

Neocortical substrates of feelings evoked with music in the ACC, insula, and somatosensory cortex

Stefan Koelsch, Vincent K.M. Cheung, Sebastian Jentschke, John-Dylan Haynes

Supplementary Figure S4

Coronal slices from all 24 participants before normalization into MNI space. Regions in green indicate decoding accuracy of at least 70% in discriminating between joy and fear music stimuli. Note that these regions included the POP bilaterally in 20 participants, and the left POP in 4 participants.
