# Welcome to the International Space Station 2010 Calendar

As we enter into our tenth year of human presence on board the International Space Station (ISS), we celebrate the fact and acknowledge the success of the ISS as one of the greatest technological, political and engineering accomplishments in human history. As we near the completion of the ISS on-orbit assembly, along with the successful expansion of the nominal crew size from three to a history-making six people, we turn our focus to the multifaceted purpose of the ISS. The ISS is the first step in exploration, from research and discovery, to international cooperation, to technology development, to living and working permanently in low-Earth orbit. With the unique capabilities of the ISS, we as a species can unravel the mysteries of life to better understand our home planet and continue our innate mandate to explore the beyond.

This calendar is designed to show all facets of the ISS using displays of astounding imagery and providing significant historical events with the hope of inspiring the next generation. NASA is grateful for the hard work and commitment that America's teachers demonstrate each and every day as they educate and shape the young students who will be tomorrow's leaders and explorers. I hope you enjoy the calendar and are inspired to learn something new and exciting about NASA and the ISS throughout the year.

Regards,  
*Michael T. Suffredini*  
ISS Program Manager

With the beginning of a new year, construction of the International Space Station is nearing completion. As the largest and most complicated spacecraft ever built, this orbiting outpost can support a crew of six, operating 24 hours a day, seven days a week, 365 days a year. It is a shining example of international cooperation for the United States and its space exploration partners.

## A New Year of Exploration

# January 2010

The 2005 NASA Authorization Act designated the U.S. segment of the space station as a national laboratory, making it available for research by other federal entities and the private sector. The research conducted on this one-of-a-kind orbiting lab helps improve life on Earth and teaches us valuable lessons needed to tackle the challenges of long-duration space flight.

For nearly a decade, crew members on board the space station have taken thousands of photos of the Earth below. From fiery volcanoes spewing smoke and lava to icy lakes and glaciers in the coldest environments of our planet, crews have given humankind views of these natural phenomena from one of the most unusual perspectives available.

Abell S0740

Giant Nebula NGC 3603

On April 24, 1990, the Hubble Space Telescope was launched aboard Space Shuttle *Discovery* and placed on orbit approximately 347 miles (559 km) above the Earth. Five servicing missions have kept Hubble's vision crystal clear as it continues to capture thousands of stunning images of faraway galaxies, helping us uncover the mysteries of our universe.

Orbiting 240 statute miles (386.24 km) above the Earth at 17,500 mph (32,410 km/h) creates a challenge when it comes to making a trip to the grocery store. Crew members rely on an international collection of space “shopping carts” to make regular deliveries to the space station. Pictured is the United States’ space shuttle, a Russian Progress, the European Space Agency ATV and the Japanese Aerospace Exploration Agency HTV.

# Special Delivery

# May 2010

*For more information about the International Space Station please visit [www.nasa.gov](http://www.nasa.gov)*

Spacewalks, global photography, scientific research, robotics – it's just another day at the office for space station crew members. Add to that the maintenance of a spaceship the size of a football field and it's easy to see how busy life on orbit can be for the space station's international crew.

Sleeping, eating and exercising are just as critical in space as they are on Earth. On the space station, microgravity requires a unique approach to accomplishing all of these. Crews literally have to strap in to take a jog, enjoy a meal or get a good night's rest.

With the installation of its last solar arrays, the International Space Station is equal to the length of a football field, including both end zones. Once complete, it will weigh almost a million pounds (453,592 kg) and have living space nearly equal to the room inside one and a half Boeing 747 jetliners. Currently, the space station travels an equivalent distance to the moon and back in about a day.

Long-duration space flight requires the invention of new technologies that often have life-improving applications back on Earth. Enhanced surgical robotics, more accurate automobile safety testing, improved air purification and plant growth using less water and no pesticides are just a few of the technological spinoffs from the International Space Station that improve our daily lives.

## Improving Life on Earth

Since the arrival of the Expedition 1 crew on November 2, 2000, there has been a continuous human presence on the International Space Station. During that decade, the space station has been home for crew members and visitors from around the world. Represented here are flags of the international partners and crew patches for each expedition.

Ground support for the International Space Station involves more than 100,000 people in space agencies, at 500 contractor facilities and in 37 U.S. states. Crew trainers, food technicians and scuba divers are only a few examples of the diverse workforce necessary to keep the space station operational.
