

Statistical Appendix for “The Distribution of World Happiness”, John F. Helliwell, Haifang Huang and Shun Wang, Chapter 2, World Happiness Report Update 2016

February 18, 2016

1 Data Sources and Variable Definitions

- Happiness score or subjective well-being (variable name *ladder*): The survey measure of SWB is from the Jan 22, 2016 release of the Gallup World Poll (GWP), which covers the years from 2005 to 2015. Unless stated otherwise, it is the national average response to the question of life evaluations. The English wording of the question is “Please imagine a ladder, with steps numbered from 0 at the bottom to 10 at the top. The top of the ladder represents the best possible life for you and the bottom of the ladder represents the worst possible life for you. On which step of the ladder would you say you personally feel you stand at this time?” This measure is also referred to as *Cantril life ladder*, or just *life ladder* in our analysis.
- Inequality/distribution statistics of happiness scores by WP5-year (variables names *giniLadder* and more) from the GWP release. WP5 is GWP’s coding of countries, including some sub-country territories such as Hong Kong. The statistics are named giniLadder, p95Ladder, p90Ladder, p75Ladder, p50Ladder, p25Ladder, p10Ladder, p05Ladder, maxLadder, minLadder, respectively the gini score, the various percentiles, the maximum and the minimum. They are all derived from the STATA command *ineqdec0* using observations in an individual country/territory in a given survey year with sample weights. According to Stephen P. Jenkins (May 2008, STATA Help), the command *ineqdec0* “estimate[s] a range of inequality and related indices” using unit record or ‘micro’ level data, and that the calculations do not exclude observations whose value is equal to zero.
- Alternative measures of inequality in happiness scores by wp5-year (variable names *sdLadder* and *cvLadder*). These extra measures are sdLadder “Standard deviation of ladder by country-year” and cvLadder “Standard deviation/Mean of ladder by country-year”.

- Gini of household income reported in the GWP (variable name *giniIncGallup*). The income variable, namely INC_001, is described in Gallup's "WORLDWIDE RESEARCH METHODOLOGY AND CODEBOOK" (Updated July 2015) as "Household Income International Dollars [...] To calculate income, respondents are asked to report their household income in local currency. Those respondents who have difficulty answering the question are presented a set of ranges in local currency and are asked which group they fall into. Income variables are created by converting local currency to International Dollars (ID) using purchasing power parity (PPP) ratios." The gini measure is generated using STATA command *ineqdec0* by WP5-year with sample weights.
- GINI index from the World Bank (variable name *giniIncWB* and *giniIncW-Bavg*) from the World Development Indicators (Last Updated: 22-Dec-2015). The variable labeled at the source as "GINI index (World Bank estimate)", series code "SI.POV.GINI". According to the source, the data source is "World Bank, Development Research Group. Data are based on primary household survey data obtained from government statistical agencies and World Bank country departments." The variable *giniIncWB* is an unbalanced panel of yearly index. The data availability is patchy at the yearly frequency. The variable *giniIncW-Bavg* is the average of *giniIncWB* in the period 2000-2013. The average does not imply that a country has the gini index in all years in that period. In fact, most do not.
- The statistics of GDP per capita (variable name *gdp*) in purchasing power parity (PPP) at constant 2011 international dollar prices are from the December 22, 2015 release of the World Development Indicators (WDI). The GDP figures for Taiwan are from the Penn World Table 7.1. Syria, Angola and Argentina and a few others are missing the GDP numbers in the December 22, 2015 WDI but were present in earlier releases. We use the numbers from the earlier release, after adjusting their levels by a factor of 1.17 to take into account changes in the implied prices when switching from the PPP 2005 prices used in the earlier release to the PPP 2011 prices used in the latest release. The factor of 1.17 is the average ratio derived by dividing the US GDP per capita under the 2011 prices with their counterparts under the 2005 prices. The same 1.17 is used to adjust the Taiwanese numbers, which are originally PPP dollars at 2005 constant prices. For Somalia, we use the 2010 estimate of GDP per capita figure in the CIA World Factbook. New Zealand, Guyana and Yemen are missing the 2014 GDP in the WDI dataset. We compute the values with their 2013 base and OECD or World Bank forecasts of growth rates of real GDP, adjusted for population growth.
 - GDP per capita in 2015 are not yet available as of Dec 2015. We extend the GDP-per-capita time series from 2014 to 2015 using country-specific forecasts of real GDP growth in 2015 first from the OECD Economic Outlook No. 98 (Edition 2015/2) and then, if missing, forecasts from World Bank's Global Economic Prospects (Last Updated: 12/19/2014). The

GDP growth forecasts are adjusted for population growth with the subtraction of 2013-14 population growth as the projected 2013-14 growth. For another 12 countries that are missing figures of growth forecast, we compute their 2015 GDP per capita as the product of 2014 value and the 2013-2014 growth rate, essentially using the 2013-14 growth rates as if they were forecast of 2014 to 2015 growth rates.

- Healthy Life Expectancy (HLE). The time series of healthy life expectancy at birth are calculated by the authors based on data from the World Health Organization (WHO), the World Development Indicators (WDI), and statistics published in journal articles. The challenge is that the healthy life expectancy, unlike the simple life expectancy, is not widely available as time series. In the WHO's Global Health Observatory Data Repository, the statistics of healthy life expectancy are reported only for the years of 2000 and 2012. In our effort to derive the time series of healthy life expectancy for our sample period (2005 to 2015), we use WDI's non-health adjusted life expectancy, which is available as time series up to the year 2013, as the basis of our calculation. Using country-specific ratios of healthy life expectancy to total life expectancy in 2012, available from the WHO, we adjust the time series of total life expectancy to healthy life expectancy by simple multiplication, assuming that the ratio remains constant within each country over the sample period. Three countries/regions are missing due to the lack of health/total life expectancy ratio. One is Hong Kong. We calculate its ratio using relevant estimates in "Healthy life expectancy in Hong Kong Special Administrative Region of China," by C.K. Law, & P.S.F. Yip, published at the *Bulletin of the World Health Organization*, 2003, 81 (1). Another is Puerto Rico. We set its ratio to the U.S. ratio of 0.886. The third is Kosovo, we set its ratio to the world average 0.868. The estimated life expectancy for Taiwan and the Palestinian Territories are available in "Healthy life expectancy for 187 countries, 1990 - 2010: a systematic analysis for the Global Burden Disease Study 2010," by Joshua A Salomon et al, *The Lancet*, Volume 380, Issue 9859. Once we have the data, we use interpolation and extrapolation to fill in the missing values (when necessary) and to extend the period to 2015.
- Social support (or having someone to count on in times of trouble) is the national average of the binary responses (either 0 or 1) to the GWP question "If you were in trouble, do you have relatives or friends you can count on to help you whenever you need them, or not?"
- Freedom to make life choices is the national average of responses to the GWP question "Are you satisfied or dissatisfied with your freedom to choose what you do with your life?"
- Generosity is the residual of regressing national average of response to the GWP question "Have you donated money to a charity in the past month?" on GDP per capita.

- Corruption Perception: The measure is the national average of the survey responses to two questions in the GWP: “Is corruption widespread throughout the government or not” and “Is corruption widespread within businesses or not?” The overall perception is just the average of the two 0-or-1 responses. In case the perception of government corruption is missing, we use the perception of business corruption as the overall perception. The corruption perception at the national level is just the average response of the overall perception at the individual level.
- Positive affect is defined as the average of three positive affect measures in GWP: happiness, laugh and enjoyment in the Gallup World Poll waves 3-7. These measures are the responses to the following three questions, respectively: “Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Happiness?”, “Did you smile or laugh a lot yesterday?”, and “Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Enjoyment?” Waves 3-7 cover years 2008 to 2012 and a small number of countries in 2013. For waves 1-2 and those from wave 8 on, positive affect is defined as the average of laugh and enjoyment only, due to the limited availability of happiness.
- Negative affect is defined as the average of three negative affect measures in GWP. They are worry, sadness and anger, respectively the responses to “Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Worry?”, “Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Sadness?”, and “Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Anger?”
- Variables in the expanded data set: Confidence in national government from the GWP. The English wording of the question is “Do you have confidence in each of the following, or not? How about the national government? (WP139)”.
- Variables in the expanded data set: “Most people can be trusted” from the GWP. The question’s English wording is “Generally speaking, would you say that most people can be trusted or that you have to be careful in dealing with people?” This indicator has a limited coverage.
- Variables in the expanded data set: “Most people can be trusted” from the 6-wave World Value Surveys. The question’s English wording is “Generally speaking, would you say that most people can be trusted or that you need to be very careful in dealing with people?” The measure is defined as the percentage of respondents saying that most people can be trusted, excluding those who did not provide an answer.
- Variables in the expanded data set: Democratic and delivery quality measures of governance are based on Worldwide Governance Indicators (WGI) project (Kaufmann, Kraay and Mastruzzi). The original data have six dimensions:

Voice and Accountability, Political Stability and Absence of Violence, Government Effectiveness, Regulatory Quality, Rule of Law, Control of Corruption. The indicators are on a scale roughly with mean zero and a standard deviation of 1. We reduce the number of dimensions to two using the simple average of the first two measures as an indicator of democratic quality, and the simple average of the other four measures as an indicator of delivery quality, following Helliwell and Huang (2008).

2 Coverage, Summary Statistics and Regression Tables

The Jan 22, 2016 release of the Gallup World Poll (GWP) covers a total of 1,275 WP5-year observations of happiness scores in the period from 2005 to 2015 involving 166 different WP5, GWP's coding of countries including some sub-country territories such as Hong Kong. Not all the countries and territories appear in all the years. Our analysis does not cover all of the country/territories that have valid happiness scores. Tables 1-3 show the WP5-year pairs that are covered.

The 2012-2015 ranking of happiness scores includes 153 countries/territories that have the happiness scores in the 2013-2015 period, plus 4 countries/territories that have the happiness score in 2012 but not in 2013-15. A later table has the list of those countries.

To appear in regression analysis that uses data from outside the GWP survey, a WP5-year needs to have the necessary external information (GDP, healthy life expectancy, etc). The regression analysis thus does not necessarily cover all of the countries/territories in the GWP. Nor does it necessarily cover all the countries/territories that are ranked by their happiness scores in this report. The underlying principle is that we always use the largest available sample. For different kind of analysis/ranking, the largest available samples can be different.

Regions: Some of the analysis includes dummy indicator for regions, namely Western Europe, Central and Eastern Europe, Commonwealth of Independent States, Southeast Asia, South Asia, East Asia, Latin America and Caribbean, North America and ANZ, Middle East and North Africa, and Sub-Saharan Africa.

Table 1: Number of ladder (WP16) observations for WP5-years - Part 1

Country/territory (wp5 ID)	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015

Notes: 1) Column 1 reports estimates from a pooled OLS regression based on data used in the WHR 2015 (sample period 2005-2014). Column 2 replicates the regression with updated data that will be used for WHR 2016 (sample period 2005-2015). 2).Standard errors in parentheses. *, **, and *** indicate statistical significance at 10 percent, 5 percent and 1 percent levels. All standard errors are cluster-adjusted at the country level. The row “e(N-clust)” indicates the number of countries. 3). See section “Data Sources and Variable Definitions” for more information.

Notes: 1) Columns (1) to (3) show estimates from pooled regressions with year fixed effects but without regional or country fixed effects. Columns (4) to (6) are from the same pooled regressions but with the addition of regional fixed effects. Columns (7) to (9) are from panel regressions with country fixed effects, in addition to the year fixed effects that are present in all the 9 regressions. For the last three columns, within country r-squared are reported. 2) Standard errors in parentheses. *, **, and *** indicate statistical significance at 10 percent, 5 percent and 1 percent levels. All standard errors are cluster-adjusted at the country level.

Table 12: Countries/territories that have valid happiness scores in 2012 but not in
2013-2015

	Sample size in 2012
Laos	941
Comoros	999
Suriname	490
Somaliland region	1000

Figure 4: Predicted happiness and actual happiness in 2013-15

Note: These average actual (predicted) happiness scores by country/territory for the 2013-2015 period are weighted averages of the yearly averages by country/territory used in (predicted by) column (1)'s regression in Table 9. The yearly weights are the sums of Gallup-assigned individual weights by country/territory in that year.

Table 13: Decomposing the happiness difference between a hypothetical average country and Dystopia

	Average country	Dystopia	Explained excess happiness over Dystopia due to	Share of explained excess happiness over Dystopia due to
Happiness	5.38	2.33		
Logged GDP per capita	9.22	6.4	.95	.31
Social support	.8	.46	.79	.26
Healthy life expectancy	62.35	43.21	.56	.18
Freedom to make life choices	.74	.39	.37	.12
Generosity	.01	-.28	.24	.08
Perceptions of corruption	.73	.97	.14	.05
Sum of explained excess over Dystopia			3.06	1

Table 14: Decomposing the happiness difference between the group of top 10 countries/territories and the group of bottom 10 countries/territories in the ranking of happiness scores

	Top 10	Bottom 10	Difference in happiness due to	Share of explained difference due to
Happiness	7.41	3.42		
Logged GDP per capita	10.7	7.37	1.13	.36
Social support	.94	.6	.8	.25
Healthy life expectancy	71.65	53.11	.54	.17
Freedom to make life choices	.93	.63	.32	.1
Generosity	.21	.04	.13	.04
Perceptions of corruption	.36	.74	.22	.07
Total explained difference in happiness			3.14	1
Total difference in happiness			3.99

Turkmenistan

Table 16: Imputed missing values that are used for decomposing the 2013-2015 happiness scores

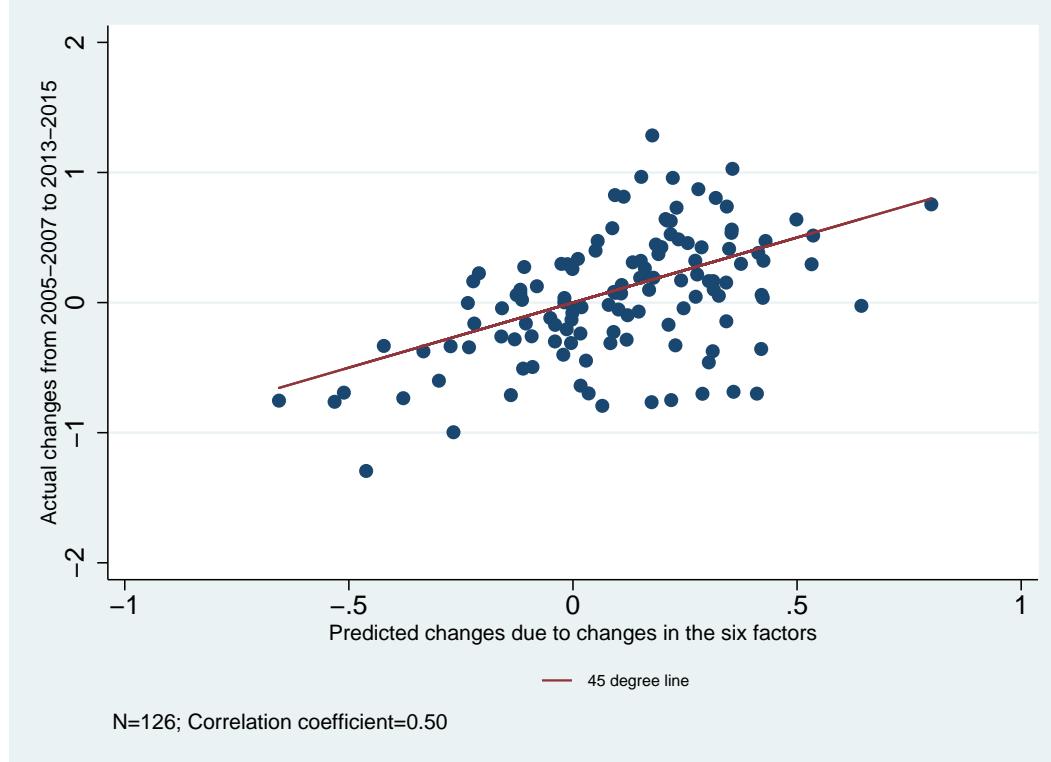

Country	GDP per capita	Social support	Perceptions of corruption	Generosity	Freedom	Healthy life expectancy
Argentina	2011 data			Predicted by donation-a-b*ln(gdp) ¹		
Bahrain				Predicted by donation-a-b*ln(gdp) (donation in 2012-14 is missing, thus 2011 value is used)		
China			Russia's data			
Iran			2008 data			
Jordan			2009 data			
Kuwait			Corruption in business in 2011	Predicted by donation-a-b*ln(gdp) (donation in 2012-14 is missing, thus 2010 value is used)		
Laos	PPP in 2013 dollar (CIA estimated) adjusted to PPP in 2011 dollar		2011 data	Predicted by donation-a-b*ln(gdp)		
Northern Cyprus	Cyprus's data			Predicted by donation-a-b*ln(gdp)		
Oman		Saudi Arabia's data	Saudi Arabia's data			
Qatar			2009 data			
Saudi Arabia			2009 data			
Somaliland Region	Ethiopia's data			Predicted by donation-a-b*ln(gdp)		
Taiwan		2010 data		Predicted by donation-a-b*ln(gdp)		
Turkmenistan			Uzbekistan's data	Predicted by donation-a-b*ln(gdp) (donation in 2012-14 is missing, thus 2011 value is used)		
United Arab Emirates						

Table 17: Imputed missing values for the 2005-2007 period that are used for decomposing the happiness changes from 2005-2007 to 2013-15

Country	Perceptions of corruption	Generosity	Freedom
China	Russia's data		2008 data
Egypt	2009 data		
Madagascar	2008 data		2008 data
Rwanda		Predicted by donation-a-b*ln(gdp) (donation in 2005-07 is missing, thus 2008 value is used) ¹	
Yemen	Corruption in government in 2007		

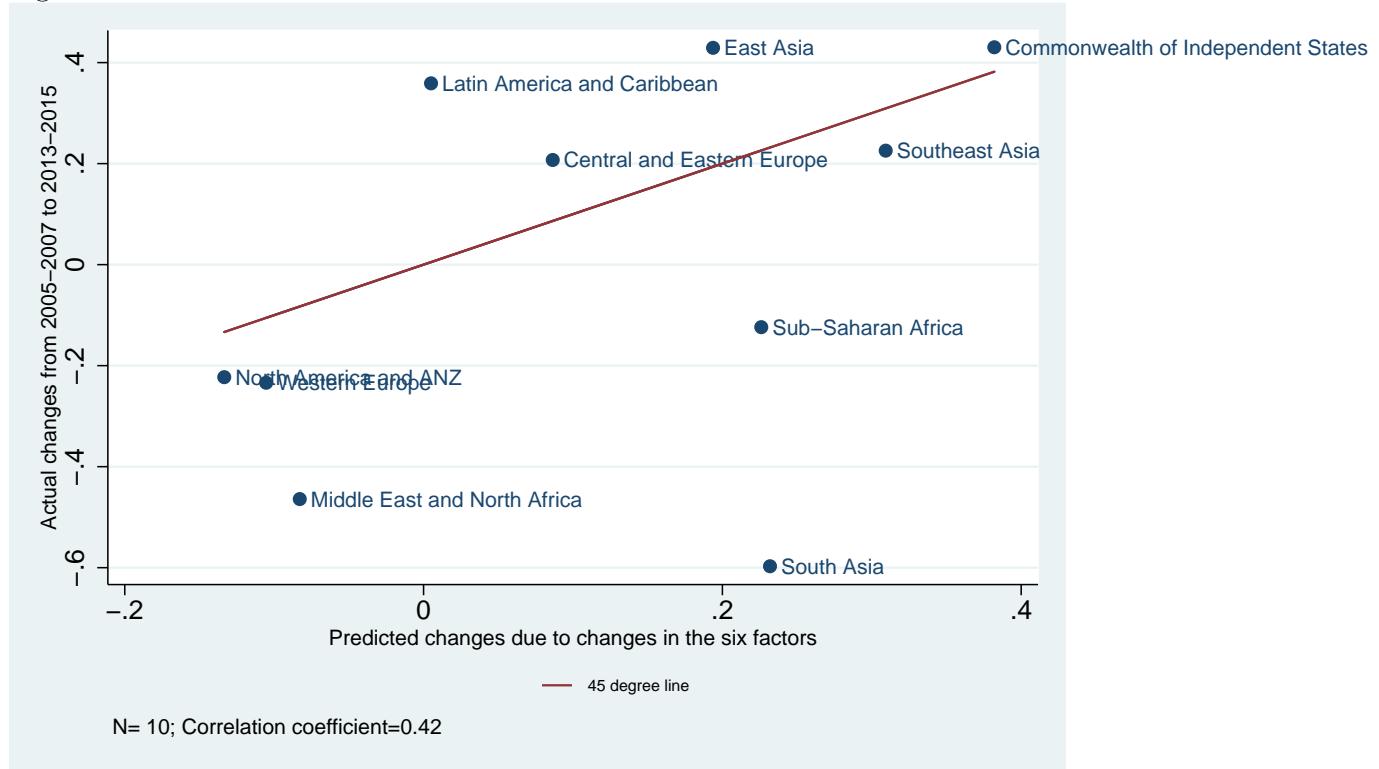

Notes: 1). The coefficients are generated by regressing national-level donations on log GDP per capita in a pooled OLS regression.

Figure 8: Actual and predicted changes in happiness from 2005-07 to 2013-15

Note: Defining predicted changes in happiness due to changes in the six factors: Step 1. Take periodical averages (2005-07 and 2013-15, respectively) of the six factors in the survey data. Step 2. Take difference between the two periods for each of the factors. Step 3. Multiply the differences with corresponding coefficients on the factors in Table 2.1. Step 4. Take the summation of the products from the previous step. The resulted sum is predicted change in ladder due to changes in the six factors.

Figure 9: Actual and predicted changes in happiness from 2005-07 to 2013-15 at the regional level

Note: This plot at the regional level shows weighted averages of the actual and predicted changes shown in figure 8. The weights for deriving the regional averages are average population from 2005 to 2014.

Table 18: Decomposing changes in happiness from 2005-2007 to 2013-2015, equal weight for each country/territory, for the full world sample

	Period 2013-2015	Period 2005-2007	Explained changes in happiness due to
