10 The compounds of the invention are preferential inhibitors of the cysteine protease Cathepsin (Cat), in particular Cathepsin S or Cathepsin L and are therefore useful to treat metabolic diseases like diabetes, atherosclerosis, abdominal aortic aneurysm, peripheral arterial disease, cancer, reduction of cardiovascular events in chronic kidney disease and diabetic nephropathy. In addition, immune mediated diseases like rheumatoid arthritis, 15 multiple sclerosis, sjorgen syndrome, lupus erythematosus, neuropathic pain, diabetes type I, asthma and allergy and skin related immune disease are suitable diseases to be treated with a cathepsin S inhibitor.

Objects of the present invention are the compounds of formula (I) and their aforementioned salts per se and their use as therapeutically active substances, a process for 20 the manufacture of the said compounds, intermediates, pharmaceutical compositions, medicaments containing the said compounds, their pharmaceutically acceptable salts, the use of the said compounds and salts for the prophylaxis and/or therapy of illnesses, especially in the treatment or prophylaxis of diabetes, atherosclerosis, abdominal aortic aneurysm, peripheral arterial disease, cancer, reduction of cardiovascular events in chronic 25 kidney disease and diabetic nephropathy, and the use of the said compounds and salts for the production of medicaments for the treatment or prophylaxis of diabetes, atherosclerosis, abdominal aortic aneurysm, peripheral arterial disease, cancer, reduction of cardiovascular events in chronic kidney disease and diabetic nephropathy.

Mammalian cathepsins are cysteine-type proteases involved in key steps of biological and pathological events. Cathepsins are considered tractable drug targets as it is feasible to 30 inhibit enzymatic activity with small molecules and are therefore of interest to the pharmaceutical industry (Bromme 2001; Roberts 2005).

Cathepsin S is prominently expressed in antigen presenting cells like macrophages and dendritic cells and smooth muscle cells. (Hsing and Rudensky 2005; Rudensky and

Beers 2006). While Cathepsin S is only weakly expressed in normal arterial tissue, strong upregulation is seen in atherosclerotic arteries (Liu et al. 2006; Sukhova et al. 1998).

Preclinical data suggest that the function of Cathepsin S is critical for atherosclerosis as Cathepsin S deficient mice have a reduced atherosclerosis-phenotype when tested in appropriate mouse models. In LDL-Rec deficient mice reduced lipid accumulation, elastin-fibre breakdown and chronic arterial inflammation is reported. In APO E deficient mice a significant reduction of acute plaque rupture events was reported. When chronic renal disease is introduced into CatS/In APO-E deficient mice a strong reduction of accelerated calcification is seen on top of the anti atherosclerotic activity in arteries and heart valves (Aikawa et al. 2009; de Nooijer et al. 2009; Rodgers et al. 2006; Sukhova et al. 2003). This suggests a potential inhibitor of Cathepsin S would stabilise atherosclerotic plaque by reducing extracellular matrix breakdown, by reducing the proinflammatory state and by reducing accelerated calcification and subsequently its clinical manifestations.

These phenotypes described in atherosclerosis models are in agreement with known cellular functions of Cathepsin S. Firstly; Cathepsin S is involved in the degradation of extracellular matrix that stabilises the plaque. In particular, Cathepsin S has potent elastinolytic activity and can exert this at neutral pH, a feature that distinguishes Cathepsin S from all other Cathepsins. Secondly, Cathepsin S is the major protease involved in antigen processing, in particular cleavage of the invariant chain in antigen presenting cells, resulting in reduced contribution of Tcells to the chronic inflammation of the atherosclerotic tissue. Elevated inflammation results in further oxidative and proteolytic tissue damage and subsequently plaque destabilisation (Cheng et al. 2004; Driessen et al. 1999; Rudensky and Beers 2006).

The anti-inflammatory and anti-elastinolytic properties of a Cat S inhibitor make it also a prominent target for chronic obstructive pulmonary disease (Williams et al. 2009). Furthermore due to its extracellular functions in matrix degradation, inhibition of cathepsin S will impact neointima formation and angiogenesis (Burns-Kurtis et al. 2004; Cheng et al. 2004; Shi et al. 2003; Wang et al. 2006). An inhibitor of Cathepsin S might therefore be useful in several different disease settings.

Cathepsin S plays also a role in the reduction of tumor growth and tumor cell invasion as described by Roberta E. Burden in Clin Cancer Res 2009;15(19). In addition, nephrectomized Cathepsin S knock out mice showed a significant reduction of arterial calcification when compared to nephrectomized wild type mice. This indicates that inhibition of Cathepsin S may have a beneficial effect on the reduction of cardiovascular events in chronic kidney disease patients (Elena Aikawa, Circulation, 2009, 1785-1794).

Cathepsin L shows a broader expression profile than cathepsin S and there are also data which suggest a role of cathepsin L in atherosclerosis, e.g. LDLrec & Cat L deficient mice show a reduced atherosclerotic phenotype (Kitamoto et al. 2007). In addition, Cat L was suggested to be involved in metabolic syndrome as it controls adipogenesis and peripheral glucose tolerance. In renal disease Cathepsin L is described to regulate podocyte function by proteolytically processing dynamin and thereby proteinuria (Sever et al. 2007).

Tissue remodelling, extracellular matrix degradation, the generation of active neuropeptides and roles in antigen presentation in thymic epithelial cells are cellular activities described for Cathepsin L (Funkelstein et al. 2008; Rudensky and Beers 2006).

The compounds of the present invention can be prepared, for example, by the general synthetic procedures described below.

Orthogonally protected cis-4-hydroxy proline derivatives such as (2S,4S)-4-hydroxy-pyrrolidine-1,2-dicarboxylic acid 1-tert.-butyl ester is reacted with an appropriate aminoacetonitrile derivative in presence of one of the various amide coupling reagents such as BOP-Cl, TBTU, BOP, PyBop, HATU, EDCI/HOBT, DIC/HOBT; DCC/HOBT, etc. to yield corresponding amide. The amide is reacted with a sulfonyl chloride such as Mes-Cl, Nos-Cl, Tos-Cl or triflic anhydride to yield compound A. Reaction of A with thiols, in the presence of an appropriate base such as NaH, LiHMDS, DIPEA, TEA, etc yields compounds of type B. Oxidation of the obtained thioether is accomplished by an appropriate oxidizing agent such as H₂O₂, Oxone, MCPBA, etc. to yield compounds C. The protecting group is removed, in the case of Boc as protecting group with TFA, HCl or formic acid in an appropriate solvent such as THF, dioxane, CH₂Cl₂, etc. to yield the final compound D.

PG = protecting group (e.g. Cbz, Boc, Fmoc); LG = leaving group (e.g. F, Cl, Br, I).

Orthogonally protected cis-4-hydroxy proline derivatives such as (2S,4S)-4-hydroxy-pyrrolidine-1,2-dicarboxylic acid 1-tert.-butyl ester 2-methyl ester is reacted with an
 5 appropriate sulfonyl chloride such as Mes-Cl, Nos-Cl, Tos-Cl or triflic anhydride to yield compound E. Reaction of E with thiols in the presence of an appropriate base such as NaH, LiHMDS, DIPEA, TEA, etc yields compounds of type F. Oxidation of the obtained thioether is accomplished by an appropriate oxidizing agent such as H₂O₂, Oxone, MCPBA, etc. to yield compounds G. Saponification with a base such as LiOH, NaOH,
 10 KOH or K₂CO₃, Na₂CO₃, Cs₂CO₃, etc. or by acids yields compounds H. Amide coupling of H with aminoacetonitrile derivatives is accomplished by one of the various coupling reagents such as BOP-Cl, TBTU, BOP, PyBop, HATU, EDCI/HOBT, DIC/HOBT;

DCC/HOBT, etc. to yield compound I. Compounds K are obtained by deprotection of compound I with either acids such as TFA, formic acid, HCl, etc. or by bases such as piperidines. The proline amines K can then be modified with alkylating agents such as R¹-Hal (Hal = Cl, Br, I, TfO, etc.) and aldehydes/ketones or acylating agents such as
 5 carboxylic acids, carboxylic acid chlorides, anhydrides, mixed anhydrides, sulfonylchlorides, etc. to yield compounds L.

Additionally, the compounds of the present invention can be prepared according to the following synthetic procedures.

Scheme 3

10

R^a and R^b are independently selected from hydrogen and fluorine. R^c is alkyl or benzyl, preferably methyl, ethyl or benzyl.

An optionally substituted carboxy-protected cyclic amino acid derivative, such as L-proline methyl ester, L-proline benzyl ester, L-proline ethyl ester, 4,4-difluoro-L-proline methyl ester, 4,4-difluoro-L-proline ethyl ester, 4,4-difluoro-L-proline benzyl ester, and
 15 corresponding homo proline derivatives, is condensed with formaldehyde in presence of an appropriate vinylsulfone. The obtained pyrrolizine regioisomeres M and N are saponified with a base such as LiOH, NaOH, KOH or K₂CO₃, Na₂CO₃, Cs₂CO₃, etc. or by acids yields or by catalytic hydrogenation to yield the corresponding acids which are reacted with
 20 aminoacetonitrile derivatives under amide coupling conditions in the presence of one of

the various coupling reagents such as BOP-Cl, TBTU, BOP, PyBop, HATU, EDCI/HOBT, DIC/HOBT; DCC/HOBT, etc. to yield compounds O and P.

Scheme 4

5 R is methyl, ethyl, isopropyl or tert. butyl.

Compounds of type 1, prepared by methods described above or analogous methods, can be converted to N-aryl derivatives of type 2 (where $R^1 = R^{11}$) by methods well known in the art, for example by copper or palladium promoted N-arylation using aryl boronic acids or aryl boronic esters as aryl source and various types of palladium or copper salts
 10 with or without ligands, eventually in the presence of additives like bases or oxygen. Alternatively, compounds of type 2 where $R^1 = R^{11}$ can be prepared by aromatic nucleophilic substitution with suitable aryl donors. Such reactions are run at room temperature or with heating, eventually in the presence of a base. Saponification with a base such as LiOH, NaOH, KOH or K_2CO_3 , Na_2CO_3 , Cs_2CO_3 , etc. or by acids yields
 15 compounds 3. Amide coupling of 3 with aminoacetonitrile derivatives is accomplished by one of the various coupling reagents such as BOP-Cl, TBTU, BOP, PyBop, HATU, EDCI/HOBT, DIC/HOBT; DCC/HOBT, etc. or by formation of a mixed anhydride with alkyl-chloroformates like ethyl chloroformate or *i*-butyl chloroformate followed by reaction with an aminoacetonitrile, to yield compounds 4.

Cis-hydroxy proline alkyl esters 5 can be converted to compounds of type 6 where R¹
10 = R¹¹ by methods well known in the art, for example by copper or palladium promoted N-arylation using aryl boronic acids or aryl boronic esters as aryl source and various types of palladium or copper salts with or without ligands, eventually in the presence of additives like bases or oxygen. Alternatively, compounds of type 6 where R¹ = R¹¹ can be prepared by aromatic nucleophilic substitution with suitable aryl donors. Such reactions are run at
15 room temperature or with heating, eventually in the presence of a base. Compounds of type 6 are reacted with an appropriate sulfonyl chloride such as Mes-Cl, Nos-Cl, Tos-Cl or triflic anhydride to yield compound 7. Reaction of 7 with thiophenols, which eventually contain an appropriate leaving group (e.g. F, Cl, Br, I, etc.), in the presence of an appropriate base such as NaH, LiHMDS, DIPEA, TEA, etc. yields compounds of type 8.
20 Oxidation of the obtained thioether is accomplished by an appropriate oxidizing agent such as H₂O₂, Oxone, MCPBA, etc. to yield compounds 9. Saponification with a base such as LiOH, NaOH, KOH or K₂CO₃, Na₂CO₃, Cs₂CO₃, etc. or by acids yields compounds 10. Amide coupling of 10 with aminoacetonitrile derivatives is accomplished by one of the various coupling reagents such as BOP-Cl, TBTU, BOP, PyBop, HATU, EDCI/HOBT,
25 DIC/HOBT; DCC/HOBT, etc. or by formation of a mixed anhydride with alkylchloroformiates like ethyl chloroformiate or *i*-butyl chloroformiate followed by reaction with an aminoacetonitrile, to yield compound 11. The residue R^e, if desired, can be introduced either by nucleophilic aromatic substitution with amines, alcohols or heteroaromatic moieties in the presence of a base (e.g. DIEA, TEA, K₂CO₃, Na₂CO₃,
30 Cs₂CO₃, etc.) or by metal catalyzed coupling reactions to yield compounds 12.

Scheme 6

R, R^d and R^e are as defined above.

R^f, R^g and R^h are independently selected from alkyl, halogen, haloalkyl, alkoxy, alkoxy carbonyl, halophenyl, halopyridinyl, oxodihydropyridinyl and nitro, preferably independently selected from methyl, fluoro, methoxy, methoxycarbonyl, trifluoromethoxy, trifluoromethyl, chlorophenyl, fluorophenyl, chloropyridinyl, oxodihydropyridinyl and nitro.

Compounds of type 13, prepared by methods described above or analogous methods, can be converted to the β -keto amides of type 14 by reaction with an appropriate β -keto ester, typically a *tert*-butyl β -keto ester under thermic exchange conditions, according to methods known in the art. Conversion to the corresponding thioamide 15 can be easily obtained for example with Lawesson's reagent. Cyclization to pyrazoles 16 is obtained by treatment with a hydrazine under thermic conditions. Optionally, conversion of β -keto amides 14 to pyrazoles 16 can also be performed in a one-pot reaction. Saponification with a base such as LiOH, NaOH, KOH or K_2CO_3 , Na_2CO_3 , Cs_2CO_3 , etc. or by acids yields compounds 17. Amide coupling of 17 with aminoacetonitrile derivatives is accomplished by one of the various coupling reagents such as BOP-Cl, TBTU, BOP, PyBop, HATU, EDCI/HOBT, DIC/HOBT; DCC/HOBT, etc. or by formation of a mixed anhydride with alkyl-chloroformates like ethyl chloroformate or *i*-butyl chloroformate followed by reaction with an aminoacetonitrile, to yield compounds 18.

Orthogonally protected *cis*-4-hydroxy proline derivatives such as (2*S*,4*S*)-4-hydroxy-pyrrolidine-1,2-dicarboxylic acid 1-*tert*-butyl ester 2-methyl ester is reacted with an appropriate sulfonyl chloride such as Mes-Cl, Nos-Cl, Tos-Cl or triflic anhydride to yield compound 19. Reaction of 19 with thiophenols, which contain an appropriate leaving
5 group (e.g. F, Cl, Br, I, etc.), in the presence of an appropriate base such as NaH, LiHMDS, DIPEA, TEA, etc yields compounds of type 20. Oxidation of the obtained thioether is accomplished by an appropriate oxidizing agent such as H₂O₂, Oxone, MCPBA, etc. to yield compounds 21. The residue R^c can be introduced either by nucleophilic aromatic substitution with amines, alcohols or heteroaromatic moieties in the presence of a base
10 (e.g. DIEA, TEA, K₂CO₃, Na₂CO₃, Cs₂CO₃, etc.) or by metal catalyzed coupling reactions to yield compounds 22. Saponification with a base such as LiOH, NaOH, KOH or K₂CO₃, Na₂CO₃, Cs₂CO₃, etc. or by acids yields compounds 23. Amide coupling of 23 with aminoacetonitrile derivatives is accomplished by one of the various coupling reagents such as BOP-Cl, TBTU, BOP, PyBop, HATU, EDCI/HOBT, DIC/HOBT; DCC/HOBT, etc. to
15 yield compound 24. Compounds 25 are obtained by deprotection of compound 24 with either acids such as TFA, formic acid, HCl, etc. or by bases such as piperidines. The proline amines 25 can then be modified with alkylating agents such as R¹-Hal (Hal = Cl, Br, I, TfO, etc.) and aldehydes/ketones or acylating agents such as carboxylic acids, carboxylic acid chlorides, anhydrides, mixed anhydrides, sulfonylchlorides, etc. to yield compounds

Scheme 10

The tetrasubstituted pyrrolidine derivatives were prepared in analogy to the procedures described in J.C. Carretero et al., *Org. Lett.*, Vol. 8, No. 9, 2006, 1795-1798. A suitable amino acid is condensed with an aldehyde to yield the corresponding imine in the presence a dehydrating agent such as Na₂SO₄, CaCl₂, MgCl₂, mol sieve etc. In the presence of a Cu(I) source such as CuClO₄, CuOAc or a Ag(I) source, a substituted vinylsulfone and a chiral ligand such as Binap, Chiraphos, Norphos, Josiphos, Mandyphos, Taniaphos etc. the 1,3-dipolar cycloaddition reaction occurs. Subsequent protection with an appropriate protecting group such as Boc, Fmoc, Cbz, etc. and saponification with LiOH, NaOH, etc. yields the corresponding N-protected amino acid. Reaction of the amino acid with cyclopropyl amino acetonitrile in the presence of a suitable amide coupling reagent such as CDI, EDCI, DIC, DCC, HATU, TBTU, BOP, PyBop and subsequent deprotection yields the final compounds.

Scheme 11

In scheme 11, R¹ and R² are independently selected from hydrogen and alkyl. R⁴ is alkyl or benzyl, preferably methyl, ethyl or benzyl. R⁵ and R⁶ are as defined above. R^z is
 5 CN, COOR, C(O)ONHR or SO₂R (R = alkyl, alkylaryl, aryl, hetaryl).

An arylsulfonyl substituted carboxy-protected cyclic amino acid derivative X is condensed under acid catalysis (TFA, MesOS, trifluoromethane sulfonic acid, HCl, HBr, H₂SO₄, H₃PO₄ etc.) with formaldehyde or aldehydes or ketones Y in presence of an appropriate activated vinyl derivative Z. The obtained pyrrolizine derivative is saponified
 10 with a base such as LiOH, NaOH, KOH or K₂CO₃, Na₂CO₃, Cs₂CO₃, etc. or by acids or by catalytic hydrogenation to yield the corresponding acids which are reacted with aminoacetonitrile derivatives under amide coupling conditions in the presence of one of the various coupling reagents such as BOP-Cl, TBTU, BOP, PyBop, HATU, EDCI/HOBT, DIC/HOBT, DCC/HOBT, etc. to yield the final compound. If compound Z contains a
 15 functional group which is not stable or is reactive under the reaction conditions of one or more reaction steps, appropriate protecting groups (PG) (as described e.g. in "Protective Groups in Organic Chemistry" by T.W. Greene and P.G.M. Wutts, 2nd Ed., 1991, Wiley N.Y.) can be introduced before the critical step applying methods well known in the art. Such protecting groups can be removed at a later stage of the synthesis using standard
 20 methods described in the literature.

Scheme 12

Scheme 12 describes a modification of the synthesis described above. It is taking advantage of the known (1*S*,4*S*)-2-oxa-5-azabicyclo[2.2.1]heptan-3-one, methanesulfonate salt 43 (CAS # : 769167-53-5) to set the relative and absolute configuration. After introduction of the N-substituent, amino acetonitrile is then coupled to form hydroxyl amide 45 using for example sodium 2-ethylhexanoate in water. The free alcohol in 45 is activated using, for example, chlorophenylsulfonate. The sulfonate is displaced in an SN₂ reaction to introduce the thioether. This thioether 47 is then oxidized to the sulfone 48 using, for example oxone.

Example 492

(2S,4R)-4-(2-Chloro-4-fluoro-benzenesulfonyl)-1-(5-methyl-2-phenethyl-2H-pyrazol-3-yl)-pyrrolidine-2-carboxylic acid (1-cyano-cyclopropyl)-amide

In analogy to the procedure described in example 237, (2S,4R)-4-(2-chloro-4-fluorophenylsulfonyl)-1-(3-methyl-1-phenethyl-1H-pyrazol-5-yl)pyrrolidine-2-carboxylic acid (example 484 b) was reacted with 1-amino-cyclopropanecarbonitrile hydrochloride

(CAS Reg. No. 127946-77-4) in the presence of HATU and DIEA to give the title compound as off-white foam. MS (ESI): $m/z = 556.2 [M+H]^+$.

Example 493

(2S,4R)-4-(2-Chloro-4-fluoro-benzenesulfonyl)-1-[5-methyl-2-(tetrahydro-pyran-4-yl)-2H-pyrazol-3-yl]-pyrrolidine-2-carboxylic acid (1-cyano-cyclopropyl)-amide

Example 494

Cathepsin enzyme inhibition assay.

15 Enzyme activity is measured by observing the increase in fluorescence intensity caused by cleavage of a peptide substrate containing a fluorophore whose emission is quenched in the intact peptide.

Assay buffer: 100 mM potassium phosphate pH 6.5, EDTA-Na 5 mM, Triton X-100 0.001%, DDT 5 mM.

20 Enzymes (all at 1 nM): human and mouse Cathepsin S, Cat K, Cat B, Cat L

Substrate (20 μ M): Z-Val-Val-Arg-AMC, except for Cat K which uses Z-Leu-Arg-AMC (both from Bachem).

Z = Benzyloxycarbonyl.

AMC = 7-Amino-4-Methyl-Coumarin.

Final volume: 100 μ L.

Excitation 360 nm, Emission 465 nm.

Enzyme is added to the substance dilutions in 96-well microtitre plates and the reaction is
 5 started with substrate. Fluorescence emission is measured over 20 minutes, during which
 time a linear increase is observed in the absence of inhibitor. IC₅₀ are calculated by
 standard methods. The results are expressed in μ M in the following table.

In the foregoing assay, the compounds according to the invention have an IC₅₀ for
 Cathepsin S which is between 0.00001 and 100 μ M, preferably between 0.00001 and 50
 10 μ M, more preferably between 0.00001 and 20 μ M.

In the foregoing assay, the compounds according to the invention have an IC₅₀ for
 Cathepsin L which is between 0.00001 and 200 μ M, preferably between 0.00001 and 100
 μ M, more preferably between 0.00001 and 80 μ M.
