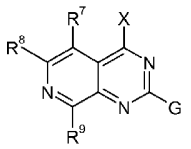
(54) Title: AZAQUINAZOLINE INHIBITORS OF ATYPICAL PROTEIN KINASE C



(I)

(57) Abstract: The present invention provides a compound of formula (I) or a salt thereof, wherein R^7, R^8, R^9, G, and X are as defined herein. A compound of formula (I) and its salts have a PKC inhibitory activity, and may be used to treat proliferative disorders.

AZAQUINAZOLINE INHIBITORS OF ATYPICAL PROTEIN KINASE C

BACKGROUND OF THE INVENTION

PKCι and PKCζ (accession numbers NM_002740 and NM_002744 respectively) together define the atypical sub-class of the protein kinase C (PKC) family. The aPKCs are structurally and functionally distinct from the other PKC sub-classes, classic/conventional and novel, as their catalytic activity is not dependent on diacylglycerol and calcium (Ono, Y., Fujii, T., Ogita, K., Kikkawa, U., Igarashi, K., and Nishizuka, Y. (1989). Protein kinase C zeta subspecies from rat brain: its structure, expression, and properties. Proc Natl Acad Sci U S A *86*, 3099-3103). Structurally, PKCι and PKCζ contain a C-terminal serine/threonine kinase domain (AGC class) and an N-terminal regulatory region containing a Phox Bem 1 (PB1) domain involved in mediating protein:protein interactions critical for aPKC function. At the amino acid level the aPKCs share 72% overall homology, however, the kinase domains share 84% identity and differ in the active site by just a single amino acid. This striking homology suggests an ATP-competitive ligand would not be expected to exhibit significant aPKC isoform selectivity.

The aPKCs have been implicated in a diverse number of signalling pathways, demonstrating both redundant and distinct signalling functions. Both isoforms have emerged as central players in the mechanisms that regulate the establishment and maintenance of cellular polarity in multiple cell types (reviewed in Suzuki, A., and Ohno, S. (2006). The PAR-aPKC system: lessons in polarity. J Cell Sci *119*, 979-987). Genetic dissection of their functions using knockout mice have also revealed preferential roles for PKCζ in the regulation of NF-kB signalling (Leitges, M., Sanz, L., Martin, P., Duran, A., Braun, U., Garcia, J.F., Camacho, F., Diaz-Meco, M.T., Rennert, P.D., and Moscat, J. (2001). Targeted disruption of the zetaPKC gene results in the impairment of the NF-kappaB pathway. Mol Cell *8*, 771-780), and PKCι in insulin secretion and action (Farese, R.V., Sajan, M.P., Yang, H., Li, P., Mastorides, S., Gower, W.R., Jr., Nimal, S., Choi, C.S., Kim, S., Shulman, G.I., *et al.* (2007). Muscle-specific knockout of PKC-lambda impairs glucose transport and induces metabolic and diabetic syndromes. J Clin Invest *117*, 2289-2301). In addition, both isoforms have been implicated in the pathogenesis of cancer making a strong case for the inhibition of the aPKCs as a novel therapeutic avenue.

PKCι is a known oncogene in non-small cell lung cancer (NSCLC). In one study it was shown to be overexpressed in 69% of NSCLC cases at the protein level. Consistent with this, the PKCι gene (*PRKCI* residing on chromosome 3q26) was shown to be amplified in 36.5% of NSCLC tumours examined, including 96% of the squamous cell carcinoma sub-type (Regala, R.P., Weems, C., Jamieson, L., Khoor, A., Edell, E.S., Lohse, C.M., and Fields, A.P. (2005b). Atypical protein kinase C iota is an oncogene in human non-small cell lung cancer. Cancer Res *65*, 8905-8911). Amplification of 3q26 has also been reported in 44% of ovarian cancers, including >70% of serous epithelial ovarian cancers where 3q26 amplification is translated into increased PKCι protein expression. Moreover, increased PKCι expression is associated with poor prognosis in NSCLC and ovarian cancer where it may serve as a diagnostic biomarker of aggressive disease (Eder, A.M., Sui, X., Rosen, D.G., Nolden, L.K., Cheng, K.W., Lahad, J.P., Kango-Singh, M., Lu, K.H., Warneke, C.L., Atkinson, E.N., *et al.* (2005). Atypical PKCiota contributes to poor prognosis through loss of apical-basal polarity and cyclin E overexpression in ovarian cancer. Proc Natl Acad Sci U S A *102*, 12519-12524; Zhang, L., Huang, J., Yang, N., Liang, S., Barchetti, A., Giannakakis, A., Cadungog, M.G., O'Brien-Jenkins, A., Massobrio, M., Roby, K.F., *et al.* (2006). Integrative genomic analysis of protein kinase C (PKC) family identifies PKCiota as a biomarker and potential oncogene in ovarian carcinoma. Cancer Res *66*, 4627-4635). 3q26 amplifications have been observed in many other cancers including oesophageal squamous cell carcinoma (Yang, Y.L., Chu, J.Y., Luo, M.L., Wu, Y.P., Zhang, Y., Feng, Y.B., Shi, Z.Z., Xu, X., Han, Y.L., Cai, Y., *et al.* (2008). Amplification of PRKCI, located in 3q26, is associated with lymph node metastasis in esophageal squamous cell carcinoma. Genes Chromosomes Cancer *47*, 127-136) and breast cancer (Kojima, Y., Akimoto, K., Nagashima, Y., Ishiguro, H., Shirai, S., Chishima, T., Ichikawa, Y., Ishikawa, T., Sasaki, T., Kubota, Y., *et al.* (2008). The overexpression and altered localization of the atypical protein kinase C lambda/iota in breast cancer correlates with the pathologic type of these tumors. Hum Pathol *39*, 824-831) suggesting that PKCι may also participate in the pathogenesis of these diseases.

In NSCLC the primary function of PKCι is to drive transformed growth via a Rac1 / PAK / MEK / ERK signalling axis. However, PKCι also functions in NSCLC survival, resistance to chemotherapy, and invasion via distinct pathways (reviewed in Fields, A.P., and Regala, R.P. (2007). Protein kinase C iota: human oncogene, prognostic marker and therapeutic target. Pharmacol Res *55*, 487-497). In ovarian cancer transformed growth is

correlated with deregulated epithelial cell polarity and increased cycle E expression (Eder et al., 2005) suggesting that PKCι can influence the cancer phenotype through multiple mechanisms. Compelling evidence has emerged to suggest that inhibition of PKCι may be a useful therapeutic approach to combat tumours characterised by increased PKCι expression. In transgenic models, mice with elevated PKCι activity in the colon are more susceptible to carcinogen-induced colon carcinogenesis, and expression of a kinase-dead mutant of PKCι blocks the transformation of intestinal cells by oncogenic Ras (Murray, N.R., Jamieson, L., Yu, W., Zhang, J., Gokmen-Polar, Y., Sier, D., Anastasiadis, P., Gatalica, Z., Thompson, E.A., and Fields, A.P. (2004). Protein kinase Ciota is required for Ras transformation and colon carcinogenesis in vivo. J Cell Biol *164*, 797-802). Finally, genetic or pharmacological inhibition of PKCι by a gold derivative – aurothiomalate (ATM) – blocks the growth of NSCLC cells in soft agar and significantly decreases tumour volume in xenograft models of NSCLC(Regala, R.P., Thompson, E.A., and Fields, A.P. (2008). Atypical protein kinase C iota expression and aurothiomalate sensitivity in human lung cancer cells. Cancer Res *68*, 5888-5895; Regala, R.P., Weems, C., Jamieson, L., Copland, J.A., Thompson, E.A., and Fields, A.P. (2005a). Atypical protein kinase Ciota plays a critical role in human lung cancer cell growth and tumorigenicity. J Biol Chem *280*, 31109-31115).

Despite the high degree of similarity between aPKC isoforms, the role of PKCζ in cancer is distinct from that of PKCι. PKCζ plays a role in NSCLC cell survival by phosphorylating and antagonising the pro-apoptotic effects of Bax in response to nicotine (Xin, M., Gao, F., May, W.S., Flagg, T., and Deng, X. (2007). Protein kinase Czeta abrogates the proapoptotic function of Bax through phosphorylation. J Biol Chem *282*, 21268-21277). PKCζ activity has also been linked to resistance against a wide range of cytotoxic and genotoxic agents. For instance, in human leukaemia cells, overexpression of PKCζ confers resistance against 1-β-D-arabinofuranosylcytosine (ara-C), daunorubicin, etoposide, and mitoxantrone-induced apoptosis (Filomenko, R., Poirson-Bichat, F., Billerey, C., Belon, J.P., Garrido, C., Solary, E., and Bettaieb, A. (2002). Atypical protein kinase C zeta as a target for chemosensitization of tumor cells. Cancer Res *62*, 1815-1821; Plo, I., Hernandez, H., Kohlhagen, G., Lautier, D., Pommier, Y., and Laurent, G. (2002). Overexpression of the atypical protein kinase C zeta reduces topoisomerase II catalytic activity, cleavable complexes formation, and drug-induced cytotoxicity in monocytic U937 leukemia cells. J Biol Chem *277*, 31407-31415). Furthermore, inhibition of PKCζ activity through expression

of a kinase-dead mutant sensitises leukaemia cells to the cytotoxic effects of etoposide both *in vitro* and *in vivo* (Filomenko et al., 2002). Atypical protein kinase C regulates dual pathways for degradation of the oncogenic coactivator SRC-3/AIB1. Mol Cell *29*, 465-476), and both of these proteins have been postulated to play a role in tamoxifen resistance in breast cancer (Iorns, E., Lord, C.J., and Ashworth, A. (2009). Parallel RNAi and compound screens identify the PDK1 pathway as a target for tamoxifen sensitization. Biochem J *417*, 361-370; Osborne, C.K., Bardou, V., Hopp, T.A., Chamness, G.C., Hilsenbeck, S.G., Fuqua, S.A., Wong, J., Allred, D.C., Clark, G.M., and Schiff, R. (2003). Role of the estrogen receptor coactivator AIB1 (SRC-3) and HER-2/neu in tamoxifen resistance in breast cancer. J Natl Cancer Inst *95*, 353-361). Together these studies suggest that inhibition of PKCζ activity may have beneficial therapeutic effects by acting as a chemosensitiser to a wide array of commonly used chemotoxic agents in the clinic.

Further evidence that small molecule inhibition of PKCζ could have important therapeutic benefits has recently emerged from tumour models that link PKCζ signalling to the mTOR pathway. PKCζ is constitutively activated in follicular lymphoma and has been identified as a novel target for the anti-CD20 therapeutic antibody rituximab (Leseux, L., Laurent, G., Laurent, C., Rigo, M., Blanc, A., Olive, D., and Bezombes, C. (2008). PKC zeta mTOR pathway: a new target for rituximab therapy in follicular lymphoma. Blood *111*, 285-291). Rituximab inhibits follicular lymphoma proliferation by targeting a PKCζ-MAPK-mTOR pathway, suggesting that PKCζ is both a target of Rituximab, and a key regulator of its' anti-leukaemic effect. Regulation of the mTOR/p70S6K pathway by PKCζ has also been implicated in the transition of prostate cancer cells to an androgen-independent state (Inoue, T., Yoshida, T., Shimizu, Y., Kobayashi, T., Yamasaki, T., Toda, Y., Segawa, T., Kamoto, T., Nakamura, E., and Ogawa, O. (2006). Requirement of androgen-dependent activation of protein kinase Czeta for androgen-dependent cell proliferation in LNCaP Cells and its roles in transition to androgen-independent cells. Mol Endocrinol *20*, 3053-3069). Finally, mice containing a homozygous deletion of Par4, a negative regulator of PKCζ, exhibit greatly enhanced PKCζ activity. These mice spontaneously develop tumours of the prostate and endometrium, and potentiate Ras-induced lung carcinogenesis consistent with a role for PKCζ in lung cancer (Garcia-Cao, I., Duran, A., Collado, M., Carrascosa, M.J., Martin-Caballero, J., Flores, J.M., Diaz-Meco, M.T., Moscat, J., and Serrano, M. (2005). Tumour-suppression activity of the proapoptotic regulator Par4. EMBO Rep *6*, 577-583; Joshi, J.,

Fernandez-Marcos, P.J., Galvez, A., Amanchy, R., Linares, J.F., Duran, A., Pathrose, P., Leitges, M., Canamero, M., Collado, M., *et al.* (2008). Par-4 inhibits Akt and suppresses Ras-induced lung tumorigenesis. EMBO J *27*, 2181-2193).

A need exists for aPKC inhibitors for use as pharmaceutical agents.

Unless otherwise indicated, the foregoing heterocycloalkyl groups can be C- attached or N-attached where such is possible and results in the creation of a stable structure. For example, piperidinyl can be piperidin-1-yl (N-attached) or piperidin-4-yl (C-attached).

The heterocycloalkylene group may contain, in addition to carbon atom(s), at least one nitrogen or oxygen. "Pharmaceutically acceptable" refers to physiologically tolerable materials, which do not typically produce an allergic or other untoward reaction, such as gastric upset, dizziness and the like, when administered to a human.

"Pharmaceutical composition" refers to a composition that can be used to treat a disease, condition, or disorder in a human.

"Pseudohalogen" refers to –OCN, –SCN, $–CF_3$, and –CN.

"Stable" or "chemically stable" refers to a compound that is sufficiently robust to be isolated to a useful degree of purity from a reaction mixture. The present invention is directed solely to the preparation of stable compounds. When lists of alternative substituents include members which, owing to valency requirements, chemical stability, or other reasons, cannot be used to substitute a particular group, the list is intended to be read in context to include those members of the list that are suitable for substituting the particular group. For example, R^1 can be C_{1-6}alkyl optionally substituted by 1-13 R^{19}; when R^1 is methyl, the methyl group is optionally substituted by 1-3 R^{19}.

"Therapeutically effective amount" refers to an amount of a compound sufficient to inhibit, halt, or cause an improvement in a disorder or condition being treated in a particular subject or subject population. For example in a human or other mammal, a therapeutically effective amount can be determined experimentally in a laboratory or clinical setting, or may be the amount required by the guidelines of the United States Food and Drug Administration, or equivalent foreign agency, for the particular disease and subject being treated. It should be appreciated that determination of proper dosage forms, dosage amounts, and routes of administration is within the level of ordinary skill in the pharmaceutical and medical arts.

"Treatment" refers to the acute or prophylactic diminishment or alleviation of at least one symptom or characteristic associated or caused by a disorder being treated. For

example, treatment can include diminishment of several symptoms of a disorder or complete eradication of a disorder.

II. Compounds

The compounds of the present invention are defined by the following numbered Embodiments. When a higher numbered Embodiment refers back to multiple previous lower numbered Embodiments in the alternative and contains a new limitation not present in the lower numbered Embodiments, the higher numbered Embodiment is intended to be an express description of each and every one of the alternatives. For example, if Embodiment 2 refers back to Embodiment 1 and contains a limitation not present in Embodiment 1, Embodiment 3 refers back Embodiments 1 or 2 and contains a limitation(s) not present in Embodiments 1 or 2, and Embodiment 4 refers back to any of Embodiments 1-3 and contains a limitation(s) not present in Embodiments 1, 2, or 3, then Embodiment 4 is intended to be an explicit description of a genus having the limitations of Embodiments 1 and 4, an explicit description of a genus having the limitations of Embodiments 2 and 4 (i.e., 1, 2, and 4), and an explicit description of a genus having the limitations of Embodiments 3 and 4 (i.e., 1, 3, and 4, and 1, 2, 3 and 4). By way of example, if Embodiment 1 is a compound of formula (I) defining R^7, R^8 and R^9 independently as alkyl or aryl, Embodiment 2 is a compound of Embodiment 1 defining R^7 as alkyl, Embodiment 3 is a compound of Embodiments 1 or 2 defining R^8 as alkyl, and Embodiment 4 is a compound of any of Embodiments 1-3 defininning R^9 as alkyl, then Embodiment 4 is an explicit description of a genus having the limitations of Embodiments 1 and 4 (i.e., a compound of formula (I) in which R^7 and R^8 are alkyl or aryl, and R^9 is alkyl), an explicit description of a genus having the limitations of Embodiments 2 and 4 (i.e., a compound of formula (I) in which R^8 is alkyl or aryl, and R^7 and R^9 are alkyl), an explicit description of a genus having the limitations of Embodiments 3 and 4 (i.e., a compound of formula (I) in which R^7 is alkyl or aryl, and R^8 and R^9 are alkyl; and a compound of formula (I) in which R^7, R^8 and R^9 are all alkyl). It should be noted in this regard that when a higher numbered Embodiment refers to a lower numbered Embodiment and contains limitations for a group(s) not present in the lower numbered Embodiment, the higher numbered Embodiment should be interpreted in context to ignore the missing group(s). For example, if Embodiment 1 recites a compound of formula (I) in which X is H, $C_{1\text{-}10}$alkyl, or $-C(=O)R^{28}$, Embodiment 2 recites a compound of Embodiment 1 in

which X is H or C_{1-10}alkyl, and Embodiment 3 recites a compound of Embodiments 1 or 2 in which R^{28} is alkyl, then Embodiment 3 defines a genus having the limitations of Embodiments 1 and 3 and a genus having the limitation of Embodiments 2 and 3 (i.e., 1, 2, and 3). In the genus defined by the limitations of Embodiments 2 and 3, X cannot be –C(=O)R^{28}; therefore this genus should be interpreted to ignore the Embodiment 3 definition of R^{28} = alkyl (i.e., the genus of Embodiments 2 and 3 has the same scope as the genus of Embodiment 2).

The compounds of the present invention are defined herein using structural formulas that do not specifically recite the mass numbers or the isotope ratios of the constituent atoms. It is intended that the present invention includes compounds in which the constituent atoms are present in any ratio of isotope forms. For example, carbon atoms may be present in any ratio of ^{12}C, ^{13}C, and ^{14}C; hydrogen atoms may be present in any ratio of ^{1}H, ^{2}H, and ^{3}H; etc. Preferably, the constituent atoms in the compounds of the present invention are present in their naturally occurring ratios of isotope forms.

III. Pharmaceutical Compositions

The present invention further provides pharmaceutical compositions comprising a compound of any of the above Embodiments (e.g., a compound of formula (I) or a pharmaceutically acceptable salt thereof), together with a pharmaceutically acceptable excipient. For preparing a pharmaceutical composition from a compound of the present invention, pharmaceutically acceptable excipients can be either solid or liquid. An excipient can be one or more substances which may act as, e.g., a carrier, diluent, flavoring agent, binder, preservative, tablet disintegrating agent, or an encapsulating material. The pharmaceutical composition may contain two or more compounds of the present invention (e.g., two different salt forms of a compound of formula (I), may be used together in the same pharmaceutical composition). Preferably, the pharmaceutical composition contains a therapeutically effective amount of a compound of formula (I) or a pharmaceutically acceptable salt form thereof. In one embodiment, the composition contains an amount of a compound of formula (I) or a pharmaceutically acceptable salt form thereof effective to treat an atypical protein kinase C (aPKC)-dependent disorder or condition. Preferably, a compound of the present invention will cause a decrease in symptoms or disease indicia associated with an aPKC-dependent disorder as measured quantitatively or qualitatively. The

composition may also contain, in addition to a compound of formula (I) or a pharmaceutically acceptable salt form thereof and a pharmaceutically acceptable excipient, another therapeutic compound, such as a compound useful in the treatment of cancer.

A compound of the present invention can be formulated as a pharmaceutical composition in any delivery form, such as a syrup, an elixir, a suspension, a powder, a granule, a tablet, a capsule, a lozenge, a troche, an aqueous solution, a cream, an ointment, a lotion, a gel, an emulsion, etc. Solid form preparations include powders, tablets, pills, capsules, cachets, suppositories, and dispersible granules. Preferably, the pharmaceutical composition is a tablet or capsule. In one embodiment, the pharmaceutical composition is a tablet. In another embodiment, the pharmaceutical composition is a capsule.

In powders, the excipient may be a finely divided solid in a mixture with a finely divided active component (i.e., compound of the present invention). In tablets, the active component may be mixed with an excipient having the necessary binding properties in suitable proportions and compacted in the shape and size desired. Suitable excipients include magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, tragacanth, methylcellulose, sodium carboxymethylcellulose, low melting wax, cocoa butter, and the like.

The pharmaceutical composition preferably contains from 1% to 95% (w/w) of the active compound (i.e., compound of the present invention). More preferably, the pharmaceutical composition contains from 5% to 70% (w/w) of the active compound.

For preparing suppositories, a low melting wax, such as a mixture of fatty acid glycerides or cocoa butter, may be melted and the active component dispersed homogeneously therein, as by stirring. The molten homogeneous mixture may then be poured into convenient sized molds, allowed to cool, and thereby to solidify.

Liquid form preparations include solutions, suspensions, and emulsions. Formulations suitable for parenteral administration, such as, for example, by intravenous, intramuscular, intradermal, and subcutaneous routes, include aqueous and non-aqueous, isotonic sterile injection solutions, which can contain antioxidants, buffers, bacteriostats, and solutes that render the formulation isotonic with the blood of the intended recipient, and aqueous and nonaqueous sterile suspensions that can include suspending agents, solubilizers, thickening agents, stabilizers, and preservatives. In the practice of this invention, compositions can be administered, for example, by intravenous infusion, orally, topically,

intraperitoneally, intravesically or intrathecally. The formulations of compounds can be presented in unit-dose or multi-dose sealed containers, such as ampoules and vials. Injection solutions and suspensions can be prepared from sterile powders, granules, and tablets of the kind previously described.

A compound of the present invention, alone or in combination with other suitable components, can be made into aerosol formulations (e.g., they can be "nebulized") to be administered via inhalation. Aerosol formulations can be placed into pressurized acceptable propellants, such as dichlorodifluoromethane, propane, nitrogen, and the like.

Pharmaceutically acceptable excipients are determined in part by the particular composition being administered, as well as by the particular method used to administer the composition. Accordingly, there is a wide variety of suitable formulations of pharmaceutical compositions of the present invention (see, e.g., *Remington: The Science and Practice of Pharmacy*, 20th ed., Gennaro et al. Eds., Lippincott Williams and Wilkins, **2000**).

The quantity of active component in a pharmaceutical composition may be varied or adjusted from, e.g., 1 mg to 1,000 mg, 5 mg to 500 mg, 10 mg to 300 mg, or 25 mg to 250 mg, according to the particular application and the desired size of the dosage form.

The dose administered to a subject is preferably sufficient to induce a beneficial therapeutic response in the subject over time. The beneficial dose can vary from subject to subject depending upon, e.g., the subject's condition, body weight, surface area, and side effect susceptibility. Administration can be accomplished via single or divided doses.

In another embodiment, the compounds of the present invention are delivered orally. The compounds can also be delivered rectally, bucally or by insufflation.

Determination of the proper dosage for a particular situation is within the skill of the practitioner. Generally, treatment is initiated with smaller dosages which are less than the optimum dose of the compound. Thereafter, the dosage is increased by small increments until the optimum effect under the circumstances is reached. For convenience, the total daily dosage may be divided and administered in portions during the day, if desired. A typical dose is about 1 mg to about 1,000 mg per day, such as about 5 mg to about 500 mg per day. In certain embodiments, the dose is about 10 mg to about 300 mg per day, such as about 25 mg to about 250 mg per day.

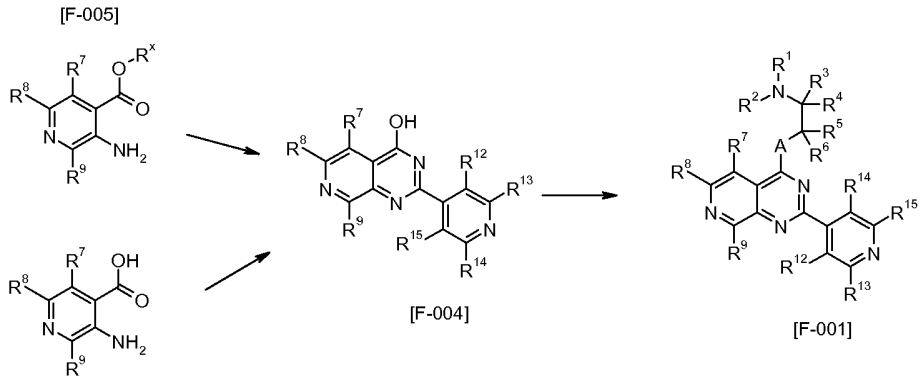
An example of a method as described above is illustrated in the following scheme.



General synthesis of 4-substituted-1-yl-2-pyridin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [F-001] Scheme A1

Substituted 2-Pyridin-4-yl-pyrido[3,4-d]pyrimidin-4-ol derivatives of general formula [F-001] were prepared by the reaction of a 2-amino-pyridyl derivative of general formula [F-005] with a 4-cyanopyridyl derivative of general formula [F-006] in the presence of a base such as sodium methoxide in a polar aprotic solvent such as methanol. The reaction is suitably conducted at elevated temperature to yield the cyclised 2-Pyridin-4-yl-pyrido[3,4-d]pyrimidin-4-ol product of general formula [F-004]. 4-substituted-1-yl-2-pyridin-4-yl-

pyrido[3,4-d]pyrimidine derivatives of general formula [F-001] were prepared by the reaction of a 2-Pyridin-4-yl-pyrido[3,4-d]pyrimidin-4-ol derivatives of general formula [F-004] with a chlorinatation agent such as phosphorous oxychloride to yield 4-chloro-1-yl-2-pyridin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [F-008] which were reacted with primary or secondary amino derivative of general formula [F-003], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et3N, DIPEA or NMM at ambient temperature [method A]. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, TCA, methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by normal phase silica gel chromatography or reverse phase preparative HPLC. 4-substituted-1-yl-2-pyridin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [F-001] were prepared by the reaction of a 2-Pyridin-4-yl-pyrido[3,4-d]pyrimidin-4-ol derivatives of general formula [F-004] with 2,4,6-triisopropylbenzenesulfonyl chloride in a polar aprotic solvent such as DMA, DMF, NMP with a tertiary alkylamine base such as Et_3N, DIPEA or NMM and a catalytic amount of DMAP [method B]. The intermediate 6,7-substituted-(2,4,6-triisopropyl-benzenesulfonic acid)- 2-pyridin-4-yl-thieno[3,2-d]pyrimidin-4-yl ester was then reacted with a primary or secondary amino derivative, of general formula [F-003], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, TCA, methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by reverse phase preparative HPLC

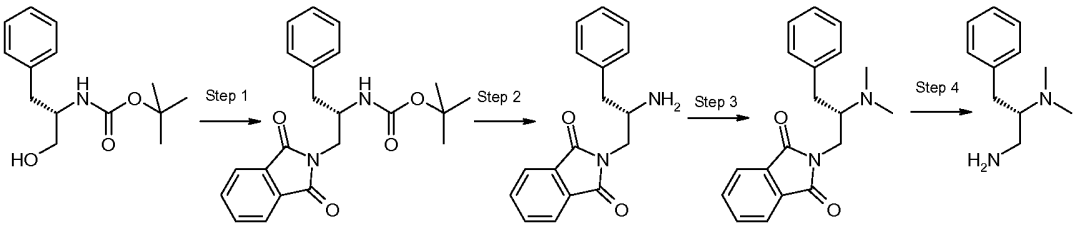
Synthesis of (S)-N^2,N^2-Dimethyl-3-phenyl-propane-1,2-diamine [A009]



[A010] [A011] [A012] [A009]

Synthesis of [(S)-1-(1,3-Dioxo-1,3-dihydro-isoindol-2-ylmethyl)-2-phenyl-ethyl]-carbamic acid tert-butyl ester [A010] A mixture of Boc-L-phenylalaninol (25 g, 99.5 mmol), triphenylphosphine (31.3 g, 119.4 mmol), phthalimide (16.1 mg, 109.5 mmol) and THF (300 mL) was chilled to 0°C. A solution of diisopropyl azodicarboxylate (19.5 mL, 99.5mmol) in THF (100 mL) was added over 15 mins. The resulting pale yellow solution was allowed to return to room temperature over night. The reaction mixture was concentrated to approximately 100 mL then partitioned between ethyl acetate and water. A white precipitate formed which was collected by filtration. The organic layer was washed with more water (x1) then brine (x1), dried ($MgSO_4$), filtered and evaporated to yield the title compound as a second white solid and this was material was used in further reactions, without further analysis.

Synthesis of ((S)-1-Aminomethyl-2-phenyl-ethyl)-carbamic acid tert-butyl ester [A011] A mixture of [(S)-1-(1,3-Dioxo-1,3-dihydro-isoindol-2-ylmethyl)-2-phenyl-ethyl]-carbamic acid tert-butyl ester [A010] (2 g, 5.25 mmol), 4M HCl in dioxane (5 mL, 20 mmol) and methanol (50 mL) was stirred at room temperature. The reaction mixture was loaded straight on to a methanol conditioned SCX-2 cartridge. The cartridge was washed with methanol (2col cols) and then eluted with 2N ammonia in methanol (2CV). LCMS analysis showed the target material to be predominantly in the methanol wash but also partially in the NH3 elution. The collected fractions were left to stand for a 3 days. After this time, needle like crystals started to form in the methanol fraction. The crystals were collected by filtration and dried in the vac oven to yield the title compound [A011] (400mg): NMR: (1H, 300MHz, d6-DMSO) 8.08 (2H, br s), 7.04 (4H, s), 7.35-7.29 (4H, m), 7.26-7.17 (1H, m), 3.83-3.66 (2H, m), 3.61 (1H, dd), 3.06 (1H, dd), 2.86 (1H, dd); LCMS method: 1, RT:2.50 min, MI 281 [M+H]

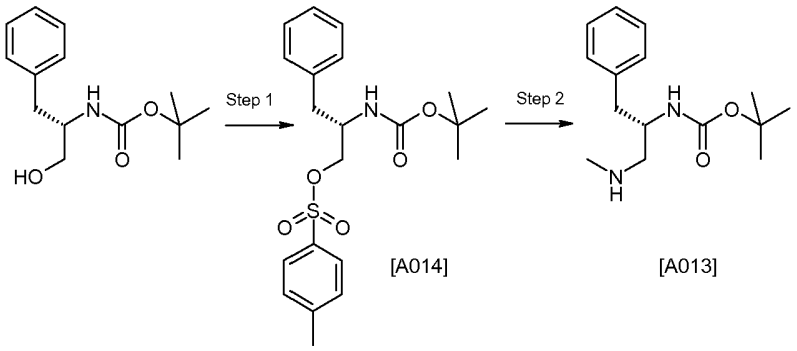
Synthesis of 2-((S)-2-Dimethylamino-3-phenyl-propyl)-isoindole-1,3-dione [A012]

A mixture of 2-((S)-2-Amino-3-phenyl-propyl)-isoindole-1,3-dione [A011] (200 mg, 0.71 mmol), formaldehyde (2 mL, xs) and formic acid (2 mL, xs) was heated to 100°C for 2 hours. The reaction mixture was concentrated under vacuum then partioned between 2M K_2CO_3 and DCM. The organic layer was washed with water then brine, passed through a phase separator and evaporated to yield the title compound [A012] (200mg) which was used without further purification: LCMS method: 1, RT: 2.42 min, MI 309 [M+H]

Synthesis of (S)-N^2,N^2-Dimethyl-3-phenyl-propane-1,2-diamine [A009]

A solution of 2-((S)-2-Dimethylamino-3-phenyl-propyl)-isoindole-1,3-dione [A012] (350mg), hydrazine monohydrate (66.1 ul, 1.36 mmol) and methanol (50 mL) was stirred at room temperature for 20 hours. The solvent was removed under vacuum to yield a white solid. This was then partitioned between 10% citric acid and isopropanol. The aqueous layer was filtered, basified with 2M NaOH, extracted into isoropanol, washed with brine, passed through a phase separator and evaporated to yield title compound [A009] (93mg): LCMS method: 1, RT:0.53 min, MI 179 [M+H]

Synthesis of ((S)-1-Methylaminomethyl-2-phenyl-ethyl)-carbamic acid tert-butyl ester [A013]



Synthesis of Synthesis of Toluene-4-sulfonicacid(S)-2-tert-butoxycarbonylamino-3-phenyl-propyl ester [A014]

To a solution of Boc-L-phenylalaninol (0.5 g, 1.989 mmol) in DCM (10 mL) at 0°C was added triethylamine (0.83 mL, 5.968 mmol). The reaction mixture was stirred at this temperature for 5minutes. para-Toluenesufonyl chloride (2.188 mmol, 0.42 g) was added dropwise as a solution in DCM (5 mL), and the reaction mixture was allowed to warm up to

room temperature slowly. The reaction mixture stirred at room temperature for 4 hours. The reaction mixture was diluted with DCM (20 mL) and washed with water. Layers separated and the organic layer dried over anhydrous magnesium sulphate. The DCM was evaporated to dryness under reduced pressure to afford the title compound [A014] as a clear oil (0.8g). No further purification was carried out and the crude product was used immediately in the next step.

Synthesis of ((S)-1-Methylaminomethyl-2-phenyl-ethyl)-carbamic acid tert-butyl ester [A013]

Toluene-4-sulfonicacid(S)-2-tert-butoxycarbonylamino-3-phenyl-propyl ester [A014] (0.80 g, 1.973 mmol) was dissolved in THF (10 mL) and methyl amine (2N in THF, 10 mL) was added in one portion. The reaction mixture was stirred at 60°C overnight. The mixture was diluted with ethyl acetate and washed with brine. The layers were separated and the ethyl acetate dried over anhydrous magnesium sulphate. The solvent was removed under reduced pressure to afford the title compound [A013] as a clear oil. No further purification was carried out at this stage. Crude material was used directly in subsequent reactions without further purification.

N-Boc-trans-4-hydroxy-L-proline methyl ester (12.28 mmol, 3 g), was dissolved in DCM (30 mL) and triethylamine (13.45 mmol, 1.87 mL) was added. The reaction was cooled to 0°C and methanesulfonyl chloride (24.46 mmol, 1.89mL) was added dropwise over 5 minutes. The reaction mixture was allowed to stir at this temperature for 45 minutes and then warmed

to room temperature for 2 hours. Brine was added and the layers were separated, the aqueous was extracted with dichloromethane (x2). General synthesis of 2-substituted-piperazine derivatives of general formula [F-008b]

Scheme A2

2-substituted piperazine derivatives of general formula [F-008b] were prepared by the reaction of (R)-1,1-Dioxo-tetrahydro-2-oxa-1λ^6-thia-5,7a-diaza-indene-5-carboxylic acid tert-butyl ester [A049] with a phenol in the presence of a strong base such as sodium hydride or potassium cyanide in a polar aprotic solvent such as DMF to give the 2-substituted piperazine derivatives of general formula [F-008a]. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release resin, followed by chromatographic purification. The N-Boc derivatives of general formula [F-008a] were deprotected under acidic conditions with a strong acid such as TFA, TCA, methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by normal phase silica gel chromatography or reverse phase preparative HPLC to give the 2-substituted-piperazine derivatives of general formula [F-008b].

General synthesis of 8-substituted-1-yl-2-pyridin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [F-011] Scheme A3

4-Substituted 8-Chloro-2-pyridin-4-yl-pyrido[3,4-d]pyrimidin derivatives of general formula [F-010] were prepared by the reaction of a 8-Chloro-2-pyridin-4-yl-pyrido[3,4-d]pyrimidin-4-ol derivative of general formula [F-009] with with 2,4,6-triisopropylbenzenesulfonyl chloride in a polar aprotic solvent such as DMA, DMF, NMP with a tertiary alkylamine base such as Et_3N, DIPEA or NMM and a catalytic amount of DMAP. The intermediate 6,7-substituted-(2,4,6-triisopropyl-benzenesulfonic acid)- 8-Chloro-2-pyridin-4-yl-pyrido[3,4-d]pyrimidini-4-yl ester was then reacted with a primary or secondary amino derivative, of general formula [F-003], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature.

After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the the crude reaction product was purified by normal phase chromatography or reverse phase preparative HPLC. The 4-Substituted 8-Chloro-2-pyridin-4-yl-pyrido[3,4-d]pyrimidin derivatives of general formula [F-010] were reacted in a Suzuki type reaction utilising a suitable boronic acid or boronic ester, of general formula [F-012], a palladium catalyst such as $Pd(PPh_3)_4$ or $Pd(PPh_3)_2Cl_2$ a base such as Et_3N, KOH, Na_2CO_3 or NaOH in a polar solvent such as EtOH, THF, DMA or dioxane at high temperature either by heating thermally or using a microwave reactor. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, TCA, methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by normal phase chromatography or reverse phase preparative HPLC.

General synthesis of 8-substituted-1-yl-2-pyridin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [F011] Scheme A4

8-substituted-1-yl-2-pyridin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [F011] were prepared by reaction of a 4-Substituted 8-Chloro-2-pyridin-4-yl-pyrido[3,4-d]pyrimidin derivatives of general formula [F-010] in a Stille type reaction utilising a suitable stannane of general formula [F013], a palladium catalyst such as $Pd(PPh_3)_4$ or $Pd(PPh_3)_2Cl_2$ a base such as K_3PO_4, in a polar solvent such as DMA or dioxane at high temperature either by heating thermally or using a microwave reactor. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, TCA, methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by normal phase chromatography or reverse phase preparative HPLC.

The mixture was heated under microwave irradiation (150oC, 10min) and the solvent was removed under reduced pressure. The crude was purified by Column chromatography (Eluent: DCM/MeOH: 1:0 to 9:1). The purified compound was solubilised in DCM and 0.5mL of TFA was added. The solution was stirred 3h and then was poured on a SCX column, washed with MeOH and the expected product was released using a solution MeOH/NH3 2M, the basic solvent was concentrated under reduced pressure to yield the title compound as a yellow solid which was was used without further purification: LCMS method: 1, RT:2.34 min, MI 434 [M+H]; ^{1}H NMR (1H, 500MHz, $CDCl_3$); 8.70-8.76 (m, 2H), 8.63 (d, 2H), 8.42 (brs, 1H), 8.27 (d, 1H), 7.96 (dd, 1H), 7.93 (m, 1H), 7.81 (d, 2H), 7.50 (td, 1H), 7.32-7.52 (m, 5H), 4.00 (d, 1H), 3.51-3.60 (m, 2H), 3.01 (dd, 1H), 2.83 (dd, 1H).

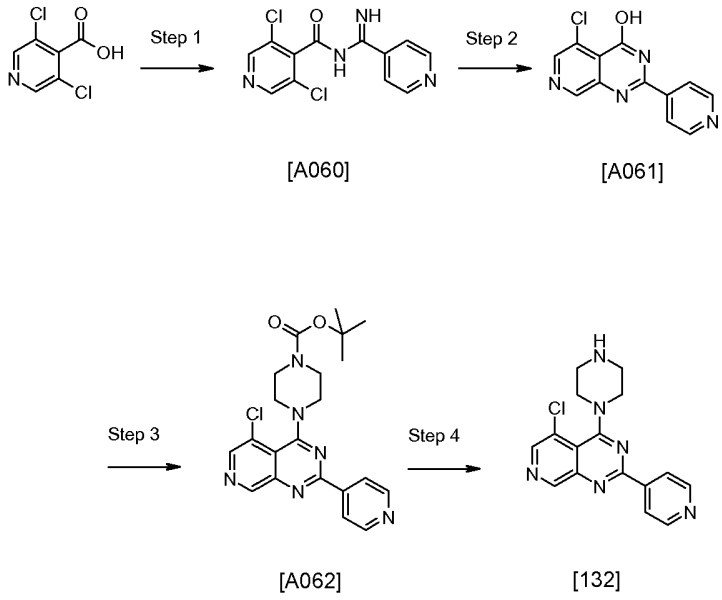
Synthesis of 5-Chloro-4-piperazin-1-yl-2-pyridin-4-yl-pyrido[3,4-d]pyrimidine [132]



Synthesis of 3,5-Dichloro-N-(imino-pyridin-4-yl-methyl)-isonicotinamide [A060]

3,5-Dichloro-isonicotinic acid (10.4mmol, 1.997g), was dissolved in anhydrous DMF (50mL) at room temperature and HATU (10.4mmol, 3.95g), added in one portion and the mixture stirred for 5mins. Then DIPEA (28.6mmol, 5.0mL) was added in one portion and reaction stirred for 40 minutes. Pyridine-4-carboximidamide hydrochloride (9.52mmol, 1.5g) was added in one portion and reaction stirred at room temperature for 18 hours.

The reaction mixture was then poured into water (~250mL in total including rinses of reaction vessel) in a conical flask. The resultant mixture was stirred at room temperature for 90 minutes and the precipitate formed was filtered, washed with water (x2) and ether (x2). Then the solid was dried in vac oven for 4hrs to yield the title compound [A060] (2.359g), as a pale brown powder. LCMS method: 1, RT:3.31 min, MI 295 [M+H].

Synthesis of 5-Chloro-2-pyridin-4-yl-3H-pyrido[3,4-d]pyrimidin-4-one [A061]

In a 25mL Biotage microwave vessel, under nitrogen, was added 3,5-Dichloro-N-(imino-pyridin-4-yl-methyl)-isonicotinamide [A060] (1.5mmol, 0.443g), cesium carbonate (3.0mmol, 0.978g) and N,N'-Dibenzylethylenediamine (0.3mmol, 0.071mL). The mixture was stirred in anhydrous DMA (10mL), vigorously and iron (III) chloride (0.15mmol, 0.024g) added in one portion. Then the mixture was heated in the microwave at 120°C for 90mins. The reaction was allowed to cool to room temperature and acetic acid (12.0mmol, 0.69mL), added dropwise over about 5 minutes and the resulting mixture diluted with MeOH (10mL) and stirred at RT for 30mins. The mixture was added to a 10g SCX-2 cartridge and washed with methanol (~25-30mL). The cartridge was then washed with ammonia (2N in MeOH, 40mL) and the ammonia washes concentrated in vacuo to yield 5-Chloro-2-pyridin-4-yl-3H-pyrido[3,4-d]pyrimidin-4-one (130mg). The non-basic methanol washes of the SCX-2 cartridge were left standing overnight, forming a precipitate. This was filtered, washed with methanol (x1), and dried in a vacuum oven overnight to yield the title compound [A061] (13mg) as an off-white solid. LCMS method: 1, RT:2.12 min, MI 259 [M+H].

2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl amine derivatives of general formula [G-002] were prepared by the reaction of a 2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-ol derivative of general formula [G-001] with 2,4,6-triisopropylbenzenesulfonyl chloride in a polar aprotic solvent such as DMA, DMF, NMP with a tertiary alkylamine base such as Et_3N, DIPEA or NMM and a catalytic amount of DMAP. The intermediate 6,7-substituted-(2,4,6-triisopropyl-benzenesulfonic acid)- 2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl ester was then reacted with a primary or secondary amino derivative, of general formula [G-004], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature. The 2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl amine derivatives of general formula [G-002] was involved in a Buchwald type reaction utilising a suitable amine, of general formula [G-005], a palladium catalyst such as $Pd(dba)_2$ or $Pd(OAc)_2$, a ligand such as Xantphos and a base such as NaOtBu or Cs_2CO_3 in a polar solvent such as dioxane or a combination of dioxane and DMA at high temperature either by heating thermally or using a microwave reactor, to yield substituted 2-amino pyridyl substituted 2-(2-amino-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl amine derivatives of general formula [G-003]. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the intermediate was purified by column chromatography and the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, HCl in a solvent such as DCM, DCE or 1,4-dioxane or by catch and release sulfonic acidic resins such as polymer supported toluene sulfonic acid and the crude reaction product was purified by normal phase chromatography or reverse phase preparative HPLC.

General synthesis of 5-chloro substituted 2-amino pyridyl substituted 2-(2-amino-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl amine derivatives of general formula [G-008] Scheme B2

5-chloro 2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl amine derivatives of general formula [G-007] were prepared by the reaction of a 5-chloro 2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-ol derivative of general formula [G-006] with 2,4,6-triisopropylbenzenesulfonyl chloride in a polar aprotic solvent such as DMA, DMF, NMP with a tertiary alkylamine base such as Et_3N, DIPEA or NMM and a catalytic amount of DMAP. The intermediate 6,7-substituted-(2,4,6-triisopropyl-benzenesulfonic acid)- 2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl ester was then reacted with a primary or

secondary amino derivative, of general formula [G-004], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature. 5-chloro 2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl amine derivatives of general formula [G-007] was involved in a Buchwald type reaction utilising a suitable amine, of general formula [G-005], a palladium catalyst such as $Pd(dba)_2$ or $Pd(OAc)_2$, a ligand such as Xantphos and a base such as NaOtBu or Cs_2CO_3 in a polar solvent such as dioxane or a combination of dioxane and DMA at high temperature either by heating thermally or using a microwave reactor. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the intermediate was purified by column chromatography and the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, HCl in a solvent such as DCM, DCE or 1,4-dioxane or by catch and release sulfonic acidic resins such as polymer supported toluene sulfonic acid and the crude reaction product was purified by normal phase chromatography or reverse phase preparative HPLC.

The intermediate 6,7-substituted-(2,4,6-triisopropyl-benzenesulfonic acid)- 2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl ester was then reacted with a primary or secondary amino derivative, of general formula [G-004], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature. 5-chloro 2-(2-chloro-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl amine derivatives of general formula [G-007] was involved in a Buchwald type reaction utilising a suitable amine, of general formula [G-005], a palladium catalyst such as $Pd(dba)_2$ or $Pd(OAc)_2$, a ligand such as Xantphos and a base such as NaOtBu or Cs_2CO_3 in a polar solvent such as dioxane or a combination of dioxane and DMA at high temperature either by heating thermally or using a microwave reactor. The 5-chlotro 2-amino-pyridyl substituted 2-(2-amino-pyridin-4-yl)-pyrido[3,4-d]pyrimidin-4-yl amine derivatives of general formula [G-008]. were reacted in a Suzuki type reaction utilising a suitable boronic acid or boronic ester, of general formula [G-009], a palladium catalyst such as $Pd(PPh_3)_4$ or $Pd(PPh_3)_2Cl_2$ a base such as Et_3N, KOH, Na_2CO_3 or NaOH in a polar solvent such as EtOH, THF, DMA or dioxane at high temperature either by heating thermally or using a microwave reactor. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the intermediate was purified by column chromatography and the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, HCl in a solvent such as DCM, DCE or 1,4-dioxane or by catch and release sulfonic acidic resins such as polymer supported toluene sulfonic acid and the crude reaction product was purified by normal phase chromatography or reverse phase preparative HPLC.

Synthesis of 3-Bromo-5-fluoro-isonicotinic acid *tert*-butyl ester [B012]

To a solution of LDA (2M, 72mL, 144mmol) in THF (100mL) cooled to approximately -70°C was added dropwise via cannula a solution of 3-bromo-5-fluoropyridine (21.12g, 120mmol) in anhydrous THF (50 mL) pre-cooled to -70°C. The rate of addition was controlled such that the internal temperature did not rise above -65°C. The dark red-brown solution was stirred for 1 hour. Di-*tert*-butyldicarbonate (52.4g, 240mmol) in THF (50 mL) was cooled to -10°C in a methanol/ice bath then added dropwise via cannula to the

dark red-brown solution. The mixture was stirred for 2 hours then allowed to warm to room temperature and stirred for another 1 hour. Saturated aqueous ammonium chloride (100 mL) was added slowly and then water (200mL) and EtOAc (200mL) and the mixture was vigorously stirred for 45 minutes. After 1.5 h, LC/MS indicated major product (M+H)+ = 273. Filtered off silver salts and concentrated and put on high vac. Purified by ISCO chomatography 12g SiO2, gradient elution 0% to 100% EA/hexane over 13 minutes to give 2-(2-Chloro-pyridin-4-yl)- 5-methoxy-pyrido[3,4-d]pyrimidine

General synthesis of substituted substituted 2-morpholin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [H-006] Scheme C1

Amino-isonicotinamide derivatives of general formula [H-002] were prepared by reaction of a substituted amino-isonicotinamide derivative of general formula [H-001] with di-tert-butyl dicarbonate and ammonium carbonate in a polar aprotic solvent such as DMA, DMF, NMP with a base pyridine. Substituted 2-mercapto-3H-pyrido[3,4-d]pyrimidin-4-one derivatives of general formula [H-003] were prepared by cyclisation of a Amino-isonicotinamide derivatives of general formula [H-002] with carbon disulfide in a polar aprotic solvent such as DMA, DMF, NMP with a hindered base such as DBU. 2-Chloro-pyrido[3,4-d]pyrimidin-4-ol derivatives of general formula [H-004] were prepared by reaction of a Substituted 2-mercapto-3H-pyrido[3,4-d]pyrimidin-4-one derivatives of general formula [H-003] with thiophosgene in a polar aprotic solvent such as 1,4-dioxane. The 2-morpholin-4-yl-pyrido[3,4-d]pyrimidin-ol derivatives of general formula [H-005] were prepared by the reaction of a 2-Chloro-pyrido[3,4-d]pyrimidin-4-ol derivative of general formula [H-004] with a sunstituted morpholine derivative of general formula [H-007] in a polar aprotic solvent such as DMA, DMF, NMP at high temperature either by heating thermally or using a microwave reactor. 2-morpholin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [H-006] were prepared by the reaction of a 2-morpholin-4-yl-pyrido[3,4-d]pyrimidin-ol derivatives of general formula [H-005] with 2,4,6-triisopropylbenzenesulfonyl chloride in a polar aprotic solvent such as DMA, DMF, NMP with a tertiary alkylamine base such as Et_3N, DIPEA or NMM and a catalytic amount of DMAP. The intermediate 6,7-substituted-(2,4,6-triisopropyl-benzenesulfonic acid)- 2-morphol-4-yl- pyrido[3,4-d]pyrimidin -4-yl ester was then reacted with a primary or secondary amino derivative, of general formula [H-008], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, TCA, methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by reverse phase preparative HPLC.

3-Amino-isonicotinamide [C001]

A slurry of 3-aminoisonicotinic acid (1.00 g, 7.24 mmol) and CDI (1.76 g, 10.85 mmol) in DMF (15 mL) was heated to 40 ºC for 0.5 h then cooled. Concentrated aqueous ammonia (50 mL) was added and the mixture was stirred for 15 min then extracted with ethyl acetate. Removal of the solvent gave a solid which was dissolved in EtOAc. The organic phase was washed with water and brine, dried over $MgSO_4$, filtered and then concentrated under reduced pressure to give the title compound [C001] (780 mg, 79%) LCMS method: 5, RT: 0.54 min, MI 138 [M+H].

General synthesis of substituted substituted 2-morpholin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [H-006] Scheme C2

The 2-morpholin-4-yl-pyrido[3,4-d]pyrimidin-4-yl derivatives of general formula [H-009] were prepared by the reaction of a 2-Chloro-pyrido[3,4-d]pyrimidin-4-ol derivative of general formula [H-004] with a chlorinatation agent such as phosphorous oxychloride and then reacted with primary or secondary amino derivative of general formula [H-008], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the 2-morpholin-4-yl-pyrido[3,4-d]pyrimidine derivatives of general formula [H-009] were reacted with a substituted morpholine derivative of general formula [H-007] in a polar aprotic solvent such as DMA, DMF, NMP at high temperature either by heating thermally or using a microwave reactor. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, TCA,

methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by reverse phase preparative HPLC.

3-halo-N-(imino-morpholin-4-yl-methyl)-isonicotinamide derivatives of general formula [H-011] were prepared by coupling of a ortho-halo-isonicotinic acid derivative of general formula [H-010] with an appropriately substituted 4-carbamimidoyl-morpholine of general formula [H-004] with a suitable coupling agent such as O-(7-Azabenzotriazol-1-yl)-N,N,N′,N′-tetramethyluronium hexafluorophosphate (HATU) in a polar aprotic solvent such as DMA or DMF. The isonicotinoyl-amidine derivative of general formula [H-011] were cyclised to displace the relevant halogen group to yield the desired morpholin-4-yl-pyrido[3,4-d]pyrimidin-4-ol derivatives of general formula [H-005]. The 2-morpholin-4-yl-pyrido[3,4-d]pyrimidin-4-yl derivatives of general formula [H-006] were prepared by the reaction of a morpholin-4-yl-pyrido[3,4-d]pyrimidin-4-ol derivatives of general formula [H-005] with a chlorinatation agent such as phosphorous oxychloride or a triflating agent such as N-Phenyl-bis(trifluoromethanesulfonimide and then reacted with primary or secondary amino derivative of general formula [H-008], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, TCA, methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by reverse phase preparative HPLC.

General synthesis of substituted substituted 4-substituted-2-(1H-pyrrolo[2,3-b]pyridin-4-yl)-azaquinazoline derivatives of general formula [I-001] Scheme D1

The 4-substituted-2-(1H-pyrrolo[2,3-b]pyridin-4-yl)-azaquinazoline derivatives of general formula [I-003] were prepared by the reaction of a 2-Chloro-pyrido[3,4-d]pyrimidine derivative of general formula [I-002], prepared in scheme C2, in a Suzuki type palladium catalysed cross coupling reaction with boronic acid or boronate ester derivative of general formula [I-004] a palladium catalyst such as $Pd(PPh_3)_4$, a base such as K_2PO_4 in a polar aprotic solvent such as DMA or DMF at elavated temperature either by heating thermally or using a microwave reactor, to yield 4PPAZ derivative of general formula [I-003]. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the intermediate was purified by column chromatography. The intermediate arylsulphonate protected derivative of general formula [I-003] was then subjected to a deprotection reaction in the presence of a base such as sodium hydroxide in a polar protic solvent such as ethanol. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the intermediate was purified by column chromatography and the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, HCl in a solvent such as DCM, DCE or 1,4-dioxane or by catch and release sulfonic acidic resins such as polymer supported

toluene sulfonic acid and the crude reaction product was purified by normal phase chromatography or reverse phase preparative HPLC.

General synthesis of substituted substituted 4-substituted-2-(1H-pyrrolo[2,3-b]pyridin-4-yl)-azaquinazoline derivatives of general formula [I-001] Scheme D3

The 4-substituted-2-(1H-pyrrolo[2,3-b]pyridin-4-yl)-azaquinazoline derivatives of general formula [I-001] were prepared by the reaction of a halogenated pyridine derivative of general formula [I-010] with a strong base such as LDA, in a polar aprotic solovent such as THF, a symmetrical anhydride such as Di-tert-butyl dicarbonate at low temeperature to yield halo-substituted-isonicotinic acid tert-butly ester derivatives of general formula [I-011]. After reaction work up, typically by a liquid-liquid extraction the intermediate was purified by column chromatography. The halo-substituted-isonicotinic acid tert-butly ester derivative of general formula [I-011] was then subjected to a Suzuki type palladium catalysed cross coupling reaction with boronic acid or boronate ester derivative of general formula [I-018] a palladium catalyst such as $Pd(PPh_3)_4$, a base such as K_2PO_4 in a polar aprotic solvent such as DMA or DMF at elavated temperature either by heating thermally or using a microwave reactor, to yield the substituted-isonicotinic acid tert-butly ester

derivative of general formula [I-012]. After reaction work up, typically by a liquid-liquid extraction the intermediate was purified by column chromatography. The t-butylester inter intermediate [I-012] was then subjected to a deprotection reaction in the presence of a base such as sodium hydroxide in a polar protic solvent such as ethanol to yield the substituted-isonicotinic acid derivative of general formula [I-013], which was then subjected to a coupling reaction with a substituted 1H-pyrrolo[2,3-b]pyridine-4-carboxamidine derivative of general formula [I-014], with a suitable coupling agent such as O-(7-Azabenzotriazol-1-yl)-N,N,N′,N′-tetramethyluronium hexafluorophosphate (HATU) in a polar aprotic solvent such as DMA or DMF. The isonicotinoyl-amidine derivative of general formula [I-015] can then be cyclised to displace the relevant halogen group to yield the desired 2-(1H-pyrrolo[2,3-b]pyridine-4-yl)-pyrido[3,4-d]pyrimidin-4-ol derivative of general formula [I-016]. The 4-substituted-2-(1H-pyrrolo[2,3-b]pyridin-4-yl)-azaquinazoline derivatives of general formula [I-001] were prepared by the reaction of a 2-(1H-pyrrolo[2,3-b]pyridine-4-yl)-pyrido[3,4-d]pyrimidin-4-ol derivative of general formula [I-016] with a chlorinatation agent such as phosphorous oxychloride to give compounds of general formula and the intermediate 4-chloro derivative was then further reacted with primary or secondary amino derivative of general formula [I-017], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature [method A]. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion exchange catch-release, the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, TCA, methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by normal phase silica gel chromatography or reverse phase preparative HPLC. 4-substituted-2-(1H-pyrrolo[2,3-b]pyridin-4-yl)-azaquinazoline derivatives of general formula [I-001] were prepared by the reaction of a -(1H-pyrrolo[2,3-b]pyridine-4-yl)-pyrido[3,4-d]pyrimidin-4-ol derivative of general formula [I-016] with 2,4,6-triisopropylbenzenesulfonyl chloride in a polar aprotic solvent such as DMA, DMF, NMP with a tertiary alkylamine base such as Et_3N, DIPEA or NMM and a catalytic amount of DMAP [method B]. The intermediate 6,7-substituted-(2,4,6-triisopropyl-benzenesulfonic acid)- (1H-pyrrolo[2,3-b]pyridine-4-yl)-pyrido[3,4-d]pyrimidin--4-yl ester was then reacted with a primary or secondary amino derivative, of general formula [G-117], in a polar aprotic solvent such as DMA, DMF, NMP in the presence of a tertiary amine base such as Et_3N, DIPEA or NMM at ambient temperature. After reaction work up, typically by a liquid-liquid extraction or purification by acidic ion

exchange catch-release, the N-Boc derivatives were deprotected under acidic conditions with a strong acid such as TFA, TCA, methanesulfonic acid, HCl or H_2SO_4 in a solvent such as DCM, DCE, THF, EtOH or MeOH and the crude reaction product was purified by reverse phase preparative HPLC.

General synthesis of substituted 1H-pyrrolo[2,3-b]pyridine-4-carboxamidine derivative of general formula [I-012] Scheme D4

The substituted 1H-pyrrolo[2,3-b]pyridine-4-carboxamidine derivatives of general formula [I-012] were prepared by the reaction of 2-methyl pyridine-2-yl carbamic acid tert butyl ester derivative of general formula [I-019] with a strong base such as nBuLi, in a polar aprotic solovent such as THF, and a substituted Weinreb amide derivative of general formula [I-025] at low temeperature followed by reaction with a mineral acid such as hydrochloric acid at elevated temperature to yield the 1-H-pyrrolo[2,3-b]pyridine derivative of general formula [I-020] , after reaction work up, typically by a liquid-liquid extraction the intermediate was purified by column chromatography. The 1-H-pyrrolo[2,3-b]pyridine derivative of general formula [I-020] was then subjected to a pyridine N-oxidation reaction with an oxidising reagent such as mCPBA in a solvent such as DCM. The intermediate 1-H-pyrrolo[2,3-b]pyridine-7-oxide derivative of general formula [I-021] was then reacted with a chlorinating agent such as methansulfonyl chloride, in a polar aprotic solvent such as DMF at elevated temperature, after reaction work up, typically by a liquid-liquid extraction the intermediate was purified by column chromatography. The intermediate 4-chloro-1H-pyrrolo[2,3-b]pyridine derivative of general formula [I-022] was then submitted to a palladium catalysed cross coupling reaction with a cyanide species such as zinc cyanide, a palladium catalyst such as dichloro[1,1'-bis(diphenylphosphino)ferrocene]palladium (II) dichloromethane adduct, zinc dust, in a polar aprotic solvent such as DMF at elevated temperature, after reaction work up, typically by a liquid-liquid extraction the intermediate was purified by column chromatography. The intermediate 1H-pyrrolo[2,3-b]pyridine-4-carbonitrile derivative of general formula [I-023] was then reacted with hydroxylamine (50% wt/wt in water) and a polar protic solvent such as EtOH at elevated temperature. The intermediate N-hydroxy-1H-pyrrolo[2,3-b]pyridine-4-carboxamide of general formula [I-024] was then subjected to a hydrogenolysis reaction with acetic anhydride in a polar protic solvent such as methanol a palladium catalyst such as palladium on activated charcoal under a atmosphere of hydrogen gas, to yield the substituted 1H-pyrrolo[2,3-b]pyridine-4-carboxamidine derivative of general formula [I-012] Scheme D4.

1253a) A mixture of azeotropically dried (xylene) 4-chloro-9H-pyrido[2,3-b]indole (1.31 g, 6.46 mmol), zinc cyanide (1.21 g, 10.3 mmol), zinc (0.145 g, 2.22 mmol), tris(dibenzylideneacetone)dipalladium(0) (0.479 g, 0.523 mmol) and 1,1'-bis(diphenylphosphino)ferrocene (0.375 g, 0.676 mmol) in N,N-dimethylformamide (27 mL) was vacuum degassed then heated at 100 °C under an atmosphere of argon overnight. The mixture is cooled and poured into water:ethyl acetate (2:1, 150 mL). The layers were separated, the aqueous extracted with ethyl acetate (2X50 mL) and the combined organic extracts are diluted with hexane (15 mL) and brine (100 mL). The fine suspension of solids was removed by filtration of the aqueous layer through Celite, washing with methanol and ethyl acetate. The organic extracts and aqueous/organic rinsate were combined, separated and the organic layer washed with additional brine (100 mL), dried over magnesium sulfate, filtered and concentrated in vacuo onto silica gel (12 g) prior to purification on silica gel (80 g, 5-35% ethyl acetate:hexane). 9H-Pyrido[2,3-b]indole-4-carbonitrile was isolated as a yellow solid (0.830 g, 66% yield). LCMS (ESI): 194 $(M+H)^+$; ^{1}H-NMR (DMSO-d_6, 400 MHz): δ 12.45 (s, 1H), 8.63 (d, 1H, J = 5.0 Hz), 8.32 (d, 1H, J = 8.0 Hz), 7.68 (d, 1H, J = 5.0 Hz), 7.64 (m, 2H), 7.40 (m, 1H); ^{13}C-NMR (DMSO-d_6, 100 MHz): δ 151.6, 146.2, 139.7, 128.6, 121.1, 120.5, 117.9, 116.9, 116.7, 114.1, 112.0, 109.8.

1253b) Lithium hexamethyldisilazide in tetrahydrofuran(1.0 M, 7.0 mL, 7.0 mmol) was added to a suspension of 9H-pyrido[2,3-b]indole-4-carbonitrile (0.422 g, 2.18 mmol) in tetrahydrofuran (12.0 mL, 148 mmol) at room temperature under an atmosphere of nitrogen. Additional lithium hexamethyldisilazide in tetrahydrofuran (1.0 M, 7 mL) was added at 48 h to drive the reaction to completion. After stirring a total of 72 h, the mixture was diluted with water (50 mL) and the resultant solids were collected by filtration, washed with water and dried on a Buchner funnel and in vacuo. 9H-Pyrido[2,3-b]indole-4-carboxamidine was isolated as beige solids (0.297 g, 65% yield) and was used without further purification. LCMS (ESI): 211 $(M+H)^+$.

The crude 3-cyclopropyl-5-fluoro-N-[imino-(9H-pyrido[2,3-b]indol-4-yl)-methyl]-isonicotinamide was combined with cesium carbonate (0.914 g, 2.81 mmol) in N,N-dimethylformamide (14.0 mL) and was heated at 90 °C under an atmosphere of nitrogen overnight. The mixture was concentrated in vacuo onto silica gel (4.5 g) then purified (silica gel 40 g, 0-10% MeOH:DCM) to afford 5-cyclopropyl-2-(9H-pyrido[2,3-b]indol-4-yl)-3H-pyrido[3,4-d]pyrimidin-4-one (0.230 g; Yield = 46.4%). General synthesis of 2-substituted-azaindole derivatives of general formula [I-034]
Scheme D5

The 2-substituted azaindole derivatives of general formula [I-034] were prepared by the reaction of a 1-benzenesulfonyl-4-bromo-1H-pyrrolo[2,3-b]pyridine derivative of general formula [I-030] in a palladium catalysed cross coupling reaction with a palladium catalyst such as $PdCl_2dppf:CH_2Cl_2$, a cyanide reagent such as $Zn(CN)_2$, zinc dust, in a polar aprotic solvent such as DMF at high temperature either by heating thermally or using a microwave reactor. The crude product was purified by column chromatography. The 1-benzenesulfonyl-1H-pyrrolo[2,3-b]pyridine-4-carbonitrile derivative of general formula [I-031] was then reacted with a strong base such as LDA in a polar aprotic solvent such as THF at a low reaction temperature such as -78 °C with an electrophile such as a ketone, a disulfide or a halogenating agent such as NIS or NCS of general formula [I-035] to yield the 2-substituted 1-benzenesulfonyl-1H-pyrrolo[2,3-b]pyridine-4-carbonitrile derivative of general formula [I-032] following reaction work up, typically by a liquid-liquid extraction and purification by column chromatography. The intermediate of general formula [I-032] was deprotected by reaction with fluoride reagent such as TBAF in a polar aprotic solvent such as THF to yield the reaction intermediate of general formula [I-033]. The reaction intermediate of general formula [I-033] was then reacted with hydroxylamine (50% wt/wt in water) and a polar protic solvent such as EtOH at elevated temperature. The intermediate N-Hydroxy-1H-pyrazolo[3,4-b]pyridine-4-carboxamidine was then subjected

PKCι IC_{50} Assay

Assays are based on the ability of PKCι to phosphorylate a commercially available peptide substrate *in vitro*. The peptide substrate is FAM-PKCε pseudopeptide derived peptide, and comprises the amino acid sequence 5FAM-ERMRPRKRQGSVRRRV-NH_2. Recombinant, full-length human PKCι expressed in Sf21 insect cells is also commercially available. Recombinant, kinase-domain human PKCι is expressed and purified in-house.

The procedure below explains how dose response curves for inhibitors of PKCι are obtained. The screen described is for a 384 well format but the assay can be adapted to 1536 or other formats as required.

Compounds to be tested are dissolved in 100% DMSO. Compounds are diluted as required to give a final concentration of 4% DMSO (v/v) in the assay. 1μl is plated into 384 well black low-binding flat bottomed assay plates which are used immediately. Dilutions and additions of compound to assay plates are carried out using Matrix WellMate® and Matrix PlateMate® Plus liquid handling systems.

On the day of the screen PKCι / substrate working solution, and ATP working solution, are prepared in buffer containing 20mM tris-HCl pH7.5, 10mM $MgCl_2$, 0.01% Triton X100, 250μM EGTA and 1mM DTT. The final concentration of PKCι used varies depending on the batch of protein but is typically 15pM. The final concentration of peptide substrate in the assay is 100nM. ATP is used at a final concentration of 150μM or 25μM in the assays containing full-length or kinase-domain PKCι respectively, which corresponds to five times or equal to the K_M^{APP} for ATP for each enzyme, respectively. The final buffer concentration in the assay is 18mM tris-HCl pH7.5, 9mM $MgCl_2$, 0.009% Triton X100, 225μM EGTA and 0.9mM DTT. Relevant controls are included, namely no compound and no enzyme. 5μl PKCι / substrate working solution at 30pM and 200nM, respectively, is added to the wells, followed by 4μl ATP working solution at 375μM or 62.5μM for full-length or kinase-domain PKCι respectively, using a 16 channel Matrix pipette. The reaction is allowed to incubate for 60 minutes at room temperature, before the reaction is stopped and developed by the addition of 20μl IMAP™ development reagent (Molecular Devices). IMAP development reagent consists of 0.25% (v/v) IMAP progressive binding reagent, 17% (v/v) IMAP progressive binding buffer A and 3% (v/v) IMAP progressive binding buffer B. The plates are then incubated for 2 hours at room temperature before being read using an appropriate plate reader, for example a Molecular

Devices HT Analyst or a BMG Pherastar. Plates are read using a fluorescence polarisation protocol with excitation at 485nm and emission at 530nm, and dichroic mirror at 505nm.

Percentage inhibition values are calculated from fluorescence polarisation values, using the no compound and no enzyme control values as 0% and 100% inhibition, respectively. IC50 determination is performed with ExcelFit software (IDBS) using curve fit 205. Z′ factors are determined for each plate tested and are all above 0.5.

Alternatively, compounds were tested for their ability to inhibit the kinase activity of recombinant human baculovirus-expressed PKCíota using the immobilized metal-ion affinity particle (IMAP®) fluorescence polarization detection system (Molecular Devices, Sunnyvale, CA). PKCíota/IMAP® substrate mixture (2X) was prepared in 1X IMAP assay buffer (Molecular Devices) containing 1 mM DTT so that the final assay concentrations were 15 pM PKCíota (EMD Millipore, Billerica, MA) and 100 nM 5-fluorescein-amidite (FAM)-PKC€-pseudosubstrate (5-FAM-ERMRPRKRQGSVRRRV-NH2) (Molecular Devices). The 2X working solution was added at 5 µL/well into a 384-well black, non-binding, flat bottom assay plate (Corning, Corning, NY). Compound serial dilutions were carried out in 100% DMSO, then 100 nL transferred to the assay plate containing 5 µL of the 2X enzyme/substrate solution using a BioMek NX pin tool (Beckman Coulter, Indianapolis, IN). Enzyme reaction was initiated by the addition of 5 µL 2X ATP, so that the final assay concentration was 150 µM. Assay plates were incubated for 1 hour in a 25°C incubator, followed by addition of 20 µL IMAP® detection reagent. The detection reagent was comprised of 85% 1X buffer A and 15% 1X buffer B and the IMAP® Binding Reagent diluted 1:400. Assay plates were then incubated for 2 hours in a 25°C incubator. Following the incubation, fluorescence polarization was measured using a PerkinElmer Envision™ 2102 plate reader (PerkinElmer, Waltham, MA) with an excitation wavelength of 480 nm and an emission wavelength of 535 nm.
