# Neocortical substrates of feelings evoked with music in the ACC, insula, and somatosensory cortex

Stefan Koelsch, Vincent K.M. Cheung, Sebastian Jentschke, John-Dylan Haynes

Supplementary Figure S3

Results of the temporally segmented decoding analysis, separately for all five time segments, showing clusters with voxels providing significant information about the difference between joy- and fear-music (after permutation-based t-tests and correction for multiple comparisons, all results were obtained without spatial smoothing). Note the increase in cluster size across segments in all clusters. For methods see main text.
