BACKGROUND OF THE INVENTION

Field of Invention

The present invention provides novel compounds possessing one or more of the following activities: antibacterial, antifungal and antitumor activity. Pharmaceutical compositions containing these compounds, methods of making and methods for using these compounds are also provided.

State of the art

The binding of the antibacterial netropsin and distamycin to AT-rich sequences in the minor groove of double stranded DNA is a well-studied phenomenon. Because such binding can be used to regulate DNA expression, e.g., by blocking and/or displacement of regulatory proteins, or by inhibiting the activity of enzymes acting on DNA, such as reverse transcriptase or topoisomerase, optimization of this binding has been the subject of numerous recent studies.

As described in a recent review by Bailly and Chaires (*Bioconj. Chem.* 9(5):513-38, 1998), the pyrrolecarboxamide unit in netropsin and distamycin is actually about 20% longer than required to perfectly match the corresponding base pair sequence in the minor groove. Accordingly, in oligomeric analogs having multiple binding moieties, successive binding moieties can become out of phase with the base pairs of the minor groove. Several studies have therefore been directed to dimers of netropsin or distamycin containing different linkers, in order to improve binding to longer target sequences. In these reports, effectiveness of various netropsin or distamycin dimers was determined, for example, in the inhibition of

transcription by HIV-1 reverse transcriptase (M. Filipowsky *et al., Biochemistry* **35**:15397-410, 1996), inhibition of mammalian DNA topoisomerase I (Z. Wang *et al., Biochem. Pharmacol.* **53**:309-16, 1997), or inhibition of HIV 1 integrase (N. Neamati *et al., Mol. Pharmacol.* **54**:280-90, 1998).

Preferred linkers in these studies included p-phenylene, *trans*-vinyl, cyclopropyl, 3,5-pyridyl, and six- and eight-carbon aliphatic chains. Several of these linkers restrict rotation around the linking group, thus reducing the extent of purely monodentate binding (e.g. by only one netropsin moiety; see Bailly) which can occur with flexible linkers. However, Kissinger *et al.* (*Chem. Res. Toxicol.* **3**(2):162-8, 1990) reported that aryl-linked groups had reduced DNA binding affinity compared to alkyl and alkylene linkers, and Neamati *et al.* (cited above) reported that the *trans*-vinyl linked compound was many times more potent (in inhibiting HIV-1 integrase) than the "more rigid" cyclobutanyl and norbornyl linkers. It was suggested in Wang and in Bailly that, for certain applications, the more rigid linkers (cyclopropyl and p-phenylene) may not allow for optimal simultaneous (bidentate) binding of the two netropsin moieties flanking the linker. Therefore, it would be desirable to provide linkers which reduce monodentate binding but which provide suitable geometries for bidentate binding. In light of the increase of antibiotic /antifungal resistant organisms, there is a need to develop new compounds to treat diseases caused by these antibiotic /antifungal resistant organisms. The compounds of the present invention fulfill this need.

Amino acid refers to any of the naturally occurring amino acids, as well as synthetic analogs (*e.g.*, D-stereoisomers of the naturally occurring amino acids, such as D-threonine) and derivatives thereof. α-Amino acids comprise a carbon atom to which is bonded an amino group, a carboxyl group, a hydrogen atom, and a distinctive group referred to as a "side chain". The side chains of naturally occurring amino acids are well known in the art and include, for example, hydrogen (e.g., as in glycine), alkyl (e.g., as in alanine, valine, leucine, isoleucine, proline), substituted alkyl (e.g., as in threonine, serine, methionine, cysteine, aspartic acid, asparagine, glutamic acid, glutamine, arginine, and lysine), arylalkyl (e.g., as in phenylalanine and tryptophan), substituted arylalkyl (e.g., as in tyrosine), and heteroarylalkyl (e.g., as in histidine). Unnatural amino acids are also known in the art, as set forth in, for example, Williams (ed.), Synthesis of Optically Active α-Amino Acids, Pergamon Press (1989); Evans et al., J. Amer. Chem. Soc., 112:4011-4030 (1990); Pu et al., J. Amer. Chem. Soc., 56:1280-1283 (1991); Williams et al., J. Amer. Chem. Soc., 113:9276-9286 (1991); and all references cited therein. The present invention includes the side chains of unnatural amino acids as well.

Compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms in space are termed "isomers". Isomers that differ in the arrangement of their atoms in space are termed "stereoisomers".

Stereoisomers that are not mirror images of one another are termed "diastereomers" and those that are non-superimposable mirror images of each other

are termed "enantiomers". When a compound has an asymmetric center, for example, it is bonded to four different groups, a pair of enantiomers is possible. An enantiomer can be characterized by the absolute configuration of its asymmetric center and is described by the R- and S-sequencing rules of Cahn and Prelog, or by the manner in which the molecule rotates the plane of polarized light and designated as dextrorotatory (D-) or levorotatory (L-) (i.e., as (+) or (-)-isomers respectively). A chiral compound can exist as either individual enantiomer or as a mixture thereof. A mixture containing equal proportions of the enantiomers is called a "racemic mixture".

The compounds of this invention may possess one or more asymmetric centers; such compounds can therefore be produced as individual L- or D-stereoisomers or as mixtures thereof. Unless indicated otherwise, the description or naming of a particular compound in the specification and claims is intended to include both individual enantiomers and mixtures, racemic or otherwise, thereof. The methods for the determination of stereochemistry and the separation of stereoisomers are well-known in the art (*see* discussion in Chapter 4 of "Advanced Organic Chemistry", 5th edition J. March, John Wiley and Sons, New York, 2001).

A "pharmaceutically acceptable excipient" means an excipient that is useful in preparing a pharmaceutical composition that is generally safe, relatively non-toxic and neither biologically nor otherwise undesirable, and includes an excipient that is acceptable for veterinary use as well as human pharmaceutical use. A "pharmaceutically acceptable excipient" as used in the specification and claims includes both one and more than one such excipient.

"Pharmaceutically acceptable acid addition salts" refers to those salts which retain the biological effectiveness and properties of the free bases, which are not biologically or otherwise undesirable, and which are formed with inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid and the like, and organic acids such as acetic acid, propionic acid, glycolic acid, pyruvic acid, oxalic acid, maleic acid, malonic acid, succinic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, cinnamic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, p-toluenesulfonic acid, salicylic acid, and the like.

"An acid addition salt" or "acid addition salts" refers to those salts which are formed with inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid and the like, and organic acids such as acetic acid, propionic acid, glycolic acid, pyruvic acid, oxalic acid, maleic acid, malonic acid, succinic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, cinnamic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, p-toluenesulfonic acid, salicylic acid, and the like.

Groups which form pharmaceutically acceptable acid addition salts include amines, hydrazines, amidines, guanidines, substituted aryl/heteroaryl and substituted alkyl groups that carry at least a heteroatom bearing substitutent , preferably a nitrogen bearing substituent such as amino, guanidino, amidino, hydrazino and the like.

Amine groups are represented by the formula –NR'R" where R' and R" are independently hydrogen, alkyl, substituted alkyl, alkenyl, substituted alkenyl, aryl, substituted aryl, cycloalkyl, substituted cycloalkyl, heterocyclic, heteroaryl, substituted heteroaryl, and where R' and R", together with the nitrogen to which they are attached, form a heterocyclic or heteroaryl group.

Hydrazines are represented by the formula –NHNR'R" where R' and R" are independently hydrogen, alkyl, substituted alkyl, alkenyl, substituted alkenyl, aryl, substituted aryl, cycloalkyl, substituted cycloalkyl, heterocyclic, heteroaryl, substituted heteroaryl, and where R' and R", together with the nitrogen to which they are attached, form a heterocyclic or heteroaryl group.

Amidino groups are represented by the formula –C(=NR''')NR'R'' where R', R" and R''' are independently hydrogen, alkyl, substituted alkyl, alkenyl, substituted alkenyl, aryl, substituted aryl, cycloalkyl, substituted cycloalkyl, heterocyclic, heteroaryl, substituted heteroaryl, and where R' and R", or R' and R''', together with the nitrogen to which they are attached, form a heterocyclic or heteroaryl group.

Guanidino groups is represented by the formula –NR''''C(=NR''')NR'R" where R', R", R''' and R'''' are independently hydrogen, alkyl, substituted alkyl, alkenyl, substituted alkenyl, aryl, substituted aryl, cycloalkyl, substituted cycloalkyl, heterocyclic, heteroaryl, substituted heteroaryl, and where R' and R", together with the nitrogen to which they are attached, form a heterocyclic or heteroaryl group.

A compound of Formula (I) may act as a pro-drug. Prodrug means any compound which releases an active parent drug according to Formula (I) as a results of conversion by metabolic processes *in vivo* when such prodrug is administered to a mammalian subject. The prodrug itself may be active. Prodrugs of a compound of Formula (I) are prepared by modifying functional groups present in the compound of Formula (I) in such a way that the modifications may be cleaved *in vivo* to release the active parent compound. Prodrugs include compounds of Formula (I) wherein a hydroxy, amino, or sulfhydryl group in compound (I) is bonded to any group that may be cleaved *in vivo* to regenerate the free hydroxyl, amino, or sulfhydryl group, respectively. Examples of prodrugs include, but are not limited to esters (e.g., acetate, formate, and benzoate derivatives), carbamates (e.g., N,N-dimethylamino-carbonyl) of hydroxy functional groups in compounds of Formula (I), and the like.

"Treating" or "treatment" of a disease includes:

1) preventing the disease, i.e. causing the clinical symptoms of the disease not to develop in a mammal that may be exposed to or predisposed to the disease but does not yet experience or display symptoms of the disease,
2) inhibiting the disease, i.e., arresting or reducing the development of the disease or its clinical symptoms, or
3) relieving the disease, i.e., causing regression of the disease or its clinical symptoms.

A "therapeutically effective amount" means the amount of a compound that, when administered to a mammal for treating a disease, is sufficient to effect such treatment for the disease. The "therapeutically effective amount" will vary depending on the compound, the disease and its severity and the age, weight, etc., of the mammal to be treated.

"Anti-fungal", "antibacterial", "antiviral" or "anti-parasitic" means that growth of the fungus, bacterial, virus or paracite, respectively, is killed, or its growth is inhibited or stopped.

"Anti-tumor" means the compound has the property of inhibiting the growth of tumor cells.

"Anticancer" means the compound has the property of inhibiting the growth of cancer cells.

"Bacteriostatic" means the compound has the property of inhibiting bacterial or fungal multiplication, wherein multiplication resumes upon removal of the active compound. For a bacteriostatic compound, its minimum bacteriocidal concentration (MBC) is greater than 4x its minimum inhibitory concentration (MIC).

"Bacteriocidal" or "fungicidal" means that the compound has the property of killing bacteria or fungi. Bacteriocidal/fungicidal action differs from bacteriostasis or fungistasis only in being irreversible. For example, the "killed" organism can no longer reproduce, even after being removed form contact with the active compound. In some cases, the active compound causes lysis of the bacterial or fungal cell; in other cases the bacterial or fungal cell remains intact and may continue to be metabolically active. A bacteriocidal compound exhibits a MBC that is less than 4x its MIC. Similarly, a fungicidal compound exhibits a minimum fungicidal concentration (MFC) that is less than 4x its MIC.

"Minimum inhibitory concentration" or "MIC" refers to the minimum concentration of a compound necessary to completely inhibit growth of the organism tested. Compounds of this invention having an MIC of 1 mM or less are active in the assays described in the examples below. In a preferred embodiment, compounds have an MIC of 500 μM or less, and even more preferably an MIC of 50 μM or less.

"dsDNA" means double stranded DNA.

The starting materials and reagents used in preparing these compounds are either available from commercial suppliers such as Aldrich Chemical Co., (Milwaukee, Wisconsin, USA), Bachem (Torrance, California, USA), Emka-Chemie, or Sigma (St. Louis, Missouri, USA) or are prepared by methods known to those skilled in the art following procedures set forth in references such as Fieser and Fieser's Reagents for Organic Synthesis, Volumes 1-15 (John Wiley and Sons, 1991); Rodd's Chemistry of Carbon Compounds, Volumes 1-5 and Supplementals (Elsevier Science Publishers, 1989), Organic Reactions, Volumes 1-40 (John Wiley and Sons, 1991), March's Advanced Organic Chemistry, (John Wiley and Sons, 5th Edition), and Larock's Comprehensive Organic Transformations (VCH Publishers Inc., 1989). These schemes are merely illustrative of some methods by which the compounds of this invention can be synthesized, and various modifications to these schemes can be made and will be suggested to one skilled in the art having referred to this disclosure.

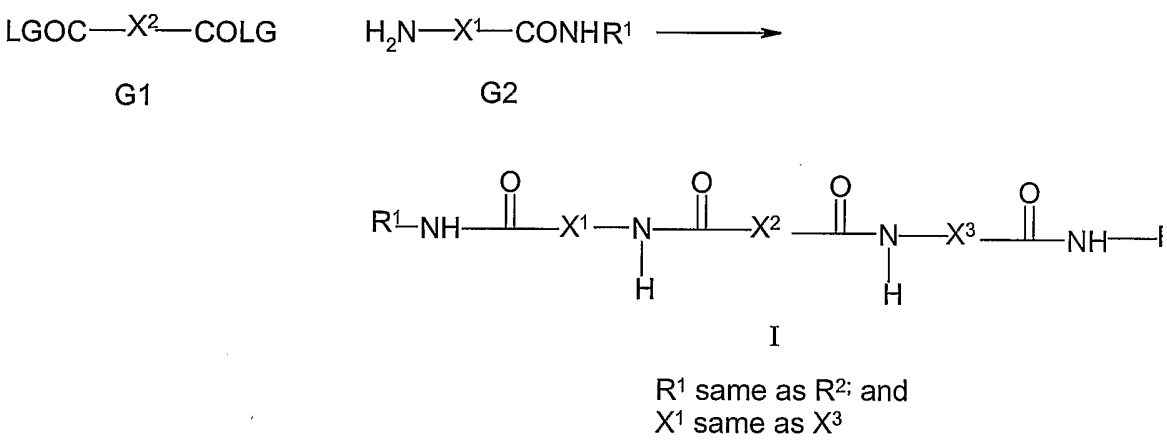
The starting materials and the intermediates of the reaction may be isolated and purified if desired using conventional techniques, including but not limited to filtration, distillation, crystallization, chromatography, and the like. Such materials may be characterized using conventional means, including physical constants and spectral data.

Preparation of compounds of Formula (I)

Schemes A, B, C and D describe alternative methods to prepare the compounds of Formula (I).

Compounds of Formula (I) where Z^1 and Z^2 are –NH-; R^1 and R^2 are as defined herein and are the same; and X^1 and X^3 are as defined herein and are the same can be prepared as shown in Scheme A below.

Scheme A



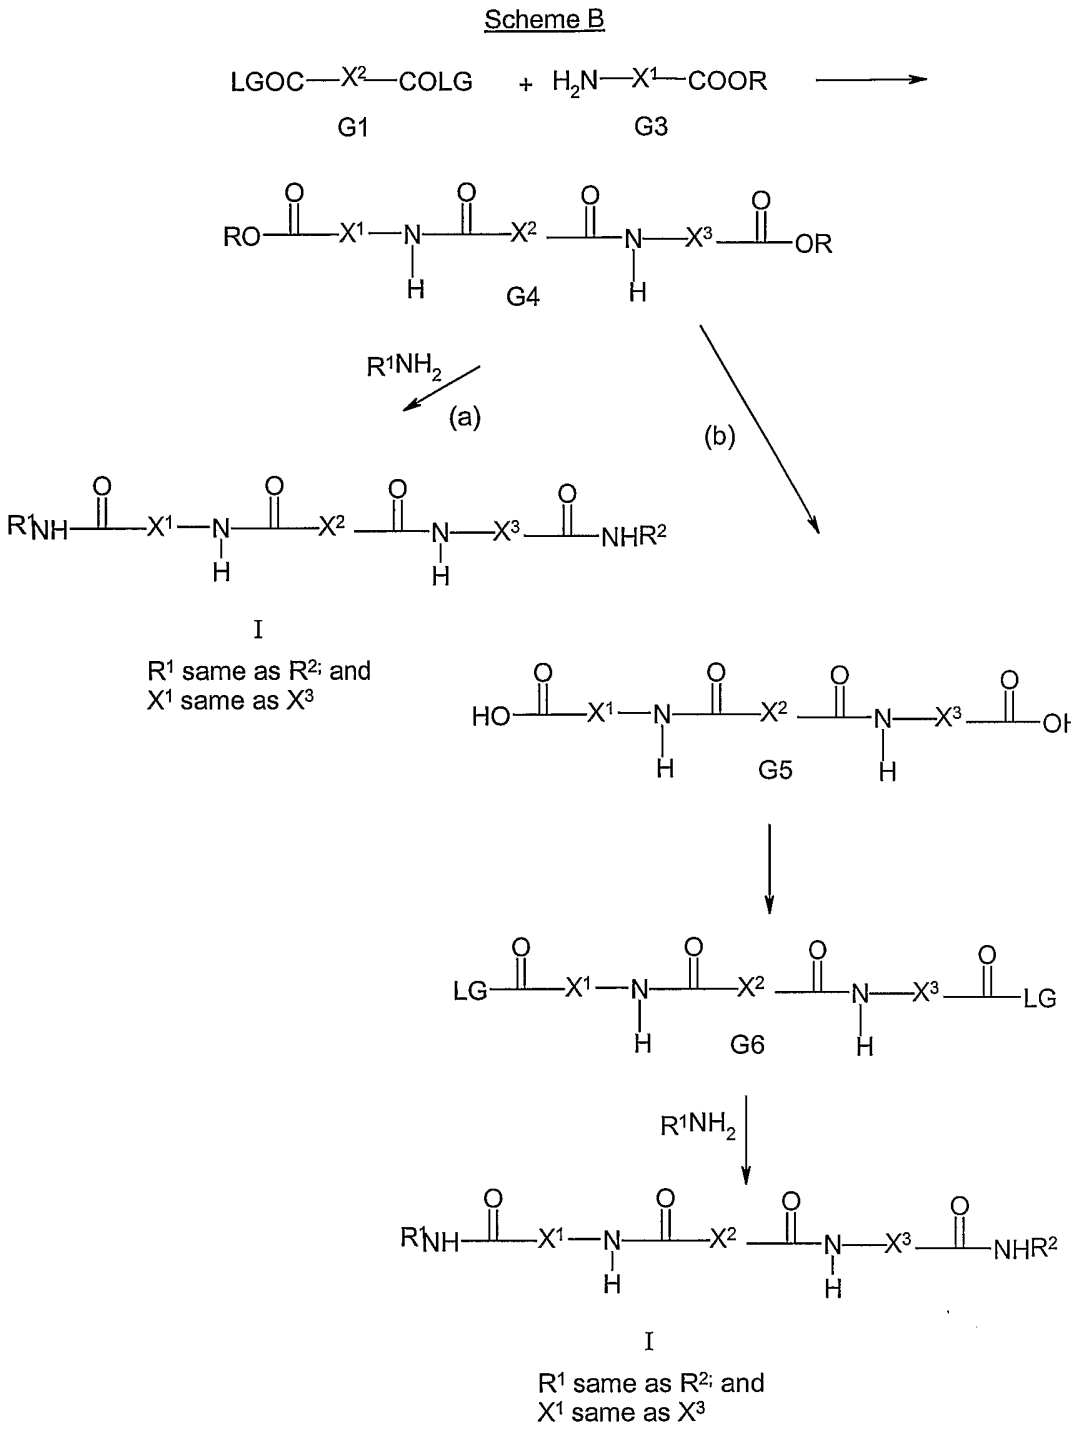
A compound of Formula I wherein Z^1 and Z^2 are –NH-; X^1 and X^3 are as defined herein and are the same and R^1 and R^2 are as defined herein and are the same can be prepared in one step by reacting a dicarboxylic acid derivative G1 (wherein LG is a suitable leaving group such as halo, pentafluorophenyloxy, and the like) with at least two equivalents of an amine of formula G2. The reaction is typically carried out in a polar organic solvent such as dimethylformamide, tetrahydrofuran, and the like and at an ambient temperature. It will be recognized by a person skilled in the art that if the leaving group is halo, then the reaction will be conducted in the presence of a non-nucleophilic base such as triethylamine and the like.

Compounds of formula G1 and G2 are commercially available from vendors such as Aldrich, Sigma, etc. Alternatively these compounds can be prepared by methods well known in the art. For example, compounds of formulae G1 and G2 can be prepared by the procedure illustrated in Scheme 1 and described in detail in Example 1 below.

Additionally, it will be readily apparent to a person skilled in the art that a compound of Formula I where Z^1 and Z^2 are –O- can be prepared by following the above procedure but substituting the amino group in compound G2 with a hydroxy group.

Alternatively, compounds of Formula (I) where Z^1 and Z^2 are –NH-; X^1 and X^3 are as defined herein and are the same; and R^1 and R^2 are as defined herein and are the same can be prepared as shown in Scheme B below.

Scheme B



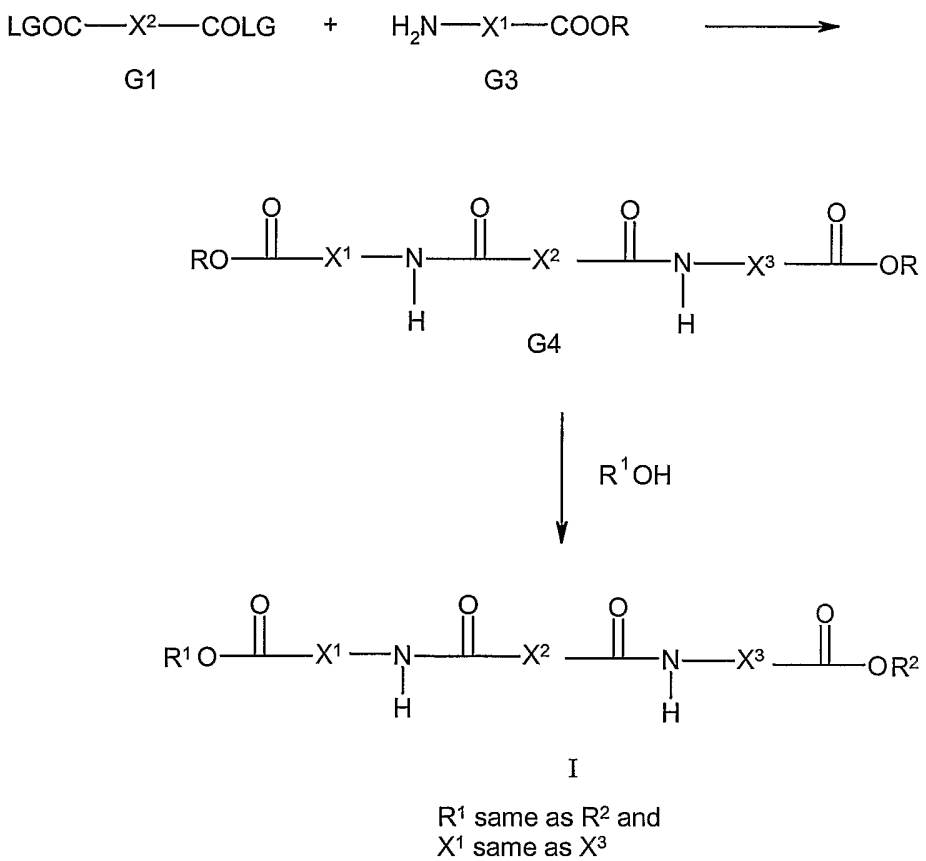
Reaction of a compound of formula G1 with an amino ester of formula G3 under conditions described in Scheme A above provides a diester compound of formula G4. Compound G4 is then converted to a compound of Formula I by following the procedures illustrated in method (a) or (b) above. In method (a), the diester G4 is treated with at least two equivalents of an amine of formula R^1NH_2 to

provide a compound of Formula (I). The reaction is carried out between 40-60 °C and in a polar organic solvent such as dimethylformamide, tetrahydrofuran and the like.

In method (b), the diester is first hydrolyzed under basic hydrolysis reaction conditions to provide the diacid G5, which is then converted to a compound of Formula (I) under the conditions described above. Syntheses of compounds of Formula (I), following the procedures described in Scheme B, are described in Examples 2-6.

Alternatively, compounds of Formula (I) where Z^1 and Z^2 are –O-; X^1 and X^3 are as defined herein and are the same; and R^1 and R^2 are as defined herein and are the same can be prepared as shown in Scheme C below.

Scheme C



Reaction of a dicarboxylic acid derivative of formula G1 (wherein LG is a suitable leaving group such as halo, pentafluorophenyloxy, and the like) with at least two equivalents of an amino ester of formula G3 provides a diester of formula G4.

This reaction is typically carried out in a polar organic solvent such as dimethylformamide, tetrahydrofuran, and the like and at an ambient temperature. It will be recognized by a person skilled in the art that if the leaving group is halo, then the reaction will be conducted in the presence of a non-nucleophilic base such as triethylamine and the like.

The diester of formula G4 may then be reacted with an alcohol (R^1OH) under conventional transesterification conditions well known in the art.

Compounds of formula G1 and G3 and R^1OH are commercially available from vendors such as Aldrich, Sigma, etc. Alternatively these compounds can be prepared by methods well known in the art.

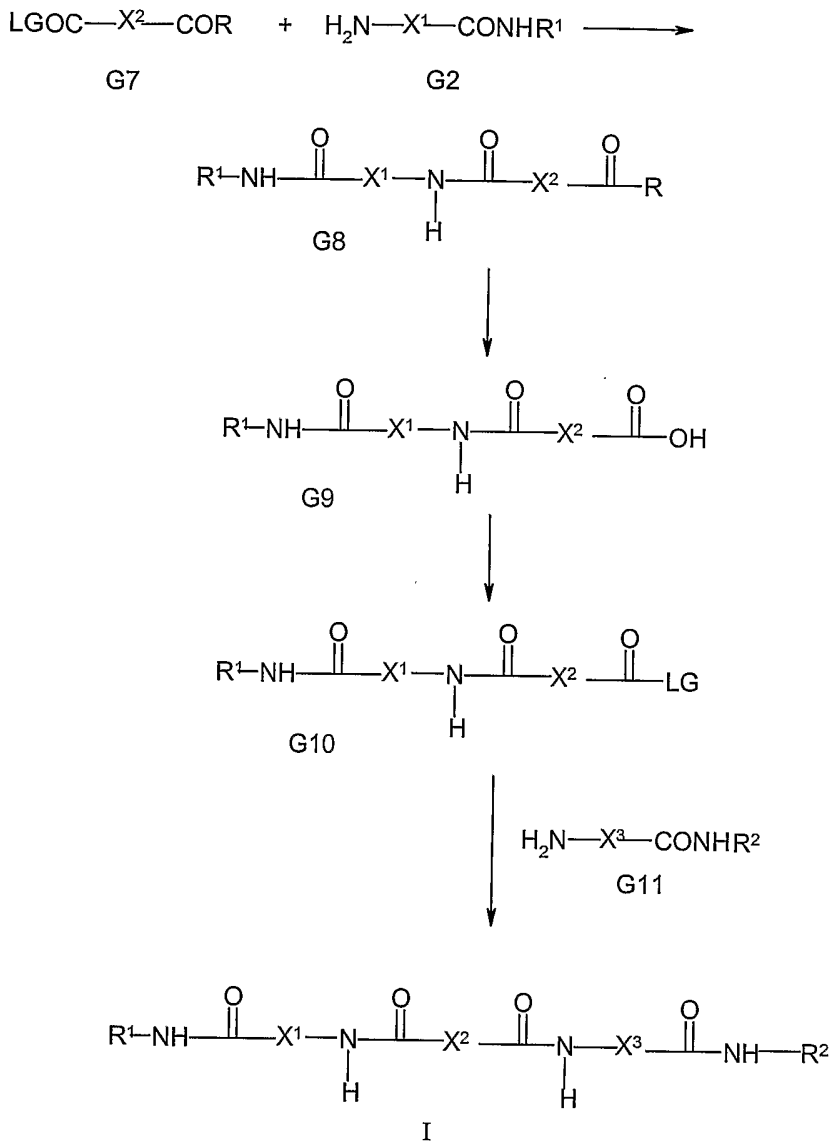
Scheme D



R^1 and R^2 are the same or different
X^1 and X^3 are the same or different

Reaction of a compound of formula G7 with an amine of formula G2 under conditions described in Scheme A above provides an ester compound of formula G8. The ester G8 is thent hydrolyzed under basic hydrolysis reaction conditions to provide the acid G9, which is then converted to acid derivative G10 with a leaving group. Reaction of G10 with an amine of formala G11under conditions described in Scheme A above provides a compound of Formula (I). Syntheses of compounds of Formula (I), following the procedures described in Scheme D, are illustrated in Scheme 15.

Compounds of formula G7 and G2 are commercially available from vendors such as Aldrich, Sigma, etc. Alternatively these compounds can be prepared by methods well known in the art. Additionally, it will be readily apparent to a person skilled in the art that a compound of Formula I where Z^1 and Z^2 are –O- can be prepared by following the above procedure but substituting the amino groups in compounds G2 and G11 with hydroxy groups.

Utility, Testing, and Administration

The present invention provides novel compounds possessing one or more of the following activities: antibacterial, antifungal and antitumor activity. The compounds and compositions containing them are therefore useful in the treatment of one or more of the following diseases: bacterial infections, fungal infections and cancer. Without wishing to be bound to any theory, Applicants believe that the antibacterial and antifungal activity of the compounds of Formula (I) is due to their binding to the minor groove of the double stranded DNA. Applicants further believe that the antitumor activity of the compounds of Formula (I) is due to their inhibition of topoisomerases.

Topoisomerases are essential enzymes in virtually all living cells. The enzymes have two distinct classes: type I and type II enzymes (J.C. Wang, review). Top I relaxes supercoiled DNA by transiently nicking one DNA strand and rotate one strand about the other. Top II relaxes supercoiled DNA and decatenate linked DNA by transiently cleaving both DNA strands and passing another DNA through the lesion. Since their discovery, topoisomerases have been widely targeted in cancer therapy.

Compounds of Formula (I) are also useful as ultraviolet (UV) light absorbers. Accordingly, they are suitable for use in compositions requiring a UV light-absorbing additive, such as plastic compositions. In this regard, it is known that prolonged exposure to UV light can have a deleterious effect on the physical properties and compositional stability of certain plastics. It is therefore conventional to include a UV light-absorbing additive in such plastic compositions, and the compounds of Formula (I) can be employed in this manner.

Compounds of the present invention are further useful in that they bind to the minor groove of dsDNA thereby inducing DNA duplex formation. This property is beneficial in biological assays or diagnostic tests that measure the formation or stability of DNA duplexes. For instance, where one is attempting to measure the formation of a DNA duplex with a low T_m, one can increase the duplex population by adding a compound of Formula (I). Such an increase in population ensures that the binding event will be more easily measured. A compound of Formula (I) can also be used where one is detecting a single nucleotide polymorphism (SNP) through duplex formation. The compound will preferentially increase the T_m of a perfectly matched duplex over a single mutated duplex, therein allowing one to more easily distinguish the two.

Administration and Pharmaceutical Composition

In general, the compounds of this invention will be administered in a therapeutically effective amount by any of the accepted modes of administration for agents that serve similar utilities. The actual amount of the compound of this invention, i.e., the active ingredient, will depend upon numerous factors such as the severity of the disease to be treated, the age and relative health of the subject, the potency of the compound used, the route and form of administration, and other factors. The drug can be administered more than once a day, preferably once or twice a day.

Therapeutically effective amounts of compounds of Formula (I) may range from approximately 0.05 to 50 mg per kilogram body weight of the recipient per day; preferably about 0.01-25 mg/kg/day, more preferably from about 0.5 to 10 mg/kg/day. Thus, for administration to a 70 kg person, the dosage range would most preferably be about 35-70 mg per day.

In general, compounds of this invention will be administered as pharmaceutical compositions by any one of the following routes: oral, systemic (e.g., transdermal, intranasal or by suppository), or parenteral (e.g., intramuscular, intravenous or subcutaneous) administration. The preferred manner of administration is oral using a convenient daily dosage regimen which can be adjusted according to the degree of affliction. Compositions can take the form of tablets, pills, capsules,

semisolids, powders, sustained release formulations, solutions, suspensions, elixirs, aerosols, or any other appropriate compositions. Another preferred manner for administering compounds of this invention is inhalation. This is an effective method for delivering a therapeutic agent directly to the respiratory tract for the treatment of diseases such as asthma and similar or related respiratory tract disorders (see U.S. Patent 5,607,915).

The choice of formulation depends on various factors such as the mode of drug administration and bioavailability of the drug substance. For delivery via inhalation the compound can be formulated as liquid solution, suspensions, aerosol propellants or dry powder and loaded into a suitable dispenser for administration. There are several types of pharmaceutical inhalation devices-nebulizer inhalers, metered dose inhalers (MDI) and dry powder inhalers (DPI). Nebulizer devices produce a stream of high velocity air that causes the therapeutic agents (which are formulated in a liquid form) to spray as a mist which is carried into the patient's respiratory tract. MDI's typically are formulation packaged with a compressed gas. Upon actuation, the device discharges a measured amount of therapeutic agent by compressed gas, thus affording a reliable method of administering a set amount of agent. DPI dispenses therapeutic agents in the form of a free flowing powder that can be dispersed in the patient's inspiratory air-stream during breathing by the device. In order to achieve a free flowing powder, the therapeutic agent is formulated with an excipient such as lactose. A measured amount of the therapeutic agent is stored in a capsule form and is dispensed with each actuation.

Recently, pharmaceutical formulations have been developed especially for drugs that show poor bioavailability based upon the principle that bioavailability can be increased by increasing the surface area i.e., decreasing particle size. For example, U.S. Pat. No. 4,107,288 describes a pharmaceutical formulation having particles in the size range from 10 to 1,000 nm in which the active material is supported on a crosslinked matrix of macromolecules. U.S. Pat. No. 5,145,684 describes the production of a pharmaceutical formulation in which the drug substance is pulverized to nanoparticles (average particle size of 400 nm) in the presence of a surface modifier and then dispersed in a liquid medium to give a pharmaceutical formulation that exhibits remarkably high bioavailability.

The compositions are comprised of in general, a compound of Formula (I) in combination with at least one pharmaceutically acceptable excipient. Acceptable excipients are non-toxic, aid administration, and do not adversely affect the therapeutic benefit of the compound of Formula (I). Such excipient may be any solid, liquid, semi-solid or, in the case of an aerosol composition, gaseous excipient that is generally available to one of skill in the art.

Solid pharmaceutical excipients include starch, cellulose, talc, glucose, lactose, sucrose, gelatin, malt, rice, flour, chalk, silica gel, magnesium stearate, sodium stearate, glycerol monostearate, sodium chloride, dried skim milk and the like. Liquid and semisolid excipients may be selected from glycerol, propylene glycol, water, ethanol and various oils, including those of petroleum, animal, vegetable or synthetic origin, e.g., peanut oil, soybean oil, mineral oil, sesame oil, etc. Preferred liquid carriers, particularly for injectable solutions, include water, saline, aqueous dextrose, and glycols.

Compressed gases may be used to disperse a compound of this invention in aerosol form. Inert gases suitable for this purpose are nitrogen, carbon dioxide, etc. Other suitable pharmaceutical excipients and their formulations are described in Remington's Pharmaceutical Sciences, edited by E. W. Martin (Mack Publishing Company, 18th ed., 1990).

The amount of the compound in a formulation can vary within the full range employed by those skilled in the art. Typically, the formulation will contain, on a weight percent (wt%) basis, from about 0.01-99.99 wt% of a compound of Formula (I) based on the total formulation, with the balance being one or more suitable pharmaceutical excipients. Preferably, the compound is present at a level of about 1-80 wt%. Representative pharmaceutical formulations containing a compound of Formula (I) are described below.

Loading of the linker. 2.5 g (2.55 mmol) MBHA resin (S=1.02) was swelled in DMF for 5 minutes. 1.06g (7.65 mmol) 4-hydroxybenzoic acid and 1.03 g (7.65 mmol) HOBt was dissolved in DMF to which 1.18 mL (7.65 mmol) DIC was added. The clear mixture was poured to the resin and was agitated gently for 2 hrs. The resin

was drained, washed with DMF (5x). A mixture of 10 mL DMF and 5 mL ethanolamine was added and was agitated overnight at room temperature (18 hrs). The next morning the resin was drained, washed with DMF (3x), DCM (3x), 50% TFA/DCM (2x), DCM (2x), DMF (2x), DCM (2x), methanol (2x), ether (2x) and it was dried to get 2.8 g phenol resin. The degree of substitution was S=0.89 mmol/g resin (calculated from the weight increase).

Loading of the first acid. 1.2 g (5 mmol) N-*tert*-butyloxycarbonyl-5-aminoindole-2-carboxylic acid (Boc-5Ain-OH) was suspended in 20 mL DCM. 0.78 mL (5 mmol) DIC was added followed by 100 mg (0.8 mmol) DMAP. The suspension became clear within 5 minutes. The clear solution was added to the dry, 2.8 g (2.5 mmol) phenol resin, B1 and the mixture was agitated overnight (18 hrs) at room temperature. The next day the resin was drained, washed with DMF (3x). The unreacted phenolic OH groups were blocked by acetylation with 20% acetic anhydryde in DCM plus 0.5 mL DIEA. The resin was then washed with DMF (3x), DCM (3x), methanol (2x), ether (2x) and was dried resulting in 3.2 g B2. The degree of substitution was about 0.55 mmol/g resin – based on the weight increment.

Synthesis. 160 mg (0.1 mmol) Boc-5Ain-Hba-Resin (B2) was swelled in DCM for ten minutes and was then treated with 25% TFA 2% anisol in DCM for 20 minutes. It was washed 3x with DCM and 3x with DMF. The unprotected B3 was coupled in DMF with 151 mg (0.3 mmol) B4 dipeptide (synthesized separately in solution) using 108 mg (0.285 mmol) HBTU and 104 μL (0.6 mmol) DIEA for three hrs resulting in the resin bound tripeptide, B5. The resin was washed with DMF (3x), DCM (3x) and was treated with the TFA/anisol/DCM reagent again for 20 minutes. The TFA was washed out with DCM (3x) and DMF (3x). The free amino containing molecule was treated with 10 fold excess of 1*H*-Pyrazole-1-carboxamidine hydrochloride (146.6 mg, 1.0 mmol) and DIEA (344 μL, 2.0 mmol) overnight at room temperature to give B6. Finally, the product **103** was cleaved from the resin by treating with EDA at room temperature for 1 hour. The resin was filtered off, the supernatant was evaporated in vacuum and the remaining oil was precipitated from methanol with ether. The precipitate was spun down and was dried. The crude product was purified with HPLC (Vydac 12 μm C_{18} 2.2x25 cm column, 0% to 60%

acetonitrile gradient over 30 minutes, flow 20 mL/min). The overall yield was 16.4 mg (24%) **103**. ES MS: 648.26 (calcd. for $M+H^{+:}$ 648.28).

The crude product was purified with HPLC (Vydac 12 μm C_{18} 2.2x25 cm column, 0% to 60% acetonitrile gradient over 30 minutes, flow 20 mL/min). The overall yield was 15.2 mg (22%) **104**. 1-Methyl-4-nitro-imidazole-2-carboxylic acid ethyl ester (4g, 20mmol) were put into a screw cap flask and overlayered with 20 mL ethylene diamine and then placed overnight into a 55°C oven. The solvent was evaporated *in vacuo* and subsequently dried under high vacuum to give **212**.

The organic layer was washed twice with 0.1M sulfuric acid, twice with water, dried over anhydrous sodium sulfate to give a yellow oil that later solidified. Recrystallisation with hot toluene gave 3.51g (56% overall yield) of **213**. ^{1}H-NMR (DMSO-d_6) δ 8.74 (tr, 1H, δ=5.9, NH), 8.54 (s, 1H, imidazole C-H), 6.87 (tr, 1H, δ=5.2, NH), 3.99 (s, 3H, Me), 3.23-3.28 (m, 2H, CH_2), 3.04 (q, 2H, δ=5.9, CH_2), 1.35 (s, 9H, tBu); m.p. 138-139°C.

2,2-Bis(azidomethyl)-1,3-propanediol was synthesized from 2,2-Bis(bromomethyl)-1,3-propanediol in two steps, similarly to a procedure published previously (J. Med. Chem. 1989, 32, 2015-2020).

2,2-Bis(bromomethyl)-1,3-propanediol (3g, 11.453 mmol) was stirred with 3g (4 eq.) of sodium azide in 100 mL DMF at 120°C for 2 days. The reaction was cooled to room temperature, filtered, evaporated to ca 10mL. The residue was taken up in 100 mL dichloromethane, filtered and again evaporated. The residue was checked by NMR, which contained only DMF and 2,2-bis(azidomethyl)-1,3-propanediol. product was not further evaporated, but used in the next step. ^{1}H-NMR (DMSO-d_6) δ 4.73 (tr, 2H, OH), 3.28 (s, 4H, 2 CH_2), 3.25 (d, 4H, 4.1 Hz); ^{13}C-NMR (DMSO-d_6) δ 60.43, 51.80, 46.20.

2,2-Bis(azidomethyl)-1,3-propanediol was dissolved in 20 mL ethanol, cooled to 0°C and 500 mg of 5% Pd/$CaCO_3$ were added. After bubbling Ar through the mixture for

15 min, the mixture was hydrogenated for 6 hr by bubbling H_2 through the suspension. The brown suspension turned black after 1-2 hours. Filtration, evaporation and drying yielded greasy 1.5g of crystals. The crude product (2,2-bis(aminomethyl)-1,3-propanediol was used without further purification. ^{1}H-NMR (DMSO-d_6) δ 4.22 (s, 4H, 2 CH_2), 2.69 (br s, 6H, 2 OH, 2 NH_2), 2.47 (s, 4H, 2 CH_2); ^{13}C-NMR (DMSO-d_6) δ 59.41, 39.57, 39.19; ESI-MS: : mass calculated ($M+H^+$) 135.11, found 135.12.

220 was synthesized from **221** in three steps. **221** (6g, 25.7 mmol) was suspended in 125 mL methanol and heated to 55°C. 3N aq. Sodium hydroxide solution was added, whereupon all of the starting material dissolved. After stirring for 5 hours at 55°C, the solution was acidified to pH 2, and filtered. The filtrate was washed with water (50mL) and subsequently dried over phosphorus pentoxide to give indole-2,5-dicarboxylic acid **222** in quantitative yield. ^{1}H-NMR (DMSO-d_6): δ 12.06 (s, 1H, NH), 8.34 (s, 1H, CH), 7.82 (d, 1H, CH, δ=8.8 Hz), 7.47 (d, 1H, CH, δ=8.8 Hz), 7.23 (s, 1H, CH); m.p. 314-315°C.

Indole-2,5-dicarboxylic acid (**222**) (3g, 12.86 mmol) was dissolved in 40 mL DMF. Diisopropylethylamine (5.37mL, 2.4 eq) and 5.3 mL (2.4 eq) of pentafluorophenol trifluoro acetate were added to the reaction mixture. The reaction mixture was stirred overnight, evaporated, and separated between 150mL ethyl acetate and 150mL satured aq. sodium bicarbonate solution. The aqueous layer was extracted two more times with ethyl acetate (150 mL each). The organic layers were combined and dried over anhydrous sodium sulfate. The crude material was loaded on a silica gel-filled Büchner funnel and the product was eluted with 50% hexane/toluene mixture. 2.13 g (30.8%) of product **223** was obtained.

5-Nitro indole-2-carboxylic acid ethyl ester (654 mg, 2.79 mmol) was hydrogenated using 5% Pd/C (0.5 g) as a catalyst at 30 psi pressure for 30 min. Filtration through a frit to remove the catalyst, evaporation in vacuo and drying under high vacuum yielded free amine (**224**). It was immediately dissolved in 3 mL DMF and 500mg **223** were added. The reaction was kept at 55°C overnight and then evaporated. The crude material was recrystallized from hot ethanol to give 273 mg (50.8%) of product (**220**) after evaporation and drying. ^{1}H-NMR (DMSO-d_6): δ 11.98 (s, 1H, NH-indole), 11.86 (s, 1H, NH-indole), 11.81 (s, 1H, NH-indole), 10.25 (s, 1H,

The reaction was stirred for 3 days at room temperature and then 4 days at 55°C. Evaporation was followed by HPLC-purification (Vydac 12 µm, C18 2.2x25 cm column, 30% to 80% aqueous acetonitrile gradient over 20 min, flow rate 20 mL/min) to give purified product. After lyophilisation, the product was dissolved in ice-cold methanol, acidified with 200 µL 4 N HCl/dioxane and then precipitated with diethyl ether. The product was centrifuged, the ether decanted. The final product was dried in vacuo to give purified **219**. In the synthesis of **225** 30 mg of tripeptide (**220**) were dissolved in 500 µL neat 2,2- Dimethyl-1,3-propanediamine. This mixture was stirred for 1 week at room temperature. The reaction was monitored via HPLC purified (Vydac 12 µm, C18 2.2x25 cm column, 0% to 100% aqueous acetonitrile gradient over 20 min, flow rate 20 mL/min). Disappearance of a peak at 100% acetonitrile (corresponding to **223**) and appearance of a major peak at ca. 75% acetonitrile. The peak was very broad and consisted predominantly of dipeptide **233** as well as a minor amount of **234**. The substitution for **233** was assumed to be at the C-2 carboxy group, in accordance with several previous studies, which showed preferred substitution at this site. 30 mg of the mixture **233** and **234** were dissolved in 5 mL ethylenediamine and stirred for 1.5 days. The mixture was subsequently evaporated and HPLC-purified. Tripeptide was isolated and converted to the HCl salt, yielding 2.3 mg of final product (**229**).

diisopropylethyl amine were added. The reaction was stirred for 1 ½ days and then evaporated to give crude **237**. It was immediately dissolved in 200 µL anisol and 1800 µL TFA, left standing for 300 min, precipitated with ether, centrifuged, the ether decanted and subsequently dried. The compound was purified via preparative HPLC, lyophilized, dissolved in ice-cold methanol, acidified with 4 M HCl/dioxane, precipitated with ether, centrifuged, the ether was decanted and the product **230** dried in vacuo.

Example 140

The reaction below depicts methods which can be used to prepare compounds of this invention wherein R^1, R^2 and/or R^3 is (are) a group of $-(W-)_s-(-alk—O-)_q-R$ as defined herein. In the example below, poly(oxyethylene)-OCH_3 is specifically used in these methods and is depicted in FIG. 7 attached.

Specifically, a stoichiometric equivalent of poly(ethylene glycol) methyl ether (compound **300** -- available from Aldrich Chemical Company and having a average molecular weight of 330 -- about 7 repeating oxyethylene units) is combined under an inert atmosphere with a stoichiometric equivalent or slight excess of phosphorus tribromide, compound **301**, in a suitable inert diluent such as methylene chloride, diethyl ether and the like. The reaction mixture is maintained at ambient conditions until reaction goes to completion as evidenced by thin layer chromatography. At this time, the bromo poly(ethylene glycol) methyl ether, compound **302**, is recovered by conventional methods such as chromatography.

The following reaction is known in the art as the Gabriel Synthesis. The synthesis is useful for converting bromo compounds into primary amines.

At least a stoichiometric equivalent or slight excess of phthalamide, compound **303**, is dissolved in a suitable inert diluent such as dimethylformamide in

the presence of at least a stoichiometric amount of potassium hydroxide to form the intermediate phthalamide anion as a potassium salt, compound **304**. Afterwards, bromo poly(ethylene glycol) methyl ether, compound **302**, is then combined with the pthalamide anion, compound **304**, and the reaction is maintained at ambient conditions until formation of the N-[poly(ethylene glycol) methyl ether] phthalamide, compound **305**, as evidenced by thin layer chromatography. This product is then recovered by conventional methods such as chromatography.

At least a stoichiometric equivalent or slight excess of hydrazine, compound **306**, is combined with the N-[poly(ethylene glycol) methyl ether] phthalamide, compound **305**, recovered above in a suitable solvent such as ethanol maintained under reflux until the corresponding amine, compound **307**. The reaction has a biproduct of phthalazine-1,4-dione, compound **308**, which can be separated by conventional means such as chromatography.

In the alternative, the same reaction described above is done in the same manner using commercially available glycols.

Other polyoxyalkylene amines of the formula NH_2-(alk-O-)$_q$-R could be prepared by following the procedures set forth above and using other well-known or commercially available starting materials. In the case of R=H, blocking of one of the hydroxyl groups will be necessary to effect the reaction at the other hydroxyl group. Suitable blocking groups and reaction conditions for preparing a mono-blocked material are well known in the art. Due to the stoichiometric conditions of the reaction, there will be a mixture of components, compising mono-, di-, and tri-blocked materials. However, because of the various polarities of the products, the mono-subsitituted product can be conventionally achieved by methods such as chromatography.

Minimum Inhibitory Concentration (MIC) Assays

The assays described below were used to measure the minimum inhibitory concentration (MIC) of a compound necessary to completely inhibit visible growth of the organism tested. These assays are adapted from NCCLS protocols M7-A4 and M27-A (NCCLS vol 17:9 and vol 17:2) as modified by Sandven, S. *Clin. Micro.* (1999) 37:12, p.3856-3859. MIC values for Aspergillus fumigatus were determined using NCCLS protocol M38-P.

Inoculum preparation, incubation and reading results

All compounds were dissolved in 100% DMSO to a stock concentration of 10mM and use fresh or stored at -80 °C. Stock compounds were kept frozen until needed and used freshly with no more then one freeze-thaw cycle. When used for test purposes, compounds were diluted in the appropriate media depending on the organism being tested.

For yeast and aspergillus species, seven 1:2 serial dilutions of compound in appropriate media buffered with MOPS at pH 7.0 were prepared such that the final starting test compound concentrations were 50.0 uM for yeast and 50 uM aspergillus species. For bacteria, dilutions were made in growth media used for the particular bacteria being tested.

Yeast

Five well-separated colonies from a 24hr Sabouraud Dextrose plate incubated at 35C were picked and resuspended into 5.0 ml of normal saline. The $O.D._{530}$ was read and the culture was adjusted to 0.5 McFarland units with normal saline. A 1:2000 dilution was made with RPMI 1640 media buffered with MOPS at pH 7.0 and 100 µL of this inoculum preparation was added to an equal volume of test compound-containing media. 25 µL of the redox indicator Alamar Blue (Biosource International) was added to each well and the plates were incubated for 48h at 35 C. Wells having yeast growth changed color from blue to pink. Accordingly, the MIC

was calculated based on the well with the lowest concentration which did not change color from blue to pink, e.g., growth was inhibited.

Bacteria

Inoculums are made in the same manner as yeast except all dilutions are made in normal saline, with a final dilution of 1:200 and an inoculum of 10 µL. Solid and liquid media, as well as plate incubation times for the various organisms tested, are listed in Table 1 below.

Filamentous fungi

Inoculums are made by incubating *Aspergillus fumigatus* for 7 days at 35 C on potato dextrose agar slants. Slants are then covered with 1.0ml of 0.85% saline, one drop of Tween 20 is added and colonies are teased with a sterile transfer loop to create a suspension which is allowed to sit for 5 min so heavier particles can drop out. The upper suspension is separated and adjusted to an optical density of 0.09 to

0.11. The resulting suspension is diluted 1:50 which yields 2X the final inoculum needed. Micro dilution trays are prepared as with yeast and incubated for 48h at 35C. For our purposes the MIC is defined as the lowest compound concentration at which no visible growth is observed after 48h.

Compounds of this invention were tested in assays described above and were found to be active. Examples of compounds that exhibited antibacterial activity (MIC <45.5 μM) are shown in FIG. 5. Examples of compounds that exhibited antifungal activity (MIC <45.5 μM) are shown in FIG. 6. Compounds **284, 285, 287, 289, 290, 292, 293, 294, 295** in FIG. 9 are also examples of compounds that exhibited antibacterial activity (MIC <45.5 μM).

Example B2

Topoisomerase Inhibition Assays

Candida albicans topoisomerases I and II (cTop1 and cTop2) were isolated according to Fostel et al. (1992) and Shen et al. (1992). Human topoisomerases I and II (hTop1 and hTop2) were purchased from Topogen (Columbus, OH).

Inhibition of topoisomerase I

Effects of GL compounds on DNA relaxation by topoisomerase I were studied using gel electrophoresis. Negatively supercoiled plasmid DNA (pARG, 8 kb) was used as the substrate. The reaction for *C. albicans* topoisomerase I was performed in 25 mM TrisHCl, pH 7.5, 50 mM NaCl, 2.5 mM MgCl2, 0.5 mM EDTA and 50 ug/mL BSA at 35°C. The reaction was stopped at any given time by adding SDS to a final concentration of 0.5%. Subsequently, proteinase K was added to 250 ug/mL and the mixture was incubated at 60°C for 30 min. The reaction mixture was further extracted with phenol followed by phenol:isoamyl alcohol:chloroform (25:1:24). Samples were loaded on 0.8% agarose gel and subject to electrophoresis using 1X TBE. Different DNA intercalators were used for better gel resolution. Ethidium bromide was sometimes added to both the gel and the running buffer to

0.25 ug/mL. In other cases, chloroquine was added to 0.25 ug/mL to separate the DNA topoisomers.

Inhibition of topoisomerase II

Effects of GL compounds on topoisomerase II were investigated by monitoring decatenation reactions using entangled kinetoplast DNA (Topogen). The decatenation reaction was performed in 10 mM TrisHCl, pH 7.5, 50 mM NaCl, 50 mM KCl, 5 mM $MgCl_2$, 0.1 mM EDTA and 0.5 mM ATP. The reaction was stopped at any given time by adding SDS to a final concentration of 1%. Subsequently, proteinase K was added to 250 ug/mL and the mixture was incubated at 60°C for 30 min. The reaction mixture was further extracted with phenol followed by phenol:isoamyl alcohol:chloroform (25:1:24). Samples were loaded on 0.8% agarose gel and subject to electrophoresis using 1X TBE. Ethidium bromide was added to both the gel and the running buffer to 0.25 ug/mL.

DNA Binding Properties of Compounds of this Invention

Fluorescence Studies

When compounds prefer to bind to the minor groove of dsDNA, they induce DNA duplex formation. Hybridization of complementary fluorescently labeled strands brings the two labels, fluorescein and dabcyl, in close proximity, thus quenching the fluorescence of fluorescein. Therefore, this hybridization stabilization assay ("HSA") can be used to measure ligand binding to double-stranded DNA.

The DNA binding properties of several compounds of this invention were investigated by fluorescence spectroscopy. The 11-bp oligo CGA_8G ("FQ11") having fluorescein at the 5′ end on one strand and dabcyl at the 3′ end on the complementary strand was used as the AT-rich ligand binding target. At room temperature, FQ11 remains largely single-stranded in the HEN buffer (10 mM HEPES, pH 7.2, 0.1 mM EDTA and 10 mM NaCl).

Fluorescence was measured at the excitation wavelength of 485 nm and the emission wavelength of 530 nm using a 96-well plate fluoreader (PE CytoFluor®

Series 4000). The FQ11 concentration was kept at 5 nM (for duplex concentration) for the binding experiments and varying concentrations of ligands were added. All experiments were performed in duplicate in the HEN buffer at room temperature unless otherwise stated. Standard deviations were calculated based on the duplicate experiments. The fluorescence signal was normalized against the fluorescence in the absence of compounds. Decreasing fluorescence signals with increasing ligand concentrations indicated binding of the ligand to dsDNA. Through this least-square fitting procedure, apparent dissociation constants ($K_{d,app}$) for each compound tested were calculated. The studies demonstrated that compounds of this invention bind to DNA very tightly, with apparent $K_{d,app}$ values below 100 nM for most compounds tested.

Circular Dichroism Studies

Because of the electronic interactions between ligand and DNA, ligand binding can often induce circular dichroism ("CD") signals that are absent when DNA or ligand is alone in solution. DNA binding of compounds of this invention were determined using CD spectroscopy by methods well know in the art.

All solution conditions were the same as described above. PolydA-polydT was used at 50 μM. CD signal was monitored using a JASCO J-600 CD polarimeter at room temperature. The results showed binding properties that indicated a 2:1 complex. The dramatic CD change in the DNA absorbing region (260 – 300 nm) upon binding of these compounds demonstrated that compounds of this invention induced DNA conformational changes.

DNA Thermal Melting Studies

Interactions between DNA and compounds of this invention were investigated using thermal melting techniques monitored at UV wavelength 260 nm. All investigated compounds showed a stabilization effect on DNA duplex formation.

During melting experiments, 3 uM GCGA3T3CGC (A3T3) oligo duplex was mixed with 6 uM of compound in HEN buffer in a total volume of 200 uL. The UV absorbance was monitored at 260 nm with a Beckman UV spectrophotometer with temperature control. The melting temperature, T_m, where half of the duplex

dissociates was determined at relative absorbance of 0.5. The free A3T3 has a T_m of approximately 42°C. With the presence of ligands, the T_m increases. The results indicated compounds of this invention tend to stabilize duplex DNA by binding to the minor groove. Increases in T_m have also been observed for duplex oligo CGATTATTAAGC in the presence of the compound.

Alternatively, DNA interactions were monitored in a buffer containing 10 mM HEPES, pH 7.2, 0.1 mM EDTA, and 50 mM NaCl. DNA thermal melting was monitored by UV absorbance at 260 nm on a Cary 100 Bio UV/vis spectrophotometer. A 12 base-pair AT-rich DNA oligonucleotide (Oligo 1: CGATTATTAAGC) was used at 5 μM and mixed with compounds at various ratios. Temperature was typically varied from 15 to 95°C with a ramp rate of 0.2 °C /min. To determine the melting temperature (T_m) where half of the double-stranded DNA molecules dissociate into two separated strands, the first-order derivatives of the absorption-temperature curve were calculated using the Varian software, and the maximum of derivatives corresponds to the melting temperature. The melting temperature determined by the derivative methods was verified using a standard hyperchromicity method provided by the Varian software. The T_m value was reported as the difference between melting temperatures in the presence and in the absence of compounds.

Determination of Drug-DNA Binding Constants

An ethidium bromide displacement assay was used to determine the dissociation constant for binding of compounds to oligo 1. The assay was described in Dyatkina *et al. J. Med. Chem.*, **45**:805-817, 2002.

Example B4
In vivo Properties

The *in vivo* properties of the compounds of the present invention are tested in animal models of infection. In animal model studies, the compound's effect on increasing the survival of infected animals, the compound's effect on infected organ systems, and other biological properties of the compounds are determined.

Effect on Survival

In a murine model of systemic aspergillosis, six-week-old female CD-1 mice (Charles River Laboratories) are infected with approximately 8.4 x10^6 conidia of a strain of *Aspergillus fumigatus* on day 0 by intravenous inoculation in a lateral tail vein. The infected mice are treated with compounds of this invention beginning on day 0, 1, 2, 3 or 4, and continue for between 2 to 30 or more additional days. The infected mice are treated once, twice, three times or four times a day. Alternatively, the infected mice are treated once every two, three, or four days. Groups of mice being treated receive various doses of compounds of this invention ranging from 0.1 to 50 mg per kg of body weight, for example, 1.0 mg/kg for one group, 3.3 mg/kg for the second group, and 10.0 mg/kg for the third group. Mice in control groups receive various doses of a known antifungal compound, for example, amphotericin B (AmB) at 0.8 mg/kg for one group, and AmB at 3.3 mg/kg for another group. A group of untreated mice serves as untreated controls. The compounds of this invention and the known antifungal compound are administered intraperatoneally (i.p.), intravenously (i.v.) intramuscularly (i.m,), intranasally, orally or subcutaneously, and are given once, twice, three times or four times daily for the duration of the experiment starting on day 0, 1, 2, 3 or 4.

Mortality is recorded through the course of infection, for example, through fourteen days of infection. Mortality is plotted on Kaplan-Meier plots and *P*-values are determined using well known statistical analysis methods, including the log rank test of comparative survival.

Effect on Infected Organ Systems

In the murine model of systemic aspergillosis described above, surviving mice are euthanized at pre-selected time points. The fungal burdens remaining in the organs, *e.g.* ,the brain and kidneys are determined by quantitative plating of organ homogenates on nutrient containing agar plates, for example, on potato dextrose agar plates. The plates are incubated for one to fourteen days. The colony forming units (CFU) recovered from the organ are determined to identify the effect of the compounds of this invention on the infected organ system. For example, a lower CFU value obtained from the brain of a treated animal when compared to the value

obtained from the brain of a non-treated or control animal indicates a lower aspergillis brain burden from the treated animal. The results obtained are analyzed using statistical methods well known in the art. For example, the *P* values are determined by using the Mann-Whitney test of comparative CFU values obtained from treated, untreated, and treatment with AmB. Compounds of the present invention that lower the aspergillis brain burden are useful in treating central nervous system (CNS) fungal infections. These compounds may cross the blood-brain barrier.

INTERNATIONAL SEARCH REPORT

I ional application No.
PCT/US 02/41087

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. [X] Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

Although claims 33-36 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

2. [X] Claims Nos.: 1-6 (part), 11-19 (part), 30-36 (part)
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

see FURTHER INFORMATION sheet PCT/ISA/210

3. [ ] Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. [ ] As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

[ ] The additional search fees were accompanied by the applicant's protest.

[ ] No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1-6 (part), 11-19 (part), 30-36 (part)

The claims cover a vast array of compounds, the only essential common features of which are the 2 head-to-head amide groups plus 2 further carbonyl groups which are part of amide or carboxyl functionalities. X1, X2 and X3 are linking groups which may be purely hydrocarbon or contain heteroatoms, may be open-chain or cyclic, saturated or unsaturated, substituted or unsubstituted. The terminal R1 and R2 groups in claim 11 are also virtually unlimited in scope. Only compounds wherein X1, X2 and X3 are all cyclic groups appear to be concretely disclosed in the present description. The claims thus go far beyond the scope which is supported by the description and hence do not fulfill the requirements of Article 5 PCT. The search has been performed for the compounds of formula (I) which appear to be supported and disclosed, namely those wherein X1, X2 and X3 are all cyclic groups. However, such a large number of documents were retrieved which are relevant to the issue of novelty of claim 11 and its dependent claims, it is not possible to cite them all. The documents cited represent merely a selection of those found.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
