Precoding Based Downlink OAM-MIMO Communications with Rate Splitting

Ruirui Chen, Jinyang Lin, Beibei Zhang, Yu Ding, Keyue Xu

Abstract-Orbital angular momentum (OAM) and rate splitting (RS) are the potential key techniques for the future wireless communications. As a new orthogonal resource, OAM can achieve the multifold increase of spectrum efficiency to relieve the scarcity of the spectrum resource, but how to enhance the privacy performance imposes crucial challenge for OAM communications. RS technique divides the information into private and common parts, which can guarantee the privacies for all users. In this paper, we integrate the RS technique into downlink OAM-MIMO communications, and study the precoding optimization to maximize the sum capacity. First, the concentric uniform circular arrays (UCAs) are utilized to construct the downlink transmission framework of OAM-MIMO communications with RS. Particularly, users in the same user pair utilize RS technique to obtain the information and different user pairs use different OAM modes. Then, we derive the OAM-MIMO channel model, and formulate the sum capacity maximization problem. Finally, based on the fractional programming, the optimal precoding matrix is obtained to maximize the sum capacity by using quadratic transformation. Extensive simulation results show that by using the proposed precoding optimization algorithm, OAM-MIMO communications with RS can achieve higher sum capacity than the traditional communication schemes.

Index Terms—Orbital angular momentum (OAM), rate splitting (RS), MIMO, precoding, uniform circular array.

I. INTRODUCTION

A. Background

THE rapid growing demand of spectrum efficiency in the big data era brings great challenges to existing traditional communication technologies [1]. Due to the scarcity of the spectrum resource, it becomes increasingly important to search for the new orthogonal resource [2], [3]. Therefore, orbital angular momentum (OAM), which can be considered as a new orthogonal resource, provides a new solution to the multifold increase of spectrum efficiency for the future wireless communications [4], [5]. The vortex waves with different OAM modes are orthogonal to each other, and thus the infinite OAM modes can be used to significantly improve the spectrum

efficiency in theory [6], [7]. However, vortex waves with non-integer OAM modes are difficult to decode, and vortex waves with high OAM modes result in serious attenuation and beam divergence, which limits the user access number of the OAM communications [8]. Therefore, improving the access capability is necessary for the application of OAM communications into the multi-user scenario.

1

To serve large number of users, OAM communications can utilize the space division multiple access (SDMA) technique or the non-orthogonal multiple access (NOMA) technique [9], [10]. By using SDMA technique, each user directly decodes the information by treating undesired signals as interferences, which leads to the rate saturation even with excess transmit power when the transmit antenna number is insufficient or a resource block is used by multiple users [11]. It is difficult for SDMA technique to support the future high-load traffic scenarios, where there are high-rate services caused by many users at the same time [12]. NOMA technique performs successive interference cancellation (SIC) at the receiver, which can realize the information transmission at the same time and frequency [13]. In NOMA transmission, only the last user can guarantee the private information, which is not decoded by other users [14].

Rate splitting (RS) technique combines the advantages of SDMA and NOMA by the flexible balance between the interference and desired signal [15], [16]. By dividing the transmission information into private message and common message , RS technique can serve multiple users at the same time and frequency [17]. All users use SIC technique to remove the common message and decode their own private message [18]. Thus, RS technique decodes part of the interference and treats part of the interference as noise [19], which avoids completely treating interference as noise and decoding interference [20]. In addition, RS technique can guarantee the private transmission of all users and be applied to high-load traffic scenarios for serving large number of users [21].

In this paper, we optimize the precoding matrix to maximize the sum capacity of the downlink OAM-MIMO communications with RS, which can guarantee the privacy performance for all users.

B. Related Works

In this paper, RS technique is introduced to the downlink OAM-MIMO communications, and precoding matrix is optimized to maximize the sum capacity. We will divide previous contributions related with this work into two aspects, i.e., precoding design for wireless communications with RS and beam steering design for OAM communications.

1) Precoding Design for Wireless Communications with RS: As early as 1981, T. Han and K. Kobayashir proposed the RS technique [22]. Based on linear precoding and SIC at the receiver, RS technique decodes part of the interference and treats the remaining part of the interference as noise [23]. It outperforms SDMA and NOMA techniques in terms of network load and user privacy [24]. Dividing message into a private part and a common part is the key of the precoding design for wireless communications with RS [25]. In [26], RS technique was proposed to be utilized in the multigroup multicast precoding design. The authors of [27] investigated RS technique to improve the energy efficiency of the multi-user multicast MISO system. Furthermore, RS technique achieves higher energy efficiency and requires less channel state information feedback [28]-[31]. The work in [32] indicates that RS technique is more robust to the impact factors such as channel disparity, channel orthogonality, network load and channel quality. These results demonstrate that the RS technique obtains better performance compared with other access techniques.

2) Beam Steering Design for OAM Communications: Although vortex wave carrying OAM is a promising beyond 5G technique [33], [34], there are still some technical challenges for the practical application of OAM communications. One challenge is that OAM communications require perfect alignment between the transmit and receive antenna arrays [35]. For OAM narrow-band communication system, the authors in [36] drawn a conclusion that if the antennas are not aligned, the system performance quickly deteriorates. To solve this problem, the authors of [37] studied the effect of misalignment on the performance of OAM broadband system and proposed a beam steering scheme for the misaligned multi-mode OAM communications. In [38], the authors proposed a hybrid position phase beam steering (HPPBS) scheme to overcome the performance deterioration caused by the misalignment of uniform circular array (UCA) based OAM communications. The authors of [39] investigated the effect of the misalignment on channel capacity, and the proposed beam steering method can avoid the performance deterioration caused by misalignment. The proposed beam steering method in [40] can eliminate inter-mode interferences induced by the misalignment error between the transmit and receive UCAs. In misaligned and incomplete receive UCA scenario, a partial receive scheme based on beam steering was proposed for the non-ideal OAM-MIMO communications to address the performance degradation caused by OAM beam divergence and misalignment [41]. Considering the size and cost of UCA, the authors in [42] developed an efficient technique for beam steering of arbitrary sizes of circular arrays based on OAM modes. For OAM communications, the authors of [43] presented a novel practical realization of field eigenmode beamforming in the azimuthal domain. To avoid multiple radio frequency chains and costly analog devices, a beam steering method was proposed in [44] to generate arbitraryorder OAM mode. The authors of [45] utilized the spherical conformal array antenna to achieve beam steering of vortex waves, which can be applied in OAM communications. In [46], the authors proposed beam steering method to solve the

aperture alignment of the transmitter and receiver in OAM communications. Through superposition of vortex waves with different OAM modes, the authors of [47] achieved single and multiple beam steerings in the transverse direction.

C. Motivations

To enhance the privacy performance of OAM communications, we are motivated to study the downlink OAM-MIMO communications with RS, where multiple vortex wave signals are simultaneously transmitted and privacy transmission can be guaranteed for all users. Then, the challenges are discussed as follows.

- *Limited OAM Mode:* Not all OAM modes can be used to achieve the high-capacity OAM communications. For the non-integer OAM mode, it is difficult to decode the vortex wave signal due to the nonuniform phase distribution. Furthermore, OAM communications with the high-order OAM mode suffers from severe divergence and attenuation. In practice, OAM communications mainly utilize the low-order integer OAM mode, thus dissatisfying the large number of user access requirements, which seriously limits its application in the multi-user scenario.
- Lack of Precoding Algorithm: The vortex wave signal is transmitted by the UCA, each element of which generates the phase shift to produce different OAM modes. Then, the transmission information is divided into private and common parts. The integration of RS technique into OAM communications complicates the transmission framework, which results in the difficult formulation of sum capacity optimization problem. Furthermore, it is difficult to obtain the optimal precoding matrix for nonconvex sum capacity maximization problem.

D. Main Contributions

To address the challenges, the sum capacity optimization problem is formulated for the downlink OAM-MIMO communications with RS. However, the formulated optimization problem is non-convex. We utilize the fractional programming (FP) with quadratic transformation to obtain the optimal precoding matrix.

The main contributions of this paper are summarized as follows.

- By integrating RS into OAM communications, different user pairs use different OAM modes and users in the same user pair utilize RS technique to obtain the information. The transmission framework is presented for the downlink OAM-MIMO communications with RS, where the UCA is used to transmit the vortex wave signal.
- The channel model is derived based on the UCA. The non-convex optimization problem is formulated to maximize the sum capacity of the downlink OAM-MIMO communications with RS. Based on the FP, the optimal precoding matrix is obtained by using the quadratic transformation.
- Simulation results demonstrate the capacity of users in the same user pair and analyze the impact of the distance

on the downlink OAM-MIMO communications with RS. Furthermore, RS technique is superior to the other traditional access schemes.

The rest of this paper is organized as follows. Section II gives the system model. In Section III, the transmission framework is proposed for the downlink OAM-MIMO communications with RS. Section IV derives the channel model and formulates the sum capacity maximization problem. In Section V, we derive the optimal precoding matrix based on the FP. Section VI gives the simulation results to evaluate the proposed precoding optimization algorithm for the downlink OAM-MIMO communications with RS. Finally, the paper concludes with Section VII.

II. SYSTEM MODEL

This paper considers the downlink OAM-MIMO communications with RS, which consist of multiple user devices (UDs) and a base station (BS). The UDs are denoted by UD_i , where $i = \{1, 2, ..., 2k-1, 2k, ..., 2K-1, 2K\}$. Based on RS technique, the transmission information is partitioned into private message and common message. The UDs should be divided into pairs, which can achieve better privacy performance. In this paper, we choose two UDs as one pair. The reason is that the two user pair is the most general case for the reader to understand our work and easy to be realized in the practical wireless communications. Note that although two user pair is chosen, our work can be extended to the user pair with more users. Furthermore, we choose the two users, which have the nearest distance, as one user pair.

Thus, the k-th user pair (UD_{2k-1}, UD_{2k}) can complete the wireless communications by dividing their information into private message and common message. The information of UD_{2k-1} and UD_{2k} can be respectively partitioned into $\{F_{2k-1}^{p}, F_{2k-1}^{c}\}$ and $\{F_{2k}^{p}, F_{2k}^{c}\}$. Furthermore, the private messages F_{2k-1}^{p} and F_{2k}^{p} are encoded separately into transmit signals \hat{x}_{2k-1} and \hat{x}_{2k} , which are respectively decoded by UD_{2k-1} and UD_{2k} . The common messages F_{2k-1}^{c} and F_{2k}^{c} are encoded into transmit signal $\hat{x}_{2k-1,2k}$, which are decoded by both UD_{2k-1} and UD_{2k} . The k-th user pair (UD_{2k-1}, UD_{2k}) can use the carrier with OAM mode l_k . In other words, each user pair uses one OAM mode. From the theoretical perspective, there exist infinite user pairs due to infinite OAM modes.

OAM communications utilize the UCA to transmit/receive vortex wave signal in general. The UCA based system model is demonstrated in Fig. 1. Each UD is equipped with one UCA to receive the vortex wave signal. BS has the transmit concentric UCAs, which include different antenna elements on different UCAs with the same center. In the downlink OAM-MIMO communications with RS, BS assigns the k-th transmit UCA to serve the k-th user pair (UD_{2k-1}, UD_{2k}) . The k-th transmit UCA consists of M_k antenna elements, which are denoted by $m_k \in M = \{1, 2, ..., M_k\}$. The center of the k-th transmit UCA is at the location (0, 0, 0) in the 3D cylindrical coordinate system. The z-axis is the line across the center of transmit concentric UCAs. The receive UCA of UD_i has N_i antenna elements, which are represented by $n_i \in N = \{1, 2, ..., N_i\}$. The distance from the *i*-th UCA center of UD_i to the *k*-th transmit UCA center of BS is denoted by $d_{k,i}$.

Fig. 1. Downlink OAM-MIMO communications with RS

III. TRANSMISSION FRAMEWORK OF DOWNLINK OAM-MIMO COMMUNICATIONS WITH RS

In the downlink OAM-MIMO communications with RS, the k-th UCA transmits the RS signal $x_k = p_{2k-1}^p \hat{x}_{2k-1}^p + p_{2k}^p \hat{x}_{2k}^p + p_{2k-1,2k}^c \hat{x}_k^c$ to the k-th user pair $(\text{UD}_{2k-1}, \text{UD}_{2k})$ by using the carrier with OAM mode l_k , where $p_{2k-1,2k}^c$ is the precoding vector of common message, p_{2k-1}^p and p_{2k}^p are respectively the precoding vectors of private messages for UD_{2k-1} and UD_{2k} . Moreover, the total transmit power is limited by

$$\left\|p_{2k-1,2k}^{c}\right\|_{2}^{2}+\left\|p_{2k-1}^{p}\right\|_{2}^{2}+\left\|p_{2k}^{p}\right\|_{2}^{2}\leq P_{\mathrm{T}},\tag{1}$$

where $\|p_{2k}^{\mathrm{p}}\|_{2}^{2} = \sum_{m_{k}=1}^{M_{k}} \sum_{n_{2k}=1}^{N_{i}} \|p_{m_{k},n_{2k}}^{\mathrm{p}}\|_{2}^{2}, \|p_{2k-1}^{\mathrm{p}}\|_{2}^{2} = \sum_{m_{k}=1}^{M_{k}} \sum_{m_{k}=1}^{N_{i}} \|p_{m_{k},n_{2k}-1}^{\mathrm{p}}\|_{2}^{2}, \|p_{2k-1,2k}^{\mathrm{c}}\|_{2}^{2} = \sum_{m_{k}=1}^{M_{k}} \sum_{n_{k}=1}^{N_{i}} \|p_{m_{k},n_{k}}^{\mathrm{c}}\|_{2}^{2}. \|\cdot\|_{2}^{2}$ is the second-order norm, P_{T} denotes the maximum transmit power, $p_{m_{k},n_{2k-1}}^{\mathrm{p}}$ represents the precoding power amplitude of the private message transmitted from the m_{k} -th antenna element to the n_{2k-1} -th antenna element of $\mathrm{UD}_{2k-1}, p_{m_{k},n_{2k}}^{\mathrm{p}}$ represents the precoding power amplitude of the private message transmitted from the m_{k} -th antenna element to the n_{2k} -th antenna element of UD_{2k} and $p_{m_{k},n_{k}}^{c}$ represents the precoding power amplitude of the private message transmitted from the m_{k} -th antenna element to the n_{2k} -th antenna element of UD_{2k} and $p_{m_{k},n_{k}}^{c}$ represents the precoding power amplitude of the private message transmitted from the m_{k} -th antenna element to the n_{2k} -th antenna element of UD_{2k} and $p_{m_{k},n_{k}}^{c}$ represents the precoding power amplitude of the common information transmitted from m_{k} -th antenna element to n_{k} -th antenna element of all users. The precoding matrix can be expressed as

$$\boldsymbol{P} = \begin{bmatrix} p_{2k-1}^{\mathrm{p}} & p_{2k}^{\mathrm{p}} & p_{2k-1,2k}^{\mathrm{c}} \end{bmatrix}.$$
 (2)

Multiple OAM modes are used to transmit different RS signals to different user pairs. By utilizing the carrier with different OAM modes, there is no inter-channel interference at the same frequency and time slot. The RS signal x_k is

simultaneously transmitted by M_k antenna elements, which is the vortex wave signal transmitted by the carrier with OAM mode l_k . For the m_k -th antenna element, the transmit vortex wave signal is expressed as

$$X_{m_{k}} = \sum_{l_{k} \in L} (x_{k}) e^{j\left(\psi_{m_{k}} + \eta_{m_{k}}\right)l_{k}}$$
$$= \sum_{l_{k} \in L} (x_{k}) e^{j\left(\frac{2\pi(m_{k}-1)}{M_{k}} + \eta_{m_{k}}\right)l_{k}},$$
(3)

where l_k denotes the OAM mode utilized by the k-th user pair (UD_{2k-1}, UD_{2k}) , and belongs to the OAM mode set $L = \{l_k | k \in [1, K]\}$. In (3), $\psi_{m_k} = 2\pi(m_k - 1)/M_k$ represents the basic angle of the transmit UCA antenna element. $\psi_{m_k} + \eta_{m_k}$ denotes the azimuth angle that is the angular position between the x-axis on the plane z = 0 and m_k -th antenna element. Furthermore, η_{m_k} is the angle between respective antenna element and the phase angle.

The receive vortex wave signal goes through the OAM channel with zero mean circular symmetric complex gaussian (ZMCSCG) noise. By using the SIC technique, UD_{2k-1} and UD_{2k} respectively decode their private signals \hat{x}_{2k-1}^{p} and \hat{x}_{2k-1}^{p} and \hat{x}_{2k-1}^{p} and \hat{x}_{2k-1}^{p} and \hat{x}_{2k-1}^{p} and UD_{2k} will decode the common message. The OAM signals received by UD_{2k-1} and UD_{2k} are respectively written as

$$y_{2k-1} = \sum_{\substack{N_{2k-1} \\ n_{2k-1} = 1}}^{N_{2k-1}} \left(\left(\sum_{m_k=1}^{M_k} \sum_{l_k \in L} X_{m_k} h_{m_k, n_{2k-1}} e^{j \left(\frac{2\pi(m_k-1)}{M_k} + \eta_{m_k}\right) l_k} \right) + z_{n_{2k-1}} \right) + z_{n_{2k-1}} \left(\frac{4}{4} \right)$$

and

$$y_{2k} = \sum_{n_{2k}=1}^{N_{2k}} \left(\left(\sum_{m_k=1}^{M_k} \sum_{l_k \in L} X_{m_k} h_{m_k, n_{2k}} e^{j \left(\frac{2\pi (m_k-1)}{M_k} + \eta_{m_k} \right) l_k} \right) + z_{n_{2k}} \right),$$
(5)

where $h_{m_k,n_{2k-1}}$ and $h_{m_k,n_{2k-1}}$ denote the channel coefficients from the m_k -th antenna element of the k-th transmit UCA to n_{2k-1} -th antenna element of the UD_{2k-1} receive UCA and n_{2k} -th antenna element of the UD_{2k} receive UCA, respectively; $z_{n_{2k-1}}$ and $z_{n_{2k}}$ represent the ZMCSCG noise with zero mean and variance σ^2 received by the n_{2k-1} -th antenna element of the UD_{2k-1} receive UCA and n_{2k} -th antenna element of the UD_{2k-1} received by the n_{2k-1} -th antenna element of the UD_{2k-1} receive UCA and n_{2k} -th antenna element of the UD_{2k-1} receive UCA and n_{2k} -th antenna element of the UD_{2k} receive UCA and n_{2k} -th antenna element of the UD_{2k} receive UCA and n_{2k} -th antenna element of the UD_{2k} receive UCA, respectively.

IV. CHANNEL MODEL AND CAPACITY MAXIMIZATION PROBLEM

The channel coefficient from the m_k -th antenna element of the k-th transmit UCA to n_i -th antenna element of the UD_i receive UCA is derived as

$$h_{m_k,n_i} = A_{k,n_i} e^{-j(B_{k,n_i}\sin(\psi_{m_k} + \eta_{m_k} - \varphi_{n_i} - \eta_{n_i} + \zeta_{k,n_i}))}, \quad (6)$$

where

$$A_{k,n_{i}} = \frac{\beta\lambda}{4\pi\sqrt{d_{k,i}^{2} + R_{k}^{2} + r_{i}^{2}}} e^{-\frac{j2\pi}{\lambda}\sqrt{d_{k,i}^{2} + R_{k}^{2} + r_{i}^{2}}} e^{j2\pi r_{i}d_{k,i}\sin\phi_{i}\frac{\cos(\varphi_{n_{i}}+\eta_{n_{i}}-\theta)}{\lambda\sqrt{d_{k,i}^{2} + R_{k}^{2} + r_{i}^{2}}}}$$
(7)

and

$$\frac{B_{k,n_i}}{2\pi R_k \sqrt{r_i^2 + d_{k,i}^2 \sin^2 \phi_i - 2r_i d_{k,i} \sin \phi_i \cos(\varphi_{n_i} + \eta_{n_i} - \theta)}}{\lambda \sqrt{d_{k,i}^2 + R_k^2 + r_i^2}}.$$
(8)

For the UD_i receive UCA, $\varphi_{n_i} = 2\pi(n_i - 1)/N_i$ is the basic angle of the n_i -th antenna element. β denotes the phase rotation error and attenuation caused by antenna property. R_k is the radius of the k-th transmit UCA. r_i represents the radius of the UD_i receive UCA. λ denotes the wavelength. η_{n_i} denotes the angle between the UD_i receive UCA and initial phase of transmit UCA. θ represents the angle between the xaxis and the central line projection of the transmit UCA and UD_i receive UCA. ζ_{k,n_i} is defined as

$$\frac{\sin \zeta_{k,n_i}}{\sqrt{r_i^2 + d_{k,i}^2 \sin^2 \phi_i - 2r_i d_{k,i} \sin \phi_i \cos(\varphi_{n_i} + \eta_{n_i} - \theta)}} \quad (9)$$

and

 $\cos \zeta_{k,n_i} =$

$$\frac{d_{k,i}\sin\phi_i\cos(\varphi_{n_i}+\eta_{n_i}-\theta)}{\sqrt{r_i^2+d_{k,i}^2\sin^2\phi_i-2r_id_{k,i}\sin\phi_i\cos(\varphi_{n_i}+\eta_{n_i}-\theta)}},$$
 (10)

where ϕ_i is the angle between the z-axis and the central connection from the transmit UCA to the UD_i receive UCA.

For the private message, the signal-to-interference-plusnoise ratios (SINRs) of UD_{2k-1} and UD_{2k} are respectively expressed as

$$\gamma_{m_{k},n_{2k-1}}^{p} = \left| h_{m_{k},n_{2k-1}}^{T} p_{m_{k},n_{2k-1}}^{p} \right|^{2} / \left(\sum_{n_{2i} \in \mathbf{N}} \sum_{m_{i} \in \mathbf{M}} \left| h_{m_{k},n_{2k-1}}^{T} p_{m_{i},n_{2i}}^{p} \right|^{2} + \sum_{\substack{n_{2i-1} \in \mathbf{N} \\ n_{2i-1} \notin n_{2k-1}}} \sum_{m_{i} \in \mathbf{M}} \left| h_{m_{k},n_{2k-1}}^{T} p_{m_{i},n_{2i-1}}^{p} \right|^{2} + \sigma^{2} \right)$$

$$(11)$$

and

$$\gamma_{m_{k},n_{2k}}^{p} = \left| h_{m_{k},n_{2k}}^{T} p_{m_{k},n_{2k}}^{p} \right|^{2} / \left(\sum_{n_{2i-1} \in \mathbf{N}} \sum_{m_{i} \in \mathbf{M}} \left| h_{m_{k},n_{2k}}^{T} p_{m_{i},n_{2i-1}}^{p} \right|^{2} + \sum_{\substack{n_{2i} \in \mathbf{N} \\ n_{2i} \notin n_{2k}}} \sum_{\substack{m_{i} \in \mathbf{M} \\ m_{i} \notin m_{k}}} \left| h_{m_{k},n_{2k}}^{T} p_{m_{i},n_{2i}}^{p} \right|^{2} + \sigma^{2} \right)$$
(12)

For the common part, the SINRs of UD_{2k-1} and UD_{2k} can be respectively written as

$$\gamma_{m_{k},n_{2k-1}}^{c} = \left| h_{m_{k},n_{2k-1}}^{T} p_{m_{k},n_{k}}^{c} \right|^{2} / (\sigma^{2} + \sum_{n_{2i-1} \in Nm_{i} \in M} \left| h_{m_{k},n_{2k-1}}^{T} p_{m_{i},n_{2i-1}}^{p} \right|^{2} + \sum_{n_{2i} \in Nm_{i} \in M} \sum_{\substack{m_{i} \in N \\ n_{i} \notin n_{2k-1}m_{i} \notin m_{k}}} \left| h_{m_{k},n_{2k-1}}^{T} p_{m_{i},n_{2}}^{p} \right|^{2} + \sum_{\substack{n_{i} \in N \\ n_{i} \notin n_{2k-1}m_{i} \notin m_{k}}} \sum_{\substack{m_{i} \in M \\ n_{i} \notin n_{2k-1}m_{i} \notin m_{k}}} \left| h_{m_{k},n_{2k-1}}^{T} p_{m_{i},n_{i}}^{c} \right|^{2}$$
(13)

and

$$\gamma_{m_{k},n_{2k}}^{c} = \left| h_{m_{k},n_{2k}}^{T} p_{m_{k},n_{k}}^{c} \right|^{2} / (\sigma^{2} + \sum_{n_{2i-1} \in \mathbb{N}} \sum_{m_{i} \in \mathbb{M}} \left| h_{m_{k},n_{2k}}^{T} p_{m_{i},n_{2i-1}}^{p} \right|^{2} + \sum_{n_{2i} \in \mathbb{N}} \sum_{m_{i} \in \mathbb{M}} \left| h_{m_{k},n_{2k}}^{T} p_{m_{i},n_{2i}}^{p} \right|^{2} + \sum_{\substack{n_{i} \in \mathbb{N} \\ n_{i} \notin n_{2k} m_{i} \notin m_{k}}} \sum_{m_{i} \in \mathbb{M}} \left| h_{m_{k},n_{2k}}^{T} p_{m_{i},n_{i}}^{c} \right|^{2} \right)$$
(14)

The private capacities of UD_{2k-1} and UD_{2k} are respectively written as

$$C_{2k-1}^{p} = \sum_{\substack{n_{2k-1} \in Nq_{2k-1} \in Q_{2k-1} \\ m_k \in M}} \sum_{m_k \in M} \log_2 \left(1 + \frac{\gamma_{m_k, n_{2k-1}}^p}{M_k} \tau_{q_{2k-1}}^2 \right)$$
(15)

and

$$C_{2k}^{\rm p} = \sum_{\substack{n_{2k} \in \mathbb{N} \\ m_k \in \mathbb{M}}} \sum_{q_{2k} \in Q_{2k}} \log_2 \left(1 + \frac{\gamma_{m_k, n_{2k}}^{\rm p}}{M_k} \tau_{q_{2k}}^2 \right).$$
(16)

The common capacities of UD_{2k-1} and UD_{2k} are respectively derived as

$$C_{2k-1}^{c} = \sum_{\substack{n_{2k-1} \in \mathsf{N}q_{2k-1} \in Q_{2k-1} \\ m_k \in \mathsf{M}}} \sum_{m_k \in \mathsf{M}} \log_2 \left(1 + \frac{\gamma_{m_k, n_{2k-1}}^{\circ}}{M_k} \tau_{q_{2k-1}}^2 \right)$$
(17)

and

$$C_{2k}^{c} = \sum_{\substack{n_{2k} \in \mathbb{N} \\ m_k \in \mathbb{M}}} \sum_{q_{2k} \in Q_{2k}} \log_2\left(1 + \frac{\gamma_{m_k, n_{2k}}^c}{M_k} \tau_{q_{2k}}^2\right), \quad (18)$$

where $\tau_{q_{2k-1}}^2$ and $\tau_{q_{2k}}^2$ are respectively the eigenvalues of channel matrix from the BS to UD_{2k-1} and UD_{2k} .

Moreover, the ranks of the channel matrix are $Q_{2k-1} \leq R_{2k-1} = \min(N_{2k-1}, M_k)$ and $Q_{2k} \leq R_{2k} = \min(N_{2k}, M_k)$. The downlink OAM-MIMO communications with RS will broadcast the common message to UD_{2k-1} and UD_{2k} , and thus the common capacity is derived as $C_{2k-1,2k}^c = \min\{C_{2k-1}^c, C_{2k}^c\}$, which guarantees that UD_{2k-1} and UD_{2k} can receive the common message. The common capacities of UD_{2k-1} and UD_{2k} are respectively c_{2k-1} and c_{2k} , which satisfy the constraint $c_{2k-1} + c_{2k} \leq C_{2k-1,2k}^c$. In this paper, we consider the full rank channel matrix (i.e., $Q_{2k-1} = R_{2k-1}$ and $Q_{2k} = R_{2k}$). The capacities of UD_{2k-1} and UD_{2k} are respectively derived as follows

$$C_{2k-1}^{\rm RS} = C_{2k-1}^{\rm p} + c_{2k-1} \tag{19}$$

and

$$C_{2k}^{\rm RS} = C_{2k}^{\rm p} + c_{2k}.$$
 (20)

The sum capacity of the downlink OAM-MIMO communications with RS is expressed as

$$C_{\rm sum}^{\rm RS} = C_{2k-1}^{\rm p} + C_{2k}^{\rm p} + c_{2k-1} + c_{2k}.$$
 (21)

The optimization problem is to maximize the sum capacity $C_{\rm sum}^{\rm RS}$.

V. FRACTIONAL PROGRAMMING BASED PRECODING OPTIMIZATION ALGORITHM

The FP with quadratic transformation is introduced to obtain the optimal precoding matrix for the sum capacity maximization problem. The private and common capacities of UD_{2k-1} and UD_{2k} can be respectively transformed in the following.

The private capacity of UD_{2k-1} is derived as

$$C_{2k-1}^{p} = \sum_{\substack{n_{2k-1} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} C_{m_{k},n_{2k-1}}^{p}$$

$$= \sum_{\substack{n_{2k-1} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} \sum_{\substack{n_{2k-1} \in Q_{2k-1} \\ M_{k}}} \log_{2}(1 + \frac{\bar{\gamma}_{m_{k},n_{2k-1}}^{p}}{M_{k}}\tau_{q_{2k-1}}^{2}), \qquad (22)$$

where

$$\bar{\gamma}_{m_k,n_{2k-1}}^{\mathbf{p}} = (a_{m_k,n_{2k-1}}^{\mathbf{p}})^{\mathrm{T}} (b_{m_k,n_{2k-1}}^{\mathbf{p}})^{-1} a_{m_k,n_{2k-1}}^{\mathbf{p}}.$$
 (23)

 $a^{\mathrm{p}}_{m_k,n_{2k-1}}$ and $b^{\mathrm{p}}_{m_k,n_{2k-1}}$ can be respectively defined as

$$a_{m_k,n_{2k-1}}^{\mathbf{p}} = h_{m_k,n_{2k-1}} p_{m_k,n_{2k-1}}^{\mathbf{p}}$$
(24)

and

$$b_{m_{k},n_{2k-1}}^{p} = h_{m_{k},n_{2k-1}} \left(\sum_{n_{2i} \in \mathbf{N}} \sum_{m_{i} \in \mathbf{M}} p_{m_{i},n_{2i}}^{p} (p_{m_{i},n_{2i}}^{p})^{\mathsf{T}} + \sum_{\substack{n_{2i-1} \in \mathbf{N} \\ n_{2i-1} \notin n_{2k-1}m_{i} \notin m_{k}}} \sum_{m_{i} \in \mathbf{M}} p_{m_{i},n_{2i-1}}^{p} (p_{m_{i},n_{2i-1}}^{p})^{\mathsf{T}}) h_{m_{k},n_{2k-1}}^{\mathsf{T}} + \sigma^{2}.$$

$$(25)$$

The private capacity of UD_{2k} is expressed as

$$C_{2k}^{p} = \sum_{\substack{n_{2k} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} C_{m_{k},n_{2k}}^{p}$$

$$= \sum_{\substack{n_{2k} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} \sum_{q_{2k} \in Q_{2k}} \log_{2}(1 + \frac{\bar{\gamma}_{m_{k},n_{2k}}^{p}}{M_{k}}\tau_{q_{2k}}^{2}), \qquad (26)$$

where

$$\bar{\gamma}_{m_k,n_{2k}}^{\mathbf{p}} = (a_{m_k,n_{2k}}^{\mathbf{p}})^{\mathrm{T}} (b_{m_k,n_{2k}}^{\mathbf{p}})^{-1} a_{m_k,n_{2k}}^{\mathbf{p}}.$$
 (27)

 $a^{\mathbf{p}}_{m_k,n_{2k}}$ and $b^{\mathbf{p}}_{m_k,n_{2k}}$ can be respectively defined as

$$a_{m_k,n_{2k}}^{\rm p} = h_{m_k,n_{2k}} p_{m_k,n_{2k}}^{\rm p}$$
(28)

and

$$b_{m_{k},n_{2k}}^{\mathbf{p}} = h_{m_{k},n_{2k}} \left(\sum_{\substack{n_{2i-1} \in \mathbf{N} \\ n_{2i} \in \mathbf{N} }} \sum_{\substack{m_{i} \in \mathbf{M} \\ m_{i} \in \mathbf{M} \\ n_{2i} \notin n_{2k} m_{i} \notin m_{k} }} p_{m_{i},n_{2i}}^{\mathbf{p}} (p_{m_{i},n_{2i}}^{\mathbf{p}})^{\mathrm{T}}) h_{m_{k},n_{2k}}^{\mathrm{T}} + \sigma^{2}.$$

$$(29)$$

The common capacity of UD_{2k-1} is derived as

$$C_{2k-1}^{c} = \sum_{\substack{n_{2k-1} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} C_{m_{k},n_{2k-1}}^{c}$$
$$= \sum_{\substack{n_{2k-1} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} \sum_{\substack{n_{2k-1} \in \mathbb{N} \\ q_{2k-1} \in Q_{2k-1}}} \log_{2}(1 + \frac{\bar{\gamma}_{m_{k},n_{2k-1}}^{c}}{M_{k}}\tau_{q_{2k-1}}^{2}),$$
(30)

where

$$\bar{\gamma}_{m_k,n_{2k-1}}^{\rm c} = (a_{m_k,n_{2k-1}}^{\rm c})^{\rm T} (b_{m_k,n_{2k-1}}^{\rm c})^{-1} a_{m_k,n_{2k-1}}^{\rm c}.$$
 (31)

 $a^{\mathrm{c}}_{m_k,n_{2k-1}}$ and $b^{\mathrm{c}}_{m_k,n_{2k-1}}$ can be respectively defined as

$$a_{m_k,n_{2k-1}}^{\rm c} = h_{m_k,n_{2k-1}} p_{m_k,n_k}^{\rm c} \tag{32}$$

and

$$b_{m_{k},n_{2k-1}}^{c} = \sigma^{2} + h_{m_{k},n_{2k-1}} \left(\sum_{n_{2i-1} \in \mathbf{N}} \sum_{m_{i} \in \mathbf{M}} p_{m_{i},n_{2i}}^{p} \left(p_{m_{i},n_{2i}}^{p} \right)^{\mathrm{T}} + \sum_{n_{2i-1} \in \mathbf{N}} \sum_{m_{i} \in \mathbf{M}} p_{m_{i},n_{2i-1}}^{p} \left(p_{m_{i},n_{2i-1}}^{p} \right)^{\mathrm{T}} + \sum_{\substack{n_{i} \in \mathbf{N}}} \sum_{\substack{m_{i} \in \mathbf{M} \\ n_{i} \notin n_{2k-1}}} p_{m_{i},n_{i}}^{c} \left(p_{m_{i},n_{i}}^{c} \right)^{\mathrm{T}} \right) h_{m_{k},n_{2k-1}}^{\mathrm{T}}.$$
(33)

The common capacity of UD_{2k} can be derived as

$$C_{2k}^{c} = \sum_{\substack{n_{2k} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} C_{m_{k}, n_{2k}}^{c}$$

$$= \sum_{\substack{n_{2k} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} \sum_{q_{2k} \in Q_{2k}} \log_{2}(1 + \frac{\bar{\gamma}_{m_{k}, n_{2k}}^{c}}{M_{k}} \tau_{q_{2k}}^{2}), \qquad (34)$$

where

$$\bar{\gamma}^{c}_{m_k,n_{2k}} = (a^{c}_{m_k,n_{2k}})^{T} (b^{c}_{m_k,n_{2k}})^{-1} a^{c}_{m_k,n_{2k}}.$$
 (35)

 $a^{\mathrm{c}}_{m_k,n_{2k}}$ and $b^{\mathrm{c}}_{m_k,n_{2k}}$ are respectively defined as

$$a_{m_k,n_{2k}}^{\rm c} = h_{m_k,n_{2k}} p_{m_k,n_k}^{\rm c}$$
(36)

and

$$b_{m_{k},n_{2k}}^{c} = \sigma^{2} + h_{m_{k},n_{2k}} \left(\sum_{n_{2i-1} \in \mathbf{N}} \sum_{m_{i} \in \mathbf{M}} p_{m_{i},n_{2i-1}}^{\mathbf{p}} (p_{m_{i},n_{2i-1}}^{\mathbf{p}})^{\mathbf{T}} + \sum_{n_{2i} \in \mathbf{N}} \sum_{m_{i} \in \mathbf{M}} p_{m_{i},n_{2i}}^{\mathbf{p}} (p_{m_{i},n_{2i}}^{\mathbf{p}})^{\mathbf{T}} + \sum_{\substack{n_{i} \in \mathbf{N} \\ n_{i} \notin n_{2k-1} m_{i} \notin m_{k}}} \sum_{m_{i} \in \mathbf{M}} p_{m_{i},n_{i}}^{c} (p_{m_{i},n_{i}}^{c})^{\mathbf{T}}) h_{m_{k},n_{2k-1}}^{\mathbf{T}}.$$
(37)

Then, the sum capacity maximization problem can be rewritten as problem **P1**.

P1 : maxmize $C_{\text{sum}}^{\text{RS}}$

s.t.C1:
$$C_{2k-1}^{p} \leq \sum_{\substack{n_{2k-1} \in \mathbb{N}q_{2k-1} \in Q_{2k-1} \\ m_{k} \in \mathbb{M}}} \sum_{\substack{n_{2k-1} \in \mathbb{N}q_{2k-1} \in Q_{2k-1} \\ m_{k} \in \mathbb{M}}} \log_{2}(1 + \frac{\gamma_{m_{k}, n_{2k}}^{p}}{M_{k}}\tau_{q_{2k}}^{2})$$

C2: $C_{2k}^{p} \leq \sum_{\substack{n_{2k} \in \mathbb{N}q_{2k} \in Q_{2k} \\ m_{k} \in \mathbb{M}}} \sum_{\substack{n_{2k} \in \mathbb{N}q_{2k} \in Q_{2k} \\ m_{k} \in \mathbb{M}}} \log_{2}(1 + \frac{\gamma_{m_{k}, n_{2k}}^{e}}{M_{k}}\tau_{q_{2k}}^{2})$
C3: $C_{2k-1, 2k}^{c} \leq \sum_{\substack{n_{2k-1} \in \mathbb{N}q_{2k-1} \in Q_{2k-1} \\ m_{k} \in \mathbb{M}}} \sum_{\substack{n_{2k-1} \in \mathbb{N}q_{2k-1} \in Q_{2k-1}}} \log_{2}(1 + \frac{\gamma_{m_{k}, n_{2k-1}}^{e}}{M_{k}}\tau_{q_{2k-1}}^{2})$

C4:
$$C_{2k-1,2k}^{c} \leq \sum_{\substack{n_{2k} \in \mathbf{N} \\ m_k \in \mathbf{M}}} \sum_{q_{2k} \in Q_{2k}} \log_2(1 + \frac{\gamma_{m_k,n_{2k}}}{M_k} \tau_{q_{2k}}^2)$$

C5:
$$\sum_{n_{2k-1} \in \mathbf{N}} \sum_{m_{k} \in \mathbf{M}} \left\| p_{m_{k}, n_{2k-1}}^{\mathbf{p}} \right\|_{2}^{2} + \sum_{n_{2k} \in \mathbf{N}} \sum_{m_{k} \in \mathbf{M}} \left\| p_{m_{k}, n_{2k}}^{\mathbf{p}} \right\|_{2}^{2} + \sum_{n_{k} \in \mathbf{N}} \sum_{m_{k} \in \mathbf{M}} \left\| p_{m_{k}, n_{k}}^{\mathbf{c}} \right\|_{2}^{2} \le P_{\mathbf{T}}$$

where C1 and C2 are the constraints on the private capacities of UD_{2k-1} and UD_{2k} , respectively; C3 and C4 are the constraints on the common capacities of UD_{2k-1} and UD_{2k} , respectively; C5 is the total transmit power constraint.

The precoding matrix P is a non-empty matrix. According to the FP in [48], problem **P1** can be converted to the convex problem **P2**.

P2: maxmize \bar{C}_{sum}^{RS}

s.t. C1:
$$C_{2k-1}^{p} \leq \sum_{\substack{n_{2k-1} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} \sum_{\substack{p_{2k-1} \in Q_{2k-1} \\ m_{k} \in \mathbb{M}}} \log_{2} \left(1 + \frac{\tau_{q_{2k-1}}^{2}}{M_{k}} \left(2 \operatorname{Re} \left\{ \left(y_{m_{k},n_{2k-1}}^{p} \right)^{\mathrm{T}} a_{m_{k},n_{2k-1}}^{p} \right\} - \left(y_{m_{k},n_{2k}}^{p} \right)^{\mathrm{T}} b_{m_{k},n_{2k-1}}^{p} \left(y_{m_{k},n_{2k-1}}^{p} \right) \right) \right)$$

C2: $C_{2k}^{p} \leq \sum_{k=1}^{p} \sum_{\substack{p_{k} \in \mathbb{N}}} \left(2 \operatorname{Re} \left\{ \left(y_{m_{k},n_{2k-1}}^{p} \right)^{\mathrm{T}} a_{m_{k},n_{2k-1}}^{p} \right\} \right) \right)$

$$\sum_{\substack{n_{2k} \in \mathbf{N} \\ m_k \in \mathbf{M}}} \sum_{\substack{q_{2k} \in Q_{2k} \\ m_k \in \mathbf{M}}} \log_2 \left(1 + \frac{\tau_{q_{2k}}^2}{M_k} \left(2 \operatorname{Re} \left\{ \left(y_{m_k, n_{2k}}^{\mathbf{p}} \right)^{\mathrm{T}} a_{m_k, n_{2k}}^p \right\} - \left(y_{m_k, n_{2k}}^{\mathbf{p}} \right)^{\mathrm{T}} b_{m_k, n_{2k}}^{\mathbf{p}} \left(y_{m_k, n_{2k}}^{\mathbf{p}} \right) \right) \right)$$

$$C3: C_{2k-1,2k}^{c} \leq \sum_{\substack{n_{2k-1} \in \mathbb{N} \\ m_{k} \in \mathbb{M}}} \sum_{q_{2k-1} \in Q_{2k-1}} \log_{2} \left(1 + \frac{\tau_{q_{2k-1}}^{2}}{M_{k}} \left(2 \operatorname{Re} \left\{ \left(y_{m_{k},n_{2k-1}}^{c} \right)^{\mathrm{T}} a_{m_{k},n_{2k-1}}^{c} \right) - \left(y_{m_{k},n_{2k-1}}^{c} \right)^{\mathrm{T}} b_{m_{k},n_{2k-1}}^{c} \left(y_{m_{k},n_{2k-1}}^{c} \right) \right) \right)$$

$$C4: C_{2k-1,2k}^{c} \leq \sum_{\substack{n_{2k} \in \mathbf{N} \\ m_{k} \in \mathbf{M}}} \sum_{\substack{p_{2k} \in Q_{2k} \\ m_{k} \in \mathbf{M}}} \log_{2} \left(1 + \frac{\tau_{q_{2k}}^{2}}{M_{k}} \left(2 \operatorname{Re} \left\{ \left(y_{m_{k},n_{2k}}^{c} \right)^{\mathrm{T}} a_{m_{k},n_{2k}}^{c} \right\} - \left(y_{m_{k},n_{2k}}^{c} \right)^{\mathrm{T}} b_{m_{k},n_{2k}}^{c} \left(y_{m_{k},n_{2k}}^{c} \right) \right) \right)$$

$$C5: \sum_{n_{2k-1} \in \mathbf{N}} \sum_{m_{k} \in \mathbf{M}} \left\| p_{m_{k},n_{2k-1}}^{p} \right\|_{2}^{2} + \sum_{n_{2k} \in \mathbf{N}} \sum_{m_{k} \in \mathbf{M}} \left\| p_{m_{k},n_{2k}}^{p} \right\|_{2}^{2} + \sum_{n_{k} \in \mathbf{N}} \sum_{m_{k} \in \mathbf{M}} \left\| p_{m_{k},n_{k}}^{p} \right\|_{2}^{2} \leq P_{\mathrm{T}}$$

$$C6: \bar{C}_{\mathrm{sum}}^{\mathrm{RS}} \leq C_{2k-1}^{\mathrm{p}} + C_{2k}^{\mathrm{p}} + C_{2k-1,2k}^{\mathrm{c}}$$

where $\bar{C}_{\text{sum}}^{\text{RS}}$ is the sum capacity $C_{\text{sum}}^{\text{RS}}$ transformed from FP optimization algorithm, and the auxiliary variables $y_{m_k,n_{2k-1}}^{\text{p}}$, $y_{m_k,n_{2k}}^{\text{p}}$ and $y_{m_k,n_{2k-1}}^{\text{c}}$, $y_{m_k,n_{2k}}^{\text{c}}$ can be written as

$$y_{m_k,n_{2k-1}}^{\mathbf{p}} = \left(b_{m_k,n_{2k-1}}^{\mathbf{p}*}\right)^{-1} a_{m_k,n_{2k-1}}^{\mathbf{p}*}$$
(38)

$$y_{m_k,n_{2k}}^{\rm p} = \left(b_{m_k,n_{2k}}^{\rm p*}\right)^{-1} a_{m_k,n_{2k}}^{\rm p*} \tag{39}$$

$$y_{m_k,n_{2k-1}}^{c} = \left(b_{m_k,n_{2k-1}}^{c*}\right)^{-1} a_{m_k,n_{2k-1}}^{c*} \tag{40}$$

$$y_{m_k,n_{2k}}^{c} = \left(b_{m_k,n_{2k}}^{c*}\right)^{-1} a_{m_k,n_{2k}}^{c*}$$
(41)

The iterations of $b_{m_k,n_{2k-1}}^{p*}$, $b_{m_k,n_{2k}}^{p*}$, $b_{m_k,n_{2k-1}}^{c*}$, $b_{m_k,n_{2k-1}}^{c*}$, $b_{m_k,n_{2k}}^{c*}$, and $a_{m_k,n_{2k-1}}^{p*}$, $a_{m_k,n_{2k-1}}^{c*}$, $a_{m_k,n_{2k}}^{c*}$ are the auxiliary variables calculated by substituting the precoding matrix obtained

from the previous iteration into (25), (29), (33), (37) and (24), (28), (32), (36), respectively. Then, we calculate \bar{C}_{sum}^{RS*} at each iteration through iterative convex approximation. The iteration stops when \bar{C}_{sum}^{RS} converges to the convergence threshold Γ . By substituting the optimal precoding matrix into (21), we can obtain the maximum sum capacity $C_{\text{sum}}^{\text{RS}}$. The FP based precoding optimization algorithm is summarized as follows.

FP based precoding optimization algorithm

- 1) Initialize P^* , \bar{C}_{sum}^{RS*} ;
- 2) Repeat steps 3) 7);
- 3) Update (38), (39), (40), (41) to obtain $y_{m_k,n_{2k-1}}^p$,
- $y_{m_k,n_{2k}}^{\rm p}, y_{m_k,n_{2k-1}}^{\rm c} \text{ and } y_{m_k,n_{2k}}^{\rm c};$ $4) By taking the fixed <math>y_{m_k,n_{2k-1}}^{\rm p}, y_{m_k,n_{2k}}^{\rm p}, y_{m_k,n_{2k}}^{\rm c}, y_{m_k,n_{2k-1}}^{\rm c}, y_{m_k,n_{2k}}^{\rm c}, x_{m_k,n_{2k-1}}^{\rm c}, y_{m_k,n_{2k}}^{\rm c}, x_{m_k,n_{2k-1}}^{\rm c}, y_{m_k,n_{2k}}^{\rm c}, x_{m_k,n_{2k}}^{\rm c}$ obtained by convex approximation;
- 5) Set $P = P^*$;
- 5) Set $\vec{r} = \vec{r}$, 6) When $\bar{C}_{sum}^{RS} \bar{C}_{sum}^{RS*} \leq \Gamma$, go to step 8); 7) Set $\bar{C}_{sum}^{RS*} = \bar{C}_{sum}^{RS}$, go to step 3);
- 8) Substitute the current P into the problem P1 to obtain the maximum sum capacity $C_{\text{sum}}^{\text{RS}}$

VI. SIMULATION RESULTS

For the downlink OAM-MIMO communications with RS, the FP based precoding optimization algorithm is demonstrated in simulation results. The transmit UCA consists of 3 antenna elements. The antenna element number of UD receive UCA is set to be 4. The attenuation and phase rotation error caused by antenna property is $\beta = 4\pi$. The radius of the transmit UCA is $R_k = k\lambda$ and the radius of the user UCA is $r_i = n\lambda$. The wavelength is set to be $\lambda = 0.01$. The angle between the x-axis and the central line projection from the transmit UCA to the receive UCA is $\theta = 0$. The angle between the z-axis and the central connection from the transmit UCA to the receive UCA is set to be $\phi_i = 0$. Table I presents the four cases of mode combinations for the downlink OAM-MIMO communications with RS. There are 4, 3, 3 and 2 antenna elements in transmit UCAs, respectively. The antenna element numbers of UD receive UCAs are respectively set to be 4, 4, 5 and 4.

TABLE I THE CASES OF DIFFERENT OAM MODE COMBINATION

Case	Mode l_k	$N \times M$	Eigenvalue $ au^2$
1	1, 2	4×2	4, 4
2	1, 2, 3	5×3	5, 5, 5
3	1, 2, 3	4×3	4, 4, 4
4	1, 2, 3, 4	4×4	4, 4, 4, 4

The capacity of different OAM mode combination is presented in Fig. 2. It can be observed that the sum capacity is a monotonic decreasing function of the transmission distance. In addition, the proposed OAM communications with case 1 obtains the highest sum capacity. This is due to the fact that the array antenna combination of case 1 has the largest number of independent OAM channels. In other words, vortex

Fig. 2. The performance comparison of OAM communications with different OAM modes

wave beams with different OAM modes are equivalent to multiple independent OAM channels, which provides high sum capacity.

Fig. 3. The capacity performance of OAM communications with multiple OAM modes

Figure 3 plots the sum capacity versus the transmission distance with multiple OAM modes. We can see that the sum capacity monotonically decreases with the increase of transmission distance. Furthermore, compared to the traditional communications with RS, the proposed OAM communications with different user pairs can obtain higher capacity. This is because the proposed OAM communications with multiple OAM modes can simultaneously transmit multiple signals by using multiple independent OAM channels. In addition, the channel condition between BS and UD decreases slowly as the transmission distance increases.

The variation of UD_{2k-1} capacity with the transmission distance is illustrated in Fig. 4. We can see that the sum ca-

Fig. 4. The variation of UD_{2k-1} capacity with total transmit power

Fig. 5. The UD_{2k} capacity of different wireless communications versus total transmit power

pacity is a monotonic increasing function of the total transmit power. Furthermore, compared with the traditional wireless communications, OAM-MIMO communications with RS can achieve the highest capacity. This is due to the utilization of multiple OAM modes, which enables different vortex wave beams to transmit multiple signals independently. Figure 5 demonstrates the UD_{2k} capacities of different wireless communications. From Fig. 5, it can be observed that TDMA communications can achieve higher capacity than the other three wireless communications if the total transmit power is relatively small. When the total transmit power is large, OAM-MIMO communications with RS can obtain the highest capacity among the four wireless communications.

Figure 6 illustrates the performance comparison of OAM communications with multiple OAM modes. We can observe that the proposed OAM communications with case 1 achieves higher sum capacity than the other three cases. This is because

Fig. 6. The capacities of different cases under various total transmit power

the array antenna combination of case 1 produces the largest number of independent channels. Multiple vortex wave beams with various OAM modes simultaneously transfer multiple OAM signals to the user pairs by utilizing multiple independent OAM channels. Each OAM channel carries different OAM signal to the user pair. The more the OAM modes are, the higher the sum capacity is.

VII. CONCLUSIONS

To enhance the privacy performance, we integrated RS technique into OAM communications and constructed the transmission framework of the downlink OAM-MIMO communications with RS. Different user pairs employed different OAM modes and users in the same user pair used RS technique to obtain the information. Based on concentric UCA, the OAM-MIMO channel model and the capacity were derived for the downlink OAM-MIMO communications with RS. The simulation experiments were conducted to show that the proposed precoding optimization algorithm can achieve higher sum capacity compared with the traditional schemes.

Ruirui Chen received the Ph.D. degree in military communication from Xidian University, Xi'an, China, in 2018. He is currently a lecturer with the School of Information and Control Engineering, China University of Mining and Technology, Xuzhou, China. He is also a master supervisor of electronic information in China University of Mining and Technology. His research interests focus on vortex electromagnetic wave communications, MIMO communications and UAV communications. Email: rrchen@cumt.edu.cn.

Jinyang Lin received the B.S. degree in information and communication engineering from China University of Mining and Technology, Xuzhou, China, in 2021. He is currently working towards the M.S. degree with the School of Information and Control Engineering, China University of Mining and Technology, Xuzhou, China. His current research interests focus on in vortex wave communication. Email: linjinyang@cumt.edu.cn.

Beibei Zhang received the M.S. degree in information and communication engineering from China University of Mining and Technology, Xuzhou, China, in 2011. He is currently a Senior Engineer with Jiangsu Automation Research Institute, Lianyungang, China and also working towards the Ph.D. degree with the School of Information and Control Engineering, China University of Mining and Technology, Xuzhou, China. His research interests include wireless sensor networks and vortex wave communications. Email:

lb15060029@cumt.edu.cn.

Yu Ding received the B.S. degree in information and communication engineering from China University of Mining and Technology, Xuzhou, China, in 2022. He is currently working towards the M.S. degree with the School of Information and Control Engineering, China University of Mining and Technology, Xuzhou, China. His current research interests focus on in UAV communications and vortex wave communication. Email: yding@cumt.edu.cn.

Keyue Xu received the B.S. degree in communication engineering from Suzhou University of Science and Technology, Suzhou, China, in 2022. She is currently working towards the M.S. degree with the School of Information and Control Engineering, China University of Mining and Technology, Xuzhou, China. Her current research interests focus on in intelligent communications and vortex wave communication. Email: kyxu@cumt.edu.cn.
