Introduction

Setting & Challenge: In OVOD [1], the detector aims to detect any objects within an object vocabulary in an input image. Previous method, e.g., DetPro [2], can easily misclassify some highly similar classes (puffin v.s. bird).

Contribution: We propose a meta prompt and instance contrastive learning strategy to improve the model generalization ability, which can be more discriminative to these similar categories.

Method

- Meta prompt learning scheme to simulate a novel-class-emerging scenario
- Instance-level contrastive strategy for intra-class compactness and inter-class separation

Conclusion

We propose a novel framework MIC for open-vocabulary object detection by simulating a novel-class-emerging scenario and expanding the low-density regions in the latent feature space. Without complex training techniques and extra training data, extensive experimental results show the strong generalization ability of our proposed method.
