Precipitation over most of Oklahoma was relatively plentiful during the first half of the month over northern and central sections of the state. This was followed by drier conditions to end the month. Ultimately, drought conditions improved slightly over the northern two-thirds of the state, while holding to slightly worsening over the southern tier of counties.

No damage reported.

A potent upper level low pressure system combined with an unseasonably moist and unstable airmass across Oklahoma to promote severe thunderstorms. Storms initially developed over western Oklahoma and migrated southward overnight, with sporadic damaging wind and large hail reports from the Kansas Oklahoma border southward to the Red River. Persistent heavy rainfall also led to flash flooding in some areas.

A potent upper level low pressure system combined with an unseasonably moist and unstable airmass across Oklahoma and north Texas to promote severe thunderstorms. Storms initially developed over western Oklahoma and migrated southward overnight, reaching western north Texas during the wee morning hours of the 16th. Sporadic wind and hail damage occurred before storms finally moved south into central Texas.
