# Reports from Africa on Flood.

## DROUGHT-STRICKEN COMMUNITIES HIT BY DESTRUCTIVE FLOODS IN THE HORN OF AFRICA

MAY 2018 | IVANA HAJZMANOVA

## DROUGHT-STRICKEN COMMUNITIES HIT BY DESTRUCTIVE FLOODS IN THE HORN OF AFRICA

After two years of severe drought and several poor rainy seasons, communities in Ethiopia, Somalia, and Kenya were struggling to keep their livestock alive and to earn a living. However, when the long-awaited rains arrived in April 2018, they brought not relief but more hardship in the form of historic floods, bringing already vulnerable communities almost to their knees.

## Floods kill 285 in Kenya, thousands displaced

Wet season, which normally lasts from March to May, has affected nearly million citizens

Andrew Wasike | 27.05.2020

EPA

The weather bureau has warned of further floods

Heavy rains have battered parts of South Africa, submerging whole neighbourhoods and flooding coal mines and power stations in a nation already hit by electricity blackouts.

At least 700 homes have been washed away near the capital, Pretoria, public broadcaster SABC reported.

# And it's going to get more complicated ...

# We can edit about cities...

## Benin City, Nigeria (10k pageviews)

### Environmental issues

#### Climate change

The city is already feeling the effects of climate change, with increases and temperature, humidity and precipitation trends between 1981 and the 2015.<sup>[37]</sup>

#### Flood management

Benin city experiences regular flooding.<sup>[38]</sup> Studies have consistently highlighted the problem since at least 1993.<sup>[39]</sup> Experts have recommended a number of ways to improve flood management, including better controls on land use, construction and development,<sup>[39]</sup> improved [Community-based programs](#) designed to improve city adaptation and disaster management,<sup>[38]</sup> and improvements in individual preparedness.<sup>[40]</sup>

In June 2020, a significant number of communities and individuals were left homeless because of city flooding.<sup>[41]</sup> At the time, residents and the city blamed poor [storm drains](#) and a failure to continue flood adaptation programs.<sup>[41]</sup>

#### Urban heating

The city, on average is .5 degrees Celsius warmer than the surrounding rural areas, and these temperature differences are greater during workweeks when human activity increases pollution in the urban area.<sup>[42]</sup>

#### Waste management

A 2021 study published in [Nature](#), highlighted that the city has not met the standards for [waste management](#) set by the [Edo State Waste Management Board](#). After surveying 2720 inhabitants of the city, the authors found that most people in the city didn't understand proper waste management practices.<sup>[43]</sup> Moreover, the study found that survey participants didn't understand how waste management was connected to other issues like greenhouse gas emissions.<sup>[43]</sup> An additional study, found that most residents didn't understand the health impacts of bad waste management.

# Or public goods and infrastructure

**Water in Africa** is an important issue encompassing the sources, distribution and economic uses of the **water resources** on the continent. Overall, Africa has about 9% of the world's **fresh water** resources and 16% of the **world's population**.<sup>[1][2]</sup> There are about 17 rivers in the African continent.<sup>[3][4]</sup> Among these rivers are the Congo, Nile, Zambezi, Niger and **Lake Victoria**, considered the world's second largest river.

Yet the continent is the second driest in the world, with millions of Africans still suffering from water shortages throughout the year.<sup>[5]</sup>

**Overall** These shortages are attributed to problems of uneven distribution, **Africa has about 9%** population boom and poor management of existing supplies. Sometimes there are smaller number of people residing where there is large amount of water. For example, 30 percent of the **world's fresh water resources** continent's water lies in the **Congo basin** inhabited by only 10 per cent of Africa's population.<sup>[3][5]</sup> There is **significant** Variations in the rainfall patterns observed in different places and **+6%** time. There is also high evaporation rates in some parts of the **world's population** region resulting in lower percentages of precipitation in such places.<sup>[1][2]</sup> However, there is very significant inter- and intra-annual variability of all **climate** and **water resources** characteristics, so while some regions have sufficient water,<sup>[2]</sup> **Sub-Saharan Africa** faces numerous water-related challenges that constrain **economic growth** and threaten the livelihoods of its people.<sup>[2]</sup> **African agriculture** is mostly based on **rain-fed farming**, and less than 10% of **cultivated** land in the continent is **irrigated**.<sup>[1][2]</sup> The impact of **climate change** and variability is thus very pronounced.<sup>[2]</sup> The main source of **electricity** is **hydropower**, which contributes significantly to the current installed capacity for energy.<sup>[2]</sup>

**Continuing** The **kainji dam** is a typical hydropower resource generating electricity for all the large cities in **Nigeria** as well as their neighbouring country, **Niger**.<sup>[6]</sup> Hence, the **Continuous** investment in the last decade, **which** has increased the amount of power generated.<sup>[2]</sup>

Solutions to the challenges of water for energy and food security are hindered by shortcomings in water infrastructure, development, and management capacity to meet the demands of a rapidly growing population.<sup>[2]</sup> This is compounded by the fact the Africa has the fastest urbanization rates in the world.<sup>[2][7]</sup> Water development and **management** are much more complex due to the multiplicity of trans-boundary water resources (**rivers, lakes** and **aquifers**).<sup>[2]</sup> Around 75% of sub-Saharan Africa falls within 53 international **river basin** catchments that traverse multiple borders.<sup>[1][2]</sup> This particular constraint can also be converted into an opportunity if the potential for trans-boundary cooperation is harnessed in the development of the area's water resources.<sup>[2]</sup> A multi-sectoral analysis of the **Zambezi River**, for example, shows that **riparian** cooperation could lead to a 23% increase in firm energy production without any additional investments.<sup>[1][2]</sup> A number of institutional and legal frameworks for transboundary cooperation exist, such as the Zambezi River Authority, the **Southern African Development Community (SADC)** Protocol, **Volta River Authority** and the **Nile Basin Commission**.<sup>[2]</sup> However, additional efforts are required to further develop political will, as well as the financial capacities and institutional frameworks needed for win-win multilateral cooperative actions and optimal solutions for all riparians.<sup>[2]</sup>

## Sources of water

### Ground water

Groundwater plays a key role in sustaining water supplies and livelihoods in sub-Saharan Africa especially due to its widespread availability, generally high

In many countries in Africa, jerry cans which are used to transport and store water are a good option for safe storage

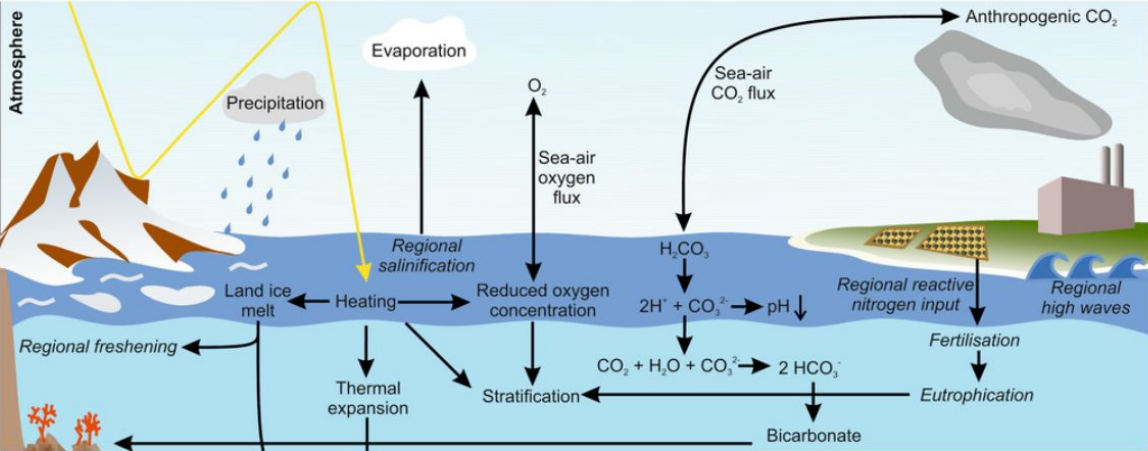

Congo Basin is the world's second largest river basin covering over 12% of the African continent

*It took too long to compute your changes, so the description below may not be optimal.*

The Bay is approximately 200 miles (320 km) long from its northern headwaters in the Susquehanna River to its outlet in the Atlantic Ocean. It is 2.8 miles (4.5 km) wide at its narrowest (between Kent County's Plum Point near Newtown in the east and the Harford County western shore near Romney Creek) and 30 miles (48 km) at its widest (just south of the mouth of the Potomac River which divides Maryland from Virginia). Total shoreline including tributaries is 11,684 miles (18,804 km), circumnavigating a surface area of 4,479 square miles (11,601 km<sup>2</sup>). Average depth is 21 feet (6.4 m), reaching a maximum of 174 feet (53 m).<sup>[3]</sup> The Bay is spanned twice, in Maryland by the Chesapeake Bay Bridge from Sandy Point (near Annapolis) to Kent Island and in Virginia by the Chesapeake Bay Bridge–Tunnel connecting Virginia Beach to Cape Charles.

Known for both its beauty and bounty, the Bay has become "emptier", with fewer crabs, oysters and watermen (fishermen) since the mid-20th century.<sup>[4]</sup> Nutrient pollution and urban runoff have been identified as major components of impaired water quality in the bay. The stressing ecosystems and compounding the the decline of shellfish populations has also been linked due to overharvesting overharvesting. Restoration efforts that began in the 1990s have continued into the 21st century and show potential for growth of the native oyster population.<sup>[5][6]</sup> The health of the Chesapeake Bay improved in 2015, marking three years of gains over a four year period, according to a 2016 report by the University of Maryland.<sup>[7]</sup> The bay is experiencing other environmental concerns, including climate change which is causing sea level rise which is eroding coastal areas and infrastructure and causing changing to the marine ecosystem.<sup>[8]</sup> These changes have already changed

# Or the industries and businesses at the root of the problem...

**Petroleum** ([pronounced](#) [pe'trouliem/](#)), also called **crude oil** or just **oil**, is a [naturally occurring](#), yellowish-black [liquid](#) found in [geological formations](#) beneath the Earth's surface. It is commonly refined into various types of [fuels](#). Components of petroleum are separated using a technique called [fractional distillation](#), i.e. separation of a liquid mixture into fractions differing in boiling point by means of distillation, typically using a [fractionating column](#). It consists of naturally occurring [hydrocarbons](#) of various molecular weights and may contain [miscellaneous organic compounds](#).<sup>[1]</sup> The name *petroleum* covers both naturally occurring unprocessed crude oil and petroleum products that are made up of refined crude oil. A [fossil fuel](#), petroleum is formed when large quantities of dead organisms, mostly [zooplankton](#) and [algae](#), are buried underneath [sedimentary rock](#) and subjected to both intense heat and pressure.

It consists of naturally occurring [hydrocarbons](#) of various molecular weights and may contain [miscellaneous organic compounds](#).<sup>[1]</sup> The name *petroleum* covers both naturally occurring unprocessed crude oil and [petroleum products](#) that are made up of refined crude oil. A [fossil fuel](#), petroleum is formed when large quantities of dead organisms, mostly [zooplankton](#) and [algae](#), are buried underneath [sedimentary rock](#) and subjected to both intense heat and pressure.

Petroleum has mostly been recovered by [oil drilling](#) (natural petroleum springs are rare). Drilling is carried out after studies of structural geology (at the reservoir scale), sedimentary basin analysis, and reservoir characterisation (mainly in terms of the [porosity](#) and [permeability](#) of geologic reservoir structures) have been completed.<sup>[2][3]</sup> It is refined and separated, most easily by [distillation](#), into numerous consumer products, from [gasoline](#) (petrol), [diesel](#) and [kerosene](#) to [asphalt](#) and chemical [reagents](#) (ethylene, propylene, butene,<sup>[4]</sup> [acrylic acid](#),<sup>[5][6][7]</sup> [para-xylene](#)<sup>[8]</sup>) used to make [plastics](#), [pesticides](#) and [pharmaceuticals](#).<sup>[9]</sup> Petroleum is used in manufacturing a wide variety of materials,<sup>[10]</sup> and it is estimated that the world consumes about 100 million [barrels](#) each day.

Petroleum has mostly been recovered by [oil drilling](#) (natural petroleum springs are rare). Drilling is carried out after studies of structural geology (at the reservoir scale), sedimentary basin analysis, and reservoir characterisation (mainly in terms of the [porosity](#) and [permeability](#) of geologic reservoir structures).<sup>[2][3]</sup> Recent improvements to technologies have also led to exploitation of other unconventional reserves such as [oil sands](#) and [oil shale](#). Once extracted, oil is refined and separated, most easily by [distillation](#), into numerous products for direct use or use in manufacturing, such as [gasoline](#) (petrol), [diesel](#) and [kerosene](#) to [asphalt](#) and chemical [reagents](#) (ethylene, propylene, butene,<sup>[4]</sup> [acrylic acid](#),<sup>[5][6][7]</sup> [para-xylene](#)<sup>[8]</sup>) used to make [plastics](#), [pesticides](#) and [pharmaceuticals](#).<sup>[9]</sup> Petroleum is used in manufacturing a wide variety of materials,<sup>[10]</sup> and it is estimated that the world consumes about 100 million [barrels](#) each day. Petroleum production can be extremely profitable and has been important for economic development in the 20th century, with some countries, so called "oil states", gaining significant economic and international power because of their control of oil production.

Petroleum exploitation has significant negative environmental and social consequences. Most significantly, the petroleum industry is one of the [major contributors to climate change](#), and parts of the [petroleum industry actively suppressed science and policy](#) to prevent the [climate crisis](#). Other [negative environmental effects](#) include the environmental impacts of exploration and exploitation of petroleum reserves, such as [oil spills](#), and air and water pollution at the sites of utilization. All of these environmental impacts have direct health consequences for humans. Socially, oil has also been a source of conflict leading to both [state-led wars](#) and can fuel other conflicts (for example, [oil revenue funded the Islamic State of Iraq and the Levant](#)). Production of petroleum is expected to reach [peak oil](#) before 2040 as global economies reduce dependencies on petroleum as part of [climate change mitigation](#) and a transition towards [renewable energy](#) and electrification.<sup>[11]</sup> This is expected to have significant economic impacts that stakeholders argue need to be anticipated in a [just transition](#) and addressing the [stranded assets](#) of the petroleum industry.
