# AI for Continuous Flow Glass Production

PreScouter worked with one of the world's largest glass manufacturers to develop an artificial intelligence algorithm to enable continuous flow glass production.

The client had the sensor from the manufacturing facilities, and requested PreScouter to investigate possible solutions.

The AI team at PreScouter identified the key bottleneck and developed an algorithm to control the rate of glass flow to maximize production time and minimize downtime.

PreScouter implemented the system on an enterprise scale. The client stated the ROI would be positive within days of deployment.
