This PDF file includes:

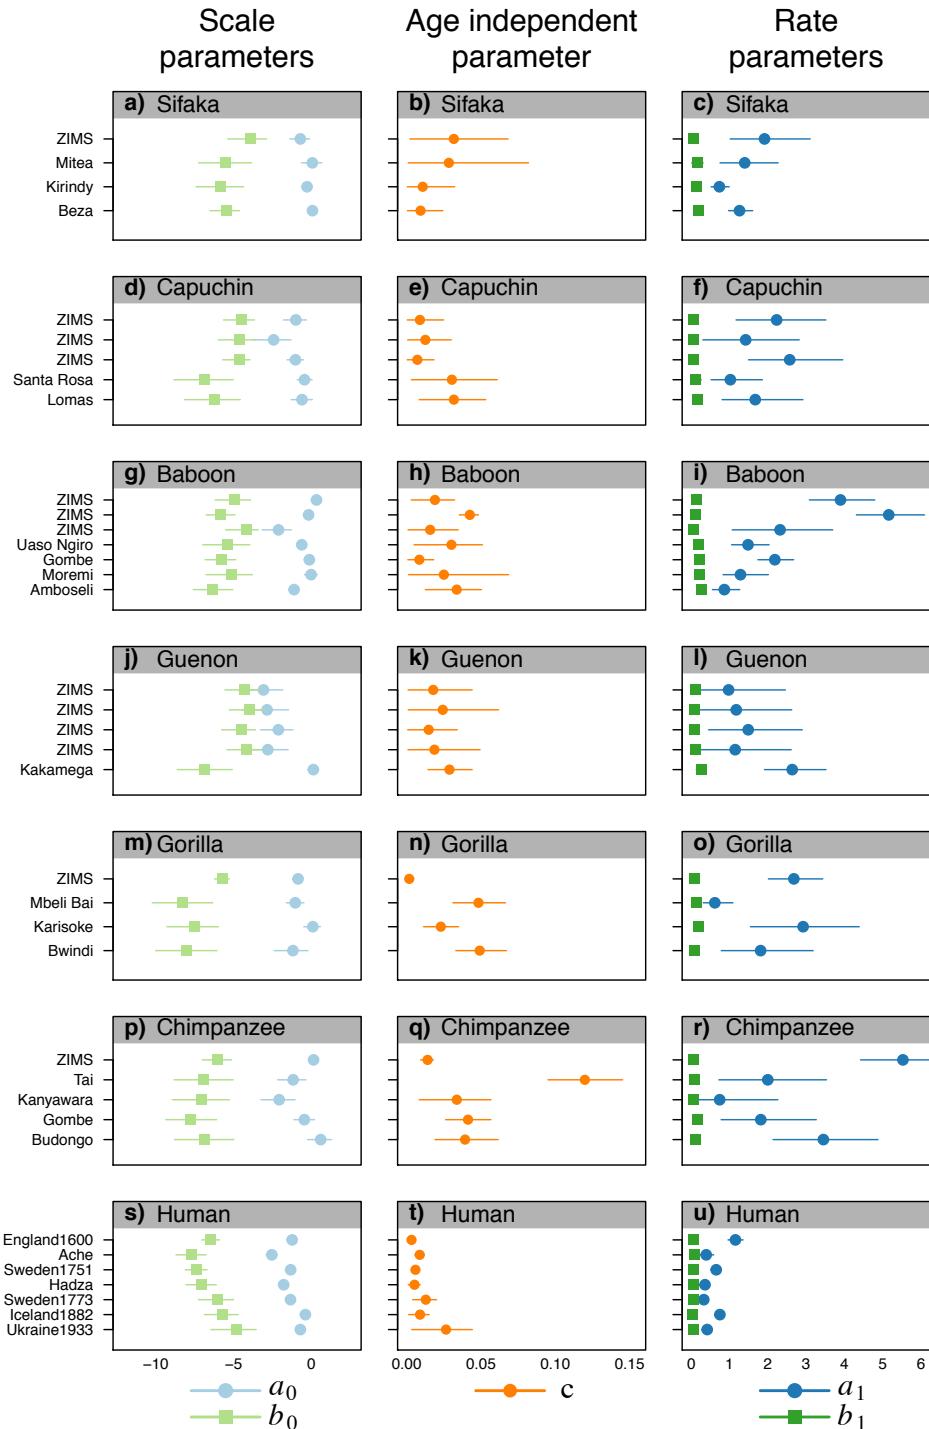

Supplementary Figures 1 to 6
Supplementary Tables 1 to 4

Supplementary Figure 1

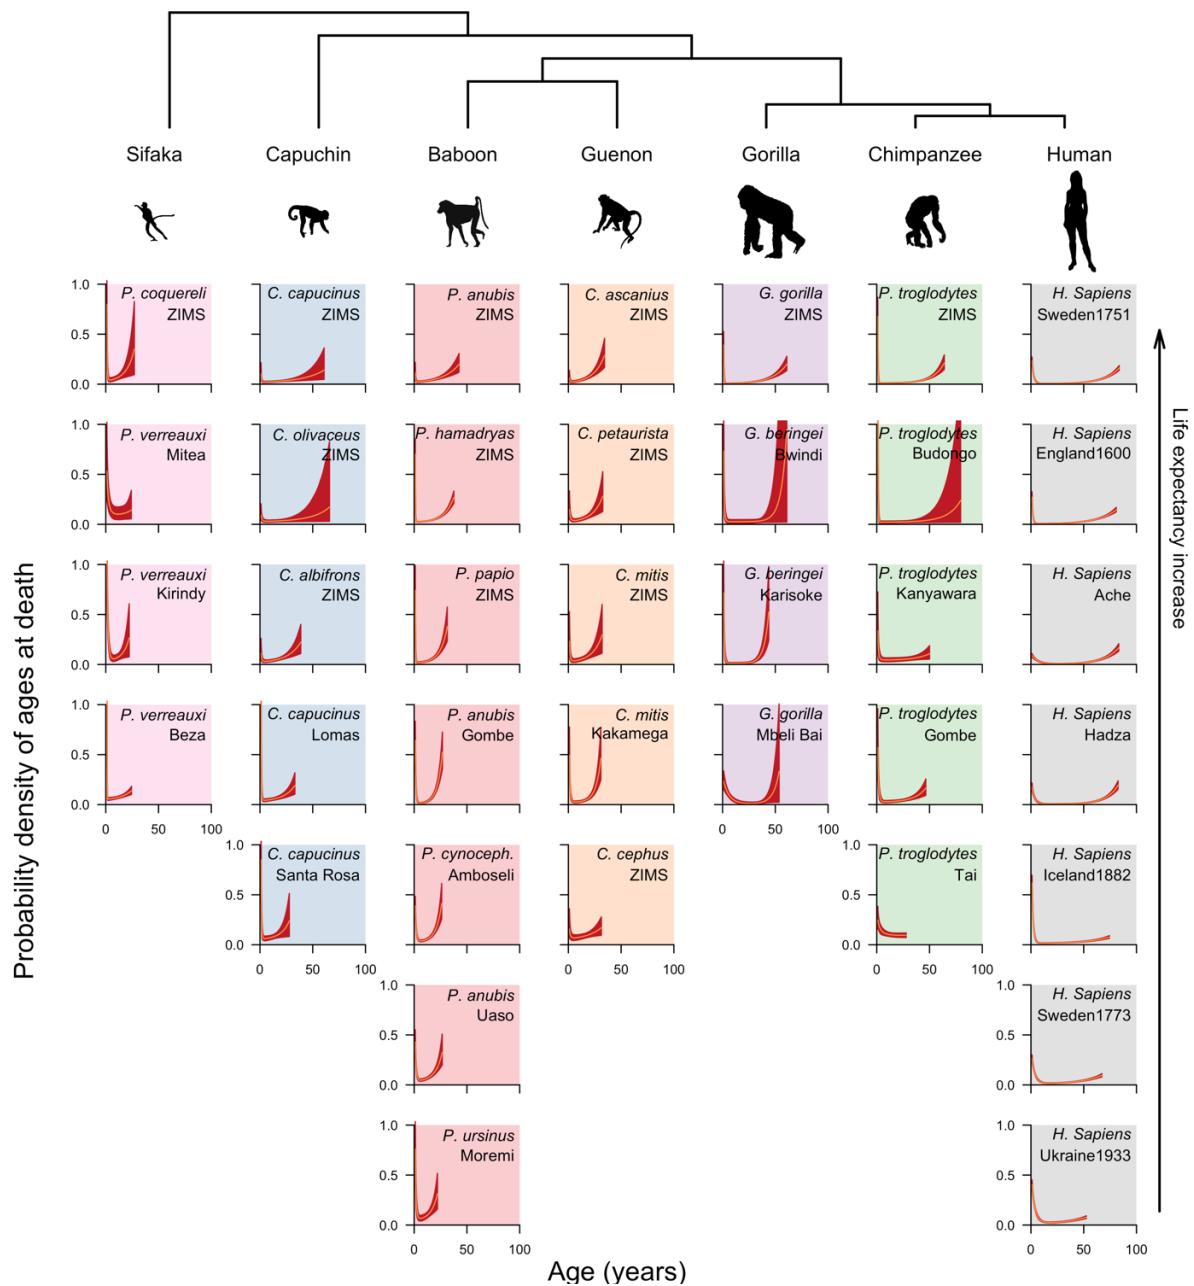

Supplementary Figure 1. Population-specific estimates of Siler mortality parameters (round or square points) and their 95% credible intervals for females. The parameters were organized in three categories (Columns of panels): 1) scale parameters (a_0, b_0); 2) age independent parameter (c); and 3) rate parameters (a_1, b_1). Each panel row corresponds to a genus: **a-c** Sifaka; **d-f** capuchin; **g-i** baboon; **j-l** guenon; **m-o** gorilla; **p-r** chimpanzee; **s-u** human.

Supplementary Figure 2

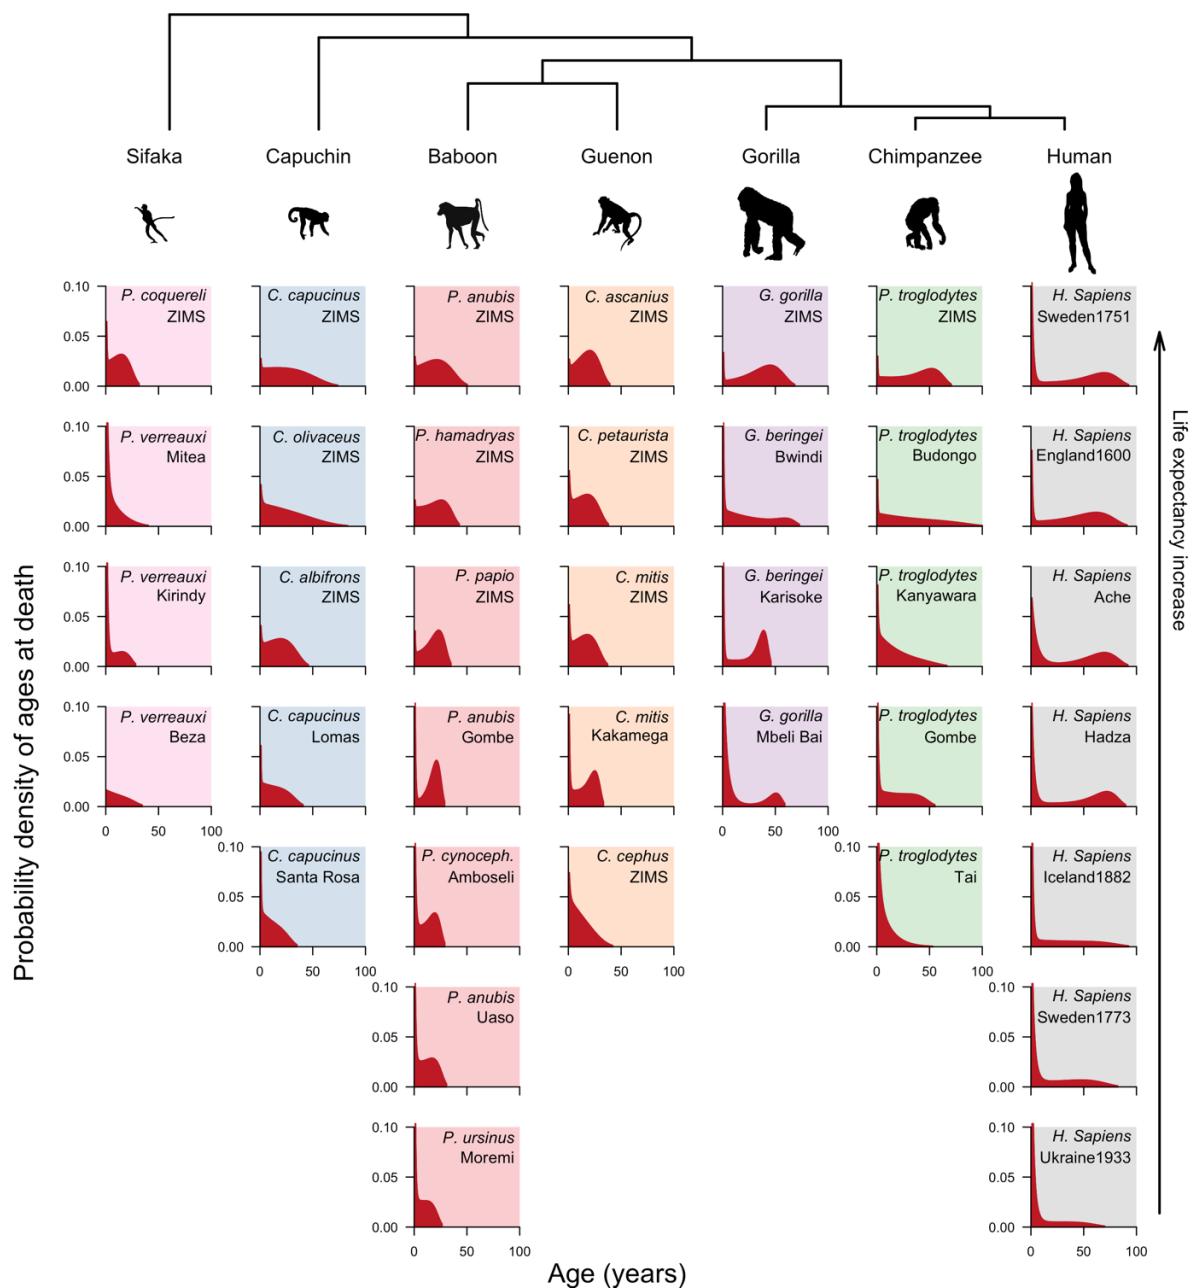

Supplementary Figure 2. Population-specific estimates of Siler mortality parameters (round or square points) and their 95% credible intervals for males. The parameters were organized in three categories (Columns of panels): 1) scale parameters (a_0 , b_0); 2) age independent parameter (c); and 3) rate parameters (a_1 , b_1). Each panel row corresponds to a genus: **a-c** Sifaka; **d-f** capuchin; **g-i** baboon; **j-l** guenon; **m-o** gorilla; **p-r** chimpanzee; **s-u** human.

Supplementary Figure 3.

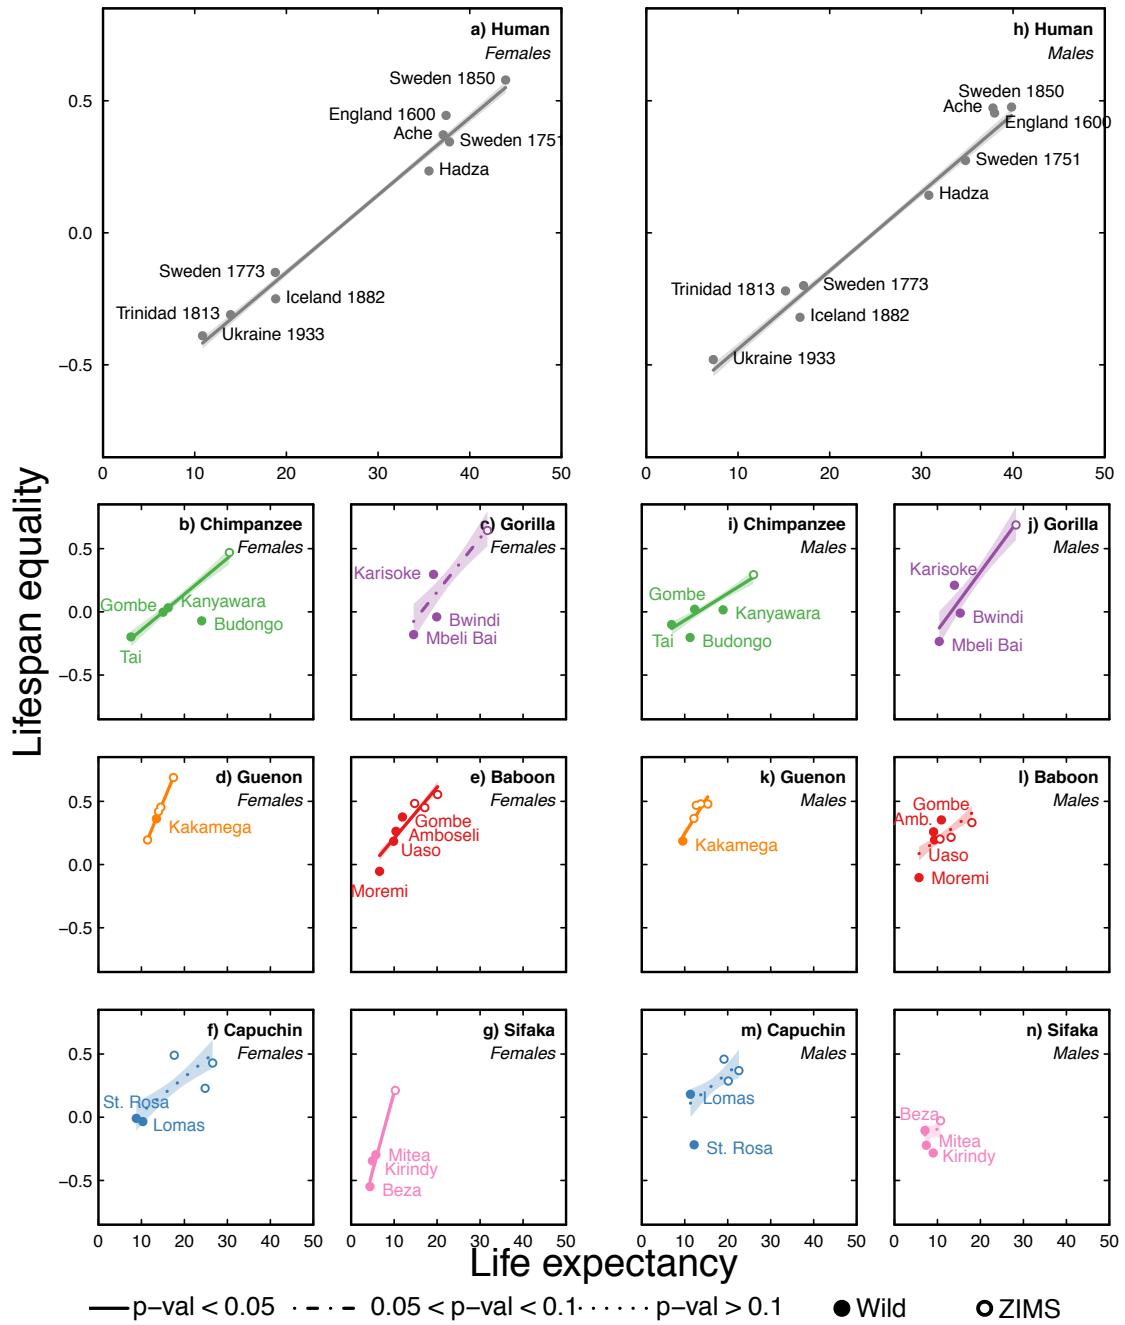

Supplementary Figure 3. Estimated age-specific mortality (i.e. hazard rates) for females in each population studied. For each genus, the direction of increase in life expectancy is from bottom to top, thus the population with lowest life expectancy appears at the bottom, while the one with highest life expectancy is at the top. The red polygons surrounding the orange average lines calculated from the posterior densities of the parameters denote the 95% credible intervals. All mortalities stop when the survival is $S(x) = 0.05$. For display purposes, we only included seven of the nine human populations. The primate silhouettes were obtained from <http://phylopic.org/>. Credits: sifaka by Terpsichores (Creative Commons Attribution-ShareAlike 3.0 Unported license), Capuchin by Sarah Werning (Creative Commons Attribution 3.0 Unported license), baboon by Owen Jones (Public Domain Dedication 1.0 license), guenon unknown author (Public Domain Mark 1.0 license), gorilla unknown author (Public Domain Mark 1.0 license), chimpanzee by T. Michael Keesey and Tony Hisgett (Creative Commons Attribution 3.0 Unported license), human by unknown author (Public Domain Mark 1.0 license)

Supplementary Figure 4.

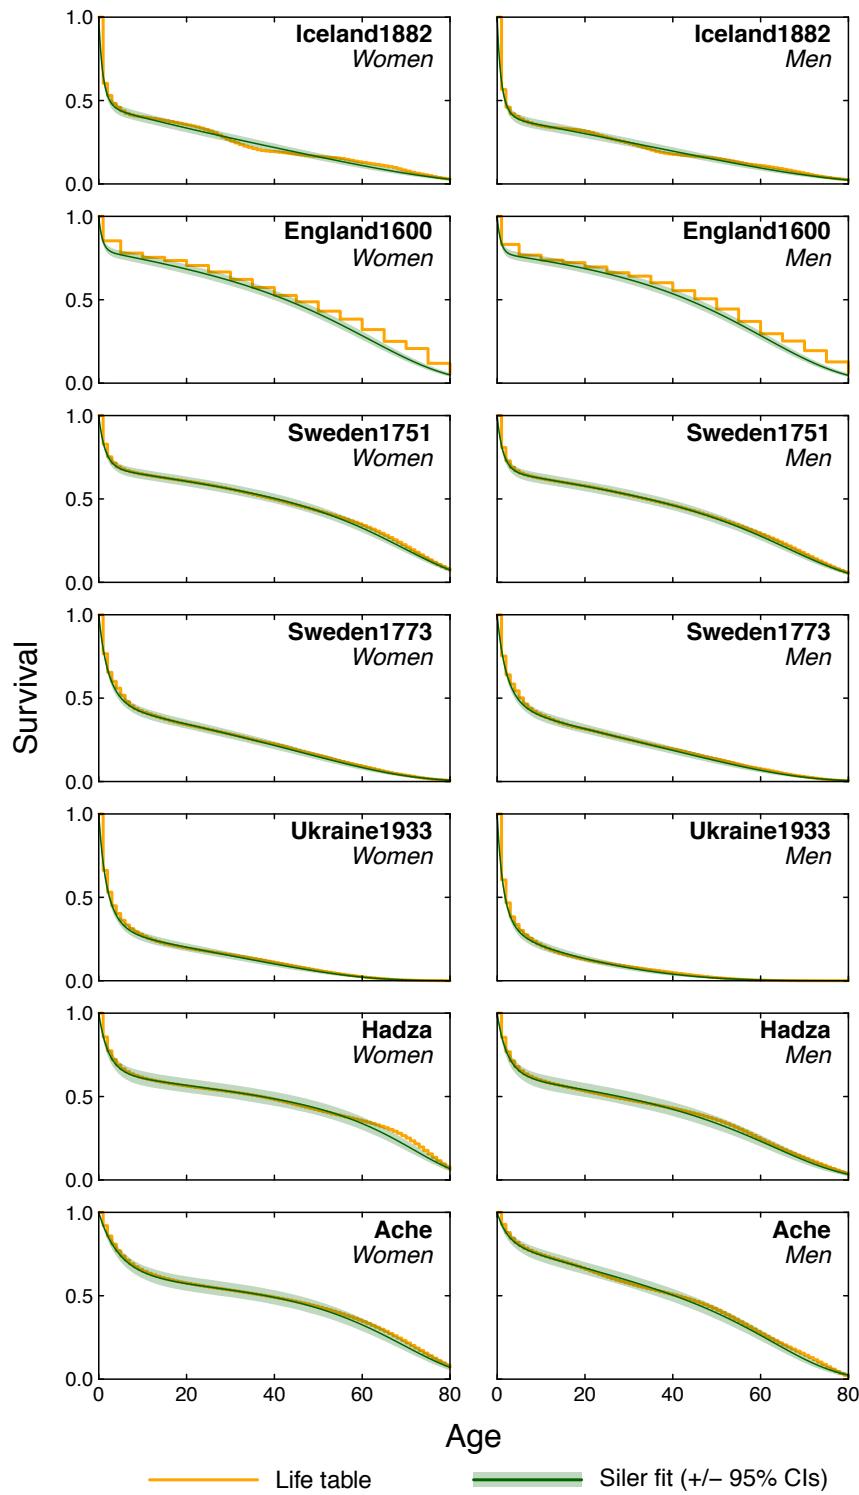

Supplementary Figure 4. Probability density of ages at death for females in the populations studied. For each genus, the direction of increase in life expectancy is from bottom to top, thus the population with lowest life expectancy appears at the bottom, while the one with highest life expectancy is at the top. For display purposes, we only included seven of the nine human populations. The primate silhouettes were obtained from <http://phylopic.org/>. Credits: sifaka by Terpsichores (Creative Commons Attribution-ShareAlike 3.0 Unported license), Capuchin by Sarah Werning (Creative Commons Attribution 3.0 Unported license), baboon by Owen Jones (Public Domain Dedication 1.0 license), guenon unknown author (Public Domain Mark 1.0 license), gorilla unknown author (Public Domain Mark 1.0 license), chimpanzee by T. Michael Keesey and Tony Hisgett (Creative Commons Attribution 3.0 Unported license), human by unknown author (Public Domain Mark 1.0 license).

Supplementary Figure 5.

Supplementary Figure 5. Scatterplots of life expectancy and lifespan equality for all genera studied. The lines show the weighted regression lines and the open circles show the populations from the ZIMS database. The central lines are the predicted fitted values of the regression and the type of line (e.g. continuous, dashed, or dotted) depicts three levels for the p -values of the slopes (how significantly different from 0 they are, two-sided t -test, $H_0: \beta_1 = 0$, Supplementary Table 4), while the shaded polygons show the 95% confidence intervals of the regressions. Panels a-g correspond to the female data, and panels h-n to the male data.

Supplementary Figure 6

Supplementary Figure 6. Fit of the Siler model to the human life table data. For display purposes we only show seven of the nine human populations.

Supplementary Table 1. Weighted least squares regression between life expectancy and lifespan equality for each genus and sex. The *p*-value corresponds to the slope coefficient by means of a two-sided *t*-test ($H_0: \beta_1 = 0$). Those in boldface correspond to significant slopes (i.e. *p*-value < 0.05).

Sex	Genera	Intercept	Slope	SE(slope)	<i>p</i> -value
Females	Human	-0.736	0.0293	0.0012	< 0.001

Chimpanzee		-0.570	0.387	-13.936	-0.087	25.009
Human		-0.498	0.340	-18.27	-0.057	85.455

Supplementary Table 3. Level of collinearity between the genus regression lines and the sensitivity vectors to each mortality parameter for the seven genera. Collinearities were calculated with respect to the sensitivities in Supplementary Table 1.

Common	a_0	a_1	c	b_0	b_1
Sifaka	0.6293	0.5950	0.1767	0.1863	0.9638
Capuchin	0.9615	0.9623	0.9894	0.9468	0.4112
Baboon	0.9980	0.9998	0.9893	0.8122	0.3901
Guenon	0.9769	0.9422	0.9490	0.5296	0.1708
Gorilla	0.9963	0.9999	0.9967	0.8693	0.1282
Chimpanzee	0.9510	0.9526	0.9879	0.9284	0.3251
Human	0.9696	0.9704	0.9677	0.8574	0.2446

Supplementary Table 4. Relative amount of change for each mortality parameter along the genus lines for both sexes. The relative amount of change was calculated by means of the path integral described in the methods and Supplementary Methods sections.

<i>Females</i>					
Common	<i>a</i> ₀	<i>a</i> ₁	<i>c</i>	<i>b</i> ₀	<i>b</i> ₁
Sifaka	1.098	1.953	0.774	0.312	0.136
