Programmes and activities for ICT sector promotion in recent years have focused on fostering technology start-ups and ICT innovation companies. Under the Economic Reform Programme, STIKK, line ministries and government agencies were supposed to establish the first digital Tech Park in Pristina, where ICT would be the leading sector. However, the Tech Park was still not operational by the end of 2020. The ICK was also created to support entrepreneurship, innovation and commercially based business development with a focus on ICT start-ups (Box 22.8). Under the scope of the Innovation Fund, the ICK implemented a dedicated scheme to support a selected number of start-ups in the ICT and technology sector. Some 220 companies were financed through this scheme with a total of EUR 1.8 million in the period 2018/19.<sup>105</sup> The ICK has also managed other financial support programmes for MSMEs that were co-funded by the German Development Cooperation (GIZ). During the same period, significant financial resources were invested in the establishment and operation of the regional centres for innovation and entrepreneurship. However, all these financial support tools focus on technology innovation and start-ups in general and cannot be considered as direct support schemes for ICT sector promotion, even though ICT sector companies may be the main beneficiaries. IT training has not been financed by any of these schemes. In the STIKK survey for the IT Barometer 2019, a majority (83%) of companies declared that they face a deficit of skilled (qualified) workers. ICT companies cope with this deficit by investing in training (in-house or other specific training) and multiple international certifications (such as Project Management Professional, Microsoft) (STIKK, 2019<sub>[153]</sub>). However, donor-funded projects under the IPA II instrument, such as the EU Support for the Competitiveness of Kosovo's ICT Sector project, also provide ICT training.

#### *Sub-dimension 10.4: Society*

The **digital inclusion framework** is only partly covered by policies for education and for the rights of individuals with disabilities, fostering social inclusion, non-discrimination principles and accessibility of information. The Strategy on the Rights of Persons with Disabilities (NSRPD) 2013-2023, co-ordinated by the Prime Minister's Office/Office for Good Governance, aims to set up a unified system of data on persons with disabilities. The Law on Electronic Identification on Trusted Services in Electronic Transactions (transposing eIDAS Regulation, EU No.910/2014), adopted in 2020, stipulates that services should be equally accessible to persons with disabilities. A project funded by IPA II (2019) will support the MEE with EUR 4 million to implement the eIDAS Regulation and the establishment of the electronic identification and authorisation scheme. However, Kosovo has not yet adopted obligatory e-accessibility regulations and guidelines for public sector websites that meet international standards – Web Content Accessibility Guidelines (WCAG) 2. These are vital to ensure equal access to public sector information and services for all citizens.

Digital inclusion is also considered in policies and legislation on the development of electronic communications that tackle universal service requirements and network infrastructure development in remote locations. The KODE project actively contributes to reducing the gap in ICT connectivity between urban and remote areas in Kosovo. According to the Kosovo Agency of Statistics, in 2020, 96.4% of households in Kosovo had access to the Internet from home, from any device. During the previous assessment period, a project to train women in IT, the Women in Online Work pilot,<sup>106</sup> achieved significant impact by increasing women's competitiveness and opening new opportunities for them to join the digital market. Although this project was not extended into the current period (2018-20), significant digital skills training activities have been launched under the KODE project, also focusing on closing the gender gap in using modern technologies. Positive results are already reflected in 2020 statistics, which report that while Internet use by men remains fairly stable at 57.4% in 2020, use by women has increased to 40.2% in 2020 from 35.4% in 2018 (Kosovo Agency of Statistics, 2021<sub>[154]</sub>). Although a steady improvement of the percentage of people over 65 years using the Internet at home has been registered (10.1% in 2020 from

8.4% in 2018), this group largely remains excluded from the digital society (Kosovo Agency of Statistics, 2021<sub>[155]</sub>).

### *Sub-dimension 10.5: Trust*

The legal framework on digital **privacy protection** is aligned with the EU framework, but not practically enforced. The new Law on Access to Public Information and Law on Personal Data Protection (PDP), transposing the General Data Protection Regulation (GDPR) (EU 2016/679), were adopted in 2019. Before the adoption of the new PDP law there was no mechanism in place to perform compliance inspections, and thus enforcement of the existing framework was limited. The new PDP law designated the Information and Privacy Agency as the competent independent authority to supervise the enforcement of the new framework and perform inspections. However, given that the agency has lacked a commissioner for the last three years, it has been facing serious operational and administrative problems and has conducted no inspections. During this time, complaints and sanctions have had to go through the court system, which in practical terms has made digital privacy protection an unrealistic cause. The implementation of the new framework requires the adoption of by-laws deriving from both laws on data protection and access to public information to enable the Information and Privacy Agency to perform its duties (e.g. impose fines). However, without the appointment of a commissioner, neither inspections nor regulation adoption can take place. The new PDP law also obliges controllers and processors of personal data to be certified. The Information and Privacy Agency is tasked with issuing this certification based on criteria and procedures that will be specified in the sub-normative acts, which are also still pending. The latest competitive process for the selection of the commissioner was launched at the end of May 2020, but none of the three candidates for the post received the required 61 votes in the Assembly on 14 August, which was the third time in two years that the parliament has failed to appoint a person to the position (Xhorxhina, 2020<sub>[156]</sub>; Assembly of the Republic of Kosovo, 2020<sub>[157]</sub>).

**Consumer protection in e-commerce** is mainly regulated by the Law on Consumer Protection, which was adopted in 2018 and includes provisions on e-commerce. E-commerce is regulated by the 2012 Law on Information Society Services, which transposes the e-Commerce Directive (2000/31/EC). The new Law on Consumer Protection came about as a result of the implementation of the Programme on Consumer Protection 2016-2020. This was adopted on the recommendation of the EC under the Stabilisation and Association Agreement to ensure further alignment of the legislation, to strengthen and develop administrative capacity, and to increase consumer information and education. The Consumer Protection Council is designated to co-ordinate activities among all institutions responsible for consumer protection in Kosovo.

E-commerce is growing fast in Kosovo, boosted by restrictions imposed to address the COVID-19 pandemic. Citizens' online shopping culture is changing (the share of the population who has never ordered or bought products online decreased from 63.6% in 2018 to 43.1% in 2020) (Kosovo Agency of Statistics, 2021<sub>[158]</sub>), and trust is increasing with gradual improvements of e-payment systems. Nevertheless, bank fees in Kosovo are the highest in the WB region (some banks are charging consumers 1% to 3% of the amount they spent online), and only 10% of people in Kosovo have credit cards (TEB, 2021<sub>[150]</sub>; PWC North Macedonia, 2020<sub>[159]</sub>). Some well-known e-commerce websites, including Amazon, Aliexpress and ASOS, recently added Kosovo to the list of countries they ship to, which has simplified purchases and increased the number of online transactions. In a positive move, the Ministry of Trade and Industry published a report in May 2020 that includes data on complaints relating to online shopping. However, a widespread awareness campaign or website with guidelines has not been implemented so far to inform citizens about their rights in e-commerce, how to exercise them, and which competent institutions are tasked to assist consumers.

Positive progress in the implementation of the domestic **digital security risk management** framework is limited by the small allocation of resources for cybersecurity. However, there is some evidence of

implementation of the Cyber Security Strategy and Action Plan 2016-2019, such as the adoption of the new Law on Electronic Identification on Trusted Services in Electronic Transactions in 2020, and the Law on Critical Infrastructure in 2019, based on the EU Directive on the Identification and Designation of Critical Infrastructure (2008/114/EC). However, the draft law transposing the Directive on Security of Network and Information Systems (NIS Directive), to achieve a high common level of security of network and information systems with EU Member States, is still under preparation, and is expected to be finalised by the end of 2021. The follow-up policy document on cybersecurity for the next period has not yet been adopted. The Kosovo Cybersecurity Council has been monitoring the implementation of the strategy and collecting relevant data, but reports are not publicly available.

The operation of the domestic cybersecurity team, KOS-CERT, continues to be challenged by insufficient human and financial resources. KOS-CERT is still operating under the authority of ARKEP, which provides basic services with only two staff members. Donor programmes<sup>107</sup> have been leveraged to support capacity building and sharing good practices. KOS-CERT signed a memorandum of understanding for co-operation with the domestic computer emergency response teams (CERTs) of Albania (AL-CSIRT) and North Macedonia (MKD-CIRT). The government is funding a new project for upgrading KOS-CERT with equipment and smart services<sup>108</sup> in 2020. During 2021, the MEE, together with KOS-CERT, plan to address cybersecurity in 5G networks through the EU toolbox for risk mitigating measures. The MEE, in co-operation with other stakeholders from the energy sector, is also planning to establish a sectoral CERT for energy during 2021.

### ***The way forward for digital society***

Despite some important steps taken to improve the digital society policy framework, the government of Kosovo should pay more attention to the following aspects:

- **Update legislation to ensure the financial independence of the domestic regulatory authority for electronic communications, in accordance with the EU framework.** Strengthen efforts to update existing legislation on public finance so that the domestic regulatory authority for electronic communications, ARKEP, is able to use the funds generated by respective regulations for the purposes described in the Law on Electronic Communication.
- **Accelerate the adoption of data re-use, sharing and commercialisation legislation, and strengthen the demand for open data innovation through inclusive co-creation processes.** Promote guidelines that regulate data formats, interoperability and data licences, and provide technical support on these issues to public institutions. Co-operate with civil society organisations to raise public awareness on data openness. Allocate sufficient resources to build the capacity of public officials and develop public-private partnerships on open data innovation for the creation of e-services and applications for citizens and businesses.
- **Ensure that the new Strategy for Electronic Governance 2020-2025, which is pending adoption, provides a concrete vision of digital transformation across government bodies and public institutions, and promotes the creation of high-quality online transactional services.** Address all remaining obstacles in public administration legacy legislation and remove bottlenecks in online payment systems. The new strategy will need to provide an overall vision for the digitalisation of the government and its commitment to deliver high-quality electronic services to citizens and businesses. Sufficient financial and human resources will need to be ensured for building capacity in the public administration to create and maintain e-services. The government could also consider reorganising the Information Society Agency so that it co-ordinates the development, interoperability and maintenance issues of e-services, directly managing or collaborating with the IT staff of line ministries and public institutions.
- **Accelerate the establishment of the Agency for Curriculum, Assessment and Standards (AKVS) and improve co-operation with the private sector for high-quality ICT education that**

**meets labour market needs.** It is important to transfer responsibilities from line ministries to the AKVS, as foreseen in the KESP 2017-2021, and to strengthen collaboration among state institutions, academia and the ICT industry (through STIKK) in redesigning curricula and adjusting the qualifications acquired by students and adults at all levels of the education system. New curricula should focus on preparing a skilled ICT workforce that will support the digital transformation of businesses and underpin ICT sector growth. The monitoring of indicators on digital skills will also need to be systematised to enable informed decision and policy-making processes.

- **Adopt obligatory guidelines that ensure that e-accessibility of public sector websites meet international standards (e.g. WCAG 2.0), and develop a database of digital inclusion indicators.** The government should consider appointing a government body, such as the Information Society Agency, to monitor and enforce e-accessibility regulations and to provide technical support to public sector institutions for implementation. A complete set of indicators to monitor digital inclusion should be adopted and regularly monitored by a competent institution to support a data-driven approach to reviewing and designing digital inclusion programmes.
- **Appoint a commissioner to head the Information and Privacy Agency, and allocate sufficient human and technical resources to allow the agency to complete and implement the legislative framework.** Personal data in Kosovo remain largely unprotected, despite the transposition of the GDPR (EU 2016/679) into domestic legislation. The government will need to resolve persisting bottlenecks in electing a commissioner to lead the Information and Privacy Agency. This will accelerate the adoption of necessary implementing legislation for the new PDP law. Regulations on guidelines and procedures for the certification of data controllers and data processors will also need to be prioritised.
- **Prioritise the design and adoption of a new policy on cybersecurity and prepare legislation on security of network and information systems to transpose the NIS Directive.** The new cybersecurity policy will need to consider the outputs from the implementation of the previous strategy and ensure cross-sectoral participation. It will also need to ensure the transposition of the Directive on Security of Network and Information Systems (NIS Directive) to achieve a high common level of security of network and information systems with EU Member States. The allocation of sufficient human and financial resources for the domestic KOS-CERT will also need to be guaranteed to ensure that the team improves the quality and diversity of services it provides for the benefit of the public and the private sector in Kosovo.

## Transport policy (Dimension 11)

### Introduction

Since the last assessment, Kosovo has made some progress in the railway and asset management sectors, but the remaining fields of the transport policy dimension have stagnated (Figure 22.1). Kosovo's performance in the transport dimension is substantially below the WB regional average (Table 22.16). Given this significant gap there is still considerable progress to be made in this policy area to reach EU performance levels. The initial goal should be to achieve the WB regional average by exchanging good practice ideas with the other WB economies.

**Table 22.16. Kosovo's scores for transport policy**

Dimension	Sub-dimension	Score	WB6 average
Transport policy dimension	Sub-dimension 11.1: Planning	1.5	2.3
	Sub-dimension 11.2: Governance and regulation	1.5	2.6
	Sub-dimension 11.3: Sustainability	1.2	1.3
Kosovo's overall score		<b>1.4</b>	<b>2.0</b>

### State of play and key developments

#### *Sub-dimension 11.1: Planning*

Since the previous assessment there have been no significant improvements to the **transport vision**. A new Law on Roads and a Law on Road Transport are in the adoption process. Kosovo has also developed a Sectorial Strategy for Multimodal Transport (SSMT) for 2015-2025 (Government of Kosovo, 2015<sub>[160]</sub>) with a corresponding five-year action plan. This strategy covers all transport modes and is proposed to be revised every five years. A working group for updating the SSMT was established in October 2020. The development of the SSMT involved consultation processes with all relevant stakeholders as per local legislation. The strategy includes clear and measurable objectives, with proposed activities and measures, follow-up indicators for each mode of transport, and a timeframe for implementing measures. However, the level of policy implementation is not entirely known as there are no available monitoring reports of implemented strategies. Some legislation has been adopted since the last CO assessment as a result of the previous and ongoing transport strategy, which are presented in the transport modes below. Overall, less than 15% harmonisation with the Transport Community Treaty (TCT) has been achieved.

The SSMT prescribes that the Transport Planning Unit, merged in 2011 with the Department for European Integration and Policy Co-ordination into a Policy Co-ordination Division, should be responsible for assessing, reporting, monitoring and updating the SSMT; however, stakeholders report that this body does not exist, and monitoring reports are not available. The monitoring reports must be used to report on the lessons learnt and assist in defining countermeasures to fill out logging activities, although it remains to be seen how they will be used to inform future strategy updates. The SSMT overlaps with the National Development Strategy 2016-2021 (Government of Kosovo, 2016<sub>[161]</sub>), which lists activities related to the development of road and railway links. The ultimate goal of the government should be a systematic and regular update of the vision/strategy based on monitoring reports, development of the strategy, impact assessments, as well as the assessment of the recommended measures through the transport model.

No transport model of Kosovo was developed during the preparation of the SSMT, and therefore could not be used to prioritise the proposed measures. The SSMT recommends using such a model to forecast future traffic flow demand and the capacity utilisation of the planned transport network/link over the estimated time horizon (e.g. 20-30 years). However, the SSMT does not recommend assessing or prioritising proposed measures within the strategy, hence the strategy and the transport model will lose their purpose.

The impact on tourism has not been assessed in the SSMT or other strategies, showing the lack of a holistic policy-making approach. Transport-related strategic documents have not been aligned with the previous European Commission Staff Working Document (CSWD) from 2019, although the current update of the SSMT should be aligned with the latest CSWD issued in October 2020 (European Commission, 2020<sup>[39]</sup>), which will directly influence the harmonisation process with the EU *acquis*. Developing and upgrading transport policy and infrastructure through a fully integrated and jointly implemented approach with tourism policy and other relevant strategies will improve the attractiveness of Kosovo and the region and make the market more competitive.

Co-operation with other WB economies to exchange experience, as recommended in the previous assessment cycle, has not occurred, other than in the Transport Community Permanent Secretariat's (TCPS) regular working meetings. Co-operation with other WB6 economies and regular exchange of good practice needs to be enhanced and intensified, as the effective development of a transport vision and planning can only be conducted through regular regional discussions that lead to a single and competitive transport market.

Since the last CO assessment, no progress has been visible in the **transport project selection** field. The project identification and selection framework is still the same as the single project pipeline (SPP)<sup>109</sup> for infrastructure projects developed in 2015 (Government of Kosovo, 2015<sup>[162]</sup>). This covers 11 transport infrastructure projects costing around EUR 1.19 billion. The efficiency of the SPP methodology applied to select and prioritise transport projects is undermined by the lack of a financial and economic assessment and an understanding of full social impact. This means that it is not clear if the proposed investment is for infrastructure that could generate the greatest return. There are no economy-wide guidelines for the development of cost-benefit analysis, but international practices and guidelines are used. Environmental impact assessments are conducted according to domestic legislation (Assembly of the Republic of Kosovo, 2009<sup>[163]</sup>; Official Gazette of the Republic of Kosovo, 2010<sup>[164]</sup>; Official Gazette of the Republic of Kosovo, 2010<sup>[165]</sup>), while social impact assessments are conducted using international financial institution (IFI) procedures.

Since the last CO assessment there have been no changes to **implementation and procurement processes**. The Law on Public Procurement (currently being amended) was adopted in 2011 and prescribes alternative procurement procedures for projects funded through public-private partnerships, IFI funds or other public contracts. *Ex post* evaluation of implementation and procurement processes exists, but frameworks have not yet been revised based on the results. Although the roles and responsibilities of government bodies<sup>110</sup> are defined, they lack the human and financial capacity to execute their procurement and implementation tasks and have not been given oversight roles for the procurement and monitoring of public-private partnerships.

There is no co-operation with WB economies during implementation and procurement, and therefore best practices and lessons have not been shared. Box 22.9 contains good examples of project implementation and monitoring tools used in Albania and Serbia to help control funds and invest in the projects that generate the best for society and the economy.

The **asset management system**<sup>111</sup> is in the early development phase in Kosovo. Legislation has been drafted and adopted based on the 2018 Technical Assistance to Connectivity in the Western Balkans (CONNECTA) study – Preparation of Maintenance Plans 2018-2022 for Road/Rail TEN-T indicative extensions to WB6 (Transport Community, n.d.<sup>[166]</sup>). Based on this, the railway infrastructure manager, Infrakos, prepared a seven-year maintenance plan for 2019-2025. In order to continue with developments in this field, a policy framework for the institutionalisation of the road asset management system needs to be developed. The key objective of a well-developed asset management system is to provide justification for the maintenance budget and to help direct limited funds towards areas where the return on investment will be the greatest. Such a system should be considered as an integral component of transport planning, identification, prioritisation, implementation and monitoring. A good example recently established in the region is the Albanian financial management system that also includes asset costs; other good examples can be found in North Macedonia and Serbia (road asset database, bridge asset databases, etc.). Co-operation with regional authorities could be worthwhile to exchange good practice. If transport infrastructure assets are well regulated and well operated it leads to a well-developed and maintained transport network, which is a pre-requisite for regional transport integration and the building of a competitive regional transport market.

### Box 22.9. Effective tools to manage transport projects in Albania and Serbia

Albania and Serbia are the only two economies with a sound tool for transport project identification, selection, prioritisation and implementation in the WB region.

In 2018, **Albania** adopted the Decision on the Public Investment Management Procedures. For the purpose of budget planning on investment expenditure, the projects are divided into two groups: 1) capital administrative expenditure on equipment, furniture, computers, IT, etc; and 2) expenditure on investment projects, including capital expenditure on infrastructure such as new constructions, reconstructions, rehabilitation with design costs, expropriation costs, purchase of larger technological equipment, implementation of works and supervision; and capital expenditure for capacity development, including research projects, technical assistance and capacity building.

The following project management cycle is applied:

1. Project identification based on an analysis of the public's needs.
2. Project evaluation and preparation, including an evaluation of the economic and financial justification.
3. Project approval and financing.
4. Project implementation.
5. Monitoring of project implementation, which should ensure that project activities are in line with planned activities.
6. Evaluation and audit, including implementation-related reporting and financial audit through the project performance indicators.

The following steps are applied based on the project cycle presented above:

1. Identify the project idea based on an analysis of public needs.
2. Review the draft idea (project management team leader and responsible authorities).
3. Prepare detailed project and evaluation, and a shortlist of alternatives.
4. Submit investment project proposal to the ministry responsible for investment projects.
5. Review the proposal (Council of Ministers).
6. Final approval, after the approval of investment projects within the annual budget.

As per Decision No. 290 of 11 April 2020, a financial management information system has been installed in every spending unit, including in all ministries, and is integrated into various departments to be used for all steps in the project management cycle.

In **Serbia**, the procedure for project identification, analysis of relevance, pre-selection, funding, implementation and monitoring is clear and publicly available, and co-ordinated through the Ministry of Finance. This procedure was adopted in 2019 through the Rulebook on the Management of Capital Projects.

The prioritisation process, which is applied to all projects, applies a cost-benefit analysis, an environmental and social impact analysis, and a safety assessment, among other things. Once the project is approved for financing there is a special procedure, similar to the one in Albania, that forms the preparation of a plan for project implementation. During project implementation there are specific procedure forms for reporting. One type of report is the interim report for the presentation of the current project status, which covers the activities carried out and the plan to execute the remaining project activities. At the end of the project, a final report needs to be developed.

There are three categories of project: 1) less than EUR 5 million; 2) between EUR 5 and 25 million; and 3) over EUR 25 million. *Ex post* monitoring is conducted for the third category three years after completion, which is a significant advancement on local legislation.

### *Sub-dimension 11.2: Governance and regulation*

Since the last CO assessment, regulatory reforms have continued in the field of **aviation regulation**. The Single European Sky (SES) I package has been transposed and is in the process of implementation, bringing Kosovo significantly closer to the EU *acquis*. The SES II package has not yet been fully transposed, and the full transposition cannot be conducted until Kosovo enters the EU. Some legislation has not been implemented yet due to political reasons beyond the control of the Civil Aviation Authority. Monitoring of SES implementation is only done by the independent observer (based on European Common Aviation Area agreement assessments, as well as through the European Union Aviation Safety Agency), and not through internal bodies and agencies in Kosovo. Kosovo does not have its own air traffic management (ATM) Plan,<sup>112</sup> and is not a member of the European ATM Network or Eurocontrol. Kosovo is not a member of any functional airspace block, which reduces safety, limits capacity and increases costs. In addition, Kosovo does not receive revenue from upper airspace management and therefore cannot utilise and invest in capacity and infrastructure development.

The Airport Charges Directive has been transposed and is being implemented. This states that airport charges must be set and monitored based on the EU non-discrimination and transparency principles, and that quality standards for the service level agreement for services provided at the airport must be applied. A supervision authority has been established, whose mission is to supervise the air traffic management regulatory framework. The market is not monitored yet as per Air Service Regulation, which provides an economic framework for air transport regarding the granting and oversight of community air carriers' operating licences, market access, airport registration and leasing, public service obligations, traffic distribution between airports if needed, and pricing. In terms of safety culture,<sup>113</sup> a programme covering safety risk assessment and safety assurance has been adopted.

Air traffic is growing in Kosovo: the total number of passengers transported from all airports increased in the period 2017-19 by approximately 25.7%, amounting to 2.37 million passengers in 2019. This could be

considered a significant increase in comparison with the world average increase of 11.7% (IATA, 2020<sub>[171]</sub>) over the same period. Given the significant growth of air travel and its projected importance for the economy, it is important that Kosovo continues regulatory reforms and brings the governance of the aviation sector closer to European standards and international best practice.

There have been many positive efforts in the **railway regulation** sector in Kosovo since the last CO assessment, but substantially more effort is needed to align legislation with the EU *acquis* and the TCT. Although the network monopoly is unbundled, the railway market is officially open and liberalised for international companies if they have valid licences and comply with local legislation to establish a legal entity (Sub-dimension 2.2: Services trade restrictiveness). Hence, the market should be fully opened and non-discriminatory. Structural reforms were adopted in 2011, and the vertical separation of the dominant state-owned railway company, Kosovo Railways, was implemented based on the Law on Railways (2012). There is only one state-owned infrastructure manager in the market and two operators (railway undertakings) – one state-owned and one private (since 2015). Of the currently applicable railway legislation in Kosovo (only 2% is considered not applicable), 19% of the of the legislation prescribed by the TCT is fully transposed and implemented, 39.5% is partially transposed and implemented, and 39.5% not transposed, while the rest remains unclear (information provided by the government). Harmonisation has been achieved since the last CO assessment in calculating direct costs, railway safety, interoperability, and maintenance; however, substantially more efforts are needed in these and all other fields to align legislation and market conditions with European railway standards.

The main oversight body for the railway sector is the Railway Regulatory Body, with responsibilities such as licensing, safety, market regulation and interoperability. Network statements for infrastructure and services facilities are regularly issued to ensure transparency and non-discriminatory access to rail infrastructure and to services in service facilities. The Investigation Body, whose purpose is to undertake accident investigation as a key input to improve the safety performance of railways, is under control of the Prime Minister's Office.

The Interoperability Directive 2016/797, which is important for the development of international railway transport, is partly transposed. The Register of Railway Vehicles was established in 2012 as a database on all used vehicles, owners, entities in charge of vehicle maintenance and vehicle technical information, as well as limitations on vehicle use. However, it should be transformed into the centralised registry for European Vehicle Register as per Commission Implementing Decision 2018/1614 by 2024. In terms of rail passengers' rights and obligations, Directive 1371/2007 has been transposed, which prescribes the framework to safeguard users' rights and improve the quality and effectiveness of rail passenger services in order to help increase the share of rail transport in relation to other modes of transport. The Rail Freight Corridors Regulation 913/2010 will need to be transposed into domestic legislation and implemented to enable the high-quality capacity of freight transport and a competitive modal shift to rail. Railway authorities signed the Declaration on European Railway Safety Culture in 2019 (ERA, 2019<sub>[172]</sub>), which should increase awareness and promotion of a higher standard of safety culture throughout the railway transport sector.

Bilateral co-operation is satisfactory, and an agreement on the incorporation of the railway networks of North Macedonia and Kosovo has been signed between the two economies, which should facilitate border crossings. The total number of transported passengers fell by 22.3% in the period 2017-19, amounting to 0.12 million passengers in 2019, while the total number of transported tonnes increased significantly, by 29.3%, amounting to 0.55 million tonnes in 2019. Kosovo's rail network and fleet utilisation are presented in Table 22.17.

**Table 22.17. Trends in rail transport in Kosovo (2017-19)**

Rail network utilisation	Change over 2017-19 (%)	2019	Share of EU average (2017) (%)
Passengers (passengers*km/km of track)	+110	3 293	0.15
Freight (tonnes*km/km of track)	+87	77 385	3.99
Rail fleet utilisation	Change over 2017-19 (%)	2019	Share of EU average (2017) (%)
Passenger (passengers*km/train*km)	+141	6	0.04
Freight (tonnes*km/train*km)	+22	329	10.4

Source: (European Commission, 2019<sub>[173]</sub>). *Statistical Pocketbook: EU Transport in Figures*, [https://ec.europa.eu/transport/facts-fundings/statistics/pocketbook-2019\\_en](https://ec.europa.eu/transport/facts-fundings/statistics/pocketbook-2019_en); Information provided by the government for this assessment.

Rail freight's share of transport modes in Kosovo was 11.6% in 2019. The freight mode share is low compared to the inland EU average, where road share accounted for 75.3% and rail share for 18.3% in 2018 (Eurostat, 2020<sub>[174]</sub>). There is potential to increase Kosovo's share of rail freight after it finishes rehabilitating the railway network (Route 10 and Route 7), which will reconnect the unbundled network and increase both speed and reliability (European Commission, 2015<sub>[175]</sub>). There is still much to be done (e.g. full opening of the market, incentives for shifting from road to rail, development of rail freight corridors, development of multimodal facilities) to achieve trends that will show the intensified development and cost-effectiveness of railway transport in Kosovo, and to reach EU average levels of rail network and fleet utilisation. An increase in the railway mode share could have direct positive impacts on air pollution and climate change.

There has been no visible positive improvement to **road market regulation** since the last CO assessment. Substantial additional efforts are needed to align local legislation with the EU *acquis* and the TCT. The Law on Road Transport is expected to be amended in 2020, while the existing law has been harmonised with some EU *acquis* regulation. Only 7% of the legislation prescribed by the TCT has been fully transposed, none of which has been fully implemented, 30% is partially transposed, and 57% is not transposed yet. Therefore, considerable efforts are needed in most fields to align the local market with European standards.

Kosovo does not participate in the multilateral quota system of the European Conference of Ministers of Transport (ECMT) (ITF/IRU, 2014<sub>[176]</sub>), which enables hauliers to undertake unlimited multilateral freight operations in 43 participating European member economies. Indicators<sup>114</sup> to measure the road network's performance have not been established yet. Kosovo will expand its bilateral agreements by signing new agreements with Latvia, Lithuania, Estonia and Finland on the transport of goods and passengers. The implementation of market access agreements and EU legislation is not monitored in Kosovo.

The high share of road freight, around 88.4% (a higher share than the EU average as presented above), has clear negative effects on air pollution and climate change. Therefore, incentives for shifting freight from road to rail could have a positive impact on reducing air pollution and climate change impacts.

The COVID-19 outbreak is affecting the transport and mobility market all over the world, including in WB economies. As a result, in the second quarter of 2020 Kosovo introduced measures at its border and customs control to enable the provision of essential goods and medical equipment. Kosovo introduced "green lane" measures in the major corridors for the transport of emergency goods. It should take no longer than 15 minutes to pass through the green lane border crossings (including any checks and screenings), and procedures should be minimised and streamlined. The implementation of these measures could directly impact how border crossings are treated in the future. Installing other measures based on regional experiences could also have positive impacts, such as the measures to minimise crossing time that include the implementation of one-stop shops (OSSs) for road border crossing point (BCP) Preševo/Tabanovce between Serbia and North Macedonia, the automation of customs procedures, and traffic management measures that transfer physical queues into virtual queues through an electronic queuing management system (e-QMS) installed in Baltic countries.<sup>115</sup>

Monitoring indicators to assess the performance of all transport modes either do not exist or are not properly established (indicators generally should include infrastructure conditions, average user costs, travel time satisfactory level [reliability], value of assets, market research and customer feedback, quality of user information, audit programmes). Regular data surveys are neither planned soundly (including the purpose and level of data needed and budget allocated) nor conducted regularly. The surveys that have been conducted have only been for the purposes of specific projects and not for general transport infrastructure assessment and planning. Therefore, there is no basis for a quality assessment of the transport network performance.

### *Sub-dimension 11.3: Sustainability*

Further efforts are required to improve **road safety** in Kosovo. A Road Safety Strategy (RSS) and related action plan have been developed for the period 2015-20, and the Ministry of Infrastructure has recently appointed a working group to review the RSS and draft a new action plan. The RSS defines the overall budget per year, but is not allocated to specific action plan measures. There are no indicators for each of the proposed measures either, which could make monitoring difficult. In any case, the RSS is currently not monitored and there are no available monitoring reports so far. Monitoring should be conducted by the secretariat of the Road Transport Safety Council and reported to the council at least twice a year, but this does not happen. The action plan also assigns responsibility to the beneficiary for each proposed measure. It is not clear if the staff of the Road Transport Safety Council are sufficient for implementing the strategy, and there is also a shortage of financial resources.

The RSS is partially compliant with EU legislation and the TCT (the outstanding parts not included in the strategy include road infrastructure safety management, road safety audit, road safety inspection, speed management, safe system approach, and "forgiving" roads). Full alignment is expected in the new strategy in 2021. Kosovo applied to become a member of the International Safety Data and Analysis Group (IRTAD) (ITF, n.d.<sup>[181]</sup>), but its request was rejected, which means that Kosovo cannot currently contribute to international co-operation on road accident data and analysis. The regional Road Safety Action Plan (Transport Community, 2020<sup>[182]</sup>) was endorsed by the Ministerial Council of the TCPS in October 2020, and Kosovo needs to align domestic plans to achieve the goals set within this plan (strengthening road safety management, promoting safe infrastructure, protecting road users, enhancing co-operation and exchanging experiences).

The total number of fatalities fell in the decade 2010-20 by approximately 59% (Table 22.18), amounting to 80 in 2020 (Kosovo Agency of Statistics, 2020<sup>[183]</sup>). This represents the best achievement in the region, and complies with the goal of the European Commission's Policy Orientation on Road Safety 2011-2020 (European Commission, 2010<sup>[184]</sup>) to reduce road fatalities by 50% between 2010 and 2020 (as per the Decade of Action for Road Safety 2011-2020, officially proclaimed by the UN General Assembly in March 2010). The RSS defined goals to reduce the number of fatalities by 50% by 2020 (it achieved 43.6%), the number of injured road users by 20%, and the number of all accidents by 10%. It will be known if these goals have been met once 2020 detailed traffic accident data are available.

**Table 22.18. Road safety trends in Kosovo (2010-20)**

	Change over 2010-20 (%)	Change over 2017-20 (%)	2020
Number of fatalities (Kosovo)	-59	-38.9	80
Number of fatalities (EU)	-23*	-2.5*	-
Number of fatalities per million inhabitants (Kosovo)	-	-	44.9
Number of fatalities per million inhabitants (EU)	-	-	51

\* Data refers to the period until 2019. EU average includes all 27 Member States.

Source: (European Commission, 2019<sub>[185]</sub>), *2019 road safety statistics: What is behind the figures?*, [https://ec.europa.eu/commission/presscorner/detail/en/qanda\\_20\\_1004](https://ec.europa.eu/commission/presscorner/detail/en/qanda_20_1004); (Eurostat, 2021<sub>[186]</sub>), *Victims in road accidents by NUTS 2 regions*, [https://ec.europa.eu/eurostat/databrowser/view/tran\\_r\\_acci/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/tran_r_acci/default/table?lang=en); (Kosovo Agency of Statistics, 2020<sub>[183]</sub>), *Statistical Yearbook of the Republic of Kosovo*, <https://ask.rks-gov.net/media/5641/vjetari-2020-final-per-web-ang.pdf>.

The goal of the European Union's "Vision Zero" strategy is to zero deaths or serious injuries on Europe's roads by 2050 (European Commission, 2019<sub>[28]</sub>). The strategy has an intermediate goal of a 50% decrease in road fatalities between 2021 and 2030. Kosovo has made positive progress but must continue harmonising its legislation with the TCT, as well as permanently carrying out activities in the fields of education, awareness campaigns, enforcements, etc. to achieve better results and comply with the requirements for the next steps (Box 22.10).

Kosovo has an **environmental sustainability strategy**, and some environmental sustainability transport related parameters are partly covered through the Kosovo Environmental Strategy 2013-2022 (Ministry of Environment and Spatial Planning, 2013<sub>[187]</sub>) and the Kosovo Environmental Plan. These strategies set different objectives and goals (without measures) related to environmental sustainability in the transport sector.<sup>116</sup> All of these objectives and goals should be followed up by specific actions and measures and linked with the domestic transport framework, which needs to define clear and measurable indicators with timelines, budgets, and a responsible body for implementation, as none of these have been set in the strategy and plan. The Strategy for Environmental Protection and Sustainable Development is planned to be drafted by the government in 2021.

**Combined transport**<sup>117</sup> is the most cost-efficient transport mode, reducing environmental pollution, and increasing co-operation between the freight forwarding network companies. The legal and regulatory framework to support combined transport is not yet defined, although the transport strategy has set some priority actions. Co-modality is proposed in the SSMT through, for example, creating a multimodal organisational framework, connecting a multimodal system with the EU networks, and improving an existing terminal and constructing a new terminal in Miradi. However, there is no separate strategy for logistics and co-modal solutions. There is both a lack of multimodal infrastructure facilities and insufficient understanding of multimodality to develop a framework for combined transport.

Data collection needs to be one of the key actions to assess the performance of all sustainability areas. A strategy for data collection is needed as a basis for assessing the transport sector and to directly influence the prioritisation processes within transport policy in general.

### ***The way forward for transport policy***

Kosovo has taken some important steps to develop a competitive transport sector, as presented above, but special attention should be paid to the following remaining challenges:

- **Update the transport strategy regularly.** The update should be based on the findings and conclusions from strategy implementation monitoring of the first five years, and include measures to implement activities not implemented in the period 2015-2020. The update should also consider the TCT and the findings from the implementation monitoring of other related strategies (e.g. environmental, climate, tourism).
- **Develop a tool for project identification, selection, prioritisation and implementation and apply it consistently and regularly.** This tool should be applied to all transport projects in Kosovo. Good examples could be followed from the region, such as in Albania and Serbia (Box 22.9). The project systems in these economies cover all processes, from project identification to the *ex post* monitoring of implemented projects, as well as the financial management IT system that is planned to be implemented in all spending departments of government institutions and implementing agencies.

- **Focus on continuing rail reforms.** These reforms should speed up harmonisation with the EU *acquis*, and therefore the transposition and implementation of all necessary legislation from the TCT needs to be faster. Enhancing the human and financial capacities of the regulatory authorities is one of the first priorities. Interoperability activities are very important for the development of international railway transport and should be continued, but gradually, as interoperability takes time and funds. Rail freight corridor regulation will need to be transposed into domestic legislation and implemented to enable the high-quality capacity of freight transport and a competitive modal shift to rail.
- **Ensure efforts to become a member of the ECMT remain a key priority.** The ECMT system could enable hauliers to undertake an unlimited number of multilateral freight operations in 43 participating European member economies. Once Kosovo becomes a member it will need to upgrade existing legislation to comply with the road haulage qualifications standards for companies, managers and drivers under the Quality Charter for Road Haulage.
- **Develop and tailor cost-benefit analysis (CBA) guidelines specific to Kosovo.** It is very important for each economy to develop its own CBA guidelines with accompanying technical instructions. The guidance needs to be updated often, on a maximum two-year basis. A good example is the United Kingdom's Transport Analysis Guideline (UK Government, 2019<sup>[188]</sup>), which provides information on the role of transport modelling and transport project appraisal tailored to the UK market. To ensure the consistency of the discount rates used for similar domestic projects it is necessary to develop a benchmark for all technical and economic parameters, including the financial and economic discount rate in the guidance documents, and then apply it consistently in project appraisals at the economy level. Empirical research needs to be conducted at the economy level to generate input data for the calculation of externalities.
- **Ensure that transport facilitation is a key priority.** It is necessary to implement one-stop shops<sup>118</sup> and other measures as per the regional Action Plan for Transport Facilitation (Transport Community, 2020<sup>[178]</sup>), endorsed in October 2020. These measures include improving and upgrading existing ICT infrastructure, constructing or modernising infrastructure to remove physical and technical barriers and to increase capacities, and capacity building to improve performance efficiency. The implementation of these measures will be a key trigger for integration of the Kosovo transport market into the regional transport market, which will increase the competitiveness and connectivity of the WB region and drive deeper integration into the broader European market. Good examples from the region include North Macedonia and Serbia, which have recently introduced a well-developed one-stop shop system and are currently in the initial stages of implementing a pilot project for an electronic queuing management system.
- **Develop a combined transport strategy.** The development of this strategy will promote sustainable transport as it will help to shift freight transported from road to rail, which is a more environmentally friendly mode of transport. As the rail and road Routes 7 and 10 (European Commission, n.d.<sup>[189]</sup>) are being modernised, the timely development of a combined transport framework in Kosovo could generate substantial benefits for the economy. Combined transport saves time and resources for shipping companies. Therefore, incentives for shifting freight to combined transport are needed.
- **Develop an integrated environmental and transport action plan.** This plan needs to integrate existing indicators and to include new ones in a framework for environmental sustainability in the transport sector. A good example is the Transport and Environment Reporting Mechanism (EEA, n.d.<sup>[190]</sup>) developed by the European Environmental Agency, which prescribes indicators for tracking transport and environmental performance in the EU.<sup>119</sup> Existing measures and indicators should be applied in the relevant strategies, including the new transport strategy.

**Box 22.10. Innovations in road safety: Road safety social impact bonds, Montenegro**

In 2018, the United Nations Development Program (UNDP) in Montenegro, in co-operation with the key domestic players in road safety, developed the idea of road safety social impact bonds as an innovative and alternative performance-based public financial instrument that shifts the policy framework from inputs and outputs to outcomes and value-for-money. This innovative idea involves the private sector investing in road safety improvements to strengthen sustainability together with the public sector. The public partner commits to paying the outcome payments to the investor if (and only if) the predefined and measurable social goals are met. This idea has great potential to help other economies in the region (and beyond) replicate and scale-up the model.

## Energy policy (Dimension 12)

### Introduction

Kosovo has made significant progress across all sub-dimensions of the energy dimension (Figure 22.1). Overall, Kosovo scored 3.0 compared to 2.3 in the last Competitiveness Outlook. The most significant progress relates to unbundling and third-party access, where Kosovo is almost fully aligned with international good practice. Kosovo has also shown significant improvement on energy efficiency, and to a lesser extent renewable energy, where the adoption of several strategies, secondary legislation and regulation has led to the increased implementation of international practices.

Kosovo's overall progress is confirmed by the Energy Community Secretariat (Energy Community Secretariat, 2020<sub>[191]</sub>), which scores Kosovo's transposition of the Third Energy Package at 64%, the third highest within the Western Balkans; implementation is scored at 56%. Despite this achievement, there is further room for improvement. The key challenges lie in finalising the transposition and implementation of the Third Energy Package (Box 22.11), continuing with market liberalisation and deregulation, promoting competition in the retail and wholesale market, and pushing forward with regional integration.

This need for improvement is also reflected in the regional perspective, where Kosovo, compared to other WB economies, has lost some ground since the previous Competitiveness Outlook when it was among the leaders in the Western Balkans, with a score above the regional average. However, in this assessment cycle the score is more in line with the regional average (Table 22.19). Driving this fall in relative performance is the rapid development in other economies, coupled with limited progress in Kosovo on energy policy, the legal and institutional framework, the energy regulator, the natural gas and electricity supply framework, and regional integration indicators (for details please see the respective sub-dimensions below). This does not mean that there was no progress in these sub-dimensions, but that progress was muted, especially when compared to the regional performance.

**Table 22.19. Kosovo's scores for energy policy**

Dimension	Sub-dimension	Score	WB6 average
Energy policy dimension	Sub-dimension 12.1: Governance and regulation	3.3	3.1
	Sub-dimension 12.2: Security of energy supply	2.8	2.9
	Sub-dimension 12.3: Energy markets	3.0	3.0
Kosovo's overall score		<b>3.0</b>	<b>3.0</b>

### State of play and key developments

#### *Sub-dimension 12.1: Governance and regulation*

Kosovo's energy sector is governed by an extensive **legislative framework**.<sup>120</sup> However, although the primary legislative environment almost fully transposes the EU Third Energy Package (see Box 22.11), the lack of adoption of secondary legislation and regulations, as well as their actual implementation, means that the final implementation of the Third Energy Package in Kosovo is not complete. The Energy Community Secretariat rates Kosovo's transposition at 64%, one of the highest of the WB6, and implementation at 56% (Energy Community Secretariat, 2020<sub>[191]</sub>). However, it notes that 22% of the Third Energy Package remains partially transposed and 14% is not transposed at all, particularly regarding renewable energy. The Secretariat also notes that implementation is lacking across all sub-dimensions, particularly natural gas, although this is partly due to Kosovo not having a natural gas market. Furthermore, the list of secondary legislation mandated by Kosovo's primary legalisation (Energy Community Secretariat, 2020<sub>[192]</sub>) shows that a variety of secondary acts are missing. Overall, the gaps in transposition and implementation of the Third Energy Package, and the lack of adoption of secondary legislation, means that Kosovo's market does not fully reflect international best standards and practices reflected in the EU

Third Energy Package. Consequently, Kosovo is unlikely to be as efficient in allocating energy as it could be.

### Box 22.11. The Third Energy Package

In 2007, the European Commission proposed a new legislative package, the Third Energy Package, in an effort to further enhance and harmonise the EU's Energy Union and internal energy market. This package entered into force in September 2009 and consisted of several important directives and regulations.<sup>1</sup>

The Third Energy Package largely rests on four pillars: 1) transparency; 2) non-discrimination; 3) a strong, independent national regulator; and 4) sustainability. Together, these pillars represent EU best practice and aim to establish a fair and level-playing field for competitive energy markets that seek to optimise scarce resources. For example, the first two pillars drive the need for unbundling the transmission and distribution system, combined with guaranteed, non-discriminatory and open access to those networks to all users backed by transparent rules and prices. Without such unbundling requirements and third-party access, it is very possible that the system operators, which are natural monopolies, could prohibit market entry and lead to sub-economic market outcomes.

In addition to these pillars, the Third Energy Package also seeks to enhance international co-operation within the EU by establishing an international regulatory agency (the Agency for the Co-operation of Energy Regulators, ACER) and promoting regional integration. Regulation (EC) No 714/2009 contains clauses that open and allow for further regulation to be drafted to enhance harmonisation in the form of network codes.

In 2019, the EU introduced the Clean Energy Package which supplements and in part replaces the Third Energy Package. That is, while the Clean Energy Package retains the key legislative aspects of the Third Energy Package, it expands measures for sustainability and green energy growth, as well as consumer rights and protections. Despite this, the Third Energy Package remains a good starting point for all of the WB economies as many of its key pillars have so far not been introduced or implemented in their entirety in the region. Aligning with it is also a requirement for the WB economies as members of the Energy Community, whose *acquis* reflects most of the Third Energy Package. Moreover, with many WB6 economies aspiring to become EU members, the transposition and implementation of the Third Energy Package and subsequent Clean Energy Package are accession requirements. To conclude, the Third Energy Package provides for the implementation of international best practice on competitive markets, and is also a firm requirement for the Western Balkan economies.

1: Directive 2009/72/EC concerning common rules for the internal market in electricity and repealing Directive 2003/54/EC; Directive 2009/73/EC concerning common rules for the internal market in natural gas and repealing Directive 2003/55/EC; Regulation (EC) No 714/2009 on conditions for access to the network for cross-border exchanges in electricity and repealing Regulation (EC) No 1228/2003; Regulation (EC) No 715/2009 on conditions for access to the natural gas transmission networks and repealing Regulation (EC) No 1775/2005; Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators.

Legislation is complemented by a comprehensive **energy policy** that consists of a variety of strategies and action plans. However, these action plans and strategies are mostly dated and do not extend into much beyond 2020. Two new long-term strategies are being drafted and are expected to be adopted by the end of June 2021: the Energy Strategy of the Republic of Kosovo 2021-2030 and the National Energy and Climate Plan 2021-2030. The government reported as part of this assessment that more than 75% of the Energy Strategy Implementation Program 2018-2020 had been implemented.<sup>121</sup>

The action plans and strategies are supplemented with a strategy for liberalising the electricity wholesale and retail market. However, the OECD understands that price liberalisation and deregulation has been suspended for customers connected to 35 kV and 10 kV power lines (i.e. their price remains regulated),

and that all customers (even unregulated) are still with the universal supplier, the Kosovo Electricity Supply Company (KESCO). The liberalisation and deregulation of the retail market was postponed by the regulator in July 2020, partly due to the COVID-19 pandemic, with the decision to extend the coverage of universal supplier obligations for KESCO to March 2021. Of the seven licensed supply companies, only the universal supplier, KESCO, is active. This means that although supplier switching is embedded in legislation, de facto competition is absent in the market, and customers have no choice but to be supplied by KESCO. So far, little has been done to promote competition or market liquidity.

Regarding market monitoring, it appears that extensive data and indicators are collected frequently. However, the precise nature of the indicators collected is not clear. Furthermore, most of the data are not shared with the public, or are only shared based on annual reporting by the Ministry of Economic Development and the regulator. This could be improved as part of a drive to increase transparency and promote competitive market behaviour by all participants. Strategies and action plans are evaluated on a regular basis and revised if needed. The Ministry of Economic Development revises the energy strategy every three years and designs a new strategy for the next 10 years.

Regarding the **institutional framework**, public institutions in the energy sector have specific roles and responsibilities, as detailed in Table 22.20.

**Table 22.20. Kosovo's institutional framework for energy policy**

Entity	Roles and responsibilities
Assembly of Kosovo	Monitors the regulator and chooses the regulator's board members. Approves the energy strategy and legislation.
Prime Minister's Office	Supports the preparation of energy policies and government approval of relevant acts.
Ministry of Economic Development	Drafts energy policy and legislation, and adopts certain secondary acts.
Ministry of Finance	Monitors subsidies and other financial aspects of government commitments to the energy market in Kosovo.
Ministry of Trade and Industry	Registers enterprises, including those within the energy sector.
Ministry of Environment and Spatial Planning	Develops environmental policies, monitors the implementation of environmental policies by energy companies, issues environmental compliance for energy companies and implements legislation on energy performance in buildings.
Energy Regulatory Office (ERO)	Monitors the energy market, licenses energy enterprises, adopts secondary legislation that regulates the energy market.
Electricity Transmission and System Operator, KOSTT	Operates the transmission system and energy market.
Electricity Distribution System and Supply Operator, KEDS	Operates the distribution system.
Kosovo Energy Corporation, KEK	Key state company that generates electricity and operates coal mines.
Independent Commission for Mines and Minerals	Licenses coal enterprises.
Kosovo Electricity Supply Company (KESCO)	Supplies electricity and acts as universal supplier until March 2021.

Note: The owner of KEDS and KESCO is the consortium made up of Çalik Holding and Limak.

Although these entities report that they currently have adequate resources, some expressed concerns that these resources might not be sufficient to meet new challenges stemming from the deployment of the EU-style electricity market.

Kosovo's **energy regulator**, the Energy Regulatory Office (ERO), conforms with the Third Energy Package, at least theoretically regarding its autonomous position, as reflected by the 77% score assigned by the Energy Community Secretariat (Energy Community Secretariat, 2020<sub>[191]</sub>). This score was partly assigned to reflect ERO's continuous efforts to transpose new *acquis*, including the integration of network codes, regulations on wholesale energy market integrity and transparency, and nominated electricity market operator rules.

Nonetheless, there are three concerns regarding possible infringements of ERO's independence. The first issue relates to the absence of a separate account for the regulator. Currently, the regulator's financing is a line item in the government's budget and accounts and is subject to government budget limitations. While in practice this might not lead to interference with the regulator's independence, assuming no steps are taken by the government that hinder the regulator in undertaking financial transactions, it would be better to separate the account of the regulator, according to international best practice. The second issue relates to staff salaries, in particular recent public administration reforms that envisage reducing the already low salaries of ERO staff. ERO is already struggling to acquire and retain the required skilled staff, and any further reduction in salaries will see it stripped of skilled labour. The third issue relates to the selection of ERO board members. Currently, the government pre-selects candidates before presenting a list to parliament. This means that the nomination is subject to political influence and considerations. This can partly be seen in the vacant chair and two additional board positions (since December 2020), leaving the board without enough members to have a quorum (i.e. no decision can be made). While the nomination and approval of board members is a lengthy process, prevailing political circumstances in Kosovo appear to contribute to delays in the nomination and approval of board members.

**Infrastructure management** is guided by the Ten-Year Network Development Plans (TYNDP) for the transmission service operator (TSO) and distribution service operator (DSO). The TYNDP provides an overview of energy infrastructure and its future developments, and aims for system stability, security of supply, diversification of energy sources and energy efficiency. The TYNDPs are supplemented with five-year investment plans. Both plans are reviewed annually and revised if needed. Kosovo also undertakes extensive monitoring and operational planning of infrastructure, supported by an asset maintenance planning policy and asset database used to identify the state of assets and need for maintenance. Nonetheless, based on information provided as part of this assessment, this system appears to be a tool of simple design used to monitor assets in six-month cycles.

#### *Sub-dimension 12.2: Security of energy supply*

Kosovo does not have a natural gas market; however, there are ongoing efforts and plans to invest in natural gas infrastructure and eventually deploy a natural gas market, thus improving **the gas supply framework**. Efforts are also underway to put in place the relevant legislative framework, as reflected by the 2016 adoption of the Law on Natural Gas.<sup>122</sup> The Energy Community Secretariat (Energy Community Secretariat, 2020<sub>[191]</sub>) rates transposition as high in this sector, although implementation is low given that there is no natural gas market. Kosovo is currently looking into establishing natural gas supply via Albania and North Macedonia. A pre-feasibility study for the interconnector with Albania has been completed and is underway for the interconnector with North Macedonia.

There are policies in place<sup>123</sup> and a comprehensive monitoring system<sup>124</sup> for Kosovo's **electricity supply framework**. The monitoring of energy policy implementation is undertaken quarterly by the Ministry of Economic Development as part of the reporting on the implementation of the government action plan. Every year the ministry prepares an annual report on the Energy Strategy Implementation Program. Public transparency and the frequency with which indicators are published could be improved, according to the Energy Community Secretariat (Energy Community Secretariat, 2020<sub>[191]</sub>), which noted that Kosovo has fully transposed and complies with data collection and dissemination standards, including those concerning the energy supply framework, but lacks monthly statistics. Before COVID-19 there was an attempt to fully implement monthly statistics collection and dissemination based on best practices; however, this project has been suspended due to the pandemic.

However, there are some more pressing concerns regarding the electricity supply framework. It is not clear to what extent Kosovo has transposed and implemented EU Regulation 2019/941 on risk-preparedness in the electricity sector. The regulation represents EU best practice on preparing for possible electricity emergency situations. It establishes certain requirements in terms of planning, preparing, identifying and

managing such a crisis. Kosovo does have some measures in place, and it is not mandatory for it to transpose this EU regulation as part of its status as an Energy Community Contracting Party; however, it is advisable for Kosovo to check, clarify and fully transpose and implement the regulation if this has not already been done.<sup>125</sup>

Another concern relates to the Energy Strategy of the Republic of Kosovo 2017-2026, which contains the objective of increasing power generation from coal. More precisely, approximately 450 MW of additional coal capacity is to be built after 2023 to replace the 270 MW that will be lost when TPP Kosovo A (a coal plant) is retired in 2023, and to support generation while the remaining coal plant, TPP Kosovo B, is refurbished in 2023 and 2024. However, the construction of the first plant has encountered difficulties with the withdrawal of the contracted company. Despite no concrete decision having been taken in response, the government has not changed its policy related to expanding coal-fired power generation, and plans to establish a new coal mine. Overall, Kosovo plans to spend EUR 1.5 billion to support the expansion and retirement of coal-fired power plants. It is not clear what drives this continued reliance on coal, nor whether the greenhouse gas costs were explicitly included in the decision to rely on coal-fired power generation.

The reliance on coal-fired power generation does not mean that Kosovo does not envisage increasing **renewable energy use**. The renewable energy sector is guided by an array of legislation, regulation, strategies and action plans, including the National Renewable Energy Action Plan 2011-2020 (adopted in November 2013) and the National Action Plan on Energy Resources of the Republic of Kosovo 2011-2020, and associated progress reports. Moreover, several reports have or are being drafted on Kosovo's renewable energy, and there has been a study on the options for the least costly integration of renewable energy into the grid. Kosovo has introduced a simplified administrative procedure for renewable energy projects with the adoption in April 2018 of regulation for a one-stop shop for renewable energy sources. This effectively establishes a single point of contact for information and applications relating to renewable energy within the Department of Energy at the Ministry of Economic Development. Furthermore, an extensive monitoring scheme is in place, associated with active policy revision if needed.

In line with international practices, self-consumption (prosumers<sup>126</sup>) is recognised by legislation, and connection and priority dispatching are guaranteed, although the associated costs are not published, which reduces transparency. Overall, Kosovo is on track to achieve the 2020 target that 25% of gross final energy consumption, and 45.6% of heating and cooling, will be from renewable sources.

Regarding transport, Kosovo is unlikely to achieve the 2020 target of 10% renewable energy in transport energy consumption, as set out in National Renewable Energy Action Plan 2011-2020. One aspect hampering the growth of renewable energy in transport is deficiencies in the support scheme for promoting renewable energy in transport, in particular the support schemes and sustainability criteria for biofuels and bioliquids. Moreover, Kosovo has not transposed any aspect of the EU Directive on the Promotion of the Use of Energy from Renewable Sources. This directive establishes the foundation of renewable energy within the transport sector, including targets, as well as the framework for increasing renewable energy.

There are several issues and concerns relating to renewable energy use in Kosovo. First and foremost is the current approach to supporting renewable energy. Kosovo should consider, in line with latest international good practices, moving away from a feed-in-tariff support scheme to a feed-in-premium or contract-for-difference scheme, at least for bigger projects (Box 22.12). The second issue relates to the lack of competitive assignment of new renewable energy source (RES) projects. However, the government does plan to adjust the support scheme soon and execute its first RES auction.<sup>127</sup>

Much like renewable energy, Kosovo's **energy efficiency** sector is guided by an array of legislation, regulation, strategies and actions plans.<sup>128</sup> The legislative framework establishes the approach to, and the requirement for, the energy efficiency certification of newly constructed buildings or buildings undergoing major reconstruction, as well as the minimum energy performance of buildings. Moreover, the legislative framework is in place for the concept of near zero energy buildings, and Kosovo expects to undertake several pilot projects in 2020. The sector has clearly established entities with specific roles and is guided by a dedicated energy efficiency agency, the Kosovo Agency for Energy Efficiency (KAEE), and an operational energy efficiency fund, the Energy Efficiency Fund (FKEE).

### Box 22.12. A new approach to subsidising renewable energy

Feed-in tariffs were the dominant form of financial support for renewables within the EU at the beginning of the 21st century. In this system, power plant operators receive a fixed payment for each unit of electricity generated, independent of the electricity market price (Banja et al., 2017<sub>[193]</sub>).

Feed-in tariff schemes offer several advantages, but mainly they insulate new market entrants from market price risks, which lowers their capital costs and enables private investment. The simplicity of feed-in-tariffs makes them suitable for markets with a large number of non-commercial participants such as households or local community-based initiatives (European Commission, 2013<sub>[194]</sub>).

However, feed-in tariff schemes exclude producers from actively participating in the market, which hinders efforts to develop large, flexible and liquid electricity markets as the share of renewable energy grows. This limits growth to certain technologies and sizes of installations, and creates difficulties in setting and adjusting appropriate tariff levels (European Commission, 2013<sub>[194]</sub>), which is a particular problem as costs of renewable generators have fallen rapidly in recent years.

The European Commission suggests switching from feed-in tariff to feed-in premium schemes (European Commission, 2013<sub>[194]</sub>). In these, plant operators sell the electricity generated directly on the electricity market and earn an additional payment on top of the electricity market price. This is received as a fixed payment or one adapted to changing market prices, thereby limiting price risks for plant operators, as well as the risks of providing windfall profits (Banja et al., 2017<sub>[193]</sub>). Feed-in premium schemes are beneficial because they force renewable energy producers to find a seller on the market. They also ensure that renewable energy operators are exposed to market signals. A well-designed premium scheme can limit costs and drive innovation by using a competitive process to allocate support. Such schemes also include automatic and predictable adjustments to cost calculations, which give investors the information and confidence necessary to invest (European Commission, 2013<sub>[194]</sub>).

The European Commission (2013<sub>[194]</sub>) suggests using a feed-in premium scheme in combination with the following good practice recommendations:

- Do not pay premiums for production in hours where the system price is negative or above the level of remuneration deemed necessary.
- Assign renewable projects and associated premiums using competitive allocation mechanisms such as auctions.
- Make planned volume-based premium reductions for new installations dependent on when they are approved, connected or commissioned.
- Conduct regular, planned and inclusive reviews of premiums for new installations.

The Council of European Energy Regulators (2018<sup>[195]</sup>), reports that in 2016/17, some 17 of the 27 EU Member States still used some form of feed-in tariff (although mainly for small projects), while around 16 used feed-in premiums, including to complement feed-in tariffs.

For more information on the different renewable support schemes employed across Europe please see <http://www.res-legal.eu/home/> and for an overview of auctions and outcomes (including databases on auctions) see <http://aures2project.eu/>.

StatLink  <https://doi.org/10.1787/888934255760>

The energy efficiency sector in Kosovo is facing several issues. First and foremost, a variety of secondary legislation still needs to be adopted, particularly regarding energy product labelling, where Kosovo has only implemented 3 out of 12 regulations and is therefore far from implementing best practices and standards. Data and indicator collection and publication also need to be improved. The sector's public entities are understaffed and in urgent need of additional human resources. Furthermore, the energy efficiency fund is mainly active with regard to public buildings, and limited financial support is available for private investment. There is currently no dedicated energy efficiency strategy for the industrial sector, with industry accounting for around 20% of final energy consumption.

### Sub-dimension 12.3: Energy markets

Although Kosovo is working towards deploying an operational organised **energy market** according to international standards and best practices, it is still far from achieving this goal. Kosovo currently has deregulated the (bilateral) wholesale market, using auctions to connect generators and public service providers. However, the liberalisation and deregulation of the retail market has been postponed, partly due to the COVID-19 pandemic, with the decision to extend KESCO's universal supplier obligation until March 2021.

Regarding the deployment of an organised wholesale market, KOSTT has signed a shareholder agreement with the transmission system operator of Albania to jointly establish a power exchange company called ALPEX. The company was established and registered in October 2020, and the agreement foresees that ALPEX will establish a branch in Kosovo and operate two separate bidding zones

(Albania and Kosovo) that will eventually be coupled. ALPEX is supported by the United States Agency for International Development (USAID) and the International Financial Corporation, which are helping Kosovo develop the necessary agreements, procedures and codes for operation, etc.

Kosovo's most significant progress since the last Competitiveness Outlook regards **unbundling and third-party access**. Both the TSO, whose ownership was unbundled, and the DSO which was fully unbundled, are unbundled and separate from generation and supply activity, and are thus in line with EU directives. Relevant compliance programmes and officers are in place. Non-discriminatory third-party access is established and guaranteed by legislation.<sup>129</sup> Nonetheless, there are two outstanding issues. The first regards the apparent separate branding of companies KEDS and KESCO.<sup>130</sup> The second issue relates to whether the regulator has adopted and published non-discriminatory rules for the connection of direct lines. These rules are mandated by the law and are part of a non-discriminatory third-party access regime. However, the regulator's website does not list this rule as being adopted.

With regard to **regional integration**, as of 14 December 2020 KOSTT began operation as a "Control Area"<sup>131</sup> within the Albania-Kosovo Control Block (Control Block AK).<sup>132</sup>

Following the entry into force of the Connection Agreement with ENTSO-E (the European Network of Transmission System Operators for Electricity), the allocation of cross-border capacities for the borders with Albania, Montenegro and North Macedonia is performed by SEE CAO (the Coordinated Auction Office in South East Europe), with the first auction having taken place at the end of 2020. The allocation of capacities with Serbia is still outstanding, subject to finalising and signing the agreement between the Electro-Power Industry of Serbia (EPS) and KOSTT for capacity calculation and allocating.

Based on the recommendation of the Energy Community Regulatory Board, ERO has adopted the rules for setting the procedure to designate the Nominated Electricity Market Operator (NEMO), in line with EU regulation on capacity allocation and congestion management. Once designated, the NEMO should accommodate international trade flows and the optimised use of interconnector capacity. Expectations are that the NEMO will be up and running towards the end of 2021.

*Cross-cutting sub-dimension: Energy incentives – direct and indirect subsidies in the energy sector*

There appears to be significant direct and indirect subsidisation in Kosovo. There are four forms of subsidies that need to be tackled:

1. Deviations in the payment conditions for public entities vs. domestic standards.
2. The blanket use of universal suppliers to supply all consumers, including all households and small consumers, with regulated prices. This stifles competition and possibly leads to price formation being significantly different to a competitive market. The regulator should investigate and recommend options to promote supplier competition and encourage consumer switching to a non-price regulated supplier.
3. The price regulation for thermal energy. While there is an appreciation that there is limited competition in the market, the continued blanket use of regulated prices can potentially lead to long-run deviation from competitive market equilibrium and prohibit new market entries.
4. The requirement for renewable generators to only pay 25% of their imbalance cost. This encourages renewable generators to forgo good forecasting practices to the extent where imbalances become greater. The resulting increased imbalances is a security of supply risk and an avoidable extra cost carried by consumers in a non-transparent manner.

## ***The way forward for energy policy***

Although Kosovo has made significant progress since the last Competitiveness Outlook, there remain some key areas that need to be tackled:

- **Ensure additional human resources.** These are needed in a variety of areas, including for energy efficiency and for the regulator’s activities throughout its areas of operation.
- **Draft and implement policies to promote competition and liquidity within energy markets.** Part of the solution will also be reinitiating **market liberalisation and deregulation**. These two areas should support the market in achieving a competitive market equilibrium.
- **Improve market monitoring and transparency.** Extending the collection of data and its publication, including frequency, will allow all stakeholders, including policy makers, to take more informed decisions and will support increased competition. Kosovo needs to collect and disseminate comprehensive monthly data to allow a closer to real-time analysis of the market and contribute to identifying issues. This is one of remaining aspects that needs to be finalised with regard to implementing the Third Energy Package data collection elements.
- **Design and implement a decarbonisation strategy and phase out coal.** These measures should support the development of a sustainable electricity sector in line with EU good practice. The strategy should also include or be supplemented by the introduction of a **greenhouse gas pricing mechanism** that eventually transforms into a **greenhouse gas certificate market/trading scheme** (Box 22.13). Together, these activities should support efforts to achieve a sustainable and climate-resilient energy market that is efficiently decarbonised in a competitive and efficient manner using economic market forces.
- **Improve the approach to renewable energy project assignment and support** to encourage renewable growth, and improve the **deployment of energy efficiency** measures to limit demand growth and volatility. Both actions will support the decarbonisation of the energy sector while easing the economic impact of possible greenhouse gas pricing, and should in the medium to long run create economic downward pressure on electricity prices.<sup>133</sup>
- **Improve regional integration.** The size of the electricity market in Kosovo does not lend itself to many generators with generation portfolios that benefit from economies of scale. To fully harness the benefits of a competitive market Kosovo needs to pursue regional integration, as trade will enhance the competitive forces at play in Kosovo and increase the liquidity of its energy market. There are additional benefits to regional integration and market coupling, including price stability due to shared demand and supply (Baker, Hogan and Kolokathis, 2018<sub>[200]</sub>; Booz&Co, 2013<sub>[201]</sub>; Böckers, Haucap and Heimeshoff, 2013<sub>[202]</sub>).
- **Finalise the transposition and implementation of the EU’s Third Energy Package** to complete the implementation of international good practice and fully align local legislation for the governance of the energy sector with the EU *acquis* (Box 22.11).

### **Box 22.13. Greenhouse gas pricing in North Macedonia**

North Macedonia does not have a current greenhouse gas pricing mechanism. However, its Energy Development Strategy foresees the “introduction of carbon price and its convergence to the Emission Trade Scheme (ETS) level” (Government of North Macedonia, 2019, p. 60<sub>[197]</sub>). North Macedonia plans to introduce greenhouse gas pricing via a progressive introduction that starts with the direct taxation of CO<sub>2</sub> emissions followed by the introduction of requirements equivalent to joining the EU Emission Trade Scheme (EU ETS). Although North Macedonia cannot participate in the EU ETS at this stage it plans to undertake certain preparatory steps, including mapping installations that fall under the EU ETS and defining the scheme’s scope, arranging the allocation of allowances through a designating authority

and defining procedures, and designing auction platforms with built-in safeguard arrangements. Furthermore, emissions monitoring, reporting and verification should be addressed both within the scope of deploying the tax and prior to joining the EU ETS.

## Environment policy (Dimension 13)

### Introduction

Kosovo has slightly improved its performance in the environmental policy dimension since the 2018 Competitiveness Outlook, from 1.8 in the last cycle to 2.1 in the 2021 assessment (Figure 22.1). Progress has been made on enhancing the frameworks for climate change mitigation and adaptation and air quality. Kosovo's score in the environment policy dimension matches the regional average of 2.1, and ranks fourth out of the six Western Balkan economies (Table 22.21).

**Table 22.21. Kosovo's scores for environment policy**

Dimension	Sub-dimension	Score	WB6 average
Environment policy dimension	Sub-dimension 13.1: Resource productivity	1.8	2.0
	Sub-dimension 13.2: Natural asset base	2.2	2.1
	Sub-dimension 13.3: Environmental quality of life	2.2	2.3
Kosovo's overall score		2.1	2.1

### State of play and key developments

#### *Sub-dimension 13.1: Resource productivity*

Although no major changes have occurred to the legislative framework for **climate change mitigation and adaptation** since the last CO assessment, there have been some positive developments to the policy framework – most notably the adoption of the Climate Change Strategy<sup>134</sup> (2019-2028) and related action plan. The main objectives of the strategy concern both climate change mitigation and adaptation, as well as building the capacity of central and local partners, actors and stakeholders to integrate climate change issues into development processes and documents (Box 22.14). However, this strategy is not aligned with other strategic documents. As part of activities under the new strategy, the government was developing a Concept Document for Climate Change at the time of drafting. This document aims to set the scene for drafting the Climate Change Law, which should further align the legislative framework with the EU *acquis*. Implementation of the strategy started in 2020 and is running to plan; however, monitoring, which was planned to be conducted twice a year, had not been undertaken at the time of drafting.

Key institutions in this field are the Ministry of Economy and Environment (MEE) and its body, the Kosovo Environmental Protection Agency (KEPA), as well as the Ministry of Agriculture, Forestry and Rural Development (MAFRD). These organisations all lack qualified staff and are in need of continuous capacity building sessions, envisaged as a key measure under the new Climate Change Strategy. Horizontal co-ordination happens through the Council on Climate Change, which includes all relevant institutions. Inter-institutional co-operation is strong, with all parties constantly co-ordinating and fulfilling their obligations defined by the legislation for reporting to KEPA. They are also active participants in drafting legislation and strategic documents.

### Box 22.14. Kosovo's Climate Change Strategy

The Climate Change Strategy of Kosovo (2019-2028), and related action plan, were adopted in February 2019. The strategy covers both climate change mitigation and adaptation actions and objectives. As the power sector accounts for around 75% of total greenhouse gas (GHG) emissions in Kosovo, followed by road transport with 12%, mitigation objectives aim to reduce GHG emissions in mainly the energy and transport sectors, as well as in the forestry and industry sectors. In this context, concrete activities are listed in the Energy and Climate Plan (2021-2030), which was being developed at the time of drafting and which should determine GHG emission reduction targets.

Regarding climate change adaptation, the major climate-related risks identified concern: 1) rising intensity and frequency of precipitation extremes such as heavy rain events, and more severe droughts; 2) flash floods in mountain areas, and river floods in plains and lowlands; 3) increased temperatures leading to heatwaves and forest fires, more uncertain rainfall, and reduced runoff, combined with socio-economic developments and increased pressure on limited water resources; 4) ecosystem degradation and reduction of ecosystem services; and 5) increasing and new forms of pollution and water-related diseases. Adaptation measures envisaged in the new strategy mainly relate to landscape restoration and reforestation actions, and the creation of more secure facility locations and infrastructure. Reforestation of 140 km of riverbanks, or 28% of the length of rivers flooded (491 km of rivers are at risk of flooding), as a flood prevention measure should be implemented in the period 2019-21.

Source: (KEPA, 2018<sup>[203]</sup>), *Annual Report of the State of the Environment in Kosovo in 2017*, [https://www.ammk-rks.net/repository/docs/Raporti\\_M\\_2017\\_english.pdf](https://www.ammk-rks.net/repository/docs/Raporti_M_2017_english.pdf); (Government of Kosovo, 2018<sup>[204]</sup>), *Climate Change Strategy 2019-2028 and Action Plan on Climate Change 2019-2021*, <https://qzk.rks-gov.net/ActDocumentDetail.aspx?ActID=29356>.

Minimal changes have been noted in relation to developing a **circular economy framework** in Kosovo since the last assessment. The topic is indirectly covered under the new Integrated Waste Management Strategy (2020-2029) and Action Plan (2020-2022), which outlines three main objectives: 1) raising awareness of the importance and benefits of managing and recycling waste; 2) encouraging innovation to prevent waste generation; and 3) creating re-use and recycle systems based on extended producer responsibility schemes.

The recycling rate of municipal waste in Kosovo is quite low, at around 5% (Eurostat, 2018<sup>[205]</sup>). However, according to relevant authorities, the recycling industry is currently gaining momentum in Kosovo as the private sector takes advantage of a lucrative opportunity for exporting secondary material within the region and to several EU Member States. At the time of drafting, Kosovo was in the second phase of development of its deposit refund system,<sup>135</sup> expected to be completed by 2022. There were also some educational awareness-raising activities on waste management organised in schools during 2018, as well as a project on reducing bio-waste through composting organised for several thousand households in the municipalities of Prizren and Fushe Kosove/Kosovo Polje. However, these activities are conducted on a rather ad hoc basis.

**Municipal waste management** in Kosovo has seen some developments since the last assessment, but is still generally weak. Although the municipal waste generation per capita of 227 kg is much lower than in the EU (492 kg per capita in 2018), and the lowest in the Western Balkans, its collection is somewhat problematic as it covers only 57.7% of the population, with significant discrepancies noted between urban and rural areas (Eurostat, 2018<sup>[205]</sup>; KEPA, 2018<sup>[203]</sup>). Furthermore, most landfill sites do not comply with sanitary standards, and waste is largely disposed of untreated. The illegal dumping of waste is a normal practice in Kosovo, especially construction and demolition waste, mostly due to the lack of dedicated landfill sites for this kind of waste. Despite efforts to close down illegal dumpsites, they continued to proliferate

(from 1 572 in 2017 to 2 529 in 2019) and represent a serious public health risk, in particular due to hazardous waste and groundwater contamination (European Commission, 2020<sub>[39]</sub>).

No major changes in the legislative framework have been recorded since 2017. The new Integrated Waste Management Strategy (IWMS) (2020-2029), which continues the Waste Management Strategy (WMS) (2013-2022), has been developed but had not been adopted at the time of drafting due to delays. The government has not produced any reports on the implementation of the WMS, thus there is no information on whether its targets have been reached. Several projects in this area have been implemented that aimed to clean up illegal landfill sites and decrease their number, increase the waste service coverage and improve the waste collection rate, and provide supply equipment for waste collection.<sup>136</sup> However, most of the measures from the WMS were just rolled over to the new IWMS.

Most municipalities in Kosovo (34 out of 38) have drafted their municipal solid waste management plans, in line with their mandate; however, the WMS is only partly reflected in local planning documents (European Commission, 2020<sub>[39]</sub>). Municipalities implement and continuously review the objectives deriving from the plans, but there is no appropriate monitoring, except for the obligatory annual reports that municipalities submit to KEPA.

According to the Law on Waste (2004), municipalities in Kosovo are obliged to organise a system of waste separation at source by developing appropriate infrastructure. However, limited efforts have been undertaken in this regard. The primary separation of waste has been introduced in several municipalities to pilot separation at source.<sup>137</sup> These pilots aim to raise awareness and ensure the full participation of citizens and businesses, enhance the implementation capacities of municipalities (and scale up across the territory from 2021), as well as provide a sustainable operator for the collection of recyclables and ensure the financial sustainability of the system. These pilots take into consideration the integration of informal waste collectors from vulnerable groups. Kosovo is also currently piloting three systems in various municipalities to tackle organic waste (e.g. in Pristina).

Similar to other WB economies, waste collection and treatment infrastructure in Kosovo is financed through budget and donor funds, while waste collection and treatment services are funded from waste collection fees. Although waste collection tariffs have not changed since the last CO assessment, most municipalities in Kosovo have undergone the process of cost recalculation, client profiling and tariff setting for waste management services, as required in the Law on Waste, to introduce new waste collection tariffs.

Actions to combat the illegal dumping of waste have been undertaken. In particular, the government is implementing the Performance Grant–Clean Environment Race (2017-2021) project<sup>138</sup> that aims to decrease the number of illegal landfill sites. According to the project, municipalities that show good performance in waste management (e.g. improved collection rate or increased service coverage) win financial grants to be used for the sustainable removal and rehabilitation of illegal landfill sites, and further improvements of the waste management system. An additional measure to combat illegally dumped waste involves improving data collection by requiring municipalities to register illegal landfill sites (using applications for GPS co-ordinates) and report them to KEPA through the annual report. The MEE has also revised the Administrative Instructions on Mandatory Fines, which stipulates strict fines for littering, burning and the illegal dumping of waste.

### *Sub-dimension 13.2: Natural asset base*

Water resources in Kosovo are relatively scarce and unevenly distributed (among the five main river basins). By regional comparison, the levels of rainfall and renewable resources per person are much lower (estimated at about 1 600 m<sup>3</sup> total renewable water resources per person, which is the lowest in the Western Balkans), water resources are highly polluted, and the levels of water storage are among the lowest in the Western Balkans (World Bank, 2018<sub>[24]</sub>; 2020<sub>[206]</sub>). Households are major users of water (52%), followed by agriculture (41%) and industry (8%) (Government of Kosovo, 2017<sub>[207]</sub>). The gap between growing water demand and available quantities of good quality water has been widening in recent

years leading to water shortages and interruptions in water supply and irrigation services (World Bank, 2020<sub>[206]</sub>). The already precarious situation with water resources might be further aggravated if the normalisation of political relations with Serbia regarding the management of water resources does not occur, especially given the disputes over water resources in the northern part of Kosovo,<sup>139</sup> which supplies around one-third of the population.

**The freshwater management framework** is only partially developed in Kosovo, and no major changes in legislative and policy framework have been noted since the last CO assessment. The provisions of the Law on Water (2004) apply to all surface and groundwater, the prevention of pollution at source, emissions control and water quality standards, as well as prevention and protection against flood risks. The mapping of hazard and risk of floods has not yet started yet, although it is being planned. The planning and management of hydropower plants do not conform with relevant EU legislation, and there have been many cases in which licences for hydropower plants (HPPs) were given before an environmental impact assessment (EIA) report was issued, or before taking into consideration the results of the EIA. Current practice in Kosovo shows that several of the built or planned HPPs are in nature reserves, which has a severe impact on biodiversity as well as water resources (CEE Bankwatch Network, 2019<sub>[208]</sub>). There is a system for the prior regulation and/or specific authorisation for water extraction from groundwater and/or surface waters, but a river basin management system has not been developed yet, nor has the river basin district authority become operational. Co-operation with neighbouring economies in this regard has been established, especially with those in the White Drini Basin.

The implementation of the Water Strategy for Kosovo (2017-2036) has been rather limited. The main area of progress is the establishment of several drinking water reservoir dams to improve drinking water supply. However their safety and management remain inadequate, especially given the water stress resulting from climate change (European Commission, 2020<sub>[39]</sub>). No implementation reports have been produced and no monitoring or evaluation mechanisms set. The strategy is not aligned with the sectoral strategies (agricultural or irrigation strategy).

Data and projections on water demand from agriculture, industry (including energy) and households are not available, and thus do not guide decisions about handling competing uses now and in the future. The government was working on introducing a water pollution cadastre at the time of drafting. Activities to establish a water information system, initially planned for 2020, have not begun. Some data on water risk management are collected, such as on historical water disasters and vulnerability/exposure to risks.

Kosovo hosts rich **biodiversity**, especially its flora, which is largely endemic. However, its ecosystems are threatened by illegal construction, illegal tree logging, hunting, the mushrooming of hydropower plants in protected areas and forest fires (KEPA, 2018<sub>[204]</sub>). **Forests** make up a large share of total land area of Kosovo (around 45% in 2018), which is around the WB average of 42%<sup>140</sup> (World Bank, 2020<sub>[210]</sub>).

There have been no major changes in the legislative framework targeting biodiversity and forest management since the last CO assessment. Regarding the policy framework, both the Strategy for the Development of the Forestry Sector (2011-2020) and the Strategy for Biodiversity (2011-2020) have been revised, and the MEE is preparing the updated Strategy for Biodiversity until 2030, which will be adopted as part of a wider Strategy of Environment Protection and Sustainable Development 2021-2030. The preparations of the new Forestry Strategy (2021-2030) started in September 2020, and its adoption is planned for the first trimester of 2021. Although no implementation reports have been produced, certain activities under the Strategy for Biodiversity have been realised, such as harmonising and strengthening the legislation for nature protection in line with the EU *acquis*; building capacity of competent bodies for implementing and enforcing measures and actions on biodiversity conservation; increasing the area of protected areas to 11.5% of the terrestrial territory (although very little progress has been noted since 2017); adopting a Red Book of Fauna in Kosovo in 2019 (Ministry of Environment and Spatial Planning, 2019<sub>[211]</sub>); and developing and implementing projects for increasing awareness of the importance of nature

and preservation of biodiversity. Kosovo became a member of the International Union for Conservation of Nature (IUCN) in 2019.

Information on biodiversity, including the conservation status of threatened species and habitats, is collected by the Kosovo Institute of Nature Protection (KINP), whereas the MEE and its Department for Environmental Protection and Waters is the main body responsible for biodiversity. The Department for Forestry under the MAFRD is responsible for forest management. The human and financial resources of both bodies are not adequate to execute their main responsibilities.

The Strategy for the Development of the Forestry Sector includes forest fire prevention measures; however, according to the government the effectiveness of these measures remains limited. The latest economy-wide forest inventory system was created in 2012, but there is no economy-wide forest programme. Although the systematic monitoring of the condition of forests is not undertaken in Kosovo, it is conducted somewhat indirectly through the monitoring of climate change adaptation and mitigation actions. Illegal tree logging is mostly treated under the Law on Forests, with penalties of up to EUR 25 000. However, sanctions are rarely enforced due to lack of staff, as competences lie at the local level where there are only a few inspectors. There is also little readiness from legal institutions to impose sanctions.

**The land-use legal and policy framework** remains underdeveloped in Kosovo, and no major changes have been recorded since the last CO assessment, with the exception of several amendments to the laws that regulate this area. The main strategic document, the Land Consolidation Strategy (2010-2020), was being revised at the time of drafting, along with the updated Agricultural Land Consolidation concept document. However, implementation of the strategy remains largely limited. The main activity realised in this area relates to the ongoing (to be finalised by the end of 2021) agricultural land consolidation in 21 cadastral zones and 10 municipalities through the Strengthening Spatial Planning and Land Management (SSPLM) Project. This project aims to provide technical assistance for the preparation of municipal land development plans, including rural spatial plans and the drafting of municipal zonal maps to protect agricultural land from ad hoc and illegal construction. However, policy making and implementation are not supported by any indicators related to land-use management.

Numerous bodies are responsible for land-use management in Kosovo (MAFRD, MEE, Ministry of Finance and MTI). Reportedly, these bodies all have qualified staff and financial resources. Horizontal institutional co-operation seem to be functioning well through the inter-ministerial committee that meets twice a year, but vertical co-ordination appears non-existent. Limited capacity building and training courses have been conducted for responsible bodies, but the measures envisaged under the SSPLM project will address this issue.

### *Sub-dimension 13.3: Environmental quality of life*

Poor **air quality** in Kosovo represents one of the major threats to health. This becomes an even greater concern in the context of COVID-19 given that exposure to ambient and indoor air pollution increases the risk of cardiovascular, respiratory and developmental diseases, as well as premature death, thus making individuals even more vulnerable to the virus (OECD, 2020<sup>[212]</sup>). Kosovo has one of the highest concentrations of air pollution in Europe, with annual mean exposure to particulate matter (PM<sub>2.5</sub>) of 27 micrograms per cubic metre (µg/m<sup>3</sup>), which is almost three times higher than the WHO recommended highest levels (10 µg/m<sup>3</sup>), and higher than the average values of the WB region (25.77 µg/m<sup>3</sup>), the EU (13.1 µg/m<sup>3</sup>) and the OECD (12.5 µg/m<sup>3</sup>) (World Bank, 2020<sup>[210]</sup>; OECD, 2020<sup>[213]</sup>). Urgent action is needed on uncontrolled pollution, notably from outdated thermal power plants (coal and lignite combustion at existing power stations<sup>141</sup>), household heating (using coal as a low-cost source of energy), traffic, industrial emissions and the incineration of waste and other toxic materials (European Commission, 2020<sup>[39]</sup>).

No major changes in the legislative and policy framework have been recorded since the last CO assessment. In 2018, the government adopted the Action Plan for Air Quality (2018-2020) as part of the Strategy on Air Quality (2013-2022), which represents a major strategic document in this area and includes

measures on air quality in the household, energy, industry and transport sectors. However, authorities have failed to implement these measures. Kosovo's government signed an agreement with the London-listed power generation company ContourGlobal in December 2017 to start the construction of the 500 MW "Kosova e Re" coal-fired power plant, aimed at replacing the 40-year-old Kosovo A plant. However, in 2020 ContourGlobal withdrew from the project and cancelled construction. In addition, the 2018 ban on the use of coal for heating in public buildings to reduce heavy air pollution has not proven effective so far.<sup>142</sup> In particular, most public schools could not comply with the ban as it was not accompanied by any financial support to facilitate the transition from coal to alternative energy sources, mainly due to budgetary constraints and weak overall planning and management.

A new action plan for air quality was being developed at the time of writing through activities as part of the Capacity Building for Air Pollution Control (2017-2020) project and the Environmental Data (2018-2021) project. These projects involve identifying air pollution sources, preparing an air emissions inventory (one central air quality portal was being developed at time of drafting), modelling pollutant distribution, and setting air pollution control measures. The results of these activities will also be useful when developing local air quality plans, envisaged for the 2020-2025 period, which are urgently needed, especially in zones where pollutant levels regularly exceed limits.

The Supply of Project Management, Air Quality Information Management, Behavioural Change and Communication Services (2019-2021) project<sup>143</sup> aims to support the Kosovo Hydro-Meteorological Institute (KHMI) in air quality monitoring and introduce an information management system, as well as collect and disseminate information on air quality. Through this project a significant increase in technical and human capacities for air quality monitoring and information management system is expected.

Air pollution monitoring consists of self-reporting by industries through the Pollutant Release and Transfer Register. However, at least twice a year the Environmental Inspectorate, in co-operation with the KHMI, measures emissions from the industrial sector. Limit values for the main atmospheric pollutants are determined by Administrative Instruction No. 02/2011 on Air Quality Assessment, transposed from Directive 2008/50 EC for Air Clean in Europe. Some of the indicators/polluters, such as PM, ozone (O<sub>3</sub>), NO<sub>2</sub> and sulphur dioxide (SO<sub>2</sub>), are aligned with WHO guidelines for the daily average, while annual average limits are higher than the WHO standards. When the alarm threshold is exceeded, there are clear administrative mechanisms established and immediate action is undertaken – normally within three days. Information on air quality is made available promptly, and the public has access to real-time data and information on air quality from 12 monitoring stations<sup>144</sup> through the webpage of the KHMI and via a smart phone application called "Kosovo Air Quality".

Most of Kosovo's population has access to safe **water and sanitation** services (92% have access to a piped water within their dwelling). Although 72.5% of the population have access to sanitation services, 11.6% have only partial coverage and 15.9% have no sewers. Only 1% of the population is connected to wastewater treatment systems, and almost all water is discharged untreated into rivers (World Bank, 2018<sub>[24]</sub>). However, this percentage might increase soon as three new urban wastewater treatment plants were being constructed in high-density urban locations at the time of drafting.

Since the last assessment, the policy framework has been complemented with the new Strategic Plan for Regional Water Companies (RWC) (2018-2022) that aims to apply and advance the legislation, improve the performance of RWCs, enhance service standards, and ensure RWC financial sustainability. A key priority in addressing water security issues for RWCs is to reduce their non-revenue water,<sup>145</sup> which currently stands at 58% (World Bank, 2018<sub>[24]</sub>). Implementation is on track, with regular annual implementation reports that underline the achievements of tariff targets. The latest assessment of this strategic plan found that clear progress had been made in reaching service standards and the financial sustainability of the RWCs, but a major challenge remained regarding the high level of water losses, although certain measures to decrease water losses in the system were introduced. The strategic plan set an annual target of a 2% reduction in water losses by RWCs (a total of 10% at the end of the

implementation period in 2022), and RWCs are not allowed to change the level of water tariffs if this target is not achieved.

Current water tariffs cover operational and maintenance costs, as well as part of capital investments, whereas the main sources of funds in infrastructure come from the donor community. Water services are considered affordable for the majority of citizens,<sup>146</sup> except for the poorest households,<sup>147</sup> who are left without any targeted assistance in this regard.

There have been no major changes in the **industrial waste management** legislative and policy framework since the last assessment. Industrial waste, with the exception of waste from the extractive industry, will be part of the Integrated Waste Management Strategy (2020-2029). The chemicals register is currently being developed, and labelling rules for chemicals have already been set. The Pollutant Release and Transfer Register system is not functional.

The Seveso-III directive (Directive 2012/18/EU) regarding managing and controlling industrial risks and accidents has been fully transposed. There are no hazardous waste disposal facilities, although the government planned to start constructing a central disposal facility for hazardous waste<sup>148</sup> in 2018 in the municipality of Fushe Kosove, and organised several rounds of consultations with citizens. However, an agreement to build the facility was not reached. The funds for this project are secured by the European Commission but have not yet been used as the alternative location has not yet been found.

There is no policy or legislative basis for soil protection, but there have been some developments regarding the identification of contaminated areas. During 2018-19, KEPA produced a report on Kosovo hotspots that identified over 100 contaminated and hazardous sites for human health and the environment. This led to a World Bank financed project called Green Land<sup>149</sup> (2020-25), which aims to clean up contaminated areas. Three polluted areas are prioritised to be cleaned and the land rehabilitated. The project also aims to support the government in developing and implementing a long-term action plan for contaminated land remediation and redevelopment in Kosovo. This should contribute to the improvement of contaminated land management to reduce associated health risks and realise economic, environmental and social values from land redevelopment, such as the creation of urban green spaces, commercial development and renewable energy production. No soil monitoring system has yet been put in place.

### ***The way forward for environment policy***

Despite some positive developments recorded since the last assessment cycle, further improvements are needed in a number of areas, mostly related to implementation. Going forward, special attention should be paid to the following:

- **Advance waste management by enforcing measures to separate and reduce waste, and increase recycling and recovery in line with circular economy principles.** Although some actions in this regard have already been planned and undertaken in the WMS, implementation has remained limited as most actions were simply rolled over to the new IWMS. The government needs to step up its enforcement efforts, and stronger co-operation with local governments will be essential. At the municipal level, incentives for the separation of municipal waste at source, i.e. before it is collected and recycled or converted to energy, should be offered (e.g. rewarding households for sorting waste, decreasing utility bills) together with regular awareness-raising activities on waste prevention and recycling (through brochures, information campaigns).
- **Improve air quality by decreasing dependence on fossil fuels in the energy mix, improving household heating systems and reducing emissions from the transportation sector.** Kosovo has one of the highest concentrations of air pollution in Europe due to power generation from polluting sources (coal and lignite), household heating, and an inefficient transport system and ageing vehicle fleet. Kosovo should undertake the following activities regarding energy, heating and transportation:

- **Energy:** phase out subsidies to coal (in the period 2015-17, more subsidies were paid for coal than renewable energy) and start supporting efforts to develop the natural gas market – see Energy policy (Dimension 12). Moreover, Kosovo should start implementing renewable support schemes that are fully aligned with the EC's Guidelines on state aid for environmental protection and energy 2014-2020 (CEE Bankwatch Network, 2019<sup>[208]</sup>). Shutting down the old Kosovo A Power Plant and installing the best-known contemporary filters at the Kosovo B Power Plant is highly recommended. In relation to renewables, priority should be given to using solar and wind energy over hydropower to address the current support imbalance and negative practices that have led to harming biodiversity.
- **Heating:** A large share of pollution is linked to poor socio-economic conditions, with most citizens using coal for heating because it is considered a low-cost source of energy. Subsidies could be considered for other forms of heating, such as solar space heating. Measures that ban the use of coal for heating in public buildings have not been effective – therefore, improved enforcement and financial support are needed through enhanced vertical co-ordination between different government levels.
- **Transportation:** Recommended measures include low-emitting buses, and ecological vehicle taxes that differentiate by age and level of CO<sub>2</sub> emissions to influence private vehicle purchasing and renewal decisions (World Bank, 2019<sup>[214]</sup>). Regarding vehicle tax an example from France may be useful for Kosovo. In 2008, France introduced the “feebate” system for new cars, which imposes a fee on vehicles with high CO<sub>2</sub> emissions or fuel consumption (i.e. those exceeding a certain threshold) and provides a rebate to vehicles with low CO<sub>2</sub> emissions or fuel consumption (those below this threshold) (Manea et al., 2019<sup>[215]</sup>).

## Agriculture policy (Dimension 14)

### Introduction

Kosovo has slightly improved its performance in the agriculture dimension since the last Competitiveness Outlook, with its score increasing from 2.0 in 2018 to 2.4 in 2021 (Figure 22.1). Most progress has been made in terms of agro-food capacity. However, Kosovo still scores low in comparison to other Western Balkan economies (Table 22.22).

**Table 22.22. Kosovo's scores for agriculture policy**

Dimension	Sub-dimension	Score	WB6 average
Agriculture policy dimension	Sub-dimension 14.1: Agro-food system capacity	2.9	2.8
	Sub-dimension 14.2: Agro-food system regulation	2.3	2.9
	Sub-dimension 14.3: Agriculture support system	2.1	2.7
	Sub-dimension 14.4: Agricultural innovation system	2.5	2.6
Kosovo's overall score		<b>2.4</b>	<b>2.7</b>

### State of play and key developments

Kosovo's agriculture sector has gone through a significant transformation in the last decade. In 2008, it lacked commercial market orientation and there was no system in place to efficiently link producers and buyers. Today, agriculture is an important economic activity that contributes 8.1% to GDP and accounts for over 23% of total employment (Kosovo Agency of Statistics, 2020<sup>[216]</sup>; 2020<sup>[217]</sup>). Around 363 000 people are involved in agriculture, and there are 130 775 registered farmers (these figures exclude four municipalities in the north part of Kosovo) (Kosovo Agency of Statistics, 2020<sup>[218]</sup>).

The total area of used agriculture land is 418 581 hectares (ha), while arable land represents 188 359 ha. The land use increases among the most important crops (fruits and vegetables). There has also been a significant increase in tree plantations (over 40%) and greenhouses (11.6%) between 2014 and 2019 (Table 22.23). The average farm size is 1.76 ha. The government recognises that land fragmentation is a factor for low productivity and aims to improve the regulation and consolidation of agricultural land.

**Table 22.23. Area covered by most important crops (2014-19)**

Hectares

	2016	2017	2018	2019	2019/2014 in %
Vegetables in the open field (first crop)	7 864	8 033	7 818	8 319	5.47
Vegetables in greenhouses (first crop)	457	467	468	517	11.61
Tree plantations	5 493	6 247	7 687	9 244	40.58
Vineyards	3 112	3 199	3 271	3 367	7.57

Source: (Kosovo Agency of Statistics, 2020<sup>[183]</sup>), *Statistical Yearbook of the Republic of Kosovo*, <https://ask.rks-gov.net/en/kosovo-agency-of-statistics/general-statistics/statistical-yearbook>.

Kosovo is a net importer of agricultural products due to a surplus of consumption over production. Surrounded by more developed agriculture sectors in neighbouring economies, it faces challenges in remaining competitive and maintaining agricultural productivity. Land fragmentation, lack of efficient irrigation, limited research and slow improvement of production technologies are among the key factors impacting productivity. Recent production trends, however, illustrate a growing awareness of the natural potential of agriculture in Kosovo and a slow but certain increase in the interest of young entrepreneurs working in this sector.

Kosovo has been severely hit by the COVID-19 crisis, with GDP decreasing by 8.8% in 2020.

The total number of unemployed increased from around 94 101 in January 2019 to 111 899 in January 2020 to 198 063 to October 2020. The persistence of COVID-19 is stifling services exports, private consumption and investment. Without the increase in remittances and the economy's counter-cyclical fiscal policy response, the economy's contraction would be stronger.

The agriculture sector has faced many challenges, such as limitation of movement, market closures, decreased demand and logistical difficulties.

Kosovo has approved a EUR 20 million budget increase for grants and subsidies to the Ministry of Agriculture, Forestry and Rural Development, the Ministry of Culture, Youth and Sports, and municipalities affected by the pandemic. The support is to be distributed through existing mechanisms. Agriculture businesses and farmers are eligible for subsidies for monthly salaries and rental costs, and can benefit from interest-free loans, financial liquidity measures, export support measures and increased social assistance measures.

The imports of goods declined by 9% by July 2020, and are expected to be down by 12% by year end. By July 2020, imports of durable goods were down by more than 16%, imports of passenger cars by over 19%, and intermediate goods for industrial processing by 11.3%. Exports decreased by 8.3% in the same period.

Kosovo has demonstrated its fragility during the crisis. The pandemic is exerting unprecedented pressure on economic activity and the livelihoods of people. The high unemployment rate, which has doubled in 18 months, decreased labour opportunities and overall market value decreases are indicators that the risk of high poverty will last much longer than the COVID-19 crisis itself.

#### *Sub-dimension 14.1: Agro-food system capacity*

Kosovo has made progress in expanding its **rural infrastructure** and digital framework in rural areas; however, access to electricity in rural areas is irregular and unstable. Based on the National Development Strategy (NDS) 2016-2021,<sup>150</sup> Kosovo identifies infrastructure as a priority for further improvement. According to the NDS, increasing agricultural production and agro-food industries are of paramount importance given the need to reduce the trade deficit. Nevertheless, "strengthening the sector is very difficult because of the limited agricultural infrastructure", which is especially true for the irrigation system, high land fragmentation and the unstable energetic system.

Kosovo has achieved considerable results in improving road infrastructure in the past decade. The new motorway network connecting Pristina with the borders of Albania and North Macedonia has enabled the much faster transfer of goods. These investments have increased the potential competitiveness of certain productions, particularly in the Dukagjini region, that lend themselves perfectly to labour-intensive horticulture. At the same time, investments in rural infrastructure are underway in several rural municipalities through public-private partnerships, donor assistance and long-term loans. However, the supply of electricity in rural areas remains a challenge. The situation has moderately improved since the last assessment cycle, but there are still power cuts and an unstable supply, especially during the winter period when consumption is higher.

Kosovo is making a great effort to improve its digital infrastructure in rural areas. As part of the Kosovo Digital Economy Project (KODE) 2018-2023, supported by the World Bank with USD 25 million, more than 200 villages, i.e. almost all of Kosovo's open-air settlements, will get broadband connections by 2023 – see Digital society (Dimension 10). Most rural areas in Kosovo are therefore expected to have broadband Internet access within the next five years. This will enable farmers to increase opportunities for digitalisation (market information systems, weather/climate data for prevention measures, online promotion/sales, etc).

To improve access to information for farmers, the domestic telecommunication provider, IPKO, signed a contract with the USAID-commissioned TetraTech in 2018 to implement the IPKO-Agrologic Forecast

Project. This project aims to inform farmers of agrologic conditions in the economy and provides the necessary information for early disaster prevention via 16 automatic meteorological stations in Kosovo.

Although Kosovo has implemented several plans to improve **irrigation infrastructure**, it remains underdeveloped and inefficient. The responsibilities for irrigation are shared among the ministries, public company and municipalities. Co-ordination and co-operation among these authorities are limited and result in low efficiency in irrigation water management.

The irrigated 32 237 ha represent only 17.3% of Kosovo's arable land, and water network losses and lack of water storage facilities hinder efficiency. As a result of unsustainable irrigation infrastructure, a large number of small illegal irrigation systems have been built by local farmers, which are unknown to irrigation companies. The ability of regional water supply companies to collect revenue from water sales is only 30%, which has led to the Government of Kosovo vowing to increase the coverage of the irrigation system to at least 40% of arable land by 2036, according to the NDS. Parliament approved the Water Strategy 2017-2036 in 2017, which largely describes the challenges of irrigation and the measures to be taken.

In 2019, the Strategy for the Irrigation Sector and Investment Framework and the Irrigation Master Plan were established as part of the EUR 20.8 million Agriculture and Rural Development Project 2017-2021 (ARDP), funded by the International Development Association (IDA) of the World Bank. The objective of the Irrigation Master Plan is to expand existing irrigated arable land by 7 000 ha by the end of 2021.

As a result of the ARDP project, two master plans were drafted and presented to domestic institutions and municipality representatives. However, the final Irrigation master plan, initially planned to be finalised by July 2020, has not been completed due to delays brought on by COVID-19. In addition to the master plan, the MAFRD will select at least five investment schemes to develop that meet government priorities; however these are also on hold due to the pandemic.

The **agriculture education system** in Kosovo lacks sustainable financing and suffers from the loss of an educated agriculture workforce to emigration. The MEST is responsible for agriculture education in Kosovo, while several ministries (along with private companies and NGOs) are involved in the provision of non-formal education, which holds equal status with formal education institutions. The agriculture education system comprises three agricultural high schools and two vocational schools that offer specialist agriculture courses. University agricultural education takes place at the Faculty of Agriculture of the University of Pristina, while university programme studies on agribusiness, agro-ecology and food technology are offered by the University of Peja and the University of Mitrovica.

Basic education and skills training are recognised by the Government of Kosovo as key elements in enabling the rural population to diversify its activities and find a basis for sustainable development in remote rural areas. Several strategic documents and plans prepared by the Government of Kosovo emphasise education as a precondition for the improvement and development of sustainable agriculture: the NDS 2016-2021, the Green Report for Kosovo 2018, and the Agriculture and Rural Development Plan 2003-2016. However, due to current low budget expenditure and the lack of prioritisation of agriculture educational development there has been little progress in bringing these plans to action.

Agriculture high schools and vocational schools are supported by government institutions and donor agencies active in Kosovo, such as the Danish DANIDA, the Norwegian Red Cross and the Swiss Agency for Development and Cooperation. The main objective of their support is to increase practical training for students and adopt curricula that meet labour market demand. As funding is mainly based on foreign support, the institutions' sustainability is at stake once donor support ends. This affects both the financial aspect and the maintenance of established educational standards.

The market is in constant demand for a qualified and professional workforce ready to meet the challenges of new production technologies and competitiveness criteria. The number of students enrolled in the first year of university studies in agriculture is not decreasing (Figure 22.14), and interest in university programmes is still very strong among the young population. However, Kosovo is facing a shortage of skilled labour due to

the exodus of a large part of its agricultural workforce to EU countries. Students who have completed an internship in international education during university often use it as a one-way ticket for migration.

**Figure 22.14. Number of students enrolling in the first year of the agriculture university programme**

### *Sub-dimension 14.2: Agro-food system regulation*

**Regulations on natural resources** in Kosovo are limited; however, progress has been made in the organisation and planning of natural resource use. Although the Department of Natural Resources in Kosovo was abolished in 2018, the topic of natural resource remains under the auspices of the MAFRD. As the average farm size is 1.76 ha, fragmentation is the key factor for low productivity, and the government recognises the regulation and consolidation of agricultural land as a priority. Through the Strategy for Land Consolidation 2010-2020 the government has developed models for the consolidation process, including voluntary exchange and public-private partnerships.

The Zoning Map of Kosovo 2020-2028 was developed in 2019 to better plan the sustainable use of natural resources. It is a multi-sectoral document that uses charts, maps, photos and text to determine the planned use of space and action measures. These measures are based on the duration and projections of available public and private investment for the entire territory for a period of at least eight years.

The Kosovo Institute of Agriculture has been implementing the Domestic Program for Inventory of Agricultural Lands since 2017 with the aim of creating a domestic database using geographic information systems (GIS) for soil, irrigation water, vegetation and quarantine pests of plants. The data from this system will help to create measures for the efficient use of natural resources from environmental pressures and in the creation of sustainable farms related to the adaptation of climate change. This programme includes a large range of institutional and public stakeholders.

However, efforts to regulate natural resource use are limited, especially in terms of designing effective measures that will stop the loss of agricultural land<sup>151</sup> and improve legislation implementation by the provision of more efficient mechanisms of inspection/control. Inconsistent cadastral information and the lack of implementation of property rights legislation are holding Kosovo back from improving its natural resources regulations.

In terms of the **regulation of products**, those on seeds and propagation material are well monitored by advisory committees and institutions, but some regulations are not making much progress in terms of drafting and implementation. The regulations in this area are based on the Law on Seeds and the Law on Planting Material,<sup>152</sup> which regulate the production and marketing of agricultural crop seed varieties,

hybrids and seed potatoes. A new Draft Law on Seeds was prepared in 2018 as part of the Italian-Kosovo project, which is a partnership between the MAFRD and a department within the Italian Ministry of Agriculture to further EU harmonisation in the agriculture sector. The draft law is awaiting further legal procedure for approval.

The seed sector of the MAFRD is fully responsible for the import, marketing, production and packaging of seeds, as well as propagation material. Seed production is controlled twice during the vegetation period by phytosanitary inspectors. The registration of new varieties is organised through the Department of Agriculture Policies and Trade within the MAFRD. Applications submitted from both regional and EU-based commercial companies illustrate that there is specific interest in registering new varieties of wheat, barley, maize and potato. Under the auspices of the Institute of Agriculture in Peja, the variety potential and adaptability of seeds is assessed. Based on the assessment report, a special committee within the MAFRD approves the variety and includes it in the list of varieties.

The Law on Fertilisers determines the rules for protecting producers and consumers of fertilisers. Based on this law, the MAFRD has developed the Kosovo Artificial Fertilisers Advisory Board, which provides recommendations on implementing legislation and proposes updates and changes. However, by 2020 only one proposal by a private business entity had been submitted.

### *Sub-dimension 14.3: Agricultural support system*

Kosovo's **agriculture policy framework** includes multiple stakeholder consultations during the policy making process; however, the monitoring and evaluation of policy implementation remains limited. The agriculture policy framework is based on the Agriculture and Rural Development Plan 2014-2020,<sup>153</sup> which has been harmonised with EU directives in terms of priority areas and measures. The MAFRD uses this plan for preparing an annual programme guided by the available budget, and via a broad consultation process with all stakeholders, including the private sector (farmers, processors, co-operatives, etc.), experts, farmers' associations and local action groups. The annual programme is then submitted to the government for approval. It is currently being aligned with the EU's Common Agricultural Policy, but all support measures are financed from the budget.

Agriculture policy is implemented through the Agency for the Development of Agriculture, which is the disbursing agency for direct grants and rural development actions planned for future IPARD measures. The agency's administrative capacity for evaluation, monitoring and accounting is still limited. The process of integrated control and management of the Land Parcel Identification System is ongoing, while the Farm Accountancy Data Network is already established. The ambition of the authorities is that Kosovo should be ready to manage EU funds for agriculture and rural development in the coming two years; however, no substantive changes to meet the criteria have yet been accomplished.

**Domestic support** for agriculture in Kosovo remains underfunded. In 2019, agricultural domestic support, including direct payments and rural development investments, reached EUR 49.6 million, which is comparable to the other WB6 economies when taking into account the size of Kosovo and its agriculture output.

The MAFRD has continued subsidising farmers through direct payments for crops based on surface cultivated; however, no cross-compliance measures have been introduced. Support in the livestock sector is based on the number of animals by category, milk production according to quality, and subsidies on reported slaughtered cattle, as well as planting material.

While investment grants are divided according to the EU IPARD structure<sup>154</sup> they are only financed by the budget supported by World Bank loans within the framework of rural development programmes. Investments are co-financed with government participation at 60% and farmer participation at 40%.

Financial assistance for natural disasters has improved. In 2011, the MAFRD established a committee to verify the damage caused by floods, hail and other natural disasters in agriculture. The committee works

in co-operation with officials of the municipal departments for agriculture and officials of regional offices. The investment grant framework for 2019 introduced new measures that provide technical and financial assistance for natural disasters of EUR 500 000. As the budget (EUR 20 million) allocated for the measures envisaged in the Rural Development Programme has been almost spent, many applicants are being rejected due to insufficient budget following the application of the first-come first-served rule.

Kosovo's **agriculture trade policy** is based on international and regional trade commitments. There are no tariffs or VAT on agricultural inputs imports to stimulate agriculture development. However, in terms of trade policy, the general prospects are complex, and there are no export support measures for agricultural commodities.

Recently, the 100% tariff on goods imports originating in Serbia and Bosnia and Herzegovina were found to violate the CEFTA agreement. In April 2020, the tariffs were lifted and replaced by gradual trade reciprocity measures, which were subsequently abolished by the new government of Kosovo in June 2020. The tariffs seriously jeopardise the position of Kosovo consumers and provoke tariff and non-tariff barriers for the few Kosovo agriculture exporters trying to penetrate the regional market.<sup>155</sup>

Specific strategies for trade policies are to be developed within the Kosovo programme for implementing the Stabilisation Association Agreement.<sup>156</sup> Kosovo is currently at a very early stage, with the first working group for the preparation of a strategy regarding trade policies in the agro-processing industry established in 2020.

The Law on Common Market Organisations (CMOs) is still planned, but no progress has been made in the last two years, even though this is considered one of the indicators for the EU harmonisation progress by the European Commission. CMOs are designed to manage production and trade to ensure a steady income for farmers and a continued supply for consumers.

Kosovo's **agriculture tax regime** is liberal and reviewed annually, but no progress has been made in developing tax regulations in the last five years. Agriculture tax regulations are based on the Law on Taxes and annual customs tariffs, and overseen by the Ministry of Finance and the Customs Service. Income tax for the agriculture sector in Kosovo is 10%; however, some reductions on income tax are available. For those in the agriculture sector with an income of less than EUR 450 per month the tax applied is 10%, and for those with an income of more than EUR 450, the tax applied is between 8% and 14%, depending on income. Standard VAT in Kosovo is 18%, but VAT on machinery and certain varieties of plants and seeds is lowered to 8% as their production is low in Kosovo. Similar exemptions are applied to smaller products such as irrigation equipment and plastic sheeting for horticulture.

Kosovo has made progress in aligning **sanitary and phytosanitary (SPS) policies** with EU and international legislation, but education and training in the field remains limited. SPS measures are based on the Law on Food, which designates the Food and Veterinary Agency (FVA) as the competent authority with a mandate covering food safety, plant health and protection, and animal health and welfare. However, local inspectors are still performing official controls within their municipalities. The FVA is fully functional and has sufficient capacity to implement SPS measures, and no significant limitations regarding infrastructure, finances, technical support or training. The FVA has received support from in technical assistance in all fields of expertise from USAID and through EU mechanisms such as TAIEX or BTSF.

Kosovo has advanced in aligning food and feed safety legislation with EU standards, and has harmonised its operating procedures for food and feed checks and controls. The legal framework for plant protection products, fertilisers, plant quarantine, and seed and plant breeders' rights was completed in 2019 with 15 new administrative instructions. New standard operating procedures were developed between 2018 and 2020 for the implementation of administrative instructions and laws.

Regarding veterinary policy, Kosovo lacks a comprehensive disease monitoring and control system that is in line with EU legislation and World Organisation for Animal Health requirements. Animal health controls mostly take place on farms, while controls for the transport of animals are relatively rare. Animal

identification and registration is still an important issue, with the under-reporting of animal movement remaining a challenge. There is also a lack of in-service training and education programmes for field veterinarians.

To improve the collection and disposal of animal by-products, Kosovo was granted EU funding for a new, fully equipped rendering plant. Despite having been built two years ago, the plant is still not operational. The FVA was obliged to launch a call for tender and select a management company for the plant. Collection will only be able to start in 2021.

The border inspection control system is the only agriculture information system in Kosovo; however, an EU-funded project has been established to create a new system to support the FVA create an additional electronic secured system that will reach EU standards.

#### *Sub-dimension 14.4: Agricultural innovation system*

**Agricultural research and development** institutions in Kosovo co-operate with international research institutions and organisations, but research outputs remain weak and the field is underfunded. The Kosovo Agriculture Institute is the public research institute, funded by the MAFRD. It covers scientific and applied research, as well as the implementation of development of projects in the fields of agriculture, food safety and the protection of cultivated environments. The work of the Kosovo Agriculture Institute is continuously evaluated and monitored through its membership in international organisations such as the International Seed Testing Association and the Global Soil Laboratory Network, as well as through participation in cross-laboratory comparison tests in international laboratories.

The MAFRD, as part of activities to improve the research capacity of the Kosovo Agriculture Institute, has signed an agreement with institutional parties on specific research topics. The agreement enhances co-operation with the University of Modena and Reggio Emilia in Italy for PhD programmes in agro-food sciences, technologies and biotechnologies for the academic year 2020/21. The agreement with the university is adapted to the needs of the Kosovo Agriculture Institute, which aims to contribute to the sustainable development of the agricultural sector and food safety at the domestic level, benefitting both academic and research staff.

Apart from the work of the Kosovo Agriculture Institute, the field of applied science and research projects is not dynamic. Research is largely dependent on donor-funded projects, while the budget for such projects is very limited and restricts projects to an ad hoc basis only.

**Agriculture extension services** are widely available and very competitive. Many of the extension services available are established as a result of donor-supported projects. The continuous monitoring and support of both public and private licenced advisors will be required once the donor funds cease. The Law on Advisory Services and the Strategy of Advisory Services 2015-2020 aim to raise agriculture knowledge among farmers and disseminate information on training, standardisation and market demands.

Besides public advisory services, 13 private companies are licenced to perform advisory activities through the Department of Advisory and Technical Services within the MAFRD. Approximately 300 advisors for agriculture and rural development have been certified, with 100 more expected to be certified by the end of 2020.

The Department of Advisory and Technical Services plays a co-ordination role in harmonising and supporting other organisations in the extension field. Activities developed at municipal information advisory centres have been organised to support farmers with technical advice in the areas of livestock, beekeeping, viticulture, arboriculture and vegetables.

### ***The way forward for agriculture policy***

- **Improve irrigation water management.** Increase investment to maintain the existing irrigation network and bring new areas under the irrigation system as a priority. The productivity of agriculture in Kosovo largely depends on irrigation, as well as a functional system of water management. It is necessary to reduce illegal irrigation systems, improve the system of monitoring and control, and increase the payment for irrigation services.
- **Enhance the land consolidation process.** The land consolidation process is crucial for improved productivity. Further implementation, along with the establishment of the Land Parcel Identification System (LPIS), will provide the structural reform of agriculture, as well as opportunities for the utilisation of EU funds, for which the existence of the LPIS is a precondition.
- **Improve the correlation between skills acquired in agriculture education and labour market needs.** This will mean that students may discover it easier to find practical work during studies or full-time employment on graduating. The mechanisms of accountability and certification in the education system will also improve as the labour market demand requirements will continuously call for the transfer of new knowledge.
- **Meet the preconditions and increase capacity for the facilitation of IPARD funding.** As part of the harmonisation with the EU Common Agricultural Policy further effort is needed to accelerate the IPARD accreditation process. The remaining obligation for introducing cross-compliance measures needs to be fulfilled (as part of the criteria for IPARD programme accreditation), the new Law on Common Market Organisations should be finalised, and administrative capacity for evaluation, monitoring and accounting increased within the Agriculture Development Agency.
- **Continuously upgrade the SPS system and harmonise it with EU requirements.** Further efforts to implement the integrated food control system and transferring inspections from municipalities to the FVA are a priority. Opening the existing rendering plant for animal by-product collection and disposal is necessary for the completion of the animal monitoring and control system.

## Tourism policy (Dimension 15)

### Introduction

The tourism policy framework in Kosovo is in its early stage of development. Table 22.24 shows Kosovo's scores for the five tourism sub-dimensions and compares them to the WB6 average. Since the last assessment, Kosovo has only made slight progress in tourism by improving its score for the availability of a qualified workforce sub-dimension, driven by improvements in the VET framework indicator where it scores above the WB6 average (Figure 22.1). However, Kosovo scores below the WB6 average in all other sub-dimensions, with its lowest score being in the tourism branding and marketing and the destination accessibility and tourism infrastructure sub-dimensions. Kosovo is currently developing its Tourism Development Strategy, which will set up the governance structure and institutional framework and define the main policy measures, timeframe and budget for their implementation. Until the strategy is developed and adopted, progress in all sub-dimensions will remain rather limited.

**Table 22.24. Kosovo's scores for tourism policy**

Dimension	Sub-dimension	Score	WB6 average
Tourism policy dimension	Sub-dimension 15.1: Governance and co-operation	1.9	2.3
	Sub-dimension 15.2: Destination accessibility and tourism infrastructure	1.5	2.2
	Sub-dimension 15.3: Availability of a qualified workforce	1.8	1.8
	Sub-dimension 15.4: Sustainable and competitive tourism	1.2	1.6
	Sub-dimension 15.5: Tourism branding and marketing	0.5	1.6
Kosovo's overall score		1.5	2.0

### State of play and key developments

In the last ten years, Kosovo has seen a steady increase in tourist arrivals and overnight stays. The highest increases were recorded in 2015 and 2016, when the number of total tourist arrivals, compared to the previous year, increased by 50% (2015) and 85% (2016), and the number of overnight stays by 117.4% (2015) and 96% (2016). The increase of foreign visitors and their overnight stays was faster than the growth of domestic visitors, reaching 160% in 2015 and 85% in 2016. However, over the last three years the increase in the number of tourist arrivals and overnight stays has slowed down, with 287 083 tourist arrivals and 490 402 overnight stays in 2019 (Figure 22.15), which is behind all other economies in the WB region. Around 50% of foreign tourists are from five destinations: Albania (19.6%), Germany (10.4%), Turkey (8.3%), Switzerland (7.9%) and the United States (5.8%). The main tourist destinations are Pristina, Peje/Pec and Prizren, where nearly 88% of tourist arrivals are registered.

**Figure 22.15. Tourist arrivals and overnight stays in Kosovo (2011-20)**

Source: (Kosovo agency of Statistics, 2021<sup>[220]</sup>), *Hotel Statistics*, <https://ask.rks-gov.net/en/kosovo-agency-of-statistics/economy/hotels-and-tourism>.

StatLink  <https://doi.org/10.1787/888934255798>

According to the available data from 2019, accommodation and food services contribute to 1.4% of GDP and 6.4% of employment (23 600 jobs) (Kosovo Agency of Statistics, 2019<sup>[221]</sup>). However, due to the lack of reliable statistical data, the actual contribution of tourism to economic development cannot be assessed.

Tourism is not perceived as a priority sector in Kosovo, despite recent growth. Tourism development is included in several strategic and policy papers: the National Programme for Implementation of Stabilization and Association Agreement (NPISAA); the Economic Reform Programme 2019-2021 (Measure 6: Enhancing competitiveness in the tourism and hospitality sector); the Government Programme 2020-2023; the National Strategy for Cultural Heritage 2017-2020; and the Strategy and Action Plan for Biodiversity 2011-2020. However, a comprehensive approach is still missing. This will hopefully be addressed through the development of an economy-wide tourism strategy being developed that aims to tackle several challenges, such as the lack of a coherent and effective governance structure and institutional set up at economy and local levels, the poor accessibility of tourist destinations due to underdeveloped transport infrastructure, the lack of a quality assurance system meeting international standards, low-quality tourist services and products, unexploited natural and cultural heritage, shortage of competent workforce, and the weak visibility of Kosovo as a tourist destination in international markets.

Due to the COVID-19 outbreak, Kosovo's economy contracted by 5.6% in the first nine months of 2020, and by 3.9% in 2020 compared to 2019 (OECD, 2021<sup>[222]</sup>). In March 2020, the government implemented containment measures that involved closing all schools and universities; suspending all public transportation services; closing all cafés, bars, restaurants and non-essential stores; cancelling all cultural and sporting events; and obliging all private sector employees to work from home (OECD, 2020<sup>[223]</sup>). The containment measures put a stop to the tourism industry: hotels were closed during April and May 2020, and Pristina airport only reopened on 28 June. In 2020, the number of local visitors decreased by 39% compared to 2019, and the number of nights they stayed decreased by 33%. The number of foreign visitors also decreased by 52%, with the number of nights they stayed decreasing by 52.5%. Overall, the number of visitors in 2020 was 47% lower than in 2019, and the number of overnight stays was 46% lower (Figure 22.15) (Kosovo Agency of Statistics, 2021<sup>[223]</sup>). Measures implemented to support the tourism industry include:

- To support the economy, the government cut the interest rate on loans for SMEs operating in the tourism sector by 50%, and the interest rate on loans for large companies by 15%.
- The Promoting Private Sector Employment project of the Swiss Agency for Development and Cooperation in Kosovo prepared a document on the Economic Impact of the COVID-19 Pandemic

in the Hospitality Sector in Kosovo (Swiss Agency for Development and Cooperation, 2020<sup>[224]</sup>). The report was submitted to the Ministry of Finance in Kosovo to support planning for economic mitigation measures.

- A fiscal package of EUR 180 million (2.5% of GDP) was adopted by the government, and 76% of the package had been executed as of 26 August 2020.
- The New Economic Recovery Programme, corresponding to EUR 384 million, was adopted by the new government. The programme includes projects foreseen under the emergency fiscal package.
- The Ministry of Finance has approached international financial institutions (e.g. IMF, World Bank, EU and EBRD) and other bilateral donors for financial support.

The COVID-19 crisis has emphasised the importance of a resilient tourism industry. Kosovo should assess the impact of COVID-19 on the tourism industry and design a specific recovery plan with an emphasis on the development of sustainable tourism. Kosovo should also put effort into moving away from the further development of mass tourism and start developing new, high-quality and personalised tourist experiences around natural and cultural sites. A dedicated co-ordination framework would guarantee the efficient implementation of policy responses. Moreover, the development of marketing and promotion strategies would contribute to accelerating the recovery.

#### *Sub-dimension 15.1: Governance and co-operation*

Kosovo's **tourism governance and institutional set-up** is still at an early stage of development. The Department for Tourism within the MTI manages tourism development and is responsible for tourism marketing (an economy-wide tourist office has not yet been established). The tourism governance structure will be defined in the new Tourism Development Strategy. The mandate of the Kosovo Tourism Council (KTK), established in 2014, was renewed in 2017. The KTK is the main body for **partnerships with stakeholders** at the economy level and for **vertical co-operation** and meets at least four times a year. Its members include representatives of the Association of Municipalities, tourism experts, and representatives of NGOs as well as senior officials of the MTI, the MEE, the MEST, and the Ministry of Culture, Youth and Sports, which are also involved in the development of the tourism strategy and are responsible for the implementation of tourism policy measures.

Implementing the new Tourism Development Strategy will depend a great deal on the ability to establish and implement an effective governance structure at the economy level (and active inter-ministerial co-operation), as well as active co-operation and dialogue with the private sector, educational institutions, NGOs, municipalities and the donor community. This is strongly related to the ability and knowledge of public officials responsible for implementing the strategy.

Municipalities that consider tourism as an opportunity for local development have adopted tourism development strategies. In the western region of Kosovo, the Destination Management Organisation was established in 2015 as an NGO to provide support for the development and promotion of sustainable tourism in the region through joint work with local authorities, businesses, public agencies and strategic partnerships with relevant stakeholders. Although this is a good achievement, in most municipalities tourism governance and destination management remain rather weak. The main constraints, besides the lack of coherent governance at the economy level, are the lack of qualified human resources, lack of financial resources and, according to private tourism stakeholders, weak co-operation and dialogue with the private sector at the local level.

The tourism **data collection and interpretation** framework is formally in place. Since 2017, some progress has been made in tourism data collection with the introduction of new processes: a register of all accommodation facilities, the monthly collection of statistics from accommodation facilities, a new quarterly survey on demand-side statistics, and the preparation of a platform for electronic data collection. A memorandum of understanding was signed in 2016 with Kosovo Police on collecting data on the number

of foreign visitors. However, due to the large informal economy in the tourism sector,<sup>157</sup> and the large share of visitors who enter Kosovo to visit relatives and friends (76% of total border crossings in 2019), statistical data are still not reliable enough to assess the actual scope of tourism activity in the economy. The Tourism Satellite Account has not been implemented yet due to the lack of staff at the Kosovo Agency of Statistics dealing with tourism statistics (currently only one person works in tourism statistics) (Kosovo Agency of Tourism, 2020<sup>[225]</sup>).

#### *Sub-dimension 15.2: Destination accessibility and tourism infrastructure*

There has been no progress in Kosovo regarding the **connectivity framework**, border crossings and visa requirements since the last assessment. Kosovo has established visa exemption agreements with 115 economies. Citizens of the EU Member States, the Schengen area and neighbouring economies can enter Kosovo with a biometric ID and can stay for up to 90 days over a six-month period.

Limited progress has been made on improving **accommodation capacity and the quality assurance framework**. The only development has been the establishment of a register of accommodation facilities. However, the categorisation of accommodation facilities is still voluntary and is not accompanied by awareness-raising campaigns and training for accommodation providers, which is necessary for Kosovo's international tourism competitiveness. There is also no monitoring or evaluation of the efficiency of the categorisation model. The quality assurance framework in Kosovo also needs to be improved. Incentives are currently limited to the provision of grants for SMEs in rural areas by the MAFRD to support rural tourism, with an annual budget of EUR 500 000. Investments in tourism are considered as strategic investments in the Law on Strategic Investments, adopted in 2017. However, no major investments have been made so far, and there is no regular evaluation of measures to develop accommodation facility to ensure the most efficient allocation of limited financial resources.

The **tourist information system** provides reliable information on tourist destinations, accommodation, attractiveness and tourist services. Information is available mainly in Albanian, English and Serbian on websites, road signs, in tourist information centres, etc., and is regularly updated by the Department for Tourism at the MTI. However, Kosovo has not yet established a framework for a tourism information system that includes the regular monitoring and evaluation of tourist information to ensure a systematic approach to the system at all levels down to destination level.

#### *Sub-dimension 15.3: Availability of a qualified workforce*

A qualified workforce is one of the main factors for furthering tourism development in Kosovo, as it is the guarantee for improving the quality of tourist products and services, which is currently rather poor. According to the Government Programme 2019-2020, in recent years progress has been made in skills development, quality improvement and access to education. Human resources development in tourism is included in the Kosovo Education Strategic Plan (KESP) for the period 2017-2020. The new Tourism Development Strategy will also introduce a **skills supply framework** and specific policy measures. Kosovo is actively involved in the regional project, Towards Regionally-based Occupational Standards (TO REGOS), implemented by the Education Reform Initiative of South East Europe (ERI SSE) and the expert group, Western Balkans Alliance for Work-based Learning. This project aims to develop common qualification standards for tourism across the Western Balkans.

Overall, the **VET framework** is well advanced, with well-functioning co-operation with private tourism stakeholders. The Agency for Quality Assurance and Accreditation of VET is reported to be well equipped with sufficient financial resources. Curricula are updated according to the tourism industry's needs. Mandatory practical training is part of the VET framework, and the evaluation of activities and measures are planned in the KESP 2017-2020. The Kosovo Government Planning Office monitors the implementation of all strategies, including the strategic education plan. However, as the evaluation and

monitoring reports of the VET framework are not available yet, a more detailed assessment of the tourism VET framework could not be provided.

Kosovo does not have a specific **higher education framework for tourism**. However, institutions offering programmes in the field of tourism, such as the Faculty of Tourism and Environment at the University of Applied Sciences in Ferizaj/Urosevac, have developed strategies and curricula in collaboration with the MEST. Despite the strategies not being specifically focused on tourism, curricula are developed in line with the labour market as they are adopted by working groups that include members from management, academic staff, students, alumni administration and industrial boards. The legislation in force for higher education specifies that each HEI should collaborate with the Agency of Accreditation (responsible for quality assurance) and meet the standards for accreditation. Institutions cannot offer programmes without accreditation. The curricula of the programmes are reviewed during the accreditation process. If programmes meet the conditions for accreditation based on European standards such as the Standards and Guidelines for Quality Assurance in the European Higher Education Area, they are subject to evaluation by local and international experts. The Agency of Accreditation plays a key role during the process of accreditation, but quality assurance within the HEI, the budget, and the engagement of sufficient and professional staff in certain areas remain a challenge.

#### *Sub-dimension 15.4: Sustainable and competitive tourism*

A comprehensive **natural and cultural heritage enhancement framework** for tourism is being developed. Natural and cultural heritage will be included in the Tourism Development Strategy. The development of cultural tourism based on the principles of sustainable development is currently defined in the National Strategy for Cultural Heritage 2017-2020. This includes clear and measurable plans with timelines for the implementation of specific measures, organisational structure, division of tasks and responsibilities, and the human and financial resources needed for implementation. Natural heritage is included in the Strategy and Action Plan for Biodiversity 2011-2020. Monitoring and evaluation reports of implemented measures for both strategies are not available to enable a more detailed assessment.

The policy framework for the **promotion of sustainable tourism and operations within the tourism sector** will be defined in the new Tourism Development Strategy. Promotional activities such as increasing awareness and co-operation among all sectors for biodiversity are currently defined in the Strategy and Action Plan for Biodiversity 2011-2020. Sustainable tourism development is promoted through meetings held with businesses, associations and NGOs, and through media communications of Department of Tourism representatives. Awareness-raising activities on the importance of using certifications and tourism standards have been implemented. However, sustainability certification schemes, such as eco-labels and specific schemes for the certification of enterprises meeting sustainability standards, are not in place yet.

**The tourism investment and innovation policy framework** is not established yet, but is planned as part of the new Tourism Development Strategy. The challenge is to prepare a comprehensive analysis of tourism investment needs that will fully support the development of the main tourist products in the major tourist destinations, as defined in the new Tourism Development Strategy.

#### *Sub-dimension 15.5: Tourism branding and marketing*

Kosovo's **tourism branding and marketing framework** has not yet been established. The Department of Tourism at the MTI manages the official websites that promote Kosovo tourism. Overall, tourism marketing is implemented by tourism stakeholders but in an uncoordinated manner. Kosovo still does not have an economy-wide organisation for tourism promotion and marketing, unlike most economies worldwide. Some progress in tourism promotion was made by KIESA, which participates in high-profile international tourism events such as ITB Berlin. However, this does not qualify as a comprehensive tourism and marketing framework.

The **digital tourism marketing framework** is not yet established. However, the Digital Agenda, which covers all sectors, began in 2020, supported by the Market Access and Digitalization Services for Kosovo Businesses (ACCESS) project, funded by the Austrian Development Cooperation and co-financed by the MTI and the MEE. A coherent tourism branding and marketing framework, including digital tourism marketing, is still needed to improve the visibility of the Kosovo tourist offer in international markets. Box 22.15 provides some ideas.

### Box 22.15. Approaches to managing tourism marketing and branding

The public sector has traditionally played a lead role in destination marketing and promotion activities, as the fragmented nature of the sector and small size of many tourism businesses makes it difficult for individual businesses to be visible to, and attract visitors from, remote tourism markets. More recently, economies have been exploring different tourism marketing models that draw on new funding sources, partnership opportunities and governance arrangements, as well as the development of digital strategies. Most economies have established economy-wide tourist organisations (NTO) or tourist boards as a central organisation responsible for tourism brand development and marketing in international markets, as well as the co-ordination of marketing and promotional activities of local tourist destination offices. However, due to high competition in the tourism market, NTOs are searching for new solutions to attract visitors using digital tools, and expanding their tasks to support tourist destinations through new tourist product development by providing market research and consultation to tourist destinations. NTOs are strengthening co-operation and dialogue with private sector stakeholders to ensure coherent and effective marketing and promotion in international markets.

Due to the rapid move to digital sales and distribution, economies are looking at new solutions to enable the small and micro-tourism business sector to be more easily connected to major online travel agents and other intermediaries. For example, in 2019 in South Africa the National Tourism Visitor Information System rebranded to become “Jurni”, which is an online platform connecting travellers and travel experiences across the country. Jurni acts as a booking tool and business application to help tourism SMEs overcome knowledge and resource constraints to reach global markets. It also acts as a central data hub providing insights to inform business strategies and decision making across the tourism value chain. A consumer-facing application also provides location-tailored information for tourists during their trip, based on geo-localised information, data analytics and artificial intelligence.

Economies with a more seasonal offer and an over-reliance on a limited number of high volume short-haul markets are seeking to diversify and expand into new markets or segments. This is both to increase the length of the season and to increase the demand for less popular destinations. Diversification can typically be based on cultural, heritage or urban products. Croatia, Greece and Turkey all have firm plans in this regard.

Many countries are also now giving greater prominence to marketing to their home markets, recognising that the volume of domestic tourism is often significantly greater than inbound tourism. Hungary, for example, is looking to use the domestic market as a way of spreading the benefits through extending the season and encouraging trips to lesser known destinations, and Slovakia and Romania have introduced recreational voucher schemes to incentivise employees to spend their holidays domestically.

There is a greater focus on the development of bookable products and experiences to attract visitors as part of the upstream marketing mix, which has translated into significant investment and specific programmes, as in for example Canada, Ireland and the United Kingdom.

Source: (OECD, 2020<sup>[226]</sup>), *OECD Tourism Trends and Policies 2020*, <https://doi.org/10.1787/6b47b985-en>.

### ***The way forward for tourism policy***

- **Finalise and adopt the new Tourism Development Strategy.** This strategy should establish an efficient governance structure and institutional set up at the economy level, define clear policy measures, responsible institutions for their implementation, timeframe and budget allocation. The strategy should also provide policy measures for establishing the legislative and regulatory framework, starting with the adoption of the Law on Tourism. A monitoring and evaluation framework should be part of the strategy to ensure that the impact of the implemented measures on tourism development in the economy is assessed.
- **Establish an economy-wide tourist organisation** that will take over tourism branding and marketing in the economy. The development of a digital marketing framework is also of growing importance. The provision of a sufficient budget and a team of qualified staff working in the field of tourism marketing are preconditions for the successful launch and development of the economy-wide tourist organisation.
- **Include destination management organisations in the new Tourism Development Strategy to empower municipalities/tourist destinations to manage tourism development.** Policy measures should include capacity-building programmes for local tourist organisations, and sufficient budget should be secured for the start-up phase of organisations' development and operations. Donor support could be valuable for the development of destination management organisations as they can provide best practice cases from advanced tourism economies.
- **Introduce a framework for accommodation capacity and tourism quality** to increase the quality of tourist products and services. The adoption of a mandatory accommodation facility categorisation framework, accompanied by awareness-raising campaigns, training and advice for private stakeholders, is also recommended. A comprehensive tourism investment programme that includes a set of incentives for investing in private tourist infrastructure (including accommodation facilities), and improving the quality of tourist products and services, would help to increase the competitiveness of Kosovo tourism in international markets.
- **Develop a comprehensive framework for promoting sustainable development within the tourism sector.** This should include the mandatory consideration of sustainability criteria in all investments in tourist infrastructure. These investments should be supported by public incentives, and provide awareness raising and training for tourism sector stakeholders on developing their businesses sustainably. Using best practices from other countries, such as the Green Scheme by Slovenian Tourism,<sup>158</sup> is recommended.

## Anti-corruption policy (Dimension 16)

### Introduction

Table 22.25 shows Kosovo's scores for the anti-corruption policy dimension and compares them to the WB6 average. All scores for Kosovo are below the WB6 average, with the score for anti-corruption law enforcement bodies closest to the average. In recent years, Kosovo has adopted several important laws to strengthen its anti-corruption framework and the rule of law more generally. Since the previous assessment, Kosovo has intensified anti-corruption awareness-raising and training activities. However, the limited capacity of key anti-corruption institutions remains a concern.

**Table 22.25. Kosovo's scores for anti-corruption policy**

Dimension	Sub-dimension	Score	WB6 average
Anti-corruption policy dimension	Sub-dimension 16.1: Anti-corruption policy framework	1.0	2.1
	Sub-dimension 16.2: Prevention of corruption	2.5	3.3
	Sub-dimension 16.3: Independence of the judiciary	n.a.	n.a.
	Sub-dimension 16.4: Business integrity and corporate liability	n.a.	n.a.
	Sub-dimension 16.5: Investigation and prosecution	2.5	2.8
Kosovo's overall score		1.8	2.5

Note: For comparability with the previous assessment, the two new sub-dimensions (16.3 and 16.4) have not been scored but are discussed in the text below.

### State of play and key developments

#### *Sub-dimension 16.1: Anti-corruption policy framework*

In terms of **policy documents, co-ordination and implementation**, the latest adopted anti-corruption policy documents in Kosovo were the Anti-Corruption Strategy and Action Plan 2013-2017. According to the government, most of the measures have been implemented, but the latest published data suggest only partial implementation. For the period July-December 2017, the action plan envisaged 120 actions or measures; however, the Anti-corruption Agency (ACA) concluded that only 70 actions had been completed or were being implemented (ACA, 2018<sub>[227]</sub>).

The adoption of the Anti-Corruption Strategy and Action Plan 2019-2023 has been delayed. By law, the ACA is responsible for drafting the strategy in co-operation with other government and non-government institutions, which is then adopted by the Assembly of Kosovo. On 29 March 2019, the ACA forwarded the draft documents to the Committee on Legislation of the Assembly (ACA, 2020<sub>[228]</sub>). The documents were based on contributions by various institutions, and the action plan contains a separate column of budget for each activity (however, no exact amounts were envisaged in the draft submitted for the competitiveness policy outlook assessment). In 2020, the ACA launched renewed preparation of the Anti-Corruption Strategy and Action Plan (now for 2021-2023), which was approved by the government in December 2020 but at time of writing had not been approved by the Assembly (ACA, 2021<sub>[229]</sub>). The latest drafts were not evaluated within this assessment.

There is evidence of civil society involvement in anti-corruption policy planning. To prepare the draft strategies 2019-2023 (2021-2023), the ACA set up working groups and discussed the measures envisaged with involved public institutions and civil society participants.<sup>159</sup> Organisations such as the Democratic Institute of Kosovo; the GAP Institute; the Kosovo Law Institute; the Organization for Democracy, Anti-corruption and Dignity (ÇOHU); and the Riinvest Institute have been monitoring various aspects of the anti-corruption policy and measures. In 2012, the President of Kosovo established the National Anti-corruption Council, but no evidence is available regarding its recent activity.

Kosovo does not have legislation governing **corruption risk assessment**, and public authorities have no legal obligation to carry out such assessments. The Anti-corruption Action Plan 2013-2017 contained a requirement to adopt integrity plans in public bodies, but its implementation did not become systematic. According to the version of the draft Anti-corruption Strategy submitted for this assessment, as of 2017, 16 municipal institutions and 6 central-level institutions had completed integrity plans. The version of the draft action plan submitted for this assessment envisaged the drafting and monitoring of integrity plans in all public institutions, as well as reviewing the competences and mandate of the ACA, as necessary for assessing corruption risks. The UNDP Kosovo and the Council of Europe have supported some corruption risk assessments, such as for the Chamber of Notaries in 2019, the extractive industries sector in 2016 (UNDP, 2020<sup>[230]</sup>), the prosecution system, the judicial system and public procurement in 2017 (Council of Europe, 2020<sup>[231]</sup>).

Kosovo does not have a legal framework for **corruption proofing of legislation**. The draft Anti-corruption Action Plan submitted for this assessment envisaged giving the ACA the right and responsibility to provide an opinion/anti-corruption assessment of laws and sub-legal acts. However, the actual participation of the ACA in the development of legal acts has been ad hoc.

### *Sub-dimension 16.2: Prevention of corruption*

The ACA is the main corruption **prevention body** in Kosovo. According to law, the agency is an independent and specialised body responsible for implementing state policies to combat and prevent corruption. The ACA has a broad scope of competencies, such as supervising and preventing conflicts of interest, supervising property of senior public officials and implementing preliminary investigations into corruption. Legal safeguards for the independence of the ACA include an open competition for selecting the director of the agency, and the competence of the ACA to prepare and propose its own annual budget. The Assembly of Kosovo establishes the ACA's oversight committee. The ACA ensures transparency by publishing most of its decisions and opinions online. With approximately 40 officials and an annual budget of slightly above EUR 500 000, the ACA is among the smaller prevention agencies in the region, and is considered by independent experts to be severely under-resourced (SELDI, 2019<sup>[232]</sup>).

In 2018, Kosovo adopted the Law on Prevention of Conflict of Interest in Discharge of a Public Function, which replaced the previous law for the prevention of **conflicts of interest** (adopted in 2011). The new law addressed several loopholes, for example it broadened the definition of a person related to an official to include, among others, every legal or natural person who has had or has a joint pecuniary or non-pecuniary interest with the official. The scope of officials covered has been broadened to include not only senior public officials as under the previous law, but also any official person. The definition of conflict of interest covers actual, apparent and potential conflicts by referring to an interest "which influences, might influence or seems to influence the impartial and objective performance of official duties". Action in an official matter in a situation of an unresolved conflict of interest can be criminally punished in Kosovo, but the formulations in the law and the Criminal Code are somewhat inconsistent, with the scope of related persons being narrower in the criminal-law provision. Inconsistencies in the terminology are also found in comparison with the Law on Suppression of Corruption (Barboric et al., 2019<sup>[233]</sup>). In 2020, the ACA published a guide on the prevention of conflict of interest in public institutions (ACA, 2020<sup>[234]</sup>). According to the ACA, upon its request public institutions have appointed officers responsible for handling cases of conflict of interest within their institutions.

Every year the ACA handles several cases of breaches related to conflict of interest – 167 in 2019 (ACA, 2020<sup>[228]</sup>) – however, the application of sanctions is limited and available statistical data on sanctions are fragmented. Reportedly, in 2018 the ACA submitted fewer than 5 conflict of interest cases as minor offences and 10 cases for criminal investigation (European Commission, 2019<sup>[111]</sup>). In 2019, the ACA forwarded 2 cases of conflict of interest to the prosecutor's office and made 2 requests for

dismissal/proceedings of minor offence (ACA, 2020<sub>[228]</sub>). As of October 2020, 659 senior public officials reportedly held two or more positions, in violation of the law (European Commission, 2020<sub>[39]</sub>).

The Law on Declaration, Origin and Control of Property of Senior Public Officials and on Declaration, Origin and Control of Gifts of All Public Officials governs **asset declarations**. The law was last amended in 2014. The scope of persons subject to the declaration includes practically all senior officials. The contents of the declarations have some gaps, such as the lack of requirement to declare savings in cash, which is relevant for ascertaining the full economic situation of a person. The ACA publishes the declarations on its website with all but certain personal data.

The degree of compliance with the obligation to submit declarations is uneven: 98.8% of senior officials submitted their regular annual declarations on time in 2019, while 90.7% complied with the obligation to submit declarations upon assuming office and only 81.5% complied with the obligation to submit declarations upon completion or dismissal from office. The ACA carries out preliminary and full control of the declarations, with 20% of declarations subject to full control in 2019. Based on the control findings, the ACA forwarded 62 cases to its Department for Combating Corruption, the police and the prosecutor's office (ACA, 2020<sub>[228]</sub>). Data on outcomes of the forwarded cases were not available for this assessment.

The ACA has had a positive record of revealing hidden assets in the past (Hoppe et al., 2013<sub>[235]</sub>). Verification involves comparing data held by other institutions, rather than an analytical assessment of the plausibility of officials' declared financial situation. A key limitation is a lack of access to information from banks. Closer co-operation and exchange of data are reportedly necessary among the police, the tax administration, the financial intelligence unit, the land registry and municipal authorities (European Commission, 2020<sub>[39]</sub>). According to the government, work is underway to develop an advanced database for managing declarations, in co-operation with UNDP.

The track record on whistle-blowing and **protection of whistle-blowers** has been weak. A new Law on Protection of Whistle-blowers was adopted in 2018, replacing the previous law of 2011. The law is comprehensive and extends to both the private and public sectors. A whistle-blower is any person who reports or discloses information on threat or damage to the public interest in the context of their own employment relationship (defined broadly to include associates, volunteers, interns, trainees, candidates, contractors, etc.). Whistle-blowing can be internal, external (to a competent authority) or public. However, external and public whistle-blowing are subject to conditions. The conditions for external whistleblowing (e.g. there are reasonable suspicions that detrimental acts may be taken against the whistle-blower or that the evidence may be concealed or destroyed if internal whistle-blowing is carried out) may act as a deterrent and more restrictive than the approach envisaged in the Directive 2019/1937 of the European Parliament on the protection of persons who report breaches of EU law.

The law contains multiple provisions for protecting whistle-blowers, such as an obligation to keep information related to whistle-blowing confidential, nullity and voidness of any detrimental act taken against the whistle-blower by their employer due to the whistle-blowing, compensation of damages, reinstatement of a whistle-blower at their place of work, protection of persons associated with the whistle-blower, and the right to protection due to mistaken identity of a whistle-blower. The law expressly prohibits any action or omission aimed at preventing whistle-blowing. However, it does not envisage anonymous whistle-blowing, and it is unclear whether a person who reports anonymously but subsequently encounters retaliation would qualify for protection. The whistle-blower protection law itself does not clarify whether a reporting person is entitled to possible provisional protection before decisions on the acceptance of a whistle-blower report or the adoption of protection measures are made, or if they are entitled to free legal assistance. Secondary legislation, which would define procedures for reporting, is still being developed by the Ministry of Justice.

The ACA has undertaken various activities to implement the law, such as sending requests to public institutions to appoint responsible whistle-blowing officials, participation in developing and implementing regulations and the organisation of a workshop. However, the actual results in the area of whistleblowing have been modest. In 2019, the ACA received three external whistle-blower reports, all of which were

rejected. Only two whistle-blower reports were received by another institution (ACA, 2020<sup>[228]</sup>). According to the Kosovo Law Institute, the main reasons for the weak whistle-blowing track record are the lack of knowledge among public institutions about the law, and the neglect of implementation of obligations stemming from the law (Shala and Bajraktari, 2020<sup>[236]</sup>). Practical factors such as lack of secluded office space for responsible persons and secure storage for files in institutions also reportedly represent risks for the confidentiality of whistle-blowing (Shala, 2019<sup>[237]</sup>).

There is little recent evidence of the government carrying out general **awareness-raising** campaigns or disseminating information materials (leaflets, posters, stickers, etc.). The website of the ACA and its YouTube account only contains video from 2016. A brief video was published in November 2018 regarding the new law for prevention of conflict of interest. However, the ACA and multiple other stakeholders (civil society organisations, international partners) have organised various awareness-raising activities within annual anti-corruption weeks that take place every December. In co-operation with other institutions, the ACA continuously holds training on conflict of interest and other topics, and the training curriculum of the Academy of Justice has an anti-corruption programme (European Commission, 2020<sup>[39]</sup>). Training is expected to continue as the draft Anti-corruption Strategy contains training activities for each sector, including advanced training for investigators. The government has not allocated specific funding for anti-corruption awareness raising and education.

### *Sub-dimension 16.3: Independence of the judiciary*

The constitution and other laws provide safeguards for the **independence of the judiciary**. In 2018, Kosovo adopted the new Law on Judicial Council. The President of Kosovo appoints judges upon the proposal of the Judicial Council (JC,) and has adhered to all of its proposals (European Commission, 2019<sup>[111]</sup>). A matter of concern is the potential vulnerability of new judges who are appointed for the initial term of three years. The JC appoints presidents of courts, except the President of the Supreme Court, who is appointed by the President of Kosovo. The President of Kosovo, based on a proposal by the JC, can decide to dismiss a judge. The JC proposes the dismissal of a judge only upon their conviction of a serious criminal offence, an intentional violation of law or for serious neglect of duties.

The JC consists predominantly of judges (7 out of 13 members are judges elected by members of the judiciary; 6 members are elected by the Assembly of Kosovo, of whom at least 3 must be judges). As of September 2020, 11 members appeared to have been appointed, according to the website of the JC. The website publishes all decisions and notices of employment opportunities for positions of judges and staff in a user-friendly format to ensure transparency.<sup>160</sup> The JC also maintains a public searchable database of court judgements.<sup>161</sup> The composition of the JC, as well as appointment procedures and transparency of work, have the potential to significantly contribute to the independence and accountability of the judiciary. A risk for the independence and capacity of the JC, and the judiciary at large, reportedly stems from the regular practice by the Ministry of Finance of reducing budget requests submitted by the JC (Thaqi, 2019<sup>[238]</sup>). However, there were budget increases in 2019 and 2020 in comparison to 2018 (European Commission, 2020<sup>[39]</sup>).

In 2018, Kosovo strengthened the disciplinary liability of judicial officials by adopting the Law on the Disciplinary Liability of Judges and Prosecutors. The JC has responsibility for imposing disciplinary sanctions on judges. In 2019, the JC's Disciplinary Commission imposed two sanctions involving a salary reduction for three and six months (Kosovo Judicial Council, 2019<sup>[239]</sup>). The disciplinary procedure includes safeguards for accused persons, such as the rights of the judge or prosecutor against whom the proceedings have been initiated to hire a defence lawyer, access all evidence and the dossier of the case, and appeal against the disciplinary decision to the Supreme Court of Kosovo. Complaints against the decision of the council have a suspension effect, and disciplinary decisions are published.<sup>162</sup> The Judicial Performance Evaluation Committee of the JC has the power to conduct performance evaluations of judges with permanent tenure, initial tenure and those eligible for promotion. However, in 2019, the rating of "good"

or “very good” to 99% of judges with permanent mandates subject to evaluation was found to contrast with general domestic perceptions regarding judges’ professionalism (European Commission, 2020<sup>[39]</sup>).

Kosovo has made progress in introducing random case distribution in courts. However, depending on the conditions and practical possibilities, distribution still takes place both automatically and manually. In January 2020, the JC adopted criteria for the distribution of cases (Kosovo Judicial Council, 2019<sup>[239]</sup>). It has been reported that high-profile and sensitive cases are not always processed in a timely manner (European Commission, 2020<sup>[39]</sup>).

#### *Sub-dimension 16.4: Business integrity and corporate liability*

Little evidence is available regarding measures for strengthening **business integrity**. Based on evidence available for the Competitiveness Outlook, it appears that company boards of directors do not have explicit statutory responsibility for overseeing the management of corruption risks. There are apparently no government incentives for companies to improve the integrity of their operations. No designated institution is specifically responsible for receiving complaints from companies about corruption-related matters, providing protection or helping businesses resolve their concerns. The Law on Business Organisations does not explicitly require information on beneficial owners of limited liability companies and joint stock companies to be submitted to the Business Registry (Evgeniev et al., 2019<sup>[240]</sup>).

The Law on Liability of Legal Persons for Criminal Offence and the Criminal Code define the criminal **liability of legal persons**. According to the Criminal Code, a legal person is liable for a criminal offence committed by a responsible person acting on behalf of the legal person and for their benefit or interest or to cause damage with that criminal offence. The legal person is liable if the criminal offence by the responsible person is a result of: 1) a power to represent the legal person, an authority to take decisions on behalf of the legal person, or an authority to exercise control within the legal person; or 2) lack of supervision or control that has made possible the commission of the criminal offence for the benefit of the legal person by a responsible person under its authority.

The liability of legal persons is general (liability possible for any criminal offence) and autonomous (the legal person shall also be liable for criminal offences when the responsible person has committed the criminal offence but was not sentenced). The liability of the legal person is based on the culpability of the responsible person. If criminal proceedings cannot be initiated or executed against the responsible person, the procedure shall only be initiated and executed against the legal person.

According to the Law on Liability of Legal Persons for Criminal Offence, fines and the termination of activity of the legal person are the main sanctions for criminal offences. The upper limit of fines is EUR 100 000, which is extremely low relative to the possible scale of large corruption transactions. Possible security measures include the prohibition of work or certain functions, confiscation of assets, confiscation of a material benefit, and publication of the judgement. Legal consequences following the conviction of a legal person may be the prohibition of work based on a licence, authorisation or concession issued by state bodies, and the prohibition to acquire such licence, authorisation or concession. The law does not allow due diligence (compliance) defence to exempt legal persons from liability or mitigate sanctions, nor does it allow the court to defer the application of sanctions on legal persons if they comply with organisational measures (as determined by the court) to prevent corruption.

The legal framework for corporate liability would benefit from guidance on anti-corruption compliance for the managerial and supervisory bodies of legal persons. The effectiveness of the corporate liability framework for combatting corruption could not be assessed due to the absence of relevant statistics.

#### *Sub-dimension 16.5: Investigation and prosecution*

In 2015, the State Prosecutor established a joint team of representatives of law enforcement institutions for selection and targeting serious crimes. The State Prosecutor has created a database of “targeted

cases” of organised crime and **high-level corruption**. As of October 2020, 56 indictments (including 36 concerning corruption) had been filed in targeted cases. Final rulings had been reached in 13 cases, 8 of which ended with fully or partially guilty verdicts and the conviction of 15 individuals of corruption-related offences (European Commission, 2020<sup>[39]</sup>). These limited data point towards a relatively low conviction rate of approximately 60%.

Indictments against high-profile individuals constitute a minor part of the total volume of corruption cases heard in courts. In 2019, the Kosovo Law Institute monitored court hearings of corruption cases involving 443 low-profile individuals, 357 medium-profile individuals and 54 high-profile individuals. In January to September 2019, the Special Prosecutor’s Office (SPO) did not file any indictment against high-profile individuals for corruption offences, and courts gave no effective imprisonment sentences for high-profile corruption offences. There is no evidence of the practice of sequestration or confiscation of assets unlawfully obtained through corruption (Musliu and Zekaj, 2019<sup>[241]</sup>), and the amount of confiscated assets generally remains low (European Commission, 2020<sup>[39]</sup>).

One example of a case involving high-profile individuals is the “Pronto” case, which concerned illegal employment in senior public enterprise positions. Prosecutors in this case have been criticised for failing to call to account all individuals involved, and the first instance court also allegedly committed violations in handling the case. The SPO started investigating this case in 2016. Despite criticism, this is one of the few prominent corruption cases against high-level public officials in which convictions have been made. The Supreme Court convicted three defendants, including a former member of parliament, in 2020 (Bugaqku, 2020<sup>[242]</sup>; Himaj, 2020<sup>[243]</sup>).

The SPO, established in 2007, qualifies as a **specialised anti-corruption prosecutorial body**. The SPO has extensive competence, which includes corruption crimes such as unjustified acceptance and giving of gifts, abuse of official position or authority, accepting and giving bribes, and misappropriation and fraud in office. As of October 2020, the SPO had 15 prosecutors out of 18 planned positions, and 4 prosecutors work in a new section specialised in high-level corruption cases (European Commission, 2020<sup>[39]</sup>). Most SPO prosecutors have received training over the past two years (in 2019 they attended 14 training courses). However, given that corruption is only one of several major areas of SPO competence, insufficient capacity remains a challenge. In February 2020, the Prosecutor’s Office published a reorganisation strategy that envisages dividing prosecutors into four departments, including the Department of Corruption and Financial Crime (State Prosecutor, 2020<sup>[244]</sup>). According to information about the structure of the SPO on the website of the Prosecutor’s Office, the reorganisation appears to have been completed (State Prosecutor, 2020<sup>[245]</sup>).

The Unit for Combating Corruption and Economic Crimes has been established at the Basic Prosecutor’s Office in Pristina, subject to supervision by a committee established by the Prosecutorial Council (State Prosecutor, 2020<sup>[246]</sup>). Specialised anti-corruption prosecutors have also been appointed in other basic prosecutor’s offices. Special departments in the Basic Court of Pristina and the Court of Appeals will handle cases brought by the SPO (European Commission, 2020<sup>[39]</sup>).

Kosovo has no independent **specialised anti-corruption investigative bodies**. Within the Kosovo Police, there is the Directorate for Investigation of Economic Crimes and Corruption within the Crime Investigation Division, as well as the Anti-corruption Task Force (Kosovo Police, 2019<sup>[247]</sup>). The anti-corruption units of the Kosovo Police do not have any safeguards of independence beyond the rules that apply to police units in general. The increased number of financial investigators working on organised crime and corruption cases is a sign of strengthening capacity (European Commission, 2020<sup>[39]</sup>).

### ***The way forward for anti-corruption policy***

- **Adopt the new anti-corruption strategy and action plan** and improve public reporting on the implementation of the anti-corruption policy. The United Nations Convention against Corruption requires that states develop and implement or maintain effective, co-ordinated anti-corruption policies that promote the participation of society and reflect the principles of the rule of law, proper management of public affairs and public property, integrity, transparency, and accountability (United Nations, 2004<sup>[248]</sup>). Even though Kosovo is not a party to this convention, the substance of this provision is nevertheless relevant. Comprehensive strategies and action plans that define objectives and goals, allocate responsibilities, set deadlines, and determine necessary funds are widely recognised as the best way to frame anti-corruption policies. The absence of an approved strategy and plan, as well as regular comprehensive reporting on their implementation, has been a serious deficiency of Kosovo's anti-corruption policy for several years. Kosovo should adopt the strategy and action plan, start implementing them vigorously in 2021, and prepare and publish the first assessment of progress no later than 2022.
- **Adopt and implement legal obligations to carry out corruption risk assessments** and, at least selectively, the corruption proofing of draft and effective legislation. Corruption risk assessment allows for the detection of vulnerabilities to corruption even before corrupt acts happen. If carried out with commitment, due resources and skill, risk assessment is one of the most effective prevention tools. According to available evidence, few public institutions in Kosovo have carried out corruption risk assessments and developed related integrity plans. Kosovo should make efforts to ensure that this practice becomes universal across the public sector. Including the relevant obligation in the law, providing necessary methodological support, and centrally monitoring the quality of the assessments would be the most effective way to achieve this goal (see Box 22.16). Establishing the legal basis for systematic corruption proofing of legislation would be a key step to limit corruption risks that arise from deficiencies in the legal framework.
- **Strengthen the auditing of asset declarations of public officials** by developing methods to analytically assess the plausibility of their declared economic conditions. The Western Balkan Recommendation on Disclosure of Finances and Interests by Public Officials recommends that verification does not limit itself to comparing data, but that it aims to detect undeclared cash-flows and their possible illicit origin (ReSPA, 2014<sup>[249]</sup>). It is possible that a corrupt public official fills a declaration with data that correspond to sources verified by an oversight body, while still incurring expenses and accumulating assets that vastly exceed their legal income. Kosovo should ensure that the form of the declarations and the verification practice allow the ACA to detect illicit enrichment based on the economic plausibility of the declared information, even when it is not possible to pinpoint specific items of income or hidden assets.

### Box 22.16. Integrity assessment of public organisations in Korea

Assessments of corruption risks and integrity can be carried out in a variety of ways. An interesting example is the integrity assessment of public organisations in Korea. The model was first designed in 1999 and has been adjusted several times since then. It remains in use for annual assessments.

Objectives of the assessment are:

- Provision of basic data for improving the levels of integrity and enhancing the effectiveness of anti-corruption activities by measuring the levels of integrity in public organisations objectively and scientifically.
- Identification of priority areas and works in public service to increase the integrity levels of individual public organisations by diagnosing integrity levels in specific service units.
- Creation of an environment where each public organisation is motivated to voluntarily carry out anti-corruption activities through the disclosure of integrity assessment results to the general public.
- Creation of a consensus on the need to improve integrity not only in the public sector but also in society as a whole through the promotion of the integrity assessment and disclosure of its results.

The assessment model contains several key elements:

- External integrity: External public service users assess the extent to which government employees handle public services with transparency and accountability without committing corruption.
- Internal integrity: Employees of an organisation as internal customers assess the levels of corruption in the organisation's managerial activities, institutional practices and organisational culture.
- Policy customer evaluation: Policy experts, related personnel and people affected by policies evaluate the corruption level of a subject organisation in the processes of determining and executing the policies.
- Statistics on corrupt employees: The data on corruption cases are quantified by calculating the number of employees in a public institution who were disciplined for their corrupt practices in a given period, and the benefits derived from those practices.
- Acts lowering assessment reliability: Surveys and inspections aim to detect the acts conducted by the organisations subject to an integrity assessment to affect the assessment results in an improper way.

The Anti-Corruption and Civil Rights Commission in Korea collects basic data for the assessment (lists of target institutions and services, public service users and policy customers), manages assessment processes, and analyses and discloses assessment results.

Source: (ACRC, 2017<sup>[250]</sup>), *A practical guide to integrity assessment*, <https://www.acrc.go.kr/en/file/file.do?command=downFile&encodedKey=Mjk2MzRfNg%3D%3D>; (ACRC, n.d.<sup>[251]</sup>), *Integrity assessment of public organizations*, <https://www.acrc.go.kr/en/file/file.do?command=downFile&encodedKey=Mjk2MzRfMQ%3D%3D>.

- **Introduce a public register of beneficial owners of legal entities.** The EU Anti Money Laundering Directives envisages that beneficial ownership information is held in a central register and is accessible to competent authorities and financial intelligence units without any restriction, to obliged entities within the framework of customer due diligence, and to any member of the general public. It is also required that the information held in the central register of beneficial

ownership information is adequate, accurate and current, and that states put in place mechanisms to this effect.

- **Increase the maximum fines applicable to legal persons for criminal offences to ensure that sanctions are effective, proportionate and dissuasive in large-scale corruption cases.** International standards do not define the sufficiency of the sanctions in specific terms, but the OECD Working Group on Bribery in International Business Transactions has adhered to the standard that monetary sanctions should be sufficiently severe to impact large multinational corporations. In certain economies, statutory ceilings of sanctions even up to several million euro have been found to be insufficient (OECD ACN, 2015<sup>[252]</sup>). Although such levels of fines may appear irrelevant given the limited size of most companies in Kosovo, the law should provide the possibility to apply adequate sanctions in case a large business player engages in corruption.
- **Further strengthen the capacity of the SPO to investigate high-level corruption cases and hand down indictments** by filling all vacancies of prosecutor positions, ascertaining gaps in specialised knowledge and skills, and providing appropriate training. Ensuring the sufficient capacity of anti-corruption institutions is a widely recognised necessity. The United Nations Convention against Corruption envisages that the staff of bodies specialised in combating corruption through law enforcement should have the appropriate training and resources to carry out their tasks (United Nations, 2004<sup>[253]</sup>). While the capacity of the SPO has been strengthened in Kosovo, it still appears too limited for the major task of prosecuting high-level corruption.
- **Consider how to strengthen the independence of specialised anti-corruption units within the Kosovo Police.** The United Nations Convention against Corruption sets the standard that a body or bodies or persons specialised in combating corruption through law enforcement shall be granted the necessary independence, in accordance with the fundamental principles of the legal system of the state party, to be able to carry out their functions effectively and without any undue influence (United Nations, 2004<sup>[253]</sup>). This CO assessment did not evaluate in-depth the work of the units of the Kosovo Police, and hence does not argue whether any undue influence on their activities has taken place. However, Kosovo should consider introducing additional means to safeguard the independence of these units, such as the more public and competitive selection of management, strengthened guarantees, and transparency of dedicated budget funding.

## Notes

<sup>1</sup> Instrument for Pre-Accession Assistance (IPA) are funds provided by the European Union to help candidates align policies and strategies with EU standards.

<sup>2</sup> A person from Kosovo Investment and Enterprise Support Agency (KIESA) who co-ordinates the whole assessment in Kosovo.

<sup>3</sup> Staff from Kosovo Agency of Statistics who co-ordinate the statistical data collection.

<sup>4</sup> World Bank classification.

<sup>5</sup> Other relevant laws governing investment include: the Law on Late Payments in Commercial Transactions, the Law on Bankruptcy, the Law on Prevention of Money Laundering and Combating Terrorist Financing, and the Law on the Credit Guarantee Fund.

<sup>6</sup> According to the law, the strategic sectors are energy, infrastructure, mines, transport and telecommunications, tourism, manufacturing industry, agriculture and food industry, health, industrial and technological parks, wastewater and waste management.

<sup>7</sup> <https://gzk.rks-gov.net/default.aspx?index=1>.

<sup>8</sup> The strategy was developed in co-operation with OECD/Sigma programme.

<sup>9</sup> As of December 2020, the draft law to establish a Kosovo commercial court was at the public consultation stage. The draft has received wide and positive public response, according to key stakeholders.

<sup>10</sup> Key IPR regulations include the Law Amending/Supplementing the Law on Patents, the Law on Intellectual Property, the Law on Industrial Designs, the Law on Trademarks, and the Law on Geographical Indications.

<sup>11</sup> Kosovo's IPR laws were amended in 2015 to align with EU standards.

<sup>12</sup> As referred to in Annex VII of the EU Stabilisation and Association Agreement.

<sup>13</sup> The trademark registration process takes approximately 9 months, while patent approval takes about 18 months.

<sup>14</sup> In August 2020, a decision was taken to reorganise the NCED to become the National Council for Economy and Investments (NCEI). The NCEI should act as an active forum for economic and investment promotion, and is expected to be more active in the development and steering of KIESA. Detailed information on the new body and its mission are not yet available.

<sup>15</sup> ICT, food processing and packaging, mining and metal processing, energy, textile and leather processing, wood processing, and tourism.

<sup>16</sup> These events are organised in co-operation with the Ministry of Foreign Affairs, embassies, consulates and the Union of Kosovo Businesses in European Countries.

<sup>17</sup> Economic zones as defined by the law include free zones (determined by the custom and excise law), industrial parks, technological parks and business incubators.

<sup>18</sup> The National Committee for Trade in Services was established on 6 July 2020, with Protocol 01/3387, signed by the minister.

<sup>19</sup> Launched on 06 October 2020, the Contact Point on Services (CPS) platform database contains a section called Start a Business in Kosovo, which provides all the information needed. Another section covers accredited professions. Legislation is covered by two sections, horizontal legislation that regulates all services classified according to the Global Agricultural Trade System (GATS) definition of trade in services, and sectoral regulation covering primary and secondary legislation. The database provides easy links to the main sources of data on services. It provides a means of communication between interested parties and the Ministry of Trade and Industry, which is willing and ready to assist the business community in any way possible. This platform will also be used as a contact point for CEFTA. The platform can be found at <https://cps.rks-gov.net/>.

<sup>20</sup> <https://konsultimet.rks-gov.net/>.

<sup>21</sup> OECD member states and STRI key partner economies (Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa, and Thailand).

<sup>22</sup> The full set of OECD STRI indices and comparison tools as well as policy simulators for OECD member states and partners states that have undertaken the OECD STRI are available on the dedicated OECD website <https://www.oecd.org/trade/topics/services-trade>.

<sup>23</sup> The complete list of measures sector by sector is available on the OECD STRI website <http://www.oecd.org/trade/topics/services-trade>.

<sup>24</sup> Law No. 06/L-016 on Business Organizations, date 24.05.2018, Official Gazette of the Republic of Kosovo No. 9/ 2018, not updated since, Articles 33, 119.

<sup>25</sup> In order to facilitate comparison with OECD member states that have undergone the STRI exercise, the paragraphs below have been drafted in accordance with the methodology of STRI project publications. The OECD member country notes and the sector notes are available on the STRI web page: <https://www.oecd.org/trade/topics/services-trade/>.

<sup>26</sup> The Central and Eastern European Countries (CEEC) are: Bulgaria, Czech Republic, Estonia, Croatia, Hungary, Latvia, Lithuania, Poland, Romania, Slovak Republic, Slovenia.

<sup>27</sup> Post and Telecommunications of Kosovo (PTK) is the public operator of Kosovo. PTK has three business units: Post of Kosovo, Telecom of Kosovo, and Vala, its mobile operator unit.

<sup>28</sup> Directive on electronic commerce 2000/31/EC.

<sup>29</sup> Directive on electronic commerce 2000/31/EC.

<sup>30</sup> The Draft Law on Electronic Identification and Trust Services in Electronic Transactions was approved at the 33rd meeting of the Government of Kosovo, with Decision No. 01/33, dated 28.09.2020, <https://kryeministri-ks.net/wp-content/uploads/2020/09/PROJEKTLIGJI-P%C3%8BR-IDENTIFIKIMIN-ELEKTRONIK-DHE-SH%C3%8BRBIMET-E-BESUARA-N%C3%8B-TRA....pdf>.

<sup>31</sup> As in almost all industries, a high level of concentration might lead to low levels of competition and higher interest rates.

<sup>32</sup> Basel III is a set of measures developed by the Basel Committee on Banking Supervision in response to the 2008/09 crisis. It has been agreed internationally and aims for a more resilient banking system. It underpins the regulatory and supervisory framework and strengthens banks' risk management.

<sup>33</sup> The Pillar 2 Requirement (P2R) is a bank-specific capital requirement which applies in addition to, and covers risks which are underestimated or not covered by, the minimum capital requirement (known as Pillar 1). The P2R is binding and breaches can have direct legal consequences for banks.

The P2R is determined via the Supervisory Review and Evaluation Process (SREP). The capital the ECB asks banks to keep based on the SREP also includes the Pillar 2 Guidance (P2G), which indicates to banks the adequate level of capital to be maintained to provide a sufficient buffer to withstand stressed situations.

<sup>34</sup> Basel II is an international business standard developed prior to the 2008/09 crisis by the Basel Committee on Banking Supervision. It requires financial institutions to maintain enough cash reserves to cover risks incurred by operations.

<sup>35</sup> Underground parking at the Faculty of Philology in Pristina awarded in 2019 (under construction); municipality of Peja – skiing resort awarded in 2017 (not yet implemented); municipality of Prizreni – cemetery in Landovica and Bajram Curri market awarded in 2016; Mitrovica municipality – overpass contract awarded in 2016; Gjilani municipality – school grounds and sport fields contract awarded in 2015.

<sup>36</sup> Depreciation rates by category are: 5% for buildings and other structures, between 20% for machinery and equipment, and 10% for other intangible assets.

<sup>37</sup> The amount of withholding tax is creditable against income tax levied on the total aggregate income.

<sup>38</sup> Instrument for Pre-Accession Assistance (IPA) are funds provided by the European Union to help candidate countries align domestic policies and strategies with EU standards.

<sup>39</sup> SOEs' estimated share of domestic employment is based on SOE employment figures provided by the authorities in the context of this assessment, concerning only the 17 SOEs under the remit of the POE Monitoring Unit. Estimates for the electricity system operator KOSTT are available on the United States Agency for International Development (USAID) website. Publicly available labour force statistics are from 2017.

<sup>40</sup> The EBRD comparison did not include Albania, but did include the other four WB economies. Kosovo had the third smallest SOE sector as measured by SOE assets as a percentage of GDP among the 20 mostly European countries included in the review. Only Moldova and Turkey had smaller reported shares. However, comparing enterprise assets to GDP has shortcomings, notably because assets are a stock variable and GDP is a flow variable. It would therefore be more pertinent to compare SOE value-added to GDP, but no such data are available. The ratio nonetheless allows for a telling cross-country comparison.

<sup>41</sup> Concerning alleged overstaffing in some SOEs, see for example (GAP Institute, 2015<sup>[87]</sup>).

<sup>42</sup> The board dismissals referenced here concern the following SOEs: KRU Prishtina, NPH Ibër Lepenc, Kosovo Electricity Corporation (KEK) and Southern Hydro. According to stakeholders interviewed for this assessment, the government had requested that these SOE boards postpone the appointment of senior

officials to allow sufficient time for the implementation of an agreement with the UK government involving support in the senior management recruitment procedures.

<sup>43</sup> See, for example, Prishtina Insight, “Controversy over new public enterprise boards”, 3 April 2020, <https://prishtinainsight.com/controversy-over-new-public-enterprise-boards/>; and Balkan Insight, “Kosovo Govt Sacks Board of Failing Telecom”, 20 February 2020, <https://balkaninsight.com/2020/02/20/kosovo-govt-sacks-board-of-failing-telecom/>.

<sup>44</sup> A November 2020 review of the Ministry of Finance’s website found that the 2019 annual reports for the 17 SOEs under its remit had not yet been published online.

<sup>45</sup> The POE Monitoring Unit’s 2016 annual aggregate report on SOEs is available online: <http://www.mzheks.net/npmnp/repository/docs/RaportiiPerformancesseNdermarrjevePublikepervitin2016.pdf>.

<sup>46</sup> The World Bank’s 2020 Doing Business report actually accords Kosovo a score of 0.0 on the extent of shareholder rights index, but this appears to be an error in aggregation, as a review of the sub-indicators that constitute the score concludes that all six minority shareholder rights that constitute the index are legislated in Kosovo (World Bank, 2020<sup>[384]</sup>).

<sup>47</sup> Each employee’s ownership share of Trepča Mine is determined based on the value of assets of the business unit where the employee is employed.

<sup>48</sup> More information on the Kosovo Telecom dispute is available online: <https://www.reuters.com/article/kosovo-telecom-court/state-owned-kosovo-telecom-may-face-bankruptcy-after-court-ruling-says-ceo-idUSL5N1EG23Y>.

<sup>49</sup> The Government of Kosovo requested EBRD assistance in preparing for Kosovo Telecom’s privatisation in 2019. For more information: <https://www.ebrd.com/work-with-us/projects/tcpsd/privatisation-of-kosovo-telecom-preprivatisation-commercialisation.html>.

<sup>50</sup> The spin-off method of privatisation involves the creation of a subsidiary company, where the parent company’s assets are transferred, following which the subsidiary is sold. In some cases, spin-off privatisations are referred to as “special spin-offs” in Kosovo because they involve special conditions that are to be respected by the buyer post-privatisation, for example related to continued employment in the enterprise.

<sup>51</sup> The Law on the Kosovo Privatisation Agency is available online: <http://www.pak-ks.org/desk/inc/media/EC4F2A29-9497-44C1-A5FA-A39BCC812359.pdf>.

<sup>52</sup> Kosovo participated in the 2015 and 2018 cycles of PISA.

<sup>53</sup> According to PISA Coverage Index 3, which corresponds to the proportion of 15-year-olds represented by the PISA sample. For more information see: [www.oecd.org/pisa/pisa-for-development/pisafordevelopment2018technicalreport/PISA\\_D\\_Chapter\\_11\\_SamplingOutcomes.pdf](http://www.oecd.org/pisa/pisa-for-development/pisafordevelopment2018technicalreport/PISA_D_Chapter_11_SamplingOutcomes.pdf).

<sup>54</sup> For the purpose of this profile, instruction system refers to teaching and learning processes that take place in school education. It generally consists of curriculum, standards for schools and student learning, assessment and evaluation frameworks, and other elements that support instruction.

<sup>55</sup> The Agency for Vocational Education and Training and Adult Education (AVETAE) is responsible for ensuring the administration and leadership of Institutions of Vocational Education Training and for Adults

(IVETA) regarding the financial, human resources, construction buildings and infrastructure of the six public institutions of VET under its governing administration.

<sup>56</sup> The National Qualification Authority is responsible for establishing and maintaining the Kosovo Qualification Framework and its relation with the European Qualification Framework. It also regulates the award of qualifications and accreditation of VET providers to ensure the overall quality system for VET in Kosovo.

<sup>57</sup> Selection into higher education requires the successful completion of upper secondary education and a minimum score on the State Matura examination. Specific requirements are set by individual higher education institutions, which may also administer their own assessments.

<sup>58</sup> The Kosovo Labour Market Barometer includes centralised data from 12 public institutions on key population, labour market, education and business indicators. In the area of education statistics, the portal provides data on some key indicators, such as enrolment by education level, public and private institutions, and municipalities. For the tertiary sector it also includes graduation data by education level, gender and university, as well as data on accredited study programmes by public and private higher education institutions, department and education level. In the area of employment it includes data on (un-)employment by education level, gender and municipality. In the area of business statistics data are provided on vocational demand and supply by education level and municipality. See: <https://sitp.rks-gov.net/>.

<sup>59</sup> Q2, 2019. 6.1% between 2015 and 2018 (WIIW and World Bank, 2020<sub>[107]</sub>).

<sup>60</sup> The strongest growth rate in employment was recorded in the agricultural sector (+187%). Employment growth was also significant in the construction industry, trade, transportation, information and communication, professional and scientific services and the real estate sector (with growth rates between 45 and 82%) (Kosovo Agency of Statistics, 2019<sub>[323]</sub>)

<sup>61</sup> Information provided by Kosovo.

<sup>62</sup> Note that at that time employment protection legislation was also slightly less strict in Kosovo as compared to other economies in the region.

<sup>63</sup> The strategy on Labour Inspectorates states that there were 56 labour inspectors in 2016, including heads of divisions and regional co-ordination. This corresponds to 6 500 workers per staff, or 8 500 per inspector (assuming that 10 staff are heads of divisions).

<sup>64</sup> Some of the planned measures include increasing the number of inspections by 10%, hiring 10 new inspectors, supervising the work of inspectors, training measures, improving hardware and software equipment and buying cars, preparing an action plan for joint inspections, carrying out inspections according to a work plan, establishing an internet site and a call center, and awareness raising activities.

<sup>65</sup> Key employment indicators are: Rate of participation in labour force, Inactivity rate, Employment to population rate, Unemployment rate, Unemployment rate among young people, Percentage of young people NEET youth population, Percentage of unstable employment to total employment.

<sup>66</sup> Other provisions entailed in the general collective agreement concern the length of probation period, maximum length on internships, layoffs, re-location, working hours and conditions, paid and unpaid leave, continued qualification, compensation through salary and bonuses, sick leave, benefits upon retirement,

etc. Most of these provisions are the same as in the Labour Law, with minor cosmetic alterations of the wording introduced in the collective agreement.

<sup>67</sup> At the regional level, there are 18 trade unions registered with the appropriate authorities (Shaipi, 2017<sub>[116]</sub>).

<sup>68</sup> Information provided by Kosovo.

<sup>69</sup> And 30.4% in Q2 2019 (WIIW and World Bank, 2020<sub>[107]</sub>).

<sup>70</sup> When the type/field of education or skills is inappropriate for the job (ILO, 2014<sub>[377]</sub>).

<sup>71</sup> The average gross wage in 2018 according to the highest economic activities was in: Electricity, gas, steam and air conditioning supply (843 euro); Information and communication (717 euro); Mining and quarrying (639 euro); while the lowest wage was in Agriculture, forestry and fishing (256 euro) (Kosovo Agency of Statistics, 2019<sub>[299]</sub>).

<sup>72</sup> The tasks consist in: 1) registration of the unemployed; 2) employment counseling; 3) career orientation for the unemployed; 4) individual employment plan; 5) registration of vacancies; 6) contacting employers; 7) providing recruitment services and advice to employers; 8) MATP services; 9) advising and providing information on migration; 10) mediation in employment through the Information System (information provided by Kosovo).

<sup>73</sup> Information provided by Kosovo.

<sup>74</sup> In France and Germany for example, caseloads of hard-to-place jobseekers are around 70 jobseekers per employment counsellor, while caseloads may vary in these countries between 100 and 350, depending on how much individual guidance job seekers need and how autonomous they are in using self-help guidance tools. (OECD, 2015<sub>[378]</sub>; Manoudi et al., 2014<sub>[379]</sub>); (Pôle emploi, n.d.<sub>[380]</sub>)

<sup>75</sup> Information provided by the PES.

<sup>76</sup> According to Law 04 / L083 on Registration and Evidence of Unemployed and Jobseekers, unemployed are all persons from age 18 to 65, who are unemployed (neither salaried nor self-employed), are actively looking for work and who are ready for work (Government of Kosovo, 2017<sub>[105]</sub>).

<sup>77</sup> Information provided by the PES.

<sup>78</sup> The long-term unemployment incidence was 89.1% in Q2 2019 (WIIW and World Bank, 2020<sub>[107]</sub>).

<sup>79</sup> Information provided by the PES.

<sup>80</sup> Information provided by Kosovo.

<sup>81</sup> Information provided by Kosovo.

<sup>82</sup> Information provided by Kosovo.

<sup>83</sup> According to the Law on Scientific Activity, No. 04/L-135.

<sup>84</sup> According to the Law on Scientific Innovation and Transfer of Knowledge and Technology.

<sup>85</sup> EURAXESS – Researchers in Motion is a pan-European initiative delivering information and support services to professional researchers, backed by the EU, member states and associated economies. It supports researcher mobility and career development and enhances scientific collaboration (<https://euraxess.ec.europa.eu/>).

<sup>86</sup> Horizon 2020 is the biggest EU framework programme for research and innovation. It provides funding for multi-national collaboration projects as well as for individual researchers, and supports SMEs with a special funding instrument (<https://ec.europa.eu/programmes/horizon2020/en/what-horizon-2020>; <https://www.euneighbours.eu/en/east/stay-informed/projects/horizon-2020>).

<sup>87</sup> European Cooperation in Science and Technology (COST) is an EU-funded, intergovernmental framework that currently gathers 38 Members and 1 Cooperating Member. It is a funding organisation for the creation of research networks (COST Actions), which offer an open space for collaboration among scientists across economies. COST funding is intended for collaboration activities and complements national research funds (<https://www.cost.eu/who-we-are/about-cost/>).

<sup>88</sup> Law No.04/L-037 on Higher Education in Kosovo.

<sup>89</sup> The KODE project offers grants to ISPs that cover 50% of deployment costs for building broadband infrastructure for unconnected settlements and public institutions (especially healthcare and educational institutions). The Grant Operations Manual (GOM) describes procedures and guidelines that are in line with the EU's guidelines for the application of state aid rules in relation to the rapid deployment of broadband networks (2013/C 25/01) (Broadband Guidelines), and relevant provision applications to broadband infrastructure of the Commission Regulation (EU) N°651/2014 of 17 June 2014 declaring certain categories of aid compatible with the internal market in application of Articles 107 and 108 of the Treaty (General Block Exemption Regulation or GBER). The MEE received permission from the State-aid Commission of Kosovo to continue with grant applications for covering rural areas (<https://kodeproject.org/en/grant-calls/>).

<sup>90</sup> White areas are those without broadband infrastructure (access speeds higher than 30 Mbps) and where it is unlikely to be developed in the near future.

<sup>91</sup> The Broadband Electronic Atlas that maps fixed, and mobile infrastructure, and services in the Kosovo territory is regularly updated and used to conduct different studies and to develop plans for concrete network deployment projects. Some of the content is publicly available (<https://broadband.rks-gov.net/med-atlas/>).

<sup>92</sup> The financial independence of ARKEP is not secure as the Kosovo budget does not allow state agencies to be financed by their own generated funds. ARKEP has its own account in Kosovo's Treasury, and it is free to spend it as long as it takes into consideration legal frameworks for public finance. When drafting the Law on Electronic Communication, the MEE included sufficient provisions for full financial independence of the regulator, but the proposals were not approved by parliament.

<sup>93</sup> The MEE, on behalf of the Government of Kosovo, asked the EBRD to support a process of “Pre-privatisation commercialisation” of Kosovo Telecom. The government identified a need to review the structure, operations and practices of Kosovo Telecom in view of privatisation, along with recommendations for its restructuring, while still under state ownership. The objective was to achieve sustainable financial viability and to improve the financial, operational, technological, and human resource standing of the company. The project's call for expert consulting services was announced in July 2019. After this study completes, the government, in consultation with other stakeholders, will decide the future steps regarding restructuring and privatisation of Kosovo Telecom (EBRD, 2019<sub>[338]</sub>).

<sup>94</sup> The international Open Data Charter: <https://opendatacharter.net/>.

<sup>95</sup> The Open Data portal was created by the Ministry of Public Administration in co-operation with the Ministry of European Integration and the Information Society Agency (AIS), with support from civil society organisations (<https://opendata.rks-gov.net>).

<sup>96</sup> According to the Law on Government Bodies for the Information Society.

<sup>97</sup> The public consultation platform: <https://konsultimet.rks-gov.net/>.

<sup>98</sup> The transparency portal, developed in co-operation with the Project for Public Finance Reform in Kosovo, is implemented by the German Development Cooperation (GIZ): <https://ptmf.rks-gov.net/>.

<sup>99</sup> According to the Regulation on Minimum Standards for the Public Consultation Process (GRK).

<sup>100</sup> The IPA II project, EU Support for the Competitiveness of Kosovo's ICT Sector, aims to enhance the competitiveness of Kosovo's digital and traditional businesses by supporting the expansion of Kosovo's ICT sector leading to growth and new job creation. The project intends to bridge the digital and business skills gap, and increase the export of Kosovar ICT businesses and traditional businesses through the use of ICT. The project is focused on providing training and courses on ICT, digital skills and business management. The project duration is 42 months, starting from January 2020 until July 2023. The EU Support for the Competitiveness of Kosovo's ICT Sector is an EU funded project managed by the European Union Office in Kosovo and implemented by WeGlobal, in partnership with European Projects Management Ltd and Prishtina REA (<https://ictkosovo.eu/>).

<sup>101</sup> The IPA II project, EU Support to Digitalisation of Businesses through ICT, aims to increase the efficiency and productivity of the private sector through ICT usage, create a proper e-business/e-commerce ecosystem, and improve electronic service delivery for citizens and businesses. These actions will contribute to government efforts to digitalise businesses through ICT to increase their efficiency and productivity, and will greatly increase the competitiveness and profitability of Kosovo businesses given the increased opportunities to improve how they operate securely nationally and across borders. By providing a proper e-ID system, and a good environment for e-business/e-commerce, cross-border interoperability between Kosovo and EU economies will be more productive and more efficient. The project has started being implemented and will last three years.

<sup>102</sup> Current internet connection speeds are below 10 Mbps, which are insufficient to support school connectivity needs.

<sup>103</sup> In co-operation with the Employment Agency and with EUR 3 million in EU financial support provided under the IPA II project EU Support for the Competitiveness of Kosovo's ICT Sector.

<sup>104</sup> Since the adoption of the IT Strategy 2020, the MEE and other government entities have financed and implemented several projects that contribute directly to the implementation of the strategy. The main initiatives and projects are:

1. Creation of the steering committee.
2. New fiscal rules for import of ICT equipment. Customs removed completely.
3. Public eProcurement system established.
4. Kosovo Digital Economy Project.
5. Women in Online Work Project.
6. IPA 2017, Supporting Competitiveness of the ICT Sector in Kosovo.
7. IPA 2019 and eIDAS system.
8. New Innovation and Training Park in Prizren (ex- KFOR camp).
9. ICT Park in Bernica ect.

<sup>105</sup> The Innovation Fund is co-financed by the Ministry of Innovation and Entrepreneurship (MIE) of the Republic of Kosovo and the German Federal Ministry for Economic Cooperation and Development (BMZ) and implemented by the Innovation Centre Kosovo (ICK). The Direct Financial Support Scheme for Start-ups provided financial support to 156 start-ups with a total funding of EUR 1 163 168 in 2018, and to 74 start-ups with a total funding of EUR 631 411 in 2019 (<https://ickosovo.com/innovation-fund>).

<sup>106</sup> The Women in Online Work (WoW) pilot project was implemented by the MEE with support from the World Bank. The WoW pilot was looking to change the asymmetry in women's employment (80% of women in Kosovo are inactive in the labour market, and among those active, 37% are unemployed) by exploring the suitability of online work for young Kosovar women around the economy. The project started in 2016, when it was implemented in three municipalities of Kosovo: Lipjan, Gjakova and Pristina. The design and implementation was enriched by the insights of the ICT Association, academia, the private sector and NGOs. Through the initial pilot project, 150 women were trained to gain the skills needed to find jobs in international online platforms, acquiring digital and IT skills and soft skills to find work or develop entrepreneurship. During project implementation, 77 beneficiaries earned at least one online work contract and a cumulative EUR 25 000 in one year. The successful implementation of the first round led to the replication of the programme during 2017 in two municipalities, Gjilan and Pristina, with USAID support. A third round extending WoW in Mitrovica and Podujeva was supported by the Swiss funded Enhancing Youth Employment (EYE) Project. (<http://www.mzhe-ks.net/sq/WoW>; <https://www.worldbank.org/en/country/kosovo/brief/kosovo-wow>).

<sup>107</sup> KOS-CERT is engaged in project implementation for capacity building (e.g. the Virtual Threat Intelligence and Incident Response Platform project as a donation from the C3K project, Cyber Crime in Kosovo, implemented by the United Nations Development Programme [UNDP] and funded by the Norwegian Ministry of Foreign Affairs).

<sup>108</sup> The project Hardware Platform for Virtualisation, which is funded by the budget of the Republic of Kosovo to upgrade KOS-CERT hardware infrastructure and services through an early warning threat system.

<sup>109</sup> A single project pipeline (SPP) is a list of the projects developed based on the strategic tool for the project planning to avoid ad hoc approaches to planning preparation and the implementation of investment projects. The SPP helps to enable strong project prioritisation and the systematic and timely planning of resources, to provide a reliable basis for defining the proper sequencing of the priority axis and actions per sector, and to help link investment planning and programme budgeting.

<sup>110</sup> The Department of Road Infrastructure, Department of Road Transportation, Department of Civil Aviation and Department of Vehicles within the Ministry of Infrastructure and Environment. The railway infrastructure manager (Infrakos) and railway operator (Trainkos), and Pristina airport.

<sup>111</sup> An appropriate definition of “asset management” for the roads sector was proposed by the OECD in 2001: “A systematic process of maintaining, upgrading and operating assets, combining engineering principles with sound business practice and economic rationale, and providing tools to facilitate a more organised and flexible approach to making the decisions necessary to achieve the public’s expectations” (OECD, 2001<sub>[376]</sub>).

<sup>112</sup> The air traffic management plan defines the operational air traffic management concept, strategic airspace management, tactical airspace management, air traffic service, air traffic flow management, flight operation, functional integration, crisis management, search and rescue, and regional air navigation plans and supplementary procedures.

<sup>113</sup> The State Safety Program (SSP) is an integrated set of regulations and activities that aim to improve safety (e.g. safety risk management, safety assurance).

<sup>114</sup> Some of the indicators for measuring the road network’s performance include average user costs, travel time satisfactory level (i.e. reliability), value of assets, market research and customer feedback, forecasted value of assets, audit programme, quality of user information, allocation of resources, long-term programmes for investment, maintenance and operations, lowering of overhead percentage, state of certain type of infrastructure (depending on the mode of transport: bridges, facilities, etc.), permanent/automatic traffic flows counts per vehicle categories for the entire state road network, road traffic accident indicators as per the Common Accident Data Set (CADAS), and tolling statistics.

<sup>115</sup> For more details see: (Transport Community and CEFTA, 2020<sub>[177]</sub>), (Transport Community, 2020<sub>[178]</sub>), (Government of Serbia, 2019<sub>[179]</sub>) and (Estonia Border, n.d.<sub>[180]</sub>).

<sup>116</sup> The objectives and goals include: Subsidies for railways (passenger and freight transportation); Subsidies for public transportation, especially in cities, and supporting the non-use of personal vehicles; Differentiation of tax charges including custom and excise rates when importing motor vehicles (personal and commercial), taking into account amortisation, fuel costs, hybrids, whether or not they are equipped with catalytic exhaust systems; Increase of taxes for the use of motor vehicles; Increase of taxes for fuels containing high sulphur and lead content; Setting taxes for obsolete vehicles and scrap tyres in accordance with EU acquis; Co-ordinated mass transport system incorporating road, rail and air transport with public amenities, public private partnership (PPP); Reduction in air pollution caused by road traffic by implementing fuel quality standards and promoting catalytic converters on vehicles; Ensuring the import of old vehicles is restricted to “fit for purpose” only; Encouraging more services delivered through non- road transportation; Improving and investing in inter- city and trans- boundary railway system, using latest technologies for environmental protection (electrification, bio- degradable construction materials, energy efficient designs); Promoting the use of natural gas and other alternative fuels, as well as hybrid vehicles; Domestic and urban road network upgraded for increased volume of traffic; Upgrading public transportation and decommission obsolete public transportation vehicles; Implementing noise and vibration protection measures for vehicular traffic in urban and inner city areas; More urban planning for pedestrian zones and special bicycle paths.

<sup>117</sup> Combined transport refers to the transport of goods between Member States where the lorry, trailer, semi-trailer (with or without tractor unit, swap body or container of 20 feet or more) uses the road on the initial or final leg of the journey and rail or inland waterway or maritime services on the other leg, where

this section exceeds 100 km as the crow flies (Combined Transport Directive 92/106EC, amended by the Directive 2013/22/EU).

<sup>118</sup> A one-stop shop is a business or office where multiple services are offered, i.e. customers can get all they need in just "one stop." The term originated in the United States in the late 1920s or early 1930s to describe a business model offering customers the convenience of having multiple needs met in one location, instead of having to "drive all over town" to attain related services at different stores. A one-stop shop is a way of facilitating trade.

<sup>120</sup>For lists and access to the laws and secondary acts governing energy see <https://www.ero-ks.org/zrre/index.php/en/legjislacioni/ligjet>, [https://mzhe-ks.net/en/energy-139#.X7\\_axGhKhhE](https://mzhe-ks.net/en/energy-139#.X7_axGhKhhE) [https://mzhe-ks.net/en/administrative-instructionenergy#.X7\\_ayWhKhhE](https://mzhe-ks.net/en/administrative-instructionenergy#.X7_ayWhKhhE) and [https://mzhe-ks.net/en/rregullation-energy#.X7\\_ay2hKhhE](https://mzhe-ks.net/en/rregullation-energy#.X7_ay2hKhhE).

<sup>121</sup> This is a three-year implementation strategy for the Energy Strategy of the Republic of Kosovo 2017-2026. Implementation progress of the Energy Strategy Implementation Programme (ESIP) is contained in the progress report for 2018 of ESIP 2018-2020. At this stage there is no information on the extent of the implementation of the Energy Strategy of the Republic of Kosovo 2017-2026.

<sup>122</sup> Law Number 05/L-082 on Natural Gas.

<sup>123</sup> The Energy Strategy of the Republic of Kosovo 2017-2026 defines five strategic objectives, two of which relate specifically to the electricity supply framework: 1) security of a sustainable, high-quality, safe and reliable electricity supply with adequate capacities for stable power system operation; and 2) the enhancement of existing thermal system capacities and construction of new capacities. The energy strategy is supplemented by the Energy Strategy Implementation Program 2018-2020, which includes 27 measures and respective objectives, foreseen for the period 2018-2020. Thus, a total 97 activities/projects are planned. Activities include legislative measures, construction, studies and promotions. The cost of implementing these measures over three years is estimated at around EUR 852 million.

<sup>124</sup> Indicators are collected across a variety of areas covering most importantly: N-1 criteria, renewable energy integration, loss reduction, increased security and quality of supply, market integration, system average interruption duration index, system average interruption frequency index, energy not served indicator, voltage and frequency quality, and service quality. They are collected by the regulator ministry, the transmission and distribution system operator, and the Kosovo Agency of Statistics.

<sup>125</sup> Chapter VII Emergency measures in energy supply in the Law no. 05/L-081 on Energy adopted in 2016 – supplemented with Administrative Instruction No. 04/2017 on Rules and Measures for Restricting Energy Supply in Emergency Situations – does transpose some of the EU regulation, but it is not clear to what extent.

<sup>126</sup> "The term 'prosumers' broadly refers to energy consumers who also produce their own energy from a range of different onsite generators," (GfK Belgium, 2017<sub>[381]</sub>) but "mainly through solar photovoltaic panels on their rooftops, citizen-led energy cooperatives or housing associations, commercial prosumers whose main business activity is not electricity production, and public institutions like schools or hospitals" (European Commission, 2016, p. 1<sub>[354]</sub>).

<sup>127</sup> In July 2020, The government established a working group involving a variety of institutions to draft a concept document on renewable energy sources. This concept document will recommend the best option for implementing the support scheme and determining pathways towards a competitive project assignment scheme. According to the plan, this document will be approved in early 2021. International donors such as

the EBRD and the World Bank are assisting the government in designing the new support scheme and competitive assignment scheme through the submission of recommendations.

<sup>128</sup> Law No. 06/L-079 on Energy Efficiency (2018); Energy Strategy of the Republic of Kosovo 2017-2026; Kosovo Energy Efficiency Action Plan (KEEAP) 2010-2018.

<sup>129</sup> Law on Electricity No. 05/L-085; Electricity Market Rules; Law on Energy No. 05/L-081; Law on the Regulatory Office No. 05/L-084; Guidelines for unbundling of DS; Transmission Connection Charging Methodology, developed by KOSTT and approved by ERO; Connection Procedures; Procedure for Review of Complaints from Third Parties regarding Access to Network and Use of Transmission Grid.

<sup>130</sup> This topic was previously raised by the Energy Community and although the issue might have been resolved, a firm confirmation is outstanding.

<sup>131</sup> “A Control Area is a coherent part of the UCTE Interconnected System (usually coincident with the territory of a company, a country or a geographical area, physically demarcated by the position of points for measurement of the interchanged power and energy to the remaining interconnected network), operated by a single TSO, with physical loads and controllable generation units connected within the Control Area. A Control Area may be a coherent part of a Control Block that has its own subordinate control in the hierarchy of Secondary Control.” (ENTSOE, 2004<sup>[382]</sup>).

<sup>132</sup> A Control Block comprises one or more Control Areas, working together in the Secondary Control function, with respect to the other Control Blocks of the Synchronous Area it belongs to” (ENTSOE, 2004<sup>[382]</sup>). An alternative explanation can be found under (Emissions-EUETS, 2019<sup>[383]</sup>).

<sup>133</sup> Although Kosovo is planning to change its approach to renewable energy project assignment and support, given the lack of clarity regarding design and timeline this aspect has been included in the recommendation for now.

<sup>134</sup> Kosovo is not a member of United Nations Framework Convention on Climate Change (UNFCCC) (and its Paris Agreement) so there are no nationally determined contributions (NDCs) prepared.

<sup>135</sup> The Deposit Refund System (DRS) combines a tax on product consumption with a rebate when the product or its packaging is returned for recycling, and is based on the scheme of extended responsibility of the manufacturers. For this initiative, support has been secured from German GIZ, and studies have been developed for suppliers, manufacturers, and consumers of beverage networks (packaged water, drinking liquids such as beer and wine), with the purpose of creating an overview of the amount of packages that are traded in Kosovo.

<sup>136</sup> At the time of drafting, the European Commission was financing a project for the expansion of the municipal waste dump, the opening of a new landfill and closure of the old one in the municipality of Peja/Pec, as well as the closure of the illegal landfill site in Istok/Istog.

A feasibility study for Regional Landfills at the central level was being conducted at the time of drafting as well as a feasibility study to introduce integrated waste management to the Pristina region.

One of the main issues in Kosovo remains disposing of construction and demolition waste and local municipalities were invited to solve this problem by dedicating dumpsites and landfills for this type of waste, with the support of the government and international community.

<sup>137</sup> According to the government, the main challenges to introducing the primary separation of waste relate to the absence of waste treatment and separation facilities, a lack of funds to scale up the system, an

inappropriate operator model for collection of recyclables, and a limited amount of recyclables to cover the operational costs for collection and re-separation.

<sup>138</sup> This project (conducted by the MEE, GIZ and EC) started in 2017 with 17 municipalities. The “race” they take relates to increasing the waste service coverage and waste collection rate, as well as cleaning up illegal dumpsites. The municipalities that “win” in the race can obtain funds for further improvements of the waste management system (a total of EUR 7 million is dedicated for this project – half of which is financed by donor funds and half by the budget). The objective is to have all 38 municipalities involved in this project by 2021. Only those municipalities that perform well are entitled to increase waste service fees in Kosovo.

<sup>139</sup> The Ibër Lepenc canal and the Gazivoda/Pridvorica Dam.

<sup>140</sup> Data from 2016.

<sup>141</sup> Two power plants (Kosovo A and Kosovo B) are among the most polluting in Europe (for air pollutants PM<sub>2.5</sub>, SO<sub>2</sub> and NO<sub>x</sub>) (HEAL, 2016).

<sup>142</sup> According to the interview with Government of Kosovo representatives in October 2020.

<sup>143</sup> The project consists of four key components: 1) management and co-ordination – ensure collaborative management and co-ordination with key stakeholders and donors, and monitor activities following project indicators; 2) Air Quality Monitoring Network and sample analysis – include new monitoring and communication equipment for existing stations; and tools, equipment and training on maintenance, calibration and sample analysis (i.e. KHMI will be able to measure independently heavy metals in ambient particulate matter and will measure air pollution in 38 monitoring locations); 3) air quality and health advisory information management – provide a nearly real-time air quality reporting service (of monitored data), a short-term forecast service (integrating emissions data, air quality monitoring data and weather data to provide early warnings), and an open data platform for data sharing and dissemination; and 4) outreach and behaviour change – communicate air quality levels to the public, including the health impacts of air pollution, behaviours for reducing pollution and behaviours for minimising exposure to pollution.

<sup>144</sup> A total of 12 monitoring stations were established in 2013. However, in the following years maintenance problems occurred due to lack of budget, and some stopped working. Five stations have been rehabilitated since 2017, and the rest were in the process of rehabilitation at the time of drafting.

<sup>145</sup> Non-revenue water is water that has been produced and is lost before it reaches the customer.

<sup>146</sup> In a 2019 survey report for measuring satisfaction with water services provided by RWC Prishtina J.S.C, over 70% of respondents reported that they were very satisfied or satisfied with service provision. Among those moderately satisfied or not satisfied, none mentioned price as a factor. The same survey reported that over 93% of respondents regularly pay water bills. Less than 7% of respondents reported that due to poor social conditions they are not able to regularly pay water services (RWC, 2019<sub>[340]</sub>).

<sup>147</sup> Population that lives below the domestic poverty line of EUR 1.83/capita/day (in 2015) (World Bank, 2018<sub>[24]</sub>).

<sup>148</sup> Not for industrial waste or extractive remains, or huge amounts of industrial waste.

<sup>149</sup> A total of EUR 21 million will be invested as part of the project on the elimination and rehabilitation of contaminated land (hotspots). In the five-year implementation period the project components comprise: 1) identification of contaminated sites for cleaning and improvement; and 2) development of capacities for prevention and control of polluted land (development of policies and technical guidelines, training and awareness programme for the prevention and control of polluted places and green industries, development of an inventory of polluted land). Three areas have been identified: 1) ash landfill next to the thermal power plant Kosovo A; 2) polluted area around the Lepenc River; and 3) rehabilitation of the contaminated area in Artane (acidic water).

<sup>150</sup> As part of the NDS 2016-2021 the government envisages: 1) further development and support of land regulation projects and their subsequent integration into rural development projects; 2) implementation of structural reforms (with special focus on legal and institutional measures) to create better conditions for increased agriculture production; 3) creation of parcels of regular geometric shape that are suited to easier utilisation of agricultural machinery, and implement the Plot Identification System (LPIS); 4) establishment of field road networks that allow direct access to plots and eliminate seasonal servitude access to a property through someone else's property.

<sup>151</sup> The loss of agricultural land is a result of the limited environmental/nature conservation input when it comes to spatial/urban planning. The reclassification of land, land use conversion when agricultural land is reclassified for non-agricultural activity, residential, commercial, industrial.

<sup>152</sup> The implementation of this law and its guidelines are enabled through administrative instructions related to: 1) packaging and labelling of certified seeds; 2) tax for registration of subjects dealing with the test varieties for the production cultivation value; 3) printing labels for seeds; and 4) on-field inspections.

<sup>153</sup> The current document contains the following objectives: 1) enhancing farm viability and the competitiveness of all types of agricultural and primary food processing while progressively aligning with EU standards; 2) restoring, preserving and enhancing the ecosystem dependent on agriculture and forestry; 3) promoting social and economic inclusion, poverty reduction and balanced territorial development in rural areas; and 4) transfer innovation and knowledge in agriculture, forestry and rural areas and strengthen public administrative capacity in implementing rural development programmes.

<sup>154</sup> The investment support grants include: Measure 101 – Investments in physical assets in agricultural economies; Measure 303 – Implementation of local development strategies – Leader approach; Measure 302 – Diversification of farm and rural business development; Measure – Scheme for irrigation of agricultural lands; Measure 103 – Investments in physical assets in the processing and marketing of agricultural products.

<sup>155</sup> The 100% tax does not resolve trade problems with non-tariff barriers faced by Kosovo businesses exporting to Serbia. Empiric studies show that these barriers can become greater obstacles than tariff barriers, which were annulled with entry into force of CEFTA. As regards the impact on consumption prices, the tariff may have significantly increased consumption prices of food, which comprises the main expenditure in the Kosovars' consumer basket. Taking this into consideration, maintaining this tax for a longer period may increase poverty (GAP Institute, 2019<sup>[357]</sup>).

<sup>156</sup> The National Programme for the Implementation of the Stabilisation and Association Agreement 2020-2024, the fifth of its kind, aims to implement short- and medium-term reforms regarding political and economic criteria for adoption of EU *acquis* into domestic legislation.

<sup>157</sup> The Economic Reform Programme 2019-2021 (pg. 72) stated: "As several studies and assessment in the area of informal economy and tax gaps have shown the extent of informal economy in Kosovo is above 30% of GDP with substantial losses for major direct and indirect taxes." (Government of Kosovo, 2019<sup>[134]</sup>).

<sup>158</sup> More information at <https://www.slovenia.info/en/business/green-scheme-of-slovenian-tourism>.

<sup>159</sup> According to the government, examples of proposals by civil society organisations taken into consideration for the new action plan were the preliminary evaluation of internal control mechanisms, the publication of assets of officials kept in trust, and keeping minutes of recruitment and promotion interviews.

# 23 Montenegro profile

## Key findings

Figure 23.1. Scores for Montenegro (2018 and 2021)

Note: Dimensions are scored on a scale of 0 to 5. Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See Scoring approach section for information on the assessment methodology. Scores for Dimension 5 Competition Policy are not included in the figure due to different scoring methodology (see Scoring approach).

Montenegro has made progress since the publication of the Competitiveness Outlook 2018 report in all the policy dimensions with the exception of State-Owned enterprises (Figure 23.1). Most of the improvements have been in the legal and regulatory environment, which forms a solid basis to improve the overall competitiveness of the economy. Its main achievements are as follows:

- **Significant new tax measures** have aligned Montenegro's tax system with recent international tax trends and have strengthened the scope for international tax co-operation. The economy joined the OECD/G20 Inclusive Framework on Base Erosion and Profit Sharing in December 2019. The OECD Global Forum on Transparency and Exchange of Information for Tax Purposes has started a peer review of Montenegro's readiness to exchange information on request (EOIR). Montenegro also signed the Convention on Mutual Administrative Assistance in Tax Matters in October 2019 and is in the process of amending its transfer pricing rules via a reform of the Law on Corporate Profit.
- **School participation levels are increasing.** As of 2019, Montenegro had achieved net universal primary school enrolment (99.9%), though lower secondary education is not quite there yet (92.3%). Net enrolment in upper secondary education (89%) has gradually increased and is on track to meet OECD (92.5%) and European Union (93%) averages in the coming years. Moreover, Montenegro has one of the lowest early school-leaving rates in the region (5% in 2019), well below the EU target of less than 10% of early school leavers by 2020.
- **Labour laws are aligned with EU standards.** Labour market flexibility and labour standards for workers in certain fields have improved. In addition, the capacity of the public employment services (PES) has been strengthened, in particular by improving the tools and instruments available to PES counsellors, such as a profiling tool for the unemployed.

- **The science, technology and innovation (STI) policy framework has advanced significantly.** Montenegro developed a set of guidelines for smart specialisation in 2018, and is the first of the six Western Balkans (WB6) economies to adopt a smart specialisation strategy (covering 2019-2024), which received a conditionally positive assessment by the European Commission services. Action plans are in place to support implementation of the strategic framework, and budget allocations have increased in recent years. A new Law on Incentive Measures for Research and Innovation Development and a revised Law on Innovation Activity strengthen the legal framework for STI.
- **The energy sector is guided by a comprehensive energy policy.** Three of the four pillars of the EU's Third Energy Package (transparency, non-discrimination and a strong regulatory framework) have mostly been implemented. This is confirmed by the Energy Community, which rates Montenegro as the highest performer in the Western Balkans regarding transposition and implementation of the Energy Package. Recent changes to the Energy Law have removed the requirement for government consent to the statute of the regulator, which is a step towards reducing the risk of political influence over the regulator and reaffirms its independence.
- **Tourism destination accessibility has increased.** The economy has expanded the eligible categories for removing visa requirements and adopted special regimes for border crossings for tourists during the high season. Accommodation capacity and quality has improved through measures to facilitate investments in high-quality accommodation, and a consistent accommodation quality standard framework based on EU standards.
- **Agro-food system regulation has improved.** Notably, phytosanitary and veterinary standards have been further harmonised with EU standards. Several regulations on seed products were updated in 2019, and there has been continuous improvement in harmonising by-laws and rulebooks on product regulations with EU directives.

### Priority areas

While Montenegro did not score below the WB6 average in 13 dimensions of the 15 policy dimensions scored in the assessment, there are several areas in which Montenegro still needs to step up its efforts (Figure 23.1):

- **Improve investment promotion and facilitation.** The recently established Montenegro Investment Agency (MIA) does not have a formal mandate to provide aftercare services. The government needs to clearly define the MIA's responsibilities for aftercare services, notably by expanding the agency's mandate and/or producing a clear system for enquiries. Providing aftercare services will require strong co-operation with other institutions and regulatory bodies. The many current incentives could prove difficult to navigate for foreign investors. Increasing the clarity and awareness of these incentives through more transparent qualification criteria, and targeting foreign investors through awareness-raising campaigns, would be beneficial for the overall competitiveness of the economy. The government should also reinforce mechanisms for evaluating the cost and benefits of the incentives, their appropriate duration, and their transparency.
- **Introduce alternative equity-based finance.** Businesses' access to finance heavily relies on bank lending. The use of alternative equity instruments, such as initial public offerings, business angels and venture capital, is limited. Integrating crowdfunding into the legislative framework could provide a feasible alternative source of finance. In addition, conducting awareness campaigns on the existence of capital markets and the advantages they offer to firms could also help to enhance the existing structure.
- **Review the effectiveness of the current state ownership arrangements and develop a state ownership policy.** Montenegro has not yet developed an overarching ownership policy

for state-owned enterprises (SOEs) that lays out why the government owns companies and how it expects them to create value. While ownership rights exercised at different levels that have diverse competencies (e.g. government, state funds, line ministries), the authorities should ensure that these state actors operate under a unified ownership policy. Given that the authorities have chosen to prioritise private investments in their SOE sector, they should review the need for the state to continue holding minority shares and also produce an aggregate report on the performance of the state's portfolio.

- **Continue to boost investment in the scientific research system.** With 734 researchers per million inhabitants, the number of researchers in Montenegro is much lower than the EU average (4 000 researchers per million inhabitants). More comprehensive measures should be put in place to build human resource capacity in priority STI areas and increase the attractiveness of research as a profession. Moreover, Montenegro should continue building a national and regional research infrastructure. Timely completion of the Science and Technology Park in Podgorica and affiliated impulse centres, coupled with sustained funding, will improve integration between academia and the private sector. Efforts should also be made to get the pilot technology transfer office at the Centre of Excellence at the University of Montenegro up and running.
- **Strengthen programmes for the digital transformation of the private sector.** The budget and the number of businesses applying for digital transformation programmes remain relatively low. Moreover, despite the proliferation of ICT training programmes, their lack of relevance to industry is widening the gap between the skills available and those sought by ICT sector companies. Developing a common digital competence framework for ICT professionals would help to meet the needs of the labour market. The government needs to review and evaluate existing support programmes to promote the adoption of e-business and e-commerce by small and medium-sized enterprises (SMEs), and to identify areas for improvement. In doing so, greater co-operation between ICT training providers and the private sector should be systematised following EU and international good practices
- **Introduce a land-use management framework.** Although there is a regulatory framework related to land-use management in place, little progress has been made to implement it. The pressure on land and soil resources is growing, especially in the context of a pronounced decrease in agricultural land, from 38% in 2012 to 18.5% in 2016. While the use of agricultural land is regulated by law, the legal framework does not prescribe the maximum concentrations of hazardous and harmful substances allowed on other types of land (industrial land, playgrounds, parks or residential areas). Montenegro needs a clear policy framework for cleaning up contaminated land, as well as concrete guidelines to help identify land that needs decontaminating.

## Economic context

### *Key economic features*

Montenegro is a small service-based economy with a large tourism sector. In 2019, services accounted for 58.7% of gross domestic product (GDP) and 73% of employment in Montenegro, with the highest contributions coming from wholesale and retail trade, accommodation related to the large tourism sector, real estate, and transportation and storage. Over the past decade, the services sector's GDP contribution has expanded considerably at the expense of both industry and agriculture. The GDP share of industry, including construction, declined from 22.3% in 2001 to 16.1% in 2019, while its contribution to employment declined from 25% to 19.1%. Currently manufacturing accounts for just 4% of GDP and 6.4% of

employment. Meanwhile, the contribution of agriculture, forestry and fishing to GDP has nearly halved since 2001, from 10.8% to 6.4%. Today this sector accounts for just 7.8% of employment, the smallest contribution in the Western Balkan (WB) region (World Bank, 2020<sup>[1]</sup>).

As a very small economy that is open to trade and capital flows but that lacks an independent monetary policy,<sup>1</sup> Montenegro is highly vulnerable to external shocks and business cycle fluctuations. As a result, the growth of its economy has been more volatile than the other WB economies. For example, in the run-up to the global financial crisis between 2005 and 2008, the Montenegrin economy was expanding at an average annual growth rate of 7.5%, well above most regional peers (World Bank, 2019<sup>[2]</sup>), on the back of a credit boom fuelled by high capital inflows (46% of GDP at their peak in 2008). During this period, progress on the privatisation and structural reform and business-friendly environment agenda helped to attract considerable foreign direct investment (FDI) and portfolio investment. However, the bust that followed the global financial crisis, when capital inflows declined dramatically, was much bigger than in neighbouring economies, resulting in a GDP contraction of 5.8% in 2009. Similarly, Montenegro experienced a more severe recession (2.7% decline in GDP growth) in the wake of the Eurozone crisis in 2012 (World Bank, 2019<sup>[2]</sup>). The most recent economic contraction caused by the COVID-19 pandemic is estimated at 15.2% in 2020, much more substantial than in the other WB economies (EC, 2020<sup>[3]</sup>). The low fiscal space and limited room for discretionary fiscal spending, especially in the wake of the current crisis, further limits the public sector's ability to absorb these external shocks.

Over the past few years, while growth has been buoyed by significant infrastructure investment and strong consumption growth, substantial imbalances have persisted. Gross fixed capital formation rose from 20% to 27% of GDP between 2013 and 2019 on the back of high growth in public infrastructure investment (mainly the Bar-Boljare Highway), as well as significant private investment in energy and tourism infrastructure. Public consumption has also contributed strongly to GDP growth despite fiscal consolidation. Export performance has also improved in recent years. Exports' contribution to GDP rose modestly from 40.6% in 2014 to 43.7% in 2019 (Table 23.1), supported by the tourism sector, which accounts for roughly half of total exports. However, the domestic production base remains low and consumption and investment are highly dependent on imports, which has led to persistently high external imbalances. The trade deficit in 2019 amounted to 21% of GDP, and the current account deficit has exceeded 15% of GDP throughout the last five years (World Bank, 2020<sup>[1]</sup>). These external imbalances have been exacerbated significantly by the COVID-19 crisis (see the COVID-19 section below).

Montenegro also suffers from a relatively undiversified export base, adding to its vulnerability to external shocks. Goods exports, which account for 14% of total exports (MONSTAT, 2019<sup>[4]</sup>), include mainly metals, which are highly susceptible to price fluctuations and offer relatively little in terms of value-added. Service exports are meanwhile dominated by travel and tourism services (65% of total service exports) (World Bank, 2019<sup>[5]</sup>), which are highly susceptible to external shocks, as witnessed during the latest crisis (see the COVID-19 section below).

Despite the strong growth, labour market challenges have persisted. At 64.8%, the labour market participation rate is low compared to the EU average of 73.3%, and lower than most other Western Balkan economies (World Bank, 2019<sup>[6]</sup>). The participation rate is particularly low for youth (36.5%) (World Bank, 2019<sup>[6]</sup>) and women (57.9%) (World Bank, 2019<sup>[7]</sup>). Unemployment remained high at 14.9% in 2019, particularly among the youth (29.3%) (EC, 2021<sup>[8]</sup>). The crisis has further exaggerated this challenge, with unemployment rising to 18.4% in 2020. Finally, the gains in employment over the past few years have been rather limited for vulnerable groups (World Bank, 2016<sup>[9]</sup>). The COVID-19 crisis has highlighted how labour market challenges stem from an insufficiently diversified economy that is more susceptible to external shocks (see the COVID-19 section below).

Long-term GDP growth and employment prospects are hampered by weak productivity, which reflects significant and deep-standing structural challenges in the economy. Labour productivity, measured as output per worker, is considerably lower than the EU average. The productivity gap is the largest in the

services sector, which employs the highest share of the labour force in Montenegro. Here the output per worker is more than four times lower than the EU average (World Bank, 2019<sub>[10]</sub>). The weak productivity growth in spite of significant capital accumulation over the past decade also points to weaknesses in the efficient use of this capital. Significant outstanding structural challenges explain these outcomes, including an inadequately skilled labour force, limited access to finance for SMEs, corruption and informality – see Structural economic challenges. The high increase in wages, which has outpaced the growth in productivity, has weakened competitiveness over the past decade (World Bank, 2016<sub>[9]</sub>).

**Table 23.1. Montenegro: Main macroeconomic indicators (2015-20)**

Indicator	Unit of measurement	2015	2016	2017	2018	2019	2020
GDP growth <sup>1</sup>	% year-on-year	3.4	2.9	4.7	5.1	4.1	-15.2
GDP per capita <sup>2</sup>	Current international \$	16 333	18 199	19 682	21 547	23 344	20 567
National GDP <sup>2</sup>	USD billion	4.05	4.37	4.85	5.50	5.54	4.78
Inflation <sup>1</sup>	Consumer price index, annual % change	1.4	0.1	2.8	2.9	0.5	-0.8
Current account balance <sup>1</sup>	% of GDP	-11.0	-16.2	-16.1	-17.0	-15.0	-26.0
Exports of goods and services <sup>1</sup>	% of GDP	42.1	40.6	41.1	42.9	43.7	25.8
Imports of goods and services <sup>1</sup>	% of GDP	60.6	63.1	64.5	66.7	64.8	60.6
Net FDI <sup>1</sup>	% of GDP	16.9	9.4	11.3	6.9	7.0	11.2
Public and publicly guaranteed debt <sup>3</sup>	% of GDP	73.7	71.4	69.1	74.1	80.0	109.2*
External debt <sup>4</sup>	% of GDP	166.2	162.6	160.6	164.7	170.2	..
Unemployment <sup>1</sup>	% of total labour force	17.8	18.0	16.4	15.5	15.4	18.4
Youth unemployment <sup>2</sup>	% of total labour forces ages 15-24	37.6	35.9	31.7	29.5	25.3	..
International reserves <sup>1</sup>	In months of imports of G&S	3.4	3.6	3.7	4.0	5.1	8.2
Remittance inflows <sup>2</sup>	% of GDP	11.6	11.0	10.8	10.7	10.5	12.6
Credit growth <sup>1</sup>	% year-on-year	0.8	1.3	11.8	8.5	4.5	3.2
Lending interest rate <sup>5</sup>	% annual average	8.93	7.97	7.20	6.53	6.18	5.91
Stock markets (if applicable) <sup>1</sup>	Average index	11 956	11 115	10 952	10 390	10 980	10 336

Note: G&S = goods and services ; \*estimates for 2020.

Improving the skills of the population and enhancing the prospects for the low-skilled and poorest groups are the most critical challenges for ensuring sustainable and inclusive long-term growth in Montenegro. In light of the unfavourable demographic trends and high outmigration – with emigrants making up 20% of the resident population (ILO, 2019<sub>[16]</sub>) – especially by high-skilled workers, the importance of strengthening labour productivity is critical. This will require rectifying the weaknesses in the education system in order to provide adequate and sufficient skills to meet the needs of the labour market; strengthening active labour market policies; and supporting adult education in order to create a nimbler workforce. Strengthening social safety nets whilst also expanding the employment opportunities of low-skilled workers will also be critical in ensuring that growth is more equitable and sustainable.

Strengthening the institutional environment and easing the outstanding frictions in the business climate will also be essential for strengthening SME investment and growth and attracting FDI in manufacturing and

service sectors with high export potential. This includes tackling corruption, further improving public services, reducing the administrative and regulatory burden on businesses, and tackling the still relatively widespread informality.

Last but not least, boosting macroeconomic growth and ensuring that it is more balanced and less volatile will also require stronger fiscal and financial policies. In the short to medium term this would entail fiscal consolidation and reducing the relatively large public debt that has further increased in the wake of the COVID-19 economic crisis. Ensuring long-term growth will also require removing structural obstacles to countercyclical fiscal policy development, which are critical in the context of the limited monetary policy options for addressing external shocks. In the same context of limited central bank tools for influencing the credit flow in the economy, strengthening financial supervision will also be important for ensuring macroeconomic stability.

### **Sustainable development**

Over the past decade, Montenegro has made progress towards the targets of Agenda 2030 for Sustainable Development, but considerable challenges still remain in achieving the Sustainable Development Goals (SDGs), as shown in Table 23.2. Montenegro is on track to achieve or has maintained the achievement of the SDGs in only two main areas: 6 and 17 – clean water and sanitation and partnerships for the goals. However, even in these areas some challenges persist.

**Table 23.2. Montenegro's progress towards achieving the SDGs**

SDG	Current assessment	Trends
1 - No poverty	Challenges remain	Moderately improving
2 - Zero hunger	Major challenges remain	Stagnating
3 - Good health and well-being	Significant challenges remain	Moderately improving
4 - Quality education	Challenges remain	Moderately improving
5 - Gender equality	Significant challenges remain	Stagnating
6 - Clean water and sanitation	Significant challenges remain	On track or maintaining SDG achievement
7 - Affordable and clean energy	Challenges remain	Moderately improving
8 - Decent work and economic growth	Significant challenges remain	Moderately improving
9 - Industry, innovation and infrastructure	Significant challenges remain	Moderately improving
10 - Reduced inequalities	Major challenges remain	Information unavailable
11 - Sustainable cities and communities	Significant challenges remain	Stagnating
12 - Responsible consumption and production	Major challenges remain	Information unavailable
13 - Climate action	Significant challenges remain	Stagnating
14 - Life below water	Major challenges remain	Stagnating
15 - Life on land	Major challenges remain	Decreasing
16 - Peace, justice and strong institutions	Significant challenges remain	Moderately improving
17 - Partnerships for the goals	Challenges remain	On track or maintaining SDG achievement

Note: The order of progress (from greatest to least) is as follows: SDG achieved; challenges remain; significant challenges remain; major challenges remain.

Source: (Sachs, 2021<sup>[17]</sup>), *Sustainable Development Report 2021, the Decade of Action for the Sustainable Development*, <https://s3.amazonaws.com/sustainabledevelopment.report/2021/2021-sustainable-development-report.pdf>.

There has been moderate improvement in many areas. In the area of poverty, while the headcount ratio of those living on USD 1.90 per day is lower than the SDG target, the target for the headcount ratio of those living on USD 2.30 per day has not been achieved. Health outcomes have been improving, but the death rates due to cardiovascular disease, cancer, diabetes and other non-communicable diseases are still above the targets. In the area of quality education, the SDG target of 100% of net primary enrolment has been achieved, but at 89.9% the lower secondary completion rate has decreased. In the area of affordable clean energy, access to electricity is high but challenges persist in accessing clean fuels and

technology. High unemployment remains an important challenge despite progress achieved over the past decade. The share of the population using the Internet and with mobile broadband subscription has increased, but limited investment in research and development (R&D) is holding back progress towards the SDG on industry, innovation and infrastructure. Finally, in the area of peace and institutions, more progress is needed to reduce corruption, eliminate child labour, as well as improve property rights and the freedom of the media (Sachs, 2021<sup>[17]</sup>).

Progress towards a number of SDGs has stagnated. In the area of gender equality, significant challenges remain in access to family planning and the ratio of female-to-male mean years of education received has decreased. Air pollution and insufficient quality of the public transport network negatively impact the quality of city life. More action is also needed to reduce carbon dioxide (CO<sub>2</sub>) emissions, particularly those stemming from energy use (Sachs, 2021<sup>[17]</sup>).

The most significant challenges according to the SDG assessment lie in the areas of inequality, responsible production and consumption, and life on land and below water. At 40.5, the Gini coefficient, which measures income inequality, is still well above the target value of 27.5. Montenegro continues to produce significant amounts of waste, and recycling and reuse remain limited. Last but not least, significant efforts are needed to protect terrestrial and marine biodiversity and reduce terrestrial and marine pollution (Sachs, 2021<sup>[17]</sup>).

### **Structural economic challenges**

Montenegro faces a number of key structural challenges that undermine its competitiveness, productivity, investment and exports.

#### *Skills gaps are a key obstacle to employment*

- **Skills gaps** contribute to unemployment and undermine economic upgrading. Despite high spending on education, which at 4.5% of GDP is nearly on a par with OECD economies, Montenegro's relatively weak student performance in international standardised tests points to considerable gaps in the provision of quality education. For example, in the latest Programme for International Student Assessment (PISA), just over 50% of students achieved the minimal level of proficiency in the three testing subjects (reading, mathematics and science), which is well below the OECD average of over 75% (OECD, 2020<sup>[18]</sup>).
- **Skills mismatches** negatively impact employment as well as firm growth. This is a particular challenge for innovative firms, 45% of which reported that a lack of skills was a problem in filling skilled manual labour vacancies (World Bank, 2018<sup>[19]</sup>). An inadequately educated workforce was also identified as a challenge by 10% of firms (World Bank, 2019<sup>[20]</sup>). Soft skills including language, leadership, critical thinking and initiative were the key missing skills, but many firms also cited challenges in hiring due to lack of technical skills (World Bank, 2018<sup>[19]</sup>). A study by the European Commission's Directorate General for Education and Culture (DG EAC) has found that for every ten students that enter the education system in Montenegro, only two find a well-matched job. Low-skilled workers face the biggest challenges in finding employment – the number of unemployed people in this category has tripled between 2013 and 2017 (ETF, 2019<sup>[21]</sup>).
- **Low labour force participation**, particularly among young people and women, brain drain and the ageing population exacerbate skills-related challenges and weaken long-term growth prospects. The capacities of the youth are particularly underused as the share of young people who are not in education, employment or training (NEET) remains high at 17.3%, while the youth labour force participation rate is low at just 37%. Female activity rates also remain below aspirational peers in the EU at 58%, reflecting constraints related to child-care and traditional values and norms regarding women's place in society. With many high-skilled workers emigrating to more developed countries, and in light of the shrinking labour force, addressing the skills

challenges is of utmost importance for setting Montenegro's economy on a higher and more sustainable long-term growth path.<sup>2</sup>

### *The business and investment climate faces persistent challenges*

Montenegro has significantly improved the business and investment climate, yet some notable challenges persist. Thanks to reforms that reduced the regulatory and administrative burden on businesses, Montenegro currently ranks 50<sup>th</sup> out of 190 economies in the World Bank's Doing Business report (World Bank, 2019<sub>[22]</sub>). Nevertheless, there are some areas where further progress is needed in order to create an environment conducive to investment and enterprise innovation, internationalisation and growth.

- **Starting a business** in Montenegro is more difficult than in most economies around the world. The process entails more procedures (8 compared to the 4.9 OECD average and 1 for the global leaders) and is more time-consuming than in other economies (12 days in Montenegro vs. 9 for the OECD average and 0.5 for the highest performers). Obtaining an electricity connection is also more costly and time-consuming: it takes on average 131 days in Montenegro to get connected, compared to 75 days for the OECD and 18 days for top performers. The cost is also more than twice as high as the OECD and well above the no-cost benchmark of the top performer (World Bank, 2019<sub>[22]</sub>).
- **Corruption** remains an important challenge for doing business in Montenegro. In the latest Business Environment and Enterprise Performance Survey (BEEPS), Montenegrin firms reported an above-average incidence of bribery and share of public transactions that require an informal gift compared to global and Europe and Central Asia region peers. The highest share of firms that responded to the survey noted expectations of gifts for obtaining licences and permits and for meetings with tax officials (World Bank, 2019<sub>[20]</sub>). Incidentally, Montenegrin firms are more likely to have to meet tax officials in person than in other peer economies.
- **Informal sector competition** represents an important constraint for businesses in Montenegro. In the latest enterprise survey, 58% of firms stated that they compete against informal competitors, and nearly a quarter of all firms identified informal competition as a major obstacle for their business. The impact is highest among SMEs, particularly in the manufacturing sector. The size of the informal sector is estimated at 28-33% of Montenegro's GDP and its share in total employment is estimated at over 20% (EC, 2019<sub>[23]</sub>).
- **Despite a notable rise in entrepreneurship over the past decade, firm growth is constrained by access to finance.** Strict collateral requirements represent an important barrier for businesses. While the share of loans that require collateral is in line with the OECD average at around 60%, the level of collateral required – at 209% of the borrowed amount – is more than double the OECD average of 88%.<sup>3</sup> The collateral requirements are particularly limiting for micro and small enterprises (MSMEs), which have limited assets. The banks' preference for real estate collateral further compounds this challenge for MSMEs – see Access to finance (Dimension 3). The high collateral requirements reflect in part the lack of adequate information on creditors. However, progress has been made in this regard as coverage of the public credit registry in Montenegro has increased from 30.8% in 2018 to 41% in 2019, and information is regularly updated.<sup>4</sup> Nevertheless, financing for start-ups and other higher risk ventures remains very limited.

### *Key sectors are being held back*

- **Tourism:** The tourism sector is one of the most important sectors in Montenegro. In 2019, travel and tourism accounted for 32% of GDP and 33% of total employment (World Travel and Tourism Council, 2020<sub>[24]</sub>). However, the sector still suffers from high seasonality, which reduces employment and skills development as well as accessibility – see Tourism policy (Dimension 15). This undermines the quality of service, which is critical for developing the low-density high-end

tourism compatible with Montenegro's geographical and infrastructural constraints. The growth in high-end tourism is also constrained by inadequate waste management, poor water quality and uncontrolled development as these are all detrimental to the environmental as well as cultural heritage – see Environment policy (Dimension 13).

- **Agriculture:** As a small and predominantly mountainous economy, Montenegro does not have a large agriculture sector. Even so, the sector contributes significantly to Montenegro's goods exports and has significant potential for further growth. As noted in the introduction, the share of agriculture, forestry and fishing in GDP is small and has declined significantly over the past two decades, from 10.4% in 2001 to 6.4% in 2019. However, in 2018, agricultural products represented a relatively high portion (18.8%) of total exports.<sup>5</sup> Agricultural productivity is undermined by high land fragmentation, lack of adequate infrastructure for irrigation, limited access to mechanisation and limited investment in R&D – see Agriculture policy (Dimension 14).
- **Information and communications technology (ICT):** The ICT sector has considerable potential to boost Montenegro's service exports and contribute to the development of the knowledge economy. Despite growth in recent years, the sector still faces significant challenges, especially the insufficient supply of skilled workers; their poor wage competitiveness (ICT sector wages are considerably higher in Montenegro than in other WB economies); underdeveloped collaboration between the sector and the relevant educational institutions; lack of access to finance, particularly for start-ups and high-risk venture capital; and weaknesses in the ICT infrastructure.<sup>6</sup>

#### *A greener growth model would improve well-being*

- **Air pollution:** Air pollution is a significant concern in Montenegro, with the annual mean exposure to PM<sub>2.5</sub> (particulate matter) reaching 21 micrograms per cubic metre ( $\mu\text{g}/\text{m}^3$ ).<sup>7</sup> This is twice the recommended limit of 10  $\mu\text{g}/\text{m}^3$  set by the World Health Organisation (World Bank, 2017<sub>[25]</sub>) (WHO, 2018<sub>[26]</sub>). The main sources of pollution include steelmaking, agricultural processing, and the aluminium and tourism industries. Air pollution is further elevated in the winter months when domestic heating by solid fuels is added to the mix (IAMAT, 2020<sub>[27]</sub>).
- **Climate change:** Montenegro has made great progress in advancing climate change mitigation legislative and policy frameworks. Nevertheless, the economic output per unit of CO<sub>2</sub> remains low (Environment Protection Agency, 2020<sub>[28]</sub>), and the highest emissions come from electricity and heat generation (61.4% in 2018, highlighting the fossil-fuel based energy production), and transport, which accounts for a little over 20% (Ministry of Sustainable Development and Tourism, 2020<sub>[29]</sub>). When it comes to climate change adaptation, a Disaster Risk Assessment was being prepared at the time of drafting and some flood risk management measures have been implemented, but more is needed to assess and adapt to the wide range of climate related risks going forward – see Environment policy (Dimension 13).

#### *COVID-19 has exacerbated structural challenges*

Montenegro was the Western Balkan economy hit hardest by the COVID-19 pandemic. In the second and third quarter (Q) of 2020, GDP declined by over 20% year on year (y-o-y), driven primarily by a sharp decline in exports (55.9% y-o-y in Q2, 70.1% y-o-y in Q3 of 2020), which reflected the loss of the summer tourism season as well as the decline in economic activity in major trading partners in the EU and the Western Balkan region. Weakening domestic demand compounded the impact of lost exports on the Montenegrin economy. Consumption fell by 5.4% in 2020, while annual investment contracted by 12.3%. As a result, annual GDP fell by 15.2% (Table 23.1) (EC, 2021<sub>[30]</sub>; EC, 2020<sub>[31]</sub>).

The crisis has exacerbated internal and external imbalances. The current account deficits have widened as exports contracted more strongly than imports – the current account deficit reached 26% of GDP at the end of 2020. Meanwhile, the negative impact on tax revenues, combined with higher government

expenditures due to fiscal support and higher healthcare spending, resulted in a widening of the fiscal deficit to 11% of GDP in 2020. As a result, public debt rose to 105% of the GDP (EC, 2021<sup>[30]</sup>).

The labour market was strongly affected by the COVID-19 crisis despite the government's measures to stave off some of the impact of the crisis. Since the start of the crisis, the government has introduced four packages of fiscal support for enterprises affected by the pandemic (Box 23.1). These packages have included measures such as wage subsidies for employees in affected companies, deferral of tax and social security payments, exemptions from payment of utility bills, moratoria on loan repayments and moratoria on enforcement of claims against enterprises in affected sectors. The government also created an Investment Development Fund to provide liquidity support to affected enterprises.<sup>8</sup> The tourism and agriculture sectors were further supported by interest rate subsidies on new loans, and a reduction in the value-added tax (VAT) rate for the hospitality industry (from 21% to 7%). Despite these important measures, the effective loss of the tourism season – overnight stays declined by nearly 80% in January to November 2020 – resulted in a sharp increase in unemployment, from 15.4% in 2019 to 18.4% at the end of 2020, reversing a seven-year trend of steady improvement.

The impact on vulnerable households and poverty was mitigated by the government's support measures. Financial assistance was provided to low-income pensioners and social welfare beneficiaries, and health and education workers received domestic travel vouchers. Additional support was provided to individuals who lost their jobs a result of the crisis through social security schemes and employment programmes. Vulnerable households were also supported through electricity subsidies from the state-owned power distribution company, which were doubled in the second package of economic measures.

### Box 23.1. Montenegro's tax response to COVID-19

As part of its responses to the COVID-19 pandemic, Montenegro carried out a number of tax measures, which included:

1. Payments of income taxes by individuals, companies and the self-employed were deferred in March 2020 for 90 days.
2. A one-off EUR 50 cash transfer was paid to beneficiaries of material assistance and of pension and disability insurance.
3. Loan repayments were deferred for a period of 90 days, at the request of individuals and companies, starting in March 2020.
4. A public loan scheme to improve the liquidity of the self-employed and companies impacted by the crisis. It allowed for a maximum amount of EUR 3 million per beneficiary. This scheme benefits from a simplified procedure, no approval fee and an interest rate of 1.5%.
5. Tax-debt repayments were made more flexible, including no interest for late payments of tax arrears.
6. A 60-day deferral of payment for customs duty and VAT was put in place in March 2020 for companies that could not continue their activity as a result of the crisis.
7. The reduced VAT rate (7%) was extended to certain catering and accommodation services.
8. Donations of medical goods to public entities were exempted from VAT.

Montenegro implemented a relatively wide set of responses to COVID-19 compared to other WB6 economies. For example, few WB6 economies implemented a public loan scheme, deferred loan repayments or offered direct cash transfers to households, which are centrepieces of Montenegro's response to COVID-19. Montenegro's comprehensive COVID-19 response package broadly aligns with those of OECD/G20 countries (OECD, 2020<sup>[31]</sup>).

Despite this support, many of the economy's structural challenges have played a role in either amplifying the impact of the COVID-19 pandemic or limiting the scope of the policy responses to reduce its impact. The crisis has, therefore, provided important lessons on how to build more resilient economies and institutions:

- **Fiscal policy:** The fiscal response has been important for reducing the economic fallout from the COVID-19 crisis, but has resulted in a significant deterioration in the fiscal position and an increase in public debt. In the context of weaker prospective revenues in the wake of the crisis, particularly if the recovery is slow, improving the efficiency of public spending will be critical over the coming months. It will also be vital to prioritise expenditures that can support the recovery and promote productivity growth and structural transformation for stronger and more resilient long-term growth. This includes increasing public investment, which has suffered significantly due to high and rising current expenditures. The crisis also highlighted the importance of rebuilding fiscal buffers in the post-crisis period. In addition to better management of expenditures this will also require tackling some of the structural constraints that undermine revenue performance and allow for more discretionary fiscal expenditures to counteract future shocks.
- **Innovation and technology adoption:** The COVID-19 crisis has starkly demonstrated the importance of firm adaptability to meet new challenges and changing circumstances. The crisis has also revealed the advantages that firms which have embraced digitalisation and modern practices have over others. The resilience of the post-COVID recovery will therefore depend on the extent to which structural issues limiting firm innovation and technology adoption are addressed and to what extent digitalisation and digital skills become mainstreamed.
- **Access to finance:** The crisis has highlighted the significance of a well-developed and diversified financial sector that can respond to the financing needs of enterprises – not only in times of crisis but also during the recovery phase. As in the rest of the region, the main instruments for providing additional liquidity to enterprises during the crisis came from the government through subsidised lending or lending guarantees. But a robust financial sector comprised of diversified financial institutions that can provide financing for riskier and innovative ventures – not just well-established enterprises with a long history of operation and significant assets – will be very important through the recovery phase and beyond.
- **Informality:** The large size of the informal sector, and the significant share of informal employment even within the formal sector, have limited the scope of the measures aimed at protecting the income and employment of people in the most affected sectors. Informality is widespread in the sectors most affected by the crisis, including retail trade and tourism, and this segment has not been able to benefit from the government subsidies and other relief and support measures. Developing a more resilient economy will also depend on the extent to which incentives for formalisation can be enhanced and the oversight and sanctioning of non-compliance improved.
- **Health sector:** Pre-existing poor health outcomes and inefficiencies in the health system have increased Montenegro's vulnerability to COVID-19 and any future pandemics. This challenge is compounded by relatively low spending on health care (8.42% of GDP in 2018 compared to 12.6% in the OECD).<sup>9</sup> Furthermore, health-sector revenues are highly sensitive to employment and economic downturns since they are financed largely by payroll contributions.<sup>10</sup> Going forward, Montenegro will need to strengthen the resilience of its health sector through more funding; better pandemic preparedness, including training health workers; and increasing the supply of equipment by strengthening supply chains for essential medicines and other supplies, etc.

## ***EU accession process***

Montenegro began its EU accession journey in 2008 when it submitted its application for EU membership. The Stabilisation and Association Agreement (SAA) came into force in September 2010 and Montenegro was granted EU candidate status in December 2010. Since then, Montenegro has advanced relatively rapidly along the accession path compared to most other Western Balkan economies. Accession negotiations began on 29 June 2012 and as of February 2021, Montenegro had opened 33 out of 35 negotiating chapters, 3 of which had been provisionally closed.

Further progress in the accession process and Montenegro's eventual joining of the EU will strongly depend on adopting and aligning its legislation with the EU *acquis*, effective implementation of this legislation, and structural reforms that will enable the economy to meet the competitive pressures and other requirements of joining the EU bloc. The findings and recommendations published in this Competitiveness Outlook 2021 provide the monitoring and guidance needed for the government in meeting the requirements related to a number of critical chapters of the *acquis* when negotiating its accession to the EU. The Competitiveness Outlook also provides a good basis for assessing the critical challenges that the economy faces as a starting point for the development of the Economic Reform Programmes (Box 23.2).

### **Box 23.2. Economic Reform Programmes**

Since 2015, all EU candidate countries and potential candidates prepare Economic Reform Programmes (ERPs) which play a key role in improving economic policy planning and steering reforms to sustain macroeconomic stability, boost competitiveness, and improve conditions for inclusive growth and job creation. The ERPs contain medium-term macroeconomic projections (including for GDP growth, inflation, trade balance and capital flows), budgetary plans for the next three years and a structural reform agenda.

The structural reform agenda includes reforms to boost competitiveness and improve conditions for inclusive growth and job creation in the following areas:

1. Public Financial Management
2. Green transition
3. Digital transformation
4. Business environment and reduction of the informal economy
5. Research, development and innovation
6. Economic integration reforms
7. Energy market reforms
8. Transport market reforms
9. Agriculture, industry and services
10. Education and skills
11. Employment and labour market
12. Social protection and inclusion
13. Healthcare systems

The structural reforms part of the ERPs is organised in two parts:

- A first part identifies and analyses the three key challenges across those 13 areas. The identification and prioritisation of key challenges imply a clear political commitment at the highest level to address them and the ERPs should propose a relevant number of reform measures to decisively tackle each of them in the next three years.
- A second part provides an analysis of the remaining areas (not included as key challenges) and may propose additional reforms to address them.

The European Commission and the European Central Bank then assess these programmes, which form the basis for a multilateral economic policy dialogue involving the enlargement economies, EU Member States, the Commission and the European Central Bank. The dialogue culminates in a high-level meeting during which participants adopt joint conclusions that include economy-specific policy guidance reflecting the most pressing economic reform needs. The findings of the Competitiveness Outlook provide guidance to the six Western Balkans EU candidates and potential candidates in identifying the key obstacles to competitiveness and economic growth, and in developing structural reform measures to overcome them.

### *EU financial and development support*

Montenegro has received considerable financial support from the EU, which has been its largest provider of financial assistance. Through the EU pre-accession funds, a total of EUR 506.2 million was allocated to Montenegro for the period 2007-20. The financing is aimed to assist the economy in improving its outcomes across the following areas: democracy and governance; rule of law and fundamental rights; environment and climate action; transport; competitiveness and innovation; education, employment and social policies; agriculture and rural development; and regional and territorial co-operation.

On 6 October 2020 the European Commission adopted the Economic and Investment Plan for the Western Balkans, which seeks to support the long-term economic recovery of the region, a green and digital transition and regional integration and convergence with the EU. The plan envisages the mobilisation of up to EUR 9 billion in investment in sustainable transport, human capital, competitiveness and inclusive growth.<sup>11</sup>

In addition to grant funding, the EU also provides important guarantees that support public and private investment by reducing the risks and costs associated with those investments. The new Western Balkans Guarantee Facility is expected to mobilise up to EUR 20 billion in investment over the coming decade.<sup>12</sup>

The Connectivity Agenda seeks to support investments in sustainable transport and clean energy. Set up under the Western Balkans Investment Framework, the latest package, which was presented at the Western Balkans Summit in Sofia on 10 November 2020, completes the delivery of the EU's 2015 pledge to finance EUR 1 billion of investment to support better connectivity in the WB region. It also represents the first step in implementing the flagship projects under the Economic and Investment Plan for the region.

## Scope and methods

### **Process**

Following the first two Competitiveness Outlook assessments, published in 2016 and 2018, the third Competitiveness Outlook assessment cycle for the WB6 economies was launched virtually (due to the COVID-19 pandemic) on 3 April 2020. The OECD team introduced Montenegro's Competitiveness Outlook Government and Statistical Office Co-ordinators<sup>13</sup> to the new digitalised assessment frameworks (see Assessment methodology and process chapter for details). The two primary documents for assessing each of the 16 policy dimensions – the qualitative questionnaire and statistical data sheet – were explained in depth, giving particular attention to new questions and indicators. The OECD team also explained digital

solutions to be used to disseminate the material together with the detailed guidelines, tutorials and information on the assessment process, methodology and timeline.

Following the launch of the assessment, the Ministry of Economic Development disseminated the materials among all 16 Policy Dimension Co-ordinators and Statistical Office contact points in Montenegro. Where additional guidance was needed, the OECD team held teleconferences with Dimension Co-ordinators and Statistical Office contact points in April and May 2020.

All 16 Dimension Co-ordinators and Statistical Office contact points completed the assessment between April and May 2020. They assigned a score (see Scoring approach) to each qualitative indicator used to assess the policy dimension in question, accompanied by a justification. The completed assessments (qualitative questionnaires and statistical data sheets) were returned to the OECD team between May and July 2020.

The OECD reviewed the inputs and, where necessary, requested additional information from the Ministry of Economic Development, Policy Dimension Co-ordinators and Statistical Office contact points. The updated assessment materials were sent back to the OECD between July and September 2020. In addition, the OECD organised policy roundtable meetings between October and November 2020 to fill in any remaining data gaps, to get a better understanding of the policy landscape, and to collect additional information for indicators where necessary.

Based on the inputs received, the OECD compiled the initial key findings for each of the 16 policy dimensions. It then held consultations on these findings with local non-government stakeholders (including chambers of commerce, academia and NGOs) in November 2020. As a follow up, the OECD presented the preliminary findings, recommendations and scores to the Competitiveness Outlook Government Co-ordinator,<sup>14</sup> Policy Dimension Co-ordinators and Statistical Office contact points at a virtual meeting on 17 December. The draft Competitiveness Outlook economy profile of Montenegro was made available to the Government of Montenegro for their review and feedback from mid-January to mid-February 2021.

### **Scoring approach**

Each policy dimension and its constituent parts are assigned a numerical score ranging from 0 to 5 according to the level of policy development and implementation, so that performance can be compared across economies and over time. Level 0 is the weakest and Level 5 the strongest, indicating a level of development commensurate with OECD good practice (Table 23.3).

For further details on the Competitiveness Outlook methodology, as well as the changes in the last assessment cycle, please refer to the Assessment methodology and process chapter.

**Table 23.3. Competitiveness Outlook scoring system**

<b>Level 5</b>	Level 4 plus independent impact evaluation. Results of monitoring and impact evaluation inform policy framework design and implementation updates in line with OECD good practice
<b>Level 4</b>	Level 3 plus evidence that the framework is monitored and, if necessary, adjusted accordingly
<b>Level 3</b>	Level 2 plus some concrete indications that the policy framework is being implemented effectively
<b>Level 2</b>	Framework specifically addressing the policy area concerned is solidly in place, officially adopted by the government or parliament (where applicable). The framework includes policy features necessary for it to have an impact
<b>Level 1</b>	Existing draft or pilot policy framework with signs of government activity addressing the policy area concerned
<b>Level 0</b>	No framework (e.g. law, institution, project, initiative) exists for the policy topic concerned

### *Exceptions*

Unlike the other 15 policy dimensions, Competition policy (Dimension 5) is assessed using yes/no answers to 71 questions in a dedicated questionnaire. A “yes” response (coded as 1) indicates that a criterion has been adopted, whereas a “no” (coded as 0) indicates the criterion has not been adopted. The overall score

reflects the number of criteria adopted. Moreover, some qualitative indicators which have been added to this edition of the assessment for the first time are not scored due to the recent character of the policy practice they capture and the unavailability of relevant data.

## Investment policy and promotion (Dimension 1)

### Introduction

Montenegro's performance on the investment dimension has improved since the last assessment. The economy's score has increased from 2.6 in the 2018 Competitiveness Outlook (OECD, 2018<sup>[34]</sup>) to 3.2 in the 2021 assessment, with notable progress having been made on all sub-dimensions. Although the economy has significantly improved its institutional framework by creating a new investment promotion agency, the Montenegro Investment Agency (MIA), with an extended mandate and capacities, the MIA has just started its work and the new scores for investment promotion and facilitation do not yet reflect these improvements. Montenegro ranks second amongst the WB6 economies for economic performance. While Montenegro is among the top WB6 performers for its investment policy, its investment promotion and facilitation performance still lags behind its neighbours (Table 23.4).

**Table 23.4. Montenegro's scores for investment policy and promotion**

Dimension	Sub-dimension	Score	WB6 average
Investment policy and promotion dimension	Sub-dimension 1.1: Investment policy framework	3.6	3.2
	Sub-dimension 1.2: Investment promotion and facilitation	2.8	3.0
	Sub-dimension 1.3: Investment for green growth	3.0	2.0
Montenegro's overall score		<b>3.2</b>	<b>3.0</b>

### State of play and key developments

Montenegro is the leading WB6 economy for attracting FDI. Net FDI inflows have averaged USD 487 million a year over the last five years (Figure 23.2). In 2019, the economy's net FDI inflows accounted for 8.4% of GDP. This figure is higher than neighbouring economies: 8.3% for Serbia, 7.8% for Albania, 3.8% for Kosovo and North Macedonia, and 1.9% for Bosnia and Herzegovina. It is also higher than the average for upper-middle income economies (1.6%) and OECD economies (1.5%).

FDI in Montenegro is mostly concentrated in the tourism, energy, telecommunications, banking and construction sectors. Its origins are diverse, with no single economy dominating. The most significant investments have originated from Hungary, Italy, Russia and Serbia, with new interest coming from Azerbaijan, China, Turkey, the United Arab Emirates and the United States.

**Figure 23.2. Net FDI inflows to Montenegro (2015-19)**

### *Sub-dimension 1.1: Investment policy framework*

Overall, Montenegro has a clear and comprehensive **legal framework for investment** activities and conducting business. The main law governing investment activities is the Foreign Investment Law (FIL), adopted in 2014. The FIL provides investors with national treatment, makes no restrictions in terms of investment activities, foreign companies can own 100% of a domestic company, and profits and dividends can be repatriated without limitations or restrictions. Montenegro has enacted sectoral and business-related laws<sup>15</sup> outlining guarantees and safeguards for investors in accordance with EU standards. Recent positive developments reinforcing the investment framework include the adoption of a public-private partnership law as well as a public procurement law at the end of 2019.

The government is endeavouring to ensure that the regulatory framework for investment is consistent, clear, transparent, readily accessible and does not impose undue burdens. In May 2019, the government adopted the Individual Reform Action Plan for implementing the Regional Investment Reform Agenda at the national level (IRAP), which represents a set of concrete reform actions in three areas of investment policy: investment entry and establishment, investment protection and retention, and investment attraction and promotion, all of which were completed in December 2020. The IRAP was adopted within the framework of the Investment Pillar of the Multi Annual Plan for Regional Economic Area (MAP REA) to continue the implementation of the commitments outlined under the investment pillar of the MAP REA 2017-2021. These efforts will continue through the Common Regional Market Plan 2012-2024.

The Ministry of Economy publishes the most important legislation concerning trade and investments on its website.<sup>16</sup> The development of laws, treaties and regulations involves stakeholder consultations and includes relevant ministries and other public bodies. Public participation in policy making and implementation is secured through the relevant decrees.<sup>17</sup> Nevertheless, NGOs – including business associations – have complained about recent policy-making and legislative processes that lacked public consultation and involvement of key stakeholders (EC, 2020<sub>[35]</sub>).

In Montenegro, the market is open and **exceptions to national treatment** are very limited. The economy's score in the OECD FDI Regulatory Restrictiveness Index (Figure 23.3),<sup>18</sup> which assesses and benchmarks market access and exceptions to national treatment, was 0.03 in 2018. This indicates that the economy maintains only a handful of restrictions (notably in the transport sector), making its FDI regime less restrictive than the average OECD economy (0.064) (World Bank, 2020<sub>[36]</sub>). This suggests that foreign investment rules do not constitute impediments to FDI. However, the economy does not have a negative list indicating the sectors where foreign investment is prohibited or conditioned and outlining which discriminatory conditions apply.

Figure 23.3. FDI Regulatory Restrictiveness Index (2019)

Note: Restrictions are evaluated on a scale of 0 (open) to 1 (closed).

Source: (OECD, 2020<sup>[37]</sup>), *FDI Regulatory Restrictiveness Index (database)*, <http://www.oecd.org/investment/fdiindex.htm>.

**Investor protection against expropriation** without fair compensation is enshrined in the constitution and its modalities are defined in the Law on Expropriation. The law stipulates that expropriation measures are taken only in a non-discriminatory manner, for a public purpose, under due process of law, and with fair compensation. It does not however recognise the concept of indirect expropriation. The expropriation law clearly defines the procedures for calculating compensation fees, including that the expropriation fee is determined by a commission of five members, at least three of whom are forensic experts in the relevant profession.

Administrative-judicial protection from expropriation decisions is available for dissatisfied parties; it also determines the fee for expropriation. Thus, a party can file an appeal against an expropriation decision with the Ministry of Finance. If the party is not satisfied with the decision of the Ministry of Finance, it can initiate an administrative dispute against it in the Administrative Court of Montenegro. Dissatisfied parties also have the opportunity to initiate civil proceedings in regular courts.

Montenegro has signed a large number of bilateral investment treaties (BITs),<sup>19</sup> which constitute an additional layer of protection for foreign investors. The Government of Montenegro is currently in the process of reforming its existing network of BITs and defining a new BIT model that will balance investor protection provisions and national strategic interests, while fully complying with EU standards and good international practices.

Foreign investors have the same rights and remedies under the national court system as domestic investors when it comes to **dispute settlement**. The justice system is continuing its reform efforts under the 2019-2022 judicial reform strategy,<sup>20</sup> which focuses notably on the independence, efficiency and professionalisation of the judiciary. Overall, the judiciary system is independent but remains vulnerable to political interference. Its financial resources have been slowly but steadily increasing over 2016-2020 to reach EUR 39.1 million (EC, 2020<sup>[35]</sup>). However, according to similar EU reports, it remains lower than the judiciary budgets of other WB6 economies. Overall, the court system is functioning well, and investors can generally rely on it for a wide range of disputes. Montenegro has commercial courts which have first-instance jurisdiction in commercial matters. Judges are trained to hear complex commercial disputes and the backlog of cases is decreasing. Though the disposition time (the average time from filing to decision) for commercial cases increased from 107 days in 2018 to 116 days in 2019, it remains comparable to OECD economies.

Montenegro is stepping up its efforts to offer alternative dispute resolution mechanisms. It ratified the Convention on the Settlement of Investment Disputes between States and Nationals of Other States (ICSID Convention) in 2012 and the 1958 Convention on the Recognition and Enforcement of Foreign Arbitral Awards (New York Convention) in 2006. By virtue of their adherence to the New York Convention, foreign arbitral awards are recognised. Moreover, Montenegro signed the United Nations Singapore Convention on Mediation in 2019.

Montenegro also adopted the Arbitration Act in 2015 and is in the process of adopting the Law on Alternative Dispute Resolution (ADR),<sup>21</sup> which provides for compulsory recourse to ADR mechanisms for specific types of cases. According to the European Commission, Montenegro is recording a positive trend in alternative dispute resolution for which a programme and accompanying action plan for 2019-21 were adopted at the end of 2018. In 2019, 917 cases were referred for mediation, up from 629 cases in 2018 and 437 in 2017, while 403 cases were resolved through mediation in 2019, compared to 107 in 2018 (EC, 2020<sup>[35]</sup>).

Montenegro has sound **intellectual property (IP) rights laws**, which are harmonised with EU legislation and contain the minimum requirements of the World Trade Organization's (WTO) Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). Montenegro is a member of the World Intellectual Property Organization and adheres to the main international treaties and conventions on IP rights. The Ministry of Economic Development of Montenegro is the public authority in charge of registration, protection and enforcement of IP rights, and co-ordinates closely with other IP institutions, including customs. Since 2018, following a restructuring of the administration, the IP office is part of the Ministry of Economy. It should be noted that following these changes, the staffing of the office was reduced.

Montenegro is strengthening its **IPR enforcement** and implementation. It has reinforced the capacity of the intellectual property rights co-ordination team and the attached working group through regular training. The Ministry of Economic Development has strengthened its co-ordination with other IP-related institutions and boosted its efforts to sensitise businesses and the public and provide them with better access to information on IP rights. The Commercial Court of Montenegro, as a specialised court, has the exclusive jurisdiction for resolving disputes in the field of intellectual property. The Commercial Court has a Department for Disputes on the Protection of Copyright and Intellectual Property Rights, which has ten judges who are regularly trained professionally in this area.

The government has also reinforced its **IP rights awareness raising and access to information**. The Ministry of Economic Development has initiated measures such as seminars and campaigns to proactively raise awareness on IP, as well as capacity-building programmes on how to file for IP protection. In addition, relevant information about registered IP rights is available on the ministry's website,<sup>22</sup> as are patent registers and other databases on IP rights.

### *Sub-dimension 1.2: Investment promotion and facilitation*

Montenegro is currently modernising its **investment promotion agency structure and strategy**. The last Competitiveness Outlook reported that the Montenegrin Investment Promotion Agency (MIPA) was constantly short-staffed, had limited capacities and a mandate focused solely on investment promotion. Following the adoption of the new PPP law in October 2019, MIPA and the Secretariat for Development Projects have ceased to exist and the Montenegro Investment Agency (MIA) was established in 2020 with significantly more employees and a much broader set of responsibilities. By the end of 2020, the MIA had 27 employees compared to the 5 previously employed by MIPA. According to the organisation's Personnel Plan, it seeks to increase the total number of employees to 42 by 2021.

The establishment of the MIA is expected to reinforce Montenegro's **investment facilitation services and activities**. It has recently been put in charge of revamping administrative systems to speed up procedures and provide the conditions for efficient work, which requires close co-operation between the agency and relevant ministries. While the former agency MIPA was not involved in any business registration

procedures, the MIA provides investors with information on all the necessary steps for business registration, as well as on which institutions to reach out to in the process. The Government of Montenegro has also approved an action plan aimed at helping businesses by digitalising and cutting unnecessary procedures, including for company registrations, and establishing an e-cadastre.

Key recent progress on simplifying company registration include:

- Developing two rulebooks<sup>23</sup> which clarify the registration procedure, the single registration application of economic entities, and the content and manner of keeping the Central Registry of Economic Entities.
- Merging the 16 previous forms for registering a business into a single form, and progressing on electronic company registration through eFirma.
- Cutting various registration fees: for example the fee for establishing a joint stock company has been reduced from EUR 50 to EUR 40, and the minimum capital for electronic registration of a one-member limited liability company for resident founders has been reduced to EUR 1.

Following its establishment, the MIA has started developing **investor targeting** actions. It is trying to move from MIPA's reactive stance to a more proactive targeting of potential investors and countries. For instance, in 2020 the MIA embarked on an investor outreach campaign for the furniture manufacturing sector with financial and technical assistance from the World Bank. It has also defined target countries and started organising missions.

Montenegro has put a complex and multi-layered **investor incentive** scheme in place to attract investment. Incentives are provided by the state and include 1) subsidies (mostly through the Program for Improving Competitiveness, consisting of 10 programme lines to provide financial and non-financial support to potential and existing entrepreneurs, SMEs and large enterprises, as well as clusters); 2) tax relief (write-offs, deferrals of taxes and contributions); 3) loans with lower interest rates (through the Investment Development Fund's loans); and 4) guarantees. In addition, incentives and facilitation measures are provided to investors in Free Zones and Business Zones or by the Law for Specific Projects, while other incentives are provided by municipalities and for investing in least developed areas, primarily in the north (OECD, 2017<sup>[38]</sup>). However, the system could prove difficult to navigate for foreign investors due to lack of awareness and clarity on qualifications (EC, 2020<sup>[35]</sup>). On the control side, the government ensures the transparency of state aid in the annual report on granted state aid by the Agency for Protection of Competition, which is publicly available on its website.

The establishment of the MIA is also a positive step towards improving **aftercare services**, which requires strong co-operation with other institutions and regulatory bodies. Although the agency does not have a formal mandate to provide aftercare services, it still answers investors' enquiries on an ad hoc basis.

### *Sub-dimension 1.3: Investment for green growth*

Overall, Montenegro has started to develop a sound green **investment policy and promotion** strategy. Its national strategy, the Smart Specialisation Strategy of Montenegro (S3.me) 2019-2024, based on the EU's cohesion policy, promotes green growth and building a legal framework that encourages green investment (Ministry of Science of Montenegro, 2019<sup>[39]</sup>). This strategy paves the way for future green investment programmes as it defines the priorities and focal areas to be developed for sustainable and green growth. In addition, Montenegro has adopted two very key laws regulating green investments and innovation: the new Law on Innovation Activity and the Law on Incentives for the Development of Research and Innovation. These are accompanied by an implementing body, the Innovation Council, and an innovation fund that supports targeted projects.

Montenegro respects core investment principles such as investor protection, intellectual property rights protection and non-discrimination in areas inclined to attract green investment. In addition, the government has developed policies, laws, market-based instruments and regulations in the energy sector to encourage

private investment for green growth, while including sustainable development provisions in the new BIT model. Additional measures are also adopted at the local level to encourage private green initiatives. Several programmes have been developed with international organisations for achieving green investment, notably the Growing Green Business in Montenegro 2018-2021 project developed in co-operation with the United Nations Development Program (UNDP).

Montenegro has also developed a strong framework for **choosing public and private partnerships for green growth**. It has recently adopted a favourable regulatory framework through the new Law on Public-Private Partnerships in 2019 that reinforces its ability to mobilise and scale-up green investments by leveraging domestic and international public and private investments in large-scale projects, including infrastructure. The new PPP law was developed in co-operation with donors following good international practices. It includes financial sustainability, value for money and environmental performance as key elements of feasibility studies of proposed PPP projects. In addition, a risk-sharing principle is clearly stated in the PPP law. Finally, the new MIA will be in charge of facilitating, promoting and monitoring PPP projects, including those for green investment.

### ***The way forward for investment policy***

Over the past decade, Montenegro has developed a solid track record in attracting and promoting investment, building on its openness and business-friendly environment. It has initiated important reforms, notably the establishment of a new institutional framework for investment promotion. It could further these efforts and remain an attractive investment destination through the following actions:

- **Improve the transparency and inclusiveness of policy making.** More open and inclusive policy-making processes help to ensure that policies will better match the needs and expectations of citizens and businesses. Improving the public consultation process and including foreign investors would lead to better targeted and more effective policies.
- **Continue efforts aimed at encouraging the use of alternative dispute mechanisms.** These mechanisms can help alleviate the pressure on the judiciary system, build trust and create a more business-friendly environment for conflict resolution. Conducting awareness-raising campaigns to increase the use of alternative dispute mechanisms will reassure prospective investors that fair resolution processes exist in the event of commercial disputes.
- **Accelerate the establishment of the MIA, clarify its aftercare mandate, and reinforce its capacity and resources** in order to improve its investment facilitation and aftercare services. Increased resources would help streamline the large mandate of MIA, while greater inter-institutional co-ordination would avoid repetitive and overlapping objectives. In addition, the government needs to clearly define the MIA's responsibilities for aftercare services, notably by expanding the agency's mandate and producing a clear system for enquiries.
- **Streamline the multiple investment incentives** and reinforce mechanisms for evaluating their cost and benefits, their appropriate duration, and their transparency. The government should increase the clarity and awareness of these incentives through greater transparency on their qualification criteria and by targeting foreign investors through awareness-raising campaigns.
- **Further reinforce the MIA's green investment promotion activities.** Montenegro should systematically consult with the private sector and other local stakeholders in the design and implementation of strategies and plans, policies and regulations that are relevant for green investment.

## Trade policy (Dimension 2)

### Introduction

Montenegro's performance on the trade policy dimension has improved since the last assessment. The economy's score has increased from 2.6 in the 2018 Competitiveness Outlook to 3.2 in the 2021 assessment (Figure 23.1), with notable progress on all sub-dimensions. Montenegro has improved inter-ministerial consultations on trade policy by establishing new bodies and adopting cross-sectoral strategies, including for implementing its WTO commitments. In addition, the economy has improved its regulatory framework for implementing public consultation standards through a new decree on state administration,<sup>24</sup> which aims to systematise the public consultation process and promote stakeholder participation in trade policy design.

As regards trade in services, Montenegro has put in place policies to liberalise its services markets. As a result, significant progress has been made in lowering non-tariff barriers that were restricting services. Efforts have been primarily regional, with the conclusion of the Central European Free Trade Agreement (CEFTA) Additional Protocol 6 in December 2019 and its ratification in June 2021. Montenegro continues to improve its trade policies. Some nodes still exist. The economy could focus on lifting and modifying some economy-wide restrictive measures affecting foreign entities from third countries wishing to invest and operate in Montenegro. The context of the COVID-19 pandemic has undermined the efforts of many states to lower barriers to trade. However, Montenegro is one of the few economies not to have introduced trade restrictions. This is particularly important in a context where recent OECD studies of member economies tend to show a growth in the number of trade-restricting regulations in 2020 (OECD, 2021<sup>[40]</sup>).

Finally, Montenegro is the regional leader in e-commerce trade flows in terms of increase in business-to-consumer (B2C) sites and trade flows made through the Internet, with a very low degree of trade restrictions in digitally enabled services. However, there have been no substantial changes to the e-commerce policy framework since 2018. Implementation efforts have not evolved fast enough, co-ordination mechanisms are absent and programme planning is insufficient, leading to inadequate monitoring and evaluation processes. These explain its below-average score on this sub-dimension (Table 23.5).

**Table 23.5. Montenegro's scores for trade policy**

Dimension	Sub-dimensions	Score	WB6 average
Trade policy dimension	Sub-dimension 2.1: Trade policy framework	3.5	3.5
	Sub-dimension 2.2: Services trade restrictiveness	n.a.	n.a.
	Sub-dimension 2.3: E-commerce and digitally enabled services	2.5	3.1
Montenegro's overall score		<b>3.2</b>	<b>3.4</b>

### State of play and key developments

Montenegro's exports of goods and services have been growing steadily since 2015, though this growth has been affected by the COVID-19 pandemic. Foreign trade overall increased from 105.6% of GDP in 2017 to 108.5% in 2019 (in real terms), compared with 103% in 2015. In 2019, Montenegro's exports of goods and services represented 43.7% of GDP, while imports of goods and services were 64.8%.<sup>25</sup>

Exports of goods reached EUR 465.6 million in 2019, while imports reached EUR 2.5 billion. The external deficit in trade in goods and services accounted for 21.1% of GDP in 2019. Montenegro is a net exporter of commercial services, with commercial exports accounting for EUR 1.7 billion against EUR 677.6 million in imports.

Serbia is Montenegro's main trading partner, accounting for 23.6% of total exports in 2018, followed by Hungary (11.7%) and Bosnia and Herzegovina (7.8%). Montenegro's main supplier is also Serbia, with 19.3% of Montenegro's imports coming from Serbia, followed by China and Germany (10.1% and 9.2% respectively). As for the European Union, it accounted for 44% of Montenegro's exports and 48.5% of its imports in 2018.

Like all economies, Montenegro has been heavily affected by the COVID-19 pandemic. The pandemic-related export bans, restrictions on the movement of people and closures of shops and services led to a significant decline in imports and exports in Q2-Q3 2020 compared to 2019 (imports down 35% and exports 45%; Figure 23.4).

**Figure 23.4. Impact of COVID-19 on trade, Montenegro versus the OECD (2019-20)**

% change, y-o-y

Note: y-o-y = year-on-year.

Source: (IMF, 2020<sup>[41]</sup>), *World Economic Outlook*, <https://www.imf.org/en/Publications/WEO/weo-database/2020/October>, (OECD, 2020<sup>[42]</sup>) *OECD Economic Outlook*, Volume 2020 Issue 1, <https://dx.doi.org/10.1787/0d1d1e2e-en>.

StatLink  <https://doi.org/10.1787/888934255836>

The tourism sector, which accounts for 25% of the economy's GDP, is expected to contract by 12.4% in 2020. The tourism and travel industry has been hit hard by the movement-of-people restrictions imposed to limit the spread of COVID-19. The decrease in tourism has also affected other related industries, such as food, entertainment and retail, as well as tourism-related investment – see also Tourism policy (Dimension 15). In 2020, Montenegro's current account deficit (CAD) is projected to increase to 16.8% of GDP, making it the largest in the WB6 region (World Bank, 2019<sup>[43]</sup>).

The closure of EU borders to non-EU citizens, as well as other regulatory responses in the Western Balkans, have particularly affected freight transport services. The Western Balkan economies set up the CEFTA co-ordinating body to exchange information on trade in goods at the beginning of the pandemic. They also set up priority "green lanes" with the EU and "green corridors" within the WB6 to facilitate the free movement of essential goods through priority "green" border/customs crossings (within the WB6 and with the EU). At the peak of the crisis (April to May 2020), most road transport in WB6 economies passed through these green lanes and corridors, and they have helped to maintain a certain degree of international trade in goods in the region. Only about 20% of the goods that benefited from the green corridor regime (i.e. within the WB6) were basic necessities, the rest being regular trade. Such inclusive regional

co-operation has proven very efficient in mitigating the consequences of the COVID-19 pandemic and is helping economies to recover.

### *Sub-dimension 2.1: Trade policy framework*

A fundamental principle of regulatory transparency is that the regulatory development process is open to all relevant stakeholders through formal and informal consultations before and after adoption. These co-ordination and consultation mechanisms have a positive impact on the efficiency of economic activities and the level of market openness, as they can improve the quality and enforceability of regulations (OECD, 2019<sup>[44]</sup>). In addition to laws setting out consultation obligations, governments are also adopting secondary standards such as guidelines to better systematise the public-private consultation (PPC) process. These include clear and detailed directives for conducting the process in a consistent manner regardless of the institution carrying out the PPC.

Montenegro has a robust regulatory framework for **institutional co-ordination on trade policy formulation**. The Ministry of Economic Development, the main ministry in charge of designing trade policies, regularly involves other ministries<sup>26</sup> in the development of trade regulations at all stages of the policy-making process.

Progress has been made since the previous cycle of analysis, with new platforms for inter-institutional co-ordination being established in 2018. These include the Government Working Group for Trade Policy Review process (TRP),<sup>27</sup> and increased competencies for the National Trade Facilitation Committee (NTFC)<sup>28</sup> with the adoption of a new strategy for trade facilitation for 2018-2022.<sup>29</sup> These developments have allowed the Ministry of Economic Development to consult on trade with an increased number of agencies and institutions (e.g. ministries of economics, agriculture, infrastructure, industry, customs authority, national standardisation body).

Progress has been made on the regulatory framework for **public-private consultation** (PPC) standards. The new Decree on State Administration (2018)<sup>30</sup> introduces a mandatory consultation procedure in which the government must hold a public hearing when preparing laws and strategies. This is obligatory unless the changes concern “extraordinary, urgent or unpredictable circumstances”.<sup>31</sup> The use of simplified legislative procedures (thus bypassing the consultation process) that affect the business community is a real challenge in the region (OECD, 2019<sup>[44]</sup>). Montenegro has made efforts to address this problem and to subject the majority of its regulations, particularly those related to trade, to a normal legislative process. This positive trend was already apparent in the previous assessment cycle; around 10% of all laws in 2016-2018 were adopted without PPC (Montenegro Ministry of Public Administration, Digital Society and Media, 2020<sup>[45]</sup>). In addition, it is now mandatory for the government to invite those stakeholders it deems relevant to provide inputs and comment on draft laws.<sup>32</sup> The Decree on State Administration has also extended the scope of public consultations to include national strategies. An online participation platform has also been created to facilitate public consultations.<sup>33</sup> Following the consultations, the ministry responsible for the draft regulation publishes a report on the consultation process on its website and the e-government portal, and disseminates it to the entities that participated in the process.<sup>34</sup>

As far as monitoring is concerned, regulatory impact analysis (RIA) was formally introduced in 2012 and enhanced further in 2018. A mandatory RIA report must accompany each legislative proposal submitted to the government for approval. Montenegro has a well-developed procedure for RIA, and the Ministry of Finance – as the central RIA unit in Montenegro – conducts the evaluation process efficiently. Since the last assessment cycle, RIAs have been systematically produced, though their quality could be improved further. They do not always compare several policy options and lack other important elements, such as assessments of impacts on the stakeholders most affected. Their publication also has room for improvement. Only 51% of them, according to the most recent report available, were published within the deadlines imposed by the law.

The Ministry of Public Administration, Digital Society and Media produces statistics on the number of legislative projects that have been subject to PPCs; reports for 2018 and 2019 are available. The reports are comprehensive and detailed but still published on an ad hoc basis. There is an upward trend in the participation by interested members of public in the policy-making process, with an increase in the number of comments received compared to 2018. In addition, there is also a notable trend in the number of comments accepted. For comparison, in 2019 the percentage of accepted comments out of the total number of comments received was 77%, in contrast to 2018 when the percentage of accepted comments out of the total number of comments received was 51% (Montenegro Ministry of Public Administration, Digital Society and Media, 2020<sup>[45]</sup>).

As regards bilateral and multilateral free trade agreements, Montenegro has not extended its **free trade agreement network** since the last cycle of analysis. The economy has been a member of the Central European Free Trade Agreement (CEFTA) since 2007 and entered the Stabilization and Association Agreement in 2010. Shortly after it joined the WTO in 2012, Montenegro concluded a Free Trade Agreement with Ukraine, liberalising the goods market for most agricultural and industrial products while opening the market for services linked to the transport of gas and fuel, as well as additional liberalisation of passenger, freight and ancillary services in road transport.

Recently, Montenegro strengthened its treaty network by signing the Additional Protocol 5 (on Trade Facilitation) to the CEFTA on 18 April 2018. Shortly afterwards, on 19 November 2018, Montenegro replaced Protocol II of the original (2010) Free Trade Agreement with Turkey in June 2019, redefining the term "originating products" and methods of administrative co-operation. Additionally, Protocol I was revised to include additional agricultural concessions, and a new Protocol III on trade in services was concluded in 2019. Montenegro is also currently amending its free trade agreements with CEFTA economies as regards rules of origin.

### *Sub-dimension 2.2: Services trade restrictiveness*

Services contribute close to two-thirds of GDP in the WB6, underlining how strongly economic growth, innovation and job creation depend on effective policies that promote open and competitive markets for services. Montenegro is particularly dependent on services as they contribute to more than half of its GDP (58.7% in 2017), and account for 72.9% of employment (Figure 23.5).

**Figure 23.5. Services, value added (% of GDP) - Montenegro (2007-17)**

Source: (World Bank, 2020<sup>[11]</sup>), *World Development Indicators (database)*, <http://data.worldbank.org/datacatalog/world-development-indicators>.

StatLink  <https://doi.org/10.1787/888934255855>

The potential gains from liberalising services trade are significant because increased domestic and foreign competition, complemented by effective regulation, can enhance performance (OECD, 2018<sup>[34]</sup>) and lower trade costs related to regulatory barriers (Box 23.3).

### Box 23.3. The costs of regulatory barriers to trade in services

OECD analysis reveals that services trade restrictions significantly affect trade by raising the costs for firms to operate in the host economy (Rouzet and Spinelli, 2016<sup>[46]</sup>). Trade costs arise both from policies that explicitly target foreign suppliers, and more generally from domestic regulation that falls short of best practice in the area of competition and rule making. The costs resulting from barriers to trade in services are much higher than those from trade in manufactured goods.

Trading services is costly. The studies show that policy-induced services trade costs are relatively high. Expressed as percentages of total trade value, average multilateral costs for cross-border services trade are around 57% for communication services and 54% for business services, around 60% for transport services, around 103% for insurance services, and around 255% for financial services. Even exporting to the most liberal countries still requires compliance with regulation at a cost that corresponds to around 30% of the export value in most sectors, and nearly 90% for financial services. Within the European Single Market, however, services trade costs are significantly lower – policy-induced costs of cross-border services trade are around 10% in most sectors and around 32% for financial services.

Source: (Benz and Jaax, 2020<sup>[47]</sup>), *The Costs of Regulatory Barriers to Trade in Services: New estimates of ad valorem tariff equivalents*, <https://dx.doi.org/10.1787/bae97f98-en>.

The OECD Services Trade Restrictiveness Index (STRI) was used to **analyse barriers to trade for 12 services sectors** in Montenegro. The OECD STRI project is a unique, evidence-based diagnostic instrument that inventories trade restrictions in 48 economies,<sup>35</sup> allowing economies to benchmark their services regulations against global best practice, identify outlier restrictions, and prioritise reform efforts. For this Competitiveness Outlook assessment cycle, the 12 services sectors are grouped into four clusters: 1) transport and distribution supply chain (air transport, road transport, rail transport, courier); 2) market bridging and supporting services (commercial banking, insurance, legal services); 3) physical infrastructure services (construction, architecture, engineering); and 4) digital network services (computer services, telecommunications).

Information was collected from the WB6 economies' laws and regulations, and indices were calculated for seven years (2014-20). These composite indices compute restrictions across five policy areas: foreign entry, movement of people, barriers to competition, regulatory transparency and other discriminatory measures. The indices quantify regulatory restrictions in each of the 5 policy areas for the 12 sectors by giving them a value between 0 and 1. Complete openness to trade in services gives a score of 0, while being completely closed to foreign service providers yields a score of 1.<sup>36</sup>

Each policy area is composed of a series of measures. These measures are called "horizontal" if they are present in all sectors, or "sector specific" if they only affect a particular sector.<sup>37</sup> The STRI measures the most-favoured-nation (MFN) restrictions and does not take into account any preferential regimes, such as regional trade agreements or mutual recognition agreements (Geloso Grosso et al., 2015<sup>[48]</sup>).

Figure 23.6 shows the STRI indices for each of the sectors, as well as the average scores for the WB6, EU and OECD. Within the region, Montenegro scores below the WB6 average in 5 out of 12 sectors. Of these, telecommunications, insurance and engineering services are the three least restrictive compared to the WB6 average, while courier, legal and architecture services are the most restrictive sectors.

Figure 23.6. Services trade restrictiveness index for Montenegro (2020)

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and therefore are not covered by STRI indices; key partners to the STRI project are Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand. Source: (OECD, 2020<sub>[49]</sub>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink <https://doi.org/10.1787/888934255874>

Montenegro has progressively eased barriers to services trade over time, with the most pronounced reforms taking place between 2016-19 (Figure 23.7). The slowdown in reforms to open up services markets in 2019-20 is explained by the focus of all regulatory change in the economy on measures to safeguard public health and the economy in the context of the COVID-19 pandemic. It should be noted that there were no trends towards regulatory protectionism in the WB6 region, including Montenegro, in 2020. This is particularly important in a context where recent OECD studies of member states tend to show a growth in the number of regulations restricting services in 2020 (OECD, 2021<sub>[40]</sub>).

Figure 23.7. Evolution of STRI scores by sector in Montenegro (2014-2020)

Percentage change over the periods 2014-2016, 2016-2019 and 2019-2020

Note: Negative values indicate a reduction in the restrictiveness of the economy's trade regulatory environment.

Source: (OECD, 2020<sub>[49]</sub>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink <https://doi.org/10.1787/888934255893>

The following analysis starts with the horizontal measures that are included in all sectors and that hamper services trade in the economy as a whole – especially in the area of general business regulation, restrictions that affect the movement of service providers, standards for the cross-border transfer of personal data, the legal framework for public procurement and the screening of foreign investment. It then reviews each of the 12 sectors analysed, displaying the STRI scores, explaining what drives the results, and providing a brief description of the most common restrictions and good practices.

### **Cumbersome horizontal business regulations affect firms' ability to operate**

In terms of *general business regulations*, Montenegro has taken major steps towards harmonisation with EU standards in the area of company law; further harmonisation of regulations in this area is planned in the coming years. There are a number of areas in which Montenegro could focus its future regulation efforts. This is the case for the acquisition or use of land and real estate by foreigners, which is not fully liberalised. There are purchase restrictions for foreign nationals in some areas – such as natural monuments, land located less than one kilometre from the border, any island area and agricultural land.

Likewise, Montenegro maintains a minimum capital deposit requirement for the establishment of joint stock companies. This measure is present in the majority of EU Member States, but is nevertheless considered restrictive under the STRI as it constitutes an obstacle for foreign service providers' ability to operate.

*Restrictions on the movement of people* are also an issue in Montenegro. Although significant progress has been made in easing the conditions for the movement of people between the CEFTA economies through the conclusion of Additional Protocol 6 to the CEFTA agreement, people from economies outside CEFTA or the EU are subject to restrictive requirements. Montenegro, according to the Law on Foreigners,<sup>38</sup> applies quotas and labour market tests for work permits issued to third-country nationals, and although intra-corporate transferees (ICTs) are exempt from the quotas (which is beneficial for Montenegro's degree of openness), they are subject to labour market tests. Labour market tests are undertaken to determine whether suitably qualified local workers are available (or could easily be trained to do the work). They typically involve seeking advice from industry representatives and government agencies to determine current skill shortages. The length of stay for independent service suppliers, contractual service suppliers and ICTs in Montenegro is limited to 12 months. This duration is comparable with those EU Member States participating in the STRI project, but shorter than best practice elsewhere, which is more than 36 months (OECD, 2020<sub>[49]</sub>).

From the perspective of trade, *regulations for the cross-border transfer of personal data* are aligned with those of the EU. Transfers to non-EEA (European Economic Area) economies may take place where these ensure an adequate level of data protection or, failing that, where appropriate safeguards (e.g. binding corporate rules or standard data protection clauses) are in place.

Similarly, in this evaluation round, data based on World Bank Doing Business indicators showed that *business registration procedures* in Montenegro take up to 12 days and consist of 8 different procedures, while best practice examples indicate shorter and less cumbersome procedures (less than 9 days and up to 5 procedures) (World Bank, 2019<sub>[22]</sub>). However, in the third quarter of 2020, Montenegro implemented a series of regulations to simplify physical registration<sup>39</sup> and introduced an electronic registration procedure for companies. Similarly, the economy has also lowered the various fees related to the opening of a business<sup>40</sup> and facilitated payment procedures.<sup>41</sup> Although the benefits of these regulations will only be felt in 2021, and therefore reflected in the next round of STRI analysis, these regulatory efforts are positive.

In *public procurement* Montenegro does not impose domestic price preferences or conditions on foreign contractors to source personnel and products locally when selecting tenders and awarding contracts. The procurement process does not bias the conditions of competition in favour of local firms. Furthermore, the economy's public procurement regulation explicitly states that the contracting authority may not specify the conditions under which national or territorial conditions are exercised in the procurement process. The

process is determined by the estimated value of a procurement classified into three different threshold categories. There is no procurement regime applied to suppliers below the value thresholds.

Montenegro's laws do not contain any elements restricting trade in services in terms of investment screening. *Screening of foreign investments* refers to cases where laws or regulations enable governments or regulators to alter or prohibit foreign investment projects; the consideration of economic motives or economic interests is explicitly included in the criteria for approval. In Montenegro, regulations do not mandate that economic interests should be considered in the review of foreign investments. The conditions or criteria are vague and the consideration of economic motives are not ruled out. The economy does not set a threshold above which a foreign investment project is subject to screening.

A final horizontal element that affects some economies is the ability of foreigners from third countries to obtain the necessary business visas. Ease of business travel is an important complement to the cross-border offer and commercial presence in services. These are mainly measures affecting the duration of issuance and the cost of business visas. The Law on Foreigners stipulates that the procedure for obtaining a business visa in Montenegro should not take more than 10 days, with the possibility of extending the time for issuing a decision to 30 days if necessary. In practice, a period of 10-15 days is the norm. The cost of obtaining a visa is USD 147 and the applicant must submit 10 different documents. These procedures are all more burdensome and costly than the best practices identified by the OECD, but it is important to note that since 2016 Montenegro has brought its visa application procedure closer to the standards set in the EU visa code.

#### **How restrictive are individual services sectors?<sup>42</sup>**

Beyond regulatory measures that affect Montenegro's trade in services across the board, a certain number of sector-specific restrictions are observed in the 12 sectors analysed.

**Air transport services** are defined as passenger and freight air transport, carried domestically or internationally (code 51 under the International Standard Industrial Classification – ISIC – Revision 4). In light of the range of air transport subsectors, the STRI project focuses on measures affecting carriers' transport of passengers and goods between points. Airport management and other aviation services are only relevant where regulations can affect the ability of foreign carriers to transport passengers and goods between points. The other aviation services are covered more fully in the STRI for logistics services. The STRI scores can range from 0 to 1, with 0 signalling a completely open sector, while 1 indicates a sector closed to foreign service suppliers. The 2020 scores for all OECD member states and STRI partners in this sector range between 0.165 and 0.601, while the WB6 average is 0.421 which is roughly in line with EU (0.406) and OECD (0.409) averages. With a score of 0.401, Montenegro is the third least-restrictive of the WB6 economies (Figure 23.6).

*Restrictions on foreign entry* figure prominently in Montenegro's STRI results for air services. Like 40 other OECD and STRI key partners (OECD, 2020<sup>[50]</sup>), Montenegro limits the equity share that foreign natural or juridical persons can hold in an air transport services company to 49%. This restriction is, however, in line with European Union legislation. The leasing of foreign aircraft without crew (dry lease) and with crew (wet lease) are allowed, but subject to prior authorisation.

The other major category that influences the degree of restriction concerns *barriers to competition*. Like several economies, Montenegro maintains public ownership in the aviation sector through a national airline, Montenegro Airlines. However, the national air carrier does not provide cargo services.

Montenegro, airport slot allocation is aligned with EU regulations; slots are allocated in a fair and transparent manner. The general principle is that an air carrier having operated its particular slots for at least 80% during the summer/winter scheduling period is entitled to the same slots in the equivalent scheduling period of the following year (grandfather rights) which is very common across countries. To mitigate this restriction, Montenegro reallocates slots which are not sufficiently used by air carriers (the so

called "use it or lose it" rule), an effective competition protection measure in the sector. The STRI score is, however, limited by the economy prohibition of commercial exchange of slots, a practice which is more restrictive than the EU *acquis*, where slots can be freely transferred.<sup>43</sup>

**Road freight transport** (ISIC Rev 4 code 4293). The 2020 scores for all OECD member states and STRI partners in this sector range between a very low 0.124 and a high 0.624. The WB6 average is in the liberal bracket, with a score of 0.225, demonstrating the region's open approach to road freight transport services. With a score of 0.191, Montenegro is the third most open of the WB6 economies, performing better than the OECD average (0.201) but remaining more restrictive than the EU average (0.184). Unlike some OECD and STRI key partners, Montenegro does not impose many sector-specific regulations on this sector (Figure 23.6).

As regards *foreign entry restrictions*, Montenegro has a standing practice of limiting capacity in the domestic transport sector by instituting transport licenses or permits, with a fixed number of permits for a given time period.

In the area of *barriers to competition*, fees are set by the government for transportation management certification, issuing of licenses, license copy statements, licenses for international carriage of goods, and special permits for foreign carriers. But transport prices are set freely by the operators, which increases the competition in the sector.

**Rail freight transport** (ISIC code 4912) is provided over a dedicated network in which the market structure may take different forms. The two most common are: 1) vertically integrated rail services firms owning and managing both the infrastructure and the operation of freight services; and 2) vertical separation between infrastructure management and operations (the case in Montenegro). Regardless of the market structure, there are well-established best practice regulations that also take into account competition from other modes of transport, particularly road transport. The 2020 scores for all OECD member states and STRI partners in this sector range between a very open 0.129 to a completely restricted score of 1. The WB6 average (0.316) is relatively low. Montenegro is the third most restrictive economy of the WB6 and its score (0.287) is higher than the EU (0.209) and the OECD (0.259) averages. It is also worth mentioning that the economy is more restrictive than the EU's worst performer (Poland) (OECD, 2020<sub>[51]</sub>) (Figure 23.6).

In terms of *foreign entry*, according to the railway law, non-resident foreign carriers can use the Montenegrin railroad under the conditions set by international agreements. Montenegro is only connected by railroad to Albania and Serbia. The bilateral agreement with Albania is only applicable for the railroad sector going from the border to the nearest stations in both economies: Bajza in Albania and Tuzi in Montenegro. Transit rights are not provided. The fact that licenses and certificates in railway traffic are required in order to enter the market has a negative effect on the STRI score.

As regards *restrictions on the movement of people*, licenses are required in order to practise. However, positively, there are laws in place which establish processes for recognising qualifications gained abroad, which mitigates this restriction.

*Barriers to competition* are an important contributor to Montenegro's STRI performance in rail transport services. Access fees are regulated and are calculated by the infrastructure manager according to certain pre-defined criteria. The fees must be approved by the government. Transfer and trading of infrastructure capacity are prohibited and there is a dominance on the infrastructure. The Montenegrin state owns the majority share capital of Montecargo, a major firm in the sector. This negatively affects competition, and consequently the STRI score in the sector.

**The courier services sector** (ISIC Rev 4 code 53) comprises postal and courier activities. While courier services have traditionally been an important means of communication, the rise of modern ICT has reduced its use for communication. The STRI for courier services covers regulations that have an impact on pick-up, transport, delivery (door-to-door delivery) services of letters, parcels, and express delivery services regardless of who provides the services. These services include both addressed and unaddressed items.

The 2020 scores for all OECD member states and STRI partners are between 0.106 and 0.881, while the WB6 average is 0.301. With a score of 0.193, Montenegro is one of the least-restrictive WB6 economies, still scoring higher than the EU (0.181) but lower than the OECD (0.259) averages (Figure 23.6).

In terms of sector specific restrictions on the *movement of people*, legal and natural persons registered as providing transport of goods must file an application to the Montenegro Agency for Electronic Communications and Postal Services (AECPS) for providing commercial postal services. However, this is a very common measure in the postal sectors.

*Foreign entry* restrictions contribute significantly to the performance of many economies; Montenegro is no exception. Such restrictions are present in the form of a license needed in order to enter the market as prescribed by the Law on Postal Services.<sup>44</sup> Postal services are carried out under either a special licence, or a decision on the fulfilment of all conditions for carrying out postal services. Among the measures that have contributed most to the liberalisation of this sector, Montenegro has abolished all reserved services for the designated postal operator (DPO) in 2013, thus increasing its openness in this sector and bringing it closer to the best performers in the EU (Box 23.4).

#### Box 23.4. Making the best of the STRI tools: Comparing courier services in Slovenia and Montenegro

The joint use of STRI tools helps identify the regulatory elements that weigh on the restrictiveness index and consequently on the degree of openness of a sector. A comparative study of the STRI 2020 indices of Slovenia and Montenegro (Figure 23.8) highlights certain elements.

Figure 23.8. Comparing courier services restrictiveness in Montenegro and Slovenia

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; MNE=Montenegro; SVN=Slovenia  
Source: OECD2020 STRI; CO2021 STRI

StatLink  <https://doi.org/10.1787/888934255912>

Comparing both economies using the STRI Sector Brief 2020 and indices, Montenegro has a relatively low score in the courier services sector compared to other OECD STRI participants. Likewise, Slovenia has a very open and liberal courier services market, scoring amongst the lowest indices in this sector. The Postal Act of 1997 brought Slovenian legislation in the postal sector partially into line with the EU *acquis*. The complete liberalisation of postal services was achieved with the adoption the new Postal Services Act in April 2002 and secondary acts in 2003. Currently, courier services are Slovenia's least restrictive STRI sector. The economy maintains only a few sector-specific restrictions, notably the

existence of a state-owned designated postal operator and limits on the proportion of shares that can be acquired by foreign investors.

Comparing both economies using the STRI policy simulator, it appears that only a limited number of regulatory measures dictates the weight difference between Slovenia and Montenegro's STRIs. This suggests that Montenegro could substantially reduce its restrictiveness index to the average levels found in the STRI by lifting specific restrictions:

- In the area of *restrictions on movement of people*, the scoring of both economies is largely driven by the quotas on foreign services suppliers. Additionally, both states allow only very short stays for foreign service providers. However, Slovenia has aligned its regulatory environment with international good practice on the length of stay of intra-corporate transferees. Overall, lifting limitations on movement of people based on the Slovenian example could decrease Montenegro's courier restrictiveness index value by 0.008. Going beyond Slovenia's reforms, lifting all restrictions on movement of people could decrease Montenegro's index by 0.052.
- In the *barriers to competition* category, unlike Montenegro Slovenia does not apply any preferential tax or subsidy treatment to the national DPO. Lifting this restriction could decrease Montenegro's courier index value by 0.011.

Source: (OECD, 2017<sup>[52]</sup>), *Services Trade Policies and the Global Economy*, <https://doi.org/10.1787/9789264275232-en>; (OECD, 2020<sup>[53]</sup>), *OECD Services Trade Restrictiveness Index (STRI) - STRI Sectoral Brief: Postal and Courier Services 2020*, <https://www.oecd.org/trade/topics/services-trade/documents/oecd-stri-sector-note-courier.pdf>.

As regards *barriers to competition*, the universal service provider is the State-owned Post Office Montenegro d.o.o Podgorica, designated by the AECPS under a public tender procedure, which is in line with EU regulations. The Post Office Montenegro Podgorica is the only postal operator with the technical capacity to provide universal services across the entire territory of Montenegro. The DPO obtains preferential tax or subsidy treatment and is entitled to compensation if the operation of the universal postal service incurs a net cost that represents an unfair financial burden on the universal postal operator. Box 23.4 presents a detailed case study of how Montenegro could reduce the restrictions in this sector.

**Legal services** (ISIC Rev 4 code 691) cover advisory and representation services in domestic and international law, and where relevant, measures are compiled separately for each of them. International law includes advisory services in the home country law, third country law, international law, as well as a right to appear in international commercial arbitration. Domestic law extends to advising and representing clients before a court or judicial body in the law of the host country. The 2020 scores for all OECD member states and STRI partners in the legal services sector range between a very open 0.141 and a completely closed 1. With a score of 0.454, Montenegro is the fifth most-restrictive economy in the WB6, scoring just above the WB6 (0.391), EU (0.394) and OECD (0.382) averages (Box 23.6).

Though foreign equity limits are rarely used in legal services amongst OECD member states, most of those countries restrict the ownership of law firms to locally qualified lawyers, particularly in the area of domestic law. Ownership restrictions are often coupled with requirements that the majority of the board (or equity partners in the case of partnerships) and the manager of law firms be locally qualified (OECD, 2020<sup>[54]</sup>). This is not the case in Montenegro, which is competitive in this respect. Its result, which is in the median of the OECD, is due to *restrictions on movement of people*, such as the requirement to practice locally for at least one year, licensing and recognition procedures for foreign qualifications. These include nationality and residence requirements for practising, as well as the obligation to pass a local examination or to engage in local practice prior to recognition of the qualification.

Montenegro separates domestic lawyers (who practice national law) from foreign lawyers (who practice their national, international or European law). In both cases, a separate registration with the Bar Association exists.

Attorneys practising domestic Montenegrin law must be registered in the directory of attorneys regulated by the Bar Association. Only citizens of Montenegro (and EU citizens who have been practising law in Montenegro for at least three years and that have passed the Bar exam) can practise domestic law.

Since 2017, EU lawyers can advise on their home country law, the European Union law and the International law without being registered as a foreign lawyer. Third country nationals are bound by the obligation of being registered as foreign lawyers with the Bar Association. Once registered, third country nationals can represent their clients in front of Montenegrin jurisdictions but only jointly with a local attorney who has the right and duty to practise legal profession in Montenegro. Foreign attorneys are also limited in their interaction with the Bar Association as they cannot be elected to its bodies or employ a law trainee. It is only after three years of practice in Montenegro that an attorney entered in the directory of foreign lawyers, can be registered in the directory of foreign attorneys-at-law under the name “attorney” (i.e. full scope of legal practice).

There is no temporary licensing in place. Nevertheless, with the 2017 amendment, some activities may be performed by an attorney from an EU Member State who is not registered in the directory of foreign attorneys-at-law. An attorney from an EU Member State must submit a written notice to the Bar Association of their intention to perform activities and attach a proof of entry in the registry for practising law in their home country, as well as proof of professional liability insurance in the home country.

As regards *restrictions on foreign entry*, local presence is required for cross-border supply of legal services. In order to practise, licensed lawyers must declare an address or a representative who has an address in Montenegro for administrative purposes, especially for receiving correspondence. Commercial association is prohibited between lawyers and other professionals. It is important to note, however, that foreign lawyers who establish a limited liability company in Montenegro may provide consultancy services and they can co-operate with other professionals as they don't have the status of law firms.

In the area of *barriers to competition*, the Bar Association of Montenegro regulates all attorneys' tariffs, which is considered as a restriction to competition in the legal sector. Registered lawyers are forbidden to advertise – these restrictions further undermine the STRI score.

**Commercial banking** (ISIC divisions 64-66) is defined as deposit-taking, lending and payment services. Commercial banking services are traded business to business, as well as business to consumer for retail banking. Efficient banking services are one of the backbones of dynamic economies; they provide financing for investment and trade across productive activities, and thus underly all value chains.

The 2020 scores for all OECD member states and STRI partners in the commercial banking sector range between 0.131 and 0.517. The WB6 average is 0.239, above the EU (0.180) and OECD (0.205) averages. With a score of 0.254, Montenegro is the third least restrictive of the WB6 economies for this services sector (Box 23.6).

Montenegro applies restrictions on cross-border mergers and acquisitions. A legal person may not acquire a qualifying holding in a bank without the prior approval of the Central Bank. Those who hold a qualifying participation in a bank may not increase their participation in the capital or voting rights in the bank to reach over 20%, 33% or 50% of the voting rights or capital of the bank, without the prior approval of the Central Bank. A foreign bank may open a representative office in Montenegro but this office may not deal with the bank's affairs. Only a commercial presence has this capacity. The criteria to obtain a licence are more stringent for foreign companies. The foreign bank must provide numerous documents proving that they have a credit rating of at least an A and that the deposit protection system in the origin country has at least the same level of protection as the Montenegrin deposit protection system. The legislation does not state

that applicants must be informed of the reason for denial of licences, an omission which further damages the STRI score.

In the area of *barriers to competition*, Montenegro's risk-weighting methodology is still not fully aligned with Basel Committee on Banking Supervision (BCBS) standards. According to its 2020 policy, the Central Bank will adopt and monitor the implementation of a comprehensive set of secondary legislation enabling the application of the Law on Credit Institutions, aimed at full execution of Basel III requirements,<sup>45</sup> and recent amendments to relevant EU regulations (CRD V and CRR2). The law will enter into force in January 2022.<sup>46</sup> Contractual and default interest rates, as well as interest rates on deposits, are regulated. The bank is obliged to calculate and report active effective interest rates on loans and effective passive interest rates on deposits received and to inform clients and the public about the amount of effective interest rates in a format determined by a Central Bank regulation.

**Insurance services** (ISIC Rev 4 code 651 and 652) comprise life insurance, property and casualty insurance, reinsurance and auxiliary services. Private health insurance and private pensions are not covered.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.104 and 0.565. With a score of 0.149, Montenegro is the second least restrictive of the WB6 economies for the insurance services sector, scoring below the EU (0.175), OECD (0.193) and WB6 (0.231) averages (Box 23.6).

Restrictions on the *movement of people* are applied through licence requirements. Criteria to obtain a licence are more stringent for foreign companies. Foreign affiliates are subject to a list of additional submissions including a report on the last three years of operations, audit reports on the financial statements for the previous business year, the opinion of the home country's supervisory authority on the applicant's business and approval to establish the affiliate in Montenegro, among others.

There are also *restrictions on foreign entry*. The regulatory body will reject the request from a foreign company if insurance companies based in Montenegro are prevented from performing insurance business under the same conditions as insurance companies in that state. Under the STRI guidelines, this measure is marked as reciprocity based and is therefore restrictive.

**Construction services** (ISIC Rev 4 codes 41 and 42) cover the construction of buildings (residential and non-residential) as well as construction work for civil engineering. **Architecture services** and related technical consultancy (ISIC Rev 4 code 711) constitute the backbone of the construction sector, with key roles in building design and urban planning. **Engineering services** (ISIC Rev 4 code 711) cover several related activities, such as engineering and integrated engineering services, and engineering related scientific and technical consulting services.

An important feature is the regulatory complementarity between architectural, engineering and construction services. Often, architectural and engineering activities are combined in projects proposed by a single firm, and are sometimes subsumed within the building and construction sector. The scope of the STRI definition for architectural services includes several related activities, such as architectural consulting and pre-design services, architectural design, contract administration services, and urban planning and landscape architecture services. Engineering services are the backbone of construction and procurement. Engineers are involved in the construction of key infrastructure, such as buildings and roads. They also play an important role in the development of production processes and the adoption of new technologies. Finally, construction services have historically played an important role in the functioning of economies, providing the infrastructure for other industries. These services account for a significant share of GDP and employment in most economies. Public works, such as roads and public buildings, account for about half of the construction services market. Therefore, the STRI for construction services covers detailed information on public procurement procedures.

The 2020 scores for construction services for all OECD member states and STRI partners range between 0.123 and 0.464, while the WB6 average is 0.242. Montenegro (0.209) is the third-least restrictive of the WB6 economies for the construction services sector, scoring lower than the OECD (0.222) and WB6 (0.242) averages, but higher than the EU average (0.207) (Box 23.6).

The 2020 scores for the architecture sector for all OECD member states and STRI partners range between 0.113 to 0.684. With a score of 0.298, Montenegro is the most restrictive of the WB6 economies in this sector. It is more restrictive than the EU (0.260), OECD (0.244) and WB6 (0.265) averages. Finally, the 2020 scores in engineering for all OECD member states and STRI partners range between 0.118 and 0.575. Montenegro (0.203) is the second-least restrictive of the WB6 economies in this sector, scoring below the EU (0.245), OECD (0.233) and WB6 (0.244) averages.

For all three sectors, *restrictions on the movement of people* are present in the form of licensing requirements which need to be respected in order to provide engineering services in Montenegro. Since 2017, a foreign entity from an EEA Member State in possession of an authorisation from its economy of origin can operate in Montenegro provided that the authorisation is related to the activity governed by the law. A foreign entity from a non-EEA Member State may also perform activities in compliance with the law governing the recognition of foreign qualifications under the principle of reciprocity. Foreign construction engineers are required to take a local examination. For architecture and engineering, a temporary licence can be issued for up to one year, which is a restrictive measure in this sector.

On the positive side, Montenegro has a procedure for recognising foreign qualifications. In the process of issuing a licence to a foreign certified engineer, foreign educational qualifications are checked according to the law on recognition of foreign qualifications.

**Computer services** (ISIC Rev 4 codes 62 and 63) include computer programming, consultancy and related activities, and information service activities. The 2020 scores for all OECD member states and STRI partners range between 0.123 and 0.448. With a score of 0.249, Montenegro is the third least restrictive of the WB6 economies, scoring above the EU (0.211), OECD (0.221) and WB6 (0.239) averages. This sector is very rarely regulated by sectoral legislation. Montenegro subjects computer services to general laws that apply to the economy as a whole. This is why restrictions on the movement of people account for one-third of the total scores in computer services (Box 23.6).

**Telecommunication services** (ISIC Rev 4 codes 611 and 612) cover all wired and wireless telecommunications activities. These services are at the core of the information society and provide the network over which other services including computer services, audio-visual services, professional services and many more are traded. The 2020 scores for all OECD member states and STRI partners range between 0.108 and 0.682. Montenegro is in the high bracket for the restrictiveness of its telecoms sector with a score of 0.159, which makes it the second-most restrictive of the WB6 economies. It scores above the EU average (0.151) but below the OECD (0.188) and WB6 (0.231) averages (Box 23.6).

The STRI participant economies' results in the telecommunications sector are usually driven by two policy areas: 1) restrictions on the entry of foreigners; and 2) barriers to competition. In all OECD member states, barriers to competition account for 30% of the total STRI scores in the sector. This reflects the particular characteristics of the sector as well as the policy environment in which it operates. It is a capital-intensive network industry and its strategic importance has led many economies to restrict foreign investment and activity in the sector.

In order to ensure fair competition in the telecommunications market, Montenegro has an independent telecommunications regulator, the Agency for Electronic Communications and Postal Services (EKIP), which is separate from stakeholders and the government and operates without state intervention. EKIP has sufficient regulatory powers to regulate the sector effectively through *ex ante* regulations applied in accordance with EU precepts. These ensure that no single operator with significant market power (SMP) in certain market segments (inevitable in certain cases) is bound by appropriate pro-competition

regulations. *Ex ante* regulations are based on regular market analysis and are readily available on the EKIP website. The government does not maintain any state-owned enterprise (SOE) in this sector. Montenegro applies a "use-it-or-lose-it" policy to frequency bands<sup>47</sup> - an important measure that prevents incumbent operators from monopolising valuable frequency licences, as well as free tradable spectrum and telecom services.

In absolute terms, the regulatory framework of Montenegro's telecommunications sector is competitive. It is only constrained by economy-wide measures, most notably on the movement of people. Although telecommunications lend themselves easily to cross-border trade from a technical point of view, restrictions on the movement of people account for a modest share of the total STRI score in this sector. Cumbersome procedures for obtaining visas and registering companies negatively affect the sector to some extent as well.

### *Sub-dimension 2.3: E-commerce and digitally enabled services*

E-commerce can bring about significant gains for businesses, driving firms' process innovation. In addition, it enlarges businesses' market scope, reduces operational costs at various stages of business activities and facilitates market access, thus intensifying competition (OECD, 2013<sup>[55]</sup>). E-commerce also benefits consumers by providing information on goods and services, helping consumers identify sellers and compare prices, while offering convenient delivery and the ability to purchase easily via a computer or mobile device (OECD, 2013<sup>[55]</sup>).

In the context of the COVID-19 pandemic, e-commerce appears to have been essential for maintaining trade flows despite the restrictions put in place to preserve public health (OECD, 2020<sup>[56]</sup>). Buying online rather than in person also reduces the risk of infection. Being able to keep selling in locked-down economies preserves jobs despite social distancing and movement restrictions. Finally, e-commerce increases the acceptance of prolonged physical distancing among the population and allows them to maintain a certain level of consumption. It is sure that 2020 will be a turning point in electronic commerce. This digital transformation underlines the importance of adopting a more holistic approach to policies as well as increasing international co-operation (Ferencz, 2019<sup>[57]</sup>); (OECD, 2020<sup>[58]</sup>).

This sub-dimension assesses those policies which are implemented in parallel and in addition to those discussed under Digital society (Dimension 10). However, it is mainly focused on the trade in digitally enabled services given the rapid growth of trade in services in the region.

Modern e-commerce regulations should focus on a number of key elements, such as electronic documentation and signature, online consumer protection, data protection and privacy, cyber security, intellectual property regulations, and intermediary liability. On the other hand, an attractive regulatory environment should refrain from maintaining disproportionately restrictive measures, such as licensing requirements for e-commerce platforms, limitations on the type of goods that can be sold online (other than for generally accepted public policy considerations), and restrictions on cross-border data flows.

Quantitative data show that e-commerce is developing rapidly in Montenegro. In 2019, 99.3% of Montenegro's businesses had access to the Internet; 83.6% of these connected enterprises had a business website. The Statistical Office of Montenegro (MONSTAT) reports that 26.9% of companies receive orders via the Internet and around 26.7% place their orders online (MONSTAT, 2019<sup>[59]</sup>). Montenegro is a regional leader in global competitiveness in the field of ICT; revenue in the e-commerce market is projected to grow in the coming years to achieve a peak annual growth rate of 13.7% by 2025.<sup>48</sup> However, the share of consumers buying online is still lower than in EU Member States. This gap is likely to narrow in the coming years as a result of the structural changes to the economy caused by the COVID-19 crisis. The majority of companies in Montenegro switched to electronic trade during the lockdown.

There have been no substantive changes to **the e-Commerce policy framework** since the last assessment cycle. Montenegro has an enabling regulatory environment for e-commerce. The Montenegrin Law on Electronic Commerce adopted in 2004 (with subsequent amendments in 2010, 2011 and 2013), regulates e-commerce services and provides legal certainty for businesses and consumers in this area. The law is largely aligned with EU *acquis* and the EU Directive on e-Commerce.<sup>49</sup> Regulations related to e-commerce fall under the competence of several institutions. The Ministry of Public Administration is responsible for adopting the law; the Ministry of Economic Development helps implement it in relevant areas of trading and business good practices; and its implementation is supervised by inspectors for information society services.

In practice, however, according to the authorities themselves, co-ordination mechanisms are lacking and programme planning is poor, leading to inadequate monitoring and evaluation for effective policy revision. To mitigate these issues, the Ministry for Public Administration will propose a new strategy for digital transformation for the period 2021-25. Relevant e-commerce indicators were identified in the Strategy for the Information Society Development for Digital Business 2020, which outlines strategic development tools with a view to reaching the EU standards set out in the Digital Agenda 2020 and the Digital Single Market Strategy.

The OECD digital STRI captures **the restrictiveness of digitally enabled services** by identifying cross-cutting barriers that inhibit or completely prevent firms from supplying services using digital networks, irrespective of the sector in which they operate. The regulatory data underlying the digital STRI were extracted from the OECD STRI database and from data collected under public laws and regulations affecting digitally enabled services. Digital STRIs are the result of aggregating the identified barriers to trade into composite indices. Digital STRI scoring uses a binary system: scores are assigned a value of 0 when there are no trade restrictions and a value of 1 when full restrictions are in place. The rating takes into account the specific regulatory and market characteristics as well as the links and hierarchies among regulatory measures affecting digitally enabled services (Ferencz, 2019<sup>[57]</sup>); (OECD, 2020<sup>[58]</sup>).

The 2020 digital STRI scores for all OECD and partner states in this sector are moderate to high, ranging from 0.043 to 0.488, and with an average of 0.183. Montenegro is in the lower bracket for the restrictiveness of its digital sector, with an overall score of 0.101. This reflects, among other things, the complete absence of restrictions in some of the categories analysed by the OECD Digital STRI as displayed in Figure 23.9.

The digital STRI scores across OECD countries are regularly driven by infrastructure and connectivity measures. This is usually the consequence of the lack of effective telecoms infrastructure regulations, especially in the area of interconnection. However, this is not a limitation in Montenegro, which benefits from regulations that are relatively well aligned with international good practice and are not excessively restrictive. Similarly, although Montenegro has stricter rules than the OECD Guidelines on the Protection of Privacy and Transborder Flows of Personal Data (OECD, 2013<sup>[60]</sup>) in this area, it does not impose overly burdensome conditions on cross-border data flows, beyond those put in place to ensure the protection and security of personal data. However, like 11 other digital STRI economies, Montenegro requires some types of data to be stored locally, though this is mitigated by allowing the transfer of copies abroad as long as the Montenegrin authorities can have direct access to the data upon request.

No specific licences or authorisations for e-commerce activities are required, other than normal commercial licences. This eases the establishment of electronically enabled services and makes the economy all the more attractive to foreign suppliers. International standards for electronic contracts and key electronic authentication measures such as recognition of electronic signatures are generally in place.

Montenegro is open in the categories of intellectual property rights and payment systems from a regulatory point of view. The regulations in place do not treat foreigners less favourably than nationals in terms of intellectual property protection.

Figure 23.9. Digital services trade restrictiveness index: WB6 and CEEC economies

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; \*CEEC=Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovak Republic and Slovenia (Bulgaria, Croatia, and Romania are not OECD member states nor OECD STRI Partner economies and therefore do not have calculated STRI indices); the absence of a category in the graph means that it is exempt from restrictions. Source: (OECD, 2020<sup>[49]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

### The way forward for trade policy

Despite some important steps taken to improve the trade policy framework, especially in the area of public consultations, the Government of Montenegro could improve its decision making further by paying attention to the following:

- **Adopt a system for evaluating regulatory frameworks by implementing public consultation standards.** A comprehensive system for review, based on both qualitative indicators (e.g. broadness of consultation, stakeholder satisfaction with their involvement) and quantitative indicators (e.g. frequency of consultations), would help to measure the success of reforms and allow for the adjustment of consultation frameworks where necessary.
- **Enforce the effective application of regulatory impact analysis.** Despite the existence of a well-developed procedure for RIA, its implementation can be improved. The analysis of the impact of legislative proposals could be more comprehensive. The government needs to build line ministries' capacity to undertake impact assessments and to evaluate the effects of legislative proposals, especially for trade-related matters.
- **Further enhance the existing process for evaluating the Public-Private Consultation frameworks.** There is a need to sustain and deepen the current process of regular review of consultation frameworks. The Ministry of Public Administration, Digital Society and Media already collects the necessary statistics on the established objectives of effectiveness, efficiency, inclusion and transparency. Its efforts should now be focused on harmonising and systematising evaluation as well as developing performance indicators that measure the degree of openness and transparency of consultations. In doing so, Montenegro can draw inspiration from the United Kingdom's guidelines on PPCs (Box 23.5). Ideally, a monitoring programme with an adequate budget and office independent from the government could be introduced to allow for systematic evaluations. In addition, training could be provided in the use of various quantitative and qualitative approaches to measure compliance with the minimum standards set by regulatory frameworks for

public consultations. Moreover, the increased participation of the business community in the consultation process demonstrates a potential to be exploited in Montenegro to improve the process. Montenegro should follow the example of the stakeholder involvement in the European Commission policy cycle (Box 23.6) to develop a feedback mechanism to improve its consultations.

- **Broaden trade in services efforts beyond regional trade agreements.** Significant improvements have been made among the WB economies to open services trade through the conclusion of CEFTA Additional Protocol 6 in December 2019. Nonetheless, the STRI analysis in this section has provided some insights into where domestic reforms could help to attract new businesses and improve competitiveness.
- **Lift some of the stringent restrictions on services in trade:**
  - **Ease conditions on the temporary movement of natural persons** by removing the remaining quotas and labour market tests which apply to foreign services suppliers. This would further encourage innovation and knowledge transfer, and contribute to economic growth.
  - **Reduce the remaining barriers to market entry and competition** in the courier sector (Box 23.4) as well as the legal and architecture services sectors, and make further efforts to increase competitiveness.
  - **Lift the requirement for third-country foreign architecture service providers to completely re-take their university degree.**
  - **Amend the preferential subsidy treatment** for the designated postal provider in the courier sector.
  - **Amend the prohibition of commercial association between lawyers and professionals**, along with the local presence requirement which states that licensed lawyers must declare an address or a representative who has an address in Montenegro in order to practise in the economy.
- **Strengthen the regulatory framework for e-commerce** by creating co-ordination mechanisms and strengthening programme planning in order to establish an effective monitoring and evaluation process to improve policy revision. A first step could be to review and assess the impact of previously implemented programmes on the digitisation of Montenegrin businesses in order to identify gaps in the design of regulatory measures governing e-commerce. A set of indicators for private sector ICT take-up, including e-commerce, should be developed and regularly monitored.

### Box 23.5. Consultation guidelines in the United Kingdom

The United Kingdom's 2008 Code of Practice is a good example of how a government can provide its civil servants with a powerful tool to improve the consultation process and its review, even though it is not legally binding and only applies to formal, written consultations. The 16-page Code of Practice is divided into 7 criteria, to be followed for every consultation:

- Criterion 1: When to consult. Formal consultation should take place at a stage when there is scope to influence the policy outcome.
- Criterion 2: Duration of consultation exercises. Consultations should normally last for at least 12 weeks with consideration given to longer timescales where feasible and sensible.
- Criterion 3: Clarity of scope and impact. Consultation documents should be clear about the consultation process, what is being proposed, the scope to influence and the expected costs and benefits of the proposals.
- Criterion 4: Accessibility of consultation exercises. Consultation exercises should be designed to be accessible to, and clearly targeted at, those people the exercise is intended to reach.

- Criterion 5: The burden of consultation. Keeping the burden of consultation to a minimum is essential if consultations are to be effective and if consultees' buy-in to the process is to be obtained.
- Criterion 6: Responsiveness of consultation exercises. Consultation responses should be analysed carefully and clear feedback should be provided to participants following the consultation.
- Criterion 7: Capacity to consult. Officials running consultations should seek guidance in how to run an effective consultation exercise and share what they have learned from the experience.

The Code of Practice was replaced with the much shorter "Consultation Principles" in 2012. The Consultation Principles highlight the need to pay specific attention to proportionality (adjusting the type and scale of consultation to the potential impacts of the proposals or decision being taken) and to achieve real engagement rather than merely following a bureaucratic process.

Source: (UK Government, 2008<sup>[61]</sup>), *Code of practice on consultation*, [www.bis.gov.uk/files/file47158.pdf](http://www.bis.gov.uk/files/file47158.pdf); (UK Government, 2016<sup>[62]</sup>), *Consultation principles 2016*, [www.gov.uk/government/uploads/system/uploads/attachment\\_data/file/492132/0160111\\_Consultation\\_principles\\_final.pdf](http://www.gov.uk/government/uploads/system/uploads/attachment_data/file/492132/0160111_Consultation_principles_final.pdf).

### Box 23.6. Stakeholder engagement throughout the policy cycle at the European Commission

Following the adoption of the 2015 Better Regulation Guidelines, the European Commission has extended its range of consultation methods to enable stakeholders to express their views over the entire lifecycle of a policy. It uses a variety of different tools to engage with stakeholders at different points in the policy process. Feedback and consultation input is taken into account by the Commission when further developing the legislative proposal or delegated/implementing act, and when evaluating existing regulation.

At the initial stage of policy development, the public has the possibility to provide feedback on the Commission's policy plans through roadmaps and inception impact assessments (IIA), including data and information they may possess on all aspects of the intended initiative and impact assessment. Feedback is taken into account by the Commission services when further developing the policy proposal. The feedback period for roadmaps and IIAs is four weeks.

As a second step, a consultation strategy is prepared setting out consultation objectives, targeted stakeholders and the consultation activities for each initiative. For most major policy initiatives, a 12-week public consultation is conducted through the website "Your voice in Europe" and may be accompanied by other consultation methods. The consultation activities allow stakeholders to express their views on key aspects of the proposal and main elements of the impact assessment under preparation.

Stakeholders can provide feedback to the Commission on its proposals and their accompanying final impact assessments once they are adopted by the College. Stakeholder feedback is presented to the European Parliament and Council and aims to feed into the further legislative process. The consultation period for adopted proposals is eight weeks. Draft delegated acts and important implementing acts are also published for stakeholder feedback on the European Commission's website for a period of four weeks. At the end of the consultation, an overall synopsis report should be drawn up covering the results of the different consultation activities that took place.

Finally, the Commission also consults stakeholders as part of the *ex post* evaluation of existing EU regulation. This includes feedback on evaluation roadmaps to review existing initiatives, public

consultations on evaluations of individual regulations and “fitness checks” (i.e. comprehensive policy evaluations assessing whether the regulatory framework for a policy sector is fit for purpose). In addition, stakeholders can provide their views on existing EU regulation at any time on the website “Lighten the load – Have your say”.

## Access to finance (Dimension 3)

### Introduction

With an overall score of 2.7, Montenegro is the WB6's second-best performer (after Serbia) for access to finance (Table 23.6). Montenegro has increased its score by 0.5 since the previous assessment (Figure 23.1), reflecting changes in the legal framework.

**Table 23.6. Montenegro's scores for access to finance**

Dimension	Sub-dimensions	Score	WB6 average
Access to finance dimension	Sub-dimension 3.1: Access to bank finance	3.1	3.4
	Sub-dimension 3.2: Access to alternative financing sources	2.1	1.9
	Sub-dimension 3.3: Mobilisation of long-term financing	3.5	2.8
Montenegro's overall score		2.7	2.6

### State of play and key developments

#### *Sub-dimension 3.1: Access to bank finance*

Montenegro's financial sector is bank-dominated, with the banking sector accounting for around 92% of total assets in the financial sector, followed by insurance companies (5%). Between 2010 and 2019, the cumulative market share of the top three banks dropped from 57% to 42%, reflecting an increase in competition in the banking sector. As of January 2020, six domestic and seven foreign banks were operating in the economy. In 2019, two domestic banks declared bankruptcy, initiated by the Central Bank of Montenegro. An external, independent review of the asset quality of all 13 banks started in February 2020, with a view to strengthening stability and confidence in the banking system. The review is expected to be concluded in 2021 (EC, 2020<sup>[66]</sup>).

Montenegro benefits from a well-established **legal and regulatory framework for the banking industry**. The banking law, most recently amended in November 2017, governs the foundation, management, operations and supervision of banks operating in Montenegro. Basel II<sup>50</sup> recommendations have been fully implemented. The law does not impose any barriers to the entry and operation of foreign banks. The conditions to obtain a licence from the Central Bank of Montenegro are the same for both domestic and foreign banks.

In December 2019, the law on the resolution of credit institutions and the law on credit institutions were finalised under the supervision of the Central Bank of Montenegro. By improving the minimum capital requirements, as well as the leverage and the liquidity coverage ratios for the banking industry, the laws aim to bring Montenegro's regulatory framework in line with Basel III core principles. Although they were planned to enter in force in January 2021, difficulties caused by COVID-19 has postponed implementation until January 2022 following the request of the Association of Montenegrin Banks.

The law on credit institutions applies uniformly to all credit institutions as recommended by the European Banking Authority,<sup>51</sup> and has the same approach regardless of the size of business. As Montenegro is a euroized economy, no special capital requirements exist for foreign exchange or for the mandatory disclosure of the risk of foreign exchange borrowing.

A functional **cadastre and registration system** is in place and the information is available on the Real Estate Administration's (REA) website. There are three types of cadastral records: 1) registry cadastre; 2) land cadastre; and 3) real estate cadastre. As in the previous assessment, the ownership of the pledges of registered assets (fixed and non-fixed) remains largely documented (75%) and covers 100% of the urban territory.

**Collateral requirements** remain strict and high, rendering access to bank loans challenging for businesses in Montenegro. Around 60% of loans require collateral in Montenegro, close to the OECD average (58%). However, 209% of the borrowed amount is required as collateral in Montenegro, compared to an average of 88% in the OECD economies (World Bank, 2019<sup>[20]</sup>). The Montenegrin legal framework allows secured creditors to create and enforce their rights over non-fixed assets such as securities, movable assets and stocks; however, real estate and land remain the most common collateral for loans. Moreover, there is no limitation in terms of threshold regulation under which collaterals are flexible for small business, and banks can adopt their own policies, potentially limiting smaller firms access to liquidity without immovable collaterals.

Montenegro lacks a national credit guarantee scheme for **credit enhancement and risk mitigation**. However, in March 2019 the Investment Development Fund (IDF) of Montenegro signed an agreement worth EUR 75 million with the European Investment Fund under the COSME Loan Guarantee Facility programme to improve the access to finance for micro and small enterprises. The programme aims to support entrepreneurs who are unable to provide adequate collateral. It foresees subsidising interest rates for SMEs with an average value of 3%, compared to the average 5% interest rates applied by commercial banks. SMEs have been able to benefit from the programme since mid-2020.

Moreover, to mitigate the effects of the COVID-19 pandemic, the government has created a new credit line under the IDF to improve the liquidity of SMEs up to a maximum amount of EUR 3 million per beneficiary. SMEs can apply through a simplified procedure with no approval fee and an interest rate of 1.5%. In addition, in January 2021 the government introduced an interest rate subsidy with a 12-month grace period for firms operating in the agriculture sector.

One public credit registry exists in Montenegro under the supervision of the Central Bank. It includes both positive and negative **credit information** on borrowers, and is accessible to financial institutions and the public upon motivated requests. In addition to daily updates on information collected by the credit registry for newly issued loans, coverage increased from 38.8% in 2018 to 41% of the adult population in 2019 (World Bank, 2019<sup>[22]</sup>). The law on data protection provides for comprehensive consumer rights on the use of personal data and allows users to correct mistakes in credit reports. However, the law does not stipulate a minimum time limit for data storage.

### *Sub-dimension 3.2: Access to alternative financing sources*

The legal and regulatory framework to support **factoring and leasing** is improving; however, the use of these options is very limited: their combined share in the total financial sector assets represents around 0.9%. According to the latest available data from the Central Bank, factoring volume decreased from EUR 3.3 million to EUR 1 million between 2011 and 2019. This is directly linked to the change of the law in 2018 (see below), which meant that only one company could obtain a work license. By contrast, the volume of leasing increased from EUR 1.6 million to EUR 40.3 million between 2011 and 2019.

The Law on Financial Leasing, Factoring, Purchase of Receivables, Micro-credit and Credit-guarantee Operations took effect in May 2018. It provides the framework for factoring and leasing activities, and assigns the Central Bank the supervisory role. For the first time in Montenegro,<sup>52</sup> the law regulates factoring and purchase of receivables. Financial leasing was previously partially covered under the Law on Banks adopted in 2011 and now benefits from a more comprehensive dedicated regulation under the new law. Overall, the new law significantly improves these activities and aligns the regulatory framework with international standards (Rosca, 2017<sup>[67]</sup>). Another novelty is that following the recent extension to the regulatory framework, factoring and leasing are supervised by the Central Bank of Montenegro. Previously factoring companies were only obliged to report to the tax administration. Since Q1 2019, licensed firms have started to report to the central bank quarterly.

There is no clear definition of **venture capital** activities in Montenegro; however, the regulatory frameworks allow these activities to be established as specialised investment funds, regulated by the law on investment

funds adopted in 2018. The law contains basic provisions, such as rules on the method for determining net asset value, and detailed requirements for investors. However, the lack of a regulation covering seed and early investors limits the development of venture capital activities in Montenegro. According to a government statement, a law on alternative investment funds is planned to be drafted by the capital market authority. However, no clear timeline could be identified. The Enterprise Innovation Fund (ENIF), which is a stand-alone venture capital fund covering the Western Balkans region, has invested in two start-ups at the seed stage – Uhura (EUR 400 000) and Om3ga solutions (Daktilograf) (EUR 30 000) – since 2014.

**Business angel networks** have recently started operating in the economy; however, there is no legal definition. Montenegro recorded a total of 13 investments in 2018 and 2019 by one active network, with a respective value of EUR 1.5 million and EUR 2.1 million (EBAN, 2019<sup>[68]</sup>).

There is no dedicated law or body that governs **crowdfunding** activities. Crowdfunding is regulated by several laws;<sup>53</sup> however, none provide the mandatory form of the contract between parties, allowing it to be concluded at all parties' own risk. As a result, crowdfunding in Montenegro is based solely on the goodwill of donors without any obligation of the applicant towards the donors. In 2019 a total of EUR 300 000 was raised through crowdfunding, a substantial increase on 2017 when only EUR 4 000 was raised. This indicates a moderately increasing level of confidence on the part of investors in crowdfunding. According to the government, an action plan (CrowdStream) is planned under the Danube Transnational Programme to draft and implement a crowdfunding law by 2024. Box 23.7 illustrates how clear laws in Lithuania have helped boost the crowdfunding sector.

**Initial coin offering** (ICO) based on blockchain technology is in the incipient phases of development, while the use of cryptocurrencies is allowed in Montenegro. The Capital Market Authority (CMA) – a financial services commission and an independent regulatory agency – has organised several cycles of education on the use of blockchain technology in the financial market and in public administration in order to explore the possibilities of its applications in both sectors. In addition, the government has reported that the CMA is working on the regulatory framework for Securities Token Offerings,<sup>54</sup> but has not specified the timeline.

### Box 23.7. Lithuania's crowdfunding legislation

While Lithuania's crowdfunding market is smaller than other European fintech hubs, the economy is only one of 11 EU member states with dedicated national legislation for crowdfunding platforms and boasts a mature and comprehensive regulatory framework for crowdfunding. Although its crowdfunding is in its infancy, Lithuania currently has 15 registered crowdfunding platforms. There has been a positive increase in the total value of crowdfunding platform loan portfolios, from EUR 6.6 million in 2019 to EUR 9.13 million in the first half of 2020 (Bank of Lithuania, 2020).

Lithuania adopted its Law on Crowdfunding in 2016 with the aim of providing a hospitable, clear and transparent setting for cross-border crowdfunding platforms. The law adopted all aspects of the European Commission's Regulation for European Crowdfunding Service Providers, allowing for a seamless transition once the EU Directive comes into force (EC, 2018<sup>[69]</sup>). It was established through a multiple stakeholder consultation process and provides protection and guarantees for investors through information disclosure obligations, governance rules, risk management and a coherent supervision mechanism. The law covers equity, real-estate, and debt-based crowdfunding models, while donation and rewards models continue to fall under the Civil Code of the Republic of Lithuania.

Transparency regulations for crowdfunding platforms help mitigate misinformation and legal risk to better protect investors. Therefore, platforms must be included on the Public List of Crowdfunding Platform Operators, subject to an efficient reliability assessment conducted by the Bank of Lithuania's supervisory authority within 30 days. Platform operators, board members and significant stakeholders

also undergo a criminal record check, while platforms must instate measures to avoid, identify and address any conflicts of interest that would prejudicially benefit the funder or project owner.

In addition to the EUR 40 000 minimum capital requirement, platform owners are required to put up 10% of starting capital themselves. In the case of offerings between EUR 100 000 and EUR 5 million, platform operators are obligated to publish a light prospectus, while offerings over EUR 5 million require a full prospectus detailing the project and project owner characteristics, proportion of own funds used, details of the offering, security measures, and existence of secondary markets.

In all cases, Lithuania's crowdfunding regulations require platforms to publish wide-ranging information on their websites for investors including data on the company, risks associated with investment, project selection criteria, conditions and procedures for repayment of funds, disclaimers on tax and insurance information, as well as monthly and yearly progress reports.

Meanwhile, Lithuania is continuously improving its innovative business environment to give financial institutions and crowdfunding platforms more investment opportunities. In 2016, the economy began allowing the use of remote identity verification via qualified electronic signatures and video streaming/transmission and is harmonising itself with the EU regulation on electronic identification. Lithuania has also recently amended its Law on the Legal Status of Aliens to include an e-residency programme, allowing foreigners to set up companies, open bank accounts and declare taxes through digital identification, furthering financing opportunities for its fintech platforms.

### *Sub-dimension 3.3: Mobilisation of long-term financing*

**Public-private partnerships** (PPPs) are regulated by the law on public-private partnership adopted in December 2019. The implementing regulations accompanying the law were prepared in co-operation with OECD SIGMA (Support for Improvement in Governance and Management) and for the first time will regulate the implementation of PPP projects. Previously, PPPs were regulated by several pieces of legislation. The legal framework regulates several factors of major importance for PPP projects:

- It identifies areas in which PPPs can be developed, as well as implementation models that fall under PPP structures, such as build-operate-transfer and design-build-operate models.
- It clearly describes investors' rights, such as the right to reimburse the invested funds, conditions of return of the invested capital to a private partner and settlements in case of disputes.

Between 2015 and 2020, several projects were implemented through PPPs, including two student dormitories in Podgorica and Nikšić, several infrastructure projects in the field of energy and two wind farm projects in Možura and Krnovo. The wind farm in Krnovo is the first large-scale PPP project for the production of electricity in Montenegro.

When it comes to capital markets, the Montenegro Stock Exchange (MNSE) located in Podgorica is the only stock exchange operating in Montenegro.<sup>55</sup> In September 2020, MNSE's total turnover was EUR 6 million, 89% lower than in September 2019. Overall, market capitalisation of MNSE remains illiquid, with a turnover ratio of 1% in 2019 against 3% in 2017. No initial public offering (IPOs) occurred between 2010-19, while five secondary public offerings were issued over the same period, for a total value of EUR 23.8 million.

Some progress has been made in the regulatory framework to facilitate **access to capital markets** since the last assessment. The law on investment and the law on voluntary pension funds, both amended in 2018, govern **institutional investors**. The CMA is the supervision authority, and acts as an independent

regulatory body accountable to the Parliament of Montenegro. The legal framework is moderately comprehensive and covers situations under which institutional investors should exercise their voting rights, prevention of conflict of interest and transparency of fees.

The CMA has adopted extensive secondary legislation related to the law on capital markets and the law on investment funds, which provide for partial alignment with the EU *acquis* concerning markets in financial instruments, securities, investment funds, prospectuses and capital markets (EC, 2019<sup>[73]</sup>). It also regulates insider trading and market manipulation. The law on capital markets details how listed companies should submit their financial reports to the CMA on a quarterly basis. All submitted reports are publicly available on the CMA website. Requirements for listing are also prescribed in article 50-93; however, as described above the stock market is static, with no IPOs.

In 2016, Montenegro applied to be part of the SEE Link project. This cross-border initiative aims to integrate regional equities markets without merger or corporate integration, using only technology that will enable participating stock exchanges to remain independent yet complementary and to allow investors an easier and more efficient approach to those markets through a local broker, for more information see Access to Finance (Dimension 3) regional chapter (SEE LINK, 2020<sup>[74]</sup>). However, as the potential benefits were not clear, the Stock Exchange has decided to stop the process of joining the SEE Link.

The main client categories of Montenegro's **asset management** industry are insurance companies, investment funds and pension funds. The top five asset management firms' total assets under management represented EUR 28.5 million in 2019. **Bond markets** are the main asset allocations preferred by pension funds; however, they are not fully developed yet. Government-issued bonds represent 0.35% of GDP in 2019, while private sector issued bonds were considerably lower (0.16% of GDP). The functioning of bond market is regulated by the capital market law under the supervision of the CMA. Information on the maturity, liquidation preferences, coupon rates and tax status is clearly indicated on Montenegro's stock exchange website.<sup>56</sup> The government does not provide any subsidies to increase the attraction of bond markets; nor does it apply specific rules to facilitate the use of corporate bond markets by smaller issuers.

### ***The way forward for access to finance***

To enhance the banking industry and support businesses' access to finance, policy makers should:

- **Continue efforts to align Montenegro's banking regulations with international standards.** The economic shock caused by the COVID-19 pandemic means the need for resilience in the banking sector to absorb shocks has become even more vital. Regularly monitoring regulations and revising them in line with internationally agreed norms would further enhance Montenegro's banking sector capacity.
- **Extend and simplify the provision of loan guarantees** to enable commercial banks to expand lending to SMEs. Credit guarantee schemes should be designed to ease liquidity constraints in the post-COVID period. While the introduction of loan subsidies under the Investment Development Fund has been an important step, it does not lower or ease collateral requirements that are limiting access to liquidity for SMEs. Ways forward could be to introduce fair pricing of the guarantees and to impose caps on the level of collateralisation for guaranteed loans, with longer repayment periods for sectors in difficulties.
- **Enhance credit information.** Montenegro should consider expanding the coverage and granularity of the credit information system by incorporating information from retailers and utilities. This will enable smaller companies without a decent credit history to access finance. Economies lacking a private credit information system typically tend to have lower coverage than those with private credit bureaus or hybrid systems. Creating a private credit information system in Montenegro would expand the coverage of the adult population.

- **Continue efforts to diversify financing sources.** Adopting dedicated legal frameworks supporting innovative businesses, such as Lithuania's crowdfunding law (Box 23.7), would increase the number of potential financing sources, especially for smaller companies.
- **Increase investor interest by conducting awareness campaigns on the existence of capital markets and the advantages they offer.** Although the capital markets tend to be viewed as a financing tool only for the largest companies, in fact capital market structure can help small and medium-sized companies raise debt and equity capital. Awareness and access could be raised by establishing programmes or digital platforms with informative and interactive tools for SMEs to promote and ease the process of capital market participation (Box 23.8).

### Box 23.8. Awareness-raising campaigns for capital market participation in OECD member states

Awareness-raising campaigns aim to share knowledge and information on the benefits of accessing capital markets for SMEs through informative platforms, public seminars, conferences, IPO summits, and workshops. Increasing awareness of the procedures and advantages of issuing financial products eases the process of issuing stocks or bonds for enterprises and increases the likelihood of SME participation in capital markets. Several OECD member states have already successfully launched initiatives to inform SMEs about the benefits of accessing the capital markets as a financing instrument for their growing businesses.

In 2012, under the National Plan for Financial Education, the Banco de Portugal, the Portuguese Securities Market Commission and the Insurance Institute of Portugal jointly launched the **Todos Contam Portal**, a platform aimed at promoting the financial education of the Portuguese population and new businesses. The portal specifically provides information on access to financing for SMEs through the capital market, highlighting the circumstances under which a new or growing company would benefit from capital market inclusion while informing SMEs of the risks associated with this type of financing.

**The Bolsa Mexicana de Valores (BMV)** has also launched a digital interactive tool to inform SMEs of the costs and benefits of going public by financing through the capital market, and guides businesses through the process of listing their company on the Mexican Stock Exchange. The platform provides information on available financing instruments and equips the user with registration forms, helps with implementing an effective corporate governance model and IFRS, guides businesses through working with brokerage and rating firms, and provides information on maximising sales, promotion of securities and securities maintenance.

Meanwhile, the Spanish National Strategy for Financial Education has established a dedicated website (**Finanzas para Todos**) providing educational tools to better equip entrepreneurs and SMEs with the financial literacy necessary to further their opportunities for growth. The initiative covers the advantages of using capital markets and stock exchanges as a source of financing from both investor and business perspectives. Additionally, the State Agency for SMEs (ENISA) in Spain regularly organises working seminars on the convenience of developing SME access to capital markets with multi-stakeholder participation, including members from academic, private and public sector institutions.

- **Promote the use of infrastructure project bonds.** While PPPs are an efficient tool to finance infrastructure projects, promoting bonds can bring beneficial dynamics to capital markets and enable a more productive use of institutional funds for long-term investments. The government can promote the use of infrastructure project bonds through streamlining issuance and placement procedures, providing clear definitions of “infrastructure” project bonds as well as providing tax incentives (APEC/OECD, 2019<sup>[78]</sup>). Moreover, although local currency bonds, in particular in developing economies, are often characterised by lower liquidity due to heightened currency risk, Montenegro’s euroisation could reverse this tendency.

## Tax policy (Dimension 4)

### Introduction

Table 23.7 compares Montenegro's scores on two tax policy sub-dimensions with the average for the WB6 economies. With regard to the first sub-dimension, which relates to the tax policy framework, Montenegro scores below the WB6 average because of its weak performance on the tax expenditure reporting indicator. However, on the second sub-dimension (tax administration), Montenegro scores close to the WB6 average.

**Table 23.7. Montenegro's scores for tax policy**

Dimension	Sub-dimensions	Score	WB6 average
Tax policy dimension	Sub-dimension 4.1: Tax policy framework	2.0	2.6
	Sub-dimension 4.2: Tax administration	3.4	3.3
	Sub-dimension 4.3: International tax co-operation	n.a.	n.a.
<b>Montenegro's overall score</b>		<b>2.8</b>	<b>3.0</b>

Note: For comparability with the previous assessment, the new sub-dimension (4.3) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 4.1: Tax policy framework*

**Tax revenues** as a share of the economy are relatively high in Montenegro. In 2019, the tax-to-GDP ratio was 35.7%, which is above both the WB6 (28.3% in 2019) and OECD (33.8% in 2019) averages (OECD, 2020<sup>[79]</sup>). The tax-to-GDP ratio in Montenegro has remained relatively stable in recent years, having slightly decreased from 36.2% in 2015. In line with other WB6 economies, Montenegro's tax mix relies heavily on taxes on goods and services and social security contributions (SSCs) (Table 23.8). In 2019, taxes on goods and services accounted for 55.8% of all tax revenues (second only to Kosovo in the WB6), which is somewhat higher than the WB6 average of 49.4% (in 2019) and substantially higher than the OECD average of 32.7% (in 2018). SSCs as a share of total tax revenues in Montenegro were 31.8% in 2019, which is in line with the regional average (32.0% in 2019) but above the OECD average (25.7% in 2018). Combined, SSCs and taxes on goods and services account for 87.6% of total tax revenues (OECD, 2020<sup>[79]</sup>).

Montenegro's reliance on these two taxes far exceeds levels found in OECD countries (58.4% on average in 2018). Consequently, other taxes play a smaller role in Montenegro. For example, **personal income tax (PIT) and corporate income tax (CIT)** combined account for slightly less than one-sixth of all tax revenues (14.5%), compared to about one-third (33.5%) in OECD countries. The reliance on SSCs may make the economy relatively vulnerable to a decline in formal employment or a rise in informal employment. One option could be to rebalance the taxation of labour income away from SSCs and towards PIT, which would increase equity and, if designed properly, efficiency by shifting the tax burden from low incomes to higher incomes. OECD research shows that a relatively higher taxation of PIT would allow for reductions in high employee SSCs and would encourage workers to register in the formal economy. With regards to taxes on goods and service, OECD research has found that consumption taxes and particularly VAT may be less distortive on the decisions of households and firms, and thus on GDP per capita, than income taxes (Johansson et al., 2008<sup>[80]</sup>).

**Table 23.8. Montenegro's tax revenues as a percentage of GDP**

	CIT	PIT	SSCs	Goods and services	Tax/GDP ratio
Montenegro	1.5%	2.6%	11.3%	19.9%	35.7%
WB6	1.8%	2.7%	9.3%	15.9%	30.6%
OECD	3.1%	8.1%	9.0%	10.9%	33.8%

Note: CIT= corporate income tax; PIT= personal income tax; SSCs= social security contributions.

Source: (OECD, 2020<sup>[81]</sup>), *OECD.stat*, <https://stats.oecd.org/> (2019 for overall tax/GDP ratio, 2018 for specific tax/GDP ratio).

In terms of **SSCs and PIT rates**, Montenegro levies a 9% CIT rate (Table 23.8), which was the lowest rate of all WB6 economies in 2020 (where the average was 11.5%). The CIT rate is also substantially below the average rate in OECD countries (23.3% in 2020). The low CIT rate results, not surprisingly, in low CIT revenues. In 2019, CIT revenues as a share of GDP were 1.5% (Table 23.8), which is only slightly below the WB6 average (1.8% in 2019), but half the OECD average (3.1% in 2018). Montenegro is currently amending its Law on Corporate Taxation with the aim of strengthening existing anti-base erosion and profit shifting (BEPS) measures in terms of transfer pricing, and is in the process of implementing thin capitalisation rules. Dividend income is excluded from the CIT base, but when dividends are distributed to an individual shareholder, a 9% withholding tax is levied by the distributing company. Capital gains are included in the CIT base.

The PIT is a relatively small tax in Montenegro. It is levied at a flat 9% rate, the lowest PIT rate among WB6 economies. Despite this low rate, PIT revenues accounted for 2.6% of GDP in 2019, which is slightly above the regional average (2.2% for WB6 economies in 2019). However, PIT revenues remain significantly below OECD levels (8.1% of GDP in 2018). Unlike other WB6 economies, Montenegro does not have a basic tax allowance that exempts people with a low income from PIT. The absence of a basic tax allowance might explain Montenegro's above-average PIT revenues compared to WB6 economies despite its below average flat PIT rate. Montenegro carried out a **PIT reform** in 2019, which took effect in 2020. This reform abolished the so-called crisis rate.<sup>57</sup> With regard to the taxation of personal capital income, a 9% withholding tax is levied upon dividend distribution to resident shareholders. Resident individuals are liable for capital gains tax at a rate of 9%.

SSC revenues reached 11.3% of GDP in 2019, which is above the WB6 average (9.3% in 2019) and the OECD (9.0% in 2018). The sum of employee and employer SSC rates was 32.3% in 2020, which is above the OECD average rate (26.9% in 2020), and slightly above the average rate in WB6 (29.4% in 2020). Employees pay SSCs at a rate of 24%, while employers pay SSCs at a rate of 8.3%. These rates are similar to average rates in WB6 economies (19.9% and 9.5% respectively) but atypical by OECD standards. In the OECD, employer SSC rates are higher than employee SSC rates, possibly linked to the fact that PIT rates are higher in the OECD than in the WB6. Self-employed individuals are liable for SSCs at a rate of 34.3%, which is above the WB6 average (29.7% in 2020).

The high SSC rates in Montenegro create a high tax burden on labour income and reduce the incentives for workers to participate in the formal economy, especially low-income and low-skilled workers who earn a relatively low gross salary (OECD, 2018<sup>[34]</sup>). The high employee SSC rate could be reduced, while the PIT could be made more progressive through the introduction of a progressive PIT rate schedule. This would help to shift the labour income tax burden from low-income workers to those with higher incomes. This in turn would strengthen the tax system's equity and would also be efficient, as it would strengthen the formal labour market and labour supply. Such a reform would require accompanying measures to prevent, for instance, tax-induced incentives for the self-employed to incorporate and turn high-taxed labour income into low-taxed capital income.

In terms of the **design and functioning of VAT and environmentally related taxes**, Montenegro relies heavily on tax revenues from consumption. In 2019, taxes on goods and services as a share of GDP were 19.9%, which is the highest share among the WB6 economies (14% average in 2019). This level of reliance on taxes on goods and services exceeds the 10.9% OECD average (in 2018). With regards to VAT, the

standard rate is levied at 21%, following an increase from 19% in 2016. This rate, the highest of the WB6 economies in 2020, is above the average rate for WB6 (19% in 2020) and OECD (19.3% in 2020). The VAT registration threshold is EUR 18 000, which is lower than other WB6 economies. Montenegro has a reduced 7% rate that applies to specific goods and services, including basic products for human consumption (bread, flour, milk etc.), medicine supplies, public transport services and print media. While VAT is levied on imports at between 0% to 7%, a 0% rate applies to exports, as well as products that are used for offshore oil exploration. Montenegro could consider whether it could broaden its VAT base. As for other consumption taxes, Montenegro levies excise duties on mineral oils, their derivatives and substitutes, as well as on coal. Overall there is significant scope to levy environmental taxes.

Concerning taxation of international business income, Montenegro operates a worldwide taxation system whereby resident companies pay taxes on domestic and foreign-sourced income, and non-resident companies are liable only for taxes on income originating from Montenegro. A worldwide taxation system is currently adopted in all of the WB6 economies. However, such systems are increasingly less common among OECD countries, particularly small open economies.

**Table 23.9. Selected tax rates in Montenegro**

	CIT	PIT	SSCs	VAT
Montenegro	9.0%	9.0%	32.3%	21.0%
WB6	11.5%	12.8%	28.6%	19.0%
OECD	23.3%	42.8%	26.9%	19.3%

Note: CIT= corporate income tax; PIT= personal income tax; SSCs= social security contributions.

Source: (OECD, 2020<sup>[81]</sup>), *OECD.stat*, <https://stats.oecd.org/> (2020 for CIT and VAT, 2019 for PIT and SSCs).

In terms of **investment tax incentives**, Montenegro operates a mix of both cost and profit-based tax incentives. Companies investing in so-called underdeveloped areas can benefit from profit-based tax incentives (which generally reduce the tax rate for taxable income). These companies are exempt from CIT for an eight-year period, provided the total amount of tax paid without the incentive would not exceed the EUR 200 000 threshold. This exemption also extends to the investors' PIT liability. Companies operating in the transport, agriculture, shipbuilding, steel and fishery sectors cannot benefit from this tax incentive. Similarly, companies investing in underdeveloped areas that are employing new workers for employment contracts of at least five years are exempt from calculating and withholding PIT for a four-year period. Montenegro also operates a few targeted cost-based tax incentives (which generally lower the cost of investments made). For example, expenses directed at environmental protection may be recognised as tax deductible business expenditure, lowering the taxable base up to a maximum of 3.5% of total income. Research shows that cost-based incentives are preferable to profit-based incentives, which risk leading to high redundancy of expenditure since the investment may have proceeded anyway (UNCTAD, 2015<sup>[82]</sup>). Given its low CIT rate, which already provides a significant investment incentive, Montenegro may wish to re-evaluate the merits of profit-based incentives.

**Tax expenditure reporting** in Montenegro could be strengthened. Currently, the annual tax expenditure report is prepared for internal government use only and is not made public. The measurement of tax expenditures is not disaggregated by item, reported in the budget or under a regular assessment. This prevents Montenegro from linking tax expenditures with other budgetary programmes. To support transparency and accountability, Montenegro should develop regular and systematic tax expenditure reporting. This will allow it to monitor the use and effectiveness of tax incentives along with the tax revenue forgone (OECD, 2010). Recently, other WB6 economies have been making good progress on tax expenditure reporting; Albania prepared a tax expenditure report in 2019, and North Macedonia and Kosovo are currently in the process of doing so.

Montenegro has an aggregated **forecasting model** based on macroeconomic data covering the main types of tax. The forecasting relies on relatively simple calculations, based on the previous year's revenues

adjusted for expected growth rates in certain economic indicators. Revenues are typically forecasted twice a year, with several new initiatives taken into account for the 2020-2021 models. A micro-simulation model has been developed for the PIT, in co-operation with the International Monetary Fund (IMF). It was used for the first time in 2019 for estimating effects of changes to the minimum wage.

#### *Sub-dimension 4.2: Tax administration*

Concerning **tax administration functions and organisation**, Montenegro has a unified tax administration responsible for collecting all types of tax, with the exception of VAT on imports, for which the Customs Administration is responsible. The Montenegro Tax Administration (MTA) carries out all the traditional functions except tax fraud investigation, which is conducted by a Special State Prosecutor's office and the police directorate. Its internal organisation mostly involves a functional approach, though a 2016 reform created a Large Taxpayers Office following recommendations by the IMF. The MTA is controlled by the State Audit Institution (SAI) on an annual basis. The SAI produces public recommendations, which in the past have led to significant reforms, such as making the MTA an independent body. MTA agents participate in regular internal and external training, such as the EU programme Fiscalis 2020. The MTA is also part of the Intra-European Organisation of Tax Administration, which also provides regular training.

**Compliance assessment and risk management** are carried out by the Department for Operations in the Field of Inspection Control, assisted by its eight regional offices. The Audit Plan is defined following a risk approach of tax audits. In 2017, a law created the Division for Risk Analysis. Montenegro is currently in co-operation with the IMF to develop a plan for managing compliance with tax regulations, which will be implemented in 2023.

In terms of **independence and transparency**, Montenegro took a step forward in January 2019 as the MTA became an independent body (it was previously integrated in the Ministry of Finance). The head of the MTA is now nominated for a five-year period and reports to the Minister of Finance. Such long-term appointments comply with the policy objective of independence. Its budget is however still integrated within the Ministry of Finance. In 2019, the MTA created an advisory board for large taxpayers, composed of members of the public and private sector. Strict requirements and subsequent sanctions are imposed by the 2016 Code of Ethics on MTA's employees. While Montenegro's overall initiatives for independence and transparency are satisfactory, several areas could be improved. The MTA still lacks a real operational budget, independent of annual budgeting process, as well as procedural safeguards to guarantee its newly found independence.

Access to electronic **tax filing** is widespread and open for every major type of tax. It is mandatory for income taxes and optional for others, though the use of e-filing is widespread (77% of VAT tax returns were electronically filed in 2019). However, e-filing is only open to taxpayers who purchase a digital certificate, at a cost of EUR 110. Tax-filing procedures are regularly audited by the SAI and current rules were defined after a large audit in June 2015. Other audits targeted at effectiveness and efficiency are jointly carried out by both the SAI and the Internal Audit of the Ministry of Finance.

In terms of **taxpayer services**, the MTA offers online access to information, electronic communications and in-person inquiries. The usual response time is approximately 30 days for written requests. Consultations with various institutions as well as taxpayers' surveys are regularly conducted to monitor these services.

#### *Sub-dimension 4.3: International tax co-operation*

Montenegro has become increasingly involved in the **international tax environment**. It became a member of the BEPS Inclusive Framework in December 2019 and is in the process of implementing BEPS minimum standards. It has also made improvements in the field of exchange of information. The OECD Global Forum has started a peer review assessment of Montenegro's readiness to exchange information on request

(EOIR). Montenegro could begin the automatic exchange of information (AEOI) in 2023. The economy also signed the Convention on Mutual Administrative Assistance in Tax Matters in October 2019 and is in the process of updating its transfer pricing rules via a reform of the Law on Corporate Profit Tax (discussed above).

Montenegro is engaged in several initiatives for **digital taxation**. While it has not yet implemented the international VAT/GST guidelines, the place of taxation for cross-border digital services is where the service is supplied, rather than where the service provider is established. This approach to cross-border VAT on electronic services resembles the “destination principle”, the cornerstone of international VAT/GST guidelines. Furthermore, revenues accruing from digital platforms are included in the PIT base and taxed at a 9% rate. Montenegro has not participated in the discussion on Pillar 1 and 2 of the OECD/Tax Challenges Arising from Digitalisation project as part of the BEPS framework. The digital taxation discussions might have a great impact on how Montenegro would want to reform its CIT. Pillar 2 of the project proposes introducing a global minimum tax on corporate profits. Montenegro’s low CIT rate will very likely be below the minimum rate that will be set. If consensus can be found amongst Inclusive Framework members, Montenegro will face the choice of either raising its rate to the minimum rate or foregoing tax revenues to foreign tax jurisdictions. The GLOBE proposal, an OECD project to globally introduce income inclusion and undertaxed payment rules as well as tax treaty provisions, might also restrict Montenegro’s use of cost-based and profit-based tax incentives. The introduction of a minimum CIT might bring to an end the fierce tax competition and race to the bottom that the WB6 region is engaged in. It would allow Montenegro to rebalance its tax mix away from high taxes on labour income towards more taxes on capital income. Montenegro should follow the ongoing international tax discussions and prepare itself for swift action if an international consensus is reached.

**Regional co-operation** in tax matters is a key challenge for the WB6 economies; it would allow them to benefit from more effective tax enforcement and lower overall tax avoidance and evasion. Montenegro does collaborate with other WB6 economies, but it could be strengthened further. The economy joined the Centre of Excellence in Finance in 2015, an organisation which supports capacity development for finance officials in South East Europe. In 2016, six Western Balkan economies planned to sign a memorandum on the establishment of a regional organisation – the so-called B-6 – to strengthen co-operation on administrative tax matters. However, due to legal obstacles in some economies, this memorandum has not yet been signed. Montenegro has started exchanging information within the WB region following a multi-lateral administrative agreement that the MTA has signed with Bosnia and Herzegovina, Bulgaria, North Macedonia and Serbia.

### ***The way forward for tax policy***

To enhance the tax policy framework and achieve their objectives, policy makers may wish to:

- **Continue to support the economy in light of COVID-19.** Montenegro has implemented a comprehensive set of measures to mitigate the effects of COVID-19 on its economy and citizens. The economy may wish to continue its efforts, while focusing on measures that could spark an economic recovery.
- **Diversify the tax mix by strengthening the role of the CIT and PIT, recurrent taxes on immovable property and environmentally related taxes.** Montenegro’s tax revenues rely heavily on SSCs and taxes on goods and services. There is scope to diversify the tax mix in a way that stimulates growth and makes the tax system more progressive.
- **Avoid the use of profit-based tax incentives given the low CIT rate.** The tax revenue foregone as a result of tax incentives needs to be measured as part of the annual tax expenditure report. This information would be the starting point of a cost-benefit analysis of all tax incentives.
- **Continue to implement anti-BEPS measures to protect the domestic tax base and to avoid international tax avoidance and evasion.** The economy is currently amending its CIT law to

implement anti-BEPS measures in the area of transfer pricing and thin capitalisation rules; these reforms could be extended to other CIT areas.

- **Develop an action plan in case members of the OECD/G20 Inclusive Framework on BEPS reach a consensus on Pillar's 2 global minimum tax.** A global minimum tax will very likely be higher than the current statutory CIT rate and would imply that foreign jurisdictions would tax profits sourced in Montenegro. This will create an incentive for Montenegro and other WB economies to increase their CIT rates and to stop their current race to the bottom in tax competition.
- **Carry out a cost-benefit analysis on the merits of a worldwide taxation system for resident corporations.** For small open economies such as Montenegro, worldwide taxation may entail high administrative costs without raising significant revenues.
- **Replace part of the high employee SSCs with a progressive PIT rate schedule.** This reform would increase the labour market participation of low-income and low-skilled workers in the formal labour market and make tax more progressive. The reform would have to be accompanied by other measures to prevent tax-induced incentives for self-employed entrepreneurs to incorporate their business. This could include an increase in the taxes on personal capital income.
- **Explore the scope to broaden the VAT base by reducing the lists of goods and services taxed at the reduced VAT rate.** Reduced VAT rates are an ineffective way to support people on low incomes, as those with higher incomes benefit more from the reduced rate. Targeted cash support, reduced employee SSC rates and progressive PIT rates are a better tool to support low-income households and make the tax system more progressive.
- **Prepare an annual tax expenditure report as part of the annual budget cycle and make it publicly available.** It should include a list of all tax expenditures, revenue foregone on an item-by-item basis and the assessment methodology used.
- **Expand the use of micro-simulation models to analyse the impact of the tax system and simulate impacts of tax reforms. Improve the methods applied to forecast tax revenues.** Montenegro's new PIT micro-simulation model can be used to assess other reforms, including the introduction of a progressive PIT rate schedule.
- **Implement strong procedural safeguards to protect the newly established independence of the tax administration.** For example, the economy could create an independent management board for the tax administration.
- **Continue to engage in international tax dialogue.** While Montenegro has strengthened its active involvement in the area of exchange of financial account information for tax information, ample scope exists to deepen the dialogue on other international tax fronts.
- **Foster regional co-operation and co-ordination on common issues for WB6 economies.** This would enable Montenegro to benefit from more effective tax enforcement and lower overall tax avoidance and evasion. Enhanced tax policy dialogue on CIT incentives could help create a more attractive investment climate across the region.

## Competition policy (Dimension 5)

### Introduction

Unlike the other dimensions, where indicators are allocated a score from one to five, the Competition policy dimension assesses four policy areas (scope of action, anti-competitive behaviour, probity of investigation and advocacy, plus a new area: implementation). Scoring is based on yes/no (coded as 1/0) answers to the 71 questions in the questionnaire administered by the OECD. Where a response to a question is yes (coded as 1), then we refer to this as an adopted criterion. Each of the four policy areas has a different number of possible criteria that can be stated as having been adopted. Each policy area is assessed through data collected from the questionnaire indicators and by measuring the number of criteria adopted. The new fifth policy area (implementation) is not scored, but is a quantitative analysis of how many competition decisions have been adopted by the competition authorities. The anti-competitive behaviour and implementation policy areas are discussed together below.

The dark blue bars in Figure 23.10 represent the number of positive answers (alignment with good practices), while the pale blue represent the negative replies.

**Figure 23.10. Montenegro's legal and institutional competition framework**

Source: Based on the OECD assessment.

### State of play and key developments

#### *Sub-dimension 5.1: Scope of action*

The Law on Protection of Competition of Montenegro does not require substantial amendment, since it is largely aligned with the EU rules on restrictive agreements (Art. 101 Treaty on the Functioning of the European Union, TFEU) and on abuses of dominant position (Art. 102 TFEU). The law also provides for *ex ante* control of mergers above certain turnover thresholds, in line with the principles of the EU Merger Regulation.

The Agency for Protection of Competition (APC) is the body responsible for implementing the Law on the Protection of Competition in Montenegro. It is an operationally independent authority and its powers are broadly comparable to those of the European Commission in the area of competition. In 2018, state aid control was included within the remit of the APC.

Nevertheless, despite the addition of a sphere of competence, the financial and human resources of the APC have not been substantially increased and are still insufficient to ensure it can function optimally. In fact, competition enforcement and advocacy still need to be developed and expanded.

In terms of competencies, the ACP has the power to adopt enforcement decisions against anti-competitive practices and to review mergers, as well as to advocate competition principles to national policy makers. In 2018, the Law on State Aid Control transferred the competence on state aid affairs from the Commission for the Control of State Aid to the ACP.

Following the adoption of the Law on State Aid Control, the Council of the APC includes the President, the Member of the Council for Competition and the Member of the Council for State Aid. They are appointed by the Government of Montenegro following proposals by the Ministry of Economic Development (for the President and the Member for Competition) and by the Ministry of Finance (for the Member for State Aid). The APC is managed by a director, in turn assisted by a deputy director, also appointed by the Government of Montenegro. The duration of all these mandates is four years.

APC's staff numbers have been steadily increasing, from 13 employees in 2015 to 29 in 2019. Nevertheless, only nine employees focus on competition. This figure is low compared with other OECD and non-OECD countries, such as those listed in the OECD CompStats database.<sup>58</sup> For example, in 2019 the average total staff of the 15 competition authorities in small economies (with a population lower than 7.5 million) was 114, of whom 43 were working on competition.

The annual budget of the APC has grown from EUR 305 000 in 2015 to EUR 820 000 in 2020. However, the most significant increase (from EUR 435 000 to 733 000) occurred between 2017 and 2018, following the assignment to the APC of the new competence on state aid control.

The Montenegrin Law on the Protection of Competition ensures competitive neutrality, insofar as it also applies to state and local administration bodies that engage in an economic activity directly or indirectly and participate in the trade of goods or services.

The APC has appropriate powers to investigate and powers to sanction possible anti-trust infringements, i.e. restrictive horizontal and vertical agreements and exclusionary or exploitative practices by dominant firms. It can impose cease and desist orders, as well as behavioural and structural remedies, on firms that have committed anti-trust infringements. It can also adopt interim measures if the alleged competition breach poses a risk of irreparable damages. In addition, it can accept commitments offered by the parties to remove the competition concerns and close the investigation.

The APC can compel investigated firms and third parties to provide relevant information and can perform unannounced inspections on parties' premises. The assessment of alleged anti-competitive conduct follows thorough scrutiny of the evidence, which can include an economic analysis of the competitive effects of vertical agreements or possible exclusionary conduct.

In terms of power to sanction, the agency has no power to impose fines directly: the imposition of fines is the competence of the Misdemeanour Courts, which can conduct the relevant procedure and determine the amount of the fines. The amount can range from 1% to 10% of the aggregate annual turnover of the undertaking in the financial year preceding the year in which the misdemeanour was committed.

The Law on Competition also contemplates a leniency programme, in that it ensures total or partial immunity from sanctions to firms involved in unlawful agreements that report to the agency the existence of the agreement and submit evidence that allows the APC to adopt an infringement decision. In particular, with respect to these firms the APC cannot submit a request for the initiation of misdemeanour proceedings or must withdraw an already submitted request or propose a milder punishment to the court. Such provisions do not apply to firms that initiated or organised the cartel. The agency can propose to the party to the agreement that they conclude it on admission of guilt.

The Law on Protection of Competition provides for *ex ante* control of mergers, following the principles of the EU Merger Regulation. The APC can compel merging firms and third parties to provide relevant information and can perform unannounced inspections of parties' premises (one was carried out in 2017).

The assessment of notified mergers must follow a thorough scrutiny of the evidence, which includes an economic analysis of the restrictive effects and of possible efficiencies stemming from the concentration.

In case of significant restriction, distortion or prevention of competition in the relevant markets, the APC can prohibit the transaction. The merging parties can submit their observations and propose measures to prevent the alleged competition distortion. If the agency establishes that the proposed measures are adequate, it adopts the decision approving concentration and orders the implementation of the measures.

Regarding private enforcement, individuals, firms and consumers – either collectively or through consumer associations – can bring a legal action to seek damages from firms that have committed antitrust infringements.

### *Sub-dimensions 5.2 and 5.5: Anti-competitive behaviour and implementation*

The anti-competitive behaviour and implementation policy areas together gauge the use of powers and resources in terms of decisions adopted and fines imposed for horizontal agreements, vertical agreements and exclusionary conduct. They also explore the actual activity of the competition authority on reviewing mergers. Despite an appreciable legal and institutional competition framework, the actual enforcement of competition rules is still limited (Figure 23.11).

**Figure 23.11. Competition decisions in Montenegro**

Source: Data provided by the authorities.

Between 2015 and 2019, the APC took only four cartel decisions (one every year except 2017), two decisions on agreements with a vertical element (in 2016 and 2017) and three decisions on abuse of dominance (two in 2016 and one in 2019). In 2019, the APC opened two vertical investigations concerning resale price maintenance (RPM) violations, a hard-core restriction in Montenegrin competition law. The agency has never received a leniency application.

Importantly, in 2019 the APC carried out unannounced inspections in the two anti-trust proceedings on RPM opened in that year. The agency had already performed one dawn raid in 2017, but in a merger case. The total amount of fines imposed in 2019 by the Misdemeanour Courts was particularly low (less than EUR 3 000). Between 2015 and 2019, the annual fines never reached EUR 100 000. Furthermore, the highest fines were not imposed in cartel cases, but for abuse of dominance.

Again, these data can be appreciated by comparing them to the 15 competition authorities in smaller jurisdictions that participated in the CompStats database. Focusing on cartel enforcement, it is telling that in those jurisdictions the average annual number of cartel cases between 2015 and 2019 was 3.2, while the average annual fines resulting from cartel investigations were EUR 2.7 million.

Cartels are the most clear-cut and undisputedly harmful competition infringements. They affect every economy. The limited number of current cases seems insufficient to deliver a strong message that firms that engage in collusion risk being severely punished. Furthermore, fines are very low. Unlike in most jurisdictions, they cannot be imposed by the APC but by a decision of the Misdemeanour Courts. Consistent with the changes introduced in other jurisdictions in the WB region, the APC could be empowered to impose fines directly. Indeed, fines act as a deterrent because the possibility of a fine enters into the decision-making process of managers and undertakings in their consideration of whether or not to violate the law. If the amount of fines sufficiently exceeds illicit gains, offences can be deterred even when the probability of incurring a fine is low. Concern about fines is also a key driver of leniency applications, thus fostering the effectiveness of the leniency programme – which has been unproductive in Montenegro so far – and further boosting detection.

In 2019, the APC rendered 65 merger decisions, which represents a sharp increase over 53 decisions in 2018 and 35 decisions in 2017. All 2019 merger decisions were unconditionally cleared in Phase I (i.e., without the need for an in-depth investigation). Many of the notified transactions concerned extraterritorial transactions, with little or no impact on the Montenegrin economy. This is due to the low merger filing thresholds applied in Montenegro, which often catch transactions with modest local nexus, i.e. hardly capable of distorting competition within the national territory of Montenegro.

For comparison, from 2015-19, the 15 competition authorities in smaller jurisdictions that participate in the cited OECD CompStats database carried out 4.2 in-depth merger investigations per year on average, out of 36 notifications.

#### *Sub-dimension 5.3 Probity of investigation*

The APC was established as a functionally independent entity in February 2013. Previously, competition law and policy fell within the remit of the Ministry of Economic Development. The agency must submit an annual report on its activity to the Montenegro Government and Parliament for approval.

In terms of procedural fairness, the decisions to open formal proceedings and the final decision finding competition infringements, as well as decisions regarding mergers, are published. However, only the decision part is made public, not the reasoning.

The APC's decisions can be appealed before the Administrative Court and the Supreme Court. Appeals regarding fines can be submitted to the Misdemeanour Court and Higher Misdemeanour Court.

During the course of the proceedings, the parties under investigation for an anti-trust infringement may consult with the APC with regard to significant legal, factual or procedural issues and have the right to be heard.

Prior to the adoption of a final anti-trust decision, the APC must inform the party of the relevant facts, evidence and other elements on which the decision is based, and enable the party to submit defences. Likewise, if the APC intends to prohibit a merger transaction it must inform the merging parties about the evidence and conclusions on which the decision would be based and enable them to submit their remarks and possible remedies.

The APC has issued explanatory notices on the procedure for submitting requests for confidentiality and for submitting information on alleged violations of competition law. These are available on the APC website. However, it has not issued guidelines for the assessment of horizontal and vertical agreements nor for abuses of dominance.

#### *Sub-dimension 5.4: Advocacy*

The ACP can formulate opinions on national or local laws or regulations that affect, or might affect, competition. The agency has issued a limited number of opinions over the last five years. The main

interventions concerned the Law on Public Procurement (in 2011), the Law on Free Access to Information (in 2016) and the Draft Law on Audio-visual Services (in 2019). In the latter, the APC clarified to the Agency for Electronic Media and Postal Services the differences between the criteria provided in the draft law for defining markets and identifying operators with significant market power and those typically used in competition enforcement.

All opinions on draft laws and regulations have been delivered on the agency's initiative, with the exception of the request submitted by the Agency for Electronic Media and Postal Services. APC's recommendations on public procurement and on free access to information have led to pro-competitive changes.

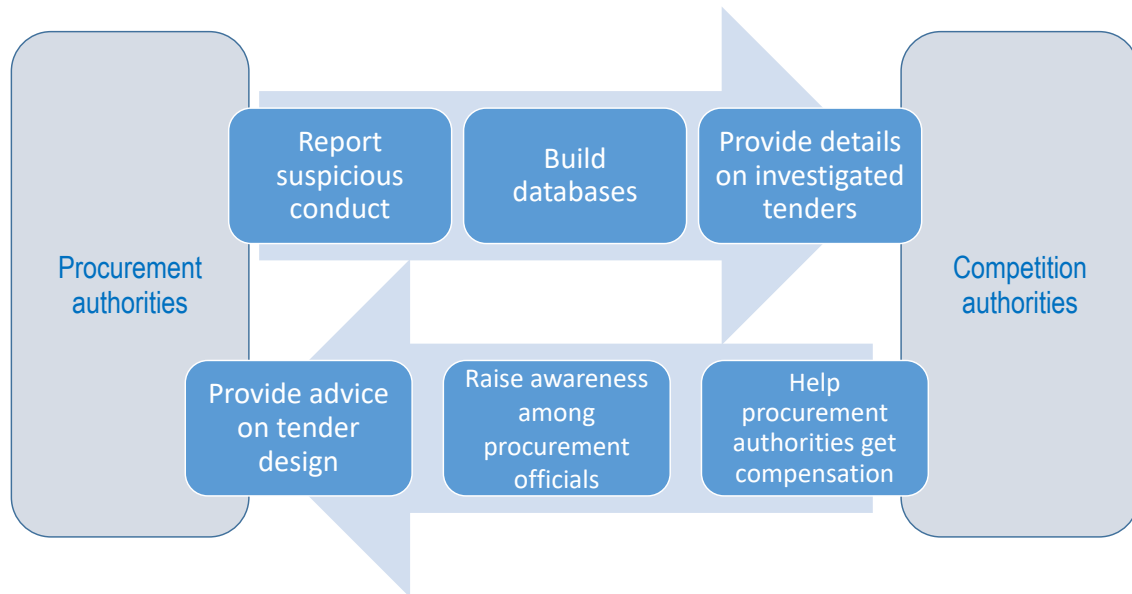

The APC has not conducted any market studies. These are a key tool to gain an in-depth understanding of restrictions to competition in crucial sectors.

Finally, over the last five years the APC has performed some activities aimed at developing a competition culture, including eight seminars for members of the Chamber of Commerce, four seminars for the judiciary and two seminars for the media and general public.

### ***The way forward for competition policy***

- **Expand APC's enforcement capacity and increase its enforcement efforts** with a view to increasing the number of decisions on cartels and abuses of dominant position, as well as the fines. The two recent on-site inspections seem to indicate the APC's determination to step up competition enforcement, but the APC needs to make full use of its powers and promote the use of its leniency policy to uncover cartels.
- **Provide the APC with adequate financial and human resources.** Despite an increase over the last few years, a more substantive growth in the budget is needed to extend the APC's activity on competition. More financial resources would enable the agency to recruit additional competition officials with appropriate skills and thus develop the APC's potential for competition enforcement and advocacy (see Box 23.9 for an example from Italy).
- **Give priority to boosting cartel enforcement and imposing high fines. To this end, the APC could be empowered to impose fines directly.** The APC should also expand its detection skills, for example by focusing on bid rigging (see next point on public procurement).
- **Pay specific attention to public procurement, particularly during the Covid-19 crisis.** The APC should explore ways to enhance cartel detection and prevent bid rigging through better tender design by procurement officials. Public procurement is a key sphere of action both for cartel enforcement and for competition advocacy. Bid rigging results in significant harm to public budget and taxpayers, dampening innovation and causing inefficiencies. Figure 23.12 shows how co-operation between competition and procurement authorities can help detect and avoid bid rigging. The APC signed a co-operation agreement with the Public Procurement Administration in 2015. The Recommendation of the OECD Council on Fighting Bid Rigging in Public Procurement (OECD, 2012<sup>[83]</sup>) calls for governments to assess their public procurement laws and practices at all levels of government in order to promote more effective procurement and reduce the risk of bid rigging in public tenders. The Guidelines on Fighting Bid Rigging in Public Procurement (OECD, 2009<sup>[84]</sup>), which form a part of the recommendation, are designed to reduce the risks of bid rigging through careful design of the procurement process and to detect bid-rigging conspiracies during the procurement process. The OECD can also provide assistance through a project aimed at assessing the main rules governing procurement of public works as well as procurement practices of major public buyers. It provides recommendations to design competitive procurement and fight bid rigging in accordance with international good practice. It can also offer training for both competition and public procurement officials, based on the Guidelines on Fighting Bid Rigging in Public Procurement.

Figure 23.12. Example of co-operation between competition and procurement authorities

Source: OECD elaboration.

- **Raise the APC's voice regularly to oppose laws and regulations that restrict competition and promote competition culture.** Competition authorities can help governments to eliminate barriers to competition by identifying unnecessary restraints on market activities and developing alternative, less restrictive measures that still achieve government policy objectives. The OECD's Competition Assessment Toolkit is a practical methodology that supports competition authorities in this task. Where a detrimental impact is discovered, the toolkit helps to develop alternative ways to achieve the same objectives, with minimal harm to competition. In the past, OECD country projects have proved to be very helpful in boosting competition advocacy and competition assessment in several jurisdictions, including in Eastern Europe. On top of establishing a competition culture in national stakeholders, competition advocacy would strengthen the APC's standing and reputation when it acts against anti-competitive restrictions by private firms.
- **Increase the APC's engagement in advocacy initiatives to promote competitive neutrality.** In particular, the COVID-19 crisis could further increase the relevance of SOEs, as a result of state interventions to support the economy and stimulate growth. The APC could contribute to a quick economic recovery by the country by ensuring competitive neutrality. The authority can advocate for industrial policies that focus on pro-competitive alternatives and ensure that state aid is provided in a transparent way and for a limited period.
- **Perform market studies.** Market studies are used to assess how competition in a sector or industry is functioning, detect the source of any competition problems, and identify potential solutions. Competition problems that can be uncovered in market studies include regulatory barriers to competition and demand-side factors that impair market functioning. Because market studies are a versatile tool, and they allow the examination of a broader set of issues than competition enforcement, their use is growing. International organisations, notably the OECD and the International Competition Network (ICN), have developed a wide range of documents on market studies, including the OECD Market Studies Guide for Competition Authorities (OECD, 2018<sup>[85]</sup>). The OECD Competition Division can also assist competition authorities, regulators, ministries and other policy makers with market study projects.
- **Expand international co-operation and training.** With the increasing complexity of anti-trust issues and the frequent cross-border nature of competition infringements, international organisations like the OECD, the ICN and UNCTAD offer valuable opportunities for sharing

experience and policy discussions. The OECD-GVH Regional Centre for Competition in Budapest also provides an ideal forum for capacity building and sharing of good practices with colleagues from other jurisdictions, focusing on the specific challenges of Eastern European and Central Asian countries. The management and the staff of the APC are already actively involved in these co-operation initiatives and can benefit from engaging more actively.

### Box 23.9. Financial independence for the Italian Competition Authority

Until 2012, the financing of the Italian Competition Authority (AGCM) was based on two main sources: annual funding from the state and fees paid by companies subject to merger notification requirements.

Legislative Decree no. 1/2012 modified the AGCM's funding system, which is now based on mandatory contributions imposed on companies incorporated in Italy whose turnover exceeds a threshold of EUR 50 million. The revenues from these contributions replace all previous forms of funding. The level of contribution, originally fixed at 0.06 per thousand, has been gradually lowered by the AGCM to 0.055 per thousand. The authority's financial statements have to be approved by 30 April of the following year, and are subject to auditing by the Court of Auditors.

This funding system can be regarded as an indirect recognition of the positive role played by AGCM in supporting a healthy and level competition field, which justifies the imposition of a small contribution on the largest businesses incorporated in Italy.

Importantly, the previous funding system entailed the risk of possible fluctuations in the amount of the annual budget, due to unpredictability in the number of notified mergers and levels of state funding. The new system shelters the AGCM from that risk, thus allowing for more stable and forward-looking recruitment planning.

## State-owned enterprises (Dimension 6)

### Introduction

Montenegro's SOE landscape has the peculiarity of including a high proportion of private shareholders, in many cases resulting from stalled privatisation efforts. Since the beginning of the privatisation process, which started in 1999, more than 90% of the country's state-owned enterprises have been privatised. However, some of the country's most important enterprises still remain state-owned, including Montenegro Airlines, Montenegro Railways and several companies in the tourism and energy sectors. State ownership responsibilities for Montenegro's SOEs are exercised directly by the government, by a variety of line ministries and a number of state funds.

Montenegro's performance on the state-owned enterprises policy dimension has not changed since the 2018 Competitiveness Outlook (Figure 23.1). Nevertheless, certain improvements to the framework for business have been made recently, especially taking into account the adoption of the new Law on Business Organisations. This is one of the key measures for the closure of negotiations on Chapter 6 (Company Law) in the context of Montenegro's membership negotiations with the European Union. The new law can be expected to affect the legislative framework for SOEs, for instance by further professionalising boards and strengthening their operational autonomy. Eventually, it should positively affect the economy's score on this indicator.

Table 23.10 provides an overview of Montenegro's scores for the state-owned enterprises dimension. This dimension considers three broad sub-dimensions which are based on elements in the SOE Guidelines on Corporate Governance of State-Owned Enterprises (SOE Guidelines) (OECD, 2015<sup>[87]</sup>). Montenegro achieves a relatively low score in the efficiency and governance sub-dimension, reflecting its lack of an ownership policy and insufficiently harmonised ownership practices. Montenegrin SOEs are subject to sound financial disclosure and auditing requirements, resulting in an average score for the transparency sub-dimension. Montenegro also achieves an average score for ensuring a level-playing field between state-owned and private companies, owing to the fact that SOEs mostly operate according to the general company law (the Law on Business Organisations).

**Table 23.10. Montenegro's scores for state-owned enterprises**

Dimension	Sub-dimensions	Score	WB6 average
<b>State-owned enterprises dimension</b>	Sub-dimension 6.1: Efficiency and performance through improved governance	2.3	2.2
	Sub-dimension 6.2: Transparency and accountability practices	3.0	3.0
	Sub-dimension 6.3: Ensuring a level playing field	3.0	2.8
	Sub-dimension 6.4: Reforming and privatising state-owned enterprises	n.a.	n.a.
<b>Montenegro's overall score</b>		<b>2.7</b>	<b>2.6</b>

Note: For comparability with the previous assessment, sub-dimension 6.4 (reforming and privatising state-owned enterprises) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 6.1: Efficiency and performance through improved governance*

According to the Central Depository Agency, the Montenegro state is the majority or full owner of 32 companies (this number also includes companies undergoing bankruptcy procedures). The state also owns several SOEs that operate under the separate legal form of "public enterprise": those which provide "public" goods and are mainly established by the local municipalities. However, data on these enterprises were not available for this assessment.<sup>59</sup> In addition, the state holds minority shareholdings (over 10%) in

21 companies operating in a range of sectors, including sea transport, manufacturing, construction, accommodation (hotels) and retail. The large number of companies in which the state still maintains minority shares often reflects privatisation attempts that were not completed.

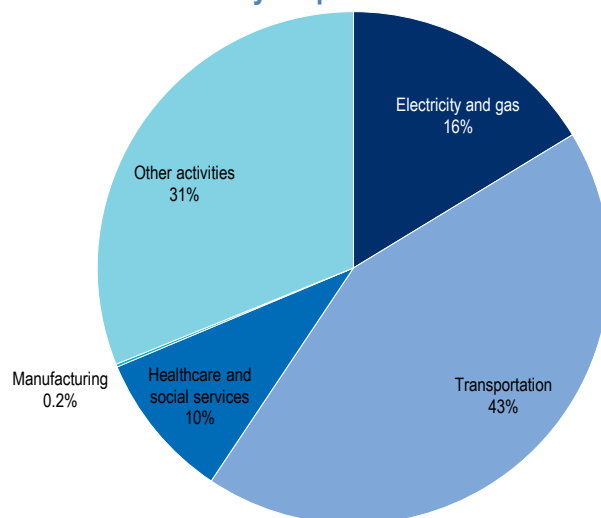

Montenegro's 32 SOEs are present in structurally important sectors such as electricity and gas, the postal services, railway and air transport (Figure 23.13). While these 32 state-owned companies do not include the aforementioned public-service SOEs that were excluded from reporting/data, most of these SOEs are reportedly owned by municipalities rather than the central government. Figure 23.13 shows how employment is allocated across sectoral SOEs. Montenegro's largest state-owned companies by employment are *Electroprivreda Crne Gore* (975 employees), *Pošta Crne Gore* (952), *Aerodromi Crne Gore* (894), *Željeznička Infrastruktura Crne Gore A.D.* (789), *Institut Za Fiz. Med. Reh. I Reum. Simo Mološević* (731) (Table 23.11). According to available data, state-owned companies in Montenegro employ almost 8 000 people, accounting for an estimated 3.3% of national employment.<sup>60</sup> This compares with an OECD average of approximately 2-3% and puts Montenegro in the lower tier of the ten largest OECD-area SOE sectors as measured by SOE's share of national employment, ranging from 2.9% in Sweden to 9.6% in Norway.<sup>61</sup>

**Figure 23.13. Sectoral distribution of Montenegro's SOEs**

Source: Calculations based on information provided by the authorities of Montenegro (for 27 SOEs).

Figure 23.14. Sectoral contribution of fully corporatised SOEs to SOE employment

Note: Employment figures were not provided for seven SOEs, including two operating in the primary sector. The total number of reported SOEs is based on data provided by the Central Depository Agency in the context of this assessment, whereas sectoral figures are based on reporting by the National Statistical Office, which arrived at a slightly different classification of companies as SOEs or minority-owned companies (27 SOEs and 24 state minority-owned companies, perhaps reflecting a different classification of enterprises undergoing bankruptcy proceedings). Source: Calculations based on information provided by the authorities of Montenegro.

Table 23.11. The five largest employers in Montenegro's SOE sector, 2019

Rank	Company name	Percentage of state ownership	Sector	Number of employees
1	Electroprivreda Crne Gore A.D Nikšić (Eng. Montenegrin Electric Enterprise AD Niksic, EPCG)	88.7%	Production of electricity	975
2	Pošta Crne Gore (Eng. Montenegro Post)	100%	Postal activities	952
3	Aerodromi Crne Gore (Eng. Airports of Montenegro)	100%	Service activities in air transport	894
4	Željeznička Infrastruktura Crne Gore A.D. (Eng. Railway Infrastructure of Montenegro, ZICG)	76.6%	Passenger rail transport, interurban	789
5	Institut za fizikalnu medicinu, rehabilitaciju i reumatologiju Simo Milošević (Eng. Institute for Physical Medicine, Rehabilitation and Rheumatology "Dr Simo Milosevic" JSC Igalo)	56%	Hospital activities	731

Source: Based on data provided by the Montenegro authorities.

It is difficult to draw a general conclusion about the efficiency and performance of Montenegro's SOEs. The limited data on their performance points to inefficiencies and low overall returns to the state's investments in these companies. Five majority-owned companies are currently undergoing bankruptcy procedures. As mentioned earlier, the state also holds minority shares in 21 enterprises. A 2020 study by the European Bank on Reconstruction and Development (EBRD) found that SOEs in Montenegro had posted overall negative returns on equity from 2014 to 2016, including inefficiencies and/or uncompensated non-commercial objectives (EBRD, 2020<sup>[88]</sup>). SOEs had particularly high employment costs relative to their revenues compared to other surveyed economies (40%, compared with 12% in Latvia). Also, according to stakeholders interviewed for this assessment, 9 out of 21 SOEs for which data are available on the Tax Administration portal operated with a loss in 2018, totalling over EUR 8 million.

The main legal document that regulates business organisations in Montenegro is the Law on Business Organisations adopted in June 2020. The law is applicable to most enterprises – state and private companies – that operate in Montenegro, including SOEs incorporated as either joint-stock or limited-liability companies. The main public sector bodies responsible for exercising state ownership rights in the case of joint-stock and limited liability companies are the state (the government and various line ministries)

and several state funds (namely the Fund for Pension and Disability Insurance, the Employment Office of Montenegro, the Compensation Fund, the Investment Development Fund of Montenegro and the Health Fund). Additionally, the Ministry of Economic Development plays an advisory role on behalf of the government for certain decisions that explicitly require government consent in fully-owned SOEs.<sup>62</sup> The fact that the ownership of many SOEs is exercised jointly by state funds introduces some elements of a centralised ownership model, wherein ownership rights are not exercised predominantly by regulatory authorities (e.g. line ministries).

Regarding the **clarification of ownership policy and rationales**, Montenegro has not developed an overarching ownership policy that states why the government owns companies and how it expects them to create value. The authorities do take steps to establish clear objectives for individual SOEs, for example within shareholder agreements or other contractual arrangements between the state and other shareholders. A range of line ministries are also responsible for monitoring individual companies, setting stimulative measures and defining support programmes. The role and power of these various government bodies are primarily related to defining goals and priorities at the sectoral level. Although individual SOEs may have performance targets, the government as a whole does not have an overview of performance objectives or how well the SOE portfolio is performing overall.

In most cases, ownership rationales can be determined through some policies and strategic decisions. They have been developed by the government based on priority sectors that possess high potential for growth with high value added and comparative advantages. As part of this assessment, the authorities cited the following as the key rationales for state ownership: 1) supporting national economic and strategic interest; and 2) supporting specific goods or services (after ensuring the market cannot supply them).

Montenegro has not established a central co-ordinating or oversight unit to **professionalise state ownership** practices and ensure a whole-of-government approach. In many cases, the exercise of ownership rights falls to the various relevant sectoral government institutions as well as the jurisdiction of the certain institutions. In principle, different line ministries, depending on the topic and their concrete field of act, are in charge of monitoring, setting stimulative measures and defining some support programmes.

Regarding SOE **board nomination procedures**, there is currently no common or transparent approach across Montenegrin SOEs. As most SOE board members are civil servants, SOE boards may not have an adequate mix of competencies, including private-sector expertise. The board nominations are not clearly framed by the Law on Business Organisations and not subject to well-defined criteria developed across government. In practice, board members are generally elected by the relevant line ministries or state funds and are in some cases vetted by the government. In June 2020, the government adopted the new Law on Business Organisations that improves clarity of the procedure for board nomination in companies. The amendments to the company law can be expected to improve SOE governance, notably by requiring independent directors on company boards, including some SOEs. Introducing independent directors on boards can help reduce conflicts of interest (because the independent members have no business relationship with management) and as a result help ensure that decisions are taken in the interest of the company and its shareholders. Special provisions in the Law on Prevention of Corruption ban government ministers and vice-ministers from serving on SOE boards (vice-ministers are banned when the ministry where he/she works is supervising the respective SOE). Public officials may not be a president or member of the management body or supervisory board, executive director, or member of management of public companies, public institutions, or other legal persons.<sup>63</sup> Nevertheless, there is still limited evidence that the whole nomination process relies on transparent and merit-based appointment criteria, leading to a high risk of political influence in appointing board positions. The risk is that corporate decisions could be politically motivated, rather than in the interest of corporate performance. There is some evidence that political affiliation has been known to play a role in job placement in Montenegrin SOEs (US Department of State, 2020<sup>[89]</sup>). Likewise, according to stakeholders interviewed for this assessment, SOE boards of directors and governing bodies are mostly made up of politicians.

In addition to ensuring basic legal requirements concerning board members' fiduciary duties – i.e. to act in good faith in the interest of the companies that they serve – Montenegro has recently taken steps to **promote independent and professional boards** in companies, including SOEs. The main step taken is to require that the boards of companies include a minimum one-third proportion of independent directors. Recent amendments also make boards of directors liable for any damages they cause to the company(ies) they serve, other than implementing decisions made by the general meeting of shareholders. According to the Law on Business Organisations, the board of directors should be a collective body whose activities are directed by its chairman. The number of board members is established by the charter of each company, but the typical size of an SOE board is five members. The legal framework states that the board of directors should also have an odd number of members, and not less than three. The law establishes that board members must act in good faith for the benefit of the company as a whole, taking into account government strategic priorities. Recent amendments to the Law on Business Organisations adopted by Parliament introduce requirements for company boards to include independent directors. In practice, the absence of independent directors can limit the extent to which enterprise management decisions are subject to external professional scrutiny. The amendments establish that 1) at least one-third of all company boards must be independent directors, and the boards of public joint stock companies must comprise at least two-fifths independent directors; and 2) a person cannot be considered independent if he/she has a kinship relationship with another member of the company's managing body(ies) or a significant shareholder or received fees from the company or was a significant shareholder of the company or related companies in the preceding two years. These amendments can be expected to improve the independence of state-owned companies' boards.

In terms of gender balance on corporate boards, the authorities report that the government follows national and international standards as well as guidance regarding gender diversity on SOE boards.

#### *Sub-dimension 6.2: Transparency and accountability practices*

According to the Law on Accounting, **financial and non-financial reports** are obligatory for all SOEs. SOEs which are not listed on the stock exchange are obliged to prepare and submit financial reports to the Tax Office of Montenegro. The reports must include a brief description of the business activities and organisational structure of the legal entity, analysis of its financial position and performance, information on the members of the governing and supervisory bodies, information on environmental investments and planned future development, and data on R&D activities, among others. However, there is an overarching concern over SOEs' weak compliance with reporting requirements. According to monitoring by the Securities Commission, only an estimated half of state-owned joint-stock companies respect these disclosure requirements.<sup>64</sup> Weaknesses in SOE compliance with reporting requirements are quite common across the region, and the fact that half of SOEs do comply with applicable disclosure requirements can be considered an achievement.

Concerning disclosure by the state, information on the aggregate performance of SOEs is not compiled into a single report. The legislative framework also does not establish comprehensive requirements for the disclosure of companies' non-financial information, and, in practice, these disclosures are generally limited. In addition, monitoring of the Capital Market Authority (CMA) does not include elements on environmental and social performance. According to the Law on Accounting, SOEs should compile financial statements following internationally recognised standards such as the International Accountant Standards (IAS) or the International Reporting Standards (IFRS). In line with the existing legislative framework for business organisations, there are no differences in accounting requirements for SOEs and private companies. According to stakeholders interviewed for this assessment, when it comes to key reporting to the Tax Administration, SOEs report fairly regularly, and transparently. It may sometimes happen that, within the report itself, certain SOEs do not provide complete information (e.g. the average number of employees, the average net salary) which means that the net result is not clearly shown. However, the fact is that they report regularly, on an annual basis, to the Tax Administration.

Montenegro has established sound basic legislation to ensure quality **auditing practices** among SOEs, but a fully informed assessment of this would require a qualitative review of how this legislation is implemented in practice. According to the Law on Audit, SOEs are subject to the same external audit requirements of their financial statements as stock-exchange listed companies. The audit should be performed by an independent auditor elected by the general meeting of shareholders for a term specified in the SOE charter, but not exceeding one year. In general, most SOEs incorporated as joint-stock companies follow this practice. In addition, the State Audit Institution is responsible for conducting audit practices of legal entities owned by state or state bodies. Although there are no rules on the frequency of SOE audits by this institution, many SOEs have been subject to an audit since the State Audit Institution was established.

Minority shareholders' rights are of paramount importance in the context of SOE governance in Montenegro since the majority of SOEs include private shareholders. Some basic elements of a sound legal framework are in place to **protect minority shareholders'** rights. However, external assessments point out that there is room to improve these legal protections in Montenegro. Notably, the World Bank's Doing Business report underlines persistent shortcomings in minority shareholder rights and accords Montenegro an average score of only 3.0 out of 6.0 for the extent of shareholder rights (World Bank, 2019<sup>[22]</sup>). The authorities expect to improve their score under the new Law on Business Organisations.

In essence, minority shareholders' rights are regulated by the Law on Business Organisations, which has been harmonised with EU Directives in this field. Generally, minority shareholders' rights are defined based on shares and for the same type of shares there are no differences in shareholders rights. Shareholders whose shares represent at least 5% of the share capital are entitled to convene a general shareholders' meeting, to add items to the agenda and to nominate board members. In practice, however, there have been "reported" instances of minority shareholders not being consulted. There is also some evidence suggesting that often minority shareholders are not aware of their rights.

The rights of shareholders have been regulated under the new law in more detailed terms, such as the right to hire experts, to ask questions relating to materials and proposals of decisions to be considered at the General Meeting, to expand the agenda, to nominate candidates for the members of the board of directors and supervisory board, and to nominate candidates for the company's auditor. Nevertheless, progress in this area will depend on effective implementation.

### *Sub-dimension 6.3: Ensuring a level playing field*

The vast majority of SOEs in Montenegro are incorporated according to company law (the Law on Business Organisations). Thus, the foundational elements of SOEs' **legal and regulatory treatment** are broadly in line with those of private competitors. According to the Law on Business Organisations, there are no differences in the legal and regulatory framework for privately owned and state-owned enterprises that carry out economic activities. The authorities assert that SOEs are subject to the same regulatory treatment regardless of shares in ownership structure and commercial orientation. SOEs – incorporated as joint-stock or limited liability companies, including municipal SOEs – are not formally exempt from the application of general laws, tax codes and regulations (including any special legal privileges neither benefit from competition and environmental/zoning regulations). In addition, the legislative framework does not distinguish between SOEs and private companies in implementing insolvency and bankruptcy procedures. Companies in which bankruptcy procedures are initiated are restructured in accordance with the Law on Insolvency.<sup>65</sup> The government is currently preparing amendments to the Law on Insolvency that aim to improve the rationality and efficiency of bankruptcy procedures. The fact that most commercially oriented SOEs are subject to the same legislative framework as private companies provides a sound foundation for ensuring a level playing field.

Concerning **access to finance**, the government can provide state guarantees for SOEs and other regulated companies which are regulated mainly by government support programmes and the Law on

State Aid Control. Each decision concerning financial guarantees is discussed, defined, and made by the government on a case-by-case basis. Although this might give SOEs a more favourable position, the authorities note that the government can give guarantees to private companies based on the same criteria. According to external assessment, although Montenegro has EU-based state-aid regulations in the form of guarantees, there is some evidence of gaps in implementation (World Bank, 2019<sup>[43]</sup>). For instance, the recent government decision to support the national carrier Montenegro Airlines from bankruptcy or closure has been widely criticised (BalkanInsight, 2019<sup>[90]</sup>).<sup>66</sup> Even though Montenegro is subject to state-aid rules to ensure fair competition, this recent example of support to their national airline highlights complexities in implementing the rules.

As a consequence of COVID-19, many state-owned enterprises have accumulated additional losses. For instance, Montenegro Airlines has posted losses of several million euros since halting its operations in mid-March 2020. The government has adopted a series of business support measures in the context of the COVID-19 crisis, issuing three packages worth over EUR 1.5 billion (more than 30% of GDP) to maintain the liquidity of companies, save jobs and support vulnerable groups.

#### *Sub-dimension 6.4: Reforming and privatising state-owned enterprises*

A significant proportion of SOEs' capital began to be privatised from the 1990s onwards. In some cases this occurred through full privatisation of the firms, while in others it involved partial privatisation, where the state maintained majority or minority shares. Many of the remaining enterprises in which the state maintains majority or full ownership are of strategic importance to the Montenegrin economy and operate in such areas as energy, transport and tourism. Table 23.12 outlines the number of SOEs privatised between 2010 and 2014.

Privatisations in Montenegro are conducted in accordance with a clearly defined legislative framework, based on the Law on Privatisation of Economy, the Law on Ownership and Management Transformation, Law on Foreign Investments, and other by-laws and regulations. An annual privatisation plan is adopted by the government in accordance with the Law on Privatisation of Economy and contains basic data on companies that are subject to privatisation that year, as well as the means and methods of the privatisation.<sup>67</sup> In recent years, the privatisation plans have mainly envisaged the sale of the remaining state capital in some of the national enterprises. The process is managed, controlled and implemented by the Privatisation and Capital Projects Council. The authorities report that the main objectives of privatisation are to 1) increase companies' competitiveness and efficiency; 2) encourage foreign investment and entrepreneurship in all areas; and 3) increase employment and improve standards of living.

Table 23.13 presents privatisation revenues and the main types of procedure in Montenegro for the period 2010-2019. The most common methods of privatisation in these years were 1) sale of shares and property through a public tender; 2) sale of shares on the stock exchange; and 3) sale of shares and property through a public auction. Although most Montenegrin SOEs have been sold, the state has still majority of ownership in 32 companies. The fact that some state-owned companies were continuously demanding help from the state has urged the authorities to accelerate their privatisation (IMF, 2018<sup>[91]</sup>). In 2019, for instance, negotiations to sell the health institute in Igalo were initiated but ultimately cancelled and restructuring of the hotel group *Budvanska Rivijera* has been completed. The calls for privatisation have also been published for another two companies from the 2019 privatisation plan. Six state-owned companies were scheduled for privatisation in 2020 through stock-exchange sales.

**Table 23.12. Montenegrin SOEs privatised between 2010 and 2014**

Year	Name of the company	Percentage of privatised shares	Sector
2010	Marina Bar AD Bar	54%	Port traffic
	Lovcen osiguranje AD – Podgorica	41%	Insurance
2011	0	0	
2012	Mijekara Zora Berane	99%	Milk production
2013	Kontejnarski terminal I generalni tereti Bar	62%	Maritime transport
2014	Gornji Ibar – sale of property	..	Wood industry
	Montenegro defence industry d.o.o Podgorica	100%	Defence industry
	Polix AD – Berane	51%	Chemical industry
	Hotel Park Bijela – sale of state property	..	Hotel

### ***The way forward for state-owned enterprises***

SOEs operate at the nexus of the public and private sector; as such, their operations are affected by both the quality of public governance and the prevailing corporate and boardroom culture. Choosing the appropriate sequencing of reforms is just as important as their content, and depends in large part on the national political climate and current reform priorities. The OECD Guidelines on Corporate Governance of State-Owned Enterprises provide signposting for reforms that the authorities can use to inform their policy efforts in this domain. Based on the state of play of SOE policy development in Montenegro, the following priority reform areas – which are in line with the OECD SOE Guidelines – could offer a basis for discussions with the authorities. Because the vast majority of Montenegro's SOEs have non-state shareholders, as the state implements its ownership responsibilities in line with the recommendations below, it will be important to ensure that non-state shareholders' interests are considered – and their rights respected – to maintain an attractive environment for private investors:

- **Develop a state ownership policy and review the effectiveness of current state ownership arrangements.** In Montenegro, ownership rights in SOEs are exercised by the government, state institutions (state funds) and (in some cases) line ministries, which is different from the somewhat common model of decentralisation under line ministries. The authorities should ensure that these state actors operate under a unified ownership policy. Since reviewing the effectiveness of the current ownership arrangements goes beyond the scope of this assessment, the authorities could for instance

undertake an in-depth review of the efficiency of current ownership arrangements with a view to improving them.

- **Improve the process for setting objectives and monitoring their fulfilment.** There is scope for strengthening the state's role in setting performance targets for SOEs and monitoring their achievement. The state should also produce an aggregate report presenting information on the performance of the state's portfolio.
- **Ensure that the SOE board nomination process is merit-based and transparent.** The state should ensure that SOE boards are equipped with qualified professionals and should minimise the risk of political board nominations. Recent updates to the company law requiring independent directors on (some) SOE boards can be expected to reduce conflicts of interest and further professionalise SOE boards. Nonetheless, company law provisions on board nominating procedures cannot be considered to constitute a robust SOE board nomination framework on their own. The authorities should establish SOE-specific board nomination procedures to ensure that SOE boards of directors are equipped with a sufficient diversity of expertise, as well as independence from both political influence and corporate management, to oversee corporate decision making in the interest of the SOEs and their shareholders.
- **Ensure that SOEs create value for all shareholders, including the state and minority non-state owners.** The role of minority shareholders in SOE decision making should be enhanced. Since the authorities have chosen to prioritise private investments in their SOE sector, they need to ensure that private capital holders' interests are taken into account. In addition, in the companies in which the state is itself a minority shareholder, the authorities should review the need to continue holding minority shares in them. Box 23.10 describes how Poland has worked towards a positive and value-creating relationship between the state and private investors.

### Box 23.10. Broadening the ownership of SOEs in Poland

Privatisation through the stock exchange has been one of the key elements in the Polish economy's transition from command to free-market economy. Share offerings of SOEs have been used as a means to develop Poland's capital markets, to strengthen Warsaw's role as a regional financial centre, to maximise revenues from privatisation through the capital markets, and to attract financial resources for the companies themselves.

In general, the Polish Government considers that listing has been a key factor in contributing to improvements in overall company performance and governance standards. This is due to a number of factors, including more effective and better qualified management teams, which are able to introduce operational efficiencies after listing (e.g. cost reductions); increased disclosure and reporting requirements following listing; and the presence of larger more active institutional investors, which helps to bring about increased diligence and focus on company performance.

In companies where the state remains the majority shareholder, the state has the power and duty (through its seats on the supervisory board) to:

- appoint, dismiss and suspend board members
- recommend a remuneration policy for the management board
- access company financial statements
- approve annual financial plans and long-term strategic goals
- monitor and control decisions which are material to the company
- approve investment/divestment decision above certain limits
- select company auditors and monitor the audit process
- assure continuous monitoring of performance and ability of the company to meet its financial and long-term strategic goals.

The Treasury considers equal shareholder rights to be of paramount importance, which is enshrined in the Commercial Companies Code and supported by codes of best practice. The code specifically states that each share carries one vote. However certain exceptions apply, such as: share with preferential voting rights, but not more than two votes per share; limitation in the exercise of voting rights by shareholders representing more than one-fifth of the total number of votes; and personal rights for individual shareholders, such as the right to appoint or remove members of the management and/or supervisory board. Shareholders representing at least one-tenth of the company's share capital may request an extraordinary general meeting to be convened, and can also place matters of particular interest on the agenda of annual general meetings. Depending on the company, some rights may be granted to shareholders representing a smaller minority of the company's share capital. Representatives of the Treasury on the supervisory boards of companies in which the state is a minority shareholder have a number of rights including: informing the appropriate supervisory units of any violation of the laws committed by company management or of any activities which may be harmful to the Treasury's interests; applying statutory provisions appropriately to secure the Treasury's best interests; and initiating reporting and disclosure obligations by the company's board members.

## Education policy (Dimension 7)

### Introduction

Overall, Montenegro has one of the best performing education systems in the Western Balkans. Participation in primary education is now on a par with EU and OECD levels, and student learning outcomes – as measured by the Programme for International Student Assessment (PISA) – have seen important progress. Notably, Montenegro’s mean score for student performance in mathematics increased by around 12 points between the 2015 and 2018 PISA cycles; compared to an average of 2 points in OECD countries (OECD, 2020<sub>[18]</sub>). In the last two years, the government has started implementing significant policy reforms, such as curriculum guidelines to ensure continuity in children’s transition from early childhood education to primary education, and free tuition for students at public higher education institutions. These efforts have led to increases in Montenegro’s education scores since the CO 2018 (for those indicators which allow for comparisons (Figure 23.1). Montenegro is also slightly above the WB6 overall average for this dimension (Table 23.14). However, a large share of students are still not mastering basic competencies.

**Table 23.14. Montenegro’s scores for education policy**

Dimension	Sub-dimension	Score	WB6 average
Education policy dimension	Sub-dimension 7.1: Early childhood and school education	3.2	3.0
	Sub-dimension 7.2: Teachers	3.3	2.7
	Sub-dimension 7.3: Vocational education and training	3.5	3.1
	Sub-dimension 7.4: Tertiary education	2.8	2.8
	Cross-cutting dimension: System governance	3.5	3.3
Montenegro’s overall score		<b>3.2</b>	<b>3.0</b>

### State of play and key developments

#### *Sub-dimension 7.1: Early childhood and school education*

Montenegro’s score in this sub-dimension is slightly above the WB6 average. Since the last CO assessment, Montenegro has made strong progress in improving access and raising the quality of early childhood education. It has also taken steps to support implementation of its new curricula for the pre-university school system. As of 2019, net enrolment in Montenegro was universal for primary education (99.9%), but slightly lower for lower secondary (92.3%) (UIS, 2020<sub>[93]</sub>). Net enrolment in upper secondary (89%) has gradually increased and is on track to meet OECD (92.5%) and EU (93%) averages in the coming years. Moreover, Montenegro has some of the lowest early school-leaving rates in the region, on a par with European and OECD countries such as Ireland, Poland and Switzerland (Eurostat, 2019<sub>[94]</sub>).

In terms of learning outcomes, Montenegro’s average scores in PISA have increased over time and are above the Western Balkan average. However, average performance across subjects remains below the EU and OECD averages (Figure 23.15). While Montenegro has a smaller share of low-performing students than most economies in the region, the share of students who lack baseline levels of proficiency in reading (44.4%) and mathematics (46.2%) is still much higher than the OECD average (around 23% and 22% respectively) (OECD, 2020<sub>[18]</sub>). This has implications for Montenegro’s long-term economic development, as students without basic skills are less likely to attain well-paid and rewarding jobs.

**Figure 23.15. Performance in reading, mathematics and science in Western Balkan six education systems, 2018**

PISA mean scores

StatLink  <https://doi.org/10.1787/888934255950>

There are also signs of educational inequities in the education system. Students from Roma and Egyptian Balkan communities and students with disabilities are more likely to face barriers in accessing high-quality early childhood education (ECE) and school education (UNICEF, 2013<sub>[95]</sub>). Moreover, data from the 2018 PISA reading assessment reveal a performance gap of 66 points between students who receive instruction in Montenegrin and those who are taught in Albanian (OECD, 2020<sub>[18]</sub>). While it is positive that Montenegro has strategies to support inclusive education and offers mother-tongue instruction in areas where there is a significant presence of minority language groups, there is a need to analyse disaggregated data on the education system to better understand and address disparities.

Montenegro's performance in **early childhood education** is slightly above the regional average. The Strategy of Early and Preschool Education in Montenegro 2016-2020 (UNICEF Montenegro, Ministry of Education of Montenegro, 2016<sub>[96]</sub>) establishes clear goals, notably to increase ECE coverage and improve the quality of services. Facilitated by the construction of new facilities, Montenegro's gross enrolment ratio in pre-primary education increased from around 31% in 2010 to 74% in 2019 (UIS, 2020<sub>[93]</sub>). This rate is now above the 2018 WB6 average (71%) but lower than the OECD and EU averages (around 94%) (UIS, 2020<sub>[93]</sub>). While participation in pre-primary education is not compulsory in Montenegro, there are several measures to reduce barriers to access, including free provision for socio-economically disadvantaged children and those with disabilities. The Ministry of Education and international partners have also organised outreach efforts to encourage families and communities to enrol their children in ECE. In terms of quality, Montenegro has clear educational requirements for ECE staff and there are curriculum guidelines to ensure continuity in children's transition from ECE to primary education. However, the latter do not include clear development and learning goals that children should achieve by each age group. Finally, donor-led initiatives continue to play an important role in implementing policy initiatives and monitoring and supporting the ECE sector in Montenegro.

While Montenegro performs relatively well compared to most Western Balkan economies in PISA, the **instructional system**<sup>68</sup> scores below the regional average for this indicator. This is primarily because the economy lacks an overarching strategy that establishes a coherent vision for the school system (see the Cross-cutting dimension: System governance). Instead, Montenegro has multiple strategies which cover different time periods, topics and levels of education. For example, there are separate strategies for general and vocational education at the secondary level, both of which cover 2015-20, in addition to strategies on inclusive education (2019-25) and supporting talented students (2020-22). Despite Montenegro's rather

fragmented approach to the strategic development of the pre-university education sector, administrative laws establish clear regulations for curricula, assessments and evaluations.

A major curricular reform was introduced in 2017. Its main goal is to shorten the primary school curriculum by 10% to create more space for the development of cognitive skills and reaffirm the educational role of the school. This reform is being supported by the Bureau for Education Services,<sup>69</sup> which is developing a manual that will set out learning outcomes for students and how their achievement should be measured by subject and grade. While the manual's finalisation has been delayed because of COVID-19, its implementation will serve as an important reference for Montenegro's Examination Centre, which is responsible for Montenegro's two national examinations. Currently, Montenegro's exams respectively certify the completion of primary education (in grade 9) and upper-secondary education (in grade 12). The Examination Centre is also responsible for managing Montenegro's participation in international assessments, like PISA, which provide valuable information to monitor and compare the quality of instruction.

Similar to many European education systems, Montenegro has a set of school quality standards that cover teaching and learning, in addition to more compliance-based requirements. These standards are accompanied by a rulebook on the content, form and manner of external and internal evaluations of schools to ensure the quality of their educational work. According to the General Law on Education and the rulebook on the content, form and manner of determining the quality of educational work in institutions, schools in Montenegro must conduct annual self-evaluations in specific areas, as well as comprehensive biannual self-evaluations. The Department for Determining the Quality of Educational Work of Schools, a body independent of the Ministry of Education, is responsible for conducting external school evaluations.

The **early school leaving** rate in Montenegro has generally declined over the last decade. It had fallen to 5% in 2019, well below the EU target of less than 10% of early school leavers by 2020 (Eurostat, 2019<sup>[94]</sup>). While there is no specific strategy for early school leaving, several policies and initiatives tackle the issue, often by targeting students at risk of leaving school early. For example, the Ministry of Education employed 21 Roma mediators in 2019-20 to help increase enrolment and reduce the dropout rates for students from Roma and Egyptian communities (EC, 2020<sup>[35]</sup>). Montenegro also benefits from IPA<sup>70</sup> funding to help marginalised students who are at risk of dropping out or leaving to prevent them leaving or return them to the system. Career guidance and a dual education programme in Montenegro further help connect students with an educational pathway that fits their interests and abilities. Other key policies, such as the multidisciplinary Protocol on the Procedure and Prevention of Early School Leaving and refined indicators in the Ministry of Education's information system have also contributed to Montenegro's low early school leaving rate by collecting a range of data and drawing on a variety of competent institutions and actors to monitor and tackle the issue. To further improve in this sub-dimension, Montenegro should evaluate and adjust its strategies and policies relevant to early school leaving.

### *Sub-dimension 7.2: Teachers*

Montenegro's score on the teacher sub-dimension is above the WB average, largely because the Teacher Education Strategy in Montenegro (2017-2024) offers a set of policy actions to improve initial teacher education and their professional development and management. Montenegro also has clear regulations and rulebooks that shape teacher policy. For example, all school teachers are required to have at least a higher education degree. National data received for this assessment reveal that as of 2019, most teachers (77.5%) had achieved at least a Bachelor's degree or equivalent. While the average gross salaries of teachers in Montenegro are lower than other European countries, they are similar to or slightly lower than the mean earnings of workers in Montenegro with similar levels of education. For example, the actual salaries of lower secondary teachers in 2014-15 were around 75% of the mean earnings of workers with a short-cycle tertiary education or a Bachelor's degree. This situation is similar to European countries like Hungary, the Czech Republic and Greece (EC/EACEA/Eurydice, 2019<sup>[97]</sup>).

Montenegro accredits **initial teacher education (ITE)** programmes based on professional teacher standards. This means that ITE providers must demonstrate how their programmes help candidates develop the specific competencies needed to teach by offering relevant courses and dedicating 25% of learning time to a teaching practicum. The latter consists of a one-year teaching internship under supervision of a trained mentor. After completing the internship, candidates must pass a professional examination before they can start working in schools as a licensed teacher. While these are positive practices found in many European countries, Montenegro does not have minimum entry requirements for candidates in ITE because higher education institutions have full autonomy to determine these criteria. To raise the profession's competitiveness and attract the most motivated and qualified candidates into ITE, Montenegro reports having made improvements to teachers' working conditions and increasing salaries. However, there are no targeted efforts to recruit teachers with specific profiles and there are no alternative pathways into the profession, which leads to imbalances in the teaching workforce.

There is a clear regulatory framework around the **professional development and management** of teachers in Montenegro. Funding for professional development comes from the Ministry of Education, schools, international projects and teachers' personal budgets. In some cases, funds are transferred directly to schools, especially in the case of international projects. Teachers must renew their teaching licences every five years and there is a progressive career structure linked to financial incentives that helps encourage continuous professional development. Montenegro has four categories of teachers (mentor, advisor, senior advisory and teacher researcher) that align with years of work experience, professional development requirements and an appraisal process based on teacher professional standards (Republic of Montenegro, 2009<sub>[98]</sub>). These types of performance-based career structures can help motivate teachers to improve their practice. However, Montenegro's professional teacher standards are not differentiated by category of teacher, meaning that the expectations for teachers do not evolve or become specialised to reflect experience or the subjects or grade levels taught.

### *Sub-dimension 7.3: Vocational education and training*

Montenegro's score in the sub-dimension on vocational education and training (VET) is slightly above the WB average (Table 23.14). Professionally oriented education can start at lower-secondary level, when students attend a single school with peers following a general curriculum; or in upper secondary, when students are allocated into either a general (gymnasium) or a 3-4 year vocational or professional school (Eurostat, 2020<sub>[99]</sub>). As of 2018, some 33% of secondary students in Montenegro were enrolled in VET programmes, above the WB (29%), EU (27%) and OECD (23.5%) averages (UIS, 2020<sub>[93]</sub>). Similar to other economies, data from PISA 2018 find that students in Montenegro's vocational programmes are more likely to be low performers<sup>71</sup> than their peers in general education. However, the share of low-performing VET students in Montenegro (55%) is one of the lowest in the Western Balkans, second to Serbia (47%) (OECD, 2020<sub>[18]</sub>). Nevertheless, some evidence suggests that VET students continue to lack the skills required by the labour market (EC, 2020<sub>[35]</sub>).

A range of public bodies are responsible for the **governance of VET** in Montenegro, which is guided by the new Strategy for the Development of Vocational Education (2020-2024). Key institutions include the Ministry of Education; the Centre for Vocational Education;<sup>72</sup> the Examinations Centre, which among other responsibilities manages vocational examinations to ensure that VET qualifications are rigorous, transferable and understood by the public; and the Bureau for Education Services.<sup>73</sup> Policy coherence is ensured by good co-operation amongst these institutions. For example, there is a co-ordination body responsible for monitoring and implementing the strategy, allowing various actors to participate in decision-making processes. Industries and social partners also engage in the sector's development by helping shape occupational standards for educational programmes and hosting and assessing students in dual education programmes. Montenegro has clear processes for accrediting VET programmes and providers must undergo an external evaluation at least once every four years, in addition to biannual self-evaluations. Reports on the findings from these evaluations are publicly available.

The Strategy for the Development of VET in Montenegro recognises the importance of **work-based learning** to improve the relevance of VET programmes for individuals, the labour market and society. Notably, Montenegro is the first economy in the Western Balkans to roll out a dual VET system nationally (ILO, 2020<sub>[100]</sub>). The relationships between the scope and duration of theoretical and practical classes are clearly defined<sup>74</sup> and the government plans to further improve the quality of dual education by developing a certification system for companies that wish to train students, improving training for teachers and in-company tutors, improving monitoring and evaluation instruments, and strengthening final examination processes. Montenegro collects a range of information on VET, often in partnership with Employment Services, to help inform the design of policies and programmes. However, there is no information on the earnings of VET graduates nor the location and type of work-based learning (WBL) opportunities, completion rates from WBL programmes or the duration of these programmes. Nevertheless, there are broad public awareness campaigns and presentations to social partners and companies to help match learners with WBL places. While Montenegro does not currently offer financial incentives for employers to provide WBL places, there are plans to create a Fund for Dual Education which will pay employers to host students during part of their study programme (see also Box 23.13 later in this report).

#### *Sub-dimension 7.4: Tertiary education*

Montenegro's score in the tertiary education sub-dimension is on a par with the Western Balkan average. School life expectancy (from primary education through tertiary education) has increased in recent decades and was similar to the WB average (nearly 15 years) in 2018, but still lower than the average in the EU (16.6 years) and OECD (17 years) (UIS, 2020<sub>[93]</sub>). The share of the labour force (aged 15+) who have attained some form of tertiary education (ISCED 5-8) increased slightly between 2018 and 2019 to 29%, the highest share among the WB economies (ETF, 2020<sub>[101]</sub>). However, gross enrolments in tertiary education have decreased by 4 percentage points since 2017 (UIS, 2020<sub>[93]</sub>) and the share of youth who are not in employment, education or training (NEET) increased slightly between 2018 and 2019 (from 16.2% to 17.3%) (ETF, 2020<sub>[101]</sub>). A new higher education strategy in Montenegro (2020-2025) is currently being developed in consultation with the public; however, its finalisation may be delayed by the COVID-19 pandemic. The sector is regulated by legal frameworks, notably the 2014 Law on Higher Education, but there have also been several national reforms in the last two years. In particular, Montenegro has aligned its study model for higher education with the European Higher Education Area (a 3+2+3 year model), and since 2017 undergraduate studies at public higher education institutions are tuition free.<sup>75</sup>

Montenegro has established transparent processes for selection into higher education<sup>76</sup> and there are affirmative action policies for people with disabilities who wish to pursue higher education studies. The Ministry of Education awards students with loans and scholarships based on their results of academic competitions, which helps pay for living and other associated costs. However, these are the only financial support mechanisms available to students since undergraduate tuition is now free. While tuition-free policies are intended to facilitate more **equitable access to higher education** it is likely they will benefit advantaged students who were already on track to attend higher education programmes, rather than create more equal opportunities to support marginalised students who may face greater barriers in accessing and completing higher education. This concern is exacerbated by the limited amount of data available to monitor equity in tertiary education in Montenegro. While the Statistical Office of Montenegro (MONSTAT) reports collecting gender data on enrolment rates, there have been no studies on associations between individual factors, such as socio-economic or minority background, and participation in higher education. Without more disaggregated data and analysis, Montenegro may struggle to identify and tackle equity issues in the tertiary sector.

An important goal of Montenegro's previous Higher Education Development Strategy (2016-2020) was to harmonise education with the needs of the labour market by modernising study programmes, introducing new learning methods (e.g. ICT), promoting entrepreneurial learning and teaching English. There are several initiatives to support the internationalisation of higher education in Montenegro both at the central

government level, such as participation in the EU Erasmus Plus programme, and by individual higher education institutions (HEIs).<sup>77</sup> Data on the **labour market relevance and outcomes** of higher education are mainly under the responsibility of Montenegro's Employment Service Bureau, which collects labour market information using employer surveys, quantitative forecasting models and sectoral studies. Individual HEIs also collect their own data on student outcomes across study programmes, but it seems they are not aggregated centrally. An important development in Montenegro since 2017 is the establishment of the Agency for Control and Quality Assurance of Higher Education. It started working at full capacity in 2018 to conduct research on the higher education system and to co-operate with international institutions in the field of quality assurance in higher education (AKOVO, 2020<sub>[102]</sub>). This change has helped align Montenegro's quality assurance mechanisms with those of the EU.

### *Cross-cutting dimension: System governance*

Montenegro's score for this cross-cutting dimension is similar to the WB average, as some **system governance** features align with the policies and practices found in European and OECD education systems. For example, Montenegro's National Qualifications Framework was aligned with European Qualifications in 2014 and covers eight levels of qualifications. The Ministry of Education, Science, Culture and Sports also manages the Montenegrin Education Information System (MEIS), which stores a range of information about the education system and helps monitor performance through a set of key indicators. These include student learning outcomes, which are generated through the economy's regular participation in international assessments since Montenegro does not have a national assessment system.

Despite these positive features of system governance, a notable difference between Montenegro and other WB6 economies, EU member states and OECD countries is the lack of a comprehensive national education strategy that sets out a clear vision and goals for the entire sector. Instead, Montenegro has several individual strategies that cover different levels of education and topics, such as the Strategy for General Secondary Education (2015-20) and the new Strategy on Support for Talented Students (2020-22). Taken alone, these strategies have clear and measurable targets, allocate responsibilities and provide timelines for implementation. However, it is unclear how the various strategies relate to one another and many are set to expire in 2020, without a clear indication on whether they will be extended or revised. A positive feature of Montenegro's strategic governance system is that there are evaluations of individual education strategies and on thematic topics, such as VET. Monitoring activities are carried out by co-ordination bodies who usually meet quarterly to analyse the implementation of planned activities. However, many of these evaluation efforts are supported by donor agencies and Montenegro does not produce its own reports on the performance of the education system as a whole.

Similar to governments around the world, Montenegro was faced with a rapid shift from classroom to remote learning in 2020 to help slow the spread of COVID-19. Working with donor agencies, the Ministry of Education introduced a variety of distance learning opportunities for the different education levels. These included a portal, "Školskiportal", for teacher-student communication with classes divided by years and subjects; a dedicated YouTube channel for recorded classes; and another portal, "UčiDoma", centralising recordings and schedules of classes.

To support the inclusion of children from marginalised social or ethnic groups, the ministry, in co-operation with the HELP organisation and Telekom Crne Gore provided a small number (100) of smartphones with free three-month subscriptions to students in need. While in-class teaching is now possible once again, policy measures are in place to provide paid leave for parents of children under the age of eleven and children with special educational needs if the country should move towards online learning again.

In the tertiary sector, the University of Montenegro, as well as private educational institutions, have created an online teaching plan and encouraged the use of online platforms such as Moodle for learning management and Zoom for online classes. Furthermore, the Ministry's Bureau of Education issued

recommendations on how to best organise distance learning, covering fields such as teaching planning and organisation, teacher-student communication, student assessment and inclusive education.

### ***The way forward for education policy***

In today's increasingly global and fast-changing world, achieving inclusive and quality education can help Montenegro increase its competitiveness and create opportunities for more individuals to develop the competencies needed for sustainable development and social cohesion. Montenegrin officials will need to reflect on the economy's political, social and fiscal environment to determine how best to achieve their education goals. The following considerations can provide insights for discussions on the way forward for enhancing education:

- **Develop a new and comprehensive education strategy with a clear set of priorities and a strong monitoring framework.** Rather than continuing to develop ad hoc strategies on various education priorities, such as inclusive education or support for talented students, Montenegro should develop a comprehensive education strategy that provides a vision and clear set of priorities for directing the education sector towards supporting more students to achieve good and excellent outcomes. This education strategy should align with Montenegro's overall development strategy as it will cover a critical period of potential accession to the EU. It will be important to focus on priorities that are clear and measurable to help mobilise stakeholders across the system and serve as a key reference for other strategic education documents that focus on specific levels or thematic areas. These priorities should be translated into financially viable implementation plans that can be measured through a monitoring framework.
- **Strengthen evaluation and assessment policies across the system.** Montenegro already has an Education Management Information System, but there are several areas where additional disaggregated data would help support education policy reforms and inform decision making. For example, data on educational participation, attainment and learning outcomes according to linguistic, socio-economic and immigrant background could help monitor and advance Montenegro's inclusive education goals. It is also important to analyse and review education data and policy initiatives. In particular, Montenegro should consider producing a regular analytical report on system-wide progress that pulls together individual work programmes and various education strategies into a prominent state of education report. The Czech Republic and Portugal provide similar reports for their education systems (Box 23.11).
- **Finalise the development of the national assessment and set targets for improving student learning outcomes.** Many Western Balkan education systems have – or are developing – national standardised assessment systems to help monitor the implementation of curricula and focus actors across the system on improving student learning outcomes. Developing a national assessment instrument would allow Montenegro to collect valuable information to monitor national education goals.

### Box 23.11. Annual analytical reports on the education system in the Czech Republic and Portugal

In the Czech Republic, the Ministry of Education, Youth and Sports produces an annual report on its evaluation of the country's education system (the Status Report on the Development of the Education System in the Czech Republic). This report relies on a set of indicators designed to assess progress towards the country's long-term policy objectives. The document summarises the main organisational and legislative changes that have occurred during the year and presents statistical indicators describing the situation and development in pre-primary, basic, secondary and tertiary education. The report also contains information on educational staff in the system, the funding of schools and the labour market situation of school leavers. These data constitute a basis for the development of education policies. Furthermore, the report typically includes an area of specific focus. For example, the 2017 annual report includes a section on the country's results in the 2016 Progress in International Reading Literacy Study (PIRLS). Individual regions within the Czech Republic also produce their own reports to assess progress towards long-term policy objectives.

In Portugal, the National Education Council, an independent advisory body to the Ministry of Education, has published the annual State of Education report since 2010, which provides an analysis of key data on the education system. The first issue, the State of Education 2010 – School Paths, offered a detailed investigation of student pathways in the education system. The latest issue, The State of Education 2017, published in 2018, contains a section dedicated to the state of education in Portugal's countryside and the role of education in promoting territorial cohesion. The report also offers policy advice on how to improve the quality of pre-primary, basic, secondary and tertiary education. It also evaluates policy initiatives, such as changes to school evaluation, human and financial resources and policies to increase educational equity.

## Employment policy (Dimension 8)

### Introduction

Since the last Competitiveness Outlook assessment, Montenegro has made efforts to align its labour legislation with the EU *acquis*. New legislation has aimed at increasing flexibility on the one hand, and better working conditions on the other. Improvements have been made to the capacities of labour inspectors and inspectorates. However, no progress has been made to analyse the volume and structure of informal employment or to analyse the impact of tax wedges and the low level of the social protection benefits on informal employment. Inter-institutional co-operation to reduce informal employment has been improved. With the support of the International Labour Organization (ILO), there are concrete plans to strengthen the role of social partners and collective bargaining. Important improvements have been made in skills mismatch analysis, co-operation between actors, setting up a dual education scheme and increasing the quality and image of VET, and building an adult education system. Although some improvements have been made in the territorial coverage of PES offices and tools for PES counsellors (profiling, setting up of individual action plans), no sizeable improvements have been made to the number of PES counsellors or budgets. Targeting of the most vulnerable unemployed and inactive groups is still weak, although relevant programmes have been set in place (however, with low budgets).

Figure 23.1 in the key findings shows the improvement of Montenegro's performance, as its overall score increased from 2.1 in 2018 to 3.0 in 2021. All four sub-dimension scores are higher than the WB6 average (Table 23.15), and its overall score is second only to North Macedonia.

**Table 23.15. Montenegro's scores for employment policy**

Dimension	Sub-dimension	Score	WB6 average
Employment policy dimension	Sub-dimension 8.1: Labour market governance	3.0	2.6
	Sub-dimension 8.2: Skills	3.0	2.2
	Sub-dimension 8.3: Job quality	2.5	2.4
	Sub-dimension 8.4: Activation policies	3.3	2.9
Montenegro's overall score		<b>3.0</b>	<b>2.6</b>

### State of play and key developments

**Table 23.16. Key labour market indicators for Montenegro (2015 and 2019)**

	Montenegro		WB6 average	EU average
	2015	2019	2019	2019
Activity rate (15-64)	62.6%	66.2%	61.0%	74.1%
Employment rate (15-64)	51.4%	56.0%	51.5%	69.3%
Unemployment rate (15-64)	17.8%	15.4%	16.3%	6.4%

Note: WB6 average rates are based on author's own calculations using simple averages.

Source: (Eurostat, n.d.<sub>[106]</sub>), Labour Force Survey database, <https://ec.europa.eu/eurostat/web/main/data/database>.

As shown in Table 23.16, the activity rate of the population aged 15-64 increased by 3.6 percentage points from 2015 to 2019 reaching 66.2%, the fourth highest in the region. However, it was still 7.9 percentage points below the EU average, as well as below the 11 new EU member states (73.7%). Over the same period the number of employed increased constantly (+11%). Between 2015 and 2019 the employment rate of people aged 15-64 rose to 56.0% (Eurostat, 2020<sub>[107]</sub>), the third highest rate in the region after Serbia and Albania, though still largely below the EU average (Eurostat, 2021<sub>[108]</sub>). There was a very strong increase in the employment rate of older workers, from 32.3% to 44.6%, and of youth (14-24 years old), from 17.7% to 25.7%.<sup>78</sup> The latter was well above the WB6 average, but markedly below the EU average. Employment growth in 2018 and 2019 was linked to the favourable economic climate (Government of

Montenegro, 2020<sub>[109]</sub>) and driven mainly by decreasing inactivity and to a lesser extent falling unemployment (one-quarter of employment growth reflects falling unemployment between 2015 and Q2 2019, according to Labour Force Survey data). The unemployment rate (amongst the 15-64 age group) fell by more than 2 percentage points from 2015 to 15.4% in 2019, and the youth unemployment rate nearly halved (25.2% in 2019, according to Labour Force Survey data). The decrease in the unemployment rate was less steep than the WB6 average, however. In 2019, the unemployment rate was below the region's average (16.3%), but largely above the EU average (6.4%). Unemployment has risen again in 2020 as a consequence of the COVID-19 pandemic. In Q2 2020, the employment rate was 5.7 percentage points lower than in the same quarter the previous year, a lower decrease than in North Macedonia, but higher than in Serbia and the EU<sup>79</sup> (-1.6 percentage points) (Eurostat, 2021<sub>[108]</sub>) where short-term work schemes have been in place (Duell, 2020<sub>[110]</sub>).

As a result of the COVID-19 pandemic, on 30 September 2020 the number of registered unemployed was 28.8% higher (+9 700) than in September 2019. Unemployment rose for all qualification levels, with a relatively stronger increase among the highly educated and medium-educated groups. Young people were more strongly affected by unemployment than older workers. Between January and September 2020, the number of registered job vacancies fell by 32.2% and the number of work permits issued fell by 40.3%.<sup>80</sup> The Employment Agency of Montenegro has continued to implement active employment policy programmes for the unemployed. These include direct job creation and public works; training measures in co-operation with employers; and the programme “stop the grey economy” that provides training and employment for young highly educated unemployed people for a period of seven months. Newly registered unemployed recent graduates are offered workshop activities through the Zoom platform. The delivery of these kinds of digital services to the unemployed is a novelty in Montenegro. To cope with social distancing rules, digitalisation and provision of remote services for the unemployed has also strongly expanded in EU countries (Duell, 2020<sub>[110]</sub>).

### *Sub-dimension 8.1: Labour market governance*

The pillars of the **regulatory framework** setting minimum employment standards consist of a new Labour Law adopted in December 2019, which entered into force in January 2020; the General Collective Agreement of 2014 with latest amendments made in 2019; and the Law on Occupational Health and Safety of 2014, with latest amendments made in 2018. The latest changes in the legislation were made to align with EU standards<sup>81</sup> by improving labour market flexibility and labour standards for workers in certain areas. The new labour law is harmonised with 14 EU directives. The work on alignment with the *acquis* will be continued.<sup>82</sup> Improvements made include the areas of (Karanovic and Partners, 2020<sub>[111]</sub>):

- transparent working conditions
- part-time work and temporary agency work (strengthening the protection and rights of temporary agency workers and lengthening the use of temporary agency workers to 36 instead of 24 months, excluding internship)
- work-life balance, i.e. working from home
- aligning overtime hours with EU standards (average working time should not exceed 48 hours per week, within a period of 4 months)
- take-up of annual leave
- improved protection of pregnant workers and workers on parental leave.

In the case of collective layoff procedures, the new law prescribes mandatory consultations with the employees' labour union (or their representatives) and to notify the Employment Bureau of the consultations; previously only employees and their representatives were notified (Karanovic and Partners, 2020<sub>[111]</sub>). An employer cannot employ another person in a position deemed redundant for a period of six months.

Certain non-standard forms of employment are covered by the social protection framework, such as temporary employed and self-employed workers. There is no regulation in place clarifying labour standards and employment protection for gig workers.

Some of the key priorities of **labour inspections** are to combat informal work and supervise the implementation of regulations on occupational health and safety, temporary agency work, and labour standards in general.<sup>83</sup> The bulk of inspections are carried out during the summer tourist season, which is characterised by a high incidence of undeclared work (70% compared to the rest of the year). Enhanced supervision is also carried out in the construction and transportation sectors. A rotating system of labour inspectors across cities has been implemented to increase the effectiveness of their work. Undeclared work cases are processed through preventive and repressive measures, controlling for registration of business and of payments, and disciplining employers for breaching labour regulations. Infractions of the law are monitored and sanctioned. Inspections are carried out through regular visits or following notification by the people employed or formerly employed, various associations and citizens. Some forms of undeclared work are particularly difficult to detect, e.g. envelope wages (where only one part of the wages is declared). In cases of breaches, inspectors first issue the employer with a “warning” and give them a deadline for correcting the breach.

There is a co-ordination mechanism in place bringing together other units with inspection facilities, such as the tax authority, police administration (border police and sector for foreigners), and local municipality institutions (communal inspection and police). The labour inspectorates share relevant data with these institutions/units, while also implementing joint inspections. Labour inspectorates are part of intergovernmental work groups for drafting laws and bylaws such as the Labour Law, the Law on Occupational Safety and Health and its bylaws. Labour inspection outcomes are monitored through indicators in the information system of the labour inspectorates, established in 2016 (Administration for Inspection Affairs, 2019<sup>[112]</sup>).

While implementing preventive measures is highly relevant, it would also be useful to conduct an assessment of the institutional capacities of labour inspectorates to fulfill their tasks. Labour inspectorates’ human and technical resources are inadequate and more frequent inspections are necessary. In 2020, there were 42 labour inspectors, up from 33 in 2017. There are around 5 800 workers for each inspector, which is a better ratio than in Albania, North Macedonia, Serbia and Kosovo.<sup>84</sup> Capacity is however lower than in a country like Germany, where the same inspector-worker ratio would apply solely to the detection of informal employment, with additional staff in charge of occupational health and safety. Most inspectors in Montenegro are lawyers (32), who carry out employment and labour law inspections. The remainder are graduate engineers of various technical and technological professions, who carry out health and safety inspections. They receive training in legal issues and attend seminars on topics like informal employment, health and safety at work, gender equality, discrimination, employment of persons with disabilities, human trafficking and corruption. Inspectorates in the field of occupational health and safety are also constantly involved in organising and delivering various training and awareness-raising events, which are attended by representatives of employers and workers in the companies.

During 2019 the Labour Inspectorate performed a total of 11 430 inspections (8 128 in the field of labour relations and employment and 3 302 in the field of occupational health and safety), in which it identified a total of 6 548 irregularities (Ministry of Public Administration of Montenegro, 2020<sup>[113]</sup>).

There is a basic labour market information system in place. The statistical office MONSTAT and the Employment Agency of Montenegro (EAM) are the primary sources for a wide array of indicators. MONSTAT provides data on temporary employment (fixed-contract) and part-time work. There are some ad hoc data on informal employment, but they date back to 2014. A question on informal employment has been introduced in the Labour Force Survey instead. It would be advisable to analyse these data and assess their quality. Progress has also been made with publication of the first results of the household survey aligned with European Union Statistics on Income and Living Conditions (EU-SILC); however more

indicators on social protection and inclusion would be needed (EC, 2019<sup>[23]</sup>). Key monitoring reports include the Report on Implementation of the Action Plan for Employment and Human Resources Development 2019 (Government of Montenegro, 2020<sup>[114]</sup>), Report on the Work of the Employment Agency of Montenegro (Employment Agency of Montenegro, n.d.<sup>[115]</sup>) and the Report on the Work of the Ministry of Labour and Social Welfare for 2019 (Ministry of Labour and Social Welfare of Montenegro, 2020<sup>[116]</sup>). There are no studies assessing the effects of current labour regulations on social protection coverage, health and participation in employment or on the recruitment behaviour of companies. Nevertheless, project-based evaluations are carried out in certain areas. While improvements have been made, efforts need to be continued to make systematic evidence-based policy making. This would include conducting thorough evaluations of measures and programmes, as well as assessing the institutional capacities of key actors, in particular labour inspectorates (the last assessment, done by the ILO, dates back to 2006).

According to the UNICEF Multiple Indicator Cluster Surveys (MICS) in 2018, 12% of children aged 5-17 were involved in child labour and 5% of children aged 5-17 worked in dangerous conditions (UNICEF, 2018<sup>[117]</sup>). In comparison, the results of the 2018 survey of North Macedonia show that 5% of children aged 5-17 years were involved in child labour and 3% worked in dangerous conditions. Although institutional mechanisms for the enforcement of laws and regulations on child labour are in place, there is room for improvement in the operations of the agencies responsible for child labour law enforcement (ILO, 2019<sup>[118]</sup>). Montenegro could take action by improving the capacities of the labour inspectorates in detecting child labour and by constantly tracking and publishing information about children involved in the worst forms of child labour.

The National Strategy for Employment and Human Resources Development 2016-2020, and its annual action plans, set the **employment policy framework**. The strategy includes four priority goals: increasing employment and reducing the rate of unemployment; achieving the efficient functioning of the labour market; adjusting qualifications and competencies to labour market needs; and promoting social inclusion and reducing poverty. A new strategy for 2021-24 aims to improve monitoring and evaluation of results and to align with the European pillar of social rights; however, it has not been adopted yet (Government of Montenegro, 2020<sup>[109]</sup>). Other relevant documents include the Economic Reform Programme for Montenegro 2020-2022, which aims to increase the labour market participation by vulnerable groups and to create and adopt the new Employment Strategy 2021-2024. Other policy documents, such as the Montenegro Development Directions 2018-2021 and multi-year sectoral programmes,<sup>85</sup> focus on employment, covering measures to increase the labour market inclusion of specific disadvantaged groups, such as people with disabilities, as well as active labour market programmes. Activities to improve the labour market integration of vulnerable groups are carried out by projects financed by international donors/organisations. The challenge is to make these approaches sustainable by introducing them into mainstream policy.

The policy framework also includes the Strategy for Promotion of Occupational Safety and Health in Montenegro 2016-2020 and related action plans. These target improving working conditions and preventing work-related injuries and professional diseases. Objectives also include adapting the regulatory framework to EU and ILO regulations, raising awareness, promoting a prevention culture and improving collection of data in a database.<sup>86</sup> All these objectives are highly relevant.

**Social dialogue and tripartism** play a role in defining some concrete labour standards, such as wages and the wage grid, and social partners<sup>87</sup> are involved in consultation processes on issues concerning employment conditions. There is a legislative framework for social dialogue in place (Labour Law, Law of Social Council, Law on Peaceful Labour Disputes Resolution, Law on the Representativeness of Trade Unions). There is uncertainty about trade union density:<sup>88</sup> assessments vary between 26% and 41% (ILO, 2019<sup>[16]</sup>). Employers organised in employers' organisations employ 51% of the employed workforce (ILO, 2019<sup>[16]</sup>). While union density is relatively high compared to other economies in the region, unions lack resources to adequately complete their tasks, according to the ILO assessment. Trade unions in multinational companies have most power to conduct collective bargaining and ensure that the labour

legislation is implemented, as they get support from the sister unions of other economies.<sup>89</sup> Collective agreements can be concluded by social partners as general agreements, at branch level and with the employer. In 2018 there were 21 collective agreements for certain sectors or professions, 8 of them targeting the public sector (ILO, 2019<sub>[16]</sub>).

The General Collective Agreement was concluded in 2014, and extended in 2018 and 2019. It defines the minimum coefficients for each level of education, based on which the salaries are calculated. The minimum wage is defined by the law. The branch agreements define additional requirements within the branch, which may be higher but not lower than those defined by the general collective agreement.<sup>90</sup> The General Collective Agreement applies to all employees and employers if no branch-level collective agreement has been concluded. There is no estimate of how many employees are covered by the collective agreements. It would be important to get an overview of collective bargaining coverage and to understand the respective role of the General Collective Agreement and branch-level collective agreements. In many EU Member States branch-level agreements are an important instrument for defining the specific minimum labour standards in this sector. The Social Council (see details below) plays a crucial role in fixing labour standards through the General Agreement, thus involving tripartism. Worker representation committees represent the interests of workers at the workplace level; however, there is no assessment of how many companies have an active committee in place. According to the new Labour Law, collective agreements must be registered with the Ministry of Labour and published. There is a conflict resolution system in place (lasting several months).

The Social Council, in which social partners participate, meets usually six times a year (except in 2020 due to the COVID-19 pandemic). It has local branches and must be systematically consulted on labour-related legislation and strategic policies. It covers a wide range of issues such as social security, health care and pensions, wages, prices and taxes, industrial relations, collective bargaining and labour relations. It was involved in the COVID-19 impact assessment of employees and enterprises conducted jointly by the ILO/EBRD and was consulted for the programme for providing support to the economy and employees in order to mitigate the negative effects the pandemic. Nevertheless, overall involvement of the Social Council in preparing key policy documents is often limited (EC, 2019<sub>[23]</sub>). One of the challenges it faces is the lack of participation by key ministries, while others are the lack of administrative, financial, technical, and professional support and insufficient funding (ILO, 2019<sub>[16]</sub>). Through the ILO Decent Country Work Programme 2019-2021,<sup>91</sup> the government and social partners have committed to giving the Social Council greater relevance as a dialogue platform, stronger organisation of employers and workers and new labour legislation aligning with international and EU standards.

### *Sub-dimension 8.2: Skills*

Montenegro has a framework for **skills mismatch analysis** in place. The EAM prepares an annual analysis of the labour market situation which includes supply and demand for all qualification levels and all municipalities (Box 23.12). The Chamber of Commerce and the Montenegrin Employers Federation conduct various analyses and provide the education sector with recommendations for future qualifications needs. In addition, various ministries prepare strategies for their specific sectors, such as the Strategy for Development of Tourism, the Strategy for Development of Construction, the Strategy for Regional Development, etc. Some municipalities prepare strategic documents for sectors of activity which are priorities for them. Based on these data, Sector Commissions prepare sector profiles, and identify the need for new qualifications. They include representatives of relevant ministries, employers' unions, chambers of commerce, trade unions, and education and tertiary institutions.

### Box 23.12. Skills mismatch analysis

The employment agency EAM conducts detailed annual supply and demand analysis, covering all levels, sectors and municipalities. Based on this analysis, the EAM provides recommendations to the education sector for determining the enrolment policy for secondary and tertiary education institutions. Relevant data include vacancies by qualification, the length of time seeking employment, people without work experience by sector, the number of pupils and students finalising secondary and tertiary education, the number of registered unemployed with no qualifications, the duration of unemployment, etc. In 2018, an advanced skills mismatch analysis was made using Labour Force Survey data, with support by the European Training Foundation (ETF). Labour market data prepared by EAM is available on its website and is updated regularly (as well as MONSTAT data).

Apart from EAM labour market analysis, sector commissions and certain units of the Ministry of Education also conduct analysis. The Ministry of Education established the Department for Qualifications in order to conduct systematic analyses of the labour market situation, skills gaps and qualifications required. In the forthcoming period, a tracing system of graduates from secondary schools will be needed, using the results to adapt the education system with the goal of improving the employability of the graduates. The Chamber of Commerce and the Montenegrin employers' federation periodically conduct research on education and labour market needs, business barriers and conduct open questions regarding hiring and seasonal employment. This kind of research is also used by the education sector.

Source: Information provided by the government for the Competitiveness Outlook assessment.

In principle, all relevant actors – social partners, relevant ministries, chambers, education institutions, Sector Commissions – are involved in the decision-making process for developing specific qualifications and their content. Sector Commissions are formed by the Council for Qualifications and are tasked with analysing developments in the labour market, and make proposals for revising/adopting new qualifications to overcome skills gaps. These commissions propose to the Council for Qualifications the adoption of occupational standards and qualifications, while the council itself adopts and classifies qualifications within the Qualifications Framework (EC, n.d.<sup>[119]</sup>). Occupational and qualification standards are adopted at the national level.

Despite a well-developed framework for skills needs and skills mismatch analysis, and good horizontal and vertical co-ordination, skills mismatches remain an issue. Nevertheless, improvements have been made in reducing the NEET rate (share of young people aged 15-24 not in employment, education or training) from 19.1% in 2015 to 16.2% in Q2 2019 (World Bank and WIIW, 2020<sup>[120]</sup>). In 2018, the NEET rate in Montenegro was lower than the WB6 average but substantially above the NEET rate in the EU-28 and the 11 new EU Member States (10.1% in both cases, in 2019). Vertical skills mismatches,<sup>92</sup> with 70% of young people enrolling in higher education, may add to the high (youth) unemployment rate. Nevertheless, the unemployment rate among highly educated people (9.6%) was lower than for medium (14.9%) and less-educated people (24.6%) in Q2 2019. While the unemployment rate has decreased since 2015 for the highly educated and in particular medium-educated people, it has remained constant for the less educated (World Bank and WIIW, 2020<sup>[120]</sup>). A skills mismatch analysis indicated that in 2017, 10.9% of employed people (aged 15-64) with a tertiary degree were overqualified for their job as they were working in semi-skilled occupations. However, this has declined since 2015. This mismatch affected more men than women. The percentage of people who have completed upper secondary education working in elementary occupations was 8.2% in 2017, up from 2015, and affected more women than men (ETF, 2019<sup>[21]</sup>).

Three-year VET programmes may not be very attractive to young people. Employers believe that there is a mismatch between the skills and knowledge that students acquire in the education system and the skills

and knowledge demanded by the labour market. There are also vertical skills mismatches and skills gaps in the application of new technologies. A desire to tackle these has led to the launch of a new dual VET education scheme (Box 23.13; and see also Education policy, Dimension 7). In addition, the Ministry of Education provides annual scholarships for professions lacking workers with the right skills as a way to encourage enrolment in three-year VET programmes. The Chamber of Commerce also provides a certain number of scholarships. The importance of successful VET programmes is highlighted further by the higher demand for medium-level skills, as shown by recent market labour developments. Employment of medium-educated people grew more strongly than for both the less and more highly educated between 2015 and 2019 (World Bank and WIIW, 2020<sup>[120]</sup>).

### Box 23.13. Dual education in Montenegro

The school year 2017/18 saw the launch of a new concept of practical education in the workplace (dual education). Dual education programmes last for three years. They are based on occupational standards and qualifications standards prepared by the Centre for Vocational Education, with active involvement of employers and their associations. The content of standards is approved by Sector Commissions and adopted by the Council for Qualifications. The business community was involved in preparing the regulations and also supported this arrangement. In accordance with the provisions of the Law on Vocational Education, the pay for students in the first and second grades acquiring practical education with employers are provided from the budget, while pay for third grade students is the employers' responsibility. First grade students spend one day, second grade students two days and third grade students three days with employers (Government of Montenegro, 2020<sup>[109]</sup>). The capacity of employers for providing practical training is being explored for deciding which training can be implemented in a dual manner.

In its first year, 277 students went through practical education programmes with 101 employers. In the school year 2019/20, the number of students rose to 800, involving 270 employers (Eurydice, 2021<sup>[121]</sup>). Initial results show that around 60% of students who finished third grade through dual education in June 2019 were employed by the same employer (ILO, 2020<sup>[100]</sup>). These results are promising, although the share is lower than in economies with long established dual VET systems such as Germany, where the corresponding share was 71% (Federal Ministry of Economic Affairs and Energy of Germany, n.d.<sup>[122]</sup>).

The Strategy for the Development of Vocational Education in Montenegro (2020-2024), along with its action plans for 2020/21, outline measures for overcoming workforce skills shortages and to improve the efficiency and the effectiveness of the VET system and lifelong learning. The planned measures aim to create flexible modularised and credit-based educational programmes, based on learning outcomes with vocational and key competences; adapt educational programmes to aid people with special education needs and talented students; promote work-based learning; and upskill VET teachers. The strategy also covers career guidance and counselling in schools. Montenegro is on the right track and should continue its efforts to develop vocational guidance, improve the quality of VET education and close skills gaps according to current and future demand for skills and employers' needs and promote good-quality work-based learning.

While VET and tertiary education should provide the workforce with a solid skills basis, adult learning is essential for upskilling low-skilled adults as well as adapting the skills of workers of all educational levels

to technological change and economic restructuring (OECD, 2019<sup>[123]</sup>) (OECD, 2019<sup>[124]</sup>). Montenegro's legislative framework for **adult education**<sup>93</sup> is guided by the Adult Education Strategy 2015-2025, its key policy framework. A budget is foreseen for specific activities, although there is still no specific Ministry of Education budget line for adult learning. Montenegro has made progress in raising awareness about adult education, including organising the Adult Education and Learning Day Conference, and publishing relevant material, such as guides and flyers and a guide to the system of non-formal education. One challenge is to better connect all the players involved: the policy makers, ministries of other departments, local governments, social partners, employers, media representatives and NGOs.<sup>94</sup>

Human resource management within the public sector foresees a budget for continuous training. In addition, the Chamber and the Employer's Federation have small budgets earmarked for adult learning for their members. However, there is no strategy or measures to set financial incentives for participating in continuous training. According to Labour Force Survey data, in 2017 only 2.8% of adults (aged 25-64) participated in learning; the percentage was higher for males (3.3%) than for females (2.7%) (Kaluderović and Golubović, 2019<sup>[125]</sup>).

A system for validating and certifying skills, including skills acquired through non-formal learning, is in place and new regulations on the verification of knowledge, skills and competencies were adopted in 2019. A remaining challenge consists of providing adequate continuous training to teachers (professional skills, adult learning pedagogy, and providing vocational rehabilitation). The Adult Education Plan 2019-2022, another key strategic document for adult education in Montenegro, lists the improvement of employees' competencies as one of its priority areas.

### *Sub-dimension 8.3: Job quality*

In terms of **quality of earnings**, minimum wages are fixed through tripartite dialogue in Montenegro. The level of the minimum wage is determined annually by the Government of Montenegro on the proposal of the Social Council of Montenegro, based on indicators such as the general level of wages in the economy, the costs of living and changes to them, economic development and the level of productivity. By law, the minimum wage must not be lower than 30% of the average wage in the preceding semester, which seems to be a moderate level. In 2018, the minimum wage amounted to 40% of the average gross wage, which was low compared to other economies in the region (Kaluderović and Golubović, 2019<sup>[125]</sup>). In 2019 the net minimum wage amounted to EUR 222 in Montenegro, 43% of the average net wage, which was EUR 515 according to MONSTAT. Recent increases in the minimum wage have reduced the gender wage gap.<sup>95</sup>

According to MONSAT, the poverty rate in Montenegro was 21.9% in 2018. The in-work poverty rate in 2017 was lower than the EU average (5.9% and 6.4% respectively) and this also holds true for the in-work poverty rate of the self-employed (19.8% compared to 22.7% in the EU). However, in-work poverty for the self-employed increased between 2013 and 2017 (Kaluderović and Golubović, 2019<sup>[125]</sup>). In-work poverty was higher for those working in the public sector than in the private sector. Personal earnings are taxed at a rate of 9%, while gross earnings that exceed EUR 720 a month are taxed at 11%. Thus, although the taxation rate is lower than in many EU countries, there is no reduced tax rate or tax exemption for low earners (those on minimum wages). Overall there is lack of regular monitoring and analysis of the structure of wages and wage distribution, as well as of the coverage and impact of the minimum wage. For more details on tax rates, refer to Tax policy (Dimension 4).

**Women's** activity and employment rates improved between 2015 and 2019 (from 56.9% to 59.1% and from 46.9% to 49.7% respectively). Nevertheless, women's activity rates are still 14.5 percentage points below men's in Montenegro, a larger gap than the EU average (10.7 percentage points for EU-28) (Eurostat, 2020<sup>[99]</sup>). In 2019, women's unemployment rates were only 0.9 percentage points higher than men's. Research commissioned by the Ministry of Labour and Social Policy in 2017 reveals the strong prevalence of gender stereotypes, a patriarchal way of thinking and a lack of openness to diversity in

Montenegro.<sup>96</sup> The 2018 report *Women and Men in Montenegro* also points to occupational segregation (MONSTAT, 2018<sub>[126]</sub>). Additional research is planned by the government on citizens' perceptions in order to assess discriminatory patterns and stereotypes and the influence of the media, as well as the level of citizens' awareness of the legislative and institutional framework for preventing discrimination.

In 2017, the Ministry for Human and Minority Rights launched the Action Plan for Achieving Gender Equality 2017-2021 and related implementation plans. Policy measures of a range of ministries focus on developing female entrepreneurship.<sup>97</sup> Women are the focus of active labour market programmes (ALMPs) run by the EAM, and they represent more than half the participants. The EAM has implemented measures to activate women who were entitled to a lifelong benefit deriving from the Law on Social and Child Protection, and who thus left the labour market prematurely (there was a strong incentive to do so in the previous scheme). Another new measure was the Pilot Programme "Empower me and I will succeed", launched in 2018. This programme aimed to support and activate hard-to-employ people. The project was primarily focused on women who benefited from pensions for mothers with three or more children and family material support. The programme reached 925 hard-to-employ people, 96% of whom were women (Ministry of Human and Minority Rights of Montenegro, 2019<sub>[127]</sub>).<sup>98</sup> As the placement rate was very low, the programme was discontinued. The reasons for the low placement rates should be evaluated and integration strategies improved.

Improvements need to be made to include gender sensitiveness in career counselling in order to reduce gender segregation. At present, there is no strategy to expand the career choices of young women or to encourage enrolment in non-traditional vocational programmes and university studies, nor are there any specific guidelines for women returning to the labour market after childcare breaks, or programmes to empower young women to climb the career ladder. Lack of childcare is hindering women's employment prospects. The employment rate for women with children younger than six was 46.5% in 2019, below the average for all women (49.7% in 2019) (Eurostat, 2021<sub>[128]</sub>). The employment rate of women with young children is significantly below the EU average (66.8% in 2019) (Eurostat, n.d.<sub>[129]</sub>). And while the EU average increased by 2 percentage points between 2015 and 2019, no progress was made in Montenegro.

#### *Sub-dimension 8.4: Activation policies*

In 2019, the Law on Employment Mediation and Rights during Unemployment was adopted and a number of new rules introduced or amended. This should help to improve the services provided by the **public employment service (PES)** in Montenegro, which is essentially the EAM (Government of Montenegro, 2020<sub>[109]</sub>). The EAM budget is financed from both assigned and budget funds.<sup>99</sup> In order to implement the new regulations, capacities will be expanded and two new regional units created in the municipalities in the north of Montenegro. In 2019, the caseload of counsellors (number of registered unemployed per counsellor) was around 556,<sup>100</sup> which is higher than the caseloads in EU countries with well-developed PESs. In France and Germany for example, the caseload for hard-to-place jobseekers is around 70 jobseekers per employment counsellor. Caseloads may vary in these countries between 100 and 350, depending on how many jobseekers need individual guidance and how autonomous they are in using self-help guidance tools (OECD, 2020<sub>[130]</sub>) (Manoudi et al., 2014<sub>[131]</sub>) (Pôle emploi France, n.d.<sub>[132]</sub>). As is done in EU Member States with well-developed PESs, Montenegro also segments jobseekers into different groups.

According to Labour Force Survey data, the share of long-term unemployed in Montenegro was 79.3% in Q2 2019, an increase since 2015. It was well above the WB6 (66.6%) and EU averages (32.2%<sup>101</sup>) in Q2 2019 (World Bank and WIIW, 2020<sub>[120]</sub>) (Eurostat, 2020<sub>[133]</sub>). This is an extremely large share of unemployed people who would need intense guidance and counselling to overcome employment barriers, including motivational ones.

While the number of counsellors has remained constant, the number of registered unemployed has decreased (although less sharply than the number of LFS unemployed) (MONSTAT, 2020<sub>[134]</sub>). The vast

majority (85%) of unemployed (according to Labour Force Survey Data) were registered at the EAM. The decreasing number of registered unemployed is in contrast with the decreasing number of registered vacancies. In 2019, 32 344 job vacancies were published through 16 934 vacancy applications, an increase since 2018, but a decline since 2015, pointing to the need for continued efforts in vacancy collection and the provision of employer services.<sup>102</sup> A comparison of the profiles of collected vacancies and the registered unemployed would help to render employer services, vacancy collection, and placement and activation measures more effective. EAM provides statistical reports monthly, semi-annually and annually. Where such evaluations exist, results have helped to improve ALMPs.

New rulebooks have improved the implementation of EAM's activation policies. These include rules on active job search, profiling, counselling and establishing an individual employment plan. One novelty is the introduction of statistical profiling. Implementation of this model is expected soon, assisted by ILO experts. Rules for mediation services address not only the provision of information and publication of vacancies but also the pre-selection of jobseekers for referral to employers, as well as employment mediation abroad and provision of information on employment conditions abroad. Since 2011, EAM has been implementing career orientation in primary and secondary schools in co-operation with the Ministry of Education and the University of Montenegro. Note that for vocational rehabilitation several rulebooks were established in 2011, 2014 and 2017.

The new Labour Law<sup>103</sup> and the Law on Mediation in Employment and Rights during Unemployment, has introduced the obligation for employers to report vacancies to the EAM, and the EAM publishes vacancies only at the request of the employer (Karanovic and Partners, 2020<sup>[111]</sup>). Experience from other countries indicates that obligations to report vacancies are often not implemented effectively. Instead, EU countries have in general developed the quality of services provided to employers, have taken a proactive stance to approach employers and are collecting vacancies through other means, e.g. in partnership with private employment agencies and web scraping.

The Law on Employment Mediation and Rights during Unemployment regulates unemployment benefits for employees and other groups (e.g. entrepreneurs<sup>104</sup>) with at least nine months of employment over the past 18 months, under the condition that they became unemployed without their fault or their consent. The same goes for self-employed who have the corresponding insurance history and whose activity ceased without their fault. There are no specific rules for gig/platform workers. Unemployment benefits should amount to 120% of the calculated value of the coefficient, which is determined by the General Collective Agreement, and was fixed at EUR 90 at the time of writing. This compensation level is low and may not be effective as it offers no incentive for taking up formal employment as it is not linked to earnings. Unemployment benefit recipients need to register within 30 days at EAM, which is longer than OECD good practice. For example, in Germany jobseekers need to register as soon as they receive their dismissal notification and three months before a temporary work contract runs out (Federal Employment Agency of Germany, n.d.<sup>[135]</sup>). In Switzerland, people need to register on the first day of unemployment. Early intervention in the unemployment period is generally perceived as important. As part of a **mutual obligation** approach, recipients of unemployment benefit, like any other jobseeker, have to actively search for work otherwise they are sanctioned. The number of unemployment benefit recipients was 12 372 in 2019, a strong increase from 2015 (7 352). Coverage is nevertheless still low, since only 27.9% of the unemployed get unemployment benefits.<sup>105</sup>

There is an agreement in place between EAM and the Social Centres for activating social assistance recipients. File transfer is mainly done electronically, but data are extrapolated from different databases. File sharing is monitored through reports (from EAM, Social Centres and the Ministry of Labour), although improvements still need to be made. Social assistance recipients participate in ALMPs, however less often than the other unemployed. During the first nine months of 2019, only 58 working-age beneficiaries receiving family financial support were employed; 129 were included in an active employment policy programme, and 9 were in professional rehabilitation measures (Government of Montenegro, 2020<sup>[109]</sup>). It

would be advisable to analyse the barriers to employment faced by family financial support recipients, as well as by the long-term unemployed not receiving any benefits.

EAM implements **active labour market programmes (ALMPs)** such as programmes to support self-employment, public works programmes, adult education and training programmes, entrepreneurship training and vocational rehabilitation. Expenditures on ALMPs fell from 0.1% to 0.05% of GDP between 2015 and 2017, but increased to 0.7% in 2018.<sup>106</sup> They then fell by one-third in 2019. The share of funds for financing adult education and training programmes, training for independent work, training for work with the employer and the "Stop the Grey Economy" programme represented 71.1% of all funds spent on ALMPs.

In terms of ALMPs' target groups, during the first 11 months of 2019, 55.4% of participants were women, 37.7% were young people, 35.7% were long-term unemployed (less than their share among all unemployed) and 53.7% were from the northern regions (Government of Montenegro, 2020<sub>[109]</sub>). The number of participants was rather low, amounting to 2 037 unemployed people in 2019, out of 37 000 registered unemployed and more than 100 000 unemployed according to LFS data. More than half participated in vocational rehabilitation measures.

People with disabilities are another target group for ALMPs. There are quotas for employing people with disabilities. When companies do not comply with the quota, they have to pay a special contribution to the vocational rehabilitation fund, administered by EAM. However, according to the audit report of the fund of 2014, the use of these financial resources could be significantly higher (Kaluderović and Golubović, 2019<sub>[125]</sub>). Activities planned in 2020 to increase labour market participation, particularly by sensitive groups of unemployed persons, focus on education and skilling programmes for adults, employment incentives, direct opening of jobs and incentives for entrepreneurship (Government of Montenegro, 2020<sub>[109]</sub>).

Another target group for public work programmes are vulnerable groups such as the Roma and Egyptian populations. Although there is a Strategy for Social Inclusion of Roma and Egyptians (2016-2020) in place, it does not explicitly include an employment dimension. Eight projects to increase training and employment of the Roma and Egyptian population in bottleneck occupations have started. It would be advisable to scrutinise the implementation and outcomes of these projects to learn more about employment barriers, scale up activities to promote employment and skills, address discriminatory behaviour by employers and identify potential employers.

The Grant Programme for Self-Employment project, targeted at young people, women and the long-term unemployed, is mainly EU-financed. The sustainability of the programme may be an issue. It would be advisable to include entrepreneurship counselling to render the measure more effective.

EAM has implemented a special programme for young highly educated unemployed people called Stop the Grey Economy. Training is provided in technical support and assistance to officials of bodies and administrations in their fight against informal business. The programme for training university graduates was introduced in 2012, substituting an earlier measure which provided wage subsidies for young graduates. All faculty graduates without prior work experience can apply for the programme and get employment in their specific field of study for a period of nine months. During this period they receive 50% of the average net wage. Graduates are expected to gain knowledge and skills during the programme that will help them find employment after completing the programme.<sup>107</sup> The number of participants amounts to 3 000 to 4 000 young university graduates annually.

The Employment Agency of Montenegro is one of the agencies implementing the project Further Development of Local Employment Initiatives in Montenegro is funded by EU-IPA. Its overall goal is to encourage the development of employment initiatives at the local level, and will last for 18 months (August 2019 to February 2021). An analysis of local labour markets in Montenegro was prepared as part of the project and local employment strategies are currently being prepared.

### *Cross-cutting policy areas: Informality*

The contribution of the informal economy to total GDP is estimated at around 28% to 33%, while over 20% of work is informal (EC, 2019<sup>[23]</sup>). Weaknesses in the institutional and regulatory environment, corruption and high tolerance of tax non-compliance are the key issues contributing to the large informal economy in Montenegro. The latest survey on informal employment dates back to 2014.<sup>108</sup> At that time, unregistered self-employed people made up almost 70% of the total number of undeclared employed people, 42.4% belonging to the age group of 46-64. The highest percentage of informally employed were in agriculture, forestry and fisheries; household services; and the construction industry. It would be useful to conduct a new survey in order to take stock of recent trends.

The term “informal employment” is not defined in any legislation. Nevertheless, there are policies in place. The Action Plan for Combating the Grey Economy in the Labour Market, adopted by the Government of Montenegro in 2017, contains preventive, restrictive and stimulative measures. Preventive measures deal with issues such as business barriers caused by tax evasion, disloyal and unequal competition. Restrictive measures cover various repressive measures designed to detect and penalise informal employment, with planned goals, deadlines and competent authorities, including Labour Inspectorates, the Administration for Inspection Affairs and the Tax Authority. Stimulative measures aim to lower the fiscal deficit and include measures for transitioning from an informal to a formal economy. However, as stated above, Labour Inspectorates do not have enough capacity to implement their work effectively.

In 2013, the Ministry of Finance conducted an analysis of the effects of progressive taxation on individuals' income, profit of legal entities and real estate.<sup>109</sup> A study on the link between the tax wedge for low wage earners and its impact on informality and reforming the tax system should be carried out, using results of previous relevant studies. There is also no research on the link between the low level of social protection (e.g. level and coverage of unemployment benefits, level of pensions) and the incentive to be formally employed.

The Parliament of Montenegro recently adopted the law on Fiscalisation in the Trade of Goods and Services; it entered into force in January 2020. Montenegro is the first economy in the region to introduce fiscalisation in non-cash transactions, i.e. business-to-consumer (B2C) and business-to-business (B2B) transactions. The Tax Administration of Montenegro will have an insight into each fiscal invoice issued that is paid in cash or by cashless transfer, in real time, via a permanent Internet connection through which the taxpayer is connected to the Tax Administration (Government of Montenegro, 2020<sup>[109]</sup>). Eventually, these developments may lead to the reduction of the informal economy, including undeclared work. Thus, it would be useful to assess implementation and impact of the new law on informal employment (in particular regarding unregistered businesses and self-employed).

### *Cross-cutting policy areas: Brain drain*

While migration into Montenegro is registered, there are no official data available on the number of people leaving Montenegro temporarily or permanently to work abroad, nor is there a thorough analysis of brain drain. The number of emigrants amounts to 20% of the resident population and this share has not declined since 2010; many of them are young and well educated (ILO, 2019<sup>[16]</sup>). Data collection on the patterns of recent emigration trends would be essential to understand whether there is a risk of brain drain and to formulate policies to tackle it.

Skills governance, i.e. planning the number of places for enrolment in VET and education, is not determined by demand abroad. However, the compatibility of qualifications acquired in Montenegro is being closely monitored in order to facilitate recognition or professional development for those who wish to continue their education or search for employment elsewhere. Currently, Montenegro is part of the dialogue on mutual recognition of vocational qualifications across the Western Balkans. Montenegro has adopted the Law on Recognition of Professional Qualifications for Regulated Professions. This law refers

to mutual recognition of professional qualifications with the EU, European Economic Area and Switzerland. It will enter into force if Montenegro joins the EU.

The Government of Montenegro has adopted the Strategy for Integrated Migration Management in Montenegro for the period 2017-2020. However, the strategy does not include any measure to contain brain drain or favour brain circulation.

### ***The way forward for employment policy***

- **Continue to improve working conditions, aligning with EU *acquis* and ILO standards.** Labour inspectors should play a preventive role in addition to controlling implementation of the law. Continue to strengthen social dialogue both at government level as well as at branch level, as foreseen in the Decent Work programme. Good working conditions in formal employment also help to increase its attractiveness vis à vis informal employment and increase labour productivity.
- **Continue to increase the capacities of Labour Inspectorates in terms of number of staff, training and equipment.** Greater capacity will allow them to make on-the-spot visits and to monitor and follow-up infringements of employment legislation and occupational health and safety regulations. Establish guidelines on how to prevent diseases and accidents at work.
- **Implement the activities planned to upskill adult learning and introduce incentives for employers and workers to participate in continuous training.** Adult learning should be perceived as a medium to long-term challenge. This should also include upskilling the low-skilled. Guidance on lifelong learning should be developed, as is done in Portugal through the Qualifica Centres (OECD, 2019<sub>[124]</sub>). Introduce financial incentives for employers to offer these schemes, such as subsidies in Finland (Box 23.14), Belgium, Portugal and Germany; as well as incentives for employees and jobseekers (tax credits, individual learning accounts, e.g. in France) or training leave (e.g. in France and Austria) (OECD, 2019<sub>[136]</sub>). Link recognition and validation of skills from prior learning to upskilling activities. This increases the quality and the acceptance of the recognition and validation of skills, as suggested by experience in Portugal (Düll et al., 2018<sub>[137]</sub>).
- **Use the skills anticipation system for guiding young people, adult workers and the unemployed in retraining and upskilling activities.** Use the information on skills in demand and tracer studies to adapt the curricula of VET and university programmes as well as of adult education programmes. Train the trainers in the area of adult education and vocational rehabilitation in skills in demand as well as in adult learning pedagogy.
- **Make a thorough analysis of wage development and the wage structure as well as of non-wage labour costs.** Assess the impact of minimum wages on reduction of poverty and informal employment.
- **Update the assessment of the scope, structure and reasons for informality.** Continue planned activities to combat informality. Explore how taxes could be adapted to aid the transition from informal employment to formal employment. The OECD Jobs Strategy recommends reducing non-wage labour costs, especially for low-wage earners (OECD, 2018<sub>[138]</sub>). Explore the options for supporting the transition to formal employment and formalising enterprises through subsidising social security contributions, as recommended by the OECD and ILO (OECD/ILO, 2019<sub>[139]</sub>).
- **Reduce labour market barriers for women.** Reduce gender stereotypes beginning from early childhood education right through education and working life, in order to increase female employment. Promote access to childcare and out of school care for school children, and part-time and flexible working to ease the reconciliation of family and working life.<sup>110</sup> Make vocational guidance in primary and secondary schools more gender sensitive and widen occupational choices for both men and women. Continue to develop and improve access for women to credit, financial support and entrepreneurship learning. Continue efforts to strengthen the labour market activation

of women receiving welfare benefits and analyse the employment barriers for family financial support recipients.

- **Increase efforts to bring vulnerable groups, e.g. Roma and Egyptian communities, into education, training and work.** Combatting discrimination needs to be addressed in a wider way. It would be advisable to analyse the reasons for the low performance of the “Empower me” programme and to investigate how approaches to integrate vulnerable groups could be improved, e.g. by better integrating the various social and employment services and ALMPs. More emphasis should also be placed on implementing vocational rehabilitation and placing people with disabilities.
- **Assess the volume of seasonal, temporary and permanent emigration to the EU and other regions, and develop strategies to mitigate the negative effects of migration and to consolidate the benefits.** It would also be useful to analyse the employment effect of remittances, the activities of the temporary migrants returning to Montenegro and labour shortages in specific professions and sectors caused by emigration. To reap the benefits of migration, encourage investments of remittances in Montenegro. It is also recommended to take advantage of migrant experiences and help workers who have gained experience abroad to find good living and working conditions when returning.

#### Box 23.14. Financial incentives and support to companies for continuous training in Finland

Finland offers a financial incentive that goes hand-in-hand with building the capacity of companies to identify their training needs and deliver training. The Joint Purchase Training (*Yhteishankintakoulutus*) supports employers who want to retrain existing staff or set-up training programmes for newly recruited staff. Offered by the PES, it supports employers to define their training needs, select the appropriate candidates for training and find an education provider to deliver the tailored training. The PES also part-finances the training (ranging from 30-80% of the expenses for the training). Types of training that can be developed include: 1) tailored training for employers who want to retrain their staff due to technological or other changes in the sector (minimum training duration of 10 days); 2) recruitment training for employers who cannot find employees with the skills needed and want to hire, then train new staff (training duration of 3-9 months); and 3) change training for employers who have staff who have become redundant to help them transition to other job opportunities (training duration of 10 days to 2 years).

Source: (OECD, 2019<sup>[124]</sup>), *Getting Skills Right: Engaging low-skilled adults in learning*, [www.oecd.org/employment/emp/adult-learning-systems-2019.pdf](http://www.oecd.org/employment/emp/adult-learning-systems-2019.pdf).

## Science, technology and innovation (Dimension 9)

### Introduction

Montenegro has continued to introduce reforms to develop a business environment conducive to innovation, research and development. It has improved its overall score in STI from 1.84 in 2018 to 2.4 in 2021 (Figure 23.1). Progress has been made in a number of areas since the previous assessment and Montenegro continues to perform better than most Western Balkan economies (Table 23.17), with only Serbia achieving a higher score and North Macedonia scoring at par. However, overall performance in this dimension remains below the economy's potential.

**Table 23.17. Montenegro's scores for science, technology and innovation**

Dimension	Sub-dimension	Score	WB6 average
Science, technology and innovation dimension	Sub-dimension 9.1: STI system	2.9	2.4
	Sub-dimension 9.2: Public research system	2.3	2.0
	Sub-dimension 9.3: Business-academia collaboration	2.0	1.6
Montenegro's overall score		<b>2.4</b>	<b>2.1</b>

### State of play and key developments

#### *Sub-dimension 9.1: STI system*

Montenegro has significantly advanced its **STI policy framework** since the last assessment. In late 2017, the government adopted the Strategy for Scientific Research Activities (2017-2021), which complements the recently expired Strategy on Innovation (2016-2020). Montenegro developed a set of guidelines for smart specialisation in 2018, and is the first WB6 economy to adopt a smart specialisation strategy (covering 2019-2024). Action plans are in place to support implementation of the strategic framework, and budget allocations have increased in recent years. However, full implementation is behind schedule due to a lack of resources within the administration and limited long-term funding security.

The new strategic framework envisages a strengthened **institutional framework** for STI policy. In 2019, the Council for Innovation and Smart Specialisation was set up to oversee the design and implementation of STI policies. Through its permanent Secretariat, funded partially by the Government of Montenegro as well as the UNDP, it acts as a co-ordination body across ministries and gives support to the Ministry of Science, the body formally in charge of STI policy making. The council became operational in early 2020, and is mandated to advise on the governance of the STI framework and oversee all funding for STI-related policy measures. Montenegro is also in the process of setting up a dedicated Innovation Fund, expected to be established by the middle of 2021. The Council for Innovation and Smart Specialisation has been leading this process, and discussions are ongoing with the World Bank to provide its expertise in setting up the fund. If designed well, the Innovation Fund, together with the Council of Innovation and Smart Specialisation, are expected to significantly accelerate implementation of the STI strategic framework in the coming years.

The **regulatory framework** has been expanded and aligned with EU standards. In July 2020, the Government of Montenegro adopted the new Law on Incentive Measures for Research and Innovation Development and a revised Law on Innovation Activity. The revised framework will regulate the STI system and incentives for innovation activity, and aims at creating an innovation-conducive environment incentivising innovation and R&D, including through the Innovation Fund. A legal framework for intellectual property (IP) is in place and largely aligned with the EU *acquis*, though it does not include specific provisions to encourage commercialisation of IP or collaboration between researchers and the private sector. Montenegro's track record of enforcing IP legislation remains poor, though the capacity of the IP

office has increased in recent years and efforts have been made to intensify co-operate with the research community.

**International collaboration**, especially within the European Research Area, is recognised as key for developing Montenegro's STI framework. Support is made available through an annual Call for Co-financing of Research and Innovation Activities, which aims to facilitate access to international STI programmes and networks, in particular Horizon 2020.<sup>111</sup> Despite increasing efforts, however, Montenegro's success in the Horizon 2020 framework remains below potential. By the end of 2019, the economy had only participated in 30 Horizon 2020-funded projects, most of which received only small-scale funding (EC, 2020<sub>[140]</sub>). However, as project submissions have become better aligned with EU priorities in recent years, an increase in successful proposals is becoming evident. Montenegro has also maintained active engagement with international bodies and networks, such as Eureka<sup>112</sup>, European Cooperation in Science and Technology (COST)<sup>113</sup> and the European Organization for Nuclear Research (CERN), and it is a shareholder in the Western Balkans Enterprise Development and Innovation Facility (WB EDIF), whose Enterprise Innovation Fund has invested in two Montenegrin start-ups to date. Another mechanism to promote international collaboration is the active inclusion of the Montenegrin diaspora in scientific research activities through visiting fellowships, evaluation of project applications and including them in research programmes.

**Alignment with EU STI policy** standards remains a priority. Montenegro is committed to the priorities of the European Research Area and actively participates in the European Strategy Forum on Research Infrastructures (ESFRI). In 2019, it revised its roadmap for research infrastructure to identify impediments to advancing research and development. It also became a member of the European Societal Survey of the European Research Infrastructure Consortium (ESS-ERIC) in 2018. Within the framework of Montenegro's participation in the EURAXESS initiative<sup>114</sup>, the University of Montenegro has adopted a human resources strategy for researchers (HRS4R) aimed at harmonising human resources policy with the principles determined by the Charter and Code for Researchers, for which it was awarded the HR Excellence in Research Award by the European Commission. National open science and open access initiatives are well underway and aligned with EU standards. Finally, Montenegro is expected to participate in the European Innovation Scoreboard in 2020 for the very first time, which is likely to enable more analysis and monitoring of the STI system in the future.

### *Sub-dimension 9.2: Public research system*

Montenegro has completed a large-scale World Bank-funded programme during the assessment period. The Higher Education and Research for Innovation and Competitiveness (HERIC), implemented between 2013 and 2019, aimed to strengthen the quality and relevance of higher education and research in Montenegro by reforming the higher education finance and quality assurance systems and by strengthening research capacity. Within this framework, and underpinned by Montenegro's new STI framework, some efforts have been made to expand the **institutional structure of the public research system**. Most notably, in May 2018, the Centre of Excellence for Research and Innovation was established at the University of Montenegro as a successor to the pilot Centre of Excellence in Bioinformatics – BIO-ICT, which was established in 2014 under the HERIC project. In addition, two centres of excellence projects are currently underway, focusing on food safety and biomedical science respectively. The total value of the projects is EUR 2.5 million, of which the state will co-finance EUR 1.8 million over three years.

The higher education institutions (HEI) sector is governed by the Law on Higher Education, but the role of the Ministry of Science as the gatekeeper of the STI policy framework in the governance of the HEI and Research and Development Institutes (RDI) sectors remains unclear. While all HEIs conduct a mandatory annual self-evaluation, independent performance assessments remain ad hoc and primarily project-linked. In March 2019, a Law on Academic Integrity was adopted aiming to promoting academic integrity and tackle plagiarism.

State budget allocations for **public research funding** and innovation have more than doubled in recent years, although from low levels. Public scientific research remains predominantly dependent on institutional funding, which is largely geared towards education and not subject to regular performance reviews. However, in line with the revised legal framework, a new performance-based financial contracting model was adopted for the University of Montenegro in 2018 aimed at improving the quality of public funding. As a result, more competitive project-based funding schemes have been introduced, and as the new Council on Research and Innovation and the Innovation Fund launch operations, more funding is expected to be made available on a competitive basis, and following international best practice evaluation methodologies.

The number of active researchers in Montenegro remains low, at around 460 in 2018. With 734 researchers per million inhabitants, Montenegro performs below some of the regional peers, such as North Macedonia and Serbia, and remains far behind the EU average of around 4 000 researchers (UIS, 2021<sup>[141]</sup>). The development of **human resources for research and innovation** has become a priority aspect of Montenegro's STI framework. Since the previous assessment, Montenegro has launched a dedicated programme to strengthen human resources and human research capability in Montenegrin research institutes. This was implemented between 2018 and 2020 and aimed to create more attractive employment prospects within academia. The programme envisaged a more favourable environment for research and overall promotion of scientific research as a profession, and included a variety of measures such as scholarships for doctoral students, and support for international mobility, training and participation in international networks. Other measures included training on proposal writing, project management and applying for international research tenders. In addition, the Law on Incentive Measures for Research and Innovation envisages tax incentives for scientific research and innovation projects that employ qualified researchers.

### *Sub-dimension 9.3: Business-academia collaboration*

Overall investment in research and development, of almost 0.37% of GDP in 2018, remains low compared to the EU average of 1.69%, while only a fraction of this investment is funded by the private sector. While the **collaboration promotion framework** is well embedded in the STI framework, only a few targeted policy measures have been implemented to date. Some awareness-raising activities are being implemented to promote the benefits and opportunities of academia-business co-operation, and the increased focus on building an institutional support structure is a welcome step in the right direction.

Montenegro has made some progress in introducing small-scale **financial incentives** to stimulate research institutes and the private sector, though these remain largely focused on fostering innovation in the private sector more broadly. Based on the positive experience of a pilot co-operation grant scheme under HERIC in 2013/14, a new Innovation Programme for Grants and Innovative Projects was launched in 2018 for a period of two years, providing competitive co-operation grants to companies to develop innovative market-oriented products, services and technologies and supporting the transfer of innovative ideas from scientific research institutions to the market. In 2018, over EUR 730 000 were awarded to ten successful projects, three of which were proposed by RDIs. In 2019, eight more innovative projects were awarded, with co-financing by the Ministry of Science amounting to EUR 615 000, and a successor programme is being considered. In addition, grants for scientific research projects are available for RDIs to co-finance investments and foster research excellence. However, a pilot voucher scheme, designed with OECD support, was discontinued in 2015 and there are no fiscal incentives for academia-business collaboration. Equally, **non-financial incentives** are also limited. Doctoral research scholarships specifically encourage a mandatory mobility placement of Montenegro PhD candidates in foreign academic institutions or in business entities in Montenegro and abroad. In reality, however, only a few scholars take up the opportunity to spend their mobility period in business entities. Montenegro also does not actively participate in the Marie Skłodowska-Curie actions, and evaluations of researcher performance continue to be primarily based on traditional criteria, thereby providing little incentive to engage with the private sector.

Similarly, the IP framework does not include specific provisions to support such collaboration, as IP rights are usually defined in employment contracts. The Ministry of Economic Development, however, offers small-scale technical assistance in the form of advising on patenting, and plans are underway to develop a booklet for innovation protection to act as a guidance for innovators and researchers.

Some progress has been made in strengthening **institutional support for business-academia collaboration**. Identified as a priority in the Smart Specialisation Strategy, the expansion of a network of Centres of Excellence is currently underway, as discussed above. This will contribute to fostering co-operation between academia and the private sector in the medium-term. In addition, an office for technology transfer has been established within the Centre of Excellence for Research and Innovation at the University of Montenegro. Furthermore, significant efforts have been made to build the country's first Science and Technology Park, which envisages a networked structure with a central base in Podgorica and three decentralised impulse centres in Nikšić, Bar and Pljevlja. Following the launch of the Innovation and Entrepreneurship Centre Tehnopolis in Nikšić, construction of the central unit of the Science and Technology Park of Montenegro in Podgorica is well underway, and is expected to be fully completed in 2021. Montenegro has also been the key driver of the creation of the South East European International Institute for Sustainable Technologies (SEEIIST), which is expected to deepen regional scientific research co-operation (Box 23.15).

### Box 23.15. Building a regional research infrastructure: The South East European International Institute for Sustainable Technologies

For the small and open economics of the Western Balkans, the availability of state-of-the-art, regional research infrastructure plays a fundamental role in developing STI.

In 2017, the South East European International Institute for Sustainable Technologies (SEEIIST), was initiated by the Government of Montenegro and supported by the governments of the Republic of Albania, Bosnia and Herzegovina, Republic of Bulgaria, Kosovo, North Macedonia, Montenegro, Republic of Serbia and Republic of Slovenia. The institute focuses on the development of pioneer high technologies used for tumour therapy and biomedical research. With funding from the European Commission and extensive capacity building provided by renowned international research institutes, including CERN, the institute is expected to become a key player within the European research spectrum on medical science and an access point for international researchers.

The institute will offer numerous opportunities for technology transfer to the region and is expected to give a boost to local industry. Moreover, the establishment of the institute could trigger spin-offs and complementary technologies, and spur on digital transformation.

## **The way forward for science, technology and innovation**

Montenegro has made good progress in advancing its STI policy framework. Efforts made in recent years have strengthened the institutional framework, and initial steps have been taken to introduce financial support schemes and build an STI-supportive infrastructure. Going forward, the focus should be on fully implementing and expanding these measures. Specifically, Montenegro should prioritise the following:

- **Ensure swift operationalisation of the new Innovation Fund.** The focus should be placed both on building the fund's internal capacity as well as ensuring sufficient funding availability.

- **Invest in the scientific research system.** More comprehensive measures should be put in place to build human resource capacity in priority STI areas and increase the attractiveness of research as a profession. An evaluation of the HERIC Programme may identify key obstacles to overcome. Montenegro should explore ways to more actively participate in the Marie Skłodowska-Curie actions.
- **Continue increasing Montenegro's participation in international research programmes such as Horizon 2020.** Concrete measures should be put in place to encourage private sector businesses to invest in research and development and intensify co-operation with RDIs. Financial programmes should be designed with the clear objective of stimulating academia-business co-operation, which should be reflected in the eligibility criteria and evaluation methodology.
- **Continue building a national and regional research infrastructure.** Timely completion of the STP in Podgorica and affiliated impulse centres, coupled with sustained funding, will improve integration between academia and the private sector. Efforts should also be made to operationalise the pilot technology transfer office at the Centre of Excellence at the University of Montenegro.

## Digital society (Dimension 10)

### Introduction

Montenegro has recognised the potential of entrepreneurship and innovation for driving smart growth, especially in the ICT sector. This is reflected in the economy's Smart Specialisation Strategy, which considers ICT as a cross-cutting enabler and Digital Montenegro as its flagship initiative. As shown in the Table 23.18, the economy achieved the second highest overall score in digital society among the Western Balkan six. However, the Montenegrin ICT industry is not yet strong enough to support digital transformation across all sectors, and support to the digital transformation of MSMEs has not been enough to allow it to accelerate. Although 99.5% of the enterprises in Montenegro have access to the Internet and 84.5% of them have a website, e-commerce is lagging behind the EU average. The economy is making steady progress on broadband development, reflected in above average score in access sub-dimension - it has aligned its respective framework with the EU *acquis* and has secured financing to support private sector investments in rural network infrastructure development. Montenegro is also moving forward to reach its vision for the digital transformation of its public administration, turning it into a digital service for citizens and businesses. Even so, the public sector is not fully aligned with international practices on privacy protections and free access to information in the digital age, and the economy scores slightly above average in the trust sub-dimension. Raising public awareness and building human capacities in the public sector on these issues needs to receive higher priority to help change mindsets and instil a culture of trust, transparency and data openness.

**Table 23.18. Montenegro's scores for digital society**

Dimension	Sub-dimension	Score	WB6 average
Digital society dimension	Sub-dimension 10.1: Access	3.2	2.9
	Sub-dimension 10.2: Use	3.0	2.4
	Sub-dimension 10.3: Jobs	2.5	2.3
	Sub-dimension 10.4: Society	2.0	2.1
	Sub-dimension 10.5: Trust	2.3	2.2
Montenegro's overall score		<b>2.7</b>	<b>2.4</b>

### State of play and key developments

#### *Sub-dimension 10.1: Access*

Montenegro has continued to improve its **broadband infrastructure** and although positive progress has been made towards the strategic targets of the Strategy for the Information Society 2020, some of them remain unattainable, particularly those for increasing broadband penetration in sub-urban and rural areas (e.g. the target for broadband penetration to reach 100% of population by 2020). In 2019, next generation access (NGA) coverage was 80.3% (the target for 2020 was 100%), fixed broadband penetration was 90.3% (the 2020 target was 100%), the share of fast broadband connections was 75.1% (the 2020 target was 70%), but ultrafast broadband penetration was 14.2% (the 2020 target was 50%) (EKIP, 2019<sup>[144]</sup>) The Ministry of Economic Development<sup>115</sup> has just started implementing two major projects on broadband infrastructure development:

1. The Regional Broadband Infrastructure Development in Montenegro<sup>116</sup> project is financed under the Western Balkan Investment Framework (WBIF). Its ultimate objective is to support the construction of adequate infrastructure (mostly in rural areas) for fast and secure Internet to all households (increase from 70% to 95%), businesses, educational and health institutions in order to support the digital transformation of society and the economy. A National Broadband Development Plan (NBDP) will be developed, based on which a secured loan of EUR 15.9 million

from the European Bank for Reconstruction and Development (EBRD) will finance broadband development plans for underserved areas.

2. The Western Balkan Digital Highway Initiative, supported by the World Bank.<sup>117</sup> Montenegro is co-operating with the other WB economies on this project, which aims to investigate regional interconnectivity improvements through infrastructure sharing of the optical fibre ground-wire installed over the years by local energy utilities. Comprehensive broadband infrastructure mapping<sup>118</sup> has been conducted in the past three years by the Agency for Electronic Communications and Postal Services (EKIP). The draft law on the use of physical infrastructure for the setting up of high-speed electronic communication networks, which transposes the EU's Broadband Cost Reduction Directive (2014/61/EU), is expected to be proposed for adoption in the second quarter of 2021. The law completes an adequate ICT policy investment framework for broadband infrastructure investments that enables strategic public spending to resolve bottlenecks to private operations without creating excessive crowding-out effects. This framework will support the implementation of the two major broadband infrastructure projects under implementation.

Montenegro's **ICT policy regulatory framework** is fully aligned with the EU 2009 Regulatory Framework and international connectivity agendas, such as the agenda for the Western Balkans, promoting quality infrastructure investment in the electronic communications sector. Montenegro also signed the Regional Roaming Agreement with WB economies in April 2019. The framework is based on the Law on Electronic Communications. This was amended in 2017 to eliminate issues that compromised the independence of the Regulatory Agency: 1) the provision to transfer budget surpluses of the regulatory body to the state budget; and 2) the provision that permitted the National Assembly to dismiss the Regulatory Agency's President and Council members if the agency's annual financial report is not accepted. As a result of these amendments, the agency now enjoys full operational and financial independence and its budget is provided from fees paid to the agency by network operators. The agency is well staffed and has the resources to perform its responsibilities, including market monitoring, publishing data on the development of the market, and maintaining a database of relevant indicators. In 2020 it also adopted a new plan for the use of the radio frequency spectrum (amending the 2017 plan), in order to implement the decisions of the World Radio Communication conference (WRC-19). Improvements to the regulatory framework are continuously being made.<sup>119</sup> The agency implements legal obligations and procedures for conducting public hearings, providing meaningful opportunities (including online) for the public to contribute to the process of preparing draft regulatory proposals in the ICT field. Regulatory impact assessments (RIA) are also conducted in the early stages of the policy-making process, and the analysis is published on the website of the relevant ministry and the e-government portal at the beginning of the public consultation period.

Since 2018, Montenegro has made significant steps in developing its **data accessibility** framework and aligning it with international practices. Data accessibility based on the principles of transparency and openness are covered by a number of policy documents, including the Information Society Development 2020, the Public Administration Reform Strategy 2016-2020, and the Open Government Partnership (OGP) Action Plan. The most important development in 2019 was the adoption of the National Interoperability Framework, which is in line with the European Interoperability Framework (EIF 2.0), and will serve as a solid basis for data exchange among public sector bodies. Amendments to the Law on Free Access to Information were made in 2017, following OGP recommendations, creating the conditions for re-use of information, and obliging each institution (data owner) to maintain and publish the information for reuse in a manner that makes it searchable, in an open and machine-readable format, on the Open Data portal.<sup>120</sup> The portal publishes open data sets for commercial and non-commercial purposes via a shared metadata catalogue, and serves as a foundation for setting standards in public data management and data re-use for added value creation. The portal included 106 data sets from 18 state institutions by mid-2020. A new draft of the Law on Free Access to Information was prepared in 2019, but was still pending adoption in 2020. The engagement of the private sector in open data re-use initiatives is still at an early stage of development and no public-private partnership data-sharing platforms (data PPPs) with certification

systems have been created yet. On the upside, the Ministry of Public Administration and the Chamber of Commerce of Montenegro organised an Open Data Hackathon<sup>121</sup> during the Infifest 2019 Conference to stimulate data innovation initiatives.

### *Sub-dimension 10.2: Use*

Montenegro has demonstrated a long-term commitment to transforming its public administration to a new public service, however progress on e-government development over the last two years (2018-2020) has been slower than in other United Nations (UN) countries. As a result, Montenegro's ranking fell from 59 (2018) to 75 out of 193 countries in the UN 2020 e-Government Survey (United Nations, 2020<sub>[145]</sub>; United Nations, 2018<sub>[146]</sub>). The **digital government** policy framework is made up of the Information Society 2020 Strategy and the Public Administration Reform Strategy (PARS) and its action plan for 2018-2020, which is also aligned with the economy's Open Government Partnership commitments. The PARS promotes e-government development and the creation of efficient electronic services for citizens and businesses in Montenegro. It also seeks to ensure interoperability of registers and user availability of data from registers. The legal framework is primarily based on the new Law on e-Government (electronic Public Administration), which was adopted in 2020<sup>122</sup> to replace the law from 2014. The new law establishes the Council for e-Government for the improved cross-cutting co-ordination of digital government development across the public sector. It aims to ensure an increasing number of user-oriented and business-oriented e-services are developed around the fundamental "only once" principle (i.e. a citizen submits certain data only once, and this data is then propagated for provision of any relevant public service). The legal framework is also complete, with a number of acts adopted in 2019 to eliminate obstacles to the development and use of e-government services.<sup>123</sup> The Law on Electronic Identification and Electronic Signature was also amended in 2019 to harmonise the framework with the new law on identity cards, to align with the eIDAS Regulation (EU 910/2014). Montenegro is also preparing a new Strategy for Digital Transformation in Montenegro 2021-2025, which is pending adoption in 2021. The new strategy aims to promote the digital economy and digital transformation in Montenegro.

The Ministry of Public Administration, Digital Society and Media has introduced the Unified Information System for Electronic Data Exchange (JISERP) to exchange data among public administration bodies and other entities. JISERP allows data from a number of e-registers and information systems to be accessed, including the Central Population Register (CRS), the Education Register, the IS Social Card and Central TAX and Insured Persons Register (CROO) and the information system of the Health Insurance Fund. The e-government portal, the eUprava portal,<sup>124</sup> is the point of access for all electronic public services (e-services) offered by state administration bodies, local self-government bodies and local government bodies. It was launched in April 2011 and initially provided 12 services, all in the Montenegrin language. By 2020, the portal was offering 598 electronic services under the competence of 52 institutions (EC, 2020<sub>[66]</sub>). The portal also includes an e-Participation module for public hearings, contributions to legislative proposals, participation in working groups and e-consultations. It also provides access to several e-health services.<sup>125</sup> Notably, according to eUprava survey statistics, there is a positive trend in public service satisfaction, as 52% of eUprava users were completely or mostly satisfied with services in 2019, an improvement on 30% in 2018. Additionally, 82.7% of survey participants believe that the procedure for requesting a particular document has been simplified (Ministry of Public Administration, 2020<sub>[147]</sub>).

The policy framework for **private sector ICT adoption** is based on the Strategy for the Development of MSMEs, with an action plan for 2018-2022. It aims to improve SMEs' competitiveness through the use of ICT, digital business transformation and promotion of e-commerce. The multi-annual action plan implementing the Industrial Policy 2020 also covers aspects of ICT adoption by companies. These policies include support measures for the purchase of ICT equipment and software, for hiring consulting services to modernise and digitalise business processes and for innovating business processes and products. They also promote modernisation and greater effectiveness of e-services for businesses. Along the same lines, the Programme for Improving the Competitiveness of the Economy, designed and approved on an annual

basis, also supports private sector ICT adoption. As part of this programme, a special programme line for business digitalisation was designed for 2020.<sup>126</sup> Unfortunately, due to the COVID-19 pandemic, its launch was delayed and the first call for applicants was announced in August 2020. The total annual budget for the implementation of the Digitalisation Support Programme Line is EUR 200 000 and each company can be reimbursed for 50% of eligible costs (excl. VAT) for a maximum amount of EUR 3 500.<sup>127</sup> The expected impact of this programme is limited, since this funding can support no more than 60 companies. Results from similar programmes in previous periods also indicate very low rates of SME participation (e.g. only 10 companies applied in 2018 for a similar digitalisation programme according to the ministry's annual report<sup>128</sup>), which has been attributed to the heavy administrative burden on SMEs when applying and implementing these projects. Government-funded capacity-building activities to support ICT adoption have not been prioritised.

On a positive note, the legal framework for e-business and e-commerce has been recently updated, providing an enabling environment for doing business online. According to a 2020 survey on ICT usage by enterprises conducted by MONSTAT, 99.5% of the surveyed enterprises have access to the Internet, 84.5% of these enterprises have a business website, 45.5% of them use connection speeds of 30Mbps or lower while another 29.7% use speeds of between 30 Mbps and 100 Mbps (MONSTAT, 2020<sub>[148]</sub>). According to Eurostat, 12% of small businesses made e-commerce sales during 2019, compared to an EU average of 17%.<sup>129</sup>

### *Sub-dimension 10.3: Jobs*

The **digital skills for students** policy framework is based on a new digital competence framework that came into force in September 2020. The policy framework also includes a national curriculum that incorporates digital skills into compulsory subjects in primary and secondary education,<sup>130</sup> and a Higher Education Strategy for 2020-2024 that promotes the adoption of e-learning platforms and learning management systems. The higher education strategy was pending adoption in late 2020. Progression of digital skills and competences between primary, secondary and higher education curricula is coherent and quality assurance (QA) processes are in place, but indicators on digital skills are not included in QA reports.

Digital skills for students are assessed through regular student assessment procedures. Competent bodies claim that several international good practices in school curricula and teaching methods have been reviewed or even transferred, particularly from the UK and Finland. Every school in Montenegro has access to the Internet, although with varying speeds and availability in the classrooms, especially in suburban and rural areas. Efforts are made to bring Internet connectivity and equipment to every classroom at higher speeds and greater quality. Network infrastructure and speed will be improved through the Regional Broadband Infrastructure Development project launched by the Ministry of Economic Development during 2020. Software and digital tools for collaboration are also gradually being adopted in classrooms and into the teaching and learning process. The COVID-19 pandemic has expedited this process.

By the end of 2020, the targeted computer-student ratio was 1:10, which is the highest in the region. Montenegro has created a regional good practice through the appointment of an ICT co-ordinator in every school. The initiative for designating an ICT co-ordinator in schools started in 2006; since then every school in Montenegro has adopted the practice. This co-ordinator is responsible for the school's overall ICT management (including system maintenance, reporting failures, monitoring antivirus protection, etc.) and for encouraging and assisting staff with the application of ICT in teaching, training them to use ICT, and supporting them with the use of electronic didactic materials. However, data on digital skills for students, as well as on teachers' digital literacy, continue to be scarce. UNICEF Montenegro has supported the Ministry of Education in surveying aspects of children's and teachers' Internet use, online safety and digital literacy, introducing the Global Kids Online research toolkit<sup>131</sup> and supporting the development of digital literacy education in schools.

During 2018, the University of Montenegro started a process of digitalisation. New servers were installed in the Information System Centre and the academic network, EDUROAM, was introduced in all organisational units with network speeds up to 1Gbps. The development of an e-index and e-services is on the way, as well as the establishment of a new e-learning system that enables online teaching and collaboration with students at all higher education institutions. The Ministry of Education, Science, Culture and Sports is also actively participating in international co-operation projects, such as the IPA-funded project on Improving Key Competencies in the Education System of Montenegro. Although the Institute for Education and the National Examination Centre conduct external evaluations of the teaching process and the progress of developing digital skills, and co-ordinate follow-up activities (including teacher training, modernisation of equipment and methods, preparation of digital textbooks, etc.), evaluation reports are not publicly available. In general, monitoring of students' digital skills is weak and data are not regularly published by the relevant institutions.

The framework for **digital skills for adults** is based on the Strategy for the Development of Vocational Education in Montenegro and Action Plan for 2020-2021, and the Adult Education Plan (2019-2022), which aim to prepare a skilled workforce through the application of the European e-skills framework. These policies make clear reference to the development of digital competencies through lifelong learning and formal and non-formal education systems, and envisage co-operation with the labour market to identify training needs and design curricula. Approximately EUR 8 million have been allocated to implement the actions for the new Strategy for Vocational Education,<sup>132</sup> spread over three years up until 2022. However, reports on the funds allocated and implementation progress so far are not publicly available.

Digital skills for adults are developed through programmes promoted by the Centre for Vocational Education in various educational forms. The centre is also responsible for quality assessments of these programmes. Despite the industry being consulted during curricula design, the number of people trained and the quality of the training do not always meet market needs for skilled ICT professionals. Donor or private sector funded programmes offer non-formal adult learning opportunities, including several teacher training courses in digital skills, which have had a positive impact. For example, the Ministry of Education, Science, Culture and Sports co-operated with the British Council on the 21st Century Schools project, which trains primary school teachers<sup>133</sup> in critical thinking, problem solving and coding with micro:bit devices. The project has trained 537 primary school teachers from 95 primary schools since 2019, and is set to train a total of 800 teachers by the time it ends in 2022. In addition, 252 teacher training courses on the basics of programming and databases were also held during 2018 and 2019 in co-operation with the Oracle Academy.

According to the regulations, professional qualifications acquired through non-formal education systems can be recognised under the national professional qualifications framework, aligned with the EU Qualifications Framework since 2014. The Employment Agency also offers opportunities for IT skill development to unemployed people and other underprivileged groups; however, data on the impact of these programmes are not publicly available. The National Education Council consults the Employment Service, the Chamber of Commerce and the Union of Employers prior to adopting a digital skills programme. External evaluations took place during 2018/19 of each education provider and the reports were published on the Centre for Vocational Education's website.<sup>134</sup> However, no reports have been published since at least 2017 on internal evaluations or on the implementation of the new strategy.

Montenegro partly covers **ICT sector promotion** in policy documents that foster digitalisation and innovation through ICTs. The Strategy for the Development of the Information Society (IS) by 2020 and the Smart Specialisation Strategy (S3) 2019-2024, which is an overarching national strategy, are the main policy documents to support the development of the ICT sector. The IS strategy together with the announced Strategy for Digital Transformation 2021-2025 highlight broadband infrastructure development as one of their main objectives, which directly supports the growth of the communications sub-sector. On the other hand, the Smart Specialisation Strategy, adopted by the Ministry of Education, Science, Culture

and Sports, highlights ICT as a cross-cutting priority and includes the flagship initiative Digital Montenegro, aimed at promoting the digitalisation of businesses and ICT-related innovation in existing or emerging technologies. By promoting these, the S3 indirectly affects the ICT sector by boosting growth in all sectors of the economy through the use of ICT; however, it doesn't support ICT industry growth directly. The IT sub-sector companies (e.g. software development and information systems) may exploit the opportunities created across industries by the S3 to develop innovative products based on emerging technologies for the domestic and the international market. The Digital Montenegro initiative plans for IT awareness raising to enable dynamic and proactive access to new and innovative technologies; once again, however, the focus of these activities is cross-cutting rather than ICT sector targeted. The Ministry of Science is already supporting some activities to raise awareness of ICT technologies and innovation, notably among the youth, such as the annual IT fair Knowledge Factory within the Open Science Days Festival. It also introduced a new instrument in 2019 that co-finances (EUR 15 000 a year) activities intended to encourage a culture of innovation, such as hackathons, intense training camps, or similar. However, the impact of these initiatives on ICT sector promotion is limited, since they are focused on fostering ICT as an enabling technology, rather than on promoting the growth of the sector itself.

No internal assessments or external evaluations have been conducted on the impact on the ICT sector of the implementation of the IS 2020 Strategy or other policies, such as the Strategy for the Development of MSMEs. The ICT Association at the Chamber of Commerce points to the fact that the ICT sector does not have a national umbrella institution, since three ministries implement relevant policies (Economic Development, Public Administration and Education), all of which consider a well-developed ICT sector important for achieving their goals. However, the IT sub-sector of the industry cannot be considered as well developed. There is a lack of trained professionals, which is attributed to education system shortcomings. The ICT Association emphasises the need for a dedicated ICT sector promotion policy or programme that fosters measures to strengthen the ICT industry through internationalisation, promotion of exports, improved access to capital and favourable tax and staff social security regimes to enable investments.

#### *Sub-dimension 10.4: Society*

The Strategy for Information Society Development 2020 and the new Law on e-Government, enacted in 2020, cover the basic principles of a **digital inclusion framework**. They promote the use of digital technologies among marginalised groups and equality across society regardless of age, geographic location, gender, education level, ethnicity or ability. The new Rulebook on e-Accessibility standards, adopted in late 2020, is aligned with international standards for websites, e-documents, e-services and procurement of ICT products and services. This rulebook complements the new Law on e-Government, and updates the existing framework through obligatory guidelines for all public sector websites in Montenegro. Guidelines had already been adopted for e-accessibility on public sector websites (since 2014) and for the creation of e-documents (since 2017), as prescribed by the Strategy for the Information Society 2020, but monitoring and enforcement was weak (OGP, 2018<sup>[149]</sup>). Some training for public officials and portal administrators has been organised, as well as a few awareness-raising and capacity-building activities for marginalised groups. The Ministry of Public Administration along with Montenegrin network operators and associations have organised free training for various population groups, equipment donations for schools in rural areas, training and certification testing for the Roma population, campaigns for people with disabilities, and ICT training workshops. However, low prioritisation and resource allocation for digital inclusion measures are aggravated by the lack of a central body tasked to oversee and coordinate digital inclusion activities by the various line ministries. Data on digital inclusion indicators are not regularly collected, which hinders informed policy and programme design.

### *Sub-dimension 10.5: Trust*

The Law on Personal Data Protection (PDP) provides a basic framework for digital **privacy protections**. However, the current PDP framework is not fully aligned with the EU's General Data Protection Regulation (GDPR) (EU) 2016/679 and is outdated, with the law on PDP having been enacted in 2008 and last amended in April 2017. The Ministry of Interior formed a working group in 2020 to prepare a new PDP Law, but preparations are still at an early stage and there is no announced schedule for the adoption of the new law. Montenegro has not yet signed or ratified the Council of Europe 2018 Protocol amending the Convention for the Protection of Individuals with regard to Automatic Processing of Personal Data. The Agency for Personal Data Protection and Free Access to Information is the competent, independent enforcement authority. It undertakes inspections of PDP compliance and although it organises training for public sector officials and public awareness-raising workshops, capacity-building activities on PDP are weak. The agency has insufficient resources to implement its tasks. It is also evident that a culture of data privacy and access to public information is yet to be instilled in the public sector and across all levels of the government. Without such a culture, implementing the framework is difficult. Public institutions often deny access to public information requests by not answering or by declaring requested documents to be classified (EC, 2019<sup>[73]</sup>). The COVID-19 crisis has further exposed the challenges of limited awareness of PDP rights and obligations, with authorities struggling to find the right balance between protecting the health of the nation while respecting the confidentiality of personal health data and citizens' right to a private life<sup>135</sup> (EC, 2020<sup>[66]</sup>). Personal data disclosure measures taken by public institutions to address the COVID-19 pandemic in 2020 have raised questions on disproportionality by civil society organisations (AZLP, 2020<sup>[150]</sup>). On a positive note, in 2018 the agency completed a successful EU-funded twinning project Strengthening the Capacity of the Agency for Personal Data Protection and Free Access to Information with its partner agency in Croatia. It used training to improve staff capacity in the application of the law on free access to information. The aim of the project was to reduce the number of cases of administrative silence by first instance bodies and the number of agency decisions annulled by the administrative courts (AZLP, 2018<sup>[151]</sup>).

The framework for **consumer protection in e-commerce** is defined by the National Consumer Protection Programme 2019-2021 and its annual action plans, as well as the Law on Consumer Protection, amended in December 2019 to transpose the EU Directive on consumer rights (2011/83/EU). The new law improves consumer protection in e-commerce and introduces many new protection mechanisms for distance contracts. The Ministry of Economic Development is working on subsequent secondary legislation to regulate consumer protection in e-commerce. During 2020 two regulations were adopted, both regarding unilateral termination of consumer contracts concluded online. A law on alternative dispute resolution was also adopted in 2019 and subsequent by-laws are under preparation. The Commission for the Implementation of the National Consumer Protection Program is an inter-sectoral body, established by the Ministry of Economic Development to co-ordinate and report on the implementation of the programme. The law enforcement authority for consumer protection in e-commerce, the Directorate for Inspection Affairs,<sup>136</sup> is in charge of inspections of information society services and also collects data on consumer complaints, surveys and other trend data that allow for comprehensive monitoring of consumer protection. However, in its 2019 annual report, the directorate doesn't mention any activities related to consumer protection in e-commerce, suggesting that the implementation of the e-commerce consumer protection framework and its monitoring are still weak. Although consumer education and information are part of the mission of the Consumer Protection Programme, activities to raise public awareness around e-commerce are also insufficient. Ministries and other agencies, as well as the NGO CEZAP (Centre for Consumer Protection), have the role of informing or educating consumers, but again e-commerce activities have not been prioritised. Indicators on e-commerce and consumer protection in e-commerce are not regularly collected and published.

The Cyber Security Strategy of Montenegro 2018-2021 draws on international instruments to promote **digital security risk management** and cybercrime mitigation and encourages in-service risk management

training and awareness raising across the population through education programmes. Since 2018, there is clear evidence of active policy implementation. The Information Security Council was established in 2019 to co-ordinate implementation of the strategy in accordance with the EU Directive on security of network and information systems (NIS Directive EU 2016/1148) (EC, 2020<sup>[66]</sup>). The Critical Information Infrastructure for Montenegro has been defined in eight critical sectors. Also, the operational capacity of the national computer incident response team CIRT.ME has been strengthened with six additional staff members, and other public and private computer security incident response teams (CSIRTs) are gradually being created. Despite the staff increases for the CIRT.ME, additional technical and financial resources are still needed both for the CIRT.ME and the police department in charge of the fight against cybercrime, which, with only two employees, is seriously understaffed. The Law on Information Security and the Law on Classified Information are in place, but further harmonisation is needed and additional regulations are pending to complete the legal framework on information security and to align further with the NIS Directive.

### ***The way forward for digital society***

Despite some important steps taken to improve the digital society policy framework, the government of Montenegro should pay more attention to the following aspects:

- **Invest in activities that promote the re-use of open data and stimulate the creation of public-private partnerships on data innovation.** Activities to promote the re-use of open data include organising open data hackathons, like the one organised in 2019; supporting business start-ups that create new value from open data sets; and open data partnering events that bring together public institutions (data owners) and private sector companies to stimulate the creation of open data PPPs focused on data innovation. Raising public awareness on data openness can be achieved by co-operating with civil society organisations and allocating sufficient resources to build the capacities of public officials.
- **Develop support programmes for SMEs to boost the adoption of e-business and e-commerce.** Review and evaluate the impact of previous programmes on digitalisation of SMEs and collaborate closely with industry stakeholders to identify shortcomings in the design of support measures. Adapt the approach and types of financial support to the needs of the market and allocate sufficient resources for co-financing tools for training SME staff in ICT. A set of indicators for private sector ICT adoption, including e-commerce, should be developed and regularly monitored.
- **Develop a common digital competence framework for ICT professionals to meet the needs of the labour market.** Despite the proliferation of ICT-related subjects and IT training programmes, their poor quality and lack of relevance to industry needs is widening the gap between the skills available and those sought by ICT sector companies. Increased co-operation between ICT training providers and the industry should be systematised following EU and international good practice. State institutions should strengthen the monitoring of digital skills indicators and regularly assess the relevance of acquired IT skills to market needs.
- **Adopt an ICT sector promotion policy or programme to strengthen the domestic industry so that it can act as an enabler of economic growth.** Although ICT is identified as a horizontal tool for growth across industries in the Smart Specialisation Strategy, the domestic IT industry has not received the necessary support to grow, increase exports or attract investments. Specific measures are needed to support the ICT sector in financing growth, internationalising products and services and retaining talent.
- **Establish or appoint a state body to oversee and co-ordinate digital inclusion activities and institutions implementing digital society policies.** Enable this body to co-ordinate activities at the highest level of the government, across ministries, agencies and institutions, to prioritise digital inclusion measures and ensure the sufficient allocation of resources to activities. This body would

need to facilitate collaboration with the private sector and donors to avoid duplicated effort and wasted resources, and to promote ICT capacity building for underprivileged groups. It could also be tasked with monitoring the implementation of e-accessibility regulations and regularly collecting data on a complete set of indicators for digital inclusion to enable data-driven policy making.

- **Accelerate the adoption of a new Law on Personal Data Protection to transpose the GDPR into national legislation.** Strengthen the Agency for Personal Data Protection and Free Access to Information with financial and human resources so it can perform its tasks effectively, particularly in view of the implementation of the new law. Intensify in-service training across the public sector to ensure that public officials understand and respect the principles of data privacy and the right to free access to public information.

## Transport policy (Dimension 11)

### Introduction

Since the last CO assessment, the main improvements made by Montenegro concern transport project selection, and implementation and procurement. The slowest progress has been in asset management. Montenegro's performance on the transport dimension is slightly above the WB6 regional average (Table 23.19), but further efforts are still needed to reach the EU's level of performance.

**Table 23.19. Montenegro's scores for transport**

Dimension	Sub-dimension	Score	WB6 average
Transport policy dimension	Sub-dimension 11.1: Planning	1.9	2.3
	Sub-dimension 11.2: Governance and regulation	3.3	2.6
	Sub-dimension 11.3: Sustainability	1.5	1.3
Montenegro's overall score		<b>2.1</b>	<b>2.0</b>

### State of play and key developments

#### *Sub-dimension 11.1: Planning*

Improvements in Montenegro's **transport vision** since the last CO assessment include its new Transport Development Strategy (TDSM) for 2019-2035. It covers all transport modes; contains clear and measurable objectives, budgets per measures, roles and responsibilities for implementation; and is supported by a detailed action plan for 2019/20 (the 2021/22 action plan is being developed). Another improvement is the new Strategy for the Development of the Maritime Economy 2020-2030 and its 2020/21 action plan (adopted in August 2020). This comprehensive TDSM represents a solid basis for contributing to Montenegro's economic development, as well as to an open and competitive regional transport market. The TDSM's implementation plan is divided into two periods, 2019-2027 and 2028-2035, while action plans are adopted for two-year periods. Both of these strategies were developed through a consultation process involving a wide range of stakeholders, including the non-government organisation (NGO) sector. A transport model was used to develop the strategy, but it is not clear why the ranking of the measures was not assessed through this transport model – instead they were taken from the single project pipeline (SPP).<sup>137</sup>

The impact of the TDSM on tourism has not been assessed, showing a lack of coherence in policy making. However, there is a separate Tourism Development Strategy to 2020, which sets transport infrastructure and accessibility improvement throughout Montenegro as one strategic goal. Achieving this would not only benefit tourism, but also other branches of the economy. Once the upgraded transport and tourism policies and relevant infrastructure are fully integrated and jointly implemented, the attractiveness of Montenegro and the region will be improved and the relevant markets will become more competitive.

Monitoring of the TDSM will be done through the co-ordination body of the Ministry of Transport and Maritime Affairs (MTMA), as prescribed in the TDSM. The ultimate goal of the government should be to update the vision/strategy systematically based on the monitoring reports and impact assessments. National transport legislation is amended based on the regular monitoring results of the EU accession process; the last monitoring report was issued in the first quarter of 2020.<sup>138</sup> Up until 2019, transport-related strategic documents were always aligned with the European Commission Staff Working Documents (CSWDs)<sup>139</sup> on EU Enlargement Policy; as the new CSWD was issued in October 2020 it is expected that the TDSM will be aligned further if needed.

Investment in road and maritime infrastructure has fallen since the last CO assessment, but has increased for rail infrastructure. The same trend applies to spending on road and rail maintenance, while data for maintenance in maritime transport are not available.

Montenegro has co-operated with other WB6 economies to exchange experiences, as recommended in the last CO, especially through the Transport Community Permanent Secretariat (TCPS) cross-border co-operation programmes.<sup>140</sup> Projects include transport facilitation at the border crossing points (BCPs) with Albania, Bosnia and Herzegovina, and Serbia; co-operation for developing the Bar-Boljare motorway and railway line along Route 4; and co-operation with Albania and Croatia on realising the Adriatic-Ionian highway. Such regional co-operation and exchange of good practices needs to be enhanced on a regular basis and intensified, as the proper development of a single and competitive transport market can only be achieved through regular regional discussions on transport vision and planning. Montenegro participates actively in the EU Strategy for the Development of the Danube Region (EUSDR), aiming to help create a more competitive region through improved mobility and intermodality, as well as the use of more sustainable energy and better environmental protection. Montenegro also participates in the EU strategy for the Adriatic and Ionian Region (EUSAIR), which promotes economic and social prosperity and growth in the region by improving its attractiveness, competitiveness and connectivity.

The government has enough human and financial capacity to execute its tasks linked to the TDSM and related policy. The level of policy implementation to date is not known. Some legislation has been adopted since the last CO assessment linked to previous and current national transport strategies (presented below for each transport mode) but the level of harmonisation with the Transport Community Treaty (TCT), which aims to create a transport community between the EU and WB6 economies, is not clear.

Montenegro has made significant progress since the last assessment in developing legislation to improve **transport project selection** and project implementation. The Decision on the Preparation of the Capital Budget and Specification of Evaluation Criteria for the Selection of Capital Projects is a new prioritisation tool.<sup>141</sup> The process takes account of intermodality; accessibility; impact on the environment, society and economy; and cross-border and regional impact, etc. It is used only for projects to be financed through the WBIF; projects funded through national budgets and small-scale projects are not considered. Cost-benefit analysis (CBA) is only used for capital projects proposed for financing from the capital budget (projects over EUR 5 million) and projects listed in the SPP. Therefore, the return on investment is not known for projects financed through the national budget. There are no national guidelines for CBA so international practices and guidelines are used. Environmental impact assessment is conducted according to national legislation,<sup>142</sup> while social impact assessment is conducted using International Financial Institution (IFI) procedures. The government has enough human and financial capacity to execute the transport project selection process. However, *ex post* monitoring of the methodology and prioritisation processes is needed and should be applied annually in order to adjust the prioritisation framework.

Since the last CO assessment, new legislation has been adopted for **implementation and procurement processes** (the Concession Law, Public Procurement Law, PPP Law, and the Law on the Prevention of Corruption).<sup>143</sup> The PPP and concession laws allow transport infrastructure to be developed using alternative models to the traditional public procurement approach. While a procurement process is applied to all transport projects funded by the state budget, if the project is funded by IFI funds, an alternative procurement process is allowed, following IFI procedures. There are no transport PPP projects implemented in Montenegro yet (though the prequalification process started in 2019 for the concession for the Montenegrin airports). The Law on PPPs and Law on Concessions have been adopted recently, and the Investment Agency will have an oversight role in the procurement and monitoring of PPPs. For procuring goods or services of a very low value,<sup>144</sup> each institution defines the framework by adopting the Rulebook for conducting small value procurement, which is based on the Public Procurement Law.

*Ex post* evaluation of procurement and implementation processes does not exist and it is therefore not known if the implementation and procurement processes have achieved their objectives and, if not, why.

While the roles and responsibilities of the government bodies are defined, human and financial capacity are not adequate for the tasks assigned, especially for PPP projects, according to information provided by the government. Co-operation with the other WB6 economies has been established in the implementation and procurement sector, and best practices are shared and applied where possible. Examples include the development of a one-stop shop<sup>145</sup> (OSS) at the railway BCP with Serbia, and a one-stop shop at the railway and road BCPs with Albania, which minimise the crossing time and make transport corridors more competitive.

An **asset management system**<sup>146</sup> for transport modes has yet to be developed, and there is not yet a national inventory system of all state-owned (public) assets. As a good starting point for the road and railway sectors, the Technical Assistance to Connectivity in the Western Balkans (CONNECTA) study on Preparation of Maintenance Plans 2018-2022 for Road/Rail TEN-T indicative extensions to WB6 (2018) could be used (CONNECTA, 2018<sub>[152]</sub>).

The state road network (1 853 kms) has been digitalised and road data collected through the Road Safety Assessment Project.<sup>147</sup> As per the newly adopted Law on Roads (2020), a medium-term state programme for roads has been adopted. It prescribes the development of maintenance plans which need to be implemented and developed to justify the maintenance budgets by directing funds to those areas where the return on investment will be greatest. This system should be considered as an integral component of planning, identification, prioritisation, implementation and monitoring processes for all transport modes.

Investment in road infrastructure is considerably higher in this assessment period than for other transport modes (Table 23.20) due to the ongoing construction of the Bar-Boljare motorway (part of the road and rail Route 4 – an important regional link, connecting the WB6 region to one of the biggest ports in the region). The planned investment in all transport infrastructure for the period 2020-22 is 25-30% lower annually than in 2019. Investment in rail infrastructure needs to be multiplied to achieve a similar level of investment as in the EU rail infrastructure market. The government's current plan for the period 2020-22 is to invest 50-100% more every year than in 2019. Investment in maritime port infrastructure is above the EU but below the OECD averages. Maintenance of road and rail infrastructure is slightly below the EU and OECD average (Table 23.20), but the government plans to invest 20-32% more annually over 2020-22 in the road sector and 45% annually in the rail sector.

**Table 23.20. Trends in transport infrastructure investments and maintenance, Montenegro (2017-19)**

	Investment costs					Maintenance costs				
	Change over 2017-19 (%)	2019 (mil EUR)	Share of GDP (2019) (%)	Share of GDP OECD average (2018)	Share of GDP EU average (2018)	Change over 2017-19 (%)	2019 (mil EUR)	Share of GDP (2019) (%)	Share of GDP OECD average (2018)	Share of GDP EU average (2018)
Road infrastructure	-6.5	202	3.7	0.46	0.38	-3.6	8.29	0.15	0.18	0.15
Rail infrastructure	+1.5	6.9	0.12	0.17	0.31	+1.5	6.9	0.12	0.16	0.16
Maritime infrastructure	-68	1.8	0.03	0.05	0.02	-	-	-	0.05	0.01

Note: OECD and EU average represents the average value for the countries with available data.

### *Sub-dimension 11.2: Governance and regulation*

Since the last CO assessment, reforms have continued in the field of **aviation regulation**. The Law on Air Transport of Montenegro provides the legal basis for the adoption of by-laws that fully transpose the EU *acquis* and the TCT. The Single European Sky (SES) I and II packages had been fully transposed by 2013, while the Civil Aviation Authority (CAA) of Montenegro, with the consent of the MTMA, is fully committed to the further implementation of the Implementing Regulations and Community Specification, bringing Montenegro significantly closer to the EU *acquis*.

Safety Culture,<sup>148</sup> a programme covering important standards for safety risk assessment and safety assurance, has been adopted. The National Aviation Safety Plan for 2019-2023 was adopted in 2019. The National Supervision Authority's (NSA) tasks are performed by the Air Navigation Safety Division of the CAA. The CAA of Montenegro has developed training programmes for its staff and an Annual Training Plan is developed and approved each year covering fields related to safety, cost-efficiency and environmental issues.

Montenegro does not have its own Air Traffic Management (ATM) Plan; instead it relies on the European ATM Master Plan developed by the EU. A national ATM plan needs to be developed to provide a roadmap for the development and deployment of the strategic and operational concepts for optimising airspace management, enhancing safety and reducing emissions. The air traffic management plan in use was developed and monitored regularly through the Local Single Sky Implementation (LSSIP) monitoring<sup>149</sup> (EUROCONTROL, 2019<sup>[156]</sup>).

The Airport Charges Directive has not been transposed or implemented yet. This is an important piece of EU legislation stating that the charges have to be set and monitored based on the non-discrimination and transparency principles defined by the EU, including quality standards related to the service level agreement of the services provided at the airports. The market is monitored by the CAA (in 2015 and 2019 so far), which needs to provide the economic framework for air transport in granting and overseeing the operating licences of air carriers, market access, airport registration and leasing, public service obligations, traffic distribution between airports, and pricing.

Montenegro is not a member of any Functional Airspace Block (FAB), but has the very same form of FAB through Serbia and Montenegro Air Traffic Services (SMATSA), which aims to avoid national fragmentation and its impacts on safety, capacity, and above all, costs.

Air traffic in Montenegro is growing. The total number of passengers transported at all airports increased in the period 2017-19 by approximately 21.5%, amounting to 2.65 million passengers in 2019. This is a significant increase compared to the world average, which was 11.7% (IATA, 2020<sup>[157]</sup>) over the same period. The new airport passenger terminal in Tivat (which is the only coastal airport) was completed in 2018 to deal with the strong passenger growth and capacity constraints, and to provide welfare benefits for passengers at the terminal, better safety and security procedures, a higher quality of service and better working conditions for employees. Given the significant growth of this transport mode and its projected importance for the economy, it is important that Montenegro continues regulatory reforms to bring the governance of the aviation sector closer to European standards and international best practice.

Some positive efforts are visible in the **railway regulation** sector in Montenegro since the last CO assessment, but significantly more efforts are needed to align legislation with the EU *acquis* and the TCT and thus achieve a fully open rail market and safer and interoperable railway infrastructure. Structural reforms have been adopted and vertical separation has been implemented based on the 2005 Law on Railways. While the network monopoly is unbundled, the market is only officially liberalised for national companies. However, it should be fully open to and non-discriminatory for foreign firms too. There is only one national private undertaking for goods transport.

Established in 2019, the Railways Directorate is an independent administrative state authority, acting as a regulatory body and the National Safety Authority (NSA). It regularly monitors the implementation of

activities, with the latest report issued in 2019. The new Law on Railways will induce a full reorganisation of the Railways Directorate to become an independent administrative state authority performing the tasks of an oversight body. Railway Directorate operations are funded by the MTMA. Oversight activities are also conducted by the Directorate for Railway Transport in the MTMA. Network statements for infrastructure and services facilities are regularly issued, ensuring transparency and non-discriminatory access to rail infrastructure, and to services in service facilities.

Montenegro has advanced bilateral co-operation in the railway sector, signing border crossing operation agreements with Albania and Serbia to improve trade facilitation, shorten driving times and simplify border procedures. An agreement was signed in 2012 with Albania for a one-stop shop at BCP Tuzi. This OSS is now functioning well, while another agreement has been signed in 2018 with Serbia for installing an OSS at Bijelo Polje – this is still being implemented.

A National Register of Railway Vehicles has been established and will be transformed as per Commission Implementing Decision 2018/1614 by 2024 into a centralised European Vehicle Register. Staff are in the final phase of training in data processing. The EU Interoperability Directive 2016/797, important for developing and facilitating international railway transport, will be prepared for implementation during 2021. The following Technical Specifications for Interoperability (TSI) have been published on subsystem energy, on safety in railway tunnels, on subsystem control and signalling, and on infrastructure.

The mode share<sup>150</sup> of intercity rail passenger transport fell in the period 2017-19 by 4.3% to 11.4% (2019) of total transported passengers, while in the same period freight's mode share dropped by 14.5% to become 56.1% of the total transported freight. This freight mode share is good compared to the EU average in 2018, where road share accounted for 75.3%, rail share for 18.3% and inland waterways for 6% (Eurostat, 2020<sub>[158]</sub>).

**Table 23.21. Trends in transport of passengers and goods in Montenegro**

Rail network utilisation	Change over 2017-19 (%)	2019 (million)	Share of the EU average (2017) (%)
Passengers (passengers*km/km of track)	+11.06	0.20	9.25
Freight (tonnes*km/km of track)	-22.84	0.40	20.65

Source: (Eurostat, 2020<sub>[159]</sub>), *Eurostat transport statistics database*, <https://ec.europa.eu/eurostat/web/transport/data/database>; (MONSTAT, 2020<sub>[160]</sub>), *MONSTAT database*, <https://www.monstat.org/cg/page.php?id=36&pageid=36>.

Even though the share of rail freight is high, there is still potential to increase this share once the rehabilitation of railway Route 4 (Bar-Belgrade section) is completed. This is expected to increase both speed and reliability, easing access from the WB6 and Eastern Europe to the Mediterranean. There is still much to be done to achieve the EU average level of rail network utilisation (e.g. full opening of the market, incentives for shifting freight from road to rail, development of rail freight corridors, development of multimodal facilities but this will lead to much greater cost-effectiveness of transport infrastructure assets.

The current predominance of investment in road transport, shown in Table 23.20, indicates that more investment is needed in the railway sector to increase the quality of the network. This will lead to an increase in demand by passengers and shippers. If Montenegro succeeds in keeping its high rail freight share and increasing its rail passenger share this will indicate sustainable growth in demand. Such a growing and open market would lead to more efficient operation and could also help to lower prices for the users of the systems.

Very good progress has been made on **road market regulation** and in dealing with the impact of COVID-19. Since the last CO assessment, the Law on Road Transport (2019) and the Law on Working Hours and Pauses during Working Hours of Mobile Workers and Devices for Registration in Road Transport (2019) have both been adopted to harmonise legislation with the TCT. Therefore, local legislation is now fully

aligned with some key EU regulations. The legislation has been amended based on regular monitoring prepared on a quarterly basis as part of the EU accession process. The last monitoring report was issued in the first quarter of 2020.<sup>151</sup> The Law on Road Transport sets the deadline of December 2020 for all companies, managers and drivers to harmonise their businesses with this law. The government has prepared rulebooks related to the forms of permits, licences, etc. required. However, secondary legislation still needs to be harmonised for social provisions, tachographs, and enforcement of social legislation. This will require harmonising the following draft rulebooks: the Rulebooks on Tachograph Workshops, and the Rulebook on technical and performance requirements for tachographs, tachographs, and memory cards.

Montenegro participates in the European Conference of Ministers of Transport's (OECD-ITF, 2014<sup>[161]</sup>) multilateral quota system, which enables hauliers to undertake an unlimited number of multilateral freight operations in the 43 European member countries participating in the system.

Road network performance is measured occasionally and only for some indicators.<sup>152</sup> There is still scope to significantly improve the measurement of other indicators to monitor the road sector market. Doing so would help to allocate funds to areas that could generate the greatest benefits.

The mode share of road transport (88.6%) is significantly higher than for rail transport (11.4%), and higher than the EU average, whose road share accounted for 75.3%, rail share for 18.3% and inland waterways for 6% in 2018 (Eurostat, 2020<sup>[158]</sup>). Even though road network use is far below the EU average (Table 23.22), the road freight share is still high, with negative impacts on air pollution and climate change. Therefore, EU strategies for shifting freight from road to intermodal transport should be followed, accompanied by incentives. This could have a positive influence on air pollution and climate change, as well as on reliability, given the increasingly congested roads in the region and across Europe.

**Table 23.22. Trends in road transport in Montenegro**

Road network utilisation	Change over 2017-2019 (%)	2019 (million)	Share of the EU average (2017) (%)
Passengers (passengers*km/km of road)	+0.02	0.013	1.26
Freight (tonnes*km/km of road)	-21.75%	0.009	2.27

Source: (Eurostat, 2020<sup>[159]</sup>), *Eurostat transport statistics database*, <https://ec.europa.eu/eurostat/web/transport/data/database>; (MONSTAT, 2020<sup>[160]</sup>), *MONSTAT database*, <https://www.monstat.org/cg/page.php?id=36&pageid=36>.

The COVID-19 outbreak is affecting the entire transport and mobility market the world over; the WB6 economies have not escaped its impacts. In the second quarter of 2020 Montenegro introduced measures at border and customs control to ease the provision of essential goods and medical equipment, aiming to keep low the number of infected individuals. Montenegro also introduced the Green Lane measure on major corridors for the transport of emergency goods, which requires that freight vehicles and drivers should be treated in a non-discriminatory manner and procedures should be minimised and streamlined. The time involved in passing through these green lane border crossings (including any checks and screenings) should not exceed 15 minutes (see also the Trade dimension). The implementation of these measures could have a direct impact on how the region's border crossings could be treated in the future. In addition to this, the regional measures underway to minimise crossing times could also have positive impacts, such as the OSS at the road BCP Preševo/Tabanovce between Serbia and North Macedonia; automation of customs procedures; and traffic management measures which transfer physical queues into virtual queues through an electronic queuing management system (e-QMS), inspired by the one installed in the Baltic countries (TCPS, 2020<sup>[162]</sup>) (TCPS, 2020<sup>[163]</sup>) (Government of Serbia, 2019<sup>[164]</sup>) (GoSwift, Estonian Border, 2020<sup>[165]</sup>).

In 2015, the Study on Inland Waterways in Montenegro was published to develop the non-existent **inland waterway (IWW)** transport legislation. Based on this study, the new Law on IWW is planned to be adopted by the end of 2021, transposing relevant EU legislation.<sup>153</sup>

Unlike for inland waterways, many EU Directives and Regulations have been transposed in the **maritime transport** market. Even so, many areas still need to be harmonised with the EU *acquis* and the TCT. These include maritime policy, market access, international relations and agreements, accident investigation, international safety management code, etc.

In April 2019 the Government of Montenegro adopted the Rulebook on Internal Organisation and Systematisation of the MTMA, establishing the Directorate for Maritime Transport and Inland Navigation comprising the Directorate for the Application of Standards to Protect the Sea from Pollution and Inland Waterways. There are still no specific incentives prescribed for shifting freight from road to maritime transport, which is flexible in terms of the size of the shipment, offers the foremost competitive freight cost especially over long distances, is the least environmentally damaging form of commercial transport, and is suitable for hazardous goods. Indicators to measure the performance of maritime transport have not been established yet. The total turnover of goods in ports decreased by 2% in the period 2017-19.

Indicators to monitor and assess the performance of all transport modes are either non-existent or not properly established (some missing indicators include average user costs, travel time satisfaction levels/reliability, value of assets, market research and customer feedback, quality of user information, audit programmes, etc.). Regular data surveys are not planned soundly – they need a clear purpose, a decision on the level of data needed, and an allocated budget. They are also not conducted regularly, and are conducted only for specific projects rather than as part of regular transport infrastructure assessment and planning. Therefore, Montenegro lacks the basis for a quality assessment of the transport network's performance.

### *Sub-dimension 11.3: Sustainability*

Further efforts are required to improve **road safety** in Montenegro. The Strategy for Improving Road Safety 2010-2019 (SIRS) was approved in 2009 after public consultations with all relevant government institutions (MTMA, Ministry of Interior, Police Administration, Ministry of Health, and Ministry of Education), municipal government units, NGOs, Insurance Supervision Agency, and the public. The SIRS was further upgraded through the Road Traffic Safety Improvement Program (RTSIP) for the period 2020-2022, and its action plan 2020-2022. The SIRS envisages that the Coordinating Body for Road Traffic Safety (CBRTS), whose task is to co-ordinate the activities of competent bodies and organisations in the field of road traffic safety, should monitor SIRS implementation. The government adopts the CBRTS annual reports, including those monitoring implementation of the previous year's action plan, and also adopts the action plan for the coming year. The most recent annual report only presents activities for 2019, therefore it is not easy to conclude the level of SIRS implementation. However, the 2019 report shows that 28% of operation goals have been fully realised, 36% are partially realised and 36% have not been realised. The RTSIP aligns the safety framework with the EU *acquis*,<sup>154</sup> as well as with the White Paper for Safe Roads in 2050.<sup>155</sup> It contains measures and actions, and assigns the bodies responsible for implementation, timelines, and budgets. Both staff and financial capacity are sufficient for implementing the strategy.

The Regional Road Safety Action Plan<sup>156</sup> was endorsed by the Council of Ministers of the TCPS in October 2020. Montenegro needs to align its national plans mentioned above with the goals set in this plan. The goal of the EU Policy Orientation on Road Safety 2011-2020 is to reduce road fatalities by 50% between 2010 and 2020 (the Decade of Action for Road Safety is 2011-2020, as proclaimed by the UN General Assembly in March 2010). SIRS is aligned with this document. This goal has already been achieved by Montenegro, as shown in Table 23.23. However, these good achievements need to be continued to secure the newly defined goal in the European "Vision Zero"<sup>157</sup> strategy to 2050, which also sets an intermediate goal for a 50% decrease in road fatalities in the decade 2021-2030. The basis for this good achievement lies with the RTSIP, whose goal is to reduce the number of road fatalities by 10% from 2018 figures and the number of persons with serious bodily injuries by 5% by the end of 2022. It is also necessary to

strengthen public-awareness and education activities, as well as promote innovative funding ideas in the road safety sector (Box 23.16).

### Box 23.16. Innovations in road safety: Road safety social impact bonds

The United Nations Development Program (UNDP) in Montenegro, in co-operation with the key national players in road safety, came up with the idea for road safety social impact bonds in 2018 as an innovative and alternative performance-based public financial instrument which shifts the policy framework from inputs and outputs to outcomes and value for money. This idea involves encouraging the private sector to invest in road safety improvements together with the public sector, with the aim of strengthening sustainability. The public partner commits to paying the outcome payments to the investor if and only if the predefined and measurable social goals are met. This idea has great potential to help other economies in the region (and beyond) to replicate and scale-up the model.

Source: (UNDP Montenegro, 2020<sup>[166]</sup>), *Project Summary, Rethinking road safety in Montenegro*, <https://www.me.undp.org/content/montenegro/en/home/projects/RoadSafety.html>.

The main sources of information on road accidents in Montenegro are the Traffic Police (for data collected in the field) and the Ministry of Health (for information on injured persons). The actual road accident data system is updated quarterly, and the data are available on the MONSAT website.<sup>158</sup>

While these figures are positive (with Montenegro showing one of the two greatest achievements in the region in terms of reducing fatalities over the period 2010-2020), they are not completely stable, bearing in mind their fluctuations throughout the entire previous decade. Much greater efforts are needed, not only in harmonising the legislation with the TCT, but also in the areas of education, awareness campaigns, enforcement, etc.

**Table 23.23. Road safety trends in Montenegro**

Road safety trends	2010-2020 (% change)	2020
Number of fatalities (Montenegro)	-49.5	-
Number of fatalities (EU-27)	-23	-
Number of fatalities per million inhabitants (Montenegro)	-	77.2
Number of fatalities per million inhabitants (EU-27)	-	51

Source: (EC, 2020<sup>[167]</sup>), *2019 Road Safety Statistics: What is behind the figures?*, [https://ec.europa.eu/commission/presscorner/detail/en/qanda\\_20\\_1004](https://ec.europa.eu/commission/presscorner/detail/en/qanda_20_1004). (MONSTAT, 2020<sup>[160]</sup>), *MONSTAT database*, <https://www.monstat.org/cg/page.php?id=36&pageid=36>.

There is no **environmental sustainability strategy**, though some environmental sustainability parameters related to the transport sector are partly covered in the National Strategy for Sustainable Development until 2030 and National Climate Change Strategy. The National Strategy for Sustainable Development (NSSD) has two main objectives: 1) enhancing the prosperity of citizens; and 2) promoting sustainable development. These strategies set a range of objectives and measures<sup>159</sup> for environmental sustainability in the transport sector. All these objectives and measures need to be linked with the national transport framework, and clear and measurable indicators need to be defined with timelines, budgets, and responsible bodies for implementation.

**Combined transport**<sup>160</sup> is the most cost-efficient transport mode, reducing environmental pollution, and increasing co-operation between the freight forwarding network companies. Achieving well-functioning logistical chains and establishing an international corridor approach and intermodal solutions could promote a high level of competitiveness in Montenegro's transport market. The legal and regulatory

framework for combined transport has been defined in Montenegro but not implemented, even though the TDSM does set some priority actions. Co-modality is proposed through the TDSM, including use of road freight transport for supporting intermodal terminals where it is impossible to achieve intermodality by other modes of transport; an increase of intermodal transport volume; an increase of intermodal transport agreements; development of intermodal stations in Podgorica and Bijelo Polje, etc. Although there is no separate strategy for logistics and co-modal solutions, the Law on Combined Transport (2014) introduced several incentives for users of combined transport (e.g. exemptions from road user tax and from permit fees to transport goods. It also required the locations for intermodal terminals and transshipment locations to be defined.

The World Bank's Logistics Performance Index (LPI) ranks Montenegro 77 out of 160 ranked countries, with an LPI score of 2.75. This is slightly below the world average (2.85) but far below the EU average (3.52). The best score achieved by Montenegro is for the timeliness indicator<sup>161</sup> (ranked at 63) while the worst is for tracking and tracing<sup>162</sup> (ranked at 105).

Improving data collection, which is currently very weak, needs to be one of the key actions for assessing performance on all sustainability areas. A strategy for data collection needs to be established as the basis for assessing the transport sector, as it could also directly influence the prioritisation processes within transport policy in general.

### ***The way forward for transport policy***

Montenegro has taken some important steps towards developing a competitive transport sector, but special attention should be paid to the following challenges:

- **Develop and tailor the national cost-benefit analysis guidelines specifically to Montenegro.** It is very important for each economy to develop its own cost-benefits analysis guidelines with accompanying national technical instructions. The guidance needs to be updated often, at least every two years. A good example is the United Kingdom's Transport Analysis Guidance (UK, 2019<sub>[168]</sub>), which provides information on the role of transport modelling and transport project appraisal tailored to the UK market. To ensure consistency amongst the discount rates used for similar projects in the same economy, it is necessary to develop an economy-specific benchmark for all technical and economic parameters, including the financial and economic discount rate in the national guidance documents, and then to apply it consistently in project appraisal at the national level. Empirical research needs to be conducted at the national level to generate input data for calculating externalities.
- **Ensure transport facilitation remains a key priority.** More one-stop shops are needed to simplify border crossing procedures and to shorten crossing times, as well other measures in the newly endorsed regional Action Plan for Transport Facilitation (TCPS, 2020<sub>[163]</sub>). These include improving and upgrading existing ICT infrastructure, constructing or modernising infrastructure and building capacity to improve performance efficiency, etc. Implementing these measures will be a key trigger for integrating the Montenegrin transport market into the regional transport market, increasing the competitiveness and connectivity of the WB region, and further deepening integration with the broader European transport market. This will improve the transport of important goods that depend on quick, cost-effective and timely delivery, and will also boost investment in transport infrastructure.
- **Develop a combined transport strategy to promote sustainable transport.** This is of high importance given Montenegro's geographical location and the untapped potential of its existing seaports. With Rail and Road Route 4 currently being constructed/modernised, the timely development of a combined transport framework in Montenegro could generate substantial benefits for the economy and leave more time and resources for shipping companies to do new business. Therefore, incentives are needed for shifting freight to combined transport modes.

Additionally, lowering the cost of access to regional and international markets will boost the competitiveness of local companies.

- **Develop sound asset management practices that are in line with the national inventory system.** Sound asset management practices include regular monitoring of the condition of infrastructure, assessing the value of assets versus costs of unmaintained assets, adopting asset management strategies, being consistent in identifying the mix and timing of asset operation and construction strategies, etc. These enable economies to collect data and to manage and analyse conditions across all transport modes so as to optimise transport sector maintenance strategies and justify maintenance budgets, directing limited funds to those areas with the greatest return on investment. Performance-based maintenance contracts are already implemented in some WB6 economies such as Albania, Bosnia and Herzegovina, and Serbia,<sup>163</sup> though not extensively, and they could be used in Montenegro too. They are an essential component of the road asset management system and if well-developed ensure good road conditions at relatively low cost. The quality of transport infrastructure affects an economy's investment attractiveness, marking out the economy's territory as good for foreign direct investment.
- **Develop an Integrated Environmental and Transport Action plan** and a framework for environmental sustainability for the sector. This plan needs to integrate existing indicators and to include new ones in the framework for environmental sustainability. A good model to follow is the Transport and Environment Reporting Mechanism<sup>164</sup> developed by the European Environmental Agency, which prescribes indicators for tracking transport and environmental performance in the EU. Existing measures and indicators should be applied in the relevant strategies, including the new transport strategy.

## Energy policy (Dimension 12)

### Introduction

Overall, Montenegro has made substantial progress on this dimension since the last CO, with its overall score rising from 2.2 to 3.0 (Table 23.24). The most significant progress is in the energy markets sub-dimension, driven by finalising the unbundling of the sector's transmission and distribution system operators and implementing third-party access, as well as deregulation, liberalising energy markets and deploying a power exchange. However, there is still room for improvement, especially in completing the transposition of the EU's Third Energy Package (Box 23.17) and in the security of supply sub-dimension (mainly renewable energy and energy efficiency).

**Table 23.24. Montenegro's scores for energy policy**

Dimension	Sub-dimension	Score	WB6 average
Energy policy dimension	Sub-dimension 12.1: Governance and regulation	3.2	3.1
	Sub-dimension 12.2: Security of energy supply	2.6	2.9
	Sub-dimension 12.3: Energy markets	3.2	3.0
Montenegro's overall score		<b>3.0</b>	<b>3.0</b>

### Box 23.17. The EU's Third Energy Package

In 2007, the European Commission proposed a new legislative package, the Third Energy Package, in an effort to further enhance and harmonise the EU's Energy Union and internal energy market. This package entered into force in September 2009 and consisted of several important directives and regulations.<sup>1</sup>

The Third Energy Package largely rests on four pillars: 1) transparency; 2) non-discrimination; 3) a strong, independent national regulator; and 4) sustainability. Together, these pillars represent EU best practice and aim to establish a fair and level-playing field for competitive energy markets that seek to optimise scarce resources. For example, the first two pillars drive the need for unbundling the transmission and distribution system, combined with guaranteed, non-discriminatory and open access to those networks to all users backed by transparent rules and prices. Without such unbundling requirements and third-party access, it is very possible that the system operators, which are natural monopolies, could prohibit market entry and lead to sub-economic market outcomes.

In addition to these pillars, the Third Energy Package also seeks to enhance international co-operation within the EU by establishing an international regulatory agency (the Agency for the Cooperation of Energy Regulators – ACER) and promoting regional integration. Regulation (EC) No 714/2009 contains clauses that open and allow for further regulation to be drafted to enhance harmonisation in the form of network codes.

In 2019, the EU introduced the Clean Energy Package which supplements and in part replaces the Third Energy Package. That is, while the Clean Energy Package retains the key legislative aspects of the Third Energy Package, it expands measures for sustainability and green energy growth, as well as consumer rights and protections. Despite this, the Third Energy Package remains a good starting point for all WB economies as many of its key pillars have so far not been introduced or implemented in their entirety in the region. Aligning with it is also a requirement for the WB economies as members of the Energy Community, whose *acquis* reflects most of the Third Energy Package. Moreover, with many WB6 economies aspiring to become EU members, the transposition and implementation of the Third Energy Package and subsequent Clean Energy Package are accession requirements. To conclude,

the Third Energy Package provides for the implementation of international best practice on competitive markets, and is also a firm requirement for the Western Balkan economies.

1: Directive 2009/72/EC concerning common rules for the internal market in electricity and repealing Directive 2003/54/EC; Directive 2009/73/EC concerning common rules for the internal market in natural gas and repealing Directive 2003/55/EC; Regulation (EC) No 714/2009 on conditions for access to the network for cross-border exchanges in electricity and repealing Regulation (EC) No 1228/2003; Regulation (EC) No 715/2009 on conditions for access to the natural gas transmission networks and repealing Regulation (EC) No 1775/2005; Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators.

## **State of play and key developments**

### *Sub-dimension 12.1: Governance and regulation*

Montenegro's **energy policy, legal and institutional framework**<sup>165</sup> encompasses an extensive array of documents (Energy Policy of Montenegro until 2030, Energy Development Strategy of Montenegro until 2030 and action plan for its implementation 2016-2020, National Renewable Energy Action Plan to 2020, and the first to fourth National Energy Efficiency Action Plans), legislation, and associated regulations. Together they provide comprehensive policy guidance for the sector. Essentially, the policy framework highlights three main priorities: 1) security in the energy supply; 2) development of a competitive energy market; and 3) sustainable energy development. These main priorities are supplemented by 20 key strategic commitments (Ministry of Economy, 2011<sub>[169]</sub>).

However, there are some limitations. For one, the government reports that only 25% of the projects stipulated in the strategies are or have been implemented to schedule. Secondly, only 75% of the Third Energy Package has reportedly been transposed into the national policy framework, with a key gap being network codes (Energy Community Secretariat, 2020<sub>[170]</sub>).<sup>166</sup>

Montenegro is also well advanced in following and implementing international best practice when it comes to **the regulator** sub-dimension. The Energy Community asserts that Montenegro's regulator, the Energy and Water Regulatory Authority of Montenegro (REGAGEN), is highly competent in executing its functions and roles and that it is one of the top two WB regulators (Energy Community Secretariat, 2020<sub>[170]</sub>). Resolving two outstanding issues would further the regulator's position as a strong, independent regulator: 1) ensuring it conforms with the EU Third Energy Package regulator roles, responsibilities and rights; and 2) enshrining and defining the independence of the regulator, as set out in Chapter IX of EU Directive 2009/72/EC, into Montenegro's primary energy legislation.

There are also two areas in which the regulator's functioning could be improved:

- Avoiding politicisation or political influence. According to the Energy Law, the government has the final decision in shortlisting their preferred candidate for the regulatory board to parliament.<sup>167</sup> This implies that there could be political influence on the regulator - although this is not in violation of EU Third Energy Package compliance and has not been raised as a major obstacle to regulator independence by the Energy Community (Energy Community Secretariat, 2020<sub>[170]</sub>). Moreover, recent changes to the Energy Law removed the requirement for government consent for the statute of the regulator, which is a step towards reducing the risk of political influence and reaffirms the independence of the regulator.
- The sanctioning powers of the regulator. Article 48 of the Energy Law requires the regulator to raise issues of non-compliance with the relevant national bodies rather than taking decisions and imposing sanctions themselves. It would strengthen the regulator's role as market enforcer if it had direct sanctioning power. However, it needs to be stressed that the current approach is not in opposition of what is permitted under the Third Energy Package. Meanwhile, the changes to the Energy Law mentioned above also fixed the former problem of fines being perceived as too low

and insufficiently dissuasive, by aligning the imposition of penalties with Articles 37 and 41 of EU Directives 2009/72/EC and 2009/73/EC.<sup>168</sup>

Progress on **managing energy infrastructure** has been a bit more muted than on energy policy and the regulator. While the sector is guided by the extensive strategy and the recently adopted Ten Year Network Development Plan, the new Infrastructure Law is yet to be adopted. Adopting it would make Montenegro compliant with the EU Third Energy Package. It also seems that Montenegro lacks a comprehensive approach to infrastructure incentives and an asset management system.

#### *Sub-dimension 12.2: Security of energy supply*

When considering **natural gas supply** security, the main issue for Montenegro is the lack of a natural gas market. Although a significant share of the EU Third Energy Package has been transposed, significant gaps remain. For example, key secondary acts still to be adopted include supplier switching rules, various tariff and associated methodologies, connection rules, grid codes, balancing rules, metering rules, market rules, vulnerable customer rules, gas quality rules, and various strategic plans (including network development plans by either the distribution or transmission system operators). The failure to adopt most of these acts is due to the absence of a natural gas market; once the market has been established these should follow naturally. Moreover, without a natural gas market no judgement can be made on implementation.

Montenegro is looking to establish a natural gas market as part of its involvement in the Ionian Adriatic Pipeline (IAP). This natural gas supply would be the first step towards establishing a natural gas market as lack of supply is a key barrier.

The National Energy Development Strategy provides a clear policy and guidance for the **electricity supply framework**. Nevertheless, Montenegro continues to rely mainly on a single fuel – coal – which is used in two coal-fired thermal power plants: Pljevlja I and II. Montenegro plans to supply most of its expected demand growth by expanding the Pljevlja coal-fired thermal power plant complex. However, based on information provided by the government, it appears as if these plans, the expansion and continued reliance on coal fired generation, might no longer materialise or be pursued.

**Figure 23.16. Montenegro's non-hydro renewable energy generation (1990-2019)**

Note: GWh: gigawatt-hours

Source: (Eurostat, 2021<sub>[171]</sub>), *Gross and net production of electricity and derived heat by type of plant and operator [nrg\_ind\_peh]* – Database accessed 26th June 2020, <https://ec.europa.eu/eurostat/web/energy/data/database>.

StatLink  <https://doi.org/10.1787/888934255969>

The Energy Policy of Montenegro until 2030 does foresee some increase in **renewable energy**.<sup>169</sup> Montenegro currently generates around 2.1 terawatt-hours (TWh) or 55% of its power via hydro generation - a well-established source in Montenegro (Eurostat, 2021<sub>[171]</sub>). To take full advantage of renewable energy, a diversified renewable generation mix should be achieved. Montenegro is at the beginning of its renewable energy journey, with its non-hydro renewable generation only beginning in 2017. In 2018 only 143 GWh or 4% came from non-hydro renewable sources, namely wind energy, which rose to 295 GWh or 9% in 2019 (Figure 23.16). This is equivalent to the EU's non-hydro renewable share in 2007 – today its share is around 16% (Eurostat, 2021<sub>[171]</sub>).

However, hurdles need to be overcome in order to attract investors. First and foremost, the legislative framework needs to be finalised. The recent adoption of amendments to the Law on Energy nearly completes the transposition of the European Union Directive 2009/28/EC which “establishes an overall policy for the production and promotion of energy from renewable sources in the EU”. The focus should now switch to implementation, including the adoption of secondary acts. Associated with this issue is also the competitive auctioning of renewable energy projects. While Montenegro has completed the first two state land locational auctions, the formal rules and regulations that create the standard approach for such auctions have not been adopted yet, which creates uncertainty around the timing and nature of future auctions.

Montenegro continues to use feed-in-tariffs, setting the price at the beginning of each year. While the tariff was increased recently, thus boosting the attractiveness of renewable energy projects, Montenegro should consider shifting to an alternative support system, such as feed-in-premiums. Feed-in-tariffs have fallen out of favour in most countries as they disconnect renewable generators from the realities of the market (Box 23.18). In addition, the priority integration and dispatching of renewable energy, while enshrined in law, is not adequately implemented in practice. Lack of resources means that connection to the grid can

take a while, and tends to be done by the renewable energy project developers and then sold to the transmission system operator (TSO) via a long-term contract. To provide optimal support and encouragement for renewable investment, Montenegro should expedite connections and TSOs should pay for and implement the connection to the grid. This in turn would lower the project capital expenditure hurdle and asset risks for investors.

Renewable energy generators are exempt from balancing responsibility (see Sub-dimension 12.3, energy markets), which is not in line with international good practice as it socialises the cost associated with renewable energy imbalances and minimises investors' responsibility to forecast their generation accurately.

Montenegro also needs to implement a framework for self-consumption of distributed renewable energy with regard to grid connection, and to promote its deployment in line with the energy efficiency and energy laws. The promotion of small-scale renewable energy producers for self-consumption ("prosumers") could increase consumer power and reboot consumer interest in energy efficiency.<sup>170</sup> The result would be an increase in renewable energy share, energy diversification and supply security.

Finally, on a positive note, Montenegro has transposed the relevant legislation to allow it to share its excess renewable energy with its neighbours, helping them to meet their national targets. This increases the value of renewable energy projects in Montenegro, even without a fully operational Guarantee of Origin system.<sup>171</sup> However, although Guarantee of Origin legislation is in place, the implementation of the scheme could be improved. The role of issuing the Guarantees of Origin has been shifted away from the regulator to the electricity market operator, which is currently working on deploying it but has not yet completed the electronic system for issuing, transferring or cancelling the Guarantee of Origin. It is worth mentioning that Montenegro has applied to become a full member of the Association of Issuing Bodies - a body that establishes a common approach to issuing and facilitates the transfer and cancellation of Guarantees of Origin in Europe.

**Energy efficiency** in Montenegro is guided by the advanced transposition of the relevant EU Third Energy Package. Even so, further transposition is needed to fully implement the Third Energy Package, in particular on energy performance of buildings and energy labelling. While most of the energy performance of building legislation is in place<sup>172</sup> and has been implemented - including mandatory energy performance audits and certification of buildings - gaps remain. These include near zero-energy building definitions as well as targets and strategies to achieve them, a comprehensive building inventory, and the software and analysis for calculating the cost-optimality of the current energy performance requirement. Moreover, there is no long-term vision for deploying energy efficiency in buildings - particularly outside the public building sector.

Another key energy efficiency issue relates to the energy service companies (ESCO) market.<sup>173</sup> This is a market in which energy service companies carry "out energy performance improvement at the contractor's site, while guaranteeing energy savings and/or the provision of the same level of energy service at a lower cost. The remuneration of ESCOs is directly tied to the energy savings achieved. The ESCOs can finance, or assist in arranging financing for the project, but this is not a prerequisite" (Boza-Kiss, Bertoldi and Panev, 2015, p. 445<sub>[172]</sub>). Although a first framework has been established in Montenegro, including standard contracts, the widespread use of ESCO markets is lacking.

Transparency is another factor weighing on Montenegro's energy efficiency performance. Montenegro has missed annual reporting deadlines to the Energy Community on its progress to implement the National Energy Efficiency Action Plan, in violation of treaty requirements. It missed the submission deadline for the third and fourth annual implementation reports. Although government sources suggest that the reports were eventually submitted, the Energy Community website does not list them as submitted.<sup>174</sup>

Finally, there are some concerns that the human resources dedicated by public entities to energy efficiency are not adequate. This is best demonstrated by the recent move by the Ministry of Economic Development to merge the Energy Efficiency Directorate into the Energy Directorate.

### *Sub-dimension 12.3: Energy markets*

Both the **electricity wholesale and retail market** are deregulated and are not subject to price regulation - apart from vulnerable customers and natural monopolies – and consumers are free to choose and switch suppliers. Currently, there are 39 participants in the wholesale market, and 6 in the retail market.

However, there are some limitations. First, while the power exchange has been established, it is not currently operational and thus Montenegro does not have an operational day-ahead market. The benefit of the day-ahead market lies in the automatic matching - based on algorithms - of supply and demand in a competitive manner to reach a price-based equilibrium. In its absence, the optimal distribution of economic rent remains out of reach in Montenegro. Second, while the retail market is deregulated and subject to free price formation and consumer switching, competition and market liquidity are so limited that consumers are in fact tied to a single supplier. This was highlighted by the government, which suggested that some consumer groups (households and small consumers) are dependent on a single supplier and/or are under a *de facto* forced price regulation regime. Despite this limitation to the quality of the market in Montenegro, the government does not appear to have plans to tackle the situation in the near term.

The balancing market is operating, with stakeholders being imbalance-responsible in a non-discriminatory manner.<sup>175</sup> However, there is a lack of competition as balancing reserves are offered by only two stakeholders: the incumbent generator, Elektroprivreda Crne Gore (EPCG), and an industrial consumer. Given the lack of reserves, the national balancing reserve capacity still falls under price regulation. However, the balancing price itself is not regulated and supplemented by the cross-border market-based exchange of balancing energy which supports the competitive price formation by increasing the liquidity. Nonetheless, Montenegro should design and implement policy to increase domestic balancing capacity and in turn deregulate balancing reserve capacity price.

One area where Montenegro has made significant progress is in **unbundling and third-party access**. The unbundling concept, which complies with the EU's Third Energy Package, is enshrined within Article 135-139 of the Energy Law. To that end the Transmission System Operator, Crnogorski elektroprivredni sistem (CGES), and the Distribution System Operator, Crnogorski elektrodistributivni sistem (CEDIS), have been certified as unbundled since April 2018 and June 2016 respectively.

In the case of the TSO, certification depended on the introduction of legislation or regulations for a compliance officer. The required legislative changes were made recently as part of the adoption of amendments to the Energy Law in July 2020. To this end, the Energy Community rates Montenegro's implementation of unbundling as 100% complete (Energy Community Secretariat, 2020<sup>[170]</sup>).

Articles 133 and 134 of Montenegro's Energy Law enshrine the concept of non-discriminatory third-party access to the transmission and distribution system, in line with the EU Third Energy Package - specifically EU Directive 2009/72/EC. Evidence that non-discriminatory third-party access is the operational norm in Montenegro can be seen in its publication of transparent tariffs, including for connections to the system. Other evidence includes the transposition of the Connection Network Codes and adoption of the Decree on requirements for connection of electricity generators to the transmission and distribution networks.

Moreover, access to the interconnector capacity with Albania and Bosnia and Herzegovina is assigned using the Coordinated Auction Office in South East Europe through competitive auctions for yearly, monthly, and daily products. In addition, the capacity of the interconnector with Serbia is based on specific rules that allocate capacity using split auctions for yearly, monthly, daily and intraday products.

As **regional integration** is a fundamental element of the national strategy, it is guided by a coherent central policy. Montenegro participates in various international bodies and working groups that aim to promote

regional integration and market coupling, including membership of the European Network of Transmission System Operators for Electricity (ENTSO-E), the Mediterranean Transmission System Operators (MEDTSO-E), the market coupling working group with Albania, Italy and Serbia (the AIMS project) and the Know-how Exchange Programme project (KEP). This is further supplemented by Montenegro's participation in various other projects aiming to promote regional integration and market coupling, including the Crossbow<sup>176</sup> and Trinity<sup>177</sup> projects within the context of EU Horizon 2020.<sup>178</sup>

However, despite these positive steps, there remains significant room for improvement. The Capacity Allocation and Congestion Management Network Code is currently being drafted and so has not yet been adopted. This code harmonises the method and rules for allocating cross border capacity and facilitating their use in a safe and competitive manner (i.e. promoting regional integration through the standardised and optimised use of interconnectors).<sup>179</sup> Additionally, market coupling is far from complete, despite Montenegro being part of various projects to that end. The lack of an operational day-ahead market is a key obstacle to progress. Finally, from the perspective of balancing reserves, Montenegro is still activating reserves on a manual bilateral basis with Serbia and Bosnia and Herzegovina. In other words, there is no regional balancing co-operation, including imbalance netting.

*Cross-cutting policy area: Energy incentives - direct and indirect subsidies in the energy sector*

Without a doubt there are direct and indirect subsidies present in Montenegro's energy sector. Although the information available within the public sphere is limited, there are strong indications that Montenegro provided subsidies to the coal sector and to thermal power plants amounting to around EUR 2.9 million between 2015 and 2017 (Miljević, Mumović and Kopač, 2019<sup>[173]</sup>), (Mumović, 2019<sup>[174]</sup>). These are limited when compared to other Western Balkan economies, however.

### ***The way forward for energy policy***

While Montenegro has made tremendous progress, some key challenges still need to be tackled:

- **Complete the transposition of the Third Energy Package.** This is essential as it will assure that Montenegro has a full and comprehensive legislative and policy framework for the sector. The Third Energy Package, despite being replaced by the Clean Energy Package in the EU, still reflects in many ways international good practice in establishing and stimulating a competitive energy market.
- **Finalise the operational deployment of the power exchange.** The main benefit of a competitive market comes from the efficient matching of supply and demand. This is the goal of the power exchange, which can facilitate competitive price development and achieve best value for money. The key next steps will be for the power exchange to undertake a dry run that eventually leads to the first trades.
- **Promote competition in the market so as to harness competitive forces and provide the best value to the economy.** This will come from increased interconnection and market coupling as trade flows will add liquidity and thus competition to the market.
- **Design and implement a decarbonisation strategy and phase out coal.** To widen acceptance of the coal phase out, the strategy should identify support for regions/municipalities that currently rely on the coal windfall to help them reorient their economies to new activities. International best practice shows that long-run sustainability and climate resilience in the power sector rely on decarbonisation. Moreover, with the EU contemplating introducing a carbon power border tax,<sup>180</sup> decarbonisation is merely a question of where the windfalls of carbon pricing will land. Thus decarbonisation could be the key to supporting the long-term competitiveness of Montenegro's exports to the EU.

- **Take steps to encourage the development and growth of renewables.** Diversification is necessary to harness the wider benefits of renewable energy while increasing supply security and decreasing risks associated with single sources of electricity. With Montenegro at the beginning of renewable deployment it needs to take steps to promote investment. These include finalising the legislative framework, establishing a project pipeline based on competitive assignment mechanisms and employing the latest best practice for subsidisation - including Guarantees of Origin (Box 23.18). Moreover, Montenegro needs to improve capacity to connect renewable projects to the transmission and distribution system so as to lower the investment hurdle for project developers.
- **Focus on energy efficiency, including developing a long-term vision and financial support mechanisms – especially outside the public building sector.** Energy efficiency is a central tool for managing demand. On the one hand it is used to make demand more cost effective in the use of energy, while on the other it contributes to the long-run sustainability of the energy market by easing demand for energy growth.

### Box 23.18. A new approach to subsidising renewable energy

Feed-in tariffs were the dominant form of financial support for renewables within the EU at the beginning of the 21<sup>st</sup> century. In this system, power plant operators receive a fixed payment for each unit of electricity generated independent of the electricity market price (Banja et al., 2017, p. 15<sub>[175]</sub>).

Feed-in tariff schemes offer several advantages, but mainly they insulate new market entrants from market price risks, which lowers their capital costs and enables private investment. The simplicity of feed-in tariffs makes them suitable for markets with a large number of non-commercial participants such as households or local community-based initiatives (CEER, 2018, p. 12<sub>[176]</sub>).

However, feed-in tariff schemes exclude producers from actively participating in the market, which hinders efforts to develop large, flexible and liquid electricity markets as the share of renewable energy grows. This limits growth to certain technologies and sizes of installations, and creates difficulties in setting and adjusting appropriate tariff levels (EC, 2013, pp. 12-13<sub>[177]</sub>). The latter has been a problem especially as costs of renewable generators have fallen rapidly in recent years.

The European Commission suggests switching from feed-in tariff to feed-in premium schemes (EC, 2013<sub>[177]</sub>). In these, plant operators sell the electricity generated directly on the electricity market and earn an additional payment on top of the electricity market price. This is received as a fixed payment or one adapted to changing market prices, thereby limiting price risks for plant operators, as well as the risks of providing windfall profits (Banja et al. 2018). Feed-in premium schemes are beneficial because they force renewable energy producers to find a seller on the market. They also ensure that renewable energy operators are exposed to market signals. A well-designed premium scheme can limit costs and drive innovation by using a competitive process to allocate support. Such schemes also include automatic and predictable adjustments to cost calculations, which give investors the information and confidence necessary to invest (EC, 2013, p. 8<sub>[177]</sub>).

The European Commission suggests using a feed-in premium scheme in combination with the following good practice recommendations (EC, 2013<sub>[177]</sub>):

- Do not pay premiums for production in hours where the system price is negative or above the level of remuneration deemed necessary.
- Assign renewable project and associated premiums using competitive allocation mechanisms such as auctions.

- Make planned volume-based premium reductions for new installations dependent on when they are approved, connected or commissioned.
- Conduct regular, planned and inclusive reviews of premiums for new installations.

However, the Council of European Energy Regulators reports that in 2016/17, 17 of the 27 European Union member countries still used some form of feed-in tariff, although mainly for small projects, while around 16 used feed-in premiums, including to complement feed-in tariffs (EUR-Lex, 2014<sup>[178]</sup>).

For further and more detailed exploration of renewable energy subsidies and best practice please see the sources below. Meanwhile, for more information on the different renewable support schemes employed across Europe please see <http://www.res-legal.eu/home/> and for an overview of auctions and outcomes (including databases on auctions) see <http://aures2project.eu/>.

## Environment policy (Dimension 13)

### Introduction

Montenegro has improved its performance in the environment policy dimension. The economy's score has increased from 1.8 in the 2018 Competitiveness Outlook to 2.4 in the 2021 assessment, with notable progress in enhancing the biodiversity and air quality policy frameworks. Montenegro is the best-performing economy in the Western Balkan region for environmental policy (Table 23.25).

**Table 23.25. Montenegro's scores for environment policy**

Dimension	Sub-dimension	Score	WB6 average
Environment policy dimension	Sub-dimension 13.1: Resource productivity	2.3	2.0
	Sub-dimension 13.2: Natural asset base	2.0	2.1
	Sub-dimension 13.3: Environmental quality of life	2.8	2.3
Montenegro's overall score		<b>2.4</b>	<b>2.1</b>

### State of play and key developments

#### *Sub-dimension 13.1: Resource productivity*

As a Non-Annex-I signatory to the United Nations Framework Convention on Climate Change (UNFCCC) and its Paris Agreement, and a party to the Kyoto Protocol,<sup>181</sup> Montenegro has joined international climate change efforts and is committed to reducing greenhouse gas (GHG) emissions and limiting global warming to a maximum of 2°C by the end of this century. However, despite some efforts, carbon productivity has not improved since the last assessment. The economic output per unit of carbon dioxide (CO<sub>2</sub>) emitted is still low (Environment Protection Agency, 2020<sub>[28]</sub>). More than two-thirds of Montenegro's total CO<sub>2</sub> emissions come from electricity generation and heat production (61.4% in 2018, highlighting its fossil-fuel based energy production), followed by transport, which accounts for a little over 20% (Ministry of Sustainable Development and Tourism, 2020<sub>[29]</sub>).

**Climate change mitigation and adaptation** policies in Montenegro have advanced slightly since the last assessment. The new Law on Protection against Adverse Impacts of Climate Change was adopted in 2019, in accordance with which the government adopted the Decree on activities or operations that emit greenhouse gases. This requires industries emitting GHGs to obtain a permit. Activities to align the legislation with the EU *acquis* have been undertaken and the Third Biennial Update Report (2020) to the UNFCCC introduces the main monitoring, reporting and verification mechanisms, including a GHG inventory (Ministry of Sustainable Development and Tourism, 2020<sub>[29]</sub>). The Law on Protection against Adverse Impacts of Climate Change and the Law on Environment oblige Montenegro to develop a Low-Carbon Development Strategy and an action plan. Developing this strategy is a priority for the coming period, but delays have occurred due to changes in government. Currently, there are three main strategies that address climate change in Montenegro:<sup>182</sup>

1. The National Climate Change Strategy to 2030, which is the main strategic document and has an advanced implementation track.
2. The National Energy and Climate Plan (NECP), which aims at aligning the main energy policy objectives and climate change mitigation actions.
3. The National Strategy and Action Plan for Transposition, Implementation and Enforcement of the EU *acquis* in the Field of Environment and Climate Change 2016-2020, which refers to harmonisation with the EU *acquis* in this area. A final report on its implementation was produced at the end of 2020.

Although a strategic framework for tackling climate change is in place, Montenegro needs to intensify its work to ensure consistency with the EU 2030 climate and energy policy framework and make sure that its strategies are integrated into all relevant sectoral policies and strategies (EC, 2020<sup>[66]</sup>).

When it comes to climate change adaptation, the Directorate for Emergency Situations of the Ministry of the Interior has started to prepare a disaster risk assessment, which will cover major climate change-related risks. Some flood-risk management measures have been implemented since the last assessment through the regional project, Adaptation to Climate Change through Transboundary Flood Risk Management in the Western Balkans (2016-2020). The project focuses on integrated water resource management and adaptation strategies in the Drin River Basin, which covers Albania, Kosovo, North Macedonia and Montenegro. Its main objective is to mitigate the impacts of climate change by focusing on flooding and drought risk management, as well as strengthening regional co-operation for managing water resources. The project has strengthened cross-border co-operation for flood warnings and established a cross-border warning system through the exchange of hydro-meteorological real-time data. Flood risk management plans have also been drawn up for the participating municipalities on Montenegro's side of the Drin River Basin, and their implementation capacity built through regular training. Furthermore, precipitation and stream-gauging networks have been extended to measure real-time data for transboundary flood forecasting, through upgrading or renovating a total of 10 stations. This now enables floods to be predicted and the population in the relevant areas receive early warnings. Local stakeholders have however reported that risk prevention analysis is insufficient and that projected measures focus on areas that have already been affected by floods and do not predict potentially new areas.<sup>183</sup>

Very little has been done to develop a **circular economy framework** in Montenegro since the last assessment. The main measures that relate to a circular economy are contained in the National Strategy for Sustainable Development until 2030 (NSSD, adopted in July 2016), with its first implementation report being finalised at the time of drafting. However, the timeframe of these measures is quite broad as they are spread up until 2030; no concrete activities have been undertaken so far. Recycling rates are very low (around 5% of municipal waste in 2018 compared to the EU-28 average of 47%) which means that 95% of municipal waste is landfilled (Eurostat, 2020<sup>[179]</sup>). There are centres for primary recycling in two Montenegrin municipalities, where certain types of waste are selected and prepared for export and further processing – and smaller lines in Kotor (including the first composting plant). Moreover, preparations are underway to construct new recycling yards and sorting plants.<sup>184</sup> There are no waste incineration plants in Montenegro.

With a municipal waste generation rate of 531.7 kg per capita, Montenegro's waste generation rate is higher than the EU average of 492 kg per capita (in 2018), and has seen a constant increase since 2014 (Eurostat, 2020<sup>[180]</sup>; Ministry of Sustainable Development and Tourism of Montenegro, 2019<sup>[181]</sup>). Despite this trend, no measures have been undertaken to decrease the amount of waste created. Since 2017, there have been no major changes in the legislative **framework for municipal waste management**. The new Law on Waste was being prepared at the time of drafting. There are two main strategy documents: the National Waste Management Plan 2015-2020 (the new plan is still being drafted and is expected to be adopted in 2022) and the National Waste Management Plan until 2030. However, their implementation is limited, with the exception of the rehabilitation of the four large unregulated landfills that was completed in 2017. The changing priorities and decreasing government revenues as a result of the COVID-19 pandemic are expected to slow implementation down still further. Although monitoring mechanisms were envisaged in the form of annual reports on the implementation of the National Waste Management Plan, they are mostly missing.

Waste collection and treatment infrastructure is financed mainly through the state budget, while waste collection and treatment services are funded from the local municipalities' budgets.<sup>185</sup> There have been no changes to waste tariffs since 2017. Waste separation at source has been introduced since the last assessment in certain municipalities: in 2020, the municipalities of Podgorica, Herceg Novi, Bijelo Polje, Pljevlja and Bar provided containers for selective waste collection. Although the awareness-raising project

Separate Waste Collection is my Decision continued to be implemented in co-operation with local self-governments throughout the assessment period,<sup>186</sup> primary selection of waste has been reported to be low despite infrastructure installed for this purpose. The situation might improve when the new law on waste is in place. No measures to combat unregulated burning or illegal dumping of waste have been undertaken, despite the fact that this practice continues to pose problems in Montenegro. Local stakeholders have been working on mapping the illegal dumps across the economy since 2015,<sup>187</sup> and sanctions for unregulated burning and illegal dumping of waste are envisaged by the law, but implementation has been weak due to the lack of capacity among the local municipalities responsible.

### *Sub-dimension 13.2: Natural asset base*

According to the Water Competition Index,<sup>188</sup> 30 425 m<sup>3</sup>/year of water<sup>189</sup> are available to each citizen of Montenegro, which makes Montenegro one of the wealthiest economies in Europe for water (EEA, 2015<sub>[182]</sub>). Despite the apparent abundance of water, around 35% of Montenegro's territory suffers from a chronic lack of water, while around 10% of the territory has a problem with seasonal surplus water. As a consequence of climatic conditions, the uncontrolled use of water, huge losses in the water supply system and inadequate infrastructure, water consumption per capita is double that of Western Europe (EEA, 2015<sub>[182]</sub>). Furthermore, during the tourist season, there is insufficient provision of drinking water in the coastal region. The following sectors place a high demand on water in Montenegro: agriculture, industry (primarily food, as well as SMEs), transport and road construction works (Ministry of Sustainable Development and Tourism of Montenegro, 2019). In 2018, households accounted for the main freshwater withdrawals (60%) in Montenegro, followed by industry (39%), with only 1% of abstractions coming from agriculture (World Bank, 2020<sub>[183]</sub>). In addition to the pressures on water, another major issue for freshwater is pollution, stemming from insufficiently treated industrial and municipal wastewater (see section below on Environmental quality of life).

The legislative and policy framework for **freshwater management** is in place and there have been no major changes since the last assessment.<sup>190</sup> Implementation has been rather limited, except for the new EU-IPA project on Support to the implementation and monitoring of water management in Montenegro, signed in December 2019, to improve overall water management in Montenegro. Monitoring and evaluation mechanisms are also lacking. According to the Government of Montenegro, prevention of pollution at source, emissions control and water quality standards are part of the legislation, as well as the prevention of and protection against flood risks.<sup>191</sup> Investments in hydropower currently do not always comply with national and international nature protection and water management obligations, such as the EU Water Framework Directive (2000/60/EC). In this regard, Montenegro should ensure public participation and consultation, and guarantee high-quality environmental impact assessment (EIA) reports that include cumulative impacts on nature and biodiversity (EC, 2020<sub>[35]</sub>).

As noted in the previous assessment, there are no data or projections on water demand from agriculture, industry (including energy) or households, despite regular requests from local NGOs. Decisions are therefore not guided by evidence on competing uses now and in the future. Water risk management data exist – mainly meteorological data (including rainfall) and historical data on water disasters – but not all are publicly available or communicated to citizens to increase awareness of water-related risks.

Montenegro hosts rich biological diversity. Forests make up 61.5% of its total land area – the greatest share in the Western Balkans region (where the average is 42%) (World Bank, 2020<sub>[183]</sub>). However, human pressures represent major risks when it comes to protecting biodiversity and maintaining forestry resources – including illegal tree logging, tourism, urbanisation and road construction, mini hydro power plants, pollution, illegal waste dumps, as well as forest fires, climate change and invasive alien species (Ministry of Sustainable Development and Tourism of Montenegro, 2019<sub>[181]</sub>). Therefore, strong **biodiversity and forestry frameworks** are key to overcoming these challenges and conserving ecosystems. Montenegro is party to the Convention on Biological Diversity, which comprises 20 Aichi Biodiversity Targets.<sup>192</sup>

Although certain activities have been implemented to meet these targets in Montenegro, progress is insufficient. For example, terrestrial protected areas increased from 6.5% in 2018 to 13.5% in 2020 (whereas the Aichi Target 11 aims for 17% coverage by 2020). Montenegro is actually regressing on some targets (e.g. Achieving sustainable tourism and Reducing pressures on biodiversity from transport, energy and infrastructure) (Ministry of Sustainable Development and Tourism, 2018<sup>[184]</sup>). Further progress is also needed to designate marine protected areas<sup>193</sup> and to establish a comprehensive system of strict species protection to be applied, among others, for seismic surveys, hydropower and touristic developments.

Biodiversity is monitored annually, through direct co-operation between institutions responsible for various thematic areas as prescribed by the Law on Nature Protection. There is a system to collect information on biodiversity (including conservation status of threatened species and habitats), but according to the government, the extent of the monitoring programme is not sufficient for an overall assessment of the conservation status of threatened species and habitats. The Nature and Environmental Protection Agency is in charge of these areas, but lacks the human and financial resources (mostly government-funded) for carrying out its main responsibilities.

A national forest inventory system exists in Montenegro and the Forest Management Programme was adopted in 2019, which defines annual forest management measures by volume, type and time of execution in order to ensure the sustainable management of forest resources. Fire prevention is an integral part of forest management plans. A co-ordination team for the suppression of illegal activities in forestry was formed in April 2019 to detect illegal forest activities, including deforestation. The Forestry Inspection, together with the Police Directorate and the Forest Directorate, carry out controls and inspections. Clear sanctions for illegal tree logging are in place and there are regular reports on the effectiveness of these measures.

**Land-use management** in Montenegro is under-developed. There is a legislative framework,<sup>194</sup> but it remains largely unchanged since the last assessment. Little progress has been achieved on policy. The National Plan for Desertification (2015-2018), the main policy document related to land-use management, has now expired and has not been updated. A National Drought Management plan is however being drafted that will cover national desertification (planned to be completed by October 2021). No new strategic documents have been produced since the last assessment, except for the new Spatial Plan of Montenegro (2020-2040) adopted in 2020, which will indirectly regulate land use. There is growing pressure on land and soil resources in Montenegro, especially in the context of a pronounced decrease in agricultural land, from 38% in 2012 to 18.6% in 2019 (comparatively lower agricultural land share than its regional peers) (MONSTAT, 2020<sup>[185]</sup>). According to the government, monitoring of potential soil contamination is hampered by the lack of an adequate legal framework. Although agricultural land is regulated by law, the legal framework does not prescribe the maximum concentrations of hazardous and harmful substances allowed on other types of land (industrial land, playgrounds, parks or residential areas).

### *Sub-dimension 13.3: Environmental quality of life*

Air quality in Montenegro remains a concern, with the population exposed to air pollution levels of PM<sub>2.5</sub> that are twice the recommended limits set by the World Health Organization<sup>195</sup> (World Bank, 2017<sup>[25]</sup>). The main polluters in Montenegro are public electricity, heat production and residential stationary combustion. Other key sources of pollution are agricultural processing and transport (IAMAT, 2020<sup>[27]</sup>). Levels of air pollution in the winter increase due to heating by solid fuels. The pollution levels in Pljevlja, where the thermal power plant is situated, regularly exceed the annual mean PM<sub>10</sub> concentration limits (EC, 2020<sup>[35]</sup>). Air pollution is recognised as a very serious environmental health risk and as such is managed through Montenegro's well-developed legislative and policy **air quality framework**. The legislative framework is almost fully aligned with the EU *acquis*,<sup>196</sup> while the policy framework, most notably the objectives of the National Strategy for Air Quality Management (2017-2020), are aligned with related policy areas including climate change, energy, agriculture and forestry.<sup>197</sup> In March 2020, Montenegro re-established reporting

on air pollution emissions and provided missing data for the period 2011-2018, which will help measure the effect of air quality measures on emissions levels given that the baseline values are now available.

Some of the key events since the last assessment relate to the extension of the air pollution emission monitoring network in 2019, from 7 to 10 automatic stations, and a slight decrease in annual mean population exposure to PM<sub>2.5</sub> air pollution. Immediate action is ensured if the recommended pollution limits are exceeded, particularly for pollutants such as sulphur oxides (SO<sub>x</sub>) and nitrogen oxides (NO<sub>x</sub>), in which case an emergency plan is prepared and prompt action taken. For example, in January 2019, following a high air pollution event, the government formed an ad hoc commission which came up with a set of urgent measures in two days. These included informing the population of pollution levels and providing advice, and cleaning streets to remove dust deposited on road surfaces. Montenegro provides data on air quality to the public almost in real time (hourly averaged) on the National Environmental Protection Agency (NEPA) website using a colour scheme to show air pollution levels. This is identical to the European air quality index. However, monitoring systems are not present in all municipalities. Since the last Competitiveness Outlook assessment NEPA has also started delivering short bulletins on air quality in the national media, as part of the weather forecast.

A high-quality **water supply and sanitation system** is also important for public health. Montenegro is a freshwater-rich territory (see the freshwater management section above), but has rising pollution problems, mostly as a consequence of untreated industrial and municipal wastewater. A significant cause of surface and underground water pollution is the inadequate condition of sewage infrastructure, including the inadequate collection and treatment of wastewater. Montenegro's legislative framework for wastewater management is almost fully aligned (95%) with the EU *acquis*. A new Municipal Wastewater Management Plan (2020-2035) was being prepared at the time of writing. The Ministry of Sustainable Development and Tourism, the Ministry of Agriculture and Rural Development, Directorate for Water, the Montenegrin Enterprise for Regional Water Supply and local enterprises established by municipalities are the key bodies responsible for wastewater management in Montenegro. However, the administration is of the view that financial and human resources are not sufficient to undertake their assigned responsibilities and there are no regular activities aimed at building their capacities. The lack of mechanisms for horizontal or vertical co-ordination impedes their effective implementation of the measures envisaged.<sup>198</sup>

In 2019, 58.4% of the population was connected to urban wastewater collecting systems in Montenegro – the highest share in the Western Balkans, but still lower than the EU average of 79.9% (Ministry of Sustainable Development and Tourism, 2020<sub>[186]</sub>) (Eurostat, 2020<sub>[187]</sub>). Some of the key measures in the draft Municipal Wastewater Management Plan (2020-2035) relate to investments in the water supply and sanitation system, such as the new sewage network and several major outfalls in the coastal region. There are currently ten wastewater treatment plants in operation or trial operation, half of which provide a secondary level of treatment.<sup>199</sup> Additional investments in wastewater treatment plants are also planned, but there is no evidence that new challenges, such as the need to treat contaminants of emerging concern,<sup>200</sup> are taken into consideration when upgrading the facilities, nor is there a plan to do so. Water supply and sanitation infrastructure projects are still largely dependent on donor funding and there is no particular methodology for calculating the service fees required. Current water service fees remain too low to cover or even complement the infrastructural investments required, as well as the water supply and services (the latter being complemented by subsidies from the municipalities). Various NGOs are also involved in implementing water sanitation projects; however, stakeholders noted that harmonisation was lacking among different actors. Although no measures have been taken to address water losses from the system since the last assessment, they have been recognised as a problem and there is a plan to reduce them in the strategic document Projection of Water Supply of Montenegro until 2040 (Ministry of Sustainable Development and Tourism, 2017<sub>[188]</sub>).

The **industrial waste management** situation has moderately improved since the last assessment. The legislative framework is now partially aligned with the EU *acquis*, including on environmental liability and industrial risks and accidents (Seveso III Directive 2012/18/EU). The preparation of a new Law on Waste

Management is in progress, which will regulate the management of industrial waste. Regarding key strategic documents, the National Waste Management Plan 2015-2020 has expired (although there is a plan to adopt a new one promptly) and the National Waste Management Strategy is valid until 2030, but its implementation record is weak. In terms of chemicals, the National Chemical Management Strategy (2019-2022) has introduced classification, packaging and labelling rules for chemicals. An inventory of chemical products is kept internally by the Nature and Environmental Protection Agency. While it is not connected to other information systems, NEPA is working on establishing an integrated electronic chemical and biocidal product register, which should use the software application IUCLID (International Uniform Chemical Information Database). The Pollutant Release and Transfer Register (PRTR) protocol was ratified in 2017 – however, the register has not been set up yet. Data on hazardous waste are scarce and, as no domestic hazardous waste disposal facilities exist, waste must be exported for treatment.

Some positive developments have been recorded for soil protection and provisions for identifying and managing contaminated sites, although the policy and legislative basis for soil protection is still non-existent. In 2014, the Government of Montenegro obtained a EUR 50 million loan from the World Bank for the Industrial Waste Management and Clean-up Project (IWMCP) to remediate four industrial waste disposal sites, and to manage the disposal of industrial hazardous waste, with NEPA being responsible for project implementation. The completion of the project was projected for July 2020, but has been delayed due to the COVID-19 pandemic. Moreover, the Global Environment Facility project, Environmentally sound management of PCBs,<sup>201</sup> intends to provide the necessary technical and financial assistance to ensure that all remaining PCBs are identified and disposed of (more than 900 tonnes of PCB contaminated equipment, waste and soil are estimated in Montenegro). The project will also ensure enough future capacity for the sound management of PCBs.

### ***The way forward for environment policy***

Despite some important steps to improve the overall environment, especially in the areas of biodiversity, forestry and air pollution, the Government of Montenegro should pay more attention to the following aspects:

- **Ensure that measures for municipal waste management are accompanied by appropriate educational activities, and step up actions to raise awareness of waste prevention, waste separation, waste reduction and recycling.** Waste separation at source is envisaged in certain municipalities of Montenegro, with key infrastructure for this purpose installed. However, according to the government, implementation has been rather weak, as citizens do not separate waste. This behaviour stems from a lack of awareness of the importance of waste separation due to the limited educational activities on the topic. It is therefore important to tackle these issues through targeted campaigns and awareness-raising activities. Good practice from OECD countries might serve as inspiration (Box 23.19).

### Box 23.19. Public information and awareness raising for municipal waste management in the OECD

Public awareness and support are key factors in changing behaviour and thus for the success of waste policies. Educating young people can be a key approach. Several OECD countries have established environmental education initiatives. For example, Colombia's Communication and Environmental Agenda (2010-14) fostered educational projects on the environment across all levels of schools. Israel has a Green Education Project and also provides grants for "green schools", that promote resource efficiency and the separate collection of waste streams. Korea's Environmental Education Master Plan has created a network of environmental education centres.

Poland's "Don't Litter Your Conscience" campaign run by the national Ministry of Environment uses the character of a priest to tell parishioners to separate recyclable waste and not burn household waste in their gardens or dump it illegally. Another campaign encouraged the reuse of toys to encourage resource efficiency. Campaigns and activities to address illegal dumping are carried out in Hungary, where the Ministry for Agriculture supports the "TsSzeddi!" ("Pick up!") Campaign to raise awareness about sound waste management practices.

Civil society organisations can also play an important role in promoting public awareness. "Let's do it! My Estonia" is an independently organised annual day of community activities, including litter clean-up. In Slovenia, about 200 000 volunteers worked together in 2010 for "Let's clean Slovenia in one day", a similar independently organised day to clean up litter and illegal waste sites, accompanied by environmental education activities.

Some OECD countries work through local government. In Israel, for example, the Ministry of Environmental Protection funds municipal activities for environmental education and awareness raising, and the country's 2010 Recycling Action Plan acknowledges the need for further action to raise public awareness and change behaviour towards separate collection.

Working with business, including producer responsibility organisations (PROs), can play an important role in fostering public awareness of recycling. In Korea, voluntary agreements with business include activities to raise public awareness on topics such as waste reduction and recycling; the country's PROs spend between 1% and 5% of their profits on information and awareness campaigns. In Poland, PROs are required to allocate 5% of their profits each year to public awareness.

Source: (OECD, 2019<sup>[189]</sup>), *Waste Management and the Circular Economy in Selected OECD Countries: Evidence from Environmental Performance Reviews*, <https://doi.org/10.1787/9789264309395-en>.

- **Direct more investment into improving wastewater systems and treating more wastewater.** Although Montenegro has taken some action to renovate and update its water supply and sanitation system, the activities are limited in scope and decisions on where to invest have not always been supported with concrete data. It is therefore important to conduct a clear mapping of the situation and identify key investment priorities. The government should try to finance these projects as much as possible from the domestic budget and higher water tariffs (at rates that take into account the needs of poor and vulnerable groups in the population). Where support from donor funds is provided, the government should make sure these finances flow regularly to ensure the sustainable maintenance of the water supply and sanitation system.
- **Introduce a comprehensive policy framework for identifying, characterising and remediating contaminated sites.** The policy and legislative basis for soil protection is still lacking and the process remains ad hoc. Given the importance of this element for Montenegro's environment, the next step will be to set a clear policy framework for cleaning up contaminated land as well as concrete guidelines to facilitate the process of identifying land that needs

decontaminating. A good practice example on how Israel approached this is presented in Box 23.20.

### Box 23.20. Cleaning up contaminated sites in Israel

Contaminated land has been discovered in hundreds of industrial, commercial and agricultural areas in Israel. These areas include several sites where hazardous waste was buried before the hazardous waste management site at Ramat Hovav was established. Such sites affect soil and water, with groundwater contamination found at 30% of sites.

Steps have been taken to develop a comprehensive framework for the identification, characterisation and remediation of contaminated sites. In 2000, the MoEP formulated a policy for cleaning up contaminated land and prepared several guidelines to facilitate the process. These documents included preliminary clean-up targets for 100 pollutants to serve as a basis for land remediation and guidelines on planning and implementing soil site characterisation, as well as guidelines for remediating contaminated soil at petrol stations. In 2009, the MoEP identified the 20 most severely polluted sites and began remediation measures. For example, EUR 42 million was allocated for remediating the hazardous waste treatment site at Ramat Hovav, which included a closed landfill, sedimentation and evaporation ponds, and temporary storage areas.

Since addressing past pollution will probably take decades, immediate actions focused on immediate risks, such as at Ramat Hovav, and monitoring other sites for potential contamination. Swift adoption of the Law on the Prevention of Land Contamination and the Remediation of Contaminated Land helped to create a comprehensive framework for rehabilitation efforts. This framework included instruments to carry out soil surveys on land suspected to be polluted (within the framework of building permits and real estate transactions, and state-owned land leasing agreements), with contamination and clean-up status recorded in the land registry. A database of contaminated and potentially contaminated sites (which includes state-owned land, such as army bases, defence industry sites, government-owned companies, as well as privately owned contaminated areas) helps the law to be implemented successfully. A risk-based methodology for soil and groundwater, approved in 2011, has enabled better risk assessment procedures.

## Agriculture policy (Dimension 14)

### Introduction

Montenegro has significantly improved its performance in the agriculture dimension. The economy's score has increased from 2.4 in 2018 to 3.4 in the 2021 Competitiveness Outlook assessment, with notable progress in enhancing its agriculture support system policies (Table 23.26).

**Table 23.26. Montenegro's scores for agriculture policy**

Dimension	Sub-dimension	Score	WB6 average
Agriculture policy dimension	Sub-dimension 14.1: Agro-food system capacity	3.3	2.8
	Sub-dimension 14.2: Agro-food system regulation	3.5	2.9
	Sub-dimension 14.3: Agriculture support system	3.5	2.7
	Sub-dimension 14.4: Agricultural innovation system	3.0	2.6
Montenegro's overall score		<b>3.4</b>	<b>2.7</b>

### State of play and key developments

The contribution of agriculture, forestry and fishing to GDP decreased from 6.7% in 2018 to 6.4% in 2019 (MONSTAT, 2020<sub>[192]</sub>). In 2018, agricultural products made up 18.8% of Montenegro's total exports and 21.5% of its imports (WTO, 2020<sub>[193]</sub>). While agriculture is a significant sector for Montenegro, its importance varies depending on the region and the climate, which shifts from Mediterranean to sub-continental over a very short distance due to the influence of the Adriatic Sea and local relief. Montenegro's landscape is characterised by substantial hilly and mountainous areas, with only a few level areas suitable for agriculture. Montenegro's entire territory is 13 812 km<sup>2</sup>, of which 18.6% (257 469 ha) was used for agriculture in 2019, an increase of 0.3% compared to the previous year. Perennial meadows and pastures make up the largest share, at 94.3% (242 717 ha), while arable land represents only 2.8% (7 205 ha), permanent crops 2.1% (5 538 ha) and kitchen gardens 0.8% (2 010 ha) (MONSTAT, 2020<sub>[194]</sub>). The rural population in Montenegro is 33.2% of the entire population, and according to the Employment Agency, the agriculture sector employs 7.1% of the economy's workforce (Table 23.27), around 17 400 workers, all of whom receive social benefits.<sup>202</sup>

**Table 23.27. Employment by sector and sex, Montenegro (2019)**

	1000			%		
	Total	Men	Women	Total	Men	Women
<b>Total</b>	243.8	136.3	107.5	100.0	100.0	100.0
<b>Agriculture<sup>1</sup></b>	17.4	(10.3)	(7.1)	7.1	(7.6)	(6.6)
<b>Industry</b>	47.3	38.8	8.5	19.4	28.5	7.9
<b>Services</b>	179.1	87.2	91.9	73.4	63.9	85.5

1: Agriculture includes forestry and fishing.

Source: (MONSTAT, 2019<sub>[195]</sub>), *Labour Force Survey - Releases 2019*, <https://www.monstat.org/eng/page.php?id=1543&pageid=22>.

Fruit and vegetables are the most significant agricultural production sub-sector in Montenegro, while commercial crop production (cereals, maize, sugar beet, oilseeds) remains small scale. Regarding farm crops, potatoes accounted for the largest amount of arable land in 2019, covering 1 624 ha and accounting for 28.1% of crop production. This was an increase of 0.13% of arable land and 1.76% (26 557 tonnes) of production compared to 2018. Regarding fruit, citrus and olive production, plums made up the largest share at 43.5% in 2019, down 18.6% from 2018. Other fruit – including apples, pears, peaches and mandarins – accounted for over 54% of production in 2019, while olives accounted for 2.5%, up 10.1% from 2018. Meanwhile, grape production has been declining annually. In 2019 total production was 21 865 tonnes, 15.2% less than in 2018, and 27.5% less than in 2016.

Livestock breeding is the most significant agriculture sub-sector in Montenegro, both in terms of production quantity and value. The breeding of cattle and sheep, which make up the majority of the livestock sector (Table 23.28), uses land not suitable for arable production, such as the permanent grassland which accounts for a large portion of the total agriculture land in Montenegro.

**Table 23.28. Livestock and poultry numbers in Montenegro (2016-19)**

	2016	2017	2018	2019	Indices 2019/2018
Cattle	89 269	86 649	83 264	81 432	97.8
Sheep	191 992	189 008	187 021	182 127	97.4
Goats	31 458	29 595	29 040	28 754	99.0
Pigs	55 841	25 043	23 651	23 089	97.6
Poultry	835 705	788 309	666 339	635 882	95.4
Horses	3 947	4 071	4 005	4 008	100.1

Source: (MONSTAT, 2019<sub>[196]</sub>), *Livestock production - data*, <https://monstat.org/eng/page.php?id=1583&pageid=61>.

As of 2019, the Montenegrin fishing fleet consisted of 244 vessels, most of them old and with a very limited range due to safety concerns and operational limitations.

The agriculture sector has faced significant challenges due to the COVID-19 pandemic, including limitations on the movement of people, market closures, decreased demand, and difficulties in logistics. As the sector is closely linked to tourism in Montenegro, it particularly underperformed during the summer of 2020. The agriculture, forestry and fishery sector saw the number of employees decrease by 21.3% in the first nine months of 2020 compared to the same period in 2019 (MONSTAT, 2020<sub>[197]</sub>). This is a much larger fall than for the economy as a whole (11.3%). According to Erste Group, the second leading bank in Montenegro (SEE News, 2020<sub>[198]</sub>), unemployment will rise to 17% by the end of 2020, from 14.9% in 2019. The average gross wage decrease was 1.4%, but in the agriculture sector wages have fallen by 7.6%.

In April 2020, the Montenegro Government decided that, in addition to the full implementation of all measures envisaged in the year's substantial agricultural budget, it would add additional support for agriculture through a special programme worth over EUR 17 million. This includes the following measures:

- Market interventions to maintain market stability, price stability and producers' incomes. This involves the purchase and storage of surplus agricultural products, assistance in marketing or buy-out by the state institutions. The planned funds for this measure amount to EUR 3 million.
- Support for the purchase of domestic products. State budget consumers (state and public institutions) will give priority to procuring domestic products, as the use of shorter supply chains involving faster transportation becomes mandatory.
- Ensuring domestic producers receive support payments for products within 15 days. In order to shorten payment deadlines, the government will mandate the Investment Development Fund (IRF) to provide credit support to retail chains, with an obligation to pay domestic producers within a period not exceeding 15 days.
- Favourable loans for the supply of working capital to registered agricultural producers, processors, and fishermen. These loans will be approved up to a maximum amount of EUR 20 000, with an interest rate of 1.5%, a repayment period of up to two years and a grace period of up to one year. The government will pay the interest during the grace period, for which about EUR 150 000 are provided. The planned funds for this measure amount to EUR 10 million.
- Support for social contributions to employees in the agriculture sector. This support will cover 529 registered farmers for a period of six months. The financial resources for this measure amount to EUR 100 000.

- One-off support of EUR 64 for 3 200 people retiring from farming. EUR 225 000 are committed to this measure.
- One-off assistance for 184 fishermen with a valid license, for which EUR 200 000 are allocated.
- Advance payment of 80% of premiums on livestock and per hectare of arable land, based on data from the previous year. On this basis, producers will be paid a total of around EUR 3.5 million in the first half of May 2020.

In September 2020, MONSAT noted a decrease in agriculture sales of 5.1% cumulative since March 2020. The total export of goods for the period January-September 2020 decreased by 15.3%. The impacts on the livestock sector were variable. Live animal exports increased by almost 18%, while dairy product exports decreased by 22%.

Although the Government of Montenegro has reduced the negative impacts of COVID-19 on the agriculture sector, the consequences for the organisation of value chains, decreased market penetration and reduced income need to be addressed further in order to rebuild the broken links in the sector. Market support measures, cheap financial products to support agricultural households' cash flow and reinforcing one-off contracted payments are needed to ensure stability for farmers and the rural population.

#### *Sub-dimension 14.1: Agro-food system capacity*

While rural infrastructure policy in Montenegro has made progress in increasing rural development expenditures and water-supply projects, Internet connectivity in rural areas remains weak and local agriculture budgets are underfunded. The responsibility for rural infrastructure policy is shared by the Ministry of Agriculture and Rural Development (MARD), Ministry of Transport and Maritime Affairs, the Transport Directorate, Government Regional Development Office, Ministry of Economic Development, and the municipalities.

The **rural infrastructure policy framework** is based on the Strategy for the Development of Agriculture and Rural Areas 2015-2020, which aims to enhance living standards and quality of life in rural areas, provide conditions for the growth of agriculture, and diversify economic activities on both agricultural holdings and in rural areas in general. Based on this strategy, the Programme for Development of Agriculture and Rural Areas in Montenegro has been established under IPARD II 2014-2020 (as described in Sub-dimension 14.3: Agricultural support system). Amongst its goals are revitalising and developing rural areas and building infrastructure on the basis of co-financing of projects by the applicant and the state, including local roads, water management and facilities of common importance.<sup>203</sup>

Investment in rural infrastructure development for 2014-2020 is supported by both the Agro-Budget and IPARD funds. The Agro-Budget for 2020 is EUR 60.7 million (compared to EUR 52.4 million in 2019), EUR 2.5 million of which has been allocated for developing village and rural infrastructure (EUR 0.7 million from the national budget and EUR 1.8 million from donations and credits), a 14.1% increase in expenditure over 2019 (MARD, 2020<sub>[199]</sub>).

As agriculture is defined as an area for strategic development in the majority of municipalities in the north and central regions, all local self-governments have agriculture units. Municipal budgets for agricultural development are predominantly intended for infrastructure, and to a lesser extent for other support measures. However, while all municipalities have agriculture units, few have their own funds for agriculture, impeding effective implementation of rural infrastructure policy.

Fixed broadband services, in particular the optical fibre sector, have shown strong growth, albeit mainly in large towns. In the first nine months of 2019, the number of fibre connections increased by 24% across the entire economy, totalling 34% of all fixed broadband connections. However, Internet connection in rural areas remains slow with low coverage. Additionally, development of telecommunication networks largely relies on the private sector as no government initiatives have been implemented.

Montenegro participates in constructing rural water supply systems through annual water management projects. In 2019, with a budget of EUR 970 000, the projects included constructing 31 water supply networks to create better living and working conditions in rural areas, as well as the further development of agriculture. Priority was given to rural water supply networks which were financed in the previous period, as well as new requests for water supply submitted by municipalities.

Montenegro has the highest level of water sediment in Europe, and due to an adverse water balance (which means that the inputs of water are lower than the outputs), almost 35% of Montenegro's territory suffers from water shortages (see also Sub-dimension 13.2: Natural asset base). However, the high amount of annual rainfall means that Montenegro, with the exception of distinct karst areas, is rich in natural springs, offering ample opportunities for irrigation.

Irrigation infrastructure falls under the auspices of the Ministry of Agriculture and Rural Development and the Directorate for Water Management within MARD. The Directorate for Water Management carries out the tasks of the ministry related to policies in the field of water management, proposing system solutions for the supply and use of water and implementing regulations on water and watercourses. While the **irrigation policy framework** is primarily based on the 2007 Law on Water, MARD adopted the National Strategy for Water Management in 2017, on the basis of which it is currently drafting a plan for irrigation development.

Irrigation infrastructure in Montenegro is underused, so there are significant water losses from irrigation systems. According to the National Strategy for Water Management, the irrigation system consists of both operating and abandoned systems, together occupying a total area of 18 310 hectares. The Agriculture and Rural Development Strategy 2015-2020 points out that some 51 000 hectares of land are suitable for irrigation, but only 15-17% of it is currently irrigated. As a consequence, 19% of water was lost from the irrigation system in 2018. The total number of irrigated agricultural holdings is 12 518, with an average area irrigated per agricultural holding of 0.42 ha (MARD, 2015<sub>[200]</sub>). The irrigation systems in Montenegro cover the areas of Ulcinjsko Polje (100 ha), Mrčevo Polje (220 ha), Sutorina (120 ha) and Bjelopavlička ravnica (840 ha), as well as working open drainage systems in Crmničko Polje, Tivatsko Polje, Lješko poljski lug and parts of Bjelopavlička ravnica.

According to the Strategy for the Development of Agriculture and Rural Areas 2015-2020, the major part of Montenegro's development potential is located in its least developed rural areas. The strategy identifies as a priority improving the standard and quality of higher education to meet the needs and requirements of the market. It also prioritises developing and strengthening entrepreneurial skills in young people to meet minimum national standards. Montenegro's **agricultural education system** is under the authority of the Ministry of Education and Science and covers specialised secondary education in agriculture as well as tertiary education. Agricultural education is partially funded from the Agro-Budget, which includes a measure for improving producers' knowledge. This measure includes support for educating permanent employees on farms, organising study visits for farmers, organising a Winter School for farmers, as well as support for participation in regional and international fairs and exhibitions. Montenegro has established the Strategy for Development of Higher Education in Montenegro (2016-2020), and the Strategy for the Development of Vocational Education in Montenegro (2020-2024) with an action plan (2020-2022), all of which cover agricultural education (MARD, 2015<sub>[200]</sub>).

There are five high schools (secondary education, 15-18 years) for agriculture, food processing and veterinary, mostly mixed schools that provide education for agriculture technicians in all domains.<sup>204</sup> Only one of the schools is vocational.<sup>205</sup> While there is an on-going reform of high school education to develop new curricula that respond to emerging labour market needs and increase students' interest, the number of students enrolled in these schools is declining (Table 23.29).

**Table 23.29. Agriculture enrolments in first year of high school (2016-20)**

School year	2016	2017	2018	2019
Total number enrolled	7 650	7 655	7 213	6 759
Agriculture, forestry, fishery and veterinary enrolments (number)	122	151	103	75
Share of total	1.59%	1.97%	1.43%	1.11%

Source: Strategy for the Development of Vocational Education in Montenegro (2020-2024) with the Action Plan (2020-2022).

Tertiary agriculture education is available at the Biotechnical Faculty of the University of Montenegro in Podgorica and at the Faculty of Food Technology, Food Safety and Ecology at the private University of Donja Gorica. Since 2005/06, the Biotechnical Faculty has included both a plant production and livestock production/cattle breeding division. The Biotechnology Faculty has departments and laboratories situated in Podgorica, Bar and Bijelo Polje, as well as experimental plots for students' professional practice.

The Faculty for Food Technology, Food Safety and Ecology (FFTFSE) has been in operation since 2012 as a department at the University of Donja Gorica. FFTFSE offers courses in technological engineering, sanitary engineering, environmental engineering and hotels, restaurants and catering (HoReCa) system engineering at an undergraduate level. FFTFSE has also established good links with industry by organising professional practice sessions and exercises for students in the field, at private laboratories, and through work on joint projects. FFTFSE has formed partnerships with various companies in the agriculture and food-processing sector as well as with national and international universities, faculties and research institutions.

#### *Sub-dimension 14.2: Agro-food system regulation*

**Natural resources regulations** in Montenegro have been improved and partially harmonised with the EU regulations; however, land consolidation remains limited and the water management system is weak. Regulations for natural resources fall under the auspices of the Ministry of Agriculture and Rural Development and are set out in the Law on Agricultural Land, the Environmental Law and the Law on Water.<sup>206</sup> The legislation defines the inter-sectoral co-operation between the various departments responsible for land, water and environment. However, there is no formal mechanism for co-ordination or information sharing. The Environmental Law defines the sustainable use of natural resources and sets the basis for agri-environmental measures.

Montenegro's Law on Agricultural Land regulates the use of agricultural land in the context of environmental and natural balance. An update of the law began in 2018 and is still on-going. Its main purpose is to include the necessary EU provisions for natural resources management, especially establishing and implementing a Land Parcel Identification System (LPIS). At present, Montenegro has implemented an LPIS partially in one specific region, supported by the EU IPA project Strengthening the Montenegrin Agriculture with establishing of Land Parcel Identification System (LPIS). The full implementation of the LPIS will enable digitalised maps of all agriculture parcels in the economy to be produced, creating a complete overview of data on type, area and volume of production. In addition, it will provide information for an integrated rural development approach and serve as a basis for the land consolidation process.

Agricultural land is very fragmented in Montenegro. This weakness is being addressed through the Law on Agricultural Land. Pursuant to this law, agricultural land consolidation is considered of general interest and land plots will therefore be grouped into larger and more regular parcels that can be used more rationally. This consolidation process remains very slow, however.

The Strategy of Water Management of Montenegro, last updated in 2017, defines the model for strategic water management planning, noting that water management should be based on the principle of preserving water as a resource. The concept of water as a natural public good means that it can only be used only in

a way that does not endanger its substance and does not exclude its natural role. The current water management system still faces a number of challenges due to a lack of investment in the maintenance of the existing network, limited wastewater treatment and lack of implementation of management plans for natural resources, including river basins (see also Sub-dimension 13.2: Natural asset base).

Several **regulations on agriculture products** have been updated in 2019 to further harmonise them with EU regulations. The legislation on seeds and planting materials is based on the Law on Plant Protection Products and the Law on Plant Nutrition Products, as well as accompanying by-laws. A range of rules has been established to systematise good agricultural practices, integrated pest management, sustainable use of natural resources, and the whole process for the registration, use and control of seeds and planting materials, as well as fertilisers and plant safety materials.

The regulations are continuously being improved through by-laws and rulebooks based on EU Directives. Over the last two years, the regulations on plant protection products have improved by adopting the 2019 Rulebook conditions for the treatment of stocks<sup>207</sup> and the updated Rulebook on maximum residue levels of plant protection products<sup>208</sup> the same year. In 2020, the Rulebook on conditions regarding professional personnel<sup>209</sup> has strengthened the regulatory framework.

The Laboratory for Seeds operates under the Biotechnical Faculty at the University of Montenegro. It is authorised by the Administration for Food Safety, Veterinary and Phytosanitary Affairs in accordance with the Law on Agricultural Plant Seed Material to undertake examinations of seed material quality, technical and professional affairs (for example, the university's Centre for Crop, Vegetable and Forage Growing, authorised by the Phytosanitary Administration, performs certifications of agricultural plants seed material). The procedures of the laboratory in this area are fully harmonised and accredited by the EU.

The review, amendments and establishment of new legislation in this field are structured through a participatory process, involving all stakeholders. The legal provisions relating to the preparation of a new regulation oblige the state institutions to organise a public stakeholder dialogue before entering into the process of parliamentary adoption. Every year, the MARD adopts the Programme of Phytosanitary Measures, whose main overall objective is to maintain the health status of plants on the territory of Montenegro. It does so by preventing the introduction of organisms harmful to plants, as well as their timely detection, control of occurrence and control of spread, and eradication. The programme also defines measurement inputs, aims, a body for implementation, and financial resources based on annual budgets. Programme input and output monitoring activities are conducted regularly according to the action plan approved at the beginning of the year.

#### *Sub-dimension 14.3: Agricultural support system*

Montenegro's **agricultural policy framework** is comprehensive and well monitored by several directorates within the Ministry of Agriculture and Rural Development (MARD). Agricultural policy is under the auspices of the MARD, which prepares and proposes programme measures to the government, along with a series of other documents, acts and regulations necessary for the harmonised functioning of agriculture in Montenegro. Agrarian policies are based on the Law on Agriculture and Rural Development which regulates the development of agriculture and rural areas, agricultural support eligibility criteria for measures, usage, and the organisation of producers. EUR 20.8 million of the Agro-Budget for 2020 has been allocated to agricultural, rural and fishery development, a 13.76% increase over 2019 (MARD, 2020<sub>[199]</sub>).

In 2015, the MARD adopted the Strategy for the Development of Agriculture and Rural Areas in Montenegro 2015-2020. It was developed to define the future reform process in the sector, respond to changes in the environment caused by both external and internal factors, and prepare the groundwork for meeting any forthcoming challenges on Montenegro's path to EU accession and the application of the Common Agricultural Policy (CAP). The strategy is financed by the Agro-Budget, as well as rural development measures and direct support for some product groups.

In addition, the Fisheries Strategy of Montenegro for 2015-2020, and its action plan for transposition, implementation and enforcement of the EU *acquis*, was adopted by the Government of Montenegro in 2015. The strategy provides a general strategic framework, and identifies the key steps that Montenegro intends to take to prepare for fulfilling all of its commitments arising from the EU Common Fisheries Policy (CFP) (Institute of Marine Biology, 2019<sup>[201]</sup>).

The harmonisation of Montenegro's rural development policy with the EU is based on the Programme for the Development of Agriculture and Rural Areas in Montenegro under IPARD II 2014-2020, adopted in 2015. Amongst the most important components of the programme are the provision of investment support for primary agriculture (Sub-dimension 14.1: Agro-food system capacity) and the processing industry, and support for diversification in rural areas. MARD's Directorate for Rural Development, along with the Legal Affairs Department, develop and prepare the IPARD II programme for Montenegro. The Directorate for Rural Development is also responsible for monitoring the progress and impact of all rural development programmes, including IPARD, and preparing monitoring and evaluation reports. It is also responsible for reporting on IPARD implementation through annual and final implementation reports.

IPARD funds and payments are regulated and monitored by the Directorate for Payments under the regulations of the new Rulebook on the internal organisation and systematisation of the Ministry of Agriculture and Rural Development, adopted in 2019. This rulebook has seen the number of systematised jobs in the Directorate for Payments increase in accordance with the requirements and recommendations of the EC, and a new organisational unit (Direction for Regional Co-ordination) has been established to co-ordinate the regional offices of the future Agency for Payments. Additionally, MARD's Internal Audit Division is fully operational and autonomous for auditing programme implementation.

All stakeholders are active in the process of drawing up strategic documents (NGOs, producer associations as well as individual farmers). MARD publishes public calls for all stakeholders to be given the opportunity to contribute their feedback and suggestions. As part of the EU integration process and alignment with the EU *acquis*, the ministry annually prepares and presents reports to the government and the European Commission.

**Domestic producer support instruments** fall under the auspices of MARD and are based on the Strategy for Agriculture and Rural Development 2015-2020, which is supported by the Agro-Budget. The Agro-Budget defines the criteria, procedures, type of measures, sources of financing and implementation dynamics on an annual basis and covers national funding, donations (including IPARD) and credit lines. The Agro-Budget for 2020 is almost EUR 9 million higher than in 2019 (EUR 52.3 million). The budget structure in 2019 was made up of 42.7% from the national budget, 43.8% from EU funds and 13.5% from credit lines.

The producer support measures in the Agro-Budget cover 1) market pricing policy measures;<sup>210</sup> 2) rural development measures;<sup>211</sup> 3) agriculture services support measures;<sup>212</sup> 4) food safety and phytosanitary measures; and 5) fishery and aquaculture support. Agriculture service measures offer support for education, extension services, quality control, food safety standardisation, promotion, fairs and exhibitions, as well as support for the institutional framework to enhance national capacities for managing EU funds.

The total support for the first four measures focusing on agriculture is around 95% of the total Agro-Budget. The remaining 5% are for support and maintenance of fishery, aquaculture and other operational programmes aimed at enhancing the capacity of institutions in the area of food safety, phytosanitary operations and veterinary. While the use of the Agro-Budget is high, there is a difference in the criteria for the allocation of direct support measures (national budget) and the rural development measures (EU funding).

On the Common Market Organization (CMO), Montenegro launched a pilot school programme for fruit, vegetables and dairy products for the school year 2019/20. New steps to comply with the CMO have been implemented for the wine and olive oil sectors and for producer organisations. The programme inputs and

outputs have been monitored as part of the action plan and are reported to the government once a year. However, producers still lack adequate information to improve their market penetration, especially on diversified market linkages.

Montenegro's **agricultural trade policy** includes several bilateral and multilateral free trade agreements (FTAs). Foreign trade is regulated by the Law on Foreign Trade, the Treaty on Accession to the World Trade Organization (WTO), the Implementing Regulation Law on Foreign Trade, and the Law on Customs Tariff. Montenegro is a member of the Central European Free Trade Agreement (CEFTA), (Stabilisation and Association Agreement (SAA), and European Free Trade Agreement (EFTA), and also has free trade agreements with the Russian Federation, Republic of Turkey and Ukraine.

The economy remains committed to further aligning its trade regime with WTO and EU regulations. Montenegro has been a full member of the WTO since 2012. It follows the WTO mechanisms for the liberalisation of international trade in all product categories, and harmonises its legal and institutional structure with all the basic principles and rules of international trade. In accordance with the WTO Accession Schedules, Montenegro has a ten-year transition period to reduce import tariff duties to a level agreed upon by the WTO, which expires in 2022.

Regarding trade with the EU and the Republic of Turkey, Montenegro has agreed on a number of products for preferential tariff quotas. The allocation and administration of these quotas are done by the Customs Administration, on a first come first served system.

In order to create a framework for the full implementation of the EU *acquis*, Montenegro will have to conduct activities agreed upon by the EU that will ensure the full implementation of EU international trade by the time of accession. Co-operation with the Customs Administration and the prospective Payment Agency is essential to this process.

While in general Montenegro does not have import and export permits, or export refunds on agricultural goods, certain agriculture products do require import<sup>213</sup> and export permits.<sup>214</sup> Import permits are also required when importing products under preferential treatment<sup>215</sup> and for importing products within tariff quotas. The Common Customs Tariff, except where the specified trade agreements have otherwise been concluded, sets the import duties. Export permits are also mandatory for exports under customs quotas. Furthermore, the provision of guarantees for the import of agricultural products does not occur in Montenegro.

The **agricultural tax regime** in Montenegro involves an exempted rate for producers. While the standard VAT rate across the economy is 21%, fodder, fertilisers, plant protection products, seeds, planting material and breeding stock have a preferential VAT rate of only 7%. Farmers (who are not VAT payers) are entitled to a lump sum fee of 5% on the selling price of their products, for which a tax credit is given to the taxpayer who purchased the agricultural products.

**Sanitary and phytosanitary measures** in Montenegro are fairly well harmonised with the EU and there is continued effort to further adapt laws on food, veterinary, and phytosanitary measures to EU directives. Most of the regulations were updated in 2019. The sanitary and phytosanitary system in Montenegro is managed by the Directorate for Food Safety, Veterinary and Phytosanitary Affairs with three separate divisions managing the three sectors. The Food and Safety Sector is responsible for food safety of nutrients, feed and by-products of animal and non-animal origin, as well as general food safety requirements. The Veterinary Sector covers animal health, veterinary epizootiology and veterinary activity, identification and registration of animals in the veterinary information system, veterinary medicines, as well as the international transport of animals. The Sector for Phytosanitary Affairs covers plant health, plant protection products and the phytosanitary information system, as well as seeds, planting material, GMOs, and the protection of plant varieties and plant genetic resources in agriculture.

As regards food protection, Montenegro's policy for aligning with and enforcing the EU *acquis* has been enhanced. A general action plan and a specific action plan on classical swine fever have been implemented

since the last cycle of assessment. A food and feed protection policy was adopted and implemented in 2019. Since 2016, the national programme for the Enhancement of the production of raw milk and a corresponding programme on the Processing of non-compliant raw milk have been underway. Their implementation is shared between the Directorate for Food Safety, Veterinary and Phytosanitary Affairs (as part of Ministry of Agriculture and Rural Development), Department of Advisory Affairs in the Field of Animal Husbandry, and the Dairy Laboratory. Reports are prepared twice a year. Alignments with EU *acquis* are being monitored at the national level. One indicator to measure progress is the percentage of milk produced that meets EU quality standards in the total volume of milk produced. This increased from 55.5% in 2018 to 63.8% in 2019.

The introduction of a national programme for the modernisation of food processing establishments has also proceeded, involving some restructuring of businesses. Around 70% of entities (63 manufacturers), producing food of animal origin were compliant with EU regulations, and 11 of them were licensed to export to the EU. The modernisation of food processing establishments has resulted in a total of 244 items that completely meet EU food safety standards, which indicates massive progress compared to the 14 that existed when the strategy was introduced in 2019.

The strategy for the treatment of animal by-products not intended for human use was established in 2019 and is in the process of being implemented. Regulatory capability and facilities need to be strengthened.

Veterinary policy was improved in 2019 by implementing the programme for compulsory measures for animal health protection. The national programme to Improve Facilities Dealing with Products or By-Products of Animal Origin has been pursued further. Capacity building for veterinary services will be continued through EU support programmes. Relevant programmes for the monitoring and control of diseases for 2020 have been prepared and are currently being implemented.

The phytosanitary strategy and several phytosanitary laws were updated in 2019. The development of the National Strategy for the Sustainable Use of Plant Health Goods has proceeded in accordance with the 2016-2021 Action Plan. A scheme for the control of genetically modified food and feed was introduced for genetically modified crops in 2019. Additionally, Montenegro plans to finalise full alignment with the EU's revised Plant Health Law (2016) and Official Controls Regulation (2017) by 2023.

#### *Sub-dimension 14.4: Agricultural innovation system*

**Agricultural research** is undertaken on a competitive basis through general requests for research projects by the Ministry of Science and at the international level through Horizon 2020. While the Strategy for the Development of Agriculture and Rural Areas 2015-2020 emphasises the need for innovation in research and development, there are no clear action plans or other policies for agriculture research.

Nevertheless, agricultural research in Montenegro has increased at the national level, with 16 of the last 104 projects financed through the national budget being in the area of agriculture, while 2 of the 8 projects funded by the Collaborative Grants Programme came from agriculture. In addition to the national budget, research is also financed by various other organisations.<sup>216</sup>

As part of the Fisheries Strategy of Montenegro, a joint assessment of shared stocks of economically important species in the Adriatic Sea was launched in order to exploit resources sustainably. Research activities are focused on the preservation of stocks, certain areas with high biodiversity, and traditional types of fisheries.

Montenegro is the first non-EU economy to have adopted a Smart Specialisation Strategy (S3). The main goal of the S3 is to modernise and increase the competitiveness of the Montenegrin economy by concentrating available research, natural and economic resources on a limited number of priority areas. The strategy hopes to see Montenegro recognised for, among others, agricultural innovation and sustainability, preservation of tradition in rural areas, and developing a food value chain for authentic Montenegrin products (S3, 2019<sub>[2021]</sub>). The implementation of the S3 is of great strategic importance for

Montenegro as it can encourage public and private investment in research, boost technological development and innovation, and attract researchers and innovators.

**Agricultural extension services** in Montenegro function well and are wide ranging. However, monitoring and evaluation of these services remain weak. Within the MARD, the Department for Extension Services in Livestock Production and Department for Extension Services in Plant Production are responsible for agriculture advisory services.

The Department for Extension Services in Livestock Production comprises 6 regional centres and 20 employees who cover all municipalities. This department is responsible for selecting and improving farm animals, providing expert advice and instructions to farmers, and the on-site control of compliance with the requirements prescribed by the Agro-Budget regarding livestock for direct payment beneficiaries.

The Department for Extension Services in Plant Production covers the entire territory of Montenegro and is divided into 7 regional centres that employ 22 plant production engineers. This department aims to improve plant production through increasing yields, as well as to improve the quality of products by providing expert advice, recommendations and instructions to farmers, as well as education, training and roundtable events. The service also performs on-site controls of compliance with direct payments and rural development measures.

The Biotechnical Institute also provides extension and laboratory services to the farming sector through its two sister services, Livestock Selection Service (LSS, established in 2000) and Plant Production Extension Service (PPES, established in 2003). Both are entirely financed from the agricultural budget of MARD, while the Biotechnical Faculty is financed by the Ministry of Education. Financing is based on an annual plan of activities and related costs, and reports approved by the MARD. However, a common challenge for both LSS and PPES is setting up performance indicators and clear mechanisms to monitor their achievements.

### ***The way forward for agriculture policy***

- **Improve rural infrastructure.** Improving rural infrastructure needs to be a priority for the development of the whole sector as local infrastructure is an essential element in any effort to realise the growth potential and promote the sustainability of rural areas.
- **Revitalise existing systems and gradually install irrigation systems in new areas.** This would allow for more intensive growth of other agricultural activities in Montenegro, such as processing capacity, greater participation of the local population and economic development. Priority should be given to sites and areas where there are quality resources and partially constructed infrastructure elements necessary for the application and development of irrigation. Investing in revitalisation and system building should concentrate on projects that generate fast returns on the funds invested, which will lead to the encouragement, interest and spread of irrigation across larger areas.
- **Continue to implement the measures under the IPARD II** and finalise the preconditions for future measures. In addition, preparations need to be made before requesting budget implementation tasks for the technical assistance measure.
- **Bring direct support measures into line with EU *acquis*** by fully decoupling them from production and linking payments to cross-compliance. As regards the Integrated Administration and Control System (IACS), further implementation of the Land Parcel Recognition System (LPIS) needs to be carried out across the entire territory.

## Tourism policy (Dimension 15)

### Introduction

Since 2018, Montenegro has made progress on all the tourism sub-dimensions, improving its overall score from 2.0 in the last assessment to 3.1 in 2021 (Table 23.30). Sound progress has been made on the tourism governance structure through the introduction of a monitoring system. Progress has also been achieved in the capacity and quality of accommodation by facilitating investment in high-quality accommodation and adopting a consistent accommodation quality standard framework. The VET framework has been improved by upgrading qualification standards, and the value derived from natural and cultural heritage has been enhanced through culture and nature-related strategies and programmes. Progress has also been made by easing visa requirements and implementing special policy measures to reduce border crossing times in peak seasons. The main remaining challenges are to strengthen the workforce supply framework, raise awareness of sustainability and digitalisation, and further strengthen dialogue with private stakeholders, education institutions, local communities and NGOs by involving them more actively in the decision-making process.

**Table 23.30. Montenegro's scores for tourism policy**

Dimension	Sub-dimension	Score	WB average
Tourism policy dimension	Sub-dimension 15.1: Tourism governance and co-operation	3.8	2.3
	Sub-dimension 15.2: Destination accessibility and tourism infrastructure	3.5	2.2
	Sub-dimension 15.3: Availability of a qualified workforce	2.3	1.8
	Sub-dimension 15.4: Sustainable and competitive tourism	3.0	1.6
	Sub-dimension 15.5: Tourism branding and marketing	2.8	1.6
Montenegro's overall score		3.1	2.0

### State of play and key developments

Tourism is one of the most important sectors in Montenegro. In 2019, its (direct and indirect) contribution to GDP was 32.1%, its (direct and indirect) contribution to employment was 32.8% (66 900 jobs), and the share of tourism in exports was 54% (World Travel and Tourism Council, 2020<sup>[24]</sup>). International tourist arrivals have grown steadily, reaching 2.5 million in 2019. Tourism arrivals have seen an average annual rate of growth of 9% over the last 10 years. This steady growth in tourism is the result of improvements to promotion and marketing in international markets, air transport accessibility, the quality and capacity of accommodation and the development of new tourist facilities and offers. These improvements have boosted Montenegro's competitiveness in the global market, also evident in the economy's improved standing in the 2019 Travel & Tourism Competitiveness Index – from 72nd place in 2017 to 67th place in 2019 – the best score of the WB6 economies (WEF, 2019<sup>[203]</sup>).

Despite these positive results, Montenegro is still facing some challenges which hinder even more successful tourism development. The COVID-19 pandemic is the most pressing challenge at the time of writing.

The COVID-19 outbreak triggered a number of restrictions that have had a severe impact on the tourism industry. Montenegro suffered a very deep recession in 2020, which led to a more than 15% decline in GDP. In 2020, tourism plummeted due to COVID-19: foreign tourist overnight stays and receipts collapsed by 90%. Consequently, retail trade fell by almost 17%, while industrial production was at 2019 levels (World Bank, 2020<sup>[204]</sup>). In 2020, there were 79.2% fewer arrivals and 79.9% fewer tourist nights than in the previous year (MONSTAT, 2020<sup>[197]</sup>). Additionally, private stakeholders felt unheard throughout the process of drafting COVID-19 support measures, which should be a priority for the future of tourism development in the economy. In order to support and mitigate the impact of the crisis on the tourism industry, measures adopted by the government included three-month deferrals of taxes and contributions

(EUR 45 million), loan repayment deferrals (EUR 160 million), the creation of the Investment Development Fund of Montenegro (IDF) and an IDF credit line of EUR 150 million, and wage subsidies of EUR 19 million to support the tourism sector. The government also reduced VAT from 21% to 7% for the hospitality industry. In a second package of economic measures, the government included grants for salaries for April and May 2020 for entrepreneurs and SMEs in the sector whose work was not prohibited (WB6 CIF, 2020<sub>[205]</sub>).

To spur the recovery of tourism after the COVID-19 pandemic, the World Tourism and Travel Council (WTTC) has awarded Montenegro the international Safe Travels label. Safe Travels is a specially designed label which allows travellers to identify destinations and companies around the world that have adopted global standards of health and hygiene, as an important prerequisite for safe travel. In the circumstances, this is a very important step for gaining the trust of tourists, and for the recovery and sustainable development of tourism. All interested participants in the tourism sector, such as hotels, restaurants, tour operators, transport providers, airports, airlines and others, can apply to use the label, with the obligatory condition that they meet and implement the conditions defined by health protocols. To assess compliance with the recommendations, measures and protocols of the Institute of Public Health and the regulations of the Ministry of Health of Montenegro, the Commission for Assignment and Control of Safe Travels has been formed. It consists of representatives of the National Tourism Organisation (NTO) Montenegro, the Institute of Public Health, the Ministry of Economic Development, the Directorate for Inspection Affairs, the Chamber of Commerce and the Civil Aviation Agency. Currently in Montenegro there are 61 users of the Safe Travels label, mostly those providing accommodation, especially hotels, but there are also restaurants, transfer service providers, operators of yachting tourism and tour operators.

The COVID-19 pandemic will change the recent fast growth trend of tourism in Montenegro. Montenegro should continue its efforts to move away from promoting mass tourism in coastal areas to developing new, high-quality and personalised tourist experiences around natural and cultural sites. This could be driven by a new marketing strategy and action plan focusing on domestic tourists, who have been relatively neglected so far, but could contribute much to the dispersal of arrivals over the year. This will help tackle a key structural challenge, which is the high seasonality and concentration of tourism in coastal areas. Most tourist arrivals (71% in 2019) occur in the summer season between May and October (Figure 23.17), making Montenegro a so-called sun-sea-sand (3S) destination. This puts great pressure on the sector's employees, who are predominately employed as seasonal workers, and on the accessibility of the destination due to traffic jams. In addition, this type of mass tourism has negative impacts on the environment, cultural heritage and social life of local communities.

**Figure 23.17. International and domestic tourist arrivals in Montenegro (2017-19)**

Number of arrivals, monthly

StatLink  <https://doi.org/10.1787/888934255988>

In order to address this challenge, Montenegro has already set clear strategic goals in the Tourism Development Strategy to 2020: 1) mitigating summer seasonality in the coastal region by reducing the number of visitors; and 2) developing tourism products outside of the main season as well as in rural areas, while setting up sustainability as a core principle of future tourism development. Concrete programmes and strategies have been adopted recently to reach these goals (Table 23.31), which position Montenegro as a unique high-quality and year-round tourist destination. This represents a sound basis on which to reposition Montenegrin tourism and exploit the potential of its rich cultural and natural heritage for developing authentic, innovative culture and nature-related tourist products and experiences in a sustainable way and for the benefit of local communities and people.

#### *Sub-dimension 15.1: Governance and co-operation*

The Montenegro Tourism Development Strategy to 2020 (Ministry of Sustainable Development and Tourism, 2008<sup>[207]</sup>) was designed in 2008 and updated following the Tourism Agenda Reforms in 2013. It commits Montenegro to developing an efficient governance structure involving effective inter-ministerial co-ordination to ensure all relevant ministries are involved in tourism planning and development. Governance of the national tourism policy is overseen by the Ministry for Sustainable Development and Tourism (MSDT), which is responsible for the development, management, co-ordination and implementation of the tourism strategy. The National Tourism Organisation of Montenegro is responsible for promoting and marketing tourism in international markets. The tourism strategy clearly defines policy measures and actions to be implemented by other ministries,<sup>217</sup> as well as the budget allocation and timeframe. To implement this cross-government approach, reflecting the cross-cutting nature of the tourism sector, specific tourism-related strategies/programmes have been prepared, and tourism has also been included in other national strategies in the last two years (Table 23.31). This, and the growth of the budget dedicated to tourism over the last five years (Figure 23.18), show the government's commitment to tourism development.

**Figure 23.18. Budget dedicated to tourism in Montenegro (2014-19)**

Million euros

Source: Information based on responses to Tourism Questionnaires completed by the Ministry of Sustainable Development and Tourism.

Since 2017, Montenegro has greatly improved its **tourism governance and institutional set up** by introducing a monitoring system to assess its performance and process efficiency against policy measures and priority actions. The first monitoring report was prepared in 2019, but it lacks measurable indicators. Accordingly, a set of measurable indicators should be prepared for the next report, and an independent evaluation should be conducted.

In terms of **partnerships with stakeholders**, Montenegro has established a public-private dialogue and co-operation framework at the national level, which also includes **vertical co-operation** at the local level. In 2017, the government established the Tourism Council,<sup>218</sup> chaired by the Prime Minister. Its main tasks are monitoring the implementation of the tourism strategy and other strategies, programmes and action plans related to tourism (e.g. the National Human Resources Strategy). In 2019, the Tourism Council established a co-ordination body, chaired by the Minister of Sustainable Development and Tourism. Its main role is to monitor the development of the peak tourist season and take steps to overcome challenges in terms of reservations, border crossing, promotional activities, etc.

In addition to representatives of relevant ministries, the members of the Tourism Council include stakeholders from the private sector (i.e. Chamber of Commerce and their associations), local communities and NGOs. Accordingly, private tourism stakeholders, municipalities and NGOs are actively involved in the preparation, implementation, and monitoring of the tourism strategy. They also play an active role when the government prepares new legislation and regulatory policy. Although the private sector stakeholders are satisfied with the co-operation and communication with public institutions, some would like to see more active involvement of educational institutions and the local population in the tourism decision-making process. Including some relevant indicators in the monitoring and evaluation system for assessing public-private dialogue and co-operation would help to drive evidence-based improvements in the process.

Montenegro's tourism governance structure at the local level is well established. Most local communities have established Local Tourism Organisations (LTO) for managing tourism development. To date, 24 LTOs<sup>219</sup> have been created to develop tourism in their municipalities. Local tourism strategies are prepared in co-operation with private stakeholders and NGOs, and are in line with the national tourism strategy. Being members of the Tourism Council, LTOs are also actively involved in the development and implementation of the national tourism strategy, and also participate in the allocation of funding. They are involved in the working groups set up for designing and implementing tourism projects by the MSDT and NTO. The efficiency of the tourism governance structure at the local/destination level cannot be fully assessed, however, as the monitoring system does not include appropriate indicators for this area.

According to public sector representatives, governance at the local level could be improved by strengthening dialogue and co-operation with private stakeholders and NGOs, building the capacity of public officials and aligning budgetary allocation with local tourism priorities.

Montenegro has developed a **comprehensive data collection system** for baseline statistics on tourism. MONSTAT collects tourism-related data in accordance with Eurostat standards. Statistics on tourism have a permanent depository at MONSTAT and the MSDT (in the Central Tourism Register, which has been improved since 2017 following the adoption of the Rulebook on the content and manner of keeping the Central Tourism Register). The collection and publication schedule for tourism data has been established in accordance with national legislation.<sup>220</sup> Data collected by MONSTAT are published annually and available both online and as hard copy. The on-line statistical portal is user friendly and includes an interactive tool for working with basic tourism statistics (i.e. accommodation capacities,<sup>221</sup> arrivals and overnight stays, foreign vessels on cruises and nautical tourism).<sup>222</sup> The MSDT directorate for monitoring tourist flows and tourist turnover is responsible for upgrading the government's framework for tourism data collection. Montenegro has established active involvement by and co-ordination between key players in the tourism industry who can provide reliable and accessible data to support policy making. However, there is no formal government co-ordination body (e.g. working group or commission) that would ensure the active involvement of all responsible institutions or co-ordinate data collection and sharing. Tourism satellite accounts and e-tourism electronic guest registration are planned to be implemented in 2021, which will further improve the tourism data information framework in the economy.

#### *Sub-dimension 15.2: Destination accessibility and tourism infrastructure*

Since 2017, Montenegro has improved destination accessibility and its **connectivity framework** by expanding the eligible categories of travellers who do not need a visa. First adopted in 2009, the Regulation on Visa Regime has since been periodically modified to adapt to the needs of the tourism and business sectors and in line with EU regulations. The last amendment was made in 2020. In 2011, the government started adopting decisions on temporary visa abolishment for citizens of certain countries during the tourist season. In 2019, the Government of Montenegro introduced visa exemptions for short stays for third-country nationals who hold valid visas or residence permits from the countries of the Schengen Zone, Commonwealth of Australia, the Republic of Bulgaria, the Republic of Croatia, Japan, Canada, New Zealand, the Republic of Ireland, Romania, the United States of America and the United Kingdom of Great Britain and Northern Ireland, as well as for people with Asia Pacific Economic Cooperation Business Travel Cards (APEC). Additionally, the government has adopted special regimes for border crossings for tourists in the high season. Article 34 of the Law on Border Control<sup>223</sup> defines the temporary omission of certain actions, and simplified and accelerated procedures for organised arrivals (primarily tourist buses) at road border crossings.

Montenegro has made progress in improving the **capacity and quality of accommodation** by introducing measures to facilitate investment in high-quality accommodation, and by adopting a consistent accommodation quality standard framework. Incentives for investment in high-quality accommodation are available through three programmes (Box 23.21) and their use is monitored. However, it is not clear if an evaluation to assess the efficiency of these measures and their impact on the development of high-quality accommodation facilities has been implemented or is at least planned.

### Box 23.21. Investment incentives for high-quality accommodation in Montenegro

There are three programmes run by the government:

1. The Programme of Incentive Measures in the Field of Tourism 2019/20, which includes:
  - Incentives for developing innovative tourist products. Budget: EUR 140 000.
  - Incentives for improving the offer and quality of services in rural households. Budget: EUR 50 000.
2. The Programme for Improving the Competitiveness of the Economy, which offers an incentive of between EUR 3 000 and EUR 10 000 for each person employed linked to investments of EUR 100 000 to EUR 250 000 (depending on the region) for constructing new capacities within development sectors, including tourism. The total budget of this programme is EUR 1 050 000.
3. Investment Programme of Special Importance for the Economic Interest of Montenegro, adopted by the Government of Montenegro in November 2018. This offers incentives for larger foreign direct investment in the country, including investment in constructing new four or five-star hotels or larger tourist complexes. Investment incentives range from EUR 5 million for projects in the north of the country, to EUR 15 million at the coast.

The Ministry of Sustainable Development and Tourism announced in 2018 a public invitation to express interest in qualifying projects on the list of development projects in the field of tourism. The list was updated by the Montenegro Investment Agency in April 2020, and to date consists of six development projects in tourism sector.

Source: Information based on responses to Tourism Questionnaires completed by national authorities.

Montenegro has been developing a consistent **accommodation quality standard framework** based on the EU standards for categorisation and this has been made mandatory for all types of accommodation.<sup>224</sup> Depending on the issuer of the permit, the categorisation is either implemented by the Commission of the MSDT or the Commissions of Municipalities. According to the Law on Tourism and Hospitality, accredited experts are engaged in the categorisation process and self-assessment is possible up to the three-star category or in the case of re-categorisation. The Rulebook of types, minimum technical conditions and categorisation of hospitality objects was updated in 2018 in line with international standards. Categorised accommodation is inspected regularly. Montenegro currently has 24 inspectors who make sure the quality standards are in place; the process is repeated every three years. However, according to public officials, efficiency is hindered by the lack of human and financial resources. The Law on Tourism and Hospitality also defines other quality standards for accommodation facilities, and other types of services (e.g. bed and bike standards, wild-beauty standards) as a part of the Rulebook of types, minimum technical conditions and categorisation of hospitality objects.

Another key element for tourism is the **availability of high-quality tourist information**. The Montenegrin tourist information system provides reliable information on tourist destinations, accommodation, attractions and tourist services. These are professionally compiled on the main tourism website<sup>225</sup> and available in five languages. The website is managed by the MSDT and the NTO Montenegro and implemented by a range of institutions such as the Chamber of Commerce, LTOs and private companies. The tourist information system in each destination is the responsibility of the LTOs. The quality of the tourism information system is monitored through regular visitor surveys. However, an independent evaluation of tourist information system would be recommended to identify potential weaknesses which are not detected in the surveys.

### *Sub-dimension 15.3: Availability of a qualified workforce*

In Montenegro the **skills supply framework** is defined in the Strategy for Human Resources Development in the Tourism Sector (HRDS), adopted by the Ministry of Tourism and Environment in 2007. The HRDS provides an assessment of skills gaps and training needs, and defines a list of policy measures for human resources development and governance structure. The Tourism Development Strategy to 2020 has as one of its priority goals the creation of qualified professional staff and promising new occupations/jobs. However, the strategy does not set out policy measures – these are contained in the HRDS. The qualification framework for tourism, hospitality and trade comprises 42 qualification standards developed between December 2012 and May 2020. Since 2017, 34 occupational standards have been revised and updated to meet the changing needs of the labour market.

The Employment Agency of Montenegro, in co-operation with Montenegro Tourism Association, conducts regular consultations on policy measures to improve the attractiveness of jobs in the tourism sector. Private sector stakeholders assess recent changes through their involvement in the Accreditation Commission, which helps to match curricula with labour market needs. A significant share of seasonal tourism jobs in Montenegro are filled by foreign workers: in 2019, 27 634 work and employment permits were issued to foreign nationals (the vast majority from Bosnia and Herzegovina and Serbia), 15 582 of whom were within the quota and 12 052 outside it. The key challenge is to encourage more Montenegrin young people into formal tourism education and to develop the required quantity and quality of skilled workers to deliver and maintain the high-quality service standards needed for future tourism development in the economy.

Since 2017, Montenegro has made sound improvements to the **VET framework for tourism**. Implementation is well advanced with clear budget allocations, sufficient funding and well-established co-operation among the relevant institutions and private stakeholders. Curricula are updated according to the needs of the tourism industry, and prepared in co-operation with the private sector. All vocational education programmes contain a compulsory practical element. The Centre for Vocational Education has sufficient funds for developing occupational standards, including the tourism sector. A VET quality assurance and accreditation framework has been established and the institutions responsible for quality insurance have sufficient financial resources and qualified staff. There is room for improvement to the system for monitoring the implementation of educational programmes, which is planned for 2021.

As part of the VET education framework, the Montenegro Government has developed a two-year **higher education framework for tourism**, based on consultations with key public and private sector decision makers. Quality assurance is provided by the Agency for Control and Quality Assurance of higher education. Although the higher education framework is regularly evaluated, according to tourism education experts it is inadequate, and there has been no training for staff over the last two years.

### *Sub-dimension 15.4: Sustainable and competitive tourism*

Montenegro is currently developing a comprehensive **natural and cultural enhancement framework** for tourism. The Ministry of Culture develops annual activities in line with the Tourism Action Plan through the Programme for Development of Culture 2016-2020. This has allowed numerous strategic cultural heritage projects to be implemented. The budget allocated for the Program for Development of Culture is EUR 68 000 and comes from the Ministry of Culture. UNESCO provides funds for involving experts. Moreover, a budget of EUR 9.2 million has been allocated to the Programme of Protection and Preservation of Cultural Goods for 2012-2020. More recently, Montenegro has been developing a comprehensive natural and cultural heritage enhancement framework under the Cultural Heritage Development Strategy for 2020-2025 and the National Strategy of Preservation and Sustainable Use of Cultural Heritage, both entrusted by UNESCO. Inter-sectoral co-operation, as well as the development of strategic documents, laws and regulations, are taken into account in the development of both strategies. The Ministry of Culture has developed four long-term management plans for cultural heritage.<sup>226</sup> There is

an annual budget for the protection of cultural heritage through the Programme for the Protection and Preservation of Cultural Heritage, which falls under the Law on Protection of Cultural Properties.

The Administration for the Protection of Cultural Properties regularly monitors the status and conducts revalorisation of the value of cultural properties. Other mechanisms prescribed by the law, such as studies of cultural heritage protection, management plans and heritage impact assessments, have been adopted. Montenegro also developed an action plan for the period 2016-20 in accordance with the National Biodiversity Strategy. It aims to integrate and develop biodiversity protection measures into the tourism sector. Montenegro is a member of several regional development projects to promote cultural and natural heritage in tourism, including DUE MARI (Box 23.22), and the Regional Cooperation Council (RCC) Triple P Tourism project, aimed at developing joint cultural and adventure tourism products.<sup>227</sup>

### Box 23.22. DUE MARI: Next generation tourism development

The Ministry of Sustainable Development and Tourism has been developing the inter-regional project DUE MARI – Next Generation Tourism Development – under the Interreg Instrument for Pre-Accession Assistance (IPA) Cross Border Cooperation involving Italy, Albania and Montenegro. The aim of the project is to create an interactive site that will promote the tourist offers of Montenegro, Albania and the Italian regions of Puglia and Molise on a common platform. Between 300 and 500 sites of special cultural, historical and other importance for Montenegro will be marked on the platform, which will be displayed through 360° virtual reality. The design and mapping of new cultural tourism routes and marking is done on the spot. Also a new website for the NTO of Montenegro will be developed and will host the platform. The project includes purchasing equipment (e.g. servers and computers) as well as communication and marketing activities to disseminate information on the results of the project.

Source: (Interreg-IPA CBC, 2019<sup>[208]</sup>), *DUE MARI*, <https://duemari.italy-albania-montenegro.eu/>.

Montenegro has made progress in **promoting sustainable tourism development** recently. The Tourism Development Strategy to 2020 includes measures for enhancing natural and cultural heritage through tourism. The National Strategy for Sustainable Development (NSSD) defines the principles of sustainable tourism and places tourism as one of the driving forces of the economy. One concrete policy measure in the Tourism Development Strategy is to implement the NSSD actions related to the protection of nature, setting up protected areas, and preparing management plans for them. There is no evidence that the NSSD has been implemented, although its first implementation report was being finalised at the time of drafting.

Montenegro has implemented other actions to improve the sustainability of tourism. A noteworthy development is the innovative Towards Carbon-Neutral Tourism in Montenegro project, financed by the Global Environment Facility (GEF), which started in September 2014 and ended in May 2020.<sup>228</sup> The project was dedicated to promoting carbon-neutral tourism by fostering sustainability and innovation in businesses. The approach engages partners from industry, government and the broader community, and identifies and prioritises innovation opportunities by explaining the links between tourism and climate change from a mitigation perspective. With a budget of USD 3 million, the project helps to reduce greenhouse gas emissions from the Montenegrin tourism sector and thus lowers its environmental impact. The project has supported 30 hotels and tourist apartments in Montenegro to gain EU eco-certificates (eco label), a well-recognised international certificate of sustainability.

However, private stakeholders note that more attention should be paid to sustainable development in tourism, which they feel is still only a priority on paper. They note a lack of awareness of the topic among public and private stakeholders. They suggest the need for awareness-raising campaigns and capacity building of private stakeholders, and especially investors in tourism, to empower them to develop their investments and business models according to sustainability standards.

Policy measures promoting **investment and innovation in tourism** are explicitly reflected in national policies for the promotion of trade and investment, such as in the Montenegro Investment and Business Opportunities, which was issued by the Ministry of Foreign Affairs for the fourth time in 2019.<sup>229</sup> The promotion of innovation in tourism is included in the Smart Specialisation Strategy of Montenegro (Table 23.31), adopted in 2019 (Ministry of Science of Montenegro, 2019<sub>[39]</sub>). Moreover, the National Tourism Development Strategy 2020 provides some guidance on promoting investment in tourism infrastructure. In addition, there is a raft of fiscal measures available aimed at reducing costs for hotels and restaurants.<sup>230</sup> The capital budget for the Improvement of Tourism Infrastructure Programme has seen progressive increases in investment in tourist infrastructure since 2015. In 2018, the available budget was EUR 13.3 million, a six-fold increase since 2015. The Programme of Incentive Measures in the Field of Tourism for 2019/20 includes measures for developing innovative tourist products that enrich the tourist offer, with a budget of EUR 140 000. In total 21 projects have been supported, including E-bikes Durmitor (Durmitor Adventure), tree house and Hobbit house (Alpine Club Sinjajevina), and a children's playground in Ski Center Kolašin (Ski Centers Montenegro), each of which received more than EUR 11 000 worth of funding (Ministry of Sustainable Development and Tourism, 2020<sub>[209]</sub>).

Despite the clear indications that the promotion of investment and innovation in tourism is a priority, the efficiency of the measures could not be assessed as there is no evidence they have been monitored or evaluated. In addition, private sector stakeholders draw attention to long and non-transparent procedures for obtaining building permits, the lack of knowledge among investors of tourism infrastructure, and inadequate spatial planning, which allows investments that are not in line with sustainable development principles. These issues should be addressed in order to ensure successful and sustainable tourism in the economy.

#### *Sub-dimension 15.5: Tourism branding and marketing*

Montenegro established its **tourism brand** identity – Montenegro: Wild Beauty – in the New Book of Standards issued in 2015. The Ministry of Sustainable Development and Tourism and the NTO informally manage the promotion of Montenegro as a tourist destination, involving both private and public sectors. The NTO is in charge of planning and implementing information and promotional activities, both within the economy and abroad. It co-ordinates and unites the reporting and promotional activities of all tourism domains and co-operates with tourism organisations across the economy and abroad. The annual budget allocated to the NTO has been raised from EUR 1.09 million in 2014 to EUR 2.20 million in 2019. The number of staff in the 18 local tourist organisations has increased from 173 in 2017 to 193 in 2019. The Marketing Strategy identifies target markets and provides a framework for promotion. However, a formal **marketing** co-ordination body has not yet been established.

Montenegro's ranking on the Effectiveness of marketing and branding indicator in the WTTC Tourism & Travel Competitiveness Index has improved: from 53th place in 2017 to 34th place in 2019 (WEF, 2019<sub>[203]</sub>). This is a result of regional marketing activities in overseas markets and shared presentations of tourist offers with neighbouring economies at the main international tourist events, such as Internationale Tourismus-Börse in Berlin (ITB). This joint approach contributes to the more efficient use of the budget available for promotion and increases the visibility of Montenegro as a tourist destination in the Western Balkans. Between 2015 and 2018, the Wild Soul of Europe campaign was conducted in the Chinese market together with the Tourist Organisation of Serbia. In 2019, the Western Balkan Crossroads of Civilization campaign was targeted at the Singapore market. This was conducted in co-operation with the Tourist Organisation of Serbia and the Agency for Tourism of the Republic of North Macedonia. All Western Balkan economies participated in the Regional Cooperation Council campaign targeted at the Chinese market and ITB. The positive effects of these marketing campaigns can be seen in the recent increase in the share of Chinese (from 1.5% of the market share in 2015 to 5.3% in 2019), and German visitors (from 3.1% in 2015 to 7.9% in 2019) (Figure 23.19).

StatLink  <https://doi.org/10.1787/888934256007>

The **digital tourism marketing framework** is in the early phases of development. A first draft of the Digital Marketing Programme for the period from 2021 to 2023 is being prepared. However, public and private stakeholders are not involved in the process yet. In order to establish a robust and effective digital marketing framework, strong involvement from all relevant stakeholders is encouraged.

### ***The way forward for tourism policy***

To ensure Montenegro's successful tourism development continues, policy makers should:

- **Empower local communities and tourist destinations to manage tourism development** by providing sufficient budgets and implementing sound capacity-building programmes for local tourism organisations. This is the basis for the faster and more efficient development of competitive tourism products in a sustainable way.
- **Further strengthen the dialogue and co-operation with private sector stakeholders, educational institutions and NGOs** at national and local levels. Organising events such as tourism forums for an exchange of views on tourism development could lead to the more active involvement of a broader spectrum of stakeholders in tourism development and implementation processes and a wider understanding of shared goals and objectives. This would provide the necessary conditions for more co-ordinated action for achieving common strategic goals.
- **Update the human resource development strategy for tourism** to overcome the key challenges regarding workforce availability and quality. This is key for providing a high-quality tourist product and offer, which is the core vision of Montenegrin tourism. The strategy should include measures for increasing the attractiveness of tourism studies and professions, especially among the young; developing flexible educational programmes at all levels in close co-operation with private stakeholders; and running training programmes for the foreign workers who will inevitably represent a significant part of the labour force into the future. Finland offers a best-practice example that can serve as inspiration (Box 23.23). The strategy should also define measures for the mandatory inclusion of sustainability and digitalisation subjects in the curricula at all levels of education and training.

- **Do more to promote sustainable development and business operation by making it mandatory to consider sustainability criteria** in all investments in tourist infrastructure. This should be supported by public incentives, and awareness raising and training for tourism sector stakeholders on how to develop their businesses sustainably. Following best practice in other economies is recommended (e.g. the Green Scheme in Slovenia's tourism sector, - more information in the regional chapter).
- **Further improve tourism data collection and sharing** by introducing Tourism Satellite Accounts to give policy makers reliable information when designing policy measures.

### Box 23.23. Improving the tourism labour supply in Finland

An examination of Finnish employment statistics reveals that although there are people with tourism and hospitality training looking for work, there are multiple vacancies in the sector. However, often the jobseekers do not have the skills and expertise required for the vacant tourism jobs. Other factors behind this labour supply gap may include the low wages; the irregular, seasonal and physically demanding nature of tourism jobs; a fall in the pipeline of students studying tourism and hospitality; and wider problems associated with lack of transport or reasonably priced housing options near the workplace.

In response, the Finnish Government launched the *Matkailudiili* programme in January 2018 to improve the employment and recruitment prospects of the tourism workforce. Over the two-year project measures were taken to boost the image of the tourism sector for work, strengthen co-operation between relevant stakeholders, and introduce a range of pilot projects. In 2018/19, over 30 pilot projects were launched to improve access to tourism employment as well as co-operation between public services and private recruitment agencies. These include training programmes for jobseekers, marketing campaigns aimed at potential employees (e.g. immigrants living in Finland), initiatives to employ workers from other sectors (e.g. forestry) during the high season, and digital platforms and training to alert people to vacancies. The result is greatly increased co-operation between relevant stakeholders, greater knowledge of tourism training and employment opportunities, increased national and international interest in the tourism jobs available, and improved understanding among the national employment services of sector circumstances, business needs and employee requirements. The results and best practices of the programme can be widely adopted in other sectors suffering from labour shortages.

## Anti-corruption policy (Dimension 16)

### Introduction

Table 23.32 shows Montenegro's scores for the anti-corruption policy dimension and compares them to the Western Balkans (WB) average. Montenegro has the highest scores for all indicators (along with certain other WB6 economies for some indicators). Montenegro has a generally well-advanced legal framework for the prevention of corruption and for ensuring judicial independence. Compared to the 2018 Competitiveness Outlook, Montenegro has strengthened its practice of corruption risk assessments as well as the capacity of its anti-corruption law enforcement bodies. A good track record of verifications, investigations and sanctions has been established, but some indicators remain weaker than expected.

**Table 23.32. Montenegro's scores for anti-corruption policy**

Dimension	Sub-dimension	Scores	WB average
Anti-corruption policy dimension	Sub-dimension 16.1: Anti-corruption policy framework	3.5	2.1
	Sub-dimension 16.2: Prevention of corruption	4.0	3.3
	Sub-dimension 16.3: Independence of the judiciary	n.a.	n.a.
	Sub-dimension 16.4: Business integrity and corporate liability	n.a.	n.a.
	Sub-dimension 16.5: Investigation and prosecution	3.5	2.8
<b>Montenegro's overall score</b>		<b>3.6</b>	<b>2.5</b>

Note: For comparability with the previous assessment, the two new sub-dimensions (16.3 and 16.4) have not been scored but are discussed in the text below.

### State of play and key developments

#### *Sub-dimension 16.1: Anti-corruption policy framework*

Montenegro has tied the strategic planning of its anti-corruption policy to its process of accession to the EU. In terms of **policy documents, co-ordination and implementation**, the Action Plan for Chapter 23 "Judiciary and Fundamental Rights" (AC23) of accession negotiations and the Operating Document (OD) for the prevention of corruption in areas exposed to special risk have served as equivalents of an anti-corruption strategy and action plan. The OD was intended as a follow-up to the Strategy for the Fight against Corruption and Organized Crime 2010-2014, and it included unimplemented measures from the strategy's action plans. The OD also contained information on prospective sources of funding, and, for some activities, the amounts of funds needed. However, the government does not publish the total amounts of its annual budget spent on anti-corruption activities.

In 2016, a working group prepared the draft of the OD, which was submitted for public debate. The debate lasted 40 days and ended on 18 April 2016. The official report of the consultations shows which proposals of civil society representatives were incorporated and reasons why some proposals were rejected. This is a good practice example of accountability (Ministry of Justice, 2016). At the other hand, according to the contribution to this assessment by the NGOs Institute Alternative and the Centre for Civil Liberties, the majority of proposals by civil society were ignored. The Competitiveness Outlook assessment cannot independently verify the validity of stakeholders' claims, and only takes note that there was some controversy surrounding the consultation process.

Multi-stakeholder co-ordination bodies have been set up. On the political level, the Rule of Law Council facilitates co-ordination and monitoring of the implementation of the obligations under the accession negotiation Chapters 23 and 24 "justice, freedom and security", as well as makes recommendations to the relevant institutions for urgent action in order to implement these obligations. Since February 2021, the

Council comprises the Prime Minister, the Minister of Justice, Human and Minority Rights, the Minister of the Interior and eight heads of public institutions from executive and judicial branches.

In December 2020, the government formed the National Council for Combating Corruption. The Deputy Prime Minister heads the Council, which is responsible for, *inter alia*, compiling an overview of the current course of investigations conducted against high-level corruption, monitoring, synchronising the activities of state bodies in the fight against high-level corruption, preparing opinions on how investigations of high-level corruption cases could be improved, and proposing concrete measures. The National Council consists of five members, including two representatives from the NGO sector, one of whom has been appointed as the Deputy President of the Council. At the operational level, the working group for Chapter 23 (established in July 2018, expanded in October 2018) ensures monitoring of and support for the accession negotiations. The working group has 47 members (39 representatives of government bodies and 8 civil society representatives). The NGO representatives are engaged through a public call. The minutes of the working group meetings are published on the website of the European Integration Office (ME4EU, n.d.<sup>[211]</sup>).

Members of the working group who are designated as co-ordinators in the field of corruption prevention have been monitoring OD implementation by working with contact people from competent implementing authorities. The EU Integration Office maintains the Portal for EU integration as an internal reporting IT tool for implementing institutions. According to Montenegro, the portal collects data on the implementation of measures from the AC23 and the OD. The government used to publish semi-annual reports on their implementation, with the last report covering July-December 2018 (Government of Montenegro, 2019). Since then, according to the government, reporting has switched to: 1) answers to a European Commission questionnaire submitted in August 2019; 2) a report on the implementation of the most important measures from the action plans for Chapters 23 and 24 submitted to the EC in February 2020; and 3) the continuous exchange of information with the EU. Reporting to the EC therefore appears to have partially replaced public accountability for the implementation of the anti-corruption policy, which is not appropriate given the government's duty to serve its citizens.

All public authorities must carry out **corruption risk assessments** by virtue of the legal obligation to develop, adopt and implement integrity plans – internal anti-corruption documents containing legal and practical measures to prevent and eliminate opportunities for corrupt and unethical behaviour. An integrity plan should be based on a self-assessment of the institution of its exposure to risks of corruption, illegal lobbying, and conflicts of interest, as well as its susceptibility to unethical or unprofessional conduct.

By the end of 2019, 689 public bodies (approximately 98%) had adopted integrity plans. The authorities must submit these integrity plans and annual reports on their implementation to the APC, as well as assess the efficiency and effectiveness of the plans every second year. In 2018 and 2019, 632 authorities updated their integrity plans based on this assessment (ASK, 2020<sup>[212]</sup>).

The APC supports the development of integrity plans by providing methodology, consultations, training, recommendations, etc. In 2018, the APC developed an extensive questionnaire for the assessment of efficiency and effectiveness of the integrity plans. It has also launched an online application for the plans (ASK, 2019). The application comprises three modules: 1) a register of corruption risks for all public bodies, which allows for various kinds of analysis and monitoring of risk trends in selected bodies or sectors, or in the public sector as a whole; 2) a reporting tool on the implementation of measures envisaged in integrity plans; and 3) a questionnaire for assessing effectiveness and efficiency.

The APC publishes annual reports on the adoption and implementation of integrity plans, which show that the majority of measures envisaged in integrity plans have been implemented (as of the end of 2019, 74.9% of measures had been implemented) (ASK, 2020<sup>[212]</sup>). The general quality of these integrity plans is a matter of somewhat divided opinions. According to information provided by representatives of the APC during consultations in October 2020, the quality of integrity plans has been improving, although around 30% of public bodies do not develop or implement them in a meaningful manner. The NGO Institute

Alternative argues that, judging by the annual reports published by the APC, authorities generally approach the development and implementation of integrity plans in a “bureaucratic” fashion, only complying with formal and technical requirements. Moreover, state administration bodies allegedly often fail to post the integrity plans and implementation reports on their website (Muk, Muk and Sošić, 2020<sup>[213]</sup>).

Montenegro has the legal basis and methodology for **corruption proofing of legislation**. According to the Law on Prevention of Corruption, the APC should give opinions on draft laws and other regulations and general acts to align them with international standards in the field of anti-corruption. The APC should also take the initiative to amend the regulatory acts in order to eliminate risks of corruption or to bring them in line with international standards. The APC has issued 17 opinions, which contain recommendations for improving regulations, and according to the APC the recommendations have been incorporated into five laws. However, activity in this area has been slowing down. The APC published 11 opinions in 2017, 2 opinions in both 2018 and 2019, and only one opinion in 2020 (a second opinion for 2020 was published in January 2021).

### *Sub-dimension 16.2: Prevention of corruption*

The central **corruption prevention body** in Montenegro is the Agency for the Prevention of Corruption, established in 2016. The law provides elaborate safeguards and mechanisms for the autonomy and accountability of the APC. The APC reports to the Parliament of Montenegro, and its managing bodies are the Council and the Director. The Council consists of five members (two of whom currently represent NGOs). The members are appointed by parliament, on the proposal of parliament’s competent committee. Council candidates are selected through a public vacancy announcement. A selection commission interviews the candidates and shortlists five. The last APC Council members were elected in August 2019. The Council also selects the Director through a public call and also decides on the dismissal of the Director. The design of these procedures aims to ensure publicity and transparency, while minimising the possibility for undue influence. The Council proposes the APC’s draft budget to parliament via the competent committee. By law, funds approved for the APC may not amount to less than 0.2% of the current state budget. Meanwhile the actual capacity of the APC remains suboptimal. The Rulebook for the APC envisages 60 employees, while at the end of 2020, 55 employees were in fact working full time. The APC regularly prepares quarterly and annual activity reports which are published on its website.<sup>231</sup>

Despite this robust legal framework, trust in the actual independence and effectiveness of the APC is not universal. A 2019 report by the European Commission noted that “challenges to the independence, credibility and priority-setting of the Anti-Corruption Agency are yet to be convincingly addressed” (EC, 2019<sup>[73]</sup>). The former Director of the APC performed unsatisfactorily, according to several non-government stakeholders, and resigned in 2019 before the end of his term (Freedom House, 2020<sup>[214]</sup>). The Council appointed a new Director in July 2020. This fresh leadership provides a renewed opportunity to mitigate concerns about the lack of effectiveness and independence of the APC.

The Law on Prevention of Corruption (LPC), adopted in 2014, governs the management of **conflicts of interest** and asset disclosure. The circle of public officials covered is comprehensive, especially in view of the fact that other regulatory acts<sup>232</sup> also contain provisions regarding conflicts of interest. The LPC does not envisage institutions and/or officials responsible for individual counselling, but overall the APC is the competent institution in the areas of prevention of conflicts of interest and restrictions in the exercise of public functions. The APC’s section for the prevention of conflict of interest has three specialised officers.

The APC has a steady track record of issuing opinions (158 in 2019) as well as decisions and other administrative acts (72 in 2019, of which 30 concerned conflicts of interest and 42 concerned restrictions in the exercise of public functions). Altogether 42 of the decisions found violations to have occurred. According to the procedure, the Director of the APC adopts a decision on whether a public official has violated the provisions of the LPC and the decision is published on the website of the APC. The APC informs the official’s employer and asks them to initiate the procedure of dismissal, suspension, or

imposition of disciplinary measures. In 2019, the authorities took action in 29 out of 44 cases where the APC had found that public officials violated provisions of the LPC. Moreover, violations are sanctioned as misdemeanours. In 2019, the courts imposed sanctions in 30 out of conflict-of-interest violation cases submitted by the APC. The total amount of fines imposed was EUR 8 150 (ASK, 2020<sup>[215]</sup>). According to the APC, in most cases the fines are below the minimum prescribed by the LPC. It appears that the procedure whereby the APC decides on the existence of a violation while the legal consequences are decided by other bodies results in a general under-enforcement of the law. On the other hand, in August 2020, a court invalidated the APC's own decision, which had found no conflict of interest in a prominent case involving the former Prime Minister of Montenegro (EC, 2020<sup>[66]</sup>). The case was returned to the APC for repeated review.

All public officials are required to **disclose assets and income**, as are certain categories of civil servants, pursuant to special regulations. Exceptions are the staff of political officials (such as advisors). The data to be declared are generally comprehensive, though there are a few gaps. These include the lack of an explicit requirement to report beneficial ownership; major transactions (expenses) unless reported in the event of an increase in assets of more than EUR 5 000; and virtual assets, e.g., cryptocurrencies. The technical system for declaration is well developed with an online platform for submission, publication by default with certain exempted data, searchable and electronically readable forms available for the public, and possibilities for internal users to manage the declarations. However, advanced electronic analysis, for example, searches for risk indicators or so-called red flags, is not possible. One of the main gaps in the declaration system is the requirement to obtain permission from a declarant in order for the APC to gain access to bank data.

The APC's section for verifying the income and assets of public officials has six employees, four of whom carry out verifications. In 2019, 285 misdemeanour proceedings for violations of asset and interest disclosure rules were completed, with sanctions applied in 263 of the cases. The total amount of fines was EUR 48 460. A 2019 report by the European Commission is critical of the practice regarding inexplicable wealth. It refers to 30 cases of inexplicable wealth opened in 2018, of which 28 were subsequently closed without finding irregularities (EC, 2019<sup>[73]</sup>). The data for 2019 reveal a similar situation (no violations found out of 31 verifications).

The Law on Prevention of Corruption contains provisions for the **protection of whistle-blowers**. The LPC guarantees protection to individuals who report a corruption-related wrongdoing that they believed to be true at the time of reporting. The APC must protect whistle-blowers who have reasonable grounds to believe that there are threats to the public interest that indicate the existence of corruption and who report this suspicion in good faith. The LPC extends this protection to both public and private sector employees.

However, the law deviates in several ways from EU Directive 2019/1937 on the protection of persons who report breaches of Union law. Under Montenegrin law, only threats that indicate the existence of corruption can be the subject of whistleblowing. Whistle-blowers may submit reports to the APC without first submitting them to the entity concerned, but there is no possibility of public disclosure to the media or public associations. The types of prohibited retaliation listed in the LPC are fewer and narrower than those found in the Directive (even though the LPC list is non-exhaustive, and thus in principle other types of retaliation could be considered too). The provisions are rather vague on the available protection measures and, in particular, compensation for damage. The LPC also does not envisage provisional protection, and it can only be provided in court proceedings. In the past, there have been controversies in Montenegro over decisions to refuse to grant someone the status of whistle-blower. One prominent case concerns a hotel employee fired in 2016 after revealing that a public entity paid the bill for a political party. However, since then the number of whistleblowing reports received by the APC has increased: from 56 in 2016 to 110 in 2019 (ASK, 2020<sup>[215]</sup>).

The APC considers that the external reporting channel to the APC is most effective, while internal whistleblowing is uncommon. According to government data, the effectiveness of whistleblowing in the

context of criminal proceedings is modest. In 2019, the APC forwarded five reports to prosecutors' offices. In two of these cases the reports were rejected, while in three cases the proceedings are ongoing. In 2018, eight out of nine reports were rejected. In 2017, seven out of nine reports were rejected. Few individuals reporting threats to the public interest request protection (eight requests in 2016, two requests in 2017, one request in 2018, three requests in 2019) (EC, 2019<sup>[73]</sup>; EC, 2020<sup>[66]</sup>).

The section of the APC dealing with whistle-blower reports and protection has three employees. According to the APC, whistle-blower reports are also used for policy development. For example, in 2016, a large number of whistle-blower reports received by the APC related to employment procedures. Based on these reports, the APC drafted an opinion on the Labour Law and the Law on Employment and Exercise of Unemployment Insurance Rights concerning public sector employment.<sup>233</sup>

The APC regularly carries out **public awareness and education** campaigns. In 2019, it created fliers (on topics such as prohibitions and restrictions on receiving gifts, etc. in the exercise of public office, submission of asset declarations by public officials, reporting threats to the public interest; brochures on the APC and on the results of the IPA Twinning project; a manual for integrity managers; a billboard and citylight "Report Corruption"; TV announcements "Corruption is not in a game" and "For a Corruption-Free Society"; and a bulletin on anti-corruption. The APC has engaged in numerous training and education activities for public officials, school pupils, university students, and other target groups. It allocates annual funds for awareness raising and public education (EUR 58 000 in 2017, EUR 63 300 in 2018, EUR 58 900 in 2019, and EUR 38 000 in 2020) and has signed co-operation agreements with NGOs to engage in joint training and awareness-raising activities. The effectiveness of these activities is measured with the help of the annual poll on Public Attitudes on Corruption and Awareness of the Work of APC. The poll measures the percentage of citizens who would report corruption to the APC, who claim to know what the APC does, who believe that the APC has contributed to the overall fight against corruption in Montenegro and who think that the APC's campaigns encourage citizens to fight corruption, etc. (ASK and Defacto Consultancy, 2019<sup>[216]</sup>). According to the APC, the survey findings have been used for targeting communication activities, such as to certain geographic areas. Despite these efforts, there is still a lack of information on permanent anti-corruption education programmes, for example, in schools.

### *Sub-dimension 16.3: Independence of the judiciary*

The legal framework generally ensures the **independence of the judiciary**. Judicial duty is permanent. The institutional setup of the Judicial Council satisfies the minimum requirements for its mandate to secure the autonomy and independence of courts and judges, save for the *ex-officio* membership of the Minister of Justice (EC, 2020<sup>[66]</sup>). The Judicial Council consists of a president and nine members (including the President of the Supreme Court and four judges to be elected and released from duty by the Conference of Judges). Thus, judges elected by their peers constitute only a minority of members; this should be changed in future reforms. The competent working body of parliament should issue a public call for appointing four members of the Judicial Council from among eminent lawyers. However, since 2020 parliament has been unable to appoint these members due to a political stalemate. In addition to the exclusion of the Minister of Justice, the Group of States against Corruption (GRECO) has also recommended establishing objective and measurable criteria for identifying professional qualities and impartiality amongst non-judicial members (GRECO, 2019<sup>[217]</sup>). Decisions of the Judicial Council, except for those issued in disciplinary proceedings against a judge, are published anonymously on the website of the Courts of Montenegro.<sup>234</sup>

A judge and a president of the court are to be elected and dismissed from duty by the Judicial Council. Vacant positions for judges should be filled in accordance with the Plan of Vacant Positions for Judges adopted by the Judicial Council. Vacant positions for judges in basic courts should be filled through an internal announcement for voluntary transfer. If the positions are not filled through this procedure, they should be filled following a public announcement. The law prescribes the promotion of judges based on

their position and achievements on a ranking list. The assessment tools for appointment involve work appraisal and an interview with the candidate. Vacant positions for judges in the High Court, the High Misdemeanour Court, the Appeals Court, and the Supreme Court are announced publicly. The procedures for public announcement, submission of applications and processing of the applications, as well as the rights of applicants, are governed by law.

An information system allocates cases to judges randomly. According to the government, all final decisions are regularly published anonymously on courts' website.

The legal framework for judges' disciplinary responsibility corresponds to the requirements for judicial independence. Court presidents may initiate disciplinary proceedings. A judge against whom disciplinary proceedings have been instituted has the right to participate in the proceedings and is entitled to a defence counsel. The disciplinary prosecutor and the judge whose liability is established may file an appeal against the decision to the Supreme Court. However, the non-publication of decisions of the Judicial Council in disciplinary proceedings against judges limits the public accountability of the process. The track record of disciplinary responsibility is limited, with sanctions applied in only three cases in 2015, and in one case each in 2017 and 2019. The Commission for the Code of Ethics for Judges prepares opinions regarding conformity of judges' conduct with the Code of Ethics. Two violations were established in 2019. The proceedings of the disciplinary and ethics bodies are reportedly inconsistent, and the system generally requires strengthening (EC, 2020<sup>[66]</sup>).

While the legal guarantees for judicial independence are generally adequate, independent sources refer to perceived vulnerability to political interference, as well as hazards to judicial independence. These include state-sponsored apartments or loans on favourable terms for some members of the judiciary, as well as failures to carry out justice according to the law (EC, 2020<sup>[66]</sup>; Građanska alijansa, 2019<sup>[218]</sup>). On the other hand, some judges have had temporary salary reductions due to the COVID-19 pandemic. The reappointment of several court presidents in breach of the statutory limitation of two terms is another source of concern (Prelević et al., 2019<sup>[219]</sup>).

#### *Sub-dimension 16.4: Business integrity and corporate liability*

The framework for promoting **business integrity** is limited. The Law on Business Organisations does not set out that it is the responsibility of the board of directors in a joint stock company to supervise corruption risk management. The Law on Prevention of Money Laundering and Terrorist Financing (adopted in 2018) stipulates that the Tax Administration – Central Registry of Commercial Entities (CRCE) should maintain a beneficial owners register. However, in 2019 the law was amended, and in late 2020 the CRCE still had not established the register. The Ministry of Interior adopted a new rulebook on keeping the register on 24 December 2020. According to information provided by Montenegro, practical preparations (work on software support, development of regulations, determination of publicly available data and fees) are in progress. The law provides for sanctions in the form of fines ranging from EUR 3 000 to 20 000 for the failure to provide data on beneficial owners and changes thereof, but in the absence of the register, there are no grounds for applying the sanctions in practice. Under the anti-money laundering legislation, reporting entities, including designated non-financial businesses and professions (DNFBPs), should identify beneficial ownership. The Chamber of Economy, in accordance with the Law on the Chamber of Economy of Montenegro, carries out activities to stimulate and improve the business environment and legislative framework and to inform its members of the need to suppress corruption in the private sector. The chamber adopted the Business Ethics Code in 2011 and established the Court of Honour to rule on violations of good business conduct rules.

The Law on Criminal Liability of Legal Entities stipulates that **legal entities are liable for criminal offences** (those referred to in the special section of the Criminal Code of Montenegro and for other criminal offences provided for under a separate law) if conditions prescribed by the law have been fulfilled. A legal entity is liable for a criminal offence if a responsible person commits the criminal offence while acting within

his/her authorities on behalf of the legal entity, with the intention to obtain gain for the legal entity, or when the activity of the responsible person was contrary to the business policy or orders of the legal entity. The legal entity will be held liable for a criminal offence even if the responsible person who committed the offence has not been convicted, but the physical person who committed the offence must be identified. Fines are determined depending on the amount of damage caused or material gain obtained. In addition to a fine and a suspended sentence, other sanctions (security measures) are also prescribed. An entity may be exempt from punishment if it has undertaken all the effective, necessary, and reasonable measures to prevent and reveal the commitment of the criminal offence. A report by the Public Prosecution Council shows that in 2019, 33 legal entities were prosecuted for offences under Chapter 34 “Criminal offences against service obligations” of the Criminal Law. Courts convicted 17 legal entities (all categories of crime) (Tužilački savjet, 2020<sup>[220]</sup>).

#### *Sub-dimension 16.5: Investigation and prosecution*

There is no detailed public information about the course of **investigation and prosecution of high-level corruption**, although the authorities reportedly inform the public at press conferences and publish relevant data on the website of the Special State Prosecutor's Office (SSPO).<sup>235</sup> Moreover, information about cases of high-level corruption is provided in periodic reports submitted to parliament (Tužilački savjet, 2020<sup>[220]</sup>). According to the government, since the formation of the SSPO in 2015, in all cases of high-level corruption where defendants have been found guilty, effective prison sentences have been handed down.

According to the SSPO, between 3 July 2015 and 1 September 2020, it raised 43 indictments against 137 individuals and 11 legal entities for high-level corruption offences. Thus, the intensity of investigation and prosecutorial activity is relatively high. The evidence is somewhat controversial regarding the track record of convictions for high-level corruption, however. According to data provided by Montenegro, the number of cases involving final convictions for high-level corruption was three in 2015, three in 2016 and one in 2018. A European Commission report mentions four final and enforceable judgements for high-level corruption each in 2018 and 2019, and one further judgement in mid-June 2020. Financial investigations are yet to be launched systematically in parallel with corruption cases investigations (EC, 2020<sup>[35]</sup>). The most prominent person convicted for corruption (the former President of the State Union of Serbia and Montenegro, and the former President of the Parliament of Montenegro) avoided serving the sentence handed down in 2016 by leaving Montenegro (EC, 2019<sup>[73]</sup>).

The Special State Prosecutor's Office forms the core of the **specialised anti-corruption prosecutorial and judicial bodies**. The SSPO's remit includes tackling high-level corruption, the abuse of position in business undertakings and the abuse of authority in the economy if the proceeds of crime exceed EUR 40 000, money laundering, etc. The SSPO brings its actions before the Special Division of the High Court in Podgorica.

The Law on the SSPO contains several guarantees for its independence, transparency and accountability. The Chief Special Prosecutor and special prosecutors are selected from applicants who respond to a public advertisement and are then elected by the Prosecutorial Council. The law describes the selection process, including criteria, in detail. The tenure of the Chief Special Prosecutor is five years while a special prosecutor can be elected to serve life tenure if he/she has worked for at least four years as a state prosecutor or as a judge. However, the autonomy of the SSPO is limited in that the Supreme State Prosecutor may directly exercise all powers and undertake all actions for which the head of the SSPO is authorised. The Chief Special Prosecutor should submit a six-month activity report on the SSPO to the Supreme Public Prosecutor, as well as separate reports on request.

There has been some strengthening of the capacity of the SSPO. Since 2018, the number of prosecutors allocated to the SSPO has increased from 10 to 13. The SSPO employs six economic experts. However poor office conditions are a concern reportedly (EC, 2019<sup>[73]</sup>; EC, 2020<sup>[66]</sup>). According to the government,

in 2019 special prosecutors participated in numerous training courses on a variety of topics, although few were specifically on corruption.

**Specialised anti-corruption investigative bodies** are located within the Police Directorate. The section for the Fight against Organized Crime and Corruption contains a Special Police Division (SPD),<sup>236</sup> which in turn contains the Group for the Investigation of Criminal Cases of High Corruption and Money Laundering (GICCHCML), headed by the Chief Police Inspector and comprising 14 specialised investigators.

The SPD is an integral organisational unit of the Police Directorate and as such does not have special formal independence guarantees different to those of other police units. The head of the division is appointed by the director of the administrative authority responsible for police affairs, subject to the consent of the Chief Special Prosecutor. The SPD acts on the orders and instructions of a special prosecutor. The Chief Special Prosecutor may form a special investigative team in particularly complex cases in which, besides a special prosecutor, police officers from the SPD, investigators and civil servants from other competent authorities may be included.

Montenegro has taken steps to gradually strengthen the capacity of its corruption investigation. In 2018, the special police unit was allocated 10 additional staff, bringing the total number of filled positions to 29. Today it has 32 staff. However, the staff numbers are reportedly still insufficient relative to the workload (EC, 2019<sup>[73]</sup>; EC, 2020<sup>[66]</sup>). The Law on Interior Affairs determines investigators' salaries, but the Government of Montenegro has supplemented the basic salary of anti-corruption investigators by 45%.

### ***The way forward for anti-corruption policy***

To strengthen the anti-corruption policy framework and implementation, policy makers should:

- **Develop and adopt a renewed national anti-corruption plan or strategy** based on an overall corruption risk and gap assessment, which reflects the current state of affairs. Montenegro approved the OD in 2016, but this document cannot fully serve the purpose of setting up-to-date goals, responsibilities, deadlines and funding needs relevant in 2021. The United Nations Convention against Corruption requires that states develop and implement or maintain effective, co-ordinated anti-corruption policies that promote the participation of society and reflect the principles of the rule of law, proper management of public affairs and public property, integrity, transparency and accountability (Article 5, Paragraph 1) (United Nations, 2004<sup>[221]</sup>). Comprehensive strategies and action plans, which define objectives and goals, allocate responsibilities, set deadlines, determine necessary funds, are widely recognised as the optimal way to frame anti-corruption policies. In preparing this strategy, the government should follow public consultation best practice and envisage regular public reporting on its implementation.
- **Widen the scope of corruption proofing of legislation** to cover most of the laws and regulatory acts that may embody corruption risks. For this task, the capacity of the APC may need to be strengthened. Corruption proofing of legislation is a key step for limiting corruption risks that arise from deficiencies in the legal framework. Such work requires substantial analytical capacity. Due to the large number of regulations to be potentially assessed, full implementation of this recommendation will take several years. The APC should strive to return at least to the intensity of the proofing activity of 2017, when it published 11 opinions.
- **Strengthen the verification of asset and interest reports** by encouraging (e.g. in codes of ethics) public officials to give permission for the APC to access the necessary bank information and by exploring the options for developing an advanced electronic risk monitoring system for detecting violations of the law. Explore further possibilities for strengthening the effectiveness of inexplicable wealth detection. The Western Balkan Recommendation on Disclosure of Finances and Interests by Public Officials recommends that banking secrecy should not be an obstacle to using banking data for verification purposes. Moreover, verification should not be limited to

comparing data but should aim at detecting undeclared cash-flows and any possible illicit origin (EIN, 2014<sup>[222]</sup>). It is possible for a corrupt public official to complete a declaration with data that correspond to public registers and other sources checked by an oversight body while still incurring expenses that vastly exceed his/her legal income. Access to data on at least the turnover and balances of the relevant bank accounts can significantly assist in assessing the economic plausibility of the declared information.

- **Continue the dissemination of information for potential whistle-blowers.** In order to promote whistleblowing activity, encourage whistle-blowers to report quickly any suspicion of corruption threats to the public interest, and maximise the usefulness of whistle-blower reports for follow up by relevant authorities. The relevant EU directive envisages mandatory and optional measures of support for whistle-blowers such as comprehensive and independent information and advice, which is easily accessible to the public and free of charge, on procedures and remedies available, on protection against retaliation, and on the rights of the person concerned; effective assistance from competent authorities before any relevant authority involved in their protection against retaliation; legal aid, counselling or other legal assistance; financial assistance and support measures, including psychological support, for reporting persons in the framework of legal proceedings. Montenegro has taken actions in these areas, but the efforts need to continue. Montenegro should also strive to fully implement the EU directive regarding opportunities for public reporting.
- **Explore ways to strengthen the record of the disciplinary liability of judges**, for example, by encouraging citizens who have grounded belief that a judge has acted illegally or unethically to inform in good faith the Judicial Council. Expand the scope of published information on disciplinary proceedings. International standards allow for the publication of disciplinary decisions with or without naming the judge (ENCJ, 2015<sup>[223]</sup>). Box 23.24 provides an example from Latvia. Where public trust in the independence and integrity of the judiciary is limited, greater transparency appears the preferable option.
- **Ensure registration of and oversight over the disclosure of beneficiary owners** of legal entities. The EU Anti Money Laundering Directive requires that the information held in the central register of beneficial ownership is adequate, accurate and current. It is required that states put in place mechanisms to this effect, e.g. ensuring that obliged entities and competent authorities report any discrepancies they find between the beneficial ownership information available in the central registers and the beneficial ownership information available to them. However, note that full assessment of compliance by Montenegro with requirements of the EU directives in this area is beyond the scope of this analysis.
- **Consider further strengthening the independence of anti-corruption investigative and prosecuting bodies.** Standards under the United Nations Convention against Corruption state that a body or bodies or persons specialised in combating corruption through law enforcement should be granted the necessary independence, in accordance with the fundamental principles of the legal system of the State Party, to be able to carry out their functions effectively and without any undue influence (Article 36) (United Nations, 2004<sup>[221]</sup>). This assessment did not evaluate in-depth the work practice of the SPD, and hence does not argue whether or not any undue influence on its activities has taken place. However, Montenegro should consider potentially introducing additional means for safeguarding the independence of the SPD, such as more public and competitive selection of management and strengthened guarantees of dedicated budget funding. Montenegro should also reconsider whether the authority of the Supreme State Prosecutor to directly exercise all powers and undertake all actions for which the head of the SSPO is authorised is compatible with due independence of the SSPO.

### Box 23.24. Publication of judicial disciplinary decisions in Latvia

According to the Judicial Disciplinary Liability Law, a decision taken in a disciplinary case must be published online, except for a decision to forward the file to the Prosecutor General's Office for deciding on the launch of criminal proceedings. In the published decision, personal data must be concealed, but the name of the person held liable is disclosed.

The published decision must be deleted from the website one year after the day it came into effect. If a disciplinary sanction is set aside before this time limit, the published decision must be deleted from the website after the decision to set aside the sanction is taken.

If a decision in a disciplinary case proposes the removal of a judge but the Parliament votes against the removal and the disciplinary case is returned to the Judicial Disciplinary Board for repeated examination, the initial published decision must be deleted from the website.

<sup>7</sup> Fine particulate matter (PM<sub>2.5</sub>) is the air pollutant that poses the greatest risk to health globally, affecting more people than any other pollutant. This becomes of even greater concern in the context of the COVID-19 pandemic knowing that exposure to ambient and indoor air pollution increases the risk of cardiovascular, respiratory and developmental diseases, as well as premature death, thus making individuals even more vulnerable to COVID-19 (OECD, 2020<sup>[293]</sup>).

<sup>25</sup> Annual GDP data by expenditure categories are available on <http://monstat.org/eng/page.php?id=19&pageid=19>

<sup>26</sup> The main ministries and bodies involved in the dialogue on trade policy, apart from the Ministry of Economy, are the Ministry of Agriculture and Rural Development, Ministry of Finance (specifically the Directorate for Tax and Customs System) and Statistical Office – MONSTAT.

<sup>27</sup> The Working Group for TRP, led by the Ministries of Economy and Foreign Affairs, is composed of 44 authorities and is charged with making recommendations and drafts relevant to the implementation of WTO *acquis*. It is also responsible for ensuring transparency on trade-related measures and fostering dialogue between the public and private sectors on these issues.

<sup>28</sup> The NTFC was created in 2015 as a permanent multi-agency platform consisting of representatives of all relevant state bodies and the private sector. Its task is to ensure co-ordination and co-operation between the above actors in order to fully and effectively implement the WTO Trade Facilitation Agreement (TFA). The committee operates on the principle of co-chairing between the Ministry of Economy and the Ministry of Finance. It is composed of representatives from across the relevant public administrations (headed by the Ministries of Economy and Finance). It notably also involves representatives from the Customs Administration, Ministries of Agriculture, Transport and Maritime Affairs and private sector associations such as the Chamber of Economy and Employers Association.

<sup>44</sup> Law on Postal Services, Official Gazette of Montenegro, (OG MNE no. 57/11, 55/2016 and 55/18).

<sup>45</sup> Basel III is a set of measures developed by the Basel Committee on Banking Supervision in response to the 2008/09 crisis. It has been agreed internationally and aims for a more resilient banking system. It underpins the regulatory and supervisory framework and strengthens banks' risk management.

<sup>46</sup> The Central Bank of Montenegro prepared and adopted a set of secondary legislation enabling the implementation of the Law (adopted in November and December 2020) in line with the EU regulatory framework, and recent amendments to EU regulations were implemented in the secondary legislation. However, considering the challenges brought by the COVID-19 pandemic, the Association of Montenegrin Banks submitted an initiative to delay the entry into force of the Law on Credit Institutions in July 2020. Banks have expressed concerns over the implementation of the new framework, as it requires a large number of harmonisation activities that they might not be able to undertake in the current context. Accordingly, in August and September 2020 the Central Bank of Montenegro prepared a set of amendments to the law to postpone its application for an additional year (until January 2022). These were adopted by the Parliament of Montenegro on 20 January 2021 (effective from 26 January 2021). Consequently, the Law on Credit Institutions will enter into force on the 1st January 2022.

<sup>47</sup> Law on Electronic Communications, Official Gazette of Montenegro, (OG MNE nos. 40/13, 2/17 and 49/19).

<sup>48</sup> Resulting in a projected market volume of USD 94m by 2025: <https://www.statista.com/outlook/243/270/ecommerce/montenegro>

<sup>49</sup> Directive 2000/31/EC.

<sup>50</sup> Basel II is an international business standard developed prior to the 2008/09 crisis by the Basel Committee on Banking Supervision. It requires financial institutions to maintain enough cash reserves to cover risks incurred by operations.

<sup>51</sup> Based on the European banking authority's report to the European Commission on the perimeter of credit institutions established in the Member States. URL: <https://www.eba.europa.eu/sites/default/documents/files/documents/10180/534414/6bbabcef-ac51-48b8-a4fb-45dfd483e486/2014%2011%2027%20-%20EBA%20Report%20-%20Credit%20institutions.pdf?retry=1>

<sup>52</sup> Financial factoring was previously covered under the Law on Banks adopted in 2011.

<sup>53</sup> The law on obligations, the law on enterprises, the law on property relations, the law on collateral security claims, the law on prevention of illegal businesses, and tax laws.

<sup>54</sup> Securities Token Offerings combine the technology of blockchain with the requirements of regulated securities markets to support liquidity of assets. They are essentially the digital representations of ownership of assets (e.g. gold, real estate) or economic rights (e.g. a share of profits or revenue).

<sup>55</sup> In 2010, the New Securities Stock Exchange (NEX) and the Montenegro Stock Exchange merged. NEX Stock Exchange ceased to exist as a legal entity as of December 2011.

<sup>56</sup> <http://www.montenegroberza.com/code/navigate.asp?id=991>

<sup>57</sup> Before 2020, a special temporary measure, the “crisis rate” applied to salaries exceeding the average monthly salary in the previous year (EUR 766 per month for 2019). The part of the salary exceeding this amount was subject to an 11% withholding tax.

<sup>58</sup> The OECD Database on General Competition Statistics (OECD CompStats) contains general statistics on competition agencies, including data on enforcement and advocacy initiatives. In 2020, it included data from competition agencies in 56 jurisdictions, including 37 OECD countries (36 OECD countries and the European Union), i.e. Argentina, Canada, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Mexico, Peru, United States (Americas): Australia, Brazil, Chinese Taipei, India, Indonesia, Japan, Korea, New Zealand (Asia-Pacific); Austria, Belgium, Bulgaria, Croatia, Czech Republic, Denmark, Estonia, European Union, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Romania, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, United Kingdom (Europe); Egypt, Israel, Kazakhstan, Russian Federation, South Africa, Turkey, Ukraine (Other), (OECD, 2020<sub>[31]</sub>).

<sup>59</sup> Limitations in data availability make it difficult to arrive at a complete picture of the SOE landscape: 1) reporting for this assessment has excluded public-service SOEs with the legal form of “public enterprise”; 2) the Central Depository Agency and the National Statistical Office report slightly different numbers of SOEs and state minority-owned companies (perhaps pointing to definitional differences); 3) SOEs’ share of national employment is understood in the available data; and 4) valuation and financial performance data are not centrally collected/available.

<sup>60</sup> Calculations based on data provided by the authorities and labour force data on number of employed from the first quarter of 2020.

<sup>61</sup> The comparison with OECD-area SOE sectors is only an imperfect approximation, owing, among other things, to the fact that data for the OECD area is based on SOEs’ share of total non agricultural employment, whereas the data used in the current assessment is based on their share of total employment.

<sup>62</sup> The three companies with 100% state ownership are Crnogorska Plovidba (Maritime and Coastal Freight Transport), Pošta Crne Gore (Montenegro Post) and Aerodromi Crne Gore (Podgorica Airport).

<sup>63</sup> Exceptionally, a public official, other than the President of Montenegro, MP, councillor, member of the Government of Montenegro, Judges of the Constitutional Court of Montenegro, Judge, the head of Public Prosecution office, Public prosecutor, Special Prosecutor for Suppression of Organized Crime, Corruption, Terrorism and War Crimes and Deputy Special Prosecutor, may be a president or member of the management body or supervisory board of a public company, public institution or other legal person in a public enterprise, public institution or other legal person owned by the state or a municipality.

<sup>64</sup> Information provided by stakeholders in the context of the assessment.

<sup>65</sup> According to data from the Central Depository Agency, the companies currently undergoing bankruptcy proceedings are as follows: Rudnici Boksita U Stečaju A.D. Nikšić (32% of the ownership), Fabrika Elektroda Piva U Stečaju A.D. Plužine (42%), Elektroindustrija « Obod » U Stečaju A.D. Cetinje (52%), N.I.G. « Pobjeda U Stečaju » A.D. Podgorica (86%), Kombinat Aluminijskog U Stečaju A.D. Podgorica (29%), Opšte Građevinsko Gorica U Stečaju A.D. Podgorica (31%), Radoje Dakić U Stečaju A.D. (51%), Jadransko Brodogradilište U Stečaju A.D. Bijela (62%), Dekor U Stečaju A.D. Rožaje (23%), Preduzeće za Izgradnju Podgorice A.D. Podgorica U Stečaju (29%), Mašinopromet Rezervni Djelovi U Stečaju (60%).

<sup>66</sup> <https://balkaninsight.com/2019/12/10/montenegro-govt-to-prop-up-indebted-national-airline/>

<sup>67</sup> The privatisation plan is prepared on the basis of proposals from the competent state administration bodies, line ministries, state funds, and the tender commissions of the Privatisation and Capital Projects Council. The privatisation plan must contain: 1) the objectives of privatisation; 2) the approach and detailed conditions and deadlines for its execution; 3) privatisation methods; and 4) a list of companies including the number and ownership structure of shares to be privatised in each company and details of the social aspect of privatisation. Annual privatisation plans are published in the media. They can be updated on a proposal by the competent ministries, on the initiative of the potential investor, or on the proposal of the owner of part of the share capital, in the case of companies that are covered by the decision on the privatisation plan for that year.

<sup>68</sup> For the purpose of this profile, the instruction system refers to teaching and learning processes that take place in school education. It generally consists of curricula, standards for schools and student learning, assessment and evaluation frameworks and other elements that support instruction.

<sup>69</sup> The Bureau for Education Services is a subsidiary institution of the Ministry of Education with responsibilities for monitoring, improving and evaluating pre-university education.

<sup>70</sup> Instrument for Pre-Accession Assistance (IPA) are funds provided by the European Union to help candidate economies align their policies and strategies with EU standards.

<sup>71</sup> The PISA 2018 reading assessment in Montenegro revealed that general/modular programmes had an average of 22% low performers while vocational programmes had 55% (OECD, 2020<sup>[234]</sup>).

<sup>72</sup> The Centre for VET sets occupational standards, qualifications and offers professional development for VET teachers.

<sup>73</sup> The Bureau for Education Services is responsible for setting general education curricula within VET programmes.

<sup>74</sup> All three-year and four-year programmes in vocational schools have a prescribed minimum portion of classes that is implemented by the employer. The total portion of practical classes ranges from 15% in four-year programmes to approximately 50% in three-year programmes.

<sup>75</sup> Montenegro plans to make Masters studies tuition free in 2020-21.

<sup>76</sup> Selection into higher education requires successful completion of upper-secondary education and a minimum score on the State Matura examination. Specific requirements are set by individual higher education institutions and certain study areas may require an additional entrance examination.

<sup>77</sup> For example, the University of Montenegro has its own Strategy for Internationalisation.

<sup>78</sup> The timeframe refers to 2015-2019, Q2, (World Bank and WIIW, 2020<sub>[120]</sub>).

<sup>79</sup> Not including the UK.

<sup>80</sup> Administrative data provided by Montenegro.

<sup>81</sup> In December 2019, Parliament enacted a new Labour Law, meant to bring national law in line with the EU directives 2006/54/EC on equal opportunities in employment and 92/85/EEC on pregnant workers, although further progress still needs to be made on alignment with the latter directive.

<sup>82</sup> The new Labour Law is designed to bring national law in line with the EU directives 2006/54/EC on equal opportunities in employment and 92/85/EEC on pregnant workers, although further progress still needs to be made regarding alignment with the latter directive (EC, 2020<sub>[35]</sub>).

<sup>83</sup> The tasks of labour inspectorates are ruled by the Law on Labour Inspection (Official Gazette no. 79/08 & 40/11), the Labour Law, the Law on Occupational Health and Safety and the General Collective Agreement, as well as the Law on Foreigners (Official Gazette, no. 12/18, 03/19).

<sup>84</sup> The number of available jobs for labour inspectors is 53 (37 in labour relations, including the chief inspector, and 16 in occupational health and safety). A total of 42 inspectors are actually employed, 32 in labour relations, including the chief inspector and 10 in occupational health and safety (Ministry of Public Administration of Montenegro, 2020<sub>[113]</sub>).

<sup>85</sup> These include the Employment and Social Reform Programme 2015-2020, Strategy for Regional Development 2014-2020, the Youth Strategy 2017-2021, the sectoral operational programme for Montenegro on Employment, Education and Social policies 2015-201, Women's Entrepreneurship Development Strategy 2015-2020, Lifelong Career Guidance Strategy 2016-2020, Strategy for Integration of Persons with Disabilities 2016-2020; and the strategy for Combating the Grey Economy.

<sup>86</sup> These measures are defined in the action plan for Combating the Grey Economy and include: 1) establishing an institutional mechanism for measuring and estimating the grey economy and calculating the tax gap; 2) establishing an appropriate institutional model for measuring the grey economy and its share in GDP; 3) eliminating administrative burdens in a way that reduces both operating costs and the time required to fulfill obligations to the state; 4) improving the regulatory framework in the field of fiscal policy, labour legislation and social policy. The goal of fiscal policy measures is to reduce the benefits, on the one hand, and increase the costs and risks of joining the grey economy, on the other. Therefore, the most important measures in the field of fiscal policy would be to reduce the cost of applying taxes and reduce tolerance of the grey economy. Reducing the costs of tax application could be achieved by reducing the number and simplification of tax procedures, and introducing the obligation to file tax returns and communicate with tax authorities electronically.

<sup>87</sup> The social partners are the Montenegrin Employers Federation and the Confederation of Trade Unions of Montenegro.

<sup>88</sup> The ratio of wage and salary earners that are trade union members to the total number of wage and salary earners in the economy (ILO, 2008<sub>[291]</sub>).

<sup>89</sup> According to an interview by the local independent consultant with stakeholders.

<sup>90</sup> Information provided by external expert.

<sup>91</sup> See for details ILO (2019), Decent Work Programme 2019-2021 Montenegro.

<sup>92</sup> When the level of education or qualification is less or more than required (ILO, 2014<sub>[288]</sub>).

<sup>93</sup> Comprising the Law on Adult Education, Adult Education Strategy 2015-2025, Adult Education Plan 2019-2022, and the Law on National Professional Qualifications.

<sup>94</sup> Information provided by the government.

<sup>95</sup> Information provided by the government.

<sup>96</sup> Information provided by the government.

<sup>97</sup> The Ministry of Labour and Social Welfare and the Ministry of Education run the Strategy for Development of Women's Entrepreneurship 2015-2020 (under the Ministry of the Economy), the Strategy for Lifelong Entrepreneurial Learning 2020-2024 (promoting female entrepreneurship) and the Strategy for Development of Micro, Small and Medium Enterprises in Montenegro 2018-2022, which aims at promoting female, youth and social entrepreneurship. The objective of the Action Plan for Achieving Gender Equality 2017-2021 consists of increasing women's employment.

<sup>98</sup> The programme reached the most vulnerable group of unemployed people, as reflected in the structure of the participants: 96% were female, almost two-fifths (38%) were older than 50, more than one-fifth (22%) were long-term unemployed and almost one-half were from the northern region, which has a much higher unemployment rate as compared than other areas of Montenegro. In total, 8.3% of total funds for ALMPs were spent on this programme, see (Employment Agency of Montenegro, 2019<sub>[319]</sub>).

<sup>99</sup> The budget is sourced from employers and employees' contributions to unemployment insurance (0.5% of wages), special contributions for the employment of persons with disabilities, income from the repayment of loans for self-employment, income from sold shares in privatised companies, assets and other income.

<sup>100</sup> Information provided by EAM.

<sup>101</sup> There was no difference between EU-28 and EU-11 average.

<sup>102</sup> In 2018 there were 29 366 vacancies published, and in 2015 35 574 vacancies through 18 367 vacancy applications (administrative data received from the government of Montenegro)

<sup>103</sup> Official Gazette of Montenegro no. 74/2019 on December 30. Labour Law, Article 24; Law on Mediation in Employment and Rights during Unemployment, Article 26.

<sup>104</sup> However, the number of unemployment benefit recipients who were self-employed in relation to the total number of cash benefit recipients is negligible.

<sup>105</sup> Information provided by the government.

<sup>106</sup> Information provided by EAM.

<sup>107</sup> The programme is carried out in accordance with the Law on Professional Training of People with Acquired Higher Education (Official Gazette, No. 38/12).

<sup>108</sup> See Uljarević, M., Lazić, M., & Krstić, G. (2014). Informal Employment and the Grey Economy in Montenegro Survey. IPSOS. (Uljarević, Lazić and Krstić, 2014<sub>[302]</sub>)

<sup>109</sup> Information provided by the government.

<sup>110</sup> There is a clear link between access to quality and accessible childcare and female employment, (OECD, 2016<sup>[290]</sup>).

<sup>111</sup> Horizon 2020 is the biggest European Union's framework programme for research and innovation. It provides funding for multi-national collaboration projects as well as for individual researchers, and supports SMEs with a special funding instrument. (<https://ec.europa.eu/programmes/horizon2020/en/what-horizon-2020>; <https://www.euneighbours.eu/en/east/stay-informed/projects/horizon-2020>).

<sup>112</sup> Eureka is the largest intergovernmental network for cooperation in R&D and innovation in the world. It is present in over 45 economies, where it provides access to public funding, promotes collaboration and innovation or offers advice, through various programmes (such as EUREKA Clusters, Globalstars, InvestHorizon) (<https://www.eurekanetwork.org/>).

<sup>113</sup> European Cooperation in Science and Technology (COST) is an EU-funded, intergovernmental framework, currently gathering 38 Members and 1 Cooperating Member. It is a funding organisation for the creation of research networks (COST Actions), which offer an open space for collaboration among scientists across economies. COST funding is intended for collaboration activities and complements national research funds (<https://www.cost.eu/who-we-are/about-cost/>).

<sup>114</sup> EURAXESS - Researchers in Motion is a pan-European initiative delivering information and support services to professional researchers, backed by the EU, member states and associated countries. It supports researcher mobility and career development and enhances scientific collaboration (<https://euraxess.ec.europa.eu/>).

<sup>115</sup> In November 2016, the government adopted the Decree on Amendments to the Decree on the Organization and Manner of Work of the State Administration, which seized operation of the Ministry of Information Society and Telecommunications. Since the adoption of the Regulation, the Directorate for Electronic Communications, Postal Services and Radio Spectrum has been under the responsibility of the Ministry of Economy, and the Directorate for the Development of Electronic Government (the field of electronic administration and electronic commerce) is in the Ministry of Public Administration. In December 2020, the government adopted the new Decree on the Organization and Manner of Work of the State Administration, according to which the responsibilities of the previous Ministry of Economy fell under the authority of the Ministry of Economic Development.

<sup>116</sup> The project is co-funded by the EU. It involves an initial grant of EUR 520 000, followed by potential investment loans from the Western Balkans Investment Framework (WBIF), and the European Investment Bank (EIB) (<https://wbif.eu/project/PRJ-MNE-DII-001>).

<sup>117</sup> For details see <https://www.worldbank.org/en/country/kosovo/brief/balkans-digital-highway-initiative>

<sup>118</sup> The EKIP has prepared broadband mapping through a geographically referenced database of installed electronic communications infrastructure based on data provided by the operators, including telecommunications ducts, poles and buildings, as well as elements like cables, equipment etc. The EKIP is in the process of upgrading this database for mapping broadband access (<http://ekinfrastuktura.ekip.me/ekip/login.jsp>).

<sup>119</sup> The most recent regulations adopted include the ordinance on the type, manner of submitting and publishing data on electronic communications infrastructure and related equipment that may be of interest for joint use (2018); the rulebook on determining the data transfer speed for functional Internet access via the Universal Service (2018); the rulebook on types of benefits and special measures for access to public electronic communication services for persons with disabilities (2017); the rulebook on providing access to persons with disabilities number 112 and emergency numbers (2017); the rulebook on the quality of public electronic communication services (2018); the rulebook on conditions and manner of prevention and suppression of abuses and fraud in the provision of electronic mail services (2018), etc.

<sup>120</sup> The government Open Data Portal is available at [www.data.gov.me](http://www.data.gov.me).

<sup>121</sup> The open data hackathon "Make it accessible and useful" was organised on the 5<sup>th</sup> October 2019 by the project Odeon, co-funded by the European Regional Development Fund (ERDF) under the INTERREG Mediterranean Program 2014-2020. The competition was integrated into the Infofest 2019 Conference programme. The topic of the competition was the creation of applications that create added value from available data sets for the public administration, the business community and citizens. Six teams contributed their ideas during the hackathon (<https://odeon.interreg-med.eu/pt/news-events/news/detail/actualites/hackathon-open-data-idea-presentations-in-budva-montenegro/>)

<sup>122</sup> The Law on Electronic Government was adopted on 3 January 2020, and was applied six months later (3 July 2020).

<sup>123</sup> Legislation adopted in 2019 includes: the Law on Administrative Fees introducing electronic collection of administrative fees; the Law on Public-Private Partnership, regulating the possibilities of public-private partnership during the implementation of projects in the field of ICT; the Law on Fiscalisation, regulating the electronic exchange of data on collected services and goods between taxpayers and the Tax Administration in real time; and the Law on Public Procurement, prescribing the implementation of electronic public procurement.

<sup>124</sup> The e-Government portal is available at: <http://www.euprava.me/>

<sup>125</sup> In June 2018 the government adopted the Strategy for the Development of the Integrated Health Information System and e-Health for the period 2018-2023, and an action plan for the period 2018-2021. The Framework for Interoperability of the Health System was also adopted and represents the basic act and guidelines for establishing a complete system of interoperability of all existing and future information systems within the entire health system in Montenegro. Several other new services have been developed including e-scheduling, e-recipes, e-results, e-pharmacies, e-insurance, e-ordering and e-exercising rights.

<sup>126</sup> In 2019 the Ministry of Economic Development gathered a variety of programmes under its responsibility into the single Programme for Improving the Competitiveness of the Economy. It consisted of 10 programme lines in 2019, offering financial and non-financial support to potential and existing entrepreneurs, micro, small, medium and large enterprises, as well as clusters. Financial support is available to help firms to hire consulting services to incorporate ICT solutions into their business practices and purchase necessary hardware or software. Certain programme lines, e.g. for innovation enhancement and for implementing international standards, were especially attractive for ICT companies. In 2020, a new, improved programme was prepared, comprising 13 programme lines that meet the needs and requests of the SME sector, with a separate programme line for business digitalisation ([http://www.mek.gov.me/program\\_za\\_unapredjenje/](http://www.mek.gov.me/program_za_unapredjenje/)).

<sup>127</sup> The programme finances up to 80% of justified costs (excl. VAT), and up to EUR 5 000 (excl. VAT) for companies in which women and/or people under the age of 35 make up at least 50% of the ownership structure.

<sup>128</sup> <http://www.mek.gov.me/ministarstvo>

<sup>129</sup> Data sourced from Eurostat:

[https://ec.europa.eu/eurostat/databrowser/view/isoc\\_ec\\_eseln2/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/isoc_ec_eseln2/default/table?lang=en)

<sup>130</sup> Informatics and technics is a compulsory subject taught from the fifth to the eighth grade in primary schools, while informatics is taught in the first and second grade in secondary schools. Elective subjects on digital skills are also available in primary and secondary schools, including algorithms and programming, computer and web presentations, and business informatics. In secondary vocational schools, there are various elective subjects in the field of digital literacy. Students also use a range of software packages: AUTO CAD, ARHICAD, FIDELIO, etc. and study subjects and modules such as: introduction to programming, databases, introduction to web programming, web application development, mobile application development, web and mobile communication services, advanced front-end programming, software project management and others using digital technologies (<https://zzs.gov.me/naslovna/programi/gimnazija>).

<sup>131</sup> Global Kids Online was developed as a collaborative initiative between the UNICEF Office of Research-Innocenti, the London School of Economics and Political Science (LSE), and the EU Kids Online network. The project aims to connect evidence with the ongoing international dialogue regarding policy and practical solutions for children's well-being and rights in the digital age. The Global Kids Online network is active in Montenegro, where the GKO Montenegro project was carried out in 2015/16 and involved a survey and qualitative research with children aged 9-17, their parents and schools' representatives.

<sup>132</sup> Including a EUR 6 million loan from the European Investment Bank.

<sup>133</sup> The British Council, under the project "21<sup>st</sup> Century Schools" has trained 537 primary school teachers from 95 primary schools and is set to train a total of 800 teachers by the end of the project in 2022.

<sup>134</sup> The reports contain information about the institution, the conditions for programme implementation, the teaching staff implementing the programmes and the teaching methods. A questionnaire for participants obtains information on their opinion of the programme (length, content, applicability of acquired knowledge, etc.), the competence of the teaching staff and the conditions under which the programme was implemented (<http://www.cso.gov.me/>).

<sup>135</sup> A list of all people subject to self-isolation was published upon the decision of the National Coordination Body and positive opinion of the Agency for Personal Data Protection. In July 2020, the Constitutional Court declared the decision to be in violation of the Constitutional right to privacy and annulled it. The list was subsequently used by a private individual to create a mobile application allowing users to locate those in self-isolation. In April 2020, a list of more than 60 persons infected with the virus, containing their names, birth data and ID numbers, was leaked. In May 2020, an indictment was lodged in this case against one defendant.

<sup>136</sup> See [www.uip.gov.me](http://www.uip.gov.me).

<sup>137</sup> A single project pipeline (SPP) is a list of projects developed using a strategic tool for project planning to avoid an ad hoc approach to planning preparation and implementation of investment projects. The SPP helps to ensure strong project prioritisation, enable systematic and timely planning of resources, provide a reliable basis for defining proper sequencing of the priority axis and actions per sector, and help link investment planning and programme budgeting for more information, please see: <https://mia.gov.me/en/home/nik>. The first SPP was developed by the Technical Secretariat in 2015, before being adopted by the National Investment Committee and the Government of Montenegro. It was later updated several times, with the last update taking place in 2019.

<sup>138</sup> For more information, please see: <http://www.eu.me/mn/pregovori-o-pristupanju/dokumenti-pregovori/category/227-izvjestaji-o-realizaciji-obaveza-iz-programa-pristupanja-crne-gore-eu>

<sup>139</sup> European Commission Staff Working Documents outline in detail the steps taken so far and initiatives involving WB6 economies in a variety of fields, such as: moving closer towards the EU and enhancing regional co-operation, people-to-people contacts, familiarising people with the EU, civil society development and dialogue, good governance, parliamentary co-operation, trade integration, investment and economic and social development, community financial support and donor co-ordination.

<sup>140</sup> For more information, please see: [https://ec.europa.eu/regional\\_policy/en/funding/ipa/cross-border/](https://ec.europa.eu/regional_policy/en/funding/ipa/cross-border/)

<sup>141</sup> The following elements should be developed during the project selection using the Project Identification Form: coherence with the valid EU policies and strategies; contribution to valid national development objectives; coherence with national Transport Sector Strategic framework; improving intermodality; providing connection to TEN-T corridors; contribution to improvement of the safety and security conditions; improving the characteristics, capacity of the infrastructure (new, upgraded or rehabilitated); impact on the annual traffic demand growth (traffic of freight and passengers); improving accessibility (no. of persons affected); impact on the environment (possible mitigation measures, climate change limitation actions); contribution to overall economic growth (effects on economic environment of the economy and economies in the area); integration with other projects; existence of alternative transport solutions in the same connection; improving transit/transport facilities, mobility, access to new markets, jobs, education; definition of the project - adequate solution, contribution for solving the transport needs; capacity of the proponent related to the project; does the project enhance connectivity; does the project have cross-border impact or impact on other economies in the region; can the project in any other way be earmarked as a regional project; does the project generate revenues from end users; description of the implementation and monitoring capacity of the beneficiary (e.g. technicians who can assess and monitor projects, inspect the works, monitor contracts).

<sup>142</sup> Environmental Law (2016), Law on environmental impact assessment Law on strategic environmental assessment, for more information, please see: <https://epa.org.me/regulativa/>

<sup>143</sup> Concession Law (Official Gazette of Montenegro No. 93/2019, <https://me.propisi.net/zakon-o-koncesijama/>), PPP Law (Official Gazette of Montenegro No. 93/2019, <http://www.ujn.gov.me/zakon-o-javno-privatnom-partnerstvu-sluzbeni-list-crne-gore-br-073-19-od-27-12-2019/>), Law on the Prevention of Corruption (Official Gazette of Montenegro No. 93/2019 42/2017) [https://www.paragraf.me/propisi-crnegore/zakon\\_o\\_sprjecavanju\\_korupcije.html](https://www.paragraf.me/propisi-crnegore/zakon_o_sprjecavanju_korupcije.html)), Public Procurement Law (Official Gazette of Montenegro No. 74/2019, <https://www.paragraf.me/propisi-crnegore/zakon-o-javnim-nabavkama.html>).

<sup>144</sup> The Rulebook on implementation of small value procurement (2017) issued by Ministry of Transport and Maritime Affairs shall regulate the initiation, implementation and finalisation of the procedure of procurement of goods and services with estimated value under EUR 15 000, i.e. the procurement of works with estimated value under EUR 30 000 (hereinafter: small value procurement) in the Central Bank of Montenegro, if the Central Bank does not implement this procurement in line with the public procurement procedure referred to in Article 20 of the Public Procurement Law.

<sup>145</sup> A one-stop-shop is a business or office where multiple services are offered; i.e., customers can get all they need in just "one stop." The term originated in the United States in the late 1920s or early 1930s to describe a business model offering customers the convenience of having multiple needs met in one location, instead of having to "drive all over town" to attain related services at different stores. One-stop shop is a way of facilitating trade.

<sup>146</sup> An appropriate definition of "asset management" for the roads sector is the one proposed by the OECD in 2001: "A systematic process of maintaining, upgrading and operating assets, combining engineering principles with sound business practice and economic rationale, and providing tools to facilitate a more organized and flexible approach to making the decisions necessary to achieve the public's expectations" (OECD, 2001<sup>[258]</sup>).

<sup>147</sup> Please see: [https://uzs.gov.me/vodici/Road\\_Safety\\_Assessment\\_o\\_Montenegro](https://uzs.gov.me/vodici/Road_Safety_Assessment_o_Montenegro)

<sup>148</sup> Safety Culture is a civil aviation safety programme. The State Safety Programme (SSP) is an integrated set of regulations and activities aiming to improve safety (e.g. safety risk management, safety assurance).

<sup>149</sup> Please see: <https://www.eurocontrol.int/service/local-single-sky-implementation-monitoring>. The Local Single Sky Implementation (LSSIP) documents are the annual expression of commitment by civil and military domestic organisations (regulators and supervisory authorities), service providers and airport operators, to the implementation of the European ATM Master Plan.

<sup>150</sup> Transport of passengers by specific transport mode over total transported passengers.

<sup>151</sup> Please see: <http://www.eu.me/mn/pregovori-o-pristupanju/dokumenti-pregovori/category/227-izvjestaji-o-realizaciji-obaveza-iz-programa-pristupanja-crne-gore-eu>

<sup>152</sup> Some of the indicators currently used to measure the performance of the road network are as follows: traffic flows, International Roughness Index, coefficient for HGVs (daily traffic divided by axis/axle weight). One of the projects for assessing the road network (1853 km of the highway and state roads network) is the Road Safety Assessment Program, <https://msp.gov.me/en/news/227711/Road-Safety-Assessment-project.html>

<sup>153</sup> Directive (EU) 2017/2397 of the European Parliament and of the Council of 12 December 2017 on the recognition of professional qualifications in inland; Directive (EU) 2016/1629 laying down technical requirements for inland waterway vessels; Regulation (EU) 2016/1628 on requirements relating to gaseous and particulate pollutant emission limits and type-approval for internal combustion engines for non-road mobile machinery.

<sup>154</sup> Specifically, with the EU Strategic Plan on Road Safety (2018), [https://eur-lex.europa.eu/resource.html?uri=cellar%3A0e8b694e-59b5-11e8-ab41-01aa75ed71a1.0003.02/DOC\\_2&format=PDF](https://eur-lex.europa.eu/resource.html?uri=cellar%3A0e8b694e-59b5-11e8-ab41-01aa75ed71a1.0003.02/DOC_2&format=PDF); Road Safety Priorities for the EU 2020-2030 (2019), [2019-07-New-EP-briefing-1.pdf \(etsc.eu\)](https://www.etsc.eu/2019-07-New-EP-briefing-1.pdf)

<sup>155</sup> For more information, please see: [https://www.who.int/roadsafety/events/unrsc\\_12\\_appendix\\_11.pdf](https://www.who.int/roadsafety/events/unrsc_12_appendix_11.pdf)

<sup>156</sup> For more information, please see: <https://www.transport-community.org/wp-content/uploads/2020/10/Action-Plan-for-Road-Safety.pdf>

<sup>157</sup> For more information, please see: European Commission, EU Road Safety Policy Framework 2021-2030 - Next steps towards "Vision Zero" - <https://ec.europa.eu/transport/sites/transport/files/legislation/swd20190283-roadsafety-vision-zero.pdf>

<sup>158</sup> For more information, please see: <https://www.monstat.org/eng/index.php>

<sup>159</sup> These include: 1) An increase in share of renewable energy sources and promote the rational use of energy. This could be achieved through the promotion and introduction of electrical, hybrid and natural gas-fuelled cars, higher share of biofuels, alternative forms of mobility (cycling), public city and intercity transport, eco-rides, diverting cargo trucks to railway transport, improving the organisation and efficiency of road transport in cities and applying integrated concepts ("smart" cities). 2) By 2030 GHG emissions levels should be reduced by 30% compared to 1990 baseline. 3) Develop and promote practice and solutions for sustainable consumption and production that support the efficient use of natural resources and minimise environmental loads. 4) By 2030 in transport implement new technologies (low emission vehicles, low fuel consumption, alternative fuels), promoting forms of transport with less impact on the environment; define and implement incentives including tax exemptions; recycle vehicles at the end of their lifetime. 5) Increase rail freight traffic from 20% to 50%, and increase the share of electric rail freight traffic from the current 33% to 70%; decrease truck transportation from the current 55% share in overall cargo transportation to 40% by 2030. 6) Promote a 5% reduction in fuel used by trucks; introduce hybrid electric vehicles; increasing the share of passengers who use public buses from 5% in the baseline year to 36% by 2030; increase by 30% the efficiency of vehicles using diesel and petrol (hybrid vehicles) and 20% increase in the efficiency of LNG vehicles and buses by 2030.

<sup>160</sup> Combined transport refers to the transport of goods between Member States where the lorry, trailer, semi-trailer (with or without tractor unit, swap body or container of 20 feet or more) uses the road on the initial or final leg of the journey and rail or inland waterway or maritime services on the other leg, where this section exceeds 100 km as the crow flies.

<sup>161</sup> Timeliness of shipments in reaching destination within the scheduled or expected delivery time.

<sup>162</sup> Ability to track and trace consignments.

<sup>163</sup> For more information, please see: Preparation of Maintenance Plans 2019-2023 for Road/Rail TEN-T indicative extensions to WB6, <https://www.transport-community.org/library/reports/>

<sup>164</sup> For more information, please see: European Environmental Agency (200-2020), Transport and Environment Reporting Mechanism, [https://www.eea.europa.eu/publications/Term\\_summaries](https://www.eea.europa.eu/publications/Term_summaries)

<sup>165</sup> Please note that there has been a recent change in the line ministry as regards energy and energy efficiency, with the portfolio being shifted away from the Ministry of Economy to the newly formed Ministry of Capital Investments. While it is too soon to make a conclusive judgement on whether this will have a positive or negative impact, what is sure is that it will be essential for the energy sector that the transfer is done in a smooth, speedy, sustainable, and transparent manner.

<sup>166</sup> Network codes were established under Article 6 of European Union regulation 714/2009 and are secondary acts, in many cases of a technical nature, to overcome the legislative gaps and barriers in pursuing a non-discriminatory, open internal EU energy market through uniform regulation. In essence they overcome barriers and friction to competition. In some sense, these represent lessons learned over time that aim to perfect the legislative framework for the EU's internal energy market and reflect the EU's standard based on best practice. Gaps in implementation imply that gaps in ensuring a competitive market. Thus not all international good practice is in place in Montenegro. For more details see, for example, (ENTSOE, 2021<sub>[322]</sub>), (EC, 2021<sub>[330]</sub>), Florence School of Regulation (2021<sub>[268]</sub>), and Meeus and Schittekatte (2018<sub>[269]</sub>).

<sup>167</sup> More precisely, Article 32 Paragraph 2 of the Energy Law stipulates that the government has the final decision on shortlisting their preferred candidate for the regulatory board to parliament and not to the independent selection committee, while Article 40 Paragraph 2 of the Energy Law requires government approval for the internal structure of the regulator. Both paragraphs imply that there could be political influence on the regulator.

<sup>168</sup> The amendments allow for the imposition of sanctions of up to 10% of a company's annual turnover, thus providing a sufficiently dissuasive sanction. This is international good practice and an important instrument of EU regulation.

<sup>169</sup> The policy's third main priority is sustainable energy development, including the "increased use of renewable energy sources" (Ministry of Economy, 2011<sub>[169]</sub>).

<sup>170</sup> The precise approach to support prosumers differs depending on a wide range of economic specific circumstances. For example, if most dwellings are multihousehold owned, then any promotion of prosumers needs to include regulation to facilitate agreement on installation, ownership, and operation of renewable energy infrastructure in the multi-household dwellings. Additionally, financial support might need to be tailored to improving existing metering system. That is, net metering would be a good approach for supporting deployment of prosumers, however, this would mean, potentially, upgrading metering infrastructure. For more information on prosumers, the current legislative framework and how to support them please see (ERCB, 2020<sub>[336]</sub>), (European Parliament, 2016<sub>[337]</sub>), and (PROSEU, 2020<sub>[338]</sub>).

<sup>171</sup> A Guarantee of Origin (GO) is a tracking instrument defined in Article 15 of the European Directive 2009/28/EC on the promotion of the use of energy from renewable sources and amending and subsequently repealing Directives 2001/77/EC and 2003/30/EC. GO are certificates used to identify and certify that specific consumed electricity was sourced from renewable energy. A certificate is issued per MWh generated from renewable energy to the generator and then transferred to and cancelled by a consumer or supplier who would like to certify that their consumed energy comes from renewable energy. For more information on GO and their use and implementation, see (Association of Issuing Bodies, 2020<sub>[334]</sub>) or (Umweltbundesamt, 2021<sub>[335]</sub>).

<sup>172</sup> For a comprehensive list of secondary legislation relating to energy efficiency and their status, please see <https://www.energy-community.org/implementation/Montenegro/secondary.html>.

<sup>173</sup> For a detailed overview of the ESCO market in the Western Balkans please see Panev et al. (2018<sub>[264]</sub>). For a global overview please see IEA (2018<sub>[261]</sub>).

<sup>174</sup> For the relevant Energy Community website please go to: <https://www.energy-community.org/implementation/Montenegro/reporting.html>.

<sup>175</sup> Balancing markets are an integral part of any energy market. Most markets are settled in advance of physical delivery, as in an organised market forecasted supply is matched with forecasted demand (i.e. the market is cleared). However, to maintain the actual system stability at the moment of delivery, it is essential that the same amount of actual energy is fed into the system as is taken out. To this end, the balancing market is used in as close to real time as possible to correct for any mismatch between what is actually generated and fed into the system and what is taken out of the system for consumption. It is essential that all generators, including renewable energy generators, are “imbalance responsible” as this means that they are liable for any mismatch between their forecasted and generated/delivered electricity. If they were not imbalance responsible, other entities or the consumer would need to cover the cost arising from the imbalance caused by the generator, which would also disincentive the generator to be precise with their forecast. For more detailed explanations of balancing market and design options please see van der Veen and Hakvoort (2016<sup>[265]</sup>), (Pinson, 2020<sup>[267]</sup>), Bundesnetzagentur (2020<sup>[311]</sup>), and 50hertz (2020<sup>[307]</sup>) and ACER (2020<sup>[309]</sup>) for an overview of the relevant EU legislation for electricity balancing.

<sup>176</sup>For further information see European Commission (EC, 2017<sup>[325]</sup>) or the Crossbow project website (Crossbow, n.d.<sup>[313]</sup>).

<sup>177</sup> For further information see European Commission (2019<sup>[327]</sup>) and European Commission (2019<sup>[328]</sup>) or the Trinity project website <http://trinityh2020.eu/>.

<sup>178</sup> EU Horizon 2020 is the EU’s flagship Research and Innovative Program that provides financial support of around EUR 80 billion from 2014 to 2020 for research and implementation in key areas including energy. For more details please see (EC, 2020<sup>[329]</sup>).

<sup>179</sup> For further information please see ACER (2020<sup>[308]</sup>) and ENTSOE (2020<sup>[321]</sup>).

<sup>180</sup> For more information, please see [https://ec.europa.eu/taxation\\_customs/news/commission-launches-public-consultations-energy-taxation-and-carbon-border-adjustment-mechanism\\_en](https://ec.europa.eu/taxation_customs/news/commission-launches-public-consultations-energy-taxation-and-carbon-border-adjustment-mechanism_en).

<sup>181</sup> The Paris Agreement was signed in 2016 and ratified in 2017, and Montenegro ratified the Kyoto Protocol in 2007 (UNFCCC, 2020). Montenegro has also adopted the Law on Ratification of the Kigali Amendment to the Montreal Protocol and the Law on Ratification of the Doha Amendment to the Kyoto Protocol.

<sup>182</sup> Other strategies that take into account climate change in Montenegro are the Nationally Determined Contribution to the reduction of GHG emissions - NDC, the National Strategy for Sustainable Development (NSSD) until 2030, Smart Specialization Strategy (S3) (2019–2023), and the Disaster Risk Reduction Strategy with a Dynamic Action Plan for the implementation of the strategy for the period 2018-2023.

<sup>183</sup> The project focuses on floods around rivers and lakes and not on other potentially affected areas. There have been some instances where soil erosion caused by deforestation has resulted in floods in the northern part of Montenegro, for which the inhabitants and public services were not properly prepared.

<sup>184</sup> Work has begun to construct a recycling yard with a sorting plant in the municipality of Berane. Preparation is also underway to create a recycling yard with a sorting and transfer station in Pljevlja and a recycling yard in Kolašin.

<sup>185</sup> The Decree on Detailed Elements and Methodology for Determining the Prices of Communal Services (Official Gazette of Montenegro, No. 55/20), adopted on the basis of the Law on Communal Services prescribes the manner for determining the prices of communal services, including waste management services. The Decree on Detailed Elements and Methodology for Determining the Prices of Utility Services prescribes four models for calculating the waste management fee: a model based on the area of the facility used by the service user; a model based on the number of household members; a model based on the mass of municipal waste taken over by the service user; and a model based on the volume of municipal waste taken over by the service user.

<sup>186</sup> Funds have been allocated from the budget of the ministry in charge of waste management for this project, which aims to strengthen environmental awareness of the need for separate waste collection and the use of waste as a resource, with recommendations for the effective establishment of a system of separate collection of municipal waste, reuse and recycling.

<sup>187</sup> The team “Zero Waste Montenegro” has been mapping illegal landfills through different projects. More information on: <https://www.zerowastemontenegro.me/>.

<sup>188</sup> The Water Competition Index measures the amount of water available in an economy as a function of population (quantity of water divided by number of persons with access to a unit volume of water) (EEA, 2015<sup>[182]</sup>).

<sup>189</sup> Among the EU countries, Finland recorded the highest freshwater resources (with a long-term average of 19 950 m<sup>3</sup> per inhabitant) followed by Sweden (19 410 m<sup>3</sup>). Freshwater abstraction by public water supply ranged across the EU from a high of 179 m<sup>3</sup> of water per inhabitant in Greece (2016 data) down to a low of 31 m<sup>3</sup> per inhabitant in Malta (2017 data, EUROSTAT).

<sup>190</sup> Freshwater management is regulated by the Law on Waters (Official Gazette of the Republic of Montenegro no. 27/07, and Official Gazette of Montenegro no. 32/11, 48/15 and 52/16) and by the Water Management Strategy 2016-2035. In addition, the Law on Municipal Wastewater Management was adopted in 2017.

<sup>191</sup> Law on Provision of Healthy Water for Human Use (Official Gazette of Montenegro, No. 80/17), Decision on the Designation of Sensitive Areas (Official Gazette of Montenegro, No.46/17) and General Plan for Protections against harmful effects of water, for waters of significance to Montenegro, for the period 2017-2022 (Official Gazette of Montenegro No. 17/17).

<sup>192</sup> The Aichi Biodiversity Targets cover the 2011-2020 period. This plan provided an overarching framework on biodiversity, not only for the biodiversity-related conventions, but for the entire United Nations system and all other partners engaged in biodiversity management and policy development. Parties agreed to translate this overarching international framework into revised and updated national biodiversity strategies and action plans within two years, which are intended to define the current status of biodiversity, the threats leading to its degradation and the strategies and priority actions to ensure its conservation and sustainable use within the framework of the socio-economic development of the country. There are 20 Aichi biodiversity targets grouped around 5 strategic goals: A: Address the underlying causes of biodiversity loss by mainstreaming biodiversity across government and society; B: Reduce the direct pressures on biodiversity and promote sustainable use; C: Improve the status of biodiversity by safeguarding ecosystems, species and genetic diversity; D: Enhance the benefits to all from biodiversity and ecosystem services; and E: Enhance implementation through participatory planning, knowledge management and capacity building (Convention on Biological Diversity, 2020).

<sup>193</sup> In relation to Aichi Target 11, no marine protected areas are established yet in Montenegro, although the target was set at 10% by 2020. Research is currently being conducted into three potential marine protected areas: Platamuni, Katič and Stari Ulcinj.

<sup>194</sup> The Law on Agricultural Land (OG of the RMNE, No.015/92, 059/92, 027/94, “OG of MNE”, no. 073/10, 032/11) regulate agricultural land.

<sup>195</sup> The most recent data (2017) indicate the economy’s annual mean concentration of particulate matter (PM<sub>2.5</sub>) to be 21 µg/m<sup>3</sup>, exceeding the recommended maximum of 10 µg/m<sup>3</sup>. This is below the WB6 average of 25.77 µg/m<sup>3</sup> (in 2016) (EEA, 2019<sup>[317]</sup>).

<sup>196</sup> Except for Directive 2016/2284 on the reduction of national emissions of certain atmospheric pollutants, which was being transposed at the time of writing.

<sup>197</sup> According to the latest implementation report (July 2019 for the year 2018), most measures had been implemented (more than 50% of those planned). According to the implementation report for 2017, all the measures related to the national air quality management strategy for 2017 had been undertaken.

<sup>198</sup> These include replacing asbestos pipes in all municipalities and reducing losses from the water system.

<sup>199</sup> Primary treatment of (urban) wastewater uses a physical and/or chemical process involving settlement of suspended solids, or other processes in which the biochemical oxygen demand (BOD<sub>5</sub>) of the incoming wastewater is reduced by at least 20% before discharge, and total suspended solids reduced by at least 50%. Secondary treatment generally involves biological treatment (use of bacteria to digest the remaining pollutants) with a secondary settlement or other process, resulting in a BOD removal of at least 70% and a chemical oxygen demand (COD) removal of at least 75%. Tertiary (advanced) treatment is a treatment (additional to secondary treatment) of nitrogen and/or phosphorus and/or any other pollutant affecting the quality or specific use of water (microbiological pollution, colour etc.) (OECD, 2020<sup>[286]</sup>).

<sup>200</sup> A vast array of contaminants that have only recently appeared in water are of concern because they have been detected at concentrations significantly higher than expected and/or their risk to human and environmental health may not be fully understood. Examples include pharmaceuticals, microplastics, industrial and household chemicals, personal care products, pesticides, and their transformation products (OECD, 2020<sup>[287]</sup>).

<sup>201</sup> The project is implemented by the Ministry of Ecology, Spatial Planning and Urbanism, UNDP, CEDIS, UNIPROM KAP and other holders of equipment containing PCBs.

<sup>202</sup> However, according to the Agriculture Census 2010, of Montenegro’s 620 029 inhabitants, 98 341 were engaged in agricultural activities on family agricultural holdings, indicating that people actually engaged in agriculture account for almost 30% of the total number employed (SDARAM, 2015). These workers are either registered as unemployed or are partly employed in other sectors.

<sup>203</sup> Support is provided for: 1) constructing local roads (serving single or groups of agriculture holdings, as well as for access to summer mountain pastures); 2) constructing water supply facilities in rural areas; 3) constructing and reconstructing existing public facilities in local communities (schools, health centres, veterinary stations, livestock and green markets, etc.); 4) solving local environmental protection issues, and renovating mountain “katuns” (huts); and 5) purchasing solar panels.

<sup>204</sup> Field crops, fruit production, vineyard production, vegetable production, livestock production, veterinary, milk production, tobacco production, meat production, bakery technicians, etc.

<sup>205</sup> One high school in Bar is vocational, while the schools in Podgorica, Berane, Andrijevica and Savnik are mixed.

<sup>206</sup> The Water Law defines the legal status and approach to integrated water management, including water and coastal land and water facilities, conditions and manner of carrying out aquatic activities and other issues of importance for water management and water resources. This includes territorial water management; use of water (for water supply, irrigation, bottling, fish farming, production electricity, navigation, sports and recreation, etc.); protection of waters against pollution, while defining areas of special protection of waters, vulnerable areas and plans for protection against pollution, monitoring; watercourse regulation and protection against harmful effects of waters (defining areas in danger of floods, protection against erosion and floods, etc.).

<sup>207</sup> Rulebooks on conditions for the treatment of stocks of plant protection products in case of the abolition of the Decision on the registration of plant protection and Rulebook on the content of the list of active substances permitted for use in plant protection products, 2019.

<sup>208</sup> Rulebook on maximum residue level of plant protection products on or in plants, plant products, food or feed, 2019.

<sup>209</sup> Rulebook on conditions regarding professional personnel, equipment and devices to be fulfilled by legal entities for the performance of professional tasks for the verification of the technical correctness of the device for the use of plant protection products, 2020.

<sup>210</sup> Market pricing policy measures cover direct payments for: 1) annual crops (vegetables, cereals, tobacco (per ha); 2) livestock production (per head); 3) milk buy-out per litre; and 4) planting material production (per piece). In addition, there are the support measures for the production of wine and honey, as well as for risk management measures. These include support to farmers to insure their crops and livestock against the long-term negative consequences of damage caused by weather conditions and other unexpected events.

<sup>211</sup> Rural development measures cover support for investments in modernising production technology, including standardisation, mechanisation and equipment; irrigation, support for young farmers, co-operatives, buy-out centres and strengthening the buy-out network for the milk industry. In addition, rural development measures also cover agri-environment measures, organic farming, as well as farm diversification activities and rural infrastructure.

<sup>212</sup> This part of the budget is dedicated to social transfers to the rural elderly population – a kind of social welfare (retirement) package.

<sup>213</sup> This applies to: cereals, rice, sugar, olive oil and table olives, flax and hemp, bananas, wine, live wood, beef and veal, pork, lamb and goat meat, chicken, milk and dairy products, eggs and ethyl alcohol of agricultural origin.

<sup>214</sup> Cereals, rice, sugar, olive oil and table olives, fresh and processed water and vegetables, wine, beef and veal, pork, lamb and goat meat, chicken, milk and dairy products.

<sup>215</sup> The special provisions apply specifically to imports of a mixture of cereals, rice or cereals and rice.

<sup>216</sup> Including the Food and Agriculture Organization (FAO) of the United Nations, AdriaMed, Higher Education Research and Development Project (HERD, funded by Norway), Mediterranean Halieutic Resources Evaluation and Advice Project (MAREA, EU-financed), and Instrument for Pre Accession Assistance (IPA, EU-financed).

<sup>217</sup> Such as Ministry of Finance, Ministry for Economic Development, MTE, SME Development Agency (SMEDA), Ministry of Tourism and Environment (MTE), Ministry of Agriculture, Forestry and Water Management, municipalities, MTE, Ministry of Health, Labour and Social Welfare, Ministry of Education and Science (with universities), etc.

# 24 North Macedonia profile

## Key findings

Figure 24.1. Scores for North Macedonia (2018 and 2021)

Note: Dimensions are scored on a scale of 0 to 5. Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See Scoring approach section for information on the assessment methodology. Scores for Dimension 5 (Competition policy) are not included in the figure due to its different scoring methodology (see Scoring approach).

Since the publication of the 2018 Competitiveness Outlook (CO), North Macedonia has improved its performance in 8 of the 15 policy dimensions<sup>1</sup> scored in the assessment (Figure 24.1). Although there is clear progress in setting up policies to enhance competitiveness – at least in about half of the dimensions covered in this assessment – if they are to have a lasting impact then their effective and continuous implementation, monitoring and upgrading should remain a key priority. North Macedonia's highest average scores are in the dimensions on trade, energy, tax, employment and anti-corruption policy (above or just marginally below 3.0). North Macedonia also outperforms the WB6 average for these five policy dimensions. Its main achievements since the last CO assessment have been the following:

- **Greater international tax policy alignment and co-operation, and a stronger capacity to model and forecast tax revenues.** In August 2018, North Macedonia joined the Inclusive Framework on Base Erosion and Profit Shifting (BEPS); in January 2020 it signed the Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS. North Macedonia has prepared a first legislative draft on country-by-country reporting, based on OECD model legislation, which is currently under internal review. It also signed the Convention on Mutual Administrative Assistance in Tax Matters in June 2018, which entered into force in January 2020. Since the last assessment, North Macedonia has also strengthened its forecasting capacities and expanded its simulation models.
- **A less restrictive trade policy, greater regulatory transparency, improved public consultations and a sound e-commerce policy framework.** The conclusion of the Additional Protocol 6 on Trade in Services to the Central European Free Trade Agreement (CEFTA) in December 2019 created an important stimulus for reducing services restrictions between parties

and for making services markets more attractive to third-country investors. All 12 service sectors in North Macedonia analysed here using the OECD Services Trade Restrictiveness Index methodology have become more open. This assessment also reveals progress in increasing regulatory transparency, improving public consultations and increasing inclusiveness in trade policy. Several amendments to the 2007 Law on Electronic Commerce have continued to strengthen the e-commerce policy framework and to align it with European Commission recommendations and the Directive on Electronic Commerce 2000/31/EC.

- **Significant upgrades to the energy policy and legislative framework.** With the adoption of its Energy Law in 2018, the economy has transposed a significant part of the European Union's Third Energy Package and the Energy Community *acquis*. In December 2019 North Macedonia adopted its Energy Development Strategy 2040, aiming to increase the share of renewable energy to 35-45% of gross final energy consumption by 2040. The strategy foresees the introduction of carbon pricing and convergence with the EU's Emission Trading System. Significant efforts have also been made on energy efficiency. The Law on Energy Efficiency, adopted in February 2020, is considered best practice by the Energy Community Secretariat.
- **Better employment policies, particularly for bringing the most vulnerable into the labour market.** North Macedonia's 2018 pilot Youth Guarantee Scheme to tackle high youth unemployment is now being implemented more widely. This has seen a strong fall in the youth unemployment rate, from 44% in the fourth quarter (Q4) of 2018 to 35% in Q4 of 2019, although this is still above the WB6 and EU average. Notable improvements have also been made to co-operation between social services and employment services in order to bring vulnerable groups into employment. North Macedonia has also increased the institutional capacities of its public employment service, in particular by categorising unemployed people according to their employability profiles, the use of case management and setting up individual employment plans.
- **A strengthened national anti-corruption body.** The State Commission for the Prevention of Corruption (SCPC) has expanded its responsibilities through a 2019 law on the prevention of corruption and conflicts of interest. The SCPC has made major progress in drafting the National Strategy for Combatting Corruption and Conflict of Interest 2020-24, a holistic policy document aimed at guiding anti-corruption efforts in key sectors (the political system, judiciary, law enforcement bodies, healthcare and education) and two cross-cutting areas (public procurement and employment in the public sector). The SCPC's annual budget has also been increased, from MKD 27 million (Macedonian denar) in 2018 to MKD 55 million in 2020 (around EUR 0.9 million), although staffing concerns remain an issue given the SCPC's high caseload.

### Priority areas

Of the 15 policy dimensions in this assessment, North Macedonia scores lowest for tourism policy, transport policy, environment policy, state-owned enterprises and digital society (Figure 24.1), with its scores for tourism policy, transport policy and state-owned enterprises below the WB6 average. To improve its performance in these five policy areas, North Macedonia should:

- **Improve municipal waste and wastewater management.** Less than 1% of solid waste is recycled in North Macedonia (compared to a 47% average in the EU), meaning almost 99% goes to landfills. Moreover, only 24 wastewater treatment plants (WWTPs) were operating in 2019, which is 24.5% of the required capacity. Municipal waste management and wastewater treatment depend largely on donor funds, impeding regular maintenance. North Macedonia needs to invest in WWTPs and ensure regular maintenance of the existing network. Effective implementation of recycling and circular economy policies will require a whole-of-government approach, with collaboration among the relevant ministries to steer the transition. The government's next step should be to encourage exchanges between municipalities by helping

local government associations or environmental non-government organisations (NGOs) to develop guidelines, training and initiatives to recognise best practice.

- **Develop strategies for environmentally sustainable and combined transport.** Transport is a significant contributor to North Macedonia's emissions, at 13% of all greenhouse gas emissions in 2014. Integrating environmental sustainability goals into its transport strategy is crucial; these are currently scattered across various policy documents, making progress harder to monitor. The use of combined transport, a more environmentally friendly and cost-efficient mode of moving freight, is increasing: the total tonnage of goods transported through this mode increased by 30% in the period 2017-19. However, combined transport still accounts for only 1.3% of total freight, compared to the EU average of 6.2% in 2017. North Macedonia also lacks a policy framework to develop this mode; creating one will help it to fully capitalise on its potential.
- **Strengthen the tourism governance and institutional set up at national, regional and local levels.** North Macedonia lags behind in tourism development, mainly due to inefficiencies in the overall governance of the tourism sector. As a result, few of the policy measures in the National Strategy for Sustainable Tourism Development have been implemented. North Macedonia should establish an intra-governmental body to improve co-ordination among ministries and other public institutions, while actively involving private and public stakeholders in developing and implementing tourism strategies. The government should also develop regional and local destination management organisations, as defined in the tourism strategy. These could take over managing tourism development within individual destinations and design and implement destination tourism master plans.
- **Step up support to digital government and private sector information and communication technology (ICT) adoption, while promoting digital inclusion.** Only 25% of individuals in North Macedonia used the Internet to interact with public authorities in 2019, compared to 55% in the EU. Many important services are unsophisticated, allowing only one-way interaction. Policy makers need to prioritise and support the digitalisation of the most frequently used services. This should include harmonising legacy legislation on e-services and e-payments, while creating a publicly available dataset of e-government indicators to evaluate service quality. Digital transformation of the private sector should also be supported through an overarching national strategy and adequate financial support schemes. The public procurement of ICT products and services should include accessibility requirements to ensure digital inclusion.
- **Develop a comprehensive state ownership policy for state-owned enterprises.** The ownership arrangements for North Macedonia's centrally held state-owned enterprises (SOEs) are dispersed across the administration and there is no unified state ownership policy to guide corporate decision making on SOE performance. There has been no attempt to define, disclose or estimate the costs of SOEs' non-commercial objectives, which can be quite wide ranging, including delivering public services and supporting local employment. As a result, many SOEs are loss-making. Developing a state ownership policy that outlines the rationales for state ownership and the expectations on SOEs would be a first step towards professionalising state ownership practices. The policy should clearly outline the main principles guiding state ownership decisions, such as setting objectives and board nominations, and define the roles and responsibilities of the different state bodies responsible for state ownership decisions and monitoring SOEs' activities. At a later stage, the authorities could establish a co-ordinating entity to monitor implementation of the state ownership policy, and other subsequent policies or decisions applicable to SOEs, across the public administration.

1: Please note that Dimension 5 (Competition policy) is excluded from the key findings section as it uses a different scoring model (See the Scoring approach section for information on the assessment methodology).

## Economic context

### **Key economic features**

The Republic of North Macedonia is a small, open economy with a sizable and diversifying service sector and an expanding manufacturing base. The economy is dominated by services, which account for 54.5% of gross domestic product (GDP) (World Bank, n.d.<sup>[11]</sup>) and 55% of employment (ILOSTAT, 2021<sup>[2]</sup>). The largest contributions among services come from wholesale and retail trade, ICT, transport, and logistics (MAKStat, 2019<sup>[3]</sup>). Industry, including construction, has expanded significantly over the past decade and now accounts for 23.9% of GDP (World Bank, n.d.<sup>[4]</sup>) and 31.1% of employment (ILOSTAT, 2021<sup>[2]</sup>). The most notable expansion in the industrial sector has been the increase in manufacturing from 8.8% of GDP in 2009 to 13.3% in 2019 (MAKStat, 2020<sup>[5]</sup>) on the back of significant inflows of export-oriented foreign direct investment (FDI). There has also been a considerable increase in public and private construction activity. The contribution of agriculture, forestry and fishing has been declining continuously since the 1990s and now accounts for only 4% of GDP (World Bank, n.d.<sup>[6]</sup>). However agriculture still accounts for nearly 14% of total employment (ILOSTAT, 2021<sup>[2]</sup>) and there is considerable scope to increase the growth and productivity of this sector.

Over the past decade the economy's growth has become more broad based and balanced. Prior to the global financial crisis, growth was mainly driven by domestic consumption and investment, underpinned by strong credit growth and significant FDI inflows into the banking sector. Between 2001 and 2008, exports accounted for just 34.2% of GDP and the heavy dependence of consumption on imports resulted in large current account deficits that peaked at 12.4% of GDP in 2008 (World Bank, n.d.<sup>[7]</sup>). In the post-crisis period, moderating domestic demand and rising external demand have resulted in a significant improvement of the external balances and the current account deficit remained below 3% of GDP throughout most of the past decade.

The rise in external demand in the post 2008/09 crisis period was driven primarily by significant inflows of export-oriented manufacturing FDI into North Macedonia's special economic zones. These investments, mainly related to the automotive industry, resulted in a significant increase in total exports, which in 2019 accounted for 61.7% of GDP, the highest share in the Western Balkan region (World Bank, n.d.<sup>[8]</sup>). Exports of services have also increased considerably but are still only 25% of total exports. This is the case despite the strong potential for the development of services linked to manufacturing global value chains (e.g. transport and logistics), the rapidly growing domestic ICT sector, and strong potential for growth in food processing exports and tourism.

Despite the positive developments in diversification and the expansion of the tradable sector, their impact on overall GDP growth has been moderated by weak links between the export-oriented FDI sector and local small and medium-sized enterprises (SMEs). Supplier linkages remain relatively weak as foreign investors rely on imports for most of their inputs other than low-cost local labour. In fact, the share of imported inputs is higher in North Macedonia than in its regional and global peers. Combined with the fact that they have been mainly in labour-intensive manufacturing activities, these investments have thus made a limited contribution to value added and GDP growth. With domestic demand moderating, the limited value added from exports has meant that GDP growth overall has declined from an average rate of 3.5% during 2001-08 to 2.6% between 2010 and 2019 (World Bank, 2021<sup>[9]</sup>).

**Table 24.1. North Macedonia: Main macroeconomic indicators (2015-20)**

Indicator	Unit of measurement	2015	2016	2017	2018	2019	2020
GDP growth <sup>1</sup>	% year-on-year	3.8	2.8	1.1	2.7	3.2	-4.5
GDP per capita <sup>2</sup>	Current international \$	13 827	15 078	15 650	16 672	17 583	16 927
National GDP <sup>2</sup>	USD billion	10.1	10.7	11.3	12.7	12.5	12.3
Inflation <sup>1</sup>	Consumer price index, annual % change	-0.3	-0.2	1.4	1.5	0.8	1.2
Current account balance <sup>1</sup>	% of GDP	-2.0	-2.9	-1.1	-0.1	-3.3	-3.5
Exports of goods and services <sup>1</sup>	% of GDP	48.7	50.9	55.0	60.2	62.1	58.1
Imports of goods and services <sup>1</sup>	% of GDP	65.0	66.2	69.1	72.9	76.5	70.9
Net FDI <sup>1</sup>	% of GDP	2.2	3.3	1.8	5.6	3.2	1.9
Public and publicly guaranteed debt <sup>3</sup>	% of GDP	46.6	48.8	47.7	48.4	49.4	60*
External debt <sup>4</sup>	% of GDP	69.3	74.7	73.4	73.3	71.9	..
Unemployment <sup>1</sup>	% of total labour force	26.1	23.8	22.4	20.7	17.3	16.4
Youth unemployment <sup>2</sup>	% of total labour force ages 15-24	47.3	48.2	46.7	45.4	35.6	..
International reserves <sup>1</sup>	In months of imports of G&S	4.2	4.9	4.1	4.4	4.6	5.3
Exchange rate (if applicable local currency/euro) <sup>1</sup>	Value	61.61	61.60	61.57	61.51	61.51	61.7
Remittance inflows <sup>2</sup>	% of GDP	3.0	2.7	2.8	2.7	2.5	3.4
Lending interest rate <sup>5</sup>	% annual average	7.5	7.0	6.6	6.1	5.6	5.2
Stock markets (if applicable) <sup>1</sup>	Average index	1 731	1 887	2 406	3 154	3 939	4 378

Note: G&S = goods and services; \* estimates for 2020

Low and weakly growing productivity is at the core of many of the above-mentioned trends over the past decade. Productivity growth slowed considerably in the period following the global financial crisis, due to both weaker productivity growth within sectors and slower reallocation of labour from less productive to more productive sectors (World Bank, 2020<sub>[16]</sub>). This poor productivity growth in the midst of strong growth in public and private investment since 2009 suggests weaknesses in how investment has been allocated. In particular, in the public sector considerable amounts were invested in public works related to monuments with limited potential to increase productivity (IBRD/World Bank, 2018<sub>[17]</sub>). It also points to significant market friction, preventing the reallocation of capital and other inputs to the most productive sectors and firms. This friction stems from numerous structural challenges including inadequate access to finance; inadequate competition, including from the informal sector; and unpredictable and discretionary enforcement of regulations and corruption (see the Structural economic challenges section below).

Modest growth and weak integration of enterprises into global value chains (GVCs), whether through the FDI sector or otherwise, also reflects enterprises' limited capacity to innovate and adopt new technology. Enterprises in North Macedonia tend to invest considerably less in research and development (R&D) or other innovation activities than their aspirational peers in the EU. They cannot meet the quality standards required by the automotive or other relevant industries and value chains. This reflects first and foremost difficulties accessing finance that are particularly pronounced for micro and small enterprises and start-ups. It also reflects problems with access to human capital and skills, which, in turn, reflect underlying challenges with the quality and relevance of the education system and weaknesses in the implementation of active labour market policies. This challenge is exacerbated by the emigration of highly skilled people to the EU and other developed economies, which has intensified over the past decade (see the Structural economic challenges section below).

Gaps in North Macedonia's infrastructure undermine connectivity, trade and GVC integration. Despite significant investment and improvement in its physical infrastructure over the past decade, some gaps remain. Combined with weaknesses in its "soft" infrastructure (customs, logistics) these undermine connectivity and further trade integration. They also undermine efforts to strengthen the FDI and export sectors (see the Structural economic challenges section below).

Despite notable improvement in labour market indicators, which was in part thanks to significant fiscal support provided to FDI investors and domestic companies in the post-crisis period, unemployment remains high at 16.4% and labour force participation is still relatively modest at 55%. This is particularly the case among the youth, with unemployment at 35.6% and labour force participation at 37.7%. Likewise, the share of young people who are not in education, employment or training is high at 23%, double the OECD and EU averages. Participation rates for women are also low, at 43%, contributing to the underutilisation of domestic human capital (World Bank, 2021<sup>[9]</sup>).

Looking ahead to the next decade, North Macedonia has considerable potential to accelerate its convergence with EU income levels on the back of further expansion and upgrading of the export-oriented manufacturing sector. This could come through continuing to attract FDI but also fostering a more conducive environment for the growth of dynamic, productive, adaptive and innovative SMEs that can be externally competitive and take part in global value chains across a variety of sectors with high development potential. Addressing the key constraints identified in this economy profile, as well as the Competitiveness Outlook more broadly, will support this agenda.

### ***Sustainable development***

North Macedonia has committed to the United Nation's Agenda 2030 for Sustainable Development. It also takes part in the National Voluntary Review Programme, which encourages countries to conduct regular and inclusive reviews of their progress on the Sustainable Development Goals (SDGs) at both the national and sub-national level. The goal is to foster the exchange of experiences, success stories and lessons learned in order to strengthen the implementation of the 2030 Agenda (Sachs et al., 2021<sup>[18]</sup>).

Overall, over the past two decades, North Macedonia has made positive progress towards achieving the goals of Agenda 2030, but the pace of progress has been relatively modest on most of the key indicators across all dimensions of the SDGs (Table 24.2). North Macedonia is on track to achieve or has maintained its achievement of the SDGs only in one main area – poverty rates are declining with proportions of the population that lives on less than USD 1.90 and USD 3.20 decreasing (Sachs et al., 2021<sup>[18]</sup>).

**Table 24.2. North Macedonia's progress towards achieving the SDGs**

SDG	Current assessment	Trends
1 - No poverty	Challenges remain	On track or maintaining SDG achievement
2 - Zero hunger	Significant challenges remain	Moderately improving
3 - Good health and well-being	Significant challenges remain	Moderately improving
4 - Quality education	Challenges remain	Stagnating
5 - Gender equality	Significant challenges remain	Moderately improving
6 - Clean water and sanitation	Significant challenges remain	Moderately improving
7 - Affordable and clean energy	Significant challenges remain	Moderately improving
8 - Decent work and economic growth	Significant challenges remain	Moderately improving
9 - Industry, innovation and infrastructure	Significant challenges remain	Stagnating
10 - Reduced Inequalities	Major challenges remain	Information unavailable
11 - Sustainable cities and communities	Significant challenges remain	Moderately improving
12 - Responsible consumption and production	Significant challenges remain	Information unavailable
13 - Climate action	Significant challenges remain	Stagnating
14 - Life below water	Information unavailable	Information unavailable
15 - Life on land	Significant challenges remain	Moderately improving
16 - Peace, justice and strong institutions	Significant challenges remain	Moderately improving
17 - Partnerships for the goals	Challenges remain	Moderately improving

Note: The order of progress (from greatest to least) is as follows: SDG achieved; challenges remain; significant challenges remain; major challenges remain.

Source: (Sachs et al., 2021<sub>[18]</sub>), *Sustainable Development Report 2021: the Decade of Action for the Sustainable Development Goals*, <https://s3.amazonaws.com/sustainabledevelopment.report/2021/2021-sustainable-development-report.pdf>.

Moderate improvements have been noted across most SDG thematic areas. While North Macedonia's health outcomes have improved in most areas and are on track to achieve the SDG targets, the high prevalence and death rates from non-communicable diseases including cardiovascular disease, diabetes and cancer remain a significant problem (SDG 3). Significant challenges remain in education, in particular in lower secondary completion rate (SDG 4). In the area of work and economic growth, unemployment still remains high and poses considerable challenges for well-being (SDG 8). High air pollution also has a strong impact on the health and life expectancy of the population (SDG 7 and 11) (Sachs et al., 2021<sub>[18]</sub>).

According to the SDG assessment, the most significant challenges lie in the areas of institutions (SDG 16) and inequality (SDG 10). Corruption remains an important challenge as does the prevalence of child labour. Likewise important issues are still noted in the area of property rights. Inequality, as measured by the Gini Coefficient, also remains high (Sachs et al., 2021<sub>[18]</sub>).

### **Structural economic challenges**

North Macedonia faces a number of key structural challenges that undermine its competitiveness, investment and GVC integration.

*Lack of skills is undermining economic growth and the development of a knowledge economy*

- **Quality of education** is at the root of this issue. For example, student performance on standardised tests like the Programme for International Student Assessment (PISA), is well below not only the OECD average but also most regional peers: fewer than 50% of students in North Macedonia achieved the minimum level of proficiency in reading (45%) and mathematics (39%) and only 51% achieved this for science, compared to the OECD average of over 75% (OECD, 2019<sub>[19]</sub>). This, in turn, reflects inefficient use of resources in the education system. Student

performance is weak despite low student-teacher ratios at all levels of education up to tertiary. The low teaching quality partly reflects the low compensation of teachers, outdated curricula, etc.

- **Lack of skills** also reflects the relevance of education. About one-third of employers have noted that they had difficulty filling job openings because they could not find workers with the required skills. Moreover, about 50% of employers, many of whom are in the automotive industry, have noted that their employees do not have sufficient skills for the jobs that they occupy and require significant on-the-job training. In addition to technical skills, the skills gaps also include cognitive and soft skills, such as communication, management and interpersonal skills, many of which are critical for the development of the services sector (World Bank, 2017<sup>[20]</sup>). These challenges reflect underlying issues with the vocational and tertiary education system – see Education policy (Dimension 7). They also include lack of adequate labour market information systems and lack of active labour market policies – see Employment policy (Dimension 8).
- **The incentives to learn and acquire skills** are significantly diminished by the fact that job prospects, salaries and career advancement are strongly determined by other factors such as political or family connections, monetary compensation or bribery in the public sector. According to the latest Balkan Barometer survey, the top two assets for finding a job identified by respondents were a network of family and friends in high places (39%) and personal contacts (38%). In comparison, only 19% of respondents identified the level of education/qualifications as one of the top two assets for getting a job (Regional Cooperation Council, 2019<sup>[21]</sup>).
- **Early childhood education** lays the foundations for cognitive and other skill development. Yet in North Macedonia, participation in early childhood education is very low and this also negatively affects women's participation in the labour market. Enrolment is particularly low for the poorest 20% of households, where it is less than 1%, while even among the richest quintile it is just 55% (World Bank, 2017<sup>[20]</sup>). In most OECD countries, the average rate of enrolment is over 80% (OECD, n.d.<sup>[22]</sup>).

#### *The economy underuses its human capital*

- **Low labour force participation** remains a problem: in 2019, more than half of the population (53%) was either unemployed or inactive. Young people are particularly underused: 15-24 year-olds have a labour participation rate of only 31% (World Bank, n.d.<sup>[23]</sup>) and an unemployment rate of 38% (World Bank, n.d.<sup>[24]</sup>). Women have even lower activity rates (43% compared to more than 50% for the total population), which reflects, in part, limited affordable childcare options and social norms in some segments of the population. The ageing population (the median age is 39 years) and high levels of emigration, particularly of highly skilled youth, further exacerbate the challenges of underutilised and underdeveloped human capital.

#### *A challenging business environment stifles enterprises, particularly SMEs*

Over the past two decades, North Macedonia has made considerable progress in reducing the administrative and regulatory burden on businesses by introducing the so-called regulatory guillotine, as well as other measures. As a result, North Macedonia's ranking in the Doing Business report has increased significantly and is now 17<sup>th</sup> globally (World Bank, n.d.<sup>[25]</sup>). Nevertheless, many outstanding challenges in this area undermine enterprises' competitiveness, investment and growth:

- **Contract enforcement** is lengthier and costlier than in peer countries and well below the global leaders (634 days compared to 590 days for the OECD average and 120 days for the global leaders). Likewise, there are still outstanding challenges with insolvency, with considerably lower recovery rates (48% compared to 70% in the OECD) (World Bank, n.d.<sup>[25]</sup>). Businesses also complain about unpredictable changes in regulation and uneven and discretionary oversight and

enforcement of regulations. This latter partly reflects the weak governance and capacities of inspection bodies (World Bank, 2018<sup>[26]</sup>).

- **Inefficient customs** impede the development of the export sector and GVC integration. While the special economic zones circumvent some of these issues by introducing dedicated customs terminals for their investors, the majority of other firms still face challenges in this area. In the latest Logistics Performance Index, North Macedonia's score was lowest in the customs indicators compared to its performance in other indicators, leading to an overall ranking of 81<sup>st</sup> out of 160 countries (World Bank, 2018<sup>[27]</sup>).
- **Unfair competition**, particularly from the informal sector, represents an important constraint for businesses in North Macedonia. In the latest Business Environment and Enterprise Performance Survey (BEEPS), 54.5% of firms stated that they compete against informal competitors (World Bank, n.d.<sup>[28]</sup>). Informal employment is also high at 17.2%, as is the prevalence of other practices including under-reporting of wages and envelope wages in cash, under-reporting sales and not issuing fiscal receipts (WIIW, 2020<sup>[29]</sup>). This not only creates an uneven playing field for some firms, it also significantly reduces public revenues and consequently limits public spending and investment on priority development areas.

#### *Firms' capacities to innovate and adopt technology are still relatively limited*

- **Investment in R&D** by businesses remains low (0.1% of GDP compared to the EU average of 1.5%), as is their adoption of quality standards (World Bank, 2020<sup>[16]</sup>). The low amounts firms invest in innovation reflect some of the constraints in the business environment that limit the flow of resources from less to more competitive firms. Lack of skills, including management and entrepreneurial skills, also limit innovation.
- **Limited Access to finance** (Dimension 3) has a significant impact on firms' capacity to invest in new technology and quality standards, particularly for small and micro-enterprises and start-ups. These firms cannot meet the commercial banks' stringent lending standards (for collateral, credit history, turnover and other requirements) but have limited access to alternative financing. In recent years, some progress has been made in improving access to finance through the Fund for Innovation, but the gap still remains significant, especially in the context of limited private-sector alternatives to bank finance.

#### *Cross-cutting and sector-specific constraints undermine the growth of key sectors*

- **Agriculture:** Agricultural productivity is very low (less than 25% of the EU average) undermined by fragmented land (the average farm is 1.62 ha), lack of adequate infrastructure for irrigation and limited access to machinery. The sector is also plagued by significant inefficiencies. Studies have shown that the average farm could produce the same output with 55% fewer inputs. High agricultural subsidies, which are well above the EU average, make matters worse by reducing the incentives to restructure the sector to enhance productivity – subsidised farms are less efficient than non-subsidised farms (World Bank, 2018<sup>[26]</sup>) – or to reallocate labour from agriculture to the more productive manufacturing and service sectors.
- **Tourism:** The tourism sector has significant potential due to North Macedonia's location, natural endowments, and rich history and culture. The sector is constrained by the lack of people with the skills needed for higher value-added activities, limited capacity to innovate and adopt new technology, and limited access to finance high-quality transport services. Businesses in the sector also complain about the bureaucratic red tape and corruption when it comes to accessing utilities, permits and licences (World Bank, 2018<sup>[26]</sup>).
- **ICT:** The ICT sector has grown significantly in recent years but it still has a great deal of unfulfilled potential especially in the area of service exports. The sector is constrained by the limited size of

the domestic market, insufficient supply of skilled workers and their high turnover across firms, underdeveloped collaboration between the sector and the relevant educational institutions, and lack of access to finance, particularly for start-ups and high-risk venture capital.

*Weak revenue performance and high and rising current expenditure limit the government's fiscal space*

- **Fiscal policy has been expansionary** for most of the past decade in order to support economic recovery in the wake of the global financial and Eurozone crises and increase employment. Support for employment has been both direct (through public construction projects) and indirect (through subsidies and tax exemptions for FDI investors and domestic companies as well as ad hoc increases in pensions, although the latter are also linked to the election cycle). At the same time, revenue performance has been relatively weak, down from 32.9% of GDP in 2008 to 29.6% of GDP in 2019 (Ministry of Finance, n.d.<sup>[30]</sup>) due to low tax rates, a narrow tax base and considerable tax avoidance from the informal economy. This has resulted in deficits widening from an average of less than 1% in the pre-crisis period to 2.9% between 2009 and 2019 (Ministry of Finance, n.d.<sup>[30]</sup>), and public debt doubling from 24% in 2008 to 51% in the second quarter of 2020.
- **Narrowing fiscal space** has important implications. Since the local currency is pegged to the euro, the central bank has limited monetary policy options to stimulate the economy in times of crisis, leaving fiscal policy as the main instrument. Moreover, with roughly 80% of government expenditure going on public wages, social transfers and subsidies, which are difficult to cut, the government's ability to adjust expenditure in response to declining revenue or to redirect spending toward other pressing needs such as the ongoing economic crisis has become much more limited. This is also why capital expenditures are most frequently cut mid-year to accommodate the higher current expenditure needs.

*A greener growth model would improve well-being*

- **Air pollution** has become one of the most acute problems in North Macedonia with significant consequences for health, mortality and economic development. At 33  $\mu\text{g}/\text{m}^3$  (in 2017) exposure to PM<sub>2.5</sub> (particulate matter) air pollution is the highest in the Western Balkan region, more than double the EU average of 13.1  $\mu\text{g}/\text{m}^3$  and the OECD average of 12.5  $\mu\text{g}/\text{m}^3$ , and well above threshold limits recommended by the World Health Organization (WHO) air quality guidelines of 10  $\mu\text{g}/\text{m}^3$  annually (EEA, 2020<sup>[31]</sup>). Pollution is particularly acute in winter when residential heating, including from burning of solid fuels, compounds the pollution from transport, power generation and industry. In fact, residential heating accounts for 63% of all PM<sub>2.5</sub> air pollution and 46% of all PM<sub>10</sub> pollution (MEPP, 2017<sup>[32]</sup>). Transport pollution is also high, particularly in urban areas, due to the high numbers of old vehicles on the streets. According to the State Statistics Office, the average car is 19 years old. (MAKStat, 2020<sup>[33]</sup>).
- **Climate change.** North Macedonia is vulnerable to the impacts of climate change due to its high exposure and low resilience to natural hazards. Yet the transition to low-carbon growth has been slow and efforts to strengthen resilience to these hazards have been relatively weak. The economy is still highly dependent on highly polluting lignite coal and the intensity of energy consumption is high. Water resource management also remains a challenge, increasing the risks of future droughts. The lack of a coherent national strategy and policies to enhance climate change preparedness and resilience as well as slow progress in the development of emergency response systems makes the economy more at risk from future disasters.

*More inclusive growth is also needed to improve well-being*

- Even though living standards have improved significantly over the past two decades (GDP per capita increased by 60%), high poverty levels and inequality remain an important challenge for North Macedonia. Nearly 18% of the population still lives on less than USD 5.5 a day, and there is also considerable inequality across different regions and ethnic groups. For example, Macedonians of ethnic Albanian origin represent more than 40% of the poorest quintile of the population and only 15% of the richest, while the ethnic Roma community is overwhelmingly in the bottom two income quintiles (World Bank, 2018<sub>[26]</sub>). The Roma population lag significantly behind others in education completion rates: only 31.3% of the Roma ethnic group have completed secondary education compared to over 86.8% for the rest of the population in North Macedonia. Gender inequality is also persistent. Lower activity rates, employment and entrepreneurship among women are estimated to have reduced GDP by 16% (World Bank, 2018<sub>[26]</sub>).

*COVID-19 has exacerbated structural challenges*

The Macedonian economy has been strongly affected by the COVID-19 pandemic, which resulted in significant declines in domestic and external economic activity. Domestic demand was strongly reduced by the confinement measures imposed in the second quarter of 2020, as well as the slow restart of the economy following their relaxation. Meanwhile, slowing economic activity in key trading partners and related disruptions in the automotive value chain notably affected external demand, resulting in a decline in exports of over 30% in Q2 of 2020. Even though economic activity picked up in the second half of the year, the recovery has been subdued. As a result, annual GDP contracted by 4.5% on the back of declining investment (-10.2%), exports (-9.6%) and private consumption (-5.6%). Declining imports (-9.2%) meanwhile mitigated the impact on GDP (Table 24.1) (EC, 2021<sub>[10]</sub>).

The pandemic strongly affected a number of critical sectors including industry, trade, transport and tourism. Industrial production declined strongly in the second quarter of 2020 as a result of the confinement measures as well as disruptions in the global supply chains. Automotive and textile manufacturing were particularly badly hit, with their volumes nearly halving compared to the same period in the previous year. Retail was affected by lower household spending related to the confinement and declining consumer confidence amid the uncertain economic recovery (EC, n.d.<sub>[34]</sub>). Air and rail transport were particularly strongly affected by limitations on travel and reductions in the movement of goods (MAKstat, 2020<sub>[35]</sub>) (EC, 2021<sub>[10]</sub>).

However, the fiscal support measures that the government took in the wake of the pandemic have helped moderate its impact on the economy, and particularly the labour market. This support included liquidity support for firms (subsidising employees' social security contributions for companies that retained employment, deferring income tax payments, more favourable lending terms and credit guarantees) as well as sector-specific support for the most affected sectors, including tourism, agriculture and catering through direct payments and grants. As a result, employment declined by just 0.3% compared to 2019 and unemployment continued to decline from 17.3% in 2019 to 16.4% in 2020 (EC, 2021<sub>[10]</sub>). **Error! Reference source not found.** outlines some of the tax measures in response to COVID-19.

The impact on household incomes and poverty was also mitigated by the government's support measures. Social security schemes provided additional support to individuals who lost their jobs a result of the crisis (e.g. a new unemployment insurance scheme and accelerated access to the social protection system). Low-income households were also supported through cash vouchers as well as delays in rent demands for social housing. At the start of the crisis, the government also introduced price controls on basic food products, medicines and disinfection products, and abolished the import duties on medical supplies and select goods.

Many of the structural challenges discussed above have played a role in either amplifying the impact of the COVID-19 pandemic or limiting the scope of the policy responses to it. The crisis has, therefore, provided important lessons on how to build more resilient economies and institutions:

- **Fiscal policy:** Among its political and administrative responses to the COVID-19 pandemic, North Macedonia introduced a number of tax policies including:
  - Advance corporate income tax (CIT) payments for certain sectors were postponed in March 2020 for five months. This deferral was available to companies which had suffered a 40% decline in revenues. Companies which took advantage of it could not pay dividends or reduce the number of employees. This provision was extended until February 2021.
  - The threshold for CIT liability was increased from MKD 3 million to MKD 5 million.
  - Advance personal income tax (PIT) payments for independent activities were also postponed in March 2020 for five months. This provision was also extended until February 2021.
  - Direct cash transfers of EUR 150 were paid to individuals with monthly incomes below EUR 250, EUR 100 to students and up to 40% of their salary to medical workers.
  - During April, May and June 2020, entrepreneurs could opt for a subsidy of up to 50% of social security contributions (SSCs).
  - For businesses that suffered a 30% loss in revenues, a wage subsidy scheme was implemented of up to the minimum wage (paid to the employer). Beneficiaries of this scheme could not pay dividends or reduce the number of employees. This subsidy was capped at EUR 350 per month during October, November and December 2020.
  - The value-added tax (VAT) refund system was simplified and facilitated.
  - A new 10% VAT rate was introduced for restaurants and catering services from January 2021. The VAT rate was also reduced for craft activities from 18% to 5% in January 2021.
  - More flexible tax-debt repayments, notably by lowering penalty interest rates.
  - The ability to carry forward losses was extended from three to five years.
  - North Macedonia has implemented a wider set of responses to COVID-19 than other WB6 economies. For example, few implemented wage subsidy schemes or direct cash transfers to households, but these are centrepieces of North Macedonia's response. North Macedonia's comprehensive COVID-19 response package broadly aligns with those of OECD/G20 countries (OECD, 2020<sup>[36]</sup>). While the fiscal response has been critical to preventing significant economic fallout from COVID-19, especially for the labour market, it has resulted in a significant narrowing of the fiscal space. With revenues likely to be weaker in the wake of the crisis, particularly if the recovery is slow, improving the efficiency of public spending will be critical over the coming months, as will prioritising expenditures that can support the recovery and promote productivity growth and structural transformation for stronger and more resilient long-term growth. This also includes increasing public investment which has suffered significantly due to high and rising current expenditure. The crisis also highlights the importance of rebuilding fiscal buffers in the post-crisis period. In addition to better management of expenditure this will also require tackling some of the structural constraints that undermine revenue performance.
- **Innovation and technology adoption:** The COVID-19 crisis starkly demonstrated the importance for firms of being able to adapt to new challenges and changing circumstances. It also revealed the advantages to firms of embracing digitalisation and modern practices. The resilience of the post-pandemic recovery will therefore depend on addressing the structural issues limiting innovation and technology adoption among firms and to what extent digitalisation and digital skills become mainstream.

- **Access to finance:** The crisis has highlighted the significance of having a well-developed and diversified financial sector that can respond to the financing needs of enterprises not only during a crisis but also during the recovery phase. As in the rest of the region, the main instruments for providing additional liquidity for enterprises during the crisis came from government support through subsidised lending or lending guarantees. But a robust financial sector comprised of diversified financial institutions that can provide financing for riskier and innovative ventures, and not just established enterprises, will be very important during the recovery phase and beyond.
- **Informality:** The large informal sector – and significant levels of informal employment even within the formal sector – have limited the scope of measures aimed at protecting the income and employment of workers in the most affected sectors. Informality is widespread in these sectors, including retail and tourism, and informal firms have not been able to benefit from government subsidies, favourable loan terms and loan guarantees, and other support measures. Developing a more resilient economy will depend on enhancing the incentives for formalisation and improving the oversight and sanctioning of non-compliance.
- **Health sector:** North Macedonia's vulnerability to the pandemic was increased by its already comparatively poor health outcomes and inefficient health system. This challenge is compounded by relatively low spending on health care (6% of GDP in 2017 compared to 12.6% in the OECD) (World Bank, 2020<sub>[16]</sub>). The health sector's revenues are highly sensitive to employment and economic downturns since they depend on payroll contributions. North Macedonia will need to strengthen the resilience of its health sector through measures such as increased funding; improving pandemic preparedness, including training of health workers and increasing the supply of relevant equipment; and strengthened supply chains for essential medicines and other supplies.

### ***EU accession process***

Following the signing of the Cooperation Agreement with the European Community in 1997, North Macedonia was the first Western Balkan economy to sign a Stabilisation and Association Agreement (SAA) with the EU in 2001. The government formally applied for EU membership in March 2004 and was granted candidate status in December 2005. The EU adopted the Accession Partnership for North Macedonia in February 2008.

For over a decade, North Macedonia's accession negotiations were stalled by the bilateral dispute with Greece over the name "Macedonia". However, in 2018, the breakthrough Prespa Agreement which, among other things, changed its name from Republic of Macedonia to North Macedonia, renewed the prospects for the start of accession negotiations. On 24 March 2020 the EU foreign ministers approved the start of negotiations and on 1 July 2020, the European Commission (EC) presented to the member states the negotiating framework with North Macedonia. However, at the time of the writing of this report, North Macedonia's EU accession course had hit another roadblock as Bulgaria vetoed the start of the negotiations over disagreements regarding the origins of the Macedonian language. It has demanded that the resolution of this bilateral issue be added to the framework for the accession negotiations.

Despite these political challenges to its quest to become an EU member state, the importance of advancing the socio-economic reform agenda remains a priority for North Macedonia. As the government negotiates its accession to the EU, the findings in this Competitiveness Outlook 2021 offer monitoring relevant to a number of critical chapters of the *acquis*, while its recommendations provide the guidance needed to meet the accession requirements. The Competitiveness Outlook also provides a good basis for assessing the critical challenges that the economy faces as a starting point for the development of the Economic Reform Programmes (Box 24.1).

### Box 24.1. Economic Reform Programmes

Since 2015, all EU candidate countries and potential candidates prepare Economic Reform Programmes (ERPs) which play a key role in improving economic policy planning and steering reforms to sustain macroeconomic stability, boost competitiveness, and improve conditions for inclusive growth and job creation. The ERPs contain medium-term macroeconomic projections (including for GDP growth, inflation, trade balance and capital flows), budgetary plans for the next three years and a structural reform agenda.

The structural reform agenda includes reforms to boost competitiveness and improve conditions for inclusive growth and job creation in the following areas:

1. Public Financial Management
2. Green transition
3. Digital transformation
4. Business environment and reduction of the informal economy
5. Research, development and innovation
6. Economic integration reforms
7. Energy market reforms
8. Transport market reforms
9. Agriculture, industry and services
10. Education and skills
11. Employment and labour market
12. Social protection and inclusion
13. Healthcare systems

The structural reforms part of the ERPs is organised in two parts:

- A first part identifies and analyses the three key challenges across those 13 areas. The identification and prioritisation of key challenges imply a clear political commitment at the highest level to address them and the ERPs should propose a relevant number of reform measures to decisively tackle each of them in the next three years.
- A second part provides an analysis of the remaining areas (not included as key challenges) and may propose additional reforms to address them.

The European Commission and the European Central Bank then assess these programmes, which form the basis for a multilateral economic policy dialogue involving the enlargement economies, EU Member States, the Commission and the European Central Bank. The dialogue culminates in a high-level meeting during which participants adopt joint conclusions that include economy-specific policy guidance reflecting the most pressing economic reform needs. The findings of the Competitiveness Outlook provide guidance to the six Western Balkans EU candidates and potential candidates in identifying the key obstacles to competitiveness and economic growth, and in developing structural reform measures to overcome them.

### *EU financial and development support*

North Macedonia has received considerable financial support from the EU, which has been its largest provider of financial assistance. Under the Instrument for Pre-Accession Assistance (IPA), North Macedonia received a total of EUR 1.25 billion between 2007 and 2020. North Macedonia has also received EUR 832.6 million in loans from the European Investment Bank since 1999. Finally, EUR 185.2 million in grants through the Western Balkans Investment Framework have leveraged an estimated EUR 2.1 billion in financing since 2009 (EC, 2021<sup>[39]</sup>).

On 6 October 2020 the EC adopted the Economic and Investment Plan for the Western Balkans, which seeks to support the long-term economic recovery of the region, a green and digital transition, and regional integration and convergence with the EU. The plan envisages the mobilisation of up to EUR 9 billion in investment in sustainable transport, human capital, competitiveness and inclusive growth (EC, 2020<sup>[40]</sup>).

In addition to grant funding the EU also provides important guarantees that support public and private investment by reducing the risks and costs associated with those investments. The new Western Balkans Guarantee Facility is expected to mobilise up to EUR 20 billion in investment over the coming decade (EC, 2020<sup>[40]</sup>).

The Connectivity Agenda seeks to support investments in sustainable transport and clean energy. Set up under the Western Balkans Investment Framework, the latest package, which was presented at the Western Balkans Summit in Sofia on 10 November 2020, completes the delivery of the EU's 2015 pledge to finance EUR 1 billion of investment in support of better connectivity in the WB region. It also represents the first step in implementing the flagship projects under the Economic and Investment Plan for the region.

The EU has also been instrumental in supporting North Macedonia as it deals with the fallout from the COVID-19 pandemic. At the start of the pandemic, the EU reallocated bilateral financial assistance to support North Macedonia's health sector in combatting the disease (EUR 4 million) and to support the government in its efforts to combat the economic impact of the crisis (EUR 62 million) (EC, 2020<sup>[41]</sup>). This help was followed by EUR 160 million in macro-financial assistance to further support the government in dealing with the economic fallout from the pandemic, EUR 80 million of which was disbursed in July 2020 (EC, 2020<sup>[42]</sup>).<sup>1</sup>

## Scope and methods

### **Process**

Following the first two Competitiveness Outlook assessments, published in 2016 and 2018, the third Competitiveness Outlook assessment cycle for the WB6 economies was launched virtually (due to the COVID-19 pandemic) on 3 April 2020. The OECD team introduced North Macedonia's Competitiveness Outlook Government and State Statistical Office coordinators to the new digitalised assessment frameworks (see Assessment methodology and process chapter for details). The two primary documents for assessing each of the 16 policy dimensions – the qualitative questionnaire and statistical data sheet – were explained in depth, giving particular attention to new questions and indicators. The OECD team also explained digital solutions to be used to disseminate the material together with the detailed guidelines, tutorials and information on the assessment process, methodology and timeline.

Following the launch of the assessment, the Cabinet of the Deputy President of the Government of the Republic of North Macedonia disseminated the materials among all 16 Policy Dimension Co-ordinators and Statistical Office contact points in North Macedonia. Where additional guidance was needed, the OECD team held teleconferences with Dimension Co-ordinators and Statistical Office contact points in April and May 2020.

All 16 Dimension Co-ordinators and Statistical Office contact points completed the assessment between April and May 2020. They assigned a score (see Scoring approach) to each qualitative indicator used to assess the policy dimension in question, accompanied by a justification. The completed assessments (qualitative questionnaires and statistical data sheets) were returned to the OECD team between May and July 2020.

The OECD reviewed the inputs and, where necessary, requested additional information from the Cabinet of the Deputy President of the Government of the Republic of North Macedonia, Policy Dimension Co-ordinators and Statistical Office contact points. The updated assessment materials were sent back to the OECD between July and September 2020. In addition, the OECD organised policy roundtable meetings between October and November 2020 to fill in any remaining data gaps, to get a better understanding of the policy landscape, and to collect additional information for indicators where necessary.

Based on the inputs received, the OECD compiled the initial key findings for each of the 16 policy dimensions. It then held consultations on these findings with local non-government stakeholders (including chambers of commerce, academia and NGOs) in November 2020. As a follow up, the OECD presented the preliminary findings, recommendations and scores to the Competitiveness Outlook Government Co-ordinator,<sup>2</sup> Policy Dimension Co-ordinators and Statistical Office contact points at a virtual meeting on 9 December 2020. The draft Competitiveness Outlook economy profile of North Macedonia was made available to the Government of North Macedonia for their review and feedback from mid-January to mid-February 2021.

### **Scoring approach**

Each policy dimension and its constituent parts are assigned a numerical score ranging from 0 to 5 according to the level of policy development and implementation, so that performance can be compared across economies and over time. Level 0 is the weakest and Level 5 the strongest, indicating a level of development commensurate with OECD good practice (Table 24.3).

For further details on the Competitiveness Outlook methodology, as well as the changes in the last assessment cycle, please refer to the Assessment methodology and process chapter.

**Table 24.3. Competitiveness Outlook scoring system**

<b>Level 5</b>	Level 4 plus independent impact evaluation. Results of monitoring and impact evaluation inform policy framework design and implementation updates in line with OECD good practice
<b>Level 4</b>	Level 3 plus evidence that the framework is monitored and, if necessary, adjusted accordingly
<b>Level 3</b>	Level 2 plus some concrete indications that the policy framework is being implemented effectively
<b>Level 2</b>	Framework specifically addressing the policy area concerned is solidly in place, officially adopted by the government or parliament (where applicable). The framework includes policy features necessary for it to have an impact
<b>Level 1</b>	Existing draft or pilot policy framework with signs of government activity addressing the policy area concerned
<b>Level 0</b>	No framework (e.g. law, institution, project, initiative) exists for the policy topic concerned

### *Exceptions*

Unlike the other 15 policy dimensions, competition policy (Dimension 5) is assessed using yes/no answers to 71 questions in a dedicated questionnaire. A “yes” response (coded as 1) indicates that a criterion has been adopted, whereas a “no” (coded as 0) indicates the criterion has not been adopted. The overall score reflects the number of criteria adopted. Moreover, some qualitative indicators which have been added to this edition of the assessment for the first time, are not scored due to the recent character of the policy practice they capture and the unavailability of relevant data.

## Investment policy and promotion (Dimension 1)

### Introduction

North Macedonia's performance has slightly worsened in the investment dimension. Its score has decreased from 3.25 in the 2018 Competitiveness Outlook to 3.0 in the 2021 assessment. While the economy has made notable progress in enhancing its investment policies, North Macedonia ranks fourth among the six Western Balkan (WB6) economies for this dimension (Table 24.4), as its investment promotion and facilitation as well as its green investment framework are limiting its potential to attract foreign investors.

**Table 24.4. North Macedonia's scores for investment policy and promotion**

Dimension	Sub-dimension	Score	WB6 average
Investment policy and promotion dimension	Sub-dimension 1.1: Investment policy framework	3.5	3.2
	Sub-dimension 1.2: Investment promotion and facilitation	2.8	3.0
	Sub-dimension 1.3: Investment for green growth	1.5	2.0
North Macedonia's overall score		<b>3.0</b>	<b>3.0</b>

### State of play and key developments

In 2020, North Macedonia attracted net FDI inflows of USD 444 million, representing 3.8% of its GDP (Figure 24.2) (EC, 2020<sup>[43]</sup>). This level is below most of its regional peers: Montenegro attracted net inflows worth 8.4% of GDP, Serbia 8.3% and Albania 7.9%. North Macedonia was on a par with Kosovo, also at 3.8% of GDP, and outperformed Bosnia and Herzegovina which attracted FDI worth only 1.9% of GDP in 2019 (World Bank, 2020<sup>[16]</sup>). Its total FDI stock was estimated at USD 6.4 billion in 2019 with investments originating primarily from the United Kingdom (14%), Austria (13%), Greece (9%), the Netherlands (8%) and Slovenia (7%). The manufacturing sector attracts the most FDI, ahead of financial and insurance activities.

**Figure 24.2. Net FDI inflows to North Macedonia (2015-19)**

StatLink  <https://doi.org/10.1787/888934256026>

### *Sub-dimension 1.1: Investment policy framework*

Although North Macedonia's **legal framework for investment** activities is favourable to investment, it remains complex and complicated to navigate. Its investment framework is comprised of several laws including the Law on Trading Companies, the Law on Technological Industrial Development Zones, the Law on Financial Support of Investments, the Law on the Establishment of ASIPI, the Law on State Aid Control, and the Law on Strategic Investment, adopted in 2020.<sup>4</sup> In 2018, the Law on Technological Industrial Development Zones was amended to introduce a new built-to-lease option that provides leaseholders with the opportunity to build a facility to meet the needs of new investors in development zones, which allow greater flexibility and competitiveness.

However, the legislation could benefit from some clarification. For instance, the national laws have no unified definition of a foreign investor. Despite the government's efforts, the overall regulatory environment remains full of complexities. Frequent changes and inconsistent interpretation of the rules tend to create an unpredictable business environment conducive to corruption (US Department of State, 2020<sup>[44]</sup>).

Despite recent improvements, transparency and consultation with key stakeholders could be further enhanced. North Macedonia does not have a single website or portal dedicated to investors providing investment laws and regulations, and English versions of laws are not always available. However, the government is striving to increase transparency and is in the process of gathering all regulations onto the Unique Electronic Register of Regulations (ENER) website.<sup>5</sup> This website also includes all draft regulations and encourages public consultations by allowing stakeholders to make comments and suggestions. Transparency has also been reinforced throughout the implementation of a regulatory impact assessment (RIA) programme,<sup>6</sup> which aims to improve the regulatory environment and increase and enhance consultations with stakeholders.

Based on stakeholders' feedback, the RIA and the consultation processes were recently improved. However, the RIA process for laws and consultation procedures provides little information on the background, rationale or expected goals of proposed laws. Moreover, the process only allocates a short amount of time for stakeholders to provide analysis and feedback and does not establish clear deadlines for submitting comments. Stakeholders also complained that consultations are not systematic and are sometimes marginalised or avoided by the government for key legislation. For instance, the Law of Strategic Investments was adopted in 2020 in the space of two months and without proper consultation with stakeholders or the involvement of key public bodies including, notably, the state aid authority.

The market in North Macedonia is open and **exceptions to national treatment** are very limited. Its score on the OECD FDI Regulatory Restrictiveness Index, which assesses and benchmarks market access and exceptions to national treatment, was 0.026 in 2019. This reflects the fact that it maintains only a handful of restrictions, specifically in the transport sector, making its FDI regime less restrictive than the OECD average of 0.064 (Figure 24.3). It does maintain discriminatory restrictions on real estate ownership by legal entities established abroad, which is subject to reciprocity with exceptions for EU and OECD residents, who have the same rights as local residents. In addition, foreign residents cannot acquire agricultural land in North Macedonia and the leasing of agricultural land by foreigners and foreign-owned enterprises is subject to reciprocity or approval from the Ministry of Justice. Overall, North Macedonia's foreign investment rules do not constitute impediments to FDI, however it does not have a negative list of sectors where foreign investment is prohibited or subject to discriminatory conditions.

**Figure 24.3. FDI Regulatory Restrictiveness Index (2019)**

Restrictions are evaluated on a scale of 0 (open) to 1 (closed)

Source: OECD (2019<sup>[45]</sup>), *FDI Regulatory Restrictiveness Index* (database), [www.oecd.org/investment/fdiindex.htm](http://www.oecd.org/investment/fdiindex.htm).

**Investor protection against expropriation** without fair compensation is enshrined in the Constitution of North Macedonia<sup>7</sup> and its modalities are defined by the Law on Expropriation.<sup>8</sup> The law stipulates that expropriation measures can only be used in a non-discriminatory manner, for a public purpose, under due process of law and with fair compensation. It also instructs public authorities to pay investors the market value within 15 days, after which interest will accrue. The Law on Expropriation clearly defines 1) the procedure for calculating the compensation value by a lawful assessor; 2) the process for paying compensation; and 3) the procedures for taking court action in the event of non-payment of the value of the private property. The Macedonian Model Agreement on the Encouragement and Reciprocal Protection of Investments provides additional protection against expropriation. However, the legal framework does not explicitly recognise the concept of indirect expropriation, which deprives investors of the certainty of compensation in cases where the state interferes indirectly with their operations and affects their benefits, investments or use without taking their property.

In 2019, North Macedonia adopted a new law on administrative disputes which aims to improve all administrative acts and procedures. Under this law, appeals against the expropriation decision to the administrative court and to the higher administrative court are better regulated and shortened.

When it comes to **dispute settlement**, foreign investors have the same rights and remedies before the national court system as domestic investors. The justice system is continuing the reform efforts of the 2017-22 Strategy on Judicial Reform. This primarily focuses on reinforcing the independence of the judiciary, which often suffers from executive interference, and strengthening the fight against corruption. The court system maintains a clearance rate of 100% and there is no backlog of cases (EC, 2020<sup>[46]</sup>). The judicial system is also stepping up its modernisation efforts through the use of information technology (IT) but these efforts are being hindered by limited funding. Judges are undergoing special training for mediation mechanisms and procedures in accordance with programmes of the Academy for Judges and Public Prosecutors.<sup>9</sup>

North Macedonia does not have dedicated commercial courts. Commercial disputes are handled by specialised court divisions in the basic courts with extended competencies. Following the amendment of the Law on Courts in 2019, 3 additional courts gained extended competency to decide on commercial cases, increasing the total to 16 courts. However, investors still complain that lengthy and costly commercial disputes through the court system are creating legal uncertainty (US Department of State, 2020<sup>[44]</sup>). In 2019, there were a total of 1 879 cases in progress (876 of which were from the previous

period) while the number of cleared cases was 1 000. In 2019, it took 320 days to complete a case (up from 268 days in 2018) with a 99.77% clearance rate (111% in 2018).

North Macedonia offers alternative dispute resolution (ADR) mechanisms but their use is limited. It has ratified the Convention on the Settlement of Investment Disputes between States and Nationals of Other States (ICSID Convention) and the 1958 Convention on the Recognition and enforcement of foreign arbitral awards (New York Convention). Local courts recognise and enforce foreign arbitration awards issued against the Government of North Macedonia. The economy has also developed a mediation framework following the Law on Mediation, adopted in 2013, and all commercial disputes under EUR 15 000 must be subjected to mediation before legal action can be initiated in the courts. However, as the use of ADR mechanisms is not common and has become less so in recent years, arbitration is not yet considered a viable tool to ensure justice by either parties or the courts (EC, 2020<sup>[46]</sup>).

North Macedonia has strengthened its **intellectual property rights (IPR) legal framework** adopting several intellectual property (IP) laws<sup>10</sup> and regulations, which are being harmonised with EU legislation and contain the minimum requirements of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS).<sup>11</sup> It is a member of the World Intellectual Property Organization and adheres to the main international treaties and conventions on IPR. It has integrated the key dispositions of international IP agreements into its national legislation,<sup>12</sup> notably in the Law on Industrial Property, as well as its patent and industrial design regulations.

However, the institutional framework for **IPR enforcement** and implementation is fragmented, with multiple institutions with overlapping mandates and a lack of human resources, limiting their co-operation and efficiency. These institutions include the State Office of Industrial Property (SOIP), the Ministry of Culture and the Ministry of Agriculture, Forestry and Water Economy (MAFWE). In addition, the State Market Inspectorate is responsible for monitoring markets and preventing the sale of counterfeit and pirated goods in co-operation with customs, and the Ministry of Interior is in charge of IP crimes.

The Coordination Body for Intellectual Property, the body responsible for IP enforcement, has recently undergone improvements that have allowed it to increase the number of actions it takes against infringers including increasing its human resources capacity and securing increased funding from the SOIP. In response to requests for action by rights holders, about 30 co-ordinated actions were carried out against violations of industrial property rights, such as patents for inventions, industrial designs and trademarks, in North Macedonia in 2020 (20 in Ohrid and 10 in Skopje). Between 1 February and 31 December 2020, the Customs Administration received 45 requests for customs protection measures and 86 requests for extension of the deadline for customs protection. In the numerous actions conducted in the reporting period, customs impounded 69 518 individual items on account of reasonable doubt that the goods had violated IPR. Representatives of the State Market Inspectorate, the Public Revenue Office and the Ministry of Interior participated in the supervision and efficient implementation of these measures and activities.

The SOIP, the body responsible for industrial property rights, has improved its registration process, making it both quicker and cheaper; it now takes less than six months to register an industrial property right. The office provides information kits and databases of trademarks, patents and industrial design. It is expected to start offering online filing for patents in 2021 and to start the procedure for online filing for trademarks and industrial design. While there are no specialised courts dealing with IPR cases, judges and public prosecutors are regularly trained on IPR laws and enforcement.

While co-operation among the many institutions charged with IP enforcement is currently lacking, the SOIP is expected to begin implementing the EU-funded Technical Assistance for Development of a National Strategy on Intellectual Property 2020-25 project in March 2021. The programme will include the development of a dedicated e-network for data exchange between IPR institutions in as well as e-filing solutions for trademarks, patents, industrial designs and e-services. The new long-term National Strategy on Intellectual Property 2021-30 also includes a concrete set of proposals to improve the functioning of IP

institutions, including the establishment of special IP rights departments within institutions and increasing the number of staff dealing with IP-related issues.

The government has also reinforced its **IPR awareness raising and improved access to information**. The SOIP leads IPR awareness seminars, workshops and training courses that are included in its annual work programme. It recently organised seminars and workshops about IPR in co-operation with universities and private sector actors.<sup>13</sup> Additional activities include the organisation of training for judges on IP matters.

### *Sub-dimension 1.2: Investment promotion and facilitation*

North Macedonia has a solid **investment promotion agency structure and strategy**. Two agencies are responsible for attracting FDI and servicing investors: the Agency for Foreign Investments and Export Promotion (ASIFI), also known as Invest North Macedonia,<sup>14</sup> and the Directorate for Technological Industrial Development Zones (DTIDZ, the national special economic zones authority). With the establishment of the new government in 2020, the role of supporting ASIFI to promote and facilitate investment has been transferred from the cabinets of four ministers in charge of attracting FDI to the cabinet of the Deputy Prime Minister in charge of economic affairs and co-ordination of economic sectors and investments as well as the department for FDI in the cabinet of the Prime Minister.

The co-ordination of investment promotion and facilitation activities is also enabled by the use of the national customer relations management (CRM) system which is used by all parties to communicate with potential investors. While ASIFI manages the system, the employment of economic promoters have made the functionality of the CRM limited, although it is in the process of being updated.

North Macedonia is doing well at fostering linkages between local firms and multinational firms. The Law on Financial Support of Investments encourages these linkages, providing financial support for the establishment and promotion of co-operation with suppliers registered in North Macedonia.<sup>15</sup> The economy also has active policies for developing clusters, of which there are currently 20 active groups. These policies are inscribed in the Competitiveness Strategy (2016-20) that aims to create an attractive business environment for foreign investors through reforms and public private dialogue, mobilising remittances from the diaspora, and improved data collection as well as in the Industrial Strategy (2018-27), and the Innovation Strategy (2012-20) that supports the integration of local companies into global value chains.

Finally, the government is providing support to local companies that are taking actions to increase their competitiveness and ability to link with foreign enterprises, such as adopting standards, digitalising, developing or improving products, improving their organisational structure, or investing in development and equipment.

North Macedonia also has a strong institutional setting and co-ordination mechanisms for its **investment facilitation services and activities**. This is reflected in its ranking in the World Bank's Doing Business index of 17<sup>th</sup> out of 190 countries. Since 2006, the National Registry has operated as a one-stop-shop for registration and allows rapid registration (1-2 days). North Macedonia is also implementing a one-stop-shop for business licences and permits to start and run a business, which was expected to be fully functional in 2020. The economy is also accelerating the digitalisation of public services used by investors. In 2018, DTIDZ also introduced a key change in the Law on Technological Industrial Development Zones in order to facilitate the establishment of businesses in the zones and allow more flexibility through a new build-to-lease option for investors in zones.

However, ASIFI has a limited investment facilitation mandate. This role was previously undertaken by the cabinet of the Vice-Prime Minister for Economic Affairs which organised a public-private platform called Learning From the Business Community, allowing representatives from the private and public sectors to discuss issues raised through yearly cycles of company visits.<sup>16</sup> However, this platform has recently ceased to operate and the role has been transferred to the Deputy Prime Minister who executes a programme of company visits throughout the year. These meetings discuss initiatives, problems, requests

and the needs of companies and business sectors in the economy, which are then brought to the government's attention.

North Macedonia has a clear **investor targeting** strategy and ASIPI has a well-defined set of priority sectors<sup>17</sup> that it promotes. The 2020 Strategic Investment Law also defines strategic sectors including energy, transport, telecommunications, tourism, manufacturing, agriculture and food, forestry and water economy, health, industrial and technological parks, wastewater and waste management, sport, science, and education. ASIPI continues to promote, target and attract investors to locations around the entire economy, including in development zones, while DTIDZ regularly reaches out to potential high value-added manufacturing companies about hosting in the technological industrial development zones in order to support a competitive environment and generate linkages with domestic firms.

North Macedonia has put complex and multi-layered **investment incentive** schemes in place to attract investments. In March 2018, the government passed the Plan for Economic Growth (Government of North Macedonia, 2020<sup>[47]</sup>) which provides substantial incentives to both domestic and foreign companies. These include a variety of measures including job creation subsidies, capital investment subsidies for the acquisition of new markets and financial support to increase competitiveness. All other incentives are included in the Law on Financial Support to Investment, the Law on Technological Industrial Development Zones and the Strategic Investment Law. Tax incentives introduced in the tax laws are under the authority of the Public Revenue Office (PRO) which is the institution authorised to carry out tax assessment and collection. The PRO also provides information to the state aid provider on how much state aid has been given in the form of tax incentives in accordance with the Law on Technological Industrial Development Zones.

In North Macedonia, **aftercare services** are provided by the cabinet of the Deputy Prime Minister, which is in charge of economic affairs, and co-ordinating the economic sector and investments, as well as ASIPI and DTIDZ. ASIPI helps investors to find suppliers through an online platform of local companies (Invest North Macedonia, 2020<sup>[48]</sup>) and facilitates communication with other administrations and local authorities. It is also actively involved in the work of the Foreign Investor Council (FIC).<sup>18</sup> This channel enables companies to raise problems which ASIPI then relays to the competent institutions. DTIDZ offers a wider range of services<sup>19</sup> to ease and streamline business procedures for investors in the zones. In addition, DTIDZ is developing an online aftercare registration platform to improve communication protocols and aftercare services to investors in the zones. Both organisations play a major part in policy advocacy, negotiating with the government on behalf of investors to help overcome their challenges.

### *Sub-dimension 1.3: Investment for green growth*

While North Macedonia has reinforced its commitment to green energy through several green strategies, the economy lacks a clear framework for **green investment policy and promotion**. The 2018 amendment of the Energy Law made it possible for investors using renewable energy sources to obtain the status of privileged power producer who could then use premiums and feed-in tariffs as support measures.

Meanwhile, the Law on Industrial and Green Zones regulates the conditions and establishment, management and activities of industrial and green areas; the conditions for their performance; and the obligations on the landowner on use of the area. The law aims to accelerate the economic development of local governments and increase employment and the competitiveness of the economy by attracting foreign and domestic capital to develop the zones. The regulation was amended in 2019 to include new provisions for regulating the benefits and opportunities for zone users, unifying applicable provisions for industrial and green zones, and better defining the conditions for performing activity in these areas.

Following the recommendations of the Innovation Strategy, which emphasises the importance of an effective national innovation system, North Macedonia established the National Fund for Innovations and Technology Development of North Macedonia in 2014. The fund aims to encourage innovation by providing additional resources for financing innovative activities through regular tenders and call for proposals.

Meanwhile, the 2020 Programme for Competition, Innovation and Entrepreneurship calls for expert analysis to contribute to the preparation of technical-project documentation and feasibility studies for planned investment projects, the establishment of enterprises to increase energy efficiency, and the introduction of the concept of a circular economy, such as a system for environmental protection and the green economy.

North Macedonia has primarily focused on transitional energy and the environmental practices of existing SMEs, while the promotion of green investments has lagged behind. ASIPI has posted for government approval on several renewable energy projects in the fields of solar, wind and hydropower to be opened to public tenders. However, while North Macedonia has reaffirmed its commitment to environmental good practice, it lacks a clear strategy or programme to attract or encourage green investments.

North Macedonia's framework for **choosing public and private partnerships for green growth** lacks specific provisions to mobilise and scale up green investments by leveraging public and private investments in large-scale infrastructure projects. However, the Energy Efficiency Law requires the contracting authorities to procure the most energy-efficient products, when procuring energy-related products that are not subject to energy labelling and valued over EUR 70 000, taking into account the competition between economic operators during public procurement. In accordance with the same law, as well as the Law on Concessions and Public Private Partnerships which is in the process of being amended, energy services contracts are established in the form of a public-private partnership when an energy services beneficiary is considered to be a public partner.

### ***The way forward for investment policy and promotion***

North Macedonia is striving to improve its investment climate and to attract FDI as a source for growth and job creation. It has made considerable efforts to create a favourable business environment. However, these efforts could be reinforced through the following actions:

- **Continue to simplify and increase the transparency of the investment framework** by accelerating the RIA programme and improving the consultation process. Providing additional information on the proposed laws such as background, rationale and expected goals; more time for stakeholders' analysis and feedback; and clear deadlines for feedback would improve the way the RIA process is applied and the consultations with stakeholders.
- **Reinforce the independence, resources and capacity of the court system, particularly for commercial disputes.** While the reform of the judiciary system has progressed very well over recent years and no backlog of cases remains, investors still complain about the uncertainty created by the slow and costly settling of disputes in the economy. As commercial cases are currently heard in general administrative courts, North Macedonia should focus on establishing a dedicated commercial court to effectively handle business disputes.
- **Increase public awareness and implementation of the recently adopted mediation mechanisms.** North Macedonia should use awareness-raising campaigns to increase businesses' access to information about alternative dispute resolution mechanisms. These mechanisms could be promoted by reinforcing the role, resources and capacities of the Chamber of Mediators as well as the work of the Permanent Elected Court-Arbitration at the Economic Chamber of Macedonia.
- **Reinforce the co-ordination between IPR implementation and enforcement bodies, increase IPR agency capacity and resources, and step up IPR awareness-raising efforts.** IPR bodies currently only have the capacity to conduct low-level awareness-raising campaigns and lack the capacity to train and allocate specialised judges and prosecutors to handle IPR disputes. Increasing the allocation of resources to IPR institutions would enable authorities to better implement IPR awareness raising campaigns and streamline inter-institutional co-operation when it comes to carrying out actions and seizures.

- **Give ASIPI the capacity and resources it needs to fully implement its mandate.** As its remit covers several sectors and divisions, ASIPI will need more resources to promote linkages between SMEs and multinational enterprises effectively. The government should also reinforce the co-operation between DTIDZ and ASIPI and clarify the institutional framework for investment and the competencies of the agencies and departments in charge of investment promotion, facilitation and aftercare
- **Streamline existing investment incentives and reinforce the evaluation of their costs and benefits, appropriate duration and transparency.** Simple and unified tax incentive regimes can make it easier for governments to evaluate the cost and benefits of such measures to allow for the better allocation of resources while improving the clarity of the system for investors.

## Trade policy (Dimension 2)

### Introduction

North Macedonia has made progress since the previous assessment round in all sub-dimensions analysed. The economy has increased its score on this dimension from an already high score of 3.7 in 2018 to 3.8 in 2021. Table 24.5 shows North Macedonia's scores for the trade policy sub-dimensions, and compares them to the WB6 average. The scores for Sub-dimension 2.2 do not follow the same scoring methodology hence are not displayed (for more information please refer to the STRI methodology displayed in Sub-dimension 2.2: Services trade restrictiveness).

In particular, North Macedonia has made progress since the last assessment in 2018 in implementing regulatory transparency, improving public consultations and increasing transparency in trade policy making, and in trade policy development and co-ordination. As a result, the climate in which the private sector operates has continued to improve. Public consultations have improved thanks to a dedicated online consultation system. However, some efforts still need to be made, as the government makes relatively frequent use of shortened and urgent procedures for the adoption of legislation. The quality of its regulatory impact assessments has slightly improved, but its budgetary impact assessments are still only partial. Together these explain its above-average score of 3.8 in Sub-dimension 2.1.

There have been significant reductions in restrictions on trade in services through the conclusion of Additional Protocol 6 to the Central European Free Trade Agreement (CEFTA) in December 2019. North Macedonia has not reported any protectionist legal changes. This is particularly important in a context where regulations restricting services have tended to increase among OECD economies in 2020 (OECD, 2021<sup>[49]</sup>). In general, North Macedonia has continued to make its economy more attractive to trade in goods and services. All of the service sectors analysed have demonstrated a greater degree of openness than in previous years, but more could be done. There are cross-cutting policies affecting foreign service providers such as restrictions on the acquisition and use of land and real estate by foreigners, as well as mandatory minimum capital requirements in the form of a deposit that must be placed in a bank or notary's office to register a limited-liability entity. North Macedonia also applies limitations on movement of people through quotas and labour market tests for work permits issued to third-country nationals. Reducing these and other efforts could significantly reduce the costs of trade in services.

Finally, North Macedonia has put in place a sound e-commerce policy framework, bringing it more in line with EU regulations, which explains its very high score of 4.0 in Sub-dimension 2.3.

**Table 24.5. North Macedonia's scores for trade policy**

Dimension	Sub-dimension	Score	WB6 average
Trade policy dimension	Sub-dimension 2.1: Trade policy framework	3.8	3.5
	Sub-dimension 2.2: Services trade restrictiveness	n.a.	n.a.
	Sub-dimension 2.3: E-commerce and digitally enabled services	4.0	3.1
North Macedonia's overall score		<b>3.8</b>	<b>3.4</b>

### State of play and key developments

North Macedonia has an open economy and is highly integrated into international trade, with a total trade-to-GDP ratio of over 138.8%, (Table 24.5). Since 2017, its main trading partners have remained the 27 EU member states, which account for more than 80% of total exports and 53% of imports.<sup>20</sup>

In 2019, exports of goods and services were worth EUR 6.5 billion – an increase of 24% since 2017 – and imports EUR 8 billion (+17% over 2017). In 2019, exports amounted to 62.2% of GDP and imports 76.5%. Although the gap between imports and exports was gradually narrowing before the COVID-19 pandemic,

the trade structure of North Macedonia remains in deficit and has been hovering at around EUR 1.8 billion since 2017. The overall trade deficit for 2019 was around 14.2% of GDP (EC, 2020<sup>[46]</sup>).

Although North Macedonia had one of the highest trade levels in the region in 2019. In 2020, pandemic-related export bans, restrictions on the movement of people, and closures of shops and services, led to a significant decline in imports and exports. Although North Macedonia was not the most severely affected economy in the region, imports declined by 11% and exports by 13% in Q2-Q3 2020. The similarity in the scale of both contractions meant the trade balance was comparable to that in 2019. Trade, tourism and transport, which are substantial drivers of growth in the economy, were the most affected, contracting by almost 12.3%.

**Figure 24.4. Impact of COVID-19 on trade, North Macedonia versus the OECD (2019-20)**

% change y-o-y

Source: IMF (2020<sup>[50]</sup>), *World Economic Outlook*, [www.imf.org/en/Publications/WEO](http://www.imf.org/en/Publications/WEO); OECD (2020<sup>[51]</sup>), *OECD Economic Outlook*, <https://doi.org/10.1787/0d1d1e2e-en>.

StatLink  <https://doi.org/10.1787/888934256045>

**Slowdown in trade flows:** Industries in the WB6 were affected by the supply shock caused by the COVID-19 pandemic and the resulting slowdown in trade flows. The decline in North Macedonia's exports was primarily due to the breakdown of global value chains (GVCs). As one of the economies in the region with a greater level of integration into GVCs, it felt the immediate effects more severely (OECD, 2020<sup>[51]</sup>). In particular, it suffered from the disruption to supply chains from the manufacturing slowdown in the People's Republic of China and reduced demand in the United States and especially the EU, its main trading partner. GVCs are concentrated in a few sectors (automotive, electrical equipment, machinery, chemicals and metals) and are located around a few European economies (OECD, 2019<sup>[52]</sup>). In North Macedonia, the producers of machinery and equipment, and mechanical appliances were most affected, as they were the most integrated into European value chains. However, given the relatively high import content of its goods exports, the volume of trade is expected to recover once production resumes alongside the revival of GVCs and demand, especially in the EU.

**Slowdown in services:** Although they make up a smaller share of its exports as goods, services generate 55.2% of GDP in North Macedonia and 54.9% of employment (IMF, 2019<sup>[53]</sup>). They have been strongly affected by the fall in domestic and external demand during the pandemic, as well as by travel restrictions and social distancing measures.

**The benefits of green lanes:** The closure of EU borders to non-EU citizens and other regulatory responses, combined with the existing logistical challenges of the Western Balkans, have particularly affected freight transport services. The WB6 set up the CEFTA co-ordinating body to exchange information on trade in

goods at the beginning of the pandemic. They also set up priority "green lanes" (with the EU) and "green corridors" (within the WB6) to facilitate the free movement of essential goods within the WB6 and with the EU, involving priority green border/customs crossings. At the peak of the crisis (April-May 2020), most road transport in the WB6 economies passed along these green corridors. These have helped to maintain a certain degree of international trade in goods in the region. In fact, only about 20% of the goods benefitting from the Green Corridor regime were basic necessities, the rest being regular trade.

### *Sub-dimension 2.1: Trade policy framework*

The importance of a transparent legislative procedure has increased over the past few years. A fundamental aspect of regulatory transparency is that the regulatory development process is open to all relevant stakeholders through formal and informal consultation channels before and after the adoption of new regulations. These consultation mechanisms have a positive impact on the efficiency of economic activities and the degree of market openness, as they can improve the quality and enforceability of regulations (OECD, 2012<sup>[54]</sup>). Governments in many economies are also adopting cross-cutting policies or guidelines to further improve the consultation process. This sub-dimension assesses the government's effectiveness in formulating, evaluating and implementing trade policy through two indicators: the institutional co-ordination of trade policy formulation, and public-private consultation and transparency.

North Macedonia has a solid **inter-institutional co-ordination of trade policy formulation** framework (Table 24.5) through official committees, councils and working groups led by the Ministry of Economy.<sup>21</sup> Inter-ministerial committees focus on the implementation and negotiation of regional and international commitments such as CEFTA and the World Trade Organization (WTO), facilitation of the EU accession process (through the preparation of relevant trade policy-related chapters of the *acquis*), and the design and amendment of specific trade measures. They also establish co-ordination mechanisms to address the more challenging areas of trade policy. Under the auspices of the Ministry of Economy, committees meet whenever a trade issue arises or a regulation is foreseen. For each issue of this nature, the law requires consultation with the ministries concerned before the project is discussed in government sessions.<sup>22</sup> Each ministry or institution preparing information on a trade issue is required to obtain the opinion of the Ministry of Economy and all other ministries and institutions concerned.<sup>23</sup> The opinion of the Secretariat for Legal Affairs is mandatory on any document sent to the government.<sup>24</sup>

One of the fundamental aspects of regulatory transparency is that the regulation-making process is open to all concerned stakeholders through formal and informal consultations prior to and after adoption. North Macedonia has formal instruments for **public-private consultation** with businesses and civil society, which involve the most relevant stakeholders (domestic and foreign companies, business associations, logistics providers, trade unions, consumer groups, etc.). The economy performs well on the frequency of its consultations, the depth of stakeholder participation in practice and the availability of online information through the Unique National Electronic Register of Regulations (ENER) platform.<sup>25</sup>

Since the last assessment, the recently started consultations for trade policy strategies cover both draft legislation and trade policy strategies. In 2018, North Macedonia had the highest number of stakeholders involved in regular public-private consultations among the WB6 economies (OECD, 2018<sup>[55]</sup>) and this trend has continued in this assessment cycle (Government of North Macedonia, 2019<sup>[56]</sup>).

A legally formalised consultation procedure exists within the legal processes for the adoption of acts. The authorities have set up a dedicated website to enable the private sector to comment on draft laws in a transparent manner. Inclusive participation in public consultations is encouraged through ENER. Stakeholders can therefore be consulted both while policy is being made and as it is implemented. The private sector has full access to draft trade normative acts, including relevant material from regulatory dossiers (supporting analysis, impact assessment results, reasons for regulatory decisions and other relevant data). Consultations include strategic, tactical and operational issues. The timelines, goals and topics of consultations are published in advance. Once the consultation process has ended, the law

mandates that the outcomes be made publicly available as the authority receiving the comments is required to respond within 15 days. This includes the reasons why comments were taken into account or discarded.

However, the system is not fully exploited, as business and citizens' associations are mainly consulted at the end of the development of strategies and are not sufficiently involved in their preparation. Moreover, feedback from local stakeholders found that in some ENER-supported consultations there were no responses to stakeholders' comments, complaints and recommendations. Stakeholders also raised sporadic concerns that they were given too little time to comment on some documents, effectively preventing some stakeholders from participating in consultations.

The various chambers of commerce and economy of North Macedonia are regularly involved when a new trade bill is being considered. The chambers then disseminate the proposals through their business networks for comment. Similarly, in the period after regulations enter into force, the chambers have the opportunity to feed back the private sector's comments about the effects of regulations on the business environment to government institutions.<sup>26</sup>

Compared to 2018, North Macedonia has improved its regulatory transparency by increasing the openness of its consultation mechanisms, in particular by making them simpler and more accessible. However, there is no systematic quality control of the public consultation process. Nor is the process always enforced: the number of laws adopted under shortened procedures, mainly on the proposal of members of parliament (MPs), has increased considerably, from 20% in 2018 to 61.6% in 2019 (EC, 2020<sub>[43]</sub>). These laws have not been subject to a genuine public consultation process and have not been regularly supported by impact assessments.

North Macedonia generally ensures that its policy and legislation development is based on evidence. The collection of administrative data has improved since 2018, but the information is not always used optimally in the decision-making process. One of the reasons for this is the lack of a specialised administrative unit for this type of analysis. Regulatory impact assessments (RIAs) remain an issue. Until mid-2019, the government regularly prepared RIAs for all regulations sent to parliament through the ordinary legislative procedure, but since then parliament has enacted an unusually high number of laws without impact assessment or public consultation (EC, 2020<sub>[46]</sub>). The government explanation for this is the large number of new bills, urgency and the lack of some of the information needed for *ex ante* evaluations. In addition, the RIA process does not include the financial impact on the budget, nor the financial implications for stakeholders of implementing regulations. Evaluations of the effects of regulations are only very rarely carried out after they have been adopted and implemented.

North Macedonia is party to a number of bilateral and multilateral **free trade agreements**, the first of which was signed between North Macedonia and Turkey in 2000, followed by a bilateral agreement with Ukraine in 2001. Having entered into a free trade agreement with the European Free Trade Association (EFTA) in 2002, North Macedonia opened the door for market access to its European partners.

In 2004, North Macedonia adopted the Stabilization and Association Agreement (SAA), providing for the free movement of goods and service between EU and potential candidate countries. It continues to bring its legislation in line with the EU *acquis*. Shortly after it joined the WTO in 2006, it became a founding member of CEFTA the same year, with the aim of achieving full tariff liberalisation on trade in manufactured products and agricultural goods, and to establish a negotiating framework for eliminating non-tariff barriers (NTBs).

In 2018, North Macedonia brought the CEFTA Additional Protocol 5 on Trade Facilitation into force, simplifying trade-related procedures and cross-border documentation processes. Most recently, it adopted Additional Protocol 6 on Trade in Services in 2019, which allows it to ease licensing and professional qualification procedures, as well as developing the regional e-commerce capacities.

### Sub-dimension 2.2: Services trade restrictiveness

Services contribute close to two-thirds of GDP in the WB6 economies, underlining how strongly economic growth, innovation and job creation depend on effective policies for services that promote open and competitive markets. In 2019, in North Macedonia, services contributed to 55.2% of GDP and accounted for 54.9% of employment, a steady though moderate increase compared to previous years (Figure 24.5), underlining the extent to which economic growth, innovation and job creation depend on effective service sector policies that promote open and competitive markets.

**Figure 24.5. Services, value added (% of GDP) - North Macedonia (2007-17)**

Source: (World Bank, 2020<sub>[16]</sub>), *World Development Indicators* (database), <https://databank.worldbank.org/source/world-development-indicators>.

StatLink  <https://doi.org/10.1787/888934256064>

More and more business models rely on services rather than sales of manufactured goods. This is the so-called “servitisation” of manufacturing (Miroudot and Cadestin, 2017<sub>[57]</sub>). Enhancing the openness of trade in services can improve domestic firms’ efficiency and productivity. Trade in services allows countries to specialise according to their comparative advantages in services and skills. The potential gains from liberalisation in services trade are significant because increased domestic and foreign competition, complemented by effective regulation, can enhance performance (OECD, 2018<sub>[55]</sub>) and lower costs provoked by regulatory barriers (Box 24.2).

### Box 24.2. The costs of regulatory barriers to trade in services

Recent OECD analysis reveals that services trade restrictions significantly affect trade by raising the costs for firms to operate in the host economy (Rouzet and Spinelli, 2016<sup>[58]</sup>). Trade costs arise both from policies that explicitly target foreign suppliers, and more generally from domestic regulation that falls short of best practice in the area of competition and rule-making. The costs resulting from barriers to trade in services are much higher than those to trade in manufactured goods.

Trading services is costly. The studies show that policy-induced services trade costs are relatively high. Expressed as percentages of total trade value, average multilateral costs for cross-border services trade are around 57% for communication services and 54% for business services, around 60% for transport services, around 103% for insurance services, and around 255% for financial services. Even exporting to the most liberal countries still requires compliance with regulation at a cost that correspond to around 30% of the export value in most sectors and nearly 90% for financial services. Within the European Single Market, however, services trade costs are significantly lower – policy-induced costs of cross-border services trade are around 10% in most sectors and around 32% for financial services.

Source: (Benz and Jaax, 2020<sup>[59]</sup>), *The costs of regulatory barriers to trade in services: New estimates of ad valorem tariff equivalents*, <https://dx.doi.org/10.1787/bae97f98-en>.

The OECD Services Trade Restrictiveness Index (STRI) was used to **analyse barriers to trade for 12 services sectors** in North Macedonia. The OECD STRI project is a unique, evidence-based diagnostic tool that inventories trade restrictions in 48 economies,<sup>27</sup> allowing economies to benchmark their services regulations against global best practice, identify outlier restrictions, and prioritise reform efforts. For this CO assessment cycle, the 12 services sectors are grouped into four clusters: 1) transport and distribution supply chain (air transport, road transport, rail transport, courier); 2) market bridging and supporting services (commercial banking, insurance, legal services); 3) physical infrastructure services (construction, architecture, engineering); and 4) digital network services (computer services, telecommunications).

Information was collected from the WB6 economies' laws and regulations, and indices were calculated for seven years (2014-20). These composite indices quantify restrictions across five policy areas: foreign entry, movement of people, barriers to competition, regulatory transparency and other discriminatory measures. The indices quantify regulatory restrictions in each of the 5 policy areas for the 12 sectors by giving them a value between 0 and 1. Complete openness to trade in services gives a score of 0, while being completely closed to foreign service providers yields a score of 1.<sup>28</sup>

Each policy area is composed of a series of measures. These measures are called "horizontal" if they are present in all sectors, or "sector specific" if they only affect a particular sector.<sup>29</sup> The STRI measures the most-favoured-nation (MFN) restrictions and does not take into account any specific concessions, such as regional trade agreements or mutual recognition agreements (Geloso Grosso et al., 2015<sup>[60]</sup>).

Figure 24.6 shows the STRI indices for each of the sectors as well as the average scores for the WB6, EU and OECD. Like most economies in the WB6 region, North Macedonia's services trade markets are generally more open than some OECD and STRI partner states. Compared to the OECD and key partners' average STRI indices (represented by a "+" in Figure 24.6), North Macedonia is in the low range for the restrictiveness of its service sectors, making it a preferred candidate for foreign service providers; especially in its three least restrictive sectors: telecommunications, road transport and courier services. In contrast, it remains less competitive in computer services, air transport and legal services, the three sectors with the highest STRI score. The analysis which follows displays the scores, explains sector by sector what drives the results and provides a brief description of the most common restrictions and good practices.

**Figure 24.6. Services trade restrictiveness index for North Macedonia (2020)**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and therefore are not covered by STRI indices; key partners to the STRI project are Brazil, the People’s Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand. Source: (OECD, 2020<sup>[61]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink <https://doi.org/10.1787/888934256083>

As Figure 24.7 shows, North Macedonia has continued to reduce restrictions on the trade in services. The slowdown in reforms to open up services markets in the years 2019-20 is explained by the reorganisation of regulatory efforts caused by the COVID-19 pandemic.

**Figure 24.7. Evolution of STRI scores by sector in North Macedonia (2014-20)**

Percentage change over the periods 2014-16, 2016-19 and 2019-20

Note: Negative values indicate a reduction in the restrictiveness of the economy’s trade regulatory environment.

Source: OECD (2020<sup>[61]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink <https://doi.org/10.1787/888934256102>

The following analysis starts with the horizontal measures that are included in all sectors and that typically hamper services trade in the economy as a whole. In particular, in the area of general business regulations (horizontal regulations), restrictions on foreign entry, restrictions on the movement of service providers, standards for the cross-border transfer of personal data, the legal framework for public procurement and the screening of foreign investment. It then reviews each of the 12 sectors analysed, displaying the STRI

scores, explaining what drives the results, and providing a brief description of the most common restrictions and good practices.

### **General business regulations affect firms' ability to operate in North Macedonia**

*General business regulations* can affect firms' ability to operate. North Macedonia could improve its company regulations in a number of areas. Foreigners need to obtain authorisation before they can acquire or use land and real estate, affecting the companies' ability to establish offices in the economy. In order to register a limited-liability company, a minimum amount of capital<sup>30</sup> must be deposited in a bank or notary's office, which also affects foreign companies. Cumbersome procedures for obtaining business visas limit the search for investment opportunities.

*Restrictions on the movement of people* are also an issue in North Macedonia. Although the conclusion of Additional Protocol 6 has made significant progress in easing the conditions for the movement of persons between CEFTA economies, people from outside CEFTA or the EU remain subject to restrictive requirements. North Macedonia applies quotas and labour market tests for work permits issued to third-country nationals, although intra-corporate transferees are exempted. Labour market tests are undertaken to determine whether suitably qualified local workers are available (or could easily be trained to do the work). They typically involve seeking advice from industry representatives and government agencies to determine current skill shortages. The initial length of stay of these categories of foreigners (12 months) also falls short of international best practice (OCDE good practice threshold is set at 36 months) (OECD, 2021<sup>[49]</sup>).

*Standards for the cross-border transfer of personal data* are set at EU level. Data may be transferred to non-European Economic Area (EEA) economies which ensure an adequate level of data protection or, failing that, where appropriate safeguards (e.g. binding corporate rules or standard data protection clauses) are in place.

North Macedonia's laws do not contain any elements restricting trade in services in terms of investment screening. *Screening of foreign investments* refers to the laws or regulations enabling governments or regulators to alter or prohibit foreign investment projects, where consideration of economic motives or economic interests is explicitly included in the criteria for approval. North Macedonia's regulations do not mandate the consideration of economic interests in the review of foreign investments but nor is it explicitly ruled out. There is threshold above which a foreign investment project is subject to screening.

### **How restrictive are individual service sectors?<sup>31</sup>**

On top of the regulatory measures that affect North Macedonia's trade in services across the board, there are a number of sector-specific restrictions in the 12 sectors analysed.

**Air transport services** are defined as passenger and freight air transport (code 51 under the International Standard Industrial Classification – ISIC Rev 4), carried domestically or internationally. The STRI for this sector covers commercial establishments only. In light of the range of air transport sub-sectors, the STRI project focuses on measures affecting carriers' transport of passengers and goods between points. Airport management and other aviation services are only relevant where regulations could have affect foreign carriers' ability to transport passengers and goods. The other aviation services are covered more fully in the STRI for logistics services.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.165 and 0.601. With a score of 0.441, North Macedonia's air transport sector is the most restrictive of the WB6 economies and it scores higher than the EU (0.406), OECD (0.409) and WB6 (0.421) averages.

*Restrictions on foreign entry* figure prominently in the results of North Macedonia's STRI for air transport services. Foreign natural or juridical persons can only hold up to 49% of the equity share in an air transport services company in North Macedonia. This restriction is in line with EU legislation, and can be found in

many of the countries that have undergone the STRI exercise. However, it greatly impacts the score (and therefore the level of restrictiveness) in air transport markets. Economies that have reformed in this area have been able to lower their level of restrictiveness substantially. Another measure that limits the openness of this sector is the limitations on leasing. Dry leasing (leasing foreign aircraft without crew) is allowed but subject to prior authorisation, but wet leasing (leasing foreign aircraft with a crew) is prohibited. Both measures negatively affect the economy's score for this sector.

*Barriers to competition.* Unlike several WB6 economies, North Macedonia does not maintain public ownership in the aviation sector through a national company. Macedonian Airlines (MAT; Македонски Авиотранспорт or Makedonski Aviotransport) was the national flag carrier, but it ceased operation in 2009. Slots are allocated in a fair, non-discriminatory and transparent manner, following the principle of equal opportunities to all airlines. The general principle regarding slot allocation is that an air carrier having operated its particular slots for at least 80% of flights during the summer/winter scheduling period is entitled to the same slots in the equivalent scheduling period of the following year (so called grandfather rights). Consequently, slots which are not sufficiently used by air carriers are reallocated (the so called "use it or lose it" rule). North Macedonia prohibits the commercial exchange of slots, which is more restrictive than the EU *acquis*, where slots can be freely transferred (EUR-Lex, 1993<sup>[62]</sup>).

**Road freight transport** (ISIC Rev 4 code 4923) covers commercial road freight establishments only. Cross-border trade is governed by a system of bilateral and plurilateral agreements which provide for permits, quotas and other regulations.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.124 and 0.624. With a score of 0.194, North Macedonia is the third-most restrictive economy among the WB6 economies. It scores higher than the EU average (0.184) but lower than the OECD (0.201) and WB6 (0.225) averages.

The most restrictive sector-specific measure is the practice of imposing licensing and permits subject to quotas for domestic traffic. Sector-specific regulations induce *foreign entry restrictions* in North Macedonia. Licences are established on the basis of technical, legal and financial criteria. Licences and certificates issued by the competent authorities in economies which have signed a bilateral or multilateral agreement with North Macedonia are fully recognised. The Law on Recognition of Professional Qualifications provides adequate solutions for third-country licences.

Public transport of goods by road refers to transport for which the relation, the price of transport and other conditions are determined by agreement between the carrier and the customer. The government only mandates set prices for inter-municipal line passenger transport, bus lines, taxi services, etc, meaning there are no specific *barriers to competition* for road freight. There are no specific visas for road freight transport crews, although there are transit visas. These can be issued for a single or double entry and, in exceptional cases, multiple transits through the territory for a maximum of five days during each individual transit.

**Rail transport** (ISIC code 4912) is provided over a dedicated network in which the market structure may take different forms. The two most common are: 1) vertically integrated rail services firms owning and managing both the infrastructure and the operation of freight services; and 2) vertical separation between the infrastructure management and operations. Regardless of the market structure, there are well-established best practice regulations that also take into account competition from other modes of transport, particularly road transport.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.129 and 1. With a score of 0.223, North Macedonia is the second-least restrictive economy of the WB6 in this sector. It scores higher than the EU (0.210) and OECD (0.260) averages, and below the WB6 average (0.317).

In terms of *foreign entry restrictions*, unlike many economies, North Macedonia provides transit rights for international rail transport, as well as access rights for international combined transport and rail transport. A licence is needed to operate in the Macedonian railway sector. A carrier with a licence and a certificate of safety may offer public transport services using the railway infrastructure if it has been given access to it. The infrastructure manager approves access to the railway infrastructure for carriers that meet the conditions in a transparent and non-discriminatory manner. Commercial presence is only required for operators willing to obtain a licence. North Macedonia recognises licences issued to carriers by the competent authorities of other states in accordance with EU legislation and on a reciprocal basis with third countries. Duly licensed freight transporters can provide cross-border services without a commercial presence.

Regarding *barriers to competition*, access fees are regulated. The infrastructure manager charges a fee for the use of the railway infrastructure by the carriers using it. The infrastructure manager prepares rules for determining the amount of compensation for infrastructure use. The applicant may not transfer the assigned infrastructure capacity to another carrier or service provider. Trading with the infrastructure facilities is also prohibited and is the basis for exclusion from further distribution of capacity. Makedonski Železnici (MŽ) (Македонски Железници, Macedonian Railways) is the public enterprise for railways North Macedonia. Railway operations are run by Makedonski Železnici and the infrastructure maintained by Makedonski Železnici - Infrastruktura. The latter has dominance on the infrastructure.

**Courier services** (ISIC Rev 4 code 53) comprises postal and courier activities. While courier services have traditionally been an important means of communication, the rise of modern ICT means letters are less frequently used for communication. The STRI for courier services covers regulations that have an impact on the pick-up, transport and delivery (door-to-door) of letters and parcels, and express delivery services, regardless of who provides the service. These services include both addressed and unaddressed items.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.106 and 0.881. With a score of 0.206, North Macedonia is the least restrictive of the WB6 economies and performs better than Poland, the worst performer among the Central and Eastern European EU countries, scoring 0.251. North Macedonia scores higher than the EU average (0.182), but below the OECD (0.259) and WB6 average (0.301).

Unlike many economies, North Macedonia does not impose a commercial or local presence requirement when providing courier services and firms do not need a licence. North Macedonia does not have a monopoly in any area of courier services, which improves its score for this sector.

Companies wishing to provide postal services must obtain general authorisation from the Postal Agency on the basis of prescribed minimum requirement. Foreign investors are entitled to tax reductions for their initial period of operation. The publicly owned Post of North Macedonia, which is the major firm in the sector, is the designated postal operator for universal postal services. Before any change in the prices for providing universal services, a request must be submitted to the Postal Agency explaining the cost analysis behind the need for a price change. Special accounting is used to calculate the net cost of the universal service.

**Legal services** (ISIC Rev 4 code 691) cover advisory and representation services in both domestic and international law and, where relevant, measures are entered separately for each of them. International law includes advisory services in home country law, third-country law, international law and appearing in international commercial arbitration. Domestic law extends to advising and representing clients before a court or judicial body in the law of the host country.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.141 and 1. With a score of 0.444, North Macedonia is the third-most restrictive of the WB6 economies in this sector, scoring higher than the EU (0.394), OECD (0.362) and WB6 (0.391) averages.

*Restrictions on the movement of people* contribute significantly to the restrictiveness score in North Macedonia. Such restrictions are present in the form of a licence requirement, needed to provide legal services in the economy. The right to practise law in accordance with this law is acquired by registration in the Directory of Lawyers of the Chamber of Lawyers of the Republic of North Macedonia. Upon registration in the Directory of Lawyers of the Chamber of Lawyers of the Republic of North Macedonia the registered lawyer is granted a licence. To obtain a licence, the person in question must be a citizen of North Macedonia or of an EU member state; otherwise a reciprocity clause applies. A foreign professional who wants to practise law in North Macedonia must pass the Macedonian bar exam, but foreign university degrees are recognised by the Bar Association. After the entry in the Directory of Foreign Lawyers of the Bar Association of the Republic of North Macedonia, the foreign lawyer, after three years of continuous and effective practice of law or after passing the North Macedonia bar exam, may request to be registered in the Directory of Lawyers of the Bar Association of the Republic of North Macedonia and practise the full scope of the law. An EU citizen who is not registered in the Directory of Foreign Lawyers may be able to perform individual activities within the practice of law, i.e. provide advice on the law of their home country, the law of the European Union, international law and law of the Republic of North Macedonia.

The registration with establishment of a legal entity in North Macedonia indicating commercial presence is required to provide cross-border services, acting as a *restriction on foreign entry*. Furthermore, local presence is also required. Liability insurance must be purchased to an insurance company in the jurisdiction. Lawyers from the EU can practise in North Macedonia under certain conditions and can be covered for liability in their country of origin.

In the area of *barriers to competition*, North Macedonia restricts advertising of legal services. The Bar Association sets mandatory minimum fees for providing legal services.

**Commercial banking** (ISIC divisions 64-66) is defined as deposit-taking, lending and payment services. Commercial banking services are traded business to business, as well as business to consumer for retail banking. Efficient banking services are one of the backbones of a dynamic economy; they provide financing for investment and trade across productive activities, and thus underly all value chains.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.131 and 0.517. With a score of 0.255, North Macedonia is the third-most restrictive of the WB6 economies in this sector, scoring higher than the EU (0.180), OECD (0.205) and WB6 (0.239) averages.

North Macedonia's laws impose restrictions on cross-border mergers and acquisitions, which has a negative effect on the STRI score. Only banks established and based in North Macedonia may perform statutory changes of mergers, mergers and divisions. North Macedonia also deviates from the international Basel Committee on Banking Supervision (BCBS) risk weighting standards, but it is taking steps to change to the international capital and liquidity standards prescribed by Basel III.<sup>32</sup> Foreign banks may open a branch after obtaining permission from the governor as well as obtaining a licence, which requires the bank to meet a list of requirements. If the application for a licence is denied, there is no legal requirement to inform applicants of the reasons for denial, which negatively affects its score in this sector.

**Insurance services** (ISIC Rev 4 codes 651 and 652) comprise life insurance, property and casualty insurance, reinsurance, and auxiliary services. Private health insurance and private pensions are not covered.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.104 and 0.565. With a score of 0.249, North Macedonia is the second-most restrictive of the WB6 economies in this sector, scoring higher than the EU (0.175), OECD (0.193) and WB6 (0.231) averages.

Regarding *restrictions on foreign entry*, North Macedonia applies cross-border restrictions on mergers and acquisitions in the insurance sector. A cross-border merger with a company from an EU member state is only possible if the law of the relevant country allows cross-border mergers against the form of companies that merge. There is a commercial presence requirement for providers of cross-border services. The

provisions of the Law on Insurance Supervision apply to insurance companies with a head office in the territory of any EU member state provided they establish a branch office in North Macedonia. A licence is needed to operate in the insurance sector, which only citizens of North Macedonia can obtain, and residency is required in order to practise. Licences and certificates issued by the competent authorities of countries with which North Macedonia has signed a bilateral or multilateral agreement are fully recognised. For third-country licences, the Law on Recognition of Professional Qualifications provides adequate solutions, which positively affects the score in this sector.

North Macedonia's rules on accounting (International financial reporting standards or IFRS), transparency and Anti-Money Laundering/Combating the Financing of Terrorism (AML/CFT) deviate from international standards. In its 2019 progress report, the European Commission noted that North Macedonia still has not completed the process of aligning its national standards with international standards in this sector (EC, 2019<sup>[63]</sup>).

In terms of *barriers to competition*; North Macedonia places restrictions on asset holdings for both life and non-life insurance companies. An insurance company's total financial investment in a bank may not amount to more than 25% of its capital. Its total financial investments in other individual entities that are not banks may not amount to more than 10% of its capital. Total financial investments are considered capital investments of the insurance company (investments in stocks), debtor's securities bought, approved loans, approved bank deposits, as well as calculated interest rate on the basis of such investments. Moreover, the insurance company is obliged to obtain a licence by the Insurance Supervision Agency for introduction of a new class of insurance.

**Construction services** (ISIC Rev 4 codes 41 and 42) cover the construction of buildings (residential and non-residential) as well as construction work for civil engineering. Construction has historically played an important role in the functioning of economies, providing the infrastructure for other industries. It accounts for a significant share of GDP and employment in most countries. Public works, such as roads and public buildings, account for about half of the market for construction services so the STRI for construction services covers detailed information on public procurement procedures. There is a good deal of regulatory complementarity between the construction services sector and architectural and engineering services (below). The regulatory landscape of North Macedonia reflects these similarities, with all three sectors having very similar STRI scores.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.123 and 0.464. With a score of 0.231, North Macedonia is the second-most restrictive of the WB6 economies in this sector, scoring higher than the EU (0.207) and OECD (0.223) averages but below the WB6 average (0.242).

The *movement of people is restricted* by licensing requirements needed to provide engineering services in North Macedonia. A foreigner with a licence from another economy may perform design, auditing, construction and surveillance works in North Macedonia if the authorisation is confirmed by the Chamber of Chartered Architects and Engineers. In order to apply for a contractor's licence, the legal entity needs to submit proof that it is registered to perform the relevant activity and that it has at least 20 employees, at least 3 of whom have an A licence for a performance engineer and 1 with a B licence.

Regarding *restrictions of foreign entry*: There are no restrictions on the purchase of buildings and houses by individuals and legal entities from EU and OECD states. Non-EU and non-OECD nationals or legal entities can only purchase real estate under reciprocity conditions which increases the restrictiveness score according to the STRI methodology.

**Architecture services** (ISIC Rev 4 code 711) cover architectural services and related technical consultancy. These services form the backbone of the construction sector, with key roles in building design and urban planning. An important feature is the regulatory complementarity between architecture, engineering and construction services. Architectural and engineering activities are often combined into

projects managed by a single company, and are sometimes subsumed in the building and construction sector. The STRI definition of architecture services includes several related activities, such as advisory and pre-design architectural services, architectural design, contract administration services, and urban planning and landscape architecture services.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.113 and 0.684. With a score of 0.235, North Macedonia is the third-least restrictive of the WB6 economies in this sector, scoring lower than the EU (0.261), OECD (0.244) and WB6 averages (0.266).

As regards *restrictions on foreign entry*, a licence or authorisation is required to practise in this sector. In order to develop or revise urban plans, legal entities need a licence issued by the state administration body responsible for spatial planning. Individuals require authorisation issued by the Chamber of Certified Architects and Certified Engineers in order to develop or revise plans. There is no temporary licensing system which would enable foreign architects to carry out a specific project or advise in a particular area. North Macedonia has a procedure for recognising foreign qualifications.

Even though there is no requirement for legal entities to have a commercial or local presence to carry out design, audit, execution and supervision of construction, they are required to have liability insurance for damages from an insurance company based in North Macedonia.

In the area of *regulatory transparency*, laws and other regulations are published before they come into force. Laws come into force on the eighth day after the day of their publication at the earliest, or on the day of publication in exceptional cases determined by the Assembly. Laws and other regulations may not have a retroactive effect, except in cases when this is more favourable for citizens. According to the STRI methodology, this amount of time is scored as restrictive.

**Engineering services** (ISIC Rev 4 code 711) cover several related activities, such as engineering and integrated engineering services, and engineering-related scientific and technical consulting services.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.118 and 0.575. With a score of 0.234, North Macedonia is the third-most restrictive of the WB6 economies in this sector, scoring lower than the EU (0.246) and WB6 (0.244) averages and in line with the OECD average (0.234).

Engineering services are the backbone of construction and supply. Engineers are involved in the construction of key infrastructure, such as buildings and roads. They also play an important role in the development of production processes and the adoption of new technologies.

Regarding *foreign entry restrictions*, in order to develop or revise urban plans, legal entities need a licence issued by the state administration body responsible for spatial planning. Individuals require authorisation issued by the Chamber of Certified Architects and Certified Engineers in order to develop or revise plans. There is no temporary licensing system which would enable foreign engineers to enter North Macedonia temporarily to carry out a specific project or provide advice in certain fields. Legal entities are required to have liability insurance for damages from an insurance company in North Macedonia in order to carry out the design, audit, execution and supervision of construction. The STRI score is further affected by the imposition of quotas for contractual and independent service providers, and labour market tests for these and intra-corporate transferees. In this regard North Macedonia is the most restrictive of the WB6 economies.

**Computer services** (ISIC Rev 4 codes 62 and 63) are defined as computer programming, consultancy and related activities, and information service activities.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.123 and 0.448. With a score of 0.291, North Macedonia is the second-most restrictive of the WB6 economies in this sector, scoring higher than the EU (0.211), OECD (0.222) and WB6 (0.239) averages.

This sector is very rarely regulated by sectoral legislation and in North Macedonia computer services are only subject to the general laws that apply to the economy as a whole. This is why restrictions on the movement of people account for one-third of the total STRI score for the sector. The need for skilled labour in computer services, combined with the complementarity between cross-border trade and the movement of natural persons, explains why restrictions on movement of people feature so prominently.

**The telecommunication sector** (ISIC Rev 4 codes 611 and 612) comprises wired and wireless telecommunications activities. These services are at the core of the information society and provide the network over which other services including computer services, audio-visual services, and professional services are traded.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.108 and 0.682. With a score 0.108, North Macedonia is the second-least restrictive of the WB6 economies in this sector, scoring lower than the EU (0.151), OECD (0.188) and WB6 (0.232) averages.

The STRI results in this sector depend on two policy areas: 1) restrictions on foreign entry; and 2) barriers to competition. In all of the states taking part in the STRI, barriers to competition account for 30% of their total scores in the telecommunications sector. This reflects the sector's particular characteristics as well as the policy environment in which it operates. It is a capital-intensive network industry and its strategic importance has led many countries to restrict foreign investment and activity in the sector.

In order to ensure fair competition in the telecommunications market, North Macedonia has an independent telecommunications regulator, the Agency for Electronic Communication (AEK). The regulator may impose obligations regarding cost recovery and price control related to providing interconnection or access on the operator with significant market power (SMP) in the relevant market. It also designates one or more universal service provider, selected through public tender. When determining a universal service provider, AEK must apply the principles of objectivity, transparency, efficiency and non-discrimination. AEK also provides decisions which mandate the access to mobile networks. Makedonski Telecom qualifies as an SMP in the market. ONE.vip is an SMP in the access to passive and active wholesale products, and Makedonski Telecom, ONE.vip, Laikamobil and TDR Robbie are considered SMPs in the termination and interconnection market. The government has a minority share in Makedonski Telecom but does not control any major firms in the sector.

The laws of North Macedonia require number portability and regulate the time and conditions for porting. Numbers should be transferred within two days of receipt of the request. Interconnection is also regulated. North Macedonia applies a "use-it-or-lose-it" policy to frequency bands – an important measure that prevents incumbent operators from hoarding valuable frequency licences and freeing up tradeable spectrum and telecom services.

In absolute terms, the regulatory framework for this sector in North Macedonia is competitive and restricted only by measures that apply to the economy as a whole, notably on the movement of people. Although telecommunications lend themselves easily to cross-border trade from a technical point of view, restrictions on movement account for a modest share of the total STRI score in this sector. Cumbersome procedures to obtain visas and register companies also negatively affect the sector to some extent.

### *Sub-dimension 2.3: E-commerce and digitally enabled services*

E-commerce can bring about significant gains for businesses, driving firms' process innovation (Ferencz, 2019<sup>[64]</sup>). In addition it enlarges businesses' market scope, reduces operational costs at various stages of business activities and lowers barriers to entry, thus intensifying competition (OECD, 2013<sup>[65]</sup>). E-commerce also benefits consumers by providing information on goods and services, helping consumers identify sellers and compare prices, while offering convenient delivery and the ability to purchase easily via a computer or mobile device (OECD, 2013<sup>[65]</sup>).

In the context of the COVID-19 pandemic, e-commerce appears to have been essential for maintaining trade flows despite the restrictions put in place to preserve public health. Buying on line rather than in person also reduces the risk of infection. Being able to keep selling in locked-down economies preserves jobs despite social distancing and movement restrictions. Finally, e-commerce increases the acceptance of prolonged physical distancing among the population and allows them to maintain a certain level of consumption (OECD, 2018<sup>[55]</sup>).

It is clear that 2020 will be a turning point in electronic commerce. This digital transformation underlines the importance of adopting a more holistic approach to policies as well as more international co-operation (Ferencz, 2019<sup>[64]</sup>). This sub-dimension assesses those policies which are implemented in parallel and in addition to those discussed under Digital society (Dimension 10). However, it is mainly focused on the trade in digitally enabled services given the rapid growth of trade in services in the region.

North Macedonia has a solid **e-commerce policy framework**. In 2018 it already had the most developed one in the region. The Law on Electronic Commerce was adopted in November 2007 and lays down the conditions for the provision of information services related to electronic commerce, the responsibilities of providers of information services, commercial communications and the rules regarding the validity of contracts in an electronic form.

Regulations related to e-commerce fall under the competence of several institutions. North Macedonia's institutional framework allows for effective institutional co-ordination across ministries and agencies regarding e-commerce. The Ministry of Information Society and Administration (MISA) is responsible for all activities regarding the enhancement of e-commerce and co-ordinates all existing inter-ministerial working groups with competences related to e-commerce. Meanwhile, the Ministry of Economy is responsible for the implementation of the law on e-commerce and related documents, such as the law on consumer protection (which has some measures regulating contracts concluded at a distance).

It is recognised that modern e-commerce regulation needs to focus on a number of key elements including electronic documentation and signatures, online consumer protection, data protection and privacy, cyber security, intellectual property rules and intermediary liability. An attractive regulatory environment also refrains from creating disproportionate rules such as licensing requirements for e-commerce platforms, limitations on the type of goods that can be sold on line (other than for generally accepted public policy considerations) and restrictions on cross-border data flows.

The relevant legislation in North Macedonia was effectively amended in 2011, 2015 and 2020 after the government conducted a gap analysis of its e-commerce legislation and proceeded to align the law with European Commission recommendations and the Directive on Electronic Commerce 2000/31/EC. The latest amendments harmonised the relevant articles with the Misdemeanour Act in order to promote interoperability with related documents and policy areas, such as trade or consumer law. In regulatory terms, the legal corpus in North Macedonia contains all the necessary e-commerce elements.

Moreover, new e-commerce programmes have been put in place to boost the usage of e-commerce in the economy. The Economic Reform Programme (ERP) 2019-21 highlights new legislation and initiatives under the remit of MISA regarding the digital economy, such as the Law on Electronic Documents, Electronic Identification and Trust Services (2019), the Law on Electronic Management and Electronic services (2019), the National Cyber Security Strategy and Action Plan (2018-22) and the National Operational Broadband Plan (2019-23). The ERP foresees the development of citizens' e-skills in the education system and among public administration staff (e.g. in the use of the national portal for e-services). The project is in line with previous Macedonian digitalisation programmes. Recent issues related to the pandemic have demonstrated the need for a connected society and efficient e-commerce. COVID-19 introduced the need for online education for all levels of education (basic schools, high school and universities) and working from home for the majority of public servants.

The OECD digital STRI captures **the restrictiveness of digitally enabled services** by identifying cross-cutting barriers that inhibit or completely prevent firms from supplying services using electronic networks, irrespective of the sector in which they operate. The regulatory data underlying the digital STRI were extracted from the OECD STRI database and data collected under public laws and regulations affecting digitally enabled services. Digital STRIs are the result of aggregating the identified barriers to trade into composite indices. Digital STRI scoring uses a binary system: scores are assigned a value of 0 when there are no trade restrictions and a 1 when full restrictions are in place. The rating takes into account the specific regulatory and market characteristics as well as the links and hierarchies between regulatory measures affecting digitally enabled services (Ferencz, 2019<sup>[64]</sup>). Figure 24.8 shows North Macedonia's digital STRI score.

**Figure 24.8. Digital services trade restrictiveness index: WB6 and CEEC economies**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; \*CEEC=Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovak Republic and Slovenia (Bulgaria, Croatia, and Romania are not OECD member states or OECD STRI Partner economies and therefore do not have calculated STRI indices); the absence of a category in the graph means that it is exempt from restrictions. Source: (OECD, 2020<sup>[61]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934256121>

The scores in this sector were moderate to high in 2020, ranging from 0.043 to 0.488, while the WB6 average was 0.183. North Macedonia has a digital STRI score of 0.101, which places it among the four least restrictive WB6 economies. Its score has not changed since 2014. North Macedonia's results in the digital STRI sector are mainly due to infrastructure measures, but electronic transaction measures also play a part.

The Law on Electronic Communications mandates interconnection in both the fixed and mobile networks. The telecommunications regulator, AEK, decides which firms have significant market power in any given market (see Sub-dimension 2.2: Services trade restrictiveness for more information). There is an obligation to publish interconnection reference offers for the fixed network, but no such obligation for the mobile network.

North Macedonia does not impose excessive conditions on cross-border data flows beyond those put in place to ensure the protection and security of personal data. Unlike most of the WB6 economies, North Macedonia does not require that some types of data be stored locally. No specific licences or authorisations for e-commerce activities are required. International standards are used for electronic contracts and key

electronic authentication measures such as the recognition of electronic signatures, and there is a dispute settlement mechanism to resolve litigations arising from the cross-border digital trade.

Policy areas relating to intellectual property rights and payment systems account for a smaller share of states' digital STRI score. North Macedonia is relatively open in this category from a regulatory point of view, following the principles of European regulations in this field.

### ***The way forward for trade policy***

The Government of North Macedonia has taken important steps to improve the trade policy framework, especially in the area of consultations, but it could improve its decision making by paying attention to the following:

- **Strengthen inter-institutional co-ordination and stakeholder participation in consultations.** A comprehensive system for review, based on both qualitative indicators (e.g. broadness of consultation, stakeholder satisfaction with their involvement) and quantitative indicators (e.g. frequency of consultations), and would help to measure the success of reforms and allow for consultation frameworks to be adjusted where necessary. Box 24.3 gives an example of how guidelines can be used to improve consultations. North Macedonia could also should follow the example of the stakeholder involvement in the European Commission policy cycle (Box 24.4) to develop a feedback mechanism to improve its consultations.
- **Improve the evaluation and monitoring of implemented trade measures.** Ideally, this should include a monitoring programme with adequate budget and staff to enable systematic evaluations.
- **Broaden trade in services efforts.** The WB6 economies have made significant improvements to open trade in services through the conclusion of CEFTA Additional Protocol 6 in December 2016. Nonetheless, The STRI analysis has provided some insights into where domestic reforms could help to attract new businesses and improve competitiveness.
- **Lift some of the existing stringent restrictions on trade in services:**
  - **Ease conditions on the temporary movement of natural persons** to further encourage innovation and knowledge transfer, and contribute to economic growth. A starting point could be to remove the remaining quotas and labour market tests which apply to foreign services suppliers.
  - **Reduce the remaining barriers to market entry and competition** in the computer, legal and insurance services and make further efforts to increase competitiveness.
  - **Remove restrictions in the insurance sector** on cross-border mergers and acquisitions, as well as on asset holdings.
  - **Amend the localisation requirements for professional liability insurance** in the legal sector.
  - **Ease the cumbersome and lengthy procedures for registering a company** which hamper all services sectors. North Macedonia could make efforts to facilitate the process and shorten the time it takes to register a company in order to increase its attractiveness to foreign investors.

#### **Box 24.3. Consultation guidelines in the United Kingdom**

The United Kingdom's 2008 Code of Practice is a good example of how a government can provide its civil servants with a powerful tool to improve the consultation process and its review, even though it is not legally binding and only applies to formal, written consultations. The 16-page Code of Practice was divided into 7 criteria, which were to be reproduced as shown below in every consultation:

- **Criterion 1: When to consult.** Formal consultation should take place at a stage when there is scope to influence the policy outcome.
- **Criterion 2: Duration of consultation exercises.** Consultations should normally last for at least 12 weeks with consideration given to longer timescales where feasible and sensible.
- **Criterion 3: Clarity of scope and impact.** Consultation documents should be clear about the consultation process, what is being proposed, the scope to influence and the expected costs and benefits of the proposals.
- **Criterion 4: Accessibility of consultation exercises.** Consultation exercises should be designed to be accessible to, and clearly targeted at, those people the exercise is intended to reach.
- **Criterion 5: The burden of consultation.** Keeping the burden of consultation to a minimum is essential if consultations are to be effective and if consultees' buy-in to the process is to be obtained.
- **Criterion 6: Responsiveness of consultation exercises.** Consultation responses should be analysed carefully and clear feedback should be provided to participants following the consultation.
- **Criterion 7: Capacity to consult.** Officials running consultations should seek guidance in how to run an effective consultation exercise and share what they have learned from the experience.

The Code of Practice was replaced with the much shorter Consultation Principles in 2012. The Consultation Principles highlight the need to pay specific attention to proportionality (adjusting the type and scale of consultation to the potential impacts of the proposals or decision being taken) and to achieve real engagement rather than merely following a bureaucratic process.

Source: (UK Government, 2008<sub>[66]</sub>), *Code of Practice on Consultation*, [www.bis.gov.uk/files/file47158.pdf](http://www.bis.gov.uk/files/file47158.pdf); (UK Government, 2016<sub>[67]</sub>), *Consultation Principles 2016*, [https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment\\_data/file/492132/20160111\\_Consultation\\_principles\\_final.pdf](https://assets.publishing.service.gov.uk/government/uploads/system/uploads/attachment_data/file/492132/20160111_Consultation_principles_final.pdf).

#### Box 24.4. Stakeholder engagement throughout the policy cycle at the European Commission

Following the adoption of the 2015 Better Regulation Guidelines, the European Commission has extended its range of consultation methods to enable stakeholders to express their view over the entire lifecycle of a policy. It uses a variety of different tools to engage with stakeholders at different points in the policy process. Feedback and consultation input is taken into account by the Commission when further developing the legislative proposal or delegated/implementing act, and when evaluating existing regulation.

At the initial stage of policy development, the public has the possibility to provide feedback on the Commission's policy plans through roadmaps and inception impact assessments (IIA), including data and information they may possess on all aspects of the intended initiative and impact assessment. Feedback is taken into account by the Commission services when further developing the policy proposal. The feedback period for roadmaps and IIAs is four weeks.

As a second step, a consultation strategy is prepared setting out consultation objectives, targeted stakeholders and the consultation activities for each initiative. For most major policy initiatives, a 12-week public consultation is conducted through the website “Your voice in Europe” and may be accompanied by other consultation methods. The consultation activities allow stakeholders to express their views on key aspects of the proposal and main elements of the impact assessment under preparation.

Stakeholders can provide feedback to the Commission on its proposals and their accompanying final impact assessments once they are adopted by the College. Stakeholder feedback is presented to the European Parliament and Council and aims to feed into the further legislative process. The consultation period for adopted proposals is eight weeks. Draft delegated acts and important implementing acts are also published for stakeholder feedback on the European Commission's website for a period of four weeks. At the end of the consultation, an overall synopsis report should be drawn up covering the results of the different consultation activities that took place.

Finally, the Commission also consults stakeholders as part of the *ex post* evaluation of existing EU regulation. This includes feedback on evaluation roadmaps to review existing initiatives, public consultations on evaluations of individual regulations and “fitness checks” (i.e. comprehensive policy evaluations assessing whether the regulatory framework for a policy sector is fit for purpose). In addition, stakeholders can provide their views on existing EU regulation at any time on the website “Lighten the load – Have your say”.

## Access to finance (Dimension 3)

### Introduction

North Macedonia has slightly worsened its performance in the access to finance dimension. Its score has decreased from 3.0 in the 2018 Competitiveness Outlook to 2.4 in the 2021 assessment, partially due to its weak performance on access to alternative financing. North Macedonia's score is below the WB6 average in both access to bank finance and access to alternative financing while it scores above the WB6 average for the mobilisation of long-term financing (Table 24.6).

**Table 24.6. North Macedonia's scores for access to finance**

Dimension	Sub-dimension	Score	WB6 average
Access to finance dimension	Sub-dimension 3.1: Access to bank finance	3.0	3.4
	Sub-dimension 3.2: Access to alternative financing sources	1.6	1.9
	Sub-dimension 3.3: Mobilisation of long-term financing	3.5	2.8
North Macedonia's overall score		<b>2.4</b>	<b>2.6</b>

### State of play and key developments

#### *Sub-dimension 3.1: Access to bank finance*

North Macedonia's financial sector is bank dominated and the banks' assets constitute over 80% of total financial sector assets. At the end of 2019, 15 banks were operating in the economy, including 1 state-owned bank (Macedonian Bank for Development Promotion) and 11 private banks with a market share of over 70% of the total assets predominantly owned by foreign shareholders. As of March 2020, the cumulative share of the top three banks was 57.1% of banking system assets, while the share of the state-owned bank was 1.8%.

North Macedonia has a relatively well-developed regulatory framework for the **banking industry**. It has been largely compliant with Basel II core principles since 2009 (OECD et al., 2019<sup>[71]</sup>).<sup>33</sup> The 2016 amendments to the Banking Law on the regulation of capital adequacy introduced capital buffers and requirements for the structure and quality of banks' own funds. The National Bank of the Republic of North Macedonia (NBRNM) has adopted a new methodology for managing credit risks and enhanced its criteria for licensing banks, following the Basel III core principles for effective banking supervision. Consequently, since 2017 banks have been obliged to determine and monitor their leverage ratio on a semi-annual basis. Starting from January 2021, banks will be obliged to maintain the liquidity coverage ratio, while the implementation of the long-term Basel III liquidity standards is in progress. In response to COVID-19, the NBRNM revised its credit risk regulation to encourage banks to temporarily restructure loans and relaxing the loan classification standards for non-performing loans.

The NBRNM is responsible for the design and implementation of secondary legislation on the banking system while the Ministry of Finance is responsible for primary legislation. However, in practice the Ministry of Finance co-ordinates all activities regarding the development of the Banking Law, its amendments and other regulations relevant for banking activities. In addition, the NBRNM consults the Ministry of Finance as part of the public hearing process when developing relevant secondary legislation.

There is no explicit regulation that encourages domestic currency lending, however lending criteria differ. Overall, denar loans represent 57.8% of total loans while foreign currency loans account for 14.7% and indexed loans 27.5%. The regulation on credit risk management requires banks to pay special attention to foreign currency (FX) lending by adequately assessing the credit risk arising from the FX risk the client is exposed to but it lacks any explicit provision to encourage or facilitate denar lending. In addition, the regulation on reserve requirements sets a 0% reserve requirement ratio for denar liabilities to natural

persons with a contractual maturity of more than one year while, for FX-linked liabilities, the 0% ratio only applies if the contractual maturity is longer than two years.

Two **registers** operate in North Macedonia. The Real Estate Cadastre Agency operates cadastres which are publicly accessible on line, while the register of pledges over movable assets is the remit of the Central Registry of the Republic of North Macedonia. Information from this register is accessible upon request. As in the previous assessment, the registry includes ownership information on more than 75% of pledges on registered assets. According to the Real Estate Cadastre Agency's strategic work plan for 2020-22, it will draft an action plan for the registration of the state-owned property rights to enhance the coverage of the cadastre register.

**Credit information services** are supplied by one public credit registry and one private credit bureau. The private bureau is regulated by the Law on Credit Bureau, while the public registry was established under the National Bank Law. The law establishes the inclusion of both positive and negative information, for a maximum of five years after payment of liabilities or settlement of a bill. The data subject can request a copy of a report that has already been prepared for the needs of a particular data user and may submit a written notice disputing the accuracy or completeness of any data contained in the report. Data are available to the financial institutions and public on request. The credit registry covers around 42% of the adult population, while the credit bureau covers the entire adult population (World Bank, 2019<sup>[72]</sup>).

**Collateral requirements** remain relatively strict, making it challenging for businesses to access bank loans in North Macedonia. Around 76% of loans require collateral, more than the OECD average of 58%, amounting on average to 174% of the amount borrowed, compared to an average of 88% in the OECD economies (World Bank, 2019<sup>[73]</sup>). The law allows companies to use non-fixed assets such as movable assets, intangibles and pledge of rights to secure loans. However, there is no threshold of loan size allowing collateral requirements to be more flexible for small businesses.

There are some schemes offering **credit enhancement and risk mitigation**. The Development Bank of North Macedonia offers a credit guarantee scheme to micro, small and medium-sized enterprises (MSMEs) which are at least 51% privately owned and registered in North Macedonia. MSMEs which have increased the number of employees or invested in energy saving or environmental protection infrastructure can benefit from a loan of up to EUR 300 000 with an annual fixed interest rate of 6.5%. The scheme offers flexible monthly/quarterly or semi-annual repayments which are defined in advance, based on the business plan, with a grace period of six months. In addition, the European Investment Bank offers a scheme aimed at increasing working capital, with loans of a maximum of EUR 666 700 repayable in six years with an annual interest rate of 1.6%. Businesses can profit from the programme if they have: increased their exports by at least 5% over the previous year; invested in modernisation, energy saving or environmental protection; or increased the number of employees.

To mitigate the effects of the COVID-19 pandemic on small businesses, the European Bank for Reconstruction and Development (EBRD) has announced two support packages. In July 2020 it granted a EUR 20 million loan to Sparkasse Bank Makedonija for on-lending to local businesses and in November 2020, gave a loan of EUR 15 million to ProCredit Bank Macedonia to help local MSMEs.

### *Sub-dimension 3.2: Access to alternative financing sources*

**Factoring** activities remain very limited in North Macedonia, partly due to the absence of an adequate legal framework. Factoring activities are regulated by the Law on Financial Companies and the Law on Obligations. The legislation provides a general definition of factoring and regulates the transfer of future and bulk receivables. However it does not cover specific definitions such as reverse factoring, the detailed content of factoring agreements and bankruptcy procedures. To improve the legal framework, the government, with the support of the EBRD, has drafted amendments which were planned to be published on the Electronic National Registry of Regulation in February 2020 for public consultation. However, the

government postponed the process due to the COVID-19 pandemic and it is now expected to be adopted in December 2021.

**Leasing** activities are also limited. As of December 2019 the total value of active leasing contracts was EUR 118 million (1% of GDP). The market demand is highly concentrated: 73.8% of contracts are for passenger vehicles, 20.6% for trucks and only 0.5% for equipment and machinery. Leasing activities are regulated by the Law on Leasing under the supervision of the Ministry of Finance. The ministry issues licences and oversees all providers of financial leasing except the banks. The law regulates the rights and obligations of contracting parties, the manner and conditions for the lease of movable and immovable property, and the rules on repossessions of assets.

**Private equity** and **venture capital** are partially regulated by the Law on Investment Funds. However, the law does not cover the instruments in which private equity and venture capital alternative investment funds may invest, nor the restrictions, types and timeframes for subscriptions by members or shareholders. Although the development of the sector is part of the Innovation Strategy 2012-20, no progress has been made since the previous assessment. According to a government statement, it expects to implement a new law on alternative investment funds in 2022 which will be in line with EU directives,<sup>34</sup> with the technical assistance of the World Bank. Overall, equity investments in the economy remain limited with barely any active equity funds present. Since 2014, two seed stage companies and three start-ups received a total of EUR 6 million in investments under the Enterprise Innovation Fund (ENIF), which is a stand-alone venture capital fund covering the Western Balkans region.

North Macedonia has relatively active **business angel networks**, involving smaller investments. It has two active networks, both created under the umbrella of the United States Agency for International Development (USAID), which made 15 separate investments in 2018 totalling EUR 250 000. However, this represents a decrease in investment of 50% compared to 2016 (EBAN, 2019<sup>[74]</sup>). Despite the active market, there is no regulatory framework nor any plans or strategies to encourage the development of business angel networks.

Although **crowdfunding** is taking place, North Macedonia does not yet have a dedicated regulatory framework for it. Since 2014, regular crowdfunding campaigns have taken place through a local platform,<sup>35</sup> with the amount collected each year fluctuating considerably: from a low of MKD 30 000 in 2015 to a high of MKD 263 000 in 2014. Nevertheless, as of 2014, no project has achieved its crowdfunding target. The domestic crowdfunding platform doesn't provide clear information about the financial risks and charges that investors may incur, including insolvency risks and project selection criteria, which may be partially due to the absence of a regulatory framework. The authorities should assess the demand for such tools. The Macedonian Stock Exchange (MSE) has begun co-operating with a foreign crowdfunding platform Funderbeam. This platform provides all the information investors need but so far no investment has occurred since the establishment of the co-operation agreement (Box 24.5).

### Box 24.5. North Macedonia's crowdfunding initiative: Funderbeam

In 2019, the Macedonian Stock Exchange entered into an exclusive co-operation agreement with Funderbeam South East Europe, registered in Croatia. Funderbeam SEE is part of the Funderbeam Market Limited group which offers a global scheme for collective financing, a crowdfunding platform based in Estonia. The MSE plays an educational and promotional role by presenting the platform to small and medium-sized enterprises and start-ups as an alternative financing source to develop their businesses into companies suitable for future listing on the exchange.

Funderbeam offers clients a simple four phase process for listing, marketing and public relations expertise, ready-to-use legal templates and access to private business angel and venture capital networks. With a community of over 60 000 users and more than EUR 29 million raised, Funderbeam offers domestic entrepreneurs a quick, transparent and simple way to finance their innovative ideas, and encouraging Macedonian investors to get involved in new and growing companies.

Source: (Funderbeam, 2021<sup>[75]</sup>), *Funderbeam: The Global Funding & Trading Platform*, [www.funderbeam.com/](http://www.funderbeam.com/); (MSE, 2019<sup>[76]</sup>), *Macedonian Stock Exchange has signed an exclusive cooperation agreement with Funderbeam SEE*, [www.mse.mk/en/news/22/5/2019/macedonian-stock-exchange-has-signed-an-exclusive-cooperation-agreement-with-funderbeam-see](http://www.mse.mk/en/news/22/5/2019/macedonian-stock-exchange-has-signed-an-exclusive-cooperation-agreement-with-funderbeam-see).

In 2016, the NBRNM proclaimed that crypto assets were illegal under the article of the law which prohibits residents from investing in foreign securities. Since 2019, as North Macedonia entered the second phase of the Stabilisation and Association Agreement, domestic residents have been allowed to invest in foreign securities and foreign real estate, but they are still generally not allowed to open foreign bank accounts (except for some specific exceptions in accordance with NBRNM by-laws) making the legality of investment in crypto assets unclear. Consequently, no activity has been reported in **initial coin offerings** based on blockchain technologies.

#### *Sub-dimension 3.3: Mobilisation of long-term financing*

North Macedonia adopted the Law on Concessions and Public-Private Partnership in 2012 and by 2018, central government and municipal authorities had implemented 29 **public-private partnership** (PPP) projects. The law is not fully harmonised with the Concessions Directive of the EU,<sup>36</sup> but it respects the general principles of public procurement (OECD, 2019<sup>[77]</sup>). The general principles of transparency, equal treatment and non-discrimination are well reflected in the legislation. To increase implementation and improve the quality and consistency of PPP project results, the government has drafted a new PPP law which was in the parliamentary validation process at the time of writing.

North Macedonia's domestic **institutional investor and asset management** base remains small and highly concentrated, limiting capital market development. At the end of 2019, five asset management firms were operating in the economy, and the top three firms were managing 94% of the total assets under management. However, data on the breakdown of the total assets under management are not publicly available.

The Securities and Exchange Commission (SEC) is the supervisory authority and is responsible for granting and withdrawing licences. Foreign institutional investors that want to operate in North Macedonia need to have a local branch or operate through a domestic institution. The laws on securities and investment funds that govern institutional investors regulate market manipulation and insider trading. However, they do not clearly govern voting rights. Overall, a provision in the law on trading companies regulates proxies and voting rights, but there are no specific rules for institutional investors, providing room for potential conflicts of interest.

North Macedonia has **capital markets** but their contribution to financing the economy is limited and they have not attracted investments from large institutional investors. There have been no developments

regarding financial market infrastructure. The law on capital markets, which aims to align national legislation on securities markets and investment services to the EU *acquis*, has still not been adopted (EC, 2020<sup>[46]</sup>). Between January and June 2020, the stock exchange registered a total turnover of securities amounting to MKD 3.82 billion (around EUR 62 million; 1.25% of GDP), which was 124% higher than the same period in 2019. Of this, the turnover of shares totalled MKD 3.59 billion (EUR 61 million) and the turnover of bonds totalled MKD 234 million (EUR 3 million).

The **stock market**, the MSE, was established in 1995 and became operational in March 1996. It is regulated by the law on securities and is organised as a joint-stock company. The major shareholders comprise banks and stockbroker companies. The SEC is responsible for stock market supervision. The commission is an autonomous organisation and is responsible for the legal and efficient functioning of the securities market, as well as the protection of investors' rights. The MSE is a member of the Federation of Euro-Asian Stock Exchanges and affiliated member of Federation of European Stock Exchange. In 2014, to facilitate integration with other South East Europe markets, the MSE, together with the Bulgarian Stock Exchange and the Croatian Stock Exchange, established SEE Link.

The law clearly enumerates the requirements for listing companies in North Macedonia, with more flexible requirements for smaller companies. The listing rules of the MSE define four listing categories for the market: 1) super listing; 2) exchange listing; 3) mandatory listing; and 4) listings of small joint-stock companies (Table 24.7) There has only been one initial public offering since 2018, with a value of MKD 575 million (around EUR 9.3 million), but the secondary public offering (SPO) market was slightly more active. Since 2018, there have been two SPOs of shares, totalling MKD 320 million (around EUR 5.2 million), and three SPOs of bonds, with a total value of MKD 492 million (around EUR 8 million). To stimulate IPOs, the SEC decided to exempt issuers from the SEC fee (around EUR 80) during 2019 and 2020.

**Table 24.7. Listing rules in North Macedonia**

	Super listing	Stock exchange	Mandatory	Small joint-stock companies
Financial statements	Audited financial statements for the last three years	Audited financial statements for the last two years	Audited financial statements for the last two years	Audited financial statements for the last year
Financial results	Profit in the last 3 years	n.a	n.a	n.a
Capital	At least EUR 10 million	At least EUR 5 million	At least EUR 1 million	At least EUR 250 000
Free float ratio	At least 20%	At least 10%	At least 1%	n.a
Number of shareholders	At least 200	At least 100	At least 50	n.a

The **bond market** is relatively stable, but volumes are small. During the first half of 2020 the trading volume of bonds was MKD 234 million (around EUR 3.8 million), 4% more than the same period in 2019 (MKD 223 million – around EUR 3.6 million).

The legislative and regulatory framework is in place to regulate the bond market in North Macedonia. According to the law, bonds may be issued by the Ministry of Finance on behalf of the Republic of North Macedonia, municipalities and the City of Skopje; joint-stock companies; limited partnerships by shares; and any other domestic or foreign legal entities. The total nominal value of a single issuance of bonds, which are not guaranteed by a bank, cannot exceed the issuer's basic capital. If an issuance of bonds is guaranteed by a bank, the highest value of the issuance shall not exceed the amount of the basic capital and the amount of the issue guarantee. Investors can access the information on the maturity and coupon rates of the issued securities. However, the law does not provide any obligation to provide information on the liquidation preference, tax status or call provisions. This means no actors, including the SEC, publish bond ratings in North Macedonia, hampering the transparency of the bond markets.

### ***The way forward for access to finance***

To enhance the banking industry and support businesses' access to finance, policy makers should:

- **Continue to align North Macedonia's banking regulations with international standards.** The economic shock caused by COVID-19 means building the resilience of the sector to shocks has become even more important. Regularly monitoring the relevant regulations and bringing them into line with internationally agreed norms would further enhance the capacity of North Macedonia's banking sector.
- **Continue to build a business environment with diverse financing sources.** Given the economy's limited success in attracting venture capital, supporting crowdfunding by adopting a dedicated legal framework and targeting the diaspora could be a more successful approach. Following the example of Lithuania (Box 24.6), such initiatives could increase the number of potential financing sources, especially for smaller companies, widening the sources of private financing and boosting foreign direct investment.
- **Create a comprehensive strategy for capital market development,** involving government and private sector stakeholders, and formulate an action plan for undertaking appropriate development activities. One solution to increase the liquidity of the private sector could be to establish a special framework for private bond placements by smaller companies, following the successful recent example of the Italian mini-bond market framework (Box 24.7).
- **Promote the use of infrastructure project bonds.** While PPPs are an efficient way to finance infrastructural projects, bonds can bring beneficial dynamics to capital markets and enable a more productive use of institutional funds for long-term investments. The government can promote the use of infrastructure project bonds through streamlining issuance and placement procedures, providing a clear definition of infrastructure project bonds, and providing tax incentives.

#### **Box 24.6. Lithuania's crowdfunding legislation**

While Lithuania's crowdfunding market is smaller than other European fintech hubs, the economy is only one of 11 EU member states with dedicated national legislation for crowdfunding platforms and boasts a mature and comprehensive regulatory framework for crowdfunding. Although its crowdfunding is in its infancy, Lithuania currently has 15 registered crowdfunding platforms. There has been a positive increase in the total value of crowdfunding platform loan portfolios, from EUR 6.6 million in 2019 to EUR 9.13 million in the first half of 2020 (Bank of Lithuania, 2020<sup>[78]</sup>).

Lithuania adopted its Law on Crowdfunding in 2016 with the aim of providing a hospitable, clear and transparent setting for cross-border crowdfunding platforms. The law adopted all aspects of the European Commission's Regulation for European Crowdfunding Service Providers, allowing for a seamless transition once the EU Directive comes into force (EC, 2018<sup>[79]</sup>). It was established through a multiple stakeholder consultation process and provides protection and guarantees for investors through information disclosure obligations, governance rules, risk management and a coherent supervision mechanism. The law covers equity, real-estate, and debt-based crowdfunding models, while donation and rewards models continue to fall under the Civil Code of the Republic of Lithuania.

Transparency regulations for crowdfunding platforms help mitigate misinformation and legal risk to better protect investors. Therefore, platforms must be included on the Public List of Crowdfunding Platform Operators, subject to an efficient reliability assessment conducted by the Bank of Lithuania's supervisory authority within 30 days. Platform operators, board members and significant stakeholders also undergo a criminal record check, while platforms must instate measures to avoid, identify and address any conflicts of interest that would prejudicially benefit the funder or project owner.

In addition to the EUR 40 000 minimum capital requirement, platform owners are required to put up 10% of starting capital themselves. In the case of offerings between EUR 100 000 and EUR 5 million, platform operators are obligated to publish a light prospectus, while offerings over EUR 5 million require a full prospectus detailing the project and project owner characteristics, proportion of own funds used, details of the offering, security measures, and existence of secondary markets.

In all cases, Lithuania's crowdfunding regulations require platforms to publish wide-ranging information on their websites for investors including data on the company, risks associated with investment, project selection criteria, conditions and procedures for repayment of funds, disclaimers on tax and insurance information, as well as monthly and yearly progress reports.

Meanwhile, Lithuania is continuously improving its innovative business environment to give financial institutions and crowdfunding platforms more investment opportunities. In 2016, the economy began allowing the use of remote identity verification via qualified electronic signatures and video streaming/transmission and is harmonising itself with the EU regulation on electronic identification. Lithuania has also recently amended its Law on the Legal Status of Aliens to include an e-residency programme, allowing foreigners to set up companies, open bank accounts and declare taxes through digital identification, furthering financing opportunities for its fintech platforms.

### Box 24.7. Italy's mini-bond market

In 2012 the Italian Government introduced a series of laws to initiate a mini-bond framework for unlisted companies to enable them to issue corporate bonds. The mini-bond framework provides a simplified process whereby unlisted companies with more than 10 employees and an annual turnover and/or assets in excess of EUR 2 million (except micro-enterprises and banks), can issue bonds that are available only to qualified investors. Firms are not required to publish a public prospectus – an admission document is sufficient.

In response to this new regulatory framework, Borsa Italiana introduced the ExtraMOT PRO segment in 2013, dedicated to the listing of bonds whose trading is only permitted to professional investors. Since its introduction, the mini-bond market has seen steady growth, with the number of issuances increasing from 16 in 2013 to 171 in 2018. The cumulated proceeds during this period amounted to EUR 10.6 billion, 25% of which was raised in 2018. Moreover, mini-bonds have also been securitised through special purpose vehicles which have created a diversified pool of mini-bond issuers available for institutional investors.

In 2019 the government introduced mini-bond placements on equity crowdfunding platforms. In October 2019, the operating rules for equity crowdfunding platforms willing to place mini-bonds were published by the competent authority (Consob). These include that the offers must be published on specific sections of the platforms; the issuers are limited to joint stock companies; and eligible investors are required to hold financial assets of at least EUR 250 000, invest at least EUR 100 000 in the mini-bond, or be client of an asset management company. The first offerings were published on crowdfunding platforms in January 2020.

## Tax policy (Dimension 4)

### Introduction

Table 24.8 compares North Macedonia's scores on two tax policy sub-dimensions with the WB6 average. With regard to tax policy framework sub-dimension, North Macedonia scores above the WB6 average as a result of recent efforts to improve tax expenditure reporting and forecasting of tax revenues. For the tax administration sub-dimension, North Macedonia scores slightly above the average as a result of its efficient risk assessment system for tax compliance.

**Table 24.8. North Macedonia's scores for the tax policy**

Dimension	Sub-dimension	Score	WB6 average
Tax policy dimension	Sub-dimension 4.1: Tax policy framework	3.0	2.6
	Sub-dimension 4.2: Tax administration	3.5	3.3
	Sub-dimension 4.3: International co-operation	n.a.	n.a.
<b>North Macedonia's overall score</b>		<b>3.3</b>	<b>3.0</b>

Note: Sub-dimension 4.3 on international co-operation is analysed qualitatively and therefore remains unscored.

### State of play and key developments

#### *Sub-dimension 4.1: Tax policy framework*

North Macedonia's **tax revenues** are relatively low as a share of its economy. In 2019, its tax-to-GDP ratio was 25.9%, below both the WB6 (30.6%) and OECD (33.8%) averages for 2019 (Table 24.9). Tax revenues as share of GDP have remained relatively stable in recent years. North Macedonia relies heavily on social security contributions (SSCs) and goods and services taxes (GSTs), which together accounted for 81.1% of its total tax revenues: in 2019, SSCs accounted for 34.4% of the total, and GSTs for 46.6%. This aligns with regional trends (the WB6 average was 80.7% in 2019), but is significantly above the OECD average of 58.4% in 2018. Consequently, other taxes play a smaller role. In OECD countries, personal income tax (PIT) and corporate income tax (CIT) together account for nearly one-third of annual tax revenues on average (33.5% in 2018). In North Macedonia, these taxes made up 16.8% of the total in 2019, only half of the OECD average. North Macedonia's reliance on SSCs and taxes on goods and services leaves room to diversify the tax mix. SSCs support the direct funding of the welfare system, meaning North Macedonia can avoid funding social welfare funds from general tax revenues, which would create challenges to its budget. The reliance on SSCs may leave the economy relatively exposed to a decline in formal employment or a rise in informal employment.

**Table 24.9. North Macedonia's tax revenues as a percentage of GDP**

	CIT	PIT	SSCs	Goods and services	Tax/GDP ratio
North Macedonia	1.7%	2.7%	8.9%	12.1%	25.9%
WB6	1.8%	2.7%	9.3%	15.9%	30.6%
OECD	3.1%	8.1%	9.0%	11.9%	33.8%

Note: CIT=corporate income tax; PIT=personal income tax; SSC: social security contributions.

Source: (OECD, 2020<sup>[83]</sup>), *OECD.Stat*, <https://stats.oecd.org/> (2019 for overall tax/GDP ratio, 2018 for specific tax/GDP ratio).

Corporate income tax in North Macedonia is mainly levied at a 10% flat rate (Table 24.10), which broadly aligns with regional trends (the WB6 average was 11.5% in 2020) but is below the average of OECD countries (23.3% in 2020). This average rate is reflected to a certain extent in the economy's tax revenues: CIT revenues accounted for 1.7% of North Macedonia's GDP in 2019, which is similar to the WB6 average (1.8% in 2019) but below the OECD average (3.1% in 2018). A 1% CIT rate applies to companies under a

simplified tax regime or for business income of non-governmental organisations (NGOs) (explained further below).

**Dividend income** is excluded from the CIT base (provided the income was taxed at distributor level), while **capital gains** are treated as regular business income and taxed at a rate of 10%. A 10% rate is withheld on payments of dividends and **corporate interest** made to individual shareholders whether residents or non-residents. North Macedonia operates a worldwide taxation system in which resident corporations are liable for taxes on income arising from domestic and foreign sources, while non-resident entities pay taxes on domestically sourced income. In 2019, North Macedonia reformed its CIT and amended its transfer pricing rules. This reform introduced a transfer pricing documentation threshold of MKD 10 million (EUR 162 860); entities whose related-party transactions are above the threshold must submit transfer pricing documentation.

**Table 24.10. Selected tax rates in North Macedonia**

	CIT	PIT	SSCs	VAT
North Macedonia	10.0%	10%	28.0%	18.0%
WB6	11.5%	12.8%	28.6%	19.0%
OECD	23.3%	42.8%	26.9%	19.3%

Note: CIT= corporate income tax; PIT= personal income tax; SSCs= social security contributions; VAT= value added tax.

Source: (OECD, 2020<sup>[83]</sup>), *OECD.Stat*, <https://stats.oecd.org/> (2020 for CIT and VAT, 2019 for PIT and SSCs).

North Macedonia uses a mix of cost-based and profit-based **investment incentives**. Cost-based incentives lower the cost of investment and increase with the size of the investment. In North Macedonia, reinvested profits can be deducted from taxable corporate profits, which makes the tax system similar to that used in Estonia. North Macedonia also has profit-based tax incentives, which generally reduce the tax rate applicable to taxable income. Companies in Special Economic Zones (referred to as Technological Industrial Development Zones) are exempt from CIT for up to 10 years. North Macedonia also implements a simplified tax regime for 'micro-enterprises' based on annual turnover. Companies with annual turnover under MKD 3 million (EUR 48 700) are exempted from CIT and companies with income between MKD 3 million and 6 million (EUR 97 400) may opt for a simplified tax regime with a 1% rate levied on their turnover, instead of the 10% CIT rate levied on profits. North Macedonia also has an employment incentive system whereby companies receive a monthly subsidy per employee depending on the salary of the employee.<sup>37</sup> Research shows that cost-based incentives are preferable to profit-based incentives, which risk leading to high redundancy of expenditure since the investments may have proceeded anyway (UNCTAD, 2015<sup>[84]</sup>).

North Macedonia has undertaken significant **personal income tax (PIT) reforms** in recent years. In January 2019, the rate for personal capital income was increased from 10% to 15% and a progressive PIT rate schedule was implemented to replace the previous 10% flat rate on labour income, with the introduction of an additional 18% rate.<sup>38</sup> This placed its top rate as second only to Albania (at 23%) among its WB6 peers. However, in January 2020, the 18% PIT rate was suspended until the end of 2022 and the personal capital tax reform was postponed until 2023. North Macedonia has the second-highest PIT revenues as a share of GDP (2.7% in 2019) among the WB6 economies (2.7% average in 2019). Similar to most WB economies, North Macedonia has a personal tax allowance for individual income which was MKD 96 000 (EUR 1 560) per year in 2020. Prior to 2019, there were other allowances for other types of income including rental and intellectual property income.<sup>39</sup> With regards to the taxation of personal capital income, a 10% rate currently applies for most income types, except for income from games of chance where the rate is 15%.<sup>40</sup> The capital gains tax rate is 15% for shares held for less than a year, 10% for shares held for 1-10 years, and zero for those held for more than 10 years. Taxation of capital gains from the disposal of shares will begin in 2023.

North Macedonia's reliance on **social security contributions** is similar to other WB6 economies. They amount to 8.9% of North Macedonia's GDP, which is slightly below both the WB6 average (9.3% in 2019) and the OECD average (9.0% in 2018). Only employees pay SSCs on labour income,<sup>41</sup> with a total SSC rate of 28%. This includes 18.8% for pension and disability, 7.5% for health insurance, 0.5% for health insurance in case of an injury at work or occupational illness, and 1.2% for unemployment insurance. The total rate is similar to the WB6 average of 29.4% in 2020. North Macedonia's practice of only levying SSCs on employees differs from most OECD countries where, on average, employers' SSC rates are higher than employees'. The self-employed in North Macedonia pay the same SSC rate as employees; this rate is similar to the average SSC rate in WB (29.7% in 2020). High SSC rates increase the tax burden on labour income, and reduce workers' disposable income and incentives to work in the formal economy, particularly those on low incomes. North Macedonia could shift its tax mix away from employee and self-employed SSCs to PIT through re-introducing a progressive PIT rate schedule (OECD, 2018<sup>[85]</sup>). This would shift the tax burden from those with lower incomes to those with higher ones, increasing equity and, if designed properly, efficiency. Such a reform would have to be accompanied by reforms to prevent tax avoidance. Increasing the top PIT rate might further strengthen the tax-induced incentives for self-employed entrepreneurs to incorporate in order to turn highly taxed labour income into lower taxed capital income. Increasing the top PIT rate therefore requires increasing the tax rate on personal capital income that applies to dividends.

Like most WB6 economies, North Macedonia relies heavily on taxes on goods and services. These amounted to 12.1% of North Macedonia's GDP, which is below the WB6 average (15.9% in 2019) but above the OECD average (10.9% in 2018). **Value-added tax** accounts for more than half of revenues from GSTs, or 7.5% of GDP. North Macedonia levies a standard VAT rate of 18%, which is the second lowest rate of the WB6, alongside Kosovo; the WB6 average VAT rate is 19% and the OECD average was 19.3% in 2020. North Macedonia's VAT base is narrowed further by a series of reduced rates of 0% and 5%; the latter is levied on goods and services including food products, medicines, books and print media, computers, and school supplies. In 2020, the mandatory VAT registration threshold was raised from MKD 1 million (EUR 16 180) to MKD 2 million (EUR 32 360). Changes to other GSTs were introduced in January 2020, including the introduction of a tax on motor vehicles, based on the purchase price and a calculation based on carbon dioxide (CO<sub>2</sub>) emissions. OECD research has found that consumption taxes, particularly value-added tax (VAT), may be less distortive on the decisions of households and firms, and thus on GDP per capita, than income taxes (Johansson et al., 2008<sup>[86]</sup>).

North Macedonia has an aggregated **tax revenue forecasting model** for all major types of taxes. It also operates a microsimulation model, which estimates firm-level CIT revenues, sector-specific CIT revenues and the revenue effects of rate or incentive adjustments. The PIT microsimulation model also analyses different redistributive indicators, such as the Gini and Atkinson index. North Macedonia is currently undertaking a Public Financial Management Reform Programme (2018-21). As part of this programme, it will further strengthen its forecasting capacities and simulation models.

**Tax expenditure reports** in North Macedonia are currently not published as part of the annual budget, but are only used to inform the government. However, as in several WB6 economies, North Macedonia plans to introduce regular tax expenditure reporting as part of the New Organic Budget Law due to come into force at the end of 2020. This is a step in the right direction. Indeed, to support transparency and accountability, the government should follow through on developing regular and systematic tax expenditure reporting in order to monitor the use and effectiveness of tax incentives along with the tax revenue forgone (OECD, 2010<sup>[87]</sup>).

#### *Sub-dimension 4.2: Tax administration*

The Public Revenue Office (PRO) of North Macedonia is a unified administrative body managing direct and indirect taxes. It is in charge of all **tax administration functions** except tax fraud investigation, which

is conducted by the Financial Police and the Ministry of Interior. It is organised under a mixture of functional and taxpayer approaches: its internal organisation follows the different functions of a tax administration, such as audit or taxpayer services, while it has a Large Taxpayer Office focused on large taxpayers. OECD research shows that having a unified body that covers all taxes and all the core tax administration functions is an important factor in strengthening the efficiency of tax administration (OECD, 2018<sup>[55]</sup>). The PRO is regularly audited by the Department of Internal Audit, which prepares annual and multi-annual audit plans. In 2019, the PRO and its regional offices underwent eight internal audits. A Tax Academy has been established as an internal unit, providing training to the PRO's employees.

With regards to **compliance and risk assessment**, the PRO carries out tax audits following a risk-based approach: it focuses on taxpayers showing certain abnormalities with regard to a predetermined set of risk criteria. OECD research shows that risk-based selection is a key element of effective and efficient compliance programmes as it allows administrations to make effective trade-offs to make the best use of their scarce resources (OECD, 2018<sup>[55]</sup>). This function is the responsibility of the General Tax Inspectorate, its six regional offices and an inspectorate in the Large Taxpayers Office. The PRO prepares a monthly tax audit plan, structured around three methods: electronic risk-assessment, analysis of individual cases and random audit based on a certain sample of risk activity. The PRO uses the DANIS system to monitor implementation of the national audit plan. While the procedure for tax audits is well established, with the Law on Tax Procedure and the Law on Administrative Disputes, it could be further developed by introducing a general framework that guarantees taxpayers' rights throughout the tax audit process.

In terms of **independence and transparency**, the PRO is organised as an administrative body integrated into the Ministry of Finance, to which it submits monthly reports. The PRO's budget is fixed in the annual budget process but it also receives additional funds in proportion to the amount of additional revenue raised from certain items. A Code of Conduct is in place defining the rights and obligations of the PRO's employees, which provides disciplinary actions for violations of these obligations. Existing rules also provide protection for whistleblowers. OECD research suggests that corruption among tax administration employees may deter individual taxpayers from paying taxes, or they may opt to pay a bribe or enter into the informal economy (OECD, 2018<sup>[55]</sup>).

Electronic **tax filing** is widely used in North Macedonia. While e-filing is only mandatory for VAT, its use is close to universal for PIT (99.3% of returns) and CIT (96.3%). Since January 2019, the PRO has prepared an annual tax return for taxpayers, which contains data on annual income and any advance payments made. Access to e-filing is based on a free software, with no payment obligations to complete a declaration. Regular audits of the tax collection process are conducted by an internal audit unit as well as the State Audit Office, an independent body. The PRO is in the process of implementing an assessment of compliance by different categories of taxpayer, but the audit process currently does not assess the efficiency of the tax collection system.

The PRO and its regional services offer various **taxpayer services**. The public may access information on line or communicate with it electronically or make inquiries in person. The tax legislation also provides for an ombudsman, which defends citizens' rights against their tax administration. A quarterly managerial report, not specific to taxpayer services, conducts a regular assessment. The PRO also conducts regular surveys of taxpayer satisfaction.

#### *Sub-dimension 4.3: International co-operation*

North Macedonia has also been proactively involved with the **international taxation framework**. In August 2018, North Macedonia joined the Inclusive Framework on BEPS (base erosion and profit shifting), which led to a series of initiatives. With regards to harmful tax practices (Action 5), a peer review began assessing North Macedonia's system in July 2020. In January 2020, North Macedonia signed the Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS (MLI) on tax treaty abuse (Action 6). North Macedonia has prepared a first legislative draft on country-by-country reporting (Action 13),

based on the OECD model legislation, which is currently under internal review. It has not implemented the mutual agreements procedure (Action 14) but requested a deferral of the peer review process.

North Macedonia also signed the Convention on Mutual Administrative Assistance in Tax Matters in June 2018, which entered into force in January 2020. Additional initiatives may be highlighted in the field of exchange of information. North Macedonia has been subject to a second round of peer review on exchange of information on request (EIOR), receiving an overall rating of “largely compliant”. It has not yet engaged in any initiatives on the automatic exchange of information (AEOI). This involvement in the international taxation framework could help North Macedonia to strengthen the protection of its domestic tax base from erosion due to tax avoidance and evasion.

North Macedonia is engaged in several initiatives in the field of **digital taxation**. It has not yet formally implemented the international VAT/GST guidelines. However, it levies VAT on cross-border digital services using a logic close to the destination principle, which is the cornerstone of the international VAT/GST guidelines. In North Macedonia, income earned through digital platforms are included in the PIT base and taxed at the 10% flat rate. North Macedonia has not participated in the discussions on Pillar 1 and 2 of the OECD’s Tax Challenges Arising from Digitalisation project. These developments might have an impact on North Macedonia’s taxation of corporate income, especially under Pillar 2, which intends to define a minimum taxation of corporate profits. While the final rate will depend on ongoing discussions, North Macedonia has a low CIT rate and is at high risk of being affected. If the minimum rate is set higher than 10%, it would be faced with the choice of either raising its rate or risk forgoing tax revenues. Pillar 2 might also challenge North Macedonia’s use of tax incentives. This topic will have a great importance in the near future and it may wish to evaluate its position on this topic and prepare an action plan.

North Macedonia is undertaking several initiatives in the field of **regional co-operation**. Since June 2006, the PRO has had a co-operation agreement with Bosnia and Herzegovina, Bulgaria, Montenegro, and Serbia. This agreement covers preventing and investigating tax fraud, co-operation on research and compliance, information for compliance purposes, and the training of staff. North Macedonia has also concluded 49 agreements on avoidance of double taxation, 24 of which were with member states of the European Union.

### ***The way forward for tax policy***

To enhance the tax policy framework and achieve their objectives, policy makers may wish to:

- **Continue to support the economy and facilitate the economic recovery** in light of COVID-19 with targeted tax and subsidy measures.
- **Assess the balance between employee SSCs and PIT.** In order to encourage low-income workers to participate in the formal labour market, some of the employee SSC burden could be shifted to the PIT by introducing a progressive PIT rate schedule, as planned for 2022. This reform might require accompanying measures to avoid tax avoidance among entrepreneurs who would face a strong incentive to incorporate their business and turn higher taxed labour income into lower taxed capital income.
- **Continue to strengthen its tax expenditure report** and publish it as part of the annual budget, as planned.
- **Avoid the use of profit-based tax incentives.** North Macedonia’s CIT is already competitive due to its low rate and the deduction of reinvested profits from the tax base. This excludes the need for overly generous profit-based tax incentives.
- **Follow the discussion of the OECD/G20 Tax Challenges Arising from Digitalisation project** and in particular the work on Pillar 2 which would introduce a global minimum tax. This reform would encourage North Macedonia (and other WB6 countries) to increase its CIT rate and redesign its CIT incentives.

- **Re-evaluate the merits and disadvantages of worldwide taxation for resident companies.** For small open economies such as North Macedonia, worldwide taxation may entail high administrative costs without raising significant revenues.
- **Strengthen the available forecasting and microsimulation models to assess the tax system and reforms, as planned.** This could be through a wider use of microsimulation models and the use of forward-looking effective tax rates.
- **Continue to engage with the international tax community and implement international best practices.** Since the last assessment, North Macedonia has strengthened its involvement in international tax matters and this approach is very much welcomed.
- **Foster regional co-operation and co-ordination on common tax issues.** North Macedonia shares common challenges with other WB6 economies; enhanced collaboration might benefit all the economies involved. Areas such as tax compliance, training of tax staff and the exchange of information would greatly benefit from a co-ordinated regional approach.

## Competition policy (Dimension 5)

### Introduction

Unlike the other dimensions, where indicators are allocated a score from one to five, the Competition policy dimension assesses four policy areas (i.e. scope of action, anti-competitive behaviour, probity of investigation and advocacy) and is based on yes/no (coded as 1/0) answers to the 71 questions in the questionnaire administered by the OECD. Where a response to a question is yes (coded as 1), then we refer to this as an adopted criterion. Each of the four policy area has a different number of possible criteria that can be stated as having been adopted. Each policy areas is assessed though data collected from the questionnaire indicators and by measuring the number of criteria adopted. The new fifth policy area (implementation) is not scored, but is a quantitative analysis of how many competition decisions have been adopted by the competition authorities. The anti-competitive behaviour and implementation policy areas are discussed together below.

Figure 24.9. North Macedonia's legal and institutional competition framework

Source: Based on the OECD assessment.

### State of play and key developments

#### Sub-dimension 5.1: Scope of action

The legislative and institutional frameworks for competition in North Macedonia are in line with international good practice. Its competition rules reflect EU provisions on restrictive agreements and abuse of dominant position (Articles 101 and 102 Treaty on the Functioning of the European Union; TFEU) and include *ex ante* control of mergers, following the principles of the EU Merger Regulation.

The Commission for Protection of Competition (CPC) is responsible for implementing the Law on Protection of Competition. The CPC is an operationally independent authority with the power to adopt enforcement decisions in anti-trust and mergers, as well as to advocate competition principles to national policy makers.

The main challenge for the CPC remains implementation. The number of significant anti-trust and merger cases it has undertaken is still limited and the related fines imposed are not enough to ensure strong deterrence. The leniency system is not proving effective in supporting cartel detection. Advocacy action should be expanded, with a view to both embedding competition principles in the legislation and spreading a competition culture.

All this requires adequate financial and professional resources. The CPC appears to need a significant increase in its budget and specialised staff to support the development of competition enforcement and advocacy.

The Commission for Protection of Competition was established in 2005, following the adoption of the Law on Protection of Competition. Its board consists of the President and four members appointed for a five-year period by the Assembly of North Macedonia, with the right to reappointment. The current board was appointed in October 2018. The CPC's investigative activities are performed by four departments managed by a Secretary General, appointed and dismissed by the board.

The total number of staff has fallen slightly, from 26 employees in 2015 to 23 in 2019, and it only employed 6 actual competition case handlers in 2019. In comparison, according to the OECD CompStats database,<sup>42</sup> the average total staff of the 15 competition authorities in small countries (with a population below 7.5 million) was 114 in 2019, of whom 43 were working on competition. The CPC's staffing levels are also at the low end for the region: on average the competition authorities in the WB6 economies employed 33 staff in 2019, of whom 21 were working on competition.

The CPC's budget has grown slightly, from EUR 289 000 in 2015 to EUR 397 000 in 2020. However, despite also having responsibility for state aid control, its budget is the smallest of the 48 respondents to the CompStats survey.

The Law on Protection of Competition ensures competitive neutrality, insofar as the **competence** of the CPC encompasses both private and public undertakings. This includes entities that have been entrusted with services of general economic interest, except where the application of the law would hinder the performance of the tasks stipulated by law or the purpose for which those entities were established.

The CPC has appropriate **powers to investigate** and **powers to sanction** possible anti-trust infringements, i.e. restrictive horizontal and vertical agreements and exclusionary or exploitative practices by dominant firms.

The CPC may impose cease and desist orders, and remedies and sanctions on firms that have committed anti-trust infringements. It may also adopt interim measures *ex officio* and based on preliminary evidence (*prima facie*), if the alleged competition breach poses a risk of serious and irreparable damage. It may also order behavioural and structural measures needed to eliminate harmful effects on competition and set deadlines for their implementation. The duration of such interim measures has to be clearly indicated by the CPC and be proportionate and consistent with the objectives of the measure.

After the initiation of proceedings, and no later than the notification of the statement of objections, parties may offer commitments to address the competition concerns. The Commission for Misdemeanour Matters, an internal body of the CPC, cannot accept such commitments in cases of a significant distortion of competition.

The CPC may compel investigated firms and third parties to provide relevant information and may perform unannounced inspections on the premises of the parties. The assessment of alleged anti-competitive conduct must follow a thorough scrutiny of the collected evidence, which may include an economic analysis of the competitive effects of vertical agreements or possible exclusionary conduct.

The Commission for Misdemeanour Matters can impose a fine of up to 10% of the value of the total annual turnover of the undertaking in the last business year. The Law on Protection of Competition includes a leniency programme, which offers partial or total immunity from sanctions to firms that report the existence of an anti-competitive agreement and submits valid evidence to the CPC.

The Law on Protection of Competition also provides for *ex ante* control of **mergers**, following the principles of the EU Merger Regulation. The CPC can compel merging firms and third parties to provide relevant information and can perform unannounced inspections on the premises of the parties. The assessment of

notified mergers must follow a thorough scrutiny of the evidence, which includes an economic analysis of the restrictive effects and of possible efficiencies stemming from the notified transaction.

In the case where a merger would create or strengthen a dominant position in the relevant markets, the CPC may prohibit the transaction. If the merging parties propose modifying the transaction and the CPC finds that the modifications address the anti-competitive concerns, the CPC may accept the proposed remedies and clear the merger.

Regarding **private enforcement**, individuals, firms and consumers – either collectively or through consumer associations – can bring a legal action to seek damages from firms that have committed anti-trust infringements.

#### *Sub-dimensions 5.2 and 5.5: Anti-competitive behaviour and implementation*

The anti-competitive behaviour and implementation policy areas together gauge the use of powers and resources in terms of decisions adopted and fines imposed for horizontal agreements, vertical agreements and exclusionary conduct. They also explore the actual activity of the competition authority on reviewing mergers. The actual **implementation** of these provisions through competition enforcement is still limited in North Macedonia (Figure 24.10). Very few decisions have tackled hard-core **horizontal agreements** (cartels), which represent the most harmful competition infringements, particularly in the last few years. In comparison, on average the 15 competition authorities in smaller jurisdictions in the OECD CompStats database tackled 4.2 cartel cases a year during 2015-19.

**Figure 24.10. Competition decisions in North Macedonia (2015-19)**

Source: Data provided by the authorities.

The sanctions on cartels were negligible until 2019, when the CPC imposed a total fine of EUR 1.7 million on two pharmaceutical companies (on average the total fines imposed annually on cartel infringers by the competition authorities in smaller jurisdictions in the OECD CompStats database were EUR 2.7 million during 2015-19). The CPC has primarily invested its investigative resources in **vertical agreements**. However, the amount of fines imposed relating to vertical agreements was also modest, totalling EUR 143 185 in 2018 and EUR 206 850 in 2019.

The CPC has not received any leniency applications to date. It has made progress on unannounced inspections (also called “dawn raids”), which are crucial for collecting evidence of competition breaches, particularly with respect to cartels. After conducting only one such inspection each year in 2016-19, it carried out three in 2019.

The number of decisions on **exclusionary conduct** ranged from three in 2015 to zero in 2019.

In 2019 the CPC received 58 **merger** notifications, after receiving 67 in 2018 and around 40 in each of the previous three years. The vast majority of the transactions were cleared without any need for a closer examination and only a small portion had real economic implications for the national economy. Over the last five years only one merger has been blocked, in 2017, while two were approved with remedies (in 2015 and 2018).

The ratio of in-depth (Phase 2) investigations and notifications is lower than in other jurisdictions, if benchmarked against the 15 competition authorities in smaller jurisdictions in the OECD CompStats database. In particular, the average annual number of in-depth merger investigations in the 15 competition authorities in the years 2015-19 was 4, out of 36 notifications.

### *Sub-dimension 5.3: Probity of investigation*

The CPC is an **independent** state body, i.e. it is autonomous in its work and decision-making process within the competencies provided by the law. It is **accountable** before the Assembly of the Republic of Macedonia, to which it must submit an activity report no later than March each year.

In terms of **procedural fairness**, the decisions of the CPC and the Commission for Misdemeanour Matters as well as the judgements by the courts, must be published on the website of the CPC and in the Official Gazette. The text of the decision has to specify the names of the parties to the proceedings and the basic contents of the decision. All data qualified as business or professional secrets may not be published.

The decisions of the CPC issued in administrative proceedings are final. They may be appealed before the Administrative Court within 30 days of the day of the notification of the decision, without deferring the enforcement of the decision. The judgements of the Administrative Court may be further appealed before the High Administrative Court. The decisions of the Commission for Misdemeanour Matters are also final. A legal action before the Administrative Court may be brought within eight days of the day of the notification of the decision.

Before making a final decision, the Commission for Misdemeanour Matters has to provide the parties with a statement of objections, which should also indicate the type and amount of the sanction to be imposed and the circumstances taken into account to determine the sanction. The parties have the right to state their views in writing. Likewise, merging parties have the right to be heard and submit evidence before a decision on a merger is taken.

A large number of by-laws, guidelines and brochures are published on the CPC website (mostly translated from EU documents). They include notices on the notion of concentration, horizontal and vertical agreements, as well as a number of guidelines, including on the calculation of fines, vertical restrictions, and horizontal and vertical mergers.

### *Sub-dimension 5.4: Advocacy*

The CPC can issue opinions on existing and draft laws and regulations. The public body concerned must inform the CPC of the reasons for not accepting the Commission's opinion. The CPC can provide opinions on issues in the area of competition policy, protection of competition on the market and granting state aid which it can do on request by the Assembly, the Government of North Macedonia, other state authorities, undertakings or *ex officio*.

In exercising its functions, the CPC has to co-operate with other state authorities and bodies on issues related to the protection of competition. The CPC and the state authorities and bodies can exchange the data and information needed to carry out their responsibilities, as long as the exchange is appropriate and proportionate to its purposes.

The CPC usually receives draft laws and regulations before they are adopted and has sufficient time to examine and comment on them. There is no specialised unit within the CPC in charge of the assessment of laws and regulations. There is no manual or guidance for conducting such an assessment.

In 2019 the CPC issued seven formal opinions, compared to six in 2018 and four each in 2017 and 2016. Recent relevant opinions concerned the Law on Public Procurement and the Law on Misdemeanour, and the CPC's suggestions were implemented. In December 2014, the CPC issued guidelines for detecting bid rigging in public procurement, in co-operation with the Bureau for Public Procurement.

The CPC has the power to perform market studies but has not issued any over the last few years.

It organised three public events to promote competition culture in 2019. In previous years, the CPC also organised workshops for judges and for members of the national chamber of commerce.

### ***The way forward for competition policy***

The CPC needs to improve its competition enforcement capacity and efforts, with a view to increasing the number of decisions on cartels and abuses of dominant position and the resulting fines.

In addition, it should engage in advocacy initiatives to promote greater awareness of competition principles among the general public and foster a competition culture among policy makers and the business community. The recent challenges arising from the COVID-19 pandemic make it even more urgent for the CPC to expand its advocacy role to contributing to the economy's quick recovery.

In addition, policy makers and the CPC should focus on the following measures:

- **Provide the CPC with adequate financial and professional resources.** Its current budget and the number of specialised staff appear insufficient to allow the CPC to effectively perform its duties. Substantially increasing the budget would align the CPC with other comparable competition authorities. Additional financial resources would enable the CPC to recruit officials with appropriate competition skills and thus develop its potential in terms of competition enforcement and advocacy. See Box 24.8 for information on how Italy's competition authority is funded.
- **Prioritise boosting cartel enforcement and increasing fines.** Cartels are the most clear-cut and undisputedly harmful competition infringements and affect every economy. The efforts of the CPC should be focused on detecting cartels and imposing heavy fines on infringers, in order to deliver a strong message that firms that engage in collusion risk will be severely punished. If the amount of fines sufficiently exceeds illicit gains, offences will be deterred even when the probability of paying a fine is low. Concern over fines is also a key driver of leniency applications, thus increasing the effectiveness of the leniency programme – which has been unproductive so far – and further boosting detection. The CPC could also expand its detection skills, for example by further strengthening the fight against bid rigging (see the next recommendation on public procurement) and continue to perform on-site inspections to collect evidence.

- Pay particular attention to public procurement, particularly during the COVID-19 crisis.** Public procurement is a key sphere of action both for cartel enforcement and for encouraging competition. Bid rigging results in significant harm for public budget and taxpayers, dampening innovation and encouraging inefficiency. Figure 24.11 shows how co-operation between competition and procurement authorities can help detect and avoid big rigging. The CPC has issued guidelines for detecting bid rigging in public procurement, in co-operation with the Bureau for Public Procurement and successfully advocated to improve the Law on Public Procurement. The CPC should further explore ways to enhance its detection of cartels and prevent bid rigging through better tender design by procurement officials. The Recommendation of the OECD Council on Fighting Bid Rigging in Public Procurement (OECD, 2012<sup>[88]</sup>) calls on governments to assess their public procurement laws and practices at all levels of government in order to promote more effective procurement and reduce the risk of bid rigging in public tenders. The Guidelines on Fighting Bid Rigging in Public Procurement (OECD, 2009<sup>[89]</sup>), which form a part of the recommendation, are designed to reduce the risks of bid rigging through careful design of the procurement process and to detect bid-rigging conspiracies during the procurement process. The OECD can also provide assistance through a project aimed at assessing the main rules governing the procurement of public works and the procurement practices of major public buyers and providing recommendations for competitive procurement and fighting bid rigging in accordance with international good practices, while offering training to both competition and public procurement officials based on the Guidelines on Fighting Bid Rigging in Public Procurement.

#### Box 24.8. Financial independence for the Italian Competition Authority

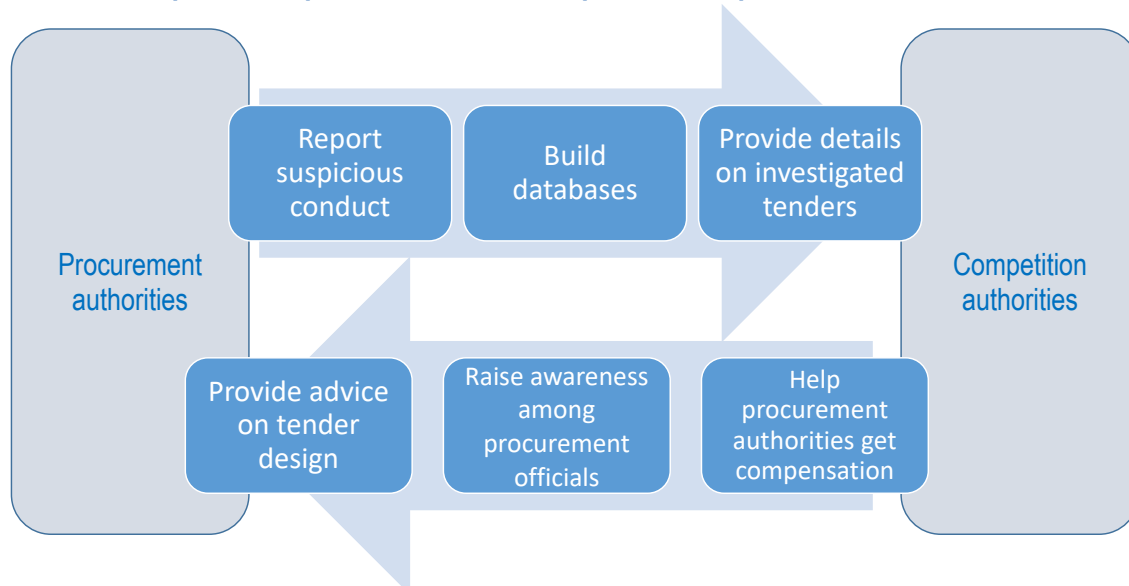

Until 2012, the financing of the Italian Competition Authority (AGCM) was based on two main sources: annual funding from the state and fees paid by companies subject to merger notification requirements.

Legislative Decree no. 1/2012 modified the AGCM's funding system, which is now based on mandatory contributions imposed on companies incorporated in Italy whose turnover exceeds a threshold of EUR 50 million. The revenues from these contributions replace all previous forms of funding. The level of contribution, originally fixed at 0.06 per thousand, has been gradually lowered by the AGCM to 0.055 per thousand. The authority's financial statements have to be approved by 30 April of the following year, and are subject to auditing by the Court of Auditors.

This funding system can be regarded as an indirect recognition of the positive role played by the AGCM in supporting a healthy and level competition field, which justifies the imposition of a small contribution on the largest businesses incorporated in Italy.

Importantly, the previous funding system entailed the risk of possible fluctuations in the size of the annual budget, due to the unpredictability of the number of notified mergers and levels of state funding. The new system shelters the AGCM from that risk, thus allowing for more stable and forward-looking recruitment planning.

Figure 24.11. Example of co-operation between competition and procurement authorities

- **Perform market studies.** Market studies are used to assess how competition in a sector or industry is functioning, detect the source of any competition problems, and identify potential solutions. They can uncover problems such as regulatory barriers to competition and demand-side factors that impair market functioning. Because market studies are a versatile tool, and they allow the examination of a broader set of issues than competition enforcement, their use is growing. International organisations, notably the OECD and the International Competition Network (ICN), have developed a wide range of documents on market studies, including the OECD Market Studies Guide for Competition Authorities. The OECD Competition Division can also assist competition authorities, regulators, ministries or other policy makers with market study projects.
- **Promote a competition culture through dedicated events.** In this phase of the development of the CPC, it needs to strengthen its standing and reputation and persuade policy makers and the business community of the key role competition plays in supporting economic growth and consumer welfare. Tailor-made conferences in co-operation with other public authorities, training events and seminars addressed at the business community or the judiciary, as well as educational materials for the general public, are effective tools to increase competition awareness.
- **Expand international co-operation and training.** In the face of increasingly complex anti-trust issues and the frequent cross-border nature of competition infringements, the management and the staff of the CPC should have frequent opportunities to meet and participate in policy discussions. International organisations like the OECD, the ICN and the United Nations Conference on Trade and Development (UNCTAD) offer valuable opportunities to this end. The OECD-GVH Regional Centre for Competition in Budapest also provides an ideal forum for capacity building and sharing of good practice with colleagues from other jurisdictions, focusing on the specific challenges of Eastern European and Central Asian countries. The CPC is already a regular participant in the centre's events and would benefit from actively continuing.

## State-owned enterprises (Dimension 6)

### Introduction

The ownership arrangements for North Macedonia's approximately 50 centrally held state-owned enterprises (SOEs) are dispersed across the administration. There is no unified state ownership policy to guide corporate decision making around SOE performance. As a result, many SOEs are loss making and North Macedonia scores on the lower end of the scale for the sub-dimension on their efficiency and governance (Table 24.11). Its performance in the transparency and accountability practices sub-dimension is around the regional average, reflecting sound basic disclosure requirements at the company level, but limited disclosure by the state on the performance of its SOE portfolio as a whole. Similarly, North Macedonia achieves an average score for providing a level playing field between state-owned and private companies. This reflects issues that are common across the Western Balkan region – namely that many SOEs are not incorporated according to general company law and that they enjoy some competitive advantages, such as lenient rate-of-return expectations, from the state as owner. North Macedonia's overall performance in this dimension remains essentially unchanged since the last Competitiveness Outlook (2018), as no state ownership reforms have been undertaken since then.

**Table 24.11. North Macedonia's scores for state-owned enterprises**

Dimension	Sub-dimensions	Score	WB6 average
<b>State-owned enterprises dimension</b>	Sub-dimension 6.1: Efficiency and performance through improved governance	1.8	2.2
	Sub-dimension 6.2: Transparency and accountability practices	2.8	3.0
	Sub-dimension 6.3: Ensuring a level playing field	2.5	2.8
	Sub-dimension 6.4: Reforming and privatising state-owned enterprises	n.a.	n.a.
<b>North Macedonia's overall score</b>		<b>2.3</b>	<b>2.6</b>

Note: For comparability with the previous assessment, Sub-dimension 6.4 (reforming and privatising state-owned enterprises) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 6.1: Efficiency and performance through improved governance*

The central and municipal governments of North Macedonia own a reported 318 enterprises, of which 50 are solely held by the central level of government.<sup>43</sup> Similar to most OECD countries, these SOEs are highly concentrated in the network industries: telecoms, electricity and gas, transport, and other utilities (including water supply and sewage companies owned by municipalities). Together they account for 59% of all SOE employees (Figure 24.12).<sup>44</sup> Individual examples include the Public Enterprise Macedonian Railways, the Public Enterprise for State Roads, and the natural gas distributor Public Enterprise Strumica-Gas. The primary sector – which includes, for example, the state forestry enterprise – is also quite important, accounting for 22% of all SOE employment in the economy.<sup>45</sup> Beyond these more “traditional” state ownership sectors, the government also owns 13 real estate companies and 6 manufacturing companies, together accounting for 4% of all SOE employment. Three SOEs are nominally listed on the national stock exchange, operating in residential and government real estate and gambling (the state lottery).<sup>46</sup>

**Figure 24.12. Sectoral distribution of SOEs by number and contribution to employment**

Note: North Macedonia's authorities excluded primary-sector SOEs from their aggregate figures, but they have been included in this profile's figures.

Source: Calculations based on data provided by North Macedonia's authorities, aggregating figures for SOEs owned at both the central and municipal level.

SOEs at all levels of government employ approximately 51 000 people, accounting for an estimated 6.4% of all employment in North Macedonia. The authorities did not provide distinct data on SOEs held only by central government (except reporting that the central level of government owns 50 of them). This makes it difficult to draw international comparisons, including with OECD economies for which the available data are usually only based on central government SOEs (OECD, 2017<sub>[90]</sub>). As an imperfect point of comparison, centrally held SOEs account for 2-3% of national employment on average across OECD countries, with the 10 largest sectors accounting for between 2.9% (in Sweden) and 9.6% (in Norway) of national employment (OECD, 2017<sub>[90]</sub>; IMF, 2019<sub>[91]</sub>). A 2019 assessment by the International Monetary Fund (IMF) of SOEs held at all levels of government in Central, Eastern and South-eastern Europe found that SOEs in North Macedonia accounted for the smallest share of employment in the region, second only to Kosovo (IMF, 2019<sub>[91]</sub>). The same study found that North Macedonia's SOEs accounted for the least amount of value added as a share of GDP compared to the other WB6 economies (IMF, 2019<sub>[91]</sub>).<sup>47</sup>

External assessments suggest significant inefficiencies and, in many cases, outright losses among SOEs in North Macedonia. A 2019 IMF study found that more than 70% of SOEs in North Macedonia are less profitable than their private sector peers (IMF, 2019<sub>[91]</sub>). A 2015 examination of the financial statements of 101 SOEs found that one in three of them were loss making (BIRN, 2014<sub>[92]</sub>). A more recent analysis of 29 SOEs, undertaken by Portalb, found that 13 of the reviewed SOEs had posted pre-tax losses in 2018 (Dodevska, 2019<sub>[93]</sub>). Among these loss-making SOEs were the national postal services operator and the railway transport and infrastructure companies. It is not uncommon for SOEs across the world to be less profitable than their private sector peers. They are often expected to fulfil costly public policy objectives that are subsidised from commercial activities, rather than being transparently compensated through the state budget. The authorities in North Macedonia have not so far attempted to define, disclose, or estimate the costs of SOEs' non-commercial objectives, which can be quite wide ranging, including delivering public services and supporting local employment. In the absence of information, understanding and addressing the sources of SOEs' weak performance could prove to be challenging.

Concerning the **clarification of ownership policy and rationales**, the authorities have not developed a publicly available policy that defines the overall objectives for state ownership or the roles of different state bodies in executing ownership decisions. Some of the rationales for state ownership can be ascertained from existing legislation, such as the Law on Public Enterprises, which references undertaking activities in the public interest as a reason to establish SOEs but provides little additional details on what constitutes the "public interest". There are 23 SOEs that do not fall under the scope of the Law on Public Enterprises, and for which the rationales for state ownership are therefore even less clear. For some individual enterprises, the founding legislation and/or articles of association implicitly outline the reasons for state ownership, while for other SOEs, the reasons for state ownership are simply not articulated. There is

significant scope to define and disclose the rationales for state ownership – both in general and for specific SOEs – so that public ownership of companies is a transparent and informed policy decision more clearly.

North Macedonia has a dispersed ownership architecture, with no single state institution responsible for executing ownership decisions. It has no co-ordinating body to harmonise and **professionalise state ownership** practices across the state administration. While the ultimate responsibility for state ownership resides, by law, with the Government of Macedonia, the practical division of responsibilities among ministries is unclear. Public bodies with state ownership responsibilities include the Ministry of Economy, the Ministry of Finance and the Ministry of Transport and Telecommunications. A portfolio of SOEs was also previously overseen by the Privatisation Agency, but the agency was disbanded in 2005 and the remaining enterprises under its purview were divided among the Ministry of Finance, the Ministry of Economy, the Pension and Disability Fund, and the Public Company for Real Estate Management.

North Macedonia is reportedly in the process of establishing a **robust board nomination framework** for SOEs, but there is currently no common approach to board appointments and the process does not seem to be very transparent. In practice, board nominations to SOEs are decided by the government based on proposals by individual line ministries. The absence of a transparent nomination process increases the risk of board positions being awarded to people with limited professional qualifications and, in the worst cases, used as tools for political patronage. Because boards of directors are in turn responsible for appointing chief executive officers (CEOs), there is a risk that any politicisation of boards could trickle down to the management level, leading to political influence over corporate decision making. According to stakeholders interviewed in the context of this assessment, the senior management of SOEs frequently changes when there is a change in government, indicating a strong degree of politicisation in SOE management oversight.

Despite these shortcomings, there are at least some basic legislative requirements to **promote independent and professional boards** for companies from North Macedonia, including most SOEs. The Trade Companies Law – which is applicable to SOEs that are incorporated as limited-liability or joint-stock companies – establishes that board members are liable for any damages to the company as a result of their decisions. It also includes requirements that company boards comprise a minimum of one-quarter independent directors. Individuals are considered independent if they and their immediate family members 1) have not had any material interests or business relationships with the company during the preceding five years; and 2) are not holding over 10% of its shares. Nonetheless, in practice, SOE boards are often seen as extensions of the ministries that own them, rather than as strong corporate decision-making bodies that operate independently under clear objectives communicated by the government. Public officials serving on SOE boards receive instructions on how to vote, indicating a boardroom culture in which members are not expected to make decisions independently in the interest of the enterprise and its shareholders.<sup>48</sup> The presence of politicians on SOE boards – which in some other WB6 economies is either barred by law or goes against applicable policy – also raises significant concerns regarding boards' professionalism and independence. North Macedonia's authorities have not taken steps to promote gender diversity on SOE boards, reflecting the wider underpinning issue of underdeveloped board nomination criteria. It is considered good practice to take gender diversity into account in the process of establishing a board of directors with varied backgrounds and experiences.

### *Sub-dimension 6.2: Transparency and accountability practices*

While legislation establishes multiple **financial and non-financial reporting** requirements for SOEs, there is an overarching concern over SOEs' compliance with these requirements. Like all companies, SOEs are required to submit annual reports and financial statements to the Central Registry, which must then make them publicly available. SOEs are also required by the Law on Public Enterprises to publish their financial statements on their own websites – or, if they do not have a website, on the website of the responsible ownership ministry – within 15 days of their submission to the Central Registry. Earlier external studies indicate that many SOEs have in the past complied with the requirement for reporting to the Central

Registry and that at least their financial reports were readily available to the public.<sup>49</sup> However, according to the assessment, the majority of SOEs do not fully implement their reporting requirements. SOEs are also required by law to submit reports on their performance, together with their annual accounts, to the responsible line minister. A more in-depth and up-to-date review of SOEs' compliance with existing disclosure requirements, as well as of the quality of their disclosures, could help determine whether additional policy measures are needed to strengthen disclosure at the enterprise level.

Concerning disclosure by the state, no single report on the aggregate performance of SOEs is compiled or made available to the general public. However, the state has established a basic online directory of SOEs, which includes their names, addresses, and contact information (in Macedonian) (KOMSPI, n.d.<sup>[94]</sup>). The Central Registry is required to publish the corporate disclosure documents that it receives from individual enterprises, including SOEs, but more information would be required to assess whether such information is in practice publicly available for most SOEs.

North Macedonia appears to have established sound basic legislation to ensure high-quality **auditing practices** among SOEs, but a fully informed assessment of this area would require a qualitative review of how this legislation is implemented in practice. The Law on Audit requires all legal entities of public interest – which presumably includes all SOEs under the scope of the Law on Public Enterprises – to have their financial statements reviewed by an external auditor. In practice, however, the government reports that independent external audits are only performed for SOEs with mixed capital and that the State Audit Office audits the financial statements of SOEs that are 100% owned by the state. This suggests a general lack of clarity about SOEs' audit requirements and there is a need to clearly identify which SOEs should undergo external audits of their financial statements.

External stakeholder assessments also point to insufficient state monitoring of SOEs' operations as well as the absence of clearly defined criteria for determining which SOEs should undergo state audits and when. The Centre for Civil Communications, a local NGO, highlighted in a recent report that the majority of SOEs had not undergone a state audit in the past 15 years. The report also highlighted the lack of clarity regarding how SOEs are selected for audits and how frequently they take place: one of North Macedonia's largest SOEs (the electricity company AD Elektrani) was last subject to a financial audit by the state in 2007, while the state road construction company was audited four times between 2005 and 2016 (Centre for Civil Communications, 2019<sup>[95]</sup>). This report also highlighted that several SOEs have received negative opinions on the soundness of their financial statements or their compliance with applicable legislation. This points to the need to improve the quality and credibility of their corporate disclosures and also to strengthen their compliance with legislative requirements.

Very few SOEs have non-state shareholders, making the **protection of minority shareholders** a somewhat low-priority issue. However, if the government ever wishes to broaden the ownership of SOEs – including the three SOEs that are currently nominally listed on the national stock exchange but do not include any private shareholders – minority shareholder rights will be paramount. Currently, there are sound laws in place for the protection of basic minority shareholders' rights, including the right to equitable treatment, to participate in shareholders' meetings and to participate in specific corporate decision making. North Macedonia has had positive external assessments of its minority shareholder protections and notably scores relatively high (5 out of 6) on the World Bank's *Doing Business* indicator on the extent of shareholder rights (World Bank, 2020<sup>[96]</sup>). It is not clear why the authorities have listed three SOEs on the stock exchange but maintained 100% state ownership in them. Although listing rules in North Macedonia normally require a company to have at least 50 shareholders and 20% free float in order to list, SOEs that operate in the public interest are exempt from these requirements.

### *Sub-dimension 6.3: Ensuring a level playing field*

The fact that most SOEs in North Macedonia are incorporated as joint-stock or limited-liability companies establishes a strong foundation for ensuring a level playing field with private companies. Nonetheless,

some differences in SOEs' **legal and regulatory treatment** exist owing to 1) the fact that several SOEs operate under the distinct legal form of “public enterprise” and have not been incorporated as joint-stock or limited-liability companies; and 2) the existence of a separate Law on Public Enterprises, which applies to its 195 SOEs (of all legal forms) that are considered to perform activities in the public interest.<sup>50</sup> While the existence of a dedicated law applicable to SOEs is not necessarily of great concern – in some countries, such laws may help to clarify and improve SOEs' corporate governance and disclosure practices – some of the provisions of the Law on Public Enterprise establish operational differences for SOEs that are not considered good practice. For example, the law explicitly allows for ministries owning SOEs to use the profits of some to subsidise the losses of others, which is not a transparent way to finance public-service activities.<sup>51</sup>

The Law on Public Enterprises establishes that public enterprises can be founded as joint-stock companies or limited-liability companies, which are also regulated by the Trade Companies Law applicable to private companies. A further 23 SOEs which are incorporated as joint-stock companies do not fall under the scope of the Law on Public Enterprises, presumably because they are not considered to undertake a public-interest activity. This suggests a patchwork of legislation applicable to SOEs. An additional concern is that, according to their founding or sectoral legislation, some SOEs cannot undergo bankruptcy proceedings. This means that they are not subject to an important market pressure – the threat of bankruptcy – faced by their private competitors, which distorts the playing field. This is supported by a provision in the Law on Public Enterprises stipulating that enterprises performing a public-interest activity must do so “permanently and without interruption”.

While such provisions are intended to ensure the continued provision of public services, they may also have unintended negative effects on SOEs' commercial viability. While many SOEs in North Macedonia do not actually compete with private companies – for example public utilities with no private competitors – it is still considered good practice to subject them to a similar legal regime as private companies, to promote corporate efficiency and ensure a level playing field if the market is ever opened to competition at a later stage. An additional issue affecting competition with private companies is that, according to stakeholders interviewed for this assessment, SOEs often offer higher wages than private competitors, making them attractive vehicles for political patronage and limiting their corporate productivity at the expense of market efficiency.

North Macedonia's authorities provided little formal information for this assessment on **SOE access to finance**, including the terms and conditions attached to financing from both the state and commercial banks. However, online media sources indicate that the state does issue explicit guarantees for (some) SOEs' commercial debt, which may constitute a competitive advantage for SOEs over their private competitors. Notably, these guarantees have been issued for large infrastructure projects, for example in road construction. The state's most recent fiscal strategy document establishes the intention to limit the total value of the state's guarantees on SOE debt for the period 2020-22 to no more than 13% of GDP (Dodevska, 2019<sup>[93]</sup>). In addition to such explicit guarantees, it is likely that SOEs also benefit from implicit guarantees – in that banks expect the state to step in if SOEs are unable to pay their debts – which would constitute an undue competitive advantage over private companies.

As an EU accession candidate, North Macedonia is expected to comply with EU rules on competition, which include state aid rules intended to ensure that state equity financing is provided on market-consistent terms and does not distort competition. It does not appear that North Macedonia's authorities have made any efforts to ensure that capital injections are made on market-consistent terms. Many SOEs in North Macedonia have benefitted from the economic assistance offered to all economic entities to help them survive the economic downturn related to the COVID-19 pandemic. Information on the terms of this support – and plans to phase it out – would be useful to better understand the current national approach to supporting SOEs. It is worth noting that the European Commission issued new guidance in May 2020 on temporary recapitalisations made by the state to keep otherwise healthy companies from going out of business due to the economic downturn related to COVID-19 (EC, 2020<sup>[97]</sup>).

Other areas affecting SOEs' financial conditions – and where state policy seems underdeveloped – include the apparent absence of rate-of-return and dividend expectations that are benchmarked against the private sector, and the use of direct state subsidies that are not calibrated to the cost of public service obligations and therefore support corporate inefficiencies. On a more general note, establishing separate accounting and performance indicators for SOEs' commercial and non-commercial activities would allow for a more informed assessment of their corporate efficiency, which in many cases might be hindered by costly public-policy obligations.

#### *Sub-dimension 6.4: Reforming and privatising state-owned enterprises*

North Macedonia has not undertaken any significant **state ownership reforms** over the past few years. Reform efforts have mostly been limited to addressing structural issues with individual SOEs. For example, there has been a recent assessment of the state-owned railway operator and ongoing discussions about its potential future privatisation.

North Macedonia does not currently have an active **privatisation** programme in place. As mentioned above, the Macedonian Privatisation Agency, which was responsible for privatising over 1 600 enterprises from 1993 to 2005, was disbanded in 2005 and its remaining assets were divided among other public institutions and ministries. The authorities report that management and employee buy-outs were a common privatisation method during that time. Both the Ministry of Economy and the Ministry of Finance maintain some enterprises that were slated for privatisation and transferred to them when the Privatisation Agency was terminated but plans for their privatisation appear to be either stalled or terminated.

Today, the privatisation process is nominally overseen by the government and a dedicated Governmental Privatisation Commission, but the authorities report that no enterprises have been privatised in the last few years. The legislative foundation for privatisations is enshrined in the Law on Privatisation of State-Owned Capital, the Law on Transformation of Enterprises with Social Capital and dedicated government regulation concerning the sale of company shares by the state.

#### ***The way forward for the state-owned enterprises***

As in most WB6 economies, ensuring that SOEs in North Macedonia operate efficiently, transparently and on a level playing field with private companies requires reforms in multiple policy areas. These cannot be done all at once: choosing the appropriate sequencing of reforms is just as important as their content and depends in large part on the national political climate and current reform priorities.

This being said, the *OECD Guidelines on Corporate Governance of State-Owned Enterprises* provide a guidepost for reforms that North Macedonia's authorities can use to inform their policy efforts in this domain. Based on the state of play of SOE policy development in North Macedonia, the following priority reform areas – which are in line with the OECD guidelines – could offer a basis for discussions with the authorities:

- **Develop a state ownership policy that outlines the rationales for state ownership and the expectations of SOEs.** This would constitute a first step towards professionalising state ownership practices in North Macedonia. The policy should provide a clear overview of why the state owns enterprises and what it expects SOEs to achieve. It should clearly outline the main principles guiding state ownership decisions, such as setting objectives and board nominations. It should also define the roles and responsibilities of the different state bodies responsible for executing state ownership decisions and for monitoring SOEs' activities. At a later stage, the authorities might consider establishing a co-ordinating entity to monitor implementation of the state ownership policy, and other subsequent policies or decisions applicable to SOEs, across the public administration.
- **Clarify and streamline the legal forms of SOEs.** Several SOEs, including some undertaking commercial activities, are not (yet) incorporated as companies and instead operate as “public

enterprises”. The authorities should review the rationale for keeping SOEs in this separate legal form and consider fully corporatising those that are engaged in predominantly commercial activities, to further align their legal and regulatory treatment with that of private companies. Where the authorities determine that it is more appropriate for an entity to remain a public enterprise, the rationale for this decision should be clearly and publicly stated. The authorities should also take steps to clarify and streamline the legislation applicable to all SOEs, which could involve updating the Law on Public Enterprises.

- **Establish a transparent and objective board nomination process.** Steps should be taken to minimise the risk of politicisation of boards of directors and to ensure that boards contain qualified professionals who make decisions independently in the interest of the SOEs and their shareholders. This could include establishing clear selection criteria for SOE board members, publishing vacancies, and involving professional recruitment agencies. Some countries, including Australia and the United Kingdom, have found it useful to involve state ownership co-ordination agencies in the board nomination process, by allowing them to review and advise on board member nominations made by line ministries (OECD, 2018<sup>[98]</sup>). While North Macedonia lacks such a centralised agency, these practices could still serve as useful examples of increasing transparency in board nominations by involving more than just responsible ministries in the process. Improving SOE board independence is a difficult task and requires not only changes to processes and requirements, but also sustained political commitment at the highest level of government. In implementing reforms in this area, the authorities should be aware of the risk that the spirit of new rules can easily be subverted and should take steps to manage this risk.<sup>52</sup>
- **Develop centralised data and publicly available aggregated reporting on SOEs.** The state should establish a central overview of all SOEs, including information on how many companies are under the remit of the central and municipal levels of government. The state already requires SOEs to submit their annual reports and financial statements to both the Central Registry and their responsible ministries. The state could build on this to produce annual aggregate reports on the activities and performance of the SOE sector as a whole. Aggregate reports can be a useful way to drive changes in the corporate governance and performance of SOEs, since they support public accountability and put pressure on ownership ministries and SOE management to improve. Even if not all SOEs provide the required information (an area which requires further assessment), this in itself can be included in the aggregate report, to highlight non-compliance and encourage improvements. The aggregate reports produced by Lithuania, Finland and Sweden could serve as inspiration for such a report (see Box 24.9 for an overview of the Swedish state ownership report).<sup>53</sup>
- **Review and improve the quality of disclosure by individual SOEs.** This assessment has pointed to significant shortcomings in SOEs’ implementation of the state’s reporting requirements. The authorities should undertake a thorough review of SOEs’ compliance with reporting requirements and the quality of their disclosures, to identify gaps and establish mechanisms to improve disclosure if necessary. The state should clarify the auditing requirements and ensure that at least all large SOEs undergo an external audit of their financial statements by an independent audit firm.

#### Box 24.9. Reporting on state-owned enterprises in Sweden

The Swedish state ownership report is available online, in both Swedish and English. It provides extensive information on the state’s expectations of SOEs as well as details of SOEs’ operational performance and governance, including:

- An overview of the state’s portfolio of companies, including those with minority state ownership.
- Detailed information on the state’s public policy expectations and financial targets for SOEs.

- Aggregate financial results of the SOE portfolio, including dividend pay-outs.
- An overview of policy guidelines on board member remuneration and external reporting by SOEs.
- Detailed company overviews, including financial performance data, public policy assignments and identification of board members.

## Education policy (Dimension 7)

### Introduction

Table 24.12 shows North Macedonia's scores for the four education policy sub-dimensions and the cross-cutting dimension on system governance, and compares them to the WB6 average. North Macedonia has the highest score (along with Albania) of the WB6 economies for the tertiary education sub-dimension, driven by its slightly above-average ratings for each indicator. Likewise it scores highest (along with Kosovo) for the system governance cross-cutting dimension. However, it scores below the WB6 average for the early childhood and school education sub-dimension – explained by its comparatively low score for the prevention of early school leaving indicator.

**Table 24.12. North Macedonia's scores for education policy**

Dimension	Sub-dimension	Score	WB6 average
Education policy dimension	Sub-dimension 7.1: Early childhood and school education	2.3	3.0
	Sub-dimension 7.2: Teachers	2.5	2.7
	Sub-dimension 7.3: Vocational education and training	3.5	3.1
	Sub-dimension 7.4: Tertiary education	3.0	2.8
	Cross-cutting sub-dimension: System governance	4.0	3.3
North Macedonia's overall score		<b>2.9</b>	<b>3.0</b>

### State of play and key developments

North Macedonia has made significant improvements to its education system policies. Recent reforms included several policies and practices that align with European and OECD countries. For example, the new school and the vocational education and training (VET) curricula focus on developing competencies to prepare students for success in the labour market. There are also plans to introduce a compulsory year of pre-primary education and a new national assessment to monitor student learning outcomes. Similar to other economies in the region, participation in primary education is now on a par with EU and OECD levels and student learning outcomes, as measured by PISA, have seen significant progress. Notably, North Macedonia's share of low performers in each subject measured by PISA fell by at least 9 percentage points between 2015 and 2018 (OECD, 2020<sub>[100]</sub>). However, educational disparities persist, linked to ethnic group and gender (OECD, 2019<sub>[70]</sub>). Maintaining progress in the aftermath of the COVID-19 pandemic and implementing newly introduced policies will be crucial to achieving education and development goals.

Like many countries around the world, North Macedonia closed its schools on 10 March 2020 to help slow the spread of COVID-19. Working with donor agencies, the education ministry launched a rapid shift to remote learning with a range of online and broadcast instructional programmes and activities to support the continuation of teaching and learning. Following the parliamentary elections in the summer of 2020, the new administration introduced a unified National Distance Learning Platform. While the youngest students (up to Grade 3) were able to attend in-person classes starting in September 2020, older students received instruction through this online platform. The shift to remote learning in North Macedonia was not without challenges. As in many other economies, teachers reported feeling stressed and unprepared for working in a new online environment and the lack of computers and technical infrastructure appears to have been a problem in some areas. The National Distance Learning Platform also experienced a major crash a few days before the start of the new school year. North Macedonia will need to redouble its efforts to address challenges related to educational quality and equity that are being exacerbated by the COVID-19 pandemic if the system is to continue advancing towards its national education goals (Kajosevic and Marusic, 2020<sub>[101]</sub>; Hawke, 2020<sub>[102]</sub>; Apostolov, 2020<sub>[103]</sub>).

### Sub-dimension 7.1: Early childhood and school education

North Macedonia's score in this sub-dimension is below the WB6 average. Since the last assessment, North Macedonia has taken steps to expand pre-primary coverage, develop a new national assessment of student learning and sustain progress towards reducing the share of early school leavers. As of 2018, net enrolment in North Macedonia was nearly universal (98%) for primary education, and stood at 88.5% for lower secondary education and 71% for upper secondary education (UIS, 2020<sub>[104]</sub>). Gross enrolment at the upper secondary level in North Macedonia is lower than the averages for the WB6 region (84.7%), OECD (121.2%) and EU (121.9%) for the same year (UIS, 2020<sub>[104]</sub>).<sup>54</sup>

North Macedonia's mean PISA scores are slightly below the WB6 average, except in science. Scores for reading, mathematics and science are much lower than the European Union and OECD averages (Figure 24.13).

**Figure 24.13. Performance in reading, mathematics and science in Western Balkan education systems (2018)**

PISA 2018 mean scores

Source: (OECD, 2020<sub>[100]</sub>), *PISA 2018 Database*, Tables I.B1.4, I.B1.5 and I.B1.6, [www.oecd.org/pisa/data/](http://www.oecd.org/pisa/data/).

StatLink  <https://doi.org/10.1787/888934256140>

North Macedonia has a large share of students who do not demonstrate baseline levels of proficiency in reading (55%) and mathematics (61%); significantly higher than the OECD averages of around 23% in reading and 22% in mathematics (OECD, 2020<sub>[100]</sub>). These findings have implications for North Macedonia's long-term economic development, as students without basic skills are less likely to attain better-paying and more rewarding jobs. One positive trend is that the percentage of low performers in each subject shrank by at least 9 percentage points between 2015 and 2018 (OECD, 2020<sub>[100]</sub>). Nevertheless, there is evidence that disparities in educational opportunities and outcomes persist among children from socio-economically disadvantaged backgrounds, those living in rural areas and those from ethnic minorities (OECD, 2019<sub>[70]</sub>).

North Macedonia's performance on **early childhood education** is below the regional average. Pre-primary education is neither compulsory nor free and, as of 2018, gross enrolment in pre-primary education stood at 42%. This is lower than the averages for the WB6 (53%), the OECD (81%) and EU (98%) (UIS, 2020<sub>[104]</sub>). Children in rural areas and marginalised communities, especially Roma communities, are less likely to participate in pre-primary education (World Bank, 2015<sub>[105]</sub>). North Macedonia has set a goal to expand coverage and gradually reach EU levels of participation.

North Macedonia has many of the elements of a strong early childhood education (ECE) sector, including professional requirements for staff and standards for service delivery and infrastructure (World Bank, 2015<sub>[105]</sub>). In the last two years, it amended its Law for Child Protection, increasing the salaries of childcare professionals (Eurydice, 2021<sub>[106]</sub>). There have also been major financial investments (mostly from donor agencies) to help expand and improve ECE facilities. While the Comprehensive Education Strategy 2018-25 sets out activities to improve the quality and equity of ECE, it does not connect the goals and curricula in ECE with those of primary education. Moreover, the accompanying action plan lacks a clear budget – a notable concern since public spending on ECE is low in North Macedonia (Eurydice, 2021<sub>[106]</sub>).

The **instructional system**<sup>55</sup> scores below the regional average for this indicator. The Comprehensive Education Strategy 2018-25 and its action plan set out objectives and activities for improving educational quality and inclusion but they do not define clear budgets or monitoring processes (OECD, 2019<sub>[70]</sub>). Without more sustainable planning, North Macedonia may continue to rely on donor agencies to support education reforms and struggle to improve learning outcomes. Implementing North Macedonia's competency-based curriculum has been a challenge as there are several inconsistencies in learning expectations across grades and subjects (OECD, 2019<sub>[70]</sub>).<sup>56</sup>

A notable strength of the instructional system is the National Examinations Centre, which manages North Macedonia's participation in international assessments such as PISA and the Trends in International Mathematics and Science Study (TIMSS). However, participation in these assessments has been intermittent, limiting the amount of comparable data on student learning. The Examinations Centre is also responsible for national examinations. Unlike other systems in the region, there is only one central exam in North Macedonia, the State Matura. This exam is highly regarded and used to certify the completion of upper secondary school and select students for tertiary education. North Macedonia is also developing a new national assessment, with support from the World Bank,<sup>57</sup> which will provide a better understanding of student learning against national learning standards and allow for more timely comparative data to support system monitoring.

To ensure the quality of its instruction, North Macedonia has a set of School Performance Quality Indicators that cover factors such as teaching and learning practices, the school environment, and school planning and management. These indicators also serve as the main reference for school self-evaluation<sup>58</sup> and external evaluation. Similar to many European systems, North Macedonia has a central State Educational Inspectorate, which is responsible for conducting external evaluations of schools on a three-yearly basis and publishing reports on line. However, the inspectorate's evaluations are mainly based on desk reviews rather than a more comprehensive evaluation of instructional quality and, while their reports provide recommendations for improvement, there are no mechanisms to allocate additional support to help schools act upon these recommendations (OECD, 2019<sub>[70]</sub>). Nevertheless, North Macedonia's 2019 Law on Primary Education introduces some measures that stand to improve the instructional system. In particular, it sets out a broader range of responsibilities for school principals, expanding their traditionally administrative function to include tasks related to instruction.<sup>59</sup>

The **early school leaving** rate in North Macedonia has gradually declined over the last decade, largely because secondary education became compulsory in 2008 (MoES, 2017<sub>[107]</sub>). The share of early school leavers was 5.7% in 2020, well below the EU target of less than 10% of early school leavers by 2020 (Eurostat, 2021<sub>[108]</sub>).<sup>60</sup> While there is no specific strategy to combat early school leaving, several policy documents – for example, related to lifelong learning, Roma inclusion and poverty alleviation – include measures relevant to addressing this issue (Eurydice, 2021<sub>[106]</sub>). The Ministry of Education and Science (MES) also introduced the Inclusion of Out-of-School Children project in 2017 to help identify, enrol and retain students in compulsory education. While such efforts can help reduce early school leaving, they appear to lack sufficient budget and are largely supported by donor agencies. Moreover, North Macedonia has not evaluated its policies to prevent early school leaving in the past three years. This may be related to the fact that there are no proxy indicators for students' socio-economic background and student absenteeism is not tracked. As a result, the data to monitor early school leaving and the factors that

contribute to this situation are limited. Such information will be crucial if the government wishes to improve policies that target groups of learners at risk of early school leaving.

### *Sub-dimension 7.2: Teachers*

North Macedonia's score in this sub-dimension is roughly on a par with the WB6 average. A new Law on Teachers and Professional Associates (2019) has introduced several measures to promote the professional development and management of teachers. There are also regulations on the initial education and selection of teacher candidates; however, implementation of these policies remains a challenge. All primary and secondary school teachers in North Macedonia are required to have a bachelor's degree (level 6 in the International Standard Classification of Education; ISCED), a requirement that has been enforced, according to national data received for this assessment.<sup>61</sup> In the last decade, North Macedonia has taken steps to increase the competitiveness of the teaching profession by improving working conditions, allowing greater professional autonomy and raising salaries. In fact, teachers' salaries increased by more than 20% between 2018 and 2019, according to national data received for this assessment. While average gross salaries are lower than other European countries, they compare favourably relative to GDP (EC/EACEA/Eurydice, 2019<sub>[109]</sub>).

Before teachers can start working in schools, they must graduate from an **initial teacher education (ITE)** programme, complete a practicum and pass a state examination to receive their teaching licence. North Macedonia also offers alternative pathways into teaching for mid-career individuals with experience gained outside of education. However, these candidates must still participate in pedagogical-psychological and methodological preparation.<sup>62</sup> In 2015, North Macedonia adopted a law<sup>63</sup> to regulate higher education institutions that offer ITE programmes. While this set minimum entry thresholds<sup>64</sup> for ITE, its policies have not been implemented because of a lack of human and financial resources. Moreover, placement quotas (a common feature of all tertiary programmes in North Macedonia) are very large for ITE, meaning nearly everyone who applies for a place is accepted (OECD, 2019<sub>[70]</sub>). This lack of competitiveness contributes to a general oversupply of teachers, although some subjects, such as mathematics and physics still experience shortages.<sup>65</sup> Another challenge facing North Macedonia's ITE system is the lack of a programme-specific accreditation process, meaning that providers do not have to demonstrate how they help candidates develop competencies specific to teaching.

North Macedonia introduced a new Law on Teachers<sup>66</sup> in 2019 linking teachers' **professional development and career management**. The law creates three categories of teachers (teacher, mentor, and advisor) aligned with years of work experience and specific professional standards for each level. To advance to higher categories, teachers must undergo an external appraisal and demonstrate they fulfil the corresponding professional standard. Similar practices are found in several OECD countries (OECD, 2013<sub>[110]</sub>). While this law – and the rulebooks that support it – represents a significant policy achievement for North Macedonia (considering previous efforts to implement such policies had stalled), the measures are largely based on technical and financial input from donor agencies (OECD, 2019<sub>[70]</sub>).

Teachers' professional development needs are determined through self-assessment surveys and appraisals conducted by schools and external experts. While there is some variety in the type of activities and programmes offered, there are no online courses or seminars, nor peer- or self-observation and coaching. Teachers are required to complete at least 60 hours of professional development over 3 years.<sup>67</sup> The Bureau for Development of Education accredits and subsidises teachers' professional development; but there is some evidence that programmes not identified as government priority areas are not covered in practice (OECD, 2019<sub>[70]</sub>). The cost of training partially helps explain low levels of participation in teacher professional development in North Macedonia. For example, only 21% of teachers had participated in professional development in the three months leading up to PISA 2018, a much lower share than the WB6 (39%), OECD (53%) and EU (51%) averages (OECD, 2020<sub>[100]</sub>).

### *Sub-dimension 7.3: Vocational education and training*

North Macedonia's score in the sub-dimension on vocational education and training (VET) is on par with the WB6 average. The VET sector has undergone several changes in the past two years, including the introduction of a new modular curriculum and the implementation of policies to promote work-based learning. Professionally oriented education starts at the upper secondary level, when students are allocated into either general (gymnasium) or vocational programmes.<sup>68</sup> Around 60% of upper secondary students in North Macedonia were enrolled in VET programmes as of 2018, which is similar to the Western Balkans average (60.5%) but higher than EU (49%) and OECD averages (42%) (UIS, 2020<sub>[104]</sub>). Unlike many other systems in the region, North Macedonia does not use examination results to select students into education tracks. Instead, teachers guide students into different programmes based on their marks in the classroom.<sup>69</sup> As these assessments may be subject to teachers' bias, there is a risk that students' background, rather than capability, influences which track they go into. Data from PISA found that students enrolled in vocational programmes in North Macedonia scored on average 48 points lower than students in general programmes, after accounting for gender and socio-economic status,<sup>70</sup> a considerably larger difference than the average across the EU (45 score points), the OECD (40 score points) and the WB6 economies (36 score points) (OECD, 2020<sub>[100]</sub>).

A series of laws<sup>71</sup> regulate the **governance of VET** in North Macedonia and government strategies<sup>72</sup> guide policies to help increase the attractiveness, quality and relevance of VET programmes. Responsibilities for VET are shared by several bodies, including the MES and the Ministry of Labour and Social Policy. Other agencies are also involved in the design and implementation of VET programmes. For example, the Center for Adult Education is responsible for adult VET, while the Center for Vocational Education and Training is responsible for developing VET schools' professional curriculum and the Bureau for Development of Education for developing their general subject curriculum. North Macedonia engages social partners in VET governance through policy consultations, where they can propose reforms. Employers can also participate in commissions to evaluate final VET examinations and offer placements for work-based learning, which helps ensure that VET students have developed relevant skills for the labour market.

In 2019, North Macedonia achieved a key objective of its Education Strategy for 2018-25 by legally establishing three regional VET centres in different parts of the country. These centres aim to serve as innovation hubs and optimise the VET school network by actively engaging the business community in **work-based learning** (WBL). They offer a variety of programmes and training to prepare people for the labour market (ETF, 2019<sub>[111]</sub>). The regional centres are being funded by the EU Sector Reform Performance Contract and were expected to become fully operational and accredited by the end of 2020. North Macedonia has partnered with other donor agencies in recent years to further develop the foundations of WBL through a dual education programme that allows students to gain qualifications by attending classes and participating in on-the-job training.

Prospective VET students can learn about study programmes and WBL opportunities through public awareness campaigns, presentations to social partners and an online portal listing opportunities. The MES also published a guide to VET qualifications to help guide students into different VET pathways at the upper secondary level. Despite these positive developments, closer monitoring of VET and WBL is needed to address the mismatch between the supply and demand of school places (EC, 2020<sub>[46]</sub>). While North Macedonia reports that it collects data on the completion, employment and earning rates of VET graduates, there is no information on the number of students who are hired after completing a WBL opportunity. There is also a lack of information on the location, type and skills gained through WBL nor demographic data to better understand which students participate in these programmes and opportunities. This information may be collected by individual institutions and providers but is not centralised. North Macedonia plans to use its new regional VET centres to collect and analyse this type of information to strengthen policy development in the sector.

### *Sub-dimension 7.4: Tertiary education*

North Macedonia's score in the tertiary education sub-dimension is slightly above the WB6 average, largely because of reforms in the last two years that introduced new agencies and policy frameworks to improve the quality, equity and labour market relevance of the sector. In the last decade, the number of years a student in North Macedonia might expect to stay in education has increased. In 2018 it was around 13.5 years; slightly lower than the WB6 average (14.8 years) and well below the EU (16.6 years) and OECD (17 years) averages (UIS, 2020<sub>[104]</sub>). Gross enrolment in tertiary education has also been rising and was around 43% in 2018. However, this remains lower than the regional average (52%), and the EU (70%) and OECD (76%) averages (UIS, 2020<sub>[104]</sub>).<sup>73</sup> While national data received for this assessment show that the share of adults who have attained some form of tertiary education has slightly increased in the last two years, some studies have found that completion of higher education remains low (EC, 2020<sub>[46]</sub>).

The Education Strategy and Action Plan 2018-25 set out key goals for the higher education sector, namely to improve the content of programmes, align the system with European good practice and increase the employability of graduates. Since 2018, the government has been working to develop by-laws and implement its new Act on Higher Education. The new law introduced major changes to the higher education system, including greater institutional autonomy for universities; more democratic, transparent and equitable process and governance arrangements; and stronger quality assurance measures (Eurydice, 2021<sub>[106]</sub>).

The majority of higher education students (87%) in North Macedonia attend public institutions (Eurydice, 2021<sub>[106]</sub>). There are transparent selection processes<sup>74</sup> and several types of scholarships to help support more **equitable access to higher education**. Annual scholarships are available to students who apply and meet the relevant criteria based on merit and/or financial need. Students with disabilities and orphans can also benefit from free tuition to pursue higher education. North Macedonia also introduced a subsidised meal plan in February 2020 to ensure that students participating in higher education programmes have access to healthy meals (Eurydice, 2021<sub>[106]</sub>). While it is unclear how this policy has been affected by the COVID-19 pandemic, such initiatives have the potential to support students in completing their study programmes.

While North Macedonia collects some disaggregated data that can help monitor equity in the tertiary sector, such as enrolment by age, gender and ethnic background, there are no centralised data on socio-economic or immigrant background. Nor are there any regular evaluations or studies to identify associations between students' characteristics and participation to help address barriers they face. North Macedonia draws on a range of sources, such as employer surveys, surveys of workers or graduates, quantitative forecasting models and data on employment rates by field of study to assess the quality of its higher education and its relevance to the labour market. The data are available on the State Statistical Office and State Employment Agency websites. The Ministry of Education and Science has received technical assistance from the World Bank to develop a new education management information system that will collect and store essential information about accredited higher education institutions (Eurydice, 2021<sub>[106]</sub>).

North Macedonia also has a number of policies and programmes to promote the internationalisation of students and staff but it is its reforms to its quality assurance mechanisms that have contributed its improved score for the **labour market relevance of higher education**. In the last two years, agencies with responsibilities for quality assurance were merged to create a new and independent Higher Education Accreditation and Evaluation Board. This aim of this change was to align North Macedonia's accreditation and quality assurance policies with the standards and guidelines of the European Higher Education Area. Higher education institutions are also now required to have a Board of Trustees to engage the public in helping plan, design and deliver relevant and high-quality study programmes. These types of education policies, combined with broader employment policies, like the Youth Guarantee Scheme,<sup>75</sup> have contributed to North Macedonia's steady decrease in unemployment rates and the share of youth who are neither employed nor in education or training (NEET) – see Employment policy (Dimension 8).

### *Cross-cutting sub-dimension: System governance*

North Macedonia's score for this cross-cutting sub-dimension is slightly above the WB6 average, as several system governance features are either being developed or already align with the policies and practices found in European and OECD education systems. For example, it has an established national education strategy that has been monitored and evaluated both by the government and through independent analysis. The new Law on Primary Education (2019) stipulates that every four years, the ministry is to prepare a comprehensive and public report on the state of education with recommendations to improve quality. North Macedonia also has a qualifications framework that regulates the acquisition and use of qualifications and is fully aligned with the European Qualifications Framework. As a result, the Macedonian Qualifications Framework (MQF) serves as a tool to provide visibility on qualifications and their acquisition and quality.

The Education Strategy and Action Plan (2018-25) set out important actions for improving the education system. For example, there are goals to expand coverage for preschool education, make school curricula more relevant to labour market demands and strengthen the competency of teaching staff at all levels of the system. These high-level strategic documents were developed in consultation with a range of stakeholders and contain clear timelines and allocations of responsibilities. However, the strategy does not include targets to raise learning outcomes, which is notable considering North Macedonia's performance in international assessments (OECD, 2019<sub>[70]</sub>).

While there is information about the education system's inputs, outputs and outcomes, comparative data on student learning outcomes have mainly been collected through intermittent participation in international assessments. For example, North Macedonia participated in the first round of PISA in 2000 but did not participate again until 2015. It did maintain participation in the latest round of PISA (2018), which is a positive development since regular participation provides important trend data on the performance of the education system. Another positive development for system governance is the government's plan to develop a new national assessment, which will provide valuable information to help monitor national education goals. An area for improvement in this indicator involves the management of education data. North Macedonia has had an operational education management information system (EMIS) since 2010; however, education data remain fragmented as various ministries and agencies continue to collect their own information (OECD, 2019<sub>[70]</sub>).

### ***The way forward for education policy***

In today's increasingly global and fast-changing world, achieving inclusive and quality education in North Macedonia can help increase regional competitiveness and create opportunities for more individuals to develop the competences needed for sustainable development and social cohesion. Officials have already made impressive progress in developing education reforms in recent years; however, the challenge for the future will be to operationalise and implement these policies. This task will be especially challenging in the aftermath of the COVID-19 pandemic. The new coalition government will need to reflect on the economy's political, social and fiscal environment to determine how best continue advancing its education goals. While the OECD review on evaluation and assessment in North Macedonia's education system (OECD, 2019<sub>[70]</sub>) provides detailed recommendations on how to strengthen the equity and quality of the education sector, the following considerations in particular can provide insights for discussions on the way forward for enhancing education:

- **Strengthen the collection and management of education data.** North Macedonia should consider ways to modernise the collection and management of education data by establishing the EMIS as a central source of information about the education system. This will entail linking databases that are managed by various institutions and co-ordinating data collection to avoid creating administrative burdens. The government should also consider developing user-friendly

portals to increase the functionality of the EMIS. The Florida Department of Education's online EMIS portal provides an example of this type of platform (Box 24.10).

- **Finalise the development of the national assessment and set national targets for improving student learning outcomes.** North Macedonia should move forward with plans to develop and administer a national standardised assessment, which would provide valuable information to monitor student performance at key stages of their education. Careful attention should be paid to the dissemination and use of the results to enhance their formative value. North Macedonia should also establish national targets based on results from the international or national assessments to help everyone across the system focus on the need to improve learning outcomes.
- **Establish clear budgets to support the implementation of policy reforms.** North Macedonia benefits from the technical and financial support of donor agencies, which has led to significant achievements but risks undermining the sustainability of reforms. The government should establish clear budgets to better understand resourcing needs and ensure there is enough funding for the education agencies to implement their planned activities. This might reveal that the Bureau for Development of Education requires additional resources in order to sufficiently subsidise mandatory teacher professional development programmes.

#### Box 24.10. Florida's Education Information Portal, a data access portal from the United States

In Florida, in the United States, the PK-20 Education Information Portal provides access to public schools from kindergarten through to grade 12, public colleges and universities, a statewide vocational and training programme, and career and adult education. Through an online interface, any individual can view data aggregated by school, district and state. Comparisons can be made across different schools and districts.

The Florida's PK-20 Education Information Portal is powerful in that it allows data to be organised not only by governance level, but also subject matter. Florida's state assessments test students in English, mathematics and science, with further delineation of different mathematics and science domains. Users of the portal can choose to view all data according to a single domain (instead of by a single school) and make further contextualised comparisons according to the domain. This saves users from having to navigate to through different schools or districts in order to find the same indicator for each.

Along with providing access to data, the portal provides simple tools for users to perform their own analysis. For example, they can format the data into tables they define themselves or the standard tables provided. They can also generate custom reports that contain several tables according to their specifications. The portal also has a strong data visualisation component which allows different types of graphs and charts to be created from the data. District-level analysis can be plotted as maps that display indicators geographically.

## Employment policy (Dimension 8)

### Introduction

Since the last Competitiveness Outlook assessment in 2018, North Macedonia has made progress in aligning its employment regulatory framework with the EU *acquis*, although actual implementation has been limited. No progress has been made in reducing informal employment. A framework for co-operation between social and employment services has been made at the local level to deliver comprehensive and integrated services, but institutional capacity will need to be further strengthened. There has been significant progress in reducing youth unemployment, but it remains very high – above the regional average and well above the average for the EU. Problems with school-to-work transitions persist and no progress has been made in reducing the NEET rate. Some progress has been made to analyse the gender gap, and gender mechanisms in institutional settings have been introduced at the local level. Nevertheless, barriers to women’s employment remain, related to difficulties in reconciling work and family lives.

Table 24.13 shows North Macedonia’s scores for the four employment policy sub-dimensions, and compares them to the WB6 average. North Macedonia has the highest scores in the region for all sub-dimensions, except for skills, where it is second to Montenegro. As a result, North Macedonia has the highest employment dimension score of the WB6 economies. It also recorded the biggest improvement in its score, with an increase of 1 point compared to 2018.

**Table 24.13. North Macedonia’s scores for employment policy**

Dimension	Sub-dimension	Score	WB6 average
Employment policy dimension	Sub-dimension 8.1: Labour market governance	3.3	2.6
	Sub-dimension 8.2: Skills	2.8	2.2
	Sub-dimension 8.3: Job quality	3.5	2.4
	Sub-dimension 8.4: Activation policies	3.5	2.9
North Macedonia’s overall score		<b>3.3</b>	<b>2.6</b>

### State of play and key developments

**Table 24.14. Key labour market indicators for North Macedonia (2015 and 2019)**

	North Macedonia		WB6 average	EU average
	2015	2019	2019	2019
Activity rate (15-64)	64.9%	66.3%	61.0%	74.1%
Employment rate (15-64)	47.8%	54.7%	51.5%	69.3%
Unemployment rate (15-64)	26.3%	17.4%	16.3%	6.4%

Note: WB6 average rates are based on author’s own calculations using simple averages.

Source: (Eurostat, n.d.<sub>[113]</sub>), *Labour Force Survey data base*, <https://ec.europa.eu/eurostat/web/main/data/database>.

As Table 24.14 shows, the activity rate of the working-age population (15-64 year-olds) increased from 64.9% in 2015 to 66.3% in 2019, above the WB6 average,<sup>76</sup> but still largely below the EU average and the 71.2% average for other EU transition countries in the region (Bulgaria, Croatia, Hungary, Romania and Slovenia).<sup>77</sup> Over the same period the number of working-age people in employment increased steadily, rising by 13%. Between 2015 and 2019 the employment rate among 15-64 year-olds increased by 6.9 percentage points, amounting to 54.7% in 2019, similar to the WB6 average, but 14.6 percentage points below the EU average (Eurostat, 2020<sub>[114]</sub>). The increase was particularly marked for young adults (25-34 year-olds), who saw an increase of nearly 12 percentage points.<sup>78</sup> There was a strong decrease of 8.9 percentage points in the unemployment rate among 15-64 year-olds, falling to 17.4% in 2019, although it is still 1.1 percentage point higher than the average for WB6 economies and 11 percentage points higher than the EU average (Eurostat, n.d.<sub>[115]</sub>). Unemployment has since risen again in 2020 because of the COVID-19

pandemic although financial support to keep workers in employment has helped to contain its impact on the labour market so far.

Labour Force Survey (LFS) data indicate that the COVID-19 pandemic has had a negative impact on employment: the number of people in employment fell by 2.8% between the first and second quarter of 2020 and by 1% between the second and third quarter. Compared to the second quarter of the previous year, employment fell by 0.4%, showing employment growth has stalled (in comparison, between the second quarters of 2018 and 2019, employment grew by 5.6%). The unemployment rate in the third quarter of 2020 was 16.5% (compared to 16.7% in the second quarter of 2019) slightly higher than in the first quarter (16.2%), but still below the level one year earlier (17.5%). As of 30 September 2020, there were 151 359 active job seekers registered with the Employment Service Agency of the Republic of North Macedonia (ESARNM), the public employment service (PES). The increase in unemployment after 11 March 2020 amounted to 14 819 people. LFS data show that the inactivity rate increased by 1.4 percentage points between the third quarters of 2019 and 2020, indicating that some people are leaving the labour market, rather than becoming or remaining unemployed.

A short-term work scheme has been set up with the support of the World Bank to cope with the labour market impact of the pandemic. Initially, the scheme was designed to provide salary subsidies to adversely affected firms for three months (April, May and June). The scheme included the conversion of the subsidy from a reimbursable grant into a non-reimbursable one to allow companies to invest in improvements that could help them recover from the crisis, and the publication of a list of all recipients and follow-up actions to help ensure companies used the subsidies to pay salaries. This support was limited to viable small and medium-sized enterprises, and covered 50% of social contributions from employees for viable firms in tourism and transport – two of the hardest hit sectors during the pandemic.

Approximately 20 000 companies (one-third of all active companies in North Macedonia) benefitted from this wage subsidy scheme, helping over 120 000 employees (one-third of all private sector employees). According to studies conducted by local NGOs, thanks to this measure the private sector only had to release 3% of their employees during this first period. According to a simulation by the World Bank, without the subsidy, more than 130 000 Macedonians would have fallen into poverty if the pandemic lasted two quarters (World Bank, 2020<sub>[116]</sub>). In November 2020, the job preservation scheme was still active. Similar short-term work schemes have been widely used in the EU to contain unemployment.

The ESARNM had mainly been offering face-to-face services, but has speeded up the delivery of digital services. In most EU countries face-to-face services were suspended during the first lockdown and resumed thereafter.

In September 2020 the operational plan for active labour market programmes (ALMPs) was revised to include people who had lost their job due to the COVID-19 crisis as one of the target groups (additional grants for self-employment, employment and growth of legal entities for employment of people who lost their jobs due to COVID-19) (Duell, 2020<sub>[117]</sub>; Duell, 2020<sub>[118]</sub>). Further initiatives have included sick pay and general measures such as reducing taxes and postponing loan repayment obligation by banks.

### *Sub-dimension 8.1: Labour market governance*

Over the past decade, North Macedonia has improved its regulatory framework for occupational health and safety, the protection of vulnerable groups in the context of collective dismissals, and in the area of social dialogue. In 2018, the Law on Private Employment Agencies was adopted, which is in line with the International Labour Organization's (ILO) Private Employment Agencies Convention. In June 2018, amendments to the Law on Labour Relations created additional criteria to be taken into account when terminating employment for business reasons, such as employees' vocational training and qualifications, work experience, performance, the type and importance of their position, length of service, and other criteria determined by a collective agreement. These amendments also included protection for people with

disabilities, single parents and parents of special needs children who have their employment terminated for business reasons. If an employee is terminated for business reasons, the employer cannot employ another similarly qualified person for the same position for a period of two years. If the need to fill that position arises before the two-year period ends, the previously terminated person is given priority. These changes give companies the flexibility to adapt their workforce to the market situation, while protecting against unfair dismissal and increasing the chances of re-employment. In this respect it resembles the temporary lay-off schemes in place in some Northern European countries. This scheme has been extended several times and is donor supported. Take-up of the benefits and re-employment should be closely monitored in order to assess the effectiveness of the measure.

The protection of employees whose employer becomes insolvent is not yet aligned with EU directives, and the government plans to start revising the relevant legislation. It proposes protecting 100% of employees' salaries in the public and private sector, instead of at the level of the minimum wage, as is the current rule. Another proposed measure is for the government and companies to cover salaries in case of illness.

A new Law on Labour Relations is currently being drafted with more focus on flexible working arrangements which are intended to be acceptable to both employers and employees. Implementation of this law will be important for promoting employment among women. Drafting of a new Law on Labour Relations is also ongoing, where more attention will be paid to improving the regulation of non-standard forms of employment. The self-employed, employed with temporary work contracts, platform workers, etc. are fully included in the social protection system, i.e. they contribute to the health, pension and unemployment insurance. Employment protection legislation and regulations for working time and working conditions also apply to non-standard workers, although it is not clear whether this is sufficiently enforced.<sup>79</sup>

Progress has been made in the area of occupational health and safety (OHS), although the implementation of the 2017-20 Occupational Health and Safety Strategy was still incomplete in 2019 (EC, 2019<sub>[63]</sub>). The current Strategy on Safety and Health at Work 2020, building on previous strategies, sets out 10 main national priorities for action. These are:

1. Creating an open and efficient legal framework and strengthening the national policy for health and safety at work.
2. Promoting and developing administrative capacities and human resources in the field of OHS.
3. Developing training and education programmes in the field of OHS.
4. Strengthening the role of the OHS Council<sup>80</sup>.
5. Developing the system and services of occupational medicine within the national health system.
6. Setting priorities for research and development on new and emerging or increased risks.
7. Promoting a culture of prevention and promotion of workers' health.
8. Improving monitoring and detection of occupational diseases and prevention and reduction of the number of occupational injuries.
9. Strengthening information systems in the field of health and safety at work.
10. Strengthening international co-operation.

In the first half of 2020, on the initiative of the National Council for OHS and in co-ordination with the Ministry of Labour and Social Policy, a comprehensive report (Ministry of Labour and Social Policy, 2020<sub>[119]</sub>) was prepared on the implemented activities, in accordance with the priorities of the strategy and 2020 action plan. This 60-page report detailed the activities and measures that have been implemented in the past (primarily during 2017-19) as part of the implementation of the strategy and action plan and the achievement of the goals and priorities set. The report was reviewed and adopted by the OHS Council in August 2020. The report highlighted the successful implementation of a number of activities in the 2020 action plan by various OHS stakeholders in all of the priority areas within the strategy.

There are few indicators on working conditions available. One is work on weekends. In 2019, 43.7% of workers in North Macedonia worked on Saturdays, higher than the EU average of 26.3% (Eurostat, n.d.<sup>[115]</sup>). In 2015, 29% of workers were exposed to vibration from tools and machinery, which is high compared to EU member states; only Romania had a higher rate according to the European Survey on Working Conditions (Eurofound, n.d.<sup>[120]</sup>). North Macedonia has relatively poor working conditions in terms of exposure to high or low temperatures, working in tiring or painful positions, and working at high speed and under time pressure, but is in the middle of the range of EU countries with regard to other indicators such as exposure to breathing in smokes, fumes, powder or dust and exposure to breathing in vapours (Eurofound, n.d.<sup>[120]</sup>).

The key pillars of North Macedonia's **employment policy framework** are the National Employment Strategy 2016-20, the Strategy for Formalization of the Informal Economy 2018-22, and the Action Plan for Youth Employment 2016-20. The implementation of the employment strategy is regularly monitored and the large majority of planned activities have been implemented. However, monitoring reports are not publicly available, the monitoring of outputs and outcomes is still weak, and impact evaluations are rarely carried out. The reports are shared with participants from all relevant stakeholders including social partners and NGOs. To overcome current weaknesses in monitoring, the Action Plan for Employment 2018-20, which is the action plan corresponding to the National Employment Strategy, has recently included aims to develop performance monitoring indicators for the employment policies. It remains to be seen whether this will eventually help to improve ongoing assessments of policies.

The National Employment Strategy included the objective of increasing the employment rate to 46.9% and reducing the unemployment rate to 21.5% by 2020 (Government of North Macedonia, 2019<sup>[121]</sup>); these objectives were already exceeded by 2019. Despite these improvements, the high unemployment rate in general, and the high youth unemployment rate in particular (35.6% of 15-24 year-olds in 2019, which is above the WB6 average of 33.1% and the EU average of 14.4%<sup>81</sup>) represent a major challenge. The EU's main recommendations to implement the poverty alleviation policy, the Roma inclusion strategy, and relevant action plans had not been implemented in 2018/19 (EC, 2019<sup>[63]</sup>).

The **labour inspectorate** oversees the application of laws and collective agreements and employment contracts. Activities are carried out according to monthly, quarterly and annual work plans. The annual programme is based on the inspectorate's risk assessment. The number of labour inspectors increased from 102 in 2015 to 118 in 2016, but then fell to 115 in 2019. This represents a ratio of 6 900 employees per inspector (a higher ratio than for example in Montenegro, where the ratio is 5 800 to one). The number of inspectors is low considering the huge challenges faced, such as the level of informal employment, and in view of plans to foster preventive activities in the area of OHS. The structure of the economy, with a large share of smaller enterprises, adds to the difficulty of covering a significant share of companies and targeting actions on those most likely to be in breach.

A lack of transparency and inter-agency co-operation is another factor limiting the effectiveness of inspectorates. The Inspection Council concludes memoranda of co-operation and data exchange with other bodies for the needs of the inspection services.<sup>82</sup> Experience from other economies shows that electronic connection and data sharing between authorities are crucial for effective labour inspections. A new Law on Inspection Supervision, enacted early in 2019, created a new legal basis for risk-based inspections and introduced good practices such as warnings and grace periods for infractions, and the use of checklists and risk criteria to increase transparency (World Bank, 2020<sup>[122]</sup>). The drafting of relevant by-laws is still in progress at the time of writing.<sup>83</sup> Improving the effectiveness of the labour inspectorates would also require strengthening the capacity of the inspection service in terms of training, equipment and working conditions.<sup>84</sup>

A **social dialogue** framework is in place. Collective bargaining mainly takes place at sector level every 2-3 years. According to a recent study by the Helsinki Committee of Human Rights, social partners such as trade unions and employer organisations do not have the capacity to implement health and safety

regulations and social protection of workers, and trade union members should be better trained (Najcevska et al., 2019<sub>[123]</sub>). Workers' representation is weak, even in some of the larger companies. The Ministry of Labour and Social Policy's strategic plan for 2020 contains activities for strengthening tripartite and bipartite social dialogue through training on various themes for the social partners.

Sector-level collective agreements are estimated to cover 24-29% of the all North Macedonian employees.<sup>85</sup> In comparison, estimated coverage is around 30% of employees in Serbia, and 25% in Albania (Eurofound, 2019<sub>[124]</sub>), and the EU average is 60% (Ladjevac, 2017<sub>[125]</sub>). While sector-level collective agreements mainly fix wages (and more rarely other working conditions), nationwide general agreements fix working conditions such as working hours, annual leave and social protection.<sup>86</sup> The new Labour Relations Act may task the Economic and Social Councils with the function of extending collective agreements (Guardiancich and Molina, 2019<sub>[126]</sub>), a practice that has been used by a range of EU countries, such as Germany and France.

The national Economic and Social Council (ESC) has a clear mandate and is comprised of 12 members: 4 members of different government bodies (headed by the labour ministry), 4 from employer organisations and 4 from trade unions. The ESC has no rotating presidency and there have been issues with selecting members linked to conflicts of interest (Guardiancich and Molina, 2019<sub>[126]</sub>). No progress has been made since the last assessment to solve these issues. The ESC has six permanent working bodies and various ad hoc working groups covering matters in the economic and social sphere mainly related to labour relations, employment, pension and health insurance, wages (minimum wage, wage growth), the legal framework for defining non-standard employment, self-employment, skills mismatch, occupational health and safety (consultation on these issues is mandatory) and other issues regarding fiscal policy. Working groups meet occasionally, depending on the documents to be reviewed and commented on. Economic and Social Councils are also operating at local levels, with local representatives of social partners and relevant stakeholders, however, not all work properly (Guardiancich and Molina, 2019<sub>[126]</sub>).

In 2019, only one of the six permanent working bodies was functioning (Guardiancich and Molina, 2019<sub>[126]</sub>) and the working groups only held occasional meetings. There are no action plans, strategies or reports on ESC activities. Consultations are mainly made by the Ministry of Labour and Social Policy, and here improvements have been recorded in the recent past. However, other ministries are consulting the ESC much less. Overall, the ESC is relatively effective for those issues that are regularly reviewed, and opinions are being adopted for them (Guardiancich and Molina, 2019<sub>[126]</sub>). The employers have voiced the need to put also the Law on Education under the ESC umbrella (Guardiancich and Molina, 2019<sub>[126]</sub>). A tripartite action plan for the Economic and Social Council for 2020-21 aims to further strengthen social dialogue. Another issue is the lack of financial resources to conduct research on specific topics that would help the ESC make informed statements. The ILO is implementing an EU-financed project over the period 2019-21 to help social dialogue institutions participate in policy making at national and local levels and foster the regular consultations through the national and local ESCs (ILO, 2021<sub>[127]</sub>).

### *Sub-dimension 8.2: Skills*

A **skills mismatch** analysis framework is in place. Supply and demand mismatches in the labour market are assessed based on the Labour Force Survey data<sup>87</sup> and analysis of the vacancy database and the employers skills needs survey of the Employment Service Agency. The results of the skills needs survey are publicly available, which is good practice. The chambers of commerce and social partners also carry out labour market analyses. The Ministry of Labour and Social Policy uses the HERMAK forecasting model to forecast the demand for skills and occupations in the labour market.

Between 2015 and 2019, the unemployment rate fell for workers of all education levels, and in particular among the medium-educated (Eurostat, 2021<sub>[128]</sub>).<sup>88</sup> In 2019, as in previous years, the unemployment rate was higher for low-educated workers (23.4%) than for both the medium-educated (16.6%) and the highly educated (14.3%). Employment growth between 2018 and 2019 was driven by growth of employment for

medium and high education levels (WIIW/World Bank, 2020<sub>[129]</sub>). Those with low education levels are not only more likely to be unemployed, but also at higher risk of being in informal employment.

A skills mismatch analysis found that 22.2% of tertiary-educated workers (15-64 year-olds) were overqualified for their jobs in 2017, as they were working in semi-skilled occupations. This is a reduction since 2015. Men were more likely to be affected than women. The share of workers with an upper secondary education in elementary occupations<sup>89</sup> was 14.3% in 2017, similar to 2015, and affecting more women than men (ETF, 2019<sub>[130]</sub>). Overqualification was more widespread than in Montenegro; comparison with other WB6 economies should be possible in the future (ETF, 2019<sub>[131]</sub>).

The first tracer study<sup>90</sup> of VET and higher education graduates in North Macedonia was conducted in 2014/15 with the support of the European Training Foundation (ETF). It pointed to poor matching of skill levels and jobs early in the careers of young graduates, particularly among those graduating from VET (Mojsoska-Blazevski, 2017<sub>[132]</sub>). In general, a gap in managerial skills has been reported (World Bank, 2020<sub>[122]</sub>). Results also found that about 45% of employed VET graduates had a discrepancy between their skills and field of study and the requirements for their job. Less than half of all employed VET graduates (45%) reported that they were using the knowledge and skills they had acquired during their education in their current job. The government does not run regular tracer studies.

The school-to-work transition has been a major challenge in North Macedonia. As in many EU countries, the youth unemployment rate is in general higher than the total unemployment rate, and the levels reached in North Macedonia have been extremely worrying. Young people very often enter the labour market through temporary contracts (World Bank, 2020<sub>[122]</sub>) and unstable employment conditions are a key feature for low-educated young people.<sup>91</sup> Discussions are underway to shorten the period before a temporary contract is automatically converted into a permanent one from five years to six months (World Bank, 2020<sub>[122]</sub>). This change may have a detrimental effect on young people, as it is not longer than the usual probationary period in many countries and may thus represent an obstacle to employment. Its effect also depends on employment protection levels and how rigid permanent work contracts are. On the other hand, it is certainly crucial to offer young people a long-term perspective for their careers and to avoid underinvesting in increasing their employability. Therefore, it may be advisable to consider a longer period than six months, though shorter than five years. Alternatively, employers could be offered financial incentives to convert fixed-term contracts into permanent ones, as has been done in Portugal, for example (Düll et al., 2018<sub>[133]</sub>).

Several improvements have been made to the education system in recent years to improve skills matching – see Education policy (Dimension 7). The web-based Occupational Outlook has been designed to inform young people about the career prospects of selected occupations and sectors in the medium term (ILO, 2018<sub>[134]</sub>). The number of careers included in the outlook has been increasing by 15 each year (Zanimanja, n.d.<sub>[135]</sub>). Progress on active labour market policy is being made through implementing the Youth Guarantee (Box 24.12).

The dual vocational education project was launched on 27 September 2017 to improve the quality of VET and increase employability among young people, based on the German dual VET system. It opened for first-year students in the 2019/20 school year in all vocational education schools, for all 52 qualifications. It is based on the new reformed modular curricula and the European Credit system for VET (ECVET) credits, based on learning outcomes for both vocational and general education subjects). In the 2018/19 school year, pilot activities began for the introduction of dual vocational education into high schools (Eurydice, 2020<sub>[136]</sub>). This pilot phase will need to be monitored carefully and any implementation problems discussed. These reforms have the potential for improving skills and employability of future graduates if they are carefully implemented.

North Macedonia has a legal framework for **adult learning** (the Law for Adult Education of 2008 and the Law for Open Civic University for Lifelong Learning). Employers have a legal obligation to provide workers with training and education related to their job requirements. There are no current data on the participation

of adults in continuing education. However, the Eurofound Working and Living Conditions Survey in 2016 found that 81% of employees in North Macedonia had not participated in training during the past year, significantly higher than the EU average of 66% (Eurofound, 2019<sup>[137]</sup>). The World Bank found that only about 25% of firms offered on-the-job training, and these are typically the most productive firms (Koettl et al., 2017<sup>[138]</sup>). There is no evidence that the situation has improved since then. Several awareness-raising campaigns on training and education aimed at workers and employers have been conducted as part of donor-funded projects but it would be better to have a sustainable awareness-raising strategy. There are no schemes offering incentives to either employers or workers to invest in continuing training.

A concept paper on non-formal adult education and informal learning was adopted in 2015, but there is no information on any progress towards implementing it in a sustainable way. In 2016, the roadmap for implementing a system for validation of non-formal and informal learning was adopted, representing an important step towards developing an adult learning strategy. In 2017, a guidance note for the validation of non-formal and informal learning processes was adopted and a proposed law is in process, while specifications for the information and methodology package were adopted in 2017. The bulk of this reform project is still in the process of being implemented and is supported by ETF and EU funds.

The Adult Education Centre is tasked with the verification of adult education programmes, monitoring the adult education process and establishing the system of validation of non-formal and informal learning. Since 2010, the centre has been implementing a government programme to provide secondary vocational education for adults who have completed only primary education (European Basic Skills Network, 2021<sup>[139]</sup>). However, the effectiveness of these activities cannot be assessed since there are no data available on how many people have participated in remedial education or in improving their skills. In October 2017, the Adult Education Centre officially launched a newly developed web platform listing certified adult education providers and training programmes (Eurydice, 2020<sup>[136]</sup>). This is likely to increase transparency for potential trainees. The centre also implements training programmes for the registered unemployed according to the annual operational plans for active employment programmes. Fourteen percent of the participants in these programmes have only completed primary education. The number of participants increases every year, but the investment in increasing the skills of low-educated adults is not sufficient to address the huge challenges of unemployment and informal employment.

There is a need for better training offers to match the skills needed by employers, both for initial education, university studies and for continuing education. Outside the ICT and automotive sectors, fewer than 10% of firms communicate regularly with any educational institution (World Bank, 2020<sup>[122]</sup>).

### *Sub-dimension 8.3: Job quality*

When it comes to **quality earnings**, the minimum wage is set by the government in agreement with the Economic and Social Council. The minimum wage was reformed in 2017 and is currently set based on changes in the cost of living, average salaries and GDP. The latest reform included a 19% increase of the minimum wage, which is the same in all sectors (ILO, 2019<sup>[140]</sup>). The minimum wage is moderate and in line with North Macedonia's economic development. In 2018, the minimum wage amounted to 48% of the average gross wage, based on the Jobs Gateway database (WIIW/World Bank, 2020<sup>[129]</sup>). There has been no analysis of the impact of the recent increase in the minimum wage (EC, 2020<sup>[141]</sup>) on informal employment or its effect on gross wages, employment in low productivity sectors or productivity.

There is no policy framework in place to reduce taxes or non-wage labour costs for low-wage earners. The contributions and taxes paid on employees' salaries are the same for all workers. The allowance paid in the case of unemployment and pension levels depend on the salary the worker received. Every formal employee, self-employed worker and platform worker has to contribute to health, pension and unemployment insurance. The unemployed who have previously worked are covered by health insurance, while those who are inactive would be covered by the health insurance of other family members.

In-work poverty fell by 2.1 percentage points between 2012 and 2016, affecting 8.9% of workers aged 18-64 in 2016. It was highest among those with lower secondary education or below (25.5%), part-time workers (24.7%), the self-employed (18.6%) and single employed adults with dependent children (30.8%). Data from the structure of earnings survey (SES) also suggest a significant incidence of low wages, with 25.1% of all employees earning low wages in 2014 (Gerovska-Mitev, 2019<sup>[142]</sup>). Implementation of the minimum wage should be monitored by labour inspectorates and monitoring reports made publicly available. Overall, despite a continuous downward trend in poverty and inequality, 21.8% of the population was still at the risk of poverty rate in 2018 (Government of North Macedonia, 2019<sup>[121]</sup>). According to Eurostat, the “at risk of poverty or social exclusion rate” amounted to 41.1% in North Macedonia in 2017, above the rate of 36.7% in Serbia, 38.9% in Bulgaria and 35.7% in Romania (the two highest rates in EU), and the EU average of 22.4% (Eurostat, 2017<sup>[143]</sup>). An improvement in the in-work-poverty rate is expected to follow the adoption of the proposed new Law on Social Protection and amended Child Protection Law, which was anticipated in early 2019. According to estimates accompanying the reform, it is expected to increase social assistance coverage by 44.2%, while an additional 40 000 families are expected to receive child allowance. Most of those affected are estimated to receive the minimum wage or are on low incomes (Gerovska-Mitev, 2019<sup>[142]</sup>). It will be crucial to analyse the impact of this reform.

When it comes to **policies to promote female employment**, significant progress has been made in analysing gender inequalities. The Ministry of Labour and Social Policy has developed and published a national gender equality index in co-operation with the State Statistical Office (Bashevskaa, 2019<sup>[144]</sup>). North Macedonia is only the second economy in the region, after Serbia, to calculate this index, which follows the methodology developed by the European Institute of Gender Equality (EIGE). The index shows that overall, North Macedonia is below the EU average (in 2015 it ranked 15<sup>th</sup> as compared to EU countries<sup>92</sup>). North Macedonia was well below the EU average for the money dimension (including earnings and access to finance) and time dimension, but the gaps with the EU average were smaller for the work and knowledge dimensions (Bashevskaa, 2019<sup>[144]</sup>).

Since 2015, when the data for the index were gathered, some improvements have been made in employment: between 2015 and 2019 the employment rate among women in North Macedonia increased by 5.9 percentage points to 44.7% (Eurostat, n.d.<sup>[115]</sup>). However, men’s employment rose even faster.<sup>93</sup> In 2019, the employment rate among men was 19.7 percentage points above that of women, having widened since 2015, when the difference was 17.7 percentage points. In 2019, the women’s employment rate was 2.6 percentage points above the WB6 average, but 19.4 percentage points below the EU average of 64.1% (Eurostat, n.d.<sup>[115]</sup>).

The gender activity rate gap among 15-64 year-olds was 22.5% in 2019 (Eurostat, 2020<sup>[145]</sup>), more than double the EU average, and also double the average for Bulgaria, Croatia, Hungary, Romania and Slovenia.<sup>94</sup> A study published in 2017, supported by UN Women, showed that the main employment barriers for women were related to culture and gender stereotypes, caring and household duties, and women’s lack of confidence in their skills and labour market prospects. This led to women becoming discouraged workers, meaning they would accept work if it were offered to them (Mojsoska-Blazevski, Petreski and Ayhan, 2017<sup>[146]</sup>). Analysis by the Ministry of Labour and Social Policy showed that the main stereotype women faced was traditional roles linked to patriarchal lifestyles, particularly for women in rural areas. Measures to balance family and working life have not been sufficient; only 4.6% of workers were employed part time in the second quarter of 2019 (WIIW/World Bank, 2020<sup>[129]</sup>). Flexible work schedules that would enable workers to combine family duties and employment are not widespread, and parental leave does not follow good practice in OECD countries.<sup>95</sup>

North Macedonia has made significant progress in developing policies to reduce gender inequality. Following the Law on Equal Opportunities for Women and Men, the Strategy for Gender Equality 2013-20 contains basic measures for the systematic inclusion of equal opportunities for women and men in the processes of creating and implementing policies and budgets. It also includes basic and special action measures to promote equality between women and men in certain priority areas of action. Gender

mechanisms are also included at the local level within institutions. Commissions for equal opportunities for women and men have been established within the local self-government councils and there are coordinators for equal opportunities for women and men within the public sector. An evaluation of the strategy was expected to become available in December 2020, which will shed light on its effectiveness and potential implementation barriers.

Activities to reduce gender stereotypes have included gender sensitive revisions of school books. Awareness-raising campaigns have been implemented in co-operation with the Agency for Audio and Audiovisual Media Services. The MES awards scholarships to female university students in the bio-technical, technical-technological, natural-mathematical, IT, chemistry, physics, mathematics and medical science fields.

The new Law on Prevention and Protection against Discrimination was adopted in March 2019. The Organization for Security and Co-operation in Europe (OSCE) and its Office for Democratic Institutions and Human Rights (ODIHR) commented that the draft did not include adequate awareness-raising and other measures to implement the proclaimed principles of equality and non-discrimination, aside from the public dissemination and educational activities of the Commission. The draft law also does not use the notion of “equal treatment”, unlike relevant EU directives (Eurostat, n.d.<sup>[115]</sup>).

The share of women participating in ALMPs varies by type of intervention: In 2019, women made up 33.5% of participants in measures supporting self-employment, 45.8% in job creation measures, 43.2% in training measures, 64.2% in internships, and 59.0% in work engagement schedule measures. According to the ESARNM, in December 2019, 48% of all unemployed people were women, and many of them were low-educated: 55% of them have never been enrolled in formal education or have only primary education.

A framework for childcare is in place and annual actions plans adopted. Primary schools are obliged to organise all-day stay/classes and provide care between the end of school activities and the end of the working day. It would be useful to follow up whether the availability and quality of childcare is improving over time. The participation of children in early childcare education is below the EU average, but has improved recently – see Education policy (Dimension 7) (EC, 2019<sup>[147]</sup>).

The latest survey of wages in North Macedonia found that the gender pay gap was 12.5% in 2017. When characteristics such as education, years of service, age and occupation profile are taken into account, the gap increases to 17.3%. Considering primary education, the gap reaches 28% (Eurofound, 2019<sup>[137]</sup>). An increase in the minimum wage in the last two years, and particularly the equalisation of the minimum wage in the textile and leather industry sector with the national minimum wage, has recently reduced the gender wage gap. But still more measures are needed in order to achieve equal pay, even though the labour law regulates equal pay for equal work.<sup>96</sup>

#### *Sub-dimension 8.4: Activation policies*

Since the last Competitiveness Outlook assessment in 2018, progress has been made in improving the institutional capacities of the **public employment service**, ESARNM. It has introduced a profiling tool which divides the unemployed into three groups, according to their level of employability. Counsellors use a standardised questionnaire to categorise jobseekers into these groups and set up individual plans with them. They may then refer those jobseekers who need them most to ALMPs. The law requires every registered unemployed person to be given an individual employment plan (IEP). For those who will be easy to employ and who face few barriers to employment, a simplified and short IEP is developed, while a more detailed IEP is used for those who might be hard to employ. While the use of individual action plans for people with (severe) employment barriers is good practice (Desiere, Langenbucher and Struyven, 2019<sup>[148]</sup>), the effectiveness of its implementation may be questioned given the capacity of the PES in terms of staff. According to the PES, follow-up interviews should be conducted once a month. The average duration of the initial interview is 30 minutes. According to good practice, hard-to-place jobseekers, in particular the long-term unemployed, benefit from intensive counselling (OECD, 2019<sup>[149]</sup>).

At end of 2019, ESARNM had 414 employees, 61% of whom were working on active measures.<sup>97</sup> There is one counsellor working on active measures for every 400 registered jobseekers, which is high,<sup>98</sup> particularly given the high share of vulnerable groups among unemployed. For instance, according to LFS data for 2018, 74.7% of all unemployed people were long-term unemployed.<sup>99</sup> The PES's capacity was recently improved through staff training: 188 employees from 30 employment centres were trained in integrated case management, in implementing the Labour Market Skills Survey for the period 2018-19 and implementing the Youth Guarantee Project (Government of North Macedonia, 2019<sub>[121]</sub>). However, North Macedonia should develop a training strategy for the PES that includes initial training for new staff, and regular thematic training for those already employed.

The PES has limited capacity to provide employer services and gather vacancies. According to the law, all vacancies must be advertised through the PES, even though international experience shows that this is difficult to implement. In 2019, the PES had recorded only 8 344 vacancies for 101 700 registered unemployed, an extremely low ratio. In 2019, nearly 60% of unemployed people looked for work through the PES.<sup>100</sup> The number of unemployed people fell by 12% between 2015 and 2019 according to registration figures, while according to the LFS unemployment fell by 32% over the same period. This may either indicate improvements in registering the unemployed, or a greater difficulty in reducing unemployment among those registered, given the greater share of long-term unemployed and vulnerable groups registering, and the small number of vacancies registered.

North Macedonia has an unemployment benefit system. Workers with a 25-year contribution history can receive unemployment benefit for a maximum of 12 months, with a shorter duration for the rest. Older unemployed adults with a long employment history and who are no more than 18 months from qualifying for an old-age pension can also receive benefits for longer. In this case unemployment benefits are being used as an early retirement scheme. This is understandable in the light of the difficulty older unemployed people can experience in finding employment but efforts should still be made to place them in work instead of effective early retirement.<sup>101</sup> The level of unemployment benefits is linked to previous earnings, but is comparatively low, which may limit its effectiveness in reducing informal employment. It amounts to 50% of previous net earnings, with a ceiling of 80% of the national average monthly net salary in the past month.<sup>102</sup> Its effectiveness is also limited by its low coverage compared to the large majority of EU countries. In 2019 only 2.8% of all unemployed adults, as measured by LFS data, received unemployment benefits, as did 4.6% of the registered unemployed, down from 8.5% in 2015 (EC, 2017<sub>[150]</sub>). As of 30 September 2020, there were 6 800 beneficiaries of unemployment benefits, and 8 191 beneficiaries under the Law on Material Security of the Unemployed due to the Privatisation of Enterprises with Dominant State Ownership (information provided by the Government of North Macedonia). The number of people receiving guaranteed minimum assistance (26 000) in May 2020 was higher by 8.7 percentage points compared to April 2019, when the former social assistance scheme was in place (data provided by the government).

Significant progress has been made in designing a social assistance system and linking it to the activation strategy. The policy design was based on lessons from international experience. The Law on Social Protection, adopted in 2019, regulates cash benefits in the area of social protection for persons at social risk, who are financially insecure or need financial assistance due to other reasons.<sup>103</sup> The amount of the guaranteed minimum assistance is calculated on the basis of a one-member household, increased by a coefficient of the equivalent scale for other members of the household, up to a maximum of five. It starts at MKD 4 000 (around EUR 65) per month for a single adult. To reach the goal of reducing the poverty rate to 16% by 2021, from 22.7% in 2017, the aim is to integrate 20% of existing social welfare beneficiaries into the labour market.<sup>104</sup> Significant progress has been made in setting up a structure for inter-institutional co-operation with the aim of integrating vulnerable groups into the labour market (Box 24.11). Lessons from other countries indicate that these types of reforms are of great importance, but implementation is challenging and requires political commitment and resources (Duell et al., 2018<sub>[151]</sub>).<sup>105</sup>

North Macedonia does have a **mutual obligation framework**. The entitlement to guaranteed minimum assistance ceases if: 1) the beneficiary fails to register with the relevant employment centre within 30 days of becoming unemployed (which is longer than in EU countries) and to regularly comply with their obligations under the Law on Employment and Insurance in Case of Unemployment; and 2) the beneficiary refuses twice to meet the obligations in their individual employment plan for inclusion in programmes for active employment measures or to take part in employment mediation in compliance with the law. The mutual obligation principle should also be implemented for informal workers who register with the PES, as long as this gives them access to health care. In this case, the PES's task would be to ease the transition from informal to formal employment.

#### Box 24.11. Co-operation between social services and employment services to integrate vulnerable groups into the labour market

Since 2019, the Centre for Social Work and the Employment Centre have co-operated to put together individual employment plans to map out beneficiaries' participation in active employment measures and job seeking. The Centre for Social Work implements plans for each working age member of a household that benefits from the minimum guaranteed assistance, using the information from the individual employment plan, obtained from the Employment Centre. The staff in the two centres communicate regularly and meet as needed, at least once a month. Employment Centre staff electronically notify the relevant Centre for Social Work staff promptly (i.e. within three days) if a beneficiary 1) fails to register as part of the regular registration; or 2) refuses to participate in preparing their individual employment plan or participate in the employment services, refuses to take part in employment mediation or refuses the offer of employment. Therefore the reform has involved upgrading the existing software for administering cash benefits.

The professional workers in the two centres perform joint assessments of the needs and employability level of all registered unemployed persons or beneficiaries from one household, with the aim of identifying the most employable person and including that person in the active employment measures and services, taking into account their age, educational attainment, previous work experience, professional qualifications, acquired skills, the job demand in the labour market and whether there are any obstacles to participation, and other circumstances.

The capacities for implementing the Law on Social Protection have been strengthened; 177 professional workers were employed in the Centre for Social Work in 2018 and 2019 and staff in both centres have been trained in individualised work with beneficiaries (case management).

During the reform process, research was carried out to determine the areas in which the Centre for Social Work's capacity to implement the planned reforms needed reinforcing. Although the previous Law on Social Protection had allowed the provision of social services to be pluralised, in practice, it was mainly carried out by the state. Municipalities did not take the initiative to establish institutions for institutional or extra-institutional social protection, or encourage greater activity and involvement of local communities in the implementation of policies in these areas. Co-ordination was lacking at the local level between relevant stakeholders or their greater co-operation with institutions at the national level. There is an evident lack of provision of social services by the civil sector, which usually depends on funds provided by external donors.

Source: (EC, 2019<sup>[63]</sup>), *North Macedonia 2019 Report*, <https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/20190529-north-macedonia-report.pdf>; (Government of North Macedonia, 2019<sup>[121]</sup>), *Economic Reform Programme: 2019-2021*, [https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/north\\_macedonia\\_erp\\_2019-2021.pdf](https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/north_macedonia_erp_2019-2021.pdf); Information received from the government.

The National Strategy for Employment 2016-20, National Action Plan for Employment 2018-20 and National Action Plan for Youth Employment 2016-20 form the strategic basis for **active labour market**

**programmes** (ALMPs) and their target groups. The focus of employment policy has remained on youth and the long-term unemployment. Significant improvements have been made to the youth unemployment rate,<sup>106</sup> which fell from 44% in the fourth quarter of 2018 to 35.1% in the fourth quarter of 2019 (Eurostat, n.d.<sub>[115]</sub>),<sup>107</sup> although this is still more than double the EU average and above the WB6 average. The improvement was linked to the implementation of the Youth Guarantee (Box 24.12). The emigration of young people has also contributed to the reduction of unemployment (EC, 2020<sub>[46]</sub>). The share of 20-24 year-olds neither in employment nor in education and training, the so-called NEET rate, has remained at a high level and stood at 25.8% in 2019, well above the EU average of 14.5% (Eurostat, 2020<sub>[152]</sub>) and also above the WB6 average of 22.1% (WIIW/World Bank, 2020<sub>[129]</sub>).

#### Box 24.12. Implementing the Youth Guarantee scheme

Reducing youth unemployment has rightly become a national priority for North Macedonia; prompting ESANRM, the PES of North Macedonia, to start the Youth Guarantee scheme in 2018 as a pilot in three employment centres (Skopje, Strumica and Gostivar). The goal of the Youth Guarantee is that each young person under the age of 29 is given the right job offer, the opportunity to continue education or be included in some of the active employment measures. Once unemployed people are on the unemployment register, they are immediately referred to their first interview with an employment counsellor who will do the profiling and set up an individual employment plan for the next four months. Young unemployed adults are offered group and individual counselling and information, job search assistance services, motivational training, and inclusion in one of the labour market integration measures (employment incentives, education and training measures). In total, 47 599 young people have been included in the scheme so far (as of 31 October 2020), of which 35% successfully exited within a period of four months.

The next step will be to reach out to young NEETs, which will mainly be the role of non-government youth organisations. If effective, this has the potential to reduce the NEET rate. Some 10 000 young people (aged 15-29) are expected to benefit from the Youth Guarantee in the underdeveloped regions, which represents one-quarter of all potential beneficiaries. As pointed out by the EC (EC, 2019<sub>[147]</sub>), its efficient implementation will require a significant effort by the Ministry of Labour and Social Policy, the ESANRM as well the National Youth Council, responsible for the fieldwork activities.

Source: (Government of North Macedonia, 2019<sub>[121]</sub>), *Economic Reform Programme: 2019-21*, [https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/north\\_macedonia\\_erp\\_2019-2021.pdf](https://ec.europa.eu/neighbourhood-enlargement/sites/near/files/north_macedonia_erp_2019-2021.pdf).

The unemployment rate among working-age adults (15-64 year-olds) has fallen significantly: from 26.3% in 2015, to 24% in 2017 and to 17.4% in 2019.<sup>108</sup> While the unemployment rate of men fell considerably, the fall for women was less marked (WIIW/World Bank, 2020<sub>[129]</sub>). The unemployment rate of Roma (around 50%) and people with disabilities has not improved in the recent past and continued to be high (EC, 2019<sub>[63]</sub>). The incidence of long-term unemployment has been very high; it was 80.7% in the first quarter of 2019 and the situation has not improved since 2015 (WIIW/World Bank, 2020<sub>[129]</sub>). While ALMPs exist for specific vulnerable target groups, take up seems to be low. In 2019, around 22% of the participants in ALMPs were long-term unemployed, 3% were Roma and 3% were people with disabilities.<sup>109</sup> The ALMPs have not been evaluated since 2015. Expenditure on ALMPs increased from 0.11% of GDP in 2015 to 0.13% in 2017 and 0.19% in 2019,<sup>110</sup> but the share still remains significantly below many European countries.

#### *Cross-cutting sub-dimension: Informality*

In 2018, the share of workers in informal employment was similar to the situation in Serbia and below the corresponding level in Albania.<sup>111</sup> It has fallen from 22.6% of workers in 2014 to 18.6% in 2018. Worryingly, the composition of informal employment shows a slight shift from low-educated to medium-educated

workers. Informal workers were mainly self-employed and unpaid family members (WIIW/World Bank, 2020<sub>[129]</sub>). The incidence of informality is higher among men (20% in 2016) than among women (15%). Slightly less than half of informal workers are aged 25-44 years, and about one-fifth (20-22%) are aged 45-54 years. Most informal workers have completed only primary education or a four-year secondary education (about 40% each). Informal workers carry out mainly elementary occupations (about 62%).<sup>112</sup>

In 2018, the government adopted the Strategy for the Formalisation of the Informal Economy 2018-22. The corresponding action plan for 2018-20 was adopted in 2018, defining measures and allocating a budget. The strategy's objectives include: 1) improving the measuring, monitoring and detection of the informal economy; 2) improving the business environment for companies; 3) stimulating and supporting the formalisation of informal economic activities; and 4) strengthening the tax morale and reducing the tolerance of the informal economy. The action plan defines the budgets for these activities. While the objectives are all relevant, there is no explicit link between the quality of jobs and informal employment. At first sight, it is also not clear how the mechanisms for implementing laws and regulations are going to be strengthened.

#### *Cross-cutting sub-dimension: Brain drain*

In 2018, 2.1% of North Macedonia's population emigrated (24 300 people), the second highest rate in the WB6 economies after Albania. In a recent survey, 35% of young people indicated that they had a strong desire to move to another country for more than six months (Lavric, 2020<sub>[153]</sub>). Given the high youth unemployment these results are not surprising, but they are alarming. Previous research has indicated a high level of emigration among highly skilled adults (Government of North Macedonia, 2019<sub>[154]</sub>). The prospects for development are reduced if young people, and in particular well-educated young people, emigrate.

The government adopted a national strategy for co-operation with the diaspora in 2019 (Government of North Macedonia, 2019<sub>[154]</sub>). The overall objective is to create the legal, institutional and other preconditions to develop a sustainable and comprehensive framework for co-operation between the state institutions and the diaspora. The strategy aims to turn brain drain into "brain circulation" (Daugeliene and Marcinkeviciene, 2009<sub>[155]</sub>) and "brain linkage" by co-operating for the transfer of know-how and technology in different areas; learning about the demand for exports of Macedonian products to countries or areas with a large diaspora; increasing activities in the area of education and co-operation with the youth, as a precondition for preserving their cultural identity; and identifying possibilities for co-operation between the scientific diaspora and Macedonian scientific institutions, in order to accelerate the development of the economy.

#### ***The way forward for employment policy***

- **Continue improvements to working conditions, to align with the EU *acquis*.** The capacity of the labour inspectorates to implement the regulatory framework needs to be strengthened. This will not only involve staff training, but also improving the methodology for risk assessment, co-operation with other relevant institutions, and a potential increase in the number of staff. The Occupational Health and Safety Strategy and the Strategy for the Formalisation of the Informal Economy are highly relevant and should be implemented. Awareness raising among employers as well as training measures and support for SMEs in the area of human resource management should be implemented.
- **Define and implement activities to combat informal employment.** The first steps would be to update the analysis of informal employment, investigating the incidence of the main forms of informal employment (unregistered self-employed, envelope wages, unpaid family members) and the main motivations behind it. Horizontal co-ordination could be improved to reduce taxes or lower non-wage labour costs for low-wage earners in order to reduce the incentives for informal employment.

- **Assess the impact of the minimum wage on both poverty reduction and informal employment.** The ESC should be given the resources to make the relevant labour market assessments. An analysis of the earnings structure, the development of productivity and development of low-wage sectors should be regularly conducted. Raising the productivity of companies will be key to improving the quality of earnings. One example to follow could be Germany's Minimum Wage Commission, which includes members from the scientific community in a consultative role. It has a mandate to constantly evaluate the impact of the minimum wage on the protection of workers, conditions of competition, employment in certain industries and regions, and productivity. The commission presents the results of its evaluation to the Federal Government in a report together with its resolution every other year (Mindestlohn Kommission, 2021<sup>[156]</sup>).
- **Increase employment rates among women** by improving access to and coverage of high-quality childcare<sup>113</sup> (OECD, 2016<sup>[157]</sup>), promoting flexible working schemes by revising labour laws, and launching awareness-raising activities targeted at employers. The government should continue its efforts to overcome gender stereotypes at all levels of education and in the workplace and develop gender-sensitive professional guidance. Women who have become discouraged should be encouraged to rejoin the workforce through measures aimed at increasing their self confidence and skills.
- **Monitor the employability of graduates from the VET system**, differentiating between various VET streams and dual VET streams, and universities, through regular tracer studies. It is also recommended to monitor the participation of employed and self-employed workers in continuing learning.
- **Introduce incentives to invest in adult learning.** Experiences from other countries show that tax credits, learning accounts and learning leave are all valuable incentives (OECD, 2019<sup>[158]</sup>). The strategy for adult learning should also envisage counselling activities for employees as well as employers, particularly for SMEs, such as is offered in Portugal through the Qualifica Centres (OECD, 2019<sup>[159]</sup>). In France, every individual has the right to information, advice and career guidance support; the Advice for Professional Evolution (*Conseil en Évolution Professionnelle*) scheme was launched in 2014 to achieve this, offering free and personalised services (OECD, 2019<sup>[159]</sup>).
- **Implement programmes to substantially improve the skills of vulnerable groups of employees and the self-employed** (Box 24.13).

#### Box 24.13. Continuing training for vulnerable groups: Examples from Ireland and Germany

Springboard+ is an Irish programme originally conceived to offer free courses for the unemployed leading to qualifications. In 2017, Ireland extended it to the self-employed who want to improve their skills in certain sectors.

Germany provides study leave incentives that focus on the low-skilled and SMEs. The WeGebAU programme, established in 2006, supports low-skilled unemployed people and workers in SMEs – as well as employees aged 45 and over – wishing to acquire a vocational training degree or to participate in certified continuous training. The participant receives an education voucher which means the PES will cover some of the costs of the training. In addition, unemployment benefits can be paid during the course of the subsidised further training. The PES also pays wage subsidies and social security contributions for low-qualified employees during their training.

Source: (OECD, 2017<sup>[160]</sup>), *Financial Incentives for Steering Education and Training*, <https://dx.doi.org/10.1787/9789264272415-en>; (OECD, 2019<sup>[161]</sup>), *OECD Employment Outlook 2019*, <https://doi.org/10.1787/9ee00155-en>.

- **Continue to increase the capacity of the public employment service.** This would involve increasing the number of employment counsellors to reduce their individual caseloads, as well as providing training in counselling. At the local level, the capacities of the social work centres and private and non-government social service providers also need to be strengthened, as these providers could also be involved in reaching out to unemployed and discouraged workers who are not currently registered at the PES. The capacity of the PES to promote the transition from informal to formal employment should be strengthened. This would include the recognition and validation of informally acquired skills linked to upskilling activities and providing financial incentives for the conversion of informal to formal jobs. Delivering effective employment services would also mean taking an active approach towards employers and delivering services to them. Developing the planned performance indicator system to measure the outcomes of employment policies on different groups of jobseekers and conducting evaluations would also improve capacity. Finally, increasing the budget for ALMPs could level up activities to integrate the long-term unemployed, young people and the most vulnerable groups into the labour market.
- **Assess the impact of the new Law on Social Protection and amended Child Protection Law** on in-work poverty and on activity rates.

## Science, technology and innovation (Dimension 9)

### Introduction

Table 24.15 shows North Macedonia's scores for science, technology and innovation, and compares them to the Western Balkan average. The economy scores above the WB6 average in each sub-dimension, rating second in the region in public research system and business-academia collaboration, and third in STI system.

**Table 24.15. North Macedonia's scores for science, technology and innovation**

Dimension	Sub-dimension	Score	WB6 average
Science, technology and innovation dimension	Sub-dimension 9.1: STI system	2.6	2.4
	Sub-dimension 9.2: Public research system	2.5	2.0
	Sub-dimension 9.3: Business-academia collaboration	2.1	1.6
North Macedonia's overall score		<b>2.4</b>	<b>2.1</b>

### State of play and key developments

#### *Sub-dimension 9.1: STI system*

An economy-wide **STI strategy** has been in place since 2012, expiring in 2020. Developed within the framework of the OECD's Regional Competitiveness Initiative, the strategy aims to leverage knowledge and innovation to increase competitiveness, stimulate economic development and produce high-value employment opportunities. It includes measures to address major societal challenges such as climate change, mobility and brain drain through emigration. In line with its Action Plan 2019-20, the strategy is being implemented by the Fund for Innovation and Technology and Development (FITD), which was established in 2013 and closely co-operates with relevant ministries. Specifically, the plan is designed to enhance private sector innovation, strengthen human resources for innovation, cultivate a regulatory environment conducive to innovation and increase the flow of knowledge and expertise between sectors and firms. Some elements of the innovation policy are also included in the national Economic Reform Programme 2019-21.

While the STI framework does not address emerging areas of STI such as artificial intelligence, digitalisation or Industry 4.0, this is largely intentional and reflects the economy's current state of development. However, with the support of the European Commission's Joint Research Centre, efforts are currently underway to develop a new smart specialisation strategy that is expected to be adopted in 2021. The smart specialisation strategy is being developed by a working group comprising government institutions, public universities and chambers of commerce. It represents a continuation of the previous innovation strategy, with a focus on enabling economic growth through innovation, collaboration and knowledge sharing.

The **institutional framework** for STI remains relatively complex, with three government institutions overseeing the development and implementation of STI policy and no unified co-ordination mechanism in place:

- The National Committee for Innovation and Entrepreneurship is based in the Prime Minister's office and comprises members of key government ministries as well as experts from academia and the business sector. It primarily supports the implementation of STI policy in a co-ordinated fashion. In addition, the Working Group for Innovation is an advisory body established in 2012 to co-ordinate the implementation of innovation policies, namely the innovation strategy and action plan. The body consists of representatives from relevant ministries, state institutions, national agencies and the private sector.

- The Ministry of Education and Science is another important institution overseeing STI policy and is responsible for implementing and monitoring the innovation strategy. Within the ministry, the Department for Science and Innovation organises, finances, and promotes scientific research, technical development and innovation.
- The FITD acts as North Macedonia's dedicated innovation agency mandated to stimulate innovation activities, particularly within the private sector. Its budget has grown substantially since the previous assessment cycle and, despite the significant slowdown in 2020 amid the COVID-19 pandemic, it is projected to reach around EUR 16 million in 2021. Its operational capacity remains somewhat below potential, but financial and human resource capacity development is being supported by the World Bank and is expected to grow further in the medium term.

The **regulatory framework** for research, development and innovation practices has made moderate progress since the previous assessment cycle. North Macedonia co-ordinates its oversight of industrial property rights with the EU Intellectual Property Office, the European Patent Office, and the World Intellectual Property Office, although its actions are largely limited to awareness raising. Proposed activities to disseminate data among law enforcement agencies have not been implemented, which has limited North Macedonia's enforcement capacity.

North Macedonia engages in extensive **international collaboration** on research, development and innovation through its participation in Horizon 2020,<sup>114</sup> Western Balkans Enterprise Development and Innovation Facility (WBEDIF), Eureka,<sup>115</sup> European Cooperation in Science and Technology (COST)<sup>116</sup> and the International Atomic Energy Agency (IAEA) Agreement on Technical Co-operation. There is evidence of successful participation in these initiatives as well as the implementation of its associated objectives and commitments. In the period up to 2019, 95 Macedonian entities engaged under the Horizon 2020 framework, receiving EUR 10.6 million. More recently, however, activities to promote Horizon 2020 have been limited. Five Macedonian early stage companies have received financing under the WBEDIF Enterprise Innovation Fund (ENIF). However, institutional weakness and limited national scientific capacity pose obstacles to achieving strategic objectives for international STI collaboration. Budgetary and managerial limitations also inhibit the relevant government institutions from fully executing their responsibilities for international collaboration.

North Macedonia has made progress in increasing its **alignment with EU STI policies**, which it considers to be a national STI priority. Its national STI statistics are fully aligned with Eurostat methodology and best practice. The economy has adopted the European Research Area (ERA) Roadmap and participated in a 2018 ERA progress report and has committed to furthering ERA policy objectives, namely gender equality in the STI sector (EC, 2019<sub>[162]</sub>). It also participates in the European Strategy Forum on Research Infrastructures (ESFRI). Since 2020, North Macedonia has participated in two ESFRI Landmarks and in two developing research infrastructure projects. In early 2020 North Macedonia became a member of the European Open Science Cloud (EOSC) Governance Board and nominated two delegates, one from the MES and the other from the Faculty of Computer Science and Engineering. With the recent restructuring of EOSC governance under Horizon Europe, the Faculty of Computer Science and Engineering became a member of the EOSC Association. North Macedonia is currently drafting a national Research Infrastructure Roadmap that is expected to be formally adopted in early 2021. One higher education institution (HEI) – Ohrid University for Information Science and Technology – has endorsed the Charter and Code, while the South East European University is a participant in EURAXESS's Human Resources Strategy for Researchers.<sup>117</sup>

### *Sub-dimension 9.2: Public research system*

The **institutional structure of the public research system** has remained largely unchanged since the previous assessment cycle. While new policy initiatives have been made to support structural changes in the public research system, there have been no significant measures to increase the overall quality of

public research. The Law on Scientific and Research Activities outlines regulations to ensure the quality of research while the Law on Higher Education requires public HEIs and research and development institutions (RDIs) to regularly undergo mandatory self-evaluations. HEIs and RDIs also face external evaluation by the Board for Accreditation to verify the quality of their teaching and research practices.

North Macedonia has recognised the need to harmonise the Law on Scientific and Research Activities with the Law on Higher Education, redefining certain provisions, and aligning them with the recommendations of the European Commission and international good practice. A working group of experts from the MES and relevant representatives of faculties and scientific institutes was established to draft the new law, which was expected to enter into force in 2021. The National Agency for Quality in Higher Education was also established in 2019, and may further enhance research quality going forward.

The public research system remains underfunded, with gross domestic expenditure on research and development (GERD) at 0.37% of GDP in 2018, down from 0.52% of GDP in 2014 (UIS, 2021<sup>[163]</sup>). North Macedonia's **public research funding** comprises a mix of institutional funding and competitive grants, but the authorities have not provided a breakdown of how the funds were distributed between the two. The Action Plan for Innovation 2019-20 allocated roughly EUR 169 million to support the implementation of the national STI strategy, with funding sourced from the national budget, World Bank loans and international donors.

While public financing for STI programmes has increased since the previous assessment, in particular for the FITD, further efforts are needed to decrease dependency on international donors to implement North Macedonia's STI policy framework in a sustainable way. While the FITD provides financing on a competitive basis to firms and researchers through multiple funding instruments, there is no formal framework for performance-based funding for public HEIs and RDIs and it is unclear whether fair and transparent criteria are being used to allocate performance-based funds. There have been few significant improvements to public research funding since the previous assessment cycle, with no actions taken to promote third-party funding of research, interdisciplinary research or high-risk research. Likewise, funding is not used to promote research integrity or promote national scientific objectives.

North Macedonia offers few non-financial incentives for research excellence. The capacity of its **human resources for research and innovation** remains limited. The number of full-time researchers (per million inhabitants) has increased by around 18% since 2013, but remains below the 2015 level (UIS, 2021<sup>[164]</sup>) and the number of patent applications is low compared to regional peers. The Innovation Strategy 2012-20 has a chapter dedicated to strengthening human resources in innovation. There are clear support mechanisms in place for researchers, such as the Challenge for Young Researchers competition that has provided grants to young researchers since 2017. School-age children are also given support to participate in international STEM competitions. There are successful policy initiatives in place to promote the participation of women and other under-represented groups in research and innovation activities. The MES also financially supports the publication of scientific papers in international peer-reviewed journals as part of its implementation of the EU Recommendation on Open Science and Open Data, and provides postgraduate and doctoral scholarships to support the public scientific base. These measures are expected to improve human resource capacity in scientific research in the medium term. However, there are few policy initiatives to support doctoral research and education, make research careers more attractive, or address challenges associated with brain drain. Still, agencies such as the FITD have made notable progress communicating with the general public using promotional events and investments in STI initiatives in primary and secondary schools.

### *Sub-dimension 9.3: Business-academia collaboration*

Collaboration between business and academia remains underdeveloped in North Macedonia, although important progress has been made in promoting collaboration since the previous assessment cycle. Business-academia collaboration is included in the national STI strategy and has been promoted by a

number of financial and non-financial initiatives, which collectively form the foundation of a solid **collaboration promotion framework**. Government promotion of such collaboration is primarily focused on communication and awareness raising alongside financial support in the form of innovation vouchers and competitive co-financing grants. In addition, the FITD has used consultation meetings to involve relevant stakeholders in the design and implementation of relevant policy initiatives.

**Financial incentives for collaboration** are predominately channelled through the FITD, which has developed a specialised system of public tenders and grants, targeting both innovative companies and researchers. Competitive co-financing grants have been used to support private sector technology development and innovation, increase business-academia collaboration, and improve access to finance for start-ups and innovative firms. As of December 2020, the FITD had allocated EUR 42 million to over 500 individual firms, with the total investment generated through co-financing grants amounting to EUR 75 million. In 2018, the FITD developed a new support instrument promoting technology extension services that has supported 11 companies so far and provides acceleration services, of which 44% was sourced via private sector co-financing. Annual allocations for competitive co-financing grants have increased considerably from nearly EUR 300 000 in 2017 to around EUR 10.5 million in 2019. The preparation of a co-operative grant instrument is ongoing and is expected to be piloted by the end of 2021. The FITD piloted innovation vouchers in October 2020, aimed at enhancing co-operation between firms and research organisations, to encourage firms to undertake innovative practices that would increase overall economic competitiveness. It received 71 applications, of which 34 were awarded an innovation voucher. The FITD also redirected some of its activities to counterbalance the impact of the COVID-19 pandemic. However, North Macedonia does not currently use public procurement or tax incentives for firms as incentives for business-academia collaboration.

There are few **non-financial incentives for collaboration** available to researchers and businesses. As part of the World Bank's regional EU4TECH project, which is designed to build capacity for technology transfer from public research organisations and invigorate regional innovation ecosystems, HEIs and RDIs are eligible to apply for technical assistance for proof-of-concept and prototyping services for potential commercial spin-offs. As part of Horizon 2020, North Macedonia participates in Marie Skłodowska-Curie Actions,<sup>118</sup> which facilitate international researcher mobility. Since 2014, 30 Macedonian researchers have participated in the programme and Macedonian organisations have received EUR 280 000 in funding (EC, 2020<sub>[165]</sub>). However, with no domestic programmes providing non-financial incentives for collaboration, overall incentives remain very few.

There has been good progress on **institutional support for business-academia collaboration** since the previous assessment cycle. Efforts to develop North Macedonia's first science and technology park continue, and a feasibility study has been completed. The park is intended to support the development of start-ups and innovative enterprises by facilitating technology transfers. INNOFEIT, the technology transfer and innovation centre of the Ss. Cyril and Methodius University, opened in 2018 with a mission to give academics the practical expertise and skills needed to overcome private sector challenges. It is a good example of a measure to stimulate collaboration between firms and academia and offers a number of services to firms interested in pursuing research, development and innovation-related activities including pairing academics and entrepreneurs, collaborative research, access to laboratories and technology, and co-working spaces. In 2019, a new business-technology accelerator, UKIM, was incorporated into the INNOFEIT structure (Box 24.14). Despite these important advances, this policy area is not approached systemically and remains under-represented in the national STI policy framework. As a result, value-added measures such as training, coaching, awareness raising and other means of promoting collaboration do not appear to be provided systematically at the institutional level.

### Box 24.14. The Business Technology Accelerator UKIM

The Business Technology Accelerator UKIM was established under the umbrella of INNOFEIT with the aim of identifying and supporting high-potential technology-focused firms and early-stage businesses in North Macedonia. It was founded in 2017, by Ss. Cyril and Methodius University in Skopje (UKIM), the Crimson Development Foundation, CEED Hub Skopje, RSM Macedonia, and Professor Dr Dimitar Stamboliev, and is co-financed by the Fund for Innovations and Technology Development.

It offers tailored pre-acceleration and acceleration programmes and support through international markets, networks and communities. The accelerator also provides early-stage seed financing valued from EUR 5 000 to EUR 33 000, and up to EUR 100 000 in follow-on financing for market development as well as sales and revenue growth.

This accelerator is the first of its kind in North Macedonia, combining the expertise of the economy's biggest and most technologically advanced university, an investment/lending firm, financial advisory organisations, and business support institutions.

### *The way forward for science, technology and innovation*

North Macedonia has made progress towards achieving its national STI objectives and has improved its overall STI policy framework. However, insufficient institutional co-ordination, funding limitations, and inadequate support systems for researchers and innovators continue to limit its progress in this policy area. The ongoing development of a national smart specialisation strategy represents a unique opportunity to build on the successes of the current innovation strategy while addressing key shortcomings. The following recommendations can help keep up the momentum:

- **Complete the development of the smart specialisation strategy** in order to build on the important gains made under the innovation strategy. The FITD could play an important role in supporting the implementation of the strategy framework if its capacities are expanded and funding sustained. Strengthening inter-ministerial co-ordination would further increase effectiveness of policy making and smooth implementation.
- **Increase investments in the public research system.** The public research system remains underfunded and detached from national STI objectives, despite significant increases in funding in recent years. Investments in public sector research, coupled with targeted measures to support researchers, would make scientific research a more attractive profession. This could be an important tool to counter ongoing brain drain within the sector, and is likely to increase overall research quality in the medium term.
- **Increase participation in Horizon 2020** and associated international research and development programmes. Efforts to promote involvement in European scientific research programmes should be revamped to include measures such as targeted awareness raising, increasing networking opportunities and international mobility for Macedonian researchers, including through the Marie Skłodowska-Curie Actions.
- **Promote business-academia collaboration through a systematic and targeted approach.** Targeted incentives, both financial and non-financial, could help raise awareness and stimulate interest in increased collaboration. North Macedonia's emerging institutional infrastructure will help to support integration between academia and the private sector, if it is designed with encouraging collaboration as a key objective.
- **Strengthen enforcement of industrial property rights.** Implementing the actions proposed in the 2016-18 strategy on industrial property rights will be essential to improving the enforcement

capacity in the economy. Likewise, increasing the number of investigations of infringements by improving institutional enforcement capacity would ensure stronger, more coherent enforcement.

## Digital society (Dimension 10)

### Introduction

North Macedonia is making steady progress with its broadband infrastructure development and has improved its legal and regulatory framework since 2018 to enable private sector investments in network infrastructure. The economy's above-average score in access indicators is reflected in Table 24.16, which shows North Macedonia's scores for the five digital society sub-dimensions and provides a comparison with the Western Balkan average. However, it is lagging behind regional champions in its digital government development. In April 2020, only 136 e-services were available on the central e-government portal and some of the most frequently used e-services for citizens and businesses are still at the second level of sophistication or lower, according to EU standards, meaning that they only support one-way interaction (Belcheva-Ristovska and Todevski, 2020<sup>[167]</sup>). For the e-services which are available, usage and satisfaction levels remain low, but North Macedonia lacks a database of digital government indicators to support data-driven evaluations and policy making.

North Macedonia scores below the WB6 average in digital society indicators on use and slightly below average in jobs. The adoption of ICT among SMEs has not been effectively promoted and continued delays in preparing and adopting a long-term vision for the ICT sector has led the industry to stagnate, demonstrating no improvement since the last assessment cycle in 2018. The indicators on society remain significantly below the WB6 average. More positively, North Macedonia has updated its policy framework for privacy protection and digital security risk management, reaching an average score on trust indicators, but the lack of human and financial resources to implement the new framework, harmonise legacy legislation, and promote capacity building to change mindsets is holding it back from reaching its full potential.

**Table 24.16. North Macedonia's scores for digital society**

Dimension	Sub-dimension	Score	WB6 average
Digital society dimension	Sub-dimension 10.1: Access	3.3	2.9
	Sub-dimension 10.2: Use	2.0	2.4
	Sub-dimension 10.3: Jobs	2.2	2.3
	Sub-dimension 10.4: Society	1.5	2.1
	Sub-dimension 10.5: Trust	2.2	2.2
North Macedonia's overall score		2.4	2.4

### State of play and key developments

#### *Sub-dimension 10.1: Access*

Broadband access remains uneven in North Macedonia, while infrastructure investments are mainly concentrated around urban areas. The National Operational Broadband Plan (NOBP), an ambitious plan to develop **broadband infrastructure** throughout North Macedonia, was adopted in 2019. It promised to connect every household and public institution to high or ultra-high-speed communications networks<sup>119</sup> by 2029. The NOBP targets the creation of a nationwide optical backhaul network, 5G infrastructure covering all cities and Next Generation Access (NGA) coverage of white zones.<sup>120</sup> The NOBP is aligned with the EU's 2016 Strategy Towards a European Gigabit Society for 2025 and also includes activities to coordinate with neighbouring Albania to avoid common obstacles to providing network coverage.

During the first year of its implementation, the plan has already shown positive results, especially in planning and accomplishing the prerequisites for developing connectivity in under-served areas. The key legal and regulatory improvements needed to ensure an enabling environment for private sector infrastructure investments, even in white and grey areas where interest and profit margin are low, have

been identified. These improvements include regulations on infrastructure sharing and re-use, co-ordination of civil works, and minimising restrictions on foreign investment in broadband infrastructure. State aid for white zones and other business models are being considered and consultations with network operators are ongoing over the selection of the most appropriate model in each area. The Law on State Aid Control (adopted in 2010) is in line with Articles 107, 108 and 109 of the Treaty on the Functioning of the European Union. However, to avoid market distortion, careful harmonisation of state aid rules with EU Guidelines for the application of State aid rules in relation to the rapid deployment of broadband networks (EU 2013/C 25/01) will be critical.

The construction, development, maintenance and management of the optical backhaul network in the white zones will fall under the responsibility of the Public Enterprise Macedonian Broadcasting (PE MKD). It will ensure that all operators have access to it and are motivated to develop NGA infrastructure in these areas. The government has secured EUR 600 000 funding from the Western Balkans Investment Framework to prepare a feasibility study for covering target areas with NGA access infrastructure. In an effort to improve co-ordination of broadband development activities, a national advisory board for broadband development was created in 2019, the Broadband Competence Office, to support and report on the progress of the implementation of the NOBP.

The second semi-annual report on NOBP implementation indicates that fixed broadband coverage was at nearly 98% in September 2020, higher than the EU average of 97% in 2019, while fixed broadband take-up was at almost 73%, approaching the EU average of 78%. However, the report also indicated that mobile broadband penetration in the first quarter of 2020 was almost 65%, against the EU average of 100% in 2019 and fast broadband take-up in September 2020 was slightly above 27%, lagging behind the EU average of 41% in 2018 (Broadband Competence Office, 2020<sup>[168]</sup>).

The ICT **regulatory policy framework** is generally aligned with the EU *acquis*. It is actively implemented and continuously improved to enhance the quality of services and to enable investments. EU Directive 2014/61/EU on measures to reduce the cost of deploying high-speed electronic communications networks has been transposed into the national framework. The electronic communications framework is aligned with the EU 2009 regulatory framework and in line with the WB6 economies' agendas. North Macedonia signed the West Balkans Regional Roaming Agreement in April 2019. Its national regulator, the Agency for Electronic Communications (AEK), is operationally and financially independent. It collects data regularly and publishes reports on the electronic communications market. The AEK is fully staffed and has the resources to perform its responsibilities, including carrying out regulatory impact assessments on every new regulatory proposal. However, the implementation of reviews of the stock of significant regulations against clearly defined policy goals is not yet a systematic practice.

North Macedonia is currently in the initial phase of developing data openness and transparency. Its **data accessibility** policy framework is based on the Transparency Strategy (2019-21) and the Open Data Strategy (2018-20). The framework supports the development of freely accessible online portals and open data access points to disseminate and allow the re-use of government data and public sector information. It facilitates public-private data exchanges for research and commercial purposes and data sharing within and across the public sector. These policies are also in line with North Macedonia's commitments under the Open Government Partnership (OGP) action plan for 2018-20. Data accessibility legislation is in place and aligned with the EU *acquis*, including the Law on Free Access to Public Information and the Law on the Use of Public Sector Data, which transposes the EU Directive (2013/37/EU). The framework regulates the format of data and their publication methods.

The government open data portal<sup>121</sup> has been improved and datasets are gradually being published by public institutions. However, although the portal had published 236 datasets from 52 public institutions by mid-2020, demand for open datasets is still low. An open data culture has yet to be instilled in the minds of both the public and the private sector in North Macedonia. Positively, a significant step forward was made to promote fiscal data transparency with a new open data portal<sup>122</sup> launched by the Ministry of

Finance in November 2019, publishing all state budget transactions. A number of online tools have been launched to foster fiscal transparency and public officials' accountability, publishing data on public spending and asset declaration tools. Regular monitoring of indicators for data accessibility and openness is weak, despite relevant provisions in the two strategies. A working group, comprising seven representatives from public institutions, academia and civil society, was planned to undertake this monitoring task but, as of 2020, no action had been taken to establish it.

### *Sub-dimension 10.2: Use*

North Macedonia has made some positive advances in developing **digital government**, directly related to the reforms outlined in the Public Administration Reform Strategy (PARS) 2018-22 and its action plan. These are aligned with open government principles and North Macedonia's international digital government commitments. Some of the activities outlined in the PARS action plan are in the planning phase, some in the initiation phase and some of them are operational or even implemented (for example the alignment of the Law on e-Management and the Law on e-Identification with the Law on General Administrative Procedure). The PARS is being implemented either through non-budgeted activities undertaken by public sector employees or through donor-funded programmes.

The Law on Electronic Management and Electronic Services was adopted in 2019. It allows public institutions and private sector entities to communicate seamlessly through an interoperability platform to provide e-services. North Macedonia and Serbia signed an agreement in August 2019 on mutual acceptance of electronic documents. However, additional harmonisation of legacy legislation and regulatory improvements will be needed to remove the remaining obstacles to the delivery of efficient e-services for citizens and businesses in the field of e-identification and e-payments. The PARS action plan has already identified and planned some of these, for example regulating archiving and storing e-documents, and the transformation of an e-signed paper document for proving payment of administrative or other fees.

Horizontal governance is provided by the National ICT Council (established in 2018), which comprises representatives of relevant ministries and state agencies. The council provides guidance on procurement plans and technical specifications, serves as a focal point for digital government policy initiatives, and is expected to co-ordinate implementation with the National ICT Strategy, once it is adopted. The Ministry of Information Society and Administration publishes annual online reports on the implementation of the PARS that include some digital government indicators. However, there is no open and accessible database of indicators on digital government, which hampers effective data-driven evaluations of digital government policies.

The national e-government portal was providing a central point of access to approximately 136 digital government services is available by mid-2020.<sup>123</sup> However, a large number of these services are not directly available through the portal; instead, it only publishes information and links to the relevant portals. Several government portals have been developed, like the successful MojTermin portal for e-health services. Successful e-services include the eTax System that has simplified tax reporting, and mobile applications like eVAT that enables VAT returns for individual taxpayers. During the COVID-19 pandemic, the government received a private company donation for the StopKorona! contact-tracing app to prevent the spread of the virus. Progress has also been made in digitalising public registries. However, while the number of e-services for citizens and businesses is increasing, their use is much lower<sup>124</sup> than the EU average; EU penetration of e-government services in 2019 was 53% (EC, 2019<sub>[169]</sub>).

North Macedonia does not have a policy framework to directly support **private sector ICT adoption**. It has done little to promote the digital transformation of companies, while neither the Innovation Strategy and corresponding fund nor the other SME or industry policies and programmes have been designed to finance the adoption of ICT. Some tax incentives for purchasing software and hardware products exist, and small-scale voucher schemes have been implemented, but not sufficient to support widespread private

sector adoption of ICT. For example, only 13 companies were recorded as benefitting from a project implemented by MASIT, the Chamber of Commerce for ICT, which offered vouchers to SMEs to assess their ICT needs and plan their digitalisation. The Ministry of Economy funded the Support for Digital Transformation of SMEs project under the Programme for SMEs Competitiveness.

A national ICT strategy for 2021-25 is currently being drafted, which aims to deliver an overarching policy that embraces and aligns all other ICT-related policies, including government digitalisation. However, as the strategy is still in an early preparatory phase, it is not yet certain that it will address the digitalisation of SMEs effectively. The Digital Forum for ICT was created in February 2019 by MISA as a partnership and coalition forum for the exchange of ideas between institutions and other stakeholders, such as chambers of commerce and civil society organisations supporting digital partnership.

### *Sub-dimension 10.3: Jobs*

The development of **digital skills for students** is part of the current education policy framework, namely the Education Strategy and Action Plan for 2018-25. Relevant basic and more advanced subjects are integrated into the curriculum from the third grade and beyond in primary schools and throughout secondary education, either as compulsory or optional subjects. Digital skills curricula are co-ordinated across primary and secondary levels of education, providing a comprehensive continuum of skills development. The education policy framework is aligned with the principles of the European Digital Framework and promotes curriculum design tuned to the needs of the labour market through co-ordination with relevant market stakeholders. It recognises the importance of ICT tools for education and the urgency of equipping classrooms with computers. Legislation and regulations have also been adopted to delineate the use of ICT in teaching. All primary and secondary schools are required to incorporate computers with Internet access into their lessons.

However, outdated ICT equipment in schools and IT-shy teachers are an obstacle to delivering the promise of digital skills' development for students. During 2020, the Ministry of Education and Science reported that 80.7% of primary and lower secondary schools and 93.6% of secondary schools had a broadband connection (>10 Mbps), while 67.1% of primary and lower secondary schools and 69.7% of secondary schools were equipped with computers for students. The ratio of computers to students is around 1:20 in primary and lower secondary schools, and around 1:19 in secondary schools.

The recent COVID-19 experience has exposed disparities between private and public schools and urban and rural areas in the availability of functional computers and portable electronic devices (such as laptops and tablets) and teachers' digital competency and readiness to employ e-learning technology. It has also propelled developments in this field, such as the creation of a Learning Management System by the education ministry, which integrates existing school platforms and provides distance learning capabilities. It also delivered training to over 25 000 teachers on the platform. Over 90% of students attended online classes in autumn 2020. During the COVID-19 pandemic, the Ministry of Labour and Social Policy (MLSP), the Ministry of Information Society and Administration (MISA), the MES and Telecom MK provided free Internet access to 30 000 students from socially vulnerable categories. MRTV started broadcasting an educational programme called "TV Classroom".

In March 2020, a national platform to support distance learning for teachers and educators ([www.eduino.gov.mk](http://www.eduino.gov.mk)) was set up by the MES, the Bureau for Development of Education (BDE) and MLSP with the support of UNICEF. The platform offers webinars for training teachers and professional associates, video tutorials for professional development, activities and games for parents to use from home, and e-tests and class schedules. A working group was also established to develop a concept for a distance learning system for primary and secondary schools. The working group comprised representatives of the MES, MISA, BDE, the Vocational Education and Training Centre, the National Examination Centre, primary and secondary school teachers, university professors, international organisations (UNICEF and USAID),

and civil society. The concept focused on three aspects: pedagogy, technology and the design of e-learning systems. The minister adopted the concept on 21 July 2020 with Decision no. 08-4895/2.

During September 2020, the MES implemented a distance learning system that provides e-content and e-activities for all primary and secondary schools. The distance-learning platform is part of the Learning Management System, which is an integrated system that incorporates several existing systems and platforms developed by the MES, along with Office365 and Microsoft Teams tools for online collaboration and e-learning. User training for the platform was initially given to 30 teachers. They became national trainers who then conducted training for an additional 1 200 teacher trainers. Finally, the third level of training was rolled out to all 25 000 school teachers. The share of students attending online classes is currently over 90%. The government acquired Microsoft licences for these tools and provided them to all primary/secondary school students and teachers.

The development of **digital skills for adults** is weak, although related policies are being implemented by different actors, including the Adult Education Centre of the MES, and the National Employment Agency of the Ministry of Labour and Social Policy. There is no overarching framework that provides vision and co-ordination on implemented activities, however. On the positive side, programmes for the development of digital skills for adults have created a positive impact, including lifelong learning programmes, formal and non-formal (re)training programmes provided by private sector education providers (accredited, or not, by the Adult Education Centre). The Employment Agency provides public service programmes for unemployed young people, which include introductory and advanced IT skills in collaboration with private sector education centres. However, even though the ICT industry is generally consulted during curriculum design for these programmes, the amount of people trained and the quality of the training do not always meet the industry's demand for highly skilled ICT professionals. The digital skills gap is exacerbated by weak indicators for monitoring and reporting. Recently, under the pressure created by the COVID-19 pandemic, the use of distance learning platforms has been incorporated in some adult training programmes to increase their accessibility. It remains to be seen if these platforms will be permanently embedded in adult (re)training programmes to empower workers and people in rural or remote areas.

The outlook on **ICT sector promotion** has not improved since the last assessment cycle. Although the ICT sector is recognised in policy documents as a driver for economic growth in North Macedonia, there is no sector strategy that addresses the needs of the industry and co-ordinates the economy's digitalisation. ICT is one of the fastest growing sectors of the economy, employing over 200 000 highly paid people and bringing export revenue of EUR 160 million in 2018. The envisioned overarching National ICT Strategy, has been under preparation for years; it was ongoing during the Competitiveness Outlook assessment in 2018, if not before. The COVID-19 crisis has further postponed its drafting and the associated internal consultation processes, which are now scheduled for early 2021. In the absence of an overarching policy framework, the sector receives arbitrary support through horizontal policy documents and programmes for the development of broadband communications infrastructure, the creation of e-government services or to finance innovation in emerging ICT such as the Fund for Innovation. In the meantime, the ICT industry (mainly the IT sub-sector) suffers from poor retention of skilled staff, limited support for advanced ICT (re)training of employees and stagnation due to the industry's branding as an outsourcing destination.

#### *Sub-dimension 10.4: Society*

**Digital inclusion** principles like social inclusion, non-discrimination, and accessibility of electronic systems and services, are included in strategic documents such as the Public Administration Reform Strategy and the National Operational Broadband Plan. However, the relevant activities in the PARS are not prioritised or budgeted in the action plan. Aspects of digital inclusion are covered by the ongoing activities for rural broadband infrastructure development that aim to close the digital gap and to provide affordable broadband connectivity to every household and citizen in North Macedonia, regardless of geography and financial capacity. A number of programmes by different actors, some donor-funded, promote equal opportunities

and narrowing gaps in ICT usage among disadvantaged or even marginalised groups of the population. Examples include ICT skills development programmes by the Employment Agency, Fund for Innovation grants for companies that minimise social exclusion through technological solutions or UNCTAD's eTrade for Women masterclass series programme. However, due to the low number of participants or beneficiaries, their impact is still limited.

The current framework guarantees the accessibility of public websites in accordance with international guidelines and standards such as the World Wide Web Consortium Web Accessibility Initiative Web Content Accessibility Guidelines. A comprehensive webpage has been set up to provide obligatory guidelines for the web presentation of public sector institutions.<sup>125</sup> However, the framework does not impose specific ICT accessibility standards and requirements for the procurement and certification of ICT products and services, which is particularly critical in sectors such as government and education. Monitoring of digital inclusion indicators is weak, basically extending no further than some basic ICT usage indicators gathered by the Agency for Electronic Communications or the National Statistics Agency.

#### *Sub-dimension 10.5: Trust*

The digital **privacy protections** framework includes the Strategy for Personal Data Protection (PDP) 2017-22 and the new Law on PDP, adopted in February 2020, transposing the EU General Data Protection Regulation (GDPR) 2016/679. Under the new law, the former Directorate for Personal Data Protection will continue its work as the Personal Data Protection Agency. The law provides a transition period of 18 months for the PDP Agency, data controllers and data processors to align with its obligations. Encouragingly, all of the points on personal data protection and privacy which were raised by the European Commission in their 2019 country report had been addressed before this assessment took place, including amendments to legislation and alignment with the GDPR (EC, 2019<sub>[63]</sub>). The PDP Agency has significantly enhanced its international co-operation, although it is still understaffed. In its annual report for 2019, it reported that it remained without a director or deputy director for about six months after the resignation of the former director, which affected its ability to sign acts and perform inspections. In October 2020 the agency employed 23 staff members, which represents 36% of its proposed human resources plan. Its plan for 2021 prioritises hiring new staff and specific allocation within the state budget to ensure its financial independence, as prerequisites for addressing the challenges with the implementation of the new PDP Law.

North Macedonia leads the way in the Balkans when it comes to the development of a contact-tracing app. During the COVID-19 pandemic, the government received a private company donation for the StopKorona! app, which helps the Ministry of Health to track people who have been in close contact with an app user who tested positive for COVID-19, to warn them and prevent the spread of the virus.

Free Software Macedonia, a civil society organisation dealing with IT-related issues, raised concerns publicly about the StopKorona! contact-tracing app in relation to data protection. They demanded that the government make the app open source and publish the code for public scrutiny. Upon signing non-disclosure agreements, the Ministry of Health formed a working group in April 2020 consisting of volunteers to review the source code. After ensuring that the app collects and processes only the minimum data necessary, the working group acknowledged that there are no major data protection issues with the app, and made recommendations for further improvement. The Personal Data Protection Agency also conducted an emergency inspection to ensure compliance with personal data protection law. The Metamorphosis Foundation also analysed the privacy policy of the StopKorona! app, regarding data protection and concluded that it contains only the information needed to inform citizens, and thus respects the principles of privacy and transparency in personal data processing.

The Consumer Protection Programme 2019-20 is being implemented and includes some activities to raise consumer awareness and improve legislation to address **consumer protection in e-commerce**. For

example, it foresees the provision of student training in consumer protection that include topics on protection in e-commerce transactions. However, the implementation of public awareness campaigns on consumer protection in e-commerce has been weak. A draft consumer protection strategy is currently being prepared. A new draft of the Law on Consumer Protection was prepared in 2019, but its adoption is still pending at the time of writing. The Law on e-Commerce, based on the EU Electronic Commerce Directive (2000/31/EC), was updated in 2017. Market surveillance and inspection of e-traders is performed by the State Market Inspectorate of the Ministry of Economy, which offers an online form<sup>126</sup> for collecting consumer complaints alongside standard submission methods (in person or by phone). The statistical analysis of these complaints is announced publicly every year.

Although e-commerce is growing in North Macedonia, it is still relatively low, both in the numbers of local merchants selling and consumers shopping on line. A 2019 UNCTAD report measuring the business-to-consumer (B2C) e-commerce index of countries, ranked North Macedonia 48<sup>th</sup> out of 151 countries (UNCTAD, 2019<sub>[170]</sub>). Persistent barriers to e-commerce development include underdeveloped financial systems and a legal and regulatory framework that is not fully up to date. Moreover, many local consumers have poor digital literacy and insufficient understanding of their rights in e-commerce and how to exercise them. The Consumer Protection Programme has identified the legal and regulatory improvements needed and relevant activities are planned, especially regarding e-payment technologies and the development of reliable and secure online transactions. However, monitoring of indicators for consumer protection in e-commerce is weak.

The National Cyber Security Strategy and Action Plan 2018-22 provides a basic policy framework for **digital security risk management**, based on the EU Cybersecurity Strategy and the NATO Cyber Defence Pledge. The strategy promotes a complete digital risk management framework for the government, research and development, and the adoption of international standards in procurement and the recruitment of professionals. However, the government has not yet secured the budget needed to implement the action plan, except for the operation of the National Centre for Computer Incident Response (MKD-CIRT). The MKD-CIRT is still operationally challenged, since it has employed only two staff members since its establishment in 2016. Its limited financial and technical resources are provided by the Agency for Electronic Communications, its hosting organisation.

More positively, the new law on Networks and Information Systems Security is aligned with EU Directive 2016/1148, concerning measures for a high common level of security of network and information systems across the Union, but is still pending adoption.<sup>127</sup> The National Cyber Security Council was established in 2019 to provide horizontal co-ordination of digital security risk management and an inter-ministerial working group was set up to provide expert, operational and logistical support to the council. However, North Macedonia's critical information infrastructure has not yet been defined, and further legal and regulatory improvements are required to complete alignment of the legal framework on digital security risk management, ensuring clear roles, responsibilities and accountability for relevant government bodies and institutions. For example, competent public sector bodies have no obligation to regularly report on digital security risk incidents. Efforts to create other computer emergency response teams (CERTs) in the public or private domain are still at the initiation phase.

### ***The way forward for digital society***

Despite having taken some important steps to improve its digital society policy framework, the government of North Macedonia should pay more attention to the following aspects:

- **Strengthen the demand for open data innovation by enabling private sector re-use of public sector data** through inclusive co-creation processes to deliver e-services to citizens. Although the legal and regulatory framework is advanced, the number of published datasets is only rising slowly, the general public are not widely engaged and the level of informed public debate on data-driven

issues remains low. The government will need to raise public awareness about open data, build the capacities of public officials and develop public-private partnerships for open data innovation.

- **Accelerate the reform and harmonisation of legacy legislation, particularly in the fields of e-identification and e-payments, and prioritise the digitalisation of the most frequently used services.** North Macedonia should prioritise the creation of e-services that are most relevant and useful for the entire population, and increase the sophistication level of services according to EU standards. It will need to create a publicly available dataset of e-government indicators and implement regular evaluations of the quality of available e-government services to facilitate their continuous improvement.
- **Prioritise policies supporting the digital transformation of private sector companies,** possibly under the umbrella of the forthcoming National ICT Strategy 2021-25. The Digital Forum for ICT and non-ICT sector chambers of commerce could help assess the type of support needed by businesses (particularly SMEs) and select appropriate financial schemes (like subsidies or tax reliefs) for purchasing software/hardware and staff IT training, while promoting business process transformation through e-commerce and e-business development. The strategy would also need to prioritise support measures for the ICT industry, to help retain highly skilled ICT professionals through favourable social security or taxation regimes, provide advanced ICT staff training, and strengthen exports and internationalisation, including re-branding the economy from an outsourcing destination to an innovation hub.
- **Adopt legal provisions to promote accessibility requirements in the public procurement of products and services** in the ICT domain and create corresponding certification schemes. Digital inclusion policies need to ensure that ICT products and services can be used by all their intended users, taking into account various physical, sensory, emotional or cognitive disabilities. Related policies need to ensure accessible ICT as a powerful enabler of peoples' ability to participate in every aspect of modern life.
- **Accelerate the adoption of the Consumer Protection Strategy** and ensure that it promotes realistic measures for educating consumers on their rights and how to exercise them, and for building trust in e-commerce. The strategy will need to address legal and regulatory shortcomings, especially related to e-payments, in order to increase e-commerce take-up. It will also need to ensure that consumer protection legislation addresses fraudulent or misleading practices, privacy issues, dispute resolution, and redress in e-commerce transactions. It should prescribe regular monitoring of indicators on consumer protection in e-commerce to verify or adjust programme implementation targets, as needed, to maximise their impact.
- **Ensure the National Centre for Computer Incident Response has sufficient human, technical and financial resources** and adopt the legal and regulatory provisions for defining North Macedonia's critical information infrastructure and the relevant digital security risk management. National CERTs play a key role in co-ordinating incident management with the relevant stakeholders at national level and are responsible for co-operating with their international counterparts. Definition and protection of the critical information infrastructure is essential for maintaining the vital social functions which ensure the health, safety, security, economic and social well-being of the population, the disruption or destruction of which would have serious national implications.

## Transport policy (Dimension 11)

### Introduction

Since the last Competitiveness Outlook assessment in 2018, the main transport improvements North Macedonia has made have been in implementation and procurement, and reforms in the aviation sector. The slowest progress has been in the fields of data collection, asset management and combined transport. North Macedonia's performance in this dimension is close to the WB6 regional average. Table 24.17 shows North Macedonia's scores for the three sub-dimensions, and compares them to the WB6 average. In the planning sub-dimension, North Macedonia scores in line with the WB6 average, in the governance and regulation sub-dimension it scores slightly above the WB6 average and in the sustainability sub-dimension it scores below the WB6 average, explained by its low score for the environmental sustainability strategy and combined transport strategy indicators (both among the lowest scoring in the WB6 economies).

**Table 24.17. North Macedonia's scores for transport policy**

Dimension	Sub-dimension	Score	WB6 average
Transport policy dimension	Sub-dimension 11.1: Planning	2.3	2.3
	Sub-dimension 11.2: Governance and regulation	2.5	2.6
	Sub-dimension 11.3: Sustainability	0.8	1.3
North Macedonia's overall score		1.8	2.0

### State of play and key developments

#### *Sub-dimension 11.1: Planning*

North Macedonia has developed its **transport vision** since the last assessment. It adopted the National Strategy for the Transport Sector (NSTS) for the period 2018-30 in December 2018, while the new National Aviation Development Strategy for 2021-30 is under preparation. The long-term NSTS presents a continuation of the transport vision in the previous strategy, which covered 2007-17. It covers all transport modes with very clear overall and specific objectives. During its development, the NSTS passed through the consultation processes with all relevant stakeholders as set out in the legislation. Strategic actions are presented with measures and indicators, so they can be monitored by the government body responsible, as prescribed within the strategy. The implementation timeline is set out for the short term (2021), medium term (2025), and long term (2030), while the budgets to meet the objectives were assessed for each measure.

The first monitoring report (which should be updated on an annual basis as set in the strategy) on the NSTS for the period 2018-20 is currently under the approval process in the government, but not yet publicly available. The monitoring report for the 2007-17 strategy is not available either, so the degree of progress could not be assessed. Therefore, it is not known if the new strategy includes measures to cover lagging activities left over from the old strategy. The new monitoring reports have to be used to report on lessons learned, and help define countermeasures against undesirable trends, as prescribed within the strategy. It remains to be seen to what extent they will be used to inform the update of the strategy in the future. Twelve years (2018 to 2030) is a long time to go without any update to the NSTS, and the strategy does not include plans for any updates before it expires.

While the planning framework and the transport vision are set out in the NSTS, some important areas need to be upgraded. For instance, the new/upgraded transport model has not been used in the prioritisation process at all. The measures and actions proposed in the national transport strategy should be assessed and evaluated through the outputs of the transport model as part of the strategy, otherwise the model will lose its purpose. Nor does the defined prioritisation methodology framework cover financial and economic

analysis or safety factors. The NSTS has not been aligned with the tourism policy and has not been designed in alignment with other strategies, showing a lack of holistic policy making. If the development and upgrade of transport policy and infrastructure was fully integrated and jointly implemented with tourism and other relevant strategies, it would improve the attractiveness of North Macedonia and the region, making it more competitive.

Public procurement rules applicable to road transport have been fully harmonised with the Transport Community Treaty (TCT). However no other fields relevant to transport have achieved a harmonisation level above 25%, showing the need to accelerate the process of bringing the framework for all transport modes closer to the EU *acquis*.

The last Competitiveness Outlook recommended co-operating and exchanging experiences with other WB6 economies. This has taken place, especially through the Transport Community Permanent Secretariat (TCPS) (Transport Community, n.d.<sup>[171]</sup>), cross-border co-operation programmes (EC, 2020<sup>[172]</sup>), and projects related to transport facilitation at border crossing points (BCPs) with Albania, Kosovo and Serbia. This co-operation and exchange of good practice needs to be regularly enhanced and intensified, as the proper development of a transport vision and planning can only take place through regular regional discussion, leading to a single and competitive regional transport market.

The funding for investment in road transport infrastructure has fallen since the last assessment, while it increased for rail infrastructure during the same period. The same trend applies for spending on road and rail maintenance.

The methodology applied for **transport project selection** is not clearly presented in the strategy. The government has provided a multi-criteria analysis tool for project prioritisation; however, it does not cover cost-benefit analysis (CBA) or safety criteria. There are no national CBA guidelines, so international practices and guidelines are used instead. National guidelines for transport projects, including all accompanying survey, analysis and technical instructions, need to be developed and updated every few years. The single project pipeline (SPP)<sup>128</sup> was developed to cover 2014-18, but it has only been updated once since the last assessment, in 2018 (Government of North Macedonia, n.d.<sup>[173]</sup>). The SPP should be monitored regularly, but the only report shared by the government is from 2015 (Government of North Macedonia, n.d.<sup>[174]</sup>). There was a proposal by the transport ministry for an update of the SPP in 2019 but it was not adopted by the National Investment Committee. The government does not have enough human capacity to select and prioritise transport projects in an effective and co-ordinated way. *Ex post* monitoring of the methodology and prioritisation processes needs to be developed and regularly applied (on an annual basis), and the prioritisation framework regularly adjusted accordingly.

In the area of **implementation and procurement**, the procurement rules applicable to the transport sector have been completely harmonised with the TCT, as mentioned above. Alternative procurement methods are allowed, but the national bodies in the transport sector do not have the capacity to execute their responsibilities for public procurement even though roles and responsibilities are clearly defined. The implementation strategy for transport projects is not complete: the processes of implementation from procurement to *ex post* monitoring are not defined, while only an overall action plan has been developed within the NSTS. Projects funded from the national budget are procured according to the Law for Public Procurement. Projects and grants funded by international financial institutions are also subject to the national public procurement law (Government of North Macedonia, 2019<sup>[175]</sup>).

Even though it was recommended in the previous Competitiveness Outlook in 2018, there is still no regional exchange of good practice and lessons learned from the implementation and procurement of public-private partnership (PPP) projects. National bodies have not been given oversight of procurement and monitoring of PPPs. There is no clear evidence of procurement procedures having been consistently monitored, or procurement procedures or project outputs being evaluated. However, there are regular internal audits of operations and audits related to the Instrument for Pre-Accession Assistance (IPA). The Central Financing and Contracting Department<sup>129</sup> develops annual reports on the lessons learned from

project procurement and implementation, for application in upcoming projects, but it remains to be seen how far they will inform future project procurement processes.

The key objective of a well-developed **asset management** system should be to provide justification for the maintenance budget, and to help direct limited funds towards those areas where the return on investment will be greatest. A soundly developed system is an integral component of the transport planning, identification, prioritisation, implementation and monitoring processes. The Government of North Macedonia is in the early stage of developing an asset management system for the transport sector. So far, only development of the road<sup>130</sup> and railway sectors have been started (Government of North Macedonia, 2019<sup>[176]</sup>). An asset management<sup>131</sup> system is still not mandatory for every transport mode, and has only been applied to a certain level in road transport. Public Enterprise State Roads and Public Enterprise Macedonian Railways Infrastructure are responsible for installing an asset management system for road and railways.

The Road Asset Management System (RAMS) is currently used as the road databank and road reference system. There is a portal offering a single point of entry into all RAMS components. Data collection has been conducted using ground penetration radar (for almost 4 400 km of state roads) and weight-in-motion measurements (for 20 locations). The results of the data analysis are presented in the global information system (GIS) application through visualisation. The rail sector has asset management software, but it is not being used due to lack of supporting facilities<sup>132</sup> and also because the Railway Infrastructure Management System (RIMS) needs to be updated. The newly developed bridge management system, subject of a recent tender in 2019 (Government of North Macedonia, 2019<sup>[176]</sup>), will be a component of the RAMS. It will need to be able to provide asset valuations, works programme monitoring, organisation and human resources, and budgets and use the outputs for reporting (annual report, key performance indicator, multi-annual programmes). The government needs to make greater efforts to follow and implement regional asset management plans.<sup>133</sup>

Investment in road infrastructure is considerably higher than other transport modes due to the current construction of new motorways and highways (Table 24.18). Investment in rail infrastructure needs to be multiplied to achieve a similar level as the EU rail infrastructure market. The current plan by the government is to invest 100-400% more annually in the period 2020-22 than in 2019. Maintenance of road infrastructure is slightly below the EU and OECD average, but maintenance spending saw a 30% increase from 2019 to 2020.

**Table 24.18. Trends in transport infrastructure investments and maintenance in North Macedonia (2017-19)**

	Investment costs					Maintenance costs				
	Change over 2017-19 (%)	2018 (road) 2019 (rail) (EUR mn)	Share of GDP (2019) (%)	OECD average (2018) (% GDP)	EU average (2018) (% GDP)	Change over 2017-19 (%)	2018 (road) 2019 (rail) (EUR mn)	Share of GDP (2019) (%)	OECD average (2018) (% GDP)	EU average (2018) (% GDP)
<b>Road infrastructure</b>	-19.5	157	1.24	0.46	0.38	-9.9	11.8	0.09	0.18	0.15
<b>Rail infrastructure</b>	+125	12.65	0.1	0.17	0.31	+6	14.96	0.001	0.16	0.16

Note: For road infrastructure, the comparison period is 2017-18 due to lack of data. OECD and EU average represents the average value for the counties with available data.

### *Sub-dimension 11.2: Governance and regulation*

Reforms have continued<sup>134</sup> in the field of **aviation regulation**. The Single European Sky (SES) I package has been fully transposed into national law, bringing North Macedonia significantly closer to the EU *acquis*, but the SES II package provisions have only partially been transposed.<sup>135</sup> Safety Culture,<sup>136</sup> a programme covering safety risk assessment and safety assurance, has not yet been adopted. The State Safety Programme is currently being drafted by the Civil Aviation Authority (CAA).

The Airport Charges Directive is an important piece of EU legislation guiding the way charges should be set and monitored. They should be based on non-discrimination and transparency principles set by the EU, and quality standards related to the service-level agreements for services provided at the airport. The government has set a deadline for transposing it into national law (October 2021), but the process has not yet started. The market is not yet monitored in line with the Air Service Regulation, which provides the EU economic framework for the granting and oversight of operating licences of community air carriers, market access, airport registration and leasing, public service obligations, traffic distribution between airports, and pricing.

Bilateral co-operation in civil aviation has advanced since 2018, as the CAA has signed memorandums of understanding (MoUs) with Greece, Poland, Russia and Singapore. Many of these MoUs have been used for the exchange of experts and carrying out oversight and other activities as part of the aviation authorities' responsibilities.

Air traffic in North Macedonia is growing: the total number of passengers carried from all airports increased by approximately 30% in the period 2017-19, and amounts to 2.67 million passengers in 2019. In comparison, the global average increased by 11.7% over the same period (IATA, 2020<sup>[180]</sup>; Statista, n.d.<sup>[181]</sup>). Given the significant growth in aviation and its projected importance for the economy, it is important that North Macedonia continues regulatory reforms and brings the governance of the aviation sector closer to European standards and international best practice.

There has been a slight stagnation in progress in **rail regulation** since the last assessment. The dominant state-owned railway enterprise, Macedonian Railways, was separated into two state-owned companies in 2007: one managing infrastructure (Macedonian Railways and Railway Undertaking) and the other managing operations (Macedonian Railway Transport). Although the network monopoly was unbundled, the railway market is open only to national companies until North Macedonia joins the EU (For more information see: Sub-dimension 2.2: Services trade restrictiveness). Only 18% of the currently applicable railway legislation to North Macedonia prescribed in the TCT has been fully transposed and implemented, 5% is partially transposed and implemented, 75% is not transposed, and the rest remains unclear (only 10% of the total was not considered to be applicable). Progress has been made in the harmonisation of train driver licensing, passenger rights and transport of dangerous goods, while partial achievements have been made in the fields of rail safety and interoperability. Other fields such as market access, interoperability, railway safety, transportable pressure equipment and working time require further efforts to transpose and implement the TCT.

Several other key reforms in the railway sector remain outstanding. For instance, no more than 25% of the regional Rail Action Plan created by the TCPS has yet been implemented. The Rail Freight Corridor Regulation and Technical Specifications for Interoperability have not yet been transposed. The Network Statement (NS) for services facilities is incorporated in the NS for railway infrastructure. The National Investigation Body (NIB), charged with investigating accidents as a key input for the improvement of rail safety performance, has not been established yet. The Passenger's Rights and Obligations Directive has been transposed but will only come into force when the Republic of North Macedonia enters the EU.

On a positive note, North Macedonia has advanced bilateral co-operation in the railway sector, by signing agreements to facilitate border crossings with Serbia and Kosovo, and initiating an agreement with Greece for two additional BCPs. The utilisation of the railway network was almost unchanged between 2017 and

2019, amounting to 2 454-2 474 trains per km of track, which is only approximately 15% of the EU average in 2017 (EC, 2019<sup>[182]</sup>). Rail network utilisation measured using passengers and goods present a slightly positive trend for passengers and a positive trend for freight (Table 24.19).<sup>137</sup>

**Table 24.19. Trends in rail transport of passengers and goods in North Macedonia (2017 and 2019)**

Rail network utilisation	Change over 2017-19 (%)	2019 (million)	Share of the EU average (2017) (%)
Passengers (passenger*km/km of track)	+4.2	0.07	3.2
Freight (tonnes*km/km of track)	+26.5%	0.38	19.6

Source: (EC, 2019<sup>[182]</sup>), *Statistical Pocketbook 2019: EU Transport in Figures*, [https://ec.europa.eu/transport/facts-fundings/statistics/pocketbook-2019\\_en](https://ec.europa.eu/transport/facts-fundings/statistics/pocketbook-2019_en); (MAKStat, 2021<sup>[183]</sup>), *Passenger and freight transport, by years*, [http://makstat.stat.gov.mk/PXWeb/pxweb/en/MakStat/MakStat\\_Transport\\_PatenTransport/560\\_Trans\\_MK\\_T39\\_en.px/](http://makstat.stat.gov.mk/PXWeb/pxweb/en/MakStat/MakStat_Transport_PatenTransport/560_Trans_MK_T39_en.px/).

The current investment levels (Table 24.18) show the dominance of investment in road transport. More investment in the railway sector will be needed to improve the quality of network and in turn increase demand by passengers and shippers. If North Macedonia succeeds in keeping its high mode share for rail freight (Table 24.19), and increases the rail passenger mode share, it will indicate sustainable growing demand. Such a growing and open market would lead to more efficient operation while also achieving lower prices. Even though there has been some increase in rail transport, there is still much to be done. In order to reach EU average levels of network utilisation, there will need to be a full opening of the market, incentives for shifting freight from road to rail, the development of rail freight corridors and the development of multimodal facilities. These will enable rail transport to dominate in North Macedonia, which will directly lead to much greater cost-effectiveness of its transport infrastructure assets.

In 2019, **road market regulation** was significantly improved with the establishment of the Integrated Border Crossing (one-stop-shop<sup>138</sup>) with Serbia. This was the outcome of the Agreement on the Establishment of Joint Controls at the Preševo-Tabanovce International Border Crossing, through which Serbian and North Macedonia customs and police officers work together in the same "office". The total number of bilateral international road transport agreements has increased since the last assessment to include one more country, Lithuania.<sup>139</sup> Based on information provided by the Ministry of Transport and Communications, 16% of the legislation prescribed by the TCT is fully transposed and implemented, 30% is partially transposed and implemented, 30% is not transposed, and the rest remains unclear. North Macedonia has continued to participate in the European Conference of Ministers of Transport multilateral quota system, which enables hauliers to undertake an unlimited number of multilateral freight operations in the 43 European countries participating in the system. The national legislation complies with the road haulage qualifications standards for companies, managers and drivers under the Quality Charter for Road Haulage.

The average age of passenger cars increased by 3% in the period 2017-19 to 19.3 years, which is almost double the EU 2018 average of 10.6 years (European Automobile Manufacturers Association, 2019<sup>[184]</sup>). Bearing in mind the environmental impact of old vehicles, incentives are needed to rejuvenate the vehicle fleet, similar to the recently implemented programme in Serbia for purchasing both new and electric vehicles.

Road transport has a significantly higher mode share than rail: 96.7% compared to 3.3%, while on average across the EU, road transport accounted for 75.3% and rail 18.3% in 2018. (Eurostat, 2020<sup>[185]</sup>). North Macedonia has a high road freight share, with a 86% heavier utilisation of roads than the EU average (Table 24.20). The negative effects of this on air pollution and climate change are obvious, so incentives to shift freight from road to rail could have a positive environmental impact.

**Table 24.20. Trends in road transport of passengers and goods in North Macedonia (2017 and 2019)**

Road network utilisation	Change over 2017-19 (%)	2019 (million)	Share of the EU average (2017) (%)
Passengers (passengers*km/km of road)	-16.1	0.072	7.21
Freight (tonnes*km/km of road)	+5.8%	0.71	186

Source: (EC, 2019<sup>[182]</sup>), *Statistical Pocketbook 2019: EU Transport in Figures*, [https://ec.europa.eu/transport/facts-fundings/statistics/pocketbook-2019\\_en](https://ec.europa.eu/transport/facts-fundings/statistics/pocketbook-2019_en); (MAKStat, 2021<sup>[183]</sup>), *Passenger and freight transport, by years*, [http://makstat.stat.gov.mk/PXWeb/pxweb/en/MakStat/MakStat\\_Transport\\_PatenTransport/560\\_Trans\\_MK\\_T39\\_en.px/](http://makstat.stat.gov.mk/PXWeb/pxweb/en/MakStat/MakStat_Transport_PatenTransport/560_Trans_MK_T39_en.px/).

The COVID-19 outbreak is affecting the global transport market, and European transport and mobility (including the WB6 economies) are no exceptions. In the second quarter of 2020, North Macedonia introduced measures at its borders and customs controls to enable the provision of essential goods and medical equipment, contributing to a low number of infected individuals at the border crossing area. “Green lane” measures were introduced on the major corridors for the transport of emergency goods. It should take no longer than 15 minutes to pass through these “green lane” crossings, including any checks and screenings, so procedures have to be minimised and streamlined. This initiative has been endorsed and implemented by all regional economies and represents a good example on how good cooperation of the regional economies could generate benefits on the region (Transport Community/CEFTA, 2020<sup>[186]</sup>).

During the first quarter of 2020, North Macedonia had started developing technical documentation to pilot an electronic border queuing management system (e-QMS), as part of a joint project with four economies along the Corridor X (Croatia, Greece, Hungary and North Macedonia), inspired by the one installed in Baltic countries, but also endorsed by the Ministerial Council of the TCPS through the regional Transport Facilitation Action Plan (Transport Community, 2020<sup>[187]</sup>). Technical documentation is expected to be finalised during 2021 and the pilot system should start operation in 2022. This system will support the Connectivity Reforms Measure, aiming at the creation of more competitive, safe and reliable transport systems and network, to reduce waiting times at the border areas and replace physical queues with virtual ones. These measures could have a direct impact on how border crossing in the region could be treated in the future, by installing measures which minimise crossing time.

The only **inland waterways** (IWW) market in North Macedonia is for passenger transport on Ohrid Lake during the summer period. The national transport strategy does not include a budget for IWW transport. Currently, according to the government, 43% of the IWW legislation in the TCT is not currently applicable to North Macedonia, while of remaining legislation, 4% is fully transposed and implemented, 23% is partially transposed, and 54% is not transposed at all, with the remainder being unclear. The areas which are fully aligned are related to access to the profession, while the partially aligned areas are related to access to the market, the harmonisation of conditions for obtaining boatmasters’ certificates, and recognition of national boatmasters’ certificates for the carriage of goods and passengers. All other fields related to safety, transport of dangerous goods, environments, etc. have not yet been transposed and implemented.

Monitoring indicators to assess performance for all transport modes are either non-existent or not properly established. Some of the missing indicators include average user costs, travel time satisfaction levels, reliability, value of assets, market research and customer feedback, the quality of user information, and audit programmes. The government has not yet planned regular data surveys (for instance their purpose, and the level of data needed have still to be planned, and budgets allocated). Surveys have only been conducted for the purposes of specific projects and not for regular transport infrastructure assessment and planning. The government has confirmed that it intends to conduct the data surveys as one of its next projects, which will provide a base for future quality assessments of the transport network.

### Sub-dimension 11.3: Sustainability

North Macedonia has taken some moderate steps to improve **road safety**, but overall its progress has stagnated since the last assessment. The National Strategy for Improving Road Safety (NSIRS) 2015-20 has expired and plans for an updated strategy have still not been presented. The government appointed a co-ordination body to follow up implementation of the strategy, and to develop annual implementation reports which should be approved by the Assembly, but in practice this body has not prepared any reports. There have been no monitoring reports on the implementation of the strategy; the only annual report in this field is on the work of the Road Traffic Safety Council. The NSIRS is not aligned with the TCT and also lacks any budget to carry out the measures and actions defined in the strategy.

The Regional Road Safety Action Plan (Transport Community, 2020<sub>[188]</sub>) was endorsed by the Ministerial Council of the TCPS in October 2020; North Macedonia needs to adapt its national plans to achieve the goals set out within this plan. The goal of the European Commission's Policy Orientation on Road Safety 2011-20 (EC, 2010<sub>[189]</sub>) was to reduce road fatalities by 50% between 2010 and 2020 as part of the Decade of Action for Road Safety, officially proclaimed by the United Nations (UN) General Assembly in March 2010. This goal would have been difficult to achieve given that North Macedonia has seen decreases of approximately 1.5% per year over the period 2010-19. Therefore, it will need to make significant additional efforts to reach the new zero deaths goal in the European "Vision Zero" strategy for 2050, with an intermediate goal of a 50% reduction in road fatalities during 2020-30 (EC, 2019<sub>[190]</sub>). As it has started the new decade without a strategy, expectations should not be high. In addition, the national goal of reducing the number of road fatalities by 30% during 2015-20 (Government of North Macedonia, 2021<sub>[191]</sub>) is also not expected to be achieved for the same reasons given above. The number of road fatalities per million inhabitants in North Macedonia was 63.6 in 2019, 24.7% higher than the EU average of 51 (Table 24.21).

**Table 24.21. Road safety trends in North Macedonia (2010-19)**

Road safety trends	North Macedonia	EU
Change in the number of fatalities 2010-19 (%)	-18.5	-23
Number of fatalities per million inhabitants (2019)	63.6	51

Source: (EC, 2020<sub>[192]</sub>), *2019 road safety statistics: What is behind the figures?*, [https://ec.europa.eu/commission/presscorner/detail/en/qanda\\_20\\_1004](https://ec.europa.eu/commission/presscorner/detail/en/qanda_20_1004); (Eurostat, 2021<sub>[193]</sub>), *Data browser: Victims in road accidents by NUTS 2 regions*, [https://ec.europa.eu/eurostat/databrowser/view/tran\\_r\\_acci/default/table?lang=en](https://ec.europa.eu/eurostat/databrowser/view/tran_r_acci/default/table?lang=en).

The figures in Table 24.21 indicate some moderate progress, but it is not enough to reach the goals in the strategy or to match the achievements of the EU and regional economies. Much greater efforts are needed not only to harmonise the legislation with the TCT, but also in the fields of education, awareness campaigns, enforcement, etc. (Box 24.15).

#### Box 24.15. Innovative ideas in road safety: Road safety social impact bonds in Montenegro

In 2018, the UNDP in Montenegro, in co-operation with the key national players in road safety, developed the new idea related to road safety social impact bonds. These are an innovative alternative performance-based public financial instrument, which shifts the policy framework from inputs and outputs to outcomes and value for money. The idea is to involve the private sector in investing in road safety improvements with the main aim of strengthening sustainability jointly with the public sector. The public partner commits to paying outcome payments to the investor if and only if the predefined and measurable social goals are met. This idea has great potential for other economies in the region (and beyond) to replicate and scale up the model.

Source: (UNDP, n.d.<sub>[194]</sub>), *Rethinking road safety in Montenegro*, [www.me.undp.org/content/montenegro/en/home/projects/RoadSafety.html](http://www.me.undp.org/content/montenegro/en/home/projects/RoadSafety.html).

The **environmental sustainability** goals<sup>140</sup> for the transport sector are addressed through many different strategies, making them difficult to monitor. Therefore, it will be necessary to integrate a clear chapter dealing with sustainability in all transport modes into the national transport strategy or the transport sector strategies for each specific mode. There is no evidence that the government is preparing an overarching environmental sustainability strategy.

The only overview of the current situation is in the Study on the Transport Sector Analysis of Policies and Measures, developed by the United Nations Development Programme (RCESD, 2017<sup>[195]</sup>), which found that road transport was the dominant energy consumer out of road, rail and air transport, accounting for 97% of transport energy consumption, with 87% due to passenger cars. This is slightly higher than the EU road transport average of 94%. Transport contributed 13% of North Macedonia's total greenhouse gas (GHG) emissions in 2014, and 20.5% of the total emissions from the energy sector. North Macedonia levies environment-related taxes on buying and using passenger motor vehicles (e.g. importing and registering vehicles, and buying fuel). The study also assessed the impact of the new scenario of the environmental tax on vehicle registrations, imports and fuel, and found that if all the funds collected from these taxes were used directly to subsidise electric vehicles (e.g. at EUR 5 000/vehicle), they could cover subsidies for 870-4 340 vehicles per year.

**Combined transport**<sup>141</sup> of goods is the most cost efficient, reduces environmental pollution, and increases co-operation between the freight forwarding network companies. However, the legal and regulatory framework to support it still needs to be developed in North Macedonia. North Macedonia lacks a combined transport strategy and does not plan to develop one. The core activity in this area has been the preparation of the design documentation for the intermodal terminal Trubarevo near Skopje. The total tonnes of goods transported through combined transport increased by 30% in the period 2017-19, reaching 138.8 million tonnes-km. This represented 1.3% of the freight transport in North Macedonia, significantly below the EU average, where container transport was estimated in 2017 to make up 6.2% of total road freight transport (Eurostat, 2019<sup>[196]</sup>).

The World Bank's Logistics Performance Index (LPI) (World Bank, 2018<sup>[27]</sup>), is a multi-dimensional assessment and international benchmarking tool focused on trade facilitation. In the last assessment in 2018, it ranked North Macedonia 81<sup>st</sup> out of 160 ranked countries, with an LPI score of 2.7. This is slightly below the world average (2.85) and far below the EU average (3.52). The best score achieved by North Macedonia was for the international shipments indicator,<sup>142</sup> where it was ranked 67<sup>th</sup>, and the worst for was for the tracking and tracing indicator,<sup>143</sup> where it ranked 100<sup>th</sup>.

Data collection, which is currently very weak, needs to be one of the key actions for assessing the performance of all sustainability areas. A strategy for data collection needs to be established to assess the transport sector, which will directly influence the prioritisation within transport policy in general.

### ***The way forward for transport policy***

North Macedonia has taken some important steps towards developing a competitive transport sector, as presented above, but special attention should be paid to the following:

- **Develop a national centralised monitoring system** for the project development and project implementation process, covering each defined indicator and/or transport mode separately through independent monitoring departments. Such a system will help support follow up and updates in the following areas: implementation of strategies and legislation, project identification and selection, procurement processes, project implementation, and *ex post* monitoring, among others.
- **Update the national transport strategy every four years.** The existing strategy does not propose any periodic updates, which would need to be based on regular monitoring. Unfortunately, the monitoring report of the implementation of the past strategy (for 2007-17) was not used for the

latest strategy. The current monitoring report, which is in the process of being approved by the government, needs to be used to extract the lessons learned and use them to update the strategy.

- **Develop and tailor cost-benefit analysis guidelines specifically for North Macedonia.** It is very important for each economy to develop its own guidelines with accompanying national technical instructions needed for a proper CBA. The guidance needs to be updated often, as a maximum every two years. A good example is the United Kingdom's Transport Analysis Guidance,<sup>144</sup> which provides all the information on the role of transport modelling and transport project appraisal tailored to the UK market. To ensure consistency in the discount rates used for similar projects, economies need to develop their own benchmarks for all technical and economic parameters, including the financial and economic discount rate in the national guidance documents, and then apply them consistently in project appraisal at the national level. The empirical research needs to be conducted at a national level to generate input data for calculating externalities.
- **Develop a tool for project identification, selection, prioritisation and implementation.** This tool needs to be applied to all transport projects in North Macedonia. Albania and Serbia have both recently introduced well-developed systems, currently in the initial stage of implementation (Box 24.16). These could be used as a model.
- **Ensure that transport facilitation remains a key priority.** North Macedonia needs to implement more OSSs to simplify border crossing procedures and shorten crossing time, alongside other measures in the Regional Action Plan for Transport Facilitation (Transport Community, 2020<sup>[187]</sup>), which was endorsed in October 2020. These include: electronic queuing management systems, improving and upgrading of existing ICT infrastructure, constructing or modernising infrastructure to remove physical and technical barriers and increase existing capacities, and capacity building to improve performance efficiency. Implementing these measures will be a key part of integrating North Macedonia into the regional transport market, increasing the competitiveness and connectivity of the region, and driving deeper integration into the broader European transport market. It will directly improve the transit times of some key goods that depend on quick, cost-effective and timely delivery, but will also influence more investment in the transport infrastructure.
- **Implement asset management principles in the transport sector in line with the national inventory system.** Developing sound asset management practices<sup>145</sup> to enable economies to collect data (through annual data collection planning and budget allocation) and to manage and analyse conditions across all the transport modes. This information can then be used to optimise transport sector maintenance strategies and justify maintenance budgets, directing limited funds into those areas where the return on investment will be greatest. Performance-based maintenance contracts (PBMC), are already implemented, though not extensively, in some WB6 economies such as Albania, Bosnia and Herzegovina, and Serbia (Transport Community, n.d.<sup>[197]</sup>). They can be an essential component of the road asset management system and if well-developed, lead to good road conditions at relatively low cost. The quality of the transport infrastructure affects an economy's attractiveness for foreign direct investment.
- **Develop an integrated environment and transport action plan and a framework for environmental sustainability for the sector.** This plan needs to integrate the existing indicators and to include any missing ones in a framework for environmental sustainability in the transport sector. A good example was developed by the European Environmental Agency in the form of the Transport and Environment Reporting Mechanism (EEA, 2000<sup>[198]</sup>), which prescribes indicators for tracking of transport and environmental performance in the EU. Measures and indicators would then be applied in the strategies to which they belong, including the updated NSTS.

### Box 24.16. Tools for identifying, selecting, prioritising and implementing transport projects in Albania and Serbia

The only two economies in the region with a sound tool for transport project identification, selection, prioritisation and implementation are Albania and Serbia.

In 2018, **Albania** adopted the Decision on the Public Investment Management Procedures. For the purpose of budget planning on investment expenditure, projects are divided into two groups: 1) capital administrative expenditures related to equipment, furniture, computers, IT, etc.; and 2) expenditure on investment projects, including capital expenditure on infrastructure, such as new construction, reconstruction and rehabilitation with design costs, expropriation costs, purchase of larger technological equipment, implementation of works, supervision, etc.; and capital expenditure for capacity development, including research projects, technical assistance and capacity building.

Albania applies the following project management cycle: 1) project identification based on the analysis of public needs; 2) project evaluation and preparation with the evaluation of the economic and financial justification; 3) project approval and financing; 4) project implementation; 5) monitoring of the project implementation, which should ensure that the project activities are proceeding as planned; and 6) evaluation and audit, including reporting on the physical and financial implementation audit against the financial rules and the project performance indicators. Based on this project cycle, the following steps are used: 1) identification of the project idea; 2) review of the draft idea by the Project Management Team Leader; 3) review of the draft idea by the Secretary General; 4) detailed project preparation and evaluation, shortlist of alternatives; 5) submission of the investment project proposal to the ministry responsible for investment projects; 6) review of the proposal by the Council of Ministers; and 7) final approval after the approval of the investment projects within the annual budget.

As per Decision No 290 from 11 April 2020, a financial management information system has been installed in every spending unit, including all ministries, and it is integrated into various departments to be used for all steps in the project management cycle.

In **Serbia**, the procedure for project identification, analysis of relevance, pre-selection, funding, implementation and monitoring is clear and publicly available, and co-ordinated by the Ministry of Finance. This procedure was adopted in 2019 through the Rulebook on the Management of Capital Projects.

The prioritisation process, which is applied to all projects, applies, among other criteria, a CBA, environmental and social impact assessment, and a safety assessment.

Once the project is approved for financing through a very similar procedure to the one described above for Albania, there is a special procedure for the preparation of a plan for the project implementation.

During the project implementation, a specific procedure exists for the reporting. One type of report is the interim report for the presentation of the current project status, covering the activities carried out and the plan for the execution of the remaining project activities. At the end of the project a final report needs to be developed.

Projects are divided into three categories: 1) less than EUR 5 million; 2) EUR 5-25 million; and 3) over EUR 25 million. Those in the third category undergo *ex post* monitoring three years after the completion of works, which is a significant advance in the local legislation.

## Energy policy (Dimension 12)

### Introduction

North Macedonia has shown tremendous progress since the last Competitiveness Outlook assessment in the area of energy policy. This progress is reflected in North Macedonia's score of 3.7, well above the previous score of 2.0, with improvements in every sub-dimension. While North Macedonia was lagging in the last CO, together with Albania it is leading the WB6 in almost every aspect this time around (Table 24.22). However, this progress does not mean that North Macedonia does not need to continue to improve. As the scores suggest, there is further room for improvement. This message is echoed by the Energy Community Secretariat, which concludes that up to 42% of the Third Energy Package (Box 24.17) still needs to be transposed, and 41% of additional implementation is required (Energy Community Secretariat, 2020<sub>[203]</sub>).

**Table 24.22. North Macedonia's scores for energy policy**

Dimension	Sub-dimension	Score	WB6 average
Energy policy dimension	Sub-dimension 12.1: Governance and regulation	3.7	3.1
	Sub-dimension 12.2: Security of energy supply	3.6	2.9
	Sub-dimension 12.3: Energy markets	3.7	3.0
North Macedonia's overall score		<b>3.7</b>	<b>3.0</b>

### Box 24.17. The EU's Third Energy Package

In 2007, the European Commission proposed a new legislative package, the Third Energy Package, in an effort to further enhance and harmonise the EU's Energy Union and internal energy market. This package entered into force in September 2009 and consisted of several important directives and regulations.<sup>1</sup>

The Third Energy Package largely rests on four pillars: 1) transparency; 2) non-discrimination; 3) a strong, independent national regulator; and 4) sustainability. Together, these pillars represent EU best practice and aim to establish a fair and level-playing field for competitive energy markets that seek to optimise scarce resources. For example, the first two pillars drive the need for unbundling the transmission and distribution system, combined with guaranteed, non-discriminatory and open access to those networks to all users backed by transparent rules and prices. Without such unbundling requirements and third-party access, it is very possible that the system operators, which are natural monopolies, could prohibit market entry and lead to sub-economic market outcomes.

In addition to these pillars, the Third Energy Package also seeks to enhance international co-operation within the EU by establishing an international regulatory agency (the Agency for the Cooperation of Energy Regulators – ACER) and promoting regional integration. Regulation (EC) No 714/2009 contains clauses that open and allow for further regulation to be drafted to enhance harmonisation in the form of network codes.

In 2019, the EU introduced the Clean Energy Package which supplements and in part replaces the Third Energy Package. That is, while the Clean Energy Package retains the key legislative aspects of the Third Energy Package, it expands measures for sustainability and green energy growth, as well as consumer rights and protections. Despite this, the Third Energy Package remains a good starting point for all WB economies as many of its key pillars have so far not been introduced or implemented in their entirety in the region. Aligning with it is also a requirement for the WB economies as members of the Energy Community, whose *acquis* reflects most of the Third Energy Package. Moreover, with many WB6 economies aspiring to become EU members, the transposition and implementation of the Third Energy Package and subsequent Clean Energy Package are accession requirements. To conclude, the Third Energy Package provides for the implementation of international best practice on competitive markets, and is also a firm requirement for the Western Balkan economies.

1: Directive 2009/72/EC concerning common rules for the internal market in electricity and repealing Directive 2003/54/EC; Directive 2009/73/EC concerning common rules for the internal market in natural gas and repealing Directive 2003/55/EC; Regulation (EC) No 714/2009 on conditions for access to the network for cross-border exchanges in electricity and repealing Regulation (EC) No 1228/2003; Regulation (EC) No 715/2009 on conditions for access to the natural gas transmission networks and repealing Regulation (EC) No 1775/2005; Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators.

### **State of play and key developments**

Overall, North Macedonia consumed around 30 TWh of energy in 2018 (Table 24.23), down from nearly 32 TWh in 2017. Driving this decline in gross inland consumption<sup>146</sup> was a decline in consumption from the commercial and household sectors. Most of the energy was consumed in the form of coal and oil and petroleum products.

Meanwhile gross electricity production rose slightly by 0.1% in 2018 to just above 5.6 terawatt hours (TWh). This slight increase hides an interesting development, which is that coal-fired generation declined by nearly 16%, and was replaced by renewable generation which expanded by nearly 52% to generate nearly 2 TWh. This growth was driven by hydrogeneration, which expanded 61% to 1.8 TWh in 2018, though wind fell by 4% to just under 0.1 TWh (Figure 24.14).

**Table 24.23. North Macedonia's energy balance (2018)**  
(GWh)

	Total	Solid fossil fuels	Natural gas	Oil and petroleum products (excluding biofuel portion)	Renewables and biofuels	Electricity	Heat
Primary production	13 180	9 305	0	0	3 875	..	0
Imports	19 292	1 368	2 430	12 813	384	2 297	0
Exports	1 741	7	0	1 352	5	377	0
Gross available energy	29 910	9 743	2 429	11 556	4 263	1 920	0
Total energy supply	29 636	9 743	2 429	11 282	4 263	1 920	0
Gross inland consumption	29 910	..	..	..	..	..	..
Primary energy consumption	29 324	..	..	..	..	..	..
Final energy consumption	21 556	..	..	..	..	..	..
Transformation input - electricity and heat generation - energy use	12 776	8 739	1 918	151	1 967	0	0
Available for final consumption	21 547	1 004	504	11 108	2 285	6 105	541
Final consumption - non-energy use	586	0	0	586	0	..	..
Final consumption - energy use	21 282	1 324	504	10 522	2 285	6 105	541
Final consumption - industry sector - energy use	4 782	1 298	425	1 436	72	1 546	6
Final consumption - transport sector - energy use	8 182	0	8	8 161	1	12	..
Final consumption - other sectors - energy use	8 317	26	71	924	2 212	4 548	535
Gross electricity production	5 607	2 848	746	47	1 966	..	..
Gross heat production	624	0	624	0	0	0	..

Note: For general gross inland consumption please see Table 24.24 below.

### *Sub-dimension 12.1: Governance and regulation*

North Macedonia has made significant progress on its **energy policy and legislative framework** since the last Competitiveness Outlook assessment. With the adoption of the new Energy Law No. 08-3424/1 in May 2018, the economy has transposed a significant part of the Third Energy Package, and hence the Energy Community *acquis*. Some work remains to fully transpose and implement the package, including secondary legislation.<sup>147</sup> According to the Energy Community Secretariat, North Macedonia has transposed 58% of the Third Energy Package into national legislation, with a further 36% having been partially transposed. Implementation is only at 59% on average, although implementation in the power sector is well above 80% (Energy Community Secretariat, 2020<sup>[203]</sup>).

Most notably, North Macedonia adopted an energy strategy in December 2019 – the Energy Development Strategy 2040 (Ministry of Economy, 2019<sup>[205]</sup>). This provides clear guidance on the direction of the energy sector up to 2040, although an action plan for its implementation is still pending. North Macedonia was also the first contracting party of the Energy Community to finalise a draft National Energy and Climate Plan (NECP) and submit it to the secretariat for official review. The secretariat concluded that the draft provides a solid basis for the development of an ambitious final NECP. The adoption of the NECP is planned for the second half of 2021, which would pave the way for tackling the transposition of the Clean Energy Package, which reflects the EU's latest energy market improvements.

Furthermore, the relevant Network Codes are being or have been transposed.<sup>148</sup> Regardless of their national transposition status, Article 84(2) of the Energy Law does stipulate that the European Network of Transmission System Operators for Electricity (ENTSO-E) Network Code applies directly to North Macedonia.

North Macedonia's Energy Law and Electricity Supply Rules provide a clear approach to market opening and deregulation and all customers are free to select their suppliers at unregulated prices. More precisely, households and small consumers can freely choose their supplier with unregulated prices or opt to be supplied by the universal supplier at regulated prices.

In line with advanced energy policy, the **energy regulator**, the Energy Regulatory Commission (ERC), conforms with best practice in many areas. The regulator is designated by the 2018 Energy Law, in line with EU's Third Energy Package, as the sole national independent regulator. The independence of the regulator is enshrined in law. Moreover, the ERC has significant autonomy over its inner working and the

work packages it chooses to undertake. It has the power to start infringement procedures according to the provisions of the law, or other procedures in front of other competent state body, as well as to start a procedure for suspending or removing licences. ERC has extensive and clearly defined roles and responsibilities that are its exclusive purview. ERC also has extensive autonomy over the use of its financial resources, and the hiring and management of staff. The Energy Community Secretariat perceives ERC to be the best performing regulator among the WB6 regulators (Energy Community Secretariat, 2019<sup>[206]</sup>). In 2020, ERC maintained its place as the best-performing national regulatory authority in the Energy Community, together with the regulatory authority of Georgia.

Despite these positive findings, three issues affect the independence and the quality of work of the energy regulator:

1. **The selection of commissioners**<sup>149</sup> pursuant to Article 18 of the Energy Law. Although an independent board of experts preselects possible commissioner candidates, they are then filtered by the government before being presented to the parliament. This could lead to the selection of commissioners being politicised.
2. **The autonomy of the regulator over salaries.** Its staff salaries are tied to public salary conditions, which are subject to the influence of other agencies such as the State Audit Office. This could make it harder for the agency to offer a competitive salary for the sector, and hence retain employees.
3. **The human (and hence financial) resources at the disposal of the regulator.** Although ERC has sufficient resources to undertake its role today with great diligence and quality, it did highlight that it will need additional resources to maintain this quality as it takes on more roles and responsibilities.

North Macedonia has a clear vision and strategy for the **management of its energy infrastructure**, particularly with regard to its investment needs. This clear strategy arises from the existence of ten-year network development plans and the long-term strategy extending to 2040. In particular, the strategy considers the need for expansion in infrastructure subject to increasing integration of ever bigger volumes of renewable energy generation. There also appears to be extensive international donor community involvement in investment projects which could be seen as ensuring that investment projects are undertaken on the basis of international best practice. Moreover, there is a comprehensive collection of annual indicators.

The planned investment projects and studies seem to be on track, including the main transformer in substation Bitola 2, which connects MEC Bitola thermal power plant to the grid, the installation of optical ground wire on the transmission network, the strategy for the reconstruction/revitalisation of the transmission network, and the study into the effects of plug-in electric vehicles on the transmission grid. Some projects are experiencing delays, however, the delayed projects are clearly identified and information on delayed projects is publicly available in the Ten-Year Network Development Plan<sup>150</sup> of the Electricity Transmission System Operator of the Republic of North Macedonia (MEPSO). Indeed, the transparency extends to providing a detailed explanation for the delays and highlighting the adjustments to the 10-year plan. MEPSO states that “the rate of progress of the projects is on a satisfying level with certain delays, firstly because of the complex administrative procedures and adjustments to the local spatial and sociological conditions” (MEPSO, 2019<sup>[207]</sup>).

However, there are a few issues to consider. The first is that North Macedonia apparently does not fully comply with some of the Energy Community *acquis* (lack of transposition and implementation of regulations on guidelines for trans-European energy infrastructure<sup>151</sup>), although the adoption of the Law on Strategic Investments in 2020, and its amendment planned for 2021, aim to solve this issue. Second, there is no proper assets management system in place for infrastructure projects, as specified by the government. This lack of an appropriate system is particularly important given the age of the existing infrastructure, and thus the need for maintenance and modernisation.

### Sub-dimension 12.2: Security of energy supply

When considering security of supply on the basis of a diversified energy mix and sources of supply, North Macedonia's **natural gas supply framework** has some way to go. Natural gas accounts for less than 10% of gross inland consumption – in line with the WB6 average but below the EU average – while coal accounts for around one-third of consumption – lower than the WB6 but well above the EU average (Table 24.24). This suggests there is still significant potential for gasification. Natural gas imports are still heavily reliant on just one source and are associated with oil index contract pricing, which implies that prices do not necessarily reflect the economic realities of the natural gas market (for a wider exposition, see the endnote<sup>152</sup>). However, efforts are underway to interconnect with Greece and thus to tap into the Trans-Adriatic Pipeline for natural gas supplied via the Shah Deniz project from Azerbaijan.

**Table 24.24. Energy consumption (2018)**

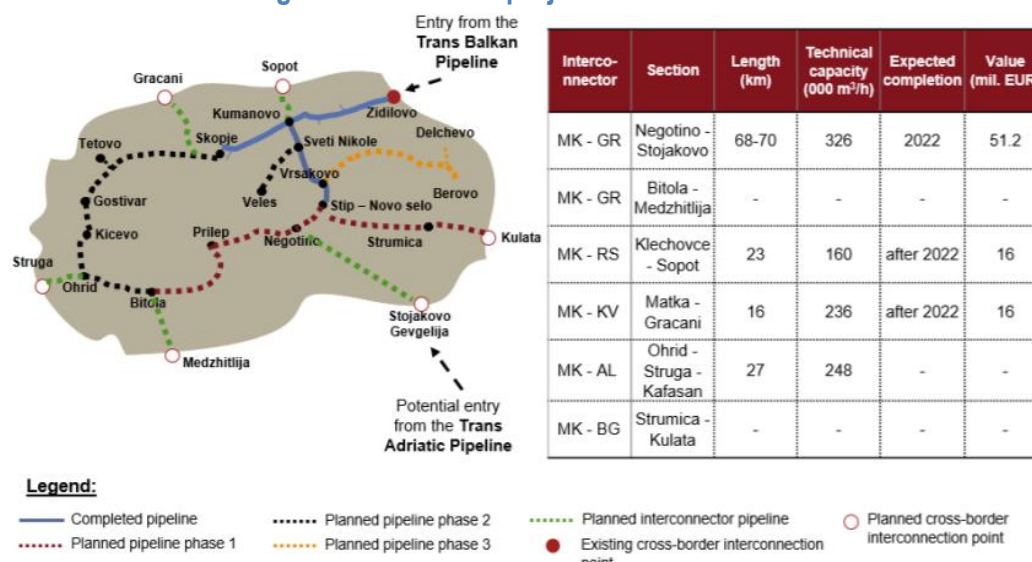

Gross inland consumption	North Macedonia		Western Balkans		European Union	
	TWh	%	TWh	%	TWh	%
Total	29.9		367.4		17207.6	
Solid fossil fuels	9.7	33%	170.2	46%	2446.7	14%
Natural gas	2.4	8%	29.9	8%	3777.3	22%
Oil and petroleum products (excluding biofuel portion)	11.6	39%	102.1	28%	5859.8	34%
Renewables and biofuels	4.3	14%	68.7	19%	2587.4	15%

Note: TWh: terawatt hour.

Source: (Eurostat, 2021<sup>[204]</sup>), *Complete energy balance*, <https://ec.europa.eu/eurostat/web/energy/data/database>.

Nonetheless, the natural gas supply framework is driven by the strategy to expand the natural gas infrastructure, gasification and ultimately the diversification of supply, as well as promoting regional interconnection. Figure 24.15 shows the planned natural gas infrastructure projects.

**Figure 24.15. Planned natural gas infrastructure projects in North Macedonia**

Source: (Ministry of Economy, 2019<sup>[205]</sup>), *Strategy for Energy Development of the Republic of North Macedonia up to 2040*, [www.economy.gov.mk/Upload/Documents/Adopted%20Energy%20Development%20Strategy\\_EN.pdf](http://www.economy.gov.mk/Upload/Documents/Adopted%20Energy%20Development%20Strategy_EN.pdf).

The **electricity supply framework** is rapidly becoming advanced. North Macedonia intends to phase coal out of its electricity generation mix, supported by the intended introduction of a carbon market. Although North Macedonia does not have a current greenhouse gas pricing mechanism, its Energy Development Strategy 2040 foresees the “introduction of carbon price and its convergence to the ETS level” (Ministry of Economy, 2019<sup>[205]</sup>). North Macedonia plans to introduce this progressively: starting with direct taxation of

CO<sub>2</sub>, then introducing requirements equivalent to the European Union Emission Trade Scheme (EU ETS), and finally joining the scheme on accession to the EU. So although North Macedonia cannot participate in the EU ETS at this stage, it does plan to undertake certain preparatory steps. These will include: mapping the installations that fall under the European Union Emission Trade Scheme and defining the scope of the scheme; arranging the allocation of allowances through designating authority and defining procedures; and designing auction platforms with built-in safeguard arrangements. It will also need to address the monitoring, reporting and verification of emissions both within the scope of deploying the tax and prior to joining the European Union Emission Trade Scheme.

However, there are some issues with regard to the electricity supply framework. Most importantly, there is some uncertainty about how far the supply framework is guided by action plans and strategies. The second key concern is that the EU regulation on risk-preparedness in the electricity sector<sup>153</sup> has not been transposed. Though it is not part of the Energy Community *acquis*, it offers benefits for planning and executing a safe and stable electricity framework. Finally, there is a need to raise public awareness of the purpose and need for greenhouse gas emission reductions and possibly pricing.

In the area of **renewable energy**, North Macedonia is in the process of deploying a system that reflects international best practice. One of the key pillars and strategic goals of the newly adopted Energy Development Strategy 2040 is to strongly increase the share of renewable energy sources to 35-45% of gross final energy consumption by 2040 from the current level in a sustainable manner. It is worth noting that this strategy was expected to be supplemented by the adoption of the National Energy and Climate (Action) Plan towards the end of 2020. According to the responses to the OECD questionnaire in 2020, this will provide a national renewable energy action plan, with targets and plans for its development. Moreover, the strategy is being supplemented by technical studies into renewable energy potential and the integration of renewable energy into the system. North Macedonia has also begun to use competitive renewable energy auctions for allocating commercial wind and solar projects, combined with a switch from feed-in tariffs (FiTs) to feed-in premiums (FiPs) (Box 24.18). Finally, it should be stressed that, in line with the latest developments in the European Union, North Macedonia promotes “prosumers”<sup>154</sup> through the guaranteed right to sell excess energy.<sup>155</sup>

#### Box 24.18. A new approach to subsidising renewable energy

Feed-in tariffs were the dominant form of financial support for renewables within the EU at the beginning of the 21<sup>st</sup> century. In this system, power plant operators receive a fixed payment for each unit of electricity generated independent of the electricity market price (Banja et al., 2017, p. 15<sub>[208]</sub>).

Feed-in tariff schemes offer several advantages, but mainly they insulate new market entrants from market price risks, which lowers their capital costs and enables private investment. The simplicity of feed-in tariffs makes them suitable for markets with a large number of non-commercial participants such as households or local community-based initiatives (CEER, 2018, p. 12<sub>[209]</sub>).

However, feed-in tariff schemes exclude producers from actively participating in the market, which hinders efforts to develop large, flexible and liquid electricity markets as the share of renewable energy grows. This limits growth to certain technologies and sizes of installations, and creates difficulties in setting and adjusting appropriate tariff levels (EC, 2013, pp. 12-13<sub>[210]</sub>). The latter has been a problem especially as costs of renewable generators have fallen rapidly in recent years.

The European Commission suggests switching from feed-in tariff to feed-in premium schemes (EC, 2013<sub>[210]</sub>). In these, plant operators sell the electricity generated directly on the electricity market and earn an additional payment on top of the electricity market price. This is received as a fixed payment or one adapted to changing market prices, thereby limiting price risks for plant operators, as well as the risks of providing windfall profits (Banja et al. 2018). Feed-in premium schemes are beneficial because they force renewable energy producers to find a seller on the market. They also ensure that renewable

energy operators are exposed to market signals. A well-designed premium scheme can limit costs and drive innovation by using a competitive process to allocate support. Such schemes also include automatic and predictable adjustments to cost calculations, which give investors the information and confidence necessary to invest (EC, 2013, p. 8<sub>[210]</sub>).

The European Commission suggests using a feed-in premium scheme in combination with the following good practice recommendations (EC, 2013<sub>[210]</sub>):

- Do not pay premiums for production in hours where the system price is negative or above the level of remuneration deemed necessary.
- Assign renewable project and associated premiums using competitive allocation mechanisms such as auctions.
- Make planned volume-based premium reductions for new installations dependent on when they are approved, connected or commissioned.
- Conduct regular, planned and inclusive reviews of premiums for new installations.

However, the Council of European Energy Regulators reports that in 2016/17, 17 of the 27 European Union member countries still used some form of feed-in tariff, although mainly for small projects, while around 16 used feed-in premiums, including to complement feed-in tariffs (EUR-LEX, 2014<sub>[211]</sub>).

For further and more detailed exploration of renewable energy subsidies and best practice please see the sources below. Meanwhile, for more information on the different renewable support schemes employed across Europe please see <http://www.res-legal.eu/home/> and for an overview of auctions and outcomes (including databases on auctions) see <http://aures2project.eu/>.

**Figure 24.16. Renewable energy as a share of gross inland consumption (1990-2018)**

Source: (Eurostat, 2021<sub>[204]</sub>), *Complete energy balance*, <https://ec.europa.eu/eurostat/web/energy/data/database>.

StatLink  <https://doi.org/10.1787/888934256178>

Despite this, renewable energy still only accounts for a small share of power generation; coal dominates, with a share of nearly 70% of the fuel mix. Overall, renewable energy accounts for about 15% of gross inland consumption, just marginally above the EU average of 14%. However, while the EU's share has been growing steadily by around 3.1% per annum since 2002, North Macedonia has shown only limited

growth (Figure 24.16). Most of its renewable energy is derived from hydrogeneration, which is subject to hydrological variations. Overall, renewable energy accounted for around 40% of North Macedonia's installed power generation capacity in 2018, with hydro accounting for 91%, at 674 MW. This is despite wind and solar offering substantial potential. Together they account for around 71% of the combined utility-scale wind, solar and hydro potential in North Macedonia. This is well above the WB6 average, where wind and solar account for around 66% of the potential (IRENA, 2019<sup>[213]</sup>).

Therefore, the most pressing issue for renewable energy in North Macedonia is promoting its attractiveness for renewable energy investment. First, although it has a FiP approach, to make it fully operational North Macedonia requires a functioning day-ahead market (DAM) to provide the appropriate baseline price. Second, while significant progress has been made in simplifying the administrative process for implementing renewable energy projects, a further reduction and simplification is possible,<sup>156</sup> which would support further investment in renewable energy by easing the administrative burden.

One consideration would be to transform its Guarantees of Origin (GOs).<sup>157</sup> While the current approach in North Macedonia to issuing GOs is compliant with the Third Energy Package, it does not conform with the Clean Energy Package.<sup>158</sup> Its restrictions on the issuing of GOs to renewable projects not receiving state aid limits the market value of renewable energy project that do and hence increases the burden on the government budget from subsidies.

The Law on Energy establishes the promotion of **energy efficiency** as one of the energy policy objectives for North Macedonia. However, the key legal act is the new Law on Energy Efficiency (adopted in February 2020), which transposes the relevant EU directives.<sup>159</sup> According to the Energy Community Secretariat, this law sets new best practice standards in the Energy Community (Energy Community Secretariat, 2019<sup>[206]</sup>). Meanwhile, the Energy Development Strategy 2040 is currently the main strategic document that outlines a vision for energy efficiency in North Macedonia.

Despite these positive steps, North Macedonia still needs to implement the secondary legislation arising from the newly adopted laws. This includes the government decree setting the energy efficiency targets, and the Fourth National Action Plan on Energy Efficiency, as well as secondary legislation on minimum energy performance requirements of buildings, the national calculation methodology, the energy performance certification of buildings, and the inspection of heating and air-conditioning systems. Finally, regarding energy labelling, the current by-law is aligned with EU Directive 2010/30/EU and so it will need to ensure compliance with EU Regulation 2017/1369 Setting a Framework for Energy Labelling and Repealing Directive 2010/30/EU.

The various state and local public entities with responsibility for energy efficiency have quite limited capacity; this urgently needs to be increased. The key authorities are the Ministry of Economy and the Energy Agency. These institutions are heavily under capacity in the number of employees and their expertise. According to the Energy Community Secretariat the significant deficiency in human resources has led to issues with the adoption and implementation of the relevant secondary legislation, despite the technical assistance available (Energy Community Secretariat, 2020<sup>[214]</sup>).

### *Sub-dimension 12.3: Energy markets*

Since the last Competitiveness Outlook, North Macedonia has made significant progress in creating an EU-style **energy market**. The positive steps include the liberalisation and price deregulation of the wholesale and retail markets, including the right to choose supplier and switching; and the integration of transparency and non-discrimination principles into the market. The universal supplier was chosen based on a competitive process, and the universal supplier is required to acquire the electricity it needs openly from the wholesale market. The balancing market is active with MEPSO procuring balancing services based on competitive principles.

However, there remain some key issues to tackle in order to complete the liberalisation of North Macedonia's energy market. The Law on Energy does stipulate a range of secondary legislation and regulatory acts. While most have been adopted, some of the acts remain outstanding. For example, the Energy Community Secretariat reported that the Rules for the Operation of Organized Markets, which are required under Article 90 Paragraph 2 of the Energy Law, have not yet been adopted<sup>160</sup> (Energy Community Secretariat, 2020<sup>[214]</sup>).

The other issue is the operational deployment of an organised electricity market. More precisely, Macedonian Electricity Market Operator (MEMO), a spin off from MEPSO, was licensed in 2019, pursuant to Article 68 and 88 of the Energy Law, to be the market operator, and, pursuant to Article 90 of the Energy Law, designated as the Organised Electricity Market Operator in 2020. However, the operational deployment of a day-ahead market is still pending subject to MEMO acquiring the associated DAM services, including a trading platform, internal clearing and settlement processes, organised electricity market rules (drafted by MEMO and approved by ERC), and relevant agreements with participants.

Similarly, there is no trading point for natural gas. Although the natural gas market is liberalised and prices are deregulated, the wholesale market lacks liquidity. This largely reflects North Macedonia's limited interconnectivity, and that its natural gas is exclusively sourced from Russia and imported via Ukraine, Moldova, Romania and Bulgaria.<sup>161</sup> Natural gas consumption is mainly driven by a few large customers, with negligible household consumption.<sup>162</sup> This largely reflects a lack of distribution network, although as discussed above, this is something North Macedonia is currently working on.

Finally, while North Macedonia does recognise licences issued by other Energy Community members, it does have a seat requirement for foreign traders and suppliers.<sup>163</sup> While not a major issue, the removal of such a seat requirement would lower the bar for new market entries from abroad and increase competition.

Meanwhile, when considering **unbundling** as per the Third Energy Package, North Macedonia is once again well advanced. The electricity transmission system operator (TSO) and distribution system operator (DSO) have been unbundled and compliance officers are active. However, the situation is less advanced in the natural gas sector, where the TSO is not unbundled.<sup>164</sup>

**Third party** access is enshrined in the legislation and regulation of both the electricity and the natural gas sectors, although some regulations need to be updated.

North Macedonia's **regional market integration** requires significant improvement. Interconnection capacity for electricity is allocated in conformity with Energy Community rules, whether bilaterally or using SEECAO, but North Macedonia has not implemented any market coupling with any of its neighbours, largely reflecting the lack of a day-ahead market. On the natural gas side, the sole interconnection point for natural gas is not being operated in conformity with the European Union Regulation 703/2015 Establishing a Network Code on Interoperability and Data Exchange Rules.<sup>165</sup> However, the greater issue is the lack of other interconnectors, although work to increase the number is ongoing, with North Macedonia working on building an interconnector with Greece.

Overall, these issues suggest that the potential for energy imports – and thus regional integration – is not being fully used, thus failing to reap the benefit it could offer in terms of liquidity and competitive pressures. More precisely, while the electricity interconnection capacity is efficiently allocated using competitive assignment, the lack of market coupling means that flows are not optimised based on efficient, transparent, and automatic matching algorithms between supply and demand in North Macedonia and its neighbours and thus the full benefit of trade flows is not being harnessed. In the case of natural gas, it is not just the lack of market coupling, but also the fact that interconnector capacity is not efficiently and transparently used based on best practice for the single interconnector in place.<sup>166</sup>

*Cross-cutting sub-dimension: Energy incentives – direct and indirect subsidies in the energy sector*<sup>167</sup>

Direct and indirect subsidies do not appear to be significant in North Macedonia's energy sector.

### ***The way forward for energy policy***

While North Macedonia has made significant strides in energy policy, it should consider the following recommendations for improvements:

- **Finalise the transposition and implementation of the Third Energy Package.** This should help deploy international good practice and standards and provide clear and competitive policy guidance to the sector. Additionally, North Macedonia should consider starting to transpose the EU's Clean Energy Package, the latest attempt to improve the competitiveness and sustainability of the EU energy market.
- **Expand the human resources for key institutions.** Although the regulator is currently well staffed, as the market becomes increasingly competitive it will need the capacity to take on additional roles and tasks. These should also be accompanied by staffing increases in key institutions involved in governing and deploying energy efficiency, as this sector also needs to be strengthened. Significant aspects of the governance and implementation of energy efficiency measures remain outstanding, largely due to lack of staff (Energy Community Secretariat, 2020<sub>[203]</sub>). Energy efficiency has the potential to significantly reduce the impact of energy costs on the competitiveness of the economy by reducing the need for energy overall. For a more comprehensive analysis of the benefits of energy efficiency please see (IEA, 2019<sub>[215]</sub>).
- **Transform the Guarantee of Origin certification to allow more renewable energy generators to apply for it.** This should allow renewable generators to market their electricity to higher-paying customers and in turn make renewable energy investments more attractive. This could also provide financial support for the state budget by reducing subsidy costs and thus allow the state to support wider range of renewable projects. Good examples include France and Luxembourg, where auctions of GOs are performed on behalf of the state for renewable energy generated with state support. In the case of Luxembourg, the income flow is used to reduce the public cost of its renewable support scheme.
- **Deploy power exchanges for natural gas and electricity.** This should support the market coupling and integration of the natural gas and electricity sector. Both of these would allow the market prices to be used as benchmarks for renewable generation support schemes or to reduce the reliance on oil-index natural gas imports. For example, Albania, together with Kosovo, has deployed a power exchange which is expected to be operational soon.
- Moreover, North Macedonia, given the size of its market, should urgently **seek further market integration and market coupling** to ensure market liquidity and in turn robustness against market manipulation by key stakeholders. This will also improve the value-add optimisation of the energy market through increased international competition.

## Environment policy (Dimension 13)

### Introduction

North Macedonia has improved its performance in the environmental policy dimension, increasing its overall score from 1.8 in 2018 to 2.3 in the current assessment. This progress places North Macedonia in second place among the WB6 economies, with its scores for the resource productivity and environmental quality of life sub-dimensions matching the regional average, while it scores above average for the natural asset base sub-dimension, in particular thanks to important advances in its biodiversity and land-use frameworks (Table 24.25).

**Table 24.25. North Macedonia's scores for environment policy**

Dimension	Sub-dimension	Score	WB6 average
Environment policy dimension	Sub-dimension 12.1: Resource productivity	2.0	2.0
	Sub-dimension 12.2: Natural asset base	2.5	2.1
	Sub-dimension 12.3: Environmental quality of life	2.3	2.3
North Macedonia's overall score		<b>2.3</b>	<b>2.1</b>

### State of play and key developments

#### *Sub-dimension 13.1: Resource productivity*

North Macedonia is a Non-Annex-I signatory to the United Nations Framework Convention on Climate Change (UNFCCC) and its Paris Agreement and is party to the Kyoto Protocol. As such it has been undertaking regular activities to reduce greenhouse gas emissions and limit global warming. It has set emission reduction targets (82% of 1990 emission levels by 2030) and has also determined emission objectives for the energy, industry, agriculture, forestry and waste sectors. It has a publicly available GHG inventory. Nevertheless, around 60% of total carbon dioxide (CO<sub>2</sub>) emissions in North Macedonia in 2016 were as a result of electricity generation and heat production, while 21.5% came from transport (MEPP, 2020<sub>[216]</sub>).

North Macedonia has made some improvements since the last assessment to its **climate change mitigation and adaptation** legislative and policy frameworks. The new Law on Energy, adopted in May 2018; its by-laws on renewable energy sources; and a Law on Energy Efficiency, adopted in February 2020, all contain climate change mitigation measures – see Energy policy (Dimension 12) for more information. These measures mainly relate to the energy sector (the introduction of energy efficiency obligation schemes, an increase in solar rooftop power plants and biomass power plants installations, etc.) given its major contribution to the economy's CO<sub>2</sub> emissions. As a result of a slow transition to renewables, however, in 2017 the government had to revise down its renewable energy target, from 28% of gross final energy consumption in 2020 to 23.9% (UNECE, 2019<sub>[217]</sub>). Progress has been made in aligning legislation with the EU *acquis*, in particular establishing GHG monitoring and reporting mechanisms. The new Law on Climate Action was being prepared at the time of drafting, and is intended to harmonise the economy's legal framework with the EU Emissions Trading System (ETS).

North Macedonia was preparing a long-term strategy on climate action – up to 2050 – at the time of writing. This will consider introducing a carbon tax as a measure to reduce GHG emissions. The Energy Development Strategy (adopted in December 2019) and the draft National Integrated Energy and Climate Plan until 2030 (expected to be adopted in March 2021) represent the other main strategic documents in this area. North Macedonia is the first contracting party in the Energy Community to integrate the pillars of energy and climate in its national energy strategy (EC, 2020<sub>[46]</sub>). Its energy, transport and industrial strategies also all contain specific climate change mitigation actions. As a UNFCCC signatory, North

Macedonia prepares regular biennial update reports,<sup>168</sup> which are the only monitoring mechanisms in this area.

Some progress has been made in climate change mitigation since 2017. The major climate-related risks were identified in a study prepared in 2020. The revision of the methodology for the National Spatial Plan (2020-40), which started in 2020, aims to integrate climate aspects into spatial planning preparation. Measures such as flood and drought risk management are being implemented, mostly through international projects.<sup>169</sup> However, no flood hazard and flood risk maps (which represent the basis for flood risk management) have been created (UNECE, 2019<sub>[217]</sub>).

Limited progress has been made towards achieving a **circular economy** in North Macedonia. Recycling rates remain extremely low: less than 1% of solid waste is recycled and almost 99% goes to landfill (Eurostat, 2020<sub>[218]</sub>). On a positive note, recycling of packaging waste has been constantly increasing, from 27.08% in 2014 to 47.21% in 2018, despite limited economic incentives to promote recycling and waste prevention (MAKStat, 2020<sub>[219]</sub>). A number of bodies are responsible for waste management<sup>170</sup> and thus the circular economy but, according to the government, there are issues with communication, and efficient co-ordination mechanisms are largely lacking. Lack of staff and financial resources among these bodies impede the implementation of measures. These are recognised issues which the government intends to tackle in its revision of the National Waste Management Strategy (2016-20) in 2021.

On the legislative side, the new Law on Waste, which was being prepared at the time of writing, addresses the circular economy and secondary raw materials and is fully harmonised with the EU *acquis* in this area.<sup>171</sup> The new Law on Food Waste was also being prepared by the agriculture ministry, which represents a good step forward in acknowledging this particular issue. Since the last assessment, the government has drafted the National Waste Management Plan 2020-30 and the National Waste Prevention Plan 2020-26 (which was planned to be adopted at the time of drafting), which also contain measures related to the circular economy.

North Macedonia currently generates 456 kg of municipal waste per capita. While this is less than the EU average (492 kg per capita in 2018), the amount has been increasing constantly since 2014 (Eurostat, 2020<sub>[220]</sub>). According to the government, the overall **municipal solid waste management legislative framework** has gaps and contradictions compared to EU directives, although the majority of directive obligations have been transposed to some extent. The laws and regulations do not provide the required clear and concise regulatory framework, which results in poor and ineffective implementation. There have been no reports on the implementation of the previous National Waste Management Strategy, nor on the progress made towards its targets. The process of establishing an integrated regional system for waste management continues to face delays due to insufficient administrative and financial resources, and it suffers from lack of ownership (EC, 2020<sub>[46]</sub>).

Waste collection and treatment infrastructure remains heavily dependent on donor funds, which impedes regular maintenance. Waste collection and treatment services are funded from the waste collection fees. Only some municipalities sort waste, and then not in an effective manner. According to the government, measures to combat unregulated burning and illegal dumping of waste are the responsibility of local inspectorates. The law includes sanctions for unregulated burning and illegal dumping of waste and there is a mechanism for the citizens to report such actions. According to local stakeholders, enforcement can be rather sporadic and is limited due to few citizens knowing about the reporting mechanism.

### *Sub-dimension 13.2: Natural asset base*

North Macedonia has 3 040m<sup>3</sup> of available water per head per year, which makes it relatively rich in water.<sup>172</sup> Water demand from agriculture and industry tends to fluctuate over the years, while household demand has shown a constant increase (UNECE, 2019<sub>[217]</sub>; World Bank, 2020<sub>[221]</sub>). One significant pressure on the water supply relates to losses in the system, which range from 40% to 65% of the system input (UNECE, 2019<sub>[217]</sub>). Another key concern in this area is water pollution, as a result of an insufficiently

treated industrial and municipal wastewater – see Sub-dimension 13.3: Environmental quality of life for more information.

As in the previous assessment, the basic legal act in the field of **freshwater management** is the Law on Waters (2016). The main change that has taken place since 2017 relates to the adoption of the Law on Setting the Prices for Water Services, which takes into consideration not only the cost of water usage but also pollutants released into water, thus indirectly contributing to improving the quality standards and reducing water pollution. There is a system for prior regulation and/or specific authorisation for water extraction from ground water and/or from surface waters. A river basin management system has been developed and co-operation with neighbouring countries in this area has been established, although this co-operation needs to be renewed. There have not been any changes to strategies since the last assessment, except for the management plans of the Ohrid Basin watershed, Strumica river basin and the Vardar river basin, which have been prepared. In general, the implementation of the National Water Strategy (2012-42) remains quite limited: no implementation reports were ever prepared, although some reports (on the state of environment or parts of the sustainable development-related strategies) contain an overview of the situation relating to water. Data and projections on water demand from agriculture, industry (including energy) and households are not available and so cannot be used to guide decisions about handling competing uses now or in the future.

A number of bodies are responsible for water management in North Macedonia, but they lack financial and human resources to fulfil their roles and there have only been sporadic capacity-building activities to tackle this. The main vertical co-ordination tool is the National Water Council, a counselling body, whose three-year mandate is expected to start at the time of writing.

North Macedonia's **biodiversity and forest management framework** has advanced since the last assessment, with major change being the adoption of the National Strategy for Nature Protection and Action Plan (2017-27) and the National Biodiversity Strategy and Action Plan (2018-23). The new Law on Nature was also being prepared at the time of drafting, which aims to fully transpose the EU Habitats and Birds directives.

In terms of measures implemented, the first complete national red list of threatened species was adopted in 2019, identifying which native species are threatened by extinction. Management plans for three protected areas have been prepared and five natural rarities have been proclaimed since the last assessment. However, no implementation reports have been produced so far (except those stemming from the reporting on the Aichi biodiversity targets<sup>173</sup>), the methodology for monitoring the state of the natural environment has not been developed and no monitoring system has been established across the economy. According to the National Biodiversity Strategy, a monitoring system for biological diversity is planned for the period 2020-23. The Aichi Biodiversity Target 11, which stipulates 17% of total land area to be protected, is unlikely to be attained. Even if the measures to extend the national protected area network contained in the spatial plan were fully implemented in 2020, protected areas would only account for 11.61% of North Macedonia's territory (UNECE, 2019<sub>[217]</sub>).

A number of government bodies regulate this field, but their human and financial resources remain inadequate to execute their main responsibilities. As a result of this deficiency, a National Biodiversity Information System, established in 2011 at the Ministry of Environment and Physical Planning, which includes a national biodiversity database, stopped operating in December 2018.

Forests make up around 40% of North Macedonia's total land area, which is the WB6 average (World Bank, 2020<sub>[221]</sub>). No national forest inventory has been carried out recently (the last one dates back to 1979) and there is no system in place for systematic monitoring of the forests. The Strategy for Sustainable Development of Forestry (2006-26) is incorporated in the new Law on Forests. This law regulates and foresees measures to prevent forest fires, as well as illegal logging, for which strict sanctions are envisaged (fines, imprisonment and confiscation of means and items). Although it is difficult to measure anthropogenic impact and pressures in the absence of forest inventories and biodiversity monitoring programmes, the

pressures on species and ecosystems from forestry operations and illegal logging do not seem to be significant in North Macedonia (UNECE, 2019<sup>[217]</sup>). In particular, no deforestation is occurring, as the total area of forest actually increased slightly from 2011 to 2019. What illegal logging there is usually takes place close to human settlements so the scope for the disturbance of forest habitats is possibly limited (UNECE, 2019<sup>[217]</sup>).

The **land-use management framework** in North Macedonia has further advanced since 2017. Major changes in the legislative framework relate to the adoption of the Law on Urban Planning at the start of 2020, and the draft Law on Spatial Planning (initially planned to be adopted until 2020, but postponed to 2021 due to the COVID-19 pandemic). The old National Spatial Plan (2004-20) was being updated and upgraded to the new National Spatial Plan (2020-40) at the time of drafting. Comprehensive annual implementation reports have been regularly prepared, based on the questionnaires submitted by local governments, public enterprises, organisations, institutions and other legal entities. An efficient inter-institutional co-ordination in this area has been noted, although all the responsible bodies lack staff and funds, impeding the implementation of plans. The key indicators related to land-use management are not collected regularly and they are neither georeferenced nor harmonised across government bodies such as property tax and forest management.

### *Sub-dimension 13.3: Environmental quality of life*

**Air quality** in North Macedonia seems to have improved over the last 10 years,<sup>174</sup> but the economy still has one of the highest concentrations of air pollution in Europe. In particular, there are high concentrations of particulate matter (PM<sub>2.5</sub>) in winter months (widely exceeding national limits as well as those set by the WHO and the EU). Annual mean exposure to PM<sub>2.5</sub> is 33 micrograms per cubic metre (µg/m<sup>3</sup>), which is more than three times the WHO recommended highest levels (10 µg/m<sup>3</sup>). These are also much higher than the EU (13.1 µg/m<sup>3</sup>) and OECD averages (12.5 µg/m<sup>3</sup>) and the highest in the WB6 region (average of 25.77 µg/m<sup>3</sup>) (World Bank, 2020<sup>[221]</sup>; OECD, 2020<sup>[222]</sup>). High concentrations of carbon monoxide (CO) indicate that burning of fuelwood presents a significant threat to air quality. Elevated concentrations of nitrogen oxides (NO<sub>x</sub>) in the capital city Skopje, show that the city's traffic is another important issue for air quality (Government of North Macedonia, 2018<sup>[223]</sup>).

North Macedonia has continued its efforts to harmonise its national legislation with the EU *acquis*. In terms of strategies, the Plan for Clean Air (2019-20) and the 2019 and 2020 Programmes for Air Quality Improvements have been developed since the last assessment and have been regularly implemented. The main objectives of these programmes are to raise public awareness about the need for air quality improvement and to reduce PM emissions, primarily through the introduction of energy efficiency measures in households and public buildings. These are the most critical pollutants in North Macedonia according to the National Emission Inventory.<sup>175</sup>

The 2019 air quality programme was developed by the Ministry of Environment and Physical Planning (MoEPP) as part of the Plan for Clean Air. It had a budget of MKD 121 million (about EUR 1.95 million) to finance measures to reduce air pollution both locally and nationally. These included the replacement of existing heating systems in households, kindergartens, and primary and secondary schools; increases in energy efficiency; the procurement of air purifiers; and the expansion of kindergarten green areas. It also included the development of a web platform to monitor these measures. The programme for 2020, with a budget of MKD 100 million (around EUR 1.6 million), involved public calls for very similar activities to the 2019 programme. Although both programmes have been successful so far, further efforts are needed as insufficient co-ordination between central and local authorities and weak inter-sectoral co-operation are limiting the implementation of air quality measures (EC, 2020<sup>[46]</sup>). Few cities have prepared an air quality plan and the pace of their implementation should be increased (EC, 2020<sup>[46]</sup>).

Air quality is monitored regularly in North Macedonia with real-time data available on the national air quality web page. Air pollution emission monitoring is provided both continuously (through automatic all-day

monitoring systems set up for real-time data production) and periodically, and the type of monitoring is prescribed in the integrated environmental permits for each monitoring station. There are 17 permanent air quality monitoring stations across the territory. According to the government, active efforts are being undertaken to replace obsolete measuring instruments and assure the quality of monitoring. In the period 2018-20, North Macedonia replaced five measuring instruments and installed 24 new ones, the majority of which were still being tested at the time of drafting. The government plans to introduce a new monitoring station (Gevgelija), and replace more obsolete instruments in the next period. However, local stakeholders report a lack of regular maintenance of stations and note that they could be better positioned to measure the real impact of emissions and detect pollutants.

At the time of drafting, North Macedonia was working on establishing a national environmental information system to gather environmental data, including on air pollution, housed in one central database. The government reports that it ensures immediate action if the air pollution limit values (PM<sub>10</sub>) are exceeded by setting alarm thresholds which trigger short-term measures, such as free public transport or more frequent inspections. However, this mechanism is rather ad hoc and there is an increased demand from the public for immediate and stricter measures against air pollution (EC, 2020<sup>[46]</sup>).

Management of the **water supply and sanitation system** remains undeveloped. Water pollution is one of the key challenges in this area, as a result of an insufficiently treated industrial and municipal wastewater. This has become of even greater concern during the COVID-19 pandemic as the deterioration of environmental health through poor water management and sanitation is expected to increase the vulnerability of communities to the virus (OECD, 2020<sup>[222]</sup>). Other than the regional sewerage systems to protect Lake Ohrid, Lake Prespa and Lake Dorjan, only 12 cities have constructed separate sewerage systems. There were only 24 wastewater treatment plants (WWTPs) operating in 2019, representing 24.5% of the required capacity (UNECE, 2019<sup>[217]</sup>). Appropriate wastewater treatment is lacking even in the sewerage systems in place for Lake Ohrid and Lake Prespa, both key tourism destinations (UNECE, 2019<sup>[217]</sup>). Skopje still lacks a WWTP and all wastewater is discharged untreated into the River Vardar. The government is planning to build a WWTP in the capital city – a donor-financed project was started in 2020, but has been delayed by the COVID-19 pandemic. Additional investments in WWTPs are planned, but the timeline is not yet established. The growing challenges related to water treatment, such as the need to treat contaminants of emerging concern, are still not taken into consideration when upgrading facilities.

According to the government, funds for water management and development are provided from the state and local budgets, fees<sup>176</sup> for water use, and international and European funds. Funds for the construction and maintenance of water supply and sewerage systems are provided from the water tariffs (for water supply and drainage service) as well as fees for connections to water supply and sewerage systems. There have not been any changes in the level of water tariffs since the last assessment.

As mentioned above, the legislative framework was amended in 2017 with the adoption of the Law on Setting the Prices for Water Services. This represents the main legal act in this area and is almost fully aligned (95%) with the EU *acquis* for wastewater management. In 2017, the government conducted a National Water Study on the investment framework for implementing projects for water supply and wastewater treatment, in accordance with the requirements of the relevant EU directives. The results of the study were taken into account in the projections of IPA III projects related to water infrastructure.

Some measures have been taken to decrease water losses from the system (mostly through the changes in legislative framework) but it still represents one of the main concerns in this area, as the losses in general range from 40% to 65% of the system input (UNECE, 2019<sup>[217]</sup>).

No major changes have been recorded in the **industrial waste management** legislative and policy frameworks since the last assessment. At the time of drafting, the National Waste Management Plan 2009-15 was being replaced with the new National Waste Management Plan 2020-30 and the National Waste Management Strategy 2008-20 with the draft National Waste Management Strategy 2020-30. There is very limited information about the implementation of these past plans: according to information received through

the government's self assessment, only one contaminated "hot spot" site – the old industrial landfill around the smelter in the city of Veles – has been rehabilitated and the slag from the industrial landfill has been exported. No monitoring or evaluation has been conducted in this area.

There is an official register of chemicals that are on the market, as well as classification, packaging and labelling rules for chemicals. The Pollutant Release and Transfer Register protocol has been ratified. As regards managing and controlling industrial risks and accidents, the Seveso-III directive (Directive 2012/18/EU) has been fully transposed in the Law on Environment. No hazardous waste disposal facilities exist and toxic waste is being exported.

There is no policy or legislative basis for soil protection, but provisions for soil protection (identification and management of contaminated sites) will be set in the amendments to the Law of Environment, which was in the process of being adopted at the time of drafting.

### ***The way forward for environment policy***

Since the last assessment, North Macedonia has made progress in several policy areas, such as climate change, biodiversity and forestry. It should now concentrate attention on the following points:

- **Involve all stakeholders in making the implementation of a circular economy a reality.** North Macedonia has made some progress in developing the legislative and policy framework for a circular economy. Effective implementation will require a whole-of-government approach with collaboration by the relevant ministries to steer the transition to a circular economy. The government should also establish a platform for wider co-operation among businesses, financial institutions and other stakeholders. North Macedonia should also consider encouraging best practice exchanges between municipalities by helping local government associations or environmental NGOs to develop guidelines, training and initiatives to recognise best practice (see Box 24.19).
- **Improve the wastewater system:**
  - **Increase the number of wastewater treatment plants.** Despite some newly constructed WWTPs, most wastewater in North Macedonia ends up untreated in rivers, resulting in high pollution levels. Only 25% of necessary WWTPs have been built and the existing ones are not maintained regularly. New investment in WWTPs is needed, financed mainly from the domestic budget and water tariffs.
  - **Apply the water-user and polluter-pays principles for all water users and dischargers,** paying attention to the vulnerable social groups in North Macedonia, and ensure regular maintenance of the existing water supply and sanitation network.

### Box 24.19. Building a circular economy in Hungary

Several non-government initiatives have addressed the circular economy in Hungary. The Hungarian Cleaner Production Centre of the Corvinus University of Budapest is involved in international and European projects to promote best practice on resource efficiency and cleaner production. The National Industrial Symbiosis project co-funded by the EU LIFE+ Environment programme helped Hungarian industries develop industrial symbiosis approaches where the waste or by-products from one industry become the raw materials for another. Over the period 2009-12, the Industrial Development Co-ordination Agency collaborated with a UK-based platform to encourage industrial symbiosis in the central region of Hungary. The three-year National Industrial Symbiosis project built capacity among Hungarian businesses and set up an industry network through a series of workshops and site visits. Thanks to the project, around 1 200 tonnes of industrial waste were diverted from landfill and used in various industrial processes. The following three-year project, Transition Regions towards Industrial Symbiosis (2016-19) aimed to integrate industrial symbiosis practices into regional policy instruments by disseminating good industry practice. As part of the project, the Hungarian company Clean Way developed an application for construction and demolition firms to gather information about emerging waste in construction and demolition sites, to facilitate their re-use and recycling.

The Circular Economy Foundation, founded in 2013, gathers business partners to promote the circular economy and provides a forum to share experiences and best practice. The Ablakon Bedeott Pénz programme encourages the dissemination of good practice in companies through an award for environmental performance, including waste management and resource efficiency. This initiative is led by KöVET, an association of environment-focused consulting companies.

## Agriculture policy (Dimension 14)

### Introduction

North Macedonia has slightly worsened its performance in the agriculture policy dimension. Its score has decreased from 2.9 to 2.8 in the 2021 Competitiveness Outlook assessment. However, North Macedonia's score is slightly above the WB6 regional average (Table 24.26).

**Table 24.26. North Macedonia's scores for agriculture policy**

Dimension	Sub-dimension	Score	WB6 average
Agriculture policy dimension	Sub-dimension 14.1: Agro-food system capacity	3.1	2.8
	Sub-dimension 14.2: Agro-food system regulation	3.3	2.9
	Sub-dimension 14.3: Agricultural support system	2.2	2.7
	Sub-dimension 14.4: Agricultural innovation system	3.2	2.6
North Macedonia's overall score		2.8	2.7

### State of play and key developments

Agriculture is the third largest sector by employment in North Macedonia, employing approximately 122 000 people, or around 15% of the total workforce (Figure 24.17) (MAKStat, 2019<sub>[225]</sub>). According to data from the Ministry of Agriculture, Forestry and Water Economy, almost one-quarter of the population receives some or all of their income from agricultural activity.<sup>177</sup> North Macedonia had 519 848 hectares of cultivated land in 2019 (MAKStat, 2019<sub>[226]</sub>), containing 178 125 registered agricultural households according to statistical data from 2016.

**Figure 24.17. Employment by economic sector (2019)**

Source: (MAKStat, 2019<sub>[225]</sub>), *Active Population in the Republic of North Macedonia, Labour Market - News Release*, [www.stat.gov.mk/pdf/2020/2.1.20.06\\_mk.pdf](http://www.stat.gov.mk/pdf/2020/2.1.20.06_mk.pdf).

The nominal gross value added in agriculture has increased by 18.9% in the period 2017-2019 (MAKStat, 2019<sub>[225]</sub>). Crop production, which represents 69.8% of total agriculture production, has increased by 22.9% in the period 2017-2019. Livestock production is 20.9% of total production, and has fallen by 1.1% in the period 2017-2019. In 2019, the nominal income in agriculture grew by 8.4%, while real income in agriculture grew by 9.5%.

Although there has been no change in the net value of the agricultural sector, its contribution to GDP has fallen about 1.2% in total for the last three years. The economic fallout of the COVID-19 pandemic reduced North Macedonia's GDP by 12.7% during the second quarter. However, agriculture and fisheries increased

by 4.5% during that period, pointing to the sector's relative resilience in the face of the pandemic. According to the State Statistical Office (MAKStat, 2020<sup>[227]</sup>) average net salaries overall increased by 8.1% over the period January 2019- October 2020, while agricultural salaries increased by 8.5%.

Agriculture was severely affected by the COVID-19 pandemic in 2020 by market constraints, lack of seasonal workers, movement restrictions and difficulties in organising transport and logistics. The uncertainty caused by the crisis, fear and the focus on health have greatly changed customer behaviour and demand towards increased level of food safety and standards. The crisis has been devastating, especially for those in the category of "underpaid workers", most of whom are farmers and women from rural areas, where the share of informal workers, who have limited access to adequate health and social care, is the biggest.

By April 2020, the Government of North Macedonia had provided a package of measures to support agriculture costing around EUR 76.1 million:

- **Support for the agricultural sector** of no-interest rate loans to a value of EUR 5 million through the Development Bank. The measure is aimed at supporting micro, small and medium-sized enterprises that produce primary products as well as processors and exporters of primary and processed agricultural products.
- **Payment cards to subsidise 50% of the cost of fuel for farm machinery**, an increase from 30% in the previous year. This measure will cover 50 000 farmers, and will cost EUR 4.6 million
- **Support for grape producers**. This measure provides financial support for grape growers and wineries to produce alcoholic distillate which will be used by domestic chemical companies, including for the production of disinfectants. In the next three years, this financial support will amount to EUR 3.5 million.

Since then, further measures have been developed:

- **In October 2020, further measures were developed to support the grape market**, with state subsidies of MKD 2/kg for purchased grapes. Additional incentives include supporting grape products and wine distillates with under 18% sugar subsidised with MKD 4/kg. Another new measure that is more directly related to the current situation is support for the transport costs of wine – 30% of the transport costs for bottled wine and 20% for bulk wine. The export of grapes is also supported with subsidy of MKD 2/kg for exports of up to 12 tonnes of grapes, MKD 3/kg for exports of 12-24 tonnes and MKD 4/kg for exports over 24 tonnes.
- **Public-private partnerships in the grape and tobacco sector** to support modernisation and make greater use of tobacco and grape product production capacities, two export-oriented agricultural sectors. This strategic commitment is expected to bring export benefits, primarily for grape and tobacco producers in North Macedonia, but also to the economy and gross domestic product. In the short term, investments are expected to reach EUR 10 million.
- **Long-term lease of pastures**, giving farmers access to about 500 000 ha of pastures for livestock grazing.
- **Support for cabbage producers**: growers were given a subsidy of MKD 3/kg for produce sold in the period from 5 April to 5 May 2020. The measure was aimed at stabilising the market for domestically produced cabbage and regulating the reduced demand and purchase price as a consequence of the state of emergency.
- **Postponing of various payments**: MAFWE postponed the deadline for rent payments of state-owned agricultural land paid by farmers and businessmen in the agro-sector to mitigate the effects of the crisis and maintain the profitability of agricultural production.
- **Support for lamb production**: through MAFWE, the government introduced support of MKD 2 500 per sheep to reduce the losses of sheep breeders due to reduced exports of lamb.

The crisis has made clear how important it was to have a stable food system that works in all circumstances and that can provide consumers with a sufficient and continuous supply of quality food at affordable prices. The pandemic also highlighted the role of farmers in the food supply chain. Small farmers are the most vulnerable, as they have to deal with both the economic and the health shock caused by the COVID-19 crisis at the same time. The global crisis has in fact deepened the problems farmers were facing anyway, especially those on the edge of sustainability.

#### *Sub-dimension 14.1: Agro-food system capacity*

**The rural infrastructure policy framework** in North Macedonia is well developed and comprehensive. The current National Programme for Rural Development is compliant with the Instrument for Pre-Accession Assistance in Rural Development (IPARD) Programme 2014-20, clearly defining the policies and measures for further agricultural support. The implementation of policies on rural infrastructure has improved since 2018 and the number of budgeted activities continues to increase every year (60% annual utilisation of the budget on average between 2018 and 2020). However, deadlines still need to be extended and policies are still implemented late, illustrating an overall lack of administrative capacity in the government institutions responsible for implementation procedures. These include local governments and the Agency for Financial Support in Agriculture and Rural Development (AFSARD). AFSARD is still awaiting accreditation to implement the IPARD 2014-20 measure on investment in rural public infrastructure, limiting access to EU funds.

The current Agriculture Market Information System (AMIS) only provides limited data (weekly, monthly and annual reports) for interested users such as producers and suppliers. The system doesn't provide enough analyses or projections to guide producers. The government's attempt to digitalise agricultural markets through an Internet sales platform has not provided the expected results. Not only does the platform lack unified criteria on what information producers are required to provide to consumers about their products, but producers were not consulted during the establishment process, and nor have they been informed on how to successfully use the platform, minimising its effectiveness. According to the new National Strategy for Agriculture Production and Rural Development 2021-27, AMIS will be strengthened to provide more reliable data for more agriculture products on a regular basis. Meanwhile, according to MAFWE, there is an ongoing process to improve the sales platform through education of producers and traders.

The monitoring system used to check and review public procurement procedures before reimbursing investments is limited. While MAFWE has no monitoring unit to follow up on policy implementations, the ministry has made some progress in improving monitoring and evaluation since 2018. MAFWE has recently started a project with the EU on establishing a monitoring unit that will work on evidence-based policy measures. However, there is no system to publish regular evaluation and impact assessments and there are no concrete plans or a timeline to establish one. Impact assessments of regulations affecting agriculture occur irregularly and only in situations where there are pressing requests for one to be done. According to MAFWE, the current limitations in monitoring are due to limited human capacities, which is not being addressed.

The expansion and modernisation of **irrigation infrastructure** is considered a government priority, but lack of funds hinder implementation. The multi-annual Programme for Investments in Water Management Infrastructure for the period 2015-25 outlines North Macedonia's irrigation infrastructure plans and provides information on the objectives, priorities, project activities/investments, and the types and sizes of beneficiaries. As such, the programme offers a relevant and realistic basis for implementation, containing projections for the investment size and sources of funding. Most of the investments are co-funded by the state budget and long-term credits provided by international development banks or investment funds.

Management of the investments is under the public enterprise joint-stock company Water Economy of the Republic of North Macedonia. This public company is fully responsible for managing the primary irrigation network, as well as 95% of the secondary irrigation network. Only 5% of the secondary irrigation network

is operated by agriculture (water economy) co-operatives. Maintenance of irrigation systems is a critical part of water management, but not enough funding is dedicated to maintenance, leading to frequent system failures during the production season which significantly influences the quality and yield of agricultural produce. AFSARD manages the support for irrigation at a tertiary level, where the funding is provided both by the state budget and IPARD as part of the initiative to modernise agricultural households.

The **agricultural education system** remains unbalanced with a long-term strategy that does not reflect the needs of producers or the sector overall. The National Strategy for Agriculture and Rural Development 2014-20 envisages continuing training and informal education on agriculture aimed at improving the qualifications of agricultural producers, especially in the fields of farm management, introduction to new technologies, and the application of market standards for food safety and quality. However, its implementation is still pending due the lack of rules being set for the establishment and implementation of this measure.

The secondary school (14-18 year-olds) agriculture system is efficient and well-represented throughout the economy and its education curriculum is continuously improved and diversified. The vocational training system is well formalised in legislation, although in practice implementation does not always follow the regulatory framework.

Authority over agricultural education is split between MAFWE and the Ministry of Education and Science, but there is no co-ordination on training or lifelong learning. Collaboration with the private sector is usually based on personal links, which should be replaced by official programmes or measures.

For many agricultural sub-sectors, the education and training requirements to perform production activities remain unregulated, and general interest in education has declined. This has led to the Rural Development Programme's measures on education and training being ineffective. The number of students enrolling in the first year of university agricultural programmes has fallen by 35% in the last three years, with students instead choosing more market-oriented university programmes.

Monitoring and evaluation of the education process and performance are patchy and the results are not integrated to give an overall picture. The results of stakeholder consultations are rarely considered in developing measures in this area (especially when it comes to young farmers). Although mandated by the NARDS, no system for flexible movement of human capital between educational, research, advisory and occupational positions has been implemented. There is a pressing need to reorganise the current system using the resources available, and create sustainable links between the educational institutions and the labour market.

#### *Sub-dimension 14.2: Agro-food system regulation*

North Macedonia's **regulations on natural resources** are harmonised with those of the EU and nearly all directives regarding the use of natural resources have been approved by the national parliament. However, realising the full potential of EU-driven regulations will take an implementation mechanism as well as additional resources. North Macedonia lacks a framework for natural resource management, which will be needed to lay the groundwork for any future plans to sustainably exploit its natural wealth.

Overall responsibility for legislation on natural resources lies with the Ministry of Environment and Physical Planning, while MAFWE has authority over the management of agricultural land, irrigation water, forestry and hunting. MAFWE uses a cross-conditionality system for the distribution of subsidies for the use of natural resources.

A number of institutions are involved in regulating natural resources but there are no permanent networking mechanisms. In 2015, the NARDS 2014-20 programme mandated an adequate legal regulatory system for the inter-institutional monitoring of the implementation of the cross-compliance system. However, this system remains in embryonic form and immediate efforts are needed to put it in place.

The existing **regulations on products** are fully harmonised with the EU, and the EU registries for seeds and propagation material are completely replicated within the national registries. The organisation and structure of this policy regulation is functional and fully operational, with a clear division of responsibilities and almost all protocols in practice are accredited according to EU standards. The existing regulations cover the registration, production, preparation for trade, certification, labelling, trade, import and export of seeds and propagation material for agricultural plants.

Monitoring and quality control of this policy area takes place regularly based on the Annual Programme for Monitoring. Consultations with stakeholders are also regularly undertaken within the Sectorial Working Group that acts as a consultative mechanism for defining policies, plans and programmes to support the process of communication among various stakeholders. Product regulations are monitored on a quarterly basis and revised regularly through updates to the Law on Seed and Propagation Material for Agricultural Plants and its by-laws, taking into account stakeholders' demands and the process of harmonisation with EU legislation.

### *Sub-dimension 14.3: Agricultural support system*

The planning period, support measures and the criteria for the **agricultural policy framework** in North Macedonia are in line with the procedures and support system envisaged in the EU Common Agriculture Policy. The agriculture support framework is rather broad in its coverage, targeting more than 90 000 agricultural households, and its scope covers the agriculture sub-sectors equally. While its main objectives focus on increased productivity and improved competitiveness, they are only moderately reflected in the support measures. All agricultural activity in the economy above a minimum size of 0.2 ha is subsidised, with almost no additional requirements for the producers. The scale of support is rather high in comparison to the value of the agriculture sector as measured by the value of total sales of agricultural products (Table 24.27). Over the period 2016-18, total support to agriculture averaged around 50% of total agriculture sales, which illustrates how heavily subsidised it is by the state.

**Table 24.27. National budget support for agriculture (2016-18) in million EUR**

	2016 mln (EUR)	2017 mln (EUR)	2018 mln (EUR)
Value of total purchases of agricultural products	243 217	254 022	284 917
Value of total budget support to agriculture	140 318	140 975	140 416

Source: (MAKStat, 2019<sup>[225]</sup>), *Active Population in the Republic of North Macedonia, Labour Market - News Release*, [www.stat.gov.mk/pdf/2020/2.1.20.06\\_mk.pdf](http://www.stat.gov.mk/pdf/2020/2.1.20.06_mk.pdf).

Agricultural support comprises three programmes (direct subsidies, the Rural Development Programme and IPARD) in order of increasing competitiveness. Direct subsidies are available to most farmers who complete a simple form to request financial support; the main requirement is cadastral evidence of land holding, cross checked with data on land use from the Land Parcel Identification System and the registration number of the farm. In contrast, the Rural Development Programme is perceived to be more complicated to access as producers are required to provide project and/or business plans for their proposals. IPARD is unattainable for the majority of farmers due to its strict criteria and the long application and implementation processes. However, the use of IPARD and rural development programme funds has been steadily increasing, with an increase of approximately 40% between 2018 and 2019.

As formalised in law, the planning of support measures involves long consultation processes and discussions through participatory mechanisms that involve all type of stakeholders, contributing to the definition of the measures.

The Rural Development Programme is quite wide and covers more than 50 measures, but annually only 17 or 18 are set. In practice, investments in rural infrastructure, including Water Economy investments, take more than 50% of the budget.

Monitoring and evaluation mechanisms are improving. For example, AFSARD has been preparing and sharing reports with the public on monitoring of this area since 2017. However, there is no fully enhanced co-ordination between AFSARD's and other institutions registries on a level of with the agency and unification of databases to provide a clear picture of sector support and indicators.

North Macedonia's **domestic producer support instruments** are well planned in legislation, with easy application procedures for subsidies and strong harmonisation with EU legislation, although the monitoring mechanisms to evaluate cross-compliance have not been implemented.

Direct payments are distributed by area under cultivation, head of breeding animal and agricultural produce sold. They are the main income support instruments for agricultural producers. Farmers, traders of agricultural products and food processors also receive credit support through the state-funded Macedonian Bank for Promotion of Development, facilitating their access to finance through a number of credit products with favourable interest rates. The only agricultural price support instrument used is tariff protection.

The direct payments largely determine the profitability of agriculture in most sub-sectors and represent an element of the decision-making process to increase agriculture as a professional occupation. The policy objective defined in the NARDS is to increase the share of investment-support instruments rather than direct payments, by increasing funding for rural development policies and modulating previous direct payment measures towards supporting rural development.

As mentioned above, only farms listed in the Farm Register can apply for direct payments. All land parcels in use have been graphically digitalised and are held within the Land Parcel Identification System. Direct payment beneficiaries are obliged by the Law on Agriculture and Rural Development and respective by-laws to adhere with cross-compliance measures, including good agricultural practice, animal welfare and sustainable land management. As part of the subsidy claim process they sign statements confirming their adherence to the cross-compliance requirements. In practice, while there is strict control of adherence to these principles for animal husbandry, for crops the monitoring of whether applicants meet these requirements is limited to the on-the-spot controls conducted by AFSARD on 1% of applicants.

Input subsidies are provided for fuel, *in vitro* insemination of cattle, and the production and use of certified seeds material and seedlings. Since 2020, MAFWE has also supported a system for climate control through airborne cloud seeding to achieve better protection of crops from hail. The budget for the measure is EUR 1 million per year and the operator is chosen through public procurement procedures.

Institutional co-ordination has not reached its full potential and the standards and criteria for the various support programmes are not fully harmonised. Some measures are not simplified enough or are still listed within a programme, even though they have been inactive for long periods. Monitoring and evaluation mechanisms are not as strong as they could be as MAFWE, AFSARD and the National Extension Agency (NEA) hold different registries and databases which are not yet integrated. In some cases, a lack of determination and capacity lies behind the failure to implement new policies (such as agriculture knowledge and innovation system and others).

When it comes to **agricultural trade policy**, North Macedonia has a few free trade agreements, which are predominantly multilateral (World Trade Organization, CEFTA, EFTA and the EU).<sup>178</sup> Some of the economy's agricultural products are characterised as sensitive or highly sensitive; tariff rates only apply to the latter. Tariff quotas on imports are only applied for wheat and there have been no export subsidies on any agricultural products since 2003. North Macedonia does not apply any export credit support or export prohibitions for agricultural production. Monitoring is improving while there is regular evaluation on performance on a multi-annual basis as part of the national agriculture strategy evaluation. Impact

assessments for import tariffs are carried out depending on the feedback received from businesses and on the market conditions analysis.

North Macedonia's **agricultural tax regime framework** does not include any specific tax legislation for farms or agricultural businesses. However, a taxpayer in the agriculture sector whose total annual income does not exceed EUR 21 140 (MKD 1.3 million) will be taxed on their lump-sum fixed income, which is still quite favourable for most small-scale farmers. The Law on Property Taxes also provides tax relief for agricultural land used for agricultural production, in an effort to stimulate agricultural production. The law also provides tax exemptions for activities that promote agricultural production such as facilities for protecting natural resources, investment in vocational training, employing disabled people and facilities for the primary processing of agriculture products.

The **sanitary and phytosanitary system (SPS) and measures** have a well-structured legal framework which enables a fully functional and operational system, and provides for a clear division of institutional responsibilities. SPS legislation in North Macedonia has been harmonised with EU legislation since 2005 and its compliance with international standards continues to improve. The Food Safety Law defines an integrated approach of policy implementation, official control and inter-institutional co-ordination in this area. A clear financing structure has been established, and the work of the phytosanitary sector is financed from the state budget and through paid services for private entities. National SPS legislation has been harmonised with the International Standards for Phytosanitary Measures which clearly defines the division of responsibilities between institutions and ensures the proper implementation of the phytosanitary policy of the International Plant Protection Convention and EU legislation.

The import of plants is regulated by the Plant Health Law, which aims to prevent the introduction and spread of harmful organisms as well as their eradication. Additional physical infrastructure needs to be established to provide facilities for phytosanitary controls at border crossings in accordance with EU practices. Standard operating procedures for border phytosanitary inspections and training for inspectors have been drafted and put forward for final endorsement by the government. These measures are regularly updated and consistently harmonised with EU directives.

Since 2013, the Phytosanitary Directorate has prepared an annual monitoring programme which includes visual inspection and sampling for testing all strategic agricultural crops (seed potatoes, grapes and other fruit, vegetables, and tobacco). The main objective of this programme is the interception and early detection and of quarantine of pests in places of production, storage, and import. The programme is implemented by phytosanitary inspectors and the State Phytosanitary Laboratory (SPL), who perform laboratory analyses. The pest risk assessment procedure includes relevant national expertise in the preparation of phytosanitary measures and preventative actions to be taken against certain pests.

The pest risk assessments are based on the available scientific evidence and monitoring plans and are undertaken in an independent, objective and transparent manner. Risk management takes into account the results of risk assessments, in particular the opinions of the European Food Safety Authority, and the opinions of the national food safety institutions. SPS risk assessments in the phytosanitary sector are in the early phases of implementation. However, there is currently no procedure or requirement in the national legislation for risk reassessment when updating regulations in this area. In 2018, the Phytosanitary Directorate prepared a first report on the phytosanitary situation in the economy which determined the presence/absence and prevalence of harmful organisms.

The Phytosanitary Information System (PIS) is in the early phases of development. MAFWE has provided funds to upgrade the data system on import, export, re-export and transit activities by including additional data to enable further risk analysis and the preparation of reports. The upgraded PIS for plant health and plant protection products will help to improve communication, co-ordination, transparency and the efficient functioning of all stakeholders involved in the phytosanitary sector. This upgrade was scheduled to take place in the second half of 2020.

Regional co-operation in the phytosanitary sector has improved since the last assessment. North Macedonia and the Republic of Serbia signed the Agreement for Phytosanitary Co-operation in September 2019. The two countries agreed to mutually recognise the results of laboratory analyses of samples taken from imports done by accredited or authorised laboratories. In 2020, North Macedonia concluded the same agreement with Albania.

#### *Sub-dimension 14.4: Agricultural innovation system*

**Agricultural research and development** has been seriously neglected over the last two decades, in terms of permanent funding for maintenance of existing research infrastructure and facilities, as well as the development of new methodologies. The MES is responsible for the development of science and innovation and organises the national system of science, research and innovation. The NARDS 2014-20 prioritised support for scientific projects in applied agricultural research, specifying a sustainable system of selection, implementation and monitoring and evaluation of the effects of subsidised research projects. Nevertheless, progress on implementing this policy area has been weak thus far. As North Macedonia lacks a well-organised agricultural research and development framework, producers are not involved in priority setting, implementation or the funding of research and advisory services.

Some research and development activities are independently implemented by institutes and universities, with funding assistance from donors. Farmers are, to certain extent, involved in limited transfer of knowledge activities carried out by the public National Extension Agency. The Law on Agriculture and Rural Development set out a process for the selection for research projects and general transfer of knowledge, but it has not been implemented. While the working groups are consulted on many other agriculture policy issues, they have little impact on research projects despite having the right to do so by law.

Currently, the only financial support to research in the field of agriculture, forestry and water management is through the Fund for Innovation and Technological Development for pilot projects of up to 6 months, short-term studies lasting 12 months, and long-term research for up to 36 months. Financial support is defined in the technical measure for implementation of the programme but this measure has not yet been launched – see Science, technology and innovation (Dimension 9) for more details.

The current **agricultural extension services framework** offers farmers only limited services. The legislation on transfer of knowledge in this area is very well planned on paper, but lacks implementation due to budget constraints and limited human resources. The aims of NEA, the body responsible for extension services, are: the transfer of know-how and information between producers, ensuring the implementation of these services in agricultural holdings in order to improve the quality and quantity of economically viable and competitive agricultural production, sustaining the development of agriculture in rural areas, and supporting the development and implementation of agricultural policies.

Even though the general assessment by MAFWE is that the services provided by the NEA are inconsistent and limited in scope and quality, they are the only services currently offered to farmers by the state free of charge.

The financing and subsidy procedures in this area also need improvement. There is a draft law on the Farm Advisory System that has been prepared since 2018, and that underwent wide consultation processes at several levels during 2019 (dissemination and public hearing, intergovernmental services, comments from the World Bank and EU, etc.), but has not yet been adopted by the government.

Private advisors are excluded from delivering publicly supported advisory services. The state does not subsidise programme support that specifically targets certain groups of farmers or specific areas according to the policy goals.

### ***The way forward for agriculture policy***

The Government of North Macedonia has made continued progress with reforms and improvements within the agriculture sector, but there are still important challenges to be considered and further efforts to be made:

- **Establish a monitoring and evaluation system.** Taking into account the sizeable investments in rural infrastructure, the agriculture support programme budget and the number of users involved, increasing monitoring and evaluation capacity, and improving the relevance of planned policy measures, are warranted. Creating a special unit within the MAFWE Department for Analysis of Agriculture Policies to handle monitoring and evaluation, while increasing inter-sectorial co-ordination by integrating the relevant databases and registries of different institutions, will allow all relevant information to be collected. In turn this will help plan realistic policy measures that reflect the needs of producers.
- **Review the agriculture support programmes.** Some of the existing policy measures suffer from low budgets and differing criteria between national and EU support programmes, and have had a limited impact on the main programme goals of improved competitiveness and productivity. Reviewing the content of support programmes would enable them to better reflect the needs of farmers and integrate measures that benefit producers and agriculture output. Support to agriculture should be continuously compared against number of social and economic indicators. Support should also be conditional and context compliant.
- **Strengthen institutional co-ordination and harmonise the standards and criteria for support measures.** Programme measures should be simplified or removed if inactive for long periods of time.
- **Improve farmers' access to information and channels of communication,** especially market information. The current Agriculture Market Information System should be upgraded into a functional and dynamic platform for the collection and dissemination of information. The legislation in place is broad enough to enable options such as outsourcing, public-private partnerships, or contracted public services implemented by private entities as part of this process.
- **Develop the education and training system, and increase the co-ordination between education entities in agriculture.** The continuous decline in interest in agriculture education and the pressing labour market demand create a large skills gap that risks damaging the performance of the agriculture sector. The NARDS programme already has a solid framework to cover this issue so North Macedonia should implement the planned activities and provide systems for flexible mobility and the transfer of human capital. In addition, greater clarification of the responsibilities between MAFWE and the MES, as well as better co-ordination, will be crucial to improving institutional performance and integrating all stakeholders in the system.
- **Enhance the policy framework supporting research and development.** Increasing investment in research and development and practical application projects is essential, as R&D is slowly declining and no value is being added to the agriculture sector. The current draft of the Law for a New Advisory System should be finalised and approved soon, and an integrated system between the NEA and private agriculture should be established.

## Tourism policy (Dimension 15)

### Introduction

Table 24.28 shows North Macedonia's scores for the five tourism sub-dimensions and compares them to the WB6 average. Since the 2018 assessment, North Macedonia has made slight progress in tourism by improving its scores in the availability of qualified workforce sub-dimension, driven by improvements in the VET framework indicator, as well as in the tourism branding and marketing sub-dimension. Progress is however limited and North Macedonia scores below the WB6 average in all sub-dimensions. Moreover, North Macedonia ranks last in the sustainable and competitive tourism sub-dimension. Overall, North Macedonia lags behind in tourism development, mainly due to inefficiencies related to the overall governance structure and the institutional set up at the national, regional and local levels. A more coherent and co-ordinated governance structure and institutional framework at both the national level and the destination level will be key to improving the competitiveness and successful future development of tourism. This is even more important in the context of the COVID-19 pandemic which significantly affected tourism in North Macedonia.

**Table 24.28. North Macedonia's scores for tourism policy**

Dimension	Sub-dimension	Score	WB6 average
Tourism policy dimension	Sub-dimension 15.1: Governance and co-operation	1.8	2.3
	Sub-dimension 15.2: Destination accessibility and tourism infrastructure	1.7	2.2
	Sub-dimension 15.3: Availability of a qualified workforce	1.7	1.8
	Sub-dimension 15.4: Sustainable and competitive tourism	0.8	1.6
	Sub-dimension 15.5: Tourism branding and marketing	1.3	1.6
North Macedonia's overall score		1.5	2.0

### State of play and key developments

North Macedonia considers tourism to be one of its six priority sectors for development. However, this prioritisation has not yet resulted in notable improvements in the sector's competitiveness. Although the number of international arrivals has been steadily growing over the last three years, the economy's standing on the 2019 Travel & Tourism Competitiveness Index has worsened from 82<sup>nd</sup> place in 2017 to 101<sup>st</sup> in 2019, with its position worsening in all sub-dimensions. The largest falls were in 1) the effectiveness of tourism marketing and branding (from 41<sup>st</sup> place in 2017 to 124<sup>th</sup> in 2019); 2) government prioritisation of travel and tourism (from 58<sup>th</sup> to 118<sup>th</sup>); and 3) the ease of finding skilled employees (from 76<sup>th</sup> to 129<sup>th</sup>). The unfavourable business environment and underdeveloped transport infrastructure also affect tourism competitiveness more widely (WEF, 2019<sup>[228]</sup>). In 2019, tourism's direct contribution to GDP was a mere 2%, and the direct contribution to employment was 1.8%, corresponding to 13 500 jobs in the tourism sector.

The new National Strategy for Sustainable Tourism Development (2016-21) sets new strategic and policy goals for the further growth of tourism in the economy. However, most of the policy measures have not yet been implemented. In addition, the strategy does not consider possible synergies between tourism, agriculture, food processing and the ICT sector, which are also considered strategic and high potential sectors for North Macedonia.

The main "accelerator" of tourism development in recent years has been the Local and Regional Competitiveness Project (LRCP), a four-year investment operation financed with a grant from the European Union (IPA II). It is based on a holistic approach to tourism development and destination management and provides investment funding and capacity building to support sector growth, investment in destinations and specific destination prosperity. According to the semi-annual report of the project, which

was reviewed together with representatives from the EU and the World Bank, 25 projects to improve tourism have been fully completed and 36 are under implementation (OECD, 2020<sup>[51]</sup>).

COVID-19 has left North Macedonia coping with its deepest recession since 2001. Robust GDP growth of 3.2% in 2019 was reversed by mid-2020 as the COVID-19 pandemic unfolded (World Bank, 2020<sup>[229]</sup>). Following the introduction of measures to contain the pandemic, hospitality, tourism and transport were the first sectors to experience lockdowns and major cuts in their revenues. In 2020, the number of tourists fell by 60.5% compared to the previous year: domestic tourists fell by 18.3% and foreign tourists fell by 84.4%. In the same period, the number of nights spent decreased overall by 48%: by 14.2% for domestic tourists and by 84% for foreign tourists (Figure 24.18) (MAKStat, 2021<sup>[230]</sup>).

**Figure 24.18. Tourist arrivals and overnight stays (2019-2020)**

Source: (MAKStat, 2021<sup>[230]</sup>), *Tourism statistics*, [https://www.stat.gov.mk/OblastOpsto\\_en.aspx?id=25](https://www.stat.gov.mk/OblastOpsto_en.aspx?id=25).

StatLink  <https://doi.org/10.1787/888934256197>

In February 2020, the government set up a crisis committee to manage the crisis and the spillover effects on the tourism industry. The committee took 19 measures to prohibit large gatherings and outdoor events and to close catering facilities. The next stage aimed to provide the private sector and SMEs with financial support. The government established a Tourism Fund of MKD 74 million, of which MKD 30 million was dedicated to the Agency for Promotion and Support of Tourism. The government also asked the Musical Copyrights Society of Macedonia (ZAMP) to put a stop to claims for paying artists' copyright fees on restaurants and hotels and exempted them from monthly income tax advance payments. Companies in the tourism industry received subsidies to cover wages and social insurance contributions for eligible workers. The wage subsidy covered the net minimum wage (EUR 236 per month) and the social insurance contribution covered 50% of actually paid social security contributions up to a maximum amount of EUR 94 per month (World Bank, 2020<sup>[229]</sup>). The government also issued vouchers to be spent at local hotels which were given to citizens with incomes below EUR 150 per month to promote domestic tourism (OECD, 2020<sup>[231]</sup>).

The COVID-19 pandemic has put the brakes on the tourism industry. Accordingly, North Macedonia should carry on its efforts to develop new, high-quality and personalised tourist experiences around its natural and cultural sites. Moreover, it should prepare a marketing strategy and action plan to attract more domestic tourists and tourists from the neighbouring countries.

### *Sub-dimension 15.1: Governance and co-operation*

In North Macedonia, **governance of the tourism sector** at the national level is relatively weak. This is reflected in how few of the policy measures defined in the tourism development strategy have been

implemented. The Ministry of Economy has the overall mandate for tourism development and is responsible for strategic planning. It also manages the Agency for Promotion and Support of Tourism, which is responsible implementing the policies developed by the ministry. However, there is no intra-governmental body (such as a tourism council or working group) to co-ordinate the work of the ministries responsible for the implementation of particular policy measures. Weak inter-ministerial co-operation also hinders the development of policy measures to promote synergies between tourism and other sectors, and the inclusion of tourism development needs in other national strategies (for instance for transport, environment or infrastructure development). Insufficient government commitment to tourism development translates into limited resources and capacity devoted to the implementation of tourism policy measures.

A working group to develop the tourism strategy has been established and is chaired by the senior tourism advisor. It provides a forum for **partnership with stakeholders** and co-ordinating tourism development at a national level and for **vertical co-operation** with regional authorities and local communities. The members of the working group are representatives of the Chamber of Commerce, the eight regions, the municipalities, the educational institutions, NGOs and other associations (such as the Mountaineering Association). The Chamber of Commerce also works in co-operation with the Ministry of Economy. However, the working group lacks substantial commitment from the government, which would contribute to a more efficient implementation of the tourism strategy. The working group does not meet regularly and proposals from private tourism stakeholders are rarely taken into account. The same applies to vertical co-operation, which is further hindered by limited financial resources and qualified staff at the local level. Although the tourism strategies for individual destinations are in line with the national tourism strategy, and developed in co-operation with the private sector, their implementation is lagging behind due to the overall inadequate co-ordination of strategic planning at the national, regional and local levels.

**Tourism data collection and dissemination** in North Macedonia is the responsibility of the State Statistical Office (SSO). The MakStat database is the core channel for data dissemination. Its user-friendly portal systems provide access to a wide range of statistical data in different formats and alert data users to new information. According to the SSO, the first Tourism Satellite Accounts (TSA) are in the process of being implemented and will be ready in 2021. This, combined with the harmonisation with EU regulations on statistics on domestic travel, are positive developments since 2017. Nevertheless, all the other recommendations made in the previous assessment are still valid (OECD, 2020<sup>[51]</sup>). These include the establishment of co-operation among relevant institutions, ensuring greater consistency of the definitions they use, updating and expanding survey evidence (such as visitor perceptions, spending, room occupancy, revenue per room and details by statistical region), and shifting to more frequent data collection, concerning foreign visitors and foreign tourists, rather than the current three-year collection system.

### *Sub-dimension 15.2: Destination accessibility and tourism infrastructure*

Since 2017, North Macedonia has made modest progress in improving its accessibility for tourists. In 2019, the number of countries on the visa requirement list was 115, which is the same as four years ago. Bilateral agreements with neighbouring Serbia and Albania enable border crossings with only an identity card. However, there has been no improvement in the intermodal **connectivity framework** over this period. Moreover, gaps in transport connectivity are impeding trade, including tourism. The quality of transport infrastructure and trade logistics remains low, and there are delays at borders (EC, 2020<sup>[46]</sup>).

When it comes to **accommodation capacity and the quality of the tourism offer**, an accommodation quality standard framework is in place and a register of accommodation has been established. The categorisation of accommodation facilities is in line with Eurostar standards and is mandatory for all types, and the rulebook for implementing the categorisation has been prepared. However, it is not clear how efficient the framework is, as no monitoring or evaluation of the categorisation system has yet been done. Inspections are still weak due to a lack of human resources and competencies at the Market Inspectorate,

which is responsible for the inspection of accommodation. According to the information available, no progress has been made in this area since 2017.

The tourism strategy includes measures to facilitate investment in new high-quality private accommodation as well as the renovation and upgrading of old facilities. The LRCP has co-financed 16 projects to renovate and build private tourist infrastructure (LRCP, 2020<sup>[232]</sup>). However, the number of tourist beds has grown only slowly in the last two years. According to private investors, one of the significant constraints on investments in accommodation is the lack of co-operation between municipalities and private investors over strategic planning at the destination level. Better co-operation would allow their investment proposals to be included in strategic papers at an early stage of preparation. This would not only contribute to better tourism strategies, which would be in line with the needs and ambitions of the private tourism stakeholders, but it would also contribute to integrating tourism investments into the urban planning for municipalities, which is currently one of the major bottlenecks for investments in tourist infrastructure.

**Tourist information is available** on tourist destinations and the accommodation, attractiveness and tourist services of those destinations. Information is provided via websites, road signs and in tourist information centres, etc. Information is available in multiple foreign languages. The Agency for Promotion and Support of Tourism, local communities, and the departments dealing with tourism regularly update the information. However, improvement in this area has been limited and there is no tourism information system framework that would connect current individual tourist information systems into a comprehensive national tourist information framework.

### *Sub-dimension 15.3: Availability of a qualified workforce*

A well-qualified workforce is one of the main success factors for the development of tourism. However, limited progress has been made in this field since 2017. The tourism strategy only recommends improving the attractiveness of tourism studies to students, with no concrete policy measures. There is no evidence of any progress in the **skills supply framework** since 2017 – in fact, North Macedonia worsened its ranking on the 2019 WEF Travel and Tourism Competitiveness Index for the ease of finding skilled employees from 76<sup>th</sup> place in 2017 to 129<sup>th</sup> in 2019 (WEF, 2019<sup>[228]</sup>). Co-operation between the public and private sector has not yet been established. The number of students in tourism and hospitality VET and higher education programmes has declined in the last two years, and no new educational programmes have been developed recently.

The **VET framework for tourism** is part of the National Qualifications Framework (NQF), defined in 2013. A VET quality assurance and accreditation body has been established in the form of a sectoral commission within the NQF that determines the quality of permanent and new qualifications. The VET teaching institutions (schools) are well equipped. The budget for the VET framework is increasing from year to year but, according to the VET representatives, it has not yet reached the level that would cover the investment needed in new technologies, modern equipment and teacher training to follow new technological advances in tourism. The development of the overall VET framework in North Macedonia appears to depend substantially on several donor projects in the economy and in the region. The latest regional project, Towards Regionally-Based Occupational Standards (TO REGOS), led by the Education Reform Initiative of South-Eastern Europe started in 2019. It looks promising as a way to improve the VET framework in tourism because of its focus on strengthening partnerships between VET institutions and businesses to define skills relevant to the labour market.

The **higher education framework** is also a part of the NQF. Tourism studies are available in some higher education institutions. The most prominent seems to be the private University of Tourism and Management in Skopje (UTMS), which offers tourism-related courses and programmes. Its curricula are in compliance with the European standards for 3+2 module of studies. UTMS is an affiliate member of the UN World Tourism Organization (UNWTO), giving students the opportunity to go on internships abroad. The courses include mandatory practical training, which is not the case in public educational institutions. Upgrading

higher education in tourism to include mandatory practical training could be the next step towards increasing the quality of higher education for the sector.

#### *Sub-dimension 15.4: Sustainable and competitive tourism*

The **natural and cultural heritage enhancement framework** for tourism is in the early stages of development. The tourism strategy includes natural and cultural heritage and represents a source for nature-related and cultural tourism products development. The cultural heritage strategy is still under development. In 2018, progress was made on raising awareness of the importance of natural and cultural heritage among young people through a range of events held all over North Macedonia. The Ministry of Culture, the Directorate for the Protection of Cultural Heritage, municipalities, and other institutions and organisations co-operated to bring this about, which was implemented within the framework of the European Year of Cultural Heritage 2018. However, North Macedonia still has improvements to make in this area, such as involving private tourism stakeholders and NGOs in the development of the cultural heritage strategy, preparing an action plan with clear policy measures, and putting in place actions to integrate the most valuable cultural and natural heritage into the tourism offer. This action plan should contain measurable indicators that would allow regular monitoring and evaluation of implemented policy measures, and especially their efficiency and impact on tourism development.

There is no policy framework for **promoting sustainable development within the tourism sector**, including clear measures to support stakeholders to develop sustainable tourism. According to private stakeholders, some lending is available on favourable terms for investment in energy efficiency and the increased use of renewable energy. However, there is no systematic approach covering all aspects of sustainable development such as environmental protection, respecting socio-cultural authenticity and ensuring socio-economic benefits reach the local population. The national tourism strategy or annual tourism action plan should be strengthened to include concrete policy measures to promote sustainable tourism development. Best practice from other countries, such as Slovenia's Green Scheme (Box 24.20), could be considered and adjusted to the context in North Macedonia.

When it comes to **tourism investment and innovation**, as mentioned above, the government has selected tourism as a strategic focus for investment, job creation and increased competitiveness for the period 2016-20. Accordingly, it created a legal and regulatory framework favourable to foreign investors that provides incentives to attract new investments.<sup>179</sup> The four-year LRCP also includes actions to facilitate investment in tourism, not only through grants to MSMEs, NGOs and municipalities, but also actions to improve the capacity of public authorities to manage the grant provision processes in the future. This could be a good basis for improving the implementation of the policy measures regarding tourism investments, defined in the National Strategy for Sustainable Tourism Development. Unlike the tourism investment framework, the tourism innovation framework is not established yet.

#### *Sub-dimension 15.5: Tourism branding and marketing*

The Agency for Promotion and Support of Tourism is responsible for **tourism branding and marketing**. The agency manages the "Macedonia Timeless" brand for promoting visits to North Macedonia. However, it has not adopted a marketing strategy of its own. It works on the basis of the annual tourism promotion programme adopted by the government. The agency has an advisory body with representatives from the private sector and universities. Since 2016, there has been a noticeable reduction in the budget for promotion and marketing (35% less in 2019 than in 2016), which is reflected in a reduction in the promotional and marketing activities carried out. To provide more stable conditions for its promotion and marketing work it would need to prepare a five-year marketing strategy with a clear budget allocation. These would empower the agency to implement a more comprehensive marketing strategy that extends beyond one fiscal year.

When it comes to **digital tourism marketing**, the Agency for Promotion and Support of Tourism has implemented digital marketing activities in 2019, which includes the promotion of all tourist destinations in the economy. In 2019, 70% of the total budget for marketing activities was allocated to digital marketing activities. However, as mentioned, to ensure more stable conditions for tourism marketing, a five-year digital marketing strategy should be prepared. This strategy should also include capacity building for private stakeholders on using digital marketing tools.

### ***The way forward for tourism policy***

To ensure the successful development of tourism, policy makers should:

- **Improve the efficiency governance structure and institutional set up at the national level** to enhance policy decision making at the government level. Moreover, North Macedonia should establish an intra-governmental body which will help improve co-ordination among ministries and other public institutions, while actively involving private and public stakeholders in the process of developing and implementing tourism strategies.
- **Develop regional and local destination management organisations**, as defined in the National Strategy for Sustainable Tourism Development. These can take over managing tourism development within individual destinations and design and implement destination tourism master plans. If such organisations are to be successful they will need sufficient budget for the start-up phase and sound capacity building programmes for their destination management teams.
- **Develop a programme promoting investment in high-quality tourism infrastructure**, building on the destination tourism master plans. This should start by preparing a comprehensive analysis of existing investment (public and private) in close co-operation with private sector stakeholders. This will help focus the programme on the financial resources available and the different forms of incentives in line with Tourism Master Plan, and in accordance with the interests of private investors. It is also necessary to ensure that investment will be appropriately included in other municipal development documents, which form the basis for the preparation of spatial plans. Currently, inconsistency between strategic documents is hindering investments in tourism infrastructure in most municipalities. While North Macedonia should make use of LRCP project support, it should also prepare a long-term tourism investment framework to ensure continuity.
- **Develop a sector-specific human resource policy for tourism** to address the specific skills needs of the industry and ensure that tourism education will be more attractive to lecturers and students.
- **Develop a comprehensive framework for the promotion of sustainable development and operation** of the tourism sector that will include at a minimum the mandatory consideration of sustainability criteria in all investments in tourist infrastructure. The framework should be supported by public incentives, and provide awareness raising and training for tourism sector stakeholders in how to develop their businesses sustainably. Using best practice from other countries is recommended, including Slovenia's green tourism scheme (Box 24.20).

### Box 24.20. Slovenia's green tourism scheme: A comprehensive model for promoting sustainable tourism

Slovenia's green tourism scheme is a good example of how tourism companies can be encouraged to develop sustainable business models. Launched in 2015 by the Slovenian Tourist Board (STO) and supported by the Ministry of Economic Development and Technology, it provides a comprehensive framework for sustainable development in tourism. The core of the scheme is a certification programme that provides guidelines for tourist destinations and companies (accommodation providers, travel agencies and tourist attractions) and tools for monitoring progress on sustainability. Destinations and companies meeting the criteria are given a green label ("green destination", "green accommodation", "green travel agency", "green park", "green tourist attraction") and marketing support from the STO under the umbrella brand Slovenia Green, which raises their profile and makes them more competitive on the global market. The certification scheme is based on the European tourism indicators system for sustainable destination management and the green destination standards (GDS), thus ensuring international comparability. It provides an awareness-raising and capacity building tool for tourism sector stakeholders.

The green tourism scheme is recognised worldwide as a unique comprehensive national scheme that promotes the development of quality and innovative tourism products with high added value. It contributes to the conservation of the environment and cultural heritage and tradition, and also benefits the economic development on the local population.

## Anti-corruption policy (Dimension 16)

### Introduction

Table 24.29 shows North Macedonia's scores for the anti-corruption policy dimension and compares them to the Western Balkans (WB) average. North Macedonia has the highest score (along with Montenegro and Serbia) of the WB6 economies for corruption proofing of legislation. The score for corruption risk assessment also exceeds the WB average. However, North Macedonia scores slightly below the WB6 average for awareness raising and education. The Law on Prevention of Corruption and Conflict of Interest of 2019 provides a new framework for several key anti-corruption areas, particularly the management of conflicts of interest and disclosure of assets and interests. Since the previous assessment, North Macedonia has strengthened the independence and performance of its specialised anti-corruption bodies.

**Table 24.29. North Macedonia's scores for anti-corruption policy**

Dimension	Sub-dimension	Score	WB6 average
<b>Anti-corruption policy dimension</b>	Sub-dimension 16.1: Anti-corruption policy framework	2.8	2.1
	Sub-dimension 16.2: Prevention of corruption	3.0	3.3
	Sub-dimension 16.3: Independence of the judiciary	n.a.	n.a.
	Sub-dimension 16.4: Business integrity and corporate liability	n.a.	n.a.
	Sub-dimension 16.5: Investigation and prosecution	3.0	2.8
<b>North Macedonia's overall score</b>		<b>2.9</b>	<b>2.5</b>

Note: For comparability with the previous assessment, two sub-dimensions (16.3 and 16.4) have not been scored but are discussed in the text below.

### State of play and key developments

#### *Sub-dimension 16.1: Anti-corruption policy framework*

The development of **anti-corruption policy documents, co-ordination and implementation** is in progress. The State Commission for Prevention of Corruption (SCPC) submitted the draft National Strategy for Combatting Corruption and Conflict of Interest 2020-24 to the Assembly of North Macedonia in January 2020. The assembly did not adopt the strategy, reportedly due to the early elections of July 2020, and the SCPC resubmitted a revised version of the document in December 2020. The strategy identifies key problems in 2 horizontal areas (public procurement and employment in the public sector) and 12 sectors (including the political system, judiciary, law enforcement bodies, healthcare, and education). The accompanying action plan defines measures aimed at tackling the problems identified, the responsible institutions, deadlines and simple indicators focused almost exclusively on outputs rather than outcomes and impact. The strategy and action plan do not envisage the amount of funding needed to implement the measures, or the sources. Within the individual sectors, the Ministry of Interior and the Customs Administration have their own anti-corruption planning documents. At a local level, 47 municipalities have adopted anti-corruption statements or commitments to undertake certain actions such as forming working groups on integrity.

The Law on Prevention of Corruption and Conflict of Interest prescribes the key actions and stages for developing the national strategy. The preparation of the strategy is to be based on corruption risk analysis and carried out with the participation of representatives of state bodies, institutions, associations, foundations, the private sector and the media. The SCPC carried out and published the risk analysis, formed a broad working group including governmental and non-governmental stakeholders, and held several workshops. In December 2019, the SCPC published the draft strategy with an open call for comments and proposals. The consultation period was rather short (27 December to 8 January) with two

public holidays within the period. The SCPC did not publish an overview of the proposals it had received, accepted and rejected (DKSK, 2021<sup>[234]</sup>). This makes it hard to assess the impact of the consultation.

The SCPC monitors the implementation of the anti-corruption policy and has been publishing the state anti-corruption programmes (for 2011-15 and 2016-19) and annual implementation reports on its website. By July 2019, 56 of 74 activities in the 2016-19 programme had been or were being implemented (DKSK, 2019<sup>[235]</sup>). The SCPC will continue to monitor the implementation of the national strategy. Monitoring will rely on respondents (focal points) from each implementing institution who will be responsible for submitting information about the level of implementation twice a year through a web application, which is to be developed.

Legislation governing risk assessments has been adopted, but **corruption risk assessments** and management generally take place within the framework of internal financial control. Risk assessments are carried out in public institutions on a systematic basis. According to the government, by the end of 2019, 68% of central-level institutions and entities had adopted risk management strategies and 56% had adopted risk registers. At the local level, the shares were 43% for risk management strategies and 37% for risk registers. The accepted by the Ministry of Finance typology of risks includes risks related to employees and the organisation, and areas to be considered include ethics and conduct (the tone from the top, fraud, conflict of interest, etc.). In 2017, Guidelines for the Management of Fraud and Corruption Risk and Guidelines for Determining Critical Job Positions were published. In 2019, the SCPC conducted a corruption risk analysis for the strategic plan of combatting corruption and conflict of interest (DKSK, 2019<sup>[236]</sup>). The Law on Prevention of Corruption and Conflict of Interest includes the preparation of corruption risks analyses for the different sectors in the remit of the SCPC, but it has not yet developed a systematic practice in this area.

The SCPC is responsible for **corruption proofing of legislation**. In 2015, it adopted the Methodology on Anti-Corruption Proofing of Legislation (DKSK, 2015<sup>[237]</sup>), later revised in November 2020. To implement the methodology, a unit for corruption proofing legislation was formed within the Secretariat of the SCPC in 2016. The SCPC has published 15 reports of corruption proofing of laws and draft laws on its website. In 2019 it analysed five laws, acting on its own initiative. It has also been included in working groups for the elaboration of four draft acts (DKSK, 2020<sup>[238]</sup>). At the request of the SCPC, and with support from the Embassy of the Netherlands and Transparency International, North Macedonia carried out an assessment of vulnerability to corruption in employment policies and procedures in 2020, with special focus on nepotism, cronyism and clientelism. No concrete evidence is available on the implementation of recommendations made during corruption proofing processes.

### *Sub-dimension 16.2: Prevention of corruption*

The SCPC is the main **corruption prevention body**. It is legally autonomous and independent, and accountable to the Assembly. Originally established in 2002, the current SCPC operates based on the Law on Prevention of Corruption and Conflict of Interest adopted in 2019. It has multiple responsibilities such as developing anti-corruption policy, monitoring the implementation of the policy and compliance with legal requirements in several areas, exercising oversight regarding conflicts of interest and declarations of public officials, probing corruption-related acts, instigating initiatives for determining the liability of officials as well as for criminal prosecution, etc. With the new law, the SCPC has gained the competency to conduct misdemeanour procedures.

Several elements of the legal framework aim to safeguard the independence of the SCPC. These include a transparent procedure for the selection and appointment of its president and six members. The Assembly's Committee on Election and Appointment Matters (CEAM) conducts the appointments, which start with the publication of a public announcement. The committee establishes a separate selection committee, comprising seven members, including two representatives of civil society organisations (CSOs). Additional stakeholders from the public are invited to participate in interviews held by the selection

committee with candidates who fulfil formal conditions and broadcast on television. The selection committee determines a ranked list of the candidates, and the CEAM proposes the best-ranked candidates to the Assembly to be appointed for a period of five years, without a right to reappointment. When specific grounds exist, the law authorises the Assembly to dismiss the president and members of the SCPC before their terms have elapsed.

The law does not guarantee any particular level of funding for the SCPC but does determine the salaries of the president and members. The SCPC prepares its own budget proposal, and its president (or his/her deputy) participates in discussions about the budget in working bodies of the Assembly. The annual budget of the SCPC has been increased recently, from MKD 27 million in 2018 to MKD 55 million in 2020 (around EUR 0.9 million). Nevertheless, it remains significantly understaffed with only 24 out of 51 administrative positions filled as of mid-2020. It has had to handle a large amount of cases. In February 2020 alone, the SCPC had to make more than 100 decisions (Blaževski and Rizaov, 2020<sup>[239]</sup>).

Although there are no special mechanisms for civil society oversight, several CSOs have monitored the work of the SCPC. These assessments and their conclusions have focused on a range of aspects. For example, it has been argued that in 2019 the SCPC was more effective at handling cases of conflict of interest than cases of corruption, that its key focus has been on abuse of employment in the public sector, and that the share of cases it has initiated on its own initiative only amounted to 8-15% (Fakik, 2020<sup>[240]</sup>). Despite identifying specific weaknesses, these independent assessments have not doubted the generally positive role played by the commission. The SCPC has been found to be proactive in preventing corruption and launching cases against, among others, high-level officials (EC, 2020<sup>[46]</sup>). The legal requirement to publish its decisions facilitates such public oversight.

When it comes to **conflicts of interest**, the Law on Prevention of Corruption and Conflict of Interest determines the rules for official persons, defined comprehensively as all elected or appointed persons and public sector employees. Other laws, regulations and codes of conduct contain rules on conflicts of interest specifically for members of parliament, members of the government, judges, public prosecutors, etc. The law defines an actual and potential conflict of interest, and clearly requires official persons to be cautious of potential conflicts of interest and take steps to avoid them. The notion of private interest is described in an indirect and general manner as “personal, family, religious, political party and ethnic interests, pressures and promises from superiors or another person”. The SCPC should provide explanations regarding such general provisions and revise the published guidelines before the adoption of the current law (SCPC, 2016<sup>[241]</sup>).

International experts have identified ambiguity over the ad hoc disclosure and management of conflicts of interest (GRECO, 2019<sup>[242]</sup>). There do not seem to be consistent procedures using an unequivocal algorithm for reporting ad hoc conflicts of interest or requesting opinions from the SCPC, or for the officials concerned or the head of their institution to take steps to resolve the conflict. A new version of the code of ethics was adopted by the government on 22 September 2020, while the SCPC adopted a guide in November 2020 which aims to clarify the rules and the general management of conflicts of interest for members of the government and other executive officials (SCPC, 2020<sup>[243]</sup>). It would be necessary to analyse what happens in practice to determine whether the guide – and the officials responsible for advising on integrity matters – manage to ensure smooth compliance with the rules in practice.

When the SCPC determines the existence of a conflict of interest, it should request that the official in question resolves the conflict. If the request is not complied with and the SCPC notified then, depending on the category of the official, the SCPC can demand that a disciplinary procedure is initiated, or the official dismissed, or it can impose a public warning and start a misdemeanour procedure. The law envisages misdemeanour sanctions (fines) for several categories of officials for violations of rules on incompatibilities, post-employment restrictions, management of conflicts of interest, etc. In practice, the number of imposed sanctions has been low: seven public reprimands in 2017, one in 2018 and two in 2019. Only one fine was imposed in 2019 – for violating post-employment restrictions.

Numerous training courses have been held on the topic of conflict of interest. For example, representatives of the SCPC participated as lecturers in training courses for administrative staff organised by the Ministry of Information Society and Administration (MISA) in 2017-19.

The obligation to **disclose assets and interests** applies to high-level functionaries, higher (category A) civil servants, and to notaries, enforcement agents and people employed in the cabinets of the President of the Republic, the President and the Vice-Presidents of the Assembly, the President of the Government (Prime Minister), deputy prime ministers, ministers and the Secretary General. The SCPC may also request an official person not covered by this obligation to submit a declaration of assets and interests when acting on a case in which the person is involved. The Group of States against Corruption (GRECO) has raised the concern that only one official in the Public Security Bureau is subject to the disclosure obligation (GRECO, 2019<sup>[242]</sup>). Officials have to provide data about themselves and their family members on taking up an official position and after the termination of their function or employment. Officials also have to report increases in property that exceed 20 times the average net salary as well as any changes of interests. According to the SCPC, it would be preferable if they made annual declarations, regardless of changes.

The scope of the disclosure of assets appears rather comprehensive although it is defined in general terms. Salaries for performing official functions do not need to be declared. According to the government, cash savings outside financial institutions and virtual assets such as cryptocurrencies are covered under the miscellaneous category, but this opens up the possibility some declarants may not clearly understand the obligation to disclose these types of assets. As of November 2020, it was not possible to precisely assess the scope of declarable information because the new declaration form and relevant by-laws had not yet been adopted. Due to a delay in developing a software solution, the implementation of the system in line with the new law has been delayed, and printed declarations using the previous format remained in use. The public procurement procedure for acquiring the software solution for electronic submission was underway at the time of the assessment.

The SCPC checks officials' property status and interests according to its established annual plan, as well as upon reports or cases formed *ex officio*. However, its capacity to carry out this task is very limited; according to its own data it has only three dedicated employees for this work. The law guarantees the SCPC has access to data from banks and other financial institutions on request as well as direct electronic access to the databases of 17 institutions (although the systems were not yet fully linked as of November 2020; full access is expected with the implementation of the new software solution).

The SCPC imposes misdemeanour sanctions for failures to submit or late submission of declarations (it applied 35 sanctions for non-submission of declarations of interest within the legal deadline, and 74 sanctions for non-submission of declarations of assets in 2019). In 2020, 67 misdemeanour payment orders were issued for non-submission of declarations of assets/interests and 13 for not reporting changes in the property status. According to the government, the amounts of fines have fallen since the 2019 law was adopted because of the general mitigation of misdemeanour sanctions policy. The current law stipulates fines of EUR 300-500 for failing to disclose assets or interests, while previously the range was EUR 500-1 000. In cases of suspected unjustified increase of property, the SCPC submits an initiative to the Public Revenue Office for the verification of undeclared and untaxed assets. It submitted 18 cases in 2017, 8 in 2018 and none in 2019. Since 2016, however, no personal income tax debt settlement decisions have followed such verifications. According to information provided by the SCPC in consultations in November 2020, one practical challenge it faces is individuals paying misdemeanour fines but failing to rectify the underlying violations.

**Whistle-blowers are protected** by the Law on Protection of Whistle-blowers, which was adopted in 2015 and extends to both the private and public sectors. Whistleblowing can be internal, external (to a competent authority) or public. However, protection of external and public whistleblowing is subject to conditions. External whistleblowing is possible, for example if whistle-blowers suspect that no remedying measures will be undertaken if they are reported internally or if internal reporting will cause them or people close to

them harmful consequences. The conditions for public disclosure do not encompass all circumstances envisaged in the EU Directive 2019/1937 on the protection of persons who report breaches of EU law, for example, when the breach reported may constitute an imminent or manifest danger to the public interest.

The law contains multiple provisions to protect whistle-blowers. These include: an obligation for the officer authorised to receive disclosures to protect data about whistle-blowers; protection against any type of violation of the rights of whistle-blowers and any detrimental activity or threat thereof; court protection, which includes possibilities to request finding that a harmful activity has been undertaken or a right has been violated due to the protected disclosure; imposing a ban on the harmful activity or the violation of the right; annulling the harmful act or violation; and awarding compensation for damage. Any provisions of contracts or acts that prohibit whistle-blower disclosure shall be considered null and void.

In any dispute regarding a violation of the right of whistle-blowers and people close to them the burden of proof lies with the institution. However, the definition of persons close to a whistle-blower does not explicitly comprise legal entities connected with the reporting person as envisaged in the EU directive. Legally guaranteed support for whistle-blowers is limited: there are no explicitly envisaged channels of counselling, no access to free legal aid apart from that based on the general rules regarding such aid, and no rules regarding provisional judicial protection before the review of the case is completed.

It has been argued that citizens generally do not understand what it means to be a whistle-blower and competent institutions are not fully prepared to receive whistle-blower reports. Internal whistleblowing is, at best, rare, and as late as in 2019, several major institutions with several thousands of employees and regional units across the economy allegedly had only one or no person designated to receive reports from whistle-blowers (Pisarev, 2019<sup>[244]</sup>).

The SCPC received 19 whistle-blower reports in 2019 and 6 in 2020. No reports were received in 2016-18. According to the SCPC, as of November 2020, only one of the reports had resulted in a misdemeanour procedure, and 15 remained under review, which is an indication of the relatively low effectiveness of whistleblowing and/or subsequent follow-ups. The SCPC received two requests for whistle-blower protection in 2019, and in both cases court proceedings were ongoing as of November 2020. According to the government, the increase in the number of whistle-blower reports is a sign of increased trust in the SCPC. It appears to be a favourable trend, which requires further strengthening.

The government has carried out some **anti-corruption public awareness-raising campaigns and education** activities. For example, the Customs Administration launched the Report Corruption campaign in 2018, which included dissemination of promotional materials. In co-operation with the Institute for Democracy *Societas Civilis*, the SCPC developed the Anticorruption Education for High School Students project. In 2019, the project resulted in completed research on students' knowledge, a manual for teachers, a manual for students and training for teachers in pilot schools. Further training activities within the project took place in 2020. Nevertheless, the efforts to raise awareness and strengthen the anti-corruption attitudes of the general public appear fragmented.

Various training activities have taken place. For example, in co-operation with MISA, representatives of the SCPC participated in state-funded training for civil servants on anti-corruption, conflict of interest, integrity and whistle-blower protection in 2017-19. Anti-corruption training for representatives of the judicial system has been done as part of the annual training plan of the Academy for Judges and Public Prosecutors. Development of e-learning is envisaged within an IPA project started in January 2020.

In 2019, employees of the SCPC themselves received training funded by USAID on ethics, codes of conduct, etc. North Macedonia provided information on numerous other professional development activities for members of the SCPC and administrative staff employed in its secretariat.

Education activities have been funded from both international sources and the national budget. However, information on the total amount of national funding for anti-corruption awareness raising and education is

not available since it is not centrally defined. There is no evidence that the effectiveness of the awareness-raising activities is being monitored, nor any corrective action based on such monitoring.

### *Sub-dimension 16.3: Independence of the judiciary*

According to the constitution, the courts are autonomous and independent. The Judicial Council (JC) appoints judges with no restriction on the duration of their term of office. The rules for the selection of judges comprise competitive elements, define criteria and ensure transparency. The JC selects a judge of a basic court from a list of applicants submitted by the Academy for Judges and Public Prosecutors, taking into account the year they completed their training and the achieved success, as well as the results of the interview conducted by the JC. Judges for higher courts are selected from among the candidates who responded to a public announcement and who meet the set requirements and criteria. Applicants are ranked according to the specialisation needed the positions to be filled. The JC also elects the presidents of courts from among candidates who have responded to a public announcement. It announces vacancies and decisions on the selection and promotion of judges on its website (Judicial Council of North Macedonia, n.d.<sup>[245]</sup>).

The JC is an independent and autonomous institution, and its institutional set up is generally adequate for its mandate. It has 15 members, with judges forming a majority (8 of the members are elected by judges from among their ranks, and the President of the Supreme Court as an *ex officio* member). The Minister of Justice is also an *ex officio* member, although without voting rights, which has been the subject of criticism (GRECO, 2020<sup>[246]</sup>). The JC has broad powers. In addition to appointing and dismissing judges, lay judges and presidents of courts, the JC monitors and assesses the work of judges, decides on the disciplinary accountability and revoking the immunity of judges, proposes two judges for the Constitutional Court, etc. By default, its sessions are held in public. It has been recognised as being increasingly proactive in its role as the guardian of the independence and impartiality of judges (EC, 2020<sup>[46]</sup>).

The Law on Courts and the Law on the Judicial Council set the grounds and procedures for the disciplinary liability of judges. The judges against whom the proceedings are conducted have the right to a fair trial, including the right to be heard and the right of appeal. Disciplinary decisions have to be published on the JC website. The number of sanctioned judges has fluctuated: one judge was dismissed in 2017, no disciplinary sanctions were made in 2018, and four decisions to dismiss judges were made in 2019 (including final decisions and decisions subject to appeal). More decisions to dismiss judges were made in 2020. Altogether, according to the JC, from 2017 to mid-2020 eight judges were dismissed in cases involving allegations of corruption. This suggests an intensifying trend. In 2019, North Macedonia adopted a new code of ethics for judges and lay judges.

Court cases are distributed among judges through an automated electronic system. This court case management information system has been subject to interference, and in August 2020 the former president of the Skopje Criminal Court was convicted of manipulating it (EC, 2020<sup>[46]</sup>). It will therefore be essential to monitor the reliability of safeguards to the system in line with the Law on Management of the Movement of Cases in Courts (adopted in February 2020). Courts have to publish decisions within seven days of the day of their coming into force, and the judicial portal provides access to a searchable database of court decisions (Judicial Council of North Macedonia, n.d.<sup>[247]</sup>).

### *Sub-dimension 16.4: Business integrity and corporate liability*

The formal framework for promoting **business integrity** is limited. For example, according to the Company Law the supervisory body of a joint-stock company is obliged to organise an independent internal audit service, which should, among other things, assess the adequacy and efficiency of internal control systems as well as the implementation of risk management policies, but there are no specific requirements concerning corruption risks.

There have been several public initiatives to support business integrity. One of them is a web platform for business integrity (Bezkorupcija, 2021<sup>[248]</sup>), which contains resource materials on principles and good practices, including a handbook for companies on systems for preventing corruption (Kusnikova and Cvetkovik, 2019<sup>[249]</sup>). The Business Confederation of Macedonia has developed principles of business ethics. In October 2020, the newly appointed Deputy Prime Minister in charge of the fight against corruption and crime, sustainable development, and human resources became the chairman of the Anti-Corruption Business Coalition, which aims to promote an attractive business climate through good governance, advocacy of best practices for integrity, co-operation and capacity building in public institutions and private entities.

According to the Law on Prevention of Money Laundering and Financing of Terrorism, the Central Registry shall establish, maintain and manage a register of beneficial owners. The definition of beneficial owner is generally in line with EU anti-money laundering directives. The name, date of birth, citizenship and country of residence of a beneficial owner, as well as their ownership share or other form and type of ownership or control are to be publicly available. This meets the requirement to provide public access established by the 5th Anti-Money Laundering Directive (2018/843). In January 2021, the register became operational. Both financial institutions and designated non-financial businesses and professions have to identify beneficial owners as part of their customer due diligence.

No designated institution such as a business ombudsman is responsible for receiving complaints from companies about corruption-related matters apart from the SCPC and law enforcement bodies.

The Criminal Code prescribes criminal **liability of legal persons** for all offences. A legal entity shall be liable for crime committed by a responsible person within the legal entity, or on behalf, for the account and for the benefit of the legal entity. Under certain conditions, an entity shall also be liable for crime committed by its employee or representative where a significant property benefit has been acquired or significant damage has been caused to a third person. The conditions link the commission of crime to actions or failure to act by a governing, managing or supervising body of the entity. The element of significant benefit or damage limits the application of liability in corruption cases where no such benefit or damage is found, for example if a bribe has only been offered.

The liability of legal persons is autonomous, i.e. an entity shall be liable for a crime even when there are obstacles to determining the criminal liability of the natural person as offender. Fines are the main sanctions for legal entities. The general upper limit of fines is MKD 30 million (around EUR 485 000) with the possibility of increasing the amount for crimes committed out of covetousness and crimes which lead to a greater benefit or damage. Provisions on the calculation of fines link the maximum amount of fines to ranges of prison sanctions. For offences which would lead to imprisonment of less than five years, fines would be many times lower. Even given the possibility of applying greater sanctions when damage has been caused or benefit acquired, as well as imposing confiscation, fines are low relative to the possible scale of large corruption transactions. The law also envisages several types of secondary sanctions ranging from prohibitions of certain types of activities to the termination of the legal entity. The law does not explicitly envisage due diligence, compliance, internal control, or other internal anti-corruption policies as mitigating circumstances, nor is it possible to defer the application of sanctions due to such circumstances. Thus, there is a room to consider introducing new incentives for compliance in the criminal law.

There are few convictions of legal persons for corruption offences. According to the government, no sanctions were applied in 2017-18, and four sanctions in 2019. The legal framework for corporate liability would benefit from guidance on anti-corruption compliance that legal entities have to ensure.

#### *Sub-dimension 16.5: Investigation and prosecution*

The statistical data available are somewhat equivocal, but they confirm that North Macedonia has established a track record of prosecutions and convictions in cases of **high-level corruption**. According

to the government, there were two such convictions in 2017, four in 2018 and seven in 2019. Three convictions were final. During 2017-19, more than 50% of the sentences were real imprisonment. The Criminal Law prescribes mandatory imposition of a prohibition to carry out a profession, activity or duty for bribery and passive trading of influence. The European Commission has noted final convictions in three cases, including a sentence of six years of imprisonment for a former interior minister and the conviction of a businessman and his associate for forging documentation to win a tender. In June 2020, the former Chief Special Prosecutor was convicted for alleged extortion and abuse of office in the first instance. The number of new investigations and involved individuals show a sustainable trend in 2019-20 (EC, 2020<sup>[46]</sup>). Between 2017 and mid-2020, there have been no high-level corruption cases recorded where proceeds located abroad have been recovered.

The Prosecutor's Office for Organized Crime and Corruption (POOCC, originally established in 2004) serves as a **specialised anti-corruption prosecutorial body**. Its activities are currently based on the Law on Public Prosecution (adopted in February 2020). The POOCC has several special safeguards of its autonomy. For instance, the Chief Public Prosecutor of the POOCC is appointed by the Council of Public Prosecutors following a vote by all public prosecutors. The selection process starts with publication of a public announcement. Without the consent of the Chief Public Prosecutor of the POOCC, the Public Prosecutor of the Republic cannot undertake criminal prosecution or perform certain activities for which the POOCC is competent or authorise another prosecutor's office to conduct proceedings or to perform activities within the competence of the POOCC, except when the function has not been performed within legal deadlines. Public prosecutors of the POOCC are dismissed by a two-thirds majority of members of the Council of Public Prosecutors.

The budget of the POOCC is based on a proposal of the Chief Public Prosecutor of the POOCC submitted to the Public Prosecutor of the Republic. Its annual budget increased in 2018 and 2019 and was around MKD 24 million in 2020 (approximately EUR 390 000). The POOCC has 10 public prosecutors with prosecutorial work experience ranging from 7 to 23 years as well as 10 assistant advisors. In terms of the number of prosecutors and budget, the POOCC is a small institution, but its capacity is backed up with the ability to engage judicial police officers. Several experts have been temporarily engaged by the POOCC such as inspectors working on financial analysis, financial investigations and analysts in the field of cybercrime.

Several units operate as **specialised anti-corruption investigative bodies**. There are three entities within the Ministry of Interior: the Economic Crime and Corruption Department, the Unit for Corruption in the Organised Crime Division, and the Unit for Corruption and Counterfeits in the Skopje Regional Department of Interior Affairs. There are two further anti-corruption units within the Financial Police (the Unit for Detection of Abuse of Official Position and the Unit for Detection of Corruption in Public Procurement).

The specialised units in the interior ministry have no special safeguards of their autonomy. The selection of heads of the units takes place following an internal announcement. An internal commission interviews candidates and may conduct written examinations. The heads of the anti-corruption units of the Financial Police are selected based on a procedure that starts with a public announcement or through internal promotion.

According to the government, there are a total of 30 officers in the Ministry of Interior's specialised anti-corruption units. In the Financial Police, there are 12 officers in the specialised units. The units' budgets are not available as separate budget lines, complicating the assessment of their capacities. Employees of the specialised units have attended numerous training and education events, the majority of which have been organised by international actors. North Macedonia has taken steps to strengthen police support for anti-corruption investigations led by public prosecutors, but further investment into the capacity of these small police units appears necessary.

### ***The way forward for anti-corruption policy***

North Macedonia should bring its anti-corruption policy further by strengthening several institutions, practices and laws. While positive reforms have been made regarding several aspects of preventing and repressing corruption, especially the relevant capacities and implementation measures require further development. Policy makers should:

- **Ensure full staffing of the SCPC with qualified personnel**, and make sure that the financial capacity of the institution is sufficient to maintain adequate staff capacity under the labour market conditions of North Macedonia. At the time of this assessment, the staffing level of the administrative apparatus of the SCPC was less than half of the envisaged strength and starkly inadequate for the various crucial functions of the SCPC in preventing corruption. The United Nations Convention against Corruption requires that states provide the necessary material resources and specialised staff for preventive anti-corruption bodies (Article 6, Paragraph 2) (United Nations, 2004<sup>[250]</sup>). More in-depth analysis would be needed to determine specific solutions in the case of North Macedonia, but generally the government should strive to ensure competitive remuneration and other service conditions in order to attract sufficient numbers of qualified personnel to the SCPC.
- **Develop and launch the electronic system of asset and interest disclosure** as soon as possible to ensure full implementation of the relevant provisions of the Law on Prevention of Corruption and Conflict of Interest. An electronic system is crucial for the effective implementation of many aspects of a system of asset and interest disclosure. Such a system should ensure a user-friendly submission of declarations, provide a comprehensive overview for the oversight body regarding compliance with the obligation to submit declarations fully and in time, include analytical tools for statistical analysis and detection of risk signs revealed by declarations, and ensure connection and data exchange with other public databases as well as swift and complete public disclosure as stipulated by law, etc.
- **Continue to disseminate information for potential whistle-blowers** in order to promote whistleblowing over acts of corruption and increase the usefulness of whistle-blowers' reports for detecting corruption. Explore the possibility of speeding up reviews of whistle-blowers' reports to ensure that they see the outcomes of their actions as soon as possible. North Macedonia should strive to implement, among other things, the support measures for whistle-blowers envisaged as mandatory or optional by the EU directive: comprehensive and independent information and advice, which is easily accessible to the public and free of charge, on procedures and remedies available, on protection against retaliation, and on the rights of the person concerned; effective assistance from competent authorities before any relevant authority involved in their protection against retaliation; legal aid, counselling or other legal assistance; and financial assistance and support measures, including psychological support, for reporting persons in the framework of legal proceedings, etc.
- **Implement the registration of beneficial owners of legal entities** and ensure oversight of compliance with the disclosure requirements. The EU Anti Money Laundering Directive requires that the information held in the central register of beneficial ownership information is adequate, accurate and current, and that states put in place mechanisms to this effect, e.g. the requirement that obliged entities and competent authorities report any discrepancies they find between the beneficial ownership information available in the central registers and the beneficial ownership information available to them. However, note that a full assessment of North Macedonia's level of compliance with requirements of the EU directives in this area is beyond the scope of this analysis.
- **Strengthen corporate liability** by ensuring that the applicable fines for all corruption offences conform with the standard of effective, proportionate and dissuasive sanctions. International standards do not define the sufficiency of the sanctions in specific terms, but the OECD Working

Group on Bribery in International Business Transactions has adhered to the standard that monetary sanctions should be sufficiently severe to impact large multinational corporations. In certain economies, statutory ceilings of sanctions even up to a few million euros have been found to be insufficient (OECD, 2015<sup>[251]</sup>). Even though such levels of fines may appear beyond relevance relative to the limited size of most companies in North Macedonia, the law should provide the possibility to apply adequate sanctions also in a possibly rare case of a large business player engaging in corruption.

- **Strengthen the practice of financial probes alongside corruption investigations** to increase the amounts of corruption proceeds that are detected and confiscated, especially those located abroad. This recommendation echoes the findings of the European Commission that law enforcement and prosecution bodies should boost operational capacity to carry out financial investigations; confiscation of illicit assets should become a strategic priority in fighting organised crime, terrorism and high-level corruption; and the authorities should use confiscation or extended confiscation systematically for certain offences. Corruption crime is mostly perpetrated for obtaining pecuniary benefit, and its recovery for the public is presumably one of the most effective remedies. Therefore, North Macedonia's authorities should make maximum effort to ensure that these benefits are identified, seized and confiscated when law enforcement bodies detect large-scale corruption and the judiciary convicts the involved persons.
- **Consider how to strengthen the independence of specialised anti-corruption law-enforcement units.** The United Nations Convention against Corruption sets the standard that a body or bodies or persons specialised in combating corruption through law enforcement shall be granted the necessary independence, in accordance with the fundamental principles of the legal system of the State Party, to be able to carry out their functions effectively and without any undue influence (Article 36) (United Nations, 2004<sup>[250]</sup>). This assessment did not evaluate in-depth the practice of the specialised anti-corruption investigative bodies of the Ministry of Interior and the Financial Police, and hence cannot argue whether or not there has been any undue influence on their activities. However, North Macedonia should consider potentially introducing additional means to safeguard the independence of these bodies such as more public and competitive selection of management and strengthened guarantees and transparency of dedicated budget funding. Box 24.21 gives an example of how the independence and accountability of Austria's body is safeguarded.

### Box 24.21. Independence and accountability of the Austrian Federal Office for Prevention and Fight against Corruption

The Federal Office for Prevention and Fight against Corruption (Bundesamt zur Korruptionsprävention und Korruptionsbekämpfung, BAK) was established in 2010 as an organisational entity of the Federal Ministry of Interior. The BAK is competent for security and criminal police matters related to corruption offences and several other kinds of crime.

Even though the BAK belongs to the system of the Ministry of Interior, the law provides it with certain special safeguards of independence and public accountability:

- The Federal Minister of Interior appoints the director of the BAK and his/her deputy for a term of five years after hearing the presidents of the Constitutional Court, the Administrative Court and the Supreme Court (re-appointments are permitted).
- Only those who have special knowledge and national and international experience in the field of corruption prevention and the fight against corruption can be appointed.
- The Legal Protection Commission consisting of the Legal Protection Officer envisaged by the Security Police Law and two other members is set up with the Federal Minister of Interior. The two other members are appointed by the Federal President upon proposal by the Federal Government after hearing the presidents of the Constitutional Court, the Administrative Court and the Supreme Court.
- The Commission reviews allegations against the activities of the BAK that are not manifestly unfounded, insofar as no legal remedy is available to those affected.
- The Commission may at any time report on its examinations to the Federal Minister of Interior and, as far as it appears necessary, to the public. The Commission submits a report on the performance of its duties to the Federal Minister of Interior annually. The Minister must make this report available to the Standing Subcommittee of the Committee on Internal Affairs of the Parliament upon request.

## Notes

<sup>1</sup> For more information, please see: OECD COVID-19 Notes - <https://www.oecd.org/south-east-europe/>

<sup>2</sup> A person from the Cabinet of the Deputy President of the Government of the Republic of North Macedonia who co-ordinates the whole assessment in the economy.

<sup>3</sup> [https://nbstat.nbrm.mk/pxweb/en/Eksterni%20statistiki/Eksterni%20statistiki\\_Direktni%20investicii\\_Direktni%20investicii%20-%20Dvizenja/4\\_DIRMPoZemjiGodisniEN.px/](https://nbstat.nbrm.mk/pxweb/en/Eksterni%20statistiki/Eksterni%20statistiki_Direktni%20investicii_Direktni%20investicii%20-%20Dvizenja/4_DIRMPoZemjiGodisniEN.px/)

<sup>4</sup> Other key laws include: the Securities Law; the Profit Tax Law; the Customs Law; the Value-Added Tax (VAT) Law; the Law on Acquiring Shareholding Companies; the Foreign Exchange Operations Law; the Payment Operations Law; the Law on Foreign Loan Relations; the Law on Privatization of State-owned Capital; the Law on Investment Funds; the Banking Law; the Labour Law; and the law on Financial Discipline.

<sup>5</sup> [www.ener.gov.mk](http://www.ener.gov.mk)

<sup>6</sup> The RIA process was started in 2010 and is managed by the Ministry for Information Society and Administration (MISA).

<sup>7</sup> Article 30 of the Constitution provides that no person may be deprived of his/her property or of the rights deriving from it, except in cases concerning the public interest determined by law. If property is expropriated or restricted, rightful compensation not lower than its market value is guaranteed.

<sup>8</sup> The Law on Expropriation predicts condition of expropriation of land in private property for public interest predicted by law.

<sup>9</sup> <https://jpacademy.gov.mk>

<sup>10</sup> North Macedonia has signed 19 international agreements and conventions including the Patent Cooperation Treaty, European Patent Convention, Paris Convention, Nice Agreement and Locarno Agreement.

<sup>11</sup> North Macedonia has been a member of the World Trade Organization since 2003 and accepted the Protocol Amending the Agreement on Trade-Related Aspects of Intellectual Property Rights in March 2010.

<sup>12</sup> IPR legislation is available on the SOIP website (SOIP, n.d.[327]).

<sup>13</sup> SOIP participated in awareness-raising activities as part of World Intellectual Property Day (April 26 2020 - Innovate for a Green Future).

<sup>14</sup> Both names are used for the agency.

<sup>15</sup> Articles 17, 18 and 19 of the Law on Financial Support for Investments.

<sup>16</sup> This initiative was initiated in 2015 and has run about 700 visits per year since.

<sup>17</sup> Machine and automotive components, ICT, healthcare sector, medical devices and pharmaceuticals, agribusiness, and food processing are the sectors with the biggest potential for investments according to the Programme for Stimulating Investment in the Republic of Macedonia (2007-10) as well as the Industrial Policy (2009-20). The energy sector, textiles and tourism are regarded as the next tier of promising sectors for investments.

<sup>18</sup> The FIC consists of more than 130 companies with foreign capital in the economy. It was established with the goal to make the economy more attractive for investment through simplified rules and increased predictability. Promoting solid business ethics and strong corporate governance principles is also high on the FIC's agenda. It gives foreign investors the opportunity to engage in direct dialogue with the highest political/executive level of government.

<sup>19</sup> DTIDZ aftercare services include: 1) support with relevant tax and customs issues; 2) assistance in acquiring visas/work permits for foreign investors; 3) dealing with other state and local authorities; 4) design and infrastructure approvals; 5) issuing building and operational permits; 6) customs outpost services in the zone; 7) zone infrastructure maintenance and upgrade; 8) services for creating linkages with universities; 9) company and recruitment agencies linkages; and 10) identification of suppliers.

<sup>20</sup> In 2018 and 2019, its main export partners were Germany, which alone accounted for almost half of total exports (47%); Serbia (7.9%); and Bulgaria (5.2%); the main sources of imports were Germany (11.6%), the United Kingdom (9.5%) and Greece (8.5%) (World Bank).

<sup>21</sup> There are several bodies established by the government:

- The Co-ordinative Body for WTO Accession, responsible for the accession process and processes after accession to the WTO. The three Economic Chambers are also included in this body. It is co-ordinated by the Ministry of Economy.
- The working group responsible for trade issues within Stabilisation and Association Agreement (SAA). It is co-ordinated by the Ministry of Economy and the Secretariat for European Affairs.
- The Advisory Council responsible for custom matters, within the Custom Administration.
- The Economic Council within the government, chaired by the Prime Minister.

Inter-institutional co-ordination is implemented through a "sectoral approach" and sectoral working groups responsible for the development and managing of sectoral strategies and implementation. There are five sectoral working groups, including one for competitiveness and innovation.

<sup>22</sup> All proposals to Cabinet Sessions must pass internal government consultations (ministries and involved agencies) and external consultations (civil and business community entities). The General Secretariat of the Government co-ordinates pre-Cabinet Sessions with all ministries' state secretaries to assess the compliance of proposals with individual ministries' interests and regulations.

<sup>23</sup> These include the Ministry of Finance, Customs Administration, the Ministry of Foreign Affairs, the Secretariat for European Affairs, the Ministry of Agriculture, Forestry and Water Management, the Food and Veterinary Agency, the Ministry of Justice, the Ministry of Health and other institutions depending on the subject matter.

<sup>24</sup> The regulatory development process is covered by the regulatory impact assessment methodology. However, due to the overload of new or updated regulations, RIA is often carried out in a more formal way than with full understanding and compliance. RIA requires both internal government institutions and external stakeholders (citizens, companies). It should be noted, however, that the effectiveness and efficiency of RIA, and respect for the need to consult stakeholders, seems to be improving. Finally, a form of legal compliance assessment exists through the obligation to obtain the approval of the Secretariat for Legal Affairs for any new regulation.

<sup>25</sup> ENER (<https://ener.gov.mk/Default.aspx>) was created in 2009 to act as the official repository of all regulations under development and consultation.

<sup>26</sup> Evidence shows that the chambers are active in this area and proactively engage in a process of "pre-drafting" legislation for general government strategies. Training programmes were delivered to the chambers on how to participate in RIA processes, ENER training and complaint management. Chambers are able to submit comments, complaints and unsolicited proposals directly to the secretariats of the Prime Minister and the Vice Prime Minister for Economic Affairs. In recent years chambers have begun submitting "white papers" to the government on emerging economic issues.

<sup>27</sup> OECD member states and partner economies: Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

<sup>28</sup> The full set of OECD STRI indices and comparison tools as well as policy simulators for OECD member states and partners states that have undertaken the OECD STRI are available on the dedicated OECD website <https://www.oecd.org/trade/topics/services-trade>.

<sup>29</sup> The complete list of measures sector by sector is available on the OECD STRI website <http://www.oecd.org/trade/topics/services-trade>.

<sup>30</sup> Law on Trade Companies, Закон за трговските друштва.

<sup>31</sup> In order to facilitate comparison with OECD members that have undergone the STRI exercise, the paragraphs below have been drafted in accordance with the methodology of the STRI project publications. The OECD Country Notes, as well as the Sector Notes, are available on the STRI web page <https://www.oecd.org/trade/topics/services-trade/>.

<sup>32</sup> Basel III is a set of measures developed by the Basel Committee on Banking Supervision in response to the 2008/09 crisis. It has been agreed internationally and aims for a more resilient banking system. It underpins the regulatory and supervisory framework and strengthens banks' risk management.

<sup>33</sup> Basel II is an international business standard developed prior to the 2008/09 crisis by the BCBS. It requires financial institutions to maintain enough cash reserves to cover risks incurred by operations.

<sup>34</sup> Directive 2011/61/ EU on alternative investment fund managers and the Regulation on venture capital funds 345/2013.

<sup>35</sup> “Letsfundit - This platform support three forms of crowdfunding: donation based, reward based and equity based <http://www.letsfundit.mk/>.”

<sup>36</sup> Directive 2014/23/EU of the European Parliament and of the Council of 26 February 2014 on the award of concession contracts.

<sup>37</sup> The amount is MKD 2 000 for employees with an average monthly salary of up to MKD 10 000; MKD 1 500 for employees with a salary between MKD 10 001 and MKD 10 500; MKD 1 000 for employees with a salary between MKD 10 501 and MKD 11 000; and MKD 500 for employees with a salary between MKD 11 001 and MKD 11 500.

<sup>38</sup> The threshold for this rate is MKD 1.08 million annually (EUR 17 500).

<sup>39</sup> For income from intellectual property, the allowance varied between 25% and 60%. For rental income, allowances in the range of 25-30% were granted. An allowance of 35% was granted for income qualifying as “other income”.

<sup>40</sup> This does not include the return on “games of chance” which are taxed at 15%.

<sup>41</sup> Employee contributions are remitted by the employer.

<sup>42</sup> The OECD Database on General Competition Statistics (OECD CompStats) is a database with general statistics about competition agencies, including data on enforcement and information on advocacy initiatives. In 2020, it included data from competition agencies in 56 jurisdictions, including 37 OECD countries (36 OECD countries and the European Union), i.e. Argentina, Canada, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Mexico, Peru, United States (Americas): Australia, Brazil, Chinese Taipei, India, Indonesia, Japan, Korea, New Zealand (Asia-Pacific); Austria, Belgium, Bulgaria, Croatia, Czech Republic, Denmark, Estonia, European Union, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Romania, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, United Kingdom (Europe); Egypt, Israel, Kazakhstan, Russian Federation, South Africa, Turkey, Ukraine (Other) (OECD, 2020<sup>[295]</sup>).

<sup>43</sup> The reported total number of SOEs in North Macedonia held by central and sub-national governments, and their total number of employees, is based on OECD calculations aggregating the sectoral figures provided by North Macedonia’s authorities. The figures provided by the authorities excluded primary-sector SOEs.

<sup>44</sup> No corporate valuation figures for SOEs were provided.

<sup>45</sup> The primary sector is understood to include all activities related to the extraction of raw materials, including agriculture, forestry, fishing and mining activities.

<sup>46</sup> The three SOEs nominally listed on the stock exchange undertake the following activities: 1) invest, build, sell and maintain private apartments; 2) invest, build and maintain government properties (government buildings, sport arenas, schools and other government properties); and 3) operate the state lottery.

<sup>47</sup> All of the WB6 economies except Montenegro were included in the IMF analysis of SOEs’ share of national economic activity. It is difficult to arrive at conclusive regional (or international) comparisons regarding SOEs’ employment share, owing to limitations in data availability or differences in methodology. The IMF study found that SOE employees accounted for approximately 4% of national employment in

North Macedonia, which is lower than the 6.4% estimate of the current OECD assessment. The employment data used in the IMF study applied to a significantly smaller portfolio of SOEs than the current assessment, which likely explains the lower estimated employment share.

<sup>48</sup> While the Government of Macedonia is legally the shareholder of SOEs, it is commonly agreed – and asserted in the OECD *Guidelines on Corporate Governance of State-Owned Enterprises* – that the state exercises ownership on behalf of the general public, who are considered the ultimate shareholders of SOEs.

<sup>49</sup> This conclusion is based on the fact that an independent study of SOEs' financial performance was undertaken by the Balkan Investigative Reporting Network in 2014, using information from financial statements available for 101 enterprises through the Central Registry (BIRN, 2014<sup>[92]</sup>).

<sup>50</sup> According to stakeholders interviewed for this assessment, 14 SOEs operate under the separate legal form of “public enterprise”.

<sup>51</sup> This is based on an unofficial translation of the 1996 version of the Law on Public Enterprises.

<sup>52</sup> For example, a government might establish heightened requirements for independent directors on boards (bringing rules in line with good practice), but then use the awarding of independent directorship positions as tools for political patronage.

<sup>53</sup> Although the latest state ownership report for Finland dates from 2016, its contents can still serve as a useful reference point. The report is available online (Ownership Steering Department, 2017<sup>[297]</sup>).

<sup>54</sup> Data for Kosovo and Japan not available.

<sup>55</sup> For the purpose of this profile, the instructional system refers to teaching and learning processes that takes place in school education. It generally consists of the curriculum, standards for schools and student learning, assessment and evaluation frameworks, and other elements that support instruction.

<sup>56</sup> Learning standards in North Macedonia vary by subject and grade level. For example, standards from the Cambridge curriculum are used for Grade 9 mathematics but these differ from the national mathematics standards used in Grades 10+, see Table 2.2 in (OECD, 2019<sup>[70]</sup>).

<sup>57</sup> The National Examinations Centre expects to start implementing the new national assessment in 2021 to monitor student achievement of the curriculum in Grades 3 and 5.

<sup>58</sup> North Macedonia requires schools to conduct self-evaluations biannually.

<sup>59</sup> Article 113 of the 2019 Law on Primary Education lists the tasks under the responsibility of school principals, including monitoring and promoting educational work – and deciding on educational measures.

<sup>60</sup> The share of early school leavers is defined as the percentage of 18-24 year-olds with at most lower secondary education (ISCED 2) who were not in further education or training.

<sup>61</sup> According to national data received for this assessment, nearly 99% of teachers in North Macedonia had attained at least a bachelor's degree as of 2018.

<sup>62</sup> Pedagogical-psychological and methodological preparation consists of attending classes and taking exams, as well as performing at least 45 days of practical teaching in primary or secondary schools.

<sup>63</sup> The Law on Higher Educational Institutions for Teaching Education Staff in Preschool Education,

Primary and Secondary Education, has undergone several amendments.

<sup>64</sup> Selection into initial teacher education programmes is based on candidate results in the State Matura.

<sup>65</sup> North Macedonia does not offer additional compensation to attract candidates or address teacher shortages in rural areas or academic subjects.

<sup>66</sup> Law on Teachers and Professional Associates in Primary and Secondary Education (Official Gazette of the Republic of North Macedonia no.161/19).

<sup>67</sup> Of the 60 professional development hours in a 3-year cycle, 40 must be from accredited programmes and 20 must cover priority areas identified by the ministry.

<sup>68</sup> Vocational education programmes in North Macedonia are either two, three or four years long.

<sup>69</sup> Teachers may be pressured by parents to give students high marks so they can attend the best upper secondary schools, raising concerns about the integrity of teachers' classroom assessments (OECD et al., 2019<sup>[71]</sup>).

<sup>70</sup> This is the second largest difference in the region, after Serbia (64 score points).

<sup>71</sup> Laws relevant to the institutional framework of VET governance in North Macedonia include the Law on Vocational Education and Training, the Law on the Bureau for Development of Education, the Law on Adult Education, the Law on Secondary Education, and the Law on the Chamber of Commerce.

<sup>72</sup> Education Strategy for 2018-25 and Strategy for Vocational Education and Training in the Context of Lifelong Learning.

<sup>73</sup> Averages taken through the World Bank Open Data portal, based on UNESCO Institute for Statistics (UIS) data. Data for Kosovo not available.

<sup>74</sup> Selection into higher education requires successful completion of a four-year upper secondary education programme and passing the State Matura examination. Specific requirements are also set by individual higher education institutions, which publish selection criteria on their websites.

<sup>75</sup> North Macedonia was one of the first non-EU member countries to introduce a Youth Guarantee Scheme that commits to ensuring all young people receive a good-quality offer of employment, continued education, an apprenticeship or a traineeship within four months of becoming unemployed or leaving formal education (OECD, 2019<sup>[70]</sup>).

<sup>76</sup> In 2019, own calculations based on Labour Force Survey (LFS) data.

<sup>77</sup> Note, that among the EU-11 (all EU transition countries) the average activity rate was 73.7% in 2019, (own calculation based on LFS data).

<sup>78</sup> From 2015 to the second quarter of 2019Q2 (WIIW/World Bank, 2020<sup>[129]</sup>).

<sup>79</sup> They are stipulated in the Law on Labour Relations, the Law on Occupational Safety and Health, and the Law on Private Employment Agencies.

<sup>80</sup> The OHS Council is an expert advisory body that reviews and gives opinions and recommendations concerning occupational health and safety issues in North Macedonia (ILO, 2013<sup>[334]</sup>).

<sup>81</sup> Note that youth unemployment rate is on average slightly lower in in countries that joined the EU after

2004 than in the “old” member states (EU-15).

<sup>82</sup> Information provided by the government.

<sup>83</sup> According to a press release of the Minister of Information Society and Administracija, drafting by-laws is in progress.

<sup>84</sup> According to the government.

<sup>85</sup> Government’s response to questionnaire.

<sup>86</sup> According to the government.

<sup>87</sup> Indicators include: 1) unemployment rates by various dimensions; 2) proportions of unemployed people versus employed people; 3) young people not in employment, education, or training (NEET); 4) coefficient of variation of education; 5) variance of relative unemployment rates; 6) mismatch by occupation; 7) over- and under-education; and 8) relative wages (ETF, 2019<sub>[130]</sub>) see also the ETF report Skills Mismatch Measurement in ETF Partner Countries (ETF, 2019<sub>[328]</sub>).

<sup>88</sup> Based on the International Standard Classification of Education (ISCED 2011), the term low-educated refers to people with less than primary, primary and lower secondary education (levels 0-2), medium educated refers to people with upper secondary and post-secondary non-tertiary education (levels 3-4) and highly educated refers to people with tertiary education (levels 5-8). Between 2015 and the second quarter of 2019, the unemployment rate among low-educated adults decreased by 5.9 percentage points, among the medium-educated by 9.6 percentage points, and among the high-skilled by 7.6 percentage points (WIIW/World Bank, 2020<sub>[129]</sub>).

<sup>89</sup> Elementary occupations consist of simple and routine tasks which mainly require the use of hand-held tools and often some physical effort (ILO, 2004<sub>[332]</sub>).

<sup>90</sup> Tracer studies can be defined as retrospective analyses of graduates through a standardised survey, which takes place some time after graduation (normally between 6 months and 3 years) (ETF, 2017<sub>[333]</sub>).

<sup>91</sup> In 2016, according World Bank (2020) data analysis, nearly two-thirds of young people with primary education had a temporary contract.

<sup>92</sup> With the lowest range showing the greatest inequality.

<sup>93</sup> The male employment rate increased by 7.8 percentage points between 2015 and 2019.

<sup>94</sup> For comparison in the EU-11 countries, the activity rate of men was 15.9% percentage points above the activity rate of women in 2019.

<sup>95</sup> Information provided by the government

<sup>96</sup> Information provided by the government.

<sup>97</sup> Of the remaining staff, 23% are working on passive measures, 10% are working as managers and 6% as support staff.

<sup>98</sup> In France and Germany for example, caseloads of hard-to-place jobseekers are around 70 jobseekers per employment counsellor, while caseloads may vary in these countries between 100 and 350, depending

on how much individual guidance job seekers need and how autonomous they are in using self-help guidance tools. (OECD, 2015<sup>[300]</sup>; Manoudi et al., 2014<sup>[282]</sup>); (Pôle emploi, n.d.<sup>[314]</sup>)

<sup>99</sup> The long-term unemployment incidence in the EU was 35% in that year.

<sup>100</sup> Information provided by the government and Eurostat, LFS database.

<sup>101</sup> As recommended by the OECD, countries should ensure access to welfare benefits, such as unemployment and disability benefits whilst reducing incentives for early retirement for those still able to work. This calls for supporting companies to retain older workers (OECD, 2019<sup>[293]</sup>).

<sup>102</sup> 50% of reference earnings for workers who have the right to benefits for up to 12 months, while for workers who are entitled to benefits for longer than 12 months it is 50% of reference earnings in the first year and 40% in the remaining time period.

<sup>103</sup> Information provided by the government.

<sup>104</sup> The poverty rate was reduced from 27% in 2010 to 22.2% in 2017 (Government of North Macedonia, 2019<sup>[121]</sup>).

<sup>105</sup> Study led by co-operation Eftheia, Icon Institut and Budapest Institute on behalf of the European Commission, DG Employment, Social Affairs and Inclusion.

<sup>106</sup> Unemployment rate among 15-24 year-olds.

<sup>107</sup> In the second quarter of 2019, the youth unemployment rate was 4.9 percentage points above the WB6 average.

<sup>108</sup> LFS data.

<sup>109</sup> Information provided by the government.

<sup>110</sup> Data provided through answers to the questionnaire.

<sup>111</sup> There are no comparable data for Bosnia and Herzegovina, Kosovo, and Montenegro available. Data from other sources suggest that informal employment is about 30.4% in Bosnia and Herzegovina; 20% in Montenegro (where in addition 10% of salaries are under-reported according to a 2014 survey (ILO, 2019<sup>[278]</sup>), based on Labour Force Survey data; (EC, 2019<sup>[305]</sup>); (Katnic, 2018<sup>[281]</sup>). According to a Eurobarometer survey, 10% of respondents in the EU report they have purchased goods or services in the past year that might have derived from undeclared work. A third of Europeans know somebody who works undeclared (EC, 2020<sup>[306]</sup>).

<sup>112</sup> According to data provided by the government.

<sup>113</sup> There is a clear link between female employment and access to high-quality and accessible childcare.

<sup>114</sup> Horizon 2020 is the biggest EU framework programme for research and innovation. It provides funding for multi-national collaboration projects as well as for individual researchers, and supports SMEs with a special funding instrument (<https://ec.europa.eu/programmes/horizon2020/en/what-horizon-2020>; <https://www.euneighbours.eu/en/east/stay-informed/projects/horizon-2020>).

<sup>115</sup> Eureka is the largest intergovernmental network for co-operation in R&D and innovation in the world. It is present in over 45 economies, where it provides access to public funding, promotes collaboration and

innovation or offers advice through various programmes (such as EUREKA Clusters, Globalstars, InvestHorizon) (<https://www.eurekanetwork.org/>).

<sup>116</sup> European Cooperation in Science and Technology (COST) is an EU-funded, intergovernmental framework that currently gathers 38 Members and 1 Cooperating Member. It is a funding organisation for the creation of research networks (COST Actions), which offer an open space for collaboration among scientists across economies. COST funding is intended for collaboration activities and complements national research funds (<https://www.cost.eu/who-we-are/about-cost/>).

<sup>117</sup> EURAXESS – Researchers in Motion is a pan-European initiative delivering information and support services to professional researchers, backed by the EU, member states and associated economies. It supports researcher mobility and career development and enhances scientific collaboration (<https://euraxess.ec.europa.eu/>).

<sup>118</sup> Marie Skłodowska-Curie Actions (MSCA) is an EU programme that provides grants to support research careers and encourages transnational, intersectoral and interdisciplinary mobility. (<https://ec.europa.eu/programmes/horizon2020/en/h2020-section/marie-skłodowska-curie-actions>; [https://ec.europa.eu/research/mariecurieactions/msca-actions\\_en](https://ec.europa.eu/research/mariecurieactions/msca-actions_en)).

<sup>119</sup> The National Operational Broadband Plan includes a specific timeline for each action and tangible targets. For example, all towns in the country will have uninterrupted 5G coverage by the end of 2027, or at least 50% of the total number of household subscriber contracts across the country will provide internet access of at least 100 Mbps by the end of 2029, and all public bodies will have internet access speeds above 1Gbps by the end of 2029. (Ministry of Information Society and Administration, 2019<sup>[284]</sup>).

<sup>120</sup> White zones are those in which there is no broadband infrastructure and it is unlikely to be developed in the near future. A basic broadband infrastructure mapping web application was created in 2018 by the Agency for Electronic Communications, the national electronic communications regulator, indicating white, grey and black zones, based on the availability of internet access speeds higher than 30Mbps (AEK, 2021<sup>[255]</sup>).

<sup>121</sup> The Open Data Portal of the Government of North Macedonia (<http://data.gov.mk/>).

<sup>122</sup> The Open Finance Portal was developed with support from USAID and IRI and participation of the civil society (<https://open.finance.gov.mk>).

<sup>123</sup> National e-government portal (<https://uslugi.gov.mk/>).

<sup>124</sup> Country report and roadmap for Digital Agenda advancement in North Macedonia, project “Increasing Citizen Participation in the Digital Agenda – ICEDA”, co-funded by the European Union and implemented by the Metamorphosis Foundation (North Macedonia), Academy for e- Government (Estonia), Levizja Mjaft! (Albania), CRTA - Center for Research, Transparency and Accountability (Serbia), NGO 35mm (Montenegro) and ODK - Open Data Kosovo (Kosovo). (Jashari and Josifovska Danilovska, 2020<sup>[280]</sup>).

<sup>125</sup> Guidelines for Accessibility to Web Content describing the application of WCAG v2.0 standards for the web presentation of public sector bodies and institutions (<http://wcag.mioa.gov.mk/>).

<sup>126</sup> State Market Inspectorate, online form for collecting consumer complaints (<https://www.dpi.gov.mk/index.php/mk/contact>).

<sup>127</sup> The draft Law on Networks and Information Systems Security was under a consultation process at the time of writing this text.

<sup>128</sup> A single project pipeline (SPP) is a list of projects developed based on a strategic tool for project planning to avoid an ad hoc approach to planning preparation and implementation of investment projects. The SPP helps to ensure strong project prioritisation, to enable systematic and timely planning of resources, to provide a reliable basis for defining the proper sequencing of the priority axis and actions per sector, and to help link investment planning and programme budgeting.

<sup>129</sup> Department within the Ministry of Finance of the Republic of North Macedonia.

<sup>130</sup> For more information, please see: World Bank, Regional and Local Roads Program Support Project, [https://ieg.worldbankgroup.org/sites/default/files/Data/reports/ppar\\_macedoniaroads.pdf](https://ieg.worldbankgroup.org/sites/default/files/Data/reports/ppar_macedoniaroads.pdf).

<sup>131</sup> An appropriate definition of “asset management” for the roads sector is the one proposed by the OECD in 2001: “A systematic process of maintaining, upgrading and operating assets, combining engineering principles with sound business practice and economic rationale, and providing tools to facilitate a more organised and flexible approach to making the decisions necessary to achieve the public’s expectations.” (OECD, 2001<sup>[330]</sup>).

<sup>132</sup> Public Enterprise Macedonian Railways Infrastructure (PEMRI, owned by the Republic of North Macedonia) possesses the Railway Infrastructure Management System (RIMS) software, but unfortunately PEMRI does not have the measurement car needed to use the software as planned.

<sup>133</sup> Draft Regional Road Asset Management Plan developed by the Transport Community Permanent Secretariat, (currently under the endorsement process but the implementation level is already monitored by the TCPS); Draft Action Plan for developing a regional rail strategy in the Western Balkans developed by the Transport Community Permanent Secretariat, (currently under the endorsement process but the implementation level is already monitored by the TCPS); Preparation of Maintenance Plans 2018-2022 for Road/Rail TEN-T indicative extensions to WB6. For more information, please see: <https://www.transport-community.org/library/reports/>.

<sup>134</sup> Important regulations include: Regulation on procedure, rules and special requirements for inspection and special requirements to be met by a person to carry out inspection of provision of air navigation services; Regulation on method of provision of Air Navigation Services and special requirements in respect of required staff, equipment and other special requirements necessary for safe and regular work; Decision on Level Charge for Air Navigation Services; Regulation on the organization and use of the airspace; Regulation on rules and requirements in respect of systems interoperability, their components and related procedures for provision of air navigation services with the European ATM network.

<sup>135</sup> According to the last Local Single Sky Implementation document, issued on 30 March 2020, the legal system of the Republic of North Macedonia is in compliance only with the ATM legislation of SES Package 1 but the transposition of SES II was initialised on the basis of the amendments of the Aviation Act enacted in 2016 and is ongoing (Eurocontrol, 2020<sup>[329]</sup>).

<sup>136</sup> Safety culture is civil aviation safety programme. The State Safety Programme is an integrated set of regulations and activities aiming to improve safety (e.g. Safety Risk Management, Safety Assurance).

<sup>137</sup> Information provided through the quantitative questionnaire by the government.

<sup>138</sup> A one-stop shop is a business or office where multiple services are offered; i.e., customers can get all they need in just "one stop." The term originated in the United States in the late 1920s or early 1930s to describe a business model offering customers the convenience of having multiple needs met in one

location, instead of having to "drive all over town" to attain related services at different stores. One-stop shop is a way of facilitating trade.

<sup>139</sup> On 28 January 2019, the Agreement on international transport of passengers and goods between the Republic of Macedonia and the Republic of Lithuania was signed by the Ministers of Foreign Affairs of both countries. It was ratified on 12.12.2019, and published in the Official Gazette of the Republic of North Macedonia no. 259/19 on 18 December 2019.

<sup>140</sup> Modal shift from road, standards for energy efficiency, standards for noise emission, reduction of GHG emissions, vehicle labelling for emissions and fuel efficiency, introduction of carbon footprint calculators, eco-driving and speed limits, ITS applications, co-modality in transport, urban mobility solutions, etc.

<sup>141</sup> As per the Combined Transport Directive 92/106EC, amended by the Directive 2013/22/EU, "combined transport" means the transport of goods between Member States where the lorry, trailer, semi-trailer, with or without tractor unit, swap body or container of 20 feet or more uses the road on the initial or final leg of the journey and, on the other leg, rail or inland waterway or maritime services where this section exceeds 100 km as the crow flies and make the initial or final road transport leg of the journey.

<sup>142</sup> Ease of arranging competitively price shipments.

<sup>143</sup> Ability to track and trace consignments.

<sup>144</sup> For more information please see the UK Transport Analysis Guidance (UK Government, 2019<sup>[323]</sup>), Special attention should be paid to the TAG unit A1-1 transport analysis guidance on the principles of cost-benefit analysis and how they should be applied in the context of transport appraisals.

<sup>145</sup> Periodical and regular measurements to monitor infrastructure assets' conditions, assessment of the value of assets and costs for non-maintained assets, adoption of the asset management strategies, consistent approach in the identification of the mix and timing of asset operation and construction strategies, etc.

<sup>146</sup> Gross inland consumption is, in this case, the total energy demand of North Macedonia excluding international marine bunker. For further explanation of statistical energy terms please see [https://ec.europa.eu/eurostat/statistics-explained/index.php?title=Category:Energy\\_glossary](https://ec.europa.eu/eurostat/statistics-explained/index.php?title=Category:Energy_glossary).

<sup>147</sup> For a list of outstanding secondary legislation and regulations please see (Energy Community Secretariat, 2020<sup>[265]</sup>)

<sup>148</sup> Network codes are a set of rules drafted by ENTSO-E, with guidance from the Agency for the Cooperation of Energy Regulators (ACER), to facilitate the harmonisation, integration and efficiency of the European electricity market. See more details at: [https://www.entsoe.eu/network\\_codes/](https://www.entsoe.eu/network_codes/)

<sup>149</sup> Commissioner in this context means, pursuant to and in compliance with Chapter III of the Energy Law No. 08-3424/1 from the 21st of May 2018, member of the governing council of ERC—including but not exhaustively the President and Deputy President.

<sup>150</sup> See Ten Year Network Development Plan (TYNDP) (MEPSO, 2019<sup>[207]</sup>).

<sup>151</sup> EU Regulation (EU) 347/2013.

<sup>152</sup> Oil indexation had been once the dominant pricing format for natural gas in Europe. This largely reflected that at the times, natural gas spot markets were not liquid enough to provide good price signals.

Moreover, at the times natural gas was competing with oil consumption in power generation and heating and oil indexation was a good approach to assure that natural gas was competitive versus main alternative fuel. Furthermore, with often oil indexation is also justified due to natural gas being partially produced as a by-product from oil exploration or as natural gas investment cost being associated with alternative investment into oil. However, oil indexation implies that in the current market situation that the natural gas price is not reflective of the supply and demand realities which are largely now disconnected from oil both in terms of alternative demand and on the production side. Furthermore, Europe has a variety of liquid natural gas spot markets that offer good pricing and indexation points, especially considering the interconnected nature of the European natural gas pipeline network. However it should be stressed that there is an extensive literature discussing benefit and drawbacks of natural gas being priced on oil indexation and this endnote only scratches the surface of the debate. Some examples of the literature are: (Dubreuil, Gergely Molnar and Jeon, 2020<sup>[262]</sup>), (EC, 2015<sup>[302]</sup>)—with regard to legality of oil indexation, (Melling, A.J. (2010), Natural gas pricing and its future- Europe as the battleground, 2010<sup>[301]</sup>), (IEA, 2020<sup>[277]</sup>)—for current split in pricing approach in Europe, (Stern, 2007<sup>[331]</sup>).

<sup>153</sup> European Union Regulation 2019/941 On risk-preparedness in the electricity sector and repealing Directive 2005/89/EC.

<sup>154</sup> “The term ‘prosumers’ broadly refers to energy consumers who also produce their own energy from a range of different onsite generators,” (EC, 2017<sup>[303]</sup>) but “mainly through solar photovoltaic panels on their rooftops, citizen-led energy cooperatives or housing associations, commercial prosumers whose main business activity is not electricity production, and public institutions like schools or hospitals” (European Parliamentary Research Service, 2016<sup>[270]</sup>).

<sup>155</sup> The Energy Law establishes the possibilities of own consumption and stipulates in Article 38 Paragraph 2, Article 96 Paragraph 4, Article 185 Paragraph 2 and Article 186 Paragraph 1.7 that this activity does not require a licence and that rules for their accommodation should be included in support measures and the distribution network code. This is right is reaffirmed by the Rulebook For Renewable Energy Source.

<sup>156</sup> There are possible improvements with respect to establishing a single entity for a streamlined permit process which renewable energy projects need to approach, as well as establishing an electronic/online platform for aspects relating to permits and Guarantees of Origins.

<sup>157</sup> A Guarantee of Origin (GO) is a tracking instrument defined in Article 15 of the European Directive 2009/28/EC On the Promotion of the Use of Energy from Renewable Sources and Amending and Subsequently Repealing Directives 2001/77/EC and 2003/30/EC. GOs are certificates used to identify and certify that a certain consumed electricity was sourced from renewable energy. A certificate is issued per MWh generated from renewable energy and cancelled by consumers or suppliers who would like to certify that energy was generated renewably. For more information on GOs and their use and implementation please see (AIB, 2020<sup>[256]</sup>) or (Umwelt Bundesamt, 2020<sup>[324]</sup>).

<sup>158</sup> European Directive 2009/28/EC On the promotion of the use of energy from renewable sources and amending and subsequently repealing Directives 2001/77/EC and 2003/30/EC, which is part of the Third Energy Package. Article 15 Paragraph 2 states that “Member States may provide that no support be granted to a producer when that producer receives a guarantee of origin for the same production of energy from renewable sources.” In other words, countries have the option to limit the issuance of GOs to renewable projects not receiving state aid, an option that is currently used by North Macedonia. However, as part of the Clean Energy Package, this Article has been recast to state in Article 19 Paragraph 2 of the European Union Directive 2018/2001 On the promotion of the use of energy from renewable sources that “Member States shall ensure that when a producer receives financial support from a support scheme, the market value of the guarantee of origin for the same production is taken into account appropriately in the

relevant support scheme.” In other words, countries can no longer exclude state funded project from receiving guarantees of origin. This change large reflects the realisation that guarantees of origin allows the owner to obtain additional financial flows for renewable generation as it separate the generated electricity and allows to capture consumer group willing to pay for the privilege of sating their consumption is derived from renewable generation. To this end, the Directive does prescribe that the additional income be used to ease the government associated support scheme cost.

<sup>159</sup> Energy Efficiency Directive 2012/27, the Energy Performance of Building Directive 2010/31, and the Directive of Eco-Design of Energy Related Products 2009/125.

<sup>160</sup> Please see the Energy Community Secretariat report (Energy Community Secretariat, 2020) for a list of all the secondary legislation which has yet to be adopted. Both the regulator and Ministry of Economy have an extensive list of energy sector legislation and regulations that have been adopted. (Energy Regulatory Commission, 2020<sup>[267]</sup>) (Ministry of Economy, 2020<sup>[283]</sup>) (Ministry of Economy, 2020<sup>[283]</sup>) However, the list in English is not as extensive as the list in the national language and so it is possible that some of the outstanding acts have been adopted .

<sup>161</sup> North Macedonia has no natural gas resources and is reliant on natural gas imports (Energy Regulatory Commission, 2019<sup>[266]</sup>).

<sup>162</sup> According to Energy Community Secretariat, there were roughly 437 consumers in North Macedonia in 2019, of which 389 were household consumers. Household consumption of 6 million cubic meters accounted for 2% of total consumption in 2019 (Energy Community Secretariat, 2020<sup>[203]</sup>).

<sup>163</sup> A seat requirement is “a provision of national law under which an undertaking established in another Member State must create a permanent establishment in the Member State in which it seeks” to be active (Energy Community Secretariat, 2018<sup>[264]</sup>). While this is not prohibited, it does add a barrier to entry and decreases the competitiveness of international market entries by imposing the additional cost of maintaining more than one establishment.

<sup>164</sup> Meanwhile, the DSO has fewer than 100 000 customers and thus, under EU Directive 2009/73/EC Article 26 Paragraph 4, does not need to be unbundled.

<sup>165</sup> For more on the natural gas network codes please see European Network of Transmission System Operators for Gas.

<sup>166</sup> For a comprehensive presentation of the benefit of trade and their mechanisms please see (Baker, Hogan and Kolokathis, 2018<sup>[257]</sup>); (Newbery et al., 2013<sup>[259]</sup>); and (Böckers, Haucap and Heimeshoff, 2013<sup>[258]</sup>).

<sup>167</sup> It should be clarified that this section is in relation to subsidies outside of support for renewable energy, energy efficiency, and social needs. All three are commonly applied policy areas that receive some form of financial support. It is common international practice to provide subsidies for renewable energy in order to support the investment and thus growth of renewable energy in the national energy mix. While at the beginning of the global deployment of renewable energy, source subsidies were needed as the cost of renewable energy was not competitive, as deployment has increased the cost has come down to a point where renewable energy sources are increasingly competitive with existing fossil fuel generation. However, renewable energy subsidisation continues to be the international norm in order to expedite the deployment and thus further the cost reduction of renewable energy. Meanwhile, international best practice also recognises social support as an acceptable form of protecting the most vulnerable consumers in society. It should be stressed that social support is sometime used as the basis to provide large section of

consumers with below market cost energy – including consumers who can afford to pay for their consumption. This use represents a cross-subsidy that is not considered international best practice. Lastly, energy efficiency is a common policy area and, much like renewable energy, it is international best practice to provide financial support to consumers to increase and accelerate the deployment of energy efficiency measures. This section concerns itself with direct or indirect subsidies that are not in any of these areas, but rather subsidisation that leads to a market distortion away from the competitive equilibrium.

<sup>168</sup> The third one was published in 2020 and the fourth one was being prepared at the time of writing,

<sup>169</sup> The project “Adaptation to Climate Change through Transboundary Flood Risk Management in the Western Balkans (2016-2020)” funded by Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ), focuses on the development of integrated water resource management and implementation of adaptation strategies in the Drin River Basin, covering Albania, Kosovo, Republic of North Macedonia and Montenegro. The main objective is to mitigate the impacts of climate change by focusing on flooding and drought risk management as well as strengthening regional co-operation as it pertains to the management of water resources. Moreover, the project “Improving Flood Resistance in the Polog Region” funded by the Swiss Agency for Development and Cooperation (SDC) and scheduled to run until 2023.

<sup>170</sup> Overall responsibility for waste management lies with the MoEPP. The Waste Management Department, established in 2010, is responsible for planning, adopting and implementing legislation, setting standards in waste management, monitoring, issuing permits for waste managers, as well as initiation and coordination of waste management projects. The Ministry of Economy (MoE), Ministry of Finance (MoF) and MoEPP are responsible for preparing regulations on Extended Producer Responsibility (packaging, WEEE, batteries). The Ministry of Finance (MoF) develops economic instruments and provides funds to encourage sustainable waste management. The Ministry of Health (MoH) and MoEPP prepare regulations on medical waste management. Responsibility for inspecting medical waste management is divided between State Sanitary Inspectorate (MoH) for the selection and storage of medical waste and State Environmental Inspectorate (SEI) for the transport and treatment of the medical waste. The competent authorities for inspection and enforcement tasks are the State Environmental Inspectorate (SEI) and the Local Inspection Authority (municipalities). Inter-Municipal Waste Management Boards (IMWMB) are established in all eight regions and have the responsibility of organising the implementation of waste management plans.

<sup>171</sup> EU Waste Framework Directive, Landfilling Directive, Packaging Waste Directive and Directives on end-of-life vehicles, on batteries and accumulators and waste batteries and accumulators, and on waste electrical and electronic equipment.

<sup>172</sup> Among the EU countries, Finland records the highest freshwater resources (with a long-term average of 19 950m<sup>3</sup> per inhabitant) followed by Sweden (19 410m<sup>3</sup>). Freshwater abstraction by public water supply ranged across the EU from a high of 179m<sup>3</sup> of water per inhabitant in Greece (2016 data) down to a low of 31m<sup>3</sup> per inhabitant in Malta (OECD, 2020<sup>[51]</sup>).

<sup>173</sup> At the tenth meeting of the Conference of the Parties to Convention on Biological Diversity, held in October 2010, in Nagoya, Aichi Prefecture, Japan, a revised and updated Strategic Plan for Biodiversity was adopted, including the Aichi Biodiversity Targets, for the 2011-20 period. This plan provided an overarching framework on biodiversity, not only for the biodiversity-related conventions, but for the entire United Nations system and all other partners engaged in biodiversity management and policy development. Parties agreed to translate this overarching international framework into revised and updated national biodiversity strategies and action plans within two years, which are intended to define the current status of biodiversity, the threats leading to its degradation and the strategies and priority actions to ensure its conservation and sustainable use within the framework of the socio-economic development of the

country. There are 20 Aichi biodiversity targets grouped around 5 strategic goals: A) Address the underlying causes of biodiversity loss by mainstreaming biodiversity across government and society; B) Reduce the direct pressures on biodiversity and promote sustainable use; C) Improve the status of biodiversity by safeguarding ecosystems, species and genetic diversity; D) Enhance the benefits to all from biodiversity and ecosystem services; and E) Enhance implementation through participatory planning, knowledge management and capacity building (Convention on Biological Diversity, 2020<sup>[261]</sup>).

Draft VI National Report to the Convention on Biological Diversity in 2020 has been prepared. The report was submitted to the Secretariat of the Convention on Biological Diversity.

<sup>174</sup> Although six pollutants (SO<sub>2</sub>, NO<sub>x</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, CO and O<sub>3</sub>) are continuously monitored, in many cases, the time coverage of the data is below 70%.

<sup>175</sup> In 2017, combustion in households and administrative capacities contributed 37% of PM<sub>10</sub>, out of the national total of 16.2kt, and 62% of PM<sub>2.5</sub>, out of the national total of 9.2kt.

<sup>176</sup> The following fees are set out in Article 213 of the Law on Water: fee for water use intended for human consumption; fee for use of irrigation water; fee for use of water for land drainage; fee for the use of water in the production of electric energy; fee for the use of water for thermal energy from geothermal waters; fee for the use of water for fish farming, in fishponds and in cages and waterfowl; fee for the use of water for washing and separation of sand, gravel and stone; fee for use of water for production and processing of food and beverages, industrial and technological needs; a fee for discharging water; and a fee for extracting sand, gravel and stone.

<sup>177</sup> According to the last agriculture census, more than 485 900 families declared at least 20% of the family income came from agriculture activity, State Statistical Office, 2019.

<sup>178</sup> After Brexit, North Macedonia and the United Kingdom concluded a new free trade agreement – Partnership, Trade and Cooperation Agreement between the United Kingdom of Great Britain and Northern Ireland and the Republic of North Macedonia. This agreement complies with the Stabilisation and Association Agreement between the European Union and the Republic of North Macedonia, in order to not disrupt the current trade relations between the two countries.

# **25** Serbia profile

## Key findings

Figure 25.1. Scores for Serbia (2018 and 2021)

Note: Dimensions are scored on a scale of 0 to 5. Scores for 2021 are not directly comparable to the 2018 scores due to the addition/removal of relevant qualitative indicators. Therefore, changes in the scores may reflect the change in methodology more than actual changes to policy. The reader should focus on the narrative parts of the report to compare performance over time. See Scoring approach section for information on the assessment methodology. Scores for Dimension 5 Competition Policy are not included in the figure due to different scoring methodology (see Scoring approach).

Serbia has improved its performance since the publication of the Competitiveness Outlook 2018 report in 13 of the 15 policy dimensions<sup>1</sup> scored in the assessment (Figure 25.1). Although this clearly indicates progress in the design of policies to enhance its competitiveness, if these policies are to have a lasting impact then their effective and continuous implementation, monitoring and upgrading should remain a key priority. Serbia achieves its highest average scores in the investment policy and promotion; trade policy; access to finance; education policy; and science, technology and innovation dimensions, all with scores over 3.0. In these five policy dimensions, Serbia also outperforms the WB6 average. The main achievements in those policy dimensions since the last assessment are:

- Serbia's investment policy is increasingly open and exceptions to national treatment are very limited.** Notably, Serbia's score in the OECD Foreign Direct Investment (FDI) Regulatory Restrictiveness Index, which assesses and benchmarks market access, was 0.05 in 2019, making its FDI regime less restrictive than the OECD average of 0.064. This indicates that its foreign investment rules do not constitute impediments to FDI. As a result, Serbia has been increasingly successful in attracting FDI over the last five years with net inflows increasing from USD 2.3 billion in 2015 to USD 4.3 billion in 2019. This makes it one of the best performers of the WB6 economies and the second largest recipient of FDI among all transition economies. This was also a better performance than the average for upper middle-income countries (2.0% of GDP) and OECD economies (2.4% of GDP) over the same period. Serbia has also adopted a strategic framework for intellectual property (IP) for 2018-22 that focuses on enforcement, and its new Law on Trademarks came into force in 2020, aligning its regulatory framework with the EU directives on trademarks. This marks significant progress in the reinforcement of its IP implementation and enforcement framework since the last assessment.

- Trade policy is less restrictive, with greater transparency, improved consultations and an enhanced e-commerce policy framework.** All 12 services sectors analysed by the OECD Services Trade Restrictiveness Index methodology showed a greater degree of openness than in previous years. Serbia has carried out economy-wide policy changes to reduce restrictions applied to investors (such as amending its public procurement legislation in 2019). It has also eased services trade between Central European Free Trade Agreement (CEFTA) parties, spurred by the conclusion of the Additional Protocol 6 on Trade in Services to CEFTA in December 2019. It has made progress in strengthening public-private consultations and increasing business participation in the formulation of transparent trade policies, and has been very active in strengthening its digital trade framework. Serbia has revised its electronic commerce framework to align it with the European Commission's recommendations and the E-Commerce Directive 2000/31/EC, and has set up a programme to identify critical challenges to further develop e-commerce in the economy.
- Alternatives to bank financing have increased.** In December 2020, the legislature broadened the scope of the legal framework by allowing financial leasing companies to be engaged in operating leasing. In addition, as of January 2021, the Financial Leasing Register, which centralises contracts of financial lease of movable and immovable assets, started to allow all types of registration applications to be submitted in electronic form, removing some of the administrative burden on enterprises. With the adoption of the Law on Alternative Investment Funds and by-laws enacted by the Securities Commission, private equity investment funds and venture capital have been able to operate in Serbia since 2020. In June 2021, Serbia and Albania will become the only WB6 economies to regulate the purchasing, selling or transferring of virtual currencies, making initial coin offerings based on blockchain technologies possible.
- The education system has been strengthened with the introduction of dual education, and early school leaving rates have continued to fall.** In 2018, Serbia introduced a new competency-based curriculum that aims to update classroom practices so that all young people develop the competencies needed to succeed in the 21<sup>st</sup> century. It also revised its school quality standards in 2017-18 to ensure that all children and young people receive a good quality education by identifying schools where additional resources and support are needed. The early school leaving rate has declined slightly over the last decade and by 2019 it was 6.6%, lower than the EU average of 10.2%. In order to further reduce early school leaving, Serbia has implemented instruments to recognise students at risk of early abandonment, introduced targeted measures for vulnerable groups (e.g. Roma students or students with disabilities) and created individualised educational plans to retain young people in education and training. Serbia has also introduced a dual model for vocational education, mixing work-based and classroom learning, which is guided by curricula in line with the Law on Dual Education adopted in 2019. This should help students in vocational education and training (VET) to better develop their core literacy and numeracy skills, an area where they lag behind their peers in general programmes.
- The policy framework and financial incentives for science, technology and innovation (STI) have improved.** Since the last assessment, Serbia has adopted two important strategic documents guiding the development of STI – the Smart Specialisation Strategy in 2020, and the Strategy for the Development of Artificial Intelligence. It also adopted the new Law on Science and Research in 2019. Serbia has expanded its support for STI with the establishment of the Science Fund, expected to become a key instrument for project-based research funding. It had a budget of EUR 4.2 million in 2019, rising to over EUR 7.5 million in 2020. Its aim is to provide funding and technical assistance to the research community, including support for young researchers and diaspora engagement, and promote international co-operation and business-academia linkages.

## Priority areas

While Serbia did not score below the WB6 average in any of the 15 scored policy dimensions, this assessment did find a number of priority areas that it should address to strengthen its competitiveness further. Serbia's lowest scores were in the environment, tourism and employment policy dimensions, all below 3.0 (Figure 25.1). Further, although Serbia scored just slightly over 3.0 in the state-owned enterprises dimension, at 3.1, its score has not improved since the previous assessment. To improve its performance in those four policy areas, Serbia should:

- **Improve environmental quality of life by reducing air and water pollution.** Although Serbia has a relatively well-developed legislative and policy air quality framework, the population is exposed to air pollutants like fine particulate matter (PM<sub>2.5</sub>) at levels of 25 micrograms per cubic metre (µg/m<sup>3</sup>), more than twice the maximum level set by the World Health Organization (10 µg/m<sup>3</sup>). Serbia should step up its efforts to combat air pollution and climate change, primarily by reforming power generation, which remains the main source of pollution. Serbia will need to phase out coal subsidies and start implementing renewable support schemes. It could also consider subsidies for other forms of heating, such as solar space heating. Despite its abundant freshwater, Serbia also faces increasing water pollution, mostly as a result of continuing discharges of municipal and industrial wastewater into rivers. Around 58% of the population are connected to public sewerage systems, but only 10.5% are connected to public sewerage served by a wastewater treatment plant (compared to 86% on average in the EU). Serbia needs to invest in improving the water supply and sanitation system to treat more wastewater.
- **Empower local actors to manage tourism development.** Vertical co-operation in tourism development has been established and some municipalities and local tourist organisations have started developing tourism programmes. However, the lack of knowledge and skills among local public officials, weak public-private co-operation, and a lack of financial resources are hampering the efficient implementation of these programmes. Serbia should focus on providing co-ordinated expert support, designing tourism master plans, improving capacity building and allocating sufficient budget to implement policy measures at the destination level. It should also strengthen its dialogue and co-operation with private sector stakeholders, especially in discussions on the key challenges of tourism development, such as seasonality, the lack of new and high-quality tourist products, digitalisation and sustainability.
- **Increase efforts to implement employment activation policies effectively.** Although efforts have been made to increase the capacity of the National Employment Service (NES), the number of staff remains too low. The average caseload for each employment counsellor was 827, which is well above the average of EU countries such as France and Germany, where caseloads may vary between 100 and 350. Funding for active labour market programmes (ALMPs) is very low. In 2019 it amounted to 0.07% of GDP, compared to the OECD average of 0.37%. Participation in ALMPs is also very low, especially given the large share of registered unemployed facing severe employment barriers. Therefore, Serbia should strengthen the capacity of the NES and increase funding for ALMPs. In particular, to increase the employment rate of vulnerable groups, it should make more effort to develop integrated approaches and to allocate budget to improve the labour market integration of the most vulnerable groups (e.g. Roma communities, women in rural areas). This will require close co-operation with other key stakeholders at national and local levels.
- **Develop a comprehensive governance framework for all state-owned enterprises (SOEs).** Despite encouraging efforts and plans to reform the SOE sector, Serbia has significant room to align governance further with the OECD Guidelines on Corporate Governance of State-owned Enterprises and to improve SOE governance overall. Serbia should develop a comprehensive

state ownership policy that provides a rationale and expectations for all its SOEs. The 2016 Law on Public Enterprises currently only applies to companies engaged in activities in the public interest. The majority of SOEs (99 out of 156 according to the Ministry of Economy) engage in commercial activities and do not fall under the public ownership framework. A comprehensive state ownership policy is important as external assessments of the performance of Serbian SOEs suggest that these enterprises suffer from inefficiencies and provide low overall returns on the state's investment.

1: Please note that Dimension 5 (Competition policy) is excluded from the key findings section as it uses a different scoring model (See the Scoring approach section for information on the assessment methodology).

## Economic context

### **Key economic features**

Serbia is the largest and most diversified economy of the Western Balkan (WB) region. Like most economies in the region, it is also dominated by the services sector, which accounts for 51.1% of gross domestic product (GDP) and 57% of employment. Industry, including construction, accounts for 26% of GDP (roughly half of which is manufacturing) and 27.4% of employment. Even though the value added of the agriculture, forestry and fishing sector has declined considerably over the past decade, to only 6% of GDP in 2019, it still accounts for 15.6% of total formal employment and likely a significant share of informal employment (World Bank, 2021<sup>[1]</sup>).

Prior to the global financial crisis of 2008, Serbia's economy was driven by high growth in consumption fuelled by credit growth and expansionary fiscal policies. This resulted in high GDP growth, averaging 6.5% per year between 2000 and 2008, but also high imbalances including high current account deficits, which reached 20.2% of GDP in 2008. It also led to high inflation (ranging from 6% to 16% annually) and high and rising risks in the financial sectors, including high levels of foreign exchange-denominated lending and non-performing loans (NPLs) (World Bank, 2021<sup>[1]</sup>).

Over the past decade, the growth rate of Serbia's economy has moderated, but it has also become more balanced. The immediate aftermath of the crisis was accompanied by weak growth and heightened volatility reflecting large structural imbalances, imported shocks from trading partners in the Eurozone (i.e. the Eurozone crisis of 2011/21) as well as the devastating floods that impacted much of the region in 2014. However, since 2015, concerted efforts to restore macroeconomic and fiscal stability have started to pay off. Private investment has increased by more than 30% since 2014, on the back of declining and stabilising inflation, declining public debt, declining NPLs, etc. Investment was also supported by an increase in FDI, particularly in export-oriented manufacturing, which led to a significant boost in export performance. Manufacturing exports have risen by nearly 52% since 2015 and in 2019 they accounted for 65% of total exports. Service exports, driven by the information and communication technology (ICT) sector, grew by 16% per year between 2017 and 2019 and accounted for 30% of total exports in 2019 (SORS, 2020<sup>[2]</sup>).

However, despite this recent progress, many structural challenges continue to undermine the growth of the Serbian economy. Investment (as a share of GDP) remains lower than most of its peers as well as the OECD and European Union (EU) averages, and, with the exception of FDI, it is still mostly directed into low-productivity sectors. Moreover, even though FDI investments over the past decade have been concentrated in technology-intensive sectors like automotive and electronics, their impact on GDP growth and productivity has been moderated by their high import intensity and limited linkages with suppliers in the domestic economy. As a result, the growth in labour productivity has been relatively limited. In 2019, value added per worker in industry (including construction) and agriculture in Serbia was roughly one-

quarter of the EU average, while in services it was even weaker, at 20% of the EU average (World Bank, 2021<sup>[11]</sup>).

These challenges are also reflected in labour market outcomes. Even though unemployment has declined significantly to 9% in 2020, the high level of long-term unemployment is a concern. Likewise, the share of young people who are not in employment or education, at 15.1%, is higher than the EU and OECD averages, as well as aspirational peers in Central Europe and the Baltic states. More progress is also needed to boost the labour force participation of women and other vulnerable groups and achieve more inclusive growth – see Structural economic challenges.

Serbia has significant potential to boost its export-driven growth in the coming decade by maintaining macroeconomic stability and addressing key constraints to investment and growth in the tradable sector. These include increasing the transparency and predictability of regulations that affect business, reducing red tape and corruption, and levelling the playing field for all actors in the economy. In line with its aspirations to foster faster and more sustainable growth through smart specialisation, Serbia also needs to improve the skills of its workforce and strengthen the capacities of its small and medium-sized enterprises (SMEs) to innovate and adopt new technologies. These reforms will also be critical for fostering deeper linkages with Serbia's growing and increasingly diverse FDI sector and global value chains.

**Table 25.1. Serbia: Main macroeconomic indicators (2015-2020)**

Indicator	Unit of measurement	2015	2016	2017	2018	2019	2020
GDP growth <sup>1</sup>	% year-on-year	1.8	3.3	2.1	4.5	4.2	-1.0
GDP per capita <sup>2</sup>	Current international \$	14 928	15 858	16 611	17 736	18 930	19 231
National GDP <sup>2</sup>	USD billion	39.7	40.7	44.2	50.6	51.5	..
Inflation <sup>1</sup>	Consumer price index, annual % change	1.4	1.1	3.1	2.0	1.8	1.6
Current account balance <sup>1</sup>	% of GDP	-4.4	-2.9	-5.2	-4.8	-6.9	-4.3
Exports of goods and services <sup>1</sup>	% of GDP	45.3	48.6	50.5	50.8	52.1	47.7
Imports of goods and services <sup>1</sup>	% of GDP	52.3	53.4	57.1	59.2	61.0	56.6
Net FDI <sup>1</sup>	% of GDP	5.1	5.2	6.2	7.4	7.8	6.2
Public and publicly guaranteed debt <sup>3</sup>	% of GDP	70.6	68.6	58.7	54.4	52.9	58.2*
External debt <sup>4</sup>	% of GDP	73.5	72.0	65.1	62.2	61.9	..
Unemployment <sup>1</sup>	% of total labour force	17.7	15.3	13.5	12.7	10.4	9.0
Youth unemployment <sup>2</sup>	% of total labour force ages 15-24	42.6	34.5	31.5	29.4	27.1	..
International reserves <sup>1</sup>	In months of imports of G&S	6.6	6.2	5.4	5.4	5.7	6.1
Exchange rate (local currency/euro) <sup>1</sup>	Value	120.7	123.1	121.4	118.3	117.9	117.6
Remittance inflows <sup>2</sup>	% of GDP	8.5	7.9	8.1	8.8	8.2	7.3
Lending interest rate (BELIBOR) <sup>5</sup>	% annual average	..	3.4	3	2.5	1.2	1.2
Stock markets (if applicable) <sup>1</sup>	Average index	1 359	1 584	1 562	1 583	1 543	1 543

Note: G&S = goods and services. Belgrade Interbank Offered Rate (BELIBOR is the benchmark rate offered on dinar deposits by BELIBOR panel banks; \* estimates for 2020.

## Sustainable development

Over the past decade, Serbia has made progress in reaching the targets of the United Nations Agenda 2030 for Sustainable Development, but across most Sustainable Development Goals (SDGs) considerable challenges still remain (Table 25.2). Serbia has achieved the 2030 SDG target in two areas: 1 – poverty, where the headcount ratio<sup>1</sup> of those living on both USD 1.90 and USD 2.30 per day are lower than their respective targets and 4 – quality education, where the rates of net primary enrolment, lower secondary completion and literacy are above 97% and on track to reach the 100% SDG targets. In all other areas, moderate or significant progress will still be needed to reach the SDG targets by the end of this decade (Sachs, 2021<sup>[7]</sup>).

**Table 25.2. SDG Trends**

SDG	Current Assessment	Trends
1 - No poverty	SDG achieved	On track or maintaining SDG achievement
2 - Zero hunger	Significant challenges remain	Moderately improving
3 - Good health and well-being	Significant challenges remain	Moderately improving
4 - Quality education	SDG achieved	On track or maintaining SDG achievement
5 - Gender equality	Significant challenges remain	Moderately improving
6 - Clean water and sanitation	Significant challenges remain	Moderately improving
7 - Affordable and clean energy	Challenges remain	Moderately improving
8 - Decent work and economic growth	Significant challenges remain	Moderately improving
9 - Industry, innovation and infrastructure	Significant challenges remain	Moderately improving
10 - Reduced Inequalities	Significant challenges remain	Information unavailable
11 - Sustainable cities and communities	Significant challenges remain	Stagnating
12 - Responsible consumption and production	Significant challenges remain	Information unavailable
13 - Climate action	Challenges remain	Stagnating
14 - Life below water	Information unavailable	Information unavailable
15 - Life on land	Major challenges remain	Stagnating
16 - Peace, justice and strong institutions	Significant challenges remain	Moderately improving
17 - Partnerships for the goals	Challenges remain	Moderately improving

Note: The order of progress (from greatest to least) is as follows: SDG achieved; challenges remain; significant challenges remain; major challenges remain.

Source: (Sachs, 2021<sup>[7]</sup>), *Sustainable Development Report 2021: The Decade of Action for the Sustainable Development Goals*, <https://s3.amazonaws.com/sustainabledevelopment.report/2021/2021-sustainable-development-report.pdf>.

The moderate challenges lie in two SDG areas: 7 and 13 – affordable and clean energy and climate action, as well as SDG 17; partnerships and financing to meet the goals. With respect to clean energy and climate action, Serbia still needs to make significant progress in reducing carbon dioxide (CO<sub>2</sub>) emissions toward the ultimate goal of carbon neutrality. Some progress is also needed to improve the population's access to clean cooking fuels and technology (Sachs, 2021<sup>[7]</sup>).

There are significant gaps with regard to the SDG agenda targets in all other areas. These include SDG 3 – health and well-being, where greater progress is needed to reach universal health coverage from the current coverage ratio of 65%. With respect to SDG 6 – clean water and sanitation, the share of the population with access to clean drinking water has fallen, while progress needs to be made to improve the treatment of waste water. Reducing unemployment remains the most important challenge to meeting the SDG 8 – decent work and economic growth, while in the area of innovation (SDG 9), expenditure on research and development (R&D) remains well below the target. Significant reduction in air pollution and improved recycling can contribute to more sustainable cities and economies (SDG 11). Reducing corruption remains the biggest challenge for SDG 16 – peace, justice and strong. Last but not least, major efforts are needed to protect terrestrial and freshwater sites important to biodiversity (SDG 15) (Sachs, 2021<sup>[7]</sup>).

## Structural economic challenges

Serbia faces a number of key structural challenges that undermine its competitiveness, investment and integration into global value chains (GVCs).

### *Strengthening education and skills is key to upgrading and building a knowledge economy*

Even though Serbia outperforms many regional peers with respect to student performance in standardised exams and other learning outcomes, it still lags behind the Central and Eastern Europe (CEE) region as well as the EU and OECD averages.

- **Spending on education lags behind aspirational peers.** At 3.6% of GDP in 2016, public spending on education is lower than the EU average of 4.7% of GDP and the OECD average of 5% (World Bank, 2021<sup>[11]</sup>). Financing per student has increased in recent years at the pre-primary and tertiary level, but has declined for primary and secondary education, and remains lower than in Serbia's WB6 peers as well as the EU economies. The low spending on secondary education partly reflects the limited practical training Serbian schools offer compared to CEEC countries. For example, vocational education and training (VET) schools require significant additional infrastructure and special equipment to enable practical learning for their students, but many Serbian schools focus on more theoretical knowledge, which limits the demand for such additional investment. Limited funding for the professional development of teachers further exacerbates the challenge of improving the quality of education (Maghnouj et al., 2020<sup>[8]</sup>).
- **Education needs to be more relevant to labour market needs.** Serbia could do considerably more to align its education with the needs of the labour market. In the latest Skills Toward Employment and Productivity (STEP) survey of employers, skills were identified as the most significant constraint on hiring, followed by lack of experience, as identified by 50% of the firms surveyed (World Bank, 2018<sup>[9]</sup>). Firms have noted the lack of not just technical skills but also cognitive skills, which are not well integrated into the curricula of educational institutions. This is very important as these skills are highly relevant in more knowledge-based activities and thus critical for economic upgrading. Recent reforms in the VET education system to introduce dual education modelled on the systems in Austria, Switzerland and Germany is an important step in the right direction (Government of the Republic of Serbia, 2020<sup>[10]</sup>). Further investments in adult education and lifelong learning could also help to address the skills gaps through opportunities for upskilling and reskilling.

### *Strengthening the institutional and business environment is critical for boosting domestic and foreign investment*

Over the past decade, Serbia has made significant progress in improving its investment environment. Thanks to reforms to streamline the process of issuing construction permits, the introduction of an e-permitting system and electronic value-added tax (VAT) returns and social security contributions, Serbia has facilitated the operations of businesses on its territory, which has resulted in a strong increase in its overall ranking on the Doing Business assessment from 88<sup>th</sup> in 2010 to 44<sup>th</sup> in 2020 (World Bank, 2020<sup>[11]</sup>). However significant challenges still remain:

- **Bureaucracy and red tape** remain an important challenge in Serbia. In the latest Business Environment and Enterprise Performance Survey (BEEPS) survey, Serbian firms cited notable challenges in dealing with the administration, including obtaining licences and permits and dealing with the tax administration. For example, it takes on average 98 days to obtain an operating licence in Serbia, compared to 24 days in Eastern and Central Europe and 28 days globally (World Bank, 2019<sup>[12]</sup>). Tax administration also remains relatively cumbersome: Serbian firms have to make 33 tax payments per year, which is twice as many as the other WB6 economies. Nearly half of the

firms surveyed in BEEPS also noted that they had to meet with tax officials twice a year on average (World Bank, 2019<sub>[12]</sub>).

- **Corruption** remains an important cost and obstacle to doing business. In the latest BEEPS survey, a larger share of businesses in Serbia reported having to provide gifts to obtain licences than in regional and global peers. For example, the bribery incidence while obtaining operational licences was 18% in Serbia compared to 9% for the Eastern and Central Europe region (World Bank, 2019<sub>[12]</sub>). The latest Transparency International Index ranks Serbia 91<sup>st</sup> out of 191 economies (Transparency International, 2019<sub>[13]</sub>), which reflects not only bribery and petty corruption but also the continuing prevalence of high-level corruption. Stronger and more consistent prosecution and sanctioning of such corruption will be critical to strengthening investor confidence in the economy (European Commission, 2019<sub>[14]</sub>).
- **Contract enforcement** is slow, costly and unreliable. Contract enforcement takes on average 622 days, which is longer than the OECD and Eastern and Central Europe averages (590 and 497 days respectively) and is more protracted than in the global leaders in the Doing Business index (120 days) (World Bank, 2020<sub>[11]</sub>). Contract enforcement is also quite costly: at 39.6% of the claim value, it is nearly twice as expensive as the OECD average of 21.5%. Finally, there is a lack confidence in the judicial system to make fair and impartial decisions. In the latest, Regional Cooperation Council (RCC) barometer survey, 73% of respondents stated that they do not trust the court system and 76% that they do not believe that the judiciary is independent of political influence. Likewise, 67% of respondents do not believe that the law is applied equally to everyone (Regional Cooperation Council, 2019<sub>[15]</sub>).
- **Predictable regulatory environments and transparency** will also be critical for boosting investment. While Serbia has set up a regulatory and institutional framework for effective, inclusive, and evidence-based policy making, in practice, institutional co-ordination and implementation still require considerable improvement. For example, enterprises operating in Serbia note the lack of timely and regular consultation in the process of drafting legislation. Businesses also complain that there is a lack of clear instructions on the implementation of regulations, which adversely affects their operations (Foreign Investors Council, 2019<sub>[16]</sub>).

*Access to finance could be further improved, particularly for micro and small enterprises and start-ups*

- **The banking sector** in Serbia is relatively well-developed and competitive and it is able to serve established enterprises well thanks to a wide range of financial products and the lowest interest rates in the region. Likewise, Serbian enterprises report lower shares of loans that require collateral (41% in Serbia compared to the 76% global average) and lower collateral requirements compared to many regional peers (101% in Serbia compared to the 200% global average) (World Bank, 2019<sub>[12]</sub>). That said, the lending environment for micro and small enterprises as well as newly established businesses is still relatively unfavourable, especially when compared to aspirational peers or the EU and OECD economies. This includes access to finance from banks, whose stringent requirements on turnover, years of operational history, etc. are difficult for SMEs to meet. It also reflects the relatively limited non-bank financing options – see Access to finance (Dimension 3).

*Cross-cutting and sector-specific constraints undermine the growth of key sectors*

- **Agriculture** is an important sector in Serbia, accounting for 6% of GDP, 13% of exports and 15% of employment in 2019. Agriculture in the northern region of Vojvodina is relatively highly productive and its exports are competitive. However, the majority of the sector is not very productive, characterised by small-scale farming, and highly fragmented and uncertain land tenure.

Productivity growth is further hampered by generous agricultural subsidies, which are still highly important for supporting rural economies. Finally, state-owned land, which still accounts for a large share of agricultural land, is only available on short-term leases which discourages investment. According to recent estimates, about one-third of state-owned agricultural land is not used (World Bank, 2020<sup>[17]</sup>).

- **Manufacturing:** Over the past decade, Serbia has attracted considerable FDI in export-oriented manufacturing, particularly in the automotive and electronics industries. However, most of this investment has been in low-value-added, labour intensive industries. Upgrading to more technology- and knowledge-intensive activities will first and foremost require better knowledge and skills. Some other important considerations include reducing the infrastructure gaps compared to competitor economies. This includes hard infrastructure as well as customs and logistics services.
- **ICT services:** ICT is a fast-growing sector with considerable potential for growth in both value added and exports in Serbia. As a globally expanding industry, ICT could benefit from Serbia's relatively low cost but highly skilled ICT workforce. According to the latest Startup Genome, Serbia ranks in the top five countries for ICT talent in the world (Startup Genome, 2020<sup>[18]</sup>). This sector has shown robust growth over the past decade. Its share of service exports rose from 6.5% in 2008 to 20% in 2019. The sector also has considerable scope for improving the productivity of other sectors. The biggest constraints to its growth include continuing challenges in secondary and tertiary education and lifelong learning; regulation and taxation of the sector, including competitive safeguards and cybersecurity; and insufficient digital connectivity outside the main urban areas (World Bank, 2020<sup>[17]</sup>).

*Better management of public finances is needed to support the long-term development of the economy*

- Serbia went into the COVID-19 pandemic with already relatively high levels of public debt and more limited fiscal space than many WB6 economies. Increased spending in the aftermath of the global financial crisis coupled with weaker revenue performance had led to higher fiscal deficits and public debt, which rose from 30% in 2009 to 70% in 2015 (Government of the Republic of Serbia, 2020<sup>[19]</sup>). Strong fiscal consolidation efforts took place during 2015-19, but the pandemic has added renewed fiscal pressure due to the need for significant support against the economic and social consequences of the crisis. Like many economies around the world, Serbia will need to build up stronger fiscal buffers in the post-recovery phase in order to strengthen its capacity to respond to future shocks. This will entail addressing significant outstanding structural constraints including broadening the tax base to improve revenue performance and better and more efficient public spending. It will also include reforming the state-owned enterprise (SOE) sector which remains relatively large compared to regional and global peers (IMF, 2019<sup>[20]</sup>).

*Stronger environmental protection will be critical for long-term development and well-being*

- **Air pollution** is a major concern for cities across Serbia. The annual exposure to particulate matter pollution PM2.5 at 25.1  $\mu\text{g}/\text{m}^3$  2017 is almost double the EU average of 13.1  $\mu\text{g}/\text{m}^3$  and the OECD average of 12.5  $\mu\text{g}/\text{m}^3$  (OECD, 2020<sup>[21]</sup>). It is also 2.5 times the World Health Organization (WHO) recommended maximum level of 10  $\mu\text{g}/\text{m}^3$ . The pollution is caused mainly by the transport and energy sectors. Pollution is exacerbated in winter months when residential heating, including heating by solid fuels, adds to the pollution from other sources. In the latest Balkan Barometer survey, 67% of people surveyed in Serbia identified air pollution as a serious problem, half of whom considered it a very serious problem (Regional Cooperation Council, 2019<sup>[15]</sup>).
- **Climate change:** Serbia is vulnerable to the impacts of climate change due to its high exposure and low resilience to natural hazards, particularly floods. Yet its transition to low-carbon growth has

been slow and more efforts are needed to strengthen its resilience to these hazards. The economy is still highly dependent on lignite coal and its intensity of energy consumption is high. Strengthening environmental sustainability and acting on climate change will require significant investments in infrastructure especially in the areas of waste and wastewater management, pollution control, and clean energy. It will also require better environmental policies and strengthening the capacities of the relevant authorities (World Bank, 2020<sup>[22]</sup>).

*More inclusive growth is needed to improve the incomes and well-being outcomes for all citizens.*

- Even though incomes, as measured by GDP per capita, have improved substantially over the past decade, inequality remains an important challenge and has improved little over the past decade (Solt, 2019<sup>[23]</sup>). There is also considerable regional inequality. For example, the Belgrade region is home to about one-quarter of the Serbian population but it accounts for over 40% of GDP, while the region Južne i Istočne Srbije, in the southern and eastern parts of Serbia, also has one-quarter of the population but generates only 13% of GDP. The poverty rate in the latter region is also three times higher than in the Belgrade region and it also lags considerably behind on access to various services. For example, one-third of the population in the region do not have access to the water supply system (SORS/World Bank, 2016<sup>[24]</sup>).

*COVID-19 has exacerbated structural challenges*

The COVID-19 pandemic has had a significant impact on the Serbian economy over the past year. The brunt of the impact was felt in the second quarter (Q2) of 2020 when domestic and external demand were hit hard by COVID-related restrictions on movement and disruptions in value chains. However, significant fiscal support and some recovery in demand mitigated the decline in the second half of the year and GDP contracted by only 1.1% in 2020, well below the other economies in the region. Exports and investment were most strongly impacted, contracting by 3% and 2.8% respectively, while private consumption declined by 2.5%. The decline in imports (4%) and the boost in government consumption mitigated the fall in domestic and external demand (EC, 2021<sup>[3]</sup>).

The service and manufacturing sectors were most strongly affected by the crisis. Retail and wholesale trade, transport, and tourism and hospitality were most affected, declining by 16.7% y-o-y in Q2. Meanwhile, professional, scientific, technical, administrative and support activities declined by 20.6% y-o-y in the same period. Industrial output fell by 7.1% y-o-y. Some sectors saw an increase in output in this period, including the ICT sector (up 5.4% y-o-y) and agriculture (2.2% y-o-y) (EC, 2020<sup>[25]</sup>; EC, 2020<sup>[26]</sup>).

Serbia implemented the largest fiscal support package in the region to counter the impact of the crisis and this helped contain the fallout in the labour market as well as among the most vulnerable populations. The package included a wide range of measures to support enterprises including the deferment of labour tax and contribution payments as well as corporate income tax payments, wage subsidies, and a moratorium on enforcement and interest on tax debt. Serbia also introduced a state guarantee scheme for bank lending to SMEs in order to support their liquidity. The fiscal package also contained measures to reduce the impact on vulnerable citizens, including a one-off payment to all pensioners (OECD, 2021<sup>[27]</sup>).

These measures helped to reduce the impact of the crisis on the labour market. Unemployment continued to decline in 2020 (from 10.4% in 2019 to 9% in 2020), while the decline in employment was minimal at 0.2% compared to the previous year (EC, 2021<sup>[3]</sup>).

Many of the structural challenges discussed above have played a role in either amplifying the impact of the COVID-19 pandemic or limiting the scope of the policy responses to it. The crisis has, therefore, provided important lessons on how to build more resilient economies and institutions:

- **Fiscal policy:** Among its political and administrative responses to the COVID-19 pandemic, Serbia introduced a number of tax policies including:
  - Deferral of personal income tax (PIT), corporate income tax (CIT) and social security contributions (SSCs) from 1 April to 30 June 2020, and exceptionally until 31 July 2020. In July 2020, these measures were extended until January 2021.
  - A wage subsidy scheme paid directly to employers of three minimum net salaries per employee, strictly to be used for the payment of salaries. These payments are conditional on employers not reducing the number of employees by more than 10% and not paying dividends until the end of 2020.
  - VAT exemption on goods and services for public health institutions during the state of emergency.

Serbia has implemented a relatively narrow set of responses to COVID-19 compared to other WB6 economies. For example, unlike some, Serbia did not introduce a public loan guarantee, direct cash transfers to households, or deferral of households' and businesses' fixed costs. Its fiscal response has been critical to preventing significant economic fallout from COVID-19 especially for labour market outcomes, but it has resulted in a significant narrowing of the fiscal space. With revenues likely to be weaker in the wake of the crisis, particularly if the recovery is slow, improving the efficiency of public spending will be critical over the coming months, as will prioritising expenditures that can support the recovery and promote productivity growth and structural transformation for stronger and more resilient long-term growth. This also includes increasing public investment which has suffered significantly due to high and rising current expenditure. The crisis also highlights the importance of rebuilding fiscal buffers in the post-crisis period. In addition to better management of expenditures, this will also require tackling some of the structural constraints that undermine revenue performance.

- **Innovation and technology adoption:** The COVID-19 crisis starkly demonstrated the importance for firms of being able to adapt to new challenges and changing circumstances. It also revealed the advantages that firms embracing digitalisation and modern practices have over others. The resilience of the recovery will therefore depend on addressing the structural issues limiting innovation and technology adoption among firms (see the Structural economic challenges section above) and to what extent digitalisation and digital skills become mainstream.
- **Access to finance:** The crisis has highlighted the significance of having a well-developed and diversified financial sector that can respond to the financing needs of enterprises not only during a crisis but also during the recovery phase. As in the rest of the region, the main instruments for providing additional liquidity for enterprises during the crisis came from government support through subsidised lending or lending guarantees. But a robust financial sector comprised of diversified financial institutions that can provide financing for riskier and innovative ventures and not just established enterprises will be very important during the recovery phase and beyond.
- **Informality:** The large informal sector – and significant levels of informal employment even within the formal sector – have limited the scope of measures aimed at protecting the income and employment of people in the most affected sectors. Informality is widespread in these sectors, including retail trade and tourism, and informal firms have not been able to benefit from government subsidies, favourable loan terms and loan guarantees, and other support measures. Developing a more resilient economy will also depend on enhancing the incentives for formalisation and improving the oversight and sanctioning of non-compliance.
- **Health sector:** The crisis highlighted the importance of building a strong and resilient health sector that can better cope with pandemics and other pressures. Even though health outcomes in Serbia are generally strong relative to its income level, the sector still faces some important challenges. First, preventative care is not as well developed as many advanced economies which means that unhealthy lifestyles and the continued rise in non-communicable diseases are likely to place a

significant burden to the health sector in the future. Second, the continued widespread evasion of health insurance contributions as well as corruption within the system limits the financing available for health care and increases the out-of-pocket expenditures for many people (European Social Policy Network, 2019<sup>[28]</sup>; World Bank, 2021<sup>[11]</sup>). A significant share of these expenses also goes to informal payments in return for better quality of care (Radošević and Filipović, 2019<sup>[29]</sup>).

### ***EU accession process***

Serbia has advanced considerably on the path to EU accession since it submitted its EU membership application in December 2009. It became an EU candidate country in March 2012 and just over a year later, in June 2013 it began accession negotiations. As of May 2021, Serbia had opened 18 out of the 35 chapters of the accession negotiations and it has provisionally closed 2.

Advancing the socio-economic reform agenda remains a critical priority in Serbia's path to EU membership. As the government negotiates its accession to the EU, the findings in this Competitiveness Outlook 2021 provide the monitoring and guidance needed for the government in meeting the requirements related to a number of critical chapters of the *acquis* when negotiating its accession to the EU. It also provides a good basis for assessing the critical challenges that the economy faces as a starting point for the development of the Economic Reform Programmes (Box 25.1).

#### **Box 25.1. Economic Reform Programmes**

Since 2015, all EU candidate countries and potential candidates prepare Economic Reform Programmes (ERPs) which play a key role in improving economic policy planning and steering reforms to sustain macroeconomic stability, boost competitiveness, and improve conditions for inclusive growth and job creation. The ERPs contain medium-term macroeconomic projections (including for GDP growth, inflation, trade balance and capital flows), budgetary plans for the next three years and a structural reform agenda.

The structural reform agenda includes reforms to boost competitiveness and improve conditions for inclusive growth and job creation in the following areas:

1. Public Financial Management
2. Green transition
3. Digital transformation
4. Business environment and reduction of the informal economy
5. Research, development and innovation
6. Economic integration reforms
7. Energy market reforms
8. Transport market reforms
9. Agriculture, industry and services
10. Education and skills
11. Employment and labour market
12. Social protection and inclusion
13. Healthcare systems

The structural reforms part of the ERPs is organised in two parts:

- A first part identifies and analyses the three key challenges across those 13 areas. The identification and prioritisation of key challenges imply a clear political commitment at the highest level to address them and the ERPs should propose a relevant number of reform measures to decisively tackle each of them in the next three years.
- A second part provides an analysis of the remaining areas (not included as key challenges) and may propose additional reforms to address them.

The European Commission and the European Central Bank then assess these programmes, which form the basis for a multilateral economic policy dialogue involving the enlargement economies, EU Member States, the Commission and the European Central Bank. The dialogue culminates in a high-level meeting during which participants adopt joint conclusions that include economy-specific policy guidance reflecting the most pressing economic reform needs. The findings of the Competitiveness Outlook provide guidance to the six Western Balkans EU candidates and potential candidates in identifying the key obstacles to competitiveness and economic growth, and in developing structural reform measures to overcome them.

### *EU financial and development support*

The EU is the largest provider of external financial assistance to Serbia. Since 2007, the EU has provided EUR 2.79 billion in assistance aimed at strengthening democracy, governance and the rule of law; boosting competition, innovation, agriculture and rural development; improving environmental outcomes, etc. A further EUR 5.5 billion has been provided through lending from the European Investment Bank (EIB) since 1999. The Western Balkans Investment Framework (WBIF) has provided EUR 210.2 million in grants that have leveraged investments of an estimated EUR 5.4 billion. Finally, the EU has provided grant financing of EUR 162.2 million to support Serbia's reconstruction efforts in the aftermath of the devastating 2014 floods (European Commission, 2021<sup>[32]</sup>).

In addition to grant funding and lending, the EU also provides important support through guarantees that support public and private investment by reducing the risks and costs associated with those investments. The new Western Balkans Guarantee Facility is expected to mobilise up to EUR 20 billion in investment over the coming decade.

The Connectivity Agenda seeks to support investments in sustainable transport and clean energy. Set up under the WBIF, the latest package, which was presented at the Western Balkans Summit in Sofia on 10 November 2020, completes the delivery of the EU's 2015 pledge to finance EUR 1 billion of investment in support of better connectivity in the region. It also represents the first step in the implementation of the flagship projects under the Economic and Investment Plan for the region (European Commission, 2021<sup>[33]</sup>).

The EU has also been instrumental in supporting Serbia's response to the COVID-19 pandemic. It provided EUR 93.4 million in bilateral assistance from the Instrument for Pre-Accession Assistance (IPA) 2014-20 to cover the urgent needs of Serbia's health sector and to support the economic and social recovery in the aftermath of the crisis. Serbia and other Western Balkan economies have also been recipients of the EU's regional economic reactivation package of EUR 455 million, a EUR 70 million package to help the WB economies gain access to vaccines and a further EUR 7 million of EC/WHO joint assistance to support vaccination readiness and health sector resilience (European Commission, 2021<sup>[32]</sup>).

## Scope and methods

### **Process**

Following the first two Competitiveness Outlook assessments, published in 2016 and 2018, the third Competitiveness Outlook assessment cycle for the WB6 economies was launched virtually (due to the COVID-19 pandemic) on 3 April 2020. The OECD team introduced Serbia's Competitiveness Outlook Government and Statistical Office Co-ordinators<sup>2</sup> to the new digitalised assessment frameworks (see Assessment methodology and process chapter for details). The two primary documents for assessing each of the 16 policy dimensions – the qualitative questionnaire and statistical data sheet – were explained in depth, giving particular attention to new questions and indicators. The OECD team also explained digital solutions to be used to disseminate the material together with the detailed guidelines, tutorials and information on the assessment process, methodology and timeline.

Following the launch of the assessment, the Ministry of Finance of the Republic of Serbia and the Public Policy Secretariat of the Republic of Serbia disseminated the materials among all 16 Policy Dimension Co-ordinators and Statistical Office contact points in Serbia. Where additional guidance was needed, the OECD team held teleconferences with Dimension Co-ordinators and Statistical Office contact points in April and May 2020.

All 16 Dimension Co-ordinators and Statistical Office contact points completed the assessment between April and May 2020. They assigned a score (see Scoring approach) to each qualitative indicator used to assess the policy dimension in question, accompanied by a justification. The completed assessments (qualitative questionnaires and statistical data sheets) were returned to the OECD team between May and July 2020.

The OECD reviewed the inputs and, where necessary, requested additional information from the Ministry of Finance of the Republic of Serbia, the Public Policy Secretariat of the Republic of Serbia, Policy Dimension Co-ordinators and Statistical Office contact points. The updated assessment materials were sent back to the OECD between July and September 2020. In addition, the OECD organised policy roundtable meetings between October and November 2020 to fill in any remaining data gaps, to get a better understanding of the policy landscape, and to collect additional information for indicators where necessary.

Based on the inputs received, the OECD compiled the initial key findings for each of the 16 policy dimensions. It then held consultations on these findings with local non-government stakeholders (including chambers of commerce, academia and NGOs) in November 2020. As a follow up, the OECD presented the preliminary findings, recommendations and scores to the Competitiveness Outlook Government Co-ordinator,<sup>3</sup> Policy Dimension Co-ordinators and Statistical Office contact points at a virtual meeting on 4 February 2021. The draft Competitiveness Outlook economy profile of Serbia was made available to the Government of Serbia for their review and feedback from mid-January to mid-February 2021.

### **Scoring approach**

Each policy dimension and its constituent parts are assigned a numerical score ranging from 0 to 5 according to the level of policy development and implementation, so that performance can be compared across economies and over time. Level 0 is the weakest and Level 5 the strongest, indicating a level of development commensurate with OECD good practice (Table 25.3).

For further details on the Competitiveness Outlook methodology, as well as the changes in the last assessment cycle, please refer to the Assessment methodology and process chapter.

**Table 25.3. Competitiveness Outlook scoring system**

<b>Level 5</b>	Level 4 plus independent impact evaluation. Results of monitoring and impact evaluation inform policy framework design and implementation updates in line with OECD good practice
<b>Level 4</b>	Level 3 plus evidence that the framework is monitored and, if necessary, adjusted accordingly
<b>Level 3</b>	Level 2 plus some concrete indications that the policy framework is being implemented effectively
<b>Level 2</b>	Framework specifically addressing the policy area concerned is solidly in place, officially adopted by the government or parliament (where applicable). The framework includes policy features necessary for it to have an impact
<b>Level 1</b>	Existing draft or pilot policy framework with signs of government activity addressing the policy area concerned
<b>Level 0</b>	No framework (e.g. law, institution, project, initiative) exists for the policy topic concerned

### *Exceptions*

Unlike the other 15 policy dimensions, competition policy (Dimension 5) is assessed using yes/no answers to 71 questions in a dedicated questionnaire. A “yes” response (coded as 1) indicates that a criterion has been adopted, whereas a “no” (coded as 0) indicates the criterion has not been adopted. The overall score reflects the number of criteria adopted. Moreover, some qualitative indicators which have been added to this edition of the assessment for the first time, are not scored due to the recent character of the policy practice they capture and the unavailability of relevant data.

## Investment policy and promotion (Dimension 1)

### Introduction

Serbia has slightly improved its performance in the investment dimension. The economy's score has increased from 3.4 in the 2018 Competitiveness Outlook to 3.9 in the 2021 assessment, with notable progress in enhancing its investment policies and introducing stable green investment initiatives (Figure 25.1). Serbia is the best-performing economy among the Western Balkan six (WB6) economies regarding investment policy and promotion dimension, driven by its above-average ratings for each sub-dimension (Table 25.4)

**Table 25.4. Serbia's scores for investment policy and promotion**

Dimension	Sub-dimension	Serbia	WB6 average
Investment policy and promotion dimension	Sub-dimension 1.1: Investment policy framework	4.1	3.2
	Sub-dimension 1.2: Investment promotion and facilitation	3.9	3.0
	Sub-dimension 1.3: Investment for green growth	3.0	2.0
Serbia's overall score		<b>3.9</b>	<b>3.0</b>

### State of play and key developments

Overall, Serbia has been increasingly successful in attracting FDI over the last five years with net FDI inflows increasing from USD 2.3 billion in 2015 to USD 4.3 billion in 2019 (Figure 25.2). Net inflows averaged 6.9% of the economy's GDP over the last five years, making the Serbia one of the best performers in the WB6 and the second largest recipient of FDI among the transition economies after the Russian Federation. This is also a better performance than the average for upper middle-income countries (2.0% of GDP) and OECD economies (2.4% of GDP), over the same period. In 2019, the total stock of FDI stood at USD 44 billion. FDI is primarily concentrated in manufacturing, trade, real estate and logistics, and financial mediation, with the vast majority coming from the EU (70%) followed by the Russian Federation, Switzerland and Hong Kong, China.

**Figure 25.2. Net FDI inflows to Serbia (2015-19)**

StatLink  <https://doi.org/10.1787/888934256216>

#### Sub-dimension 1.1: Investment policy framework

Overall, Serbia has a clear and comprehensive **legal framework for investment** activities and the conduct of business. The economy has a unified investment regime that covers both local and foreign investors

under the Law on Investment which was last amended in 2018. The law provides foreigners with the same treatment as nationals, imposes no restrictions on investment activities, allows foreign companies to own 100% of a domestic company, and permits the repatriation of profits and dividends without limitations or restrictions. Serbia's legal framework for investment also provides guarantees and safeguards for investors that are in accordance with EU standards. In addition, the Law on Investment is being revised to include additional protections for investors and is expected to be completed in 2021. However, there have been no significant changes to the legislative and regulatory framework recently as the pace of reform that made the economy successful in attracting FDI over the last decade has slowed.

The government is endeavouring to ensure that the regulatory framework for investment is consistent, clear, transparent, readily accessible and does not impose undue burdens. The authorities publish a plan of changes to legislation and regulations including deadlines on line, while all proposed and adopted legislation are available on the Parliament's website (Parliament of the Republic of Serbia, n.d.<sup>[35]</sup>). Draft legislation that significantly affects the legal regime in a specific field or if the subject matter is an issue of a particular interest are made available on line for consultation as required by Serbian legislation.

In Serbia, investors report that public consultations are not consistently held in accordance with regulations. They report the following shortcomings: 1) limited time for inputs – although the Rules of Procedure require at least 15 days from the public call for submissions, and public hearings from the public call for submissions, investors report an average of 7 days, while the EU guidelines recommend 20 working days;<sup>4</sup> 2) consultations are held at a late stage of policy making; 3) the continued frequent use of the urgent procedure for adopting laws which deprives stakeholders from providing inputs; and 4) limited use of shareholders' contributions in the final texts. According to the EU, the regulatory framework for public consultations was improved with amendments to the Laws on State Administration and on Local Government and the Law on the Planning System, requiring that public consultations are organised early in the policy-making process (EC, 2020<sup>[36]</sup>).

In Serbia, the market is open and **exceptions to national treatment** are very limited. The economy's score in the OECD FDI Regulatory Restrictiveness Index, which assesses and benchmarks market access and exceptions to national treatment, was 0.05 in 2019 (Figure 25.3), making its FDI regime less restrictive than the average for OECD economies of 0.064, and indicating that foreign investment rules do not constitute impediments to FDI (OECD, 2020<sup>[37]</sup>). It is worth noting that the economy maintains some restrictions for services, notably in the media and transport sectors.

**Figure 25.3. FDI Regulatory Restrictiveness Index (2019)**

Restrictions are evaluated on a scale of 0 (open) to 1 (closed)

Source: (OECD, 2020<sup>[37]</sup>), FDI Regulatory Restrictiveness Index (database), <http://www.oecd.org/investment/fdiindex.htm>.

Serbia also maintains licence requirements for investments in a number of activities for both local and foreign investors. Licensing obligations apply to the following sectors: finance, energy, mining, pharmaceuticals, medical devices, tobacco, arms and military equipment, road transportation, customs processing, land development, electronic communications, auditing, waste management, and production and trade of hazardous chemicals. However, there is no list of sectors where foreign investment is prohibited or where discriminatory conditions apply.

**Investor protection against expropriation** without fair compensation is enshrined in the Serbian Constitution and the Law on Investments, and its modalities are defined by the Law on Expropriation and the Law on General Administrative Procedure. The Law on Investments stipulates that expropriation can occur only when it is in the public's interest and in a non-discriminatory manner.

The Law on Expropriation stipulates the rules, procedures and competencies for determining the amount of compensation for expropriation. The evaluation is performed with the support of sectoral experts (forestry, agriculture, construction or economic) and indicates that compensations shall be paid to the investor without delay and shall include the legal default interest in case of delay, calculated from the date of expropriation until the date of payment. Decisions on expropriation by local self-government administrations are subject in the first instance to an appeal before the Ministry of Finance (MoF).

The Administrative Court decides the legality of the Ministry of Justice's final decision on expropriation. Once the decision has been made, parties to the expropriation may agree on the expropriation fee before the competent local self-government body. The local municipal court is authorised to intervene and decide the level of compensation if there is no mutually agreed resolution within two months of the expropriation order. However, although the law clearly defines direct expropriation and appropriate compensation measures, it does not recognise the concept of indirect expropriation, leaving unnecessary room for interpretation and difficulties in estimating the amount of compensation. Serbia has also signed a large network of bilateral investment treaties, which provide an additional layer of protection for foreign investors.

When it comes to **dispute settlement**, foreign investors have the same rights and remedies before the national court system as domestic investors. The justice system is continuing its reform efforts<sup>5</sup> to achieve the objectives included in the National Strategy for Judicial Reform and National Anti-Corruption Strategy. The judiciary is being reformed to reinforce its independence and efficiency and limit political interference. Overall, the court system is functioning well, and investors can generally rely on it to settle a wide range of disputes. However, it is still suffering from significant backlogs of cases despite improvements in recent years. Serbia also has commercial courts which have first instance jurisdiction in commercial matters. The economy's laws and regulations on commercial matters are consistent with international benchmarks, but the system suffers from the congestion of the commercial courts, uneven implementation of decisions and challenging contract enforcement (EC, 2020<sub>[36]</sub>).

As part of its efforts to reinforce make the judiciary more efficient, Serbia has improved its alternative dispute resolution mechanisms. There are opportunities for mediation to resolve disputes between private parties, including in commercial matters, regulated by the 2014 Law on Mediation. Serbia also ratified the Convention on the Settlement of Investment Disputes between States and Nationals of Other States (ICSID Convention) and the 1958 Convention on the Recognition and Enforcement of Foreign Arbitral Awards (New York Convention) which mean it recognises foreign arbitral awards. The Law on Arbitration and the Law on Management of Courts regulate proceedings and jurisdiction over the recognition of foreign arbitral awards. However, the enforcement of an arbitration award can be a slow and difficult process due to a number of reasons including political motivation and limited enforcement capacity (US Department of State, 2020<sub>[38]</sub>).

Serbia has sound and modern<sup>6</sup> **intellectual property (IP) rights legal framework**, which are harmonised with EU legislation and meet the minimum requirements of the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS) even though Serbia is not yet a member of the World Trade Organization (WTO). It is a member of the World Intellectual Property Organization (WIPO) and adheres

to the main international treaties and conventions on IP rights including the Berne Convention and the Paris Convention.

Serbia is reinforcing its IP implementation and enforcement efforts. Recent positive progress includes the adoption of a strategic framework for intellectual property for 2018-22 that focuses on enforcement, as well as the new Law on Trademarks that came into force in 2020 which has aligned the economy with EU Directives 2015/2436 and 2004/48 on trademarks. The new law has also introduced an efficient opposition procedure in line with European standards, by extending opposition filing deadlines and publishing trademark applications before trademarks are granted, as well as developing new provisions to strengthen trademark protection and combat counterfeiting more effectively. Overall, the procedures for the registration of industrial property rights and deposit of works and authorship with the Serbian Intellectual Property Office are efficient and in line with EU standards (US Department of State, 2020<sup>[38]</sup>).

The Intellectual Property Office (IPO) is the main institution in charge of IP rights in Serbia. It is well staffed and efficient at registering trademarks (EC, 2020<sup>[36]</sup>). It offers online registration procedures for patents, trademarks and industrial designs. Its website includes all national databases for patents, trademarks, industrial designs and geographical indications of origin. The office has also issued several publications aimed at supporting SMEs dealing with IP rights. It co-operates with the following IP enforcement institutions: the customs administration, the market inspectorate, the tax administration, the Public Prosecutions Office, the Ministry of Health, the Ministry of Interior and Courts, the Agency for Medicines and Medical Devices, and the Tourist Inspectorate. However, co-ordination with other IP-related institutions should be reinforced.

While Serbia does not have specialised courts to hear IP-related cases, it has established several courts competent to hear civil intellectual property rights (IPR) cases. According to the Law on Organization of Courts and the Law on Seats and Territories of Courts and Prosecutor's Office, the Commercial Court in Belgrade, the Higher Court in Belgrade, the Commercial Court of Appeal and the Court of Appeal in Belgrade may handle civil law IPR cases. While the judges in these courts who regularly handle civil IPR cases do not exclusively adjudicate IPR disputes, the judges of the Education and Information Centre (EIC), a special organisational unit of the IP office, regularly partake in IPO-organised seminars on IPR, most recently on harmonisation with EU Directive 2015/2436 on copyright and related rights as well as enforcement.

The government has also reinforced its **intellectual property rights awareness-raising efforts**, which are included in the National Intellectual Property Strategy for the Period 2018-2022. The 2019 EU Serbia report indicated that the government's new strategic framework on IPR, focusing on the enforcement of intellectual property rights is fully aligned with the relevant EU Directive (EC, 2020<sup>[36]</sup>). Development of a platform for exchanging data among the enforcement institutions is underway within the framework of the ongoing Twinning Project 2016, which brings together public administrative institutions of EU member states with pre-accession economies to share expertise on the protection and enforcement of intellectual property rights. Although the platform was expected to be finished by the end of 2021, many of the planned awareness-raising activities were postponed due to the COVID-19 pandemic. However, Serbia's IPR awareness-raising fair is currently still planned to take place during 2021 if the circumstances of COVID-19 permit.

### *Sub-dimension 1.2: Investment promotion and facilitation*

Serbia has a solid **investment promotion agency structure and strategy** for promotion and facilitation. According to the Law on Investments, the Development Agency of Serbia (RAS) is the sole agency in charge of promoting and facilitating investment projects at the national level. The agency has a wide scope of activities as its mandate encompasses export promotion and SME development as well as investment promotion. The agency is also involved in the design and implementation of all investment promotion policies, programmes and measures. These include the Strategy for Development of SMEs,

Entrepreneurship and Competitiveness 2015-20 and the Strategy and Policy of Industrial Development 2011-20, as well as preparing the new industrial development strategy and policy for 2021-30.

RAS is well funded by the state budget. It has a large staff (29 employees) in comparison to similar bodies in other WB6 economies, and they have regular training. The agency submits a work plan, financial plan and annual report to the government each year. Its performances are regularly benchmarked internationally and RAS usually takes part in benchmarking surveys and mystery shopper programmes performed by international organisations (Multilateral Investment Guarantee Agency, International Finance Corporation, World Bank, World Association of Investment Promotion Agencies, etc).

**Investment facilitation services and activities** include the development of free economic zones. Serbia has currently developed 15 free economic zones that host the majority of foreign investors. As of 2018, the zones have recorded investments amounting to EUR 3 billion (since 2008), attracted 204 multinational companies and created jobs for more than 35 000 employees. These zones accounted for 14% of Serbian exports, for a total turnover of EUR 5 billion. All 15 free zones are obliged to submit an annual report on their business activities. Based on those reports, the MoF provides consolidated reports to the government.

RAS has developed an investor targeting strategy based on its strategic framework for 2017-19. Key developments include a clear definition of the **investor targeting** function with expected values, follow-up activities and lessons learned. RAS is conducting targeted outreach campaigns followed by the follow-up mechanism and evaluating any lessons learned. This strategy has selected key sectors for attracting FDI based on Serbia's competitive advantages, giving priority to projects that have the potential to benefit SME development, export promotion and regional development. The agency is also striving to reinforce linkages between local firms and multinational companies by facilitating contacts between them and through the implementation of a supply chain support programme that relies primarily on working groups consisting of representatives from the public sector and companies.

Serbia also provides tax **investor incentives** targeting large projects, with no special groups or regions are benefitting more than others. According to the Law on Company Income Tax, any company that invests approximately EUR 8.5 million in fixed assets in Serbia and employs at least 100 additional employees throughout the investment period enjoys a 10-year corporate income tax incentive. These tax incentives are applicable for business entities registered in Serbia and operating under the Serbian Tax Administration. Serbia also provides a cost-based tax incentive scheme for qualifying R&D investment expenses as well as a 30% tax credit for investments in new companies performing innovative activities, provided the investor maintains less than 25% ownership. The free economic zones also offer exemption from VAT for income generated through commercial activities. All tax incentives are consolidated under the Tax Administration Office in the MoF.

Serbia has strongly reinforced its investment facilitation activities, as reflected by its improved ranking in the World Bank Doing Business Index from 91<sup>st</sup> in 2015 to 44<sup>th</sup> in 2020 (World Bank, 2020<sup>[34]</sup>). It has made significant procedural improvements in dealing with construction permits, trading across borders, protecting minority investors and resolving insolvency. RAS co-ordinates and facilitates activities on investment project development. According to the Law on Investment, for projects of national significance, project teams are formed with representatives from different levels of administration (local, central) with authority to collect mandatory documentation from other public offices on the investor's behalf. RAS is in charge of co-ordinating the work of project teams. The agency also acts as a one-stop-shop for both local and foreign investors. However, it is not entitled to approve any document on behalf of other institutions for the purpose of facilitating investment projects.

The official mandate of RAS extends to **aftercare activities** and this function has been defined as a permanent activity since the 2017-19 strategic framework. RAS has an aftercare unit that remains in continuous contact with foreign investors doing business in Serbia in order to get feedback on where it could better assist the company or how the business environment could be improved. The agency is also striving to develop and maintain strong collaborations with business associations such as the Chamber of

Commerce and Industry and the Foreign Investment Council as well as through the establishment of a working group consisting of representatives from the public and private sector.

### *Sub-dimension 1.3: Investment for green growth*

Serbia has begun developing a sound **investment policy for the promotion of green investment** and has established comprehensive legislation outlining its green growth priorities and objectives. As part of EU accession negotiations, Serbia adopted the Multi-annual Investment and Financing Plan (MIFP) for the environment in January 2020, further aligning its environmental priorities with Chapter 27 of the EU *acquis*. The MIFP includes an overview of investments needed for compliance, project cost estimates and assessment of potential sources of finance. It discusses the affordability of projects, defines priorities for investment and develops a financing strategy with investment needs, finance sources and the timing of individual projects. A priority investment plan was developed for projects to be started by 2029, based on detailed pipelines of required investments in waste, wastewater and drinking water infrastructure. However, no documents related to the 2020 MIFP are available to the public.

Serbia respects core investment principles such as investor protection, intellectual property rights protection and non-discrimination in areas inclined to attract green investment. These procedures are either part of individual institutional operational frameworks or part of multi-sectoral operational frameworks. For instance, the Ministry of Environmental Protection co-operates with Serbian Chamber of Commerce over regulatory frameworks, project implementation and matters relevant to EU integration. This inter-institutional co-operation between public and private institutions ensures lower costs cutting, simplified administrative procedures and a generally supportive environment for investment in new technologies, innovations, products and workplaces.

Serbia has shown commitment to creating predictable strategic and legal frameworks that are aligned at a national and sub-national level. In 2019, the economy adopted its National Strategy for Sustainable and Integrated Urban Development as well as a three-year action for its implementation. The strategy covers sustainable economic development, urban development and settlement management, social well-being, and environment quality, further aligning the economy with the European Union Urban Agenda. The strategy also addresses, among other things, climate change monitoring; air pollution; the protection of water resources and land, water, sewage and waste management infrastructure; and electricity infrastructure. It also covers the institutional framework needed to implement these areas of the strategy at local and national government levels.

Serbia has also developed a strong framework for making and implementing the choice of **public and private partnerships for green growth**. The economy's public-private partnership (PPP) framework is governed by the Law on Public Procurement and the Law on Public Private Partnership and Concessions, which was last amended in 2016 to account for PPP projects growing in both complexity and value. The law was amended with input from the European PPP Expertise Centre, an advisory service of the European Investment Bank.

Since 2012, Serbia's Public-Private Partnerships Commission has been providing professional support to PPP parties by overseeing concession proposals, holding consultations, giving advice, implementing best international practice and enforcing co-operation between government authorities and PPP parties. The commission is composed of nine government representatives, including those from the Ministry of Mining and Energy as well as the Ministry for Environmental Protection. Since 2017, Serbia has committed to several PPP projects in renewable energy or green growth areas, including four high-value wind farm PPPs<sup>7</sup> as well as a high-value PPP project for the Belgrade municipal waste-treatment facility.

### ***The way forward for investment policy and promotion***

Serbia has an open economy and a clear pro-investment stance that has successfully attracted FDI over recent years. Yet improving its attractiveness as an FDI destination requires further policy adjustments and reforms in the following areas:

- **Accelerate reforms to the legal and regulatory investment framework.** In order to retain its competitiveness as a leading destination for FDI, Serbia should continue to improve its legal framework for investment, in particular by amending investment law to provide additional guarantees and protection for investors, and improving its public consultation processes by involving stakeholders earlier in the policy-making process and allowing them enough time to comment.
- **Reinforce the independence, resources and capacity of the courts, particularly for commercial disputes.** Improving the functioning of the commercial courts over the protection of property rights and the enforcement of contracts will be crucial to underpinning Serbia's economic performance and its ability to attract investors while reducing transactions costs. In the long run, a more efficient judiciary could encourage investments and promote the establishment of economic relationships while having a positive impact on competition and innovation.
- **Increase the take up of mediation mechanisms.** While Serbia has developed mediation mechanisms that are aligned with EU standards, their use remains limited, preventing them from alleviating the pressure on the courts. Raising public awareness of alternative dispute mechanisms could represent a first step towards this goal.
- **Reinforce efforts to implement the IPR framework and strengthen enforcement bodies.** Successful implementation of the strategic framework for intellectual property for 2018-22 will require solid governance, co-operation and co-ordination among the multiple actors involved in the implementation and enforcement of IPR rights, and increased resources and regular training on IPR matters.
- **Reinforce IPR awareness-raising efforts.** While the IPR strategic framework focuses on enforcement, it is also crucial to increase awareness about IP protection and management strategies among policy makers and in business communities. This could be done by improving access to information and regularly organising joint events with the private sector and the education system.
- **Continue to strengthen the capacity of RAS's staff.** While the national investment promotion agency has played an important role in attracting investors, it will be crucial to strengthen the capacity of its staff, notably in areas related to investor targeting and support for SMEs to enable RAS to reinforce linkages between local firms and multinational firms.
- **Reinforce the investment facilitation role of RAS through better co-ordination with other government bodies and agencies.** RAS acts as the main counterpart for investors but its role is hampered by its inability to facilitate its administrative procedures directly and effectively. Reinforcing its role of collecting and validating administrative procedures and/or strengthening its co-operation with the responsible government bodies and agencies will improve its ability to work alongside investors during the project definition and establishment phase, as well as to continue to assist investors once a project has been implemented.

## Trade policy (Dimension 2)

### Introduction

Serbia's performance on the trade policy dimension has improved since the last assessment. The economy's score has increased from 3.5 in the 2018 Competitiveness Outlook to 3.8 in the 2021 assessment (Table 25.4) with notable progress having been made on all sub-dimensions. Serbia improved the legal framework of its trade policy-making process through the implementation of a new trade facilitation body and expert groups. Its inter-institutional co-ordination mechanism has proved effective and the Ministry of Trade, Tourism and Telecommunications (MTTT) has established a National Co-ordination Body for Trade Facilitation which ensures co-operation between various government authorities, organisations, the business community and other foreign trade stakeholders. Public-private consultations have been strengthened and the business community have greater involvement in the formulation of trade policy. Serbia had made efforts to increase stakeholder participation in both the formation and implementation phases of policy making, as mandated by the amendments to the Law on State Administration. It has also significantly increased trade regulatory transparency by ensuring openness at all stages of the public consultation process through new obligations to publish relevant information, documents and assessments.

Serbia is integrated into the global network of international trade agreements. The economy extended its trade network by signing a free trade agreement (FTA) with the Eurasian Economic Union (EAEU) on 25 October 2019. Some challenges, however, remain unchanged since the last cycle of analysis. Very little progress has been made in accession to the WTO since the last review and a number of bilateral treaties are in the preparation phase.

Significant progress has been made in opening up trade with the conclusion of Additional Protocol 6 to the Central European Free Trade Agreement (CEFTA) in December 2019. Serbia continues to make progress in increasing the attractiveness of its economy by amending and adopting policies on trade in services. It has not reported any protectionist legal changes. This is particularly important in a context where regulations restricting services have tended to increase among OECD economies in 2020 (OECD, 2021<sup>[39]</sup>). By amending the new Public Procurement Law, Serbia has horizontally increased the attractiveness of all its sectors to trade in services since the last review round. The law is now fully harmonised with EU directives, including the abolition of preferential price conditions for domestic suppliers for the selection of tenders and the award of contracts. It has also taken major steps to open up the markets in certain specific service sectors, such as architecture, which has seen the most significant fall in restrictiveness among the sectors analysed. Further efforts could be made to improve company regulations and amend cumbersome procedures for obtaining business visas.

Serbia has a strong policy framework for e-commerce which has improved since the last assessment. The Law on Electronic Commerce has been amended to align it with the EU *acquis* and a working group has been set up to identify key challenges to e-commerce development. In October 2019, an action plan was created to improve e-commerce in Serbia.

**Table 25.5. Serbia's scores for trade policy**

Dimension	Sub-dimensions	Score	WB6 average
Trade policy dimension	Sub-dimension 2.1: Trade policy framework	3.8	3.5
	Sub-dimension 2.2: Services trade restrictiveness	n.a.	n.a.
	Sub-dimension 2.3: E-commerce and digitally enabled services	4.0	3.1
<b>Serbia's overall score</b>		<b>3.8</b>	<b>3.4</b>

### ***State of play and key developments***

Serbia's exports of goods and services have been steadily growing since 2015. Overall trade increased from 115.8% of GDP in 2018 to 112% in 2019 in real terms, compared with 97.4% in 2015.

Exports of goods reached EUR 16.4 billion in 2019, while imports reached EUR 22.0 billion. The external deficit on trade in goods and services in 2019 amounted to 10% of the economy's GDP (official balance of payments statistics). In 2019, exports of goods and services were 50.8% of GDP while imports were 51%. Due to the pandemic, exports of goods and services as a share of GDP fell to 48.7% in 2020, while imports of goods and services fell to 56.7%. Serbia is a net exporter of commercial services, with commercial exports accounting for EUR 6.7 billion against EUR 2 billion in imports.

The introduction of a 100% customs duty by Kosovo on imports from Serbia and Bosnia and Herzegovina at the end of 2018 strongly affected Serbia's trade of goods and explains some of the variation in the main export and import destinations. Although it is difficult to establish the exact amount, the losses have been estimated at around EUR 400 million, or about 1% of GDP per year (European Commission, 2019<sup>[14]</sup>). These tariffs were lifted by Kosovo on 1 April 2020 and other non-tariff barriers for deliveries from Serbia were lifted in early June.

The EU is Serbia's main trade partner, followed by the CEFTA economies. In 2019, the EU accounted for 66.7% of Serbia's exports. Trade with CEFTA signatories accounted for 17.4% of total exports and 4.0% of total imports in 2019. Italy (12.2% of exports) and Germany (11.9%) were the main export destinations, followed by Bosnia and Herzegovina (7.9%). In 2019, Germany (12.9%) and Italy (8.7%) were also among Serbia's main suppliers, together with the Russian Federation (9.7%) and the People's Republic of China (9.4%).

Like all economies, Serbia was affected by the COVID-19 pandemic. Containment-related export bans, restrictions on the movement of people, and closures of shops and services, which were in force from mid-March until the first week of May 2020, led to a decline in imports and exports in Q2-Q3 2020 compared to 2019 (Figure 25.4). The fall in GDP was more minimal (by 1% y-o-y). The COVID-19 outbreak means private consumption has plummeted, which was the largest contributor of the negative growth in the economy. Compared to other economies in the region and globally, Serbia was not the most severely affected; imports of goods and services declined by 5.8% and exports by 4.9% which was a smaller fall than the OECD average.

Exports of goods fell by 2.3% y-o-y in 2020, while imports declined by 3.5% leading to improvement of external goods trade balance by 7.1% (official balance of payments statistics). A geographical diversification of Serbia's export base resulted in increased exports to the United States (by 18.7% y-o-y), China (by 11.5% y-o-y) and Turkey (by 10.3% y-o-y), as well as Poland (by 16.2% y-o-y), Hungary (by 8.6% y-o-y), and Romania (by 8.0% y-o-y) in the EU. These helped compensate for a decline of exports to Italy (by 19.3% y-o-y) and CEFTA economies (by 8.5% y-o-y). Exports to Serbia's main trading partner, Germany, remained almost the same as in 2019 (decrease by only 0.7% y-o-y).

The largest reduction in goods imports in 2020 was from the Commonwealth of Independent States (CIS) (by 39.9% y-o-y) mainly due to low oil prices, and CEFTA economies (by 8.4% y-o-y). Imports increase from China (by 28.3% y-o-y), Hungary (by 11.7% y-o-y), and Slovenia (by 11.2% y-o-y).

**Figure 25.4. Impact of COVID-19 on trade, Serbia versus the OECD (2019-20)**

% change y-o-y

StatLink  <https://doi.org/10.1787/888934256235>

Industries in the WB6 economies were affected by the supply shock caused by the COVID-19 pandemic and the resulting slowdown in trade flows. The decline in Serbia's exports was primarily due to the breakdown of global value chains. As one of the economies in the region with a higher level of integration into GVCs, and which has maintained its manufacturing base, it felt the immediate effects more severely but also saw its trade flows decline much less in the long run. The region's relatively low level of development and sophistication, has limited most WB6 economies to backwards linkages, mainly as assembly centres (World Bank, 2020<sup>[41]</sup>). Trade in intermediate industrial goods linked to global value chains accounts for about two-thirds of Serbia's exports (OECD, 2020<sup>[42]</sup>). The disruption in supply chains resulting from the combined slowdown of manufacturing production in China and reduced demand in the United States and the EU has brought some production and trade to a virtual standstill. This was the case for Serbia, where GVCs are concentrated in a few sectors (automotive, electrical equipment, machinery, chemicals and metals) and linked to a single European country (Germany). However, once the supply of raw materials was restored and demand from the EU stabilised, production and exports resumed to.

The closure of EU borders to non-EU citizens and other regulatory responses, combined with the existing logistical challenges of the Western Balkans, have particularly affected freight transport services. The WB6 set up the CEFTA co-ordinating body to exchange information on trade in goods at the beginning of the pandemic. They also set up priority "green lanes" with the EU and "green corridors" within the WB6 to facilitate the free movement of essential goods through priority "green" border/customs crossings (within the WB6 and with the EU). At the peak of the crisis (April to May 2020), most road transport in WB6 economies passed through these green lanes and corridors. These have helped to maintain a certain degree of international trade in goods in the region. In fact, only about 20% of the goods benefitting from the Green Lanes and Corridors regimes were basic necessities, the rest being regular trade. Such inclusive regional co-operation has proven to be very efficient in mitigating the consequences of the COVID-19 pandemic and helping the region's economies to recover.

### *Sub-dimension 2.1: Trade policy framework*

The Republic of Serbia boasts a comprehensive network of **inter-institutional co-ordination** mechanisms to formulate trade policies and regulations with the co-operation of expert groups, co-ordination bodies and civil society, under the direction of the MTTT. In addition to its existing trade policy mechanisms, Serbia

established the National Co-ordination Body for Trade Facilitation (NTFB) in 2017, which meets at least twice a year and ensures the effective facilitation of foreign trade and co-ordination efforts through the co-operation of various government authorities, organisations, the business community and other foreign trade stakeholders.<sup>8</sup> Four expert working groups have been established under the auspices of the NTFB and meet whenever necessary.<sup>9</sup> The NTFB formulates action plans for each group (currently for period 2020-21), in close co-operation with representatives of the business community in order to address the most relevant issues of trade facilitation for the private sector, and evaluate the previous action plan outcomes.

Serbia has significantly strengthened and formalised its **public-private consultation** process on regulatory issues, including trade issues, since the last assessment. The Law on the Planning System (2018) obliges the government to conduct public consultation processes at all stages in the development of public policy legislation. A 2018 amendment to the Law on State Administration required the authorities to conduct consultations and ensure public participation early in the preparation of draft laws, regulations and other acts including regulations on trade issues. The rulebook governing the Guidelines of Good Practice for the Realisation of Public Participation in the Preparation of the Draft Laws and Other Regulations and Acts, was adopted in 2019, further defining the process and methods of consultation. In January 2020, the government adopted guidelines on the inclusion of the civil society in working groups for drafting regulations and public policies.

The business community regularly engages with the NTFB and its expert groups through a platform where companies and interested parties can easily ask questions and submit proposals. Private sector organisations are members of each expert working group, so business community representatives are included from the start of the drafting process. As a result, many of the activities that are formalised in the action plans are proposed by private stakeholders and accepted by public institutions, members of the NTFB. In line with the Law on Planning Systems, the competent authorities are required to publish the findings of regulatory impact assessments conducted in the process of preparing legislation.

Since the assessment in 2018, Serbia has made progress in developing new bodies to strengthen public-private partnerships and improve business community involvement in the formulation of trade policy. The government has made strides in increasing stakeholder participation among non-governmental organisations (NGOs), academia, the private sector and chambers of commerce<sup>10</sup> in both the formation and implementation phases of policy making, as mandated by the amendments to the Law on State Administration.

Serbia has also significantly improved the transparency of its regulation by making consultation with all relevant entities mandatory in order to ensure openness, while obliging the competent authorities to inform the public at an early stage of the preparation of draft laws and relevant regulations. The new legislation in force has put in place a system that limits the use of shortened procedures for the adoption of regulations, including those affecting trade. As part of the consultation process, the authorities need to publish information on the options being considered and call on the public to submit proposals and written comments. The e-government portal<sup>11</sup> has dedicated applications redirecting to all ongoing consultation processes that are being conducted by the line ministries. When a public debate is required, the competent authority is obliged to publish on public websites and on the e-government portal the draft law, the presentation of the problem in a specific area, its causes, the objectives and the expected effect of the adoption of the law, and the rights and obligations of the entities covered by the law.

However, Serbia has not yet fully established a dedicated operational website that can act as a hub for all public-private consultations. A website is envisaged and the authorities are very active in implementing it in order to provide the public and all interested parties with an overview of all phases of the preparation of laws and other regulations. The portal should be operational by the end of the first quarter of 2021. As the site is not yet fully operational, the positive effects of the regulation on PPCs have yet to be quantified. There are very limited concrete data on the number of regulations affecting trade adopted under simplified

procedures in the current regulatory context<sup>12</sup> and reporting on the effectiveness of consultations is still limited. The Public Policy Secretariat (PPS) collects statistics on the number of legislative projects that have gone through public consultation, but this reporting is still done on an ad hoc basis. Furthermore, a number of local private sector stakeholders reported that the time allocated for public consultations was sometimes too limited. In addition, the implementation of comments in draft regulations does not always seem to be carried out in a fully harmonised way.

In the area of bilateral and multilateral **free trade agreements**, no progress has been made in Serbia's accession to the WTO since the last assessment. Serbia compensates for this through bilateral treaties and partnerships, notably by an FTA with the Eurasian Economic Union (EAEU) signed on 25 October 2019. The agreement was ratified in February 2020, but has not yet entered into force. This only extends the agreement to Armenia and Kyrgyzstan, as Serbia had already signed treaties with the other parties of the EAEU. Negotiations for a free trade agreement with Ukraine are ongoing. Since December 2018, negotiations are also underway on a bilateral investment treaty with South Korea. Discussions on a future trade agreement with the United Kingdom started in 2019. Serbia has also amended a series of existing treaties such as Protocol I and Protocol III on Trade in Services to the Agreement on Free Trade with Turkey, which entered into force on 1 June 2019. Similarly, Serbia supported the adoption of the Additional Protocol 5 (on trade facilitation) to the CEFTA on 26 May 2017, and the Additional Protocol 6 on Trade in Services to the CEFTA on 18 December 2019, which entered into force on 11 January 2021. Finally, Serbia has signed a limited, strategic partnership agreement signed in August 2009 with China.

Overall the integration of Serbia into international trade is half-hearted, with the economy having strong legal bases with major partners, in line with its regional integration policies and with the EU, but limiting trade outside this scope. This is particularly negative as Serbia is the largest economy in the WB6 region, and this status quo may hinder the benefits of a favourable regulatory regime for foreign direct investment in this economy (see investment chapter) and close the doors to third country investors.

### *Sub-dimension 2.2: Services trade restrictiveness*

Services contribute almost two-thirds of GDP in the WB6 economies, underlining how strongly economic growth, innovation and labour markets depend on effective policies on services that promote open and competitive service markets. In Serbia, services contribute to more than 50% of GDP (Figure 25.5) and account for more than 57.5% of employment.

**Figure 25.5. Contribution of services to Serbia's GDP (2007-17)**

Source: (World Bank, 2019<sup>[43]</sup>), *World Development Indicators* (database), <http://data.worldbank.org/datacatalog/world-development-indicators>.

StatLink  <https://doi.org/10.1787/888934256254>

Enhancing openness of trade in services can improve domestic firms' efficiency and productivity. Trade in services allows countries to specialise according to their comparative advantages in services and skills.

The potential gains from liberalising services trade are significant because increased domestic and foreign competition, complemented by effective regulation, can enhance performance (OECD, 2018<sup>[44]</sup>) and lower trade costs related to regulatory barriers (Box 25.2).

### Box 25.2. The costs of regulatory barriers to trade in services

Recent OECD analysis has found that restrictions on trade in services significantly affect trade by increasing the costs for firms operating in the host economy (Rouzet and Spinelli, 2016<sup>[45]</sup>) Trade costs arise both from policies that explicitly target foreign suppliers, and more generally from domestic regulation that falls short of best practice in the area of competition and rule-making. The costs resulting from barriers to trade in services are much higher than those from trade in manufactured goods.

Trading services is costly. The studies show that policy-induced services trade costs are relatively high. Expressed as percentages of total trade value, average multilateral costs for cross-border services trade are around 57% for communication services and 54% for business services, around 60% for transport services, around 103% for insurance services, and around 255% for financial services. Even exporting to the most liberal countries still requires compliance with regulation at a cost that correspond to around 30% of the export value in most sectors and nearly 90% for financial services. Within the European Single Market, however, services trade costs are significantly lower – policy-induced costs of cross-border services trade are at around 10% in most sectors and around 32% for financial services.

Source: Benz and Jaax (2020<sup>[46]</sup>), "The costs of regulatory barriers to trade in services: New estimates of ad valorem tariff equivalents", <http://dx.doi.org/10.1787/bae97f98-en>.

The OECD Services Trade Restrictiveness Index (STRI) was used to **analyse barriers to trade for 12 services sectors** in Serbia. The OECD STRI project is a unique, evidence-based diagnostic tool that inventories trade restrictions in 48 economies,<sup>13</sup> allowing economies to benchmark their services regulations against global best practice, identify outlier restrictions, and prioritise reform efforts. For this CO assessment cycle, the 12 services sectors are grouped into four clusters: 1) transport and distribution supply chain (air transport, road transport, rail transport, courier); 2) market bridging and supporting services (commercial banking, insurance, legal services); 3) physical infrastructure services (construction, architecture, engineering); and 4) digital network services (computer services, telecommunications).

Information was collected from the WB6 economies' laws and regulations, and indices were calculated for seven years (2014-20). These composite indices quantify restrictions across five policy areas: foreign entry, movement of people, barriers to competition, regulatory transparency and other discriminatory measures. The indices quantify regulatory restrictions in each of the 5 policy areas for the 12 sectors by giving them a value between 0 and 1. Complete openness to trade in services gives a score of 0, while being completely closed to foreign service providers yields a score of 1.<sup>14</sup>

Each policy area is composed of a series of measures. These measures are called "horizontal" if they are present in all sectors, or "sector specific" if they only affect a particular sector.<sup>15</sup> The STRI measures the most-favoured-nation (MFN) restrictions and does not take into account any specific concessions, such as regional trade agreements or mutual recognition agreements (Geloso Grosso et al., 2015<sup>[47]</sup>).

Figure 25.6 shows Serbia's score in the 12 sectors covered by the STRI project along with the average and the lowest score among the WB6 economies. Serbia has a lower score on the STRI than the WB6 average in 8 out of 12 sectors. Compared to the STRI project member states, Serbia is in the low range for the restrictiveness of its service sectors. Legal services, architecture services and telecommunication

services are the three least restrictive sectors (those with the lowest STRI score). Commercial banking, courier services and air transport are the three relatively most restrictive sectors.

**Figure 25.6. Services trade restrictiveness index for Serbia (2020)**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; Bulgaria, Croatia and Romania are not OECD members nor OECD STRI key partner economies and therefore are not covered by STRI indices; key partners to the STRI project are Brazil, the People’s Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand. Source: (OECD, 2020<sup>[48]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934256273>

Serbia has demonstrated a continued willingness to lower restrictions affecting trade in services, as Figure 25.7 shows. The slowdown in reforms to open up services markets in 2019-20 is explained by the focus of all regulatory change in the economy on measures to safeguard public health and the economy in the context of the COVID-19 pandemic. It should be noted that there are no trends towards regulatory protectionism in the WB6 region, including Serbia, although some minor restrictive policy changes were introduced in 2020. Refraining from introducing disproportionate limitations on services is particularly important in a context where recent OECD studies of member states tend to show a growth in the number of protectionist regulations hindering services in 2020 (Banja et al., 2017<sup>[49]</sup>).

**Figure 25.7. Serbia's Services Trade Restrictiveness Index by sector (2014-20)**

Percentage change over the periods 2014-16, 2016-19 and 2019-20

Note: Negative values indicate a reduction in the restrictiveness of the economy's trade regulatory environment.

Source: (OECD, 2020<sup>[48]</sup>). Services Trade Restrictiveness Index Regulatory Database, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934256292>

The following analysis starts with the horizontal measures that are included in all sectors and that typically hamper services trade in the economy as a whole. In particular, in the area of general business regulations, restrictions on the movement of service providers, standards for the cross-border transfer of personal data, the legal framework for public procurement and the screening of foreign investment. It then displays the STRI scores, explains sector by sector what drives the results, and provides a brief description of the most common restrictions and good practices. Box 25.3 presents the modes of supply of trade in services as defined by the General Agreement on Trade in Services (GATS) and used in the OECD STRI.

### Box 25.3. Examples of the four services supply modes

The definition of trade in services under the General Agreement on Trade in Services (GATS) has four components, depending on the territorial presence of the foreign service provider and the consumer at the time of the transaction. Pursuant to Article I:2, the GATS covers services supplied.

**Mode 1: Cross-border:** Services are provided from the territory of one member into the territory of any other member.

*Example:* A consumer in economy A receives services from abroad through its telecommunications or courier infrastructure. These supplies may include any type of consultancy, legal advice, architectural services, or computer related services.

**Mode 2: Consumption abroad:** Services are provided in the territory of one economy to the service consumer of any other economy.

*Example:* Nationals of economy A have moved abroad as tourists, students, or patients to use respective services.

**Mode 3: Commercial presence:** Services are provided by a supplier of one economy, through commercial presence, in the territory of any other economy.

*Example:* The service is provided within A by a locally-established subsidiary, or representative office of a foreign-owned and controlled company (bank or insurance company, air company, construction firm, etc.).

**Mode 4: Movement of natural persons:** Services are provided by a foreign supplier, through the presence of natural persons of an economy in the territory of any other economy.

*Example:* A foreign national provides a service within A as an independent supplier (e.g., IT consultant) or employee of a service supplier (e.g. IT consultancy firm).

### **Cumbersome horizontal business regulations affect firms' ability to operate**

There are a number of areas where Serbia could improve its *general business regulations*. Foreigners are limited in their ability to acquire or use land and real estate.<sup>16</sup> The STRI methodology captures cases where economies have minimal capital requirements in their legislation. In order for a limited liability company to be established and registered in Serbia it must deposit a minimum amount of capital, which in theory affects the operating capacity of foreign companies. However, the effect of this measure is marginal in practice as, according to the Company Law, the minimum share capital for limited liability companies is 100 dinars, which is less than EUR 1. Moreover, the minimum capital does not have to be paid before or at the time of registration; shareholders are able to commit to fulfil this obligation in the foundation deeds within a predefined period of time.

*General restrictions on the movement of people* also limit trade in services in Serbia. Although significant progress has been made in easing movement between the CEFTA economies through the conclusion of Additional Protocol 6 to the CEFTA Agreement, nationals from non-CEFTA and EU economies are subject to restrictive requirements. Serbia does not apply quotas or labour market tests for foreigners from third countries, which has a positive impact on its STRI score. The length of stay of Independent service suppliers and intra-corporate transferees in Serbia is limited to 12 months. Contractual service suppliers can initially only stay up to 3 months. The 12-month duration is comparable with those observed in the EU Member States participating in the STRI project, but less than best practice elsewhere which is more than 36 months (OECD, 2020<sup>[48]</sup>). The length of stay for contractual service suppliers falls short of both EU and OECD best practice, however.

Finally, the STRI indices in the partner countries of this project are very often negatively impacted by the World Bank *Doing Business* indicators, particularly for registering a company (World Bank, 2020<sup>[52]</sup>). Serbia has made it much easier to start a business on its territory and is therefore very attractive. There are seven steps involved in starting a business in Serbia: 1) notarisation of the deed of incorporation; 2) opening a bank account and paying the registration fees; 3) obtaining a registration certificate, tax identification number, pension fund (PIO Fund) and health fund certificates, and the certification of signatures (three copies) for opening a bank account; 4) the affixing of a stamp and a seal; 5) registering employment contracts with the organisation / employment fund; 6) obtaining an electronic certificate; and 7) registering the ultimate beneficial owners (UBOs). This is below the maximum set as good practice by the STRI. Likewise, the procedure takes 5.5 days to completed and the total cost of all the official procedures needed to register a company is 2.4% of per capita income, also very competitive compared to other economies in the region.

*The legal framework for public procurement* has also improved. Serbia has reduced limitations in this area since the last review cycle. The new Law lifted the domestic prices preferences or conditions on foreign

contractors to source personnel and products locally when selecting tenders and awarding contracts that hindered the public procurement process. The new regime does not bias the conditions of competition in favour of local firms. Moreover, the regulations on public procurement explicitly prohibit discrimination against foreign suppliers,<sup>17</sup> which is relatively rare among the WB6 and has a highly positive impact on Serbia's STRI score. No procurement regime is applied to foreign suppliers below the value thresholds.<sup>18</sup>

Serbia's laws and regulations do not require the consideration of economic interests in the *screening of foreign investments* but nor is it explicitly excluded. The economy does not set a threshold above which a foreign investment project is subject to screening.

### **Restrictions in specific services sectors<sup>19</sup>**

Beyond the horizontal issues affecting Serbia's trade in services across all sectors, a number of sector-specific restrictions still remain in the 12 sectors analysed.

**Air transport services** are defined as passenger and freight air transport (code 51 under the International Standard Industrial Classification – ISIC Rev 4), carried domestically or internationally. The STRI for this sector only covers commercial establishments. In light of the range of air transport sub-sectors, the STRI's approach is to focus on measures affecting carriers' transport of passengers and goods between points. Airport management and other aviation services are only relevant where regulations enacted by relevant authorities could affect the ability of foreign carriers to transport passengers and goods between points. The other aviation services are covered more fully in the STRI for logistics services.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.165 and 0.601. The WB6 average is 0.421, which is roughly in line with the EU average of 0.406 and the OECD average of 0.409 (where 0 signifies a completely open sector, and 1 a sector closed to foreign service providers). With a score of 0.429, Serbia is the second most-restrictive of the WB6 economies.

Due to the regulatory structure of the sector, which is largely driven by a multilateral approach, there is limited variation in STRI scores across the WB6 economies. Serbia is no exception, as its regulatory environment in this sector is largely aligned with EU regulations.

*Restrictions on foreign entry* play a prominent role in Serbia's STRI score for this sector. Like 40 other OECD and STRI key partners (OECD, 2020<sub>[53]</sub>), Serbia limits the equity share that foreign natural or juridical persons can hold in an air transport services company to 49%. This restriction is, however, in line with European Union legislation. Serbia follows a liberal approach in the leasing of foreign aircraft without crew (dry lease), which allowed subject to prior authorisation. In contrast, the lease of foreign aircrafts with crew (wet lease) is prohibited.

The other major category that influences Serbia's STRI score is *barriers to competition* due to the non-competitive allocation of slots. Like many economies, Serbia maintains public ownership of its national carrier Air Serbia. Slots at airports with high demand are allocated on the basis of historical rights, prohibiting the commercial exchange of slots. However, half of the slots remaining after the historical allocation go to new entrants, which reduces the degree of restrictiveness in the sector.

**Road freight transport** (ISIC Rev 4 code 4293) covers commercial road freight establishment only. Cross-border trade is governed by a system of bilateral and plurilateral agreements which provide for permits, quotas and other regulations.

The 2020 scores for all OECD member states and STRI partners in this sector range between a very low 0.124 and a high 0.624. The WB6 average is 0.225, demonstrating the region's open approach towards transport services, although still more restrictive than the averages for the OECD (0.201) and EU (0.184). Serbia is the second least restrictive of the WB6 economies with a score of 0.158. Due to the wide spread of scores in this sector, Serbia compares well against many OECD member states; against EU countries,

Serbia is only slightly more restrictive than the best performer (the Czech Republic) and less restrictive than the worst performer (Poland).

Serbia's score is worsened by cross-cutting factors affecting the whole economy, particularly those related to movement of people. Professional qualifications are paramount in this sector, particularly for truck drivers, who must obtain a special licence that demonstrates their professional competence. However, Serbia does not have procedures in place to recognise certificates gained abroad, meaning foreign licences are not recognised and imposing *restrictions on the movement of people*.

Sector-specific regulations also impose *restrictions on foreign entry* in Serbia. One such is the existence of a regime of discretionary authorisation. Within 15 days of receipt of a request, the transport ministry assesses whether Serbia has adequate transport capacities, i.e. a certain type and number of vehicles, and decides on the allocation of licences on a case by case basis. Serbia also applies an economic needs test before issuing a licence to transport freight within its borders. If Serbia has adequate transport capacity for the transport licence requested, the ministry will reject the request. In this sector, truck drivers providing cross-border road transport services (Mode 1) are highly dependent on visa measures. Thus, any regime that grants them adaptations to the general visa regime has positive effects on the fluidity of transport and thus the attractiveness of this activity within the host economy. Among the measures that can be found among the best STRI performers is the possibility to obtain a visa at the border or even a simple visa exemption for the entry/temporary transit of the crew. In that regard, Serbia do not grant any visa exemptions for third-country truck drivers. However, preferential treatment (in the form of a non-visa regime) is given to nationals from the WB6 and the EU economies.

**Rail transport** (ISIC Rev 4 code 4912) is provided over a dedicated network; the market structure may take different forms. The two most common are: 1) vertically integrated rail services firms owning and managing both the infrastructure and the operation of freight services; and 2) vertical separation between the infrastructure management and operations. Regardless of the market structure, there are well-established best practice regulations that also take into account competition from other modes of transport, particularly road transport.

The 2020 scores for all OECD member states and STRI partners in this sector range between a very open 0.129 and 1, indicating the sector is completely restricted, while the WB6 average is a relatively low 0.317. Serbia, with a score of 0.259, is the median WB6 economy, scoring higher than the EU average (0.259) and in line with the OECD (0.209). Serbia is also substantially in line with EU's worst performer (Poland). (See Trade policy (Dimension 2) regional chapter)

Serbia's score for this sector is negatively affected by the lack of grants of access rights, *restricting foreign entry*. Rail companies from neighbouring economies are granted access to Serbia's rail network to operate international and domestic cargo services.<sup>20</sup> Railway operators must also be established locally in order to provide services in Serbia and require an operating licence. The procedure for issuing railway licences and safety certificates is in accordance with the EU regulations (Directives 2012/34, 2004/49, 2016/798) governing this area. According to the rulebook on transport licences in railway traffic, operators must submit a business plan when applying for a licence to prove their financial capability.

On the issue of the *movement of people*, some professions in the sector, such as train drivers, need a licence in order to operate. This is in accordance with EU Directive 2007/59/EC on the certification of train drivers, and overall Serbia does not impose any additional burdens on foreign service providers.

Barriers to competition are an important contributor to the STRI score for this sector. Access fees are calculated by the infrastructure manager following certain predefined criteria. These fees must also be approved by the government. Prices for rail services are also regulated through formal government approval of the level of tariffs. The infrastructure manager regulates congested traffic and decides on requests to use congested tracks. Serbian Railways was split into subsidiaries responsible for cargo, passenger and infrastructure in 2015. Srbija Kargo is Serbia's main rail freight operator and it is state-

owned.<sup>21</sup> While the Railway Law stipulates that both public and private companies may participate in railway infrastructure, the state has a monopoly on this sector. The activity of infrastructure management is considered a natural monopoly and activity of public interest according to the Law on Railways, which is in accordance with EU Directive 2012/34.

**Courier services** (ISIC Rev 4 code 53) comprises postal and courier activities. While courier services have traditionally been an important means of communication, the rise of modern ICT means letters are less frequently used for communication. The STRI for courier services covers regulations that have an impact on the pick-up, transport and delivery (door-to-door) of letters and parcels, and express delivery services, regardless of who provides the service. These services include both addressed and unaddressed items.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.106 and 0.881, while the WB6 average is 0.301. With a score of 0.361, Serbia is in the median position among WB6 economies, and is more restrictive than the EU average of 0.181 and the OECD average of 0.259. Serbia's score has become less restrictive in this sector since 2014 but is still affected by two sector specific measures: the fact that the designated universal service provider is the state-owned Post of Serbia and preferential treatment of the designated postal operator .

A new law on postal services entered into force in November 2019. It replaced the Postal Act and harmonised the regulatory framework fully with the first and second EU postal services directives and partly with the third.

Serbia does not impose a commercial presence requirement, but cross-border services do require a local presence in Serbia, affecting foreign entry. Postal operators are able to provide postal services on the basis of a permit. As in many other economies, Serbia grants the designated postal operator two reserved areas: a monopoly on a subset of the range of universal services. Universal postal services in Serbia include collection, sorting, transport and delivery of letter-post items weighing up to 2kg as well as collection and delivery of letter-post items weighing up to 10kg in domestic and international postal traffic, and delivery of parcels up to 20kg in international postal traffic. As regards *barriers to competition*, Serbia's designated universal postal services operator is the public company Pošta Srbija (Post of Serbia), which could act as a barrier to competition. There is at least one other dominant provider in the courier services market. Postal operators in the economy are obliged to submit the price list of postal services to the designated Agency, RATEL no later than three days before its implementation begins. The postal operator is also obliged to apply the postage in accordance with the price list of postal services.

Sectoral *regulatory transparency* measures include customs and licensing procedures. Serbia requires postal operators to bear the costs of a licence fee. The operators must also pay an annual fee of 0.4% of the total revenue generated from the provision of postal services.

**Legal services** (ISIC Rev 4 code 691) cover advisory and representation services in both domestic and international law and, where relevant, measures are entered separately for each of them. International law includes advisory services in home-country law, third-country law, international law, and appearing in international commercial arbitration. Domestic law extends to advising and representing clients before a court or judicial body in the law of the host country.

The 2020 scores for all OECD member states and STRI partners in this sector range between a very open 0.141 and 1, while the WB6 average is 0.391. With a score of 0.209, Serbia is the least restrictive of the WB6 economies, and is also less restrictive than the averages for the EU (0.394) and OECD (0.362).

Serbia's score is negatively affected largely due to foreign entry restrictions and *restrictions on the movement of people*. There are relatively stringent procedures on foreign lawyers who wish to practise in Serbia. A licence is needed to provide legal services in Serbia. Foreign citizens registered in the Register A of the Directory of Lawyers, are limited to giving oral and written legal advice and opinions related to the application of the laws of their home country and international law. Foreign citizens registered in Register

B of the directory (i.e. to be permitted to provide advice on Serbian law as a foreign licensed lawyer), have the same advocacy rights as domestic lawyers, although for the first three years after registration, foreign lawyers can only act in Serbia via a partnership with a domestically licensed lawyer. In order for foreign professionals to enter Register B as a fully locally licensed practitioner, they must, in addition to other conditions, have passed the bar exam in the Republic of Serbia. Foreign lawyers are not able to obtain authorisation for temporary entry to carry out a specific project or to advise in some areas of legal services.

*Restrictions on foreign entry* are especially present in domestic law in Serbia. The law requires that equity shares of legal services firms may only be held by licensed lawyers or firms in Serbia. Registration with the establishment of a legal entity in Serbia indicating commercial presence is required to provide cross-border services (Mode 1 – see Box 25.3). A lawyer is required to have an office in Serbia, meaning that local presence is also required. The Bar Association is obliged to enable candidates to take a lawyer's oath, provided they have paid the costs of registration, and, if they are foreign citizens, provided they have submitted proof of a concluded contract of professional liability insurance in the Republic of Serbia.

Regarding *barriers to competition*, Serbian law does not permit lawyers, joint law firms or law firms to advertise.

**Commercial banking** (ISIC divisions 64-66) is defined as deposit-taking, lending and payment services. Commercial banking services are traded business to business, as well as business to consumer for retail banking. Efficient banking services are one of the backbones of a dynamic economy; they provide financing for investment and trade across productive activities, thus underlying all value chains.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.131 and 0.517, while the WB6 average is 0.239. With a score of 0.311, Serbia is the second most-restrictive of the WB6 economies in this services sector and is also more restrictive than the OECD average (0.205) and the EU average (0.180). However, it has made progress since 2014.

Serbia's scores are mainly influenced by three policy areas: restrictions on foreign entry, barriers to competition and regulatory transparency. These results reflect the particular characteristics of the sector as well as the policy environment in which it operates. As the banking sector plays a key role in each economy but can pose risks to financial stability, restrictions on entry and competition have sometimes been used as a means for authorities to maintain control over the operation of the sector in the absence of effective prudential regulation.

Regarding *foreign entry*, Serbia does not limit the share of foreign equity capital in local banks, nor does it restrict the establishment of foreign bank branches or the licensing of foreign-owned banks which is a positive outcome of the Banking Law. Furthermore, licensing is done according to objective and transparent principles applied in the same way as to domestic banks. Finally, Serbia's regulation of cross-border mergers and acquisitions is non-discriminatory. Restrictions remain, however: foreign banks need to have a commercial presence in Serbia to provide services to residents. In the same logic, at least one of the members of the board of directors of a commercial bank must be a resident.

*In barriers to competition*: Serbia's STRI scores are positively affected by its adequate regulation of financial products and the full operational, managerial and fiscal independence of its supervisory authority from the government. Finally, none of the largest commercial banks are state-owned. In consequence, this STRI category is up to speed with STRI best performers.

As regards *regulatory transparency* The authorities are obliged to provide reasons for rejecting an application for a licence within a maximum of 15 days, in line with OECD good practice on the matter. However, the time and cost required to resolve a debtor's insolvency contributes negatively to Serbia's score in this area.

In *other discriminatory measures* Serbia's adherence to International Reporting Standards (IFRS) improves its STRI score in the area of other discriminatory measures. Its regulations are in line with Basel

II, while the implementation of Basel III recommendations is ongoing: Since December 2016, the National Bank of Serbia has adopted a set of regulations implementing Basel III standards<sup>22</sup> – see Access to finance (Dimension 3) – which also positively affects the openness of Serbia’s commercial banking sector.

**Insurance services** (ISIC Rev 4 codes 651 and 652) comprise life insurance, property and casualty insurance, reinsurance and auxiliary services. Private health insurance and private pensions are not covered.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.104 and 0.565, while the WB6 average is 0.231. With a score of 0.185, Serbia is the third most-restrictive of the WB6 economies in this sector and lies between the EU average of 0.175 and the OECD average of 0.193. The relatively low spread of scores in this sector means that differences in rankings are dictated by measures with a limited impact on the trade in services. Thus, it is more relevant to note that Serbia maintains a very high level of attractiveness, including in comparison to EU and OECD states.<sup>23</sup>

Serbia’s STRI scores in this sector are mainly influenced by two policy areas: foreign entry restrictions and regulatory transparency. These results reflect the particular characteristics of the sector as well as the wider policy environment. In general, as with the wider financial services sector, insurance is relatively non-restrictive in Serbia. The main factors that make Serbia’s banking sector relatively also apply for insurance. Serbia does not limit the share of foreign equity capital in local (re)insurance companies, nor does it restrict the licensing of foreign-owned (re)insurance companies. Licences are issued according to objective and transparent principles with no distinction made between foreign-owned and domestic companies. Serbia’s regulation of cross-border mergers and acquisitions is non-discriminatory.

A few policies increase the *restrictions on foreign entry* in this sector, however. Foreign insurers need to have a local presence in Serbia to provide services to residents. Serbia also restricts the operation of branches of foreign insurance companies operating in its territory. At least one member of the board of directors of a foreign insurance company must be a resident. In addition, the Insurance Act sets a requirement for Serbian language proficiency as a prerequisite for obtaining a managerial position in a (re)insurance company.

Before 2019, *other discriminatory measures* affected the openness of the insurance sector because of Serbia’s deviation from international standards on transparency and anti-money laundering (AML) and combatting the financing of terrorism (FATF 40). In 2019, as part of a major legal reform, Serbia introduced a new AML law as well as by-laws that regulate specific AML activities for the insurance industry. These measures have increased the openness of the sector.

**Construction services** (ISIC Rev 4 codes 41 and 42) cover the construction of buildings (residential and non-residential) as well as construction work for civil engineering. Construction has historically played an important role in the functioning of economies, providing the infrastructure for other industries. It accounts for a significant share of GDP and employment in most countries. There is a good deal of regulatory complementarity between the construction services sector and architectural and engineering services (below). The regulatory landscape of Serbia reflects these similarities, with all three sectors having very similar STRI scores.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.123 and 0.464, while the WB6 average is 0.242, the OECD average is 0.222 and the EU average is 0.207. Serbia is the second least-restrictive of the WB6 economies in this sector with a score of 0.198, placing it within the range of EU and CEEC scores. Serbia scores more liberally than the worst-performing CEEC country (Slovenia) but more restrictive than that region’s best performer (the Czech Republic).

Serbia’s score in the sector is mostly driven by horizontal measures such as restrictions on the acquisition and use of land and real estate by foreigners and local presence requirements for cross-border supply

Construction services is a labour-intensive sector (skilled and unskilled), which means it generally accounts for a higher share of employment than GDP in most economies. The potential for mechanisation and automation, and thus capital-intensive production, remains limited. *Restrictions on the movement of people* are applied across the board in Serbia and thus have a significant impact on this sector. Serbia's score is also affected by restrictions applied to architecture and engineering services, discussed below.

The movement of people is also restricted by licensing requirements to provide engineering services in Serbia. In 2018 an amendment to the law extended licensing requirements to all types of design and construction, whereas previously it only applied to specific sectors such as airports, railways, waste treatment plants and renewable energy facilities.

**Architecture services** (ISIC Rev 4 code 711) cover architectural services and related technical consultancy. These services form the backbone of the construction sector, with key roles in building design and urban planning. An important feature is the regulatory complementarity between architecture, engineering and construction services. Architectural and engineering activities are often combined into projects managed by a single company, and are sometimes subsumed in the building and construction sector. The STRI definition of architecture services includes several related activities, such as advisory and pre-design architectural services, architectural design, contract administration services, and urban planning and landscape architecture services.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.113 and 0.684, while the WB6 average is 0.265. With a score of 0.189, Serbia is the second least-restrictive of the WB6 economies in this sector and is also less restrictive than the EU (0.260) and OECD (0.244) averages. Its score is mostly affected by licensing requirements and the lack of temporary licensing system.

Serbia places restrictions on the *movement of people* in this sector with licence requirements with no temporary licensing system in place, meaning foreign architects cannot be granted temporary entry to carry out a specific project or provide advice in some area. Serbia has limited the negative impact of this by implementing a procedure for recognising foreign qualifications in 2020. Even so, applicants with a qualifying licence in their home country must take the general part of the professional exam and must fulfil the conditions prescribed in the law. However, some foreign licences are recognised on a reciprocal basis, mainly applying to CEFTA and EU licensed professionals.

As regards *restrictions on foreign entry*, Serbia restricts cross-border services. In consequence, services can only be supplied via some form of local presence in the economy, but there is no obligation to establish a commercial presence. Foreign authorised persons are only recognised in Serbia upon proving the conclusion of a professional liability insurance contract in the state in which they reside. Moreover, the contract is accepted in Serbia only if the insured is covered by a guarantee that is equivalent or comparable to the amount of insurance determined by the regulations governing professional liability insurance for performing activities in the field of spatial planning and construction in Serbia.

**Engineering services** (ISIC Rev 4 code 711) cover several related activities, such as engineering and integrated engineering services, and engineering-related scientific and technical consulting services. Engineering services are the backbone of construction and supply. Engineers are involved in the construction of key infrastructure, such as buildings and roads. They also play an important role in the development of production processes and the adoption of new technologies

The 2020 scores for all OECD member states and STRI partners range between 0.118 and 0.575, while the WB6 average is 0.243. Serbia, with a score of 0.212 is less restrictive than the averages for the EU (0.245) and the OECD (0.233). As in the architecture services sector, the engineering sector's score is mostly affected by licensing requirements and the lack of a temporary licensing system.

In engineering services, the results are mainly due to *restrictions on the movement of people*. A licence or permit is required to practise and there is no temporary licensing system, which means that foreign engineers cannot enter Serbia temporarily to carry out a specific project or to provide advice in certain

fields. On the positive side, Serbia implemented a procedure for recognising foreign qualifications in 2020. Even so, applicants with a qualifying licence in their home country must take the general part of the professional exam and must fulfil the conditions prescribed in the law.

**Computer services** (ISIC Rev 4 codes 62 and 63) are defined as computer programming, consultancy and related activities, and information service activities.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.123 and 0.448, while the WB6 average is 0.232. Serbia's score is 0.212, making it the second-best performer in the region, marginally more restrictive than the EU average of 0.211, but more open than the average for the OECD (0.221).

This sector is very rarely regulated by sectoral legislation and in Serbia computer services are only subject to the general laws that apply to the economy as a whole. Therefore, restrictions on the movement of people account for one-third of the total score in this sector. The need for skilled labour, combined with the complementarity between cross-border trade and movement of people explain why these restrictions feature prominently in this sector in Serbia.

**The telecommunication sector** (ISIC Rev 4 codes 611 and 612) comprises wired and wireless telecommunications activities. These services are at the core of the information society and provide the network over which other services including computer services, audio-visual services, and professional services are traded.

The 2020 scores for all OECD member states and STRI partners in this sector range between 0.108 and 0.682, while the WB6 average is 0.231. Serbia's score of 0.156 is in line with the EU average of 0.151, and it is a little more open than the OECD average of 0.188. The economy is the third most-restrictive of the WB6 economies.

Serbia's score in this sector depends on three policy areas: restrictions on foreign entry, barriers to competition and regulatory transparency.

In order to ensure fair competition in the telecommunications market, Serbia has an independent telecommunications regulator, RATEL, which is separate from stakeholders and the government. It operates without state intervention. RATEL has sufficient regulatory powers to regulate the sector effectively through ex-ante regulations applied in accordance with EU precepts to ensure that no single operator with significant market power in certain market segments (inevitable in certain cases) is bound by appropriate pro-competition regulation in place for operators that already have significant market power. Ex ante regulations are applied on the basis of a regularly conducted market analysis and readily available on the RATEL website. The government maintains the presence of an SOE as the majority shareholder in one of the main telecoms providers, *Telekom Srbija*. Serbia applies a "use-it-or-lose-it" policy to frequency bands – an important measure that prevents incumbent operators from over-holding valuable frequency licences as well as free tradable spectrum and telecom services.

In absolute terms, the regulatory framework of the telecommunication sector in Serbia is competitive and constrained only by horizontal measures that apply to the economy as a whole, most notably for the movement of people. Although telecommunications lend themselves easily to cross-border trade from a technical point of view, such restrictions account for a modest share of the total STRI score in this sector. Cumbersome procedures to obtain visas and register companies also negatively affect the sector to some extent.

### *Sub-dimension 2.3: E-commerce and digitally enabled services*

E-commerce can bring significant gains for businesses, driving firms' process innovation (Ferencz, 2019<sup>[54]</sup>). It can enlarge businesses' market scope, reduce the operational costs of various business activities and lower barriers to entry, thus intensifying competition (OECD, 2013<sup>[55]</sup>). E-commerce also

benefits consumers by providing information on goods and services, helping consumers identify sellers and compare prices, while offering convenient delivery and the ability to purchase easily via a computer or mobile device (OECD, 2013<sup>[55]</sup>)

In the context of the COVID-19 pandemic, e-commerce has proved essential for maintaining trade flows despite restrictions put in place to preserve public health. Buying online rather than in person also reduces the risk of infection. Being able to keep selling in locked-down economies preserves jobs despite social distancing and movement restrictions. E-commerce also increases public acceptance of prolonged physical distancing and allows people to maintain a certain level of consumption. (World Bank, 2020<sup>[56]</sup>)

It is clear that 2020 will prove to have been a turning point in e-commerce. This digital transformation underlines the importance of adopting a more holistic approach to policies as well as increasing international co-operation (Ferencz, 2019<sup>[54]</sup>).

This sub-dimension assesses policies which are implemented in parallel with those of the Digital society (Dimension 10). However, it focuses mainly on the trade in digitally enabled services given the rapid growth of trade in services in the region.

Serbia has a strong **e-commerce policy framework** and has made substantial changes since the last assessment cycle to meet the challenges of a growing trade sector.<sup>24</sup> The economy can boast of having the most complete e-commerce legal regime in the WB6 region. E-commerce policy falls under the remit of several institutions: the MTTT, the National Bank of Serbia, the Customs Administration, the MoF, and the Statistical Office of the Republic of Serbia (SORS). Serbia's institutional framework allows for effective institutional co-ordination between these ministries and agencies over e-commerce.

Serbia's e-commerce strategic framework was substantially updated in January 2019 after the MTTT set up a multi-stakeholder working group to identify the main obstacles to the development of e-commerce. In October 2019, following a proposal by this working group, the government adopted the Programme and Action Plan for the Development of E-Commerce for the period 2019-20. This action plan was prepared in cooperation with the United States Agency for International Development (USAID) Growth Cooperation Project.<sup>25</sup> The Action Plan' activities include the general removal of regulatory barriers to trade but also incentives for e-traders such as tax breaks or training, and activities related to promoting e-commerce and improving consumer confidence, logistics, and financial infrastructure. The ministry, in co-operation with relevant partners and stakeholders, implements these activities. The main purpose of the programme is to support the integration of SMEs selling online via social networks or other unregistered means into the registered online sales network – see Digital society (Dimension 10).

Modern e-commerce regulation needs to focus, among other things', on a number of key elements such as electronic documentation and signature, online consumer protection, data protection and privacy, cyber security, intellectual property rules and intermediary liability. While maintaining an attractive regulatory environment that refrains from creating disproportionate rules such as licensing requirements for e-commerce platforms, limitations on the type of goods that can be sold online (other than for generally accepted public policy considerations), and restrictions on cross-border data flows. In this respect, Serbia demonstrates an effective legal framework with only residual gaps remaining. These are well known to the Serbian authorities.

The Law on E-commerce, adopted in 2009, has been complemented by the recently adopted 2019 Law on Trade. Together they form the basis of Serbia's legal environment for e-commerce. Both have been successively updated in 2018 and 2019 to bring them into line with EU Electronic Commerce Directive 2000/31/EC. In order to close some of the remaining gaps, the government is working on improving the consumer protection rules through a new strategy and amendments to the above-mentioned laws and the Consumer Protection Act. The MTTT has also published a series of guides to inform consumers of their rights and to increase their confidence in the digital economy – see Digital society (Dimension 10).

However, challenges remain; one missing element, which is also a restriction on the trade in services, is the lack of a proper online dispute resolution (ODR) mechanism in Serbian legislation.

In absolute terms, the regulatory environment is not an obstacle to the development of e-commerce in Serbia. The SORS publishes e-commerce performance indicators every year. The report covers statistics on the devices available in households, frequency of computer and Internet use and enterprises using computers or the Internet for business purposes. The National Bank of Serbia also publishes data related to e-commerce, such as payment transactions for the purchase of goods and services via the Internet.

The OECD digital STRI captures the **restrictiveness of digital enabled services** due to cross-cutting barriers that inhibit or completely prohibit firms' ability to supply services electronically, irrespective of the sector. The regulatory data underlying the digital STRI were extracted from the existing OECD STRI database and data collected under public laws and regulations affecting digitally enabled services. The digital STRI aggregates the identified barriers to trade into a composite index. In accordance with the OECD STRI methodology, it uses a binary scoring system where 0 indicates there are no trade restrictions and 1 that restrictions are in place. The rating takes into account specific regulatory and market characteristics as well as the links and hierarchies between regulatory measures affecting digitally enabled services (López González and Ferencz, 2018<sup>[57]</sup>).

Serbia's score on the STRI index in the digital sector covered by the STRI project is shown in Figure 25.8.

**Figure 25.8. Digital services trade restrictiveness index: WB6 and CEEC economies**

Note: (0=no restrictions, 1=fully restricted); average represents the WB6 average for 2020; \*CEEC=Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Slovak Republic and Slovenia (Bulgaria, Croatia, and Romania are not OECD member states or OECD STRI Partner economies and therefore do not have calculated STRI indices); the absence of a category in the graph means that it is exempt from restrictions. Source: (OECD, 2020<sup>[48]</sup>), *Services Trade Restrictiveness Index Regulatory Database*, <http://oe.cd/stri-db>.

StatLink  <https://doi.org/10.1787/888934256311>

Globally the 2020 scores in this sector are moderate to high, ranging from 0.043 to 0.488, while the WB6 average is 0.183. Serbia's score is 0.181, which makes it the second most-restrictive of the WB6 economies. It should be noted, however, that the WB6 economies tend to be very open in this sector compared to the average for states participating in the digital STRI. In absolute terms, Serbia is therefore a very open economy for foreign digital service providers. Moreover, the variations in this sector in the region are very small, so the differences in scores are due to a limited number of regulatory measures.

The scores for most economies across OECD and partner states are driven by *infrastructure and connectivity* measures. This is usually the result of a lack of effective telecoms infrastructure regulations, especially in the area of interconnection. However, this is not the case in Serbia, where regulations are largely aligned with international good practice. Similarly, although Serbia has stricter rules than the OECD guidelines in this area, it does not impose excessive conditions on cross-border data flows beyond those

put in place to ensure the protection and security of personal data. Like 11 other participating economies, Serbia requires that some types of data be stored locally, but the transfer of copies abroad is allowed under terms specified in articles 63-71 of the Law on Personal Data Protection.

Businesses do not need any specific licences or authorisations for e-commerce activities on top of the ordinary commercial licences. However, Serbia does require a local presence in order to operate an e-commerce business.

Serbia has implemented international standards for electronic contracts and key electronic authentication measures such as the recognition of electronic signatures. However, as noted above, it lacks a proper dispute settlement mechanism to resolve litigations arising from cross-border digital trade which also affects its openness towards digitally enabled services.

Policy areas relating to *intellectual property rights* and payment systems account tend to be less important to states' STRI scores. Serbia is relatively open in this category from a regulatory point of view. There are no intellectual property protection regulations that treat foreigners less favourably than nationals.

### ***The way forward for trade policy***

Despite having taken some significant steps to improve its trade policy framework, especially in the area of consultations, the government could improve its policy making in the following areas:

- **Enhance the quality of the public consultation process.** Although, from the regulatory point of view, Serbia has a theoretically flawless public-private consultation mechanism for its trade policy-making process, in practice its implementation has not been as effective as it could be. Serbia should continue to limit the adoption of laws affecting trade through shortened or exceptional procedures and should ensure longer deadlines for consultation procedures in order to respond to criticism from economic actors. Serbia should also raise awareness among the Serbian business community about their increased right to participate in legislative processes that affect them.
- **Expand the network of bilateral and multilateral FTAs,** as no progress has been made in Serbia's accession to the WTO since the last review round. A number of bilateral treaties are in an embryonic phase.
- **Broaden efforts to ease the trade in services and open markets beyond the commitments due to regional trade agreements.** Significant improvements have been made among the WB6 economies to open services trade through the conclusion of CEFTA Additional Protocol 6 in December 2019. Nonetheless, The STRI analysis of Serbia's regulatory environment affecting trade in services has provided some insights into where domestic reforms could help to attract new businesses from third countries and improve competitiveness:
  - **Relax the conditions for the temporary movement of people** for third-country service providers to further encourage innovation and knowledge transfer from third countries and contribute to economic growth. A starting point could be to extend the period intra-corporate transferees and independent service providers can stay from the current 12 months, and the very short period for contractual service providers (3 months). Although the current regulation is in line with the relevant EU legislation, the best practice prescribed by the OECD is 36 months for all categories of service providers (for the first permit).
  - **Reduce the remaining barriers to market entry and competition** in commercial banking, courier services and air transport by lifting some of the existing restrictions on services in trade. In the courier services sector, this would mean amending the preferential subsidy treatment available to the designated public postal provider, which is entitled to reimbursement of the net cost incurred in providing this service if it can prove that they are greater than the revenue generated in the previous year and represent an unfair burden on the postal operator's business. The restriction on foreign banks from operating in the economy through a branch

could be abolished. In the air transport services sector, “wet” leasing of foreign aircrafts could be allowed and the slot allocation process amended to no longer give priority to historic slots.

- **Strengthen the regulatory framework for e-commerce and digitally enabled services.** Some limitations remain in this area, in particular on settling disputes that may arise from e-commerce transactions. A first step should be the establishment of a national ODR platform based on the EU model (Box 25.4) The platform should be designed to resolve disputes over the online purchase of goods and services without the intervention of a national court. This process is known as alternative dispute resolution and is faster and cheaper than a court case. The ODR platform should not be affiliated with any merchant but should provide an independent dispute resolution body that could be called upon at any time to deal with a complaint from any party to an e-commerce contract. The body should be an impartial organisation or person that helps consumers and online traders and is independent of, but approved by, the authorities and meets quality standards of fairness, transparency, efficiency and accessibility.

#### Box 25.4. The European Online Dispute Resolution (ODR) platform

The European ODR platform was set up to make online shopping safer and fairer through access to high-quality dispute resolution tools. EU Regulation 524/2013 provides the framework, the creation of the EU ODR platform and required every e-shop in the European Union to provide a link to the platform enabling European consumers to electronically submit their complaints. From 9 January 2016, all online retailers and traders in the EU, Iceland, Liechtenstein and Norway have been obliged to provide an easily accessible link to the ODR platform and an email address for the platform to contact the consumers.

Consumers can use the EU ODR platform to solve any problem directly with the trader. The platform initially acts as an intermediary between the parties in the dispute by notifying the traders of the issue. If the trader is willing to discuss the dispute, the platform allows the exchange of messages directly via a dashboard which allows users to send attachments such as product photos and schedule online meetings. If the parties request it, or if the dispute cannot be resolved amicably within 90 days, the platform refers the dispute to a dispute resolution body. Although the model is mainly aimed at disputes initiated by a consumer, some European countries allow traders to also file complaints against consumer. However, the consumer must reside in Belgium, Germany, Luxembourg or Poland.

## Access to finance (Dimension 3)

### Introduction

Serbia has made further progress to enable businesses to access finance, improving its performance to a score of 3.3 well above the regional average of 2.6 (Table 25.6). Serbia scores the best in all the sub-dimension as well as being the best overall performer in the Western Balkan region.

**Table 25.6. Serbia' scores for access to finance**

Dimension	Sub-dimension	Score	WB6 average
Access to finance dimension	Sub-dimension 3.1: Access to bank finance	4.4	3.4
	Sub-dimension 3.2: Access to alternative financing sources	2.5	1.9
	Sub-dimension 3.3: Mobilisation of long-term financing	3.8	2.8
Serbia's overall score		<b>3.3</b>	<b>2.6</b>

### State of play and key developments

#### *Sub-dimension 3.1: Access to bank finance*

Serbia's financial sector is bank dominated; the banking sector accounts for around 90% of the overall financial sector's assets which is considerably more than in the euro area (around 45%). As of end 2020, there were 26 banks operating in the economy. This is a relatively large number compared to similar economies – for example, there are 13 banks operating in Hungary, 16 in the Czech Republic and 17 in Bulgaria. The top three banks together hold 36.1% of the total banking assets, while the three state-owned banks had a combined market share of 7%. According to the regulations, a bank can only operate in Serbia if it is registered as a domestic legal entity, regardless of whether the owner of the bank is from a foreign country. Since 2010 five banks have had their licences revoked by the National Bank of Serbia (NBS), due to undercapitalisation and their inability to maintain the minimum required level of financial operability.

Serbia has a relatively well established regulatory framework for the **banking industry** which is in line with Basel II and Basel III recommendations (EC, 2019<sup>[58]</sup>). In December 2016, the National Bank of Serbia adopted a set of regulations implementing Basel III standards. The most significant changes these introduced were: new capital standards strengthening capital requirements, improvements to the risk management process to ensure proper coverage of all risks with capital, the introduction of capital buffers, leverage ratios, and the introduction of minimum standards for liquidity risk management and minimum liquidity ratios.

Under the Memorandum on Dinarisation Strategy adopted by the government and the NBS in 2012 and revised in 2018, the NBS implemented a set of measures to encourage local currency lending. This included loan-to-value ratios for foreign currency (FX) mortgage loans, but not for dinar mortgage loans and minimum mandatory down payment for FX household loans. In 2019, the NBS adopted two decisions<sup>26</sup> to reinforce dinar lending to businesses. The amended regulations establish new rules for banks, and created incentives for banks to exclusively lend in dinars to SMEs, entrepreneurs and farmers. Instead of all lending being treated in the same way, as before, dinar exposures are now given a more favourable regulatory treatment – banks will be able to allocate less capital to cover the risks arising from dinar exposures than from non-dinar and FX-indexed exposures.

Supported by these measures, and macroeconomic and exchange rate stability, Serbia has made progress in dinarisation. The main indicators have shown substantial improvement in the dinarisation of deposits of households and the corporate sector. Since the end of 2012, total household and corporate sector deposits in Serbian dinars (RSD) rose by 19.5 percentage points, reaching 38.8% by the end of January 2021; household deposits increased to 26.3%, and corporate deposits increased to 59.0%, both all-time highs.

The increase in household deposits is related to substantial growth of dinar savings:, which rose by 22% in 2018, 30% in 2019 and 17% in 2020, despite the pandemic. The growth of household savings has continued in 2021, by RSD 2.3 billion or 2.5% so far, reaching a peak of RSD 95.3 billion by 4 March 2021.

Dinarisation of receivables to households and the corporate sector combined increased by 9.5 percentage points also reaching an all-time high of 37.5% at the end of January 2021. Dinar receivables to households increased to 55.7%, while dinarisation of receivables to the corporate sector decreased to 21.5 per cent, despite the growth in 2020 (at end-2019 it equalled 14.0%), which is to a large extent driven by increase of corporate dinar lending within the state guarantee scheme. Moreover, interest rates for SME loans indexed to FX decreased to 4.2% in 2018 (from 4.6% in 2017 and 5.7% in 2016), while the interest rate spread between large companies and SMEs increased slightly to 1.9 percentage points (from 1.8 percentage points in 2017).

Serbia has had a **cadastre** and a **registration** system for pledges over movable assets since 2005, which are largely functional and actively used by the local banking system. The real estate cadastre covers the entire territory and is accessible on line; the online data are updated every week. The Register of Pledges is an integrated, centralised, electronic database of registered pledge rights, and it has full geographical coverage. Its data are public and accessible to all interested parties to search on line. In 2019 the registration of two additional types of security instruments on movable assets were introduced (RS Official Gazette, 2019<sup>[59]</sup>). These are contracts of sale with the retention of ownership rights, and pledge agreements instituting pledges by the transfer of the pledged item into the creditor's possession. According to the law, these contracts are subject to registration as of 1 January 2021.

**Collateral requirements** are among the lowest in the Western Balkan region, however they remain relatively important especially for smaller firms. In 2019 around 41% of loans required collateral (less than the OECD average of 58%), while on average 101.1% of the borrowed amount is required as collateral, higher than OECD average of 88% (World Bank, 2019<sup>[60]</sup>). There are no thresholds for loans below which collateral requirements are flexible for small businesses, which could limit smaller firms' access to loans. The NBS regulations only set the rules on the requirement of collateral from the perspective of risk-weighted asset calculations and classification of assets.<sup>27</sup> The regulations neither require nor ban flexibility over collateral for the bank's internal purposes.

Serbia has one credit bureau providing **credit information services**, an organisational part of the Association of Serbian Banks. Its work is regulated by the Law on Banks, the Law on Personal Data Protection, the Law on Information Security and other laws, by-laws and internal regulations. The retention periods for data used in credit reports are three years for individuals and five years for legal entities and entrepreneurs, as of the date of termination of the contractual obligation to the bank. The information collected by the credit bureau covers the entire adult population and is updated daily.

Under **credit enhancement and risk mitigation**, there are two national credit guarantee schemes in Serbia, one aimed at the banks and the second to support export-oriented firms. The Serbian Development Fund issues guarantees to commercial banks lending at subsidised interest rates to SMEs. Similarly, the Serbian Export and Insurance Agency (AOFI) issues guarantees and other forms of sureties for export businesses and investments abroad, such as bid guarantees, performance guarantees, advance payment guarantees, retention money guarantees and maintenance guarantees. The European Investment Fund (EIF) has selected five banks (Raiffeisen, UniCredit, Banca Intesa, ProCredit and Komercijalna Bank) to implement the European Union's financing for the Serbian SME guarantee programme. The EIF provides a direct guarantee enabling these banks to support around 1 250 loans to SMEs on favourable terms, such as reduced pricing, lower collateral or longer maturities. Starting from 2020, the EU contribution of EUR 20 million over three years will mobilise up to EUR 180 million in the form of loans on favourable terms.

In addition to these guarantee schemes, in 2020 the government issued the Law Establishing a Guarantee Scheme to support to the economy and mitigate the consequences of the COVID-19 pandemic. It is

intended to provide EUR 2 billion of cut-rate funding to micro, small and medium-sized enterprises and entrepreneurs, for liquidity and financing of current assets. The NBS has made additional efforts to support dinar lending under this law. Where banks approving dinar loans under the scheme at interest rates at least 50 basis points lower than the maximum rate prescribed by the law (1M BELIBOR+2.5 pp), the NBS will pay a remuneration rate on dinar required reserves for the amount of these loans at a rate 50 basis points higher than the standard remuneration rate (currently 0.1%).

Since the COVID-19 outbreak, international financing institutions have made significant efforts to support the liquidity of Serbian firms. The European Bank for Reconstruction and Development (EBRD) provided a new credit line of EUR 210 million to Banca Intesa, Erste Bank, Eurobank, ProCredit Bank and UniCredit Bank with the aim of supporting SMEs. The EIB provided a total of EUR 67 million in credit lines to Banca Intesa and Erste Bank, focused on SMEs which commit to generating positive socio-economic impact and contribute towards strengthening economic resilience and sustainable growth in Serbia. The Council of Europe Development Bank (CEB) provided credit lines totalling EUR 50 million to ProCredit and Erste Bank to support urgent working capital requests following liquidity shortages brought on by the COVID-19 pandemic. In addition to these, and in line with the Washington Agreement signed on 4 September 2020, at the White House, the International Development Finance Corporation opened its overseas office in Belgrade, with the announcement of SME support projects worth USD 1 billion that are expected to be realised by the end of Q2 2021.

### *Sub-dimension 3.2: Access to alternative financing sources*

The **factoring** market is still in an early stage of development despite Serbia having had a dedicated law on factoring since 2013. Factoring is mainly driven by banks; as of December 2018 there were 18 factoring providers including 1 state-owned provider (AOFI). The factoring market has declined recent years in terms of total assets: the total volume of factoring assets fell from RSD 28 billion (around EUR 240 million or 0.57% of the GDP) in 2014 to RSD 21 billion (around EUR 180 million or 0.43% of GDP) in Q2 2020. Following recommendations made by the EBRD and the evaluation conducted by the MONEYVAL<sup>28</sup> Committee of the Council of Europe on Anti-Money Laundering requirements, in 2018 the government amended the law on factoring to align it with these requirements. Overall, the law regulates the conditions and manner of performing factoring, types of factoring, rights and obligations of participants in factoring, factoring agreements, reverse factoring, and supervision over factoring, however some additional components are still required such as the establishment of a proper invoice registry and the clarification on local providers' obligations to perform due diligence on customers (World Bank, 2019<sup>[61]</sup>; OECD, 2019<sup>[62]</sup>).

The financial **leasing** market in Serbia is relatively small, but has been growing since 2016. The total assets leased increased by 64.9% between 2016 and Q2 2020 to reach an approximate nominal value of RSD 109.3 billion (around EUR 929.7 million). As at the end of Q2 2020, 17 financial leasing companies were operating in Serbia. Seven lessors were 100% or majority owned by foreign legal entities, while 10 were 100% or majority-owned by domestic entities (of which 8 were owned by domestic banks with foreign capital). As of the end Q2 2020, financial leasing was primarily provided for freight vehicles, minibuses and buses (40.4%), followed by passenger cars (37.7%).<sup>29</sup> The Law on Financial Leasing of 2003, amended in 2011 under the supervision of the NBS, regulates financial leasing activities. In December 2020, following the adoption of a new decision,<sup>30</sup> the legislature broadened the scope of the legal framework by allowing financial leasing companies to be engaged in operating leasing. As of January 2021, the Financial Leasing Register, which centralises contracts of financial lease of movable and immovable assets, started to allow all types of registration applications to be submitted in electronic form.

**Private equity investment funds and venture capital** are regulated by the Law on Alternative Investment Funds and by-laws enacted by the Securities Commission which became effective on May 2020. As a result, the regulatory framework clearly details regulations governing the manner of investment and the

instruments in which private equity and venture capital alternative investment funds may invest; the restrictions, types, and timeframes for subscriptions by members or shareholders; the type and extent of restrictions on investment; the calculation of subscriptions; and the determination of the relevant costs. While no activity has been recorded, Serbian firms are more actively using the Enterprise Innovation Fund (ENIF; see Box 25.5)

There is no legal framework regulating the **business angel networks**. One network is operating: the Association of Business Angels of Serbia (ABAS) is a not-for-profit association of private investors which connects start-ups with investors. In 2019, Serbia recorded four business angel investments representing a total value of EUR 310 000, halting a trend of gradual increases between 2014 (EUR 1.8 million in investment) and 2018 (EUR 2.5 million) (EBAN, 2019<sup>[63]</sup>; EBAN, 2017<sup>[64]</sup>).

### Box 25.5. Enterprise Innovation Fund

The Enterprise Innovation Fund is an active fund managed by South Central Ventures, StartLabs, and Eleven Ventures, focusing on early stage high-growth companies mainly in the tech sector. South Central Ventures offers seed funding up to USD 100 000 per company while StartLabs goes up to USD 50 000 for an equity stake of 10-15%. Eleven Ventures is based in Bulgaria, but also invests in Serbia with pre-seed funding of up to EUR 100 000 for an equity stake of 10-12%. South Central Ventures also offers early stage and growth investments of up to EUR 3 million per company and Eleven Ventures can follow with additional funding as well. All companies offer mentorship to the companies they invest in and connections to boosters, angel investors and venture capital internationally. Eleven Ventures also acts as an accelerator. All funds also invest in other countries in the region. South Central Ventures had nine active investments in Serbia and StartLabs had about seven at the end of 2018. Eleven Ventures has invested in about more than 15 companies in Serbia. Demand for venture capital funding seems to be greater than the available supply, suggesting that there is space for more funds to come in.

Source: (World Bank, 2019<sup>[61]</sup>), *Serbia New Growth Agenda: Financing for Growth*, <https://pubdocs.worldbank.org/en/358601577293558709/SRB-CEM-Financing-for-Growth-wg.pdf>; (WB EDIF, 2019<sup>[65]</sup>), *WB EDIF Annual Report*, [http://www.wbedif.eu/wp-content/uploads/2020/05/WB\\_Edif\\_AR\\_2019.pdf](http://www.wbedif.eu/wp-content/uploads/2020/05/WB_Edif_AR_2019.pdf).

There are no **crowdfunding** activities in Serbia, nor any regulation of them although the National Bank of Serbia is in the process of drafting a law which will regulate the conditions and manner of providing group financial services. According to an official statement, the NBS will take into consideration provisions of the EU Regulation 2020/1503 on European crowdfunding service providers for business. However, the authorities have not announced a clear timeline for this.

In the area of **initial coin offerings based on blockchain technologies**, the Securities Commission of Serbia, in co-operation with the Prime Minister's office, issued a statement on the regulation of cryptocurrencies in March 2019. This qualified cryptocurrencies as one of the instruments included under the Capital Markets Act. The use of cryptocurrencies is also governed by the Law on the Prevention of Money Laundering and the Financing of Terrorism, amended in 2019. This regulates the services of purchasing, selling or transferring virtual currencies or exchanging such currencies for money or other property through Internet platform, devices in physical form or otherwise, and custody wallet service providers. Furthermore, in December 2020 the government adopted the Law on Digital Assets which will take effect on 29 June 2021. This law aims to govern the issuance and secondary trading in digital assets, provision of digital asset services, and pledge and fiduciary rights on digital assets, the competencies of the Securities Commission and the NBS, and supervision over its application. In theory, the law offers a comprehensive framework for the development of digital assets but its effect will be assessed in upcoming

cycles. It should also be noted that the law open the possibility to raise funds for businesses on crowdfunding platforms through digital currencies.

The NBS has also issued several public warnings on the risk of using cryptocurrencies on its website. According to the report published by Start-up Genome,<sup>31</sup> Serbia is one of the top five economies in the world for blockchain developers and has many product-oriented blockchain start-ups. The biggest initial coin offerings in Serbia include those by MobileGo (USD 56 million) and OriginTrail (USD 22 million).

### *Sub-dimension 3.3: Mobilisation of long-term financing*

**Public-private partnerships** (PPPs) are moderately well developed in Serbia. Between 2012 and 2019, the Commission for Public-Private Partnership approved 154 PPP proposals, mainly in the sectors of urban transport, highway concession, and sewage and solid waste management and treatment.<sup>32</sup> As of 2019, the total value of contracted PPPs and concessions exceeded EUR 2.5 billion (around 5.9% of GDP), with 10 projects accounting for 98% of the total (Jelena, 2020<sub>[66]</sub>). The majority of these projects involve the central government or the city of Belgrade.

The Law on Public-Private Partnership and Concessions was adopted in 2011 and amended twice in 2016. It allows for different types of co-operation between the public and private sectors. Projects can be implemented within the time frame of 5 years or up to 50 years. The selection of the private partner is governed under two laws: the law regulating public procurement if the partnership consists predominantly of public works, or by the law on PPPs and concessions if the PPP implies the granting of a concession, or the provision of services with the right to exploit the specific service and to collect payments. However, the reciprocity between both laws has not worked quite so well in practice; both laws have a number of ambiguities over deadlines and some of the procedural steps involved in a PPP that have remained a point of concern for a notable number of stakeholders on the market (CMS Law-Now, 2017<sub>[67]</sub>).

Serbia's domestic **institutional investor** base remain underdeveloped, limiting capital market development. At the end of 2019, of asset management firms were managing EUR 377.5 million of assets, about 0.9 % of GDP. The first investment funds were established in 2007, right after the adoption of the Law on Investment Funds. Initially, the investment fund industry grew rapidly but the investment fund industry collapsed during the 2008 financial crisis because of the fall in stock exchange prices. The Belgrade stock exchange 15 index (BELEX15<sup>33</sup>) plunged from a historical high at 3 335.2 in May 2007 to a historical low of 347.46 in March 2009. After suffering huge losses during the crisis, most of the funds that continued to operate were transformed from growth funds into money market funds (World Bank, 2019<sub>[68]</sub>). As of December 2019, five asset management firms were operating in Serbia managing 18 investment funds. Natural persons (93%) are the main categories of clients and of the remaining 7%, 89% are limited liability companies. As of March 2020, the main asset allocation preferences among pension funds were bonds (80.8%), stocks (9%) and private equity (3.3%), indicating limited diversification.

Serbia has **capital markets** but they are relatively underdeveloped. The only market segment that functions comparatively well is the government bond market. The contribution of capital markets to financing the economy is limited. In July 2020 the Belgrade stock exchange (BELEX) registered a total turnover of securities of RSD 2.8 billion (around EUR 23.7 million or 0.06% of GDP). Turnover of shares totalled RSD 133.9 million (around EUR 1.1 million or 0.002% of GDP) while Republic of Serbia bonds (RS bonds) totalled RSD 2.7 billion (around EUR 22.9 million or 0.05% of GDP).

The private sector is not making use of the **stock market** for its financing needs. There has been only one initial public offering (IPO) since World War II. Shares of Fintel Energy a.d. were included on the Prime Listing and after the successfully completed IPO, they started trading on 20 November 2018, at an approximate total value of RSD 755 million. The lack of IPOs remains the biggest challenge for the Belgrade Stock Exchange and Serbian capital market. The government never used them as a privatisation model for state-owned enterprises, while companies from the private sector are very hesitant to raise capital through IPOs as there are no success stories. In addition, there are no clear and optimised

procedures, nor any prior experience or specific incentives that would encourage IPOs. All this, combined with financing dominated by bank lending has kept companies out of the capital market, leaving the IPO market effectively still in the testing stage.

In order to trade on the Belgrade Stock Exchange, an issuing company may apply for one of the three listing segments in Table 25.7. “Smart listing” was introduced in August 2016, with the aim of supporting the development of start-ups and SMEs, improve their business environment, and promote investment and growth. Yet, as of January 2020, no new businesses have used it to introduce their companies to the stock exchange. If the equity securities do not meet any of the listing standards described in Table 25.7 they may operate in the non-listed segment/open market which is a segment below. If the securities also do not meet the requirements for admission to the non-listed segment of the regulated market, they may be admitted to trading on the multilateral trading facility (MTF). It should be noted that only investment companies with a licence from the SEC may trade on a regulated market or MTF; other persons may only trade on these markets through such investment companies.

**Table 25.7. Listing segments of the regulated market in the Belgrade Stock Exchange**

	Prime listing	Standard listing	Smart listing
Length of business operations	Minimum 3 years	Minimum 3 years	New companies with up to 3 years of operations
Business results	Net profit	-	-
Opinion of the authorised auditor	Unqualified	Unqualified or qualified	Unqualified or qualified
Minimal amount of capital	EUR 3 million	EUR 2 million	At least 1 million EUR, and no less than EUR 500.000 under special conditions
General conditions during the period of listing	Auditor's report with expressed unqualified or qualified opinion Issuer's webpage – in both Serbian and English		
Special conditions for shares and depository receipts on shares	<ul style="list-style-type: none"> <li>at least 25% of total number of issued shares</li> <li>shares of minimal capital of EUR 1 million which are owned by at least 250 shareholders</li> <li>shares which are in the ownership of at least 500 shareholders</li> </ul>	<ul style="list-style-type: none"> <li>at least 25% of total number of issued shares</li> <li>shares of a minimal amount of capital of EUR 1 million, which are in the ownership of at least 150 shareholders</li> <li>shares which are in the ownership of at least 300 shareholders</li> </ul>	At least 25% of the total number of shares, or shares of a minimal amount of EUR 150.000, under special conditions
	Average value of daily turnover of at least RSD 500 000 and an average daily number of at least five transactions calculated in the last six months, agreement on market making operations concluded, more than 1 000 shareholders, shares in the free float in the total amount of at least EUR 2 million.		

Source: Adapted from the inputs collected from the Government of Serbia.

In December 2016, BELEX joined the SEE Link network, enabling trading on multiple markets participations. SEE Link was set up by three regional stock exchanges with the support of the EBRD in 2014: the Bulgarian Stock Exchange, the Croatian Stock Exchange and the Macedonian Stock Exchange. It aims to integrate regional markets without mergers or acquisition, using only technology. It provides investors easier and more efficient access to those markets through a local broker. Since the launch of the network, five more stock exchanges have joined, including two from Bosnia and Herzegovina, the Ljubljana Stock Exchange from Slovenia, the Belgrade Stock Exchange, e and the Athens Stock Exchange. This

regional collaboration could enhance stock market liquidity in the participating economies, but the different legal and regulatory frameworks, the lack of central securities depository links, and different currencies create challenges for market operators which limit more intense trading activity on this platform.

Prior to the COVID-19 pandemic, Serbia was working on developing a comprehensive capital market development strategy. Together with domestic and international stakeholders, such as the World Bank, the EBRD, USAID and the United Nations Development Programme (UNDP), it aimed to assess the potential benefits of the capital market and instruments to boost the financing of both the state and the private sector. One of the most concrete measures foreseen was the inclusion of incentives in order to support and encourage companies to make an initial public offering, however, at the time of drafting this initiative was suspended due to competing priorities related to the pandemic response. In December 2020, Serbia continued the work on the Capital Markets Development Strategy with a new adoption date set for the end of Q2 2021. A number of activities envisioned by the initial strategy have also been adopted during the pandemic, primarily those relating to the efficiency of the corporate bond market.

The government **bond market** has made substantial progress in recent years but the non-government bond markets remain in their infancy. The bond market has a solid foundation in terms of its infrastructure, technology and regulation, but it has not been used extensively by the corporate sector, with private sector bonds only amounting to 0.06% of GDP. The main reason is that corporate bonds are considered to be more expensive than bank financing. In 2019 only one corporate bond was admitted to market, Erste bank a.d.

There are no subsidies to make the bond market more attractive, nor any specific incentives encouraging business to use it. However, in April 2020 the government introduced one simplification measure regarding the public offerings of debt securities to mitigate the impact of COVID-19 (Box 25.6). Investors can easily find information on the maturity, secure/unsecure, liquidation preferences, coupon rate, tax status and call provision in the prospectus but the SEC does not publish bond ratings. These measures resulted in a milestone event in terms of corporate bond market, with a landmark transaction, which saw a private sector company successfully completing a corporate bond issue, listed on the Belgrade Stock Exchange.

#### Box 25.6. Emergency rules on the issuance of “Corona bonds” in Serbia

On 10 April 2020, the Government of Serbia adopted the emergency Decree on the Procedure for Issue of Debt Securities, which simplifies the current regime regarding public offerings of debt securities by Serbian companies in Serbia. This new simplified regime will be in force for a period of 180 days following the end of the state of emergency.

The decree releases prospective issuers from the obligation to prepare a short-form prospectus. It also cuts down the paperwork needed to obtain the SEC’s approval. Businesses no longer have to submit documents that are publicly available and can be obtained from public registers to the SEC. This relates to current information on the issuer from the commercial registry, published financial statements, stock exchange information in case of public companies, share ownership structure available at the central registry, depository of securities, etc. Information about the issuer and its financial statements do not have to be included in the prospectus, but the prospectus may instead refer or link to publicly available or online information (e.g. the issuer’s website, website of the commercial registry, the central register and depository of securities, or the register of financial statements). The issuer is required to list all referenced documents and webpages on which they can be found, and specify which relevant information can be found in which document and which section of the document.

When applying for the SEC’s approval of the prospectus, if no more than 200 days have passed since the end of the relevant financial year and the date of the application for the SEC’s approval, the issuer

is not required to additionally prepare and submit to SEC semi-annual financial statements for the current year.

The SEC is required to approve publication of the prospectus for the offering of debt securities within 10 days from the receipt of the issuer's application (provided that the application is complete).

Following the completion of the public offering, the bond issuer obtains the status of a public company, which triggers various reporting and other regulatory obligations. However, private joint-stock companies or limited liability companies are not required to apply for the listing of their shares at the regulated market.

### ***The way forward for access to finance***

To enhance the banking industry and support businesses' access to finances, policy makers should:

- **Continue efforts to implement crowdfunding legislation in line with EU norms.** In addition to the possibility of investing in these platforms through digital assets, the government should pay attention to facilitating FX investments to potentially attract investments from the diaspora.
- **Consider a business angel network review.** Despite increasing between 2014 and 2018, total business angel investments have only reached around EUR 2 million. A comprehensive assessment of existing investments could help the government to better understand the requirements of business angel networks. Additional policy tools could be deployed to promote further interest including tax incentives. Another option could be to provide support to the existing operator.
- **Promote access to equity capital through the stock market.** The low level of activity and liquidity in the stock market is a barrier for companies that could use it to raise new capital. To stimulate capital market development, the government could encourage the listing of state-owned enterprises which would help increase the size the stock market and its visibility among international institutional investors (see Box 25.7 for an example from Lithuania). To increase their attractiveness, the government could consider a tax credit system for costs related to initial listings and secondary equity offerings by already listed companies. Such a system would allow companies to deduct the listings costs, including any advisory service costs, against the corporate income tax payable up to a certain amount.

#### **Box 25.7. Ignitis Group in Lithuania**

Ignitis Group is a Lithuanian state-owned international energy company focusing on renewable energy transitions and one of the largest energy groups in the Baltic region. In October 2020, the previously fully state-owned group was listed on Nasdaq Vilnius and London Stock (LSE) exchanges. Ignitis group's IPO became the largest transaction in the Baltics in several decades, as a total of EUR 450 million of all primary capital was raised by offering 26.91% of the shares and global depository receipts (GDRs) to institutional and Baltic retail investors.

Ignitis group's IPO has already proved beneficial to Baltic capital markets with a 70% increase in Nasdaq Baltic turnover over 2020 and a doubled increase in turnover on the Nasdaq Vilnius market, making Ignitis shares the most traded and accounting for 35% of the total increase on the Vilnius stock exchange. Priority investments were given to high quality and local investors to allow for high-quality distribution among shareholders with approximately 9% of shares allocated to long-term investors while

retail and other hedge funds acquired the remaining shares. The group's IPO not only attracted strong interest from the Baltic states, but also by international Nordic, European and other international institutional investors, with the largest minority shareholder being the EBRD with 4% ownership.

According to a statement of the Lithuanian Ministry of Finance, the attracted funds will help with the implementation of the National Energy Independence Strategy by promoting green energy production and ensuring energy security and self-sufficiency. As the Bank of Lithuania requires a prospectus for listings on the Vilnius stock exchange, in line with international best practices, Ignitus group published a document containing risk factors, general information on the offering, payment policies, corporate government strategies and more.

Source: (EBRD, 2020<sup>[70]</sup>), EBRD Board Report: Ignitus Group IPO, <https://www.ebrd.com/what-we-do/project-information/board-documents/1395294375006/ignitus-grupe-ipo.pdf?blobnocache=true>; (Ignitus Group, 2020<sup>[71]</sup>), Press Release: Ignitus grupė completed the largest IPO in the Baltic States 2020, <https://ignitigrupe.lt/lt/ignitis-grupe-ivykde-didziausia-baltijos-salyse-ipo>.

- Facilitate market-based long-term debt financing for businesses.** Firms need access to fit-for-purpose financing that meets their needs at various stages of their growth trajectory and development. This will be even more important in the long run as the economy starts to recover from the COVID-19 crisis. Given businesses' dependence on bank financing, on top of the corona bond measures, more extensive use of corporate bond financing could help lengthen maturities, increase resilience and facilitate long-term investments in Serbia. One way to achieve this would be by creating an appropriate credit rating mechanism. The authorities could assess credible and reliable mechanisms, such as the model where central banks play a central role in providing rating services. Another way to increase the liquidity of the bond market could be to establish a special framework coupled with technology platforms such as crowdfunding for private bond placements by smaller companies. One recent and successful example of alternative financing options for SMEs is the Italian mini-bond market framework (see Box 25.8).

### Box 25.8. The Italian “Mini-bond” market

In 2012 the Italian Government introduced a series of laws<sup>1</sup> to initiate a mini-bond framework for unlisted companies to enable them to issue corporate bonds. The mini-bond framework provides a simplified process whereby unlisted companies with more than 10 employees and an annual turnover and/or assets in excess of EUR 2 million (except micro-enterprises and banks), can issue bonds that are available only to qualified investors. Firms are not required to publish a public prospectus – an admission document is sufficient.

In response to this new regulatory framework, Borsa Italiana introduced the ExtraMOT PRO segment in 2013, dedicated to the listing of bonds whose trading is only permitted to professional investors. Since its introduction, the mini-bond market has seen steady growth, with the number of issuances increasing from 16 in 2013 to 171 in 2018. The cumulated proceeds during this period amounted to EUR 10.6 billion, 25% of which was raised in 2018. Moreover, mini-bonds have also been securitised through special purpose vehicles which have created a diversified pool of mini-bond issuers available for institutional investors.

In 2019 the government introduced mini-bond placements on equity crowdfunding platforms. In October 2019, the operating rules for equity crowdfunding platforms willing to place mini-bonds were published by the competent authority (Consob). These include that the offers must be published on specific sections of the platforms; the issuers are limited to joint stock companies; and eligible investors are required to hold financial assets of at least EUR 250 000, invest at least EUR 100 000 in the mini-bond, or be client of an asset management company. The first offerings were published on crowdfunding platforms in January 2020.

1: Law Decree No.83/2012 and its subsequent amendments (Law Decree No. 179/2012; Law Decree No. 145/2013), Law Decree No: 91/2014; Law Decree No: 157/2019, (Fiscal Decree 2020) and Law Decree No: 160/2019 (Budget Law 2020) which created the possibility for unlisted companies to issue corporate bonds through the so-called mini-bond framework.

Source: (OECD, 2020<sup>[72]</sup>), *OECD Capital Market Review of Italy 2020*, [www.oecd.org/corporate/OECD-Capital-Market-Review-Italy.htm](http://www.oecd.org/corporate/OECD-Capital-Market-Review-Italy.htm).

## Tax policy (Dimension 4)

### Introduction

Table 25.8 provides Serbia's scores for two tax policy sub-dimensions, against the WB6 average. Serbia scores below the average for the tax policy framework as a result of its poor performance on the tax expenditure indicator, the lowest among the WB6 economies. However, Serbia scores above the WB6 average for tax administration as a result of its strong performance in the function and organisation and taxpayer services indicators: the highest rating possible for both indicators, and the highest among the WB6 economies.

**Table 25.8. Serbia's scores for tax policy**

Dimension	Sub-dimension	Score	WB6 average
Tax policy dimension	Sub-dimension 4.1: Tax policy framework	2.0	2.6
	Sub-dimension 4.2: Tax administration	3.9	3.3
	Sub-dimension 4.3: International co-operation	n.a.	n.a.
Serbia's overall score		3.1	3.0

Note: Sub-dimension 4.3 on international co-operation is analysed qualitatively and therefore remains unscored.

### State of play and key developments

#### *Sub-dimension 4.1: Tax policy framework*

Serbia's **tax revenues** as a share of GDP are relatively high. Its tax-to-GDP ratio was 36.8% in 2019, the highest of the WB6 economies, (compared to 30.6% WB6 average) (Table 25.9). This ratio is also above the average for OECD countries (33.8% in 2019). As with most WB6 economies, Serbia's tax-to-GDP ratio has risen since the last Competitiveness Outlook assessment in 2018, increasing from 36.2% in 2015. Serbia relies heavily on revenue from taxes on goods and services and social security contributions (SSCs) to fund its public spending programmes and healthcare system. These taxes accounted for 76.9% of total tax revenues in 2019, which broadly aligns with the 80.7% WB6 average but significantly diverges from the average in OECD countries (58.4%). Consequently, other taxes such as corporate income tax and personal income tax play a smaller role in the tax mix, accounting for only 16.6% of Serbia's total tax revenues (14.9% WB6 average; 33.5% OECD average).

The heavy reliance on SSCs supports the direct funding of the welfare system. It also prevents the need to fund social welfare from general tax revenues, which would create challenges from a budget perspective. However, Serbia could consider rebalancing its tax mix by shifting revenues away from SSCs and towards PIT (OECD, 2018<sup>[73]</sup>). The very high SSC rates may be having an adverse effect on the functioning of the labour market and comes at the cost of equity, as SSCs are mostly levied at flat rates, while PIT can be levied at progressive tax rates. With regards to taxes on goods and service, OECD research has found that consumption taxes, and particularly VAT, may have less of a distortionary effect on the decisions of households and firms and thus on GDP per capita than income taxes (Johansson et al., 2008<sup>[74]</sup>).

**Table 25.9. Serbia's tax revenues as a percentage of GDP**

	CIT	PIT	SSCs	Goods and services	Tax/GDP ratio
Serbia	2,3%	3,8%	12,5%	15,8%	36,8%
WB6	1,8%	2,7%	9,3%	15,9%	30,6%
OECD	3,1%	8,1%	9,0%	10,9%	33,8%

Note: CIT= corporate income tax; PIT= personal income tax; SSCs= social security contributions.

Source: (OECD, 2020<sup>[75]</sup>) OECD.Stat, <https://stats.oecd.org/> (2019 for overall tax/GDP ratio, 2018 for specific tax/GDP ratio)

Serbia levies a standard CIT rate of 15%, which is, with Albania, the joint-highest rate among the WB6 economies (Table 25.10). This rate is higher than the WB6 average of 11.5% in 2020 but below the average rate in OECD countries (23.3% in 2020). Serbia's CIT revenues amounted to 2.3% of GDP, which sits between the WB6 average of 1.8% in 2019 and the OECD average of 3.1% in 2018. Serbia and Albania have the joint-highest reliance on CIT revenues among WB6 economies, relative to GDP. Dividend income is excluded from the CIT base of resident companies while capital gains are included. A 15% withholding tax is levied on dividend payments to non-residents, but tax treaties may result in a lower rate. Resident individuals receiving dividends are liable for a 15% PIT rate, also withheld at source. Serbia operates a worldwide taxation system whereby resident companies pay taxes on domestic and foreign-sourced income, while non-resident companies are liable for taxes on income originating from Serbia. All of the WB6 economies have adopted a worldwide taxation system, although, such systems are becoming increasingly less common among OECD countries, particularly for small open economies.

**Table 25.10. Selected tax rates in Serbia**

	CIT	PIT	SSCs	VAT
Serbia	15.0%	15.0%	36.4%	20.0%
WB6	11.5%	12.8%	28.6%	19.0%
OECD	23.3%	42.8%	26.9%	19.3%

Note: CIT= corporate income tax; PIT= personal income tax; SSCs= social security contributions; CIT and PIT averages are based on top statutory rates.

Source: (OECD, 2020<sup>[75]</sup>) OECD.Stat, <https://stats.oecd.org/> (2020 for CIT and VAT, 2019 for PIT and SSCs)

As part of a tax reform in 2018, Serbia introduced a number of new **investment incentives** to its corporate taxes, many of which are cost-based incentives. Cost-based incentives lower the cost of investment and increase with the invested amount. For example, expenses directly related to qualifying research and development (R&D) in Serbia are eligible for a CIT deduction of twice the value of the investment undertaken. In addition, companies investing in the capital of a new company performing so-called “innovative activities” are entitled to a tax credit of 30% of the investment undertaken. To benefit from this tax incentive, the investing company should not own more than 25% of the shares of the newly established company. Another corporate tax incentive allows companies that invest over RSD 1 billion (around EUR 8.5 million) in fixed assets and employ at least 100 employees to be exempt from CIT for 10 years in proportion of the investment undertaken. This proportion is the value of the qualifying investment to the total value of the taxpayer's fixed assets for a period of 10 years. Research shows that cost-based incentives are preferable to profit-based incentives, which run the risk of a high redundancy of expenditure since the relevant investments may have proceeded anyway (UNCTAD, 2015<sup>[76]</sup>).

In Serbia, individual income is generally taxed at different rates for each category of income. The **personal income tax rate** on labour income is 10% for individuals with a taxable income of six times the average annual salary or less. When the aggregated net income exceeds this threshold, a “complementary income tax” with a 15% PIT rate applies to the portion of income above the threshold. For the self-employed, a flat 10% PIT rate applies. Serbia has the highest reliance on PIT revenues relative to GDP (3.8% compared to the WB6 average of 2.7%) and the second-highest top PIT rate (after Albania). However, PIT revenues remain significantly below the OECD average (8.1% in 2018). Serbia manages these relatively high PIT revenues despite low salaries, a relatively low rate for most taxpayers, informality and increases to the basic allowance in recent years. The monthly basic allowance for wages is currently RSD 16 300 (around EUR 139). It has increased by 38% since 2017, when it was RSD 11 790. A differentiated set of tax rates are levied in Serbia with regard to the taxation of personal capital income. Individuals' income from **dividends, capital gains and interests** are taxed at a rate of 15%. Rental income is taxed more heavily at 20%.

As mentioned above, Serbia raises significant revenues from **social security contributions**: 12.5% of GDP, which is significantly above the average for the WB6 economies (9.3%) or for OECD countries (9.0%). Its SSC rates are comprised of compulsory pension and disability insurance, compulsory health insurance, and unemployment insurance. Serbia has reformed its SSC rates modestly in recent years although the total rate remains high at 36.5%, which is the second highest rate among the WB6 economies (average 29.4% in 2020). In 2019, it reduced the rate of unemployment insurance from 1.5% to 0.75% and in 2020 it reduced the rate for pension and disability insurance from 26% to 25.5%, while health insurance stands at 10.3%. The employer SSC rate is 16.6% and the employee rate is 19.9%. Although the employee SSC rate aligns with the WB6 average of 19.9% in 2019, the employer SSC rate is significantly above the regional average of 9.5%. Serbia is also atypical by OECD standards in having a higher employee SSC rate than the employer rate, although this is common in the WB6 region.

These high SSC rates, combined with PIT, result in a high tax burden on labour income compared to capital income. This differentiated taxation creates an incentive for entrepreneurs to incorporate and receive income in the form of lowly taxed capital instead of highly tax salaries. OECD research shows that high SSC rates can place a significant tax burden on labour income, reducing incentives to work and making it expensive for employers to hire workers, especially low-paid and low-skilled ones. Serbia's large informal economy is likely related to the very high SSCs (OECD, 2018<sup>[77]</sup>). Moreover, SSCs are mostly levied at the same rate for all income levels,<sup>34</sup> and as such, they do not contribute to making the taxation of labour income more progressive (OECD, 2018<sup>[77]</sup>).

When it comes to the **design and functioning of the VAT system**, tax revenues from goods and services are relatively high in Serbia, as is common among WB6 economies. Revenues were 15.9% of GDP in 2019, the same as the WB6 average (15.9%) but significantly above the OECD average (10.9%). The standard VAT rate in Serbia is 20%, which is similar to the average rate of OECD countries (19.3% in 2020) and WB6 economies (19% in 2020). The VAT base is narrowed by a reduced rate of 10% which applies to a wide range of basic goods and services. These include food products, medicines and textbooks, as well as natural gas, transport and other services that are temporarily imported. OECD research has found that reduced rates are not an effective way to target those on low incomes, and can be regressive in some instances (OECD, 2018<sup>[77]</sup>). The combination of high SSCs, a high standard VAT rate and low PIT rates results in a tax system that is overall flat and very unlikely to play much of a role in reducing inequality.

The mandatory VAT registration threshold in Serbia in 2020 is RSD 8 million (around EUR 68 000). This threshold is relatively high compared OECD countries and WB6 economies. Reducing the VAT registration threshold could be investigated as a policy option as it would bring additional businesses in the tax base and increase tax revenues. Such a policy would likely need to be accompanied by a strengthening of the tax administration and VAT simplification measures.

Despite the wide range of corporate tax incentives in Serbia, the economy currently does not operate a regular **tax expenditure report**, unlike a number of other WB6 economies. For example, Albania implemented a tax expenditure report in 2019 and North Macedonia and Montenegro are currently in the process of doing so. Serbia should develop a regular tax expenditure report which would allow it to monitor the use and effectiveness of tax incentives and tax expenditures along with the tax revenue forgone (OECD, 2010<sup>[78]</sup>). The report should identify, measure and report on the cost of tax expenditures in a way that enables their cost to be compared with direct spending programmes (IMF, 2019<sup>[79]</sup>). The authorities could also conduct cost-benefit analyses to evaluate whether specific tax incentives are meeting their stated objectives and, if not, whether they should be abolished or replaced.

With regards to the **modelling and forecasting of tax revenues**, Serbia carries out projections and estimates of tax revenues for all major taxes using macroeconomic modelling. The MoF does not currently use micro-simulation modelling to analyse tax policy proposals. As a result, there may be scope for Serbia

to develop micro-simulation models using tax and survey data to estimate the cost and distributional outcomes of different policies.

#### *Sub-dimension 4.2: Tax administration*

Serbia redesigned the **functions and organisation** of its tax administration in July 2019. The organisation is based around the different functions of a tax administration, with divisions such as audit, tax collection and taxpayer services. The tax administration carries out most classical tax administration functions, including tax fraud investigation. This function is usually the responsibility of a special police department in other WB6 economies. The tax administration collects all taxes, with the exception of taxes on immovable property, which are collected by local governments. Serbia follows OECD good practice in having a unified body that covers all taxes and all the core tax administration functions, which is an important factor in strengthening the efficiency of the tax administration (OECD, 2018<sup>[77]</sup>). Monitoring of the tax administration's performance is carried out by the State Audit Institution which issues an annual report. Similarly, regular assessments are carried out by the Fiscal Council, an independent body which reports to the National Assembly of Serbia. Serbia also took part in the Tax Administration Diagnostic Assessment Tool (TADAT), an international assessment programme for tax administrations.

Serbia's **compliance assessment** follows a risk-based approach. Each month, taxpayers are selected for audit on the basis of a wide range of risk criteria. The tax administration also carries out an annual audit plan. This plan includes a breakdown by types of taxpayer, activities, company type and company size. OECD research shows that risk-based selection is a key element of effective and efficient compliance programmes as it allows administrations to make effective trade-offs and make the best use of their resources (OECD, 2018<sup>[77]</sup>). It conducts several types of audits, ranging from general comprehensive audits to more targeted ones.

In terms of **independence and transparency**, a legal framework regulates the role of the Tax Administration. Serbia adopted the Tax Administration Transformation Programme 2015-20 in 2015. Among other objectives, this programme aims to improve the strategic management within the Tax Administration. As part of this initiative, an action plan was produced for the period 2018-23. It included the creation of several permanent committees such as an organisational transformation committee, a business oversight committee and a compliance committee. With regards to disciplinary sanctions, the administration has established rules and procedures against the abuse of tax collection. Their application is monitored by the Internal Control Department. This department also performs direct and indirect controls on the legality, timeliness, responsibility and efficiency of actions by the tax administration's employees. OECD research suggests that corruption among employees of a tax administration may deter individual taxpayers from paying taxes (OECD, 2018<sup>[80]</sup>).

In Serbia, electronic **tax filing** is mandatory for companies and entrepreneurs. Individuals may file tax returns either on paper or electronically. Tax returns for CIT and the personal business income of the self-employed are submitted annually. Payments are made monthly in the form of advance payments. Serbia's tax administration has a built-in system for the validation of reported data. It performs a variety of mathematic, logical and syntactic verification, and tax returns are corrected if necessary.

Various **taxpayer services** are at the public's disposal in Serbia, including online access to information, electronic communications with taxpayers, electronic submission of requests for reimbursement, and online tax payments and in-person inquiries. The Protector of Citizens is an independent state body that protects the rights of citizens and controls the work of administrative bodies. Taxpayers who believe they have been harmed by an act, action or omission of the tax administration, can turn to the Protector of Citizens. An assessment of the efficiency of the delivery of taxpayer services is conducted quarterly by the Ministry of Finance.

### *Sub-dimension 4.3: International co-operation*

As with other WB6 economies, Serbia has become increasingly involved in dialogue and reforms related to the **international tax framework** in recent years. As a member of the Inclusive Framework on BEPS (base erosion and profit shifting), it recently signed the OECD Multilateral Convention to Implement Tax Treaty Related Measures to Prevent BEPS. This was implemented in January 2019. Serbia also joined the OECD Global Forum in March 2018 and implemented the Convention on Mutual Administrative Assistance in Tax Matters in December 2019. Serbia's assessment by the OECD Global Forum on exchange of information upon request (EOIR) was initially scheduled for the second half of 2021 but was postponed to the first half of 2022 because of COVID-19. The economy has yet to engage in initiatives in the field of automatic exchange of information (AEOI). It has transfer pricing rules in place, based on OECD transfer pricing guidelines. This involvement in the international taxation framework could help it to protect its domestic tax base from erosion due to tax avoidance and evasion.

Serbia is engaged in several initiatives in the field of **digital taxation**. With regards to VAT, it has not formally implemented the international guidelines on VAT/goods and services tax (GST). However, it levies VAT on cross-border digital services using a logic close to the "destination principle",<sup>35</sup> the cornerstone of the international VAT/GST guidelines. Serbia levies VAT in the place where the service recipient is established. Concerning taxation of individual income arising from digital platforms, the Strategic Risk Department of the Tax Administration carried out an analysis assessing tax compliance. This analysis found a poor reporting of revenues from digital platforms and a low rate of tax compliance among individual taxpayers. As a result, the Tax Administration requested data from commercial banks on payments received by individuals from digital platforms. It is currently developing a risk response plan to audit these taxpayers.

With regards to the OECD's Tax Challenges Arising from Digitalisation project, Serbia intends to actively participate in discussions on Pillar 1 and 2. Developments taking place at OECD level might have an impact on Serbia's taxation of corporate income, especially under Pillar 2. The GLOBE proposal intends to define a minimum taxation of corporate profits. Although Serbia has relatively high CIT rates compared to the other WB6 economies, it still may be affected by this proposal. Its comprehensive investment tax incentives regime lowers the effective tax rate of corporate profits. Depending on the minimum tax rate set, Serbia could be faced with the choice of either redesigning its tax incentives to increase the effective rate on corporate profits to the level of the minimum tax, or risk forgoing tax revenues to foreign jurisdictions. This topic will have a great importance in the near future and Serbia may wish to evaluate its position and prepare an action plan.

Serbia is engaged in moderate **regional co-operation** with other WB6 economies. In 2006, an Agreement on Co-operation and Mutual Assistance was concluded with Bosnia and Herzegovina, Bulgaria, North Macedonia, and Montenegro. Serbia would benefit from more regional tax co-ordination and tax co-operation. The intensification of co-operation efforts would help tackle tax avoidance and evasion in a coherent manner across the region. As Serbia faces similar challenges similar to other WB6 economies, it will benefit from intensifying information sharing and learning from its peers' experience.

### ***The way forward for tax policy***

To enhance the tax policy framework and achieve their objectives, policy makers may wish to:

- **Strengthen its support to the economy and facilitate the economic recovery** in light of COVID-19 with targeted tax and subsidy measures. Serbia implemented a relatively narrow set of measures to mitigate the effects of COVID-19 on its economy and citizens. It may wish to strengthen existing efforts, while focusing on measures that could spark economic recovery.
- **Diversify the tax mix by strengthening the role of corporate and personal income taxes.** Serbia's tax revenues rely heavily on SSCs and taxes on goods and services. There is scope to

diversify the tax mix and focus on taxes that stimulate growth or make the tax system more progressive.

- **Instigate a regular report on tax expenditures.** Serbia recently implemented a diversified set of investment tax incentives. A regular tax expenditure report would help assess tax revenue forgone from all tax expenditure and would increase transparency on the revenue costs and, ideally, their distributional impact, which would result in better-informed tax policy making.
- **Weigh the advantages and disadvantages of its differentiated taxation of capital and labour income.** Taxing capital and labour income differently allows for more targeted tax policies. However, it may create distortionary spillover effects and encourage business owners to take advantage of this difference by incorporating and receiving income in the form of capital rather than labour income. Serbia may wish to assess its position on this issue.
- **Broaden the VAT base** by reducing the list of goods and services taxed at the reduced rate and, possibly, by lowering the VAT registration threshold. Broadening the VAT base could be accompanied by additional measures to strengthen the VAT administration.
- **Strengthen the design and progressivity of the PIT.** Revenues from the PIT are relatively high compared to regional average but low when compared to OECD countries. Several initiatives could strengthen its design and raise additional revenue. Serbia could also introduce a new progressive PIT rate schedule.
- **Rebalance the taxation of labour income away from high employer and employee SSCs.** This imbalance may affect labour market outcomes, especially for informal, low-skilled or low-income workers. There is scope to rebalance the tax mix away from SSCs and towards PITs.
- **Develop an action plan in case consensus is found on a possible global minimum tax** amongst members of the OECD/G20 Inclusive Framework on BEPS. Although a global minimum tax will very likely be lower than the current statutory CIT rate, Serbia could still face a choice of either redesigning its investment tax incentives or risking forgoing tax revenues. The government should evaluate its position on this issue and prepare an action plan
- **Implement micro-simulation models to analyse the impact of tax system changes.** Although Serbia implements models to forecast tax revenues it would benefit from implementing micro-simulation models to assess the impact of tax reforms.
- **Continue to strengthen the functioning of the tax administration.** Control of the tax administration is carried out by the State Audit Institution and the Fiscal Council. The economy is also engaged in the TADAT and the Tax Administration Transformation Program 2015-20. These initiatives are critical in building public scrutiny and Serbia is encouraged to continue these and other efforts to strengthen the functioning of its tax administration.
- **Continue to engage with the international tax community and implement international best practice.** Since the last assessment, Serbia has strengthened its involvement in international tax matters and this approach is very much welcomed.
- **Carry out a cost-benefit analysis on the merits of its worldwide taxation system for resident corporations.** For small open economies such as Serbia, worldwide taxation may entail high administrative costs without raising significant revenues.
- **Foster regional co-operation and co-ordination on common tax issues.** Serbia shares common challenges with other WB6 economies and enhanced collaboration might benefit all economies involved. Areas such as tax compliance, training of tax administration officials or exchange of information would greatly benefit from a co-ordinated regional approach.

## Competition policy (Dimension 5)

### Introduction

Unlike the other dimensions, where indicators are allocated a score from one to five, the Competition policy dimension assesses four policy areas (i.e., scope of action, anticompetitive behaviour, probity of investigation and advocacy) is based on yes/no (coded as 1/0) answers to the 71 questions in the questionnaire administered by the OECD. Where a response to a question is yes (coded as 1), then we refer to this as an adopted criterion. Each of the four policy areas has a different number of possible criteria that can be stated as having been adopted. Each policy areas is assessed though data collected from the questionnaire indicators and by measuring the number of criteria adopted. The new fifth policy area (implementation) is not scored, but is a quantitative analysis of how many competition decisions have been adopted by the competition authorities. The anti-competitive behaviour and implementation policy areas are discussed together below.

Figure 25.9 shows the number of positive (alignment to good practices) and negatives replies to the questionnaire administered by the OECD, with respect to each of the policy areas for this dimension. It is clear that Serbia is fully aligned to international best practice in the scope of action and its powers to fight anti-competitive behaviour. Some minor discrepancies persist in the probity of investigation and competition advocacy.

**Figure 25.9. Serbia's legal and institutional competition framework**

Source: Based on the OECD assessment.

Serbia has not made substantial changes to its legislative framework on competition since the previous Competitiveness Outlook assessment. The legal provisions regarding anti-competitive agreements, abuse of dominance and merger review are closely aligned with those in the Treaty on the Functioning of the European Union and consistent with international standards.

The Commission for Protection of Competition (CPC), established in 2005, is the body responsible for implementing competition enforcement and advocacy in Serbia. It is an independent institution, provided with skilled and qualified staff. The CPC is a well-established competition authority in the context of the Western Balkan economies. After carrying out some significant cases in the last few years, it has the potential to make its competition enforcement even more impactful. In the area of advocacy, the CPC has endeavoured to embed competition principles in national laws and regulations and promote a competition culture.

## State of play and key developments

### Sub-dimension 5.1: Scope of action

The Council of the CPC consists of the President of the Commission and four members, elected from among eminent experts in the field of law and economics, particularly the field of competition protection. They are elected for a five-year term by the National Assembly, on being proposed by the committee in charge of trade operations, and they can be re-elected after serving their term. The candidates' interviews are streamed on line. The current council was appointed in 2019.

The total number of CPC staff has been steadily growing over the past few years, from 39 in 2015 to 49 in 2019. This figure is limited but reasonable compared with other OECD and non-OECD countries. In comparison, according to data from the OECD CompStats database,<sup>36</sup> the 15 competition authorities in small economies (with a population below 7.5 million) had an average of 114 staff in 2019, of whom 43 were working on competition.

The CPC's budget for competition law and policy has increased over the years. In 2015 it was EUR 2.7 million, rising to EUR 4 million in 2018 and EUR 4.4 million in 2019. Despite being high in comparison with WB6 economies, this budget is still small compared with foreign competition authorities. As Figure 25.10 shows, the CPC's budget places it well below the median of EUR 9 million. Its budget is small even when comparing it against the comparable budgets of the 15 competition authorities in small countries, which averaged EUR 5.4 million in 2019.

**Figure 25.10. Distribution of the budget of competition agencies participating in OECD CompStats 2020**

Note: Based upon the 43 authorities in the CompStats database that provided budget data for four years solely for competition activities.  
 Source: OECD CompStats Database.

In October 2019, the Republic of Serbia introduced a new Law on State Aid Control and established an independent authority, the Commission for State Aid Control (CSAC). The CSAC's mandate encompasses issuing opinions on alignment of laws and regulations with the rules on state aid control, as well as raising awareness about the significance of state aid control.

The provisions of the Law on Protection of Competition contribute to ensuring competitive neutrality, insofar as the **competencies** of the CPC encompass all legal and natural persons that directly or indirectly perform economic activities in Serbia, regardless of their legal status, ownership or state of origin. Competitive neutrality is likely to be key during the COVID-19 crisis, which may further increase the role that states play through SOEs.

The CPC has appropriate **powers to investigate and powers to sanction** and remedy possible anti-trust infringements, i.e. restrictive horizontal and vertical agreements and exclusionary or exploitative practices by dominant firms. The CPC can impose cease and desist orders, remedies, and sanctions on firms that have committed anti-trust infringements. It can also adopt interim measures if the alleged competition restriction could lead to irreversible damages. It can accept commitments offered by the parties to remove the competition concerns and close the investigation.

The CPC can compel investigated firms and third parties to provide relevant information and perform unannounced inspections on their premises. The assessment of alleged anti-competitive conduct follows a thorough scrutiny of the collected evidence, which includes an economic analysis of the competitive effects and of possible efficiencies. In 2015, the CPC introduced a leniency programme, which ensures partial or total immunity from sanctions to firms that reveal the existence of a cartel and/or bring evidence to support a cartel investigation. The programme is consistent with international best practices.

The Law on Protection of Competition provides for *ex ante* control of mergers, following the principles of the EU Merger Regulation. The CPC can compel merging firms and third parties to provide relevant information and can perform unannounced inspections on the premises of the parties in the course of in-depth (so called Phase II) investigations. The assessment of notified mergers must follow a thorough scrutiny of the evidence, which includes an economic analysis of the restrictive effects and of possible efficiencies stemming from the concentration. In cases of significant restriction, distortion or prevention of competition in the relevant markets, the CPC can prohibit the transaction. It can also accept remedies proposed by the merging parties to address possible competition concerns and clear the merger to go ahead. It can also issue conditional approvals, which require merging parties to implement specific conditions.

Regarding **private enforcement**, individuals, firms and consumers – either collectively or through consumer associations – can bring a legal action to seek damages from firms that have committed anti-trust infringements.

#### *Sub-dimensions 5.2 and 5.5: Anti-competitive behaviour and implementation*

The anti-competitive behaviour and implementation policy areas together gauge the use of powers and resources in terms of decisions adopted and fines imposed for horizontal agreements, vertical agreements and exclusionary conduct. They also explore the actual activity of the competition authority on reviewing mergers. Serbia's record of competition enforcement is appreciable, particularly compared to the average among WB6 economies, but could still improve (Figure 25.11).

Figure 25.11. Competition decisions in Serbia (2015-19)

Source: Data provided by the authorities.

In 2019, the CPC took only one decision concerning anti-competitive **horizontal agreements** (cartels). In previous four years, it had made nine cartel decisions in total, including a few cases of bid rigging in public procurement. The CPC also tackled three cases of **vertical agreements** (in 2016, 2017 and 2018), related to resale price maintenance. It should be noted that the investigation and collection of evidence was often supported by unannounced inspections on the premises of the parties. However, the leniency programme has not been effective to date: the CPC has received only one application in 2018, despite active promotion of the initiative.

The total amount of fines imposed on parties involved in anti-competitive agreements and abuse of dominance reached a peak of EUR 3.8 million in 2018 but then fell to EUR 857 000 in 2019.

The CompStats database can help place these figures in context. On average, the 15 competition authorities in smaller jurisdictions that participated in CompStats made decisions on 3.2 cartel cases per year in the period 2015-19, while the average fines levied on cartel infringers was EUR 2.7 million per year.

The data for 2020 seem to show that the CPC is continuing its enforcement actions on anti-competitive agreements. It issued infringement decisions and imposed fines on the parties in four cases: one related to horizontal price fixing, one to bid rigging and two concerning resale price maintenance.

The CPC also significantly increased the number of decisions on abuse of dominance (**exclusionary conduct**) in 2019, by adopting an infringement decision and closing three other cases with commitments imposed on the parties.

The number of **merger** notifications has almost doubled in four years, from 107 in 2015 to 197 in 2019. However, it should be noted that a significant share of mergers notified to the CPC concern extra-territorial transactions. In the period 2015-19, the CPC carried out eight Phase II investigations and two “gun-jumping” cases (i.e. failure to notify a merger to the competition authority, or implementing all or part of a merger during the mandatory waiting period). None of the transactions were prohibited, but remedies were imposed for five of them between 2016 and 2019. Three additional Phase II merger reviews and two gun-jumping cases were also conducted in 2020. In comparison, during 2015-19 the 15 competition authorities in smaller jurisdictions carried out 2.8 in-depth merger investigations per year on average, out of 30 notifications.

### *Sub-dimension 5.3: Probity of investigation*

The CPC is an **independent** organisation that performs its duties in accordance with the Law on Protection of Competition. The government has no legal right to interfere with its decisions. The CPC is **accountable** for its work before the National Assembly, to which it must submit an annual report.

In terms of **procedural fairness**, the decisions to open formal proceedings and the final decisions finding competition infringements, as well as decisions regarding mergers, are published in the Official Gazette of the Republic of Serbia and on the CPC website.

During the course of the proceedings, the parties under investigation for an anti-trust infringement can consult with the CPC with regard to significant legal, factual or procedural issues and have the right to be heard. Prior to the adoption of a final decision, the CPC must inform the party of the relevant facts, evidence and other elements on which the decision is based, and enable the party to submit its defence. Decisions can be appealed within 30 days before the Administrative Court.

The CPC has published procedural instructions and guidelines explaining its investigative procedures and its criteria for setting fines.

#### *Sub-dimension 5.4: Advocacy*

The CPC has wide advocacy powers. It can monitor and analyse competition conditions in specific markets or sectors, issue opinions to the competent authorities on draft or existing regulations that affect competition, and co-operate with state entities to improve the implementation of competition rules. The Department for Legal Affairs is the CPC's specialised unit in charge of competition assessment, i.e. the scrutiny of laws and regulations aimed at identifying unnecessary restraints on market activities and developing alternative, less restrictive measures that still achieve government policy objectives. Even though public entities have no obligation to do so, they often submit draft laws and regulations to the CPC to seek its advice.

The CPC has engaged in a wide range of initiatives aimed at promoting compliance with competition principles in laws and regulations. The number of formal opinions addressed to the government or courts increased from 28 in 2015 to 70 in 2018. They include an opinion on the regulation of ride hailing services and an opinion on regulation impact assessment, both in 2018. In 2019, the CPC signed a memorandum of understanding with the Public Policy Secretariat to improve the competition assessment of legislation, on the basis of the OECD's Competition Assessment Toolkit.

The CPC has also conducted outreach activities to promote co-operation with other public authorities, including public procurement officials. Since November 2016 the CPC has been part of a tripartite co-operation agreement signed with the Serbian Anti-Corruption Agency and the Commission for Protection of Rights in Public Procurement Procedures. In October 2019, under the auspices of the EU Twinning project ("Further development of protection of competition in Serbia") with the Italian Competition Authority, the CPC held a five-day workshop on competition and public procurement. Several Serbian authorities in the field, including the Public Procurement Office, the Commission for Protection of Rights in Public Procurement Procedures, and representatives of large contractors, participated in the event. The CPC also issued Instructions for detecting rigged bids in public procurement procedures in 2011, based on the OECD's guidelines for fighting bid rigging in public procurement.

The CPC has performed a significant number of market studies over the last four years (at least three per year), which allowed it to gain a better understanding of several sectors, including retail, oil derivate retail and baby equipment.

It also performs activities aimed at developing competition culture: it regularly organises training and seminars, disseminates educational materials through dedicated social media accounts, and publishes a weekly newsletter on competition news. The number of advocacy events organised by the CPC has grown steadily over the years, reaching 25 in 2019.

### ***The way forward for competition policy***

The CPC has been performing positively over the last few years, confirming its place as a leading competition authority in the region. Increasing the number of infringement decisions and the amount of fines levied against anti-competitive behaviour would further strengthen its reputation, thus fostering deterrence and competition compliance and making the leniency programme more effective.

The economic challenges brought about by the COVID-19 pandemic may suggest the CPC should focus its advocacy on the promotion of competitive neutrality, with a view to expanding the role that it can play in the rapid recovery of the national economy.

Policy makers and the CPC should focus on the following measures:

- **Prioritise boosting cartel enforcement and increasing fines.** Cartels are the most clear-cut and undisputedly harmful competition infringements and affect every economy. Although the CPC has successfully conducted some cartel cases over the last few years, it could make more effort to detect and sanction cartels, in order to deliver a strong message that firms that engage in collusion risk to be severely punished. Fines should be high to ensure deterrence and support the effectiveness of the leniency programme. Fines only act as a deterrent insofar as the risk of incurring in fines outweighs illicit gains. Concern over fines is also a key driver for leniency applications, thus fostering the effectiveness of the leniency programme – which has been barely productive in Serbia so far – and further boosting detection.
- **Pay specific attention to public procurement, particularly during the COVID-19 crisis.** Public procurement is a key sphere of action both for cartel enforcement and for competition advocacy. Bid rigging results in significant harm for public budget and taxpayers, dampening of innovation and inefficiencies. The CPC should further extend its co-operation with public procurement bodies to enhance cartel detection and foster bid rigging prevention through better tender design, using best practice guidelines such as those issued by the OECD. The Recommendation of the OECD Council on Fighting Bid Rigging in Public Procurement (OECD, 2012<sup>[81]</sup>) calls for governments to assess their public procurement laws and practices at all levels of government in order to promote more effective procurement and reduce the risk of bid rigging in public tenders. The Guidelines on Fighting Bid Rigging in Public Procurement (OECD, 2009<sup>[82]</sup>), which form a part of the recommendation, are designed to reduce the risks of bid rigging through careful design of the procurement process and to detect bid-rigging conspiracies during the procurement process. Figure 25.12 shows how co-operation between competition and procurement authorities can help detect and avoid bid rigging. The OECD can also provide assistance through a project aimed at assessing the main rules governing procurement of public works as well as procurement practices of major public buyers and providing recommendations to design competitive procurement and fight bid rigging in accordance with international good practices, while offering training to both competition and public procurement officials based on the Guidelines on Fighting Bid Rigging in Public Procurement.

Figure 25.12. Example of co-operation between competition and procurement authorities

- Advocate strongly for competitive neutrality** to ensure that all enterprises face the same set of rules, irrespective of their ownership or nationality. Competitive neutrality occurs where no entity operating in an economic market is subject to undue competitive advantages or disadvantages. In other words, it is a framework within which all enterprises, irrespective of their ownership (state-owned or privately owned) or nationality (domestic or foreign). In most jurisdictions, the state has a dual role as policy maker/sector regulator and supplier or purchaser of goods and services. Consequently, in markets open to competition the state also acts as a market participant and interacts with private businesses, most often indirectly, through SOEs. Governments may be tempted to grant SOEs certain advantages, e.g. privileged market position, soft loans, outright subsidies, regulatory exemptions or tax benefits. Given the importance of SOEs in Serbia and the increased role of the state in the economy that is likely to result from the COVID-19 crisis, the CPC has a decisive role to play to promote competitive neutrality, in co-operation with the Commission for State Aid Control. It might need to discourage the government from granting selective aid to SOEs and resist political pressure to adopt a more lenient approach when investigating SOE conduct.
- Expand international co-operation and training.** In the face of increasingly complex anti-trust issues and the frequent cross-border nature of competition infringements, the management and the staff of the CPC should have frequent opportunities to meet and participate in policy discussions. International organisations like the OECD, the International Competition Network (ICN) and the United Nations Conference on Trade and Development (UNCTAD) offer valuable opportunities to this end. The OECD-GVH Regional Centre for Competition in Budapest provides an ideal forum for capacity building and sharing of good practices with colleagues from other jurisdictions, focusing on the specific challenges of Eastern European and Central Asian countries. The CPC is already a regular participant in the centre's events and would benefit from actively continuing with this.

## State-owned enterprises (Dimension 6)

### Introduction

Serbia has made only limited reforms on state ownership since the 2018 edition of the *Competitiveness Outlook* (Figure 25.1). However, the Serbian authorities recently developed a state-ownership strategy document concerning future SOE reforms, which notably envisages a greater centralisation of state ownership responsibilities under the Ministry of Economy as well as the development of an ownership policy. This new policy can contribute to more professional ownership practices, supported by improved SOE performance monitoring.

Table 25.11 provides an overview of Serbia's scores for state ownership practices along with four broad sub-dimensions which are based on elements of the OECD Guidelines on Corporate Governance of State-Owned Enterprises (SOE Guidelines) (OECD, 2015<sub>[83]</sub>).

**Table 25.11. Serbia's scores for state-owned enterprises**

Dimension	Sub-dimension	Score	WB6 average
State-owned enterprises dimension	Sub-dimension 6.1: Efficiency and performance through improved governance	2.8	2.2
	Sub-dimension 6.2: Transparency and accountability practices	3.5	3.0
	Sub-dimension 6.3: Ensuring a level playing field	3.3	2.8
	Sub-dimension 6.4: Reforming and privatising state-owned enterprises	n.a.	n.a.
Serbia's overall score		3.1	2.6

Note: For comparability with the previous assessment, Sub-dimension 6.4 (reforming and privatising state-owned enterprises) has not been scored but is discussed in the text below.

### State of play and key developments

#### *Sub-dimension 6.1: Efficiency and performance through improved governance*

According to the Ministry of Economy, Serbia has 156 state-owned enterprises (SOEs) and 38 state minority-owned companies. Approximately 57 SOEs fall under the scope of the Law on Public Enterprises by virtue of their involvement in performing public-interest activities.<sup>37</sup> The remaining SOEs operate primarily under the companies law and are not subject to a common state ownership policy.

State-owned enterprises play an important role in the Serbian economy. The SOE landscape is larger than most other economies in the Western Balkans and Central Eastern European region in terms of both employment and productivity (IMF, 2019<sub>[84]</sub>). State-owned companies are dominant or present in many structurally important sectors, including electricity and gas, transportation (railways, roads and postal services), telecoms, and finance. SOEs are also notably present in the primary sector, including mining and forestry.

**Figure 25.13. Sectoral distribution of SOEs by number of enterprises**

Note: Two water supply and sewage SOEs were not included because of their small employment share (29 employees).  
Source: Calculations based on information provided by the Serbian authorities.

Figure 25.13 presents the sectoral distribution of SOEs by the number of enterprises. Prominent SOEs include the Public Enterprise Electric Power Industry (EPS), Serbian Railways, Srbijagas, Telekom Serbia and Air Serbia. Measured by their employment share, the majority of Serbian SOEs are concentrated in the electricity and gas sector (33% of all SOE employees), followed by transportation (27%), other activities (13%), manufacturing (8%) and telecoms (8%) (Figure 25.14). SOEs in Serbia employ almost 85 000 people, accounting for an estimated 2.9% of national employment.<sup>38</sup> This share of national employment is similar to the OECD average of 2-3%.

**Figure 25.14. Sectoral distribution of SOEs by employment**

Note: There are two state-owned water supply and sewage enterprises that employ 29 people and are not included in the figure because of their very small employment share.  
Source: Calculations based on information provided by the Serbian authorities.

The state also holds non-trivial minority shareholdings (over 10%) in 38 companies, together employing over 26 000 people and accounting for nearly 1% of total national employment. These companies are

highly concentrated in the manufacturing sector (75% of all employment in state minority-owned companies) (Figure 25.15).

**Figure 25.15. Sectoral distribution of state minority-owned companies by employment**

Note: There is 1 state minority-owned company in the real estate sector, not included here because of its very small employment share.

Source: Calculations based on data provided by the Serbian authorities and the number of employed persons in Serbia (2 938 200) as reported in the national Labour Force Survey Quarter IV 2019 (SORS, 2019<sup>[85]</sup>).

External assessments of the performance of Serbian SOEs point to inefficiencies and low overall returns on the state's investment in these enterprises. For instance, a 2020 EBRD assessment of 25 emerging economies found Serbian SOEs had among the lowest returns on assets and the largest negative returns on equity (2014-16) (EBRD, 2020<sup>[86]</sup>).

Serbia has not yet developed a publicly available **ownership policy and rationale** that defines the state's overall ownership objectives, clarifies the main functions of various state bodies and specifies the state's expectations from SOEs. Some elements of an ownership policy can currently be gleaned within the existing legal framework covering SOEs, in particular within the Law on Public Enterprises, and certain strategic documents. However, the Serbian authorities recently developed an overall ownership policy document concerning future SOE reforms.

Serbia has not explicitly defined its rationale for state ownership for the majority of its SOEs. However, given that the Law on Public Enterprises applies only to enterprises that perform public-interest activities, it can be understood that performing public-interest activities ("activities of general interest" in national nomenclature) is one of the rationales for maintaining enterprises in state ownership.<sup>39</sup> In contrast, the rationale for state ownership of other SOEs, namely the companies that are primarily engaged in commercial activities and hence by definition not considered to be "public enterprises", has not been articulated. The authorities therefore need to clearly define and disclose the rationale behind state ownership of SOEs that are incorporated under other legal forms.

There is no co-ordinating body responsible for **professionalising state ownership** across the whole of the government. By law, the Government of Serbia has the ultimate responsibility for exercising ownership rights over SOEs which fall under the scope of the application of the Law on Public Enterprises. The Law on Ministries, the Law on Public Enterprises and the Government's Decision on the division of responsibilities of competent ministries define the roles and responsibilities of various ministries in the government. In accordance with these acts, the government is primarily responsible for exercising ownership rights in SOEs, including the right to appoint and dismiss SOE board members. However, a number of other important responsibilities (e.g. determination of strategic goals) are the responsibility of line ministries for many SOEs. For example, the Ministry of Mining and Energy oversees SOEs involved in the production and supply of electricity and gas. With the adoption of the Law on Public Enterprises in

2016, Serbia has taken some steps towards centralising ownership functions for a portfolio of SOEs under the responsibility of the Ministry of Economy. This is an important advance in its state ownership arrangements, as a more centralised model will help improve monitoring and professionalise and harmonise state ownership practices, which can ultimately lead to better performance and management of SOEs. The new state ownership strategy, currently under development, also foresees the establishment of a state ownership co-ordinating body.

Serbia has professionalised its **board nomination framework** for SOEs by introducing measures such as minimum qualification requirements (e.g. education and work experience) for board members and directors, and clarifying their responsibilities and competencies. The minimum qualifications for SOE board members go beyond what is established by law in most other WB6 economies. For example SOE board members are required to have at least three years of work experience related to the activities of the SOE in question, as well as knowledge of corporate management or finance. The related requirements do not apply to all SOEs, however, only those under the scope of the Law on Public Enterprises.

Although Serbia has made a significant effort to improve the board nomination process, unfortunately, there is still a lack of substantive information to assess if the process is robust in practice. The appointment process does not seem to be transparent and there is a perception that appointments are often influenced by political connections rather than purely based on professional merit. It should also be noted that these qualification requirement elements only apply to the subset of SOEs that operate under the Law on Public Enterprises. In view of the lack of clear facts on the implementation of the process there is still a risk that it will be politicised, especially since there is little evidence about the selection procedures or public tenders for board members.

Regarding the **promotion of independent and professional boards**, the Law on Public Enterprises requires that one member of every public enterprise board must be independent and that both the independent member and the company chief executive officer (CEO) cannot be a member of political party. However, this restriction does not apply to other board members, which, in practice, means that they can be politicians. The issue of political influence on SOE boards has been highlighted in external reviews: see, for example Transparency Serbia (Transparency Serbia, 2017<sup>[87]</sup>). The 2018 edition of the *Competitiveness Outlook* (OECD, 2018<sup>[80]</sup>) also raised concerns about politically affiliated persons serving on boards in the region. As no visible progress has been made in Serbia since then this remains highly problematic.

There are also some overarching issues which significantly weaken the corporate decision-making power of public enterprise boards. For instance, the government appoints the CEOs of public enterprises, leaving the board with no role in choosing CEOs. Normally, corporate boards responsible for monitoring their CEOs' activities should also have the power to appoint and dismiss them but in Serbia, the board of a public enterprise only has the authority to "monitor" the work of directors. Moreover, the Law on Public Enterprises means that several board responsibilities require the consent of the government.

On the positive side, it is worth noting that although there is no specific legal framework to enhance gender equality in SOE boards, the gender balance of the boards of the 10 largest listed companies in Serbia is among the best in the Western Balkans and Central Eastern European region. In total, 13 of the 63 board members were women in 2016 and the average female board representation within the largest listed companies was around 20% (EBRD, 2017<sup>[88]</sup>). Women accounted for 23% of top management positions in the country's largest employer Public Enterprise Electric Power Industry (EPS) in 2019. This statistics also stands out favourably when compared with the global average – according to Ernst & Young (2019<sup>[89]</sup>) only 15% of senior managers in power and utilities were women as of early 2019.

### *Sub-dimension 6.2: Transparency and accountability practices*

Legislation establishes multiple **financial and non-financial reporting** requirements for SOEs, including the requirement to publish audited financial statements and business plans on their websites. By law,

public enterprises are required to submit annual reports and financial statements to the Business Register Agency (BRA), which makes them publicly available. They are legally obliged to submit quarterly reports on the implementation of their annual and triennial business programmes to the Ministry of Economy and are required to report according to internationally recognised standards such as the International Financial Reporting Standards (IFRS). The Law on Public Enterprises also requires that SOEs publish quarterly reports on their websites. Nevertheless, according to stakeholders interviewed in the context of this assessment, in general, Serbia's SOEs are characterised by lack of transparency in their business and financial operations. The largest SOEs in Serbia do not necessarily implement good reporting practices that are not directly envisaged by the Law on Public Enterprises.<sup>40</sup> The law does not require them to publish sustainability reports, although some enterprises do it on their website within the framework of an internal act (i.e. enterprises which operate in energy sector).

Serbia appears to have established sound basic legislation to ensure high-quality **auditing practices** of SOEs. Their financial statements are audited by independent external providers and Serbia's SOE auditing standards compare favourably with the average OECD country (OECD, 2018<sub>[90]</sub>). SOEs with the status of "public-interest entities" are required to establish an audit committee, in line with the Law on Audit and other relevant legislation. This includes all SOEs that operate under the scope of the Law on Public Enterprises, as well as all SOEs that are considered "large" in accordance with criteria set forth in the Law on Accounting. SOE audit committees must be chaired by an independent member and include an audit professional or person with experience in the financial sector. The role of the audit committee includes proposing and controlling the implementation of accounting policies and standards in the preparation of financial reports, assessing the content of these reports and proposing candidates for auditors. SOEs are also obliged to establish internal audit and financial management control units.

Regarding the **protection of minority shareholders**, Serbia has established sound legislation to ensure the protection of basic minority shareholders' rights, which apply to the minority shareholders of SOEs. In practice, however, there are cases involving abuse of minority shareholders rights. For instance, the World Bank's 2020 *Doing Business* report gave Serbia a score of 5 out of 6 concerning the extent of shareholder rights (World Bank, 2020<sub>[11]</sub>). The 2018 *Competitiveness Outlook* found that some disputes between minority shareholders and the state had been brought to court, with minority shareholders claiming that their rights have not been respected (OECD, 2018<sub>[80]</sub>). Concerns have been also raised over the judicial system, which is sometimes biased in favour of SOEs, suggesting it is perhaps not fully equipped to protect minority rights in practice. The 2018 Company Law amendments strengthened minority shareholder rights, for instance reducing the ownership share required to request shareholder meetings and add agenda items. The protection of minority shareholders is a high-priority issue since 38 of Serbia's SOEs have non-state minority shareholders. Minority and state shareholders should both play an active role in shareholder decisions to ensure that SOEs create value for all shareholders.

### *Sub-dimension 6.3: Ensuring a level playing field*

Serbia has the basic elements in place to ensure that SOEs' **legal and regulatory treatment** is broadly in line with that of private companies. A large proportion of SOEs are subject to the same company law that applies to private companies and SOEs are generally not formally exempt from the market regulations (e.g. competition rules) applicable to private companies. However, the existence of a subset of SOEs incorporated as "public enterprises" gives rise to concerns over the operational differences that may arise owing to their different legal treatment. A commonly occurring example is that some SOEs are exempt from bankruptcy procedures, removing a key incentive to undertake corporate improvements to avoid liquidation. There is also some evidence that SOEs are often expected to undertake non-commercial activities (such as sponsoring sports teams), which, in the absence of adequate and transparent compensation from the state, can prevent a level playing field with private companies.

In some sectors (e.g. electricity and gas), independent regulators have been established, thus mitigating the problematic mixing of objectives that can arise when the state bodies responsible for ownership are also responsible for sectoral regulation or policy. Nevertheless, this is only the case for some sectors and line ministries still play a role in the operational activities of SOEs, while also being responsible for sectoral policy. This means Serbia has not ensured a full separation of ownership and regulatory functions. The steps taken to centralise monitoring of SOEs and place some ownership responsibilities under the Ministry of Economy should help to separate these functions, but since line ministries still reportedly play an important role in SOE operational decision making, the separation is not complete. Streamlining SOEs' legal status, and eliminating any significant legislative differences that could distort fair competition, will be crucial to optimising their position in the marketplace.

Concerning **access to finance**, most SOEs obtain some financing on the marketplace, but not on market consistent terms due to explicit or implicit state guarantees. Serbia has committed to reducing the extent of state guarantees to SOEs and improving transparency surrounding them, mainly in the context of commitments made to the IMF (US Department of State, 2018<sup>[91]</sup>). As an EU candidate country, Serbia is expected to comply with EU rules on competition, which include state aid rules intended to ensure that state equity financing is provided on market-consistent terms and does not distort competition. Serbia has implemented the EU state aid regulations and its law is largely aligned with the EU, however, there are still implementation gaps.

In October 2019, Serbia introduced a new Law on State Aid Control and established an independent authority in this field – the Commission for State Aid Control (CSAC). Its mandate encompasses issuing opinions on alignment of laws and regulations with the rules on state aid control, as well as raising awareness about the significance of state aid control. Explicit state guarantees on SOEs' commercial debt are allowed, although recently the government has limited them to situations where the SOE is making capital investments; guarantees cannot be given for loans simply to finance ongoing operations. Many SOEs benefit from preferential financing and/or leniency over payments to the government or other SOEs, distorting the level playing field and leading to an inefficient allocation of resources. Examples highlighted in external assessments include direct state subsidies to state-owned railways and coal mines, explicit state guarantees on bank loans, tax arrears, and unpaid debts to the state-owned electricity company.

In terms of COVID-19 support measures to the SOEs, one of the most important measures was directed towards AirSerbia, Serbia's national carrier. Another significant injection was to Telekom Serbia. The National Bank of Serbia bought 50% (EUR 100 million) of Telekom's issued corporate bonds.

#### *Sub-dimension 6.4: Reforming and privatising state-owned enterprises*

The privatisation process in Serbia is regulated by the Law on Privatisation which was adopted in 2014. The process is conducted by the Ministry of Economy. The legal framework defines three privatisation models 1) equity sales; 2) asset sales; and 3) strategic partnerships. Since the adoption of the law, the government has concluded 62 equity sales, 4 asset sales and 1 strategic partnership. Serbia continues to engage foreign investors in the privatisation process, inviting them to submit bids, participate in auctions, and purchase company shares. More than 310 enterprises, mostly with zero or a small number of employees have been put into bankruptcy since 2014. Other companies were privatised and non-EU investors acquired some of the largest firms in mining, metallurgy and agriculture (European Commission, 2019<sup>[14]</sup>). For instance, Chinese Hestil bought Serbia's steel plant in Smederevo. The copper mining complex RTB Bor was sold to China's Zijin Mining, and the agricultural corporation PKB to Al Dahra of the United Arab Emirates.

The government has also begun the process of restructuring of SOEs which is still ongoing, although at a slow pace. Restructuring of large SOEs, particularly in the sectors of mining, energy and transport, is supported by the IMF, World Bank and the EBRD. Among them are *Železnice Srbije* (Serbian Railways), *PE Srbijagas* (public enterprise activities for the transport, distribution and trade of natural gas), *PE*

*Elektrprivreda Srbije* (Public Enterprise Electric Power Industry; EPS) and *PE Putevi Srbije* (Public Enterprise Roads of Serbia; PERS). The government has adopted the programmes for restructuring these enterprises, which include measures to improve the financial position of the enterprises (debt restructuring), and also improving organisational and management structure. The 2016 amendments to the Law on Public Enterprises aimed to strengthen the professionalism of SOEs' management, e.g. requiring directors to be appointed through public procedures. External assessments point to significant shortcomings in implementing the provisions of the law, including several cases where "acting directors" were still in place past the deadline for appointing directors according to the new procedures.

### ***The way forward for state-owned enterprises***

SOEs operate at the nexus of the public and private sectors and, as such, their operations are affected by both the quality of public governance and the prevailing corporate and boardroom culture. As is the case in most economies in the Western Balkans, ensuring that SOEs in Serbia operate efficiently, transparently and on a level playing field with private companies will require reforms in multiple policy areas that cannot be done all at once. Choosing the appropriate sequencing of reforms is just as important as their content and depends in large part on the national political climate and current reform priorities. In short, identifying the most appropriate SOE reform priorities can only be done by the Serbian authorities.

The OECD Guidelines on Corporate Governance of State-Owned Enterprises provide a guide for reforms that the Serbian authorities could use to inform their policy efforts in this domain (OECD, 2015<sup>[83]</sup>). Based on the state of play of SOE policy development in Serbia, the following priority reform areas – which are in line with the guidelines – could offer a basis for discussions with the authorities:

- **Further professionalise state ownership practices** by developing an ownership policy applicable to all SOEs, including those that undertake predominantly commercial activities. The ownership policy should clearly stipulate the rationales for state ownership, including for those SOEs that are not currently under the remit of the Ministry of Economy (see Box 25.9 for an overview of Lithuania's ownership co-ordination body). It should also clearly establish how the state expects SOEs to create value and detail the respective roles and responsibilities of state bodies responsible for exercising ownership rights in SOEs.
- **Strengthen the transparency and professionalism** of the SOE board nomination process. In line with OECD best practice, the board nomination process should be merit-based and fully transparent and it should result in boards with the requisite mix of experience, qualifications and independence to effectively oversee management decisions in the interest of corporate performance and value creation.
- **Improve SOE monitoring and disclosure practices**, including using the information that the Ministry of Economy already collects to produce a publicly available aggregate report on the activities and performance of SOEs or a selected portfolio of them. Making this information public (if indeed SOEs are complying with the reporting requirements) can be a good way to encourage ministries and SOEs to improve their management. Aggregate reports can also highlight weaknesses in SOEs' implementation of applicable reporting requirements, encouraging their improved compliance.
- **Streamline SOEs' legal forms**. The state should review the appropriateness of SOEs' legal forms, particularly for SOEs that are still incorporated as "public enterprises". Good practice calls for SOEs engaged in economic activities to be incorporated under the same legal form as privately owned companies.

### Box 25.9. Lithuania's state ownership co-ordination body

Lithuania has primarily decentralised its state ownership arrangements. For most of the country's 66 SOEs, the line ministries that are also responsible for sectoral policy and/or regulation in the relevant markets primarily exercise state ownership rights.

In the context of this decentralised system, Lithuania has taken significant steps to harmonise state ownership practices across the public administration through the development of SOE governance and disclosure standards and the establishment of a Governance Co-ordination Centre tasked with monitoring and reporting to the public on their implementation. It produces a detailed annual report on SOEs. Its main tasks include the following

- preparing aggregate reports on SOEs, with information on their financial performance and efficiency
- supporting SOE goal setting, including by calculating return-on-equity targets and evaluating the content and implementation of strategic goals
- participating in SOE board nomination processes
- contributing to SOE policy formulation, including by making methodological recommendations and initiating legislative reforms
- advising and consulting with the government, responsible line ministries and SOEs on matters like SOE governance practices, ownership decisions and dividend pay-outs.

## Education policy (Dimension 7)

### Introduction

Table 25.12 shows Serbia's scores for the four education policy sub-dimensions and the cross-cutting sub-dimension on system governance, and compares them to the WB6 average. Serbia has the highest score (along with Kosovo) of the WB6 economies for the early childhood and school sub-dimension, driven by its above-average ratings for the indicators on the instruction system and early school leaving prevention. Moreover, except for the sub-dimension on tertiary education, Serbia scored above the WB6 average in all sub-dimensions.

**Table 25.12. Serbia's scores for education policy**

Dimension	Sub-dimension	Score	WB6 average
Education policy dimension	Sub-dimension 7.1: Early childhood and school education	3.5	3.0
	Sub-dimension 7.2: Teachers	3.3	2.7
	Sub-dimension 7.3: Vocational education and training	3.3	3.1
	Sub-dimension 7.4: Tertiary education	2.5	2.8
	Cross-cutting sub-dimension: System governance	3.5	3.3
<b>Serbia's overall score</b>		<b>3.2</b>	<b>3.0</b>

### State of play and key developments

Since the last assessment, Serbia has introduced reforms to further improve the quality and equity of the education system, such as the roll-out of a competency-based curriculum and learning standards. As of 2019, net enrolment in Serbia was 98.2% for primary education and 97.9% for lower secondary, meaning that compulsory education is nearly universal. Enrolment in upper secondary education (87.7%) is also high for the region (UIS, 2020<sup>[94]</sup>).

In terms of learning outcomes, Serbia's average scores in the Programme for International Student Assessment (PISA) are close to those of some countries in the European Union, such as Bulgaria, Greece and Romania. While students in Serbia perform better than their peers in other parts of the Western Balkans (Figure 25.16), many still do not achieve baseline levels of proficiency in reading (nearly 38%) and maths (nearly 40%), much higher shares than the OECD averages of 23% for reading and 22% for maths (OECD, 2020<sup>[95]</sup>). There has been a slight increase (by around 2%) in Serbia's share of high performers in reading since 2009 but the share of low performers has also increased (by around 4.9%), signalling widening educational inequities.

**Figure 25.16. Performance in reading, mathematics and science in Western Balkan education systems, 2018**

PISA 2018 mean scores

StatLink  <https://doi.org/10.1787/888934256330>

Similar to many countries around the world, Serbia closed its schools at the onset of the COVID-19 outbreak on 16 March 2020 (World Bank, 2020<sup>[96]</sup>). As part of the educational response to the pandemic, the government launched a Plan of Action for Inclusive Distance Learning that set out several recommendations for ensuring the continuity of education and providing support to children and families. For example, the plan called for the development of distance learning through television and other modalities, such as an online learning platform My School (*Moja škola*). It also emphasised communication among caregivers, teachers and school administrators and the need for accountability at the school level to monitor the quality of distance learning and implications for equity (UNICEF, 2020<sup>[97]</sup>).

Primary schools in Serbia partially re-opened for the 2020/21 school year on 1 September 2020, with students in Grade 1 to Grade 4 returning to their classrooms. No more than 15 students were allowed in each classroom, lessons lasted 30 instead of the usual 45 minutes, and total number of students attending could not exceed 50% of total enrolment of the school. Students and teachers had to wear face masks and maintain a safe distance, and schools had to be disinfected after the first group of pupils finished their lessons. Students in Grades 5-8 attended schools either through a similar model, if their school has enough space and staff, or a combined model including both distance (through public TV) and in-school teaching (MPN, 2020<sup>[98]</sup>).

### *Sub-dimension 7.1: Early childhood and school education*

Serbia's performance in the **early childhood education (ECE)** indicator is relatively low for the region, despite having established a strong strategic and legal framework. It introduced a new Preschool Curriculum Framework in 2018 that aims to support the well-being of young children and promote continuity between preschool and primary education. There have also been a series of rulebooks designed to improve the quality and evaluation of Serbia's ECE institutions and workforce. For example, minimum education requirements for ECE staff have been in place since 2010 but a 2018 rulebook now outlines the professional competencies expected of ECE staff. Funding for ECE is mainly the responsibility of local authorities, with parents and families covering around 20% of costs, a regressive model that leaves poor municipalities struggling to create sufficient places for young children (World Bank, 2019<sup>[99]</sup>). Broad public initiatives to improve the quality and equity of ECE are still largely project based and donor funded, jeopardising the financial sustainability of recent improvement efforts. Serbia has made progress in

expanding access to ECE since the last assessment. Around 62% of children participated in pre-primary education in 2018 although, this share remains much lower than the EU average of 98% (UIS, 2020<sub>[94]</sub>). Despite good overall levels of participation, children from disadvantaged families and those who live in rural and remote areas continue to face barriers to educational access (Pešikan and Ivić, 2016<sub>[100]</sub>).

The Serbian **instruction system**<sup>41</sup> has one of the highest scores in the region for this indicator. The Strategy for Education Development in Serbia 2020 sets out a series of goals and targets to improve the quality and inclusiveness of teaching and learning, which the Ministry of Education, Science and Technological Development (MoESTD) evaluates in an annual report. Serbia also introduced a new competency-based curriculum in 2018 and is gradually updating learning standards for each grade and subject area, starting with the first year of each curriculum cycle (i.e. Grades 1, 5 and 9). This curriculum reforms aims to update classroom practices so that all young people develop the competencies needed to succeed in the 21<sup>st</sup> century. Serbia is working to align the new curriculum and learning standards with national examinations, which are used to certify the completion of basic education (in Grade 8) and upper secondary education (in Grades 11 and 12<sup>42</sup>). Serbia also plans to develop a new sample-based national assessment that will help measure the implementation of the curriculum and together with regular participation in international assessments, monitor the quality of learning outcomes to drive system improvement (Maghnouj et al., 2020<sub>[8]</sub>). Such information will be crucial to monitor student learning in light of school closures caused by the COVID-19 pandemic.

Serbia revised its school quality standards in 2017-18, to focus more on classroom instruction and ensure that all children and young people receive a good quality education by identifying schools where additional resources and support are needed. These standards are supported by a strong school evaluation framework that includes both self-evaluation and external evaluations modelled after inspection systems in other European countries. However, policies to provide additional support to low-performing schools (e.g. through expert assistance or small grants) remain in the pilot phase because of resource limitations. To further strengthen instruction in Serbian schools, principals participate in mandatory training and certification processes that aim to support them in becoming pedagogical leaders.

The **early school leaving** rate in Serbia has declined slightly over the last decade and, at 6.6% in 2019, is lower than the EU average of 10.2% (Eurostat, 2020<sub>[101]</sub>). While these rates are the same for young men and women, there are higher proportions of early leavers in rural areas (9.3%) compared to towns and suburbs (7.3%) and cities (3.2%) (Eurostat, 2020<sub>[101]</sub>). Despite this remaining challenge, Serbia has adopted several policies to help prevent early school leaving. For example, it has instruments to recognise students at risk of early leaving and individualised educational plans are used to retain young people in education and training. Moreover, Serbian schools are required to incorporate measures to prevent students dropping out into their development plans. Donor agencies continue to play an important role in reducing early school leaving in Serbia and have developed several programmes to help reduce it.<sup>43</sup> There are also been targeted policies to support Roma students and those with disabilities, for example Serbia's affirmative action programme for entry into secondary and tertiary education for Roma students.

### *Sub-dimension 7.2: Teachers*

Serbia's score in this sub-dimension is above the WB6 average. Compared to most European countries, teachers' salaries are relatively low (EC/EACEA/Eurydice, 2019<sub>[102]</sub>). While Serbian teachers have benefitted from salary increases since 2017, earnings continue to be lower than those of other tertiary-educated workers, partly because of the large share of teachers who work part time (MoSALSG, 2015<sub>[103]</sub>). The government has several policies and mechanisms to increase the attractiveness of the teaching profession and encourage teachers to develop their competencies. For example, there is a merit-based career structure that includes increasing levels of responsibility and a set of professional standards help to inform initial teacher education and professional development activities. Serbia now requires all primary

and secondary school teachers to complete a postgraduate degree (ISCED 7); however, national data suggests that only 85% of teachers had attained this level of education as of 2019.

There are no programme-specific accreditation criteria for **initial teacher education (ITE)** in Serbia; however, revisions to national accreditation standards in 2019 established a minimum duration for the initial practicum component.<sup>44</sup> This is an important development since the quality of ITE programmes and minimum entry requirements vary across the individual institutions. Serbia has some policies to attract and support students who wish to enter the teaching profession, such as offering scholarships to students in their second year of ITE and a mentoring programme for novice teachers. However, a general oversupply of teachers combined with a recent hiring freeze mean that many ITE graduates are not able to find employment (Maghnouj et al., 2020<sup>[6]</sup>). The number of teachers hired on part-time contracts in Serbia has also grown steadily in the last decade, from 28 380 teachers in 2010 to over 35 000 in 2019. This trend may discourage talented young people who are looking for more stable employment opportunities.

Serbia has a clear regulatory framework around the **professional development and management** of teachers. There is a specific institution, the Institute for Improvement of Education, responsible for accrediting professional development providers and a range of sources help determine professional development needs, namely self-assessment surveys, appraisals conducted by schools and external experts, and reports from schools. When the government identifies a teacher training priority area, this is paid for directly by the ministry but other activities are financed by local authorities, schools and donor agencies. While Serbia has a clear external appraisal process for promoting teachers, advancement is mainly based on years of experience, not performance or level of responsibility. Moreover, there is no progressive salary scale to reward teachers for moving to higher levels of the career structure. However, the ministry plans to develop such a scale, which will provide a powerful incentive for teachers to continue to develop their competencies.

### *Sub-dimension 7.3: Vocational education and training*

Serbia's score in the VET sub-dimension is similar to the Western Balkan average. Professionally oriented education starts at the upper secondary level, when students are allocated into either general, vocational or art programmes based on their academic performance in lower secondary school, results in a national exam and individual preferences. The majority of upper secondary students in Serbia (74% as of 2018) enrol in vocational upper secondary schools, much higher than the EU (48%) and OECD average (32%) (World Bank, 2020<sup>[104]</sup>).

However, evidence from PISA finds that learning outcomes across VET and general education tracks are not equal, as vocational students tend to have weaker literacy and numeracy skills than their peers in general education. While many education systems struggle with this challenge, Serbia has the widest gap in reading performance (85 score points) between vocational and general students (OECD, 2020<sup>[105]</sup>). Moreover, socio-economically disadvantaged students in Serbia are more than five times as likely to attend a vocational upper secondary school, suggesting that current sorting mechanisms may reflect students' background more than their capability (OECD, 2020<sup>[105]</sup>). These inequalities may limit Serbia's long-term competitiveness.

The **governance of VET** in Serbia is determined by a legal framework and strategic documents that regulate the sector and work-based learning (WBL). Several government agencies share responsibility for managing VET, with policy coherence ensured by MoESTD. To develop VET programmes and determine the number of study and/or training places, Serbia engages stakeholders through Sector Councils, whose main function is to determine the demand for qualifications through dialogue with representatives of labour unions and education sectors.

The Serbian government recently passed a set of by-laws to better plan and co-ordinate career guidance activities across the education system. It introduced a set of standards for career guidance practitioners in 2019 and Career Guidance and Counselling Teams were extended to vocational schools offering dual-

education (Government of Serbia, 2019<sub>[106]</sub>; EC, n.d.<sub>[107]</sub>). This is a positive development considering that data from the Ministry of Youth and Sports found that some 50% of youth report having never taken part in career guidance and counselling activities (CeSID, 2019<sub>[108]</sub>).

To inform career pathways and policy development, Serbia collects and disseminates data about the VET system, such as enrolment and completion rates. There is also some information about labour market outcomes. For example, at around 53.6%, the employment rate of VET graduates (20-34 year-olds) in Serbia is lower than the EU average of 76.8% (EC, 2020<sub>[36]</sub>). While this type of information can be useful, other labour market information about the WBL system is limited. For example, there is no information on the number of learners who are hired after completing an apprenticeship or WBL opportunity, nor are there any earnings data. Serbia plans to start collecting these data once its new education management information system (EMIS) is fully developed (see the Cross-cutting sub-dimension: System governance) but such mechanisms are not yet in place.

Serbia has started to move away from its previous theoretical model of vocational education towards more **work-based learning** (ETF, 2018<sub>[109]</sub>). The government started implementing a dual model for vocational education in 2019, whereby students attend regular classes in school and take part in work-based learning experiences outside of the classroom. The Law on Dual Education clearly defines all aspects of WBL and requires that curricula include a set of compulsory general, vocational and elective subjects. This could help ensure that all students develop the core literacy and numeracy skills needed to succeed in the workplace and adjust to changes in the labour market.

#### *Sub-dimension 7.4: Tertiary education*

Serbia's score in this sub-dimension is lower than the WB6 average. While the EU has set a goal of having 15% of the population aged 25-64 participate in lifelong learning and adult education by 2020, Serbia's strategic commitment is to reach at least 7% (MoESTD, 2018<sub>[110]</sub>). The Serbian tertiary education sector is mostly public (66% in 2018), with a stable share of private institutions (Serbia Excel, n.d.<sub>[111]</sub>). The sector has expanded over the past decade and national data show that nearly 22% of adults (aged 25 and over) have attained some form of tertiary education (Serbia Excel, n.d.<sub>[111]</sub>). However, this is still behind the OECD average of 45% (OECD, 2020<sub>[112]</sub>) and access to tertiary education in Serbia remains a challenge for individuals from vulnerable social groups, especially Roma (MoESTD, 2018<sub>[110]</sub>).

To **improve equity in access to tertiary education**, the Serbian government has taken steps such as introducing affirmative action measures to increase the coverage of students from under-represented groups. Serbia is also acting to improve access by replacing university-led entrance exams with results from the new central Matura exam.<sup>45</sup> While this reform stands to improve the fairness and transparency of university admissions, Serbia's limited financial and human resources risk hindering the new Matura's implementation (Maghnouj et al., 2020<sub>[8]</sub>). A positive feature of Serbia's higher education system is the availability of financial aid for students, some of which specifically targets vulnerable groups (e.g. Roma and people with disabilities). However, the distribution of financial aid is mainly based on academic performance and only 10% of student loans and scholarships are granted to vulnerable students (MoESTD, 2019<sub>[113]</sub>). As a result, the cost of higher education remains a barrier to participation for many students.

The Serbian government collects some data to monitor equity in tertiary education, such as enrolment and completion rates by gender and minority background. However, no research has been conducted to better understand and address the individual factors that may hinder participation in higher education.

Serbia has taken several steps to improve the **labour market relevance of higher education** in recent years and this topic is expected to be a priority in the next education strategy. For example, the 2017 Law on Higher Education now requires higher education institutions to have a Council of Employers to help strengthen links between the labour market and education system. There have also been efforts to promote

the internationalisation of education, namely through Serbia's full participation in the European Union Erasmus+ Programme (European Commission, 2021<sub>[114]</sub>).

Several government agencies collect data to monitor the quality and labour market relevance of the tertiary sector, including employer surveys. The government also established a Qualifications Agency in 2019 that will be responsible for collecting data on labour market outcomes for each higher education institution and programme. Other measures to increase labour market relevance have included establishing a National Council for Higher Education to harmonise the higher education system's quality assurance and accreditation mechanisms with European and international standards.

Despite these efforts, there is evidence that skill shortages extend across most sectors of the economy (Reyes, Javier and Nguyen, 2020<sub>[115]</sub>) and Serbia's share of 15-24 year-olds who are not in employment, education or training is higher than the OECD and EU averages. Overall, Serbia's unemployment rate remains high – see Employment policy (Dimension 8) – especially among young adults and recent tertiary graduates (Eurostat, 2020<sub>[101]</sub>). This contributes to outgoing migration as skilled young people search for better opportunities abroad and when combined with Serbia's decreasing population, presents a risk to economic competitiveness.

#### *Cross-cutting sub-dimension: System governance*

Serbia has several governance features that align with practices found in European and OECD education systems and economies; however, the score for this cross-cutting dimension is similar to the WB6 average. The National Qualifications Framework of Serbia (NQFS), for example, is harmonised with ISCED and has been linked to the European Qualifications Framework, which establishes the recognition of learning outcomes and qualifications within the economy and internationally. The Strategy for Education Development in Serbia 2020 sets out broad long-term objectives for the entire education system. The present education strategy was developed in consultation with a range of stakeholders and informed by an analytical review of the system. It is also accompanied by a set of action plans to support implementation. The ministry has written a draft for the new education strategy, which will outline Serbia's vision for education for 2021-30, as well as the corresponding action plan for 2021-23. Public consultations are currently underway.

The Serbian government evaluates its education strategy and action plans through annual progress reports using a variety of indicators. While system inputs and outputs are regularly monitored, indicators related to outcomes are relatively limited since Serbia does not have a regular national assessment of student learning. However, the government plans to develop a new national assessment building on a pilot instrument<sup>46</sup> that was conducted in 2018. This will address an important system governance gap, as the majority of EU and OECD countries already use some sort of national assessment to monitor student learning (OECD, 2013<sub>[116]</sub>). At present, Serbia must rely on international assessments (which are not specific to the Serbian context) and national examinations (which do not provide information on learning during the earlier years of schooling) in order to have comparable information about student learning. Such information is crucial to support system monitoring and inform education policy decisions.

In recent years, there have been some efforts to modernise Serbia's data collection and system evaluation efforts to help improve system governance. For example, the EMIS was connected to a new interface in 2016, called the *Dositej* platform, to collect school-level data more efficiently. However, the functionality of this platform is limited and does not link with Serbia's labour market data. While the government does not aggregate relevant and available data to produce a comprehensive report on the state of the education system, there are a range of thematic reports prepared by technical education agencies and donors.

### ***The way forward for education policy***

In today's increasingly global and fast-changing world, achieving inclusive and quality education in Serbia could increase its regional competitiveness and create opportunities for more individuals to develop the competencies needed for sustainable development and social cohesion. Serbian officials will need to reflect on the economy's political, social and fiscal environment to determine how best to achieve their education goals. While the OECD review on evaluation and assessment in Serbia's education system (Maghnouj et al., 2020<sup>[8]</sup>) provides detailed recommendations on how to strengthen the equity and quality of the education sector, the following considerations in particular can provide insights for discussions on the way forward to enhancing education in Serbia:

- **Ensure the new education strategy has a clear set of priorities and a strong monitoring framework.** Serbia's next education strategy will cover a critical period for its national development and potential accession to the EU, highlighting the importance of directing the education sector towards supporting more students to achieve good and excellent outcomes. It will therefore be important to focus on clear and measurable priorities to help mobilise stakeholders across the system. Considering the low rate of enrolment in ECE, increasing coverage at this level of education should be considered a priority. This and other national priorities should be translated into action plans that are financially viable and can be measured through a monitoring framework. Box 25.10 shows the how Ireland included specific indicators in its Action Plan for Education 2018 to measure progress towards its national goals.
- **Provide teachers with stronger incentives to develop their practice.** Serbia has a merit-based career structure and has recently raised teacher salaries; however, the professional management system does not effectively reward performance or provide teachers with incentives to update their skills, knowledge and practice. Serbia should strengthen the link between teachers' performance and rewards. Current plans to introduce a salary increase for different levels of teaching careers will be an important step in this direction. However, it will also be important that the procedures for appraising and promoting teachers is fair and transparent.
- **Implement plans to strengthen the collection and management of data.** Serbia has already taken several significant steps towards modernising the collection and management of education data in recent years. However, it is important that current plans to link education and labour market databases are implemented so the system can more effectively analyse education inputs, processes and outcomes.

### Box 25.10. Ireland's indicator framework for the Action Plan for Education 2018

Ireland's Action Plan for Education 2018 accompanies the country's national education strategy for 2016-19, setting out priorities and actions that the Department of Education and Skills and its technical agencies should undertake during the year. The action plan clearly aligns each action and sub-action to the country's five main goals for improving the quality of its education system. Each goal is associated with a list of actions and a set of indicators that are used to measure progress. For example, the first goal, "improve the learning experience and the success of learners", identifies six objectives, followed by indicators, as in the table below:

**Table 25.13. Objectives and indicators**

Objectives	Indicators
1.2 Deliver a "step change" in the development of critical skills, knowledge and competencies to provide the foundations for participation in work and society	Increase the percentage of students taking higher-level maths at the end of Junior Cycle: 60% by 2020
	Increase the proportion of students performing at Level 5 or above for reading in PISA: 12% by 2020
	Decrease the proportion of students performing below Level 2 for science in PISA: < 10 by 2025
	Increase the proportion of students performing at Level 5 or above for mathematics in PISA: 13% by 2020
1.6 Enable learners to communicate effectively and improve their standards of competency in languages	Percentage of candidates presenting a foreign language at the Junior Certificate/ Cycle Examination: 100% by 2026, 92% by 2022
	Students studying a foreign language as part of their HE course: Support 20% of all HE students to study a foreign language as part of their course (2026)
	Students doing Erasmus +: 4 100 HE students (2018/19)

## Employment policy (Dimension 8)

### Introduction

Serbia has strengthened its regulatory framework for the labour market since the last assessment but when it comes to implementing these regulations, improvements have been more limited. It has made no progress in strengthening the role of collective bargaining in the private sector, nor of Economic Social Councils. There have been some improvements in processes to detect informal employment and efforts have been made to reduce it. Some improvements have been made to skills matching, with a framework for improving training contents for initial VET training laid down, but few improvements to support continuing learning, and in particular to increase the skills of low-skilled adults. Although advances have been made in improving the capacity of the public employment service, caseloads remain too high and budgets for active labour market policies too low.

Table 25.14 shows Serbia's employment policy dimension scores, detailing them for each of the four employment sub-dimensions. Serbia scores above average for all sub-dimensions except for job quality. This is due to a lower score on the policies to promote female employment indicator, the second lowest in the region. However, Serbia's overall score remains above the WB6 average.

**Table 25.14. Serbia's scores for employment policy**

Dimension	Sub-dimension	Score	WB6 average
Employment policy dimension	Sub-dimension 8.1: Labour market governance	2.9	2.6
	Sub-dimension 8.2: Skills	2.8	2.2
	Sub-dimension 8.3: Job quality	2.3	2.4
	Sub-dimension 8.4: Activation policies	3.0	2.9
Serbia's overall score		<b>2.8</b>	<b>2.6</b>

### State of play and key developments

**Table 25.15. Key labour market indicators for Serbia (2015 and 2019)**

	Serbia		WB6 average	EU average
	2015	2019	2019	2019
Activity rate (15-64)	63.7%	68.1%	61.0%	74.1%
Employment rate (15-64)	52.1%	60.7%	51.5%	69.3%
Unemployment rate (15-64)	18.2%	10.9%	16.3%	6.4%

Note: WB6 average rates are based on author's own calculations using simple averages.

Source: (Eurostat, n.d.<sup>[118]</sup>), Labour Force Survey data base, <https://ec.europa.eu/eurostat/web/main/data/database>.

As Table 25.15 shows, the activity rate of the population aged 15-64 increased by 4.4 percentage points from 2015 to 2019 reaching 68.1%, above the WB6 average, but still well below the EU average and also below the five EU countries that may serve as peer countries (Bulgaria, Croatia, Hungary, Romania and Slovenia), which average 71.2% (Eurostat, 2019<sup>[119]</sup>). A favourable economic climate has led to employment growth over this whole period. The number of people in employment increased by 10.6% between 2015 and 2019. The employment rate among 15-64 year-olds increased by 8.6 percentage points over the same period, reaching 60.7% in 2019, compared to the EU average of 69.3%. The unemployment rate for the same age group decreased steadily from 2015 to 2019 reaching 10.9%, which is one of the lowest rates in the region, but markedly above the EU unemployment rate and the average of the five peer countries mentioned above (4.1%).

The COVID-19 pandemic has had only a limited effect on the labour market so far. The main change has been an increase in inactivity rates and a slowing of the improving labour performance trend. Those in

informal employment have been hit by the crisis and informal employment fell. Since they were unable to search for a new job during the lockdown and COVID-19 outbreak they were classified as inactive (ILO, 2020<sub>[120]</sub>). An increase in unemployment among those formally employed was avoided, due to the introduction of a job preservation scheme by the Ministry of Finance. This took the form of a wage subsidy scheme (at the level of minimum wages from March to May, and half the minimum wage thereafter) for micro-enterprises and SMEs affected by the pandemic (CEVES, 2020<sub>[121]</sub>; Government of Serbia, 2020<sub>[122]</sub>).<sup>47</sup> Take up of this measure was very high, covering roughly half of those in employment. However, the most vulnerable workers – those in temporary or seasonal work contracts, service contracts, agency contracts, vocational training and advanced training contracts, and supplementary work contracts – are not covered by these measures (CEVES, 2020<sub>[121]</sub>; United Nations, 2020<sub>[123]</sub>). The labour market impact has been comparable to that in EU countries which introduced similar schemes (Duell, 2020<sub>[124]</sub>).

### *Sub-dimension 8.1: Labour market governance*

Most parts of the legislative **regulatory framework** for governing the labour market have been aligned with the EU *acquis* (EC, 2020<sub>[36]</sub>).<sup>48</sup> As a rule, draft labour laws are submitted to the European Commission for comments and alignment. The Law on Safety and Health at Work is, for the most part, harmonised with the relevant EU directive. By-laws in this area have transposed 24 individual EU directives to the greatest possible extent. A proposal of the Law on Safety and Health at Work was prepared, which will bring further harmonisation with the Framework Directive. Changes to the law on Temporary Work Agencies made in December 2019 will come into force in 2021. In line with EU legislation, this mainly concerns the principles of equal pay and equal working conditions. Recent changes in the legal framework also include the Law on Employment of Foreigners (further simplifying of the procedure for issuing work permits for foreigners) and the Law on Conditions for Sending Employees to Temporary Work Abroad (abolishing the legal obligation of employers to submit a notice and the Central Registry of Compulsory Social Insurance Certificate to the Ministry of Labour, Employment, Veterans and Social Affairs (MoLEVSA) with regards to the employees who shall be sent to work abroad). Other recent amendments to labour laws aim to promote formal employment by reducing the administrative burden (see the Cross-cutting sub-dimension: Informality below).

Serbia plans to harmonise its labour law with another 14 EU directives. The first step will be an analysis of the current gaps in the law. The areas being reviewed relate to collective redundancies, the protection of young and pregnant workers, employment conditions of workers with service contracts and non-standard contracts, and working hours. The labour law recognises certain non-standard contracts but it does not regulate in detail the labour and legal status of persons engaged via those contracts. Serbia adopted an action plan for aligning with the EU *acquis* in social policy and employment in May 2020.

The labour law does not regulate the term “self-employed” and their status, nor does it regulate temporary work contracts, or platform<sup>49</sup> and gig workers. In 2019Q2, about 23% of workers were self-employed (a slight increase on 2015 but a decrease since 2017), in line with the WB6 average, and well above the EU average of nearly 14% (WIIW and World Bank, 2020<sub>[125]</sub>; Eurostat, n.d.<sub>[126]</sub>). There were also 137 000 contributing family workers (usually unpaid workers, with no social benefits and labour rights), equivalent to 4.7% of total employment in 2019 .

In Serbia, a significant share of the self-employed are own-account workers,<sup>50</sup> nearly half of whom work in the informal sector. Generally, self-employment is linked to poor employment conditions (SORS, 2020<sub>[127]</sub>). Informal employment is particularly widespread in the agricultural sector.

The Strategy for Safety and Health at Work in the Republic of Serbia (2018-22) and its related action plan set the objectives of reducing injuries at work by 5%, making progress on the prevention of workplace injuries and occupational diseases, and improving the monitoring of injuries at work.<sup>51</sup> Advances are being made in monitoring; the authorities intend to start public procurement for the register of injuries at work, in order to establish an IT system and a database on key indicators related to injuries at work in line with the

European Statistics on Accidents at Work methodology (Eurostat, 2013<sub>[128]</sub>).<sup>52</sup> The introduction of this register should align the existing different monitoring systems, which are run by the Administration for Safety and Health at Work, the Labour Inspectorate, and the Republic Fund for Health Insurance.

Reducing and preventing accidents at work and improving working conditions requires that a strong implementation mechanism is in place. In 2015, around 38% of employers had elected representatives for safety and health at work (EU-OSHA, 2016<sub>[129]</sub>). More efforts could be made to encourage the establishment of representatives and support their work. A study on improvements since 2015 and the remaining challenges should be conducted.

The Strategy for Safety and Health at Work in the Republic of Serbia 2018-22, aims to strengthen the capacity of the **labour inspectorate** and a budget was allocated to this task. In particular, the Labour Inspectorate is expected to focus more of its work on preventive measures, in line with OECD good practice, by the end of 2022. The labour inspectors currently focus on controlling compliance with the regulatory framework in the field of safety and health at work and labour standards, detecting informal employment, and controlling temporary agency employment. Labour inspectors can impose fines and, in case of severe misconduct, file criminal charges. The effective implementation of preventive measures would require a substantial increase in capacity. Labour inspection lacks technical and human resources, and is not audited.<sup>53</sup> The number of inspectors fell by one-third between 2009 and 2019, leaving 243 inspectors operating in 2019. This means there are nearly 12 000 workers for every labour inspector, nearly 50% higher than the ratio in Montenegro and North Macedonia, and higher than that recommended by the International Labour Organization.<sup>54</sup>

The Labour Inspectorate plans inspections of employers in certain sectors and in certain territories on the basis of risks that are assessed according to previously completed inspections. It uses data from the Central Registry of Compulsory Social Insurance and the Agency for Business Registers, which it receives upon written request. It has also access to certain data entered into the unified IT system “eInspector” from other inspections. However, this system does not yet offer reporting and it has not been set up to meet the needs of labour inspectors. The inspectorate conducts unscheduled inspections, often applying the principle of “rotation” of inspectors. It is important that labour inspectorates are able to carry out on-the-spot visits right across Serbia.

Efforts have recently begun to increase the technical capacity of labour inspectors to tackle child labour and human trafficking through participation in the 'Engagement and Support at the National Level to Reduce Appearance of Child Labour' project which started in 2016, and the 'Prevention and Fight against Human Trafficking in Serbia' project which started in 2017.<sup>55</sup> These projects have developed special protocols and guidelines for detecting child labour and human trafficking, and trained inspectors in issues related to child labour. A total of 70% of inspectors have been trained in this area.

Despite some improvements in key labour market indicators, the main labour market challenges that remain are the low employment rates of older people and youth unemployment, long-term unemployment, the high inactivity rates, labour market integration of vulnerable groups, and wide regional disparities (WIIW and World Bank, 2020<sub>[125]</sub>; Government of Serbia, n.d.<sub>[130]</sub>). Efforts have been made to base the **employment policy framework** on labour market analysis and on assessments of policies already in place. The National Employment Strategy 2021-26, which forms the basic employment policy document, is being developed on the basis of an *ex ante* evaluation, an *ex post* evaluation of the previous plan, a feasibility study into introducing a youth guarantee, and the barriers facing hard-to-employ groups in accessing jobs and active labour market programmes (ALMPs). However, these reports are not publicly available, which is against good practice for transparent policy making. The new strategy was adopted in February 2021.<sup>56</sup>

Employment policies are developed by a working group consisting of several ministries, the Standing Conference of Towns and Municipalities, the public employment service (PES), chambers of commerce and social partners. Specific objectives are encouraging employment in less developed regions and the

development of regional and local employment policies, the improvement of labour force skills and competencies with emphasis on hard-to-employ categories, strengthening the capacities of labour market institutions, and decreasing duality in the labour market.<sup>57</sup> With the support of the Project Youth Employment Promotion, an updated guidebook on drafting local employment action plans was developed, and an analysis of Roma integration conducted. More efforts need to be made to develop integrated approaches and to allocate suitable budgets to improve the labour market integration of vulnerable groups, including Roma and people with disabilities (see also Sub-dimension 8.4: Activation policies).

In 2016, the government adopted the Strategy for Social Inclusion of Roma in the Republic of Serbia 2016-25. According to the most recent 2017 Regional Roma Survey data, only 21% of Roma are employed compared to 40% of non-Roma living in close vicinity with them, and 55% nationally. At the same time 71% Roma are engaged in undeclared work, compared to only 17% non-Roma and the national average of 22% (RCC, 2019<sub>[131]</sub>). The strategy has specific objectives to increase the labour market participation rate and combat discrimination against Roma in the labour market, increasing the number of Roma employed in public authority bodies, and formalising the work of informally employed Roma men and women, (especially introducing individual collectors of secondary raw materials into the waste management system at local self-government level, without any results so far). The action plan for employment and social inclusion of Roma expired in 2018. Implementation has been followed up with less intensity than planned, planned actions were not fully implemented and there have been delays in the preparation of the new action plan (EC, 2020<sub>[36]</sub>).<sup>58</sup>

A framework for **social dialogue** is in place, but it lacks practicable procedures, mechanisms, rights and obligations for collective bargaining partners. Improvements have included the adoption and amendments of the Law on Peaceful Resolution of Labour Disputes<sup>59</sup>. Data from 2011 suggested that the unionisation rate in the private sector was around 20% (Arandarenko, 2012<sub>[132]</sub>; Ladjevac, 2017<sub>[133]</sub>). This would be comparatively high for the region, but it is not known whether the rate has increased or decreased since then. Major companies in the metal industry, banking sector and retail are not members of the Union of Serbian Employers (UPS) (Ladjevac, 2017<sub>[133]</sub>). Collective bargaining is conducted at sector level (mainly in the public sector) and company level in the private sector. While sector agreements are monitored by MoLEVSA, company level agreements do not need to be reported. It is estimated that only 30% of employees, probably largely in the public sector, fall within the scope of collective agreements in Serbia, compared with an EU average of 60% (Ladjevac, 2017<sub>[133]</sub>). Information on collective bargaining at all levels would need to be collected to assess collective bargaining coverage and monitor the level of wages agreed. The labour law stipulates that employees working for an employer with over 50 employees may establish a works council, but it is not known how many companies have a works council.

The Social and Economic Council (SEC) is a tripartite body composed of the representatives of the government, employer organisations and trade unions. There are also 21 local SECs. The SEC is consulted on draft labour regulations and is the main actor setting the minimum wage. In 2019, the SEC held 8 sessions, down from 11 sessions in 2018. The permanent SEC working groups held 23 meetings in 2019. However, the operations of SEC are not underpinned by the state budget and the secretariat is not in a position to pursue analytical activities from its own resource (Ladjevac, 2017<sub>[133]</sub>).

### *Sub-dimension 8.2: Skills*

Labour market outcomes are significantly determined by level of education. Low educational attainment is associated with a higher risk of being in informal employment. Employment growth has been driven by a rise in employment among both low and highly educated workers (WIIW and World Bank, 2020<sub>[125]</sub>).<sup>60</sup> The unemployment rates fell for workers with all levels of education each year between 2015 and 2018 (and 2019 Q2); among low-educated workers they fell from 15% in 2015 to 12.1% in 2018 (and 9.2% in Q2 2019), among medium-educated workers from 19.4% to 13.7% (11.4% in Q2 2019) and among highly-educate workers from 15.3% to 10.8% (8.5% in Q2 2019). The strongest percentage-point reduction in

unemployment was among the medium educated, followed by the highly educated (WIIW and World Bank, 2020<sub>[125]</sub>). The proportion of young people not in employment, education or training (NEET) stood at 15.3% in 2019, down from 19.9% in 2015 (SORS, 2020<sub>[127]</sub>).

Despite improvements in labour market outcomes, **skills mismatches** continue to be a major challenge. The employment rate among recent graduates (20-34 year-olds) was 56.9% in 2017, well below the EU average of around 80% (European Commission, 2019<sub>[134]</sub>). Employers name lack of work experience as one barrier to recruitment, and generally indicate they face shortages of candidates with the skills they need, according to a survey conducted by the National Employment Service (NES), Serbia's public employment service. Over-education is another pressing issue (ETF, 2019<sub>[135]</sub>). Over-education may result from an oversupply of university graduates and/or from skills gaps among young graduates if they are not acquiring the technical and soft skills employers need, and weaknesses in the education-to-work transition. Graduates' first work experience may thus be in jobs requiring a much lower formal education level.

The NES has set up a new programme, My First Salary, which started in the second half of 2020. The programme works with employers in the private or public sector, but prioritises private sector employers, especially those from disadvantaged municipalities in accordance with the Decree of the Government of the Republic of Serbia on the level of development of local self-government units. During the programme, the NES pays a monthly cash benefit to young people being employed through this scheme: RSD 20 000 dinars to those with secondary education, and RSD 24 000 to those with higher education, and it also pays a contribution in the case of injuries at work and occupational diseases for people included in this programme. The programme is expected to benefit 10 000 young people during 2020 and 2021 (Government of the Republic of Serbia, 2020<sub>[136]</sub>). Its implementation and outcomes should be closely monitored, including the types of private companies taking part and the employment outcomes for the participants after 6 and 12 months.

Research on graduates' transition to the labour market has so far been limited to periodic school-to-work transition studies. Efforts are needed to develop a regular monitoring system for education outcomes that would include information on graduate employment, use of skills in the workplace, and the difficulties encountered while searching for work and their strategies to find employment. A pilot graduate tracking study was implemented in 2018 with the aim to make this practice mainstream in future (ETF, 2019<sub>[135]</sub>). Difficult transitions from higher education to work may act as an additional push for young people to emigrate, aggravating skills shortages.

Further improvements have been made to the skills anticipation system. A survey on the skills needs of employers is used for one-year forecasting at occupational level. The results are used in the design and implementation of ALMPs as well as in the context of the National Qualification Framework. In 2020/21, with the support of the IPA 2014 (Project for the Development of an Integrated System of National Qualifications), MoESTD has been developing a methodology to establish sector profiles, for collecting and forecasting key indicators such as the number of employed/unemployed persons in the sector, relevant vocations, the qualifications structure, the supply of programmes for gaining relevant qualifications, economic parameters and strategic directions for sector development. These data should support the work of sector councils on required competencies, and the mapping of qualifications and updating of the existing list of vocations in line with the National Classification of Vocations.

Serbia has taken major steps towards improving its skills framework. It adopted the National Qualification Framework for Serbia in 2018, and established a link to the European Qualification Framework. The Council for the National Qualifications Framework is an advisory body appointed by the government, which makes recommendations on the process of planning and development of human potential in accordance with public policies in the area of lifelong learning, employment, career guidance and counselling. The council includes decision makers in the education, employment, youth, economy, local self-government and health sectors as well as representatives from social partners, the Chamber of Commerce and Industry of Serbia, the NES, associations of secondary schools and higher education institutions, and civil society

organisations. The council has the power to propose qualification standards for all levels of the NQFS. The government has decided to form 12 sector councils. It has also established the Qualifications Agency, which is in charge of developing qualifications standards, recognising foreign school and higher education documents, and accrediting adult education providers. Serbia therefore has a modern structure for skills governance to co-ordinate and take into account the different views and skills needs of employers, which in principle is the right way to reduce skills mismatches.

Efforts have been undertaken since 2016 to introduce work-based learning elements into VET and the corresponding legislative provisions were completed in 2018 – see Education policy (Dimension 7) for more information. The system is still in its pilot stage and the first evaluation results will become available in 2021 (European Commission, 2019<sub>[134]</sub>). Efforts should then be undertaken to introduce a quality assurance mechanisms.

Career guidance is being improved as part of the National Employment Action Plan. More efforts are needed to make career guidance gender sensitive in order to reduce gender imbalances in some professions, as well as to develop career guidance for adults.

Participation in **adult learning** is low (European Commission, 2019<sub>[134]</sub>). According to data from the Adult Education Survey of 2016, 19.8% of adults participated in some type of formal or non-formal education or training in 2016, an increase on 2011, but still well below the EU average of 45.1% (SORS, 2018<sub>[137]</sub>). Participation in Serbia was higher than in other economies in the region for which information is available (Albania, Bosnia and Herzegovina, and North Macedonia). The participation rate was highest among young adults (25-34), particularly among highly educated urban women. For the most part, training was work-related and performed at work, during working hours and paid for by employers.<sup>61</sup> Almost half of respondents (47%) wanted to participate in adult learning but could not due to the costs of education/training, family reasons, scheduling (i.e. overlapping with working hours) and lack of suitable training. The Strategy for Education Development in Serbia, adopted in 2012, aimed to increasing the education offer for adults by 2020 (Government of Serbia, n.d.<sub>[138]</sub>). More efforts are needed to increase participation in continuing training of prime age and older workers, as well as among those who are medium and low-educated, vulnerable groups, and the self-employed. Adult education and lifelong learning opportunities and second chance education for adults are not enough to improve the labour market integration of vulnerable groups. There is little co-ordination between public and private institutions involved in implementing education and training policies for labour market integration and social inclusion (European Commission, 2019<sub>[134]</sub>).

### *Sub-dimension 8.3: Job quality*

To improve the **quality of earnings**, the Social and Economic Council regularly fixes the minimum wage for workers with standard working hours. Only when the SEC cannot come to an agreement on the level of the minimum wage does the government step in. This has happened in 2018, 2019 and 2020 and has led to an increase in the minimum wage (of 28% over the whole period). The minimum wage is decided on the basis of the social parameters, the minimum consumer basket, the unemployment rate, GDP, retail prices, productivity levels, and average salary trends. In 2019, Albania and Serbia had the highest minimum wage to average wage ratio in the region (WIIW, 2020<sub>[139]</sub>).<sup>62</sup> Based on information from the MoF and the tax administration, about 12.5% of workers receive the minimum wage. There are clear difference in wages between companies covered by collective agreements and those not covered, according to the government, but there is no statistical analysis or collection of data in this area. Efforts need to be undertaken to make a thorough analysis of wage structure and development and to make the results public. This would also require systematically collecting data on collectively agreed wages from sector- and company-level agreements.

The in-work poverty rate among the self-employed stood at 35.1% in 2017, lower than in 2015, but 12.9 percentage points above the EU average. The self-employed were at a significantly risk of poverty

than employees (6.8% in 2017). This gap may be over-reported, as around 38% of the self-employed worked in the informal sector (in 2016), but nevertheless it is substantially higher than the EU average and points to low earnings in the informal sector. The in-work poverty rate of workers with temporary contracts was 11.2% in 2017, nearly double the rate for those with a permanent contract (5.9%). (Pejin Stokić and Bajec, 2019<sub>[140]</sub>) (B92, 2018<sub>[141]</sub>).

There is no co-ordination between the MoF and MoLEVSA over policies on non-wage labour costs, in particular for social security contributions. However, these can have a significant impact on the quality of jobs (e.g. social protection of formal self-employed) and the promotion of formal employment among low earners (e.g. through a lower social security contribution rate). There is apparently also no co-ordination over addressing the tax wedge of low wage earners.<sup>63</sup>

On the **promotion of female employment**, in Serbia, as in Albania, the employment and activity rate gender gap is smaller than in other WB6 economies, but still higher than in EU peer countries (WIIW and World Bank, 2020<sub>[125]</sub>). Women's employment rates have grown faster than men's, increasing by 9.4 percentage points between 2015 and 2019 for women compared to 7.9 percentage points for men. Informal employment has also declined more among women than men, linked to a decline in employment in the agricultural sector. The employment rate among women aged 15-64 stood at 54.3% in 2019, well above the WB6 average of 42.5%, but still below the EU average of 63.3% (Eurostat, n.d.<sub>[118]</sub>). Young rural women, in particular from Roma communities, are the most disadvantaged groups in the area of education and access to decent work (World Bank, 2016<sub>[142]</sub>).

Young women are more likely to enrol in higher education than young men, but the subjects they choose tend to be segregated by gender. Men dominate the fields of informatics and communication technologies (74%) and engineering, manufacturing and civil engineering (63%). Nevertheless, women made up 43% of science, technology, engineering and mathematics (STEM) graduates in 2015 which is higher than the EU average of 33% for that year (Risteska, Memeti and Samardzic Jankova, 2020<sub>[143]</sub>). Women are over-represented in mathematics, often connected to the objective of becoming a teacher. Access to dual VET in technical fields among female students is promoted in a wide range of technical and mechanical professions but there is no breakdown of enrolment by gender for these courses. Middle-aged, and especially older women are more likely to have low educational attainment than their male peers, so on average women are still more likely not to have completed upper secondary education (35% of women and 23% of men in 2015) (European Commission, 2019<sub>[134]</sub>).<sup>64</sup>

Gender segregation also characterises the Serbian labour market with women over-represented in some occupational groups, particularly service and sales workers, clerical support workers, professionals and associated professionals, and elementary occupations. Men are significantly more likely than women to work in skilled blue collar jobs, as plant and machine operators and assemblers, as craft workers, and as managers. According to a study conducted by the Centre for Advanced Economic Studies, in Serbia women earn about 11% less than men working in jobs with the same characteristics (education, work experience, profession, industry sector, etc.) (CEVES, 2018<sub>[144]</sub>). In 2018 the gender gap in monthly average gross earnings was wider for working women with a university degree (19%) than the average for all workers (10%) (SORS, 2018<sub>[145]</sub>).<sup>65</sup>

Women are still greatly under-represented among entrepreneurs and managers (NALED, 2019<sub>[146]</sub>). Progress is being made to promote female entrepreneurship. In 2019, a Programme for Supporting and Promoting of Female Innovative Entrepreneurship was established. The programme awards grants, conducts mentoring, offers training in entrepreneurial knowledge and skills, organises lectures, and publicly promotes the experiences of successful female entrepreneurs. In 2019, another entrepreneurship programme was launched with the theme "Economic empowerment of women who have experienced violence in the process of self-employment", targeting vulnerable women.

Women are one of the target groups for Serbia's active labour market programmes and they tend to participate more often than men. However, no assessment has been made to determine which ALMPs work particularly well to address the employment barriers women face.

There was a National Strategy for Gender Equality 2016-20 with an action plan for 2016-18. The evaluation of the plan by UN Women found it had limited success. Based on the lessons from this evaluation, more efforts are needed to deliver gender sensitive formal education, increase public awareness of the significance of gender equality, ensure men and women play more equal roles in parenting and the economy of care and in the area of gender studies (UN Women, n.d.<sup>[147]</sup>). Childcare services are in short supply, and the number of preschool institutions should be increased (World Bank, 2016<sup>[142]</sup>).

The Gender Equality Administration was removed in 2014. The situation improved with the establishment of the Department for Antidiscrimination Policy and Promotion of Gender Equality in MoLEVSA on 1 July 2017, with immediate responsibility for monitoring the application of the Law on Equality of Sexes. Employers with more than 50 permanent employees are obliged by law to adopt a plan to remove or mitigate unbalanced gender representation and report on its implementation. These reports form the basis of the ministry's annual report.

While it is important to gather information on companies' activities and to monitor progress, it will also be important to conduct permanent awareness-raising campaigns aimed at reducing discrimination and to have a strategy of gender mainstreaming in all policy fields. MoLEVSA's budget does not allocate any funds to awareness-raising media campaigns, and nor were any donor funds secured for this purpose. However, UNICEF are implementing a project to address gender discrimination in kindergarten and schools. This also includes training of teachers.

#### *Sub-dimension 8.4: Activation policies*

Efforts have recently been made to increase the capacity of Serbia's **public employment service**, the NES, by expanding the number of public employment agencies (20 of the 129 offices were established in 2019). However, the number of staff is still too low to effectively implement activation policies. Although most staff are certified employment advisors, in line with the World Bank methodology, each employment counsellor's average caseload was 827, which is well above OECD good practice guidelines and high for the WB6 region. A small caseload is particularly important when finding jobs for hard-to-place jobseekers. In France and Germany for example, employment counsellors have caseloads of around 70 hard-to-place jobseekers each, while caseloads of regular jobseekers may vary between 100 and 350, depending on how much individual guidance they need and how autonomous they are at using self-help tools (OECD, 2015<sup>[148]</sup>; Manoudi et al., 2014<sup>[149]</sup>; Pôle emploi, n.d.<sup>[150]</sup>).

A reform process for the NES was launched in 2015, starting with a feasibility analysis conducted in January 2015. This recommended expanding the role of employment counsellors, and setting up an integrated IT system. The World Bank also performed a functional analysis of the NES and made a number of recommendations (World Bank, 2017<sup>[151]</sup>). Based on these assessments, an Action Plan for Optimization in Provision of Public Social Services was set up, including the NES. Its objectives include increasing the placement of unemployed workers in the formal sector, benchmarking and peer learning among employment service offices, and taking contextual factors into account when assessing employment outcomes. Improving the quality of services offered to employers has also been an integral part of NES reform. The amended Law on Employment and Insurance in Case of Unemployment of 2019 extends the coverage of activities of the PES to include employee training programmes.

In its work, the National Employment Service uses documents of the Integrated Management System which determine in detail the individual interviews with job seekers who are registered as unemployed. Individual interviews last between 20 and 60 minutes. An employability assessment is conducted and employability plans established. It is, however, not clear who benefits from a 60-minute interview given the very high caseload and the high incidence of long-term unemployment among registered jobseekers. The

yearly National Employment Action Plan determines the categories of hard-to-employ persons who have priority for participating in ALMPs. A new functional analysis of the NES is planned to prepare the new employment policy strategic framework for 2021-26.

Progress has been made in strengthening the analytical and planning capacities of the NES, particularly for planning training measures. As well as carrying out the skills needs survey (see Sub-dimension 8.2: Skills), the NES also communicates with local governments and uses their investment plans to determine which future skills will be needed. The NES also analyses unfilled vacancies, to understand the circumstances when it was not able to provide a suitable candidate for the job, and the education profiles included in the individual employment plans of the unemployed. Cross-referencing all this information, helps to define a catalogue of training for the unemployed to meet labour market needs.

Serbia has a **mutual obligation framework**. To be eligible for unemployment benefits, a worker must have paid insurance for a minimum of 12 months either continuously or intermittently during the last 18 months. Unemployment benefits are based on previous income and not a fixed amount, as in other WB6 economies. This aligns Serbia with EU good practice. The law prescribes the minimum and maximum amount per month. The payment period ranges from 3 to 12 months, and exceptionally 24 months for people who are less than 2 years from retirement although in principle unemployment benefit schemes should not be used as pre-retirement schemes. Unemployment benefit recipients need to register with the NES. They need to report in person, in accordance with their individual employment plan, at least once every three months and, if necessary, submit a job search diary to their employment counsellor. Unemployment benefit recipients are removed from the unemployment register if they do not comply with the job-search requirement. Monitoring job-search activities every three months is not frequent enough; in the United Kingdom and Australia, for example, fortnightly reporting is required. There seems to be no instrument for soft sanctioning, as implemented in a number of OECD countries.

The existing minimum income scheme does not provide sufficient coverage. Around 3-4% of the population receive social assistance of the equivalent of EUR 69 per month for adults, less for children. The vast majority of recipients are very poor (European Commission, 2019<sup>[134]</sup>). Recent reforms have strengthened the mutual obligation principle but have not changed benefit levels. Social assistance recipients are referred by Centres of Social Work (CSW) to the NES where the first interview is within 10 days. The CSW may conclude agreements with the beneficiaries of cash social assistance to take active steps to overcome their situation. These impose activities and obligations on the beneficiaries, and their right to social assistance can be reduced or revoked if they do not abide by these obligations without just cause.

Co-operation between the CSW and the NES has improved in recent years, including electronic co-operation and joint thematic meetings, during which all relevant information related to the treatment of people from this category are exchanged. According to the Report on NES Performance Agreement, during the period January-December 2019, 11 565 cash social assistance beneficiaries took part in some type of ALMP or NES activity. Of these, 549 were included in public works measures. In 2017, 105 051 families (257 354 people) received monetary social aid, (Government of Serbia, n.d.<sup>[152]</sup>). More progress is needed in fostering co-operation at the local level.

A significant number of local self-government units have formed local employment councils (LECs), which jointly, or with technical support provided by NES, implement ALMP measures. Their activities include the activation of social assistance recipients, reducing informal employment and combating discrimination so co-operation with the CSW and NES may become necessary. As LECs play a potentially important role for the labour market integration of vulnerable groups, an assessment of their functioning is recommended.

The number of registered unemployed has been well above the number of unemployed recorded in the Labour Force Survey (LFS).<sup>66</sup> This indicates that people have an incentive to be registered as unemployed or need to register as unemployed, although they may have small jobs (and thus are underemployed), are not searching for work, or have difficulty being available for work (e.g. due to care responsibilities or health issues). Another incentive may be to be covered by health insurance through registration with the NES. It

is therefore important to increase efforts to place vulnerable job seekers into formal employment and ALMPs, implement in-work benefits that would create incentives to move into formal employment, and to offer comprehensive and integrated social and employment services.

Funding for **active labour market programmes** is very low: in 2019 it amounted to 0.07% of GDP, compared to the OECD average of 0.37%, or 0.51% if PES administration and services are included, and thus also counselling (OECD, n.d.<sup>[153]</sup>; Government of Serbia, 2020, pp. 58, Table 30<sup>[154]</sup>), despite a significantly lower average unemployment rate. The budgets and number of participants of Serbia's ALMPs are very low, especially, given the high share of those facing severe employment barriers among the registered unemployed. About 28% of the unemployed registered with the NES benefitted from any type of support (EC, 2020<sup>[36]</sup>). Nearly one-third of the registered unemployed are aged 50 and over, one-third have no formal qualifications, and many have health problems (Government of Serbia, n.d.<sup>[130]</sup>). About 60% of those unemployed according to LFS data were long-term unemployed in 2019 Q2, below the WB6 average of 66%, but well above the share of long-term unemployment in peer countries such as Austria (26.4%) (WIIW and World Bank, 2020<sup>[125]</sup>).

The measures provided under the yearly National Action Plan on Employment are mostly one-day services such as job fairs and job-search training, covering around 120 000 participants per year. These measures may be useful but have limited impact on the job prospects for unemployed people. Only around 3% of registered unemployed people have been included in measures such as training, employment and self-employment subsidies or public works. Training measures are mostly for medium and highly educated jobseekers and there are no specific training measures for low-educated adults (European Commission, 2019<sup>[134]</sup>). A small training programme for low-educated jobseekers was planned for 2020, which would have included 200 participants, but could not be implemented due to the pandemic.

As a result of improved labour market conditions, the number of both registered and LFS unemployed fell by 30% between 2015 and 2019. Although the unemployment rate (10.9% in 2019) was below the regional average of 16.3%, it is nearly double the EU average (6.4%) and the incidence of long-term unemployment is 2.5 times the EU average (Eurostat, n.d.<sup>[118]</sup>).<sup>67</sup> The past reforms and activities of the NES are unlikely to have had a major impact on reducing unemployment, given counsellors' very high caseloads and the extremely low budget for ALMPs. However, around 32% of those who participated in any type of measure, including very short ones, were in employment six months after completing them, with variations regarding the level of employment barriers they face.

#### *Cross-cutting sub-dimension: Informality*

In 2019, 18.2% of Serbia's workers were informally employed. Informal employment is especially pronounced in agriculture (64% of all informally employed).<sup>68</sup> Informally employed women mostly work as unpaid family members while informally employed men are predominantly self-employed. Within the private sector excluding agriculture, the share of informal employed is estimated to be 12%.<sup>69</sup> In recent years, there has been an increase in registered employment in Serbia (+6% between 2016 and 2018). The number of entrepreneurs and their employees and self-employed persons has also increased (12.7%), while the number of registered individual farmers fell by 11.9% (Government of Serbia, n.d.<sup>[130]</sup>).

Serbia has adopted a National Programme for Countering Grey Economy with an action plan for its implementation covering 2019-20. The objective was to decrease informal employment by 2 percentage points between 2018 and 2020, and to improve the monitoring of the informal economy. The other objectives include improving tax collection, reducing the administrative burden of formal employment, and raising awareness (Box 25.11).

### Box 25.11. Activities to combat informal employment in Serbia

The Law on Simplified Work Engagement for Seasonal Jobs in Certain Areas implemented since 2019 to simplify the employment of seasonal workers in certain activities (e.g. agriculture) introduces a new type of contract, which made it easier to register these workers for social insurance and tax payments. The objective is to reduce informal employment and first results from the labour inspectorates seem promising: Between 2017 and 2019, even though the number of inspections increased, the numbers of undeclared workers they detected decreased.

A “name and shame” approach has been used to raise awareness among employers. Two lists are published and updated weekly on MoLEVSA’s website, of employers which have employed informal workers and of workers who have engaged in informal activity.

Source: Information received from the Government of Serbia.

Improvements have been made in the co-operation among agencies to detect informal employment. The Director of the Labour Inspectorate is the president of a working group for combating informal employment, involving a wide range of relevant actors. The working group meets regularly and conducts joint inspections. In 2019, 895 joint and co-ordinated inspections were conducted, mainly in co-operation with the tourist inspection, the tax administration and the Ministry of Interior. Co-operation with the Ministry of Interior over the administration for foreigners is necessary to tackle informal employment among foreigners. These joint inspections detected about 291 undeclared workers and 10 unregistered businesses. An external assessment of the performance of labour inspectorates is recommended. The labour inspectorate has also started a free helpline for citizens who wish to report informal work.

#### *Cross-cutting sub-dimension: Brain drain*

Emigration from Serbia has been high, although not as high as in some other WB6 economies. About 400 000 people (about 5.5% of the 2016 population) emigrated from Serbia to OECD countries between 2008 and 2016 (IMF, 2019<sub>[155]</sub>). This trend has continued and in 2018, an estimated 50-70 000 people left the country (WIIW and World Bank, 2020<sub>[125]</sub>; Bjelotomic, 2019<sub>[156]</sub>).

The working-age population (15-64 year-olds) has fallen by 10.3% since 2012, driven by population ageing and emigration; while the activity rate increased by 7 percentage points. Labour shortages in some sectors due to continued migration also put pressure on wages (WIIW and World Bank, 2020<sub>[125]</sub>). The share of young people wanting to emigrate is still high and has been increasing (Lavric, 2021<sub>[157]</sub>). Employment opportunities and higher earnings are by a long way the main reasons young people emigrate.

An estimation of the costs to the economy of the emigration of young people shows that directly and indirectly, the lost employment has generated an annual loss of gross value added of EUR 897.3 million, which was about 2.1% of Serbia’s GDP in 2018 (Government of Serbia, n.d.<sub>[130]</sub>).

The World Bank LinkedIn Digital Data for Development show that in Serbia, skill losses due to brain drain have mainly affected Internet services, financial services, higher education, research, and international affairs. The five main skills that were lost were dentistry, genetic engineering, development tools, medicine and rehabilitation, and web development (World Bank Group & LinkedIn Corporation, n.d.<sub>[158]</sub>). In addition Serbia has lost management and cross-cutting skills such as problem solving, time management and oral communication, although less so than in Albania, Bosnia and Herzegovina and North Macedonia (WIIW and World Bank, 2020<sub>[125]</sub>). Skills shortages also affect a number of crafts and low-skilled activities.<sup>70</sup>

The NES has mediated finding employment abroad for some unemployed people (mainly to Croatia, Germany and Slovenia).<sup>71</sup> It has a bilateral agreement with the German PES. Serbian citizens were predominantly employed in construction, medicine, hospitality and manufacturing. Private employment

services also provide mediation abroad. Individual networks and other job search channels play a major role. In order to protect migrant workers, bilateral agreements on temporary employment have been concluded with a number of countries, including Belarus, Bosnia and Herzegovina, Hungary, Malta, the Russian Federation, and Slovakia.

Recently, the government has adopted a strategy to reduce brain drain. On 27 February 2020, it adopted the Strategy on Economic Migration of the Republic of Serbia 2021-27. The overall objectives are to create an economic and social environment that will slow down the departure of the working-age population, strengthening ties with the diaspora, encouraging returning and circular migration, and attracting foreigners with a variety of education profiles. A public debate on the related draft action plan 2021-23 was conducted in February 2021 (Government of Serbia, n.d.<sup>[159]</sup>). This strategy looks highly relevant but its impact may take some time to be felt.

### ***The way forward for employment policy***

The main efforts needed to advance employment policy relate to strengthening the capacities of government and other actors at national and local level to effectively implement regulations, increase transparency in monitoring working conditions and wages, and deepening labour market analysis. In particular:

- **Increase the capacity of the labour inspectorate to detect informal employment**, including enhancing staff capacities. More efforts are needed to strengthen the role of inspectors to provide health and safety advice in order to prevent injuries and improve working conditions. An efficient monitoring system of the activities of the labour inspectorate is still under construction and it will be essential to implement and use it. The co-operation between various actors should continue to be fostered in order to detect informal employment.
- **Strengthen collective bargaining capacity at sector and company levels, and strengthen worker representation in companies.** The Social and Economic Council should be equipped with basic resources to conduct labour market and sector analysis, as in France (Arkwright et al., 2020<sup>[160]</sup>) and a number of other European countries. The council should evaluate the impact of minimum wage on poverty reduction and informal employment. A good example is the work of the minimum wage commission in Germany (Box 25.12).

#### **Box 25.12. Germany's Minimum Wage Commission**

The Minimum Wage Commission in Germany includes members from the scientific community in a consultative role. It has a mandate to constantly evaluate the impact of the minimum wage on the protection of workers, conditions of competition, employment in certain industries and regions, and productivity. The commission presents the results of its evaluation to the Federal Government in a report together with its resolution on adjusting the minimum wage every other year.

Source: (Minimum Wage Commission, n.d.<sup>[161]</sup>), website, [www.mindestlohn-kommission.de/EN/Commission/Commission\\_node.html](http://www.mindestlohn-kommission.de/EN/Commission/Commission_node.html).

- **Foster links between universities and employers to ease the transition from universities to work.** Internships should be included in university curricula, in order to improve the employability of young people. Promoting a smooth school-to-work transition may also help to reduce the emigration of young skilled adults. Recent efforts to place young graduates into quality jobs should be continued. Skills development and reducing skill mismatches are also key strategies for reducing informal employment.

- **Promote adult education, especially for low-skilled adults.** This would include providing remedial education as well as linking upskilling measures to the recognition of prior learning (Box 25.13).

### Box 25.13. Adult learning in Portugal

Portugal has developed standards to recognise the skills acquired by adults outside of formal education that are equivalent to those required to obtain an upper secondary diploma. It has hundreds of adult-learning centres across the country with staff dedicated to helping adults undergo such a process. The 303 Qualifica Centres specialise in the provision of adult-learning services. They are operated by various types of institutions, public and private. Qualifica Centres offer information, vocational guidance, and the recognition, validation and certification of skills free of charge. The Qualifica programme promotes participation in training alongside the completion of prior learning and recognition processes.

Source: (OECD, 2019<sup>[162]</sup>), *OECD Skills Strategy 2019: Skills to Shape a Better Future*, <https://doi.org/10.1787/9789264313835-en>.

- **Encourage employers to promote continuing training at company level, particularly among middle-skilled employees, to adapt to technological change.** Other countries have provided subsidies to employers, financed study leave, and offered tax credits and individual learning accounts (OECD, 2019<sup>[163]</sup>). The strategy for adult learning should also include counselling activities for employees and employers, in particular for SMEs (e.g. as done in Portugal through the Qualifica Centres (OECD, 2019<sup>[162]</sup>). In France, every individual has the right to information, advice and career guidance support. To put this into practice, the Advice for Professional Evolution was launched in 2014, offering free and personalised services (OECD, 2019<sup>[162]</sup>).
- **Assess and expand the availability of affordable and quality childcare in order to enhance female employment.** More efforts are needed to adapt vocational guidance accordingly and to reduce gender discrimination in companies in order to attract women in non traditional career paths.
- Continue to strengthen the capacities of the NES:
  - **Significantly reduce the caseload of NES staff,** enhance the number of employment counsellors and increase the budget for active labour market programmes.
  - **Continue to strengthen the co-ordination and monitoring of local employment councils.** An assessment of their functioning should be carried out. More efforts should be made to develop integrated approaches and allocate relevant budgets to improve the labour market integration of the most vulnerable groups (e.g. Roma communities, women in rural areas). This would require close co-operation with other key stakeholders at national and local levels. More efforts will be needed beyond job fairs to develop services for employers and to proactively collate vacancies.
  - **Systematically differentiate outcomes (employment) by degree of disadvantage.** Thorough evaluations of ALMPs and their impact on different target groups should be conducted by an external evaluator.

## Science, technology and innovation (Dimension 9)

### Introduction

Serbia has made continuous progress in developing its science, technology and innovation (STI) policies, and continues to set the pace for the region. With an overall score of 3.1, it is outperforming its WB6 peers in all three sub-dimensions (Table 25.16) and has continued to improve in all areas, particularly its overall STI system and business-academia linkages.

**Table 25.16. Serbia's scores for science, technology and innovation**

Dimension	Sub-dimension	Serbia	WB6 average
Science, technology and innovation dimension	Sub-dimension 9.1: STI system	3.4	2.4
	Sub-dimension 9.2: Public research system	2.9	2.0
	Sub-dimension 9.3: Business-academia collaboration	3.0	1.6
Serbia's overall score		<b>3.1</b>	<b>2.1</b>

### State of play and key developments

According to the 2020 European Innovation Scoreboard, Serbia continues to be categorised as a moderate innovator, despite significant improvements compared to 2019 (EIS, 2020<sub>[164]</sub>). The government recognises the development of STI as a key policy priority, and investment in R&D, albeit from low levels, has increased almost consistently in recent years to 0.89% of GDP in 2019 (RZS, 2021<sub>[165]</sub>). Since the previous assessment, several policy changes favourable to STI have been implemented. While the impact of the measures developed and implemented is not yet fully evident, they are expected to boost STI activity in the medium to long term.

#### *Sub-dimension 9.1: STI system*

Serbia has an **STI strategy** in the form of the Scientific and Technological Development of the Republic of Serbia – Research for Innovation strategy, adopted in 2016, and the Smart Specialisation Strategy Serbia (4S), adopted in 2020. The preparation of the 4S was aligned with the methodological guidance provided within the S3 Framework for the EU Enlargement and Neighbourhood Region, with the support of the Joint Research Centre. It was based on the identification of economic, innovation and scientific potential, and included the Entrepreneurial Discovery Process which brought together key stakeholders to jointly identify strategic priorities and measures. In 2019, Serbia also adopted a Strategy for the Development of Artificial Intelligence, following comprehensive analysis and stakeholder consultation.

The **institutional framework** for implementing STI policy is overseen by the Ministry of Education, Science and Technological Development, which is responsible for designing policies to support STI and in charge of budget allocations within this area. However, the lack of a fully adopted action plan to implement the strategic framework has somewhat hindered its full and comprehensive execution. MoESTD is supported by the National Council for Science and Technological Development, which provides assistance in inter-ministerial co-ordination and monitoring. Emphasising its commitment and strong focus on developing STI, the government further established a Ministerial Council on IT and innovative entrepreneurship, as well as a minister without portfolio for Innovation and Technological Development. Whilst these measures ensure that STI development remains a priority, overlapping mandates and unclear objectives of the various co-ordination mechanisms somewhat weaken the institutional framework.

The Serbian Innovation Fund remains the key vehicle for implementing the STI policy framework. Established in 2011, the fund now runs several programmes in support of innovation, entrepreneurship, technology transfer and business-academia collaboration, with a budget of EUR 5.5 million in 2019. In response to the unfolding COVID-19 pandemic, the Innovation Fund introduced a new programme aimed

at supporting innovative products and services to fight the pandemic (Box 25.14). The fund's activities are currently funded through both the state budget and donor support, further underlining the government's strong commitment to the innovation agenda.

#### Box 25.14. The Innovation Fund at the forefront of Serbia's response to COVID-19

Amid the unfolding COVID-19 pandemic in March 2020, the Innovation Fund launched its own response to counter the crisis. In an ad hoc call for projects, it aimed to identify and support innovative ideas addressing the health and well-being of the population, which had the potential to be scalable and developed quickly and would contribute to combatting the pandemic.

Nearly 300 proposals were received. Given the urgency, the fund's independent panel of experts prioritised those solutions they assessed would be able to produce the most influential, rapid and strategically important response to specific problems. Overall, the fund identified 12 innovative projects, awarding a total amount of approximately EUR 500 000 in support.

Within one month, all 12 proposed solutions were developed and made available for use and the final products and services were donated to organisations and institutions of strategic importance throughout Serbia. These included the first Serbian ventilator, a new type of protective mask with a removable high efficiency particulate air (HEPA) filter for multiple and long-term use, disinfection booths intended for use in public places and locations of interest, a mobile counter for contactless use, temperature measurement and manual disinfection, and portable ozonisers for the fast and safe disinfection of critical objects.

Source: (Serbian Innovation Fund, 2020<sup>[166]</sup>), Results of the public call for suppression of the effects of the COVID-19 pandemic presented, <http://www.inovacionifond.rs/news/results-of-the-public-call-for-suppression-of-the-effects-of-the-covid-19-pandemic-presented0>; (Government of the Republic of Serbia, 2020<sup>[167]</sup>), Support for innovative projects for suppressing effects of COVID-19, <https://www.srbija.gov.rs/vest/en/152532/support-for-innovative-projects-for-suppressing-effects-of-covid-19.php>.

A key achievement since the last assessment in 2018 has been the establishment of a Science Fund in early 2019 to serve as a technology agency to scientific research. Within its first year of operation, the fund launched five programmes, providing both financing and technical assistance to the research community. These programmes include support to young researchers, artificial intelligence and better leverage of the Serbian diaspora to advance domestic scientific research activities.

The new Science Fund is regulated through the new Law on Science and Research and the Law on the Science Fund, which were both adopted in 2019 and complete Serbia's STI **regulatory framework**. The Patent Law has also been amended twice since the last assessment, in 2018 and 2019, in order to align with the EU *acquis* on intellectual property. The law now also reflects a more balanced approach between the interest of an employer and those of employees who may have created a patent during the course of their employment. This reform of the IPR legal framework is welcome but, amid weak law enforcement, further efforts are needed to protect intellectual property and incentivise the commercialisation of scientific research in line with the European Commission's most recent recommendations (EC, 2020<sup>[36]</sup>).

Serbia has expanded its engagement in international research activities as **international collaboration** is a key component of its STI policy framework. The new Science Fund is expected to be a key tool to reaching Serbia's diaspora, and Serbia has actively participated in the EU's Horizon2020 framework<sup>72</sup>, with over 500 Serbian entities having benefitted, receiving over EUR 144 million in grants to date (EC, n.d.<sup>[168]</sup>). Equally, Serbia participates in Eureka<sup>73</sup> and has been a main beneficiary of the Western Balkans Enterprise Development and Innovation Facility (WB EDIF), which has invested in 13 Serbian companies since its inauguration in 2012.

Serbia has continued its **alignment with European STI policies**: the priorities of the European Research Area<sup>74</sup> are reflected in the STI framework and the economy adopted the European Research Infrastructure roadmap in 2018. Serbia is a member of key European research networks and has also adopted EURAXESS's European Charter & Code for Researchers.<sup>75</sup> It facilitates open access initiatives, such as the Open Science Platform to promote science and enhanced access to publications and research data. Serbia has been participating in the EU Innovation Scoreboard since 2012.

### *Sub-dimension 9.2: Public research system*

The new Law on Science and Research establishes excellence in research as a key objective of Serbia's STI framework, while higher education institutes (HEIs) are governed through the Law on Higher Education. HEIs and research and development institutes (RDIs) across Serbia operate relatively autonomously, setting their own research priorities and requiring minimal co-ordination with MoESTD, resulting in a somewhat scattered **institutional structure of the public research system**. RDIs and HEIs undergo regular internal evaluations and some external ones to monitor their performance. However, there is no strategic approach to assessing the performance of public research institutes and it remains unclear whether the results affect public funding availability.

Overall, investment into research in Serbia remains very low at 0.92% of GDP, with only one-third provided by the private sector. Serbia is currently in the process of defining and establishing a new model of financing of research activities. Until recently, **public research funding** has mainly been project-based, but the allocation of funds has not always been transparent or implemented in line with a clear methodology. The Law on Science and Research has a strong focus on reforming the funding model for scientific research, envisaging a clear shift towards performance-based institutional funding in combination with highly competitive project-based financing through the Science Fund. As a result, the Science Fund has a transparent methodology for evaluating projects and follows a two-step review process including the National Council for Science and Technological Development, in line with best practice. However, as it is a relatively new institution, this methodology is yet to be fully tested and evaluated.

The Science Fund is expected to become a key instrument for project-based research funding, with a budget of EUR 4.2 million in 2019, rising to over EUR 7.5 million in 2020, to implement financial support programmes for research. It has already launched a number of programmes, including instruments incentivising closer collaboration between academia and industry (the IDEAS Programme and the Programme to Support the Development of Artificial Intelligence).

A further objective of Serbia's STI strategy is to strengthen **human resources for research and innovation**, amid low capacity of scientific research personnel. The number of full-time researchers has remained relatively constant in recent years (UIS, 2021<sub>[169]</sub>), while more encouragingly, the number of young people entering research has increased in recent years.

In line with the strategic goal to strengthen human resource capacity in the STI sector, the Science Fund has developed the PROMIS Programme which provides young researchers with financial support to initiate research programmes early in their careers, which has triggered high interest. A second programme is the Collaboration Programme with the Serbian Scientific Diaspora, which aims to foster mobility among researchers and provides vouchers to facilitate short-term study visits and collaboration between Serbian research institutes and the diaspora. In addition to these programmes, MoESTD makes scholarships available for doctoral research, co-finances researchers to participate in conferences or professional training, and offers incentives to Serbian researchers returning to Serbia to continue their careers.

### *Sub-dimension 9.3: Business-academia collaboration*

Serbia's STI policies have identified the need for increased integration of scientific research with the private sector, and have put a number of mechanisms in place. The **collaboration promotion framework**

envisaged under the Science and Innovation Strategy encourages the commercialisation of IP, the introduction of technology transfer services, and an extended support infrastructure and financing programmes to encourage collaboration between businesses and academia. However, there is no evidence of a clear roadmap to implement a comprehensive framework. The measures predominately focus on building an STI-conducive infrastructure, awareness raising and visibility, and providing financial support to encourage more engagement of the private sector with RDIs through the Innovation Fund and Science Fund. Although support is extensive and covers a wide range of areas, there are currently no measures in place to encourage technology extension. As the new Law on Science and Research begins to address wide-ranging reform in the governance and funding of public research, more concrete steps to enhance public-private sector research may be expected. The revised intellectual property legislation also favours academia-industry collaboration, covering both research in RDIs, universities and in-company research, and guaranteeing an equal split of proceeds from commercialised IP between the organisation holding the IP and its creator. In 2019, the fees for patents or trademarks were also significantly reduced.

The Innovation Fund remains Serbia's key instrument offering **financial incentives for business-academia collaboration**. In 2016, the fund introduced a collaborative grant scheme, a dedicated finance programme to encourage businesses and RDIs to engage in joint technological projects with a promising business model and commercialisation strategy. Since 2017, the fund has also been offering innovation voucher to SMEs, financing up to 80% of technical research services provided by RDIs that they may need in order to develop or improve their products and services. The fund also runs a technology transfer facility, providing support to RDIs for commercialisation. Companies that evidently support research and development or hire qualified researchers are also eligible for tax relief.

While the focus on financial support has been strong, less attention has been paid to date to developing **non-financial incentives** for business-academia collaboration. To enhance exchanges between researchers and the private sector, the government actively encourages exchanges, sabbaticals or research leave, though there is no evidence of a systematic approach to facilitate these measures. Researchers continue to be primarily evaluated against publication in scientific journals, citations and patents. However, factors such as engagement with the private sector or the impact of research are increasingly being considered, thereby encouraging researchers to engage with businesses. The number of Serbian researchers' successfully participating in the Marie Skłodowska-Curie Actions<sup>76</sup> has increased steadily over recent years, reaching a total of 246 since 2014.

Lastly, Serbia has invested greatly in expanding its **institutional support for collaboration**. Serbia now has four science and technology parks, most notably the one in Belgrade, which has attracted a large number of start-ups since it started in 2016 and also hosts the Innovation Fund. Further efforts need to be made to boost the parks beyond their capacity as incubators. The number of Centres of Excellence has also increased in recent years. There are currently 21 centres, as well as a number of largely self-sufficient technology institutes operating out of Serbia's more urban areas. All major universities have established technology transfer offices, although, these remain largely under-resourced.

### ***The way forward for science, technology and innovation***

Serbia continues to make good progress in developing its science, technology and innovation. It has built the momentum to introduce several key measures, in line with international best practice and often adequately funded. However, several challenges remain in building capacity of the public scientific research system and increasing overall investment in research and development, particularly through the private sector. Such challenges may be addressed by implementing the following measures:

- **Further strengthen the Science Fund.** Following its successful launch in 2019, the momentum should be maintained to further strengthen the agency's capacity and outreach. Political commitment will be needed to fully implement the reformed scientific research funding model. Close monitoring of the its activities and impact will help to optimise operations, where applicable.

- **Implement the action plan of the Smart Specialisation strategy.** Empowering the National Council for Science and Technological Development with a clear mandate to lead and oversee its implementation, in combination with the Strategy on Artificial Intelligence, will ensure comprehensive and well-timed execution.
- **Increase investment in R&D.** The continuing allocation of state budget to the Innovation Fund is an important signal of the government's commitment to the STI agenda. However, further investments are needed to strengthen capacity of the public scientific research sector and attract private sector participation.
- **Build capacity for better enforcement of intellectual property protection.** Building on initial efforts, Serbia should continue raising awareness about the importance and benefits of IP protection and strengthen the capacity of the IP Office to provide support in patent application. Judicial expertise in IP should be strengthened.
- **Stimulate more intense co-operation between industry and academia,** by transforming the existing institutional innovation ecosystem to become a genuine interlocutor for academic research and private sector needs.

## Digital society (Dimension 10)

### Introduction

Table 25.17 shows Serbia's scores for five digital society sub-dimensions and compares them to the Western Balkan average. The economy scores above average across all sub-dimensions and ranks first among the WB6 in use, jobs, society and trust. It, however, scores close to average for access, which mainly reflects the need for further efforts in improving the ICT regulatory policy framework. Digitalisation has been recognised as a powerful enabler of economic growth and, together with education, is a key priorities of the Serbian government. Serbia has adopted a strategy that promotes artificial intelligence as one of the areas with the greatest potential to contribute to these priorities. In the last three years, it has intensified its public administration reform efforts and digitalisation of government services, which is already reflected in increasing users' satisfaction. Serbia is ranked 59<sup>th</sup> out of 193 economies in the United Nations e-Government Survey 2020 (United Nations, 2020<sub>[170]</sub>). It has also made progress in aligning its education system with labour market needs, with special emphasis on digital skills development.

Serbia is the strongest of the WB6 economies in supporting the fastest growing sector in its economy, ICT. Information and communication technologies accounted for 4.9% of GDP in 2019 and generates international visibility for the Serbian economy (SORS, 2019<sub>[171]</sub>). During 2019, exports of ICT services grew by over 20% for the fifth consecutive year (Government of the Republic of Serbia, 2020<sub>[172]</sub>). Serbia also ranks 13<sup>th</sup> among 129 economies in the 2019 Global Innovation Index for the ICT services exports sub-index (Cornell University, INSEAD and WIPO, 2019<sub>[173]</sub>). However, although the government is readily adopting new digital society policies, regulatory impact assessments (RIAs) are not sufficiently systematised and the policy design process is not always informed by regular policy and programme reviews.

**Table 25.17. Serbia's scores for digital society**

Dimension	Sub-dimension	Score	WB6 average
Digital society dimension	Sub-dimension 10.1: Access	3.0	2.9
	Sub-dimension 10.2: Use	3.5	2.4
	Sub-dimension 10.3: Jobs	3.0	2.3
	Sub-dimension 10.4: Society	3.5	2.1
	Sub-dimension 10.5: Trust	2.7	2.2
Serbia's overall score		3.0	2.4

### State of play and key developments

#### *Sub-dimension 10.1: Access*

During 2018, the Serbian government adopted the Strategy for the Development of New Generation Networks by 2023, as its economy-wide **broadband infrastructure** development framework, but a budgeted action plan was never adopted. The strategy is aligned with the overall digital strategy and prioritises the development of cloud computing, the "Internet of Things" and 5G mobile systems, but the lack of dedicated funding has limited its implementation. The Law on Broadband Development that would provide an effective ICT-sector investment framework is still being prepared. The existing framework provides weak incentives for private sector broadband infrastructure investments. Continuing obstacles include unregulated issues and the pending reform of the Law on Planning and Construction which would improve the investment environment for joint construction projects and reduce the costs of developing broadband network infrastructure. Although a Broadband Competence Office has been part of the Ministry of Trade, Tourism and Telecommunications since 2017, its direct effect on the co-ordination of different levels of the government is not yet evident.

Broadband connectivity and penetration are steadily rising. Fixed broadband penetration (i.e. number of subscriptions per 100 inhabitants) was 18.5% in 2019, up from 17.4% in 2018, but still lagging behind European countries and also some of neighbouring economies, like Montenegro (28.5%) and Bosnia and Herzegovina (23.6%) (ITU, 2019<sub>[174]</sub>). According to 2020 statistics, 81% of households in Serbia have some type of connection to the Internet, compared to 91% in the EU (Eurostat, 2021<sub>[175]</sub>). Revenues from electronic communications continue to rise, reaching 3.8% of GDP in 2019 (RATEL, 2020<sub>[176]</sub>). Despite market growth, new generation network (NGN) coverage in rural and remote areas has not been expanding.

In June 2020, the government announced the launch of a new programme for rural broadband development, promising to deliver high-speed affordable communications to more than half a million households in rural areas. The programme aims to use loans provided by the EBRD to support private sector investments in scarcely populated areas, where investment interest in the development of NGNs is limited. During the first phase of the project, in spring 2021, broadband infrastructure development will gradually enable access to high-speed Internet of 100 Mbps for 90 000 households in rural settlements. The project will support the deployment of mid-mile fibre broadband, connecting the existing fibre backbone to 600 schools in white zones<sup>77</sup> in rural areas (EBRD, 2020<sub>[177]</sub>). The project is part of a larger initiative; the second phase, targeting around 900 schools, is planned as a separate project for 2021/22.

Significant progress has also been made in completing Serbia's broadband mapping exercise. The national regulatory agency, the Regulatory Agency for Electronic Communications and Postal Services (RATEL) has implemented a structured, geo-referenced broadband infrastructure mapping application and database that includes cables, antennas and other electronic communications equipment. Its future plans include extending this map to reference all electronic communications infrastructure and to integrate information about infrastructure from other sectors, such as the power distribution network.

Serbia has made limited progress since 2018 in completing the alignment of its ICT **regulatory policy framework** with the EU *acquis*. The new Law on Electronic Communications, expected to partially align with the EU Directive 2018/1972 on Electronic Communications Code and to remove any remaining misalignments with the EU 2009 regulatory framework, has been under preparation since the previous assessment and is expected to be adopted by the end of 2021. RATEL is well staffed and performs regular monitoring of the market and reviews of regulatory policy outcomes.<sup>78</sup> However, the regulator's financial and operational independence has been challenged by concerns about insufficient transparency in enforcing regulations to secure competitive safeguards in favour of the state-owned operator, Telekom Srbija. Despite relevant European Commission's recommendations, no action has been taken to improve this situation so far (EC, 2020<sub>[36]</sub>).

Regulatory impact assessments are implemented on new regulatory proposals, but their outcomes are not publicly accessible on line. EU Directive 2014/61/EU on measures to reduce the cost of deploying high-speed electronic communications networks, which would boost network infrastructure investment, hasn't yet been transposed. With no major regulations adopted since 2018, the regulator's market overview report for 2019 indicates that although all three mobile network operators have around 97% population LTE coverage, territorial coverage still ranges between 72% and 78% (RATEL, 2020<sub>[176]</sub>). In April 2019, Serbia signed the Western Balkan Regional Roaming Agreement, paving the way towards eliminating roaming charges within the region.

The framework for **data accessibility** has advanced significantly since 2018 through newly adopted or updated legislation on the accessibility, transparency and openness of data. This included the Law on e-Government that obliges government bodies to ensure reuse of their data, acting as an initial adjustment of national legislation to meet the EU Public Sector Information (PSI) Directive.<sup>79</sup> A by-law on the detailed conditions for creating and maintaining a web presentation of government bodies, which was adopted in 2018, defines the standards for publishing data and information in machine readable format. During 2018, Serbia adopted a series of other by-laws and regulations, such as the regulation on the operation of the

Open Data Portal and the by-law on the manner of keeping the Metaregister. The Open Data Portal,<sup>80</sup> launched in 2017, contained 273 open data sets published by 58 governmental and non-governmental organizations by the middle of 2020. The Office for IT and e-Government (ITE) co-ordinates the implementation of the data accessibility framework among government bodies and public institutions and monitors their compliance with e-accessibility standards and web presentation.

### *Sub-dimension 10.2: Use*

Serbia has made notable progress in **digital government** development in the last two years, with the adoption of important e-government legislation and programmes demonstrating that digitalisation is a top priority. The new digital government framework includes the Law on e-Government, adopted in April 2018, the Program for e-Government Development 2020-22, adopted in June 2020, and relevant secondary legislation that promotes the digitalisation of public administration and the development of electronic services on the e-government portal. The framework stipulates continuous improvement of legal and regulatory aspects of public administration and it is also in line with the economy's commitments under the Open Government Partnership<sup>81</sup> (OGP) action plan. Serbia also adopted the Artificial Intelligence (AI) Strategy in 2019, and the action plan for its implementation in June 2020, aiming to investigate the integration of AI technologies into e-government services, making it a front runner in this area in the Western Balkans region.

Given the cross-sectoral nature of digital government, the framework prescribes the creation of horizontal co-ordination mechanisms, including the ITE and the e-Government Coordination Council. The ITE is a key body in the policy governance structure, and is specifically engaged in the design, planning and implementation of related ICT systems. The ITE is also in charge of the Government Data Centre and the use of cloud technologies in e-government. The e-Government Coordination Council monitors and reports on the implementation of the Program for e-Government Development. In an effort to demonstrate progress and increase public access to programme outputs, the Ministry of Public Administration and Local Self-Government has created an online tool for monitoring the progress of the Public Administration Reform Strategy process, which provides data, statistics and reports regarding the implementation of the strategy's 2018-22 action plan.<sup>82</sup> By the end of 2020, the platform reported that 47% of planned activities had been implemented. The ministry has also leveraged donor co-financing to support the reforms through several projects outlined on its website.<sup>83</sup>

Over 1 million of Serbia's 7 million citizens have used the e-government portal<sup>84</sup> so far. Although citizen engagement is not yet as high as desired, the Program for e-Government Development aims to strengthen users' trust and improve their experience in using digital government services. Serbia is currently designing a more modern e-government portal and developing an e-participation module. The portal currently offers services provided by 20 state and 6 local authorities, including in areas of health, education and employment. "My First Salary" programme, subsidizing the first work experience of young graduates, is also accessible on the portal and implemented in a fully digital process, supported by an AI recommendation algorithm to match candidates and vacancies (OECD, 2020<sub>[178]</sub>). During the COVID-19 pandemic, the ITE and the Health Insurance Fund developed a service on the e-government portal that allows citizens to receive email and text notifications, when their COVID-19 test result is ready. In other cases, however, the services on offer only allow applications to be submitted or appointments scheduled, rather than entire administrative procedures to be completed on line.

Serbia has actively supported **private sector ICT adoption** since 2018, integrating relevant measures into a number of digital society policy documents. Leveraging e-commerce to boost the adoption of ICT, the government adopted the Programme for e-Commerce Development 2019-20 with an action plan, which includes incentives for e-traders (e.g. tax relief), awareness-raising activities promoting e-commerce development and consumers' trust, and measures to improve e-commerce legislation, logistics and financial infrastructure for e-commerce. The programme targets SMEs in all sectors, particularly focusing

on companies with limited IT capacities and those making unregistered (informal) online sales through social media or other channels. It provides training, mentoring and guidelines for e-traders<sup>85</sup> and supports those who wish to start registered online sales, contributing to the reduction of the online grey economy.

The use of ICT to modernise business operations in all branches of the economy is also an integral part of the action plan for the implementation of the Strategy for the Development of Information Technology (IT) Industry 2017-20. This strategy provides schemes to support companies, including consulting services to help them incorporate ICT solutions into their business practices and financial support for purchasing the necessary software or hardware equipment.

The government has not always fully budgeted awareness raising and training activities linked to these policies, but they have been supported by donors and the Chamber of Commerce and Industry in Serbia. The chamber continues to play a pivotal role in activities promoting private sector ICT adoption. Its key initiative, in collaboration with the MTTT, was establishing the Centre for Digital Transformation (CDT) in 2018, as a service unit that provides SMEs with hands-on support and information sharing on technical and funding issues, consulting, and training on digitalisation. The CDT is also focused on promoting the use of technological innovation across industries, providing qualitative analysis, and recording the current state of affairs regarding digitalisation in Serbian enterprises.

The CDT and the Development Agency of Serbia were supported by the German Organization for International Cooperation (GIZ) to implement the MSMEs 2019-2020 Digital Transformation Support Programme<sup>86</sup> for business digitalisation. Their efforts were continued and intensified during 2020 to address the adverse effect of the COVID-19 pandemic on micro, small and medium-sized enterprises (MSMEs), through two emergency support programs, SPEED 1.0 and SPEED 2.0, offering cost-free support to companies and helping them improve their business in line with digital trends and switch to remote work and online operations with customers and suppliers (WB6 CIF, 2020<sub>[179]</sub>). The MSME digitalisation programme has supported more than 700 companies so far in Serbia and Republika Srpska in Bosnia and Herzegovina.

### *Sub-dimension 10.3: Jobs*

Serbia has strengthened its policy framework on the development of **digital skills for students** since the last assessment in 2018. In 2020, it adopted the Strategy for Digital Skills Development 2020-24,<sup>87</sup> but without a budgeted action plan so far. The strategy and with the Law on the Education System Foundations from 2017, create positive conditions and align the policy framework with international standards for the development of basic and more advanced digital skills for students at all levels of the education system. Although there is no common digital competence framework for students, a certain level of digital skills is obligatory in pre-university education and is assessed according to the national rulebook. Computer information systems was introduced as a mandatory course for all students starting from Grade 5 of primary school, and the curricula are designed in consultation with the IT industry stakeholders. The number of specialised IT classes was also increased in the gymnasiums (secondary schools), while teachers working with specialised IT classes attend additional training. At the request of industry and parents, new digital skills profiles have been introduced for students at VET secondary schools, according to a dual VET system. Box 25.15 gives an example of the use of innovative methods to promote digital skills among students in Serbia.

### Box 25.15. Innovative teaching and learning to develop students' digital skills

In 2018, in order to improve teaching at tertiary education faculties in Serbia and to promote digital skills for students with innovative courses and teaching methods, a public call for ideas was held. Professors were invited to submit ideas for innovative programmes, and 166 teams of professors responded, of which 66 were selected to implement their ideas. The teams received funding ranging from RSD 250 000 to RSD 1 million (around EUR 8 500). When selecting projects, particular emphasis was placed on the degree to which they increase the use of information technology in the teaching and learning process, as well as how far they followed market needs and developed students' entrepreneurship skills and co-operation with other stakeholders in the local community.

Source: (Council for Innovative Entrepreneurship and Information Technologies, 2019<sup>[180]</sup>), Priority Measures and Activities of the Government Bodies for Enhancement of the IT Sector in Serbia in 2019, with Report for 2018, <https://www.srbija.gov.rs/tekst/en/137375/plan-for-the-it-sector-improvement.php>.

During the COVID-19 pandemic, MoESTD, in collaboration with ITE (which provided technical support and hosting), set-up a Moodle learning management system called My School. MoESTD manages the My School portal, but from the very beginning of the use of distance learning during the pandemic, the rich digital content on the portal has been contributed by primary and secondary teachers of all subjects on a voluntary basis. MoESTD is planning to make My School the national platform for e-learning management.

Although 95% of schools are reported to have the computer equipment needed to implement computer science teaching, digital skills' development in the education system is hampered by outdated computers and ICT equipment, low computer-to-student ratio (0.3 in 2018, compared to 0.81 in the EU) and limited connectivity speeds outside the main urban centres (OECD, 2020<sup>[181]</sup>). In efforts to improve the digitalisation of teaching, 10 000 laptops have been delivered to school classrooms since 2018. The MTTT also launched the Connected Schools project in 2019 to provide Internet access in primary and secondary schools. So far, around 1 600 schools have been connected to the Academic Network of Serbia (AMRES) and another 400 schools were provided with wireless connectivity. The project aimed to deliver wireless local area network (WLAN) connectivity to an additional 500 schools by the end of 2020 and connect all remaining schools (over 4 000 main and remote facilities) by the end of 2021, provided that technical requirements for WLAN rollout are fulfilled, as part of the rural broadband rollout project supported by the EBRD (see Sub-dimension 10.1: Access). According to the MTTT, approximately 92% of primary and secondary schools had a broadband connection of 10 Mbps or more by mid-2020.

Serbia is developing a strong framework for **digital skills for adults** to address the needs of the labour market through the Digital Skills Development Strategy 2020-24. The strategy was informed by a variety of stakeholders, and particularly the ICT industry, due to their growing demand for highly skilled ICT professionals. The strategy prioritises basic digital skills development for all citizens, including marginalised groups, and digital skills for the workplace, as well as training programmes for the unemployed. However, its implementation has not yet started<sup>88</sup> and the expected co-ordination mechanisms, like the local coalitions for the development of digital skills that ensure participation of various stakeholders in curriculum development for IT training programmes, are yet to be established.

The establishment of the Agency for Qualifications and the Sector Skills Councils in 2018 were steps towards bridging the identified skills' gaps. During 2019, the councils started to provide information about the needs of users and the labour market and to propose the list of qualifications by levels and types. MoESTD also published a revised Digital Competence Framework – Teacher for a Digital Age 2019 to help teachers integrate digital content into their practice. However, the European Commission has flagged the lack of systematic teacher training to support the implementation of new curricula and the development of students' key competencies, and outdated VET qualifications (EC, 2020<sup>[36]</sup>).

The conditions for non-formal adult learning in Serbia are outlined in the Law on Adult Education and the Law on the National Qualifications Framework. The Centre for Accrediting Publicly Recognised Adult Education Providers, part of the Agency for Qualifications, enables the accreditation of training programmes. The by-law on accreditation makes specific reference to digital skills for adults and requires all ICT-related non-formal adult education programmes to align with European Computing Driving Licence (ECDL) standards. Vocational qualifications are recognised from a lifelong learning perspective and trainees are certified according to the Law on Adult Education. The Centre for Vocational and Adult Education, part of the Institute for the Improvement of Education, is the body focused on the development of adult education programmes.

The action plan of the National Employment Service for 2018 also includes IT training within the government's IT requalification programme. During 2018, the NES organised specialist IT training for 778 participants in various cities in Serbia that covered programming and web applications (250-400 hours each) and internships with companies. The government also adopted the Programme for Enhancing Women in ICT for the period 2019-20 to increase digital literacy and competencies among women in rural areas to help them start their own business on line.

**ICT sector promotion** is supported by a number of sectoral and cross-cutting policies that promote the growth and internationalisation of Serbian ICT companies. ICT sector exports have grown constantly over the last decade and the average salary in the sector is more than twice as high as in other industries, while Each ICT sector job is claimed to create an additional 4-5 jobs in other sectors (Council for Innovative Entrepreneurship and Information Technologies, 2019<sup>[180]</sup>). The advanced implementation of the Strategy for Development of Information Technology Industry 2017-20 underpins these positive trends. The strategy reached the end of its term and an impact assessment is expected, but a new strategy is currently being developed. The government devoted resources and high-level co-ordination to its implementation, demonstrating clear recognition of the sector's contribution to the economy. For instance, the Office of the Prime Minister provides a strategical overview and initiates policy changes for the ICT sector. The Prime Minister is also the president of the Council for Innovative Entrepreneurship and Information Technology, where ministers, academia representatives, and the Governor of the National Bank of Serbia participate as council members.

Most major global IT companies have established development centres in Serbia or outsourced services to local IT companies. The 2019 Global Innovation Index report ranked Serbia on 21<sup>st</sup> out of 129 economies, in mobile applications development (Cornell University, INSEAD and WIPO, 2019<sup>[173]</sup>). However, the IT industry is interested in rebranding Serbia from an outsourcing destination to a world-class centre for innovation. The majority of financial instruments and policy programme measures for ICT Sector promotion focus on innovation support and exports of products and services. UNDP Serbia funded a programme for improving business capacity in the IT sector in co-operation with the Office of the Prime Minister and the ITE. The programme supported the transfer of business knowledge for innovative product development and better positioning of the domestic IT industry and its products in the global market.<sup>89</sup> The ICT industry can also use financial instruments and programmes, not specific to ICT, including tax incentives for R&D and start-ups, funding for innovation activities (e.g. provided by the Innovation Fund), and support for internationalisation provided by the Development Agency of Serbia.

#### *Sub-dimension 10.4: Society*

Serbia has made positive progress in improving its **digital inclusion policy** framework through the digitalisation of public administration, while plans to empower citizens through digital skills and rural broadband development should help reduce the digital divide in the immediate future. Digital inclusion measures have been included in a number of policy documents on e-government development, broadband infrastructure development and education reform since 2018, but in some cases the relevant activities are not prioritised in action plans or resources are insufficient. The Ministry of Labour, Employment, Veterans

and Social Affairs has adopted strategies for people with disabilities and protecting children from violence that include measures for digital inclusion through access to information and safety on line, starting implementation in 2020. The Social Inclusion and Poverty Reduction Unit (SIPRU) provides strong co-ordination of the implementation of the digital inclusion framework at the highest level of government and across public institutions. The SIPRU publishes a report on digital inclusion every four years, but despite these efforts, the monitoring of indicators is insufficiently systematised and dispersed among the government bodies implementing the various programmes (Government of Serbia, 2019<sub>[182]</sub>). E-accessibility guidelines in line with international standards are applied to public sector websites, as discussed in Sub-dimension 10.1: Access.

The single electronic register of Serbian citizens and the eZUP information system (i.e. the Government Service Bus) delivers government-to-government (G2G) services. This eliminates the need for citizens to engage in gathering documents from different public services, advancing inclusion through digital technologies. Its effect is particularly evident in remote and underdeveloped areas, saving citizens time and resources when accessing public services. The recently launched rural broadband development programme and the ongoing implementation of the NGN strategy (see Sub-dimension 10.1: Access) aim to bridge the digital divide by providing free access to the Internet in public places in remote areas and ensuring that affordable services are available to all citizens throughout Serbia.

Significant regulatory changes are also planned for digital inclusion in education, including the Regulation for the Activity of Resource Centres for Assistive Technologies (supporting schools to provide inclusive education), and the Regulation for Distance Learning and the rigorous application of the instructions for the development of teaching materials in line with the universal design principle. The MTTT has supported numerous projects, co-financed through international co-operation programmes and civil society initiatives, in online safety, protection from digital violence and support for increasing digital literacy among vulnerable groups. The Programme for Enhancing Women in ICT for the period 2019-20, raising the digital competencies of women in rural areas is one successful example.

#### *Sub-dimension 10.5: Trust*

Serbia has taken steps to improve the framework for **privacy protections** through the new Law on Personal Data Protection (PDP) in August 2019, which partly transposes the EU General Data Protection Regulation (GDPR) 2016/679 and the Police Directive<sup>90</sup> (EU) 2016/680 into national law. Eight by-laws aligned with the new PDP Law were adopted in 2019, but the framework requires further attention for full alignment with the GDPR (e.g. on restrictions imposed on data subjects' rights), as well as in harmonising outdated sectoral laws. The Ministry of Justice had planned relevant activity for the last quarter of 2020.

However, enforcement of the framework and capacity among public officials is rather weak. A new Commissioner for Information of Public Importance and Personal Data Protection was appointed in July 2019, after seven months of temporary governance, but obstacles to exercising the rights of the commissioner and enforcing decisions persist, especially with regards to the Law on Free Access to Information of Public Importance, which provides a weak legal framework.<sup>91</sup> On a positive note, in January 2021, the Ministry of State Administration and Local Self-Government has formed a working group to amend this law, including the commissioner as a member. The National Assembly also considered the commissioner's annual report for 2018<sup>92</sup> (for the first time since 2014) and adopted certain conclusions to strengthen the enforcement of the framework; however most of these have not been implemented (Commissioner for Information of Public Importance and Personal Data Protection, 2020<sub>[183]</sub>).

Neither digital and online privacy protections, nor public information disclosure and transparency, are yet embedded in public sector mindsets in Serbia. Even the final text of the new PDP Law regarding data subjects' rights includes an article listing limitations to these rights, omitting the original text that stated they could only be restricted by law. This would mean that state institutions or private companies processing citizens' personal data could arbitrarily restrict their rights as data subjects. The law also fails

to cover video surveillance, a particularly important aspect of personal data processing. The installation of smart video surveillance in Belgrade is indicative of this climate. The installation includes thousands of cameras and face-recognition software that raised public concern, and analysis by civil society organisations found it was breaching the new PDP law. The commissioner has also ruled that the assessment of the impact of processing on personal data protection using video surveillance system submitted by the Ministry of Interior was not done in accordance with the PDP Law (Commissioner for Information of Public Importance and Personal Data Protection, 2019<sup>[184]</sup>).

Serbia has demonstrated its intention to improve **consumer protection in e-commerce** and to align the framework to international practices and standards. The government adopted a new Strategy for Consumer Protection for 2019-24 and an action plan for 2019-22. It also amended the Law on e-Commerce and adopted a new Law on Trade in 2019. A specialised donor-funded Programme for e-Commerce Development was launched in 2019 to address obstacles to e-commerce development. The first positive achievement was the publication of a Guide to e-Commerce, and relevant web services for consumers,<sup>93</sup> delivered by the Department for Digital Agenda Development in the MTTT. The MTTT's Consumer Protection Department enforces the law and maintains the National Register of Consumer Complaints. The ministry also conducted a public awareness campaign to boost consumers' trust in e-commerce, and to promote the safety of e-banking and card payments. It also implemented the EU-funded Twinning project<sup>94</sup> (2017-19), to improve public sector capacity to protect consumers using e-commerce.

The improved framework for **digital security risk management** is also gradually increasing levels of trust in electronic services and information systems in Serbia. The recent adoption of the new Strategy for the Fight Against Cybercrime 2019-23 complements the implementation of the Information Security Strategy 2017-20, which has led to significant improvements in the relevant legislation since 2017. The government has sufficient resources and capacity to implement these strategies and continues capacity building in methods and tools for combating cybercrime. The Body for Coordination of Information Security Affairs provides horizontal co-ordination among public bodies involved in digital security risk management.

The national computer emergency response team (CERT) operates as a unit of RATEL and has been accredited according to international standards since 2019. Its human resources remain very low, due to continuing restrictions on creating new posts in the public sector, despite the amended Law on Information Security from 2019 that specifically stipulates increasing human resources for the national CERT. Co-operation with other domestic, public and private sector CERTs is ongoing and capacity building programmes are being implemented for public authorities and businesses. The Serbian competent authorities and the national CERT are actively engaging in international co-operation in the fight against cybercrime. However, although some information security data are being collected through surveys, no regular monitoring of digital risk management indicators is in place.

### ***The way forward for digital society***

Despite taking some significant steps to improve its digital society policy framework, the government should pay more attention to the following aspects:

- **Accelerate the adoption of new laws and regulations to ensure an enabling ICT investment framework**, including the new Law on Electronic Communications and the Law on Broadband Development. An improved legal and regulatory framework that aligns with the EU and reduces the cost of developing and sharing broadband network infrastructure will be vital for reaping the benefits of the “gigabit society”. The government will need to transpose EU Directive 2018/1972 on Electronic Communications Code and Directive 2014/61/EU on measures to reduce the cost of deploying high-speed electronic communications networks, especially with the launch of its ambitious rural broadband development project in 2021.
- **Strengthen the demand for open data innovation through inclusive co-creation processes to enable re-use of public sector data by the private sector to deliver e-services and**

**applications to citizens.** Although the legal and regulatory framework is advanced, few datasets have been published so far. The general public have not been widely engaged and the level of informed public debate on data-driven issues remains low. The government will need to raise public awareness, build the capacities of public officials and develop public-private partnerships on open data innovation.

- **Systematise the monitoring of digital government indicators to support informed policy making.** Despite making some progress in implementing the digital government framework, and individual external evaluations of the public administration reform process, there is not yet a database of digital government indicators. No public authority is publishing consistent reports on specific measurable indicators.
- **Accelerate the implementation of the Strategy for Digital Skills Development 2020-24** with the development of an action plan and sufficient budget allocation. Although the adoption of the strategy undoubtedly constitutes a positive step forward, specific resources need to be allocated to implementing the measures and activities it includes. Serbia has a realistic opportunity to respond to the need for highly skilled ICT professionals among its IT industry and to effectively rebrand Serbia from an outsourcing destination to a world-class centre for innovation. A regularly updated database of digital skills indicators will also be needed to monitor policy impact.
- **Empower citizens to reap the benefits of digitalisation and monitor progress in digital inclusion.** As digitalisation of government and public services accelerates, it will be important to strengthen digital literacy and digital competency programmes for underprivileged groups of the population, to avoid deepening the digital divide. The SIPRU has developed a set of indicators for e-inclusion, pending implementation within the Unique Register of institutions, specifically referring to information accessibility. This could be augmented with digital inclusion indicators drawn from the fields of electronic communications, education, social protection and online safety and privacy, in collaboration with competent bodies. A systematic, cross-cutting, approach to monitoring digital inclusion indicators would enable regular policy impact assessments and better policy design.
- **Complete the alignment of the framework for personal data protection with the EU and ensure its stronger enforcement.** The government should complete its alignment with the GDPR Directive (EU) 2016/679, update the law on access to information and update or adopt necessary relevant secondary legislation. Combined with public sector capacity building, the ultimate goal of these reforms should be to remove obstacles that reduce the executive power of the Commissioner for Information of Public Importance and Personal Data Protection, improve the voluntary disclosure of information by public institutions, and impose greater transparency and accountability of public authorities without exceptions.

## Transport policy (Dimension 11)

### Introduction

Since the last Competitiveness Outlook assessment in 2018, the main improvements Serbia has made have been in procurement and implementation, followed by transport project selection, combined transport and environmental sustainability. It has made moderate progress in rail regulation sector and progress in asset management has stalled. Serbia's performance in the transport policy dimension is the highest in the region and significantly above the WB6 average (Table 25.18) but further efforts are still needed to achieve the EU average level. Serbia scores above the WB6 regional average in all three sub-dimensions of the transport dimension. Serbia shares the lead with Albania for the planning sub-dimension while for the governance and regulation and sustainability, it scores the highest in the WB6 region.

**Table 25.18. Serbia's scores for transport policy**

Dimension	Sub-dimension	Score	WB6 average
Transport policy dimension	Sub-dimension 11.1: Planning	3.3	2.3
	Sub-dimension 11.2: Governance and regulation	3.8	2.6
	Sub-dimension 11.3: Sustainability	2.2	1.3
Serbia's overall score		<b>3.0</b>	<b>2.0</b>

### State of play and key developments

#### *Sub-dimension 11.1: Planning*

In the area of **transport vision**, Serbia has continued to follow the Plan of Rail, Road, Inland Waterway, Air and Intermodal Transport Development 2015-20 as the draft National Transport Strategy (NTS) for the period 2016-25 has not yet been approved. The measures needed to improve the transport sector have also been based on the General Transport Master Plan (GTMP) for 2009-27. The GTMP has a clear vision and measurable objectives, including a timeline for implementing the proposed measures. It uses a transport model to prioritise and rank the recommended measures across all transport modes, including intermodal transport, and has defined budgets for both implementation and maintenance. The priority projects presented in the strategy have been adopted for development after wide-ranging consultation with the relevant stakeholders. Multimodality has been considered in all these documents.

The NTS is outdated and the updated version should take into consideration the GTMP and the individual strategies that have since been developed for each transport mode. It should also take into consideration the fact that some municipalities and regions have made significant economic progress, directly influencing transport demand and infrastructure needs. The adoption of the strategic transport documents has not gone smoothly, with some of the documents remaining as drafts and a national strategy still not in place. Serbia's transport-related strategic documents have been aligned with the commission staff working document on EU Enlargement Policy up to 2019.<sup>95</sup> The European Commission issued a new working document in October 2020 (EC, 2020<sub>[36]</sub>) and, as required in the terms of reference (ToR) for the development of the NTS, it is expected that the new NTS will be fully aligned too.

The development of a new NTS for the period 2022-30<sup>96</sup> is currently under tender, which should include analysis and alignment with the remaining requirements of the EU accession Chapters 14 (Transport policy) and 21 (Trans-European networks). It will therefore directly generate a set of actions and measures that will bring the transport sector closer to European standards and improve regional trade and transport integration.

The existing transport strategies are aligned with the tourism policy to a certain extent as the Master Plan for Marking Touristic Objects in Serbia (Public Enterprise Roads of Serbia, n.d.<sub>[185]</sub>), and the Rulebook for

Cycle Path Design (Public Enterprise Roads of Serbia, 2012<sup>[186]</sup>) have been developed and adopted, showing a holistic policy-making approach. A new governance tool<sup>97</sup> from 2020 is expected to facilitate inter-ministerial communication as all ministries can use the same procedure to identify capital projects, and their pre-selection, financing, implementation, monitoring and impact assessment. They will all be co-ordinated through the same procedure by the Ministry of Finance. The degree to which the policy has been implemented is not entirely known as there are no monitoring reports of implemented strategies available. The Republic Commission for Capital Investment was established in 2020, and will be in charge of confirming the pre-selected investments, selecting capital projects based on their relevance, and doing the justification and compliance checks of the funding sources. Some legislation has been adopted (see the individual transport modes below) as a result of the transport strategy but the level of harmonisation with the Transport Community Treaty (TCT) is not available.

The last Competitiveness Outlook recommended co-operation with other WB6 economies to exchange experience on a common approach to transport planning. This has taken place, particularly through the cross-border co-operation programmes (EC, n.d.<sup>[187]</sup>), projects related to transport facilitation at border crossing points (BCPs) with Montenegro and North Macedonia, and co-operation over the realisation of Bar-Boljare highway along Route 4 (EC, 2015<sup>[188]</sup>). Co-operation also takes place through participation in EU regional strategies such as the EU Strategy for the Development of the Danube Region (EUSDR, n.d.<sup>[189]</sup>) and the EU Strategy for the Adriatic and Ionian Region (EUSAIR, n.d.<sup>[190]</sup>). Such regional co-operation, and exchange of good practices, needs to take place on a regular basis and be intensified, as the proper development of a transport vision and planning can only happen through regular regional discussion, leading to a single and competitive regional transport market.

Since the last assessment, Serbia made excellent progress in developing legislation for **transport project selection** and implementation. The Rulebook on the Management of Capital Projects (Ministry of Finance, 2019<sup>[191]</sup>) was adopted in 2019 and the Law on Special Procedures for the Implementation of the Project of Construction and Reconstruction of Line Infrastructure Structures of Particular Importance to the Republic of Serbia<sup>98</sup> in 2020. The procedure by which projects are identified, analysed for relevance, pre-selected, funded, implemented, monitored (during and after implementation), and their impact assessed is clear and publicly available (Government of Serbia, n.d.<sup>[192]</sup>), and co-ordinated by the MoF. The prioritisation process, which is applied to all capital projects, uses, among other criteria, cost-benefit analysis (CBA), environmental and social impact, and safety assessment.

A pre-selection tool has been developed and access to the Public Investment Management Information System is under development, which should improve the efficiency of the monitoring of capital projects. *Ex post* monitoring and impact assessment is to be conducted for all third category projects<sup>99</sup> three years after the completion of works, which is a significant advance on the existing legislation. Serbia also needs carry out regular *ex post* monitoring and impact assessment of its prioritisation and implementation processes (on an annual basis) based on which the prioritisation and implementation framework could be regularly adjusted. The first single project pipeline has been developed but it is neither publicly available nor regularly updated, according to information provided by the government.

There are national guidelines for road transport CBAs, but they are outdated and require either updating or the development of new ones. Up to now, the EU's 2014 CBA guide has been used (EC, 2014<sup>[193]</sup>). National CBA guidelines should be developed as soon as possible and regularly updated, which will help to prioritise and control funds. The prioritisation framework does not take affordability into account, so the project selection framework should be updated to incorporate affordability, directly assessing whether the projects under consideration are affordable for wider population but also for the economy. The government has the human and financial capacities it needs to carry out the transport project selection process.

In the area of **implementation and procurement**, the new Law on Public Procurement (2019) allows alternative procurement processes for specific groups of projects defined by the implementation strategy (projects funded based on the contracts as a result of international co-operation for which Serbia has to

inform the European Commission, projects funded by international organisations, etc.). The roles and responsibilities of the government bodies involved are defined, including those with oversight of the procurement and monitoring of public-private partnerships. The public enterprises (Public Enterprise Roads of Serbia, Serbian Railways Infrastructure, Serbia Cargo, etc.) with jurisdiction over individual transport modes have adequate human and financial capacity to execute their procurement and implementation tasks.

Horizontal co-operation with other WB6 economies over implementation and procurement is well established and good practice shared and applied where possible, for instance the development of one-stop-shops (OSSs)<sup>100</sup> at the road and railway border crossing points with North Macedonia. Procurement procedures have only been consistently monitored through the regular annual audits conducted by the State Audit Institution (State Audit Institution, n.d.<sup>[194]</sup>). No exchanges of good practice have taken place related to the lessons learnt from the implementation and procurement of PPP projects in the region.

Serbia is making moderate progress in the development of its **asset management system**.<sup>101</sup> An asset management system is not required by the national legal framework but each public entity needs to have the list of the inventory under its jurisdiction. The key objective of a well-developed asset management system is to provide justification for the maintenance budget and to help to direct limited funds towards those areas where the return on investment will be greatest. A soundly developed system should be considered an integral component of the transport planning, identification, prioritisation, implementation, monitoring and impact assessment processes.

Some efforts have been made in the last few decades to establish an asset management system as presented in the Preparation of Maintenance Plans 2018-2022 for Road/Rail TEN-T indicative extensions to WB6 (CONNECTA, 2018<sup>[195]</sup>)<sup>102</sup> but these have not been successful, although some partial actions have been undertaken since the last assessment. The road sector uses the highway development and management (HDM-4)<sup>103</sup> tool for road maintenance and planning and there are various databases for structures. The data are surveyed occasionally but not regularly updated, mainly due to lack of funds and capacity. The same applies in the railway sector; a railway infrastructure asset management system was tested by Serbian Railways during 2010-13, but no regular monitoring of the condition of railway infrastructure assets has been performed since then. A project to determine the condition of the state road network is in the final stage, while a contract to install 54 road meteorological stations, including software and training on the Road Weather Information System, was signed at the end of 2019. There are ongoing performance-based maintenance contracts (PMBCs) for the maintenance of 3 000 km of roads, while the remaining 12 000 km are maintained through ongoing contracts. If PMBCs were implemented for all roads, this could lead to roads being maintained to predefined conditions at relatively low cost. In 2020, the Serbian Railways Infrastructure adopted a programme for the construction, reconstruction and maintenance of railway infrastructure and organisation and management of rail traffic for 2021-24.

The government will need to make more efforts to follow and implement regional asset management plans. The road asset management system needs to be integrated into the policy framework, becoming the basis for the assessment, operation and maintenance of transport assets in the economy. One very good example, recently established in the region, is Albania's financial management system, which also includes asset values. Other good examples can be found in North Macedonia (road asset database, bridge asset databases, etc.). Co-operation with the Albanian authorities to exchange good practice could be worthwhile in this area.

### *Sub-dimension 11.2: Governance and regulation*

Since the last assessment, reforms have progressed in the field of **aviation regulation**. Serbia has fully transposed the Single European Sky (SES) I package into national law, along with a large number of SES II regulations. In the field of air traffic, Serbia has fully completed the transposition and local implementation of SES I and SES II. Serbia is not a member of any functional airspace block (FAB), which could help it

avoid national fragmentation which in turn affects safety, limits capacity, and above all, adds to costs. On a positive note, Serbia has a similar arrangement to a FAB with Montenegro through the Serbia and Montenegro Air Traffic Services (SMATSA), and has established a free route airspace with Austria, Bosnia and Herzegovina, Croatia, Montenegro, and Slovenia, which reduces fuel consumption and emissions, and improves flight efficiency. The Civil Aviation Directorate (CAD) is Serbia's national supervisory authority<sup>104</sup> and is adequately staffed to fulfil its obligations.

The EU Airport Charges Directive has been transposed.<sup>105</sup> The market is monitored regularly by the CAD as required by the EU Air Service Regulation, which provides the economic framework for air transport on the granting and oversight of operating licences of Community air carriers, market access, airport registration and leasing, public service obligations, traffic distribution between airports, and pricing. An air traffic management plan has been developed and is monitored regularly through the Local Single Sky Implementation Monitoring (EUROCONTROL, 2019<sub>[196]</sub>). A safety culture, covering safety risk assessment and safety assurance, is being fostered through a State Safety Programme, designed as an integrated set of regulations and activities aiming to improve safety (e.g. safety risk management, safety assurance). The programme adopted by the government is being implemented through the State Safety Plan published by the CAD.

Air traffic is growing in Serbia. The total number of passengers transported from all airports by approximately 13.4% between 2017 and 2019 to 6.4 million passengers, compared with global growth of 4% (IATA, 2020<sub>[197]</sub>) and EU average growth of 4% (Eurostat, n.d.<sub>[198]</sub>) over the same period. Given the significant growth of this transport mode and projected importance for the economy, it will be important for Serbia to continue its regulatory reforms and bring the governance of the aviation sector closer to European standards and international good practice.

Serbia has made substantial progress in **rail regulation** since the last assessment. The Third Railway Package (EC, n.d.<sub>[199]</sub>) of 2007 has been fully transposed while the Fourth Railway Package (EC, n.d.<sub>[200]</sub>) of 2016 is expected to be transposed by 2022. The Law Amending the Law on Railways is expected to be adopted by the end of 2021. However, the degree of active policy implementation and the implementation of the regional Rail Action Plan (Transport Community, 2020<sub>[201]</sub>) is not currently available. A Network Statement (NS) is issued only for infrastructure, but includes some data related to service facilities. National legislation<sup>106</sup> has been aligned with the EU Regulation on Access to Service Facilities and Rail-Related Services 2017/2177 since 2019, and therefore the NS will be published as of 2021. EU Interoperability Directive 2016/797 has been transposed and implemented, helping to reach an optimal level of technical harmonisation to facilitate, improve and develop international rail transport services within the EU and with third countries.

The Directorate for Railways is the regulatory body and safety authority, including supervising the implementation of legislation, and has had enough capacity so far. However, the amended Law on Railways (2020) has expanded its remit (cableways, passenger rights, licensing, market regulation, metro, etc.) so it is estimated that it will need additional staff. The market is open to local companies while the opening of the market for foreign companies depends on bilateral agreements and the compliance of the origin country with the EU's Transport Community Treaty (TCT). There are currently two state-owned operators and ten private operators, of which two are responsible for maintenance. This is the largest number of private operators in the region and could serve as a regional good practice example of an open rail market. The National Register of Railway Vehicles has existed since 2013 although the new National Vehicle Register will be transformed in line with EU Commission Implementing Decision 2018/1614 into a centralised registry for European Vehicle Register vehicles. The EU Rail Freight Corridor Regulation has been transposed and the first freight corridor developed: the Alpine-Western Balkan Rail Freight Corridor (going through Austria, Bulgaria, Croatia, Serbia and Slovenia),<sup>107</sup> which will increase the competitiveness of rail against other modes.

Serbia has advanced bilateral co-operation in the railway sector, by signing border crossing agreements with North Macedonia and Montenegro. Since the last assessment, the Ministry of Construction, Transport and Infrastructure has initiated a process to sign or renew border crossing facilitation agreements with all other neighbouring economies (Bulgaria, Croatia, Hungary, Romania, etc.) but this is only in progress with the Government of Croatia, with agreement expected during 2021, while the other economies have been either slow or reluctant to respond.

**Table 25.19. Trends in rail transport of passengers and goods in Serbia (2017 and 2019)**

Rail network utilisation	Change over 2017-19 (%)	2019 (million)	share of the EU average (2017) (%)
Passengers (passengers*km/km of track)	-14	0.085	3.9%
Freight (tonnes*km/km of track)	-1	0.861	44.4%
Rail network utilisation (train*km/ km of track)	-24	0.005	22.4%
Rail fleet utilisation	Change over 2017-19 (%)	2019	share of the EU average (2017) (%)
Passengers (passengers*km/train*km)	+39	32	23.7%
Freight (tonnes*km/ train*km)	-22	516	90.8%

Source: Inputs provided by the government as part of the quantitative questionnaire (CO2021); (European Commission, 2019<sup>[202]</sup>); (Statistical Office of the Republic of Serbia, 2021<sup>[203]</sup>)

Road freight transport's mode share is 70%, significantly higher than that of rail, at 24%, and similar to the EU average of 75.3% for road, 18.7% for rail, and 6% for inland waterways in 2018 (Eurostat, n.d.<sup>[204]</sup>). Rail transport has shown a slight decline (Table 25.19). There is still much to be done<sup>108</sup> to achieve the numbers which will make the rail network cost-effective and achieve rail utilisation levels close to the EU average. Increasing rail's mode share could also have direct positive effects on air pollution and climate change.

In the context of **road market regulation**, good progress has been made, with significant efforts undertaken to harmonise legislation with the TCT. Legislation on the transport of dangerous goods, training of professional drivers, certificates of professional competence, driver's qualification cards, and working times of vehicle crew engaged in road transport and tachographs has been further aligned with TCT requirements.

Serbia continues to participate in the European Conference of Ministers of Transport (OECD-ITF, 2014<sup>[205]</sup>) multilateral quota system, which enables hauliers to undertake an unlimited number of multilateral freight operations in 43 European countries participating in the system. Its regulations comply with the road haulage qualifications standards for companies, managers and drivers under the Quality Charter for Road Haulage (OECD-ITF, 2015<sup>[206]</sup>).

Road network performance<sup>109</sup> is regularly measured for some indicators and occasionally for others. There is still space to improve the list of indicators<sup>110</sup> to assess the performance of the road network better. The average age of passenger cars in 2019 was 15.6 years, which is almost 50% higher than the EU average (10.6 years) in 2018 (ACEA, 2019<sup>[207]</sup>). Such old vehicles can endanger the environment, and the policy instruments controlling vehicle pollution needs to be stricter.

On a positive note, incentives for purchasing new electric vehicles (EVs) have already been implemented, in 2020 (Ministry of Construction, Transport and Infrastructure, n.d.<sup>[208]</sup>; Paragraf, n.d.<sup>[209]</sup>; Paragraf, n.d.<sup>[210]</sup>). The first chargers for electric vehicles on a motorway in Serbia were installed by Public Enterprise Roads of Serbia (PERS) in July 2017 and the list of charging points grows. Serbia still lacks a specific legislative framework for the development of the EV sector, but the policy framework is expected to be drafted when the project A Pathway for Electric Mobility for Belgrade, funded by the World Bank Group, is finalised in June 2021.

The total number of passenger cars that entered Serbia increased by approximately 22% over the period 2017-19 while the total number of freight vehicles crossing the border (including export, import and transit) fell by 3.3% in the same period. Recent trends show an increase in the utilisation of the road network, particularly for the transport of goods (Table 25.20).

**Table 25.20. Trends in road transport of passengers and goods in Serbia (2017 and 2019)**

Road network utilisation	Change over 2017-19 (%)	2019 (million)	share of the EU28 (2017) (%)
Passengers (passengers*km/km of road)	+4	0.328	32.8%
Freight (tonnes*km/km of road)	+28	0.291	15%

Source: Inputs provided by the government as part of the quantitative questionnaire (CO2021); (European Commission, 2019<sub>[2021]</sub>); (Statistical Office of the Republic of Serbia, 2021<sub>[2021]</sub>)

Having in mind a high road freight share, which is 70% as mentioned above, the negative effects on air pollution and climate change are obvious, therefore, incentives for shifting freight from road to rail could have a positive impact on reducing air pollution and climate change impact.

The COVID-19 outbreak is affecting the entire transport and mobility market across the world, and the WB6 economies are no exception. In the second quarter of 2020 Serbia introduced measures at border and customs control to enable the provision of essential goods and medical equipment. These consist of “green lane” measures on its major corridors for transporting emergency goods. Passing through these green lane border crossings should not exceed 15 minutes (including any checks and screenings), and so procedures should be minimised and streamlined, etc. In the first quarter of 2020, as part of a joint assignment with four economies along Corridor X (Croatia, Greece, Hungary and North Macedonia), Serbia also started developing technical documentation for the implementation of the pilot electronic border queuing management system (e-QMS), inspired the system in the Baltic countries.<sup>111</sup> It is expected to finalise the documentation during 2021. The system will support the Connectivity Reforms Measure, which aims to create a more competitive, safe and reliable transport system and network, to decrease waiting times at border areas and transfer physical queues to virtual queuing (Transport Community / CEFTA, 2020<sub>[211]</sub>; Transport Community, 2020<sub>[212]</sub>; Government of Serbia, 2019<sub>[213]</sub>). The implementation of these measures could have a direct impact on how the border crossing is treated in the future.

In the area of **inland waterways** (IWWs) Serbia’s market regulation legislation has achieved a high level of alignment with the TCT and EU *acquis*, and has been permanently updated with the latest updates since the last assessment. The market access framework is established through the aligned legislation. The national framework on market access to port services and the financial transparency of ports was developed before the adoption of EU Regulation 2017/352, but was already in line with the later regulation. The relevant strategy is the Strategy on the Development of Water Transport (2015-25). This defines clear and measurable objectives, including timelines and budgets for the recommended measures and actions.

A lot of effort has been made to increase IWW transport in recent years, including the privatisation of river ports and incentives for combined transport. The impact is apparent in the current results, with a further increase expected if the measures defined in the strategy are implemented. The total weight of freight transported on IWWs in Serbia increased by 17% in the period 2017-19, to reach 1.7 million tonnes, while the total tonnes\*km remained the same at 0.7 million tonnes\*km. This represents 6% of total land transport in Serbia (SORS, 2020<sub>[214]</sub>), the same as the EU average in 2018, while transport on EU inland waterways fell by 10% during 2016-18 (Eurostat, n.d.<sub>[215]</sub>).

Monitoring indicators to assess the performance of all transport modes are either non-existent, not properly established, or not fully updated. The missing indicators include average user costs, travel time satisfaction levels, value of assets, market research and customer feedback, quality of user information, audit programmes). Data surveys are either not soundly planned (e.g. the purpose, and the level of data needed

have not been planned, or budgets allocated), as they have not yet been planned by the government or not conducted regularly but only for specific projects rather than regular transport infrastructure assessment and planning. Therefore, Serbia lacks the basis for a quality assessment of its transport network performance.

### *Sub-dimension 11.3: Sustainability*

Further efforts are required to improve **road safety** in Serbia even though some progress has been made.<sup>112</sup> There is a Road Traffic Safety Strategy (RTSS) for the period 2015-20 (MCTI, 2015<sup>[216]</sup>). The Road Traffic Safety Agency has been tasked with preparing a new one for the next decade which will be adopted by the government. The RTSS was not fully aligned with the TCT and EU *acquis* as both the treaty (European Union, 2017<sup>[165]</sup>) and the new EU policy orientation (European Commission, 2019<sup>[217]</sup>) were adopted after the RTSS, but the new strategy is expected to be harmonised with both. The development process of the RTSS included consultations with a wide range of stakeholders, some of which were also members of the working group developing the strategy. However, implementation of the road safety framework and corresponding measures remains a concern. The implementation plan contains measurable indicators and the bodies responsible for implementation. The budget for each measure is not provided, but clear information was provided under which budget it is expected to be financed. One important area which has not been well developed is the monitoring of the strategy's implementation, and the process for updating the strategy and legislation based on the resulting monitoring report.

Data on road safety are collected by a government body, the Ministry of the Interior. Road accident data are developed in line with the Common Accident Data Set (CADAS) (EC, 2017<sup>[218]</sup>). The data are regularly collected and publicly available on the Road Safety Traffic Agency website, under various road safety data categories (e.g. tunnels, bridges, intelligent transport systems equipment, etc.), and on the government's open data portal (Government of Serbia, 2019<sup>[219]</sup>).

The ongoing EU-funded project Improving Road Safety in Serbia has the goals of improving local communities' traffic safety management capacities, establishing the MAIS3+ (Safety Cube, 2016<sup>[220]</sup>) scale of injury classification system, and improving road infrastructure management at national and local level. Introducing an improved traffic accident injury classification system will improve the ability of national and local government officials to apply proven road safety tools and to identify and improve the most dangerous sections of state and local roads. There is a need to further strengthen institutional capacities in the field of road safety, particularly enforcement. The human and financial resources of the relevant institutions (Road Safety Traffic Agency, PERS, Transport Ministry, local road traffic safety bodies, etc.) are not adequate for executing their responsibilities, according to information provided by the government.

Serbia has been a member of the International Safety Data and Analysis Group (OECD - ITF, n.d.<sup>[221]</sup>) since 2016, and could contribute to international co-operation on road accident data and their analysis. The level of implementation of the Regional Road Safety Action Plan (Transport Community, 2020<sup>[222]</sup>) which has been endorsed by the Ministerial Council of the Transport Community Permanent Secretariat (TCPS) in October 2020, is already on a high level compared to other WB6 economies<sup>113</sup> although slightly more efforts are needed to align local legislation with the Road Safety Action Plan. The number of fatalities per million inhabitants is higher than the average risk from fatalities in EU countries and it is clearly necessary to continue efforts to improve traffic safety in Serbia (Table 25.21).

**Table 25.21. Road safety trends in Serbia (2010-19)**

Road safety trends	2010-2019 (%)	2017-2019 (%)	2019
Change in the number of fatalities (Serbia)	-19	-7.8	534
Change in the number of fatalities (EU)	-23	-2.5	-
Number of fatalities per million inhabitants (Serbia)	-	-	79.1
Number of fatalities per million inhabitants (EU)	-	-	51

Source: EC (2020<sup>[223]</sup>), 2019 road safety statistics: *What is behind the figures?*, [https://ec.europa.eu/commission/presscorner/detail/en/qanda\\_20\\_1004](https://ec.europa.eu/commission/presscorner/detail/en/qanda_20_1004). (Road Safety Agency, 2020<sup>[224]</sup>), *Statistical Report on the Status of Road Safety in the Republic of Serbia for 2019*, <https://www.abs.gov.rs/admin/upload/documents/20200813084936--izvestaj-o-stanju-bezbednosti-saobracaja-u-republici-srbiji-u-2019.-godini.pdf>. (Government of Serbia, 2019<sup>[219]</sup>), *Open Data Portal - Data on traffic accidents by police administration and municipality*, <https://data.gov.rs/sr/datasets/podatsi-o-saobratshajnim-nezgodama-po-politsijskim-upravama-i-opshinama/>.

The RTSS is aligned with the European Policy Orientation on Road Safety 2011-20 (EC, 2010<sup>[225]</sup>), which has the goal of reducing road fatalities by 50% between 2010 and 2020 in line with Decade of Action for Road Safety 2011-20, officially proclaimed by the UN General Assembly in March 2010. This goal would have been difficult to achieve considering Serbia only managed an average 3% annual reduction in fatalities during 2010-19 (Table 25.18). It will need to make significant additional efforts to secure a newly defined goal aligned with the European Vision Zero strategy for 2050 (European Commission, 2019<sup>[217]</sup>), which also set an intermediate goal of a 50% reduction in road fatalities during 2021-30. As no strategy for the new decade has yet been developed, expectations should not be high.

Serbia has addressed some of the **environmental sustainability** goals related to the transport sector across multiple strategies, making them difficult to monitor.<sup>114</sup> Having a section explicitly dealing with sustainability in all transport modes in the national transport strategy or transport sector strategies for each specific mode, will be needed.

There is no evidence that the government is preparing an environmental sustainability strategy. The National Strategy for Sustainable Development obliges the government to calculate the emissions of pollutants into the atmosphere from traffic on state roads and PERS often performs these assessments (so far they have been conducted for the periods 1990-2012, 2013-15 and 2015-19). PERS has also developed studies related to climate resilience.<sup>115</sup> The Strategy of Railway, Road, Inland Waterway, Air, and Intermodal Transport Development 2008-15 promoted the “polluter pays” principle which has been introduced in road transport so that the vehicles which pollute the environment more pay more to use the roads. It is expected the same approach and more will be implemented in the transport strategy as of 2022.

The SORS recently published its Eco-Bulletin (SORS, 2020<sup>[226]</sup>), presenting trends related to environment in the economy. In the period 2010-19 the total use of liquid fuels increased by 64%, while in road transport (which accounts for 48% of the total consumption of liquid fuel in the economy) it increased by 143% over the same period. At the same time, electricity consumption fell by 38% in total. Further efforts are needed to shift transport from road to other more sustainable modes.

**Combined transport**<sup>116</sup> is the transport mode that has the best cost efficiency, decreases environmental pollution, and increases co-operation between the freight forwarding network companies. The legal and regulatory framework in Serbia is covered in several existing strategic documents<sup>117</sup> related to the development of logistics and multimodal transport. The new multimodal transport strategy, the Five-year Action Roll-on Plan, is under development and expected to be finalised in 2021. Since the last assessment several regulations have been developed to strengthen multimodal transport legislation and partially align with the Combined Transport Directive. Full transposition of the Council Directive 92/106/EEC will not be carried out at this stage of the harmonisation due to the announcement that new EU regulations are to be adopted that will replace the existing ones.

The Department for Railways and Intermodal Transport of the Ministry of Construction, Transport and Infrastructure is the main institution responsible for combined transport in Serbia. There is no monitoring

body, except for representatives on the Technical Committee for the Transport Facilitation of the TCPS, which is yet to follow implementation of the regional Transport Facilitation Action Plan endorsed by the Ministerial Council of the TCPS in October 2020.

Currently, a construction contract for the multimodal terminal Batajnica near Belgrade has been signed. Construction is expected to commence in the second quarter of 2021 and it is expected to be completed in the first quarter of 2023. Depending on the readiness of local governments and the state of infrastructure capacity, future intermodal terminals could be planned in Pirot, Apatin, Smederevo, Bačka Palanka, Šabac, Novi Sad, and Vršac. These proposals need to be tested against transport demand modelling, and align with plans in the new logistics and transport strategies.

The World Bank's Logistics Performance Index (LPI) (World Bank, 2020<sup>[227]</sup>), is a multi-dimensional assessment and international benchmarking tool focused on trade facilitation. In the last index in 2018, Serbia was ranked 65<sup>th</sup> out of 160 economies, with an LPI score of 2.84 which is around the world average of 2.85 but well below the EU average of 3.52. Serbia ranked best for international shipment<sup>118</sup> (57<sup>th</sup>) and worst for logistic competence (ranked as 80).

Data collection, which is currently moderate to weak, needs to be one of the key areas of focus. Serbia needs to establish a strategy for data as a basis for the assessment of the transport sector, as it will directly influence prioritisation processes within transport policy in general.

### ***The way forward for transport policy***

Serbia has taken some important steps in the development of a competitive transport sector, as presented above, but special attention should be paid to the following areas:

- **Enhance the implementation, monitoring and readjustment of the existing policy framework.** The transport policy framework is not regularly revised based on the monitoring reports and available information. Doing so will be key to keeping it up to date, relevant and effective. Monitoring reports need to be developed for each strategy and other strategic documents, and also be publicly available. Based on these monitoring reports, the policy framework then needs to be regularly adjusted.
- **Update or renew outdated national cost-benefit analysis guidelines, covering all transport modes.** Economies need to regularly update their own CBA guidelines with accompanying national technical instructions needed for a proper CBA, at least every two years. A good example is the United Kingdom's Transport Analysis Guidance (UK Government, 2019<sup>[228]</sup>), which provides all the information on the role of transport modelling and transport project appraisal tailored to the UK market. To ensure consistency in the discount rates used for similar projects economies need to develop their own benchmark for all technical and economic parameters, including the financial and economic discount rate in the national guidance documents, and then apply it consistently in project appraisal at the national level. The empirical researches need to be conducted on the national level to generate input data for the calculation of externalities.
- **Ensure road safety remains a key priority.** Further efforts are required to align national legislation with the TCT and EU *acquis*, with the aim of removing black spots and dangerous locations, placing the safety of vehicles at the top of the agenda, and enforcing the implementation of legislation (e.g. proper spending of funds allocated from fines on road safety improvements, transport of dangerous goods, speed enforcement, and licensing of road safety auditors and inspectors). Box 25.16 is an example of an innovative approach in Montenegro.
- **Keep transport facilitation as a key priority.** Serbia needs to implement more OSSs, and other measures in line with the newly endorsed regional Action Plan for Transport Facilitation (Transport Community, 2020<sup>[212]</sup>), which includes: electronic queuing management systems, upgrades of existing ICT infrastructure, construction or modernisation of infrastructure to remove physical and

technical barriers and increase existing capacities, and capacity building to improve performance efficiency.

- **Establish the basics of a transport asset management system in line with the national inventory system.** Sound asset management practices<sup>119</sup> enable economies to collect data and manage and analyse conditions across all transport modes, in order to optimise transport maintenance strategies and justify maintenance budgets by directing funds to those areas where the return on investment will be the greatest. Performance-based maintenance contracts (PBMC) are already implemented in WB6 economies, including Serbia (CONNECTA, 2018<sub>[195]</sub>), and are an essential component of the road asset management system. The quality of transport infrastructure affects an economy's investment attractiveness, making it seen as a good market for foreign direct investment.
- **Develop an integrated environmental and transport action plan.** This plan needs to integrate existing indicators and to include any missing ones in a framework for environmental sustainability in the transport sector. Measures and indicators should then be applied in the strategies where they belong, including the new transport strategy. A good example was developed by the European Environment Agency in the form of Transport and Environment Reporting Mechanism (EEA, 2000<sub>[229]</sub>), which prescribes indicators for tracking transport and environmental performance in the EU.

#### Box 25.16. Innovative ideas in road safety: Road safety social impact bonds in Montenegro

In 2018, the UNDP in Montenegro, in co-operation with the key national players in road safety, developed the new idea related to road safety social impact bonds. These are an innovative alternative performance-based public financial instrument, which shifts the policy framework from inputs and outputs to outcomes and value for money. The idea is to involve the private sector in investing in road safety improvements with the main aim of strengthening sustainability jointly with the public sector. The public partner commits to paying outcome payments to the investor if and only if the predefined and measurable social goals are met. This idea has great potential for other economies in the region (and beyond) to replicate and scale up the model.

## Energy policy (Dimension 12)

### Introduction

Serbia has made significant strides in introducing more advanced policy and legislation in the energy sector. As a result, Serbia achieved an overall score of 3.0 for energy in this assessment compared to 2.3 in the last Competitiveness Outlook (Figure 25.1). The improvement has been driven by the increased transposition of EU's Third Energy Package into national legislation and policy.

However, while there has been progress in the development of policy and legislation, there are gaps in their implementation across all sub-dimensions. This is reflected in the assessment of the Energy Community Secretariat (2020<sup>[231]</sup>) which gave Serbia a score of 67% for transposition of the Third Energy Package – with the remaining 33% being only partially transposed – while it scored 30-70% for implementation across the different sub-dimensions, averaging 56%. In particular, Serbia's implementation of unbundling and third-party access falls short when compared to other WB6 economies with the second lowest score of 2.5, ahead of only Bosnia and Herzegovina. Nonetheless, as can be seen in Table 25.22, Serbia performed fairly well in other sub-dimensions, especially in the governance and regulation sub-dimension, so that despite its low performance in unbundling and third party access, Serbia's overall scoring is in line with WB6 average.

**Table 25.22. Serbia's scores for energy policy**

Dimension	Sub-dimension	Serbia	WB6 average
Energy policy dimension	Sub-dimension 12.1: Governance and regulation	3.3	3.1
	Sub-dimension 12.2: Security of energy supply	2.9	2.9
	Sub-dimension 12.3: Energy markets	2.8	3.0
Serbia's overall score		<b>3.0</b>	<b>3.0</b>

### State of play and key developments

#### *Sub-dimension 12.1: Governance and regulation*

Overall, Serbia's **energy policy, legal and institutional framework** is comprised of an extensive array of legislations, action plans, and strategies that govern the energy sector. Serbia has transposed a significant share of the EU's Third Energy Package.

Both the natural gas and electricity markets are liberalised, and price are deregulated, although the markets remain dominated by key players (see Sub-dimension 12.3: Energy markets). Moreover, policy is informed by an extensive array of indicators and monitoring systems and *ex post* assessments are used to analyse and inform adjustments to policy. A large number of the EU's Network Codes have been fully or partially transposed, but the full transposition of all codes is not possible without amending the primary legislation – something that is currently being tackled.<sup>120</sup>

Beside the need to adopt and transpose the remaining EU legislation, there are some key areas of concern. First and foremost – and a theme throughout this dimension – Serbia lacks in implementation of the framework. For example, unbundling and third-party access are key pillars of EU's Third Energy Package, but the Energy Community Secretariat concluded that it “has not yet been finalised in compliance with the Third Energy Package” (Energy Community Secretariat, 2020<sup>[232]</sup>). Progress in the implementation of unbundling and third-party access has been slow over the years partly due to the strong position of the incumbent firms (see Sub-dimension 12.3: Energy markets). Moreover, key policy documents are absent, including a new National Energy Efficiency Action Plan, which has been drafted but not yet adopted, and the National Energy and Climate Plan, which is in the early stages of drafting. And finally, Serbia continues to expand its fossil fuel generation, in part as greenhouse gas pricing is not currently factored in.<sup>121</sup>

### Box 25.17. The EU's Third Energy Package

In 2007, the European Commission proposed a new legislative package, the Third Energy Package, in an effort to further enhance and harmonise the EU's Energy Union and internal energy market. This package entered into force in September 2009 and consisted of several important directives and regulations.<sup>1</sup>

The Third Energy Package largely rests on four pillars: 1) transparency; 2) non-discrimination; 3) a strong, independent national regulator; and 4) sustainability. Together, these pillars represent EU best practice and aim to establish a fair and level-playing field for competitive energy markets that seek to optimise scarce resources. For example, the first two pillars drive the need for unbundling the transmission and distribution system, combined with guaranteed, non-discriminatory and open access to those networks to all users backed by transparent rules and prices. Without such unbundling requirements and third-party access, it is very possible that the system operators, which are natural monopolies, could prohibit market entry and lead to sub-economic market outcomes.

In addition to these pillars, the Third Energy Package also seeks to enhance international co-operation within the EU by establishing an international regulatory agency (the Agency for the Cooperation of Energy Regulators – ACER) and promoting regional integration. Regulation (EC) No 714/2009 contains clauses that open and allow for further regulation to be drafted to enhance harmonisation in the form of network codes.

In 2019, the EU introduced the Clean Energy Package which supplements and in part replaces the Third Energy Package. That is, while the Clean Energy Package retains the key legislative aspects of the Third Energy Package, it expands measures for sustainability and green energy growth, as well as consumer rights and protections. Despite this, the Third Energy Package remains a good starting point for all of WB economies as many of its key pillars have so far not been introduced or implemented in their entirety in the region. Aligning with it is also a requirement for the WB economies as members of the Energy Community, whose *acquis* reflects most of the Third Energy Package. Moreover, with many WB6 economies aspiring to become EU members, the transposition and implementation of the Third Energy Package and subsequent Clean Energy Package are accession requirements. To conclude, the Third Energy Package provides for the implementation of international best practice on competitive markets, and is also a firm requirement for the Western Balkan economies.

1: Directive 2009/72/EC concerning common rules for the internal market in electricity and repealing Directive 2003/54/EC; Directive 2009/73/EC concerning common rules for the internal market in natural gas and repealing Directive 2003/55/EC; Regulation (EC) No 714/2009 on conditions for access to the network for cross-border exchanges in electricity and repealing Regulation (EC) No 1228/2003; Regulation (EC) No 715/2009 on conditions for access to the natural gas transmission networks and repealing Regulation (EC) No 1775/2005; Regulation (EC) No 713/2009 of the European Parliament and of the Council of 13 July 2009 establishing an Agency for the Cooperation of Energy Regulators.

The theme of the policy being in place but the implementation lacking is also apparent when it comes to the regulatory framework, or more precisely the **energy regulator**. The legislative framework for the regulator conforms with the EU's Third Energy Package and clearly intends to establish a competent and independent regulator. This independence is partly reflected by the reporting requirements and oversight of the Energy Agency of the Republic of Serbia (AERS), which is in line with the EU Third Energy Package. Moreover, AERS's revenues are separate and independent with AERS being financed through revenue from regulated activities, fees for issued energy licences, as well as from other revenue from activities within its jurisdiction.

However, there are several issues when it comes to implementation. First and foremost, AERS lacks the human resources it needs to fulfil the role as prescribed by the Third Energy Package.<sup>122</sup> While plans are in place to hire more staff over the next few years, it is not quite clear how successful it will be at hiring

new staff and retaining existing staff.<sup>123</sup> This is particularly challenging as the financial budget is subject to approval by Parliament.<sup>124</sup>

Another issue with AERS's independence is with its Statute. That is, according to Article 47 of the Energy Law, the Statute is subject to approval by the Parliament. This limits the regulator's independence as it limits its ability to structure itself according to the task and roles it faces. Moreover, it creates another avenue through which political influence can be asserted and lead to interference of the operation of the regulator, particularly when combined with the requirement for parliamentary approval of its budget.

Finally, in a minor point that largely does not affect the score, AERS does not have the authority to impose fines. According to Article 58 of the Energy Law, it cannot impose fines but can initiate proceedings at the appropriate court. While this approach is permitted by the Third Energy Package, it does weaken AERS' ability to act as a credible market enforcer as it partly transfers this role to the judicial system, and also slows the enforcement process.<sup>125</sup> In part, as this becomes more of a judicial issue, it raises the danger that when the matter becomes "[...] overly legalistic in the application of rules and imposition of fines, [...] business people would tend to respond by scaling down their efforts to comply with the intent of the law; instead, they would aim to achieve only the minimal level of compliance which the rules required" (OECD, 2000, p. 16<sup>[233]</sup>).

The theme continues with the **management of energy infrastructure**. Serbia has strategies and action plans that guide the infrastructure development and management.<sup>126</sup> At their core, these strategies provide guidance on the rehabilitation, modernisation and expansion of infrastructure with the aim of increasing the efficiency and reliability of energy supply to consumers. However, several factors reduce Serbia's score when it comes to implementation. First, although there has been significant progress in finalising the transposition of EU regulations, some existing transposition needs to be improved and the final implementation remains outstanding. This is most clearly seen in the lack of the adoption of the network development plans from the transmission system operator (TSO) and distribution system operator (DSO) within the natural gas sector, which creates uncertainty about the path of infrastructure development. Another problem is high distribution losses (see Sub-dimension 12.2: Security of energy supply), although the policy plans to tackle this issue.

#### *Sub-dimension 12.2: Security of energy supply*

When considering energy supply, there is a wide gap between the natural gas and the electricity sector. Considering the **natural gas supply framework**, while an extensive policy and legal framework is in place, the market is dominated by one player, *Srbijagas*.<sup>127</sup> Such centralisation exposes the market to the risk of a dominant player abusing their market position to achieve certain outcomes, which could include behaviour that raises barriers to competition and market entry. This risk is aggravated by the lack of third-party access which means that the nature and extent of competition is limited, giving more opportunities to abuse market position. Moreover, it should be noted that Serbia is currently completely reliant on oil-indexed natural gas sources<sup>128</sup> exclusively from a single source, Russia, which further increases energy security risks due to the lack of alternative natural gas supply sources.

Figure 25.17. Serbia's gross electricity generation mix (2016 and 2019)

Source: Eurostat (2021<sup>[234]</sup>), Gross and net production of electricity and derived heat by type of plant and operator, <https://ec.europa.eu/eurostat/web/energy/data/database>.

StatLink  <https://doi.org/10.1787/888934256349>

Serbia's **electricity supply framework**, while still not optimal, is more advanced than is the case for natural gas. The power mix is more diversified, but still dominated by coal power generation, which accounted for around 70% of power generation or between 27 and 26 TWh in between 2016 and 2019 (Eurostat, 2021<sup>[234]</sup>) – see Figure 25.17. Meanwhile, Serbia's energy strategy suggests that it plans to continue its reliance on coal as it seeks to build new coal-based power generation capacity (MRE, 2016, pp. 81-85<sup>[235]</sup>). While its stated goal is to replace old and less efficient plants, it is not clear to what extent the climate impact, especially compared to renewable energy, was or is a factor in these decisions.

Another issue facing the electricity supply framework in Serbia is the aspect of network losses. Although the Western Balkans, including Serbia, are in line with European average with regard to transmission losses, Serbia and the Western Balkans as a whole are still lagging behind with regard to distribution losses (Table 25.23),<sup>129</sup> and urgent action is needed to upgrade infrastructure to avoid wasting energy.

Table 25.23. Serbia's distribution losses as % of final electricity consumption (2014-18)

GEO/TIME	2014	2015	2016	2017	2018
European Union	10.7%	8.0%	7.8%	7.6%	6.7%
Serbia	14.4%	14.4%	13.0%	13.0%	12.2%
CEEC	5.9%	5.8%	5.5%	5.3%	5.2%

Note: CEEC: Central and Eastern European countries. Both the EU and CEEC exclude Bulgaria and Romania.

Source: (CEER, 2020<sup>[236]</sup>). 2nd CEER Report on power losses <https://www.ceer.eu/documents/104400/-/-/fd4178b4-ed00-6d06-5f4b-8b87d630b060>.

Table 25.24. Serbia's renewable energy generation as a share of gross inland consumption (2014-19)

	2014	2015	2016	2017	2018	2019
EU	13.6%	13.8%	14.0%	14.1%	14.7%	15.5%
Serbia	15.5%	13.4%	13.3%	12.1%	13.4%	13.6%

Source: (Eurostat, 2021<sup>[234]</sup>), Gross and net production of electricity and derived heat by type of plant and operator, <https://ec.europa.eu/eurostat/web/energy/data/database>.

Meanwhile, although coal remains dominant, **renewable energy** is on the rise, with wind generation rising from 26 GWh in 2016 to 898 GWh in 2019 and solar rising from 12 GWh to 13 GWh (Eurostat, 2021<sup>[234]</sup>). However, although Serbia has various legislation and action plans governing and guiding renewable energy generation,<sup>130</sup> it does not appear that it will meet its 2020 target. Renewable energy accounted for just 13.6% of gross inland consumption in 2019, compared to the target share of 27% by 2020 and an EU

average share of 15% and WB6 share of 19% (Table 25.24). Moreover, in 2018 nearly all (approximately 98%) of Serbia's renewable energy generation comes from hydropower (Eurostat, 2020<sup>[237]</sup>). In 2018, just 0.4% of Serbia's generated power came from non-hydro renewable energy sources. This is below the WB6 average and significantly less than the EU average of 15% (Eurostat, 2020<sup>[237]</sup>). The key issue facing Serbia is therefore the promotion of renewable generation other than hydropower. Serbia recently amended key laws and adopted new legislation to promote the use of non-hydro renewable energy sources. These laws introduce promising elements such as a new funding scheme and auctions for renewable energy projects, which should further promote the use of non-hydro renewables.

When looking at the legislative and policy environment and the actual renewable energy market, Serbia faces several issues. The first is that despite having made significant strides in transposing and implementing the EU renewable energy *acquis*, including the adoption of secondary legislation for biofuels in 2019, it still has not fully transposed all of it and more remains to be implemented. The second is promoting the share of renewable energy in Serbia's primary energy mix. This could be supported by streamlining the approval process for new renewable energy projects at every stage (permits, construction, licensing, etc.).

Another challenge has been the suspension of feed-in tariff payments under the previous scheme for existing renewable energy generators as a consequence of the COVID-19 pandemic, with some sources suggesting that payments to generators were completely suspended and other sources suggesting payments were limited to one-third of the feed-in-tariff. This suspension risks undermining investor confidence and, consequently, the sustainability of renewable energy financing in Serbia.

Serbia's old tariff system used feed-in-tariffs combined with purchasing power agreements. As Serbia has a wholesale market with an organised day-ahead market,<sup>131</sup> it is encouraging that the new Law on renewable energy adopted in April 2021 introduced feed-in-premiums, which represent a more modern and efficient approach to subsidising renewable generation (Box 25.18).<sup>132</sup>

#### **Box 25.18. A new approach to subsidising renewable energy**

Feed-in tariffs were the dominant form of financial support for renewables within the EU at the beginning of the 21<sup>st</sup> century. In this system, power plant operators receive a fixed payment for each unit of electricity generated independent of the electricity market price (Banja et al., 2017, p. 15<sup>[238]</sup>).

Feed-in tariff schemes offer several advantages, but mainly they insulate new market entrants from market price risks, which lowers their capital costs and enables private investment. The simplicity of feed-in tariffs makes them suitable for markets with a large number of non-commercial participants such as households or local community-based initiatives (CEER, 2018, p. 12<sup>[239]</sup>).

However, feed-in tariff schemes exclude producers from actively participating in the market, which hinders efforts to develop large, flexible and liquid electricity markets as the share of renewable energy grows. This limits growth to certain technologies and sizes of installations, and creates difficulties in setting and adjusting appropriate tariff levels (EC, 2013, pp. 12-13<sup>[240]</sup>). The latter has been a problem especially as costs of renewable generators have fallen rapidly in recent years.

The European Commission suggests switching from feed-in tariff to feed-in premium schemes (EC, 2013<sub>[240]</sub>). In these, plant operators sell the electricity generated directly on the electricity market and earn an additional payment on top of the electricity market price. This is received as a fixed payment or one adapted to changing market prices, thereby limiting price risks for plant operators, as well as the risks of providing windfall profits (Banja et al. 2018). Feed-in premium schemes are beneficial because they force renewable energy producers to find a seller on the market. They also ensure that renewable energy operators are exposed to market signals. A well-designed premium scheme can limit costs and drive innovation by using a competitive process to allocate support. Such schemes also include automatic and predictable adjustments to cost calculations, which give investors the information and confidence necessary to invest (EC, 2013, p. 8<sub>[240]</sub>).

The European Commission suggests using a feed-in premium scheme in combination with the following good practice recommendations (EC, 2013<sub>[240]</sub>):

- Do not pay premiums for production in hours where the system price is negative or above the level of remuneration deemed necessary.
- Assign renewable project and associated premiums using competitive allocation mechanisms such as auctions.
- Make planned volume-based premium reductions for new installations dependent on when they are approved, connected or commissioned.
- Conduct regular, planned and inclusive reviews of premiums for new installations.

However, the Council of European Energy Regulators reports that in 2016/17, 17 of the 27 European Union member countries still used some form of feed-in tariff, although mainly for small projects, while around 16 used feed-in premiums, including to complement feed-in tariffs (EC, 2014<sub>[241]</sub>).

For further and more detailed exploration of renewable energy subsidies and best practice please see the sources below. Meanwhile, for more information on the different renewable support schemes employed across Europe please see <http://www.res-legal.eu/home/> and for an overview of auctions and outcomes (including databases on auctions) see <http://aures2project.eu/>.

Besides using supply-side policies to promote security, Serbia needs to improve its demand-side management through **energy efficiency policies**. The Energy Community has extensively reported that Serbia's legislative framework does not fully transpose and thus is not fully compliant with EU's Third Energy Package (Energy Community Secretariat, 2021<sub>[243]</sub>), (2020<sub>[231]</sub>), (2020<sub>[232]</sub>). Issues range from the energy performance of buildings to energy labelling. That said, Serbia has adopted a new Law on energy efficiency and the rational use of energy in April 2021 that expands Serbia's energy efficiency approach. Among other measures, the law expands the transparency and data collection for measuring energy efficiency, provides a detailed legislative framework for highly efficient cogeneration, the public energy efficiency supply framework, energy labelling and eco-design standards.

Meanwhile, much like the legislation, policies needs to be enhanced. The Ministry of Mining and Energy's Third National Energy Efficiency Action Plan has been adopted, but only provides guidance for energy efficiency in Serbia up to 2018. Meanwhile, the fourth National Energy Efficiency Action Plan is still being drafted.

Serbia has implemented energy efficiency funding of some sort since 2014. The new Law on energy efficiency expands the availability of funding for energy efficiency projects (i.e. renovations of buildings, replacing of heating systems), to cover private initiatives. This is a welcome change, as previously funding was only allocated to public projects.

Most state entities involved in the energy efficiency sector lack human resources, which limits their ability to implement and monitor government policy objectives.<sup>133</sup> The monitoring of developments in energy efficiency is neither comprehensive nor regular but is limited to the collection of indicators on a project basis.<sup>134</sup> Furthermore, it is not clear which entity collects which data/indicator. However, the introduction of the changes mentioned above through the new law might present improvements to data collection.

### *Sub-dimension 12.3: Energy markets*

In the area of **market operations**, Serbia may be the most advanced economy in the region both from legislative and implementation perspective. Serbia allows for free selection of suppliers and has switching rules in place. Moreover, markets are liberalised, and prices deregulated, although households and small consumers can opt to be supplied by the regulated supplier of last resort/universal supplier. Serbia's electricity market also has an active power exchange with an organised day-ahead market in addition to bilateral trading. For natural gas, only the latter exists. Also, it should be noted that wholesale traders do not have a seat requirement,<sup>135</sup> although they are required to obtain a licence in Serbia much as for all other activities.

Despite its advanced progress, some shortcomings remain in Serbia. The EU market model has only partially been implemented. Moreover, despite market liberalisation in both natural gas and electricity, the incumbents have the largest market share. In the case of electricity, the Energy Community Secretariat also asserts that “the regulated price of guaranteed supply, to which households and small customers are entitled, is still below a competitive and economically justifiable price” which discourages the switching of consumers to non-regulated retail suppliers (Energy Community Secretariat, 2020<sup>[232]</sup>). In the natural gas market, there is no organised market or trading point—although *Srbijagas* aims to deploy a virtual trading point at some point in the future. Finally, balancing services and ancillary services remain in part regulated due to low competition. That is, due to limited liquidity and service providers, price formation is not likely to be indicative of efficient market equilibrium meaning prices remain regulated. In the long run, it would be advisable to establish and implement a strategy to promote competition in order to have market forces drive prices for balancing services and ancillary services down.

Despite these issues, the area which has the greatest need for improvement is **unbundling and third-party access**, particularly in the natural gas sector. While Serbia's legislation, action plans and strategies conform with the EU's Third Energy Package, the implementation of unbundling is far from complete.

In the case of electricity, the Energy Community Secretariat (2020<sup>[232]</sup>) notes that the unbundling of both the TSO and the DSO are not in compliance with the Third Energy Package requirements. Although some efforts have been expended, the Energy Community Secretariat has so far not confirmed the unbundling with a positive opinion.<sup>136</sup> More precisely, while the TSO, *Elektromreža Srbije* (EMS), was certified by AERS as unbundled, for technical reasons<sup>137</sup> the Energy Community has not given a positive opinion. Meanwhile, the DSO, *Elektro distribucija Srbije*, has been legally unbundled and has a compliance officer in place. Moreover, although progress has been made in functional unbundling through the adoption of a new foundation act in January 2021, and AERS has issued a licence to operate as a distribution system operator in April 2021, the Energy Community affirmation is still outstanding.

The situation is not much different for the three TSOs within the natural gas sector. Although the legislation is in place, *Srbijagas* still continues to effectively operate both as a supplier and TSO. *Srbijagas* has established a company for the purpose, *Transportgas Srbija*, but it is not equipped to handle the operational tasks of a TSO and nor have the transfer of assets taken place. In other words, it is not functionally unbundled and accordingly has not been certified by AERS as such. In the case of the other TSO,

Yugorosgaz JSC Belgrade, the independent system operator model applied is not compliant with the Third Energy Package. The third, Gastrans, was certified in February 2020 by AERS (AERS, 2020<sup>[244]</sup>) as an independent TSO despite Energy Community objections (Energy Community Secretariat, 2019<sup>[245]</sup>). Both Yugorosgaz and Gastrans have implemented compliance officers.<sup>138</sup>

The situation for non-discriminated third-party access is also mixed. While the legislative requirement is in line with the Third Energy Package for the electricity sector, there are concerns over its implementation. For instance, most of the cross-border interconnectors are allocated based on bilateral agreed auctions. Only the interconnector capacity on the border with Bulgaria and Croatia are being assigned using the international standard for joint capacity auction through the Joint Allocation Office.<sup>139</sup>

Another concern is with regard to use of congestion revenue to subsidise domestic transmission tariffs. While this use of revenue to reduce transmission tariffs is not prohibited by EU regulations (see EU Regulation 714/2009 Article 16 Paragraph 6), the regulation does encourage using such income to guarantee the availability of capacity, or to maintain or increase interconnection capacity in order to further interconnection, rather than to lower domestic transmission costs..

Much as in the electricity sector, the legislation for unbiased third-party access, including entry-exit tariff system, is also in place for the natural gas market but implementation is lacking. For instance, the Srbijagas run interconnector at Horgoš on the Hungary-Serbia border is foreclosed to third-party access. The new interconnector through the Gastrans project, which started commercial operations on 1 January 2021, offers some volume to third party. However, an exemption was granted that permits Gastrans to limit the volume open to third parties to 10% of the entry and exit capacities based on short-term capacity auctions (AERS, 2019<sup>[246]</sup>). This means third parties can supply approximately 15% of the domestic market via Gastrans pipeline's Serbian exit points. The Energy Community Secretariat have stated that confining access to just 10% of capacity is detrimental to the development of competition in the natural gas market (Energy Community Secretariat, 2019<sup>[245]</sup>).

Finally, although **regional market integration** is not completely lacking it still has potential for improvement. Currently there are two natural gas interconnectors which are significant from a supply perspective. As discussed above, one is for closed completely to third party access, while the second restricts access to 10% of its capacity, limiting the competitive nature of international integration. Meanwhile, market coupling is absent, partly due to Serbia lacking an organised market/trading point. Although Srbijagas has codified a virtual trading point in its network codes, in practice it has failed to implement it so far. Gastrans also included in their Network Code provisions for a virtual trading point although it is unclear to what extent this has been implemented.

Regional integration is a bit more advanced in the electricity sector. On the positive side, the Connection Network Codes and the Grid Code are partially implemented. Moreover, the outlines of regional co-operation are in place.<sup>140</sup> However, for the most part, regional co-operation for interconnection allocation is done on a bilateral basis, except for with Croatia and Bulgaria, where it is done via joint auction through the Joint Allocation Office, and (manually) balancing reserves.

Serbia also has been and is part of various project to couple markets, but these have failed to result in actual market coupling and integration.<sup>141</sup>

#### *Cross-cutting sub-dimension: Energy incentives – direct and indirect subsidies in the energy sector*

While no information was provided on the topic of cross subsidisation, our understanding is that substantial subsidisation is taking place, particularly in the coal sector, which has a cascading effect on power. More precisely, a study by (Miljević, Mumović and Kopač, 2019<sup>[247]</sup>) estimated that, between 2015 and 2017, the Serbian government provided on average direct subsidies to coal producers of around EUR 99.78 million per year. They estimate that this amounted to an indirect subsidisation of electricity generated from coal

of about 4 EUR/MWh. In other words, subsidising coal producers has a pass-through effect that results in coal-fired generation being around EUR 4 cheaper per MWh than it would have been without it.

Moreover, information provided by the government seems to suggest that state entities do not settle their bills with the power sector in full and promptly, which is another form of subsidy. This is supported by Srbijagas writing off of EUR 1.2 billion in debt in 2019.<sup>142</sup> However, the extent of this is unclear at this stage.

### ***The way forward for energy policy***

Given the various points raised above, Serbia should:

- **Finalise the transposition of EU Third Energy Package** across all sub-dimensions but especially with regard to the EU Network Code, EU target model and renewable energy. This should complete the framework for a competitive market that can harness competitive economic forces to drive the optimisation of consumed energy and enhance the value added of energy for the entire economy.
- **Improve implementation across all sub-dimensions**, in particular:
  - **Fully unbundle TSOs and DSOs.** These roles have an essential natural monopolistic role in any energy market and so, to maximise social gain, it is best if they do not operate in the interest of certain suppliers or generators. To this end, the unbundling and the national certification should conform with Chapter IV, V and VI of EU Directive 2009/72/EC and be confirmed by the Energy Community to that effect that the TSOs and DSOs have been unbundled pursuant to those requirements.<sup>143</sup>
  - **Implement non-discriminated and transparent third-party access to transmission and distribution systems.** This is essential for more competitive market forces to be brought to bear. To this end, third-party access on a national level should conform with Chapter VIII of EU Directive 2009/72/EC and this should be confirmed by the Energy Community.
- **Improve regional integration and market coupling.** Market integration and coupling is essential to help keep price variances in check through the use of regional forces. While some projects are ongoing, the authorities need to step up their efforts and finalise projects successfully. Regional trade and integration is also an important tool to help bolster the national energy sector subject to rising integration of variable renewable energy capacity.
- **Implement a new approach to support and subsidies renewable energy.** Serbia's support for renewable energy faces a variety of issues and so it should take the opportunity to overhaul its approach. This should also be combined with new approach to energy diversification by reducing the reliance on coal and a single natural gas supply. In part, with the adoption of the new laws, the opportunities lie in their implementation including with regard to switch from a Feed-in-Tariff model to Feed-in-Premiums.
- **Increase the share of renewable energy by streamlining the approval process at every stage** (permits, construction, licensing, etc.) for new renewable energy projects—with focus on non-hydro renewable energy sources.

## Environment policy (Dimension 13)

### Introduction

With an overall score of 2.2 in environmental policy, Serbia is third among the WB6 economies and performs slightly above the regional average (Table 25.25). It has significantly improved its performance in resource productivity and achieved further increases in environmental quality of life since the previous assessment. However, its results for the natural asset base sub-dimension are below the regional average, reflecting a decrease in performance in this regard since 2018.

**Table 25.25. Serbia's scores for environment policy**

Dimension	Sub-dimension	Score	WB6 average
Environment policy dimension	Sub-dimension 13.1: Resource productivity	2.2	2.0
	Sub-dimension 13.2: Natural asset base	1.8	2.1
	Sub-dimension 13.3: Environmental quality of life	2.5	2.3
Serbia's overall score		<b>2.2</b>	<b>2.1</b>

### State of play and key developments

#### *Sub-dimension 13.1: Resource productivity*

As a Non-Annex-I signatory to the UN Framework Convention on Climate Change (UNFCCC) and its Paris Agreement and party to the Kyoto Protocol,<sup>144</sup> Serbia has joined the international effort to combat climate change. It has committed to reducing greenhouse gas (GHG) emissions by 9.8% by 2030 compared to 1990 levels with the goal of limiting global warming to a maximum of 2°C by the end of this century. Despite some efforts in this area, Serbia's carbon productivity has not improved since the last assessment. Almost 70% of total GHG emissions come from the energy sector, followed by transport which accounts for slightly over 15% (World Bank, 2020<sub>[248]</sub>).

Serbia's **climate change mitigation and adaptation** policies are at an early stage of development. Promisingly, in March 2021, it adopted the climate law it had prepared in 2018. However, it still lacks a long-term climate change mitigation strategy that would encompass energy and climate targets. The draft Low Carbon Development Strategy, submitted for public consultation until the end of January 2020, has not yet been adopted, while the Ministry of Mining and Energy was developing the integrated National Energy and Climate Plan (NECP) at the time of drafting.<sup>145</sup> Given the dominance of the energy sector in total GHG emissions, the adoption and implementation of the NECP, which is consistent with the EU 2030 framework for climate and energy policies, will be crucial for Serbia's future low carbon development. The government will also need to make sure that the NECP is integrated into all other relevant sectoral policies and strategies, such as transport, industry and agriculture. Other positive developments have been the improvement of GHG inventories and updating of the Nationally Determined Contributions (2021-30), mostly as a result of the establishment of a new Department on Climate Change in the Ministry of Environmental Protection (MoEP).

The National Programme for Disaster Risk Management (2014-20) and its draft action plan for implementation addresses climate change related issues but does not contain sufficient climate change adaptation measures and policies. The government therefore asked for support from the international community to develop its National Adaptation Plan (NAP) to increase its capacity to address its vulnerability to climate change<sup>146</sup> and integrate climate change adaptation considerations into its development planning and budgeting, particularly in the agriculture-water management nexus, and transport infrastructure and construction. Serbia was one of the first economies to request Green Climate Fund (GCF) readiness financing for this purpose (UNDP, 2019<sub>[249]</sub>). As part of these efforts, a stocktaking report was produced in 2017 and served as a basis for Serbia's NAP Readiness Proposal, Advancing Medium and Long-Term

Adaptation Planning in the Republic of Serbia. This was approved by the GCF in July 2019 (UNDP, 2019<sub>[249]</sub>).

Serbia was the first WB6 economy to put a **circular economy framework** in place. The key institutions involved in the policy framework are the MoEP, and the Serbian Environmental Protection Agency (SEPA).<sup>147</sup> In October 2018 the MoEP established a Special Working Group for Circular Economy, which works on the transition process and acts as the main co-ordinator of stakeholders in the circular economy. In 2020, Serbia prepared its Roadmap for Circular Economy, an important document that sets the guidelines for the transition towards a circular economy (Box 25.19).

### Box 25.19. A roadmap for a circular economy in Serbia

A Special Working Group for Circular Economy within the Ministry of Environmental Protection (MoEP) developed a roadmap for the circular economy in April 2020, important guidance that outlines the actions Serbia needs to take to make the transition from a linear economy. It is modelled on the same type of document developed in EU countries such as Finland, France, the Netherlands, Slovenia and Spain. This initial document will be harmonised with EU recommendations to align it with newly adopted EU documents (the Green New Deal and the new Circular Economy Action Plan). The working group will undertake a range of activities to this end, including developing a Circular Economy Roadmap 2.0.

The aim of the roadmap is to initiate a dialogue between decision makers and representatives of industry, academia and civil society, in order to encourage industry to innovate, increase market opportunities for production through circular business models, create new jobs and improve business, while preserving the environment. The intention is to encourage the whole of society to adopt radical changes in attitude towards limited resources. The roadmap is accompanied by a communication plan that contains measures to raise public awareness about the circular economy. Its main goal is to inform and involve as many actors as possible and thus achieve a broader social consensus for the implementation of the roadmap.

The key drivers behind the roadmap can be grouped into four main areas:

- **Economic:** boosting competitiveness, market development, (horizontal) economic diversification, and development and application of new business models and new technologies.
- **Political:** regional positioning, creating a national political consensus, EU accession process and implementation of international obligations in the field of environmental protection and combating climate change.
- **Environmental:** waste reduction, GHG emission reduction, conservation of natural resources and improving energy independence and the use of renewable energy sources.
- **Social:** improving social welfare, improving consumer rights, savings in household budgets, improvement in people's health and green jobs.

Source: (Government of Serbia, 2020<sub>[250]</sub>), Roadmap for a Circular Economy, [https://www.ekologija.gov.rs/wp-content/uploads/razno/2020/FINAL\\_202004020\\_roadmap%20SRBIJA.pdf](https://www.ekologija.gov.rs/wp-content/uploads/razno/2020/FINAL_202004020_roadmap%20SRBIJA.pdf).

Serbia generates 319 kg of municipal waste per capita. This is lower than the EU average (492 kg per capita in 2018) but has been steadily, albeit slowly, increasing over the last five years. Waste collection is provided for 87% of the population (in 2018), but the waste is primarily deposited untreated at disposal sites that do not comply with any sanitary standards (Eurostat, 2020<sub>[251]</sub>; SORS, 2017<sub>[252]</sub>). Only 3% of waste was recycled in Serbia in 2018, with the rest ending up in landfill (SORS, 2017<sub>[252]</sub>). There are only 10 operating sanitary landfills, and no composting centres or incinerator facilities. Local stakeholders also reported an estimated 3 000 wild dumpsites (CEVES, 2018<sub>[144]</sub>). There is no systematically organised collection, sorting and recycling of separated municipal waste, although primary waste selection in Serbia

is defined by law. Hazardous waste is also often mixed with municipal waste or piled up in temporary storage facilities.<sup>148</sup>

Serbia's **municipal solid waste management framework** is relatively well developed. There have been no major changes since the last assessment except for the adoption of a new regulation on the reduction of packaging waste for the period 2020-24, which contains objectives for recycling and reuse of packaging waste and all packaging waste streams. The Law on Waste Management (2016) is the legal basis for waste management in Serbia. At the time of writing, this was being used to prepare the new Waste Management Strategy (2020-25) and National Waste Management Plan.<sup>149</sup> The new strategy will mark a shift from the model of regional sanitary landfills to regional waste management centres which will include waste sorting, separation and recycling, as well as non-recyclable waste treatment.

No systematic monitoring is taking place. The State of the Environment Report, one of Serbia's fundamental environmental reports which SEPA produces each year, provides a comprehensive assessment of the state of the environment and trends, and thus indirectly on waste management and progress towards a circular economy. SEPA also prepares the annual Report on Economic Activities of Importance to the Environment in the Republic of Serbia, which covers industry, energy, agriculture, forestry, tourism, and resource efficient and circular economy. These two reports also describe the funds for subsidies and other incentive measures, which include incentives for waste re-use and recovery, i.e. for the recycling industry.

In addition to SEPA and MoEP, a number of bodies<sup>150</sup> are involved in municipal solid waste management. Vertical (national and local) institutional co-ordination is ensured through special working groups and commissions for drafting national regulations. Opportunities for capacity building in local governments are regularly offered through various projects in Serbia, implemented by the donor community.

As in other WB6 economies, waste collection and treatment infrastructure in Serbia is financed through waste collection fees, budgets and donor funds, while services are funded from waste collection fees. Some investments into new waste treatment facilities have been made since the last assessment<sup>151</sup> and measures have been taken to combat unregulated burning and illegal dumping of waste by the Sector for Environmental Monitoring and Precaution within the MoEP. Nevertheless, stakeholders report the existence of a large number of illegal landfills and the lack of systematic approach in prevention and sanction of illegal dumping and burning of waste. The undertaken measures proved ineffective as many institutions are involved in their realisation and the responsibility is often taken away from one body to another, making the introduction of changes difficult.

### *Sub-dimension 13.2: Natural asset base*

With 24 443 m<sup>3</sup> of water per year per capita, Serbia is a water-rich country, with far larger quantities of renewable internal fresh water resources per inhabitant than its WB6 peers (which averaged 11 560 m<sup>3</sup> of water per year in 2017) (World Bank, 2017<sub>[253]</sub>). In 2017, around 75% of water was used in the industry sector, mainly for cooling in electric power generation (SORS, 2017<sub>[252]</sub>), followed by agriculture (13%) and municipal use (14%)<sup>152</sup> (Worldometers, 2016<sub>[254]</sub>).

**The freshwater management** framework in Serbia is relatively well developed. The Law on Water (2012) and the Water Management Strategy (2017-34) regulate this area, but the level of alignment with the EU *acquis* on water quality remains moderate (EC, 2020<sub>[36]</sub>). While the first steps towards development of the Water Management Plan for the Territory of the Republic of Serbia (2021–27) were taken at the end of 2019, its progress has been rather slow (Coalition 27, 2020<sub>[255]</sub>).

The provisions of the Law on Water apply to all surface and groundwater, prevention of pollution at source, emissions control and water quality standards, and prevention and protection against flood risks. In 2019, Serbia adopted a Regulation on Establishing a General Flood Protection Plan which covers a six-year period and stipulates measures to be undertaken in periods of high water, as well as institutional

responsibilities, the interpretation of data, forecasting and flood alerts. However, the Flood Risk Management Plan has not yet been adopted. The development of the plan is required by the Law on Water, as well as the EU directive on assessment and management of flood risks (Coalition 27, 2020<sup>[255]</sup>). Mapping of flood hazards and risks is still at an initial stage, mainly due to the lack of human and financial resources and data availability (EC, 2020<sup>[36]</sup>).

The law also regulates licences for the construction of hydropower plants. These require a detailed environmental impact assessment (EIA) and strategic impact assessment to be conducted. Yet, this procedure seems to be widely circumvented: there are cases in which hydropower licences were issued before the EIA report or which did not take the EIA report into account when issuing a licence. The most recent violation of this sort was in 2019, when the MoEP banned an investor in a mini hydropower plant from performing any work in the village of Rakita in Eastern Serbia, in the Stara Planina national park – although the municipality had issued a permit for it – and ordered the investor to restore the location to its original state.<sup>153</sup>

Approximately 90% of the Serbian territory lies in the Danube River Basin, the second largest in Europe, and Serbia is part of other transboundary basins, the Sava, Tisa and Drina. Work on the river basin management plan is progressing slowly, as such a plan has yet to be prepared and adopted (EC, 2020<sup>[36]</sup>).

Numerous bodies are responsible for freshwater management in Serbia. The Ministry of Agriculture, Forestry and Water Management is the main body but its administrative capacities remain limited, in particular for monitoring, enforcement and inter-institutional co-ordination. SEPA conducts annual water status monitoring and as part of this work it plans the development and supervises the functioning of the state network of stations for water quality monitoring.

As in the previous assessment, no data or projections of water demand from agriculture, industry (including energy) and households are collected, so cannot guide decisions about handling competing uses now or in the future. Data on water risk management – meteorological data (including data on rainfall) and historical data on water disasters – are available, but not all are publicly available or communicated to citizens to increase awareness of water-related risks.

The **biodiversity and forest management frameworks** have been slightly improved. The Nature Conservation Programme (2020-22) was being prepared at the time of drafting. Although the scope of the draft Nature Protection Programme (2021-23) is harmonised with the Law on the Planning System, the period it covers is significantly shorter than that stipulated by the Law on Nature Protection. The previous Biodiversity Strategy of the Republic of Serbia (2011-18) is currently being revised.

Numerous bodies<sup>154</sup> are responsible for biodiversity and forestry in Serbia, but institutional and human resource capacities at national and local level remain weak, particularly regarding enforcement (EC, 2020<sup>[36]</sup>). Capacity building and training are being conducted, mostly as part of various regional or national projects or through the National Academy for Public Service.

SEPA develops biodiversity, forestry, hunting and fishing indicators, as well as on sustainable use of natural resources, and prepares national reports. However, a fully operational system for monitoring biodiversity is still being developed. SEPA co-ordinated and prepared the Sixth National Report of the UN Convention on Biological Diversity. Serbia had not attained Aichi Target 11<sup>155</sup> at the time of drafting; its terrestrial protected area stood at 7.6% of its total landmass in 2019 (instead of the 17% target by 2020 set in the Aichi Target 11) (Ministry of Environmental Protection of the Republic of Serbia, 2019<sup>[256]</sup>).

Forests make up a smaller share of Serbia's total land area (31%) than the WB6 average (42%). It has made some changes to the legislative framework since 2017, such as the amendments to the Law on Forests, adopted in 2018. The Second National Forest Inventory<sup>156</sup> (the first was in 2009) and the National Forestry Programme were being developed at the time of drafting. There are no reports on the implementation of the Forestry Development Strategy of Serbia, which was adopted in 2006 and formally expired in 2018 when the Law on the Planning System came into force, even though the law stipulated

that the revised policy document needs to include *ex post* analysis of the implementation of the previous one. There is no systematic monitoring in place but instead monitoring takes place indirectly through the monitoring of the health of forests within the Monitoring and Assessment of Air Pollution Impacts and its Effects on Forest Ecosystems in Serbia.

Although the preparation of the Law on Trade in Timber and Timber Products has been announced, there has been no action to adopt new strategic or legislative documents to transpose EU legislation in this area.<sup>157</sup> The Law on Forests prescribes penalties for illegal logging and timber trading but they are rather mild, or poorly enforced in practice. Out of 1 519 misdemeanour charges filed in 2017, 433 people were fined an average of EUR 70 each for illegal logging (Forest Directorate of Serbia, 2017<sup>[257]</sup>). Although national statistics and official reports show extremely low levels of illegal forestry activities, by combining data with other sectors, primarily energy, it is possible to conclude that illegal logging levels in Serbian forests are several times higher than reported by the Directorate of Forests and the Statistical Office of Serbia. Over one million households in Serbia use wood as the main energy source for heat and cooking in a very inefficient way.<sup>158</sup> Moreover, according to local stakeholders, the lack of appropriate planning and control of the use of privately owned forests remains a significant issue in Serbian forestry. They report that data about privately owned forests, needed for appropriate forest management, are often of poor quality or unavailable.

The **land-use management** policy framework in Serbia was being developed at the time of drafting. The legal framework is well established through the Law on Soil Protection (2015), on the basis of which Serbia is in process of establishing a national soil monitoring programme. Serbia was also preparing a new Spatial Plan for the period 2021-35 at the time of drafting.

SEPA, as an administrative body within the MoEP, carries out state administration tasks related to the development, harmonisation and management of the national environmental information system within the land information system. It has a legal obligation to report on the state of the environment in Serbia, which it does through the Change in Land Use indicator.<sup>159</sup> The SORS covers agricultural land and publishes key indicators on the land usage and cover of agricultural and farm structures. The data are updated through several surveys run approximately every five years, with the last one being conducted in 2018 (SORS, 2018<sup>[258]</sup>). However, little information can be found about other key indicators related to land-use management including whether they are georeferenced and harmonised with government bodies like property tax and forest management, or if the data are publicly available.

### *Sub-dimension 13.3: Environmental quality of life*

Air quality in Serbia remains a concern. The population is exposed to air pollutants like fine particulate matter (PM<sub>2.5</sub>) levels that are more than twice those guidelines set by the WHO<sup>160</sup> (25 µg/m<sup>3</sup> as compared to 10 µg/m<sup>3</sup>) (World Bank, 2017<sup>[259]</sup>). The main sources of outdoor air pollution include the energy sector (thermal power plants,<sup>161</sup> district heating plants and individual household heating), the transport sector (due to an ageing vehicle fleet), waste dump sites and industrial activities (oil refineries, the chemical industry, mining and metal processing and the construction industry) (WHO, 2019<sup>[260]</sup>). Air pollution has become of even greater concern during the COVID-19 pandemic as it is known that exposure to ambient and indoor air pollution increases the risk of cardiovascular, respiratory and developmental diseases, as well as premature death, thus making individuals even more vulnerable to COVID-19 (OECD, 2020<sup>[261]</sup>). Air pollution also contributes significantly to the overall burden of disease and premature death in Serbia, which has higher estimated premature deaths due to air pollution than most countries in the EU (World Health Organisation, 2019<sup>[262]</sup>).

Serbia recognises the seriousness of the health risk from air pollution and it is managed through a relatively well-developed legislative and policy **air quality framework**. No major changes in the legislative framework have been recorded since the last assessment, but the policy framework has seen the adoption of the National Plan for Reducing Emissions of Major Pollutants from Old Large Combustion Plants (NERP)

was adopted in January 2020. This plan aims to reduce total annual emissions of sulphur dioxide, nitrogen oxides and particulate matter from the combustion plants it covers, to meet limit values prescribed in the plan by 1 January 2028 the latest. Supported by an EU-funded project,<sup>162</sup> Serbia was also developing the Air Protection Programme with an action plan at the time of drafting (to be finalised in 2021). This Program is expected to provide a basis for further development and adoption of by-laws and continued implementation of the EU legislation in the field of air protection.

Air quality plans have also been developed at the local level. Since 2013, 6 out of 13 local governments have obtained the ministry's approval for their plans, including 4 since the last assessment. However, Serbia's annual air quality report for 2018 lists 11 urban agglomerations with air pollution above the limits,<sup>163</sup> 5 of which do not have air quality management plans in place (EC, 2020<sub>[36]</sub>). Also worrying is the lack of funding for environmental protection and investment in climate change by the largest air polluters in Serbia. The pollution caused by the Kostolac B thermal power plant needs to be addressed as a priority (EC, 2020<sub>[36]</sub>).

Numerous bodies are responsible for air quality, but the lack of human resources and insufficient funding at all three levels (national, provincial and local) are a continuing problem, with clear consequences for operational monitoring and reliable assessment of air quality in zones and agglomerations. Capacity building is regularly offered, mostly through the support from the international community. Horizontal and vertical co-ordination have been functioning well.

SEPA regularly monitors air quality, conducting automatic air quality monitoring at the national level. It maintains the air quality information system (as a subsystem of the environmental protection information system), conducts laboratory analyses of air samples, carries out regular calibration of equipment and produces annual and periodic reports on the state of air quality, thus enabling decision makers to take measures to reduce air pollution. SEPA publishes monthly reports on the state of air quality, based on data obtained from the state and local air quality monitoring networks. It also prepares and publishes an annual report on the state of air quality.

No mitigation measures have been specified for when air pollution thresholds are exceeded, which means that there is often no immediate response, especially from local governments. According to the Law on Air Protection and the accompanying by-laws, SEPA is obliged to inform the public about the exceedance, which is done exclusively through the website in real time. According to data obtained by SEPA, around 2.5 million people, or one-third of the Serbian population, have been exposed to excessively polluted air. At the same time, local stakeholders report incomplete data about air pollution, due to insufficient monitoring infrastructure (in particular in rural areas) and the number of pollutants monitored. Local stakeholders confirm that the data provided should be interpreted with caution, due to limited availability of valid hourly data provided by the state air quality monitoring network. Only 48% of stations provided valid data in 2019 (Coalition 27, 2020<sub>[255]</sub>). Local stakeholders also noted that the air quality monitoring framework does not stipulate clear obligations for polluters, thus impeding the efficiency of responses.

Another element that strengthens public health by reducing health risks is a high-quality **water supply and sanitation (WSS) system**. Although traditionally Serbia has good access to drinking water with proven water service continuity, the quality of the water is rather low, especially in rural areas and the Autonomous Province of Vojvodina, in the latter due to high concentration of arsenic in the groundwater (Serbian Environmental Protection Agency, 2020<sub>[263]</sub>). Untreated sewage and waste water are still the main source of water pollution (EC, 2020<sub>[36]</sub>). Around 58% of the population is connected to public sewerage systems, but only 10.5% are connected to public sewerage served by a wastewater treatment plant. This is higher than the WB6 average of 6.5%, but lower than the EU average of 86% (Eurostat, 2020<sub>[264]</sub>). In 2018, 42 municipal wastewater treatment plants were operational in Serbia, but worked at lower efficiency level and 18 are still under construction or being rebuilt (Serbian Environmental Protection Agency, 2019<sub>[265]</sub>).

Serbia has made no major changes to its WSS legislative and policy frameworks since the last assessment (2018). It still needs to make significant efforts to align its legislation further with the EU *acquis*, and to

strengthen administrative capacity, in particular for monitoring, enforcement and inter-institutional co-ordination (EC, 2020<sup>[36]</sup>). As mentioned in the section on freshwater management, the government failed to adopt the action plan for the Water Management Strategy (2017-34), which impeded appropriate implementation in the field.

The Ministry of Agriculture, Forestry and Water Management, and the Ministry of Construction, Transport and Infrastructure, as well as local enterprises established by municipalities, are the key bodies responsible for wastewater management in Serbia. However, the administration is of the view that they do not have the financial and human resources to undertake their assigned responsibilities and nor are there any regular activities aimed at building their capacity. No horizontal or vertical co-ordination tools exist in this area, which impedes effective implementation of the envisaged measures.

The water supply network in Serbia is very old (approximately 35 years) and that is one of the main reasons for the large water losses in the system, around 33% in 2019 (State Audit Institution, 2019<sup>[266]</sup>). Despite these statistics, the government has not taken any action to reduce these losses. Additional investments in wastewater treatment plants are planned, but they remain largely dependent on donor funding. Current water service fees have proved too low to cover or even supplement investment in WSS infrastructure; indeed they aren't even covering the operational costs of the system.

At the time of drafting, the strategic **industrial waste management** framework (the Waste Management Strategy 2020-25 and the National Waste Management Plan) was being updated, together with the establishment of the National Soil Monitoring Programme. Alignment with most of the EU *acquis*, including the Industrial Emissions Directive, is at an early stage. Serbia adopted its long-awaited national emission reduction plan in 2020 and established a database strengthening the monitoring of Seveso III operators<sup>164</sup> (EC, 2020<sup>[36]</sup>). Serbia has a high level of alignment with the EU *acquis* on chemicals; in 2019, it opened an online platform for registering biocidal products (EC, 2020<sup>[36]</sup>).

Urban soils are being monitored locally in order to determine contamination levels and potential risks to population health, with SEPA collecting data from local authorities. The monitoring includes the concentration of hazardous and harmful substances in soils in industrial zones, zones situated near the roads, drinking water supply zones, recreational and residential zones, agricultural areas, and zones near landfills.

Reporting on contaminated sites was established in 2020 through the Cadastre of Contaminated Sites information system, which is part of the environmental information system. SEPA maintains the cadastre,<sup>165</sup> which includes data on contaminated, endangered and degraded land, and is an integral part of the Land Information System.

### ***The way forward for environment policy***

Despite taking some important steps to improve the overall environment, especially in the areas of waste and freshwater management, biodiversity, and forestry, the authorities should still consider the following steps:

- **Step up efforts to combat air pollution and climate change, primarily by reforming power generation.** Serbia would need to phase out coal subsidies and start implementing renewable support schemes that are fully aligned with the EC's guidelines on state aid for environmental protection and energy 2014-20. In particular, the share of incentives dedicated to renewables continues to be modest in Serbia compared to coal subsidies and almost half of them were dedicated to support the expansion of small hydropower plants, which continue to be more privileged than other sources (CEE Bankwatch Network, 2019<sup>[267]</sup>). Permanently closing two of its thermal power plants (Kolubara A and Morava) and installing the best-available modern filters for the Kostolac plant are highly recommended. Subsidies for renewable energy should prioritise solar and wind over hydropower to address the current support imbalance and negative practices that

have harmed biodiversity. High levels of pollution are also linked to socio-economic conditions, as most citizens depend on coal as a low-cost source of energy. Subsidies could therefore be considered for other forms of heating, such as solar space heating.

- **Invest in improving the water supply and sanitation system and treating more waste water.** Despite its abundant freshwater, Serbia faces increasing water pollution, mostly as a result of continuing discharges of municipal and industrial wastewater into the rivers, a large number of illegal dumpsites, uncontrolled waste deposits, and pollution from agriculture sources. Inadequate sewage infrastructure is a significant cause of surface and underground water pollution due to the inadequate collection and treatment of waste water. Serbia's ageing infrastructure is also at the root of high levels of water losses. This is why it is important to conduct a thorough investigation of the situation and identify key investment priorities. The government should try to finance these projects as much as possible from the domestic budget and water tariffs (taking into account the needs of poor and vulnerable groups in the population). If it does reach out for support from donor funds, it will need to make sure such funding flows regularly to ensure sustainable maintenance of the water supply and sanitation system.

## Agriculture policy (Dimension 14)

### Introduction

Serbia has significantly improved its performance in this dimension. Its score has increased from 2.8 since the 2018 *Competitiveness Outlook* to 3.1 in this assessment (Figure 25.1), with notable progress in enhancing its agricultural support systems.

**Table 25.26. Serbia's scores for agriculture policy**

Dimension	Sub-dimensions	Score	WB6 average
Agriculture policy dimension	Sub-dimension 14.1: Agro-food system capacity	2.5	2.8
	Sub-dimension 14.2: Agro-food system regulation	3.3	2.9
	Sub-dimension 14.3: Agricultural support system	3.3	2.7
	Sub-dimension 14.4: Agricultural innovation system	3.0	2.6
Serbia's overall score		<b>3.1</b>	<b>2.7</b>

### State of play and key developments

Agriculture is an important sector for Serbia, accounting for 6.2% of total GDP in 2019 (SORS, 2020<sub>[127]</sub>). The importance of the agricultural sector is also evident in its contribution to employment: it accounted for 15.1% of total employment in 2020 (SORS, 2020<sub>[127]</sub>). However, only 51.6% of the total agricultural workforce are formally employed, and around 19% are already aged over 65. Agricultural land takes up 39.3% of the total land area, with arable land accounting for 29.6%. In 2018, arable made up 74.1% of land under agricultural use, while 5.3% was plantations/orchards, 0.6% vineyards, 10.1% permanent grasslands and 9.3% pastures. Cereals accounted for 66.3% of arable land, industrial crops 19%,<sup>166</sup> vegetables 1.9% and fodder crops 8.9%.

Agriculture is one of Serbia's top five export sectors: (SORS, 2020<sub>[127]</sub>) food and livestock accounted for 13.2% of total exports in 2019; maize and raspberries (frozen, no sugar) were among the top ten exported goods. Serbia is the world's largest exporter of frozen berries (raspberries, blackberries, mulberries and loganberries). In 2019, it exported 148 000 tonnes of frozen berries valued at more than USD 250 million, 30.5% of the world's exports.

Serbia is among the top five global producers of raspberries and plums, cultivating 127 011 tonnes of raspberries and 430 199 tones of plums in 2018. After fruit, grain is the dominant crop: it produced 6.2 million tonnes of maize (corn) and 2.1 million tonnes of wheat in 2018, making Serbia among the 30 largest producers of these crops in the world. In 2020, compared to 2018, maize production has increased by 9.6% and plums by 4.2%. Over the last decade, production of wheat (17.8%), maize (29.4%), sunflower (26.3%) and soya (60.3%) have all increased.

In 2019, crops accounted for 66.3% of total agricultural production, while livestock accounted for 33.7%. The net index of the volume of agricultural output increased by 14.3% over 2018. The value of livestock production also increased by 1.3% over the previous year while the production of raspberries increased by 7.4% and sour cherries by 70.9% (SORS, 2020<sub>[268]</sub>).

The COVID-19 crisis has affected all sectors of the Serbian economy, with most of the impact felt in services and tourism, resulting in reduced incomes, significant financial losses, increased unemployment, and the closing down of a number of small and medium-sized service providers. The agriculture sector also faced difficulties that have broken value chain linkages. Movement restrictions (lockdown) closed the traditional open green markets and prevented visitors coming to farms providing agro-tourism services (especially during the weekends). Lockdown, uncertainty and widespread fear of the virus created significant gaps into provision of seasonal labour, especially in March-June 2020. Complications with the transport of goods (both domestic and export) has slowed down the performance of the agriculture sector

overall. Some of Serbia's traditional agriculture export markets saw significantly decreased demand for some products (mostly fruits, lamb meat). On the other hand, the demand for wheat (flour) has increased.

In September 2020, the SORS noted an overall increase in the agriculture sector of 2.5% overall compared to 2019% (SORS, 2020<sup>[269]</sup>). The buy-out prices of most of the crops have remained the same as in 2019, or slightly increased. The most significant fall in prices has been in the livestock sector where broilers fell by 5.46%, pigs by 4.04% and calves (veal) by 8.68%. Comparing August 2020 with August 2019, prices rose for industrial crops (13.3%) and fruits (30.3%). Salaries in the agriculture, hunting and forestry sector fell by 10.2% compared to 2019, while employment in the sector fell by 1.8%. Exports of agriculture products (January-August 2020) increased by 7.8%, while imports decreased by 0.9%. The government adopted a few measures to support agricultural producers, including financial support measures (per ha/per head) to agricultural producers to mitigate the negative consequences to agriculture in April 2020. It also granted all types of agricultural producers preferential access to financial products (credit lines, leasing), prolonged grace periods, lower interest rates, paid insurance on financial products, etc. In September 2020 it introduced financial support measures (per head) to veal producers and slaughterhouses to mitigate the reduction in market demand caused by COVID-19.

At this stage, the government appears to have successfully mitigated the immediate and medium-term impact of COVID-19 on the agriculture sector. The support measures have been welcomed and widely used by producers. At the time of writing, even though the infection rate is increasing strongly in Serbia and the region, the government has completely changed its strategy compared to April 2020. Borders are open for the whole region (Albania, Kosovo, North Macedonia) without PCR tests and there is free movement for both people and goods, which should protect the economy from the harmful effects of COVID-19. This will not have any significant impact on agriculture during the winter period, when activity levels are very low.

#### *Sub-dimension 14.1: Agro-food system capacity*

Serbia has significantly enhanced its **rural infrastructure policy framework** over the last decade, with large projects investing in greater connectivity and faster expansion of broadband access in rural areas. Serbia's national rural infrastructure policy predominately falls under the remit of the Ministry of Agriculture, Forestry and Water Management (MAFWM)<sup>167</sup> while provincial secretariats<sup>168</sup> handle regional rural infrastructure. While these secretariats are independent and have their own budgets, their measures and activities are consistent with the policies of national ministries.

Serbia's investment in infrastructure, particularly in road construction and the railway network, reached close to EUR 3.5 billion in the period 2016-20. The E-80 corridor from Nis to the Bulgarian border was completed in 2016, enabling faster movement of goods and people from Bulgaria and Turkey to the EU. The E-75 road corridor was completed in 2019, enabling faster movement from the border with North Macedonia to the borders with Croatia and Hungary. The highway Milos Veliki from Belgrade to Cacak towards Montenegro, connecting the Ibar Valley to Belgrade, was completed the same year. Sizeable investments were also made in the E-70 corridor linking Serbia with Romania and Croatia which was completed in 2011.

Apart from these large-scale projects, there have been a number of ongoing investments in the rehabilitation of local roads, bridges and river banks. In August 2019, Serbia announced a EUR 12.4 billion investment plan for 2020-25, of which EUR 3 billion of which was allocated to improving sewage systems in rural areas while an additional EUR 1.3 billion was allocated to improving local and regional speed railways.

The MAFWM has implemented the Rural Development Strategy for the protection, development and use of agricultural land including land consolidation and the restoration of field roads. In 2019, the rulebook on subsidies for investments in physical assets of agricultural holdings for field electrification was adopted, defining support for investments related to electrification of fields. The goal is to accredit this measure as

part of rural infrastructure in the Instrument for Pre-Accession Assistance in Rural Development (IPARD) programme and to provide users with support for the realization of investments.

As of November 2020, the Ministry of Trade, Tourism and Telecommunications has begun implementing the Last-Mile Broadband to Households in White Zones in Rural Areas project, aimed at households that are not targeted for network expansion by any commercial operator in the next three years – see Digital society (Dimension 10).

In addition to the national budget, funding is provided through the World Bank, the EBRD, the EIB, and the European Agency for Reconstruction (EAR), as well as the China Investment Fund<sup>169</sup> and Abu Dhabi Fund<sup>170</sup> with an investment plan of EUR 300 million in agriculture infrastructure for the period 2013-21.

When it comes to Serbia's **irrigation policy framework**, the new irrigation strategy for 2020-30, which is under preparation, should include measures to use water more efficiently, considering Serbia's overall low water productivity. The current irrigation infrastructure is underused and in need of rehabilitation while drainage systems remain limited.

In 2018, a total of 159 587 ha was covered by irrigation systems, which is 6.18% of arable land in Serbia (which totals 2.58 million ha). Only 46 863 ha of agricultural land was actually irrigated in 2018, which represents 29.3% of the total area covered by irrigation systems.<sup>171</sup> In 2018, 33% of all Serbia's farms could use some form of irrigation system (564,540 ha). The commonest form of irrigation system is through sprinklers. Of the total irrigated area in 2018, 92.3% was irrigated by sprinklers (down 1.6% on the previous year), 7.6% by drip irrigation (up 1.6%) and 0.1% by surface irrigation.

At the end of 2019, the government announced the EUR 14 billion Serbia 2025 investment programme for economic development, with EUR 300 million earmarked for investments in agriculture. A sizeable amount of this investment (EUR 86 million) has been allocated to developing irrigation and drainage systems that will double the arable land under irrigation and drainage. The National Programme for Rural Development 2018-20 also provides support for three types of irrigation measures. Farmers and water users' organisations can apply for support to buy new irrigation equipment (50% support) or new irrigation systems (100% support). Water supply/irrigation public companies can apply for 100% support for preparing technical documents for new irrigation systems. IPARD also provides support for the use of groundwater (from springs and wells) and surface water (from rivers, lakes and reservoirs), and the construction of irrigation systems, including pumps, pipes, valves and sprinklers, which replace old inefficient systems and contribute to reducing the amount of water used.

In 2019, the Government of Serbia signed a memorandum of understanding (MoU) with the EBRD to implement joint programmes and investment activities aimed at strengthening Serbia's agri-food sector. One of the priority areas of co-operation set out in the MoU is upgrading, expanding and modernising irrigation infrastructure and water management systems to reduce farmers' vulnerability to climate change. The programme describes on the financing, construction and rehabilitation of critical irrigation infrastructure in three regions of Serbia: Negotin (Eastern Serbia), Svilajnac (Central Serbia), and Vojvodina (Northern Serbia) with a total of EUR 30 million. It also continues policy dialogues with the MAFWM by assisting in the preparation of Serbia's first Irrigation Strategy and a five-year action plan.

As part of the co-operation between Serbia and the United Arab Emirates, the current Abu Dhabi Fund for Serbia, envisages EUR 300 million support, with more than 30% for investment in irrigation. As of 2017, the fund had supported 12 irrigation projects, and planned to finalise an additional 10 by the end of 2020. The projects cover investment in small to medium-sized irrigation/drainage systems, each covering around 1 000-3 000 ha.

Serbia has made progress in updating the legislation on qualifications and establishing monitoring and evaluation of **agricultural education**. The educational system in agriculture is regulated and organised by MoESTD while the Institute for Improvement of Education is responsible for preparing the initiatives and reforms introduced by MoESTD. In 2020, Serbia adopted the By-law on Special Educational

Programmes which defines the implementation of teaching and learning in case of a state of emergency or unpredictable circumstances, in particular, the ongoing COVID-19 measures.

Agricultural education in Serbia is covered by 4 universities and 26 secondary schools, which are supported by 16 specialised research institutes predominantly focused on technologically advanced production. The four universities are the faculties of agriculture at the University of Belgrade, the University of Novi Sad, the University of Kragujevac and the Faculty of Bio Farming at the Megatrend University in Belgrade.<sup>172</sup>

The share of students enrolled in agriculture, forestry, fisheries and veterinary tertiary programmes in Serbia increased from 2.45% in 2018 to 3.39% in 2019 (Trading Economics, 2021<sup>[270]</sup>). While the number of students graduating from high school agriculture programmes has slightly increased, the number enrolling in the first year of university agriculture programmes fell from 9 147 in 2017 to 8 201 in 2019 (Figure 25.18). In secondary vocational schools, the share of students enrolling in agriculture, food production and processing increased from 6.5% of total high school students in 2017 to 6.7% in 2018. In 2018, 49% of farmers had completed primary education, 45% had completed secondary education and 6% completed tertiary education. Only 0.7% of all employees in Serbia are skilled agricultural, forestry and fishery workers.

**Figure 25.18. Number of students enrolling in the first year of university agriculture programmes**

Source: (SORS, 2020<sup>[214]</sup>), *Statistical Yearbook 2020*, <https://publikacije.stat.gov.rs/G2020/Pdf/G20202053.pdf>.

The Strategy for Education Development in Serbia 2012-20 aims to improve the quality of education, increase the share of the population covered at all educational levels, maintain the relevance of public education, and increase the efficiency and use of all education resources. A new strategy to follow on from this is currently being prepared. In line with the strategy's action plan, MoESTD established the Qualifications Agency and 12 sectoral councils in 2018, one of which is the Council for Agriculture, Food Production, Forestry, Fishery and Veterinary Sectors which is responsible for updating the skills, qualifications, education and training required to practise in these fields.<sup>173</sup>

Serbia has also begun implementing an evaluation mechanism for the agricultural education system. In March 2020, the national system for assessment of the education and its outcomes was established as an education management information system, on the basis of the education strategy. The system is connected to the SORS, which is in charge of gathering and managing education data in the fields of economy, agriculture, finance and regional policy, as well as the Institute for Education Quality and Evaluation. The first results from the systems are expected next year and the information gathered will serve for planning and implementation of education programmes in agriculture.

### *Sub-dimension 14.2: Agro-food system regulation*

Serbia has made progress regarding **regulations on natural resources** through an enhanced land consolidation process and the Land Parcel Identification System (LPIS), but inter-institutional co-operation is lacking. Natural resources in Serbia are the remit of the MAFWM and MoEP but inter-sectorial co-operation between the two ministries is limited, and there is no committee or administrative body where they could formally share information regarding the activities and challenges. Several regulations cover this field including the Law on Land Protection,<sup>174</sup> the Law on Environmental Protection,<sup>175</sup> the Law on Planning and Utilisation of Natural Resources, the Law on Nature Protection, and the Water Law,<sup>176</sup> which is harmonised with EU directives.

Recently, Serbia has emphasised land consolidation as a way to increase agricultural production. A new draft Law on Land Consolidation is being prepared, which will define the reasons and conditions for initiating land consolidation; land consolidation procedures; competent bodies, organisations and other bodies to implement land consolidation; sources of land consolidation; and other issues of importance for land consolidation, as well as the procedure for voluntary grouping of land. The Strategy for Rural Development 2014-24 also prioritises land consolidation to improve agriculture competitiveness, while the Serbia 2025 programme allocates an additional EUR 70 million to land consolidation processes.

The National Strategy for Sustainable Use of Natural Resources and Goods<sup>177</sup> also aims to further protect land and minimise damage and loss of agricultural land due to natural resource extraction. However, there has been no significant progress in the implementation of this strategy in relation to agriculture (World Bank, 2020<sup>[271]</sup>) Efforts to increase investment and productivity in agriculture continue to be hampered by land tenure uncertainty, the fragmentation of farms, and the incentive structure of agricultural subsidies. Large tracts of arable land continue to be owned by the state, including in zones with high production potential. The MAFWM has been offering state-owned land on multi-year leases (5-40 years), especially after 2018. There are now multi-year lease agreements covering 161 212 ha of state agricultural land. The ministry has also granted approvals for investments in agricultural infrastructure on 10 259 ha of leased agricultural land.

The LPIS<sup>178</sup> is an important tool for planning, implementing and monitoring support in agriculture. The main reasons for the establishment of both it and the Integrated Administration and Control System (IACS) are transparent and fair distribution of subsidies, easy identification and declaration of the land cultivated by farmer(s), easy control of declarations by the administration, reliable and accurate sources of information for policy and statistics on crops and area cultivated, and the assessment of policy impacts. As of November 2019, an EU project<sup>179</sup> has assisted in developing the technical software specification for the LPIS and land cover, developing a methodology, and training employees in the Directorate for Agrarian Payments and representatives of local self-government in the establishment of the LPIS. An analysis of the advantages and disadvantages of the four types of reference parcels has been done to select the most suitable type of reference parcel for Serbia. The LPIS pilot project (phase II) will include updating the LPIS methodology, developing an action plan to implement it across the whole of Serbia, and training on the new software.

When it comes to **regulations on products**, the regulations for seeds are comprehensive and regularly updated and thorough impact assessments and evaluations are conducted on an annual basis. The MAFWM is responsible for regulations on seed products which are based in the Law for Agricultural Plant Species, the Law on Seeds, the Law on Plant Health, and several rulebooks based on these laws. The Law on Plant Nutrition Products and Soil Improvers was updated in 2019 and regulates the classification, quality, designation, phytosanitary control and sampling for the sale, import and use of seeds and planting material. In adopting new laws and rulebooks for product regulations, impact assessments are conducted at least once a year. Officials of the Plant Protection Directorate are responsible for seeds and fertilisers.

The MAFWM established a Public Register of Plant Nutrition Products and Soil Improvers, available on its official website. The register contains over 2 500 plant nutrition products and soil improvers and is updated on daily basis. Entry in the register is enabled by the manufacturer, distributor or importer with approval of the ministry. Plant nutrition material, planting material and plant protection products are subject to documentation checks to identify shipments upon import. Sampling and testing are carried out to verify the product quality as mandated by the decision of entry in the Register of Plant Nutrition Products and Soil Improvers. Registrations are valid for a maximum of 10 years and can be extended by the ministry. If there is a suspicion that the plant protection product does not meet the conditions for registration, the ministry may initiate the procedure of reviewing the decision on registration. The register of agricultural plant varieties contains nearly 5 000 registered varieties and it is also regularly amended with new varieties.

### *Sub-dimension 14.3: Agricultural support system*

The **agricultural policy framework** in Serbia is partially harmonised with the EU and there are multiple stakeholder consultation processes for the adoption of new policies. The creation and implementation of agricultural and rural development policies falls under the auspices of the MAFWM while at the local level, all municipalities have bodies responsible for local agricultural and rural development policies in their territories. Additionally, the Ministry for European Integration is responsible for monitoring and reporting on the harmonization of the national policies with Chapters 11, 12 and 13 of the EU *acquis*. Serbia's plan for the development of agriculture and rural areas is set out in the National Agriculture and Rural Development Strategy (NARDS) of Serbia 2014-24,<sup>180</sup> developed with the participation of over 200 stakeholders from universities, the food industry, producers' associations, individual producers, relevant ministries and other government bodies. The procedure for adopting agriculture policies in Serbia includes public debate during which multiple stakeholders have the possibility to send their suggestions regarding policy content.

Based on the NARDS, the National Agriculture Programme (NAP) 2018-20 aims to support the development of agriculture, in particular the implementation of the agricultural policy and its harmonisation with the EU and Common Agricultural Policy (CAP) requirements. Besides the NAP, there is also National Programme for Rural Development in the period 2018-20 that sets the medium-term courses for the development of rural areas and describes the methods of implementing rural development measures for 2018-20. As of March 2020, the preparations for drafting the next national programmes for agriculture and rural development for 2021-24 had been started, with six agriculture sectoral analyses completed.

The 2018-23 action plan for the transposition, implementation and enforcement of the EU *acquis* in agriculture and rural development covers agricultural policy reforms, legislation changes and the strengthening of administrative capacities in the period before the EU accession. The action plan provides an assessment of necessary resources and capacity development measures required to strengthen and implement programmes and control bodies, as well as establishing the Paying Agency and the IACS.

The National Programme for the Adoption of the Acquis 2018-21 is a detailed, multi-year plan for harmonising domestic regulations with EU regulations. It is designed to link European legislation and domestic legislation in order to monitor the pace, scope and quality of that harmonisation. EU law is divided according to the responsibilities of state bodies, which enables regular planning and monitoring of their legislative activities. However, the agriculture policy framework in Serbia is still only partially harmonised.

Serbia's **domestic support instruments for producers** in agriculture are comprehensive and numerous. Income support measures improve farmers' income by reducing variable costs and increasing gross margins. The milk premium is the only scheme based on price support, i.e. payment per output. Basic subsidies for plant and livestock production contribute to farmers' income by paying them a fixed amount per hectare/head. All subsidies are available to farmers registered in Farm Register but basic subsidies for plant production are limited to 20 ha per beneficiary while there are also limits on livestock subsidies, depending on the animal.

Support is provided for rural development investments that contribute to increasing competitiveness and reaching quality standards. The support rate for such rural development measures is a minimum of 30% of the measure value; for farms in areas with difficult working conditions in agriculture the minimum rate is 45%, rising to 70% for some districts. The rural development programme supports 15 measures, including investment in agricultural households' physical assets; investments in the processing and marketing of agricultural, food and fishery products; subsidies for the preservation and improvement of the environment and natural resources; support for organic production; and the conservation of plant and animal genetic resources. Rural development measures also focus on economic activities and income diversification in rural areas, as well as improving the transfer of knowledge and innovative projects in agriculture.

Support is provided through national measures to support rural development and through the IPARD programme. As part of the IPARD programme, two public calls have been made for investments in the physical assets of agricultural holdings. Users can receive up to 60% of the value of the investment and young farmers can up to 65%, up to a maximum of EUR 1 million per person. The same programme has issued three public calls for investments in physical assets related to the processing and marketing of agricultural and fishery products. Beneficiaries can receive support of up to 50% of the value of the investment, up to a maximum of EUR 2 million per person. Despite significant EU resources being allocated to agriculture in Serbia, the available investment funds are underused because of the limited uptake of development grants by small and medium-sized producers (World Bank, 2019<sup>[272]</sup>).

To help with risk management, farmers can receive support to cover 40% of their insurance premiums for crops, permanent crops, nurseries and animals (45% in areas with difficult agricultural conditions), to encourage them to insure their crops and animals and avoid losses in the event of natural disasters.

The MAFWM lacks the administrative capacity to deal with policy creation and implementation. Budgetary funding for agricultural subsidies and rural development are monitored and are used to plan funding for following years. The MAFWM publishes the Green Book (by 30 June each year), which contains a review of all budgetary spending on subsidies in the previous year, as well as an overview of production in the agricultural sector. It is available on the MAFWM's official website.

Monitoring and evaluation of implementation of the IPARD II programme is carried out on a monthly, bi-monthly, semi-annual and annual basis, as well as on request. During the preparation of the IPARD II programme, an *ex ante* evaluation was conducted, and evaluation has been ongoing during its implementation. An impact assessment will be conducted after implementation and will include the impact of the programme on innovation adoption, structural change and sustainability.

The current agriculture support system is funded by direct payments, rural development measures plus specific subsidies and credit support, and IPARD. All schemes are financed out of the MAFWM's annual budget, while the IPARD measures are co-financed by the EU fund. The annual regulation on allocation subsidies in agriculture and rural development defines the level of support for each scheme in that year. The current subsidies have been in force since 2013 and have since been harmonised, in terms of categorisation, with the CAP.

As almost all the schemes defined by the Law on Subsidies in Agriculture and Rural Development have been implemented, the entire budget for subsidies in agriculture and rural development is spent every year. There are no significant differences in the use of the national budget and IPARD fund, as the application procedures are similar, but IPARD applications are subject to several controls and are therefore more time-consuming than the national measures.

Although **agricultural trade policy** in Serbia is mostly harmonised with World Trade Organization (WTO) and EU standards, its customs regulations are unorganised and ambiguous. Agricultural trade policy is based on the Law on Foreign Trade which requires that measures affecting foreign trade, including in agriculture, are applied in accordance with WTO rules, EU legislation and commitments undertaken under international agreements. The law envisages the possibility of introducing quantitative restrictions in the

case of a critical shortage of basic products, or to alleviate the effects of such a shortage. Tariff quotas are implemented through the Customs Administration within the Ministry of Finance. The use of quotas is registered and deducted after the goods have gone through customs, and an automatically updated overview of the use of quotas is available on the Customs Administration website.

Serbia has begun the process of negotiating its membership of the WTO<sup>181</sup> and begun consolidating the form and level of customs protection of agriculture. The liberalisation of trade in the region has continued through bilateral free trade agreements, under which significant agricultural concessions were agreed and later integrated into the Central European Free Trade Agreement (CEFTA). Tariff quotas are defined in the Stabilization and Association Agreement (SAA) with the EU, the free trade agreement with Turkey and the European Free Trade Association (EFTA) Agreement. Serbia does not apply export quotas except for sugar and some other products exported to the EU market, based on the SAA double-checking model.

There have been no export duties for agricultural products since 2013. Customs for the agriculture sector are regulated by the Law on Customs Tariffs, the Law on Specific Duties for Import of Certain Agricultural and Food products, and the Customs Law which includes the Decision on Seasonal Tariff Rates for products such as flowers, vegetables and fruits with *ad valorem* rates of 20%. As tariff protection for agricultural products is subject to decisions by the government, agricultural trade policy is unpredictable and not transparent. Serbia's accession to the WTO will consolidate customs regulations into a single piece of legislation and establish a binding maximum level of tariffs.

In terms of its **agricultural tax regime**, Serbia applies reduced taxes on agriculture products. The taxation system distinguishes between agricultural holdings and individual agriculture. Agricultural legal entities enjoy the same tax treatment as all other legal entities, and are included in the corporate income tax system. Individual farmers are natural persons, and are included in the personal income tax system. A natural person who generates income from agriculture, and does not have the status of entrepreneur, is not obliged to keep business and financial records.

In principle, farmers in the Republic of Serbia are not VAT payers, even when their total turnover is more than RSD 8 million. They can voluntarily choose to pay VAT by submitting a registration application, in which case the obligation to pay VAT lasts for at least two years (Article 34, paragraphs 5-7 of the Law on Value Added Tax). After two years, their status as VAT payers does not cease automatically, but they must submit the appropriate request. The situation is different for farmers who have entrepreneur status and who keep books. They become VAT payers once their total turnover exceeds RSD 8 million. However, since they choose freely whether or not to have the status of an entrepreneur, entering the VAT system can also be seen as a choice. When they enter into the VAT system, farmers are subject to the same treatment as other VAT payers.

The standard VAT rate in Serbia 20%, and the reduced rate for agricultural products is 10%. In most cases, VAT on agriculture products is at the reduced rate. VAT for agricultural inputs that are not produced in Serbia are updated every year based on a proposal by the MAFWM to the Ministry of Finance, most of which are technical production machinery and equipment. Personal income tax is 10% but increases for those whose income is three times the average salary, by an additional 10% on the difference between their net earnings and the average salary.

Although Serbia's annual programmes for plant health are aligned with the EU, the organisation and monitoring of its **sanitary and phytosanitary (SPS) measures** are still being developed. The veterinary and food policies need further improvement in the process of alignment with EU legislation. The authorities responsible for SPS measures are the Veterinary Directorate, the Plant Protection Directorate and the Sector for Agriculture inspection under the MAFWM, and the Sanitary Inspection Sector under the Ministry of Health. SPS regulations are based in the Food Safety Law which covers the organisation, implementation and monitoring of SPS measures as well as the division of responsibilities, and the Law on Inspection Control.

The annual programmes for plant health measures have been adopted and the list of approved active substances in pesticides is aligned with the EU. While duplication may occur over composite products, due to their complex structure, this is rare and the responsibilities for inspection are clearly divided in the Law on Food Safety. This law was amended in 2019, adopting the rulebook on the division of competencies regarding food safety and listing composite foods. Risk analysis for SPS measures and plant products uses the International Plant Protection Convention methodology, and phytosanitary inspections and financing are based on a risk approach.

Serbia lacks the capacity to introduce SPS initiatives as it has no written processes for the systematic evaluation of the quality of services and the capacity requirements of the organisations involved, and the overall system. However, the management hierarchy is clearly defined, as are the working plans and objectives. There is system for evaluating employees and in-house procedures, all of which could be a good basis for establishing written processes for the systematic evaluation of the quality of services. Due to a permanent shortage of staff to carry out phytosanitary inspections, 16 new inspectors were hired in 2020.

In 2019, Serbia adopted annual programmes for veterinary policies consisting of animal health protection measures. The further delegation of inspection duties from Phytosanitary in the Veterinary Inspectorate led to the employment of 39 new veterinary inspectors in 2020. Serbia has a large network of accredited reference laboratories with well-established data and information exchange between laboratories and inspections. Accreditation of the national reference laboratories directorate was extended for milk (additional methods), food and seeds for between 3 and 10 years, depending on the product. Although animal welfare legislation is mostly harmonised with EU regulations, some legislation remains to be amended, such as the regulation on official controls for slaughter. Serbia is also not fully harmonised with EU legislation over maximum residue levels of related substances, as the permitted level of aflatoxins in milk remains five times that permitted by the EU *acquis*.

#### *Sub-dimension 14.4: Agricultural innovation system*

Serbia has made substantial progress in improving its **agricultural research and development framework**. Research regulations are fully harmonised with the EU and the key EU research goals are incorporated into the policy on scientific and technical advancement. Serbia has continued its involvement in the EU research framework and international co-operation, through Horizon 2020 and Eureka.

The scientific work at the faculty level in Serbia is realised through basic, applied and developmental research. The aims are to raise the quality of teaching, improve the skills of scientific and teaching staff, introduce students to scientific work, create material conditions for work and development of the faculty, and develop new technologies and products, new species, breeds, varieties, etc. Research in the field of agriculture and food has always been in the most direct connection with the development of agriculture and the food industry of Serbia. Teachers, researchers and associates of the faculty participate in a large number of national and international projects.

Work has begun on the implementation of a new research and innovation plan for the next seven years and the Science, Technology and Innovation Roadmap, focused on the Smart Specialisation Plan. Some progress has been made with the new Science and Research Act and the introduction of the first Smart Specialisation Strategy, but no action plan for the strategy has yet been implemented.

Extension services in Serbia are comprehensive, widely available and commonly used by farmers. The **agriculture extension services framework** is based in the Law on Agricultural Advisory and Extension Services and several by-laws.<sup>182</sup> The key action plan is the Multiannual Programme for the Creation of Agricultural Advisory Services, along with seven statutory and administrative provisions.

The farm advisory system has 36 agricultural advisory and extension services (AAES), 31 of which are public and 5 of which are private, employing a total of 273 advisors. The work of the AAES is managed by

the MAFWM (Sector for Rural Development, Advisory Group) and the Provincial Secretariat for Agriculture, Water Management and Forestry (PSAWMF), for the territory of the Autonomous Province of Vojvodina. Since 2016, the MAFWM and PSAWMF have authorised two organisations to educate and train advisors, monitor them and report on their work for a 10-year period, the Institute for Agricultural Science Application (IPN) and the (Poljoprivredna Stanica) (PSS) Novi Sad Education Centre. These approved entities assess the effects of the advisors' work and the advisory activities carried out by them in accordance with the Monitoring and Assessment Programme of the Work Effects of the Advisors.

Extension services are widely used by agricultural producers. The advisory work of the MAFWM is entirely financed in conjunction with the annual programme for the production of agricultural advisory services. Some groups of farmers are targeted for individual work with consultants and facilities and educational programmes are often offered free of charge. A training programme for advisory services is also available and is implemented periodically in conjunction with the annual training plan prepared by the approved organisation. There are also one-off initiatives to encourage creativity, environmentally sustainable practices and transfer of knowledge on farms.

The current rural development support mechanisms include subsidies for improving knowledge creation and transfer and the development of technical-technological, applied, developmental and creative projects in agriculture and rural development. Since 2006, the MAFWM has funded subsidies for the implementation of science, growth and innovation projects in agriculture with agricultural faculties in Belgrade, Novi Sad, Čačak and Lesak. Projects are carried out in close collaboration between research institutions and extension services. Impact evaluations are performed by the MAFWM and are updated based on the previous annual review of the operations of the extension offices.

### ***The way forward for agriculture policy***

For the further improvement of the agriculture policy, Serbia needs to:

- **Continue investment in irrigation infrastructure.** Irrigation and drainage are crucial to Serbian agriculture and can double yields, or even triple them in some agricultural sub-sectors. The current plans and strategies for investment in irrigation need to be implemented as planned to improve the competitiveness of Serbia's agriculture products.
- **Enhance the agriculture land management policy.** Full establishment of a functional and operational LPIS is crucial. The LPIS is one of the preconditions for accreditation of new IPARD measures and represents a strong tool for planning, implementing and monitoring agricultural support policy.
- **The Common Market Organisation law** needs to be adopted through secondary legislation in areas including marketing standards, public and private storage, and producer organisations.
- **Improve the performance of the Directorate for Agrarian Payments.** Accelerate the processing of applications for the measures already entrusted under the IPARD II programme in order to prevent any shortage of EU funds and begin to entrust the execution of the budget to the remaining initiatives of the programme.
- **Improve food safety policies.** After a proper and inclusive public consultation, Serbia needs to prepare a strategy and action plan for completing its alignment with the EU *acquis*. Although the rules on monitoring systems for food of animal and plant origin have been introduced, along with those for animal feed, will be important to further develop its risk-based approach to imports, including products subject to sanitary checks, and ensure that audits are carried out by inspection workers.

## Tourism policy (Dimension 15)

### Introduction

Table 25.27 shows Serbia's scores for the five tourism sub-dimensions and compares them to the WB6 average. Serbia has the second highest score in the tourism dimension (after Montenegro). Serbia scores higher than the WB6 average in all sub-dimensions. Since the previous assessment, Serbia has made only limited progress (Figure 25.1). Its main progress has been in improving the accessibility and quality of its tourism infrastructure by supporting investments in public and private infrastructure and establishing a mandatory accommodation categorisation system. The adoption of the Law on Tourism and the Law on Hospitality in 2019 provided a good basis for improving its accommodation quality assurance framework and the establishment of the central information system (E-Tourist) which will enable more accurate statistical monitoring of domestic and foreign tourists. Nevertheless, underdeveloped tourist infrastructure and poor-quality tourist services remain important challenges.

**Table 25.27. Serbia's scores for tourism policy**

Dimension	Sub-dimension	Score	WB6 average
Tourism policy dimension	Sub-dimension 15.1: Governance and co-operation	3.0	2.3
	Sub-dimension 15.2: Destination accessibility and tourism infrastructure	2.7	2.2
	Sub-dimension 15.3: Availability of a qualified workforce	2.0	1.8
	Sub-dimension 15.4: Sustainable and competitive tourism	1.7	1.6
	Sub-dimension 15.5: Tourism branding and marketing	1.8	1.6
Serbia's overall score		<b>2.3</b>	<b>2.0</b>

### State of play and key developments

Tourism has not yet been recognised as an important sector of Serbia's economy. However, the rapid increase of tourist arrivals and overnight stays in the last ten years (11% average annual growth since 2010), and other positive trends indicate its growing economic importance. In 2019, tourism directly accounted for 2.4% of GDP (USD 2.99 billion) and 2.1% of employment, or 44 300 jobs. Overall, it was responsible for 6.2% of employment, or 134 800 jobs in tourism and tourism-related sectors (WEF, 2019<sub>[273]</sub>). In 2019, tourism accounted for 8.2% of Serbia's exports and tourism-related exports are growing faster than total exports (Radivojevic, 2020<sub>[274]</sub>). The industry attracted capital investment of RSD 33.8 billion, or 4.1% of total national investment. This is expected to rise by 2% per year to RSD 43.5 billion by 2028 (World Bank, n.d.<sub>[275]</sub>).

Serbia ranks second in the Western Balkan region, just behind Montenegro for average receipts per arrival. There were 3.7 million tourist arrivals in Serbia in 2019, an increase of 84.4% compared to the beginning of the decade (2010) (SORS, 2019<sub>[276]</sub>). Foreign tourism grew faster than domestic tourism, with foreign tourist arrivals growing by 170% to 1.8 million arrivals, and domestic tourists by 39.3% since 2010, which contributed to foreign tourist arrivals reaching 50% of total tourist arrivals in 2019 (Figure 25.17). This clearly shows the growing attractiveness of Serbia as a destination for foreign tourists.

This progress is a result of continuous improvement of Serbia's competitiveness in the global market. Serbia has made significant efforts to improve its standing in the World Economic Forum (WEF) 2019 Travel & Tourism Competitiveness Index by 12 places, ranking 83<sup>rd</sup> in 2019 (WEF, 2019<sub>[273]</sub>). This is, along with Albania, the fastest rise among the WB6 economies. The most prominent progress has been in improving the overall business environment. Serbia has improved its international openness (visa requirements reduction), construction permit procedures, human resources and labour market investment, and environmental sustainability. Nevertheless, key challenges remain; Serbia ranks 105<sup>th</sup> for the stringency of its environmental regulations and 116<sup>th</sup> for their enforcement in the index.

Serbia faces challenges in the sector, such as its relatively high seasonality (69% of tourist overnight stays are from April to October; Figure 25.19) and a high level of informality. This not only reduces the real impact of tourism on the economy but also hampers government efforts to improve its quality. Although there has been increased investment in public tourism infrastructure and transport (such as investments in new sections of highways or the new Morava Kraljevo airport), the quality of tourism services and infrastructure is still underdeveloped compared to other economies in the region. The lack of tourism marketing and branding (Serbia ranked 133<sup>rd</sup> in 2019; 6 places lower than 2017), and the lack of government prioritisation of the travel and tourism industry (137<sup>th</sup> place, 6 places lower than 2017) are also an issue (WEF, 2019<sub>[273]</sub>).

**Figure 25.19. Seasonality and growth of tourism in Serbia (2017-20)**

Source: (SORS, 2021<sub>[277]</sub>), *Tourism Statistics* provided in quantitative assessment questionnaire.

StatLink  <https://doi.org/10.1787/888934256368>

In order to address these challenges, Serbia has already set up clear and measurable strategic goals, defined in the Tourism Development Strategy 2016-25. The strategy includes commitments to strengthen the sector's governance and co-operation with private tourism stakeholders in order to improve the quality and attractiveness of tourism products. This represents a solid basis for successful tourism development in a sustainable way and for the benefit of local communities.

In early March 2020, the Serbian government declared a national state of emergency and adopted containment measures to limit the spread of COVID-19. Borders were closed and public transport and leisure venues suspended. These measures had a strong impact on the tourism industry. In 2020, the number of domestic tourists fell by 25.4%, and the number foreign tourist arrivals by 75.9% compared to the year 2019 (SORS, 2021<sub>[277]</sub>). The Ministry of Construction, Transport and Infrastructure estimates the tourism industry lost over EUR 137 million in 2020.

To address the immediate economic impacts, the government delivered three waves of economic support, which also include support to tourism-related sectors. These focused on the deferment of labour taxes and social security contributions (RSD 100 billion), deferment of corporate income tax advance payment during the second quarter of 2020 (RSD 21 billion), wages subsidies (RSD 93 billion), approval of state guarantee scheme for bank loans to SMEs (RSD 240 billion) and approval of new loans to SMEs from the Development Fund (RSD 24 billion) to improve their liquidity and working capital during the crisis. The government set aside RSD 2.8 billion to distribute 560 000 tourist vouchers worth RSD 5 000 each in order to boost domestic tourism. In late August, the government announced a one-off fiscal support package to help hotels in cities, through a fixed subsidy per room and per bed, at a cost of about RSD 1.1 billion (WB6-CIF, 2020<sub>[278]</sub>). Moreover, the government has made sure to maintain regular contact and gather and exchange relevant data with all stakeholders in tourism and hospitality from the public and private sectors.

The crisis has emphasised the importance of a resilient tourism industry. COVID-19 will have the worst impact on city tourism, specifically tourism businesses and city hotels. Serbia should focus first on assessing its impact on the tourism industry, followed by designing a recovery plan with an emphasis on the development of sustainable tourism. The recovery plan should also focus on green tourism and further developing domestic tourism. Serbia should focus on moving away from further developing mass tourism and start developing new, high-quality and personalised tourist experiences around natural and cultural sites. A dedicated co-ordination framework would guarantee the efficient implementation of policy responses. Marketing and promotion strategies will also contribute to a prompt recovery.

#### *Sub-dimension 15.1: Governance and co-operation*

Serbia's national tourism **governance structure and institutional set up** was developed in the Tourism Development Strategy 2016-25. The Ministry of Trade, Tourism and Telecommunications (MTTT) is the government authority overseeing tourism in Serbia. It has jurisdiction over the National Tourism Organisation of Serbia (NTOS), the national agency for promoting tourism domestically and abroad. The Serbian Convention Bureau is a part of the NTOS, responsible for meetings, incentives, conferences and exhibitions (MICE) tourism development. The MTTT co-ordinates, monitors, analyses and reports on the implementation of the strategy, and proposes measures and carries out activities within its jurisdiction. Each year, the government analyses and proposes measures for the implementation of the strategy, especially in the context of inter-ministerial co-operation. Regular co-operation among public officials in the ministries has been formally established. Due to the cross-cutting nature of the tourism sector, it is included in other national strategies, such as the Strategy for Agriculture and Rural Development 2014-24, the Strategy of Sustainable Urban Development until 2030 and the Culture Development Strategy 2020-29.<sup>183</sup> However, stakeholders report that actual inter-ministerial co-operation is still weak and monitoring of implemented policy measures is still lacking, hindering adaptation and more realistic assessments.

**Partnerships with stakeholders** is mainly implemented through the National Council for Tourism Development, which was established in 2017.<sup>184</sup> The council is the main body for inter-ministerial and public-private co-operation. As well as establishing co-operation and dialogue with tourism sector stakeholders, it is responsible for publicising and developing Serbia as a tourist destination. It is in charge of improving the tourism business and investment climate. It also takes steps to improve competitiveness through promotion and marketing, construction of infrastructure, harmonisation of local and regional institutions and other actions. Besides the ministries, its members are representatives of the Tourism Organisation of Serbia (TOS), the National Association of Travel Agencies of Serbia (YUTA), the National Hotel and Catering Providers Association of Serbia (HORES), the Association of Tourist Guides, Spa Associations of Serbia, Air Serbia, and representatives from universities and Belgrade municipality. The Minister of Trade, Tourism and Telecommunications chairs the council. Although public-private co-operation and dialogue have been established, private sector stakeholders would like to be more involved in defining long-term decisions about tourism development (such as the development of new tourism products, digitalisation and improving the quality of the tourism offer). In contrast, the focus of discussion is mostly on short-term and direct incentives (such as grants, tax reductions and regulations).

**Vertical co-operation** in tourism development has been established. The aim is to implement the national tourism strategy measures and actions as well as any local or destination tourism strategies and formunicipalities and regional authorities to harmonise their strategic documents with the National Tourism Strategy. There are 3 regional and 116 local tourism organisations. Local and regional governments manage these with the support of the private sector. In 2019, Serbia started the comprehensive process of preparing strategic master plans for the municipalities and tourism development programmes for regional and provincial levels. The process for preparing these strategic documents is defined in the new Law on Tourism, adopted the same year, and the Rulebook on the Content and Manner of the Preparation of the Tourism Development Programmes, which was adopted in 2020.

Several municipalities and local tourist organisations have already started developing tourism development programmes with the assistance of local institutions and stakeholders, as well as with logistical assistance from the MTTT over harmonisation with the national tourism strategy and legislation. The main constraints on the more efficient development and implementation of master plans and development programmes are the lack of knowledge and skills among local public officials, weak public-private co-operation and the lack of financial resources. These could reduce the quality of newly prepared master plans, especially in the context of the new trends in tourism demand due to the COVID-19 pandemic.

The tourism **data collection and interpretation** framework is formally in place. The SORS is the main producer and distributor of official statistics, as well as the authorised professional agent, organiser and co-ordinator of the statistical system of Serbia. It performs statistical activities according to a five-year programme and annual plans. Although there is no established formal co-ordination body for tourism data collection, the SORS co-operates with the National Bank of Serbia, the City administration of Belgrade and the other authorised producers of official statistics, listed in the five-year statistical programme. Tourism statistics have a permanent repository in the form of an online portal. However, local stakeholders reported that the portal was not user friendly and that Tourism Satellite Accounts (TSAs) have still not been implemented.

Since the last assessment, the Law on Hospitality was adopted in 2019, introducing a central information system for hospitality and tourism (E-tourist). This system aims to consolidate all data on accommodation providers in order to enable more accurate statistical monitoring of domestic and foreign tourists. The rulebook regulating the central information system was adopted, and E-tourist started operating in October 2020. Nevertheless, further improvements in tourism data collection and sharing are needed, and they should include visitor satisfaction surveys and TSAs.

#### *Sub-dimension 15.2: Destination accessibility and tourism infrastructure*

Since 2017, Serbia has improved its **connectivity framework** for tourists by further reducing visa requirements. The number of countries whose citizens do not need a visa to visit Serbia as tourists has increased from 81 in 2017 to 93 in 2019. This has contributed to the increase of tourist arrivals from China (42% growth between 2018 and 2019, and 280.5% growth since 2017), giving China the highest market share, with 7.9% of total international arrivals.<sup>185</sup> There was also an increase of arrivals from Ukraine (34.6% compared to 2018, and 67.9% compared to 2017), and the Russian Federation (28.8% growth in 2019 compared to 2018) (UNWTO, 2020<sub>[279]</sub>).

Since 2017, Serbia has also improved its **accommodation capacity and quality assurance framework** by fostering greater availability and quality among all types of accommodation. The Law on Tourism and the Law on Hospitality both provide a good basis for improving the field of quality assurance of accommodation as well as other tourist services (catering, travel agencies, etc.). A consistent accommodation quality standard framework has been established, including the mandatory categorisation of accommodation facilities. The Tourism Inspectorate monitors the implementation of this categorisation. However, it needs more financial and human resources for more effective and efficient monitoring, which could in turn contribute towards reducing the high levels of informality in the tourism sector.

The MTTT is supporting tourism development through a programme of incentives and loans. Over the past two years, the ministry has been financing projects focusing on promoting, training, improving and developing the tourism supply chain, as well as projects that support the improvement of tourism infrastructure, including private accommodation. Loans at favourable interest rates (1%) are available to companies and entrepreneurs registered to perform activities in the field of tourism as well as agricultural holdings investing in tourist infrastructure, including building or renovating accommodation facilities. The budget for these loans is around EUR 1.5 million, funded by the Development Fund. Incentives for investments in rural tourism accommodation and development are available through IPARD. Investors

have also access to funds aimed at supporting investments according to the Law and Decree on Investments. However, no evaluation of the implementation of these measures has yet been undertaken.

Reliable **information is available** through the tourist information system on tourist destinations, accommodation and attractions, and the services available at destinations. Information is provided via websites, road signs, in tourist information centres, etc. According to the Law on Tourism, the TOS is responsible for developing and managing the tourist information system, as well as for co-ordinating tourist information activities with regional and local tourist organisations. The TOS is also responsible for the definition of the standards of arrangement, equipment and services offered in tourist information centres. Information is available in multiple foreign languages and is regularly updated by the TOS and regional and local tourist organisations. The main room for improvement in this regard is the establishment of a tourist information system framework that will include regular monitoring and evaluation of the information provided. More intensive involvement of tourism stakeholders in the tourism information system is needed, and this could be accomplished through awareness-raising campaigns and capacity-building activities.

#### *Sub-dimension 15.3: Availability of a qualified workforce*

A qualified workforce is vital for further developing tourism. Between 2017 and 2019, Serbia improved its position in the WEF Competitiveness Index Human Resources and Labour market indicator by 24 places, ranking 58<sup>th</sup>. The largest improvements have been made in the ease of finding skilled employees (moving up 51 places to 70<sup>th</sup>), pay and productivity (up 46 places to 59<sup>th</sup>), and on the labour market indicator (up 30 places to 69<sup>th</sup>) (WEF, 2019<sup>[273]</sup>).

Despite these improvements, Serbia still needs to strengthen its human resources and labour market framework in the sector. Its competitiveness in these dimensions could quickly change due to the overall lack of qualified workers and increasing competition in the wider region to attract the few who exist. However, the development of human resources in tourism is poorly represented in the Tourism Development Strategy. There are no concrete policy measures for the goals targeting the improvement or sustainability of the **availability of qualified workforce** in the action plan. The assessment of skills gaps and training needs is yet to be implemented. The **skills supply framework** depends on the activities of private tourist associations such as HORES, which organises training programmes in the hotel and catering industry. These programs include seminars and courses for waiters, bartenders, cooks, confectioners, receptionists, hotel housekeepers and other occupations. YUTA also provides training for tourist animators and travel agencies.

Serbia has a **VET framework for tourism** in place. However only limited progress has been made since the last assessment due to the lack of financial resources and equipment in schools. Serbia has established quality assurance agencies, which involve private sector stakeholders in the elaboration of VET curricula. Mandatory practical training is part of the VET. However, in general, the monitoring and evaluation of VET framework still needs improvements to better assess the efficiency of VET in the economy, and the effectiveness of cooperation with private sector in this area.

Progress in the **higher education framework in tourism** since the last assessment has been rather limited. Tourism studies are included in higher education programmes at universities but Serbia does not have a specific two-year higher education framework dedicated to tourism. Serbia should consider establishing such a framework for tourism, which would include obligatory practical training.

#### *Sub-dimension 15.4: Sustainable and competitive tourism*

Serbia is developing a comprehensive **natural and cultural heritage enhancement framework** for tourism. The Culture Development Strategy 2020-29 has been adopted by the government but was yet to be ratified by Parliament at the time of drafting. The Tourism Development Strategy underlines the importance of natural and cultural heritage for tourism, and contains an analysis of the impact of tourism

on cultural heritage and natural resources. It pays special attention to setting rules to protect cultural and natural heritage from the possible negative impacts of tourism. The project documentation for any public or private investment should include an assessment of its impact on the environment and cultural heritage. Each project should adhere to the protection regulations and practices of the institutions in charge of protecting natural and cultural heritage.

The Environment Report in the Republic of Serbia, prepared by the Environmental Protection Agency (Ministry of Environmental Protection) includes monitoring of the impact of tourism on the environment. Although there is co-operation among the responsible ministries to co-ordinate policy measures and activities in this area, the policy measures defined in different policy documents should be combined into one tourism specific policy. This policy should be more in line with the annual Tourism Action plan, which will allow regular monitoring and evaluation of implemented policy measures and especially their effectiveness and impact on tourism development.

The policy framework for the **promotion of sustainable development and operations within the tourism sector** is in place. The principles of sustainable tourism development are defined in the Law on Tourism and in the Tourism Development Strategy. The MTTT supports the development of sustainable tourism through a programme of incentives and loans, which includes energy efficiency and use of renewable energy as part of the selection criteria for approving loans and grants to private investors. It also provides capacity building in this area which it promotes to tourism businesses to enhance the sustainability of their projects and operations. The Environmental Education Foundation (FEE) or the National FEE Operators have been awarding Blue Flags since 2012 and Green Keys since 2014, which are both renewed annually.<sup>186</sup> However, the effectiveness of these policy measures could not be assessed as no monitoring and evaluation are in place. According to the best practice examples of some advanced tourism countries,<sup>187</sup> a more comprehensive policy framework for promoting sustainable tourism should be adopted in order to achieve sound improvements.

In the area of **tourism investment and innovation**, Serbia has established a comprehensive tourism investment policy framework but its tourism innovation policy framework is not yet in place. Investment policy is one of the most extensive parts of the Tourism Development Strategy. The action plan for the strategy includes measures to promote investment in tourism infrastructure, and to improve the quality of tourism products and services, training, and promotion. In 2018, the MTTT allocated RSD 679 million to support 57 tourist infrastructure projects, RSD 115 million to support promotion projects and RSD 179.8 million to the Development Fund to support investments in tourism with favourable loans. In 2019, it allocated RSD 875 million to 64 tourist infrastructure projects, and RSD 125 million to promotion projects, and supported 14 tourism projects with the credit funds. While a monitoring system is in place, no evaluation that would enable future policy measures to be adjusted has been implemented yet.

#### *Sub-dimension 15.5: Tourism branding and marketing*

The NTOS is responsible for **tourism branding and marketing** at the national level and has established co-operation with regional and local tourist organisations. Serbia adopted its Strategic Marketing Plan for Tourism until 2025 in 2021. The plan projects monitoring and evaluation of the brand image and marketing strategy framework. Monitoring should be done regularly to ensure information about the effectiveness of its marketing activities. Serbia co-operates with Montenegro and North Macedonia in some regional marketing activities in long-distance markets. The NTOS budget has increased from nearly EUR 4 million in 2016 to EUR 4.7 million in 2019, although staffing levels remain the same, at 52 employees. Although Serbia improved its ranking for the effectiveness of its marketing and branding in the WEF Travel & Tourism Competitiveness Index by 29 places in 2019 (from 107<sup>th</sup> in 2017 to 78<sup>th</sup> in 2019), its overall ranking is still low. It fell 6 places in the country brand strategy ranking, to 133<sup>rd</sup> in 2019.

**The digital tourism marketing framework** is at an early development stage. It should be included in the new Marketing Strategy and supported by the MTTT, and should be developed with the implementation of

the Strategy. Private stakeholders are involved in implementing some digital marketing activities, but the main weakness is the lack of financial resources. The lack of knowledge about digital marketing in the overall sector could also be a constraint on the efficient use of digital marketing tools. Policy measures to build capacity among tourism stakeholders and provide incentives for them to implement their digital marketing strategies and tools could be helpful.

### ***The way forward for tourism policy***

To ensure the further successful development of tourism in Serbia, policy makers should:

- **Empower municipalities and local tourist organisations to manage tourism development** by providing co-ordinated expert support, designing tourism master plans, improving capacity building and allocating sufficient budget to implement policy measures at the destination level. This is important for the harmonised and efficient development of competitive tourism products in a sustainable way. Destinations should be prepared for the re-opening of tourism after COVID-19 with personalised bookable products aimed at domestic tourists and tourists from the region.
- **Strengthen dialogue and co-operation** with private sector stakeholders, educational institutions and NGOs from the national to the local level. Stakeholders should be included in discussions on the key challenges of tourism development, such as seasonality, the lack of new and high-quality tourist products, digitalisation, and sustainability.
- **Develop a sector-specific human resource policy for tourism** and strengthen co-operation and dialogue with the private sector to better address the specific needs of the tourism industry and tourism overall, and ensure that tourism education is more attractive for lecturers and students.
- **Upgrade the tourism investment policy framework with a focus on innovation.** Innovations do not necessarily require a huge amount of financial resources to implement but can help increase the attractiveness of the tourism offer by developing unique experiences with high added value.
- **Maintain and enhance local community prosperity and quality of life**, for example by encouraging the purchase of local goods and services, and the promotion of local culinary heritage, history and culture, handicrafts and folk art, small museums, and vineyards.
- **Establish regular monitoring and introduce independent evaluation of implemented policy measures** to assess the efficiency of such measures and make adjustments accordingly.
- **Further improve tourism data collection and sharing by introducing tourism satellite accounts**, to empower policy makers with reliable information for designing policy measures.
- **Tailor the marketing and branding strategy** to the new circumstances in the market and new trends in tourism demands. This should include a digital marketing strategy to improve Serbia's visibility as a tourist destination in the international market (Box 25.20).

#### **Box 25.20. The digital tourism roadmap in Finland**

In 2018, the Roadmap for Digitalisation of the Finnish Tourism Sector was developed to steer the sector towards greater digital competency, through digital platforms and data management. The goal is to create nation-wide digital ecosystems and to have Finnish travel products and services available in multiple digital channels locally and globally. The vision was to become a smart, pioneering destination providing the best customer experience.

The key steps to reach these are:

1. data management and collaboration to enable seamless purchases and real-time information for travellers

2. using platforms and programming interfaces to enable multi-channel online booking
3. starting with pilots and scaling up to nationwide ways of working
4. supporting the sustainable development of the Finnish travel industry with digital tools.

The roadmap was developed with a team of industry and digital experts and is updated annually to keep up with the fast changing industry. Pilot projects focusing on the digital customer experience and data were carried out in four travel destinations. The pilots enabled tailored and cost-effective development of digital know-how and services. They developed initiatives to help travellers find and get to hidden destinations like Turku and the archipelago, to handle scattered destination information (Lake Saimaa, Kuopio Tahko, North Karelia), to design the ideal digital customer journey (Visit Rovaniemi & Finnair) and to share and analyse data (Helsinki, House of Lapland, Finnair). In 2020, the focus was to scale up the work to the national level, improving data-driven tourism marketing and sales and deploying a national travel data hub. There is also e-learning and “Visit Finland” academy digital training available to the travel trade. Based on the work undertaken, a digital inventory of tourism assets is the main priority to be developed in future years.

## Anti-corruption policy (Dimension 16)

### Introduction

Table 25.28 shows Serbia's scores for the Anti-corruption policy dimension and compares them to the Western Balkan (WB) average. Serbia along with Montenegro and North Macedonia has some of the more elaborate systems for corruption risk assessment and proofing of legislation. Serbia has a generally advanced legal framework for the prevention of corruption. Since the previous competitiveness outlook assessment, Serbia has strengthened the legal grounds for corruption proofing of legislation and improved the capacity of its anti-corruption law enforcement and prosecutorial bodies. It has established a track record for the investigation and prosecution of high-level corruption, but its sustainability and effectiveness are yet to be demonstrated.

**Table 25.28. Serbia's scores for anti-corruption policy**

Dimension	Sub-dimension	Score	WB6 average
Anti-corruption policy dimension	Sub-dimension 16.1: Anti-corruption policy framework	2.8	2.1
	Sub-dimension 16.2: Prevention of corruption	3.0	3.3
	Sub-dimension 16.3: Independence of the judiciary	n.a.	n.a.
	Sub-dimension 16.4: Business integrity and corporate liability	n.a.	n.a.
	Sub-dimension 16.5: Investigation and prosecution	3.0	2.8
Serbia's overall score		<b>2.9</b>	<b>2.5</b>

Note: For comparability with the previous assessment, two sub-dimensions (16.3 and 16.4) have not been scored but are discussed in the text below.

### State of play and key developments

Since the previous assessment, Serbia has undertaken noteworthy initiatives for the fight against corruption (Box 25.21).

#### Box 25.21. Recent initiatives in the fight against corruption in Serbia

- The launch of the Business Integrity Country Agenda (BICA) report for Serbia by Transparency Serbia in 2020. The Business Integrity Assessment is the first study of its kind conducted in Serbia. The research covered the following topics: bribery in public and private sector; money laundering; restrictive agreements; whistle-blower protection; accounting and auditing; conflict of interest, lobbying, and party financing; public procurement; taxes and customs; integrity mechanisms in the private sector; transparency of business entities; business sector anti-corruption initiatives; role of media and CSOs.
- Pištaljka is a civil society organisation that investigate abuses in government, public and private enterprises and other institutions and to advocate for whistleblowers' rights. Some of its activities include:
  - training for local self-governments and public utility companies
  - integrity and internal whistleblowing training for public prosecutors (December 17-18 2020), in cooperation with the Republic Prosecutor's Office and the Government Accountability Initiative (USAID project)
  - setting up a database of public procurement jobs and investigating abuse in public procurement (UNDP-funded), thru June 2021

- integrity and ethics training for judges (in 2021 and 2022), with the Judicial Academy and the Supreme Court of Cassation
- The signature of the International Treaty on Exchange of Data for the Verification of Asset Declarations in March 2021 in Belgrade, as part of a regional anti-corruption initiative. Serbia, North Macedonia and Montenegro are the first signatories of the Treaty that was prepared and negotiated with the support of the Austrian Development Cooperation.

### *Sub-dimension 16.1: Anti-corruption policy framework*

Serbia has made progress in the development of its **anti-corruption policy documents, co-ordination and implementation**. The planning of its anti-corruption policy is integrated with its accession negotiations with the European Union. The main strategic document is the Action Plan for Negotiations of Chapter 23,<sup>188</sup> originally adopted in 2016 with a revised version approved in July 2020 (Negotiation Group for Chapter 23, 2020<sup>[285]</sup>). The action plan envisages the preparation and adoption of a new planning document – the Operational Plan for Prevention of Corruption – in areas of particular risk. According to the government response to the OECD questionnaire in mid-2020, more than 60% of activities envisaged in the Fight against Corruption sub-chapter of the Chapter 23 action plan had been implemented. The Anti-Corruption Agency published annual reports on the implementation of the National Anti-Corruption Strategy 2013-18 on its website,<sup>189</sup> but regular public reporting on the implementation of the action plan appears to have ceased in 2018.<sup>190</sup> The new Law on Prevention of Corruption changed the title of the ACA to the Agency for Prevention of Corruption (APC) as of September 2020. Further in the text the choice of the acronym (ACA or APC) reflects the time that is referred to.

As of mid-March 2020, 105 local self-government (LSG) units (70% of the total) had adopted local anti-corruption action plans, according to Transparency Serbia. The model local action plan envisages the identification of corruption risks and measures to eliminate them. Every local self-government unit should designate a person/body in charge of co-ordinating the activities and set up a body responsible for monitoring and informing the public and other concerned actors (ACA, 2017<sup>[286]</sup>). The effects of the local action plans on the transparency of LSGs are reportedly not yet apparent (Transparency Serbia, 2020<sup>[287]</sup>).

The authorities have actively co-operated with civil society. During the drafting of the Chapter 23 Action Plan in 2016 and its revised version in 2019/20, several working versions were discussed with civil society organisations (CSOs), notably through the participation platform National Convention for the EU (a body for structured debate on the accession of Serbia to the EU). After the consultations, the Ministry of Justice published feedback on its website.<sup>191</sup> However, at least some civil society stakeholders argue that they have been engaged late in the process after the final draft has already been developed, so there are only limited possibilities to introduce changes. In 2017, the ACA held public consultations on the model local action plan and published a report containing comments submitted by CSOs as well as feedback regarding each of the comments (ACA, 2017<sup>[288]</sup>). Another consultative arrangement – the Anti-Corruption Council<sup>192</sup>, established in 2001, acts as an advisory body to the government, established in 2001. The Council has seven members – current and former public office holders and academics.

The ACA/APC has been providing grants to CSOs on a competitive basis. In 2017, the grants supported alternative reporting on the implementation of the action plan. In 2018, the ACA provided five grants to CSOs to directly assist local self-government units in drafting local action plans. Against this favourable background, it is notable that CSOs have not been routinely involved in the monitoring and evaluation of

the implementation of the action plan since 2018. The revised plan aims to remedy this gap, and positive developments in this area will indicate significant progress in the implementation.

**Corruption risk assessments** are mandatory for all public sector institutions as a step towards the preparation of integrity plans (IPs). The Law on the Anti-corruption Agency obliged all public bodies – national and local – to adopt integrity plans. The new Law on Prevention of Corruption (in force from 1 September 2020) contains a similar obligation and explicitly defines risk assessments as part of an IP. The handbook on the preparation and implementation of the IP adopted by the ACA envisages the assessment of the state of affairs as a stage in the preparation of the plans. IPs shall contain, among other elements, an assessment of exposure to risks and measures to detect, prevent and diminish those risks (ACA, 2015<sub>[289]</sub>). An online IP template is available on the website of the APC. The process of developing, monitoring and reporting on the implementation of IPs takes place in electronic form. IPs are to be revised every three years, and in practice most public institutions are carrying out risk assessments and adopting IPs. During 2016-19, 2 716 out of 4 267 public authorities adopted IPs and the remaining authorities should do so in 2020. However, the ACA/APC supervises the development and implementation of IPs and has observed that IPs remain formal documents; organisations pay little attention to their content and meaning (ACA, 2020<sub>[290]</sub>). In the area of corruption risk assessment, there seems to be a gap between the volume of activity and its impact.

The **corruption proofing of legislation** has a firm legal ground in the Law on Prevention of Corruption. State administration bodies are obliged to submit draft laws in areas of high risk and areas affected by international agreements in the anti-corruption field to the APC to obtain its opinion. This means all relevant draft laws are potentially subject to corruption proofing. The assessment of legislation used to be a regular activity of the ACA. Since 2013, it has published more than 100 assessments, but the last published assessment is dated 27 February 2018 and this kind of activity appears somewhat diminished (ACA, n.d.<sub>[291]</sub>). In 2019, the ACA issued 18 opinions on proposals and draft regulations (ACA, 2020<sub>[290]</sub>). According to the government, most of the recommendations of the ACA have remained unimplemented, without any reasons provided.

### *Sub-dimension 16.2: Prevention of corruption*

The main **corruption prevention body** is the APC, which has multiple preventative and oversight responsibilities. Operational since 2010, the APC has operated according to the Law on Corruption Prevention since 1 September 2020. The APC is an independent state body accountable to the National Assembly (NA). Several elements of the legal framework aim to safeguard its independence. These include collective management (the council, consisting of five members and the director) and transparent appointment procedures. The NA appoints the director and members of the council from among candidates who have gained at least 80 out of 100 points in a public competition conducted by the Judicial Academy (under the previous law the director was appointed by the non-political board of the ACA). The new law authorises the NA to dismiss the director on specific grounds before the expiry of his or her five-year term, which used to be a power of the board. The consent of the committee of the NA is required for the adoption of the rulebook on the internal organisation and systematisation of jobs in the APC.

The director of the APC proposes its budget and submits it to the Ministry of Finance. The law contains general guarantees of funding and financial independence: the funds shall be sufficient for efficient and independent operation; the APC has autonomy over the disposal of the funds; and the government shall not suspend, delay, or limit the funds without the consent of the director. In practice, the budget of the ACA/APC has been fluctuating: it was RSD 364 million in 2018, RSD 253 million in 2019, and RSD 283 million (approximately EUR 2.4 million) in 2020. The APC is bound by the general criteria that apply to civil servants on the remuneration of its employees, but the director may increase salaries by 30%. The APC has 71 specialists and 9 administrative staff members. According to the government, numerous in-service training opportunities have been available to staff.

The more direct role of the NA in the appointment and dismissal of the director, as well as the limited funding safeguards, warrant further monitoring to ensure political decision makers respect the independence of the APC in practice. The public regard for the ACA has been modest. In 2019, on a scale from 1 to 5, the average evaluation of the work of the ACA was 2.3; the same as for the police and marginally lower than for the government (USAID, 2019<sup>[292]</sup>).

The Law on Corruption Prevention provides a concise but generally comprehensive framework on **conflicts of interest** and applies to public officials – defined as any elected, appointed or nominated person in a position of public authority. Meanwhile the Law on Civil Servants envisages that conflicts of interest among civil servants who are not public officials be managed and resolved within their respective public bodies. The definition of conflict of interest covers actual, potential and apparent conflicts. The Law on Corruption Prevention provides few details of the ways conflicts of interest should be resolved. Generally, public officials should notify their superiors and the APC of any conflict and suspend the affected proceedings. The APC then proposes measures to eliminate the conflict of interest. Public officials must transfer the management rights of any company stakes or shares to another person but there is no explicit prohibition on officials giving instructions regarding the management or obtaining any information about the company, i.e. the transfer is not a blind trust (which could render officials unaware of their private interest in a company).

The law sets general principles and empowers the APC to assess situations where the holders of public office perform other work or activities outside their role on a case-by-case basis. Public officials who do another job or activity at the time of entering public office should inform the APC, and the APC then determines whether this activity could endanger their impartial performance of the public function. The somewhat inconclusive provisions of the law and the considerable discretion of the APC in applying them could raise questions regarding the sufficient clarity of the law. The Group of States Against Corruption (GRECO) has noted that the new Law on Corruption Prevention has some shortcomings; for example, the lack of criteria for allowing or restricting public officials from performing business activities (GRECO, 2020<sup>[293]</sup>). The capacity of the APC appears limited as it has only nine staff members handling conflicts of interest and lobbying matters.

As well as its powers to determine how to tackle individual cases of conflicts of interest and incompatibilities, the APC decides on violations of the Law on Corruption Prevention. It may issue a warning or a public recommendation of dismissal from public office (where officials are elected directly by citizens and former officials, it makes a public announcement of the decision on violation). The announcements should contain brief reasoning. According to the government, the ACA issued 83 recommendations of dismissal for violations of the Law on ACA between January 2017 and December 2019 (related to conflicts of interest and other areas). The bodies concerned complied with 11 recommendations, and in further 12 cases the official had already been dismissed.

When the APC identifies offences, it should submit a notification of a crime to the competent body and apply to start misdemeanour or disciplinary proceedings. According to the government, the ACA filed two crime notifications for acts associated with conflicts of interest, but the prosecutor's office did not find grounds for prosecution. The law clearly implements the GRECO recommendation to provide the ACA/APC with the right to act upon anonymous complaints.

The Law on Corruption Prevention also governs **asset and interest disclosure**. Under this law, as under the previous one, the obligation of regular disclosure applies to most public officials with a few exceptions such as members of local government councils (although the APC may still request declarations from them). According to the government, coverage does not extend to the staff of offices of political officials (such as advisors) and officials responsible for public procurement except the director of the Directorate for Public Procurement and his or her assistants. Declarations should also provide information regarding public officials' spouses or common-law partners, and minor children if living in the same household. By default, declarations should be submitted upon starting and leaving public office, with extraordinary

declarations due only when significant changes of assets or income have occurred. The declaration leaves a few gaps in the comprehensive coverage of the economic and private interest of a declarant, such as gifts not covered under other categories of declarable income or assets, cash savings, and beneficial ownership of entities or assets when not based on formal ownership.

Declarations are filed through an online platform. Information subject to public disclosure is published by default and searchable by the name of the official. However, broad categories of data are exempt from public disclosure such as sources and amounts of income from non-public sources, amounts of savings, or the ownership of financial instruments. The publicly available information does not provide a comprehensive picture of an official's economic situation. Nevertheless, on several occasions, declarations have helped the public to detect possible illicit enrichment of high-level officials.

The APC verifies the declarations based on an annual verification plan, and extraordinary verifications are also permitted. Public authorities must provide the APC with direct access to their databases kept in electronic form upon written and reasoned request. The requirement of a reasoned request could turn out to be an obstacle for efficient routine verifications. The APC may also obtain data on the accounts of public officials from banks and other financial institutions (according to the government's response, in practice, banks rarely provide this type of data). To enable electronic data exchange between all competent institutions, multiple bodies, including the APC, have agreed to develop the National Criminal Intelligence System, but it is not yet decided what exact access the APC will have through the system.

If the APC suspects that officials have failed to report their assets or provided false data to conceal information about their assets, it should file a crime notification. Since 2013, it has referred 18-28 cases per year to law enforcement bodies based on the verification of declarations. If officials fail to submit their reports on time, the APC should request the initiation of misdemeanour proceedings with the court. In recent years, the number of sanctions imposed for non-submission of declarations has been falling, which could be a sign of improved overall compliance.

The Law on **Whistle-blower Protection** (adopted in 2014) is comprehensive and extends to both the private and public sectors. Whistleblowing may be carried out by internal or external reporting, or by public disclosure. However, the grounds for public disclosure are narrow: essentially, in cases of imminent danger, but not when there is a risk of retaliation or there is little chance of the breach being effectively addressed otherwise, as envisaged in EU Directive 2019/1937 on the protection of persons who report breaches of EU law. The law contains multiple provisions to protect whistle-blowers. These include obliging the recipient of information to protect the whistle-blower's personal data, an express prohibition on placing the whistle-blower in an unfavourable position, enabling courts to impose temporary protection measures, compensation for damages, reinstatement of employment, the protection of people associated with the whistle-blower, the right to protection due to mistaken identity, etc. In case of reprisal, protection also applies to anonymous whistle-blowers. The law expressly prohibits the hindering of whistleblowing.

Employers must inform employees about their rights stemming from the Law on Whistle-blower Protection and appoint an authorised person to receive information and administer procedures regarding whistleblowing. An employer with more than ten employees must have an internal whistleblowing procedure.

Serbia has had a high level of whistleblowing activity. The courts received 774 whistle-blower cases between June 2015 and December 2019 (Negotiation Group for Chapter 23, 2020<sup>[285]</sup>) and have a track record of decisions in favour of whistle-blowers. Whistle-blowers are entitled to seek protection from the court but the procedure to do so is relatively complicated. The Law on Free Legal Aid does not recognise whistle-blowers as a special group, and they are entitled to free legal aid only if they meet the general conditions. In view of lack of legally guaranteed external counselling support and lack of a centralised system to protect whistle-blowers, the need to apply to courts and sometimes seek professional legal assistance represent barriers to the more effective and consistent implementation of the law (Worth et al., 2018<sup>[294]</sup>). The whistle-blower protection system seems to fall short of providing all measures of support

envisaged in EU Directive 2019/1937, such as comprehensive and independent information and advice, which is easily accessible and free of charge, effective assistance from competent authorities before any relevant authority involved in the protection against retaliation, financial assistance and other measures, including psychological support.

The government has continued to carry out **anti-corruption public awareness and education** activities although there is no evidence of broader campaigns since 2018. The ACA has been organising annual conferences on 9 December (International Anti-Corruption Day) and produced various tutorials and guidance materials: online tutorials for the development of integrity plans and monitoring and reporting on their implementation, a model local anti-corruption plan, the methodology for monitoring and reporting on the implementation of the local anti-corruption plan, online tutorials for officials regarding the declaration of income and assets, a manual on media co-operation, and educational videos on asset declaration and gifts. Meanwhile there is no evidence that the effectiveness of awareness-raising activities is being monitored, or corrective action taken based on such monitoring.

The ACA has been engaged in numerous training and education activities. In 2017-19, it held 51 educational/training programmes for public officials, 6 training sessions for trainers, online training on ethics and integrity in the public sector, and 9 training courses on ethics and integrity organised in co-operation with the Government Agency for Human Resources Management and the National Academy for Public. In 2019, the ACA held four training sessions attended by more than 1 000 high school pupils. Most of the training activities have been funded from the ACA budget. However, the amount of funding that for awareness raising and public education have been in decline since at least 2017.

### *Sub-dimension 16.3: Independence of the judiciary*

Serbia has had serious discussions about constitutional reforms to strengthen the independence of judiciary, but they have not been adopted. According to the constitution (adopted in 2006), judicial appointments are permanent, but a probationary period of three years applies for first-time judges. The constitutionally established power of the NA to appoint judges remains a limitation on the independence of judiciary. The NA also directly or indirectly appoints members of the High Judicial Council (HJC) even though 7 out of 11 members are judges (Venice Commission, 2007<sup>[295]</sup>). A key task in the Judicial Development Strategy (2020-25) is to complete the amendment of the constitution with a view towards, further strengthening of independence of courts. Public comments by some government officials regarding court proceedings represent a form of pressure on the judiciary (EC, 2020<sup>[36]</sup>).

The HJC has adopted rulebooks defining criteria for candidates for judicial positions to be elected for the first time, the evaluation of candidates for permanent judicial positions at the second or higher court, the nomination of court presidents, modalities of examinations of candidate judges, etc. These rules strengthen the objectivity and transparency of proceedings at various stages of judges' careers. The HJC has strengthened the transparency of its work by establishing that all interested parties can attend interviews with candidates for the first election to a judicial function, and that interviews are recorded. Lists of candidates and the grades they achieve are made public on the website of the HJC (GRECO, 2019<sup>[296]</sup>). Nevertheless, the European Commission has recommended the thorough revision of the system for judicial appointments and the evaluation of the work of judges and prosecutors (EC, 2020<sup>[36]</sup>). The Judicial Development Strategy contains priorities and tasks clearly in line with these recommendations.

In 2019, the Disciplinary Commission of the HJC handled 31 cases. The commission issued public warnings, imposed salary reductions and initiated one dismissal procedure. The disciplinary and ethics rules have been being revised to improve the definitions of offences, among other things. One positive feature for upholding impartiality is the random distribution of cases among judges through an automatic case allocation system (European Commission, 2019<sup>[14]</sup>; EC, 2020<sup>[36]</sup>). However, random case assignment has not yet been established in all courts (Government of the Republic of Serbia, 2020<sup>[297]</sup>).

*Sub-dimension 16.4: Business integrity and corporate liability*

Serbian company law does not specifically address **business integrity** and the management of corruption risks. The law prescribes general principles of oversight, such as the duty of the supervisory board of a joint-stock company to supervise the management. More specific obligations apply to public joint-stock companies where at least one dedicated person shall be responsible for the internal supervision of operations. This person must meet the requirements prescribed for internal auditors, must be employed by the company and perform only internal supervision, and cannot be a director or a member of the supervisory board. This internal supervision should encompass, among other tasks, verification of the implementation of risk management policies.

According to the Law on the Central Records of Beneficial Owners (adopted in 2018), information on beneficial owners of legal entities has to be publicly disclosed in the Central Records of Beneficial Owners kept by the Serbian Business Registers Agency. The disclosed information is accessible free of charge and searchable by the registration number of a legal entity. The law complies with the 5<sup>th</sup> EU Anti-Money Laundering Directive (2018/843) as far as the requirement to provide access to any member of the general public is concerned, and the definition of a beneficial owner covers most types of beneficial owners defined in the anti-money laundering directives. The law envisages criminal liability as well as fines for non-compliance for legal entities and their responsible persons. However, no data are available about the enforcement of this liability.

There is no designated institution such as a business ombudsman responsible for receiving complaints from companies about corruption-related matters apart from the APC.

Serbia has established **liability of legal persons** for all criminal offences established in law. According to the Law on Liability of Legal Persons for Criminal Matters (adopted in 2008), a legal person shall be held accountable for criminal offences that have been committed for the benefit of the legal person by a responsible person within the scope of his or her authority. Lack of supervision by the management can also trigger corporate liability. Legal entities, which are entrusted by law with the exercise of public authority, are exempt from liability for criminal offences committed during the exercise of public authority.

The liability of legal persons is autonomous, i.e. a legal person shall be liable even though criminal proceedings against the responsible person have been suspended or the indictment has been rejected. If, due to certain reasons, it is not possible to initiate or conduct criminal proceedings against the responsible person, the proceedings may be initiated and conducted only against the legal entity.

The law envisages both fines and the termination of the legal entity as penalties, as well as security measures (prohibition of certain registered activities or tasks, confiscation, public announcement of the judgment) and other possible legal consequences, such as a ban on participation in public procurement. The upper limit of fines for corruption offences such as active bribery is approximately EUR 42 500, which is extremely low compared to the potential scale of large corrupt transactions. Active bribery also carries the maximum prison sentence of up to five years (Article 368 of the Criminal Law). Courts may impose suspended sentence, after taking into account any measures taken by the legal entity to prevent and detect the crime and against the responsible person after the crime. Thus, although the law does not explicitly envisage due diligence or compliance as defence or a mitigating circumstance, taking such preventive measures may serve a basis for suspended sentencing.

The legal framework for corporate liability would benefit from guidance on the anti-corruption compliance that responsible persons of legal entities should ensure. The effectiveness of the corporate liability framework for combatting corruption could not be assessed due to the absence of the relevant statistics.

### *Sub-dimension 16.5: Investigation and prosecution*

Based on the Law on Organisation and Competences of State Bodies in the Suppression of Organised Crime, Terrorism and Corruption (adopted in 2016 and in force since 2018), the Prosecutor's Office for Organised Crime (POOC) and the Section for Suppressing High-Level Corruption within the Service for Combating Organised Crime (SCOC) of the Criminal Police Directorate have responsibility for the **investigation and prosecution of high-level corruption**. High-level corruption is not defined explicitly but the anti-corruption remit of these bodies comprises abuse of official authority, trading in influence, and passive and active bribery when the defendant or the person to whom a bribe is given is an official or responsible person performing a public function on the basis of election, appointment or appointment by the NA, the President of the Republic, the Government, the general session of the Supreme Court of Cassation, the HJC or the State Prosecutorial Council.

Available statistical data on convictions for high-level corruption vary slightly but generally reflect a similar decreasing trend. According to the government, 42 convictions for high-level corruption took place in the first instance in 2017, 41 convictions in 2018, and 25 convictions in 2019. According to the European Commission, based on indictments from the POOC, the courts rendered first instance judgements against 50 individuals for high-level corruption in 2017, 41 in 2018, and 30 in 2019 (EC, 2020<sup>[36]</sup>). For this assessment, the authorities stated that the majority of the defendants received prison sentences plus a prohibition on carrying out certain professions, activities or duties. In 2019, 10 out of 30 convictions were based on plea agreements, and confiscation of assets was imposed in 3 cases (EC, 2020<sup>[36]</sup>). This information suggests that the level of recovery of corruption proceeds remains modest. No data are available about final convictions for high-level corruption, and this gap makes it difficult to fully assess the track record. Although the SORS gathers data on prosecutions and convictions, the government has recognised that current record keeping is not suitable for measuring progress and the efficiency of the criminal justice system, and aims to establish a new information system (Negotiation Group for Chapter 23, 2020<sup>[285]</sup>).

According to the law, the Ministry of Interior (MoI) has at least two **specialised anti-corruption investigative bodies**: the unit responsible for the suppression of organised crime (the SCOC) and the unit responsible for the suppression of corruption (the Anti-Corruption Department of the Criminal Police Directorate, responsible for cases other than high-level corruption).

The police units generally do not have special guarantees of independence. The Minister of the Interior appoints and dismisses the head of the SCOC with the advice of the Prosecutor for Organised Crime. The minister also issues acts which further regulate the organisation and work of both specialised units. Otherwise the general procedures and conditions of the Ministry of the Interior apply to the selection, appointment and dismissal of officers as well as the determination of the budget and salaries. The units submit regular reports to superior officials, but these reports are not published.

Serbia has several **specialised anti-corruption prosecutorial and judicial bodies**. The relevant prosecutorial bodies are the POOC and special anti-corruption departments of four higher public prosecutor's offices. The Prosecutor for Organised Crime manages the work of the POOC. The law is rather general regarding the criteria for this office. When proposing candidates for prosecutor and selecting the deputy prosecutor, priority should be given to candidates who have the necessary professional knowledge and experience in the field of the fight against organised crime and corruption. The State Prosecutorial Council (SPC) holds a competition for the post and submits a list of suitable candidates to the government, which in turn submits a proposal to the NA. The NA appoints the prosecutor for a term of six years. The procedure for dismissal is similar; the SPC determines reasons for the dismissal and forwards the decision to the government, which proposes the dismissal to the NA. Unless otherwise provided by the law, the general rules governing the public prosecutor's office also apply to the POOC. Heads of higher public prosecutor's offices appoint and dismiss heads of the special anti-corruption

departments who have no fixed term. Thus, the law provides stronger safeguards of independence and transparency for the POOC than for the anti-corruption departments.

Investments have been made in the capacity of the specialised prosecutorial bodies. Within the POOC, 21 prosecutors act as processors of economic crime and criminal offences related to corruption, supported by 27 administrative staff members. As of 2020, there were 45 deputy public prosecutors working in the anti-corruption departments. Six task forces have been established in the prosecutorial bodies, which include representatives of the police, the tax administration and the anti-money laundering administration. There are regular co-ordination meetings between the police and the prosecution, and liaison officers have been appointed (European Commission, 2019<sup>[14]</sup>; EC, 2020<sup>[36]</sup>). The law envisages the possibility of establishing financial forensics services in the specialised prosecutorial bodies, and, since 2018, the POOC has employed a financial forensic expert.

There is evidence of training on various relevant topics for the staff of the investigation and prosecution bodies: courses and education meetings on the detection, investigation and prosecution of high-level corruption and other related topics for representatives of the ministry and prosecutors, education activities through projects led by international organisations, and continuing education organised by the Centre for Police Training of the Ministry of the Interior and the Judicial Academy.

As well as the investigation and prosecutorial bodies, Serbia has established special departments for organised crime in the High Court and in the Court of Appeals in Belgrade as well as special anti-corruption departments in high courts.

### ***The way forward for anti-corruption policy***

To strengthen the anti-corruption policy framework and its implementation, policy makers should:

- **Create a mechanism to involve civil society in the monitoring of the implementation of the Action Plan for Chapter 23 negotiations.** Ensure that the monitoring is carried out in an inclusive and transparent way. The revised Action Plan foresees systematic, continuous and institutionalized inclusion of civil society organizations in the process of monitoring the implementation. This is a significant commitment considering the widely recognised crucial role of the civil society for the success of anti-corruption policies. The OECD Recommendation on Public Integrity envisages encouraging transparency and stakeholders' engagement at all stages of the political process and policy cycle to promote accountability and the public interest. This is all the more important regarding anti-corruption efforts, which often provoke attempts of obstruction by powerful beneficiaries of corruption.

#### **Box 25.22. The Citizen Participation Space for monitoring the implementation of the anti-corruption strategy in Catalonia (Spain)**

Catalonia has set up the Citizen Participation Space (CPS) for monitoring the execution of the Strategy for Fighting Corruption and Strengthening Public Integrity of the *Generalitat de Catalunya*. Three public authorities (the Anti-fraud Office, the Regional Audit Office, the Regional Ombudsman) and three civil-society organizations (the Ostrom Institute of Catalonia, the Citizen against Corruption Observatory, the College of Political Scientists and Sociologists of Catalonia) are key partners in the activity.

The CPS comprises ten people who act as an independent commission for auditing the implementation. Seven members have been chosen by lot from among people who participated in the development of the Strategy. Three are representatives of the organised civil society and have been chosen by the above-mentioned civil society organizations.

Members of the CPS receive constantly updated information regarding the state of actions carried out under the Strategy. In January 2021, the first annual report of the Strategy was published. The CPS evaluated the report and provided public feedback like they had already done in relation to earlier quarterly reports.

The CPS assessed positively the exhaustive work that had been performed for the elaboration of the report, recognized efforts made to address requests formulated in the previous evaluation by the CPS and the incorporation of the theory of change that would allow evaluating the impact of the Strategy.

On the other hand, the CPS emphasized the need to specify more clearly how the degree of execution is determined and assessed, incorporate methods used and specify the reason why certain actions or sub-actions remain uninitiated. The CPS also raised the need to set a timetable for the start and execution of all actions in order to impose proper monitoring and ensure compliance with the timeframe.

Open Government Partnership, *Create citizen Monitoring Space for anti-corruption strategy (ES0095)*, <https://www.opengovpartnership.org/members/spain/commitments/ES0095/>

- **Ensure that reports on property and income of public officials and the data subject to public disclosure are comprehensive**, reflecting their full economic position. Continue steps to smooth the APC's access to the information it needs for verification. According to the Western Balkan Recommendation on Disclosure of Finances and Interests by Public Officials, income and asset declarations need to show the fullest picture possible of incoming and outgoing cash and asset flows during the time in office, and the oversight body needs to cross-check the data with a wide range of databases (ReSPA, 2014<sup>[298]</sup>). While it is necessary to exclude certain personal data from publication, the publicly available data should also provide as full as possible picture of an official's economic situation.
- **Monitor protection of whistleblowers to identify and mitigate practical obstacles that they face**. In particular, ensure that it is easy for any whistleblowers to find out where and how they can apply for protection. The relevant EU directive envisages mandatory and optional measures of support for whistle-blowers such as information and advice on procedures and remedies available, on protection against retaliation, and on the rights of the person concerned; effective assistance from competent authorities and legal aid, counselling or other legal assistance, etc. Serbia has taken some actions in these areas, but the efforts need to continue and strengthen. Serbia should also widen recognised grounds for public reporting by whistle-blowers.
- **Safeguard judicial independence** by continuing the debate over the relevant legal provisions and ultimately amend them to reduce the role of political bodies in judicial careers, among other things. Judicial independence is a fundamental principle enshrined in international standards such as the European Convention on Human Rights, according to which "everyone is entitled to a fair and public hearing within a reasonable time by an independent and impartial tribunal established by law" (European Court of Human Rights, 2021<sup>[299]</sup>). Serbia should continue efforts to reach compliance with international standards, for example, to ensure that not less than half the members of councils for the judiciary are judges chosen by their peers (the Council of Europe Recommendation CM/Rec(2010)12 on judges: independence, efficiency and responsibilities).
- **Strengthen corporate liability for corruption offences** by significantly increasing the maximum applicable fines. International standards do not define the sufficiency of the sanctions in specific terms, but the OECD Working Group on Bribery in International Business Transactions has adhered to the standard that monetary sanctions should be sufficiently severe to impact large multinational corporations. In certain economies, statutory ceilings of sanctions even up to a few

million EUR have been found to be insufficient (OECD Anti-corruption Network, 2015<sup>[300]</sup>). Even though such levels of fines may appear beyond relevance relative to the limited size of many companies in Serbia, the law should provide the possibility to apply adequate sanctions also in a case of a large business player engaging in corruption.

- **Monitor the effectiveness of the investigation and prosecution of high-level corruption** by collecting, analysing, and publishing data on, inter alia, official position at the time of offence, indictments, final convictions, sentences, and recovered proceeds of corruption. Several kinds of factors affect investigations, prosecutions and convictions in corruption cases, for example, the qualification, number and independence of investigators, public prosecutors and judges, effectiveness of procedural and substantive law, efficiency of international legal co-operation, case management and prioritisation of work, etc. Comprehensive and detailed record keeping, collection and analysis of relevant statistical indicators, systematic review of case law are necessary conditions for fair assessment of challenges for the effective repression of high-level corruption.

## Notes

<sup>1</sup> The headcount ratio (HCR) is the proportion of a population that exists, or lives, below the poverty line.

<sup>2</sup> Staff from the Statistical Office of the Republic of Serbia who co-ordinated the statistical data collection.

<sup>3</sup> A person from the Ministry of Finance of the Republic of Serbia and from the Public Policy Secretariat of the Republic of Serbia who co-ordinate the whole assessment in Serbia.

<sup>4</sup> EU STAKEHOLDER CONSULTATION GUIDELINES 2014

<sup>5</sup> These reforms started in 2014 as part of the pre-accession discussions with the EU.

<sup>6</sup> The legal framework for IP rights includes: the Law on Copyright and Related Rights, the Patent Law, the Trademark Law, the Law on the Legal Protection of Industrial Design, the Law on Legal Protection of Topographies of Semiconductor Products and the Law on Indications of Geographical Origin.

<sup>7</sup> Dolovo Cibuk Wind Farm (USD 354 million), Kovacica Wind Farm (USD 225.2 million), Kosava Wind Farm Phase I (USD 138.8 million), and Alibunar Wind Farm (USD 100 million).

<sup>8</sup> Apart from the Ministry of Trade, other relevant government agencies include the Ministry of Finance, Ministry of Agriculture, Ministry of Economy, and the Customs Administration, while business community involvement in trade policy ranges from the Serbian, American and French Chambers of Commerce to the Foreign Investors Council and the National Alliance for Local Development.

<sup>9</sup> The NTFB holds meetings to address issues and regulations on agricultural, sanitary and phytosanitary measures, technical barriers to trade, customs procedures, and co-ordination of trade facilitation activities under international and regional trade agreements.

<sup>10</sup> According to the Law on the Chamber of Commerce, chambers of commerce play an active role in the preparation of legal acts important for the economy and business environment. They monitor all legislative amendments, conduct related analysis and submit initiatives for policy changes to the relevant ministries.

<sup>11</sup> <https://euprava.gov.rs/>.

<sup>12</sup> This issue has been raised in previous editions of the Competitiveness Outlook as an ongoing issue in Serbia. In 2017, 60% of laws relevant to business did not go through a public hearing, 90% were made by urgent procedure and half of all draft laws were not available on the relevant ministry websites. According to statistics from the Public Policy Secretariat (PPS), a consultation process in accordance with the Law on Planning System was conducted for 15 out of 42 relevant draft laws (35.71%) during 2020. However, these data should be viewed in the context of the COVID-19 pandemic.

<sup>13</sup> OECD member states and the following partner economies: Brazil, the People's Republic of China, Costa Rica, India, Indonesia, Kazakhstan, Malaysia, Peru, the Russian Federation, South Africa and Thailand.

<sup>14</sup> The full set of OECD STRI indices and comparison tools as well as policy simulators for OECD member states and partners states that have undertaken the OECD STRI are available on the dedicated OECD website <https://www.oecd.org/trade/topics/services-trade>.

<sup>15</sup> The complete list of measures sector by sector is available on the OECD STRI website <http://www.oecd.org/trade/topics/services-trade>.

<sup>16</sup> According to the Law on Agricultural Land, the prohibition on the sale of agricultural land to foreigners was removed in 2017, however restrictions remain: residency in Serbia for at least 10 years in the local self-government unit in which they want to buy land; a history of cultivation for at least 3 years; and possession of registered agricultural farm machinery and equipment.

<sup>17</sup> According to Article 7 (“Principle of ensuring competition and prohibition of discrimination”) Paragraph 3 of the Law on Public Procurement, the contracting authority/entity shall not impose conditions that would constitute national, territorial, or personal discrimination among economic operators, directly or indirectly.

<sup>18</sup> According to Article 27 and Article 49. Paragraph 2 of the Law on Public Procurement, “Contracting authority/entity shall regulate in a special act in greater detail the manner of planning, conducting public procurement procedures and monitoring of the execution of the public procurement contract, (the manner of communication, the rules, duties and responsibilities of persons and organisational units), the manner of planning and conducting procurements exempted from the law and procurements of social and other specific services”.

Also, according to Article 18, the contracting authority/entity shall record data on values and types of public procurements referred to in Article 11 - 21 of this Law, for each exemption ground separately, as well as the public procurements referred to in Article 27, paragraph 1 of this law. Contracting authorities/entities shall aggregately publish data referred to in paragraph 3 of this article on the Public Procurement Portal, no later than 31 January of the current year for the previous year, pursuant to the instruction published by the Public Procurement Office on the Public Procurement Portal.

<sup>19</sup> In order to facilitate comparison with OECD member states that have undergone the STRI exercise, the paragraphs below have been drafted in accordance with the methodology of the STRI project publications. Country Notes for the OECD members, as well as Sector Notes, are available on the STRI web page: <https://www.oecd.org/trade/topics/services-trade/>.

<sup>20</sup> Access to the railway infrastructure and the ability to do business on its territory is provided to all companies registered in Serbia (Article 32, paragraph 1 of the Law on Rail Services; [https://www.paragraf.rs/propisi/zakon\\_o\\_zeleznici.html](https://www.paragraf.rs/propisi/zakon_o_zeleznici.html)). In accordance with the provisions of the Agreement on the Establishing the Transport Community, there are plans to further liberalise the market, i.e. opening the market at the regional level (the Western Balkans signatories to the agreement) and, later, at the EU level (Transport Community Treaty, Art 11).

<sup>21</sup> Srbija Kargo is main railway freight operator but the rail market has been open to all interested stakeholders since 2016. Serbia now has 10 railway freight transport operators and Srbija Kargo's share of market has decreased relative to other operators, from about 95% in 2016 to about 80% in 2020.

<sup>22</sup> The National Bank of Serbia adopted a set of regulations implementing Basel III standards, that apply from June 30, 2017. The set of regulations consisted of the following decisions: Decision on Capital Adequacy of Banks, Decision on Disclosure of Data and Information by Banks, Decision on Reporting on Capital Adequacy of Banks, Decision Amending the Decision on Reporting Requirements for Banks, Decision on Liquidity Risk Management by Banks, and Decision Amending the Decision on Risk Management by Banks.

<sup>23</sup> Some evidence for this lies in the fact that the market is largely dominated by foreign-owned insurance companies. According to the Serbian authorities, out of the total of 20 insurance undertakings, 15 were majority foreign owned in 2020.

<sup>24</sup> In 2019, 34% of the population purchased goods on line at least once. E-commerce revenue in the e-commerce market is projected to reach EUR 395 million in 2020. The market's largest segment is toys, hobbies and DIY. User penetration is expected to reach 48.1% in 2020 and prior to COVID-19 it had been estimated it would reach 60% by 2024.

<sup>25</sup> The project's target groups are: e-commerce traders, primarily small and medium-sized enterprises, women working in the field of e-commerce, companies providing postal services, consumers and inspection bodies.

<sup>26</sup> Decision Amending the Decision on Capital Adequacy of Banks and Decision Amending the Decision on Risk Management by Banks.

<sup>27</sup> Decision on Capital Adequacy of Banks and Decision on the Classification of Bank Balance Sheet Assets and Off-balance Sheet Items.

<sup>28</sup> MONEYVAL is a permanent monitoring body of the Council of Europe which is assessing compliance with the principal international standards to counter money laundering and the financing of terrorism and the effectiveness of their implementation, as well as with the task of making recommendations to national authorities in respect of necessary improvements to their systems.

<sup>29</sup> A passenger car is a road motor vehicle, other than a motor cycle, intended for the carriage of passengers and designed to seat no more than nine persons (including the driver). (OECD, 2013<sub>[414]</sub>)

<sup>30</sup> The Decision on Management of Risks Arising from Introduction Of New Products/Services By Lessor (RS Official Gazette, No. 149/2020).

<sup>31</sup> Startup Genome is the research and policy advisory organisation for public and private agencies committed to accelerating the success of their start-up ecosystem. For more information see <https://startupgenome.com/>.

<sup>32</sup> Concrete PPP examples include: the renovation and expansion of existing optical telecommunication network in Novi Sad; the construction, financing and operation of the internal ports and roads on the Danube in Apatin; the acquisition of necessities of public transport services in Loznica; the design, construction, financing and operation of public car parks in Sabac; the construction of factories for the processing of biomass in Zrenjanin; the acquisition of necessities of public transport services in Topola; and the acquisition of necessities of public transport services in Srbobran.

<sup>33</sup> Belgrade Stock Exchange has two indices: BELEXline, the general benchmark index of the Belgrade Stock Exchange, and BELEX15, representing the 12 most liquid stocks.

<sup>33</sup> A newly established company that performs so-called "innovative activities" is a company established for less than three years and which mainly performs innovation activity in terms of the law governing innovation activity (activities undertaken to create new products, technology, processes and services or significant changes to existing ones, in accordance with the needs of the market). A series of criteria define what a company performing innovative activity: R&D costs should account for at least 15% of total expenditure, highly qualified employees should make up more than 80% of all employees and no dividends should be distributed within a three-year period.

<sup>34</sup> The maximum monthly base for contributions is five times the statutory average monthly salary in Serbia (RSD 368 590 in 2020, or around EUR 3 130).

<sup>35</sup> Under the destination principle, tax is ultimately levied only on the final consumption that occurs within the taxing jurisdiction.

<sup>36</sup> The OECD Database on General Competition Statistics (OECD CompStats) is a database with general statistics about competition agencies, including data on enforcement and information on advocacy initiatives. In 2020, it included data from competition agencies in 56 jurisdictions, including 37 OECD countries (36 OECD countries and the European Union), i.e. Argentina, Canada, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Mexico, Peru, United States (Americas): Australia, Brazil, Chinese Taipei, India, Indonesia, Japan, Korea, New Zealand (Asia-Pacific); Austria, Belgium, Bulgaria, Croatia, Czech Republic, Denmark, Estonia, European Union, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Romania, Portugal, Slovak Republic, Slovenia, Spain, Sweden, Switzerland, the United Kingdom (Europe); Egypt, Israel, Kazakhstan, Russian Federation, South Africa, Turkey, Ukraine (Other) (OECD, 2020<sup>[417]</sup>).

<sup>37</sup> According to the Serbian authorities, there is not a fixed number of SOEs that fall under the scope of the Law on Public Enterprises, but rather fixed criteria for determining which enterprises fall under its scope.

<sup>38</sup> Calculations based on data provided by the authorities of Serbia and the number of employed persons in Serbia (2 938 200) as reported in the national Labour Force Survey Quarter IV 2019 (SORS, 2019<sup>[85]</sup>).

<sup>39</sup> According to the Serbian authorities, public-interest activities are those defined as such by the relevant laws applicable to the following fields of activity: mining and energy; transportation; electronic communications; publishing the official gazette and publishing textbooks; nuclear facilities, armaments and military equipment; the use, management, protection, development and promotion of goods of general interest and goods in general use (water, roads, forests, navigable rivers, lakes, banks, spas, game, protected areas, etc.); waste management; and other fields.

<sup>40</sup> Good practices include making publicly available: audit reports for the past 3-5 years; information about discounts and benefits; information about SOE debts and loans; information about SOE financial claims; policy on collecting financial claims; minutes of governing, supervisory and audit body meetings, and inventories (or information on major assets – real estates/properties, vehicles). Transparency Serbia has published comprehensive report regarding reporting practices of Serbia's SOEs (Transparency International, 2019<sup>[418]</sup>).

<sup>41</sup> For the purpose of this profile, the instruction system refers to teaching and learning processes that takes place in school education. It generally consists of curricula, standards for schools and student learning, assessment and evaluation frameworks, and other elements that support instruction.

<sup>42</sup> Students may take this exam in Grade 12 (for general education and four-year VET upper secondary schools) or in Grade 11 (for three-year VET schools).

<sup>43</sup> Examples include Peace-Building and Inclusive Local Development (PBILD), Youth Employment and Migration (YEM), Career Development and Youth Entrepreneurship in Serbia (US Embassy), The Sustainable Local Development Project (USAID), the Economic Security Enhancement Project (USAID), TEMPUS projects (EU), IPA projects (EU), and many others. The regional and national programmes related to the topic of professional orientation and entrepreneurship were also recognized - Balkan Community Initiatives Fund (BCIF), European Movement in Serbia (EPuS), SMART Kolektiv, Group 484, Initiative for Development and Cooperation - Serbia (IDC). etc.

<sup>44</sup> Under the 2019 revised accreditation standards, the teacher practicum must be at least 90 hours per year in the 2<sup>nd</sup>, 3<sup>rd</sup> and 4<sup>th</sup> year of the programme. In the 5<sup>th</sup> year of the programme, the teaching practicum is at least 180 hours and 6 European Credit Transfer and Accumulation System (ECTS) credits.

<sup>45</sup> Starting in 2021/22, students in Serbia will take the state Matura examination to certify their completion of upper secondary school and inform student selection into tertiary education.

<sup>46</sup> In 2017-18, Serbia piloted a new national assessment for students in Grades 7 (basic education) and 11 (the third year of upper secondary). The results will inform discussions about how to establish a new national assessment system (Maghnouj et al., 2020<sup>[8]</sup>).

<sup>47</sup> The only criteria was that companies did not cut employment by more than 10%.

<sup>48</sup> In the field of labour law, the law of 2014 is only partially aligned with the EU *acquis*. A new law on the right to strike has yet to be adopted.

<sup>49</sup> Platform workers are individuals who use an app (such as Uber) or a website (such as Amazon Turk) to match themselves with customers, in order to provide a service in return for money. They offer a diverse range of services including transport, coding and writing product descriptions (OECD, 2019<sup>[407]</sup>).

<sup>50</sup> Self-employed persons without employees

<sup>51</sup> During 2019, 59 fatalities in the workplace were recorded – a record number. Most were in the construction sector.

<sup>52</sup> The procurement was planned for the third quarter of 2020.

<sup>53</sup> Government response to the questionnaire

<sup>54</sup> The ILO consider that the ratio of labour inspectors to workers should be approximately 1:10 000 in industrial market economies.

<sup>55</sup> These programmes are supported by the European Union and Council of Europe for Western Balkans and Turkey.

<sup>56</sup> Published in the Official Gazette of RS, No. 18/21 on 1 March 2021.

<sup>57</sup> Duality is the division of the labour market into two separate submarkets or segments, distinguished by different characteristics and behavioural rules. Segmentation may arise from the particularities of labour market institutions, such as governing contractual arrangements (segmentation along permanent/temporary nature of employment contracts), lack of enforcement (segmentation along formal/informal line), as well as types of workers concerned (such as migrant and non-migrant workers).

<sup>58</sup> In particular the European Commission notes that the co-ordination body for monitoring the strategy's implementation, chaired by a Deputy Prime Minister, met three times during the reporting period, not six times a year as previously agreed in the 2017 Roma Seminar conclusions. The Expert Group involving civil society organisations, mandated to support the co-ordination body, never met. The fifth Roma Seminar was held in October 2019. The operational conclusions were finalised but their adoption has yet to be formalised nor their implementation closely monitored and reported on. The institutional structure dealing with Roma integration remains ineffective and complicated, without a clear distribution of tasks. Co-ordination between the national and local authorities, and Roma-sensitive budgeting, still need to be strengthened. There has been a serious delay in establishing the legal basis for local Roma co-ordinators and pedagogical assistants.

<sup>59</sup> Official Gazette of RS, No. 125/04, 104/09 and 50/18.

<sup>60</sup> Based on the International Standard Classification of Education (ISCED 2011), the term low-educated refers to people with less than primary, primary and lower secondary education (levels 0-2), medium educated refers to people with upper secondary and post-secondary non-tertiary education (levels 3-4) and highly educated refers to people with tertiary education (levels 5-8).

<sup>61</sup> Data received from the government.

<sup>62</sup> Jobs Gateway Database, based on data provided by national statistical offices and Eurostat, WIIW' own calculations).

<sup>63</sup> Reducing personal income taxes or employee social security contributions has the potential to stimulate labour supply and create work incentives, in particular for low-income and second earners, who are especially responsive to changes in after-tax wages (European Commission, 2020<sup>[464]</sup>).

<sup>64</sup> Overall, the share of the population with lower educational level was higher than the EU Member States that joined in 2004 and later (18%).

<sup>65</sup> Note that this does not refer to hourly gross wages.

<sup>66</sup> Registered unemployed refer to data provided by the registers of the PES, according to different national definitions and rules, while LFS unemployed refer to harmonised data which are figures provided by the Labour Force Survey, according to the ILO definition of unemployment.

<sup>67</sup> Note that the average of the unemployment rate of the five peer EU countries (Bulgaria, Croatia, Hungary, Romania and Slovenia) was 4.1%.

<sup>68</sup> Informal employment includes employment in unregistered companies, employment in registered companies but without a formal contract and without paying social and pension contributions, and unpaid family workers (SORS, 2020<sup>[127]</sup>).

<sup>69</sup> There were 191 000 people informally employed outside the agricultural sector. It is assumed that there is no informal employment in the public sector (SORS, n.d.<sup>[419]</sup>; SORS, n.d.<sup>[420]</sup>).

<sup>70</sup> Information from government (policy roundtable).

<sup>71</sup> Around 1 000 mediated through NES each year, and another 5 000 to 7 000 workers mediated through private agencies in the past. The numbers have been lower in 2020, due to the COVID-19 pandemic.

<sup>72</sup> Horizon 2020 is the biggest European Union's framework programme for research and innovation. It provides funding for multi-national collaboration projects as well as for individual researchers, and supports SMEs with a special funding instrument. (<https://ec.europa.eu/programmes/horizon2020/en/what-horizon-2020> ; <https://www.euneighbours.eu/en/east/stay-informed/projects/horizon-2020>)

<sup>73</sup> Eureka is the largest intergovernmental network for cooperation in R&D and innovation in the world. It is present in over 45 economies, where it provides access to public funding, promotes collaboration and innovation or offers advice, through various programmes (such as Eureka Clusters, Globalstars, InvestHorizon). (<https://www.eurekanetwork.org/>)

<sup>74</sup> European Research Area (ERA) is the ambition to create a unified research area open to the world, based on the EU Internal Market, that enables free circulation of researchers, scientific knowledge and technology. ([https://ec.europa.eu/info/research-and-innovation/strategy/era\\_en](https://ec.europa.eu/info/research-and-innovation/strategy/era_en)).

<sup>75</sup> EURAXESS - Researchers in Motion is a pan-European initiative delivering information and support services to professional researchers, backed by the EU, member states and associated countries. It supports researcher mobility and career development and enhances scientific collaboration. (<https://euraxess.ec.europa.eu/>).

<sup>76</sup> Marie Skłodowska-Curie Actions (MSCA) are an EU programme, which provides grants to support research careers and encourages transnational, intersectoral and interdisciplinary mobility. (<https://ec.europa.eu/programmes/horizon2020/en/h2020-section/marie-skłodowska-curie-actions>; [https://ec.europa.eu/research/mariecurieactions/msca-actions\\_en](https://ec.europa.eu/research/mariecurieactions/msca-actions_en)).

<sup>77</sup> White zones are areas which have no broadband infrastructure (based on the availability of Internet access speeds higher than 30Mbps) and where it is unlikely to be developed in the near future.

<sup>78</sup> Until the new Law on Electronic Communications is adopted, RATEL continues to conduct the analysis of relevant markets. In cases where there is no effective competition in a relevant market, the regulator designates the operator who, individually or jointly with other operators, has significant market power and its regulatory obligations.

<sup>79</sup> Directive 2013/37/EU of the European Parliament and of the Council of 26 June 2013 amending Directive 2003/98/EC on the reuse of public sector information.

<sup>80</sup> The Open Data Portal (<https://data.gov.rs/sr/>), as accessed in October 2020.

<sup>81</sup> The OGP is an international agreement aiming to increase transparency, civic participation and the use of new technologies in achieving a more open, effective and accountable government. Currently, 78 governments are members of the partnership ([www.opengovpartnership.org/about/approach/](http://www.opengovpartnership.org/about/approach/)).

<sup>82</sup> The data displayed on the platform are automatically downloaded from the Unified Information System for Planning, Implementation Monitoring, Policy Coordination and Reporting, maintained by the government through the state administration body responsible for policy co-ordination (Republic Secretariat for Public Policies) in accordance with Article 47 of the Law on Planning System of RS. The platform is co-financed by the European Union, (<https://monitoring.mduls.gov.rs/>), as accessed on 12 February 2021.

<sup>83</sup> Ministry of Public Administration and Local Self-Government, Projects and Programmes (<http://mduls.gov.rs/en/category/projects-and-programmes/>), as accessed on 12 February 2021.

<sup>84</sup> The e-Government Portal (<https://euprava.gov.rs/>) had been used by 1 026 347 people, according to data on the website, as accessed on 10 October 2020.

<sup>85</sup> For instance, the MTTT's Smart and Safe platform: Tips and Guides for Traders (<https://pametnoibezbedno.gov.rs/saveti-za-trgovce/>).

<sup>86</sup> GIZ-funded "Digital transformation support program for MSMEs" by the Development Agency of Serbia in cooperation with the Center for Digital Transformation (<https://ras.gov.rs/javni-poziv-za-ucesce-u-programu-podrske-digitalnoj-transformaciji-mmssp>).

<sup>87</sup> UNICEF in Serbia and USAID Cooperation for Growth Project (CFG) supported the preparation of the Digital Skills Development Strategy for the period 2020-24, through surveys and analysis performed under the framework of co-funded programmes like “Digital transformation of the labour market” by USAID CFG and “kids online” by UNICEF.

<sup>88</sup> At the time of writing (Q3 2020), the implementation of the Digital Skills Development Strategy had not yet started; the strategy action plan for the period 2020-21 was still being prepared and budget planning was under development.

<sup>89</sup> The programme is part of the Serbia at Your Fingertips - Digital Transformation for Development project, implemented by UNDP Serbia in co-operation with the Office of the Prime Minister of the Republic of Serbia and the ITE.

<sup>90</sup> The Police Directive (EU) 2016/680 deals with processing of personal data by competent authorities for the purposes of the prevention, investigation, detection or prosecution of criminal offences or the execution of criminal penalties and on the free movement of such data.

<sup>91</sup> The Annual Report of the former Commissioner for Information of Public Importance and Personal Data Protection for 2018 vividly describes the refusal of controlled public authorities to co-operate, submit data and fulfil their legal obligations according to the Law on Access to Information. It also outlines the reduced level of transparency of the new draft law through provisions excluding state-owned enterprises from its jurisdiction, which has also been signalled as contrary to the principles of openness and transparency by the Support for Improvement in Governance and Management, Joint Initiative of the European Union and the Organization for Economic Cooperation and Development (Commissioner for Information of Public Importance and Personal Data Protection, 2019<sub>[406]</sub>).

<sup>92</sup> Annual Report of the Commissioner for Information of Public Importance and Personal Data Protection for 2018 (Commissioner for Information of Public Importance and Personal Data Protection, 2019<sub>[406]</sub>).

<sup>93</sup> Smart and Safe Platform: Guide for Consumers in e-Commerce, Tips for e-Traders (<https://pametnoibezbedno.gov.rs/elektronska-trgovina>) and the eShop Fast, Easy and Simple video campaign (<https://pametnoibezbedno.gov.rs/video/4>).

<sup>94</sup> The twinning project "Further Development of Consumer Protection in Serbia" [SR 13 IPA OT 01 16], jointly funded by the European Union and the Republic of Serbia in the total amount of 1.425 million EUR, is implemented by the Ministry of National Development of the Republic of Hungary and the Regional Development Agency Pezinok from the Slovak Republic in cooperation with the Ministry of Trade, Tourism and Telecommunications of the Republic of Serbia (user organisation). Project duration is August 2017 - August 2019, (<https://zastitapotrosaca.gov.rs/o-nama#S4>).

<sup>95</sup> The working document elaborates in detail the steps taken so far and initiatives involving WB6 economies in the following areas: closer ties with the EU and enhancing regional co-operation, people-to-people contacts, familiarising people with the EU, civil society development and dialogue, good governance, parliamentary co-operation, trade integration, investment and economic and social development, community financial support, and donor co-ordination.

<sup>96</sup> The NTS should cover the following fields: 1) non-physical bottlenecks; 2) reform path for the transport sector including objectives and the key performance indicators; 3) the national transport model and demand forecast; 4) a strategic policy options paper covering road transport and infrastructure, urban transport, rail infrastructure and railway transport, intermodal transport, ports and inland waterways, air transport, e-mobility, active mobility, and technology uptake; 5) a draft national transport strategy with

detailed action plan; and 6) a strategic framework for the sustainable implementation of intelligent transport solutions (ITS), defining the ITS vision and priority interventions, development of the ITS architecture and institutional arrangements and roadmap for adopting ITS standards and the relevant EU Directives, and finally an ITS strategy and action plan with prioritised interventions.

<sup>97</sup> For more information, please see: <https://mfin.gov.rs/dokumenti2/saobracaj>.

<sup>98</sup> Its purpose is to regulate the determination of the public interest for complete and incomplete expropriation and temporary occupation of immovable property for the construction of those structures, then to determine specific expropriation procedures if needed permits, approvals, etc.

<sup>99</sup> The Rulebook on the Management of Capital Projects has three categories of projects: 1) less than EUR 5 million; 2) EUR 5-25 million; and 3) over EUR 25 million.

<sup>100</sup> A one-stop-shop is a business or office where multiple services are offered so that customers can get all they need in just "one stop." The term originated in the United States in the late 1920s or early 1930s to describe a business model offering customers the convenience of having multiple needs met in one location, instead of having to drive all over town to attain related services at different stores. One-stop-shops are a way of facilitating trade.

<sup>101</sup> An appropriate definition of "asset management" for the roads sector is the one proposed by the OECD in 2001: "A systematic process of maintaining, upgrading and operating assets, combining engineering principles with sound business practice and economic rationale, and providing tools to facilitate a more organised and flexible approach to making the decisions necessary to achieve the public's expectations." (OECD, 2001<sub>[380]</sub>).

<sup>102</sup> The assignment covered the preparation of detailed needs assessments, guidelines, maintenance plans and recommendation for performance-based maintenance contracts. Regional action plans for transport facilitation, rail, road and road safety (<https://www.transport-community.org/library/meetings/ministerial-council/>) have been endorsed by the Council of Minister of the Transport Community Permanent Secretariat (TCPS) in October 2020 and economies need to align their own plans to achieve the goals set within these ones.

<sup>103</sup> HDM-4 is a powerful tool for road management, economic analysis, programming road works, estimating funding requirements, predicting road network performance, project appraisal, and policy impact studies.

<sup>104</sup> According to Article 234 of the Air Transport Law, the CAD is the national supervisory authority of the Republic of Serbia in air navigation, in accordance with the regulations of the European Union, issuing the certificate of competence for air navigation services provision and assessing whether air navigation services providers fulfil the requirements for the provision of services.

<sup>105</sup> Regulation on Airport Charges.

<sup>106</sup> Regulation on the details of the procedure and the criteria applied for access to services provided in service facilities and Rulebook on the elements of service facility description.

<sup>107</sup> Alpine-Western Balkan rail freight corridor, <https://www.rfc-awb.eu/>.

<sup>108</sup> Full opening of the market, more incentives for shifting, development of multimodal facilities, etc.

<sup>109</sup> The indicators include: traffic flows (transparent per vehicle categories in the last 15 years, currently 407 counters in operation constantly measuring the traffic intensity, conducted by PERS), detailed road accident database (transparent road safety indicators through the Road Traffic Safety Agency), for road network – IRI coefficient, databases on bridges and tunnels, a database of landslides. Regional maintenance centres supervise the state of all roads.

<sup>110</sup> Additional indicators that could be monitored include average user costs, travel time satisfaction levels i.e. reliability, value of assets, market research and customer feedback, forecasted value of assets, audit programme, quality of user information, allocation of resources, long term programmes for investment, maintenance and operations, lowering of overhead percentage, etc.

<sup>111</sup> See the example of the border queue management system in Estonia (Estonia Border, n.d.<sup>[452]</sup>).

<sup>112</sup> Since the last CO2018 assessment, road safety legislation has been updated: adopted amendments of Law on road traffic safety; adopted new Law on roads and its corresponding by-laws which introduce a system of licensing of professional drivers and introduce tools for infrastructure safety management; updated new Rulebook on roadworthiness test. A survey of performance safety indicators is conducted every year using a methodology revised in 2017. Annual road traffic safety statistical reports have been published. A lot of road safety campaigns were conducted for all road users especially for children and young drivers. Seminars refreshing the knowledge of traffic police and traffic inspectors have been conducted. Most local communities (110 out of 161) have established Road Safety Councils and adopted their own road safety strategies.

<sup>113</sup> Established and operated the Road Safety Coordination Body; established and operated Road Traffic Safety Agency from 2010; Data collection according to CADAS started from January 1, 2016; established integrated road safety database from 2015, with data publicly available on the website of the Road Traffic Safety Agency; measured key performance indicators on a yearly basis from 2013 (publicly available on the website of the Road Traffic Safety Agency) based on the methodology according to Safety Net project; developed specific programmes for vulnerable road users (safety training for bicyclists, moped drivers since 2018 and motorcycle drivers since 2017).

<sup>114</sup> The goals include: modal shift from road, standards for energy efficiency, standards for noise emission, reduction of greenhouse gas emissions, vehicle labelling for emissions and fuel efficiency, introduction of carbon footprint calculators, eco-driving and speed limits, ITS applications, co-modality in transport, and urban mobility solutions.

The following environmental sustainability measures have been proposed: 1) to prepare sustainable urban mobility plans for Belgrade and major cities by 2020 (Belgrade's was completed in 2020); 2) to reduce dependence on conventionally fuelled cars in the five biggest Serbian cities by 25% by 2025 (several legal acts were adopted in 2019 and 2020 to provide incentives to promote electric vehicles); 3) to prepare strategies and define concepts of city logistics for Belgrade and bigger cities by 2020 (the city logistic strategy for Belgrade is in the procurement plan for 2020 but has not yet been tendered out); 4) shifting freight and transport to more environmentally friendly modes (such as rail and water); and 5) more intensive promotion of intermodal transport (see section on combined transport for more details).

These measures are included in the National Sustainable Development Strategy, National Environmental Approximation Strategy for the Republic of Serbia and the National Environmental Protection Programme, but also in the Serbian Strategy of Energy Sector Development; the overall Strategy of Railway, Road, Inland Waterway, Air and Intermodal Transport Development in the Republic of Serbia; and many other existing strategic documents as spatial plans, sector strategies and action plans.

<sup>115</sup> Study of snow deposits on state roads, study of endangerment of the state roads from the occurrence of floods (Kolubara river basin, Sava river basin, South Morava River Basin, West Morava basin without Ibar river, etc.). PERS also implements the Technical Assistance to Mainstream Climate Resilience in the Road Transport Management in Serbia.

<sup>116</sup> Combined transport refers to the transport of goods between Member States where the lorry, trailer, semi-trailer (with or without tractor unit, swap body or container of 20 feet or more) uses the road on the initial or final leg of the journey and rail or inland waterway or maritime services on the other leg, where this section exceeds 100 km as the crow flies (Combined Transport Directive 92/106EC, amended by the Directive 2013/22/EU).

<sup>117</sup> The General Transport Master Plan for Serbia for the period 2009-2027; Plan for Railway, Road, Water, Air and Intermodal Transport Development in the RS 2015-2020; Railway Master Plan for years 2012-2021; National Program of Public Railway Infrastructure from 2017 to 2021; and The Law on Spatial Plan of the Republic of Serbia from 2010 to 2020 defines potential locations of intermodal terminals and logistics centres.

<sup>118</sup> Ease of arranging competitively priced shipments.

<sup>119</sup> Periodical and regular measurements to monitor infrastructure assets' conditions, assessment of the value of assets and costs for non-maintained assets, adoption of the asset management strategies, consistent approach in the identification of the mix and timing of asset operation and construction strategies, etc.

<sup>120</sup> Network Codes were established under Article 6 of EU Regulation 714/2009 and are secondary acts, in many cases of technical nature, to overcome legislative gaps and barriers to a non-discriminated, open internal EU energy market by establishing uniform regulation. In essence they overcome barriers and friction in order to promote competition. In some sense, they represent lessons learned over time that aim to perfect the legislative framework for the EU internal energy market and represents EU best practices and standards. While not an exhaustive list, the interested reader can find more information about Network Codes under (Eurostat, 2021<sup>[465]</sup>; ENTSOE, 2021<sup>[449]</sup>; Florence School of Regulation, 2021<sup>[388]</sup>).

<sup>121</sup> More precisely, Serbia does not currently have a legal binding documents (policy, regulation or legislation) that govern or require the pricing or taxation of greenhouse gases. However, it is understood that Serbia is currently working on legislation that would implement some type of pricing mechanism akin to the EU emission certification market, with similar monitoring verification and reporting requirements and mechanisms. Moreover, the Energy Community, of which Serbia is a member, plans to adopt relevant legislation into its *acquis* that would require the establishment of national or even regional greenhouse gas market that would eventually be integrated into the European Union Emission Trading Scheme. For more information, please see Capros (2020<sup>[434]</sup>), Energy Community Secretariat (2020<sup>[387]</sup>), Kantor (2020<sup>[393]</sup>; 2021<sup>[392]</sup>).

<sup>122</sup> This conclusion is supported by the European Commission (2020<sup>[301]</sup>) which notes that “staff levels are still insufficient to allow the agency implement all regulatory responsibilities under the Third Energy Package and the new *acquis* upfront” (page 89).

<sup>123</sup> More precisely, according to AERS (2020<sup>[423]</sup>) it had 45 staff members in 2018 and planned to expand that to 51 at the end of 2019. However, at the end of 2019, AERS had 43 staff members. Based on conversation with AERS, it plans to hire additional 9 staff members, in part to support its work on the full transposition and implementation of the network codes.

<sup>124</sup> Parliamentary approval of the budget is not a necessarily a prohibitive procedure, but it does increase the risk of delays in adopting a budget and makes it more susceptible to political influence. Both factors could lead to delays or interruptions to hiring and retaining staff as well as interrupting the general function of the regulator.

<sup>125</sup> Although related to matters of security please see IOSCO (2015<sub>[390]</sub>) for further elaboration.

<sup>126</sup> The framework includes the Energy Development Strategy of the Republic of Serbia until 2025 - with projections until 2030, the Electricity Transmission System Development Plan of the Republic of Serbia for 2020-29, the Electricity Transmission System Investment Plans for 2020-22, and the Natural Gas Transport Transmission System Development Plan for 2020-29 – see AERS (n.d.<sub>[424]</sub>).

<sup>127</sup> Although another significant player is Gazprom as the dominant exporter of natural gas to Serbia and part owner of the Serbian transmission system operators, YugoRosgaz and Gastrans. Moreover, Gazprom is the majority owner of NIS j.s.c. which is actively engaged in the development of the 200 MW thermal power plant in Pancev where construction started in 2019. Additionally, Gazprom Germania, a subsidiary of Gazprom, is part owner of the natural gas underground storage facility Banatski Dvor, LLC.

<sup>128</sup> Oil indexation was once the dominant pricing format for natural gas in Europe. This largely reflected the fact that natural gas spot markets were not liquid enough at the time to provide good price signals. Moreover, when natural gas was competing with oil for power generation and heating, oil indexation was a good approach for assuring that natural gas was competitive with the main alternative fuel. Oil indexation is often also justified by natural gas being produced as a by-product from oil exploration or because natural gas competes with oil for capital investment. However, in the current market situation, oil indexation means that price of natural gas price does not reflect the supply and demand realities which are largely now disconnected from oil, both in terms of alternative demand and on the production side. Furthermore, Europe has a variety of liquid natural gas spot markets that offer good pricing and indexation points, especially considering the interconnected natural gas markets, including those based on the European natural gas pipeline network. However, it should be stressed that there is an extensive literature discussing benefit and drawbacks of the oil indexation of natural gas pricing and this endnote only scratches the surface of the debate. Some examples of the literature are: Dubreuil et al. (2020<sub>[439]</sub>), European Commission (2015<sub>[458]</sub>)—with regard to legality of oil indexation, Melling (2010<sub>[394]</sub>), IEA (2020<sub>[389]</sub>) --for the current split in pricing approach in Europe, see Stern (2007<sub>[396]</sub>).

<sup>129</sup> For a more detailed exposition of the issue of losses in the transmission and distribution of electricity please see CEER (CEER, 2020<sub>[236]</sub>).

<sup>130</sup> Please see Ministry of Mining and Energy's website (<https://mre.gov.rs/dokumenta-efikasnost-izvori.php>) or Energy Community website (<https://www.energy-community.org/implementation/Serbia/secondary.html>) for a comprehensive list of the regulations and legislation that govern the renewable energy sector in Serbia.

<sup>131</sup> A day-ahead market is an organised market space in which interested parties can buy and/or sell energy for the next day in the form of putting in bids/offers that are algorithmically matched. For more detailed explanations please see, for example, NordPool (2021<sub>[395]</sub>) or ISO-NE (2021<sub>[391]</sub>).

<sup>132</sup> A feed-in tariff (FIT) refers to a renewable support scheme in which “[...] power plant operators receive a fixed payment for each unit of electricity-generated independent of the electricity market price” (Banja et al., 2017, p. 15<sub>[238]</sub>). A feed-in-premium is a renewable support scheme in which “[...] plant operators have to market the electricity generated directly at the electricity market and receive an additional payment on top of the electricity market price either as a fixed payment or adapted to changing market prices in

order to limit both the price risks for plant operators and the risks of providing windfall profits at the same time” (Banja et al., 2017, p. 16<sup>[238]</sup>). Contract-for-difference is a renewable support scheme in which variable premiums are paid to plant operators for delivered electricity where the “[...] variable premium [is] calculated as the difference payment between an administratively prefixed price (the strike price) and a measure of the market price for electricity (the reference price)” (Eurostat, n.d., p. 5<sup>[198]</sup>). For a brief but comprehensive non-technical overview of the different renewable financial subsidy schemes please see Aures (2021<sup>[425]</sup>). For an overview of the different support schemes applied across Europe please see <http://www.res-legal.eu/>.

<sup>133</sup> This conclusion is based on the government input, indicating that the current human resources are not sufficient. This is also supported by Energy Community Secretariat (Energy Community Secretariat, 2020<sup>[232]</sup>) which reports that “the Ministries [Ministry of Mining and Energy and the Ministry of Construction, Transport and Infrastructure] reported about the needs and plans to strengthen the currently weak human capacities for implementation of the energy efficiency directives. Human resource capacities for energy efficiency in the Ministry of Mining and Energy were slightly increased but still remain insufficient to effectively implement the required reforms.”

<sup>134</sup> The government response indicated that “The collected indicators are not collected systematically. It is done on the project base.”

<sup>135</sup> A seat requirement is “a provision of national law under which an undertaking established in another Member State must create a permanent establishment in the Member State in which it seeks to” be active (Energy Community Secretariat, 2018, p. 13<sup>[448]</sup>).

<sup>136</sup> As Serbia is a member of the Energy Community, the Energy Community Secretariat publishes opinions that the network operator(s) is(are) unbundled in line with EU Directive 2009/72/EC and 2009/73/EC. To this end, the absence of a positive opinion could indicate that the network operator is not unbundled in line with the Directives and thus do not conform with international best practices.

<sup>137</sup> Following the publication of the original opinion of Energy Community Secretariat, the relevant aspect of the Law on Ministries was amended. However, without a re-opening of the certification procedure by AERS, the Energy Community is not in a position to submit a new, positive opinion on the matter.

<sup>138</sup> The requirement for a compliance officer in the transmission system operator originates in Article 21 of the EU Directive 2009/72/EC. It establishes the role of compliance officer as an independent position to monitor that the TSO complies with transparency and non-discriminatory behaviour requirements and that it operates independently from any other influence when part of a vertically integrated undertaking. This is a vital role as it assures that the TSO behaves equally and adequately towards all market participants and thus, does not use its natural monopoly position to hamper the competitive nature of the market.

<sup>139</sup> The Joint Allocation Office (JAO) is a service company that facilitates the electricity market by organising auctions for cross border transmission capacity jointly for both TSO. The Joint Allocation Office is the single allocation platform (SAP) for all European TSOs that operate in accordance and compliance with EU legislation. For more details, please see [www.jao.eu/aboutus/aboutus/overview](http://www.jao.eu/aboutus/aboutus/overview).

<sup>140</sup> This spirit of regional co-operation is best exemplified by AERS’s participation in the Energy Community as well as in:

- 1) Energy Regulators Regional Association which is an association of regulators aiming at the improvement of co-operation, exchange of experience and capacity building in member states.

- 2) Council of European Energy Regulators (CEER), a platform for co-operation, information exchange and assistance between Europe's national energy regulators and their interface at EU and international level, aiming to facilitate the creation of a single, competitive, efficient and sustainable EU internal energy market.
- 3) Balkan Advisory Forum, a national regulatory agency platform for exchange of experience on regulatory issues falling within the scope of the electricity, gas and water and sewerage markets in the region.

<sup>141</sup> Please see (Energy Community Secretariat, n.d.<sup>[446]</sup>).

<sup>142</sup> See (BIZLife, 2019<sup>[466]</sup>).

<sup>143</sup> Please see (Energy Community Secretariat, 2021<sup>[467]</sup>) for the current state of TSO certification and thus state of unbundling.

<sup>144</sup> The Paris Agreement was signed in 2016 and ratified in 2017, while the Kyoto protocol was ratified in 2007. Serbia submitted two National Communications on climate change in 2010 and 2017 (UNFCCC, 2020<sup>[307]</sup>). The Ministry of Environmental Protection, together with the UNDP, drafted the Second Biennial Update Report and initiated drafting of the Third National Communication under the UNFCCC. Both are expected to be submitted in 2021.

<sup>145</sup> The NECP will define targets in the field of renewable energy sources, energy efficiency and reduction emissions of GHG for 2030 with long-term vision until 2050. The NECP is prepared through the IPA 2017 “Further Development of Energy Planning Capacity” project, which started in February 2021.

<sup>146</sup> In the period from 2006 to 2019, Serbia suffered 10 natural disasters, 8 of which were floods. It suffered flooding once in 2007 and in 2009, twice in 2010 and in 2013, and then once in 2014 and in 2019. The floods in May 2014 were particularly severe, affecting 22% of the population (1.6 million people) and two-thirds of Serbia’s municipalities (mostly located in Central and Western Serbia). The damage amounted to EUR 1.5 billion (EC/UN/World Bank, 2014<sup>[456]</sup>).

<sup>147</sup> SEPA performs public administration tasks relating to the development and management of the national information system for environmental protection, collection and compilation of environmental data and preparation of reports on the state of the environment. It also ensures the right of access to relevant environmental data and information at national and international levels, and improves communication and dissemination of information to decision makers and the public.

<sup>148</sup> In 2019, the Ministry of Environmental Protection revoked the waste management licences of one of the largest hazardous waste management operators. The inability of hazardous waste producers to transfer waste to an appropriate operator resulted in hazardous waste accumulating in temporary storage, creating an additional hazard for the environment and human health. The Draft Law on the Amendments to the Law on Waste Management amends Article 36 paragraph 4 to allow waste to remain in temporary storage for 24 months instead of 12 months, which will result in large amounts of hazardous waste piling up in temporary storage facilities.

<sup>149</sup> The National Waste Management Plan should include: estimates of expected quantities of municipal waste, as well as other relevant waste streams (e.g. “special waste streams” in accordance with definitions from Articles 47 to 58 of the Law on Waste Management), a review of existing waste collection systems and networks of waste recovery and disposal facilities, assessment of the need for new collection systems and additional waste management infrastructure, criteria for identifying the location and required capacity of additional waste management facilities, an implementation plan for reducing the amount of

biodegradable waste in landfills, and the estimation of waste management costs, measures, guidelines and deadlines for the implementation of the plan.

<sup>150</sup> The Ministry of Construction, Transport and Infrastructure; Provincial Secretariat for Sustainable Development and Environmental Protection; local self-government units; public and private utility companies, the Serbian Chamber of Commerce / boards of utility companies; the Standing Conference of Towns and Municipalities; and the non-governmental organisation (NGO) sector.

<sup>151</sup> The capital city of Belgrade is working on the construction of a new landfill Vinca, with the construction of a municipal waste incinerator planned for the second phase, as well as plants for biodegradable waste treatment (anaerobic digestion). Both plants will convert waste to energy, which is in accordance with the Law on Waste Management and related by-laws. Communal infrastructure is being built, in accordance with the regional waste management principle, such as the construction of regional waste management centres. One of these is the construction of the regional landfill Kalenic for 11 municipalities in the Kolubara region with accompanying infrastructure. Infrastructural development plans have also focused on the construction of such centres in Novi Sad, Zaječar, Niš, Priboj and Nova Varoš, Kraljevo, Kruševac and other regions that were not built by 2020.

<sup>152</sup> Data for agriculture and municipal use are from 2016.

<sup>153</sup> In its decision of January 2019 the MoEP ordered the investor to remove 300-350m of pipes from the riverbed because the works had been carried out in violation of the conditions issued by the Institute for Nature Conservation of Serbia in September 2018. Inspectors have also determined that a landslide has been activated at the water intake level on the right bank of the river, and that the flora on the left bank has been destroyed. The investor's appeal against the ministry's decision was rejected in April 2019. However, not only did the investor fail to comply with the decision, but also continued with construction works, and the mini hydropower plant recently obtained a use permit from the municipality of Babušnica where the village of Rakita is situated. This ignited anger in the local population, who as part of the protest held during summer 2020, removed some of the pipes to implement the ministry's decision (Balkan Green Energy News, 2020<sub>[428]</sub>).

<sup>154</sup> The MoEP; SEPA; Institute for Nature Conservation of Serbia; Provincial Secretariat for Urbanism and Environmental Protection; Institute for Nature Conservation of Vojvodina Province; the city of Belgrade; local self-governments; and the Directorate of Forests, situated in the Ministry of Agriculture, Forestry and Water Management. Operational and field activities are covered by the activities of public forest enterprises, Srbijašume and Vojvodinašume, while the management in national parks are the responsibility of five national parks (Kopaonik, Tara, Fruška Gora, Đerdap and Šar Planina).

<sup>155</sup> Aichi Target 11 states: "By 2020, at least 17% of terrestrial and inland water, and 10% of coastal and marine areas, especially areas of particular importance for biodiversity and ecosystem services, are conserved through effectively and equitably managed, ecologically representative and well-connected systems of protected areas and other effective area-based conservation measures, and integrated into the wider landscapes and seascapes".

<sup>156</sup> The Implementation of an Innovative Forest Management Planning Considering Economic, Ecological and Social Aspects in Serbia project was being implemented at the time of drafting, to help establish the basic outlines of the Serbian national forestry programme.

<sup>157</sup> The Forest Law Enforcement, Governance and Trade (FLEGT) regulation governing the import of timber products into the EU, and the EU Timber Regulation, governing the trade in timber and timber products, are two key elements of the EU *acquis* regarding forestry.

<sup>158</sup> According to interviews with government representatives.

<sup>159</sup> This indicator shows trends in the change in use of agricultural, forest and other semi-natural and natural land into urban land and other artificial areas. It shows surfaces occupied by construction and urban infrastructure, as well as urban green, sports and recreational areas. The indicator shows changes in the use of agricultural land, land used for different types of human activities, the origin of urban land expressed through the share of different categories to which the change was made. The indicator is calculated by analysing maps based on Landsat satellite images from the CLC database for 1990, 2000, 2006, 2012 and 2018, i.e. based on the increasing trend of areas use of which has changed in a certain period of time and based on CLC databases of changes.

<sup>160</sup> The most recent data (2017) indicate the economy's annual mean concentration of particulate matter (PM<sub>2.5</sub>) is 25 µg/m<sup>3</sup>, exceeding the recommended maximum of 10 µg/m<sup>3</sup>. This is equal to the WB6 average of 25.77 µg/m<sup>3</sup> in 2017. PM concentrations in the winter months regularly reach ten times the limit in the majority of municipalities of Serbia.

<sup>161</sup> Several of the most polluting coal power plants in Europe are located in Serbia: Kostolac B is the most notorious sulphur dioxide polluter in Europe with 128 000 tonnes of emissions of SO<sub>2</sub> in 2016, followed by Kostolac A (109 000 tonnes of SO<sub>2</sub>) and Nikola Tesla B (57 100 tonnes of SO<sub>2</sub>), Kolubara A (3 255 tonnes of PM<sub>10</sub>) and Nikola Tesla A (2 680 tonnes of PM<sub>10</sub>) (Health and Environment Alliance. Climate Action Network, 2017).

<sup>162</sup> "Further implementation of the Approximation Strategy in the field of environment - Implementation framework for full compliance with legislation in the field of air, chemicals and horizontal legislation".

<sup>163</sup> Belgrade, Subotica, Pančevo, Užice, Smederevo, Kosjeric, Valjevo, Kraljevo, Sremska Mitrovica, Kragujevac and Niš.

<sup>164</sup> The Seveso-III Directive (Directive 2012/18/EU) is a European Union directive aimed at controlling major chemical accident hazards.

<sup>165</sup> SEPA was developing its capacity to maintain the Cadastre of Contaminated Sites at the time of drafting. Co-operation between different UN Agencies and ministries over projects related to contaminated sites in Serbia has included improving the reporting system for the cadastre, developing capacity to carry out investigations and improving the management of contaminated sites overall.

<sup>166</sup> Industrial crops include both annuals (flax, **potatoes**, sunflower, caraway) and perennials (olive, essential-oil rose, hevea, hops, ginseng). They belong to many botanical families, including Solanaceae (**potatoes**, tobacco), Compositae (sunflower, safflower), Cruciferae (rape, mustard), and Rosaceae (essential-oil rose).

<sup>167</sup> Other relevant ministries are the Ministry of Economy; the Ministry of State Administration and Local Self-Government; the Ministry of Labour, Employment, Veterans and Social Affairs; and the Ministry of Environmental Protection as well other government agencies or departments with specific mandates for certain projects

<sup>168</sup> As a province, Vojvodina has its own institutions supporting rural infrastructure. These include the Provincial Secretariat for Agriculture, Forestry and Water Management; the Provincial Secretariat for Interregional Cooperation and Local Self-Government; the Provincial Secretariat for Economy, Employment and Gender Equality; and the Provincial Secretariat for Urban Planning, Construction and Environmental Protection.

<sup>169</sup> Serbia was the first economy in the region to enter the Chinese Belt and Road Initiative. Due to the particular bilateral relations with China, its investments in infrastructure in Serbia are much larger than in neighbouring economies.

<sup>170</sup> In 2014, the UAE-based Arabtec Holding, which is 21% owned by the Abu Dhabi investment fund Aabar, opened its regional headquarters in Belgrade to drive its expansion into the Balkan region.

<sup>171</sup> The area under irrigation is less than 1.5% of Serbia's arable land, significantly lower than in Bulgaria (3.0%), Hungary (5.0%), and Italy and Greece (around 30%).

<sup>172</sup> These faculties offer a wide range of programmes including agricultural economics, agriculture engineering, veterinary medicine, water management, animal husbandry, field and vegetable crops, fruit growing and viticulture, environment protection, organic agriculture, agricultural technological equipment, agritourism, rural development, forestry, and horticulture.

<sup>173</sup> The council is also responsible for identifying any required qualifications in the sector that need to be updated or no longer reflect the sectoral requirements; provide opinions about expected outcomes of knowledge and skills within the sector; promote opportunities for education, training and employment within the sector; propose lists of qualifications per levels and types, that may be acquired by the recognition of prior learning, etc.

<sup>174</sup> Regulates the planning, protection, arrangement and use of agricultural land.

<sup>175</sup> Regulates the protection and preservation of nature, biological, geological and landscape diversity as part of the environment as well as the integral system of environmental protection to ensure a healthy environment.

<sup>176</sup> Regulates the legal status of waters, integral water management, water land management, sources and methods of financing water activities.

<sup>177</sup> The National Strategy for Sustainable Use of Natural Resources and Goods was adopted in May 2012, based on the Law on Environment. The main, basic goals set to be achieved by this National Strategy are: directing and providing conditions for sustainable use of natural resources and goods, reducing the negative impact of resource use on the economy and the environment, contribution to directing development towards sustainable production

<sup>178</sup> The LPIS serves to identify land use for a given area. It uses orthophotos – basically aerial photographs and high precision satellite images that are digitally rendered to extract as much meaningful spatial information as possible. A unique number is given to each land parcel to provide a unique identification in space and time. This information is then updated regularly to monitor the evolution of the land cover and the management of the crops.

<sup>179</sup> Technical Assistance for the IPA2018: Action "Introducing and maintenance of functioning Land Parcel Identification System in pilot municipalities in Republic of Serbia" FWC SIEA 2018 – LOT 1. The value of entire project is EUR 300 000.

<sup>180</sup> The goals of NARDS are: 1) increased production growth and stability of producers' incomes; 2) improved competitiveness by adjustments to the requirements of the domestic and international markets and through the technological and technical improvement of the sector; 3) sustainable resources management and environmental protection; 4) improvement of the quality of life in rural areas and poverty reduction; and 5) efficient public policy management and institutional framework improvement for agricultural and rural areas development.

<sup>181</sup> As regards common commercial policy, no progress has been made on Serbia's accession to the WTO. The possibility of Serbia becoming a member of the WTO depends on the adoption of a modified law on the trade in genetically modified organisms, and the completion of market access negotiations with a small number of WTO members.

<sup>182</sup> Regulation on the performance of agricultural advisory services; Regulation on the issuance of licences and ID cards; Regulations on the maintenance of the register of agricultural extension agents

<sup>183</sup> The Culture Development Strategy was adopted by the government, but still needs to be ratified by the parliament.

<sup>184</sup> Through the Decree on the Formation of the National Council for Tourism Development of the Republic of Serbia.

<sup>185</sup> Bosnia and Herzegovina had the second highest market share, at 7.38% of total international tourist arrivals in 2019.

<sup>186</sup> The Blue Flag is one of the world's most recognised voluntary awards for beaches, marinas, and sustainable boating tourism operators. In order to qualify for the Blue Flag, a series of stringent environmental, educational, safety, and accessibility criteria must be met and maintained. Central to the ideals of the Blue Flag programme is the aim of connecting the public with their surroundings and encouraging them to learn more about their environment. As such, environmental education activities must be offered and promoted in addition to a permanent display of information relevant to the site in terms of biodiversity, ecosystems and environmental phenomena (Blue Flag, n.d.<sup>[431]</sup>).

The Green Key is a voluntary eco-label awarded to more than 3 200 hotels and other establishments in 65 countries. It is the leading standard for excellence in the field of environmental responsibility and sustainable operation within the tourism industry. This prestigious eco-label represents a commitment by businesses that their premises adhere to the strict criteria set by the Foundation for Environmental Education. A Green Key stands for the promise to its guests that by opting to stay with the Green Key establishment, they are helping to make a difference on an environmental level. The high environmental standards expected of these establishments are maintained through rigorous documentation and frequent audits. Hotels, hostels, small accommodation providers, campsites, holiday parks, conference centres, restaurants and attractions are all eligible for Green Keys (Green Key, n.d.<sup>[405]</sup>).

<sup>187</sup> For example, the Green Scheme of Slovenian Tourism <https://www.slovenia.info/en/business/green-scheme-of-slovenian-tourism>.

<sup>188</sup> The chapter of the *acquis* on the judiciary and fundamental rights.

# Annex A. The Competitiveness Outlook 2021 scoring model for Bosnia and Herzegovina

## Constitutional set-up of Bosnia and Herzegovina

The governance structure of Bosnia and Herzegovina (BiH) is highly decentralised, comprising the state-level institutions of Bosnia and Herzegovina, the governments of the two entities – the Federation of Bosnia and Herzegovina (FBiH) and the Republika Srpska (RS) – as well as the autonomous Brčko District. The FBiH and the RS have significant constitutional autonomy and responsibility for the matters which the Constitution of Bosnia and Herzegovina has not assigned to the state-level government.<sup>1</sup> The entities have jurisdiction over a range of policies including health care, education, agriculture, culture, labour, police and internal affairs. Both entities have a president, prime minister and their own governments. The FBiH is furthermore divided into ten federal units (cantons), each with its own government and constitution that defines the institutions and functioning of government authorities.

## The 2021 Competitiveness Outlook assessment of Bosnia and Herzegovina

Bosnia and Herzegovina submitted questionnaire responses from the state level and both entities for the Competitiveness Outlook (CO) 2021 assessment. Information from all three sources has been taken into account in the analysis.

Policy making in Bosnia and Herzegovina is much more decentralised than in the other Western Balkan economies covered by the CO 2021 assessment. Therefore, information from the state level, FBiH and RS has been taken into account in the calculation of the assessment scores for the different policy dimensions. Following the changes to the CO assessment framework (see Assessment framework sections in the 16 policy dimension chapters), the scoring model for Bosnia and Herzegovina has been revisited to allow for a more accurate assessment of the different policy dimensions at the different levels of governance.

However, policy recommendations have in many cases been formulated to emphasise the importance of policy co-ordination in Bosnia and Herzegovina in order to strengthen the single domestic market and avoid imbalances in competitiveness between the entities.

Based on these considerations, a scoring system with three models has been developed (Table A A.1).

**Table A A.1. Overview of the three scoring models**

Model 1	Model 2	Model 3
1/3 (state) + 1/3 (FBiH) + 1/3 (RS)	1/2 (FBiH) + 1/2 (RS)	State-level only

Table A A.2 shows which scoring model has been applied in which CO 2021 policy dimension, as well as a rationale for its selection. For most of the 16 policy dimensions, a score has been derived by giving one-third of the weight to the state and both entities (Model 1). This reflects a more balanced division of competencies and responsibilities in the policy area between the state level and the entities. For five dimensions (Access to finance, Tax policy, State-owned enterprises, Employment policy and Environment

policy) a score has been derived by calculating a simple average of the two entities' scores. This approach (Model 2) reflects that major policies, mechanisms and institutions in these policy areas exist mainly at the level of the entities. Lastly, the Competition policy dimension only takes state-level information into consideration as it is an exclusively state-level competence (Model 3).

**Table A A.2. Application of the scoring models to the CO 2021 policy dimensions**

Policy dimension	CO 2021 assessment	Rationale
1. Investment policy and promotion	Model 1	Investment policy and promotion is managed at both the entity and state level. The Ministry of Foreign Trade and Economic Relations (MoFTER) regulates the economy's overall investment policy, while the entities follow supplemental legislation on topics such as expropriation, contract enforcement and alternative dispute mechanisms. Although the economy's investment promotion agency exists at the state level, promotion activities, incentive regimes and investor targeting also occur at the entity level.
2. Trade policy	Model 1	Trade policy is guided by the jurisdiction, framework laws and priorities put in place at the state level by MoFTER. However, the entities have an important role to play as they adopt their own sectoral laws and regulations governing and affecting various aspects of trade. Moreover, in various services sectors (i.e. road and rail transport, courier services or telecommunications) the entities control and operate key publicly-owned enterprises.
3. Access to finance	Model 2	Responsibilities under this dimension are largely at the entity level, with legal and regulatory frameworks mostly put in place at the entity level (and FBiH cantons in the specific case of public-private partnerships). However, the state level also plays a role in this area given that the Central Bank of Bosnia and Herzegovina oversees the central registries.
4. Tax policy	Model 2	While the Indirect Tax Authority collects indirect taxes and is managed at the state level, the entities define their own taxation framework for direct taxes and are in charge of tax collection. As scoring was not provided at the state level, and the majority of tax policies remain at the entity level, scores for the tax policy dimension's indicators and averages are based solely on FBiH and RS scores.
5. Competition policy	Model 3	Competition policy is within the competencies of the state level. The Bosnia and Herzegovina Competition Council has exclusive competence and decision-making power in competition matters. Three out of the six members of the Competition Council are designated by the Council of Ministers of Bosnia and Herzegovina, two members by the FBiH Government and one member by the RS Government.
6. State-owned enterprises	Model 2	Bosnia and Herzegovina's performance in the state-owned enterprises dimension is based on FBiH and RS activities. The assessment focuses mostly on enterprises held by the central levels of FBiH and RS rather than by cantons and municipalities.
7. Education policy	Model 1	Education policy is primarily under the responsibility of the entities (and cantons in FBiH). However, the state level does play a role by adopting important framework laws and through the Agency for Pre-school, Primary and Secondary Education, which is a state-level institution responsible for developing learning standards and common core curricula, as well as evaluating learning achievements for pre-primary, primary and secondary education.
8. Employment policy	Model 2	Employment, labour and social policy is within the remit of the entities. The state level is not responsible for labour, employment and social policy, nor social protection. The Ministry of Civil Affairs of Bosnia and Herzegovina is assigned only a co-ordinating role when representing the economy's interests abroad.
9. Science, technology and innovation	Model 1	The strategic and institutional frameworks on science, technology and innovation (STI) are highly decentralised, with dedicated ministries in the two entities, as well as at the canton-level in FBiH. However, the state level plays a role as the Ministry of Civil Affairs co-ordinates STI policy across Bosnia and Herzegovina and represents the economy internationally.
10. Digital society	Model 1	Digital society encompasses a number of different policy areas, such as data accessibility, digital skills development and privacy protection, in which policy frameworks are developed at the state or entity levels. Policies in different areas are guided by state and/or entity-level institutional and regulatory frameworks.
11. Transport policy	Model 1	Transport policy is guided by state-level framework laws and investment priorities. However, the entities have a significant role to play as they adopt their own laws and regulations governing different transport modes, make their own investments and operate key publicly-owned enterprises.
12. Energy policy	Model 1	Energy policy is guided by legal and regulatory frameworks at both the state and entity levels. The state-level MoFTER plays an important role in co-ordinating energy policy between the entities, as well as in international co-operation and trade.
13. Environment	Model 2	Responsibility for environment and climate policy rests with the two entities. In the FBiH,

Policy dimension	CO 2021 assessment	Rationale
policy		responsibility is shared between the entity level and the ten cantons. At the state level, MoFTER is responsible for defining policies and basic principles, co-ordinating activities and consolidating entity plans with those of international institutions in the areas of energy, agriculture, protection of environment and use of natural resources, and tourism. Entity-level institutions are responsible for strategic frameworks, policy setting, data exchange and reporting.
14. Agriculture policy	Model 1	Agricultural policy is guided by framework laws and priorities established at the state level by MoFTER. The ministry is responsible for defining and co-ordinating the state agricultural policy framework in co-operation with the relevant entity institutions. The entity institutions are responsible for the management and implementation of policies, programmes and measures in their respective territories.
15. Tourism policy	Model 1	Tourism is under the jurisdiction of the two entities. Accordingly, the entities are responsible for the adoption of their own tourism strategies and the establishment of the governance structure and institutional set up, which differ in each entity. While the tourism governance framework in the RS is similar to the most commonly established governance frameworks in other Western Balkan economies, the governance structure in the FBiH is divided among the Federal Ministry of Environment and Tourism and the ministries of the cantons responsible for tourism, which have also adopted their own legislation and regulation. At the state level, the Tourism Working Group was established by MoFTER to co-ordinate tourism activities among the entities.
16. Anti-corruption policy	Model 1	The state-level Agency for Prevention of Corruption and Co-ordination of the Fight Against Corruption focuses primarily on countering the corruption of state-level public officials and on co-ordinating the anti-corruption efforts of the entities. The entities are responsible for most aspects of the prevention and repression of corruption at their level.

## Notes

<sup>1</sup> Paragraph (3) of Article III of the Constitution of Bosnia and Herzegovina stipulates that all government competences not expressly assigned to the state-level government belong to the entities.

## Competitiveness and Private Sector Development

# Competitiveness in South East Europe 2021

## A POLICY OUTLOOK

The future sustainable economic development and well-being of citizens in South East Europe depend on greater economic competitiveness. Reinforcing the region's economic potential in a post-COVID-19 context requires a holistic, inclusive and growth-oriented approach to policy making. Against the backdrop of enhanced European Union (EU) accession prospects and a drive towards deeper regional integration, the governments of the six Western Balkan (WB6) economies have demonstrated a renewed commitment to enacting policy reforms.

The third edition of *Competitiveness in South East Europe: A Policy Outlook* comprehensively assesses policy reforms in the WB6 economies across 16 policy dimensions crucial to their competitiveness. It leverages a highly participatory assessment process, which brought together the views of OECD experts, WB6 policy makers and local non-governmental stakeholders to create a balanced and realistic depiction of their performance. The report seeks to provide WB6 policy makers with a multi-dimensional benchmarking tool, enabling them to compare performance against regional peers as well as OECD good practices, and to design future policies based on rich evidence and actionable policy recommendations.

Economy-specific profiles complement the regional assessment for the first time in this edition of *Competitiveness in South East Europe: A Policy Outlook*, and provide each WB6 economy with an in-depth analysis of their competitive potential as well as policy recommendations tailored to their specific challenges to inform their structural economic reforms and sustainable development agenda.
