementing Kosovo's WBL policies, and there is limited data to monitor participation and the outcomes of programmes.

#### *Sub-dimension 7.4: Tertiary education*

Kosovo's score in the tertiary education sub-dimension is on par with the Western Balkan average (Table 22.11). Despite having several institutional bodies and policies that support the two respective qualitative indicators in this sub-dimension (equitable access to higher education, and labour market relevance and outcomes of higher education), the transition between education and the labour market remains a significant challenge. For example, Kosovo has the highest share of youth (aged 15-24) who are not in employment, education or training (NEET) among Western Balkan economies, around 33% as of 2019 (ETF, 2020<sup>[98]</sup>). The share of the labour force (aged 15+) who have attained some form of tertiary education (ISCED 5-8) is around 27%, similar to other economies in the region (ETF, 2020<sup>[98]</sup>). While individuals with higher levels of education and skills are more likely to be employed, Kosovo has one of the lowest formal employment rates in the world, and women are especially at risk of having limited opportunities – see Employment policy (Dimension 8).

Some policies promote **equitable access to higher education** in Kosovo, and the Law on Higher Education requires that all students who wish to study at this level receive equal access to opportunities (Official Gazette of the Republic of Kosovo, 2011<sup>[99]</sup>). There are transparent processes for selection into higher education,<sup>57</sup> and scholarships are available for students who earn high grades or who represent certain categories (e.g. students with disabilities, veterans). However, there are no incentive mechanisms in place to encourage institutions to enrol these groups of students. Some data on equity in the tertiary sector are collected through Kosovo's System for Information Management in Higher Education platform, such as enrolment and completion by age, gender and minority background. However, there are no proxies for socio-economic background, and challenges remain regarding the participation of Roma and Egyptian students. Moreover, no evaluation or analysis has been undertaken to identify associations between student factors and higher education participation.

Kosovo's current education strategy addresses the **labour market relevance and outcomes of higher education**. There are already mechanisms in place that help increase the labour market relevance of higher education, such as career guidance in higher education institutions (HEIs), scholarships for in-demand programmes and communication/awareness campaigns to inform prospective students about study options. Kosovo also has several initiatives to support the internationalisation of higher education, such as participation in the EU Erasmus Plus programme and grants for students who wish to study abroad. Several public agencies collect data on the labour market and higher education system using surveys of employers and graduates, quantitative forecasting models and sector studies. Moreover, Kosovo's Employment Agency, supported by international donors, recently set up the Kosovo Labour Market Barometer, which centralises data from 12 different public institutions and makes it publicly available in an online portal.<sup>58</sup> While there are no data on employment rates by field of study, and labour market information is not yet used to inform curriculum design, the Labour Market Barometer plans to start connecting labour market data with information from higher education institutions. This tool has the potential to support sector analysis that could help improve the quality and relevance of Kosovo's higher education system. Currently, quality assurance is regulated by law and the Kosovo Accreditation Agency, which uses EU standards and practices such as requiring HEIs to monitor and review their programmes to ensure that they achieve set objectives and respond to the needs of students and society.

#### *Cross-cutting dimension: System governance*

Kosovo's score for this cross-cutting dimension is slightly above the Western Balkan average, as several of the economy's **system governance** features align with policies and practices found in European and OECD education systems. For example, there is a clear and comprehensive education strategy (and accompanying action plan) that was developed in consultation with stakeholders and that covers all levels of education. Importantly, this strategy has been evaluated, and there are technical reports on the overall system and thematic issues. While there has also been some independent research and analysis on Kosovo's education system, this has mostly been led by donor agencies. Another strength of Kosovo's system governance is the Kosovo Qualification Framework, which was developed in line with the European Qualification Framework. The economy also has a clear indicator framework for monitoring the education system, and donor agencies are working with the government to strengthen Kosovo's EMIS. This system includes information on student learning outcomes available through participation in international assessments and economy-level exams. However, Kosovo does not have a system-wide standardised assessment to measure student performance, unlike many Western Balkans economies which have either established one or are in the process of doing so. Despite some positive features of system governance, Kosovo has struggled to improve teaching practices and learning outcomes, suggesting that the implementation of these well-designed policies may be an issue.

#### ***The way forward for education policy***

In today's increasingly global and fast-changing world, achieving inclusive and quality education can help Kosovo increase its regional competitiveness and create opportunities for more individuals to develop the competencies needed for sustainable development and social cohesion. The government will need to reflect on the economy's political, social and fiscal environment to determine how best to achieve Kosovo's education goals. The following considerations can provide insights for discussions on the way forward to enhance education:

- **Strengthen data collection and management across the system.** Kosovo is already working with international partners to strengthen the interoperability of EMIS, but there is a clear need for more rigorous, timely and comparable data on the education system. To this end, it is important that Kosovo continues participating in large-scale international surveys that generate valuable comparable data, and establishes protocols for mapping and defining indicators and co-ordinating

data collection among public agencies (to avoid overlap across the government). The education information system in Estonia could be a useful example for Kosovo to explore (Box 22.6).

- **Improve evaluation and reporting on the education system.** Although Kosovo already publishes an annual statistical report on the education system, the government should consider producing an analytical state of education report. This report should be published regularly and draw on data from the improved EMIS, which would support the monitoring of education legislation and policies at all levels of the system. These analyses and reporting practices would help hold education actors accountable for achieving Kosovo's education goals.
- **Continue to develop and refine teacher policies.** Kosovo has already taken steps to strengthen the teaching profession by introducing new requirements for initial teacher preparation and reforming the teacher licensing processes. However, it will be important to monitor the implementation of teacher policies and refine them if necessary to improve the quality of teaching and learning. Importantly, Kosovo will also need to ensure adequate and sustainable funding to support reforms to teacher preparation and professional development.

### Box 22.6. The Estonian Education Information System

Estonia is known for having a sophisticated digital civil registration system. Most of the country's public services are available online, and even voting can be done through a secure digital identification process available for all citizens via their national identity card, a mandatory document that establishes a person's identity. This personal identification system is also used in the education sector. As a result, the web-based Estonian Education Information System (EHIS) is able to link all education databases with each other and with over 20 different information systems across the economy, such as the Population Register (used for example, to calculate the number of out-of-school children) and the Estonian Examination Information System.

The EHIS follows clear guidelines about how information can be accessed and presented, which helps protect personal and statistical data from being misused. In particular, access to the EHIS requires registered authorisation. Only individuals performing a duty prescribed by law that requires information from the database are able to access personal information about students, teachers and school staff. To obtain approval, individuals must submit a written application to the Ministry of Education setting out what data they require and how they intend to use it. These features enable the EHIS to serve as an important tool for monitoring and guiding policies in Estonia's education system.

## Employment policy (Dimension 8)

### Introduction

Limited progress has been made to align labour market regulation, including laws on occupational health and safety, with EU directives. The implementation of the labour law and occupational health and safety (OHS) legislation, as well as the framework for the work of labour inspectorates, remains deficient, and the capacity of labour inspectorates still needs to be increased. More progress is needed to reduce the high levels of skills mismatch and to develop and implement an adult education system. Very limited progress has been made in the area of bilateral and tripartite social dialogue, and the low minimum wage has remained unchanged. Introducing a comprehensive social security system is still on the agenda, and progress needs to be made in the reform process. Limited progress has been made to address the extremely high gender employment gap and facilitate women's labour market access. Important progress in the area of employment policies has been made by setting up public employment services in 2017. However, limited progress has been made to strengthen their capacities and enhance the level and scope of targeted ALMPs to have a sizeable impact on reducing unemployment and bringing vulnerable groups into work.

Table 22.12 shows Kosovo's scores for the four employment policy sub-dimensions, and compares them to the WB6 averages. Kosovo scores below the regional average in all four employment policy sub-dimensions, leading to a dimension score below the WB6 average. There has been a very limited increase in the score compared to the last assessment (Figure 22.1), showing the need for more progress in this policy dimension.

**Table 22.12. Kosovo's scores for employment policy**

Dimension	Sub-dimension	Score	WB6 average
Employment policy dimension	Sub-dimension 8.1: Labour market governance	1.8	2.6
	Sub-dimension 8.2: Skills	1.0	2.2
	Sub-dimension 8.3: Job quality	1.5	2.4
	Sub-dimension 8.4: Activation policies	2.0	2.9
Kosovo's overall score		1.6	2.6

### State of play and key developments

**Table 22.13. Key labour market indicators for Kosovo (2015 and 2019)**

	Kosovo		WB6 average	EU average
	2015	2019	2019	2019
Activity rate (15-64)	37.6%	40.5%	61.0%	74.1%
Employment rate (15-64)	25.2%	30.1%	51.5%	69.3%
Unemployment rate (15-64)	32.9%	25.7%	16.3%	6.4%

Note: WB6 average rates are based on author's own calculations using simple averages.

Source: (Kosovo Agency of Statistics, n.d.<sub>[103]</sub>), Labour Market Yearly Indicators, [https://askdata.rks.gov.net/PXWeb/pxweb/en/askdata/askdata\\_Labour%20market/?rxid=c3e44c2e-1aff-4e4a-b55b-2ca64a485a50](https://askdata.rks.gov.net/PXWeb/pxweb/en/askdata/askdata_Labour%20market/?rxid=c3e44c2e-1aff-4e4a-b55b-2ca64a485a50); (Eurostat, n.d.<sub>[104]</sub>), Labour Force Survey data base, <https://ec.europa.eu/eurostat/web/main/data/database>.

Between 2015 and 2019, the working-age population (15-64 years old) rose by 9.4%<sup>59</sup> and the number of young people entering the labour market every year increased (Government of Kosovo, 2017<sub>[105]</sub>). As seen in Table 22.13, the activity rate of the population aged 15-64 increased from 37.6% in 2015 to 40.5% in 2019 (Kosovo Agency of Statistics, 2020<sub>[106]</sub>). Between 2015 and Q2 2019, the strongest increase in activity rate was recorded among young people (15-24) and older people (55-64). The activity rate of older workers increased strongly between 2015 and 2017 (by nearly 6 percentage points), but fell by 3.4

percentage points between 2017 and Q2 2019, possibly as a result of the Law on War Veterans passed in 2016 (WIIW and World Bank, 2020<sub>[107]</sub>).

In 2019, the activity rate in Kosovo was still far below the EU average and the 71.2% average of five Eastern and South East European transition economies that could serve as peer economies (Bulgaria, Romania, Hungary, Slovenia and Croatia). The employment rate increased from 25.2% in 2015 to 29.8% in 2017, and has risen only slightly since then, reaching 30.1% in 2019 – the lowest in the region and far below the WB6 average and the EU average (Eurostat, 2020<sub>[108]</sub>). Between 2015 and 2019, the employment rate rose among all age groups, driven by employment growth in the wholesale and retail trade sector, the construction industry and agriculture.<sup>60</sup> The unemployment rate fell steadily from 32.9% in 2015 to 25.7% in 2019 (with a marked drop between 2018 and 2019 of 3.9 percentage points). However, as the employment rate only rose by 1.3 percentage points during this period, this implies that people exited unemployment either for inactivity or migration.

Estimates on the basis of the Labour Force Survey (LFS) show that the employment rate fell from 29.1% in the first quarter of 2020 to 24.1% in the second quarter. Employment growth resumed in the third quarter, with the employment rate reaching 30.1%. The unemployment rate increased from 25% in the first quarter of 2020 to 27.2% in the second quarter, and fell to 24.6% in the third quarter. Variations in the employment rate have thus had a bigger impact on inactivity than on unemployment (Kosovo Agency of Statistics, 2020<sub>[109]</sub>).

The number of registered jobseekers rose noticeably between March 2020 and May 2020, from around 120 000 to 187 000, and continued to rise to 201 000 in October 2020, according to administrative data. This increase is caused by expected benefit receipts linked to the COVID-19 pandemic and the discrepancy between the recording of LFS unemployment and registered jobseekers, indicating a possible misuse of benefits. The government guaranteed that all individuals who lost their jobs due to COVID-19 would receive monthly payments of EUR 130 from April to June 2020. All payments to social welfare recipients were planned to be doubled during April and May.

Support was also available for private sector activity and employment. Eligible firms received EUR 170 a month for each employee on their payroll for March and April 2020, as well as EUR 206 for each new employee hired on a minimum one-year contract during the crisis. Wage supplements were paid during the crisis by the government to vital health and safety personnel such as doctors, police officers and firefighters (EUR 300 per month in additional wages), and to workers in pharmacies, grocery stores and other essential businesses (EUR 100 per month in additional wages). By 11 May 2020, over 170 000 workers had applied for salary compensation, unemployment benefits and other social welfare measures included in the emergency fiscal package (OECD, 2020<sub>[29]</sub>).

A scheme to regularise informal employment has been established. To help transform undeclared work into declared work, employers who voluntarily disclose to state authorities that they previously employed unregistered employees are provided with access to the short-term financial assistance available during the 2020 coronavirus pandemic if they employ the workers on a declared contract of at least one year. By May 2020, formal employment had increased by 2.6% (Williams, 2020<sub>[110]</sub>). While these are initial indications that the regularisation scheme may be effective, misuse has been reported, and it may take time until more unregistered enterprises are convinced to participate in the scheme.

The economic recovery plan, approved in August 2020, allocates EUR 365 million to support businesses, create jobs and stimulate aggregate demand. Out of this budget, the government allocated EUR 67 million to increase employment, with a specific focus on groups of workers with a lower probability of finding employment during the crisis. Firms can receive subsidies covering 50% of their rental expenses and access professional support to help them operate effectively during the pandemic, including guidance on moving operations online, working from home and digitising key business practices. The plan also foresees that citizens can withdraw up to 10% of their pension trust contributions for a period of four months,

although this may not have a big impact on income as the rate of people employed in the formal economy is very low (OECD, 2020<sub>[29]</sub>).

### *Sub-dimension 8.1: Labour market governance*

Regarding the **regulatory framework** in Kosovo, the current Law on Labour was first prepared in 2010. The level of transposition of EU directives is only partial, and the European Commission has stressed the need to undertake more efforts in this area (European Commission, 2019<sub>[111]</sub>). In 2018, the Ministry of Labour and Social Welfare (MLSW) prepared new draft laws on labour and on maternity and parental leave, which transpose 17 EU directives.<sup>61</sup> The drafts had not been adopted at the time of writing.

According to the current labour law, non-standard forms of work include fixed-term employment contracts and contracts for specific tasks (up to 120 days a year). Employees for specific tasks do not enjoy various rights, such as annual leave. The new labour law proposes several other forms of employment contract, such as temporary agency work contracts and contracts/agreements on specific tasks.

The share of workers on temporary contracts (including contracts for specific tasks) is extremely high in Kosovo, although it fell from 72% in 2015 to 60.5% in 2019, which is still largely above the WB6 average of 21.9% in Q2 2019 (WIIW and World Bank, 2020<sub>[107]</sub>) and the EU average of 13.6% (Eurostat, 2020<sub>[108]</sub>). As shown on the Labour Force Survey, individuals with temporary contracts were asked why they had this kind of contract, and 92% reported that there was no other contract type available. Only 5.3% of employees surveyed said that they had the right in their main job to benefit from the social security scheme at work (Kosovo Agency of Statistics, 2020<sub>[112]</sub>). In general, there is a link between a higher level of employment protection of permanent workers and a high share of less protected temporary workers. In 2016, the gap between regular and fixed-term contracts in the strictness of employment protection legislation was far higher in Kosovo than in the other economies in the region. Kosovo showed the lowest level of employment protection for fixed-term contracts (OECD, 2016<sub>[113]</sub>).<sup>62</sup>

The self-employment rate has slightly increased from 21.2% in 2015 to 22.4% in Q2 2019 (near the WB6 average of 23.1% in Q2 2019). Some 18.8% of employed persons were in “unstable employment”, according to Labour Force Survey data of the Kosovo Agency of Statistics. Unstable employment refers to workers in unstable jobs who are either self-employed without employees or who work without pay in a family business. These two groups of workers are vulnerable and are more likely to be informally employed than wage earners. Men are more likely to be in unstable employment than women (Kosovo Agency of Statistics, 2020<sub>[106]</sub>).

The social security system is not fully developed. Non-standard workers without an employment contract or with a contract for specific tasks are not covered by all branches of the social security system. The Concept Note on Pension Reform and Social Security was drafted in December 2018 but had not been adopted at the time of writing.

Kosovo’s legal framework for OSH covers to some extent specific areas regulated by EU directives, and progress has been made in this area in recent years. This progress needs to be built on to close the gap with the EU *acquis* (European Commission, 2019<sub>[114]</sub>).

The implementation of the labour law, OHS legislation and the framework for the work of **labour inspectorates** remains deficient, and no progress has been made to improve the work of labour inspectorates. According to the Law on Labour Inspectorate, labour inspectorates’ tasks include: 1) ensuring implementation of the labour law, conditions of work and protection at work; 2) providing technical information and advice to employers and employees on the most effective means of observing legal provisions; 3) notifying the Minister of Labour and Social Welfare or other competent authorities on any deficiencies in the applicable law; and 4) supplying information and advice to employers and employees on issues relating to the labour law and the protection of employees if an enterprise is reorganised or restructured. In practice, labour inspectorates mainly carry out inspections of workplaces, review

complaints and requests, carry out investigations of accidents at work, certify OHS experts and license OHS services. It is the key supervisory body regarding OHS, which means that its tasks also include the collection, processing, analysing and publishing of information in the area of employment relationships and safety and health at work. This information is gathered at the domestic, regional, sectoral and company and workplace level to investigate the causes of injuries and occupational diseases. Fines can be imposed in the range of EUR 500 to 35 000 for violations of the Law on Health and Safety at Work, and EUR 100 to 10 000 for violations of the Law on Labour; however, these fines appear to be rarely imposed. The Strategic Development Plan for Labour Inspectorates was established for the period 2017-2021 but there is no evidence that major measures have been taken to implement this plan.

There is no comprehensive monitoring system set up by labour inspectorates. There has been an increase in the number of fatalities related to workplace accidents, from 14 in 2017 to 21 in 2018, which points to weaknesses in preventing accidents and occupational diseases and investigating complaints (European Commission, 2019<sup>[114]</sup>). Fatal accidents happen mainly in the construction sector. The labour inspectorate does not follow up on these cases properly and there are concerns regarding the accuracy of data on workplace accidents and occupational diseases, and the under-reporting of fatalities. Available data also point to a poor record on detecting and combatting child labour. According to the latest data from April 2019, 10.7% of children in Kosovo, mainly from Roma and Ashkali communities, are involved in work, 6.8% of whom work in hazardous conditions. However, labour inspectorates have not reported a single case of minors engaged in work (European Commission, 2019<sup>[114]</sup>). The number of labour inspectors is low, although increased slightly in 2018 (European Commission, 2019<sup>[111]</sup>).<sup>63</sup>

As shown in an analysis of strengths, weaknesses, opportunities and threats (SWOT) included in the Labour Inspectorate Strategy 2017-2021, there is little trust in labour inspectorates and no awareness-raising activities to remedy their poor image or advocate for compliance with the law (Government of Kosovo, 2016<sup>[115]</sup>). Labour inspectors are mainly law graduates who receive little or irregular continuous training (depending on external funding) and whose working conditions are poor. The strategy identifies a risk of high staff turnover and other weaknesses including the lack of a work plan, action plans not being implemented, a lack of statistics, poor social dialogue and corruption. Inter-institutional co-operation is neither regular nor systematic. The strategy contains a number of planned measures to improve the capacities of labour inspectors and inter-agency co-operation;<sup>64</sup> however, there is no evidence of their implementation. In 2019, the Strategy for Prevention and the Fight against Informal Economy, Money Laundering, Financing Terrorism and Financial Crimes 2019-2023 was adopted. This also contains measures to improve the work of labour inspectorates (see Cross-cutting policy areas: Informality); however, there is no evidence that implementation has started. A new Law on Labour Inspectorates of Kosovo, which mainly concerns changes regarding OSH, was in the process of approval by the Assembly of Kosovo at the time of writing.

The **employment policy framework** comprises the Sectoral Strategy and Action Plan of the MLSW 2018-2022, the Action Plan for Youth Employment 2018-2020 and the Employment Policy 2019-2021, which defines the activities of Kosovo's public employment service (the Employment Agency of Kosovo, APRK). The Employment Policy also includes small measures to bring vulnerable groups into employment (in particular Roma, Ashkali and Egyptian communities, and women from rural areas). These groups are particularly vulnerable, and the unemployment rate in Roma and Ashkali communities is assessed to be above 90% (European Commission, 2019<sup>[114]</sup>). The members of these communities usually work in the informal sector and few are registered as unemployed.

The Sectoral Strategy of the Ministry of Labour and Social Welfare (2018-2022) addresses the lack of a complete and functional system of safety and health at work. There is a basic labour market information system<sup>65</sup>; however, there is no monitoring system for policy outputs. The MLSW is in the process of drafting a policy paper addressing OHS issues (intersectoral strategy).

There is a legal framework for **tripartite social dialogue** and collective bargaining in Kosovo. Several basic laws and sub-legal documents specify the nature and type of collective bargaining that can take place. Nevertheless, social dialogue is weak.

Workplace representation exists only in the public sector, except for a limited trade union presence in the private sector mainly in former public/socially owned enterprises. There is no other workplace representation (e.g. works councils) in Kosovo. Trade unions are not present at the company level (data for 2016, there is no new information). Two new initiatives (one in banking and one in the arts sector) were undertaken in 2016 to establish trade unions that also cover the private sector (Shaipi, 2017<sup>[116]</sup>).

The Union of Independent Trade Unions of Kosovo is the only trade union confederation in Kosovo. It is represented in the public sector, although healthcare and education have been formally disengaged from the confederation for some time. Progress has been made in these two sectors following a sector collective agreement signed between the Ministry of Health and the Federation of Health Trade Unions of Kosovo (FSSHK) in 2015 and 2018. A collective sectorial agreement was signed between the MEST and the United Trade Union of Education, Science and Technology. The first collective agreement was signed at the firm level between the Municipality of Kamenica and the United Science Education Union in 2019. Aside from these examples, collective bargaining occurs mainly at the economy level, and even there it is not representative. The Social Economic Council (SEC) meets regularly, but has been weak in terms of pushing forward its agenda effectively (see below) (SBASHK, 2017<sup>[117]</sup>) (FSSHK, n.d.<sup>[118]</sup>).

The general collective agreement signed by social partners in 2014 and negotiated at the SEC expired before it was fully implemented either in the public or social sector. The general scope of the collective agreement includes the establishment of labour relations; working hours and leave; salaries and other compensations for employees; contract terminations; and the rights and obligations of employers and employees, as well as conflict resolution between the two.<sup>66</sup> The agreement is largely not respected in the private sector. The most problematic aspect identified by businesses concerns the fact that permanent contracts will only be signed after an employee has successfully performed in a position for three continuous years. Another significant item is the inclusion of experience as a factor in annual salary increases that amount to 0.5% for every year of professional experience. In the private sector, this provision has barely been implemented and in the public sector it has not been well implemented as it affects the state budget.

The members of the tripartite SEC include five members of the Union of Independent Trade Unions (BSPK),<sup>67</sup> which has been criticised by consecutive EU progress reports for lack of representation.<sup>68</sup> Employers are represented by the Kosovo Chamber of Commerce (three members) and the Kosovo Business Alliance (two members). Representatives of five ministries are also members. The SEC is involved in negotiations regarding the minimum wage (no new agreement since the 2018 CO), the general collective agreement (no new agreement), amendments to the labour law, and reforms of the pension system and the law on SEC (Kosovar Stability Initiative, 2016<sup>[119]</sup>). Within the SEC there are five professional commissions that cover tripartite legislation; finance, economy and privatisation; salaries, prices and pensions; employment and vocational training; and the health and safety of the working environment. Although the SEC meets regularly, its influence is weak. Nevertheless, there have been some instances when the government has considered the requests of social partners (e.g. the establishment of a social security fund, as noted by the trade union confederation).

At the regional level, the FSSHK, which is the federation of health workers in Kosovo's public institutions, has established regional bodies that take part in Ministry of Health and MLSW working groups and play a significant role in social dialogue. It is one of the first unions bringing the dialogue to the grassroots (local) level. There are also various economic chambers at the regional level that are not represented on the SEC but that play a role in ministry working groups.

Consultations on new policies are generally conducted with all stakeholders, including social partners (employer and employee organisations) and civil society. Initially, individual meetings are held with key

stakeholders to present the ministry's objective for the proposed policy and the field of implementation. Workshops are then organised with larger groups, where written comments are accepted and at the end of the process a report is published with the justification for accepting or not accepting the comments (Government of Kosovo, 2011<sub>[120]</sub>; Government of Kosovo, 2016<sub>[121]</sub>).

So far, there have been no strategies or action plans addressing tripartism and social dialogue. However, the MLSW is in the process of drafting a Strategy for Tripartite Social Dialogue.

### *Sub-dimension 8.2: Skills*

Key indicators point to a significant **skills mismatch** in Kosovo. The extremely high youth unemployment rate (15-24 years old), at roughly 49% in 2019, indicates major problems in the school-to-work transition, even though the rate has been slightly decreasing in recent years (57.7% in 2015). The youth unemployment rate is largely above the WB6 average of 35.6%<sup>69</sup> and the EU average of 14.6% in 2018 (Eurostat, 2021<sub>[122]</sub>). Poor labour market outcomes for young people are linked to weaknesses in the education system, in particular the poor quality of education at all levels, the failure of educational programmes to meet market demand, and insufficient practical work in school and enterprises, which leads to a lack of practical experience and ties to employers. A lack of advice and career guidance leads to horizontal skills mismatches (Government of Kosovo, 2017<sub>[105]</sub>).<sup>70</sup>

The NEET rate among all 15-24 year-olds rose from 31.4% in 2015 to 32.7% in 2019, which represents a major labour market risk for these young people and is far above the 2018 WB6 average of 22.1%. The employment rate of low-educated individuals is extremely low according to Labour Force Survey data, at 11% in Q2 2019 (WIIW and World Bank, 2020<sub>[107]</sub>). This rate may even be underestimated as it probably does not consider the high share of informal employment, which is typically taken up by low-skilled individuals. Data show that the employment rate increases considerably with skill level. The employment rate of medium-educated individuals increased by 10 percentage points between 2015 and 2019, reaching 63% in Q2 2019. Between 2018 and 2019, employment growth in Kosovo was driven by the increased employment of low- and medium-skilled individuals, and the unemployment rate was highest among the low educated (34.2%) and lowest among the high educated (22.4%) (WIIW and World Bank, 2020<sub>[107]</sub>). Entering the labour market through informal employment is widespread as only slightly more than half (54.8%) of young people have an employment contract (Government of Kosovo, 2017<sub>[105]</sub>). Similar to some other economies in the region, Kosovo is participating in a project to develop skills mismatch indicators supported by the European Training Foundation (ETF), which will deepen insights on skills mismatches.

Despite the high unemployment rate, skills shortages hinder the growth of companies. According to the Skills Towards Employment and Productivity (STEP) employer survey conducted by the World Bank in 2015, 18% of employers indicated that a skills gap in general education was a major obstacle for business expansion, 22% noted gaps in technical and vocational education and training (TVET), and 36% identified gaps in workers' experience (WIIW and World Bank, 2020<sub>[107]</sub>). According to the same survey, more than half of hiring companies faced a skills problem. Horizontal skills mismatches are prevalent: there are popular professions that young people especially continue to aspire to that have abundant applicants, but a lack of professional institutions that provide training and education for professions in which jobs are available. For example, there is high demand for workers in the IT sector, yet a large number of students graduate from law school every year and cannot be absorbed by the labour market. In general, many job postings require computer skills as well as foreign language skills, which are lacking in Kosovo (Brancatelli, Marguerie and Brodmann, 2020<sub>[123]</sub>). Low pay in the private sector also discourages people from undertaking training and education in particular professions.

A basic **adult education** framework is in place. There was a Strategy for Adult Learning for the period 2005-2015, but it had no major impact. The staffing and infrastructure of adult learning institutions are inadequate, and learning content needs to be better adapted to labour market needs (Haxhikadrija, Mustafa and Loxha, 2019<sub>[124]</sub>).

The STEP household survey indicated that 37.3% of adults lack basic reading skills (well above the OECD average of 19.7%) (WIIW and World Bank, 2020<sub>[107]</sub>). Some learning programmes for remedial education (grades 6-9) and adult education programmes within VET schools are being developed and supported by international donors (Haxhikadrija, Mustafa and Loxha, 2019<sub>[124]</sub>). Some specific programmes are also being offered, such as “Literacy for women and girls” for Roma, Ashkali and Egyptian communities. However, developing an efficient and quality adult education system remains a key challenge. Most firms do not provide continuous training to their workers, according to the STEP employer survey (the situation is similar in Serbia, worse in Albania and better in Bosnia and Herzegovina). According to the World Bank study, on-the-job training is more common among firms that had problems hiring due to inadequate skills among applicants, larger firms, firms that invested in research and development, and foreign-owned firms (Cojocar, 2017<sub>[4]</sub>). Progress has been made on offering training to unemployed individuals, however (see Sub-dimension 8.4: Activation policies). The Kosovo qualification system is being revised, which could serve as a framework for the recognition of prior learning (Alija, 2018<sub>[125]</sub>).

As in many European countries, SMEs in particular need support for upskilling their workers. Some good practice examples are given in Box 22.7.

### Box 22.7. Incentives for SMEs to train their employees, Belgium (Flanders)

In Belgium (Flanders), the SME Wallet (KMO-portefeuille) programme offers specific incentives to encourage SMEs to train their employees. It targets SMEs exclusively and is designed to help them grow and become more competitive through skills investments. The SME Wallet covers 30-40% of training costs, depending on the size of the enterprise. SMEs can apply for subsidies on line. Employers determine their own training needs, and there is no targeting element. A recent impact assessment determined that participating firms achieved higher growth than a control group.

Other countries have developed similar programmes targeting SMEs exclusively, including the Chèque Formation in Wallonia, Belgium; Profil!Lehre and Weiter!Bilden in Austria; the Consortium for HRD Ability Magnified Program (CHAMP) in Korea; the Industry Skills Fund in Australia; and the Formação-Ação in Portugal.

Source: (OECD, 2019<sub>[126]</sub>), *OECD Skills Strategy 2019: Skills to Shape a Better Future*, <https://doi.org/10.1787/9789264313835-en>.

### Sub-dimension 8.3: Job quality

Real wage development has been moderate in recent years. While labour productivity declined in 2016 and 2017, it grew in 2018. This meant that unit labour costs increased in 2016 (+9.2%) and 2017 (+5.2%), but fell in 2018 (-1.6%) (WIIW and World Bank, 2020<sub>[107]</sub>). Breaking the low wage/low productivity cycle is a major challenge.

A minimum wage set at a moderate level may be a good tool to raise wages at the bottom of the wage ladder, and can prevent poor **quality earnings** (OECD, 2018<sub>[127]</sub>). In Kosovo, the minimum wage is low compared to average gross wages, and thus likely has little impact. At the beginning of 2019, the minimum wage amounted to 28% of average monthly wages, by far the lowest rate in the region (WIIW and World Bank, 2020<sub>[107]</sub>). For comparison, in 2019 minimum wages were 40% of gross wages on average in Austria, Bulgaria, Croatia and Hungary (WIIW and World Bank, 2020<sub>[107]</sub>). The minimum wage for employees over the age of 35 is EUR 170 a month, while for those under the age of 35 it is EUR 130. The minimum wage is below the average wage paid in the agricultural sector, a sector in which wages are usually low (Government of Kosovo, 2011<sub>[128]</sub>). In contrast to other economies in the region, the minimum wage has not increased since 2011, although the Government of Kosovo is supposed to define a minimum wage at the end of every calendar year based on SEC proposals. It is questionable whether the minimum wage has significant coverage among formal employment, but data are not available to confirm.

The highest wages in Kosovo are paid in the state-owned enterprise sector, while the lowest wages are in the private sector.<sup>71</sup> In private companies, workers have longer working weeks (45.8 hours) on average than in the government sector (35 hours) and in state-owned enterprises (39.2 hours). Some 31.4% of respondents to the 2019 Labour Force Survey reported to sometimes work on Sundays, while 6% reported to do so usually (Kosovo Agency of Statistics, 2020<sub>[106]</sub>). The low wages and poor working conditions in the private sector quite likely push workers to seek employment in the public sector or abroad, which exacerbates the skills shortage in the private sector. Improving working conditions and wages in the private sector would need to go hand in hand with a strategy to increase the sector's productivity.

Due to the very low work intensity in Kosovo, poverty remains high, and many people do not have access to essential services such as health care. According to the latest poverty estimates from the Kosovo Agency of Statistics, 18% of the population were living below the poverty line in 2017 (set at EUR 1.85 per day), while 5.1% were living below the extreme poverty line (EUR 1.31 per day). Low-educated individuals and female-led households are more likely to be poor. Roma and Ashkali communities face disproportionately high levels of poverty and social exclusion given their low education and marginal employment levels (European Commission, 2018<sub>[74]</sub>).

Only 13.9% of working age women (aged 15-64) were employed in 2019, an increase from 11.5% in 2015 (Kosovo Agency of Statistics, 2020<sub>[106]</sub>; WIIW and World Bank, 2020<sub>[107]</sub>). This is well below the EU female employment rate (64.1%) (Eurostat, 2020<sub>[108]</sub>), and extremely low compared to other economies in the region (the WB6 average **female employment rate** was 45.8% in Q2 2019, and the female activity rate was 53.7% (WIIW and World Bank, 2020<sub>[107]</sub>)). The male employment rate was 46.2% in 2019, which shows that the gender employment gap is extremely high, the largest in the region. The activity rate of women was only 21.1% in 2019, a slight increase since 2015, but no increase since 2017. The female unemployment rate was 34.4% in 2019 and the female youth unemployment rate was 62.9% (in Q2 2019, an increase from 38% in 2015). The female unemployment rate was 36.3% among medium-educated women, 26.6% for low-educated women and 31.1% for high-educated women (WIIW and World Bank, 2020<sub>[107]</sub>).

Key explanations for the low female employment rate include traditional gender roles, family responsibilities, limited access to quality and affordable child and elderly care, conservative social norms and discrimination, and women's limited access to assets and productive inputs (World Bank, 2017<sub>[129]</sub>; Haxhikadrija, Mustafa and Loxha, 2019<sub>[124]</sub>). Migration by men further reduces women's possibilities to combine work and family life. Despite improvements among younger cohorts, women in Kosovo have significantly lower levels of education than their male counterparts (e.g. 50% of working-age women are not educated beyond lower secondary education compared to 27% of men) (World Bank, 2017<sub>[129]</sub>). Career breaks further reduce women's likelihood of accessing employment. The female part-time employment rate is low (4.3% in Q2 2019) (WIIW and World Bank, 2020<sub>[107]</sub>), indicating that employers may not be willing to offer suitable working hours for women that would permit them to reconcile work and family life (Government of Kosovo, 2020<sub>[130]</sub>). Article 49 of the Law on Labour regulates the principles, conditions and criteria for the use of maternity leave. Although the law is generous in protecting mothers, it sets disincentives for hiring women due to the added financial burden on employers (World Bank, 2017<sub>[129]</sub>). Secondary legislation for implementing the Law on Protection from Discrimination has not yet been adopted. In the reporting period, the Ombudsperson received a similar volume of discrimination cases as in previous years, but the number of *ex officio* investigations on discrimination grounds doubled. Institutions continue to perform poorly in processing and investigating cases of discrimination (European Commission, 2019<sub>[111]</sub>).

The Sectoral Strategy of the Ministry of Labour and Social Welfare (2018-2022) includes women as a target group. However, they remain under-represented among the Employment Agency's beneficiaries: while women represented around 45% of all registered jobseekers, they only represented 34% of participants in active labour market measures (World Bank, 2017<sub>[129]</sub>).

The Agency for Gender Equality has prepared the Kosovo Programme for Gender Equality 2020-2024, which outlines highly relevant activities to improve skills and the reconciliation of work and family life, as well as combat discrimination in the labour market. The related action plan for 2020-2022 has a budget of EUR 13.7 million. Some EUR 2.6 million will be funded by Kosovo's own budget, with EUR 11.1 million covered by donors (Government of Kosovo, 2020<sub>[130]</sub>). In the long run it will be important to include these social investments in the economy's budget.

#### *Sub-dimension 8.4: Activation policies*

The MLSW's draft Sectoral Strategy for Employment and Welfare for 2018-2022 and the related action plans for the Employment Agency of the Republic of Kosovo (APRK), form the policy framework for **public employment service** (PES) activities. The APRK was created in April 2017. Previously, employment services and ALMPs were offered by the MLSW. The APRK has a tripartite committee and provides services and measures for unemployed individuals through its mechanisms at regional and local levels. It has 28 employment offices, 8 centres of vocational training and 5 mobile centres (Government of Kosovo, 2017<sub>[105]</sub>). The range of services provided corresponds to standard PES tasks,<sup>72</sup> but resources are low. The APRK employed 294 staff in 2019, 92 of whom provide employment services to jobseekers.<sup>73</sup> In 2017, when the APRK was set up, the average caseload per job counsellor was 1 020, the highest in the region. Progress has been made to reduce the caseload to 769 in 2019, which is still higher than in other economies of the region and more than eight times the average caseload of counsellors in a range of EU Member States with well-developed PES.<sup>74</sup> The reduction in Kosovo's average caseload was largely linked to the fall in registered unemployed individuals, from 93 866 in 2017 to 70 970 in 2019.<sup>75</sup> In 2017, 71.5% of unemployed individuals were long-term unemployed, while in Q2 2019 this figure was 63.6%, according to Labour Force Survey data (WIIW and World Bank, 2020<sub>[107]</sub>). The long-term unemployed made up 90% of total registered jobseekers in 2016 (Government of Kosovo, 2017<sub>[105]</sub>).

The employment offices register and profile unemployed individuals and other jobseekers.<sup>76</sup> Unemployed individuals are segmented into three groups that define the services provided to them:

1. **Low risk of becoming long-term unemployed.** These individuals are advised to use self-service instruments and, if necessary, will be provided assistance in using them, as well as in activating social networks and advice on how to contact an employer directly to find a job.
2. **Medium risk of becoming long-term unemployed.** Employment services are provided to these individuals that include job mediation, job search assistance, labour market information and training.
3. **High risk of becoming long-term unemployed.** For this group the counsellor should offer intensive support and counselling that combines job search skills, career guidance, motivation during the job search period and creating an individual employment plan. In-depth and individual counselling is provided for those who are long-term unemployed during an interview lasting about 30 to 45 minutes.<sup>77</sup> The counsellor informs and advises the unemployed client to participate in the various ALMP measures, taking into account the categories and funds available.

The budget for ALMPs was EUR 6.6 million in 2019, corresponding to 0.08% of GDP, which is very low compared to OECD standards (0.36% on average in 2018, and 0.46% if including placement services and PES administration) (OECD, 2020<sub>[131]</sub>). In 2019, 11 500 people participated in ALMPs (including training measures), 37% of whom were young people and 40% women (women were well targeted as they represented only 30% of unemployed according to LFS data). In 2016, only 3.9% of registered unemployed individuals benefited from employment services for placement into regular employment, and 10.2% participated in ALMPs according to administrative data (Government of Kosovo, 2017<sub>[105]</sub>). Among ALMP participants, most were enrolled in vocational training courses (7.6% in 2016), 0.8% participated in public works, 0.5% in wage subsidies, 0.4% in practical work and 0.1% in self-employment schemes. There is no information available on whether these shares have risen since.

Data for 2016 show that more than 60.9% of registered unemployed individuals had not attended school or were enrolled only in primary school, while 31% had not gone higher than secondary school (Government of Kosovo, 2017<sub>[105]</sub>). There are no recent data available on the composition of registered unemployed individuals. However, Labour Force Survey data indicate that more than two-thirds of the unemployed are long-term unemployed.<sup>78</sup> Given the high caseload of counsellors and the low budget for ALMPs, employment services for the vast majority of jobseekers cannot be delivered in an effective and meaningful way. Consequently, the placement rate is low (12.4%), particularly among those with professional skills (9.3%).<sup>79</sup>

The PES identified 12 511 job vacancies in 2017, which is not enough given the high number of registered unemployed. Progress has been made, however, with the number of registered vacancies increasing to 15 647 in 2019.

The Employment Agency has a performance management module, undertaken through the Employment Management Information System, with monitoring data issued every three months and annually; however, detailed results are not publicly available. A customer satisfaction survey was also conducted that targeted PES users. The results obtained from this research are reflected in the work plan of the Employment Agency, but not published.

There is currently no unemployment benefit system (although benefits have been exceptionally allocated during the pandemic). As part of the reforms of the social protection system, arrangements for unemployment benefits are planned. A concept paper is part of the government work plan for 2020, but has not yet been approved.

The Social Assistance Scheme (SNS) is the main social assistance programme in Kosovo. The amount of family benefit is based on the number of family members and starts at EUR 60 a month for a one-member family and goes up to EUR 180 for a family of 15.<sup>80</sup> Coverage is low, social assistance does not sufficiently target the poor, and spending has been declining (Government of Kosovo, 2017<sub>[105]</sub>) (European Commission, 2018<sub>[74]</sub>) (European Commission, 2019<sub>[111]</sub>). A concept paper for reforming the SNS was drafted and approved in September 2020 by the Government of Kosovo. It aims to improve the scheme's impact on poverty alleviation and expand the coverage of poor families. Able-bodied social assistance recipients must register at the PES and actively search for work, otherwise they get sanctioned. Electronic data management and information exchange systems have been established. All social assistance recipients must register with the PES to qualify for assistance; however, monitoring and follow-up on job searches is weak. Kosovo has not implemented a general health insurance scheme.

In the absence of unemployment benefits, and with the low coverage of social assistance, the implementation of activation requirements is weak compared to many OECD and EU countries (OECD, 2015<sub>[132]</sub>; Langenbucher, 2015<sub>[133]</sub>). Jobseekers must report to the employment office every three months, which is not frequent enough (e.g. in the United Kingdom jobseekers must report every two weeks). If a person registered as unemployed does not appear within six months in an employment office they are automatically cleared by the information system and considered passive. Although it is useful to clear the registry data regularly, more could be done to ensure that jobseekers are actively searching for employment, particularly those receiving welfare benefits.

The Sectoral Strategy for Employment and Welfare 2018-2022 points to the lack of co-ordination between different programmes and services for social inclusion, although some co-ordination takes place within the MLSW.<sup>81</sup> In particular there is no integrated delivery of social and employment services at the local level.

Despite poor labour market outcomes among marginalised Roma and Ashkali communities, Kosovo's latest revised action plan on the integration of these communities does not include measures specifically targeting them in **ALMPs**, unlike elsewhere in the region (European Commission, 2019<sub>[114]</sub>). Strategic documents define the target groups for ALMPs as women from rural areas, women without other income, young NEET, long-term unemployed, people with disabilities and repatriates. While increasing employment

among youth and the Roma, Ashkali and Egyptian community are stated objectives of the 2018-2022 sectoral strategy, there is no evidence that these groups are well targeted by ALMPs. The Action Plan for Youth Employment (adopted in 2018) has limited scope (European Commission, 2018<sup>[74]</sup>). ALMPs should continue to focus on women, young people and marginal groups.

The Economic Reform Programme for Kosovo 2019-2021 sets out plans to improve the delivery of ALMPs. These include the objective to increase referrals to ALMPs by 10% and to develop and implement self-employment and entrepreneurship programmes, on-the-job training programmes for newly graduated from higher education, and support voluntary work initiatives. An evaluation of ALMPs is planned for 2021.

Kosovo has made progress in strengthening institutional capacity to deliver ALMPs to vulnerable groups through the adoption of the Law on Social Enterprises approved by the Assembly of Kosovo. In August 2020, four bylaws were adopted that enable the registration and operation of social enterprises in the Republic of Kosovo. In co-operation with the EU, a grant support programme has been developed for social enterprises implementing active labour market measures. It is expected to be finalised by the end of 2020, and several NGOs and businesses should be contracted.<sup>82</sup>

### *Cross-cutting policy areas: Informality*

The size of the informal economy in Kosovo is estimated to be above 30% of GDP (Government of Kosovo, 2019<sup>[134]</sup>). Although informal sector employment is not covered by the economy's Labour Force Survey, it is also estimated to be high. The incidence of informal employment is higher for men, young and elderly people, and the low educated (WIIW and World Bank, 2020<sup>[107]</sup>). The main sectors for informality are construction, manufacturing and social services, according to a MLSW Report. Data on time use show that informal workers work 52 hours per week on average, while those employed formally work 44 hours per week (Social Impact, 2018<sup>[135]</sup>).

The Strategy for Prevention and the Fight against Informal Economy, Money Laundering, Financing Terrorism and Financial Crimes 2019-2023, adopted in 2019, plans to develop approaches to formalise informal employment. The objectives of the strategy are:

- Improving the analysis and monitoring of informal employment, and establishing a register for employed people at MLSW.
- Conducting public information campaigns on the consequences of informal employment and the benefits of formal employment, and informing employers about the consequences of informal employment.
- Organising joint activities with social partners to address informal employment.
- Deepening inter-institutional co-operation in combating informal employment.
- Conducting an analysis of the state of informal work and an assessment of good practices for its reduction.
- Building the capacity of labour inspectors through training.
- Establishing an efficient system for supervising and evaluating the work of labour inspectors.
- Establishing a methodology to ensure better targeting, based on risk.
- Improving the working conditions for labour inspectorates through the establishment of an information management system and the improvement of technical working conditions.

This strategy is highly relevant, and it should begin to be implemented.

### *Cross-cutting policy areas: Brain drain*

Although there are no data, there is evidence that significant numbers of medium and highly educated workers have left Kosovo to seek better opportunities abroad (e.g. in the construction sector). Brain drain

in Kosovo has been happening for a long time and is caused by, for example, limited opportunities for highly skilled people and/or very low compensation for workers and professionals, and poor working conditions such as health and safety at work and long working hours. There are no policies to address brain drain in Kosovo.

### ***The way forward for employment policy***

To improve employment policy, policy makers should consider the following recommendations:

- **Implement as a minimum the Strategic Development Plan for Labour Inspectorates 2017-2021 and the Strategy for Prevention and the Fight against Informal Economy, Money Laundering, Financing Terrorism and Financial Crimes 2019-2023.** It is particularly important to improve the monitoring system of labour inspectorates and increase transparency, implement preventive measures, and effectively impose fines in cases of clear infringements of the law. The capacities of inspectorates in terms of training, hardware and software need to be improved, and inter-agency co-operation needs to be strengthened. Labour inspectors need to be trained to detect child labour.
- **Establish a complete and functional system of health and safety at work.** The first step will be to develop a strategy document on occupational safety and health, to implement preventive measures, and to strengthen worker representation for OHS-related issues at the company level. Labour inspectorates' capacity to reduce accidents at work and occupational diseases should be increased.
- **Use the whole education and training infrastructure in the economy, including VET institutions, to provide remedial education and vocational upskilling to adults,** as also recommended by the ETF (ETF, 2019<sup>[136]</sup>). In order to build on the already acquired skills and knowledge of the working population, and given the high level of informality, it is recommended to develop a framework for the recognition of prior learning combined with upskilling activities.
- **Scale up childcare facilities and support for elderly care.** International experience shows that the labour market participation rates of women depend on the availability of childcare and after school care (OECD, 2016<sup>[137]</sup>). Amend the maternity leave law to remove the financial burden on employers for generous compensation during maternity leave (e.g. by tax financing the leave). This should reduce the barriers to employing young women. Implement all employment relevant measures of the Kosovo Programme for Gender Equality 2020-2024.
- **Continue to enhance the number of job counsellors and significantly reduce their caseload.** This is necessary given the high incidence of long-term unemployed and unemployed individuals with multiple employment barriers. In order to serve vulnerable groups and hard-to-place jobseekers the number of counsellors would need to be multiplied by eight to reach the caseload of well-developed PES such as those in Germany in France. It is also recommended that for vulnerable groups, job counsellors should co-operate with social and health services at the local level, as employment barriers are often complex. This is increasingly implemented in the EU (Konle-Seidl, 2020<sup>[138]</sup>). Jobseekers should be followed up more regularly (e.g. every two to four weeks).
- **Introduce the planned comprehensive social protection system that includes an unemployment benefit scheme and a general healthcare scheme, and reform the social assistance scheme to better target the poor.** The system should include the possibility to top up low incomes with means-tested welfare benefits to encourage the taking up of work and to activate recipients to participate in the labour market, as in a number of EU Member States.
- **Use time-limited (e.g. six months) exemptions to social security contributions to transform temporary contracts into permanent ones,** as in Portugal (Düll et al., 2018<sup>[139]</sup>). At the same

time revise the employment protection legislation of temporary and permanent contracts to increase the use of permanent contracts and ensure that temporary employed individuals enjoy the same basic employment rights and working conditions (working time, paid holidays, etc.) and have equal access to social protection.

- **Continue implementing the scheme to regularise informal employment (set up in the context of COVID-19), and implement awareness-raising campaigns.** Evaluate the scheme and make the necessary adjustments in programme design and implementation to limit misconduct and fraud.

## Science, technology and innovation (Dimension 9)

### Introduction

Table 22.14 shows Kosovo's scores for science, technology and innovation (STI), and compares them to the WB6 average. The economy scores below average in all three sub-dimensions and ranks fifth out of the six Western Balkan economies in STI and public research systems, and sixth in business-academia collaboration indicators. Kosovo's performance in this dimension has been constrained by a lack of system-level STI priorities and the limited implementation of relevant policy initiatives. In particular it is difficult to fully assess Kosovo's progress since the previous assessment cycle due to inadequate monitoring and evaluation activities. The resulting scarcity of relevant data has also slowed ongoing reform efforts, most notably the Smart Specialisation Strategy being developed in partnership with the EU.

**Table 22.14. Kosovo's scores for science, technology and innovation**

Dimension	Sub-dimension	Score	WB6 average
Science, technology and innovation dimension	Sub-dimension 9.1: STI system	1.8	2.4
	Sub-dimension 9.2: Public research system	1.3	2.0
	Sub-dimension 9.3: Business-academia collaboration	0.7	1.6
Kosovo's overall score		1.3	2.1

### State of play and key developments

#### *Sub-dimension 9.1: STI system*

Kosovo's STI system is in the early stages of development, and limited progress has been made since the previous assessment cycle in 2017. Without a clearly defined system-level policy framework, policy makers and stakeholders struggle to prioritise and effectively engage in STI activities. Kosovo does not have a clear **STI strategy** in place, as the most recent strategy on research expired in 2016. Instead, the strategic framework consists of two high-level strategies: the Kosovo Research Programme (NRP), which outlines Kosovo's overarching development agenda and sets research priorities, and the Kosovo Education Strategic Plan (KESP) 2017-2021. The lack of a dedicated and uniform STI strategic framework has prevented Kosovo from addressing challenges to its STI system and formulating targeted policy actions, and implementation remains highly uncoordinated. The Kosovo Strategy for Innovation and Entrepreneurship provides some high-level guidance but does not provide a comprehensive roadmap for STI policy making or tools to co-ordinate implementation efforts. Other relevant policy documents include the Kosovo IT Strategy, which includes provisions to promote innovation and research and development within the IT sector, and the University Strategic Plan.

Since the previous assessment, the government has drafted the Strategy for Supporting Innovation and Entrepreneurship 2019-2023, adopted in March 2019. Efforts to develop a smart specialisation strategy, in line with Joint Research Centre methodology are underway, but remain in the early drafting stages. However, the lack of comprehensive statistical data collection practices for relevant STI indicators has hindered this process and slowed the necessary mapping of Kosovo's innovation ecosystem.

The **institutional framework** of the STI system remains complex, with a number of government ministries and institutions, private sector groups and international organisations overseeing various aspects of STI policy development and innovation. Following a governmental reshuffle in early 2020, innovation is now within the competency of the MEST, whereas previously responsibility lay with the Ministry for Innovation and Entrepreneurship (MIE). Established in 2017, the MIE was intended to co-ordinate innovation activities between government institutions, academia and the private sector. Although it did not act as an independent implementing agency for innovation, it oversaw a specific budget allocation for innovation.

Responsibility for developing and implementing STI policy remains fragmented. Without a functioning mechanism for identifying and resolving issues through inter-ministerial co-ordination, the development and implementation of STI policies suffers from inadequate co-ordination and overlapping areas of responsibility. In addition to the MEST, the Kosovo Research Council and the Scientific Innovation Council (SIC) oversee similar policy domains. MEST plays an extensive role within STI policy and is responsible for promoting scientific research and technological development, as well as overseeing the higher education system. It also oversees the implementation and funding of the STI objectives outlined in the NRP,<sup>83</sup> and is responsible for promoting knowledge and technology transfer within the economy.<sup>84</sup> The SIC aims to monitor the creation and commercial application of new innovations and is overseen by MEST; however, it has not yet been fully established and remains inoperative.

Kosovo's **regulatory framework** for the STI system is primarily defined by the Law on Scientific Research Activities, which oversees scientific research, knowledge and technology transfer and innovation. As such it regulates research institutions, scientific councils, financing for STI activities and conditions for researchers. The law requires the government to allocate at least 0.7% of its annual budget to support STI activity, although this requirement has yet to be upheld in practice.

The Law on Scientific Innovation and Transfer of Knowledge and Technology defines which organisations and institutions operate within the STI sector, and identifies multiple sources of funding used for innovation and knowledge and technology transfer. The law also requires MEST to establish the SIC, and outlines its mandate to monitor the development and commercial application of new innovations. The Law on Higher Education distinguishes between various types of HEI and outlines their primary objectives, including a commitment to knowledge creation and transmission as one of their core functions. Kosovo does not participate in EURAXESS.<sup>85</sup>

There have been no major changes to the regulatory framework since the previous assessment cycle, and implementation of the legal framework, including the requirement to develop an economy-wide research programme, is somewhat lagging. Kosovo adopted amendments to the Law on Patents in 2019, which brought the economy's legal framework for intellectual property somewhat closer to the EU *acquis*. The capacity of the Agency for Industrial Property has also been strengthened, which has helped to clear the backlog of patent applications accumulated in recent years. However, enforcement of intellectual property (IP) rights remains low, and public awareness of the use of IP, especially amongst the business community, needs to be increased.

Kosovo engages in extensive **international collaboration** to further its STI objectives and participate in international initiatives and research projects. However, the impact of these efforts remains limited amid the underdeveloped domestic STI policy framework, which restricts the potential to fully exploit access to international programmes and meet international commitments. With only 72 applications submitted from 2014 to 2019, Kosovo's participation rate in Horizon 2020, the EU research and innovation funding programme<sup>86</sup> in which Kosovo participates as an international co-operation partner, is lower than other Western Balkan economies. To date, Kosovo has participated in 18 projects and received over EUR 2.5 million in funding. However, since the previous assessment cycle, Kosovo has taken a number of steps to expand its contact points network and raise awareness among researchers about available opportunities associated with Horizon 2020. As a result the economy performed well in 2019, with a 20.4% success rate for applications from Kosovo compared to an average of 12% among all Horizon 2020 participants. As part of Horizon 2020, Kosovo also participates in the European Cooperation in Science and Technology (COST).<sup>87</sup>

As a participant in the European Research Area (ERA), Kosovo has strong incentives to increase its **alignment with EU STI policies**. However, it has made relatively little progress since the previous assessment cycle in achieving its commitments and further integration into the ERA due to the insufficient collection of the necessary statistical indicators. Overall, the lack of readily available and reliable data makes it difficult to assess the economy's progress in this policy area.

### *Sub-dimension 9.2: Public research system*

Kosovo's public research system remains underdeveloped and lacks adequate budgetary, administrative and strategic support. The Law on Higher Education regulates the overall structure and organisation of the public research system in Kosovo, which is mainly populated by public universities and private HEIs.<sup>88</sup> Kosovo has yet to develop a new strategic approach to research since the previous research strategy expired in 2016, and has made limited progress in implementing its existing objectives.

The **institutional structure of the public research system** remains ineffective. The expired Kosovo Research Programme was largely unimplemented and based on outdated guidelines and standards for scientific research drafted by the Kosovo Science Council, which ceased operation in 2011 amid political turmoil. There are 26 HEIs in Kosovo, of which 7 are public universities and the rest are private colleges. Although all public HEIs include commitments to pursuing research in their mission statements, most prioritise teaching over research in practice. Coupled with often poorly equipped research labs and other key research infrastructure, the quality of HEI research in Kosovo remains below potential (Kačaniku, Rraci and Bajrami, 2018<sub>[140]</sub>). For example, since the previous assessment Kosovo has been unable to implement plans to install new research labs in five HEIs due to budgetary constraints, and there have been no new initiatives to maintain or update lab equipment in the economy (Mehmeti, Mehmeti and Boshtrakaj, 2019<sub>[141]</sub>). The Kosovo Accreditation Agency is not part of the European Association for Quality Assurance in Higher Education or the European Quality Assurance Register for Higher Education, which further limits quality research outputs.

Limited **public research funding** is a key constraint to the development of STI, as the sector is systemically underfunded. Although required by law to allocate at least 0.7% of its annual budget to support scientific research activities, government spending on science and research amounted to only 0.1% of GDP in 2019 (European Commission, 2020<sub>[39]</sub>). However, absolute funding for scientific research, which is predominately institution-based, has increased significantly in recent years (albeit from very low levels), suggesting an increasing commitment by the authorities to invest in the system.

Grants valued up to EUR 10 000 per year are available to fund small projects, mainly within the HEI sector. These grants cover expenses such as short-term visits and conferences, specific laboratory equipment and software, and costs for external advisors. Although researchers in Kosovo are eligible to access funding through Horizon 2020 and COST, Kosovo's participation in these initiatives remains low compared to other Western Balkan economies. Low levels of domestic expenditure on research activity and reliance on foreign donors inhibit the development and implementation of strategic investment in research infrastructure and programmes.

The development of **human resources for public scientific research** remains limited, as HEIs tend to prioritise teaching over research and apply uneven criteria for promoting scientific research excellence. The quality of postgraduate programmes in terms of preparing students for research careers is poor, and academic staff are not typically required to engage in research activities. Furthermore, there are few mechanisms to monitor or evaluate their research (Kačaniku, Rraci and Bajrami, 2018<sub>[140]</sub>). Subsequently, the number of publications published in international peer-reviewed journals was less than a quarter of the Western Balkans regional average in 2018 (World Bank, 2018<sub>[142]</sub>). There is also limited support available for researchers to engage in international research projects and attend international events and conferences. Although international initiatives and donors such as Horizon 2020 and COST provide additional resources to researchers, the low awareness of these programmes and the limited resources to support access to them continues to restrict their impact in the economy.

### *Sub-dimension 9.3: Business-academia collaboration*

Kosovo does not appear to have a formal **collaboration promotion framework** to support business-academia collaboration. Such collaboration is not explicitly recognised in the STI policy

framework and there are no concrete promotion measures or objectives in place. Consequently, technology absorption capacity remains limited and investment in research and development by the private sector remain low compared to other Western Balkan economies.

There are some **financial incentives for collaboration**; however, most are oriented towards the private sector to promote innovative companies and do not specifically promote business-academia collaboration. An innovation voucher scheme overseen by the Ministry of Innovation and Entrepreneurship is in place but has reportedly been underutilised, with few applications submitted. It is unclear whether low participation rates are due to lack of interest or awareness among firms and academics. **Non-financial incentives for innovation** remain similarly underdeveloped in Kosovo. Researchers have few incentives to participate in business-academia collaboration as they are still assessed against conventional performance criteria. The funding and efforts of the MEST are geared to providing full or partial scholarships for students to study abroad, mostly for master's courses, and there are few opportunities for PhD/postgraduate research.

Kosovo has made some progress since the previous assessment in developing stronger **institutional support for collaboration**. A number of innovation centres operate in major cities throughout the economy (Box 22.8), and EUR 1.1 million was allocated to fund labs and equipment at two regional innovation centres. The establishment of four innovation centres and training parks across the economy have strengthened Kosovo's innovation infrastructure. These centres have played an important role during the COVID-19 pandemic in supporting domestic innovative solutions to the challenges presented, including the fabrication of face shields and distance-learning tools for primary school students. However, these institutions are primarily oriented towards business incubation and may not fully accommodate scientific research activities.

### Box 22.8. Innovation Centre Kosovo

The Innovation Centre Kosovo (ICK) was founded in 2012 to support entrepreneurship, innovation and commercially based business development in Kosovo. It aims to create new jobs and promote green energy. The centre supports both start-ups and existing companies with the potential for growth.

An integral element of the ICK is the incubator, which provides pre-incubation, incubation and virtual incubation services to both start-ups and early-stage companies. In addition to the incubator, various innovation and ICT-related support programmes are implemented via the ICK, including Junior Geeks, Angel Club, a Tech Boost Programme and the Start-up Social Workshop.

Since 2018, the ICK has administered a small-scale "Innovation Fund" grant scheme, which makes available co-financing of up to EUR 50 000, supported with donor funding. To date, two calls have been successfully completed, awarding over EUR 500 000 to 13 SMEs in 2018 and 2019.

Overall, more than 390 start-ups have successfully worked with the ICK, and over 2 100 have been created.

### ***The way forward for science, technology and innovation***

Kosovo has made limited progress in developing science, technology and innovation since the last assessment. The development and prioritisation of targeted policy measures remains a major challenge amid the absence of an overarching strategic support framework for STI and a lack of funding. To improve the situation, Kosovo should consider the following:

- **Establish an overarching strategic view and develop mechanisms to co-ordinate policies across the whole of government.** The Smart Specialisation Strategy represents an important opportunity to develop a strategic approach to STI policy making, especially if coupled with the adoption of a new research strategy.
- **Identify and map the research and development infrastructure** to gather economy-wide data on labs and researchers. If these efforts are further complemented with the expanded collection of statistical data related to STI, Kosovo will be able to meet its commitments under the ERA and prepare for a research infrastructure roadmap.
- **Increase investment in public sector research and encourage research excellence.** Comprehensive financial and non-financial programmes to upgrade research as a profession, including though investment in better equipment in research labs, increased assistance to encourage international collaboration and research exchanges, will increase the quality and quantity of research outputs in the medium term and should stimulate the integration of academic research with the business community.
- **Maintain momentum and continue to improve participation in international STI collaboration.** Further actions should be taken through the contact points network under Horizon 2020 to provide more training and awareness raising about the opportunities of international initiatives. Measures could include better linkages of researchers through increased mobility and the exchange of best practices.

## Digital society (Dimension 10)

### Introduction

Table 22.15 shows Kosovo's scores for digital society and compares them with the WB6 average. Kosovo has continued digital society policy reforms since the last assessment cycle, but progress has been slow in most of the sub-dimensions. The economy nearly reached the WB6 average for the access sub-dimension as broadband development has shown stable progress, with the rural broadband infrastructure programme launched in 2019 already demonstrating solid impact on the Internet connectivity of remote areas. Although the regulatory framework on electronic communications continues to be improved to facilitate investment in network infrastructure development, alignment with the EU framework is not yet complete, and the market suffers from some persisting competitive distortions. There has been widespread discussion of the potential of the ICT sector in Kosovo; however, there is also a lack of reliable data to support data-driven decision making, which affects all aspects of digital society development, including digitalisation, jobs, inclusion and trust. Kosovo scores below the WB6 average in the sub-dimensions of use and society, and has average ratings for jobs and trust. The contribution of the ICT industry to GDP stagnated at 1.9% in 2018 and 2019 (Kosovo Agency of Statistics, 2021<sup>[144]</sup>). The digitalisation of SMEs is stagnant, and although the IT industry continues to work mostly in international markets, there is limited evidence to indicate that it is ready to move focus from outsourcing and exploit the promise of data-driven innovation. There is evidence that e-commerce reforms, boosted by the new conditions imposed by the COVID-19 pandemic, are creating a new e-commerce culture in Kosovo, although limited resources have been allocated since 2018 to building trust in the digital society domain. Privacy, personal data protection and free access to information remain critically underdeveloped.

**Table 22.15. Kosovo's scores for digital society**

Dimension	Sub-dimension	Score	WB6 average
Digital society dimension	Sub-dimension 10.1: Access	2.8	2.9
	Sub-dimension 10.2: Use	1.8	2.4
	Sub-dimension 10.3: Jobs	2.3	2.3
	Sub-dimension 10.4: Society	1.5	2.1
	Sub-dimension 10.5: Trust	2.2	2.2
Kosovo's overall score		2.3	2.4

### State of play and key developments

#### *Sub-dimension 10.1: Access*

Kosovo is in the process of completing an ambitious rural **broadband infrastructure** programme that promises to connect every household and every public and private institution in the territory with high-speed Internet. The Electronic Communication Sector Policy – Digital Agenda for Kosovo 2013-2020, along with the overarching Kosovo Digital Economy (KODE) project for 2018-2023, have created a broadband development framework that facilitates private sector investment. The data collected by the Regulatory Authority of Electronic and Postal Communications (ARKEP) suggest that fixed broadband penetration increased from 15.1% at the end of 2017 to 20% in Q3 2020 (ARKEP, 2020<sup>[145]</sup>). According to ICT usage survey data from the Kosovo Agency of Statistics, 96.4% of households in Kosovo had Internet access at home in 2020, which is the highest percentage in the region, surpassing even the EU average (90% in 2019) (Kosovo Agency of Statistics, 2021<sup>[146]</sup>). The same survey indicates the type of access from home is 95.1% through fixed lines and 54.7% through mobile connections. However, just over 70% of the population uses 3G/4G mobile broadband (ARKEP, 2020<sup>[145]</sup>).

To cover scarcely populated areas, the government secured a World Bank loan of EUR 20.7 million for a rural broadband infrastructure development project under the KODE project. The overall objective of the project is to improve the quality of digital infrastructure throughout Kosovo to deliver at least 100 Mbps, upgradeable to 1 Gbps, to all households. Implementation started in 2019 with the announcement of eight competitive calls for co-financed infrastructure development projects<sup>89</sup> covering 85 specific “white”<sup>90</sup> areas, 48 schools and 17 healthcare centres. In total, 30 grant agreements were signed with different Internet service providers (ISPs) for respective sub-projects. During 2020, another 6 calls were published, which resulted in the financing of 21 new sub-projects to cover 62 white areas, 27 schools and 9 healthcare centres, offering free Internet access for five years. Along with public institutions, 4 000 families in 147 white area villages will benefit from free-of-charge high speed Internet connections for the same duration. These projects are co-financed up to 50% by the state, according to state aid rules that are aligned with the EU Guidelines on the Rapid Deployment of Broadband Networks (2013/C 25/01). The target of the project was to cover 100% of Kosovo households with broadband Internet by the end of 2020, which is close to actual monitored data. KODE also started the pilot project in 2020 of connecting mobile towers with fibre optic and 5G-ready active equipment. This project will continue until the end of 2022. The KODE Project Implementation Unit within the MEE acts as the broadband competence office and provides programme co-ordination and implementation monitoring. The MEE also monitors the implementation of the digital agenda.

In co-operation with ARKEP, the MEE has developed a comprehensive Broadband Electronic Atlas<sup>91</sup> to map fixed and mobile infrastructure and services. Kosovo, supported by the World Bank, takes part in the Balkans Digital Highway Project with other WB economies to investigate regional interconnectivity improvements through infrastructure sharing of the optical fibre ground wire installed by local energy utilities. During July 2020, ARKEP further improved the regulatory environment for network infrastructure investments by adopting a number of regulations to facilitate broadband infrastructure development and shared use (e.g. regulations on open access to the local loop or to the curve and bitstream, on technical and operational issues of access to networks in bitstream, and on interconnection services). These were in addition to the regulations adopted during the 2018/19 period (e.g. regulations on the shared use of associated facilities, on general authorisations, and on the quality of electronic communication services). ARKEP adopted regulation on the rights of way and common use of infrastructure in 2012. The government has prepared draft legislation on measures that reduce the cost of deploying high-speed electronic communications networks, in accordance with the EU’s Broadband Cost Reduction Directive (2014/61/EU), but the law has not yet been adopted.

The **ICT policy regulatory framework** is constantly improving its alignment with the EU *acquis*. The existing electronic communications framework is almost fully aligned with the EU 2009 regulatory framework, which is positively reflected in market developments. The domestic regulator, ARKEP, is fully staffed and has the resources to ensure the active improvement of the regulatory framework through adjustments that support private sector investment in communications infrastructure development. However, the only pending issues to complete alignment with the EU framework are the financial independence of ARKEP, which is not ensured,<sup>92</sup> and relevant EC recommendations that have not yet been implemented (European Commission, 2020<sup>[39]</sup>). A persistent challenge for the Ministry of Economy and Environment and the regulator is the outstanding privatisation of the incumbent state-owned operator, Kosovo Telecom, after failed attempts to sell the company and the large debt it has accumulated since 2015. In 2019, the Ministry requested EBRD assistance to prepare Kosovo Telecom for privatisation.<sup>93</sup> In the meantime, government-imposed competition restrictions continue, as public institutions are still obliged to use services solely provided by Kosovo Telecom. In a positive move, the regulator reviewed pricing policies for frequency allocation, leading to a 30% price drop for the currently allocated frequencies for mobile telephony services. ARKEP is also reviewing pricing policies for new frequency allocations and annual regulatory fees. ARKEP monitors the electronic communications market and regularly publishes reports and indicators on its development. Although citizens have online access to regulations and open consultation outcomes, regulatory impact assessments for new regulatory proposals are not being

conducted, and human resource capacity in this field remains low. ARKEP and MEE took part in preparations for the Regional Roaming Agreement, which was signed in April 2019.

A basic legal framework on **data accessibility** is in place in Kosovo to enable data sharing within and across the public sector; to allow data openness; and to guide the transparent collection, access and control of data. The adoption of the 2019 Law on the Right for Access to Information, the new Law on Personal Data Protection and subsequent regulations on fees for access to public documents, are major legislative improvements. The international Open Data Charter<sup>94</sup> was adopted as a strategic framework for data accessibility in 2016. The Open Data Readiness Assessment, performed in 2018 following World Bank methodology, concluded that there is limited understanding of the significance of data formats and licences in the public sector, and that demand for open data is still limited in the industry because an ICT-outsourcing mindset prevails (Ministry of Public Administration, 2018<sub>[147]</sub>). It also noted that key data for enabling FDI and business development, such as a business registry, are not fully available or searchable (Ministry of Public Administration, 2018<sub>[147]</sub>). With the assessment, an action plan, co-ordinated and monitored by the Unit for Open Data in the Information Society Agency (AIS), was developed to address the identified shortcomings.

The AIS also manages the government's Open Data Portal,<sup>95</sup> created in 2016, as well as the State Electronic Data Centre and ICT infrastructure for public institutions. Over 205 datasets from 14 different public sector organisations were published on the portal by August 2020, using a variety of closed and open formats and licences, because of the absence of specific, formal guidance. Regulations and corresponding technical support for the re-use, sharing and commercialisation of data are not yet in place. There is also no database of indicators on data accessibility and openness to assist data-driven policy making. However, the Ministry of Public Administration has formally put in place a process for the general secretary of every ministry to nominate official open data focal points in each ministry with specific role and duties.

### *Sub-dimension 10.2: Use*

The current **digital government** framework is based on the Strategy on the Modernisation of Public Administration 2015-2020, whose publication was a positive step towards rationalising, optimising and digitalising administrative processes. However, its implementation has not progressed as planned, as noted by the European Commission in its report on Kosovo in May 2019, where it recommended increasing efforts to implement e-government frameworks and services (European Commission, 2020<sub>[39]</sub>). Since then, the AIS has prepared and proposed a new e-government strategy in its role as the central co-ordination point for digital government.<sup>96</sup>

The draft Strategy for Electronic Governance 2020-2025 and its action plan are expected to provide the new digital government framework for the next period; however, the document was still under consultation with stakeholders in late 2020. Until the strategy is adopted, a number of other policies cover aspects of digitalisation in Kosovo, including the Digital Agenda 2020, the KODE project and the Strategy on the Modernisation of Public Administration 2015-2020. These policies promote digital technologies for civic engagement in policy design, legal and regulatory reform, online public services and tools, public officials' asset disclosure, and fiscal transparency. Positive results from the implementation of these policies include the development of Kosovo's interoperability framework, based on the European Interoperability Framework model; the creation of some e-government services; and the adoption of the Law on Electronic Identification and Trust Services in Electronic Transactions in late 2020. This law supplements the Law on Information Society Services to create an enabling legal environment for electronic services.

Recent initiatives include launching the Ministry of Finance's public consultations online platform<sup>97</sup> and transparency portal,<sup>98</sup> backed by the strong commitment of government for collecting and investigating public officials' asset declarations. Since 2017 all public sector institutions, including local authorities, have been legally obliged<sup>99</sup> to use the public consultations platform for every policy or legislative proposal. The

Prime Minister's Office, which is tasked with implementation monitoring, reported positive trends in fulfilling the minimum standards of public consultations in 2019, despite challenges. Impressively, the number of participants in the public consultation process has more than doubled since 2018. Although tax authority services have been largely digitalised, Kosovo is still a long way from achieving a fully digital government, and the need for increased co-operation and support in building the capacities of public officials for developing and maintaining e-services is still high (Office on Good Governance, 2019<sup>[148]</sup>).

Improving the e-business environment and encouraging **private sector ICT adoption** to increase companies' efficiency and competitiveness is one of the high-level objectives of the Digital Agenda 2020; however, the document does not outline specific measures to promote the adoption of ICT by firms. As in the previous assessment cycle, there has been limited or no government funding for programmes that provide IT training or consulting support for the digitalisation of private sector companies. However, the government has reduced VAT for ICT equipment to 8%, and ICT is exempt from VAT and customs duties on import. The government depends on donor-funded projects to offer digital skills training for employees of traditional businesses to enable the exploitation of digital technologies for increased productivity and exports. Such projects include the IPA II projects EU Support for the Competitiveness of Kosovo's ICT Sector<sup>100</sup> and EU Support to Digitalisation of Businesses through ICT.<sup>101</sup> However, use of ICT by business has stagnated, reflected in 2019 ICT usage data presented by the Kosovo Agency of Statistics which shows that only 52.4% of enterprises declared they had business web pages, down from 63.1% in 2018 (Kosovo Agency of Statistics, 2021<sup>[149]</sup>).

Although e-commerce is a significant driver of private sector ICT adoption, a comprehensive legal framework to support its regulated use still needs to be developed. Bottlenecks include the poor security of online payment systems and the fact that banks in Kosovo still charge 2.5% to 3% in fees for each international online credit card payment transaction (TEB, 2021<sup>[150]</sup>). The logistics and transport infrastructure needed for e-commerce is also inadequate. The government has not built a critical mass of transactional e-services for businesses, which would stimulate the adoption of ICT by private sector companies.

### *Sub-dimension 10.3: Jobs*

The Kosovo Education Strategic Plan (KESP) 2017-2021 is the main policy document for the development of education at all levels. Although it does not directly address **digital skills for students**, it draws attention to the need to accelerate the integration of ICT in schools and to prepare digital teaching material. The use of ICT and modern teaching technologies in Kosovo's education system is relatively low. In 2017, the reported computer-student ratio in Kosovo was 1:46, which is much lower than the EU average (1:7). According to the MEST, 44.4% of schools had ICT equipment in 2017, but equipment maintenance continues to be poor. The MEE, via the KODE project, is gradually improving Internet connectivity speeds for schools<sup>102</sup> in under-served areas, as well as building a data centre for research and education that will serve as a hosting facility for a video conferencing platform and other online services and platforms. During 2020, 12 municipalities in Kosovo received high school IT equipment worth EUR 160 000 to fulfil distance learning requirements imposed by the COVID-19 pandemic. However, despite the technological investment, the number of teachers able to prepare and use electronic content in the learning process is very limited. Teacher training and qualification testing on digital skills has not received adequate attention, even though it is key to ensure high-quality education. The MEST depends heavily on donor support to provide teacher training in ICT. For example, the EU Support for the Competitiveness of Kosovo's ICT Sector project offers free IT courses for ICT teachers and trainers/instructors.

Students' digital skills are developed through classes on information technology, taught from the sixth grade of primary education through secondary education. However, the curriculum is outdated, mainly providing basic information on how to use a computer and the background on how it functions, which does not meet the actual needs of 12-year-old pupils, most of whom started using digital devices at preschool

age. The situation is further exacerbated by tech-shy or ill-trained teachers. The IT subject is graded annually and tested in economy-wide achievement tests. Curricula are designed by the MEST in co-operation with working groups that comprise municipality, academia and civil society representatives. According to the KESP this role was supposed to be transferred to the Agency for Curriculum, Assessment and Standards (AKVS), but this agency is yet to be established. The MEST is monitoring progress of the implementation of the KESP, but data collection on digital skills is not systematic. High schools and universities lack the data-driven approach required to create up-to-date learning programmes. As a result, the curricula, especially in tertiary education, do not meet the needs and requirements of IT companies, which adversely affects the industry's competitiveness.

The KESP also provides a basic policy framework for **digital skills for adults**. The framework includes formal and informal training systems, public services, support programmes and social protection to address barriers to learning faced by low-skilled and disadvantaged adults, and the use of digital learning and mentoring platforms to increase the accessibility of training opportunities. Legislation on adult education and vocational training has been in place since 2013. The Agency for Vocational Education and Training and Adult Education plans, implements, oversees and improves the professional education and adult education system. The Ministry of Labour and Social Welfare, through the Employment Agency, manages eight vocational training centres in seven regions of Kosovo, where ICT is one of many training programmes for unemployed individuals. It is also foreseen that the VET school Gjin Gazulli in Pristina will be upgraded to a new centre of competence for ICT, where six IT professional profiles will be developed. Non-formal learning options, including IT training, are widely available from private sector providers, some of which are accredited by the National Qualification Authority and licenced by the MEST. However, not all available ICT programmes, including university programmes, offer quality training that addresses labour market needs. The Kosovo Association of Information and Communication Technology (STIKK) has repeatedly signalled the poor quality of digital competencies and IT skills acquired through the education system. This is reflected in the Kosovo IT Strategy 2020, which emphasises improving IT education and promoting HR excellence in Kosovo. On a positive note, the MEE<sup>103</sup> has introduced a project to provide advanced digital and business skills training for around 1 500 current and newly trained ICT professionals. The first cohort of trainees, which was balanced in terms of gender, have already been trained, and follow-up activities on their employability in the local ICT market are being conducted. The KODE Project launched its youth training activity under the Youth Online and Upward (YOU) programme in 2020, which aims to train 2 000 young people in digital and soft skills by 2023.

**ICT sector promotion** has been driven by the private sector, mainly STIKK, in co-operation with line ministries and government agencies. Currently, the main policy instruments for ICT sector promotion are the Electronic Communications Sector Policy – Digital Agenda for Kosovo 2013-2020; the KODE project that supports growth for the communications sub-sector; and the IT Strategy 2020<sup>104</sup> that promotes the IT sub-sector. Although some progress has been made, the implementation of the IT Strategy 2020 has been slow as the allocation of financial resources has been limited and it has been given low priority by all recent governments. Kosovo's Smart Specialisation Strategy, which will probably highlight ICT as a priority, is still at a very early preparation stage. The ICT sector, including outsourcing, has 1 249 registered companies, 621 of which registered in 2019 (Kosovo Agency of Statistics, 2020<sub>[151]</sub>; 2021<sub>[152]</sub>). Some 61% of IT companies work in international markets, with most revenue coming from exports to EU countries; 39% of IT companies operate in the local market (STIKK, 2019<sub>[153]</sub>). IT companies are not highly specialised or differentiated in terms of technologies, target industries (vertical specialisation) and specific functional areas (horizontal specialisation). IT companies represented by STIKK have repeatedly signalled the mismatch between skills taught at different levels of the education system with the skills required by the industry. Among IT companies there is a lack of knowledge (e.g. IT market and technology trends, especially regarding potential export markets) and resources to underpin IT sector growth (STIKK, 2019<sub>[153]</sub>). Access to finance is another bottleneck. The IT Strategy foresees that the Ministry of Finance will draft a legal act to stimulate the supply of venture capital, but the process is still in an initial phase.

Preliminary consultations with stakeholders have begun to identify the most suitable model for a venture capital instrument.
