(54) Title: METHODS AND COMPOSITIONS FOR TREATING WITHDRAWAL SYNDROMES USING NON-SEDATIVE DEXMEDETOMIDINE TRANSDERMAL COMPOSITIONS

Figure 1

(57) Abstract: Aspects of the invention include methods of treating withdrawal syndrome by applying a transdermal delivery device containing a dexmedetomidine composition formulated to deliver a non-sedative amount of dexmedetomidine to a subject diagnosed as having withdrawal syndrome. In practicing methods according to certain embodiments, a transdermal delivery device having a dexmedetomidine composition is applied to a subject and is maintained in contact with the subject in a manner sufficient to deliver a non-sedative amount of dexmedetomidine to treat withdrawal syndrome in the subject. Also provided are transdermal delivery devices configured to deliver a non-sedative amount of dexmedetomidine sufficient for practicing the subject methods, as well as kits containing the transdermal delivery devices.

WO 2015/054063 A1

METHODS AND COMPOSITIONS FOR TREATING WITHDRAWAL SYNDROMES USING NON-SEDATIVE DEXMEDETOMIDINE TRANSDERMAL COMPOSITIONS

CROSS-REFERENCE TO RELATED APPLICATIONS

5 Pursuant to 35 U.S.C. §119(e), this application claims priority to the filing date of United States Provisional Application Serial No. 61/887,871 filed October 7, 2013, the disclosure of which is herein incorporated by reference.

INTRODUCTION

10 Withdrawal syndrome is the group of symptoms which occur upon cessation or reduction of use of a physiologically active (e.g., psychoactive) substance that has been taken repeatedly, usually for a prolonged period or in high doses. Withdrawal syndrome is typically accompanied by signs of physiological disturbance. The onset and course of the withdrawal syndrome are time-limited and are related to the type of substance and dose
15 being taken immediately before cessation or reduction of use. Many times, the features of a withdrawal syndrome are the opposite of those of acute intoxication, such as for example tremor, sweating, anxiety, agitation, depression, nausea, malaise, delirium, aches, muscle twitches, perceptual distortions, abdominal cramps and psychological instability. Management of withdrawal syndromes in the clinical setting includes the sedation-inducing
20 dosages of sedatives or hypnotics as well as physical restraints to control confusion, delirium, psychosis and agitation.

Dexmedetomidine is the S-enantiomer of medetomidine and is an agonist of α_2 -adrenergic receptors that is used as a sedative medication in intensive care units and by anesthetists for intubated and nonintubated patients requiring sedation for surgery or short
25 term procedures. The α_2 -adrenergic receptor is a G-protein coupled receptor associated with the G_i heterotrimeric G-protein that includes three highly homologous subtypes, including α_{2a} , α_{2b} and α_{2c} -adrenergic receptors. Agonists of the α_2 -adrenergic receptor are implicated in sedation, muscle relaxation and analgesia through effects on the central nervous system.

30 Dexmedetomidine is used in clinical settings as a sedative through parenteral, intravenous and oral administration and thus, requires close supervision by a health care professional in a hospital setting. Dexmedetomidine is currently employed for sedation of intubated or mechanically ventilated subjects in an in-clinic (e.g., hospital) setting as well as for the sedation of non-intubated subjects as a part of monitored anesthesia during surgery,

radiography or diagnostic procedures. Dexmedetomidine is also approved for continuous intravenous infusion in non-intubated subjects since it does not adversely affect breathing.

SUMMARY

5 Aspects of the invention include methods of treating withdrawal syndrome by applying a transdermal delivery device containing a dexmedetomidine composition formulated to deliver a non-sedative amount of dexmedetomidine to a subject diagnosed as having withdrawal syndrome. In practicing methods according to certain embodiments, a transdermal delivery device having a dexmedetomidine composition is applied to a subject
10 and is maintained in contact with the subject in a manner sufficient to deliver a non-sedative amount of dexmedetomidine to treat withdrawal syndrome in the subject. Also provided are transdermal delivery devices configured to deliver a non-sedative amount of dexmedetomidine sufficient for practicing the subject methods, as well as kits containing the transdermal delivery devices.

BRIEF DESCRIPTION OF THE FIGURES

Figure 1 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition with polyisobutylene/polybutene and crosslinked polyvinylpyrrolidone adhesive
20 according to one embodiment.

Figure 2A shows an example of cumulative dexmedetomidine delivered amount with time according to one embodiment. Figure 2B shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a non-functionalized acrylate adhesive
25 according to one embodiment. Figure 2C shows an example of dexmedetomidine utilization with time according to one embodiment.

Figure 3 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a non-functionalized acrylate adhesive according to one embodiment.

30 Figure 4 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a hydroxyl functionalized acrylate adhesive containing vinyl acetate according to one embodiment.

35 Figure 5 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal

composition having a hydroxyl functionalized acrylate adhesive according to another embodiment.

Figure 6 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having hydroxyl functionalized acrylate adhesive and a hydroxyl functionalized acrylate adhesive containing vinyl acetate according to another embodiment.

Figures 7A-7B shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for dexmedetomidine transdermal compositions having a non-functionalized acrylate adhesive, a hydroxyl functionalized acrylate adhesive and a hydroxyl functionalized acrylate adhesive containing vinyl acetate according to one embodiment.

Figure 8 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a carboxylic acid functionalized acrylate adhesive according to another embodiment.

Figure 9 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having acrylic adhesive with carboxyl group and hydroxyl group as the functional group containing vinyl acetate according to another embodiment.

Figure 10 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a polyisobutylene/polybutene adhesive with a carboxylic acid functionalized acrylate adhesive according to one embodiment.

Figure 11 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a polyisobutylene/polybutene adhesive with the solubility enhancer levulinic acid according to one embodiment.

Figure 12 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a polyisobutylene/polybutene adhesive with the solubility enhancer lauryl lactate according to one embodiment.

Figure 13 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a polyisobutylene/polybutene adhesive with the solubility enhancer propylene glycolmonolaurate according to one embodiment.

Figure 14A shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal

composition having a hydroxyl functionalized acrylate adhesive containing vinyl acetate with levulinic acid according to one embodiment.

Figure 14B shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a hydroxyl functionalized acrylate adhesive containing vinyl acetate with polyvinylpyrrolidone according to one embodiment.

Figure 14C shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a hydroxyl functionalized acrylate adhesive containing vinyl acetate with a carboxylic acid functionalized acrylate adhesive according to one embodiment.

Figure 15 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having acrylate pressure sensitive adhesive in the absence and presence of levulinic acid, oleic acid or a carboxylic acid functionalized acrylate adhesive according to one embodiment.

Figure 16 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a hydroxyl functionalized acrylate adhesive containing vinyl acetate with a carboxylic acid functionalized acrylate adhesive according to another embodiment.

Figure 17 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a hydroxyl functionalized acrylate adhesive containing vinyl acetate with oleic acid or a carboxylic acid functionalized acrylate adhesive according to another embodiment.

Figure 18 shows an example of a plot of average dexmedetomidine flux as a function of transdermal delivery device application time for a dexmedetomidine transdermal composition having a hydroxyl functionalized acrylate adhesive containing vinyl acetate with solubility enhancers such as carboxylic acid functionalized acrylate adhesives, lauryl lactate or oleic acid according to another embodiment.

Figure 19 shows the average dexmedetomidine in-vitro skin flux with respect to time from various formulations.

Figures 20 and 21 show the flux on two different skin samples from various formulations.

DETAILED DESCRIPTION

Aspects of the invention include methods of treating withdrawal syndrome by applying a transdermal delivery device containing a dexmedetomidine composition

formulated to deliver a non-sedative amount of dexmedetomidine to a subject diagnosed as having withdrawal syndrome. In practicing methods according to certain embodiments, a transdermal delivery device having a dexmedetomidine composition is applied to a subject and is maintained in contact with the subject in a manner sufficient to deliver a non-sedative amount of dexmedetomidine to treat withdrawal syndrome in the subject. Also provided are transdermal delivery devices configured to deliver a non-sedative amount of dexmedetomidine sufficient for practicing the subject methods, as well as kits containing the transdermal delivery devices.

Before the present invention is described in greater detail, it is to be understood that this invention is not limited to particular embodiments described, as such may, of course, vary. It is also to be understood that the terminology used herein is for the purpose of describing particular embodiments only, and is not intended to be limiting, since the scope of the present invention will be limited only by the appended claims.

Where a range of values is provided, it is understood that each intervening value, to the tenth of the unit of the lower limit unless the context clearly dictates otherwise, between the upper and lower limit of that range and any other stated or intervening value in that stated range, is encompassed within the invention. The upper and lower limits of these smaller ranges may independently be included in the smaller ranges and are also encompassed within the invention, subject to any specifically excluded limit in the stated range. Where the stated range includes one or both of the limits, ranges excluding either or both of those included limits are also included in the invention.

Certain ranges are presented herein with numerical values being preceded by the term "about." The term "about" is used herein to provide literal support for the exact number that it precedes, as well as a number that is near to or approximately the number that the term precedes. In determining whether a number is near to or approximately a specifically recited number, the near or approximating unrecited number may be a number which, in the context in which it is presented, provides the substantial equivalent of the specifically recited number.

Unless defined otherwise, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. Although any methods and materials similar or equivalent to those described herein can also be used in the practice or testing of the present invention, representative illustrative methods and materials are now described.

All publications and patents cited in this specification are herein incorporated by reference as if each individual publication or patent were specifically and individually indicated to be incorporated by reference and are incorporated herein by reference to

disclose and describe the methods and/or materials in connection with which the publications are cited. The citation of any publication is for its disclosure prior to the filing date and should not be construed as an admission that the present invention is not entitled to antedate such publication by virtue of prior invention. Further, the dates of publication
5 provided may be different from the actual publication dates which may need to be independently confirmed.

It is noted that, as used herein and in the appended claims, the singular forms “a”, “an”, and “the” include plural referents unless the context clearly dictates otherwise. It is further noted that the claims may be drafted to exclude any optional element. As such, this
10 statement is intended to serve as antecedent basis for use of such exclusive terminology as “solely,” “only” and the like in connection with the recitation of claim elements, or use of a “negative” limitation.

As will be apparent to those of skill in the art upon reading this disclosure, each of the individual embodiments described and illustrated herein has discrete components and
15 features which may be readily separated from or combined with the features of any of the other several embodiments without departing from the scope or spirit of the present invention. Any recited method can be carried out in the order of events recited or in any other order which is logically possible.

In further describing various embodiments of the invention, methods for applying to a
20 subject diagnosed as having a withdrawal syndrome a transdermal delivery device having a dexmedetomidine composition and maintaining the transdermal delivery device in contact with the subject in a manner sufficient to deliver a non-sedative amount of dexmedetomidine to the subject are first reviewed in greater detail. Next, transdermal delivery devices suitable for practicing the subject methods are described. Kits that include transdermal delivery
25 devices of interest are then reviewed.

METHODS FOR TREATING WITHDRAWAL SYNDROME WITH TRANSDERMAL DELIVERY DEVICES HAVING A DEXMEDETOMIDINE COMPOSITION FORMULATED TO DELIVER A NON-SEDATIVE AMOUNT OF DEXMEDETOMIDINE

30

Aspects of the invention include methods of treating withdrawal syndrome by applying a transdermal delivery device containing a dexmedetomidine composition formulated to deliver a non-sedative amount of dexmedetomidine to a subject diagnosed as having withdrawal syndrome. In practicing methods according to embodiments of the
35 invention, a transdermal delivery device having a dexmedetomidine composition is applied to a subject and is maintained in contact with the subject in a manner sufficient to deliver a non-sedative amount of dexmedetomidine to the subject. The term “transdermal” is used in

its conventional sense to refer to the route of administration where an active agent (i.e., drug) is delivered across the skin (e.g., topical administration) or mucous membrane for systemic distribution. As such, transdermal dexmedetomidine compositions as described herein include compositions which are delivered to the subject through one or more of the subcutis, dermis and epidermis, including the stratum corneum, stratum germinativum, stratum spinosum and stratum basale. Accordingly, extended transdermal delivery devices containing a transdermal dexmedetomidine composition may be applied at any convenient location, such as for example, the arms, legs, buttocks, abdomen, back, neck, scrotum, vagina, face, behind the ear, buccally as well as sublingually. In describing methods of the present invention, the term "subject" is meant the person or organism to which the transdermal composition is applied and maintained in contact. As such, subjects of the invention may include but are not limited to mammals, e.g., humans and other primates, such as chimpanzees and other apes and monkey species; and the like, where in certain embodiments the subject are humans. The term subject is also meant to include a person or organism of any age, weight or other physical characteristic, where the subjects may be an adult, a child, an infant or a newborn.

Transdermal administration of dexmedetomidine may be passive or active. By "passive" transport is meant that the dexmedetomidine composition is delivered across the skin or mucous membrane in the absence of applied energy (e.g., rubbing or heat) and is primarily dependent on the permeability of the barrier (e.g., skin or mucous membrane) and by entropy of delivery. However, transdermal administration according to certain embodiments may also include active transport of the dexmedetomidine composition across the skin or mucous membrane. Active transport can be any convenient protocol sufficient to transport the composition through the skin or mucous membrane in conjunction with applied energy and may include, but is not limited to microneedle delivery, facilitated diffusion, electrochemically-produced gradients, iontophoretic systems, among other protocols.

In embodiments of the invention, methods include applying a transdermal delivery device having a dexmedetomidine composition to a subject diagnosed as having withdrawal syndrome and maintaining the transdermal delivery device in contact with the subject in a manner sufficient to deliver a non-sedative amount of dexmedetomidine to the subject. By "non-sedative" is meant that the dexmedetomidine composition is formulated to deliver an amount of dexmedetomidine to the subject which does not cause complete sedation of the subject. In other words, a subject remains conscious and responsive throughout the entire time dexmedetomidine is transdermally administered to the subject. In certain instances, throughout administration of the dexmedetomidine transdermal composition, the subject remains in a cooperative, oriented and tranquil state. In other instances, throughout administration of the dexmedetomidine transdermal composition, the subject remains alert

and capable of responding to commands (e.g., oral or written commands). In yet other instances, throughout administration of the dexmedetomidine transdermal composition, the subject is in an alert, cooperative, oriented and tranquil state and is capable of responding to commands (e.g., oral or written commands).

5 Suitable protocols for determining level of sedation may include but are not limited to the Ramsay Sedation Scale, the Vancouver Sedative Recovery Scale, the Glasgow Coma Scale modified by Cook and Palma, the Comfort Scale, the New Sheffield Sedation Scale, the Sedation-Agitation Scale, and the Motor Activity Assessment Scale, among other convenient protocols for determining the level of sedation.

10 In some embodiments, methods may further include evaluating the level of sedation of the subject to determine whether any reduction in responsiveness or cognitive or motor activity has resulted from administration of a transdermal delivery device formulated to deliver a non-sedative amount of dexmedetomidine. The level of sedation may be evaluated by any convenient protocol, such as with those mentioned above. In certain embodiments, 15 the level of sedation is evaluated using the Ramsey Sedation Scale, (as disclosed in Ramsay, et al. Controlled sedation with alphaxalone-alphadolone, British Med Journal1974; 2:656–659, the disclosure of which is herein incorporated by reference). For example, each subject may be evaluated by a qualified health care professional and assigned a score for the level of sedation according to the Ramsey Sedation Scale, summarized below.

20

Ramsay Sedation Scale

Score	Description of Responsiveness, Cognitive and Motor Activity
1	Patient is anxious and agitated or restless, or both
2	Patient is co-operative, oriented, and tranquil
3	Patient responds to commands only
4	Patient exhibits brisk response to light glabellar tap or loud auditory stimulus
5	Patient exhibits a sluggish response to light glabellar tap or loud auditory stimulus
6	Patient exhibits no response

In some embodiments, during administration of subject dexmedetomidine transdermal compositions the level of sedation of a subject is evaluated and the subject is 25 assigned a Ramsey score of 4 or less, such as a Ramsey score of 3 or less, such as a Ramsey score of 2 or less and including where the subject is assigned a Ramsey score of 1. In certain instances, throughout administration of the dexmedetomidine transdermal composition, the subject exhibits brisk response to light glabellar tap or loud auditory

stimulus. In other instances, throughout administration of the dexmedetomidine transdermal composition, the subject is responsive to oral commands. In yet other instances, throughout administration of the dexmedetomidine transdermal composition, the subject is co-operative, oriented and tranquil. In yet other instances, throughout administration of the
5 dexmedetomidine transdermal composition, the subject is anxious, agitated or restless.

The level of sedation of a subject may be evaluated at any time during the methods. In some instances, the level of sedation is evaluated while maintaining the extended transdermal delivery device in contact with the subject at regular intervals, e.g., every 0.25 hours, every 0.5 hours, every 1 hour, every 2 hours, every 4 hours or some other interval.

10 For instance, the level of sedation may be evaluated while maintaining the transdermal delivery device in contact with the subject, such as 15 minutes after applying the transdermal delivery device to the subject, 30 minutes after applying the transdermal delivery device, 1 hour after applying the transdermal delivery device, 2 hours after applying the transdermal delivery device, 4 hours after applying the transdermal delivery device including 8 hours after
15 applying the transdermal delivery device.

The level of sedation of the subject may be evaluated one or more times during a dosage interval, such as 2 or more times, such as 3 or more times, including 5 or more times before, during or after a dosage interval. An upper limit for the number of times the subject may be evaluated during a dosage interval is, in some instances, 10 times or fewer, such as
20 7 times or fewer, such as 5 times or fewer, such as 3 times or fewer and including 2 times or fewer. In certain embodiments, the number of times the subject may be evaluated during a dosage interval ranges such as from 2 times to 10 times, such as from 3 times to 9 times, such as from 4 times to 8 times and including from 5 times to 7 times.

In certain embodiments, sedation level may be monitored throughout the entire time
25 the transdermal delivery device is maintained in contact with the subject, such by heart rate monitors, breathing monitors or by visual observation, including with the aid of a video monitor.

In some embodiments, the subject being treated is in a non-sedated state and is awake, alert, oriented, coherent and capable of responding to oral or written commands
30 including questions or requests. For example, the subject may be in a non-sedated state when administration commences. In other embodiments, the subject is in a non-sedated state when administration commences and remains in a non-sedated state throughout one or more dosage intervals (i.e. the period of time dexmedetomidine transdermal delivery devices of interest are maintained in contact with the subject). In yet other embodiments,
35 the subject is in a non-sedated state when administration commences and remains in a non-sedated state throughout the entire treatment protocol.

As summarized above, in practicing methods according to embodiments of the invention a transdermal delivery device having a dexmedetomidine composition is applied to a subject and is maintained in contact with the subject in a manner sufficient to deliver a non-sedative amount of dexmedetomidine to treat withdrawal syndrome in the subject. The term “withdrawal syndrome” is used in its conventional sense to refer to the group of symptoms occur upon cessation or reduction of use of a physiologically active (e.g., psychoactive) substance that may have been taken repeatedly, usually for a prolonged period or in high doses. Withdrawal may be physiological dependence, such as where the body has adjusted to incorporate the substance into normal functioning resulting in increased tolerance and experiences of withdrawal by the subject. Likewise, withdrawal syndrome may also be psychological, such as where dependence is a behavioral addiction. Withdrawal syndromes according to embodiments of the invention may include, but are not limited to alcohol withdrawal syndrome, benzodiazepine withdrawal syndrome, opioid addiction, cannabis withdrawal syndrome, neonatal withdrawal syndrome, nicotine withdrawal syndrome and antidepressant (e.g., selective serotonin reuptake inhibitor) withdrawal syndrome.

In certain embodiments, methods include treating a subject for alcohol withdrawal syndrome.

In other embodiments, methods include treating a subject for benzodiazepine withdrawal syndrome. The term “benzodiazepine” is used in its conventional sense to refer to the class of psychoactive drugs having a fused benzene and diazepine ring structure that exert pharmacological action by enhancing gamma-aminobutyric acid (GABA) at the GABA_A receptor. Example benzodiazepines include, but are not limited to Alprazolam, Bretazenil, Bromazepam, Brotizolam, Chlordiazepoxide, Cinolazepam, Clobazam, Clonazepam, Clorazepate, Clotiazepam, Cloxazolam, Delorazepam, Diazepam, DMCM (methyl-6,7-dimethoxy-4-ethyl-beta-carboline-3-carboxylate), Estazolam, Eszopiclone, Etizolam, Ethyl loflazepate, Flumazenil, Flunitrazepam, 5-(2-bromophenyl)-7-fluoro-1H-benzo[e][1,4]diazepin-2(3H)-one, Flurazepam, Flutoprazepam, Halazepam, Ketazolam, Loprazolam, Lorazepam, Lormetazepam, Medazepam, Midazolam, Nimetazepam, Nitrazepam, Nordazepam, Oxazepam, Phenazepam, Pinazepam, Prazepam, Premazepam, Pyrazolam, Quazepam, Temazepam, Tetrazepam, Triazolam, Zaleplon, Zolpidem, Zopiclone, among others benzodiazepines.

In certain embodiments, methods include treating a subject for opioid addiction. The term “opioid addiction” is used in its conventional sense to refer to the medical diagnosis characterized by a subject’s inability to stop using a compound from the opiate class of compounds, even when continued use will result in adverse physiological or psychological effects to the subject. Opioid addiction according to embodiments of the invention may be

physiological dependence, such as where the body has adjusted to incorporate the opioid into normal functioning resulting in increased tolerance and experiences of opioid withdrawal by the subject. Likewise, opioid addiction may also be psychological, such as where opioid dependence is a behavioral addiction.

5 The term “opioid” is used herein in its conventional sense to refer to the naturally occurring or synthetic chemical substances that exert pharmacological action by interaction at opioid receptors (i.e., μ , κ and δ opioid receptors). In certain embodiments opioids are biosynthetic benzyloisoquinoline alkaloids and may be opioid receptor agonists, antagonists and inverse agonists. Example opioids may include but are not limited to codeine,

10 morphine, oripavine, pseudomorphine, thebaine, 14-dihydroxymorphine, 2,4-dinitrophenylmorphine, 6-methyldihydromorphine, 6-methylenedihydrodesoxymorphine, 6-acetyldihydromorphine, azidomorphine, chlornaltrexamine, chloroxymorphamine, desomorphine (dihydrodesoxymorphine), dihydromorphine, ethyldihydromorphine, hydromorphinol, methyl-desomorphine, N-phenethylnormorphine, RAM-378, 6-

15 nicotinoyldihydromorphine, acetylpropionylmorphine, diacetyldihydromorphine (dihydroheroin, acetylmorphinol), dibutyrylmorphine, dibenzoylmorphine, diformylmorphine, dipropanoylmorphine, heroin (diacetylmorphine), nicomorphine, 6-monoacetylcodeine, benzylmorphine, codeine methylbromide, desocodeine, dimethylmorphine (6-O-methylcodeine), ethyldihydromorphine, methyldihydromorphine (dihydroheterocodeine),

20 ethylmorphine (dionine), heterocodeine, isocodeine, pholcodine (morpholinylethylmorphine), myrophine, nalodeine (N-allyl-norcodeine), transisocodeine, 14-cinnamoyloxycodone, 14-ethoxymetopon, 14-methoxymetopon, 14-phenylpropoxymetopon, 7-spiroindanyloxymorphine, 8,14-dihydroxydihydromorphinone, acetylcodone, acetylmorphine, α -hydrocodol, bromoisopropylidihydromorphinone, codeinone,

25 codorphone, codol, codoxime, IBNtxA, acetyldihydrocodeinone, dihydrocodeinone enol acetate, hydrocodone, hydromorphone, hydroxycodone, methyldihydromorphinone, morphenol, morphinone, morphol, N-phenethyl-14-ethoxymetopon, oxycodone, oxymorphol, oxymorphone, pentamorphone, semorphone, α -chlorocodide, β -chlorocodide, α -chloromorphide, bromocodide, bromomorphide, chlorodihydrocodide, chloromorphide,

30 codide, 14-hydroxydihydrocodeine, acetyldihydrocodeine, dihydrocodeine, dihydrodesoxycodone, dihydroisocodeine, nicocodeine, nicodicodone, 1-nitrocodeine, codeine-N-oxide, morphine-N-oxide, oxymorphazone, 1-bromocodeine, 1-chlorocodeine, 1-iodomorphine, codeine-N-oxide, heroin-7,8-oxide, morphine-6-glucuronide, 6-monoacetylmorphine, morphine-N-oxide, naltrexol, norcodeine, normorphine, 4-

35 chlorophenylpyridomorphinan, cyclorphan, dextrallorphan, levargorphan, levorphanol, levophenacylmorphinan, levomethorphan, norlevorphanol, N-methylmorphinan, oxilorphan, phenomorphan, methorphan, morphanol, Ro4-1539, stephodeline, Xorphanol, 1-

nitroaknadinine, 14-episinomenine, 5,6-dihydronorsalutaridine, 6-keto nalbuphine,
 aknadinine, butorphanol, cephakicine, cephasamine, cyprodime, drotebanol, fenfangjine G,
 nalbuphine, sinococuline, sinomenine, tannagine, 5,9 alpha-diethyl-2-hydroxybenzomorphan
 (5,9-DEHB), 8-carboxamidocyclazocine (8-CAC), alazocine, anazocine, bremazocine,
 5 butinazocine, carbazocine, cogazocine, cyclazocine, dezocine, eptazocine, etazocine,
 ethylketocyclazocine, fedotozine, fluorophen, gemazocine, ibazocine, ketazocine,

In certain embodiments, methods include opioid detoxification. The term "opioid
 20 detoxification" is used in its conventional sense to refer to the physiological or medicinal
 removal of opioid or opioid metabolites in the subject and includes the period of withdrawal
 during which the subject returns to homeostasis. Depending on the physiology of the
 subject, age, opioid type and course of treatment as determined by a qualified health care or
 drug intervention professional, dexmedetomidine transdermal delivery devices of interest
 25 may be employed in an opioid detoxification protocol, which may include, but is not limited to
 chronic medical detoxification, acute medical detoxification, rapid detoxification, stepped
 rapid detoxification, ultra rapid detoxification, as well as interval (e.g., outpatient)
 detoxification. In practicing methods of opioid detoxification according to certain instances,
 one or more transdermal delivery devices having a dexmedetomidine composition are
 30 applied to a subject and maintained in contact with the subject in a manner sufficient to
 deliver an amount of dexmedetomidine to carry out opioid detoxification in the subject.

In some instances, the amount of dexmedetomidine delivered by the subject
 transdermal delivery devices to carry out opioid detoxification in the subject is a sedative
 amount. As used herein, by "sedative" is meant that the dexmedetomidine composition is
 35 formulated to deliver an amount of dexmedetomidine to the subject which causes at least
 partial sedation. For example, in some instances methods include delivering an amount of
 dexmedetomidine to the subject such that the subject is characterized as being in a state

where the subject can exhibit brisk response to light glabellar tap or loud auditory stimulus. In other instances, methods include delivering an amount of dexmedetomidine to the subject such that the subject is characterized as being in a state where the subject exhibits a sluggish response to light glabellar tap or loud auditory stimulus. In certain instances, 5 dexmedetomidine compositions of interest are formulated to deliver an amount of dexmedetomidine which is fully sedative and the subject is characterized as being in a state where the subject exhibits no response to touch or auditory stimulus. As discussed above, a suitable protocol for determining level of sedation includes the Ramsey Sedation Scale. In embodiments where dexmedetomidine transdermal delivery devices are configured to 10 deliver a sedative amount of dexmedetomidine to carry out opioid detoxification in the subject, the subject may be assigned a Ramsey score of 2 or higher, such as 3 or higher, such as 4 or higher and including a Ramsey score of 5. For example, methods may include delivering an amount of dexmedetomidine to the subject in manner sufficient to maintain a Ramsay score of between 2 and 5 in the subject, such as between 3 and 5 and including a 15 Ramsay score of between 4 and 5. In certain instances, throughout administration of the dexmedetomidine transdermal composition, the subject exhibits brisk response to light glabellar tap or loud auditory stimulus. In other instances, throughout administration of the dexmedetomidine transdermal composition, the subject exhibits a sluggish response to light glabellar tap or loud auditory stimulus. In yet other instances, throughout administration of 20 the dexmedetomidine transdermal composition, the subject is fully sedated and exhibits no response to touch or auditory stimulus.

As discussed above, methods include applying to a skin surface of a non-sedated subject diagnosed as having withdrawal syndrome a transdermal delivery device having a 25 dexmedetomidine composition that contains dexmedetomidine and a pressure sensitive adhesive and maintaining the transdermal delivery device in contact with the subject in a manner sufficient to deliver a non-sedative amount dexmedetomidine over a period of time to treat withdrawal syndrome in the subject. By “treating withdrawal syndrome” or “treatment of withdrawal syndrome” is meant at least a suppression or amelioration of the symptoms 30 associated with the condition affecting the subject, where suppression and amelioration are used in a broad sense to refer to at least a reduction in the magnitude of a parameter, e.g., symptom, associated with the withdrawal syndrome. As such, treatment of withdrawal syndrome includes situations where the withdrawal syndrome is completely inhibited, e.g., prevented from happening, or stopped, e.g., terminated, such that the subject no longer 35 experiences withdrawal syndrome. For example, treatment according to embodiments of the invention may include both preventing and managing opioid addiction with a non-opioid transdermal composition.

In some embodiments, methods include extended transdermal delivery of dexmedetomidine to the subject. By "extended transdermal delivery" is meant that transdermal administration is formulated to provide for delivery of the dexmedetomidine composition over an extended period of time, such as over the course of hours, days and including weeks, including 1 hour or longer, such as 2 hours or longer, such as 4 hours or longer, such as 8 hours or longer, such as 12 hours or longer, such as 24 hours or longer, such as 48 hours or longer, such as 72 hours or longer, such as 96 hours or longer, such as 120 hours or longer, such as 144 hours or longer and including 168 hours or longer. For the above ranges an upper limit period of time is, in some instances, 168 hours or shorter, such as 144 hours or shorter, such as 120 hours or shorter, such as 96 hours or shorter, such as 72 hours or shorter, such as 48 hours or shorter and including 24 hours or shorter. In certain embodiments, extended transdermal delivery ranges such as from 0.5 hours to 168 hours, such as from 1 hour to 144 hours, such as from 1.5 hours to 120 hours, such from 2 hours to 96 hours, such as from 2.5 hours to 72 hours, such as from 3 hours to 48 hours, such as from 3.5 hours to 24 hours, such as from 4 hours to 12 hours and including from 5 hours to 8 hours.

In some embodiments, sustained release transdermal administration of the dexmedetomidine composition includes multi-day delivery of a therapeutically effective amount of the dexmedetomidine active agent that is applied to the skin of a subject. By multi-day delivery is meant that the transdermal composition is formulated to provide a therapeutically effective amount to a subject when the transdermal delivery device is applied to the skin of a subject for a period of time that is 1 day or longer, such as 2 days or longer, such as 4 days or longer, such as 7 days or longer, such as 14 days and including 30 days or longer. In certain embodiments, transdermal delivery devices provide a therapeutically effective amount of dexmedetomidine to a subject for a period of 10 days or longer. For multi-day delivery, an upper limit period of time is, in some instances, 30 days or shorter, such as 28 days or shorter, such as 21 days or shorter, such as 14 days or shorter, such as 7 days or shorter and including 3 days or shorter. In certain embodiments, multi-day transdermal delivery ranges such as from 2 days to 30 days, such as from 3 days to 28 days, such as from 4 days to 21 days, such as from 5 days to 14 days and including from 6 days to 10 days.

Depending on the specific protocol employed, treatment of withdrawal syndrome according to embodiments of the invention may include one or more treatment dosage intervals. The term "dosage interval" is used herein in its conventional sense to mean the duration of a single administration of applying and maintaining the transdermal delivery device in contact with the subject. In other words, a dosage interval begins with applying the transdermal dexmedetomidine composition to the skin or mucous membrane of the subject

and ends with the removal of the transdermal dexmedetomidine composition from contact with the subject. As such, a dosage interval is the period of time that an amount of dexmedetomidine is in contact with the skin or mucous membrane of the subject and may last about 0.5 hours or longer, such as 1 hour or longer, such as 2 hours or longer, such as 4
5 hours or longer, such as 8 hours or longer, such as 12 hours or longer, such as 16 hours or longer, such as 20 hours or longer, such as 24 hours or longer, such as about 48 hours or longer, such as about 72 hours or longer, such as 96 hours or longer, such as 120 hours or longer, such as 144 hours or longer and including about 168 hours or longer. An upper limit period of time for the duration of dosage intervals is, in some instances, 168 hours or
10 shorter, such as 144 hours or shorter, such as 120 hours or shorter, such as 96 hours or shorter, such as 72 hours or shorter, such as 48 hours or shorter and including 24 hours or shorter. In certain embodiments, the duration of dosage intervals ranges such as from 0.5 hours to 168 hours, such as from 1 hour to 144 hours, such as from 1.5 hours to 120 hours, such from 2 hours to 96 hours, such as from 2.5 hours to 72 hours, such as from 3 hours to
15 48 hours, such as from 3.5 hours to 24 hours, such as from 4 hours to 12 hours and including from 5 hours to 8 hours.

The term "treatment protocol" as used herein refers to one or more sequential dosage intervals sufficient to produce the desired therapeutic effect of transdermal dexmedetomidine composition. In certain embodiments, protocols may include multiple
20 dosage intervals. By "multiple dosage intervals" is meant more than one transdermal delivery device is applied and maintained in contact with the subject in a sequential manner. As such, a transdermal delivery device is removed from contact with the subject and a new transdermal delivery device is reapplied to the subject. In practicing methods of the invention, treatment regimens may include two or more dosage intervals, such as three or
25 more dosage intervals, such as four or more dosage intervals, such as five or more dosage intervals, including ten or more dosage intervals.

The duration between dosage intervals in a multiple dosage interval treatment protocol may vary, depending on the physiology of the subject or by the treatment protocol as determined by a health care professional. For example, the duration between dosage
30 intervals in a multiple dosage treatment protocol may be predetermined and follow at regular intervals. As such, the time between dosage intervals may vary and may be 1 day or longer, such as 2 days or longer, such as 3 days or longer, such as 4 days or longer, such as 5 days or longer, such as 6 days or longer, such as 7 days or longer, such as 10 days or longer, including 30 days or longer. An upper limit period of time between dosage intervals is, in
35 some instances, 30 days or shorter, such as 28 days or shorter, such as 21 days or shorter, such as 14 days or shorter, such as 7 days or shorter and including 3 days or shorter. In certain embodiments, the time between dosage intervals ranges such as from 2 days to 30

days, such as from 3 days to 28 days, such as from 4 days to 21 days, such as from 5 days to 14 days and including from 6 days to 10 days.

In certain instances, the duration between dosage intervals may depend on the plasma concentration of dexmedetomidine during the time the transdermal delivery device is not in contact with the subject between dosage intervals. For example, a subsequent dosage interval may commence when the plasma concentration of dexmedetomidine reaches below a particular threshold.

In certain embodiments, transdermal delivery devices provide a therapeutically effective non-sedative amount of dexmedetomidine to a subject for a period of 10 days.

As described above, aspects of the invention include treating the withdrawal syndrome in a subject by applying a transdermal delivery device containing a dexmedetomidine composition to a subject formulated to deliver a non-sedative amount of dexmedetomidine to treat the withdrawal syndrome. In some embodiments, methods include maintaining the transdermal delivery device in contact with a subject in a manner sufficient to deliver a target non-sedative dosage of dexmedetomidine to treat the withdrawal syndrome in the subject, such as for example delivering a target dosage as determined by total drug exposure or by average daily drug exposure that will treat the withdrawal syndrome. The term target dosage is meant the desired amount of permeated dexmedetomidine.

Depending on the desired therapeutic effect of the transdermal dexmedetomidine composition, the treatment protocol, the physiology of the subject and the level of sedation in the subject at the time of administration, target drug exposure for treating the withdrawal syndrome may vary. In certain embodiments, the target drug exposure of dexmedetomidine is an amount which is in the non-sedative therapeutic window of the subject. The term "non-sedative therapeutic window" is used herein to refer to the dexmedetomidine dosage range which is therapeutically effective in treating a subject for the withdrawal syndrome which results in little, if any sedation. In other words, the non-sedative therapeutic window of dexmedetomidine for a specific individual subject being treated for withdrawal syndrome is the range of concentrations of dexmedetomidine defined as below an amount considered to be "fully sedative" or "full sedation-inducing" and above an amount considered to be

"ineffective" to treat withdrawal syndrome in the subject. In certain embodiments of the invention, a non-sedative therapeutically effective amount provides for a systemic amount of dexmedetomidine that enables desired treatment while maintaining a Ramsay score of 4 or less in the subject. For example, in treating withdrawal syndrome in a subject the target non-sedative dosage of dexmedetomidine may range from 50 $\mu\text{g}/\text{day}$ to 350 $\mu\text{g}/\text{day}$, such as from 100 $\mu\text{g}/\text{day}$ to 340 $\mu\text{g}/\text{day}$, such as from 145 $\mu\text{g}/\text{day}$ to 330 $\mu\text{g}/\text{day}$, such as from 155 $\mu\text{g}/\text{day}$ to 320 $\mu\text{g}/\text{day}$, such as from 165 $\mu\text{g}/\text{day}$ to 310 $\mu\text{g}/\text{day}$, such as from 175 $\mu\text{g}/\text{day}$ to 300 $\mu\text{g}/\text{day}$, such as from 185 $\mu\text{g}/\text{day}$ to 290 $\mu\text{g}/\text{day}$, such as from 195 $\mu\text{g}/\text{day}$ to 280 $\mu\text{g}/\text{day}$

and including from 50 $\mu\text{g}/\text{day}$ to 250 $\mu\text{g}/\text{day}$ over the course of a dosage interval (e.g., a 168 hour dosage interval). In certain embodiments, the target dosage of dexmedetomidine ranges from 147 $\mu\text{g}/\text{day}$ to 290 $\mu\text{g}/\text{day}$ over the course of a dosage interval (e.g., a 168 hour or longer dosage interval).

5 In some embodiments, the target dosage is an amount that when applied to a subject provides for a systemic amount of dexmedetomidine that gives a desired mean plasma concentration of dexmedetomidine at specific times during the withdrawal syndrome treatment. In other embodiments, the target dosage is an amount that when applied to a subject provides for a steady state mean plasma concentration of the dexmedetomidine
10 throughout a dosage interval or treatment protocol. In other embodiments, the target dosage is an amount that when applied to a subject provides for a particular rate of delivery of dexmedetomidine to the subject *in vivo*.

 In some embodiments, applying and maintaining a transdermal delivery device containing a dexmedetomidine composition in contact with a subject includes delivery of a
15 target amount of dexmedetomidine, such as for example an average cumulative amount of dexmedetomidine delivered over the course of a dosage interval (e.g., 7 days or longer). The term "target cumulative amount" is meant the total quantity of dexmedetomidine which is delivered to the subject through the skin and may vary due to skin or mucous membrane permeability and metabolic activity of the site of application. In some embodiments, the
20 average cumulative amount of dexmedetomidine may be 5 $\mu\text{g}/\text{cm}^2$ or greater, such as 25 $\mu\text{g}/\text{cm}^2$ or greater, such as 50 $\mu\text{g}/\text{cm}^2$ or greater over a 7 day delivery interval, such as 75 $\mu\text{g}/\text{cm}^2$ or greater, such as 100 $\mu\text{g}/\text{cm}^2$ or greater, such as 125 $\mu\text{g}/\text{cm}^2$ or greater and including 200 $\mu\text{g}/\text{cm}^2$ or greater over the dosage interval. For average cumulative amount of dexmedetomidine delivery over a dosage interval, an upper limit is, in some instances, 500
25 $\mu\text{g}/\text{cm}^2$ or less, such as 400 $\mu\text{g}/\text{cm}^2$ or less, such as 300 $\mu\text{g}/\text{cm}^2$ or less, such as 200 $\mu\text{g}/\text{cm}^2$ or less, such as 100 $\mu\text{g}/\text{cm}^2$ or less and including 50 $\mu\text{g}/\text{cm}^2$ or less. In certain embodiments, average cumulative amount of dexmedetomidine delivery over a dosage interval ranges such as from 5 $\mu\text{g}/\text{cm}^2$ to 500 $\mu\text{g}/\text{cm}^2$, such as from 25 $\mu\text{g}/\text{cm}^2$ to 400 $\mu\text{g}/\text{cm}^2$ and including from 50 $\mu\text{g}/\text{cm}^2$ to 300 $\mu\text{g}/\text{cm}^2$.

30 Methods according to certain embodiments may include applying to the subject a transdermal delivery device containing a dexmedetomidine composition and maintaining the transdermal dexmedetomidine composition in contact with the subject in a manner sufficient to provide a mean plasma concentration which ranges from 0.05 ng/mL to 0.5 ng/mL over the course of a dosage interval, such as from 0.1 ng/mL to 0.45 ng/mL, such as from 0.15
35 ng/mL to 0.4 ng/mL, such as from 0.2 ng/mL to 0.35 ng/mL and including from 0.25 ng/mL to 0.3 ng/mL. For example, the transdermal delivery device may be maintained in contact with

the subject in a manner sufficient to provide a mean plasma concentration which ranges from 0.16 ng/mL to 0.36 ng/mL over the course of a dosage interval (e.g., a 168 hour or longer dosage interval). In other embodiments, methods include maintaining the dexmedetomidine transdermal composition in contact with the subject in a manner sufficient to provide a mean plasma concentration which ranges from 0.05 ng/mL to 0.5 ng/mL over the course of the entire treatment protocol (i.e., over one or more dosage intervals), such as from 0.1 ng/mL to 0.45 ng/mL, such as from 0.15 ng/mL to 0.4 ng/mL, such as from 0.2 ng/mL to 0.35 ng/mL and including from 0.25 ng/mL to 0.3 ng/mL over the course of the entire treatment protocol. For example, the transdermal delivery device may be maintained in contact with the subject in a manner sufficient to provide a mean plasma concentration which ranges from 0.16 ng/mL to 0.36 ng/mL over the course of the entire treatment protocol.

In certain embodiments, methods may also include determining the plasma concentration of dexmedetomidine in the subject during treatment of withdrawal syndrome in the subject. The plasma concentration may be determined using any convenient protocol, such for example by liquid chromatography-mass spectrometry (LCMS). The plasma concentration of the dexmedetomidine may be determined at any time desired. In some embodiments, the plasma concentration of dexmedetomidine may be monitored throughout the entire time the transdermal delivery device is maintained in contact with the subject, such by real-time data collection. In other instances, the plasma concentration of dexmedetomidine is monitored while maintaining the transdermal delivery device in contact with the subject by collecting data at regular intervals, e.g., collecting data every 0.25 hours, every 0.5 hours, every 1 hour, every 2 hours, every 4 hours, every 12 hours, every 24 hours, including every 72 hours, or some other interval. In yet other instances, the plasma concentration of dexmedetomidine is monitored while maintaining the transdermal delivery device in contact with the subject by collecting data according to a particular time schedule after applying the transdermal delivery device to the subject. For instance, the plasma concentration of dexmedetomidine may be determined 15 minutes after applying the transdermal delivery device to the subject, 30 minutes after applying the transdermal delivery device to the subject, 1 hour after applying the transdermal delivery device to the subject, 2 hours after applying the transdermal delivery device to the subject, 4 hours after applying the transdermal delivery device to the subject, 8 hours after applying the transdermal delivery device to the subject, 12 hours after applying the transdermal delivery device to the subject, 24 hours after applying the transdermal delivery device to the subject, 48 hours after applying the transdermal delivery device to the subject, 72 hours after applying the transdermal delivery device to the subject, 76 hours after applying the transdermal delivery device to the subject, 80 hours after applying the transdermal delivery

device to the subject, 84 hours after applying the transdermal delivery device to the subject, 96 hours after applying the transdermal delivery device to the subject, 120 hours after applying the transdermal delivery device to the subject and including 168 hours after applying the transdermal delivery device to the subject.

5 In certain embodiments, the plasma concentration of dexmedetomidine is determined before the transdermal delivery device is applied to a subject, such as for example, to determine the basal plasma concentration of the dexmedetomidine. For example, the plasma concentration may be determined 5 minutes before applying the transdermal delivery device, such as 10 minutes before, such as 30 minutes before, such as 60 minutes before, 10 such as 120 minutes before, such as 240 minutes before and including 480 minutes before applying the transdermal delivery device. As described detail below, methods may include multiple dosage intervals where applying and maintaining the transdermal delivery device in contact with the subject may be repeated. In these embodiments, the plasma concentration may be determined after a first transdermal delivery device is removed and before a second 15 transdermal delivery device is applied.

The blood plasma concentration of the dexmedetomidine may be determined one or more times at any given measurement period, such as 2 or more times, such as 3 or more times, including 5 or more times at each measurement period. An upper limit for the number of times the blood plasma concentration of dexmedetomidine is determined at any given 20 measurement period is, in some instances, 10 times or fewer, such as 7 times or fewer, such as 5 times or fewer, such as 3 times or fewer and including 2 times or fewer. In certain embodiments, the number of times the blood plasma concentration of dexmedetomidine is determined at any given measurement period ranges such as from 2 times to 10 times, such as from 3 times to 9 times, such as from 4 times to 8 times and including from 5 times to 7 25 times.

Methods for treating withdrawal syndrome according to certain embodiments may include applying to the subject a transdermal delivery device containing a dexmedetomidine composition and maintaining the transdermal dexmedetomidine composition in contact with the subject in a manner sufficient to maintain a transdermal dexmedetomidine flux which is 30 within 30% or more of the peak transdermal dexmedetomidine flux after reaching the peak transdermal flux. As such, once transdermal delivery devices of interest reach peak transdermal dexmedetomidine flux, the transdermal delivery device is configured to maintain a flux of dexmedetomidine to the subject that is at least 30% of peak flux during the course of any given dosage interval, such as at least 35%, such as at least 40% and including at 35 least 50% of peak flux during the course of any given dosage interval. In other words, once peak flux is reached by the transdermal delivery device according to these particular

embodiments, the transdermal flux of dexmedetomidine to the subject does not fall below 30% or more of the peak flux at any time during the dosage interval.

For example, the transdermal dexmedetomidine composition may be maintained in contact with the subject in a manner sufficient to maintain the transdermal dexmedetomidine flux which is within 80% or more of peak transdermal dexmedetomidine flux, such as within 85% or more, such as within 90% or more, such as within 95% and including within 99% of peak transdermal dexmedetomidine flux after reaching peak transdermal flux. In certain embodiments, the transdermal dexmedetomidine flux does not decrease at all after reaching peak flux and maintains a rate of 100% of peak dexmedetomidine flux from the moment it reaches peak flux until the end of a given dosage interval.

The flux of an active agent by transdermal administration is the rate of penetration of the active agent through the skin or mucous membrane of the subject. In some instances, the flux of the dexmedetomidine can be determined by the equation:

$$(1) \quad J_{\text{skin flux}} = P \times C$$

where J is the skin flux, C is the concentration gradient across the skin or mucous membrane and P is the permeability coefficient. Skin flux is the change in cumulative amount of drug entering the body across the skin or mucous membrane with respect to time.

In some instances, the transdermal dexmedetomidine composition is maintained in contact with the subject in a manner sufficient to provide a peak flux of 0.05 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater, such as 0.1 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater, such as 0.5 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater, such as 1 $\mu\text{g}/\text{cm}^2/\text{hr}$, such as 2 $\mu\text{g}/\text{cm}^2/\text{hr}$, such as 3 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater, such as 5 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater, such as 7.5 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater and including maintaining the single layer transdermal dexmedetomidine composition in contact with the subject in a manner sufficient to provide a peak flux of 10 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater. For peak flux of transdermal dexmedetomidine delivery, an upper limit is, in some instances, 10 $\mu\text{g}/\text{cm}^2/\text{hr}$ or or less, such as 9 $\mu\text{g}/\text{cm}^2/\text{hr}$ or or less, such as 8 $\mu\text{g}/\text{cm}^2/\text{hr}$ or or less, such as 7 $\mu\text{g}/\text{cm}^2/\text{hr}$ or or less, 6 $\mu\text{g}/\text{cm}^2/\text{hr}$ or or less, such as 5 $\mu\text{g}/\text{cm}^2/\text{hr}$ or less and including 2 $\mu\text{g}/\text{cm}^2/\text{hr}$ or less. In certain embodiments, the peak flux of transdermal dexmedetomidine delivery ranges such as from 0.05 $\mu\text{g}/\text{cm}^2/\text{hr}$ to 10 $\mu\text{g}/\text{cm}^2/\text{hr}$, such as from 1 $\mu\text{g}/\text{cm}^2/\text{hr}$ to 9 $\mu\text{g}/\text{cm}^2/\text{hr}$ and including from 2 $\mu\text{g}/\text{cm}^2/\text{hr}$ to 8 $\mu\text{g}/\text{cm}^2/\text{hr}$.

As such, where the transdermal dexmedetomidine composition is maintained in contact with the subject in a manner sufficient to provide a transdermal dexmedetomidine flux which is within at least 30% of peak transdermal dexmedetomidine flux, the single layer transdermal composition may be maintained in contact with the subject in a manner

sufficient to provide a flux which is 0.15 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater after reaching a peak transdermal flux of 0.5 $\mu\text{g}/\text{cm}^2/\text{hr}$, such as 0.18 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater after reaching a peak transdermal flux of 0.6 $\mu\text{g}/\text{cm}^2/\text{hr}$, such as 0.225 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater after reaching a peak transdermal flux of 0.75 $\mu\text{g}/\text{cm}^2/\text{hr}$, such as 0.27 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater after reaching a peak flux of 0.9 $\mu\text{g}/\text{cm}^2/\text{hr}$, such as 0.3 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater after reaching a peak flux of 1.0 $\mu\text{g}/\text{cm}^2/\text{hr}$, such as 1.5 $\mu\text{g}/\text{cm}^2/\text{hr}$ after reaching a peak flux of 5 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater and including maintaining the transdermal dexmedetomidine composition in contact with the subject in a manner sufficient to provide a flux which is 3.0 $\mu\text{g}/\text{cm}^2/\text{hr}$ or greater after reaching a peak flux of 10.0 $\mu\text{g}/\text{cm}^2/\text{hr}$.

10 Depending on the amount of dexmedetomidine present in the transdermal composition, the physiology of the subject, target site of application, the time required to reach peak dexmedetomidine flux may vary. In some instances, peak dexmedetomidine flux is reached 2 hours or more after applying the transdermal delivery device to the subject, such as 4 hours or more, such as 6 hours or more, such as 12 hours or more, such as 18
15 hours or more and including at 24 hours or more after applying the transdermal delivery device to the subject. In other instances, the peak dexmedetomidine flux is reached at 168 hours or earlier, such as 144 hours or earlier, such as 120 hours or earlier, such as 96 hours or earlier, such as 72 hours or earlier, such as 48 hours or earlier, such as 24 hours or earlier, such as 12 hours or earlier, such as 8 hours earlier, such as 4 hours or earlier and
20 including at 2 hours or earlier. In some embodiments, peak dexmedetomidine flux is reached at 24 hours after applying the transdermal delivery device to the subject.

In certain embodiments, during treatment of withdrawal syndrome in the subject the transdermal composition is maintained in contact with the subject sufficient to provide a steady state average flux of dexmedetomidine to the subject. The term "steady state" is
25 used in its conventional sense to mean that the amount of dexmedetomidine released from the transdermal composition maintains a substantially constant average flux of dexmedetomidine. As such, the dexmedetomidine flux from transdermal delivery devices of interest increases or decreases by 30% or less at any time while the transdermal delivery device is maintained in contact with the subject, such as 20% or less, such as 15% or less,
30 such as 12% or less, such as 10% or less, such as 6% or less, such as 5% or less, such as 4% or less, and including 1% or less at any time while the transdermal delivery device is maintained in contact with the subject.

Where the dexmedetomidine transdermal composition is maintained in contact with the subject sufficient to provide a steady state average flux of dexmedetomidine, the steady
35 state average dexmedetomidine flux may be maintained from for 0.5 hours or longer, such as 1 hour or longer, such as 2 hours or longer, such as 3 hours or longer, such as 4 hours or longer, such as 8 hours or longer, 12 hours or longer, such as 24 hours or longer, such as

36 hours or longer, such as 48 hours or longer, such as 72 hours or longer, such as 96 hours or longer, such as 120 hours or longer, such as 144 hours or longer and including 168 hours or longer. For maintaining a steady state average dexmedetomidine flux, an upper limit is, in some instances, for 168 hours or shorter, such as 144 hours or shorter, such as 5 120 hours or shorter, such as 96 hours or shorter, such as 72 hours or shorter, such as 48 hours or shorter, such as 24 hours or shorter, such as 12 hours or shorter, such as 8 hours or shorter, such as 4 hours or shorter and including 2 hours or shorter.

In these embodiments, the transdermal delivery device is configured to provide a constant flux, such as by introducing a concentration gradient across the skin or mucous 10 membrane or providing an excess in dexmedetomidine dosage amount. For example, dexmedetomidine transdermal compositions of interest may include a dexmedetomidine dosage that is 5% or greater in excess of the normal dosage amount, such as 10% or greater, such as 15% or greater, such as 20% or greater, and including 25% or greater in excess of the normal dosage amount. For amount of excess dexmedetomidine present in 15 the transdermal delivery device to provide a constant flux, an upper limit is, in some instances 50% or less in excess, such as 45% or less in excess, such as 25% or less in excess, such as 20% or less in excess and including 10% or less in excess of the normal dosage amount. While dexmedetomidine transdermal compositions of interest may include an excess in order to provide a constant flux, the excess dosage amount is not absorbed as 20 part of the dosage interval and is not sufficient to result in a dosage which is fully sedative (i.e., the dexmedetomidine dosage delivered to the subject still remains a non-sedative amount). As such, in some embodiments where the transdermal dexmedetomidine composition is maintained in a manner sufficient to provide a constant flux, 25% or less of the available dexmedetomidine in the transdermal composition may not be utilized, such as 25 20% or less, such as 15% or less, such as 10% or less, such as 5% or less and including 1% or less of the available dexmedetomidine in the transdermal composition may not be utilized during the dosage interval.

Methods for treating withdrawal syndrome in a subject according to certain embodiments may include applying to the subject a transdermal delivery device containing a 30 dexmedetomidine composition configured to deliver a non-sedative amount of dexmedetomidine and maintaining the transdermal dexmedetomidine composition in contact with the subject in a manner sufficient to provide an average flux of dexmedetomidine *in vivo* of from about 0.005 to about 5 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$, such as from about 0.01 to about 4 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$, such as from about 0.02 to about 3 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$, such as from about 0.05 to about 2.5 35 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$, such as from about 0.1 to about 2 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$ and including from about 0.1 to about 1 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$ at any time after applying the transdermal delivery device. In some embodiments, methods include applying the transdermal dexmedetomidine composition to

the subject and maintaining the transdermal composition in contact with the subject in a manner sufficient to provide an average flux of dexmedetomidine *in vivo* of from about 0.005 to about 2.0 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$ at 24 hours after application, such as from about 0.01 to about 1.75 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$, such as from about 0.02 to about 1.5 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$, such as from about 0.05 to about 1.25 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$ and including from about 0.1 to about 1 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$ at 24 hours after application. In yet other embodiments, methods include applying the transdermal dexmedetomidine composition to the subject and maintaining the transdermal composition in contact with the subject in a manner sufficient to provide an average flux of dexmedetomidine *in vivo* of from about 0.005 to about 2.0 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$ at 168 hours after application, such as from about 0.01 to about 1.75 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$, such as from about 0.02 to about 1.5 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$, such as from about 0.05 to about 1.25 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$ and including from about 0.1 to about 1 $\mu\text{g}/\text{cm}^2\cdot\text{hr}$ at 168 hours after application.

In certain embodiments, methods include determining the transdermal dexmedetomidine flux. The transdermal dexmedetomidine flux may be determined using any convenient protocol, such for example by protocols employing human cadaver skin with epidermal layers (stratum corneum and epidermis) in a Franz cell having donor and receptor sides clamped together and receptor solution containing phosphate buffer. The amount of permeated dexmedetomidine can further be characterized by liquid chromatography. The transdermal dexmedetomidine flux may be determined at any time during methods of the invention. In some embodiments, the transdermal dexmedetomidine flux may be monitored throughout the entire time the transdermal dexmedetomidine composition is maintained in contact with the permeation barrier (e.g., human cadaver skin), such by real-time data collection. In other instances, the transdermal dexmedetomidine flux is monitored by collecting data at regular intervals, e.g., collecting data every 0.25 hours, every 0.5 hours, every 1 hour, every 2 hours, every 4 hours, every 12 hours, every 24 hours, including every 72 hours, or some other regular or irregular intervals. In yet other instances, the transdermal dexmedetomidine flux is monitored by collecting data according to a particular time schedule. For instance, the transdermal dexmedetomidine flux may be determined 15 minutes after applying the transdermal delivery device, 30 minutes after applying the transdermal delivery device, 1 hour after applying the transdermal delivery device, 2 hours after applying the transdermal delivery device, 4 hours after applying the transdermal delivery device, 8 hours after applying the transdermal delivery device, 12 hours after applying the transdermal delivery device, 24 hours after applying the transdermal delivery device, 48 hours after applying the transdermal delivery device, 72 hours after applying the transdermal delivery device, 76 hours after applying the transdermal delivery device, 80 hours after applying the transdermal delivery device, 84 hours after applying the transdermal delivery device, 96 hours after applying the transdermal delivery device, 120 hours after

applying the transdermal delivery device and including 168 hours after applying the transdermal delivery device.

The transdermal dexmedetomidine flux may be determined one or more times at any given measurement period, such as 2 or more times, such as 3 or more times, including 5
5 or more times at each measurement period. An upper limit for the number of times the transdermal dexmedetomidine flux is determined is, in some instances, 10 times or fewer, such as 7 times or fewer, such as 5 times or fewer, such as 3 times or fewer and including 2 times or fewer. In certain embodiments, the number of times the transdermal dexmedetomidine flux is determined ranges such as from 2 times to 10 times, such as from
10 3 times to 9 times, such as from 4 times to 8 times and including from 5 times to 7 times.

In some embodiments, in maintaining the dexmedetomidine transdermal composition in contact with the subject the average cumulative amount of permeated dexmedetomidine increases at a substantially linear rate over the course of the dosage interval (e.g., 7 days or longer). By “substantially linearly” is meant that the cumulative amount of dexmedetomidine
15 released from the transdermal composition increases at a substantially constant rate (i.e., defined by zero-order kinetics). As such, the change in rate of cumulative permeated dexmedetomidine increases or decreases by 10% or less at any given time while maintaining the transdermal composition in contact with the subject, such as 8% or less, such as 7% or less, such as 6% or less, such as 5% or less, such as 3% or less, such as
20 2.5% or less, such as 2% or less, and including 1% or less at any time while maintaining the dexmedetomidine transdermal composition in contact with the subject.

As described above, aspects of the invention include treating withdrawal syndrome in a subject applying a transdermal delivery device containing a dexmedetomidine composition
25 and maintaining the dexmedetomidine composition in contact with the subject over a period of time sufficient to deliver a non-sedative amount of dexmedetomidine to the subject. In some embodiments, methods for treating withdrawal syndrome may include maintaining the dexmedetomidine transdermal composition in contact with the subject in a manner sufficient to deliver a predetermined amount of dexmedetomidine to the subject. Where protocols
30 include delivering a predetermined amount of dexmedetomidine to the subject, the amount of dexmedetomidine in dexmedetomidine transdermal compositions of interest may range from 0.001 mg to 50 mg, such as 0.005 to 40mg, such as 0.01 mg to 30 mg, such as 0.05 to 20 mg, such as 0.1 mg to 15 mg, such as 0.5 mg to 12.5 mg and including from 0.5 mg to 10 mg.

35 In certain embodiments, the predetermined amount of dexmedetomidine delivered to the subject may be a percentage of the total amount of dexmedetomidine present in the dexmedetomidine transdermal compositions. For instance, the predetermined amount of

dexmedetomidine delivered to the subject may be 1% or greater of the total amount of dexmedetomidine present in the dexmedetomidine transdermal composition, such as 2% or greater, such as 5% or greater, such as 10% or greater, such as 25% or greater and including 50% or greater of the total amount of dexmedetomidine present in the
5 dexmedetomidine transdermal composition. In other words, methods for treating withdrawal syndromes may include maintaining the dexmedetomidine transdermal composition in contact with the subject in a manner sufficient to deliver 5% or greater of the dexmedetomidine in the dexmedetomidine transdermal composition to the subject over the course of a single dosage interval. In these embodiments, the utilization percentage of
10 dexmedetomidine is 5% or greater during the time the transdermal delivery device is maintained in contact with the subject. As such, 95% or less of the original amount of dexmedetomidine remains in the dexmedetomidine transdermal composition after a dosage interval. As described in greater detail below, the subject transdermal delivery devices are capable of high utilization percentage. In other words, the subject transdermal delivery
15 devices are capable of delivering dexmedetomidine to the subject leaving little residual dexmedetomidine in the transdermal delivery device after a given dosage interval. The utilization percentage may be 5% or greater over the course of a dosage interval, such as 10% or greater, such as 25% or greater, such as 40% or greater, such as 45% or greater and including 50% or greater of the dexmedetomidine over the course of a dosage interval.
20 For utilization percentage, an upper limit over the course of a dosage interval is, in some instances, 90% or less, such as 50% or less, such as 25% or less and including 5% or less over the course of a dosage interval.

For instance, where the subject dexmedetomidine transdermal composition contains 1 mg of dexmedetomidine, methods for treating withdrawal syndrome may include
25 maintaining the transdermal delivery device in contact with the subject in a manner sufficient to deliver 0.05 mg or more of dexmedetomidine in the dexmedetomidine transdermal composition over the course of the dosage interval (e.g., 7 days or longer), such as 0.1 mg or more, such as 0.25 mg or more, such as 0.4 mg or more, such as 0.45 mg or more and including maintaining the transdermal delivery device in contact with the subject in a manner
30 sufficient to deliver 0.5 mg or more of dexmedetomidine in the dexmedetomidine composition. As such, 0.95 mg or less of dexmedetomidine remains in the dexmedetomidine transdermal composition after 7 days or longer, such as 0.9 mg or less, such as 0.75 mg or less, such as 0.6 mg or less and including 0.5 mg or less of dexmedetomidine remains in the dexmedetomidine transdermal composition after the
35 dosage interval.

As described in greater detail below, in certain embodiments transdermal delivery devices include a single layer matrix dexmedetomidine composition which is configured to

deliver a non-sedative amount of dexmedetomidine to a subject. As such, methods according to certain instance include applying to a subject a transdermal delivery device having a single layer matrix dexmedetomidine composition and maintaining the single layer dexmedetomidine composition in contact with the subject over a period of time sufficient to
5 deliver a non-sedative amount of dexmedetomidine to the subject.

In certain embodiments, each of the subject methods described in greater detail below may further include the step of removing the transdermal delivery device from contact with the subject at the conclusion of a dosage interval. For example, the transdermal delivery device may be removed from contact with the subject after maintaining the
10 transdermal delivery device in contact with the subject for 0.5 hours or more, such as 1 hour or more, such as 2 hours or more, such as 4 hours or more, such as 8 hours or more, such as 12 hours or more, such as 24 hours or more, such as 36 hours or more, such as 48 hours or more, such as 60 hours or more, such as 72 hours or more, such as 96 hours or more, such as 120 hours or more, including 144 hours or more, and including 168 hours or more.

An upper limit for the amount of time the transdermal delivery device is maintained in contact with a subject before removal is, in some instances, 168 hours or shorter, such as 144 hours or shorter, such as 120 hours or shorter, such as 96 hours or shorter, such as 72 hours or shorter, such as 48 hours or shorter, such as 24 hours or shorter, such as 12 hours or shorter, such as 8 hours or shorter, such as 4 hours or shorter and including 2 hours or
15 shorter.
20

By "removing" the transdermal delivery device from contact with the subject is meant that no amount of dexmedetomidine from the transdermal composition remains in contact with the subject, including any residual amount of dexmedetomidine left behind on the surface of the skin or mucous membrane when the transdermal delivery device was applied.

In other words, when the transdermal delivery device is removed all traces of
25 dexmedetomidine are no longer on the surface of the skin or mucous membrane at the application site, resulting in zero transdermal flux of dexmedetomidine into the subject.

As described above, a dosage interval is a single administration of applying and maintaining the transdermal delivery device in contact with the subject which begins with
30 applying the transdermal dexmedetomidine composition to the skin or mucous membrane of the subject and ends with the removal of the transdermal delivery device from contact with the subject. In certain embodiments, protocols for may include multiple dosage intervals. By "multiple dosage intervals" is meant more than one transdermal delivery device is applied and maintained in contact with the subject in a sequential manner. As such, a transdermal
35 delivery device is removed from contact with the subject and a new transdermal delivery device is reapplied to the subject. In practicing methods of the invention, treatment regimens may include two or more dosage intervals, such as three or more dosage intervals,

such as four or more dosage intervals, such as five or more dosage intervals, including ten or more dosage intervals.

The location on the subject for reapplying subsequent transdermal delivery devices in multiple dosage treatment regimens may be the same or different from the location on the subject where the previous transdermal delivery device was removed. For example, if a first transdermal delivery device is applied and maintained on the leg of the subject, one or more subsequent transdermal delivery devices may be reapplied to the same position on the leg of the subject. On the other hand, if a first transdermal delivery device was applied and maintained on the leg of the subject, one or more subsequent transdermal delivery device may be reapplied to a different position, such as the abdomen or back of the subject. Subsequent dosages applied in multiple dosage interval regimens may have the same or different formulation of dexmedetomidine. In certain instances, a subsequent dosage interval in a treatment regimen may contain a higher or lower concentration of dexmedetomidine than the previous dosage interval. For example, the concentration of dexmedetomidine may be increased in subsequent dosage intervals by 10% or greater, such as 20% or greater, such as 50% or greater, such as 75% or greater, such as 90% or greater and including 100% or greater. An upper limit for the increase in concentration of dexmedetomidine in subsequent dosage intervals is, in some instances, 10-fold or less, such as 5-fold or less, such as 2-fold or less, such as 1-fold or less, such as 0.5-fold or less and including 0.25-fold or less.

On the other hand, the concentration of dexmedetomidine may be decreased in subsequent dosage intervals, such as by 10% or greater, such as 20% or greater, such as 50% or greater, such as 75% or greater, such as 90% or greater and including 100% or greater. An upper limit for the decrease in concentration of dexmedetomidine in subsequent dosage intervals is, in some instances, 10-fold or less, such as 5-fold or less, such as 2-fold or less, such as 1-fold or less, such as 0.5-fold or less and including 0.25-fold or less.

In other instances, a subsequent dosage interval may contain a different formulation of dexmedetomidine than the previous dosage interval, such as a different pressure sensitive adhesive or the presence or absence of a permeation enhancer, as described above.

In certain embodiments, compositions of the invention can be administered prior to, concurrent with, or subsequent to other therapeutic agents for treating the same or an unrelated condition. If provided at the same time as another therapeutic agent, the subject dexmedetomidine compositions may be administered in the same or in a different composition. Thus, dexmedetomidine compositions of interest and other therapeutic agents can be administered to the subject by way of concurrent therapy. By "concurrent therapy" is intended administration to a subject such that the therapeutic effect of the combination of the

substances is caused in the subject undergoing therapy. For example, concurrent therapy may be achieved by administering dexmedetomidine compositions of the invention with a pharmaceutical composition having at least one other agent, such as an analgesic (such as an opioid), anesthetic, antihypertensive, chemotherapeutic, among other types of
5 therapeutics, which in combination make up a therapeutically effective dose, according to a particular dosing regimen. Administration of the separate pharmaceutical compositions can be performed simultaneously or at different times (i.e., sequentially, in either order, on the same day, or on different days), so long as the therapeutic effect of the combination of these substances is caused in the subject undergoing therapy.

10 Where dexmedetomidine is administered concurrently with a second therapeutic agent to treat the same condition, the weight ratio of dexmedetomidine to second therapeutic agent may range from 1:2 and 1:2.5; 1:2.5 and 1:3; 1:3 and 1:3.5 1:3.5 and 1:4; 1:4 and 1:4.5; 1:4.5 and 1:5; 1:5 and 1:10; and 1:10 and 1:25 or a range thereof. For example, the weight ratio of dexmedetomidine to second therapeutic agent may range between 1:1 and
15 1:5; 1:5 and 1:10; 1:10 and 1:15; or 1:15 and 1:25. Alternatively, the weight ratio of the second therapeutic agent to dexmedetomidine ranges between 2:1 and 2.5:1; 2.5:1 and 3:1; 3:1 and 3.5:1; 3.5:1 and 4:1; 4:1 and 4.5:1; 4.5:1 and 5:1; 5:1 and 10:1; and 10:1 and 25:1 or a range thereof. For example, the ratio of the second therapeutic agent dexmedetomidine may range between 1:1 and 5:1; 5:1 and 10:1; 10:1 and 15:1; or 15:1 and 25:1.

20
DEXMEDETOMIDINE TRANSDERMAL DELIVERY DEVICES CONTAINING A DEXMEDETOMIDINE COMPOSITION FOR TREATING A SUBJECT FOR WITHDRAWAL SYNDROME

Aspects of the invention also include dexmedetomidine transdermal delivery devices
25 for delivering a non-sedative amount of dexmedetomidine to a subject suitable for practicing the subject methods. Transdermal delivery devices of interest include a composition having dexmedetomidine and a pressure sensitive adhesive. Dexmedetomidine is the S-enantiomer of medetomidine described by the formula:

30 Dexmedetomidine according to embodiments of the invention may be in the form of a free base, salt, solvate, hydrate or complex. For example, dexmedetomidine may be in the

form of a pharmaceutically acceptable salt including, but not limited to, a mesylate, maleate, fumarate, tartrate, hydrochloride, hydrobromide, esylate, p-toluenesulfonate, benzoate, acetate, phosphate and sulfate salt. Dexmedetomidine according to some embodiments may be a free base. In other instances, dexmedetomidine may form a complex.

5 Depending on the site of application, the type of withdrawal syndrome being treated and the physiology of the subject (e.g., body mass), the amount of dexmedetomidine in compositions of interest may vary, in some instances, the amount of dexmedetomidine ranges from 0.001 mg to 50 mg, such as 0.005 mg to 40 mg, such as 0.01 to 30 mg, such as 0.05 to 20 mg, and including 0.1mg to 10 mg. In some embodiments, the amount of
10 dexmedetomidine in the transdermal composition ranges from 0.1% to 20% w/w, such as 0.5% to 18% w/w, such as 1% to 15%, such as 2% to 12.5% w/w and including 3% to 10% w/w. In other embodiments, the amount of dexmedetomidine in the subject transdermal compositions is 10% by weight or less of the total weight of the transdermal composition, such as 9% by weight or less, such as 8% by weight or less, such as 7% by weight or less,
15 such as 6% by weight or less, such as 5% by weight or less and including 3% by weight or less of the total weight of the transdermal composition. In certain embodiments, dexmedetomidine compositions include an amount which is below the saturation point of dexmedetomidine. In other embodiments, dexmedetomidine compositions include a saturated amount of dexmedetomidine. In yet other embodiments, dexmedetomidine
20 compositions include a supersaturated amount of dexmedetomidine.

In embodiments of the invention, dexmedetomidine compositions described herein are formulated to deliver a non-sedative amount of dexmedetomidine. As described above, by non-sedative is meant that the dexmedetomidine composition is formulated to deliver an amount of dexmedetomidine to the subject which does not cause complete sedation of the
25 subject. In other words, a subject remains conscious and responsive throughout the entire time dexmedetomidine compositions of interest are transdermally administered to the subject. In certain instances, throughout administration of the dexmedetomidine transdermal composition, the subject remains in a cooperative, oriented and tranquil state. In other instances, throughout administration of the dexmedetomidine transdermal composition, the
30 subject remains alert and capable of responding to commands (e.g., oral or written commands). In yet other instances, throughout administration of the dexmedetomidine transdermal composition, the subject is in an alert, cooperative, oriented and tranquil state and is capable of responding to commands (e.g., oral or written commands).

As described in greater detail below, in some embodiments dexmedetomidine
35 transdermal compositions of interest are formulated such that throughout transdermal administration the subject may be evaluated according to the Ramsey Sedation Scale and assigned a Ramsey score of 4 or less, such as a Ramsey score of 3 or less, such as a

Ramsey score of 2 or less and including where the subject is assigned a Ramsey score of 1. In certain instances, throughout administration of the dexmedetomidine transdermal composition, the subject exhibits brisk response to light glabellar tap or loud auditory stimulus. In other instances, throughout administration of the dexmedetomidine transdermal composition, the subject is responsive to oral commands. In yet other instances, throughout administration of the dexmedetomidine transdermal composition, the subject is co-operative, oriented and tranquil. In yet other instances, throughout administration of the dexmedetomidine transdermal composition, the subject is anxious, agitated or restless.

In embodiments of the present invention, transdermal dexmedetomidine compositions also include a pressure sensitive adhesive. Pressure sensitive adhesives may include, but are not limited to, poly-isobutene adhesives, poly-isobutylene adhesives, poly-isobutene/polyisobutylene adhesive mixtures, carboxylated polymers, acrylic or acrylate copolymers, such as carboxylated acrylate copolymers.

Where the pressure sensitive adhesive includes polybutene, the polybutene may be saturated polybutene. Alternatively, the polybutene may be unsaturated polybutene. Still further, the polybutene may be a mixture or combination of saturated polybutene and unsaturated polybutene. In some embodiments, the pressure sensitive adhesive may include a composition that is, or is substantially the same as, the composition of Indopol® L-2, Indopol® L-3, Indopol® L-6, Indopol® L-8, Indopol® L-14, Indopol® H-7, Indopol® H-8, Indopol® H-15, Indopol® H-25, Indopol® H-35, Indopol® H-50, Indopol® H-100, Indopol® H-300, Indopol® H-1200, Indopol® H-1500, Indopol® H-1900, Indopol® H-2100, Indopol® H-6000, Indopol® H-18000, Panalane® L-14E, Panalane® H-300E and combinations thereof. In certain embodiments, the polybutene pressure-sensitive adhesive is Indopol® H-1900. In other embodiments, the polybutene pressure-sensitive adhesive is Panalane® H-300E.

Acrylate copolymers of interest include copolymers of various monomers, such as "soft" monomers, "hard" monomers or "functional" monomers. The acrylate copolymers can be composed of a copolymer including bipolymer (i.e., made with two monomers), a terpolymer (i.e., made with three monomers), or a tetrapolymer (i.e., made with four monomers), or copolymers having greater numbers of monomers. The acrylate copolymers may be crosslinked or non-crosslinked. The polymers can be cross-linked by known methods to provide the desired polymers. The monomers from of the acrylate copolymers may include at least two or more exemplary components selected from the group including acrylic acids, alkyl acrylates, methacrylates, copolymerizable secondary monomers or monomers with functional groups. Monomers ("soft" and "hard" monomers) may be methoxyethyl acrylate, ethyl acrylate, butyl acrylate, butyl methacrylate, hexyl acrylate, hexyl methacrylate, 2-ethylbutyl acrylate, 2-ethylbutyl methacrylate, isooctyl acrylate, isooctyl methacrylate, 2-ethylhexyl acrylate, 2-ethylhexyl methacrylate, decyl acrylate, decyl

methacrylate, dodecyl acrylate, dodecyl methacrylate, tridecyl acrylate, tridecyl methacrylate, acrylonitrile, methoxyethyl acrylate, methoxyethyl methacrylate, and the like. Additional examples of acrylic adhesive monomers are described in Satas, "Acrylic Adhesives," Handbook of Pressure-Sensitive Adhesive Technology, 2nd ed., pp. 396-456 (D. Satas, ed.), Van Nostrand Reinhold, New York (1989), the disclosure of which is herein incorporated by reference. In some embodiments, the pressure sensitive adhesive is an acrylate-vinyl acetate copolymer. In some embodiments, the pressure sensitive adhesive may include a composition that is, or is substantially the same as, the composition of Duro-Tak® 87-9301, Duro-Tak® 87-200A, Duro-Tak®87-2353, Duro-Tak®87-2100, Duro-Tak®87-2051, Duro-Tak®87-2052, Duro-Tak®87-2194, Duro-Tak®87-2677, Duro-Tak®87-201A, Duro-Tak®87-2979, Duro-Tak®87-2510, Duro-Tak®87-2516, Duro-Tak®87-387, Duro-Tak®87-4287, Duro-Tak®87-2287, and Duro-Tak®87-2074 and combinations thereof. The term "substantially the same" as used herein refers to a composition that is an acrylate-vinyl acetate copolymer in an organic solvent solution. In certain embodiments, the acrylic pressure-sensitive adhesive is Duro-Tak® 87-2054.

In certain embodiments, the pressure sensitive adhesive is an acrylate adhesive that is a non-functionalized acrylate, hydroxyl-functionalized acrylate or an acid functionalized acrylate. For example, the acrylate adhesive may be an acrylic adhesive having one or more –OH functional groups. Where the acrylic adhesive has one or more –OH functional groups, in some instances, the pressure sensitive adhesive may be a composition that is, or is substantially the same as, the composition of Duro-Tak® 87-4287, Duro-Tak® 87-2287, Duro-Tak® 87-2510 and Duro-Tak® 87-2516 and combinations thereof. The acrylate adhesive may alternatively be an acrylic adhesive having one or more –COOH functional groups. Where the acrylic adhesive has one or more –COOH functional groups, in some instances, the pressure sensitive adhesive may be a composition that is or is substantially the same as, the composition of Duro-Tak® 87-387, Duro-Tak® 87-2979 and Duro-Tak® 87-2353 and combinations thereof. Still further, the acrylate adhesive may be a non-functionalized acrylic adhesive. Where the acrylic adhesive is non-functionalized, in some instances the pressure sensitive adhesive may be a composition that is or is substantially the same as, the composition of Duro-Tak® 87-9301.

The amount of pressure sensitive adhesive in transdermal dexmedetomidine compositions of interest may vary, the amount of pressure sensitive adhesive ranging from 0.1 mg to 2000 mg, such as 0.5 mg to 1500 mg, such as 1 to 1000 mg, such as 10 to 750 mg, and including 10 mg to 500 mg. As such, the amount of pressure sensitive adhesive in the transdermal composition ranges from 1% to 99% w/w, such as 5% to 95% w/w, such as 10% to 95%, such as 15% to 90% w/w and including 20% to 85% w/w. In other embodiments, the amount of pressure sensitive adhesive in the subject transdermal

compositions is 70% by weight or greater of the total weight of the transdermal composition, such as 75% by weight or greater, such as 80% by weight or greater, such as 85% by weight or greater, such as 90% by weight or greater, such as 95% by weight or greater and including 97% by weight or greater of the total weight of the transdermal composition.

5 The weight ratio of pressure sensitive adhesive to dexmedetomidine in the subject compositions may range from 1:2 and 1:2.5; 1:2.5 and 1:3; 1:3 and 1:3.5; 1:3.5 and 1:4; 1:4 and 1:4.5; 1:4.5 and 1:5; 1:5 and 1:10; 1:10 and 1:25; 1:25 and 1:50; 1:50 and 1:75; and 1:75 and 1:99 or a range thereof. For example, the weight ratio of pressure sensitive adhesive to dexmedetomidine in compositions of interest may range between 1:1 and 1:5;
10 1:5 and 1:10; 1:10 and 1:15; 1:15 and 1:25; 1:25 and 1:50; 1:50 and 1:75 or 1:75 and 1:99. Alternatively, the weight ratio of dexmedetomidine to pressure sensitive adhesive in the subject compositions ranges between 2:1 and 2.5:1; 2.5:1 and 3:1; 3:1 and 3.5:1; 3.5:1 and 4:1; 4:1 and 4.5:1; 4.5:1 and 5:1; 5:1 and 10:1; 10:1 and 25:1; 25:1 and 50:1; 50:1 and 75:1; and 75:1 and 99:1 or a range thereof. For example, the ratio of dexmedetomidine to
15 pressure sensitive adhesive in compositions of interest may range between 1:1 and 5:1; 5:1 and 10:1; 10:1 and 15:1; 15:1 and 25:1; 25:1 and 50:1; 50:1 and 75:1; or 75:1 and 99:1.

In some embodiments, transdermal dexmedetomidine compositions may further include one or more crosslinked hydrophilic polymers. For example, the crosslinked polymer may be an amine-containing hydrophilic polymer. Amine-containing polymers may include,
20 but are not limited to, polyethyleneimine, amine-terminated polyethylene oxide, amine-terminated polyethylene/polypropylene oxide, polymers of dimethyl amino ethyl methacrylate, and copolymers of dimethyl amino ethyl methacrylate and vinyl pyrrolidone. In certain embodiments, the crosslinked polymer is crosslinked polyvinylpyrrolidone, such as for example PVP-CLM.

25 The matrix may contain other additives depending on the adhesive used. For example, materials, such as PVP-CLM, PVP K17, PVP K30, PVP K90, that inhibit drug crystallization, have hygroscopic properties that improve the duration of wear, and improve the physical properties, e.g., cold flow, tack, cohesive strength, of the adhesive.

The amount of crosslinked polymer in dexmedetomidine compositions of interest may
30 vary, the amount of crosslinked polymer ranging from 0.1 mg to 500 mg, such as 0.5 mg to 400 mg, such as 1 to 300 mg, such as 10 to 200 mg, and including 10 mg to 100 mg. As such, the amount of crosslinked polymer in the transdermal composition ranges from 2% to 30% w/w, such as 4% to 30% w/w, such as 5% to 25%, such as 6% to 22.5% w/w and including 10% to 20% w/w. In other embodiments, the amount of crosslinked polymer in the
35 subject transdermal compositions is 8% by weight or greater of the total weight of the transdermal composition, such as 10% by weight or greater, such as 12% by weight or greater, such as 15% by weight or greater, such as 20% by weight or greater, such as 25%

by weight or greater and including 30% by weight crosslinked polymer or greater of the total weight of the transdermal composition.

In certain embodiments, the subject transdermal dexmedetomidine compositions further include a dexmedetomidine solubility enhancer. By "solubility enhancer" is meant a compound or composition which increases the dexmedetomidine solubility in the subject compositions, such as, for example, to prevent any unwanted crystallization of dexmedetomidine in the composition. The dexmedetomidine solubilization enhancer is incorporated into the dexmedetomidine composition in an amount ranging from 0.01% to 20% (w/w), such as from 0.05% to 15% (w/w), such as from 0.1% to 10% (w/w), such as from 0.5% to 8% (w/w) and including from 1% to 5% (w/w).

Example solubility enhancers include, but are not limited to acids including linolic acid, oleic acid, linolenic acid, stearic acid, isostearic acid, levulinic acid, palmitic acid, octanoic acid, decanoic acid, dodecanoic acid, tetradecanoic acid, hexadecanoic acid, octadecanoic acid (i.e., stearic acid), N-lauroyl sarcosine, L-pyroglutamic acid, lauric acid, succinic acid, pyruvic acid, glutaric acid, sebacic acid, cyclopentane carboxylic acid; acylated amino acids. Other solubility enhancers of interest may include, but is not limited to aliphatic alcohols, such as saturated or unsaturated higher alcohols having 12 to 22 carbon atoms (e.g., oleyl alcohol or lauryl alcohol); fatty acid esters, such as isopropyl myristate, diisopropyl adipate, lauryl lactate, propyl laurate, ethyl oleate and isopropyl palmitate; alcohol amines, such as triethanolamine, triethanolamine hydrochloride, and diisopropanolamine; polyhydric alcohol alkyl ethers, such as alkyl ethers of polyhydric alcohols such as glycerol, ethylene glycol, propylene glycol, 1,3-butylene glycol, diglycerol, polyglycerol, diethylene glycol, polyethylene glycol, dipropylene glycol, polypropylene glycol, polypropylene glycolmonolaurate, sorbitan, sorbitol, isosorbide, methyl glucoside, oligosaccharides, and reducing oligosaccharides, where the number of carbon atoms of the alkyl group moiety in the polyhydric alcohol alkyl ethers is preferably 6 to 20; polyoxyethylene alkyl ethers, such as polyoxyethylene alkyl ethers in which the number of carbon atoms of the alkyl group moiety is 6 to 20, and the number of repeating units (e.g. $-O-CH_2CH_2-$) of the polyoxyethylene chain is 1 to 9, such as but not limited to polyoxyethylene lauryl ether, polyoxyethylene cetyl ether, polyoxyethylene stearyl ether, and polyoxyethylene oleyl ether; glycerides (i.e., fatty acid esters of glycerol), such as glycerol esters of fatty acids having 6 to 18 carbon atoms, where the glycerides may be monoglycerides (i.e., a glycerol molecule covalently bonded to one fatty acid chain through an ester linkage), diglycerides (i.e., a glycerol molecule covalently bonded to two fatty acid chains through ester linkages), triglycerides (i.e., a glycerol molecule covalently bonded to three fatty acid chains through ester linkages), or combinations thereof, where the fatty acid components forming the glycerides include octanoic acid, decanoic acid, dodecanoic acid, tetradecanoic acid,

hexadecanoic acid, octadecanoic acid (i.e., stearic acid) and oleic acid; middle-chain fatty acid esters of polyhydric alcohols; lactic acid alkyl esters; dibasic acid alkyl esters; acylated amino acids; pyrrolidone; pyrrolidone derivatives and combinations thereof. Additional types of solubility enhancers may include lactic acid, tartaric acid, 1,2,6-hexanetriol, benzyl
5 alcohol, lanoline, potassium hydroxide (KOH), tris(hydroxymethyl)aminomethane, glycerol monooleate (GMO), sorbitan monolaurate (SML), sorbitan monooleate (SMO), laureth-4 (LTH), and combinations thereof. In certain embodiments, the solubility absorption enhancer is levulinic acid, lauryl lactate or propylene glycolmonolaurate.

The formulation of the subject transdermal dexmedetomidine composition may vary.
10 For example, compositions of the invention may be in the form of a liquid solution or suspension, syrup, gel, foam or any combination thereof for application by the transdermal delivery device.

In some embodiments, the transdermal delivery device is configured to include a single layer matrix dexmedetomidine composition. By "single layer" is meant that the
15 transdermal delivery device includes only a single layer of dexmedetomidine composition disposed on the surface of a substrate of the transdermal delivery device and does not include separate distinct layers for the pressure sensitive adhesive, transdermal dexmedetomidine composition, or if present any solubility enhancers. Likewise, single layer transdermal delivery devices of the present invention do not further include a separate
20 dexmedetomidine reservoir (i.e., active agent reservoir) separate from the pressure sensitive adhesive. As such, single layer transdermal delivery devices of the present invention may include in a single matrix an amount of each of the components of the transdermal dexmedetomidine compositions necessary for practicing the subject methods, as described in greater detail below. For example, in some embodiments, single layer transdermal
25 delivery devices of interest include a single layer matrix of dexmedetomidine and a pressure sensitive adhesive which is configured to deliver a non-sedative amount of dexmedetomidine to a subject. In another embodiment, single layer transdermal delivery devices of interest include a single layer matrix of dexmedetomidine, a pressure sensitive adhesive and a solubility enhancer which is configured to deliver a non-sedative amount of
30 dexmedetomidine to a subject. In another embodiment, single layer transdermal delivery devices of interest include a single layer matrix of dexmedetomidine, a pressure sensitive adhesive and a fatty acid ester which is configured to deliver a non-sedative amount of dexmedetomidine to a subject. In certain embodiments, single layer transdermal delivery devices of interest include a single layer matrix having only dexmedetomidine and a
35 pressure sensitive adhesive. Depending on the length of the dosage interval and the desired target dosage, the thickness of single layer matrices of interest may vary, in some instances ranging in thickness from 10 to 260 microns, such as 15 to 250 microns, such as

25 to 225 microns, such as 50 to 200 microns, such as 75 to 175 microns and including 20 to 130 microns such as 35 to 110 microns.

The size of subject transdermal delivery devices may vary, in some instances sized to cover the entire application site on the subject. As such, the transdermal delivery device
5 may have a length ranging from 1 to 100 cm, such as from 1 to 60 cm and a width ranging from 1 to 100 cm, such as from 1 to 60 cm. As such, the area of the transdermal delivery device may range from 4 cm² to 10,000 cm², such as from 5 cm² to 1000 cm², such as from 10 cm² to 100 cm², such as from 15 cm² to 50 cm² and including from 20 cm² to 40 cm². In certain embodiments, the transdermal delivery device is sized to have an area of 30 cm². In
10 certain instances, the transdermal delivery device is insoluble in water. By insoluble in water is meant that that the transdermal delivery device may be immersed in water for a period of 1 day or longer, such as 1 week or longer, including 1 month or longer, and exhibit little if any dissolution, e.g., no observable dissolution.

In certain embodiments, the transdermal delivery device as described above furthers
15 includes an overlay backing layer. The overlay backing may be flexible, such as so that it can be brought into close contact with the desired application site on the subject. The overlay backing may be fabricated from a material that does not absorb the dexmedetomidine, and does not allow the dexmedetomidine to be leached from the matrix. Overlay backing layers of interest may include, but are not limited to, non-woven fabrics,
20 woven fabrics, films (including sheets), porous bodies, foamed bodies, paper, composite materials obtained by laminating a film on a non-woven fabric or fabric, and combinations thereof.

Non-woven fabric may include polyolefin resins such as polyethylene and polypropylene; polyester resins such as polyethylene terephthalate, polybutylene
25 terephthalate and polyethylene naphthalate; rayon, polyamide, poly(ester ether), polyurethane, polyacrylic resins, polyvinyl alcohol, styrene-isoprene-styrene copolymers, and styrene-ethylene-propylene-styrene copolymers; and combinations thereof. Fabrics may include cotton, rayon, polyacrylic resins, polyester resins, polyvinyl alcohol, and combinations thereof. Films may include polyolefin resins such as polyethylene and
30 polypropylene; polyacrylic resins such as polymethyl methacrylate and polyethyl methacrylate; polyester resins such as polyethylene terephthalate, polybutylene terephthalate and polyethylene naphthalate; and besides cellophane, polyvinyl alcohol, ethylene-vinyl alcohol copolymers, polyvinyl chloride, polystyrene, polyurethane, polyacrylonitrile, fluororesins, styrene-isoprene-styrene copolymers, styrene-butadiene
35 rubber, polybutadiene, ethylene-vinyl acetate copolymers, polyamide, and polysulfone; and combinations thereof. Papers may include impregnated paper, coated paper, wood free

paper, Kraft paper, Japanese paper, glassine paper, synthetic paper, and combinations thereof.

Depending on the dosage interval and the desired target dosage, the size of the overlay backing may vary, and in some instances sized to cover the entire application site on the subject. As such, the backing layer may have a length ranging from 2 to 100 cm, such as 4 to 60 cm and a width ranging from 2 to 100 cm, such as 4 to 60 cm. In certain instances, the overlay backing layer may be insoluble in water. By insoluble in water is meant that the backing layer may be immersed in water for a period of 1 day or longer, such as 1 week or longer, including 1 month or longer, and exhibit little if any dissolution, e.g., no observable dissolution.

Transdermal delivery devices having a dexmedetomidine composition according to embodiments of the invention are non-irritable to the skin of the subject at the site of application. Irritation of the skin is referred to herein in its general sense to refer to adverse effects, discoloration or damage to the skin, such as for example, redness, pain, swelling or dryness. As such, in practicing methods with the subject transdermal delivery devices the quality of the skin remains normal and transdermal delivery is consistent throughout the entire dosage interval.

In some embodiments, skin irritation is evaluated to determine the quality and color of the skin at the application site and to determine whether any damage, pain, swelling or dryness has resulted from maintaining the transdermal composition in contact with the subject. The skin may be evaluated for irritation by any convenient protocol, such as for example using the Draize scale, as disclosed in Draize, J. H., *Appraisal of the Safety of Chemicals in Foods, Drugs and Cosmetics*, pp. 46-49, The Association of Food and Drug Officials of the United States: Austin, Texas, the disclosure of which is herein incorporated by reference. In particular, the skin may be evaluated at the transdermal application site for erythema or edema. For example, grades for erythema and edema may be assigned based on visual observation or palpation:

Erythema: 0=no visible redness; 1=very slight redness (just perceptible); 2=slight but defined redness; 3=moderately intense redness; 4=severe erythema (dark red discoloration of the skin)
5 = eschar formation

Edema: 0=no visible reactions or swelling; 1=very mild edema (just perceptible swelling); 2=mild edema (corners of area are well defined due to swelling); 3=moderate edema (up to 1 mm swelling); 4=severe edema (more than 1 mm swelling).

The site of application may be evaluated for skin irritation at any time during the subject methods. In some instances, the skin is evaluated for irritation while maintaining the

transdermal delivery device in contact with the subject by observing or palpating the skin at regular intervals, e.g., every 0.25 hours, every 0.5 hours, every 1 hour, every 2 hours, every 4 hours, every 12 hours, every 24 hours, including every 72 hours, or some other interval.

For instance, the site of application may be evaluated for skin irritation while maintaining the transdermal delivery device in contact with the subject, such as 15 minutes after applying the transdermal delivery device to the subject, 30 minutes after applying the transdermal delivery device, 1 hour after applying the transdermal delivery device, 2 hours after applying the transdermal delivery device, 4 hours after applying the transdermal delivery device, 8 hours after applying the transdermal delivery device, 12 hours after applying the transdermal delivery device, 24 hours after applying the transdermal delivery device, 48 hours after applying the transdermal delivery device, 72 hours after applying the transdermal delivery device, 76 hours after applying the transdermal delivery device, 80 hours after applying the transdermal delivery device, 84 hours after applying the transdermal delivery device, 96 hours after applying the transdermal delivery device, 120 hours after applying the transdermal delivery device, including 168 hours after applying the transdermal delivery device.

In other embodiments, the site of transdermal application is evaluated for skin irritation after the transdermal delivery device has been removed from contact with the subject. For example, the site of application may be evaluated for skin irritation 30 minutes after removing the transdermal delivery device, such as 1 hour after removing the transdermal delivery device, such as 2 hours after removing the transdermal delivery device, such as 4 hours after removing the transdermal delivery device, such as 8 hours after removing the transdermal delivery device, such as 12 hours after removing the transdermal delivery device, such as 24 hours after removing the transdermal delivery device, such as 48 hours after removing the transdermal delivery device, including 72 hours after removing the transdermal delivery device.

In some embodiments, the site of transdermal application is evaluated for skin irritation before the transdermal delivery device is applied to a subject, such as to record the skin color and texture before commencing a dosage interval. For example, the site of application may be evaluated for skin irritation 5 minutes before applying the transdermal delivery device, such as 10 minutes, such as 30 minutes, such as 60 minutes, such as 120 minutes, such as 240 minutes and including 480 minutes before applying the transdermal delivery device. Where methods include multiple dosage intervals applied sequentially, the site of application may be evaluated for skin irritation after each transdermal delivery device is removed and before the subsequent transdermal delivery device is applied. For example, when a first transdermal delivery device is removed, the site of application may be evaluated for skin irritation 2 hours, 24 hours and 48 hours after removal and before application of a

second transdermal delivery device. A subsequent transdermal delivery device may be applied to the previous site of application immediately after evaluating the skin for irritation or may be applied after a predetermined time after evaluating the skin for irritation, such as 4 hours, 12 hours, 24 hours, 48 hours, 72 hours, 96 hours, 120 hours, 144 hours or 168 hours after evaluating the skin for irritation.

The site of application may be evaluated for skin irritation one or more times before, during or after a dosage interval, such as 2 or more times, such as 3 or more times, including 5 or more times before, during or after a dosage interval. An upper limit for the number of times the site of application may be evaluated for skin irritation before, during or after a dosage interval is, in some instances, 10 times or fewer, such as 7 times or fewer, such as 5 times or fewer, such as 3 times or fewer and including 2 times or fewer. In certain embodiments, the number of times the site of application may be evaluated for skin irritation before, during or after a dosage interval ranges such as from 2 times to 10 times, such as from 3 times to 9 times, such as from 4 times to 8 times and including from 5 times to 7 times. In certain embodiments, skin irritation may be monitored throughout the entire time the transdermal delivery device is maintained in contact with the subject, such by video monitoring.

KITS

Kits for use in practicing certain methods described herein are also provided. In certain embodiments, the kits include one or more transdermal delivery devices containing a dexmedetomidine composition having an amount of dexmedetomidine and pressure sensitive adhesive as described above. In certain embodiments, the kits include an adhesive overlay as described above. In a given kit that includes two or more of the subject transdermal delivery devices, the compositions may be individually packaged or present within a common container.

In certain embodiments, the kits will further include instructions for practicing the subject methods or means for obtaining the same (e.g., a website URL directing the user to a webpage which provides the instructions), where these instructions may be printed on a substrate, where substrate may be one or more of: a package insert, the packaging, reagent containers and the like. In the subject kits, the one or more components are present in the same or different containers, as may be convenient or desirable.

The following examples are offered by way of illustration and not by way of limitation. Specifically, the following examples are of specific embodiments for carrying out the present invention. The examples are for illustrative purposes only, and are not intended to limit the

scope of the present invention in any way. Efforts have been made to ensure accuracy with respect to numbers used (e.g., amounts, temperatures, etc.), but some experimental error and deviation should, of course, be allowed for.

5

EXPERIMENTAL

Materials and Methods

Preparation of Example Dexmedetomidine Transdermal Formulations

Formulations were prepared by mixing dexmedetomidine and a pressure sensitive adhesive in organic solvents (e.g., 30-60 wt% solid content in ethyl acetate, isopropyl alcohol, hexane, or heptane), followed by mixing. Once a homogeneous mixture was formed, the solution was cast on a release liner (siliconized polyester or fluoropolymer coated polyester sheets of 2-3 mils) and dried at 60° - 80°C for 10-90 minutes. The single layer adhesive films were then laminated to a PET backing, cut to the desired size, and pouched. In some instances, crosslinked polyvinylpyrrolidone (PVP-CLM), polyvinylpyrrolidone K90 (PVP K90), levulinic acid (LA), oleic acid (OA), lauryl lactate (LL), and propylene glycolmonolaurate (PGML) was added to the adhesive composition.

10

15

Transdermal Flux Tests

Human cadaver skin was used and epidermal layers (stratum corneum and viable epidermis) were separated from the full-thickness skin as skin membrane. Samples were die-cut with an arch punch to a final diameter of about 2.0 cm². The release liner was removed and the system was placed on top of the epidermis/stratum corneum with the dexmedetomidine adhesive layer facing the outer surface of the stratum corneum. Gentle pressure was applied to effect good contact between the adhesive layer and stratum corneum. The donor and receptor sides of the Franz cell were clamped together and the receptor solution containing a phosphate buffer at pH 6.5 and 0.01% gentamicin was added to the Franz cell. The cells were kept at 32°C -35°C for the duration of the experiment. Samples of the receptor solution were taken at regular intervals and the active agent concentration was measured by HPLC. The removed receptor solution was replaced with fresh solution to maintain sink conditions. The flux was calculated from the slope of cumulative amount of the drug permeated into the receiver compartment versus time plot.

30

Examples

Example 1

In-vitro flux obtained from dexmedetomidine transdermal composition formulations in PIB/PB polymers

35

Pressure-sensitive adhesives used in this example are polyisobutylene/polybutene (PIB/PB) adhesives. The PIB/PB adhesives are mixtures of high molecular weight PIB (5% Oppanol B100), low molecular weight PIB (25% Oppanol B12) and a polybutene tackifier, e.g., Indopol H1900 or Panalane H-300e (20%) in organic solvent, e.g., heptane (50%). The combination was mixed for about 3 days, until the mixture was homogeneous. Example dexmedetomidine transdermal composition formulations are shown in Tables 1 and 2.

An in-vitro skin flux study was performed as described above with transdermal delivery devices having different concentrations of dexmedetomidine as shown in Table 1. The average dexmedetomidine in-vitro skin flux with respect to time is illustrated in Figure 1. As depicted in Figure 1, dexmedetomidine in-vitro skin flux was high in the initial hours in the case of 1% formulation (Formulation 1) as compared to higher drug loading (Formulations 2 and 3). Formulations 2 and 3 were found to have needle-like crystals of dexmedetomidine, therefore flux profile is constant and did not change with drug loading. However, no crystals were observed in Formulation 1. Formulation 1 includes a saturated or supersaturated amount of dexmedetomidine.

Dexmedetomidine transdermal formulation was also made using PIB made from Indopol H1900 as shown in Table 2. The results of dexmedetomidine in-vitro permeation from 1% dexmedetomidine formulation made with 20%PVP-CLM in PIB/PB adhesive (Formulation 4) through skins that have different skin permeability are illustrated in Figure 2. Figure 2(A) shows the cumulative dexmedetomidine delivered amount with time. The in-vitro permeation of dexmedetomidine deviated depending on the permeability of the skin. The in-vitro dexmedetomidine delivered amount could vary from 4-35 ug/cm² at 8 hr. and 15-67 ug/cm² at 24 hr. Figure 2(B) shows the flux or derivative of cumulative drug delivered amount with respect to time. The delivery rate of dexmedetomidine from Formulation 2 reached the maximum at about 5-7 hr, then maintain constant for at least 24 hr. In case of high permeable skin (Skin#14), the flux might decreased due to depletion. Figure 2(C) shows the % drug remaining in patch with time. As depicted in Figure 2(C), the utilization of dexmedetomidine obtained from Formulation 4 was 20-70% after applying the patch for 24 hr.

Table 1

Example 2

5 **In-vitro flux obtained from dexmedetomidine transdermal composition formulations in non-functionalized acrylate polymers**

Dexmedetomidine in-vitro flux was measured using non-functionalized acrylate adhesive. An example of a non-functionalized acrylate adhesive used experimentally includes non-functionalized acrylate polymer Duro-Tak 87-9301. An in-vitro skin flux study was performed as described above with transdermal delivery devices having different concentrations of dexmedetomidine in non-functional Duro-Tak 87-9301. Dexmedetomidine transdermal composition formulations are shown in Table 3. The average dexmedetomidine in-vitro flux with respect to time is illustrated in Figure 3. As depicted in Figure 3, higher dexmedetomidine loading gave increased in-vitro skin flux.

15

Table 3

Components	% w/w		
	Formulation 5 (1%DMT/DT9301)	Formulation 6 (2%DMT/DT9301)	Formulation 7 (3%DMT/DT9301)

Example 3

20 **In-vitro flux obtained from dexmedetomidine transdermal composition formulations in hydroxyl (-OH) functionalized acrylate polymers**

Dexmedetomidine in-vitro flux was measured using hydroxyl (-OH) functionalized acrylate adhesives. Examples of a hydroxyl functionalized acrylate adhesive used experimentally include hydroxyl functionalized acrylate polymers, e.g., Duro-Tak 87-4287, Duro-Tak 387/87-2510, Duro-Tak 387/87-2287 and Duro-Tak 387/87-2516. An in-vitro skin flux study was performed as described above with transdermal delivery devices having

25

different concentrations of dexmedetomidine with different hydroxyl functionalized acrylate adhesives.

Tables 4 and 5 show the dexmedetomidine transdermal composition formulations with different concentrations of dexmedetomidine in Duro-Tak 87-4287 (acrylate-vinyl acetate polymer) or Duro-Tak 387/87-2510 (acrylate polymer). The mean dexmedetomidine in-vitro fluxes are illustrated in Figures 4 and 5. As depicted in Figures 4 and 5, dexmedetomidine in-vitro flux increased with the dexmedetomidine loading in the formulation.

Table 4

Components	% w/w		
	Formulation 8 (1%DMT/DT4287)	Formulation 9 (2%DMT/DT4287)	Formulation 10 (3%DMT/DT4287)
Dexmedetomidine base	1.00	2.00	3.00
Pressure Sensitive Adhesive Duro-Tak 87-4287	99.00	98.00	97.00

Table 5

Components	% w/w		
	Formulation 11 (1%DMT/DT2510)	Formulation 12 (2%DMT/DT2510)	Formulation 13 (3%DMT/DT2510)
Dexmedetomidine base	1.00	2.00	3.00
Pressure Sensitive Adhesive Duro-Tak 387/ 87-2510	99.00	98.00	97.00

Tables 6 show the dexmedetomidine transdermal composition formulations containing 1% dexmedetomidine in another hydroxyl functionalized acrylate polymers containing vinyl acetate, e.g., Duro-Tak 87-2287 (no crosslinker added polymer) and Duro-Tak 87-2516 (crosslinker added polymer). The mean dexmedetomidine in-vitro fluxes are illustrated in Figure 6. As depicted in Figure 6, in -vitro flux obtained from Duro-Tak 387/87-2287 was slightly higher than that from Duro-Tak 387/87-2516, possibly resulting from the higher adhesion properties of Duro-Tak 387/87-2287 compared with Duro-Tak 387/87-2516.

Table 6

Components	% w/w	
	Formulation 14 (1%DMT/DT2287)	Formulation 15 (1%DMT/DT2516)
Dexmedetomidine base	1.00	1.00

Pressure Sensitive Adhesive Duro-Tak 387/ 87-2516	0.00	99.00

Example 4

In-vitro flux obtained from 1% dexmedetomidine transdermal composition formulations in non-functionalized or hydroxyl (-OH) functionalized acrylate polymers

Another set of examples of dexmedetomidine transdermal formulations are transdermal compositions which include 1% w/w dexmedetomidine with non-functionalized acrylate polymer (Duro-Tak 87-9301, Formulation 5), hydroxyl functionalized acrylate polymer (Duro-Tak 387/87-2510, Formulation 11) and hydroxyl functionalized acrylate polymer containing vinyl acetate (Duro-Tak 87-4287, Formulation 8). In-vitro flux experiments were performed for 3 days and 1 day and the results are shown in Figure 7A and 7B, respectively. As depicted in both Figure 7A and 7B, dexmedetomidine in-vitro flux was less in non-functional adhesives as compared to hydroxyl functionalized adhesives with the same drug loading.

Example 5

In-vitro flux obtained from dexmedetomidine transdermal composition formulations in acid (-COOH) functionalized or acid/hydroxyl (-COOH/OH) functionalized acrylate polymers

Dexmedetomidine in-vitro flux was measured using acid (-COOH) functionalized or acid/hydroxyl (-COOH/OH) functionalized acrylate adhesives. Examples of acid (-COOH) functionalized acrylate adhesive used in this study is Duro-Tak 387/87-2353 (no crosslinker added acrylate polymer). The acid/hydroxyl (-COOH/OH) functionalized acrylate adhesive used in this study is Duro-Tak 87-2979 (crosslinker added acrylate-vinyl acetate polymer).

Tables 7 and 8 show the dexmedetomidine transdermal composition formulations with different acid (-COOH) functionalized or acid/hydroxyl (-COOH/OH) functionalized acrylate polymers. The concentration of dexmedetomidine in the formulations was selected based on the solubility of dexmedetomidine in each adhesive. The solubility of dexmedetomidine in Duro-Tak 387/87-2353 was found to be about 10-15%, whereas that in Duro-Tak 87-2979 was found to be less than 2%. The solubility of drug in acid functionalized acrylate adhesives was greater than that in non-functionalized or hydroxyl functionalized acrylate adhesives.

In-vitro skin flux study was performed as described above. The mean dexmedetomidine in-vitro fluxes are illustrated in Figures 8 and 9.

Table 7

Components	% w/w

Table 8

Components	% w/w
	Formulation 17 (1.5%DMT/DT2979)
Dexmedetomidine base	1.00
Pressure Sensitive Adhesive Duro-Tak 87-2979	99.00

Example 6

In-vitro flux obtained from dexmedetomidine transdermal composition formulations in PIB/PB polymers containing PVP-CLM and Duro-Tak 387/87-2353

Another example of dexmedetomidine transdermal composition formulation is shown in Table 9. In order to increase the solubility of drug in PIB/PB (e.g., Indopol H-1900) adhesive, PVP-CLM and acid (-COOH) functionalized acrylate polymer (Duro-Tak 387/87-2353) were used. Formulations 18 to 21 were prepared with different loadings of Duro-Tak 387/87-2353.

As depicted in Figure 10, Formulations containing acid (-COOH) functionalized acrylate polymer (Duro-Tak 387/87-2353), Formulations 19, 20 and 21, appear to have lower initial flux compared with Formulations without Duro-Tak 2353 (Formulation 18). The in-vitro flux of dexmedetomidine did not change with 3% and 6% of acid functionalized adhesive, however, at 9% acid functionalized adhesive, a slight decrease in the in-vitro flux is observed.

Table 9

Components	% w/w			
	Formulation 18 (3%DMT/20% CLM/PIB)	Formulation 19 (3%DMT/3%D T2353/18.8%CLM/PIB)	Formulation 20 (3%DMT/6% DT2353/18.2 %CLM/PIB)	Formulation 21 (3%DMT/9% DT2353/17.6 %CLM/PIB)
Dexmedetomidine base	3.00	3.00	3.00	3.00
PVP-CLM	20.00	18.8	18.7	18.6
Pressure Sensitive Adhesive Duro-Tak 387/87-2353	-	3.00	6.00	9.00
PIB/PB (Indopol H-1900)	q.s. to 100	q.s. to 100	q.s. to 100	q.s. to 100

Example 7

In-vitro flux obtained from dexmedetomidine transdermal composition formulations in PIB/PB polymers containing PVP-CLM and levulinic acid

Another example of dexmedetomidine transdermal composition formulation is shown in Table 10. In order to increase the solubility of drug in PIB/PB (e.g., Indopol H-1900) adhesive in presence of 20% PVP-CLM, various concentrations of an acid were used to test increased dexmedetomidine solubility. Formulations 22 to 25 were prepared with different loadings of levulinic acid.

Table 10

Components	% w/w			
	Formulation22 (3%DMT/0.6%LA/20%CLM/PIB)	Formulation23 (3%DMT/0.9%LA/20%CLM/PIB)	Formulation24 (3%DMT/1.75%LA/20%CLM/PIB)	Formulation25 (3%DMT/6.9%LA/20%CLM/PIB)
Dexmedetomidine base	3.00	3.00	3.00	3.00
PVP-CLM	20.00	20.00	20.00	20.00
Levulinic Acid	0.60	0.90	1.75	6.90
PIB/PB (Indopol H-1900)	q.s. to 100	q.s. to 100	q.s. to 100	q.s. to 100

As depicted in Figure 11, in-vitro flux of dexmedetomidine was reduced dramatically where the formulation included 6.9% of levulinic acid. However, at a concentration of 1.75% levulinic acid, in-vitro flux was comparable to lower concentrations of levulinic acid (i.e., 0.6% and 0.9%). The initial flux obtained from formulations containing levulinic acid (Formulations 22,23,24 and 25) was lower than that from formulation without levulinic acid (Formulation 18) However, after 24 hr, the flux obtained from the formulations containing levulinic acid (Formulations 22,23,24 and 25) appear to be higher than that from formulation without levulinic acid (Formulation 17). Dexmedetomidine crystals were observed at levulinic acid concentrations of 1.75% and lower.

Example 8

In-vitro flux obtained from dexmedetomidine transdermal composition formulations in PIB/PB polymers containing PVP-CLM and lauryl lactate or propylene glycolmonolaurate

Another example of dexmedetomidine transdermal composition formulations are shown in Tables 11 and 12. Dexmedetomidine has solubility of 5 to 10% in lauryl lactate and propylene glycolmonolaurate. Each of lauryl lactate and propylene glycolmonolaurate increase solubility of dexmedetomidine in the PIB/PB adhesive in the subject formulations. In-vitro flux profiles of Formulations 26 to 28 are shown in Figure 12. In-vitro flux profiles of

Formulations 29 to 31 are shown in Figure 13. Formulations 26 to 31 were found to have needle-like crystals of dexmedetomidine,

Table 11

Example 9

In-vitro flux obtained from dexmedetomidine transdermal composition formulations in Duro-Tak 387/87-2287 polymers containing levulinic acid, PVP K90 or Duro-Tak 387/87-2353

10

Another set of examples of dexmedetomidine transdermal formulation include transdermal compositions having 1% w/w dexmedetomidine with a solubilizer to improve physical stability of the composition. In these formulations, levulinic acid, PVP K90 and Duro-Tak 87-2353 were employed. The formulation compositions are shown in Tables 13, 14 and 15. In-vitro flux profiles for transdermal compositions having 1% dexmedetomidine with 0.3% and 0.6% levulinic acid are shown in Figure 14(A). In-vitro flux profiles for transdermal compositions having 1% dexmedetomidine with 5% and 10% PVP K90 are shown in Figure 14(B). In-vitro flux profiles for transdermal compositions having 1% dexmedetomidine with 2% or 3% Duro-Tak 387/87-2353 are shown in Figure 14(C). From the in-vitro flux profiles, levulinic acid enhanced the permeation after application for 15 hr., PVP K90 delayed transdermal flux of dexmedetomidine whereas Duro-Tak 2353 slightly reduced transdermal flux.

15

20

Table13

Components	% w/w	
	Formulation 32 (1%DMT/0.3%LA/DT2287)	Formulation 33 (1%DMT/0.6%LA/DT2287)

Example 10

In-vitro flux obtained from dexmedetomidine transdermal composition formulations in Duro-Tak 87-9301 polymers containing lauryl lactate, oleic acid or Duro-Tak 387/87-2353

10

Another set of examples of dexmedetomidine transdermal formulation include transdermal compositions having 3% w/w dexmedetomidine and non-functionalized acrylate polymer Duro-Tak 87-9301 in combination with 3.3% levulinic acid, 5% Oleic acid or 15%Duro-Tak 387/87-2353. The formulation compositions are shown in Table 16. In-vitro flux profiles for these formulations (Formulations 38,39 and 40), compared with 3% dexmedetomidine in non-functionalized acrylate polymer Duro-Tak 87-9301 without additive

15

(Formulation 7) are illustrated in Figure 15. Compositions having just 3% dexmedetomidine and non-functionalized acrylate polymer Duro-Tak 87-9301 were supersaturated. Levulinic acid and oleic acid were used as a solubilizer and permeation enhancer and increased flux at the beginning of in-vitro flux, but declined with time. Like with the 1% dexmedetomidine compositions, Duro-Tak 87-2353 reduced flux.

Table 16

Components	% w/w		
	Formulation 38 (3%DMT/3.3%LA/ DT9301)	Formulation 39 (3%DMT/5%OA/ DT9301)	Formulation 40 (3%DMT/15%DT2 353/DT9301)

Pressure Sensitive Adhesive Duro-Tak 387/ 87-2353	0.00	0.00	15.00
Pressure Sensitive Adhesive Duro-Tak 87-9301	93.70	92.00	82.00

Example 11

In-vitro permeation of dexmedetomidine obtained from 1%, 2%, 3% and 4%

dexmedetomidine in the mixture of adhesives (15%Duro-Tak2353 in Duro-Tak 2287)

Dexmedetomidine transdermal composition formulations containing the mixture of hydroxyl functionalized acrylate polymer (e.g., Duro-Tak 87-2287) and acid functionalized acrylate polymer (e.g., Duro-Tak 87-2353) are summarized in Table 17. Formulations 41 to 44 were prepared with different loadings of dexmedetomidine.

Table 17

Components	%w/w			
	Formulation 41 (1%DMT/15% DT2353/DT22 87)	Formulation 42 (2%DMT/15% DT2353/DT22 87)	Formulation 43 (3%DMT/15% DT2353/DT2 287)	Formulation 44 (4%DMT/15 %DT2353/D T2287)
Dexmedetomidine base	1.00	2.00	3.00	4.00
Pressure Sensitive Adhesive Duro-Tak 2353	15.00	15.00	15.00	15.00
Pressure Sensitive Adhesive Duro-Tak 2287	84.00	83.00	82.00	81.00

As depicted in Figure 16, in-vitro flux of dexmedetomidine increased with increasing percent of dexmedetomidine loading.

Example 12**In-vitro permeation of dexmedetomidine obtained from dexmedetomidine formulations containing oleic acid**

Another example of dexmedetomidine transdermal composition formulations is summarized in Table 18. In order to increase the solubility of dexmedetomidine in the hydroxyl functionalized acrylate polymer (e.g., Duro-Tak 87-2287), oleic acid was used. Formulations 45 to 47 were prepared with different loadings of oleic acid and dexmedetomidine.

Table 18

Components	%w/w		
	Formulation 45 (3%DMT/5%OA/DT2 287)	Formulation 46 3%DMT/7%OA/DT2 287	Formulation 47 3%DMT/5%OA/DT2 287
Dexmedetomidine base	3.00	3.00	4.00
Oleic acid	5.00	7.00	5.00
Pressure Sensitive Adhesive Duro-Tak 2287	92.00	90.00	91.00

As depicted in Figure 17, dexmedetomidine in formulations containing oleic acid has a higher flux than a dexmedetomidine composition (e.g., Formulation 43) which does not contain oleic acid. Oleic acid enhanced the permeation of dexmedetomidine through the skin. An increase of oleic acid from 5% to 7% (e.g. Formulation 46) did not show an enhancement effect as compared to the formulation containing 5% oleic acid (e.g. Formulation 45). This may be the result of the contribution of oleic acid in increasing in solubility of dexmedetomidine in the composition. A comparison of Formulation 45 and Formulation 47 shows that the in-vitro flux increases with increasing percent drug loading.

Example 13**In-vitro permeation of dexmedetomidine obtained from dexmedetomidine formulations containing levulinic acid**

Dexmedetomidine transdermal formulations were also prepared with levulinic acid. The composition is shown in Table 19.

Table 19

Components	%w/w	
	Formulation 48 (3%DMT/4%LA/DT2287)	Formulation 49 (4%DMT/4%LA/DT2287)
Dexmedetomidine base	3.00	4.00
Levulinic acid	4.00	4.00
Pressure Sensitive Adhesive Duro-Tak 2287	93.00	92.00

25

As shown in Figure 18, in-vitro flux of dexmedetomidine in formulations containing levulinic acid (Formulations 48 and 49) increased with percent dexmedetomidine loading. The enhancement effect of levulinic acid on permeation of dexmedetomidine through the skin was higher than oleic acid.

5 The results of percent in-vitro penetration of dexmedetomidine in formulations 43, 45 and 48 relative to the amount of dexmedetomidine in the patch are summarized in Table 20. Formulations 45 and 48, which contain levulinic acid and oleic acid, demonstrate a substantial enhancement in permeation of dexmedetomidine under in-vitro condition.

Table 20

Formulation No.	Formulation names	Amount of dexmedetomidine base in patch (μg)	%Permeation of dexmedetomidine base relative to the amount of drug in patch after 7 days	No. of replicates
Formulation 43	3%DMT/15%D T2353/DT2287	690 \pm 27	18 \pm 4	4
Formulation 45	3%DMT/5%Oleic acid/DT2287	486 \pm 11	52 \pm 4	4
Formulation 48	3%DMT/4%Levulinic acid/DT2287	573 \pm 39	74 \pm 5	5

10 The solubility of dexmedetomidine in hydroxyl functionalized acrylate polymer was less than 1%. In order to increase the dexmedetomidine, an acid functionalized acrylate polymer (e.g., Duro-Tak2353), oleic acid and levulinic acid were used. The solubility of dexmedetomidine in Duro-Tak2353, oleic acid and levulinic acid was about 10-15%, 40% and 60% respectively. The amount of acid added in the formulation was adjusted according
15 to the solubility of each component in the formulation.

After preparation, the crystal presence was examined using microscope. Results obtained from this microscope examination indicated that all formulations (Formulations 41 to 48) did not contain crystals.

20 The flux profile of all formulations (Formulations 41 to 48) showed a clear increasing trend in flux with time during the first 24 hours (Figures 16 to 18). This is followed by a gradual decrease in flux with time. As such, the increase in flux during the first 24 hours may, in certain instances, be useful for achieving a rapid higher initial therapeutic concentration in the body. Where there is a decrease in flux with time, the decrease in flux could be due to the crystallization of the drug in the adhesive induced by the absorbed water
25 in the patch.

Example 14

In-vitro flux obtained from different backings

Pressure-sensitive adhesives used in this example are polyisobutylene/polybutene (PIB/PB) adhesives. The PIB/PB adhesives are mixtures of high molecular weight PIB (5% Oppanol B100), low molecular weight PIB (25% Oppanol B12) and a polybutene tackifier, e.g., Indopol H1900 or Panalane H-300e (20%), in an organic solvent, e.g., heptane (50%). The combination was mixed for about 3 days, until the mixture was homogeneous. Example dexmedetomidine transdermal composition formulations are shown in Table 21. Same formulation was coated on release liner but laminated with three different backing materials: backing 1 has a MVTR value (g/m²/24hr) around 10, Backing 2 has a MVTR value around 50 (g/m²/24hr), and backing 3 has MVTR value around 150(g/m²/24hr).

The average dexmedetomidine in-vitro skin flux with respect to time is illustrated in Figure 19. As depicted in Figure 19, dexmedetomidine in-vitro skin flux was similar for backing 1 and 2. But it is significantly lower with backing 3.

Table 21

Components	% w/w
Dexmedetomidine	1.00
PVP-CLM	20.00
PIB/PB (Indopol H1900)	79.00

Example 15

In-vitro flux obtained from formulations with lauryl lactate as enhancer

Another set of examples of dexmedetomidine transdermal formulation include transdermal compositions having 2-4% w/w dexmedetomidine with an enhancer to improve skin permeability. In these formulations, lauryl lactate (LL) and Duro-Tak 87-2287 were employed. The formulation compositions are shown in Table 22. In-vitro flux profiles for transdermal compositions. Figures 20 and 21 show the flux on two different skin samples. From the in-vitro flux profiles, LL shows its skin permeability enhancement effect. The flux is also proportional to API loading.

Table 22

Components	% w/w			
	2	2	3	4
Dexmedetomidine base	2	2	3	4

Pressure Sensitive Adhesive Duro-Tak 87-9301	98	93	92	91

Notwithstanding the appended clauses, the disclosure set forth herein is also defined by the following clauses:

1. A method of treating a withdrawal syndrome in a subject, the method comprising
5 applying to a skin surface of a non-sedated subject diagnosed as having the withdrawal syndrome a transdermal delivery device comprising:
a dexmedetomidine composition, the dexmedetomidine composition
comprising:
dexmedetomidine; and
10 a pressure sensitive adhesive; and
a backing layer,
wherein the dexmedetomidine composition is formulated to deliver a non-sedative amount of dexmedetomidine to treat the withdrawal syndrome in the subject.
2. The method according to clause 1, wherein the withdrawal syndrome is selected from
15 the group consisting alcohol withdrawal syndrome, benzodiazepine withdrawal syndrome, opioid addiction, cannabis withdrawal syndrome, neonatal withdrawal syndrome, nicotine withdrawal syndrome, antidepressant withdrawal syndrome.
3. The method according to clause 2, wherein the withdrawal syndrome is opioid addiction.
- 20 4. The method according to clause 2, wherein the withdrawal syndrome is alcohol withdrawal syndrome.
5. The method according to clause 2, wherein the withdrawal syndrome is benzodiazepine withdrawal syndrome.
6. The method according to clause 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject for 1 day or longer.
25
7. The method according to clause 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject for 3 days or longer.
8. The method according to clause 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject for 7 days or longer.
- 30 9. The method according to clause 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject in manner sufficient to maintain a Ramsay score of not greater than 3 in the subject.
10. The method according to clause 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject in manner sufficient to maintain a
35 Ramsay score of not greater than 2 in the subject.
11. The method according to clause 1, wherein the subject is alert and capable of responding to oral commands.

12. The method according to clause 1, wherein the method comprises delivering dexmedetomidine to the subject with the transdermal delivery device at a rate ranging from about 5 $\mu\text{g}/\text{day}$ to about 500 $\mu\text{g}/\text{day}$.
13. The method according to clause 12, wherein the method comprises delivering
5 dexmedetomidine to the subject with the transdermal delivery device at a rate ranging from 145 $\mu\text{g}/\text{day}$ to about 300 $\mu\text{g}/\text{day}$.
14. The method according to clause 1, wherein the method comprises delivering dexmedetomidine to the subject in a manner sufficient to maintain a mean plasma
10 concentration of dexmedetomidine in the subject of from about 0.01 ng/mL to about 0.4 ng/mL.
15. The method according to clause 1, wherein the pressure sensitive adhesive comprises a vinyl polymer.
16. The method according to clause 15, wherein the vinyl polymer is selected from the group consisting of polyethylene, polypropylene, polyisobutylene, polybutene, polystyrene,
15 polyvinyl chloride, polyvinyl acetate, polyvinyl alcohol, and organosilicones and combinations thereof.
17. The method according to clause 15, wherein the pressure sensitive adhesive comprises polyisobutylene or polybutene and combinations thereof.
18. The method according to clause 17, wherein the pressure sensitive adhesive
20 comprises saturated polybutene.
19. The method according to clause 17, wherein the pressure sensitive adhesive comprises unsaturated polybutene.
20. The method according to clause 1, wherein the pressure sensitive adhesive comprises an acrylic polymer, acrylate copolymer, acrylate-vinyl acetate copolymer or
25 polyacrylonitrile and combinations thereof.
21. The method according to clause 1, wherein the pressure sensitive adhesive comprises a non-functionalized polymer.
22. The method according to clause 21, wherein the pressure sensitive adhesive comprises a non-functionalized acrylate polymer.
- 30 23. The method according to clause 1, wherein the pressure sensitive adhesive comprises a carboxylic acid or hydroxyl functionalized polymer and combinations thereof.
24. The method according to clause 23, wherein the pressure sensitive adhesive comprises a carboxylic acid functionalized polymer.
25. The method according to clause 24, wherein the pressure sensitive adhesive
35 comprises a carboxylic acid functionalized acrylate polymer.
26. The method according to clause 23, wherein the pressure sensitive adhesive comprises a hydroxyl functionalized polymer.

27. The method according to clause 26, wherein the pressure sensitive adhesive comprises a hydroxyl functionalized acrylate polymer.
28. The method according to clause 1, wherein the pressure sensitive adhesive comprises a mixture of a hydroxyl functionalized polymer and a carboxylic acid
5 functionalized polymer.
29. The method according to clause 28, wherein the pressure sensitive adhesive comprises a mixture of a hydroxyl functionalized acrylate polymer and a carboxylic acid functionalized acrylate polymer.
30. The method according to clause 1, wherein the pressure sensitive adhesive is
10 substantially the same as or is selected from the group consisting of Duro-Tak® 87-9301, Duro-Tak®87-2353, Duro-Tak®87-2510, Duro-Tak®87-2516 and Duro-Tak®87-4287. Duro-Tak®87-2052, Duro-Tak®87-2194, Duro-Tak®87-2677, Duro-Tak®87-201A, Duro-Tak®87-2979, and Duro-Tak®87-2074.
31. The method according to clause 1, wherein the pressure sensitive adhesive
15 comprises crosslinked polyvinylpyrrolidone or crosslinked polyacrylic acid.
32. The method according to clause 1, wherein the transdermal delivery device comprises a single layer matrix comprising the dexmedetomidine composition, the single layer matrix being formulated to deliver a non-sedative amount of dexmedetomidine to the subject.
- 20 33. The method according to clause 1, wherein the transdermal delivery device is configured to deliver 30% or more of the dexmedetomidine in the dexmedetomidine composition.
34. The method according to clause 1, wherein the transdermal delivery device is configured to deliver 50% or more of the dexmedetomidine in the dexmedetomidine
25 composition.
35. The method according to clause 1, wherein the amount of dexmedetomidine in the composition is 3% w/w or less.
36. The method according to clause 1, wherein the dexmedetomidine composition consists of dexmedetomidine and the pressure sensitive adhesive.
- 30 37. A transdermal delivery device for treating a subject for withdrawal syndrome, the transdermal delivery device comprising:
a dexmedetomidine composition formulated to deliver a non-sedative amount of dexmedetomidine to a subject, wherein the dexmedetomidine composition comprises:
35 dexmedetomidine; and
a pressure sensitive adhesive; and
a backing layer.

38. The transdermal delivery device according to clause 37, wherein the dexmedetomidine composition is formulated to deliver dexmedetomidine to a subject for 6 hours or longer.
39. The transdermal delivery device according to clause 37, wherein the
5 dexmedetomidine composition is formulated to deliver dexmedetomidine to a subject for 1 day or longer.
40. The transdermal delivery device according to clause 37, wherein the dexmedetomidine composition is formulated to deliver dexmedetomidine to a subject for 7 days or longer.
- 10 41. The transdermal delivery device according to clause 37, wherein the amount of dexmedetomidine in the composition is 20% w/w or less.
42. The transdermal delivery device according to clause 37, wherein the amount of dexmedetomidine in the composition is 10% w/w or less.
43. The transdermal delivery device according to clause 37, wherein the
15 dexmedetomidine composition comprises a saturated amount of dexmedetomidine.
44. The transdermal delivery device according to clause 37, wherein the dexmedetomidine composition comprises a supersaturated amount of dexmedetomidine.
45. The transdermal delivery device according to clause 37, wherein the transdermal delivery device is configured to deliver a non-sedative amount of dexmedetomidine to a
20 subject at a rate ranging from about 10 $\mu\text{g}/\text{day}$ to about 1000 $\mu\text{g}/\text{day}$.
46. The transdermal delivery device according to clause 37, wherein the transdermal delivery device is configured to deliver a non-sedative amount of dexmedetomidine to a subject at a rate ranging from about 145 $\mu\text{g}/\text{day}$ to about 300 $\mu\text{g}/\text{day}$.
47. The transdermal delivery device according to clause 37, wherein the transdermal
25 delivery device is configured to deliver dexmedetomidine in a manner sufficient to maintain a mean plasma concentration of dexmedetomidine in a subject of from about 0.01 ng/mL to about 0.4 ng/mL.
48. The transdermal delivery device according to clause 37, wherein the transdermal delivery device is configured to deliver dexmedetomidine to a subject in a manner sufficient
30 to maintain an assignment of a Ramsay score of not greater than 2 or 3 in the subject.
49. The transdermal delivery device according to clause 48, wherein the transdermal delivery device is configured to deliver dexmedetomidine to a subject in a manner sufficient to maintain an assignment of a Ramsay score of not greater than 2.
50. The transdermal delivery device according to clause 48, wherein the transdermal
35 delivery device is configured to deliver dexmedetomidine to a subject in a manner sufficient to maintain an assignment of a Ramsay score of not greater than 3.

51. The transdermal delivery device according to clause 37, wherein the transdermal delivery device is configured to deliver 30% or more of the dexmedetomidine to the subject over an extended period of time.
52. The transdermal delivery device according to clause 37, wherein the transdermal
5 delivery device is configured to deliver 90% or more of the dexmedetomidine to the subject over an extended period of time.
53. The transdermal delivery device according to clause 37, wherein the pressure sensitive adhesive comprises a vinyl polymer.
54. The transdermal delivery device according to clause 53, wherein the vinyl polymer is
10 selected from the group consisting of polyethylene, polypropylene, polyisobutylene, polybutene, polystyrene, polyvinyl chloride, polyvinyl acetate, polyvinyl alcohol, and organosilicones and combinations thereof.
55. The transdermal delivery device according to clause 54, wherein the pressure sensitive adhesive comprises polyisobutylene or polybutene and combinations thereof.
- 15 56. The transdermal delivery device according to clause 55, wherein the pressure sensitive adhesive comprises saturated polybutene.
57. The transdermal delivery device according to clause 55, wherein the pressure sensitive adhesive comprises unsaturated polybutene.
58. The transdermal delivery device according to clause 37, wherein the pressure
20 sensitive adhesive comprises an acrylic polymer, acrylate copolymer, acrylate-vinyl acetate copolymer or polyacrylonitrile an combinations thereof.
59. The transdermal delivery device according to clause 58, wherein the pressure sensitive adhesive comprises a non-functionalized polymer.
60. The transdermal delivery device according to clause 59, wherein the pressure
25 sensitive adhesive comprises a non-functionalized acrylate polymer.
61. The transdermal delivery device according to clause 58, wherein the pressure sensitive adhesive comprises a carboxylic acid or hydroxyl functionalized polymer and combinations thereof.
62. The transdermal delivery device according to clause 61, wherein the pressure
30 sensitive adhesive comprises a carboxylic acid functionalized polymer.
63. The transdermal delivery device according to clause 62, wherein the pressure sensitive adhesive comprises a carboxylic acid functionalized acrylate polymer.
64. The transdermal delivery device according to clause 61, wherein the pressure sensitive adhesive comprises a hydroxyl functionalized polymer.
- 35 65. The transdermal delivery device according to clause 64, wherein the pressure sensitive adhesive comprises a hydroxyl functionalized acrylate polymer.

66. The transdermal delivery device according to clause 58, wherein the pressure sensitive adhesive comprises a mixture of a hydroxyl functionalized polymer and a carboxylic acid functionalized polymer.
67. The transdermal delivery device according to clause 58, wherein the pressure sensitive adhesive comprises a mixture of a hydroxyl functionalized acrylate polymer and a carboxylic acid functionalized acrylate polymer.
68. The transdermal delivery device according to clause 37, wherein the pressure sensitive adhesive is substantially the same as or is selected from the group consisting of Duro-Tak® 87-9301, Duro-Tak®87-2353, Duro-Tak®87-2510, Duro-Tak®87-2516, Duro-Tak®87-4287, Duro-Tak®87-2287, Duro-Tak®87-2052, Duro-Tak®87-2194, Duro-Tak®87-2677, Duro-Tak®87-201A, Duro-Tak®87-2979, and Duro-Tak®87-2074.
69. The transdermal delivery device according to clause 37, wherein the pressure sensitive adhesive comprises crosslinked polyvinylpyrrolidone or crosslinked polyacrylic acid.
70. The transdermal delivery device according to clause 37, wherein the dexmedetomidine composition comprises polyvinylpyrrolidone, PVP K90, levulinic acid, oleic acid, PGML, lauryl lactate or mixtures thereof.
71. The transdermal delivery device according to clause 37, wherein the transdermal delivery device comprises a single layer matrix dexmedetomidine composition.
72. The transdermal delivery device according to clause 37, wherein the dexmedetomidine composition consists of dexmedetomidine and the pressure sensitive adhesive.
73. A kit comprising:
two or more transdermal delivery devices, wherein each transdermal delivery device comprises: a dexmedetomidine composition formulated to deliver dexmedetomidine a non-sedative amount of dexmedetomidine to a subject, the dexmedetomidine composition comprising: dexmedetomidine; and a pressure sensitive adhesive; and a backing layer.

Although the foregoing invention has been described in some detail by way of illustration and example for purposes of clarity of understanding, it is readily apparent to those of ordinary skill in the art in light of the teachings of this invention that certain changes and modifications may be made thereto without departing from the spirit or scope of the appended claims.

Accordingly, the preceding merely illustrates the principles of the invention. It will be appreciated that those skilled in the art will be able to devise various arrangements which, although not explicitly described or shown herein, embody the principles of the invention and are included within its spirit and scope. Furthermore, all examples and conditional language

recited herein are principally intended to aid the reader in understanding the principles of the invention and the concepts contributed by the inventors to furthering the art, and are to be construed as being without limitation to such specifically recited examples and conditions. Moreover, all statements herein reciting principles, aspects, and embodiments of the
5 invention as well as specific examples thereof, are intended to encompass both structural and functional equivalents thereof. Additionally, it is intended that such equivalents include both currently known equivalents and equivalents developed in the future, i.e., any elements developed that perform the same function, regardless of structure. The scope of the present invention, therefore, is not intended to be limited to the exemplary embodiments shown and
10 described herein. Rather, the scope and spirit of present invention is embodied by the appended claims.

WHAT IS CLAIMED IS:

1. A method of treating a withdrawal syndrome in a subject, the method comprising applying to a skin surface of a non-sedated subject diagnosed as having the withdrawal syndrome a transdermal delivery device comprising:
5 a dexmedetomidine composition, the dexmedetomidine composition comprising:
dexmedetomidine; and
a pressure sensitive adhesive; and
10 a backing layer,
wherein the dexmedetomidine composition is formulated to deliver a non-sedative amount of dexmedetomidine to treat the withdrawal syndrome in the subject.
- 15 2. The method according to claim 1, wherein the withdrawal syndrome is selected from the group consisting alcohol withdrawal syndrome, benzodiazepine withdrawal syndrome, opioid addiction, cannabis withdrawal syndrome, neonatal withdrawal syndrome, nicotine withdrawal syndrome, antidepressant withdrawal syndrome.
- 20 3. The method according to claim 2, wherein the withdrawal syndrome is opioid addiction.
4. The method according to claim 2, wherein the withdrawal syndrome is alcohol withdrawal syndrome.
25
5. The method according to claim 2, wherein the withdrawal syndrome is benzodiazepine withdrawal syndrome.
- 30 6. The method according to claim 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject for 1 day or longer.
7. The method according to claim 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject for 3 days or longer.

8. The method according to claim 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject for 7 days or longer.

5 9. The method according to claim 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject in manner sufficient to maintain a Ramsay score of not greater than 3 in the subject.

10 10. The method according to claim 1, wherein the method comprises delivering a non-sedative amount of dexmedetomidine to the subject in manner sufficient to maintain a Ramsay score of not greater than 2 in the subject.

11. The method according to claim 1, wherein the subject is alert and capable of responding to oral commands.

15

12. The method according to claim 1, wherein the method comprises delivering dexmedetomidine to the subject with the transdermal delivery device at a rate ranging from about 5 $\mu\text{g}/\text{day}$ to about 500 $\mu\text{g}/\text{day}$.

20 13. The method according to claim 1, wherein the pressure sensitive adhesive comprises a vinyl polymer.

14. A transdermal delivery device configured for use in a method according to any of Claims 1 to 13.

25

15. A kit comprising two or more transdermal delivery devices configured for use in a method according to any of Claims 1 to 13.

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: 1-13
because they relate to subject matter not required to be searched by this Authority, namely:
Claims 1-13 pertain to a method for treatment of the human by therapy, and thus relate to a subject matter which this International Searching Authority is not required, under PCT Article 17(2)(a)(i) and PCT Rule 39.1(iv), to search.
2. Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of any additional fees.
3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- No protest accompanied the payment of additional search fees.
