
Switches: One or more of the *date-and-time-formatting-switch*, *general-formatting-switch*, or *date-and-time-formatting-switch*es, depending on the type of *field-argument*.

[*Example*: When the current month is January and the following field is updated:

```
Last month was QUOTE IF DATE \@ "M" = 1 "12" "= DATE \@ "M" - 1"/1/2000 \@
"MMMM".
```

the result is:

```
Last month was December.
```

end example]

2.16.5.57 RD

Syntax:

RD *field-argument* [*switch*]

Description: *field-argument* identifies a file to include when creating a table of contents, a table of authorities, or an index using a TOC (§2.16.5.75), TOA (§2.16.5.74), or INDEX field (§2.16.5.35). RD fields that reference a series of files must be in the same order as the files in the final document. If the location includes a long file name containing spaces, field-argument shall contain delimiting quotes. A single backslash in the file path shall be preceded directly by a backslash.

For a complex field implementation in XML the optional field-value storage is not needed.

Field Value: None.

Switches: One of the following *field-specific-switch*es:

\p	Indicates that the path is relative to the current document.

[*Example*: The following fields inserted into one document create a table of contents that includes entries from the three referenced documents:

```
{ TOC }
{ RD C:\\Manual\\Chapters\\Chapter1.doc }
{ RD C:\\Manual\\Chapters\\Chapter2.doc }
{ RD C:\\Manual\\Chapters\\Chapter3.doc }
```

end example]

2.16.5.58 REF

Syntax:

[REF] *field-argument* [*switches*]

Description: Inserts the text or graphics represented by the bookmark specified by *text* in *field-argument*. The bookmark shall be defined in the current document. Provided the bookmark name is not exactly the same as a field name, the REF prefix can be omitted. If the text marked by the bookmark contains a paragraph mark, the text preceding the REF field assumes the formatting of the paragraph in the bookmark.

Field Value: The specified text or graphics.

Switches: One of the following *general-formatting-switch*es: * Caps, * FirstCap, * Lower, or * Upper, and zero or one of the following *field-specific-switch*es.

\d *field-argument*	*text* in this switch's *field-argument* specifies the character sequence that is used to separate sequence numbers and page numbers.
\f	Increments footnote, endnote, and annotation numbers that are marked by the bookmark, and inserts the corresponding footnote,

	endnote, and comment text.
\h	Creates a hyperlink to the bookmarked paragraph.
\n	For a referenced paragraph, causes the field result to have the entire paragraph number without trailing periods. No information about prior levels is displayed unless it is included as part of the current level.
\p	Causes the field result to contain the position relative to the source bookmark using the word "above" or "below." If the REF field appears in the document before the bookmark, it evaluates to "below". If the REF field appears after the bookmark, it evaluates to "above". If the REF field appears within the bookmark, an error is returned. This switch can also be used in conjunction with the \n, \r, and \w switches, in which case, "above" or "below" is appended to the end of the field result.
\r	Inserts the entire paragraph number of the bookmarked paragraph in relative context—or relative to its position in the numbering scheme —without trailing periods.
\t	Causes the REF field to suppress non-delimiter or non-numerical text when used in conjunction with the \n, \r, or \w switch.
\w	Inserts the paragraph number of the bookmarked paragraph in full context from anywhere in the document.

[*Example*: The following field

```
REF _Ref116788778 \r \h
```

makes a hyperlink reference. This kind of field is commonly used, to indicate forward references within a document. *end example*]

2.16.5.59 REVNUM

Syntax:

REVNUM

Description: Retrieves the document's revision number (which indicates the number of times the document has been saved), as recorded in the Revision element of the Core File Properties part.

Field Value: The document's revision number.

Switches: None.

[*Example*: Consider the case in which the Revision element is as follows:

```
<Revision>11</Revision>
```

and the following field is updated:

```
REVNUM
```

The result is:

```
11
```

end example]

2.16.5.60 SAVEDATE

Syntax:

SAVEDATE [*switches*]

Description: Retrieves the date and time on which the document was last saved, as recorded in the DateModified element of the Core File Properties part. By default, the Gregorian calendar is used and the *date-and-time-formatting-switch* used is implementation-defined. For a document that has never been saved, the date and time corresponds to `0000-00-00T00:00:00` local time and each text component is XXX.

Field Value: The date and time on which the document was last saved.

Switches: Zero or one *date-and-time-formatting-switch* and zero or one of the following *field-specific-switch*es.

\h	Use the Hijri/Lunar calendar.
\s	Use the Saka Era calendar.

[*Example*: Consider the case in which the DateModified element is as follows:

```
<DateModified>2006-01-06T20:15:00Z</DateModified>
```

and the following fields are updated in a US-English context that is UTC -5:

```
SAVEDATE
SAVEDATE \@ "dddd, MMMM dd, yyyy  HH:mm:ss"
```

the results are:

```
1/6/2006 3:15:00 PM
Friday, January 06, 2006 15:15:00
```

For a document that has never been saved, the result is:

```
0/0/0000 0:00:00 AM
XXX, XXX 00, 0000  00:00:00
```

end example]

2.16.5.61 SECTION

Syntax:

SECTION [*switches*]

Description: Retrieves the number of the current section.

Field Value: The number of the current section.

Switches: Zero or more *general-formatting-switch*es.

[*Example*: When the current section number is 19 and the following fields are updated:

```
SECTION
SECTION \* ArabicDash
SECTION \* ALPHABETIC
SECTION \* roman
```

the results are:

```
19
- 19 -
S
xix
```

end example]

2.16.5.62 SECTIONPAGES

Syntax:

SECTIONPAGES [*switches*]

Description: Retrieves the number of the current page within the current section.

Field Value: The number of the current page within the current section.

Switches: Zero or more *general-formatting-switch*es.

[*Example*: When the current page number within the current section is 19 and the following fields are updated:

```
SECTIONPAGES
SECTIONPAGES \* ArabicDash
SECTIONPAGES \* ALPHABETIC
SECTIONPAGES \* roman
```

the results are:

```
19
- 19 -
S
xix
```

end example]

2.16.5.63 SEQ

Syntax:

SEQ *identifier* [*field-argument*] [*switches*]

Description: Sequentially numbers chapters, tables, figures, and other user-defined lists of items in a document. If an item and its SEQ field are added, deleted, or moved, updating the remaining SEQ fields in the document reflects the new sequence. A SEQ field in a header, footer, annotation, or footnote shall NOT affect the sequence numbering that results from SEQ fields in the document text.

[*Note*: The LISTNUM field also produces automatic numbering and may be a better alternative when creating a complex numbered list. *end note*]

identifier is the name assigned to the series of items that are to be numbered. [*Example*: *identifier* might be Equation, Figure, Table, or Thing, as the user deems appropriate for a caption. *end example*] *identifier* shall start with a Latin letter and shall consist of no more than 40 Latin letters, Arabic digits, and underscores. (See the TOC field (§2.16.5.75) switches \c and \s for uses of *identifier*.)

text in *field-argument* specifies a bookmark name that refers to an item elsewhere in the document rather than in the current location.

Field Value: The next number in the sequence.

Switches: Zero or one of the *numeric-formatting-switch*es, or zero or more of the following *field-specific-switch*es. If no *numeric-formatting-switch* is present, * Arabic is used.

\c	Repeats the closest preceding sequence number. [*Note*: This is useful for inserting chapter numbers in headers or footers. *end note*]
\h	Hides the field result unless a *general-formatting-switch* is also present.[*Note*: This switch can be used to refer to a SEQ field in a cross-reference without printing the number. *end note*]
\n	Inserts the next sequence number for the specified item. This is the default.
\r *field-argument*	Resets the sequence number to the integer number specified by *text* in this switch's *field-argument*.
\s *field-argument*	Resets the sequence number to the built-in (integer) heading level specified by *text* in this switch's *field-argument*.

[*Example*: When the following fields are updated:

```
SEQ Figure
SEQ Figure \* roman
SEQ Figure \n
SEQ Figure \c : …
SEQ Figure \h : …
SEQ Figure
SEQ Figure \r 1
SEQ Figure
```

the results are:

```
Figure 1
Figure ii
Figure 3
Figure 3: …
Figure : …
Figure 5
Figure 10
Figure 11
```

end example]

2.16.5.64 SET

Syntax:

SET *field-argument-1 field-argument-2*

field-argument-1:
field-argument

field-argument-2:
field-argument

Description: Defines the bookmark name specified by *field-argument-1* to represent the information specified by *field-argument-2*.

Field Value: None.

Switches: None.

[*Example*: Consider the following:

```
SET EnteredBy "Paul Smith"
SET UnitCost 25.00
SET Quantity FILLIN "Enter number of items ordered:"
SET SalesTax 10%
```

```
SET TotalCost = (UnitCost * Quantity) + ((UnitCost * Quantity) * SalesTax)
Total cost: TotalCost \# "$#0.00"
Thank you for your order,
EnteredBy
```

end example]

2.16.5.65 SKIPIF

Syntax:

SKIP *Expression-1 Operator Expression-2*

Expression-1:
expression

Expression-2:
expression

Description: Compares the values designated by *Expression-1* and *Expression-2* using the operator designated by *Operator*. If the comparison is true, SKIPIF cancels the current merge document, moves to the next in the data source, and starts a new merge document. If the comparison is false, the current merge document is continued.

Operator can be any one of the six relational and equality operators specified for *operator* (§2.16.3.3).

Field Value: None.

Switches: None.

[*Example*: Inserted into a mail merge main document, the following field examines the contents of the Order field for the current data record. If the field contains a number less than 100, no merged document is produced for that data record.

```
SKIPIF MERGEFIELD Order < 100
```

end example]

2.16.5.66 STYLEREF

Syntax:

STYLEREF *field-argument* [*switches*]

Description: Inserts the nearest piece of text prior to this field that is formatted by the style whose name is specified by *text* in *field-argument*. The style can be a paragraph style or a character style.

When this field is used in a header or footer, it results in the first or the last text formatted with the specified style on the current page, allowing for dictionary-style headers or footers.

The location at which a STYLEREF field is inserted determines the direction searched for the style, as follows:

- In document text, by default, the search goes backward from the STYLEREF field. If the style isn't found, the search goes forward from the STYLEREF field.
- In footnotes, annotations, and endnotes, the search goes backward from the footnote, annotation, or endnote reference mark. If the style isn't found, the search goes forward from the reference mark.
- In headers and footers in a printed document, the search is applied to the current page, by default, from top to bottom, for the specified style. If the style isn't found, the search goes from the top of the page to the beginning of the document, and then from the bottom of the page to the end of the document. If the \l switch is used, the search goes from the bottom of the page to the beginning and then to the end of the document.
- In headers and footers in an electronic document, the search goes on in the section that contains the STYLEREF field, from the beginning, for the specified style. If the style isn't found, the search goes from the end of the section to the end of the document.

Field Value: The nearest piece of text prior to this field that is formatted by the style whose name is specified by *text* in *field-argument*.

Switches: Zero or more of the following *field-specific-switch*es.

\l	Inserts the nearest text following the field.
\n	Inserts the paragraph number of the referenced paragraph exactly as it appears in the document.
\p	Inserts the relative position of the referenced paragraph as being "above" or "below".
\r	Inserts the paragraph number of the referenced paragraph exactly in relative context.
\t	When used with the \n, \r, or \w switch, causes non-delimiter and non-numerical text to be suppressed.
\w	Inserts the paragraph number of the referenced paragraph in full context, from anywhere in the document.

[*Example*: When the following field is inserted in a header, it displays the contents of the first paragraph formatted with the style "Heading 3" on the current page:

On this page: { STYLEREF "Heading 3" }

To print the first and last names that appear on each page in a membership directory, for example, apply a character style called Last Name to each member's last name. Then insert the following fields in the header:

{ STYLEREF "Last Name" } — { STYLEREF "Last Name" \l }

end example]

2.16.5.67 SUBJECT

Syntax:

SUBJECT [*field-argument*] [*switch*]

Description: Retrieves, and optionally sets, the document's subject, as recorded in the Subject element of the Core File Properties part or, if *field-argument* is present, the subject specified by *text* in *field-argument*. Specifying a *field-argument* shall change Subject to *text*.

Field Value: The document's subject.

Switches: One of the following *general-formatting-switch*es: `\* Caps`, `\* FirstCap`, `\* Lower`, or `\* Upper`.

[*Example*: Consider the case in which the Title element is as follows:

```
<Subject>A specification for fields</Subject>
```

and the following field is updated:

SUBJECT

The result is:

```
A specification for fields
```

Updating the following field:

```
SUBJECT "A specification for WordprocessingML Fields"
```

causes the Subject element to take on the given value. *end example*]

2.16.5.68 SYMBOL

Syntax:

SYMBOL *field-argument* [*switches*]

Description: Retrieves the character whose code point value is specified in decimal or hexadecimal (by using a leading 0x or 0X) by *text* in *field-argument*. The formatting switches over ride any formatting applied directly to the result.

The XML generated for a complex field implementation shall not have the optional field value stored.

Field Value: The specified character.

Switches: Zero or more of the following *field-specific-switch*es.

`\a`	Interprets *text* in *field-argument* as the value of an ANSI character.
`\f` *field-argument*	Interprets *text* in the switch's *field-argument* as the name of the font from

	which the character whose value is specified by *text* in the field's *field-argument*. By default, the font used is that for the current text run.
\h	Inserts the symbol without affecting the line spacing of the paragraph. If large symbols are inserted with this switch, text above the symbol may be overwritten.
\j	Interprets *text* in *field-argument* as the value of a SHIFT-JIS character.
\s *field-argument*	Interprets *text* in the switch's *field-argument* as the integral font size in points.
\u	Interprets *text* in *field-argument* as the value of a Unicode character.

[*Example*: Consider the case in which the following fields are updated:

```
SYMBOL 65
SYMBOL 66 \a
SYMBOL 67 \u
SYMBOL 0x20ac \u
SYMBOL 68
SYMBOL 68 \f Symbol
SYMBOL 40 \f Wingdings \s 24
```

the results are:

A
B
C
€
D
Δ
☎

end example]

2.16.5.69 TA

Syntax:

TA [*switches*]

Description: Defines the text and page number for a table of authorities entry, which is used by a TOA field (§2.16.5.74).

Field Value: None.

Switches: Zero or one of the following *field-specific-switch*es.

\b	Applies bold formatting to the page number for the entry. If the table of authorities style for the entry already has bold formatting, \b removes it.
\c *field-argument*	*text* in this switch's *field-argument* specifies the integral entry category, which is a number that corresponds to the order of categories. The number determines how citations are grouped in tables of authorities. If \c is omitted, category 1 is the default.
\i	Applies italic formatting to the page number for the entry. If the table of authorities' style for the entry already has italic formatting, \i removes it.
\l *field-argument*	*text* in this switch's *field-argument* defines the long citation for the entry.
\r *field-argument*	Inserts as the entry's page number the range of pages marked by the bookmark specified by *text* in this switch's *field-argument*.
\s *field-argument*	*text* in this switch's *field-argument* defines the short citation for the entry.

[*Example*: Given the following fields occurring on page 2:

```
TA \l "Hotels v. Leisure Time" \c 2
TA \l "Baldwin v. Alberti, 58 Wn. 2d 243 (1961)"
   \s "Baldwin v. Alberti" \c 1 \b
```

the table of authorities produced by `INDEX \e "tab" \c "1" \z "1033"` is:

Cases

Baldwin v. Alberti, 58 Wn. 2d 243 (1961)…….. 2

Statutes

Hotels v. Leisure Time…… 2

end example]

2.16.5.70 TC

Syntax:

TC *field-argument* [*switches*]

Description: Defines the text and page number for a table of contents (including a table of figures) entry, which is used by a TOC field (§2.16.5.75). The text of the entry is *text* in *field-argument*.

Field Value: None.

Switches: Zero or one of the following *field-specific-switch*es.

`\f` *field-argument*	The type of items collected in a particular contents list. Use a unique Type identifier (typically a letter from A-Z) for each type of list. For example, to build a list of illustrations, mark each illustration with a field such as `TC "Illustration 1" \f i`, where `i` indicates only illustration entries. If no type is specified, the entry is listed in a table of contents.
`\l` *field-argument*	The level of the TC entry. [*Example*: The field `TC "Entering Data" \l 4` marks a level-4 entry, and applies the built-in style TOC 4 to that entry in the table of contents. *end example*] If no level is specified, level 1 is assumed.
`\n`	Omits the page number for the entry.

2.16.5.71 TEMPLATE

Syntax:

TEMPLATE [*switch*]

Description: Retrieves the disk file name of the template used by the current document.

Field Value: The disk file name of the template used by the current document.

Switches: One of the following *general-formatting-switch*es: `\* Caps`, `\* FirstCap`, `\* Lower`, or `\* Upper`, and zero or one of the following *field-specific-switch*es.

`\p`	Include the full file path name.

[*Example*: Consider the case in which the following fields are updated:

```
TEMPLATE \* Upper
TEMPLATE \p
```

the results might be:

```
NORMAL.DOTM
C:\Templates\Normal.dotm
```

end example]

2.16.5.72 TIME

Syntax:

TIME [*switch*]

Description: Retrieves the current date and time. The Gregorian calendar is always used. By default, the *date-and-time-formatting-switch* used is implementation-defined.

Field Value: The current date and time.

Switches: Zero or one *date-and-time-formatting-switch*.

[*Example*: Consider the case in which the following fields are updated on the given date and time:

```
TIME
TIME \@ "dddd, MMMM dd, yyyy  HH:mm:ss"
```

the results are:

```
1:59 PM
Friday, January 06, 2006  13:59:421/5/2006
```

end example]

[*Note*: For some *date-and-time-formatting-switch*es, the DATE (§2.16.5.18) and TIME fields can produce the same result. *end note*]

2.16.5.73 TITLE

Syntax:

TITLE [*field-argument*] [*switch*]

Description: Retrieves, and optionally sets, the document's title, as recorded in the Title element of the Core File Properties part or, if *field-argument* is present, the name specified by *text* in *field-argument*. Specifying a *field-argument* shall change Title to *text*.

Field Value: The document's title.

Switches: One of the following *general-formatting-switch*es: * Caps, * FirstCap, * Lower, or * Upper.

[*Example*: Consider the case in which the Title element is as follows:

```
<Title>My Life's Story</Title>
```

and the following field is updated:

TITLE

The result is:

```
My Life's Story
```

Updating the following field:

```
TITLE "My Life, the Fantasy" \* Upper
```

causes the Title element to take on the value My Life, the Fantasy while the result is:

MY LIFE THE FANTASY

end example]

2.16.5.74 TOA

Syntax:

TOA [*switches*]

Description: Builds a table of authorities (that is, a list of the references in a legal document, such as references to cases, statutes, and rules, along with the numbers of the pages on which the references appear) using the entries specified by TA fields (§2.16.5.69).

Field Value: The table of authorities.

Switches: Zero or more of the following *field-specific-switch*es.

\b *field-argument*	Includes entries only from the portion of the document marked by the bookmark specified by *text* in this switch's *field-argument*.
\c *field-argument*	*Includes the entries whose integral category is that specified by text* in this switch's *field-argument*.
\d *field-argument*	Used in conjunction with \s to specify the character sequence that separates the sequence numbers and page numbers. If \d is omitted, a hyphen (-) is used.
\e *field-argument*	*text* in this switch's *field-argument* specifies the character sequence that separates a table of authorities entry and its page number. If \e is not specified, a tab stop with leader dots is used.
\f	Removes the formatting of the entry text in the document from the entry in the table of authorities.
\g *field-argument*	*text* in this switch's *field-argument* specifies the character sequence that separates the pages in a page range. If \g is omitted, an en dash (–) is used.
\h	Includes the category heading for the entries in a table of authorities.
\l *field-argument*	*text* in this switch's *field-argument* specifies the character sequence that separates multiple page references. If \l is omitted, a comma (,) and space are used.
\p	Replaces five or more different page references to the same authority with "passim", which is used to indicate that a word or passage occurs frequently in the work cited.
\s *field-argument*	Includes a case or section number before the page number. The entry shall be numbered with a SEQ field (§2.16.5.63), and *text* in this switch's *field-argument* shall match the identifier in the SEQ field.

[*Example*: See TA (§2.16.5.69). *end example*]

2.16.5.75 TOC

Syntax:

TOC [*switches*]

Description: Builds a table of contents (which can also be a table of figures) using the entries specified by TC fields (§2.16.5.70), their heading levels, and specified styles, and inserts that table at this place in the document. Each table entry is a separate paragraph.

Field Value: The table of contents.

Switches: Zero or more of the following *field-specific-switch*es.

\a *field-argument*	Includes captioned items, but omits caption labels and numbers. The identifier designated by *text* in this switch's *field-argument* corresponds to the caption label. Use \c to build a table of captions with labels and numbers.
\b *field-argument*	Includes entries only from the portion of the document marked by the bookmark named by *text* in this switch's *field-argument*.
\c *field-argument*	Includes figures, tables, charts, and other items that are numbered by a SEQ field (§2.16.5.63). The sequence identifier designated by *text* in this switch's *field-argument*, which corresponds to the caption label, shall match the identifier in the corresponding SEQ field.
\d *field-argument*	When used with \s, the *text* in this switch's *field-argument* defines the separator between sequence and page numbers. The default separator is a hyphen (-).
\f *field-argument*	Includes only those TC fields whose identifier exactly matches the *text* in this switch's *field-argument* (which is typically a letter).
\h	Makes the table of contents entries hyperlinks.
\l *field-argument*	Includes TC fields that assign entries to one of the levels specified by *text* in this switch's *field-argument* as a range having the form *startLevel*-*endLevel*, where *startLevel* and *endLevel* are integers, and *startLevel* has a value equal-to or less-than *endLevel*. TC fields that assign entries to lower levels are skipped.
\n *field-argument*	Without *field-argument*, omits page numbers from the table of contents. Page numbers are omitted from all levels unless a range of entry levels is specified by *text* in this switch's *field-argument*. A range is specified as for \l.
\o *field-argument*	Uses paragraphs formatted with all or the specified range of built-in heading styles. Headings in a style range are specified by *text* in this switch's *field-argument* using the notation specified as for \l, where each integer corresponds to the style with a style ID of

	HeadingX (e.g. 1 corresponds to Heading1). If no heading range is specified, all heading levels used in the document are listed.
\p *field-argument*	*text* in this switch's *field-argument* specifies a sequence of characters that separate an entry and its page number. The default is a tab with leader dots.
\s *field-argument*	For entries numbered with a SEQ field (§2.16.5.63), adds a prefix to the page number. The prefix depends on the type of entry. *text* in this switch's *field-argument* shall match the identifier in the SEQ field.
\t *field-argument*	Uses paragraphs formatted with styles other than the built-in heading styles. *text* in this switch's *field-argument* specifies those styles as a set of comma-separated doublets, with each doublet being a comma-separated set of style name and table of content level. \t can be combined with \o.
\u	Uses the applied paragraph outline level.
\w	Preserves tab entries within table entries.
\x	Preserves newline characters within table entries.
\z	Hides tab leader and page numbers in Web layout view.

[*Example*: The index produced using the corresponding set of index entries and the field TOC \o "3-3" \h \z \t "Heading 1,1,Heading 2,2,Appendix 1,1,Appendix 2,2,Unnumbered Heading,1" is:

1. Introduction …… 1

2. Syntax…….. 2

3. XML representation…….. 4

4. Formulas and expressions…… 6

4.1 Constants…… 6

4.2 Bookmarks…….. 6

4.3 Operators…….. 6

4.4 Functions…… 7

4.5 Table cell references…….. 8

…

Annex A. Index…… 12

end example]

2.16.5.76 USERADDRESS

Syntax:

USERADDRESS [*field-argument*] [*switch*]

Description: Retrieves the current user's postal address or, if *field-argument* is present, the address specified by *text* in *field-argument*. Specifying a field-argument shall not change the address of the current user.

Field Value: A postal address.

Switches: One of the following *general-formatting-switch*es: `\* Caps`, `\* FirstCap`, `\* Lower`, or `\* Upper`.

[*Example*: Given the current user's address, the following fields:

```
USERADDRESS
USERADDRESS "10 Top Secret Lane, Chiswick" \* Upper
```

produce results of:

```
114 Rue du Rhône
CH-1204 Geneva
Switzerland

10 TOP SECRET LANE, CHISWICK
```

end example]

2.16.5.77 USERINITIALS

Syntax:

USERINITIALS [*field-argument*] [*switch*]

Description: Retrieves the current user's initials or, if *field-argument* is present, the initials specified by *text* in *field-argument*. Specifying a field-argument shall not change the initials of the current user.

Field Value: The set of initials.

Switches: One of the following *general-formatting-switch*es: `\* Caps`, `\* FirstCap`, `\* Lower`, or `\* Upper`.

[*Example*: Given a current user with initials "DW", the following fields:

```
USERNAME \* Lower
USERNAME "JaJ"
USERNAME "jaj" \* Upper
```

produce results of:

```
dw
JaJ
JAJ
```

end example]

2.16.5.78 USERNAME

Syntax:

USERNAME [*field-argument*] [*switch*]

Description: Retrieves the current user's name or, if *field-argument* is present, the name specified by *text* in *field-argument*. Specifying a field-argument shall not change the name of the current user.

Field Value: The name.

Switches: One of the following *general-formatting-switch*es: `\* Caps`, `\* FirstCap`, `\* Lower`, or `\* Upper`.

[*Example*: Given a current user of "David Williams", the following fields:

```
USERNAME \* Lower
USERNAME "John Jones"
USERNAME "Mary Smith" \* Upper
```

produce results of:

```
david williams
John Jones
MARY SMITH
```

end example]

2.16.5.79 XE

Syntax:

XE *field-argument* [*switches*]

Description: Defines the text and page number for an index entry, which is used by an INDEX field (§2.16.5.35). The text of the entry is *text* in *field-argument*. To indicate a subentry, the main entry text and the subentry text shall be separated by a colon (:). Subentries beyond one level are permitted.

Field Value: None.

Switches: Zero or one of the following *field-specific-switch*es.

\b	Applies bold formatting to the entry's page number. However, if the index style for that entry is already bold, this switch removes

	that formatting for that entry.
\f *field-argument*	The *text* in this switch's *field-argument* defines an index entry type. If an INDEX field has the same \f switch and *field-argument*, this entry is included in the resulting index; otherwise, it is excluded.
\i	Applies italic formatting to the entry's page number. However, if the index style for that entry is already italic, this switch removes that formatting for that entry.
\r *field-argument*	Instead of the entry's page number, uses the range of pages marked by the bookmark specified by *text* in this switch's *field-argument*.
\t *field-argument*	Uses *text* from *field-argument* in place of a page number. [*Note*: Useful for "See …" or "See also …" entries. *end note*]
\y *field-argument*	Specifies that the *text* from *field-argument* defines the yomi (first phonetic character for sorting indexes) for the index entry.

[*Example*: Given the following fields spread over a series of pages, and a multi-page bookmark called OOXMLPageRange:

```
XE "Office Open XML" \b
XE "syntax" \f "Introduction"
XE "behavior:implementation-defined" \b
XE "Office Open XML" \i
XE "behavior:implementation-defined:documenting" \b
XE "grammar" \f "Introduction" \b
XE "Office Open XML"
XE "item: package-relationship" \t "See package-relationship item"
XE "XML" \r OOXMLPageRange
XE "grammar" \f "Introduction"
XE "production" \f "Introduction"
```

the index produced by INDEX \e "*tab*" \c "1" \z "1033" is:

behavior

implementation-defined ……. **2**

documenting …….. **3**

item

package-relationship …….. See package-relationship item

Office Open XML …… **2**, *3*, 4

end example]

2.16.6 calcOnExit (Recalculate Fields When Current Field Is Modified)

This element specifies that the current contents of all fields within the current WordprocessingML document shall be recalculated from their field codes when the contents of the parent form field are modified. [*Note*: It is at the discretion of an application to determine the scope of a single modification, for example, when the user moves the insertion point in a user interface, or after each keystroke, etc. *end note*]

If this element is omitted, then modification of the contents of the current field shall not result in all fields in the current document being recalculated.

[*Example*: Consider the following WordprocessingML fragment for the contents of two fields in a document:

```
<w:bookmarkStart w:name="Text1" … />
<w:fldSimple w:instr="FORMFIELDTEXT">
  <w:ffData>
    <w:calcOnExit/>
    …
  </w:ffData>
  <w:r>
    <w:t>1</w:t>
  </w:r>
</w:fldSimple>
<w:bookmarkEnd w:name="Text1" … />
<w:fldSimple w:instr="=Text1+10">
  <w:r>
    <w:t>11</w:t>
  </w:r>
</w:fldSimple>
```

The first field above (the text form field) has a current value of `1`, but also has the calcOnExit element present (therefore inheriting its default attribute value of `true`). This means that if the value of this form field is changed to `10`, that all fields in the document shall automatically be updated, resulting in the second field's value being automatically changed to `20`. *end example*]

Parent Elements
ffData (§2.16.17)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property shall be explicitly turned off. [*Example*: For example, consider the following on/off property: `<w:… w:val="off"/>` The val attribute explicitly declares that the property is turned off. *end example*] The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.16.7 checkBox (Checkbox Form Field Properties)

This element specifies a set of properties which shall be associated with the parent FORMCHECKBOX checkbox form field (§2.16.5.26) within the document.

If the parent form field is not a checkbox (i.e. its field code does not have a value of FORMCHECKBOX), then these properties may be ignored.

[*Example*: Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
<w:ffData>
  <w:checkBox>
    <w:size w:val="20" />
    <w:checked w:val="true" />
  </w:checkBox>
</w:ffData>
```

The checkBox element specifies that it contains a set of properties for the parent checkbox form field. In this case, these properties specify that the size of the checkbox shall be exactly 10 points via the size element

(§2.16.30), and that the current state of the checkbox shall be checked via the checked element (§2.16.8). *end example*]

Parent Elements
ffData (§2.16.17)

Child Elements	Subclause
checked (Checkbox Form Field State)	§2.16.8
default (Default Checkbox Form Field State)	§2.16.12
size (Checkbox Form Field Size)	§2.16.30
sizeAuto (Automatically Size Form Field)	§2.16.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFCheckBox">
   <sequence>
      <choice>
         <element name="size" type="CT_HpsMeasure"/>
         <element name="sizeAuto" type="CT_OnOff"/>
      </choice>
      <element name="default" type="CT_OnOff" minOccurs="0"/>
      <element name="checked" type="CT_OnOff" minOccurs="0"/>
   </sequence>
</complexType>
```

2.16.8 checked (Checkbox Form Field State)

This element specifies the current state for a checkbox form field. This value shall be used to specify the current value for a checkbox as explicitly chosen for that checkbox, as opposed its default value, which is specified using the default element (§2.16.12).

If this element is omitted, then the parent form field checkbox has no state, and its state shall be determined based on the value of the default element in the checkbox form field properties.

[*Example*: Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
<w:ffData>
  <w:checkBox>
    <w:checked w:val="true" />
  </w:checkBox>
</w:ffData>
```

The checked element specifies that the current state of the checkbox is checked (via an attribute value of `true`). *end example*]

Parent Elements

Parent Elements
checkBox (§2.16.7)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property shall be explicitly turned off. [*Example*: For example, consider the following on/off property: `<w:… w:val="off"/>` The val attribute explicitly declares that the property is turned off. *end example*] The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.16.9 ddList (Drop-Down List Form Field Properties)

This element specifies a set of properties which shall be associated with the parent FORMDROPDOWN drop-down list form field (§2.16.5.27) within the document.

If the parent form field is not a drop-down list (i.e. its field code does not have a value of FORMDROPDOWN), then these properties may be ignored.

[*Example*: Consider the following WordprocessingML fragment for the properties of a drop-down list form field:

```
<w:ffData>
  <w:ddList>
    <w:listEntry w:val="One" />
    <w:listEntry w:val="Two" />
    <w:listEntry w:val="Three" />
  </w:ddList>
</w:ffData>
```

The ddList element specifies that it contains a set of properties for the parent drop-down list form field. In this case, these properties specify that the drop-down list shall contain three entries of `One`, `Two`, and `Three` via the listEntry elements (§2.16.26). *end example*]

Parent Elements
ffData (§2.16.17)

Child Elements	Subclause
default (Default Drop-Down List Item Index)	§2.16.11
listEntry (Drop-Down List Entry)	§2.16.26
result (Drop-Down List Selection)	§2.16.29

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFDDList">
   <sequence>
      <element name="result" type="CT_DecimalNumber" minOccurs="0"/>
      <element name="default" type="CT_DecimalNumber" minOccurs="0"/>
      <element name="listEntry" type="CT_String" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

2.16.10 default (Default Text Box Form Field String)

This element specifies the default string for the parent text box form field. This string is the content which shall be displayed in the document story within this form field if its current run contents are empty (i.e. there is not actual content within the text box). If the type (§2.16.34) of the current form field is `calculation`, then this string shall hold the calculation to be performed.

If this element is omitted, then the current text box form field shall not have a default value.

[*Example*: Consider the following WordprocessingML fragment for a text box form field:

```
<w:fldSimple w:instr="FORMTEXT">
  <w:ffData>
    <w:textInput>
      <w:default w:val="No content."/>
    </w:textInput>
  </w:ffData>
</w:fldSimple>
```

The default element specifies the default value of the text box form field to be `No content.` Since the form field does not contain any value, this is the content which shall be displayed when the contents of the form field are displayed by an application. *end example*]

Parent Elements
textInput (§2.16.33)

Attributes	Description

val (String Value)	Specifies that its contents will contain a string.
	
	The contents of this string are interpreted based on the context of the parent XML element.
	
	[*Example*: Consider the following WordprocessingML fragment:
	
	`<w:pPr>`
	`  <w:pStyle w:val="heading1" />`
	`</w:pPr>`
	
	The value of the val attribute is the ID of the associated paragraph style's `styleId`.
	
	However, consider the following fragment:
	
	`<w:sdtPr>`
	`  <w:alias w:val="SDT Title Example" />`
	`  ...`
	`</w:sdtPr>`
	
	In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. *end example*]
	
	The possible values for this attribute are defined by the ST_String simple type (§2.18.89).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
   <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

2.16.11 default (Default Drop-Down List Item Index)

This element specifies the zero-based index of the default entry for the parent drop-down list form field. This index value is the value within the drop-down list which shall be displayed in the document story within this form field if no element is selected (i.e. the result element (§2.16.29) is omitted).

If this element is omitted, then the current drop-down list form field shall have a default value of `0` (its first entry). If the attribute value references an index value which does not exist (i.e. a negative number or a number that exceeds the number of items in the drop-down list), then this value may be ignored and the current drop-down list form field shall have a default value of `0` (its first entry).

[*Example*: Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
  <w:ffData>
    <w:ddList>
      <w:default w:val="1" />
      <w:listEntry w:val="One" />
      <w:listEntry w:val="Two" />
      <w:listEntry w:val="Three" />
    </w:ddList>
  </w:ffData>
</w:fldSimple>
```

The default element specifies the index of the default value of the drop-down list form field to be 1. Since the form field does not contain a result element, this is the index of the content which shall be displayed when the contents of the form field are displayed by an application. In this case, the resulting default value text is Two. *end example*]

Parent Elements
ddList (§2.16.9)

Attributes	Description
val (Decimal Number Value)	Specifies that the contents of this attribute will contain a decimal number. The contents of this decimal number are interpreted based on the context of the parent XML element. [*Example*: Consider the following numeric WordprocessingML property of type ST_DecimalNumber: <w:… w:val="1512645511" /> The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. *end example*] The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DecimalNumber">
   <attribute name="val" type="ST_DecimalNumber" use="required"/>
</complexType>
```

2.16.12 default (Default Checkbox Form Field State)

This element specifies the default checkbox state for the parent checkbox form field. This value determines the checkbox state when its current run contents are empty (i.e. there is not actual content within the drop-down list).

If this element is omitted, then the current checkbox form field shall have a default value of `0` (unchecked).

[*Example*: Consider the following WordprocessingML fragment for a checkbox list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
  <w:ffData>
    <w:checkBox>
      <w:default w:val="true" />
    </w:checkBox>
  </w:ffData>
</w:fldSimple>
```

The default element specifies the default state of the checkbox form field to be `true`. Since the form field does not contain any run content, this is the state which shall be displayed when the contents of the form field are displayed by an application. *end example*]

Parent Elements
checkBox (§2.16.7)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element. A value of on, `1`, or `true` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property shall be explicitly turned off. [*Example*: For example, consider the following on/off property: `<w:… w:val="off"/>` The val attribute explicitly declares that the property is turned `off`. *end example*] The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.16.13 delInstrText (Deleted Field Code)

This element specifies that this run contains deleted field codes (§2.16.5) within a complex field in the document. The delInstrText element shall be used for all runs containing field codes which are part of a region of text that is contained in a deleted region using the del element (§2.13.5.12).

If this element is not contained within a del element, then the document is invalid. If this element is contained within a run which is not part of a complex field's field codes, then it should be handled as regular deleted text.

[*Example*: Consider a complex field within a WordprocessingML document which was changed from a text box form field to a checkbox form field with revision tracking enabled. This field would therefore be represented as follows:

```
<w:fldchar w:type="begin" />
<w:ins>
  <w:r>
    <w:instrText>FORMCHECKBOX</w:instrText>
  </w:r>
  <w:del>
    <w:r>
      <w:delInstrText>FORMFIELDTEXT</w:delInstrText>
    </w:r>
  </w:del>
<w:fldChar w:type="seperate" />
…
<w:fldChar w:type="end" />
```

The deleted field code is contained in a delInstrText node, while the inserted (and current) field code is contained in an instrText node. *end example*]

Parent Elements
r (§7.1.2.87); r (§2.3.2.23)

Attributes	Description
space (Content Contains Significant Whitespace) Namespace:	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. [*Example*: Consider the following run contained within a WordprocessingML document:

Attributes	Description
http://www.w3.org/XML/1998/namespace	<w:r> <w:t>significant whitespace </w:t> </w:r> Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. *end example*] The possible values for this attribute are defined by the type in the namespace.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Text">
   <simpleContent>
      <extension base="ST_String">
         <attribute ref="xml:space" use="optional"/>
      </extension>
   </simpleContent>
</complexType>
```

2.16.14 enabled (Form Field Enabled)

This element specifies whether the parent form field shall behave as though it is enabled or disabled when it is displayed in the document. This setting shall have no effect on the behavior of this form field unless the document's Settings part specifies that the documentProtection element for the current document is in a state allowing the filling in of form fields.

If this element is omitted, then the parent form field shall be in its enabled state when the document settings specify that the document allows the filling-in of form fields.

[*Example*: Consider the following WordprocessingML fragment for a text box form field:

```
<w:fldSimple w:instr="FORMTEXT">
  <w:ffData>
    <w:enabled w:val="false"/>
    <w:textInput>
      …
    </w:textInput>
  </w:ffData>
</w:fldSimple>
```

The enabled element specifies that the state of the current text box form field is disabled; therefore this text box shall not be editable within the current document even when the state of the documentProtection element specifically allows the editing of form fields. *end example*]

Parent Elements

Parent Elements
ffData (§2.16.17)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property shall be explicitly turned off. [*Example*: For example, consider the following on/off property: `<w:… w:val="off"/>` The val attribute explicitly declares that the property is turned off. *end example*] The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.16.15 entryMacro (Script Function to Execute on Form Field Entry)

This element specifies a subroutine in a scripting language which should be executed when the when the run contents of the parent form field are entered. The language and location of this subroutine may be determined using any method desired by an application. [*Note*: It is at the discretion of an application to determine the scope and timing of "entering" a form field, for example, when the user moves the insertion point in a user interface or upon each operation by an application without a user interface, etc. *end note*]

If this element is omitted, then no subroutine shall be associated with entering the run contents of the parent form field. If this element specifies a macro which cannot be located or is not supported by an application, then its value may be ignored, but shall not be lost upon resaving the file.

[*Example*: Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
<w:ffData>
  <w:entryMacro w:val="TestEntryFunction" />
  <w:checkBox>
    …
  </w:checkBox>
</w:ffData>
```

The entryMacro element specifies that any application which processes this file should attempt to locate and execute a scripting subroutine called `TestEntryFunction` when the contents of the checkbox are entered. If this subroutine cannot be located or executed, then this setting is silently ignored. *end example*]

Parent Elements
ffData (§2.16.17)

Attributes	Description

val (Name of Script Function)	Specifies the name of a single scripting subroutine which shall be associated with the parent element. Its use is specifies based on the context of the parent XML element.
	
	[*Example*: Consider the following WordprocessingML fragment for the properties of a form field:
	
	`<w:ffData>`
	`  <w:exitMacro w:val="HelloWorld" />`
	`</w:ffData>`
	
	The val attribute specifies that a script function called `HelloWorld` shall be used in the context of the parent element; in this case, to execute when the field is exited. *end example*]
	
	The possible values for this attribute are defined by the ST_MacroName simple type (§2.18.58).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MacroName">
   <attribute name="val" use="required" type="ST_MacroName"/>
</complexType>
```

2.16.16 exitMacro (Script Function to Execute on Form Field Exit)

This element specifies a subroutine in a scripting language which should be executed when the when the run contents of the parent form field are exited. The language and location of this subroutine may be determined using any method desired by an application. [*Note*: It is at the discretion of an application to determine the scope and timing of "exiting" a form field, for example, when the user moves the insertion point in a user interface or upon each operation by an application without a user interface, etc. *end note*]

If this element is omitted, then no subroutine shall be associated with exiting the run contents of the parent form field. If this element specifies a macro which cannot be located or is not supported by an application, then its value may be ignored, but shall not be lost upon resaving the file.

[*Example*: Consider the following WordprocessingML fragment for the properties of a form field:

```
<w:ffData>
  <w:exitMacro w:val="TestExitFunction" />
</w:ffData>
```

The exitMacro element specifies that any application which processes this file should attempt to locate and execute a scripting subroutine called `TestExitFunction` when the contents of the form field are exited. If this subroutine cannot be located or executed, then this setting is silently ignored. *end example*]

Parent Elements
ffData (§2.16.17)

Attributes	Description

val (Name of Script Function)	Specifies the name of a single scripting subroutine which shall be associated with the parent element. Its use is specifies based on the context of the parent XML element.
	
	[*Example*: Consider the following WordprocessingML fragment for the properties of a form field:
	
	`<w:ffData>`
	`  <w:exitMacro w:val="HelloWorld" />`
	`</w:ffData>`
	
	The val attribute specifies that a script function called `HelloWorld` shall be used in the context of the parent element; in this case, to execute when the field is exited. *end example*]
	
	The possible values for this attribute are defined by the ST_MacroName simple type (§2.18.58).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MacroName">
   <attribute name="val" use="required" type="ST_MacroName"/>
</complexType>
```

2.16.17 ffData (Form Field Properties)

This element specifies a set of properties which shall be associated with the parent form field within the document. This form field may be of any of the following types (with the associated field codes in parentheses):

- Checkbox (`FORMCHECKBOX`)
- Drop-down List (`FORMDROPDOWN`)
- Text box (`FORMTEXT`)

If this element is present and the field codes for the document do not specify a form field of one of these types, then the document shall be considered invalid.

If this element is omitted, then the properties associated with the parent form field shall be determined based on their default values.

[*Example*: Consider the following WordprocessingML fragment for a text box form field:

```
<w:fldSimple w:instr="FORMTEXT">
  <w:ffData>
    <w:name w:val="TextTextBox" />
    <w:enabled w:val="false"/>
    <w:textInput>
      <w:maxLength w:val="10" />
    </w:textInput>
  </w:ffData>
</w:fldSimple>
```

The ffData element specifies the set of properties for this text box form field; in this example, a form field name of TestTextBox via the name element (§2.16.28), a disabled state via the enabled element (§2.16.14), and a maximum character length of 10 characters via the maxLength element (§2.16.27). *end example*]

Parent Elements
fldChar (§2.16.18)

Child Elements	Subclause
calcOnExit (Recalculate Fields When Current Field Is Modified)	§2.16.6
checkBox (Checkbox Form Field Properties)	§2.16.7
ddList (Drop-Down List Form Field Properties)	§2.16.9
enabled (Form Field Enabled)	§2.16.14
entryMacro (Script Function to Execute on Form Field Entry)	§2.16.15
exitMacro (Script Function to Execute on Form Field Exit)	§2.16.16
helpText (Associated Help Text)	§2.16.23
name (Form Field Name)	§2.16.28
statusText (Associated Status Text)	§2.16.32
textInput (Text Box Form Field Properties)	§2.16.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFData">
   <choice maxOccurs="unbounded">
      <element name="name" type="CT_FFName"/>
      <element name="enabled" type="CT_OnOff"/>
      <element name="calcOnExit" type="CT_OnOff"/>
      <element name="entryMacro" type="CT_MacroName" minOccurs="0" maxOccurs="1"/>
      <element name="exitMacro" type="CT_MacroName" minOccurs="0" maxOccurs="1"/>
      <element name="helpText" type="CT_FFHelpText" minOccurs="0" maxOccurs="1"/>
      <element name="statusText" type="CT_FFStatusText" minOccurs="0" maxOccurs="1"/>
      <choice>
         <element name="checkBox" type="CT_FFCheckBox"/>
         <element name="ddList" type="CT_FFDDList"/>
         <element name="textInput" type="CT_FFTextInput"/>
      </choice>
   </choice>
</complexType>
```

2.16.18 fldChar (Complex Field Character)

This element specifies the presence of a complex field character at the current location in the parent run. A *complex field character* is a special character which delimits the start and end of a complex field or separates its field codes from its current field result.

A complex field is defined via the use of the two required complex field characters: a *start character*, which specifies the beginning of a complex field within the document content; and an *end character*, which specifies the end of a complex field. This syntax allows multiple fields to be embedded (or "nested") within each other in a document.

As well, because a complex field may specify both its field codes and its current result within the document, these two items are separated by the optional *separator character*, which defines the end of the field codes and the beginning of the field contents. The omission of this character shall be used to specify that the contents of the field are entirely field codes (i.e. the field has no result).

[*Example*: Consider the following complex field definition within a WordprocessingML document:

```
<w:fldChar w:type="start" />
<w:r>
  <w:instrText>AUTHOR</w:instrText>
</w:r>
<w:fldChar w:type="separate" />
<w:r>
  <w:t>Rex Jaeschke</w:t>
</w:r>
<w:fldChar w:type="end" />
```

The three fldChar elements specify:

- The beginning of the field, using the type attribute value of `start`
- The separator between the field codes and the current field results, using the type attribute value of `separate`
- The end of the field, using the type attribute value of `end`

end example]

If a complex field character is located in an inappropriate location in a WordprocessingML document, then its presence shall be ignored and no field shall be present in the resulting document when displayed. Also, if a complex field is not closed before the end of a document story, then no field shall be generated and each individual run shall be processed as if the field characters did not exist (i.e. the contents of all field code run content shall not be displayed, and the field results shall be displayed as literal text).

[*Example*: Consider the following WordprocessingML document:

```
<w:body>
  <w:p>
    <w:fldChar w:type="start" />
    <w:r>
      <w:instrText>AUTHOR</w:instrText>
    </w:r>
    <w:fldChar w:type="separate" />
    <w:r>
      <w:t>Rex Jaeschke</w:t>
    </w:r>
  </w:p>
</w:body>
```

The complex field is technically incorrect since no end character exists in the main document story. The resulting content shall be interpreted as though no field characters exist, resulting in only the literal text `Rex Jaeschke` being displayed in the document. *end example*]

Parent Elements
r (§7.1.2.87); r (§2.3.2.23)

ffData (Form Field Properties)	§2.16.17
fldData (Custom Field Data)	§2.16.19
numberingChange (Previous Numbering Field Properties)	§2.13.5.29

Attributes	Description

Attributes	Description

dirty (Field Result Invalidated)	Specifies that this field has been flagged by an application to indicate that its current results are invalid (stale) due to other modifications made to the document, and these contents should be updated before they are displayed if this functionality is supported by the next processing application.
	
	[*Rationale*: This functionality allows applications with limited subsets of the full functionality of this Office Open XML Standard to process Word Open XML documents without needing to understand and update all fields based on the semantics for their field codes.
	
	For example, an application can add a new paragraph and flag the table of contents as dirty, without needing to understand anything about how to recalculate that field's content. *end rationale*]
	
	If this attribute is omitted, then its value shall be assumed to be `false`. If the type of the current field character is not `start`, then his setting may be ignored.
	
	[*Example*: Consider the following WordprocessingML for a complex field:
	
	`<w:fldChar w:type="start" w:dirty="true"/>`
	`<w:r>`
	`<w:instrText>TOC /l 1-3</w:instrText>`
	`</w:r>`
	`<w:fldChar w:type="separate"/>`
	…
	
	The dirty attribute value of `true` specifies that the contents of this field are no longer current based on the contents of the document, and should be recalculated whenever an application with this functionality reads the document. *end example*]
	
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

fldCharType (Field Character Type)	Specifies the type of the current complex field character in the document. [*Example*: Consider the following WordprocessingML for a complex field character: … `<w:fldChar w:type="separate" />` … The type attribute value of `separate` specifies that this is a complex field separator character; therefore it is being used to separate the field codes from the field contents in a complex field. *end example*] The possible values for this attribute are defined by the ST_FldCharType simple type (§2.18.33).
fldLock (Field	Specifies that the parent complex field shall not have its field result recalculated, even if

Attributes	Description

Should Not Be Recalculated)	an application attempts to recalculate the results of all fields in the document or a recalculation is explicitly requested.
	
	If this attribute is omitted, then its value shall be assumed to be `false`. If the type of the current field character is not `start`, then his setting may be ignored.
	
	[*Example*: Consider the following WordprocessingML for a complex field:
	
	`<w:fldChar w:type="start" w:fldLock="true"/>`
	`…`
	`<w:fldChar w:type="separate"/>`
	`<w:r>`
	`<w:t>field result</w:t>`
	`</w:r>`
	`<w:fldChar w:type="end" />`
	
	The fldLock attribute value of `true` specifies that the contents of this field shall remain `field result` regardless of the actual result of the current field codes. *end example*]
	
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FldChar">
   <choice>
      <element name="fldData" type="CT_Text" minOccurs="0" maxOccurs="1"/>
      <element name="ffData" type="CT_FFData" minOccurs="0" maxOccurs="1"/>
      <element name="numberingChange" type="CT_TrackChangeNumbering" minOccurs="0"/>
   </choice>
   <attribute name="fldCharType" type="ST_FldCharType" use="required"/>
   <attribute name="fldLock" type="ST_OnOff"/>
   <attribute name="dirty" type="ST_OnOff"/>
</complexType>
```

2.16.19 fldData (Custom Field Data)

This element specifies custom field data which shall be associated with the parent field. No information or semantics are applied to the contents of this data by this Office Open XML Standard, and therefore this field may be used as desired to store additional application-specific data with the field. However, applications should not lose the contents of this custom data if they do not understand or utilize it (i.e. the information should continue to be saved with the file).

If this element is omitted, then no custom field data is stored with the parent field. If the type attribute of the current field character is not `start`, then his setting may be ignored.

[*Example*: Consider the following WordprocessingML fragment for a complex field:

```
<w:fldChar w:type="start">
  <w:fldData xml:space="preserve">///3645ERKJHE</w:fldData>
</w:fldChar>
<w:r>
  <w:instrText>PRIVATE</w:instrText>
</w:r>
<w:fldChar w:type="separate" />
…
```

The fldData element contains custom data stored with this PRIVATE field (§2.16.5.55), the contents of which are determined by a hosting application. *end example*]

Parent Elements
fldChar (§2.16.18)

Attributes	Description

space (Content Contains Significant Whitespace)
 	
Namespace: http://www.w3.org/XML/1998/namespace
	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.
	
	[*Example*: Consider the following run contained within a WordprocessingML document:
	
	`<w:r>`
	`  <w:t>significant whitespace  </w:t>`
	`</w:r>`
	
	Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. *end example*]
	
	The possible values for this attribute are defined by the type in the namespace.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Text">
   <simpleContent>
      <extension base="ST_String">
         <attribute ref="xml:space" use="optional"/>
      </extension>
   </simpleContent>
</complexType>
```

2.16.20 fldData (Custom Field Data)

This element specifies custom field data which shall be associated with the parent field. No information or semantics are applied to the contents of this data by this Office Open XML Standard, and therefore this field may be used as desired to store additional application-specific data with the field. However, applications should

not lose the contents of this custom data if they do not understand or utilize it (i.e. the information should continue to be saved with the file).

If this element is omitted, then no custom field data is stored with the parent field.

[*Example*: Consider the following WordprocessingML fragment for a simple field:

```
<w:fldSimple w:instr="PRIVATE">
  <w:fldData xml:space="preserve">///3645ERKJHE</w:fldData>
</w:fldSimple>
```

The fldData element contains custom data stored with this PRIVATE field (§2.16.5.55), the contents of which are determined by a hosting application. *end example*]

Parent Elements
fldSimple (§2.16.21)

Attributes	Description

space (Content Contains Significant Whitespace)
 	
Namespace: http://www.w3.org/XML/1998/namespace
	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.
	
	[*Example*: Consider the following run contained within a WordprocessingML document:
	
	`<w:r>`
	`  <w:t>significant whitespace  </w:t>`
	`</w:r>`
	
	Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. *end example*]
	
	The possible values for this attribute are defined by the type in the namespace.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Text">
   <simpleContent>
      <extension base="ST_String">
         <attribute ref="xml:space" use="optional"/>
      </extension>
   </simpleContent>
</complexType>
```

2.16.21 fldSimple (Simple Field)

This element specifies the presence of a simple field at the current location in the document. The semantics of this field are defined via its field codes (§2.16.5).

[*Example*: Consider the following WordprocessingML fragment for a simple field:

```
<w:fldSimple w:instr="FILENAME">
  <w:r>
    <w:t>Example Document.docx</w:t>
  </w:r>
</w:fldSimple>
```

The fldSimple element defines a `FILENAME` field (§2.16.5.23) using the simple field syntax. The current field result for the field is `Example Document.docx`. *end example*]

Parent Elements
customXml (§2.5.1.5); fldSimple (§2.16.21); hyperlink (§2.16.24); p (§2.3.1.22); sdtContent (§2.5.2.35); smartTag (§2.5.1.9)

sdt (Inline-Level Structured Document Tag)	§2.5.2.29
smartTag (Inline-Level Smart Tag)	§2.5.1.9
subDoc (Anchor for Subdocument Location)	§2.17.2.1

Attributes	Description
dirty (Field Result Invalidated)	Specifies that this field has been flagged by an application to indicate that its current results are invalid (stale) due to other modifications made to the document, and these contents should be updated before they are displayed if this functionality is supported by the next processing application. [*Rationale*: This functionality allows applications with limited subsets of the full functionality of this Office Open XML Standard to process Word Open XML documents without needing to understand and update all fields based on the semantics for their field codes. For example, an application can add a new paragraph and flag the table of contents as dirty, without needing to understand anything about how to recalculate that field's content. *end rationale*] If this attribute is omitted, then its value shall be assumed to be `false`. [*Example*: Consider the following WordprocessingML for a simple field: `<w:fldSimple w:instr="AUTHOR" w:dirty="true"/>` The dirty attribute value of `true` specifies that the contents of this field are no longer current based on the contents of the document, and should be recalculated whenever an application with this functionality reads the document. *end example*] The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).
fldLock (Field Should Not Be Recalculated)	Specifies that the parent field shall not have its field result recalculated, even if an application attempts to recalculate the results of all fields in the document or a recalculation is explicitly requested.

Attributes	Description

	If this attribute is omitted, then its value shall be assumed to be `false`.
	
	[*Example*: Consider the following WordprocessingML for a simple field:
	
	`<w:fldSimple w:instr="AUTHOR" w:fldLock="true">`
	`  <w:r>`
	`  <w:t>Rex Jaeschke</w:t>`
	`  </w:r>`
	`</w:fldSimple>`
	
	The fldLock attribute value of `true` specifies that the contents of this field shall remain `Rex Jaeschke` regardless of the actual result of the current field codes. *end example*]
	
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

instr (Field Codes)	Specifies the field codes for the simple field. The possible field codes are defined in §2.16.5.
	
	[*Example*: Consider the following WordprocessingML for a simple field:
	
	`<w:fldSimple w:instr="AUTHOR" w:fldLock="true">`
	`  <w:r>`
	`  <w:t>Rex Jaeschke</w:t>`
	`  </w:r>`
	`</w:fldSimple>`
	
	The instr attribute specifies the field codes for this simple field to be `AUTHOR`. *end example*]
	
	The possible values for this attribute are defined by the ST_String simple type (§2.18.89).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SimpleField">
   <sequence>
      <element name="fldData" type="CT_Text" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_PContent" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="instr" type="ST_String" use="required"/>
   <attribute name="fldLock" type="ST_OnOff"/>
   <attribute name="dirty" type="ST_OnOff"/>
</complexType>
```

2.16.22 format (Text Box Form Field Formatting)

This element specifies the field formatting which shall be applied to the contents of the parent form field whenever those contents are modified. The type of formatting which is applied to the field depends on the value of its type element (§2.16.34), as follows:

- When the type is equal to `currentDate`, `currentTime`, or `date`, a date formatting string using the syntax defined in §2.16.4.1
- When the type is equal to `calculated` or `number`, a number formatting string using the syntax defined in §2.16.4.2
- When the type is equal to regular, a text formatting string defined as follows:

Argument	Description
`Uppercase`	All letters are uppercase. [*Example*: `Mary Smith` results in `MARY SMITH`. *end example*]
`Lowercase`	All letters are lowercase. [*Example*: `Mary Smith` results in `mary smith`. *end example*]
`First capital`	Capitalizes the first letter of the first word. [*Example*: `Mary Smith` results in `Mary smith`. *end example*]
`Title case`	Capitalizes the first letter of each word. [*Example*: `Mary Smith` results in `Mary Smith`. *end example*]

[*Example*: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
  <w:textInput>
    <w:type w:val="number" />
    <w:maxLength w:val="4" />
    <w:format w:val="0.00" />
  </w:textInput>
</w:ffData>
```

The format element specifies the field formatting which is applied to the input to the field (in this case, a grouping of number formatting picture items as the type element specifies a value of `number`). If a value of 8 was entered into this field, the formatted result would be `8.00`. *end example*]

Parent Elements
textInput (§2.16.33)

Attributes	Description
val (String Value)	Specifies that its contents will contain a string. The contents of this string are interpreted based on the context of the parent XML element. [*Example*: Consider the following WordprocessingML fragment:

Attributes	Description
	<w:pPr> <w:pStyle w:val="heading1" /> </w:pPr> The value of the val attribute is the ID of the associated paragraph style's styleId. However, consider the following fragment: <w:sdtPr> <w:alias w:val="SDT Title Example" /> ... </w:sdtPr> In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. *end example*] The possible values for this attribute are defined by the ST_String simple type (§2.18.89).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
   <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

2.16.23 helpText (Associated Help Text)

This element specifies optional help text which shall be associated with the parent form field. The method or user interface by which this help text may be surfaced is not defined by this Office Open XML Standard.

If this element is omitted, then no help text shall be associated with the current form field.

[*Example*: Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
  <w:ffData>
    <w:helpText w:type="text" w:val="Example help text." />
    <w:ddList>
      …
    </w:ddList>
  </w:ffData>
</w:fldSimple>
```

The helpText element specifies the help text for the parent form field - in this case, literal help text consisting of the string `Example help text.` *end example*]

Parent Elements

Parent Elements
ffData (§2.16.17)

Attributes	Description

type (Help Text Type)	Specifies the type of help text which is specified by this element, defined by the simple type below.
	
	If this attribute is omitted, then its value shall be assumed to be `text`.
	
	[*Example*: Consider the following WordprocessingML fragment for a form field:
	
	`<w:ffData>`
	`  <w:helpText w:type="text" w:val="Example help text." />`
	`</w:ffData>`
	
	The type attribute has a value of `text`, which specifies that the text in the val attribute is the literal help text for this form field. *end example*]
	
	The possible values for this attribute are defined by the ST_InfoTextType simple type (§2.18.49).

val (Help Text Value)	Specifies the help text for the current form field. Based on the value of the type attribute, the contents of this field shall be interpreted as follows:
	• When the type attribute value is `text`, contains the literal help text for the form field.
	• When the type attribute value is `autoText`, contains the name of a glossary document entry which contains the help text for the form field.
	
	[*Example*: Consider the following WordprocessingML fragment for a form field:
	
	`<w:ffData>`
	`  <w:helpText w:type="autoText" w:val="HelpText" />`
	`</w:ffData>`
	
	The text in the val attribute is the name of a glossary document entry containing the help text for this form field, since the type attribute has a value of `autoText`. *end example*]
	
	The possible values for this attribute are defined by the ST_FFHelpTextVal simple type (§2.18.29).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFHelpText">
   <attribute name="type" type="ST_InfoTextType"/>
   <attribute name="val" type="ST_FFHelpTextVal"/>
</complexType>
```

2.16.24 hyperlink (Hyperlink)

This element specifies the presence of a hyperlink at the current location in the document.

[*Example*: Consider the following WordprocessingML fragment for a hyperlink:

```
<w:hyperlink r:id="rId10">
  <w:r>
    <w:t>Click here</w:t>
  </w:r>
</w:hyperlink>
```

The hyperlink element defines a hyperlink whose display text is `Click here`, and whose target is specified by the relationship with an Id attribute value of `rId10`. *end example*]

Parent Elements
customXml (§2.5.1.5); fldSimple (§2.16.21); hyperlink (§2.16.24); p (§2.3.1.22); sdtContent (§2.5.2.35); smartTag (§2.5.1.9)

moveFromRangeStart (Move Source Location Container - Start)	§2.13.5.24
moveTo (Move Destination Run Content)	§2.13.5.26
moveToRangeEnd (Move Destination Location Container - End)	§2.13.5.27
moveToRangeStart (Move Destination Location Container - Start)	§2.13.5.28
oMath (Office Math)	§7.1.2.77
oMathPara (Math Paragraph)	§7.1.2.78
permEnd (Range Permission End)	§2.13.7.1
permStart (Range Permission Start)	§2.13.7.2
proofErr (Proofing Error Anchor)	§2.13.8.1
r (Text Run)	§2.3.2.23
sdt (Inline-Level Structured Document Tag)	§2.5.2.29
smartTag (Inline-Level Smart Tag)	§2.5.1.9
subDoc (Anchor for Subdocument Location)	§2.17.2.1

Attributes	Description

anchor (Hyperlink Anchor)	Specifies the name of a bookmark in the current document which shall be the target of this hyperlink.
	
	If this attribute is omitted, then the default behavior shall be to navigate to the start of the document. If a hyperlink target is also specified using the r:id attribute, then this attribute shall be ignored. If no bookmark exists in the current document with the given bookmark name, then the default behavior shall be to navigate to the start of the document.
	
	[*Example*: Consider the following WordprocessingML fragment for a hyperlink:
	
	`<w:hyperlink w:anchor="chapter3">`
	`  <w:r>`
	`  <w:t>Go to Chapter Three</w:t>`
	`  </w:r>`
	`</w:hyperlink>`
	
	The anchor attribute specifies that the target of the current hyperlink shall be the text contained within the bookmark `chapter3` within the document. *end example*]
	
	The possible values for this attribute are defined by the ST_String simple type (§2.18.89).

docLocation (Location in Target Document)	Specifies a location in the target of the hyperlink that has no bookmarks. The method by which the contents of this attribute are linked to document text is outside the scope of this Office Open XML Standard.

Attributes	Description

	If this attribute is omitted, then no location shall be associated with the parent hyperlink. If the anchor attribute is also specified, then this attribute may be ignored when the hyperlink is invoked.
	
	[*Example*: Consider the following WordprocessingML fragment for a hyperlink:
	
	`<w:hyperlink r:id="rId9" w:docLocation="table">`
	`  <w:r>`
	`  <w:t>Click Here</w:t>`
	`  </w:r>`
	`</w:hyperlink>`
	
	The docLocation attribute specifies that the target of the current hyperlink shall be a region targeted by the string `table` within the target document. *end example*]
	
	The possible values for this attribute are defined by the ST_String simple type (§2.18.89).

history (Add To Viewed Hyperlinks)	Specifies whether the target of the parent hyperlink (as specified via the r:id attribute) shall be added to a list of viewed hyperlinks when it is invoked.
	
	If this attribute is omitted, then its value shall be assumed to be `false`.
	
	[*Example*: Consider the following WordprocessingML fragment for a hyperlink:
	
	`<w:hyperlink r:id="rId9" w:history="true">`
	`  <w:r>`
	`  <w:t>http://example.com</w:t>`
	`  </w:r>`
	`</w:hyperlink>`
	
	The history attribute value of `true` specifies that the target of the current hyperlink shall be added to a list of visited hyperlinks when invoked within the document. *end example*]
	
	The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

id (Hyperlink Target)
 	
Namespace: .../officeDocument/2006/relationships
	Specifies the ID of the relationship whose target shall be used as the target for this hyperlink.
	
	If this attribute is omitted, then there shall be no external hyperlink target for the current hyperlink - a location in the current document may still be target via the anchor attribute. If this attribute exists, it shall supersede the value in the anchor attribute.
	
	[*Example*: Consider the following WordprocessingML fragment for a hyperlink:
	
	`<w:hyperlink r:id="rId9">`
	`  <w:r>`
	`  <w:t>http://example.com</w:t>`
	`  </w:r>`

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<pre></w:hyperlink></pre>
The id attribute value of rId9 specifies that relationship in the associated relationship part item with a corresponding Id attribute value shall be navigated to when this hyperlink is invoked. For example, if the following XML is present in the associated relationship part item:
<pre><Relationships xmlns="…">
  <Relationship Id="rId9" Mode="External"
Target=http://www.contoso.com />
</Relationships></pre>
The target of this hyperlink would therefore be the target of relationship rId9 - in this case, http://www.contoso.com. end example]
The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
</td></tr>
<tr><td>tgtFrame
(Hyperlink Target Frame)</td><td>
Specifies a frame within the parent HTML frameset for the target of the parent hyperlink when one exists. All values specified by this element shall be handled as follows:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>_top</td><td>Open hyperlink target in the full region of the current window.</td></tr>
<tr><td>_self</td><td>Open hyperlink target in the same frame as the hyperlink appears.</td></tr>
<tr><td>_parent</td><td>Open hyperlink target in the parent of the current frame, or the current frame if this frame has no parent.</td></tr>
<tr><td>_blank</td><td>Open hyperlink target in a new window.</td></tr>
<tr><td>all other values</td><td>Open hyperlink target in the frame with the specified name. If no frame exists with this name, open in the current frame.

If this string does not begin with an alphabetic character, it shall be ignored.</td></tr>
</table>
If this attribute is omitted, then no target frame information shall be associated with the
</td></tr>
</table>

Attributes	Description

	parent hyperlink. If the current document is not part of a frameset, then this information may be ignored.
	
	[*Example*: Consider the following WordprocessingML fragment for a hyperlink:
	
	`<w:hyperlink r:id="rId9" w:tgtFrame="_top">`
	`  <w:r>`
	`  <w:t>http://example.com</w:t>`
	`  </w:r>`
	`</w:hyperlink>`
	
	The tgtFrame attribute value of `_top` specifies that the target of this hyperlink shall be displayed in the full extents of the current window. *end example*]
	
	The possible values for this attribute are defined by the ST_String simple type (§2.18.89).

tooltip (Associated String)	Specifies a string which may be surfaced in a user interface as associated with the parent hyperlink. The method by which this string is surfaced by an application is outside the scope of this Office Open XML Standard.
	
	If this attribute is omitted, then no associated string shall be linked to the parent hyperlink in the document.
	
	[*Example*: Consider the following WordprocessingML fragment for a hyperlink:
	
	`<w:hyperlink r:id="rId9" w:tooltip="Click here!">`
	`  <w:r>`
	`  <w:t>http://example.com</w:t>`
	`  </w:r>`
	`</w:hyperlink>`
	
	The tooltip attribute value specifies that the parent hyperlink has the associated string of `Click here!`, which may be used as desired. *end example*]
	
	The possible values for this attribute are defined by the ST_String simple type (§2.18.89).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlink">
   <group ref="EG_PContent" minOccurs="0" maxOccurs="unbounded"/>
   <attribute name="tgtFrame" type="ST_String" use="optional"/>
   <attribute name="tooltip" type="ST_String" use="optional"/>
   <attribute name="docLocation" type="ST_String" use="optional"/>
   <attribute name="history" type="ST_OnOff" use="optional"/>
   <attribute name="anchor" type="ST_String" use="optional"/>
   <attribute ref="r:id"/>
</complexType>
```

2.16.25 instrText (Field Code)

This element specifies that this run contains field codes (§2.16.5) within a complex field in the document.

If this element is contained within a run which is not part of a complex field's field codes, then it and its contents should be treated as regular text. If this element is contained within a del element, then the document is invalid.

[*Example*: Consider a complex checkbox field within a WordprocessingML. This field would be represented as follows:

```
<w:fldchar w:type="begin" />
<w:r>
  <w:instrText>FORMCHECKBOX</w:instrText>
</w:r>
<w:fldChar w:type="seperate" />
…
<w:fldChar w:type="end" />
```

The field code is contained in a instrText node which occurs within the field codes portion of the complex field (i.e. before the separator character). *end example*]

Parent Elements
r (§7.1.2.87); r (§2.3.2.23)

Attributes	Description

space (Content Contains Significant Whitespace)
 	
Namespace: http://www.w3.org/XML/1998/namespace
	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules.
	
	[*Example*: Consider the following run contained within a WordprocessingML document:
	
	`<w:r>`
	`  <w:t>significant whitespace  </w:t>`
	`</w:r>`
	
	Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. *end example*]
	
	The possible values for this attribute are defined by the type in the namespace.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Text">
   <simpleContent>
      <extension base="ST_String">
         <attribute ref="xml:space" use="optional"/>
      </extension>
   </simpleContent>
</complexType>
```

2.16.26 listEntry (Drop-Down List Entry)

This element specifies the presence of a single drop-down list entry within the parent drop-down list form field in the document. The order of appearance of the series of listEntry elements in the WordprocessingML markup shall dictate the order of the entries in the drop-down list when it is displayed.

[*Example*: Consider the following WordprocessingML fragment for the properties of a drop-down list form field:

```
<w:ffData>
  <w:ddList>
    <w:listEntry w:val="One" />
    <w:listEntry w:val="Two" />
    <w:listEntry w:val="Three" />
  </w:ddList>
</w:ffData>
```

The three listEntry elements each specify one drop-down list entry for the parent drop-down list form field. In this case, these properties specify that the drop-down list shall contain three entries of `One`, `Two`, and `Three` in that order when displayed. *end example*]

Parent Elements
ddList (§2.16.9)

Attributes	Description

val (String Value)	Specifies that its contents will contain a string.
	
	The contents of this string are interpreted based on the context of the parent XML element.
	
	[*Example*: Consider the following WordprocessingML fragment:
	
	`<w:pPr>`
	`  <w:pStyle w:val="heading1" />`
	`</w:pPr>`
	
	The value of the val attribute is the ID of the associated paragraph style's `styleId`.

Attributes	Description

	However, consider the following fragment:
	
	`<w:sdtPr>`
	`  <w:alias w:val="SDT Title Example" />`
	`  ...`
	`</w:sdtPr>`
	
	In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is interpreted in the context of the parent element. *end example*]
	
	The possible values for this attribute are defined by the ST_String simple type (§2.18.89).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
   <attribute name="val" type="ST_String" use="required"/>
</complexType>
```

2.16.27 maxLength (Text Box Form Field Maximum Length)

This element specifies the maximum length of text which should be allowed within the parent text box form field before any formatting specified by the format element (§2.16.22). If the current contents of this field exceed the specified value when the document is loaded, that violation shall not result in an error, but the application shall prevent the addition of any additional characters until the contents are brought below that limit.

If this element is omitted, then there shall be no limit on the number of characters in the parent text box form field.

[*Example*: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
  <w:textInput>
    <w:type w:val="number" />
    <w:maxLength w:val="4" />
    <w:format w:val="0.00" />
  </w:textInput>
</w:ffData>
```

The maxLength element specifies that the contents of this form field should not be allowed to exceed four characters when edited by an application. *end example*]

Parent Elements
textInput (§2.16.33)

Attributes	Description
val (Decimal Number Value)	Specifies that the contents of this attribute will contain a decimal number. The contents of this decimal number are interpreted based on the context of the parent XML element. [*Example*: Consider the following numeric WordprocessingML property of type ST_DecimalNumber: <w:… w:val="1512645511" /> The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. *end example*] The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DecimalNumber">
   <attribute name="val" type="ST_DecimalNumber" use="required"/>
</complexType>
```

2.16.28 name (Form Field Name)

This element specifies the name of the current form field.

[*Example*: Consider the following WordprocessingML fragment for a text box form field:

```
<w:fldSimple w:instr="FORMTEXT">
  <w:ffData>
    <w:name w:val="FirstName"/>
    <w:textInput>
      …
    </w:textInput>
  </w:ffData>
</w:fldSimple>
```

The name element specifies that the name of the current form field is `FirstName`. *end example*]

Parent Elements
ffData (§2.16.17)

Attributes	Description
val (Form Field Name Value)	Specifies the name of the form field. If this attribute is omitted, then the parent form field shall have no name.

Attributes	Description

	[*Example*: Consider the following WordprocessingML fragment for a form field:
	
	`<w:ffData>`
	`  <w:name w:val="ExampleFieldName"/>`
	`</w:ffData>`
	
	The val attribute specifies that the name of the current form field is `ExampleFieldName`. *end example*]
	
	The possible values for this attribute are defined by the ST_FFName simple type (§2.18.30).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFName">
   <attribute name="val" type="ST_FFName"/>
</complexType>
```

2.16.29 result (Drop-Down List Selection)

This element specifies the zero-based index of the currently selected entry for the parent drop-down list form field.

If this element is omitted, then the current drop-down list form field shall have the selection specified by the value of the default element (§2.16.11). If the attribute value references an index value which does not exist (i.e. a negative number or a number that exceeds the number of items in the drop-down list), then this value may be ignored and the current drop-down list form field shall have the selection specified by the value of the default element.

[*Example*: Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
  <w:ffData>
    <w:ddList>
      <w:default w:val="1" />
      <w:result w:val="2" />
      <w:listEntry w:val="One" />
      <w:listEntry w:val="Two" />
      <w:listEntry w:val="Three" />
    </w:ddList>
  </w:ffData>
</w:fldSimple>
```

The result element specifies the index of the currently selected value of the drop-down list form field to be 2. In this case, the resulting default value text is Three. *end example*]

Parent Elements
ddList (§2.16.9)

Attributes	Description
val (Decimal Number Value)	Specifies that the contents of this attribute will contain a decimal number. The contents of this decimal number are interpreted based on the context of the parent XML element. [*Example*: Consider the following numeric WordprocessingML property of type ST_DecimalNumber: <w:… w:val="1512645511" /> The value of the val attribute is a decimal number whose value must be interpreted in the context of the parent element. *end example*] The possible values for this attribute are defined by the ST_DecimalNumber simple type (§2.18.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DecimalNumber">
    <attribute name="val" type="ST_DecimalNumber" use="required"/>
</complexType>
```

2.16.30 size (Checkbox Form Field Size)

This element specifies the exact size for the parent checkbox form field. The resulting field shall be displayed in this point size regardless of the size specified by the formatting of its corresponding content in the document via the style hierarchy.

[*Example*: Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
<w:ffData>
  <w:checkBox>
    <w:size w:val="20" />
    <w:checked w:val="true" />
  </w:checkBox>
</w:ffData>
```

The size element specifies that the checkbox shall be displayed in a ten point font size, regardless of the formatting which would normally be applied to this text via the style hierarchy. *end example*]

Parent Elements
checkBox (§2.16.7)

Attributes	Description

val (Half Point Measurement)	Specifies a positive measurement specified in half-points (1/144 of an inch).
	
	The contents of this attribute value are interpreted based on the context of the parent XML element.
	
	[*Example*: Consider the following WordprocessingML fragment:
	
	`<w:rPr>`
	`  <w:sz w:val="28" />`
	`</w:rPr>`
	
	The value of the val attribute is the font size of the run's contents.
	
	However, consider the following fragment:
	
	`<w:rPr>`
	`  <w:kern w:val="30" />`
	`</w:rPr>`
	
	In this case, the value in the val attribute is the minimum size for which font characters shall be automatically kerned.
	
	In each case, the value is interpreted in the context of the parent element. *end example*]
	
	The possible values for this attribute are defined by the ST_HpsMeasure simple type (§2.18.48).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HpsMeasure">
   <attribute name="val" type="ST_HpsMeasure" use="required"/>
</complexType>
```

2.16.31 sizeAuto (Automatically Size Form Field)

This element specifies that the parent checkbox form field shall be formatted using the point size which is applied to its field characters via the style hierarchy.

[*Example*: Consider the following WordprocessingML fragment for the properties of a checkbox form field:

```
<w:r>
  <w:rPr>
    <w:sz w:val="40"/>
  </w:rPr>
  <w:fldChar w:type="begin">
  <w:ffData>
    <w:checkBox>
      <w:sizeAuto />
      <w:checked w:val="true" />
    </w:checkBox>
  </w:ffData>
</w:r>
…
```

The sizeAuto element specifies that the checkbox shall be displayed in the point size of the formatting which would normally be applied to this text via the style hierarchy. In this case, this size is the twenty points specified via the direct formatting on the parent run. *end example*]

Parent Elements
checkBox (§2.16.7)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property shall be explicitly turned off. [*Example*: For example, consider the following on/off property: <w:… w:val="off"/> The val attribute explicitly declares that the property is turned off. *end example*] The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
    <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.16.32 statusText (Associated Status Text)

This element specifies optional status text which shall be associated with the parent form field. The method or user interface by which this status text may be surfaced is not defined by this Office Open XML Standard.

If this element is omitted, then no status text shall be associated with the current form field.

[*Example*: Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
  <w:ffData>
    <w:statusText w:type="text" w:val="Example status text." />
    <w:ddList>
      …
    </w:ddList>
  </w:ffData>
</w:fldSimple>
```

The statusText element specifies the status text for the parent form field - in this case, literal text consisting of the string `Example status text.` *end example*]

Parent Elements
ffData (§2.16.17)

Attributes	Description

type (Status Text Type)	Specifies the type of status text which is specified by this element, defined by the simple type below.
	
	If this attribute is omitted, then its value shall be assumed to be `text`.
	
	[*Example*: Consider the following WordprocessingML fragment for a form field:
	
	`<w:ffData>`
	`  <w:statusText w:type="text" w:val="Example status text." />`
	`</w:ffData>`
	
	The type attribute has a value of `text`, which specifies that the text in the val attribute is the literal status text for this form field. *end example*]
	
	The possible values for this attribute are defined by the ST_InfoTextType simple type (§2.18.49).

val (Status Text Value)	Specifies the status text for the current form field. Based on the value of the type attribute, the contents of this field shall be interpreted as follows: • When the type attribute value is `text`, contains the literal status text for the form field.

Attributes	Description

	• When the type attribute value is autoText, contains the name of a glossary document entry which contains the status text for the form field.
	
	[*Example*: Consider the following WordprocessingML fragment for a form field:
	
	`<w:ffData>`
	`  <w:statusText w:type="autoText" w:val="MyStatusText" />`
	`</w:ffData>`
	
	The text in the val attribute is the name of a glossary document entry containing the status text for this form field, since the type attribute has a value of autoText. *end example*]
	
	The possible values for this attribute are defined by the ST_FFStatusTextVal simple type (§2.18.31).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFStatusText">
   <attribute name="type" type="ST_InfoTextType"/>
   <attribute name="val" type="ST_FFStatusTextVal"/>
</complexType>
```

2.16.33 textInput (Text Box Form Field Properties)

This element specifies a set of properties which shall be associated with the parent FORMTEXT text box form field (§2.16.5.28) within the document.

If the parent form field is not a text box (i.e. its field code does not have a value of FORMTEXT), then these properties may be ignored.

[*Example*: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
  <w:textInput>
    <w:maxLength w:val="4" />
    <w:type w:val="number" />
  </w:textInput>
</w:ffData>
```

The textInput element specifies that it contains a set of properties for the parent text box form field. In this case, these properties specify that the drop-down list shall contain no more than four characters via the maxLength element (§2.16.27), and that its contents shall contain a number via the type element (§2.16.34). *end example*]

Parent Elements

Parent Elements
ffData (§2.16.17)

Child Elements	Subclause
default (Default Text Box Form Field String)	§2.16.10
format (Text Box Form Field Formatting)	§2.16.22
maxLength (Text Box Form Field Maximum Length)	§2.16.27
type (Text Box Form Field Type)	§2.16.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFTextInput">
   <sequence>
      <element name="type" type="CT_FFTextType" minOccurs="0"/>
      <element name="default" type="CT_String" minOccurs="0"/>
      <element name="maxLength" type="CT_DecimalNumber" minOccurs="0"/>
      <element name="format" type="CT_String" minOccurs="0"/>
   </sequence>
</complexType>
```

2.16.34 type (Text Box Form Field Type)

This element specifies the type of the contents of the current text box form field. This element shall not be used to prevent the successful loading of any contents in the field, but shall be used to parse the formatting specified in the format element (§2.16.22) and should be used to prevent the addition of illegal content when its contents are edited by an application.

If this element is omitted, then its default value shall be assumed to be `regular`.

[*Example*: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
  <w:textInput>
    <w:type w:val="number" />
    <w:maxLength w:val="4" />
    <w:format w:val="0.00" />
  </w:textInput>
</w:ffData>
```

The type element specifies that the contents of this form field should be handled as a `number` by an application. *end example*]

Parent Elements
textInput (§2.16.33)

Attributes	Description

val (Text Box Form Field Type Values)	Specifies the type of the text box form field, as defined by the simple type referenced below.
	
	[*Example*: Consider the following WordprocessingML fragment for the properties of a text box form field:
	
	`<w:ffData>`
	`  <w:textInput>`
	`  <w:type w:val="currentDate" />`
	`  </w:textInput>`
	`</w:ffData>`
	
	The val attribute value of `currentDate` specifies that the contents of this form field should be the current date when the field is updated. *end example*]
	
	The possible values for this attribute are defined by the ST_FFTextType simple type (§2.18.32).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FFTextType">
   <attribute name="val" type="ST_FFTextType" use="required"/>
</complexType>
```

2.17 Miscellaneous Topics

This section covers topics not covered elsewhere within the WordprocessingML documentation.

2.17.1 Text Box Content

All VML-based drawing objects (except for connectors) support the addition of rich WordprocessingML content within their extents. When WordprocessingML contents have been added to a VML drawing object, the resulting text is contained within a *text box*.

When WordprocessingML content is contained within a text box, it is allowed within the object by specifying the VML textbox element (§6.1.2.22), which contains within it a single txbxContent element that contains all of the desired WordprocessingML content.

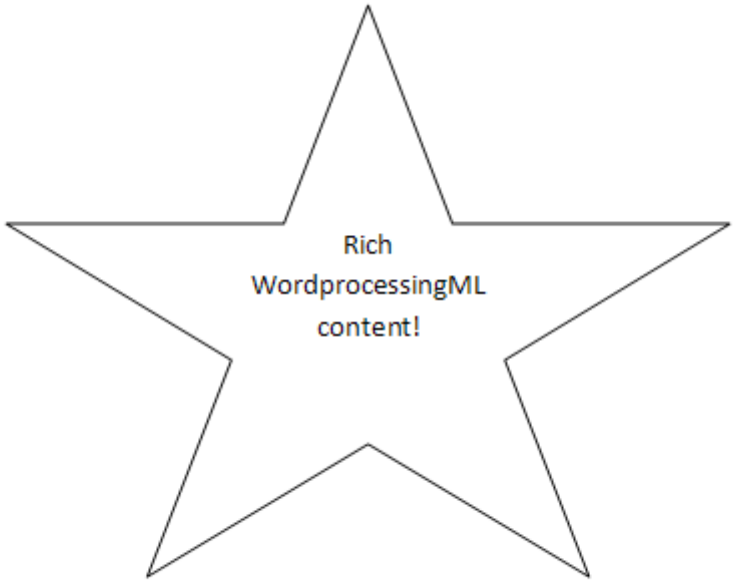
2.17.1.1 txbxContent (Rich Text Box Content Container)

This element specifies that its contents shall be any rich WordprocessingML content, and that this content is the rich contents of a drawing object defined using the Vector Markup Language (VML) syntax (§6.1).

If this element contains within any of its contents any of the following content, then the document shall be considered non-conformant:

- References to other WordprocessingML document stories (comments, footnotes, endnotes)
- Additional txbxContent elements (as part of nested VML objects)

[*Example*: Consider a WordprocessingML document consisting of a single VML shape element (§6.1.2.19) (in this case, a star) that contains within it some WordprocessingML content:



That drawing object now contains a text box, and so uses the syntax for that text box:

```
<v:shape id="_x0000_s1026" type="#_x0000_t12" style="…">
  <v:textbox>
    <w:txbxContent>
      <w:p>
        <w:pPr>
          <w:jc w:val="center"/>
        </w:pPr>
        <w:r>
          <w:t>Rich WordprocessingML content!</w:t>
        </w:r>
      </w:p>
    </w:txbxContent>
  </v:textbox>
</v:shape>
```

The txbxContent element is the container for the WordprocessingML contained within the text box inside that shape - once inside this element any content (subject to the restrictions defined above) may be used. *end example*]

Parent Elements

Parent Elements
textbox (§6.1.2.22)

Child Elements	Subclause
altChunk (Anchor for Imported External Content)	§2.17.3.1
bookmarkEnd (Bookmark End)	§2.13.6.1

permStart (Range Permission Start)	§2.13.7.2
proofErr (Proofing Error Anchor)	§2.13.8.1
sdt (Block-Level Structured Document Tag)	§2.5.2.30
tbl (Table)	§2.4.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TxbxContent">
   <group ref="EG_BlockLevelElts" minOccurs="1" maxOccurs="unbounded"/>
</complexType>
```

2.17.2 Subdocuments

Within a WordprocessingML document, it is sometimes necessary to break a large document into two or more separate WordprocessingML document files, allowing each of these files to be distributed, edited, and handled independently.

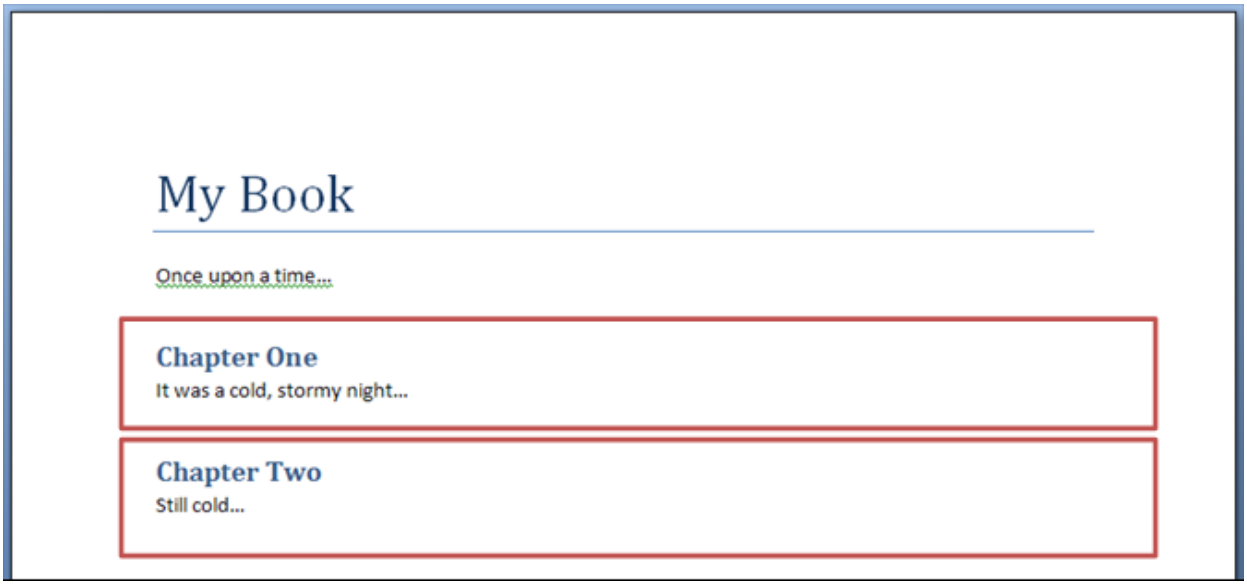
[*Example*: A book might consist of five chapters, each edited by a separate author. The editor for the book would therefore desire to create six WordprocessingML documents - one for each author to work on their chapter, and a main document which collates the content of the five chapters appropriately. *end example*]

When a WordprocessingML document is comprised of other WordprocessingML documents in this way, the resulting documents are called a master document and its subdocuments.

- A *subdocument* is a WordprocessingML document - there is no specific information in a document which classifies it as such, other than that it is incorporated into another document.
- A *master document* is a document which incorporates one or more subdocuments (as well as optional WordprocessingML content) to create a larger document

[*Example*: Consider a WordprocessingML document which is being used to write a book:

To allow this document to be written by multiple authors, each chapter in the book is placed in a separate file (the sections highlighted in red below):



The result is three WordprocessingML documents:

- A master document (containing the title of the book, the first paragraph, and references to the subdocuments for each chapter)
- Two subdocuments (one for each chapter)

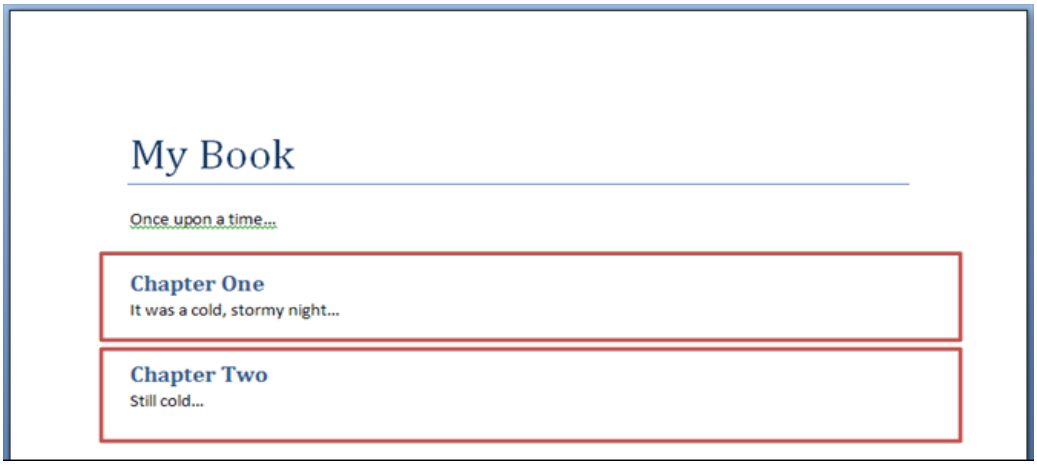
end example]

2.17.2.1 subDoc (Anchor for Subdocument Location)

This element specifies a location within a master document for the insertion of the contents of a specified subdocument. The specified subdocument's contents should appear at the specified location within the master document as needed, but shall remain part of the separate file specified by the subdocument location. The location of the subdocument shall be specified by the relationship whose Id attribute matches the id attribute on this element.

If the relationship type of the relationship specified by this element is not http://schemas.openxmlformats.org/officeDocument/2006/subDocument, is not present, or does not have a TargetMode attribute value of `External`, then the document shall be considered non-conformant.

[*Example*: Consider a book consisting of three chapters, two of which have been divided into subdocuments as follows (the red rectangle indicates the bounds of each subdocument's contents):



The resulting master document would consist of its own WordprocessingML content as well as subdocument anchors in the appropriate locations:

```
<w:body>
  <w:p>
    …
    <w:r>
      <w:t>My Book</w:t>
    </w:r>
  </w:p>
  <w:p>
    <w:r>
      <w:t>Once upon a time…</w:t>
    </w:r>
  </w:p>
  <w:subDoc r:id="subDocRel1" />
  <w:subDoc r:id="subDocRel2" />
  <w:sectPr>
    …
  </w:sectPr>
</w:body>
```

The two subDoc elements specify that the subdocuments targeted by the relationships with an ID of subDocRel1 and subDocRel2 shall be imported in that order after the content of the first two paragraphs of content. Examining the contents of the corresponding relationship part item, we can see the targets for those relationships:

```
<Relationships … >
  …
  <Relationship Id="subDocRel1" TargetMode="External"
Type="http://schemas.openxmlformats.org/officeDocument/2006/relationships/subDoc
ument" Target="Chapter1.docx" />
  <Relationship Id="subDocRel2" TargetMode="External"
Type="http://schemas.openxmlformats.org/officeDocument/2006/relationships/subDoc
ument" Target="Chapter2.docx" />
  …
</Relationships>
```

The corresponding relationship part item shows that the two files to be imported are located in the same location as the current file and name `Chapter1.docx` and `Chapter2.docx` respectively. *end example*]

Parent Elements
customXml (§2.5.1.5); fldSimple (§2.16.21); hyperlink (§2.16.24); p (§2.3.1.22); sdtContent (§2.5.2.35); smartTag (§2.5.1.9)

Attributes	Description
id (Relationship to Part) Namespace: …/officeDocument/2006/relationships	Specifies the relationship ID to a specified part. The specified relationship shall match the type required by the parent element: • http://schemas.openxmlformats.org/officeDocument/2006/relationships/footer for the footerReference element • http://schemas.openxmlformats.org/officeDocument/2006/relationships/header for the headerReference element • http://schemas.openxmlformats.org/officeDocument/2006/relationships/font for the embedBold, embedBoldItalic, embedItalic, or embedRegular elements • http://schemas.openxmlformats.org/officeDocument/2006/relationships/printerSettings for the printerSettings element [*Example*: Consider an XML element which has the following id attribute: `<… r:id="rId10" />` The markup specifies the associated relationship part with relationship ID `rId1` contains the corresponding relationship information for the parent XML element. *end example*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rel">
   <attribute ref="r:id" use="required"/>
</complexType>
```

2.17.3 External Content Import

When generating WordprocessingML documents, it is sometimes necessary to include existing document content (henceforth called *external content*) within the document. External content in a document is typically included because it was stored in a format other than the WordprocessingML format defined by this Office Open XML Standard.

In order to facilitate the inclusion of such content without requiring its conversion as a prerequisite to its inclusion in a document, WordprocessingML includes the facility for applications to implement the import of external content in any format as part of a WordprocessingML document. This functionality, called external content import, allows the inclusion of content of an arbitrary content type within the WordprocessingML package, which shall then be opened and merged into the main document when the package is consumed by applications which understand that content type.

[*Example*: Consider a WordprocessingML document which is being created based on the following existing HTML content:

```
<html … >
  <body style="margin-left:200px;margin-top:50px">
    <p>Paragraph one.</p>
    <blockquote style="border:5px solid #00FFFF">Paragraph in a
blockquote.</blockquote>
    <p>Paragraph two.</p>
  </body>
</html>
```

This content could be converted to its WordprocessingML equivalents using the XML syntax defined by this Office Open XML Standard, or a more basic tool can use the external content import to include the HTML document within a WordprocessingML package, allowing a subsequent consumer of that content to import the resulting HTML. When the resulting WordprocessingML package is opened, the HTML document shall be read (if it is an alternate format understood by the consuming application) and migrated into the appropriate location in the main WordprocessingML document. *end example*]

2.17.3.1 altChunk (Anchor for Imported External Content)

This element specifies a location within a document for the insertion of the contents of a specified file containing external content to be imported into the main WordprocessingML document. The specified file's contents should appear at the specified location within the document, and may henceforth be emitted as regular WordprocessingML without distinction to its origin. The location of the external content to be imported shall be specified by the relationship whose Id attribute matches the id attribute on this element.

If the relationship type of the relationship specified by this element is not http://schemas.openxmlformats.org/officeDocument/2006/afChunk, is not present, or does not have a TargetMode attribute value of `Internal`, then the document shall be considered non-conformant. If an application cannot process external content of the content type specified by the targeted part, then it should ignore the specified alternate content but continue to process the file. If possible, it should also provide some indication that unknown content was not imported.

[*Example*: Consider a WordprocessingML document consisting of contents which shall be imported from the following HTML document:

```
<html … >
  <body style="margin-left:200px;margin-top:50px">
    <p>Paragraph one.</p>
    <blockquote style="border:5px solid #00FFFF">Paragraph in a
blockquote.</blockquote>
    <p>Paragraph two.</p>
  </body>
</html>
```

The resulting WordprocessingML host document would consist of its own WordprocessingML content as well as an external content import anchor in the appropriate location:

```
<w:body>
  <w:altChunk r:id="altChunk1" />
  <w:p/>
  <w:sectPr>
    …
  </w:sectPr>
</w:body>
```

The altChunk element specifies that the external content targeted by the relationship with an ID of `altChunk1` shall be imported at the beginning of the document. Examining the contents of the corresponding relationship part item, we can see the targets for that relationship:

```
<Relationships … >
  …
  <Relationship Id="altChunk1" TargetMode="Internal"
Type="http://schemas.openxmlformats.org/officeDocument/2006/relationships/afChun
k" Target="import.htm" />
  …
</Relationships>
```

The corresponding relationship part item shows that the file to be imported is located next to the main document and is named `import.htm`. *end example*]

Parent Elements
body (§2.2.2); comment (§2.13.4.2); docPartBody (§2.12.6); endnote (§2.11.2); footnote (§2.11.10); ftr (§2.10.3); hdr (§2.10.4); tc (§2.4.62); txbxContent (§2.17.1.1)

Child Elements	Subclause
altChunkPr (External Content Import Properties)	§2.17.3.2

Attributes	Description
id (Relationship to Part) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID to a specified part containing alternate content for import. If the specified relationship does not match the type required by the parent element, then this document shall be considered to be invalid. [*Example*: Consider an XML element which has the following id attribute: `<… r:id="rId10" />` The markup specifies the associated relationship part with relationship ID `rId1` contains the corresponding relationship information for the parent XML element. *end example*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AltChunk">
   <sequence>
      <element name="altChunkPr" type="CT_AltChunkPr" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:id" use="optional"/>
</complexType>
```

2.17.3.2 altChunkPr (External Content Import Properties)

This element specifies the set of properties which shall be applied to the import of the external content specified by the parent altChunk element. Within this Office Open XML Standard, only one property is specified.

[*Example*: Consider a WordprocessingML document consisting of contents which contains an external content import anchor in the appropriate location:

```
<w:body>
  <w:altChunk r:id="altChunk1">
    <w:altChunkPr>
      <w:matchSrc w:val="false" />
    </w:altChunkPr>
  </w:altChunk>
  <w:p/>
  <w:sectPr>
    …
  </w:sectPr>
</w:body>
```

The altChunkPr element specifies the set of properties applied to the external content import when importing the specified content. *end example*]

Parent Elements
altChunk (§2.17.3.1)

Child Elements	Subclause
matchSrc (Keep Source Formatting on Import)	§2.17.3.3

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AltChunkPr">
   <sequence>
      <element name="matchSrc" type="CT_OnOff" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

2.17.3.3 matchSrc (Keep Source Formatting on Import)

This element specifies if any style definitions present in the imported content shall be overridden by identical styles present in the host WordprocessingML document. If this element's val attribute is `true`, then any style exists in both the imported content and main document shall be maintained on the imported content by redefining the style name and/or ID as needed. Conversely, if this element's val attribute is false, any style which exists in both the imported content and main document shall apply the style form the main document in place of the style in the imported content.

If this element is omitted, then styles from the main document shall override identical styles from the imported content.

[*Example*: Consider a WordprocessingML document consisting of contents which contains an external content import anchor in the appropriate location:

```
<w:body>
  <w:altChunk r:id="altChunk1">
    <w:altChunkPr>
      <w:matchSrc w:val="true" />
    </w:altChunkPr>
  </w:altChunk>
  <w:p/>
  <w:sectPr>
    …
  </w:sectPr>
</w:body>
```

The matchSrc element has a val attribute value of true, which specifies that conflicting styles shall be maintained when importing the specified content. For example, if the Heading 1 style was defined in both places, then applications shall ensure that the resulting document does not lose either instance of its formatting as appropriate. *end example*]

Parent Elements
altChunkPr (§2.17.3.2)

Attributes	Description
val (On/Off Value)	Specifies a binary value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property shall be explicitly turned off. [*Example*: For example, consider the following on/off property: `<w:… w:val="off"/>` The val attribute explicitly declares that the property is turned off. *end example*] The possible values for this attribute are defined by the ST_OnOff simple type (§2.18.67).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

2.17.4 Roundtripping Alternate Content

Office Open XML defines a mechanism for the storage of content which is not defined by this Office Open XML Standard, for example extensions developed by future software applications which leverage the Open XML formats. This mechanism allows for the storage of a series of alternative representations of content, of which the consuming application should use the first alternative whose requirements are met.

[*Example*: Consider an application which creates a new paragraph property intended to make the colors of its text change colors randomly when it is displayed. This functionality is not defined in this Office Open XML Standard, and so the application might choose to create an alternative representation setting a different manual color on each character for clients which do not understand this extension using an AlternateContent block as follows:

```
<ve:AlternateContent xmlns:ve="…">
  <ve:Choice Requires="colors" xmlns:colors="urn:randomTextColors">
    <w:p>
      <w:pPr>
        <colors:random colors:val="true" />
      </w:pPr>
      <w:r>
        <w:t>Random colors!</w:t>
      </w:r>
    </w:p>
  </ve:Choice>
  <ve:Fallback>
    <w:p>
      <w:r>
        <w:rPr>
          <w:color w:val="FF0000" />
        </w:rPr>
        <w:t>R</w:t>
      </w:r>
      <w:r>
        <w:rPr>
          <w:color w:val="00FF00" />
        </w:rPr>
        <w:t>a</w:t>
      </w:r>
      …
    </w:p>
  </ve:Fallback>
</ve:AlternateContent>
```

The Choice element that requires the new color extensions uses the random element in its namespace, and the Fallback element allows clients that do not support this namespace to see an appropriate alternative representation. *end example*]

These alternate content blocks may occur at any location within a WordprocessingML document, and applications shall handle and process them appropriately (taking the appropriate choice).

However, WordprocessingML does not explicitly define a set of locations where applications shall attempt to store and roundtrip all non-taken choices whenever possible. This behavior is therefore application-defined.

[*Example*: If an application does not understand the colors extension, the resulting file (if alternate choices are to be preserved would appear as follows:

```
<ve:AlternateContent xmlns:ve="…">
  <ve:Choice Requires="colors" xmlns:colors="urn:randomTextColors">
    …
  </ve:Choice>
  <ve:Fallback>
    …
  </ve:Fallback>
</ve:AlternateContent>
```

The file would then appear as follows after the choice is processed:

```
<w:p>
  <w:r>
    <w:rPr>
      <w:color w:val="FF0000" />
    </w:rPr>
    <w:t>R</w:t>
  </w:r>
  <w:r>
    <w:rPr>
      <w:color w:val="00FF00" />
    </w:rPr>
    <w:t>a</w:t>
  </w:r>
  …
</w:p>
```

The state of the alternate choices (preserved or not) is dependent on the application hosting the file. Preserving the content involves storing each non-taken choice while the file is being edited, and writing out the file with an AlternateContent block when it is resaved. *end example*]

2.18 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/wordprocessingml/2006/main namespace.

2.18.1 ST_AlgClass (Cryptographic Algorithm Classes)

This simple type specifies the possible classes of cryptographic algorithm used by protection. [*Note*: The initial version of this Office Open XML Standard only supports a single version - hash - but future versions may expand this as necessary. *end note*]

[*Example*: Consider a WordprocessingML document with the following information stored in one of its protection elements:

```
<w:… w:cryptAlgorithmClass="hash"
  w:cryptAlgorithmType="typeAny"
  w:cryptAlgorithmSid="1"
  w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The cryptAlgorithmClass attribute value of hash specifies that the algorithm used for the password is a hashing algorithm. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hash (Hashing)	Specifies that the algorithm is a hashing function, which creates a hash value for user-supplied input that is very difficult to reverse-engineer.

Referenced By
documentProtection@cryptAlgorithmClass (§2.15.1.28); writeProtection@cryptAlgorithmClass (§2.15.1.94)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AlgClass">
   <restriction base="xsd:string">
      <enumeration value="hash"/>
   </restriction>
</simpleType>
```

2.18.2 ST_AlgType (Cryptographic Algorithm Types)

This simple type specifies the possible values for the type of cryptographic algorithm used by protection. [*Note*: The initial version of this Office Open XML Standard only supports a single type - typeAny - but future versions may expand this as necessary. *end note*]

[*Example*: Consider a WordprocessingML document with the following information stored in one of its protection elements:

```
<w:… w:cryptAlgorithmClass="hash"
  w:cryptAlgorithmType="typeAny"
  w:cryptAlgorithmSid="1"
  w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The cryptAlgorithmType attribute value of `typeAny` specifies that any type of algorithm may have been used for the password. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
typeAny (Any Type)	Specifies that any type of cryptographic algorithm type may be used.

Referenced By
documentProtection@cryptAlgorithmType (§2.15.1.28); writeProtection@cryptAlgorithmType (§2.15.1.94)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AlgType">
   <restriction base="xsd:string">
      <enumeration value="typeAny"/>
   </restriction>
</simpleType>
```

2.18.3 ST_AnnotationVMerge (Table Cell Vertical Merge Revision Type)

This simple type specifies the possible values for the vertical merge setting which applied to a table cell by a cell merge (or split) revision.

[*Example*: Consider a two row by two column table in which the cells in the second column are merged, and this change is tracked as a revision. The annotation on the last cell in the table would appear as follows:

```
<w:tc>
  <w:tcPr>
    <w:cellMerge … w:vmerge="cont" />
  </w:tcPr>
  …
</w:tc>
```

The vmerge attribute value of `cont` specifies that the revision on the table cell resulted in it being merged with the previous set of vertically merged cells above it (whether that was one cell or many). *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cont (Vertically Merged Cell)	Specifies that the revision resulted in this cell being vertically merged with the cell above it.
rest (Vertically Split Cell)	Specifies that the revision resulted in this cell being vertically split from the one above it.

Referenced By
cellMerge@vMerge (§2.13.5.3); cellMerge@vMergeOrig (§2.13.5.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnnotationVMerge">
   <restriction base="xsd:string">
      <enumeration value="cont"/>
      <enumeration value="rest"/>
   </restriction>
</simpleType>
```

2.18.4 ST_Border (Border Styles)

This simple type specifies the types of borders which can be specified for WordprocessingML objects which have a border.

Borders can be separated into two types:

- *Line borders*, which specify a pattern to be used when drawing a line around the specified object.
- *Art borders*, which specify a repeated image to be used when drawing a border around the specified object.

Line borders may be specified on any object which allows a border, however, art borders may only be used as a border at the page level - the borders under the pgBorders element (§2.6.10).

[*Example*: Consider a left border resulting in the following WordprocessingML:

```
<w:left w:val="single" …/>
```

This border's val is `single`, indicating that the border style is a single line border. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
apples (Apples Art Border)	Specifies an art border consisting of a repeated image of an apple, as follows (showing two repetitions): archedScallops (Arched Scallops Art Border)	Specifies an art border consisting of a repeated image of a shell pattern, as follows (showing two repetitions): 
babyPacifier (Baby Pacifier Art Border)	Specifies an art border consisting of a repeated image of a baby pacifier, as follows (showing two repetitions): 
babyRattle (Baby Rattle Art Border)	Specifies an art border consisting of a repeated image of a baby rattle, as follows (showing two repetitions): 
balloons3Colors (Three Color Balloons Art Border)	Specifies an art border consisting of a repeated image of a set of balloons, as follows (showing two repetitions): 
balloonsHotAir (Hot Air Balloons Art Border)	Specifies an art border consisting of a repeated image of a hot air balloon, as follows (showing two repetitions): 
basicBlackDashes (Black Dash Art Border)	Specifies an art border consisting of a repeating image of a black and white background.

Enumeration Value	Description
	If the border is on the left or right, this image is as follows (repeated twice): If the border is on the top or bottom, this image is as follows (repeated twice): At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:
basicBlackDots (Black Dot Art Border)	Specifies an art border consisting of a repeating image of a black dot on a white background. If the border is on the left or right, this image is as follows (showing two repetitions): If the border is on the top or bottom, this image is as follows (showing two repetitions): At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:
basicBlackSquares (Black Square Art Border)	Specifies an art border consisting of a repeating image of a black and white background. If the border is on the left or right, this image is as follows (repeated twice):  If the border is on the top or bottom, this image is as follows (repeated twice):

Enumeration Value	Description
	  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately:
basicThinLines (Thin Line Art Border)	Specifies an art border consisting of a repeating image of a black and white background. If the border is on the left or right, this image is as follows:  If the border is on the top or bottom, this image is as follows:  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
basicWhiteDashes (White Dash Art Border)	Specifies an art border consisting of a repeating image of a black and white background. If the border is on the left or right, this image is as follows (repeated twice):  If the border is on the top or bottom, this image is as follows (repeated twice): At any corner where two borders of this type intersect,

Enumeration Value	Description
	the intersection shall use the following image, rotated appropriately:
basicWhiteDots (White Dot Art Border)	Specifies an art border consisting of a repeating image of a white dot on a black background. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
basicWhiteSquares (White Square Art Border)	Specifies an art border consisting of a repeating image of a black and white background. If the border is on the left or right, this image is as follows (repeated twice): If the border is on the top or bottom, this image is as follows (repeated twice): At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
basicWideInline (Wide Inline Art Border)	Specifies an art border consisting of a repeating image of a black and white background.

Enumeration Value	Description
	If the border is on the left or right, this image is as follows (showing for the left, flipped horizontally for the right border):  If the border is on the top or bottom, this image is as follows (showing for the top, flipped vertically for the bottom border):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
basicWideMidline (Wide Midline Art Border)	Specifies an art border consisting of a repeating image of a black and white background. If the border is on the left or right, this image is as follows (showing for the left, flipped horizontally for the right border):  If the border is on the top or bottom, this image is as follows (showing for the top, flipped vertically for the bottom border):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
basicWideOutline (Wide Outline Art Border)	Specifies an art border consisting of a repeating image

Enumeration Value	Description
	of a black and white background. If the border is on the left or right, this image is as follows (showing for the left, flipped horizontally for the right border):  If the border is on the top or bottom, this image is as follows (showing for the top, flipped vertically for the bottom border):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
bats (Bats Art Border)	Specifies an art border consisting of a repeated image of bats, as follows (showing two repetitions): 
birds (Birds Art Border)	Specifies an art border consisting of repeating images of birds. If the border is on the left or right, no border is displayed. If the border is on the top or bottom, this image is as follows (showing two repetitions): 
birdsFlight (Birds Flying Art Border)	Specifies an art border consisting of a repeated image of birds flying, as follows (showing two repetitions):

Enumeration Value	Description
	
cabins (Cabin Art Border)	Specifies an art border consisting of a repeated image of a cabin, as follows (showing two repetitions): 
cakeSlice (Cake Art Border)	Specifies an art border consisting of a repeated image of a piece of cake, as follows (showing two repetitions): 
candyCorn (Candy Corn Art Border)	Specifies an art border consisting of a repeated image of candy corn, as follows (showing two repetitions): 
celticKnotwork (Knot Work Art Border)	Specifies an art border consisting of a repeated image of a knot work pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
certificateBanner (Certificate Banner Art Border)	Specifies an art border consisting of a banner.

Enumeration Value	Description
	If the border is on the left or right, no border is displayed. If the border is on the top, this image is as follows (showing each end):  If this border is on the bottom, then the ends shall be flipped vertically.
chainLink (Chain Link Art Border)	Specifies an art border consisting of a repeating image of a chain link pattern. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions): 
champagneBottle (Champagne Bottle Art Border)	Specifies an art border consisting of a repeated image of a champagne bottle, as follows (showing two repetitions): 
checkedBarBlack (Black and White Bar Art Border)	Specifies an art border consisting of repeating images of a compass. If the border is on the left or right, this image is as follows (showing two repetitions on the left, the right would be flipped horizontally):

Enumeration Value	Description
	 If the border is on the top or bottom, this image is as follows (showing two repetitions on top, the bottom would be flipped vertically):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
checkedBarColor (Color Checked Bar Art Border)	Specifies an art border consisting of a repeating image of a colored pattern. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
checkered (Checkerboard Art Border)	Specifies an art border consisting of a repeated image of a checkerboard, as follows (showing two repetitions): 
christmasTree (Christmas Tree Art Border)	Specifies an art border consisting of a repeated image of a Christmas tree, as follows (showing two

Enumeration Value	Description
	repetitions): 
circlesLines (Circles And Lines Art Border)	Specifies an art border consisting of repeating images of lines and circles. If the border is on the left or right, this image is as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image: 
circlesRectangles (Circles and Rectangles Art Border)	Specifies an art border consisting of a repeated image of a rectangular pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 

Enumeration Value	Description
classicalWave (Wave Art Border)	Specifies an art border consisting of a repeated image of a wave, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
clocks (Clocks Art Border)	Specifies an art border consisting of a repeated image of a clock, as follows (showing two repetitions): 
compass (Compass Art Border)	Specifies an art border consisting of repeating images of a compass. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image: 
confetti (Confetti Art Border)	Specifies an art border consisting of a repeated image of confetti, as follows (showing two repetitions):

Enumeration Value	Description
	
confettiGrays (Confetti Art Border)	Specifies an art border consisting of a repeated image of confetti, as follows (showing two repetitions): 
confettiOutline (Confetti Art Border)	Specifies an art border consisting of a repeated image of confetti, as follows (showing two repetitions): 
confettiStreamers (Confetti Streamers Art Border)	Specifies an art border consisting of a repeated image of confetti streamers, as follows (showing two repetitions): 
confettiWhite (Confetti Art Border)	Specifies an art border consisting of a repeated image of confetti, as follows (showing two repetitions): 
cornerTriangles (Corner Triangle Art Border)	Specifies an art border consisting of a repeated image of a line as follows: At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
couponCutoutDashes (Dashed Line Art Border)	Specifies an art border consisting of a dashed line, as follows: As well, this art border shall be rotated such that the

Enumeration Value	Description
	bottom of the image above is always nearest the text extents. If the top border is of this type, the border shall use the following image in the top left corner: 
couponCutoutDots (Dotted Line Art Border)	Specifies an art border consisting of a dotted line, as follows: As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. If the top border is of this type, the border shall use the following image in the top left corner:  If the bottom border is of this type, the border shall use the following image in the bottom right corner: 
crazyMaze (Maze Art Border)	Specifies an art border consisting of a repeated image of a maze-like pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image: 

Enumeration Value	Description
creaturesButterfly (Butterfly Art Border)	Specifies an art border consisting of a repeated image of a butterfly, as follows (showing two repetitions): 
creaturesFish (Fish Art Border)	Specifies an art border consisting of a repeated image of a fish, as follows (showing two repetitions): 
creaturesInsects (Insects Art Border)	Specifies an art border consisting of repeating images of insects. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image: 
creaturesLadyBug (Ladybug Art Border)	Specifies an art border consisting of a repeated image of a ladybug, as follows (showing two repetitions): 
crossStitch (Cross-stitch Art Border)	Specifies an art border consisting of repeating images of a cross-stitch pattern, as follows (showing two repetitions): 

Enumeration Value	Description
cup (Cupid Art Border)	Specifies an art border consisting of a repeated image of Cupid, as follows (showing two repetitions): 
dashDotStroked (Dash Dot Strokes Line Border)	Specifies a line border consisting of a line with a series of alternating thin and thick strokes around the parent object. [*Example*: *end example*]
dashed (Dashed Line Border)	Specifies a line border consisting of a dashed line around the parent object. [*Example*: - - - - - - - - - - - - - - *end example*]
dashSmallGap (Dashed Line Border)	Specifies a line border consisting of a dashed line with small gaps around the parent object. [*Example*: ---------- *end example*]
decoArch (Archway Art Border)	Specifies an art border consisting of repeating images of an archway. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):

Enumeration Value	Description
	 At any corner where two borders of this type intersect, the intersection shall use the following image: 
decoArchColor (Color Archway Art Border)	Specifies an art border consisting of repeating images of a color archway. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image: 
decoBlocks (Blocks Art Border)	Specifies an art border consisting of repeating images of a series of blocks. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as

Enumeration Value	Description
	follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly: 
diamondsGray (Gray Diamond Art Border)	Specifies an art border consisting of a repeated image of diamonds, as follows (showing two repetitions): 
dotDash (Dot Dash Line Border)	Specifies a line border consisting of a alternating dotted and dashed line around the parent object. [*Example*: - - - - - - - - - - - - - - - *end example*]
dotDotDash (Dot Dot Dash Line Border)	Specifies a line border consisting of a alternating dotted, dotted, dashed line around the parent object. [*Example*: - - - - - - - - - - - - - - - - - - *end example*]
dotted (Dotted Line Border)	Specifies a line border consisting of a dotted line around the parent object. [*Example*: ..... *end example*]
double (Double Line Border)	Specifies a line border consisting of a double line around the parent object.

Enumeration Value	Description
	[*Example*: *end example*]
doubleD (Double D Art Border)	Specifies an art border consisting of repeating images of a pattern. If the border is on the left, this image is as follows (showing two repetitions):  If the border is on the right, this image is rotated as follows (showing two repetitions):  If the border is on the top, this image is rotated as follows (showing two repetitions):  If the border is on the bottom, this image is rotated as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
doubleDiamonds (Diamond Art Border)	Specifies an art border consisting of a repeated image of a series of diamonds, as follows (showing two repetitions): 

Enumeration Value	Description
doubleWave (Double Wave Line Border)	Specifies a line border consisting of a double wavy line around the parent object. [*Example*:  *end example*]
earth1 (Earth Art Border)	Specifies an art border consisting of a repeated image of Earth, as follows (showing two repetitions): 
earth2 (Earth Art Border)	Specifies an art border consisting of a repeated image of Earth, as follows (showing two repetitions): 
eclipsingSquares1 (Shadowed Square Art Border)	Specifies an art border consisting of a repeated image of a shadowed square, as follows (showing two repetitions): 
eclipsingSquares2 (Shadowed Square Art Border)	Specifies an art border consisting of a repeated image of a shadowed square, as follows (showing two repetitions): 
eggsBlack (Painted Egg Art Border)	Specifies an art border consisting of a repeated image of a painted egg, as follows (showing two repetitions): 
fans (Fans Art Border)	Specifies an art border consisting of a repeated image of fans, as follows (showing two repetitions):

Enumeration Value	Description
	
film (Film Reel Art Border)	Specifies an art border consisting of repeating images of a film reel. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image: 
firecrackers (Firecracker Art Border)	Specifies an art border consisting of a repeated image of a firecracker, as follows (showing two repetitions): 
flowersBlockPrint (Flowers Art Border)	Specifies an art border consisting of a repeated image of flowers, as follows (showing two repetitions): 
flowersDaisies (Daisy Art Border)	Specifies an art border consisting of a repeated image of a daisy, as follows (showing two repetitions): 
flowersModern1 (Flowers Art Border)	Specifies an art border consisting of a repeated image

Enumeration Value	Description
	of flowers, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.
flowersModern2 (Flowers Art Border)	Specifies an art border consisting of a repeated image of flowers, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.
flowersPansy (Pansy Art Border)	Specifies an art border consisting of a repeated image of a pansy, as follows (showing two repetitions): 
flowersRedRose (Red Rose Art Border)	Specifies an art border consisting of a repeated image of a red rose, as follows (showing two repetitions): 
flowersRoses (Roses Art Border)	Specifies an art border consisting of a repeated image of a rose, as follows (showing two repetitions): 
flowersTeacup (Flowers in a Teacup Art Border)	Specifies an art border consisting of a repeated image of flowers in a teacup, as follows (showing two repetitions): 
flowersTiny (Small Flower Art Border)	Specifies an art border consisting of a repeated image

Enumeration Value	Description
	of small flowers, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.
gems (Gems Art Border)	Specifies an art border consisting of a repeated image of a square pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image (shown from the left side - this image shall be flipped horizontally for the right side): 
gingerbreadMan (Gingerbread Man Art Border)	Specifies an art border consisting of a repeated image of a gingerbread man, as follows (showing two repetitions): 
gradient (Triangle Gradient Art Border)	Specifies an art border consisting of a repeated image of a triangle with a gradient pattern as follows (showing two repetitions): 
handmade1 (Handmade Art Border)	Specifies an art border consisting of an image with a handmade appearance. On the top (bottom is flipped vertically), this image shall be a stretched version of the following:

Enumeration Value	Description
	 On the left (right is flipped horizontally), this image shall be a stretched version of the following:
handmade2 (Handmade Art Border)	Specifies an art border consisting of an image with a handmade appearance. On the top (bottom is flipped vertically), this image shall be a stretched version of the following:  On the left (right is flipped horizontally), this image shall be a stretched version of the following:

Enumeration Value	Description
	
heartBalloon (Heart-Shaped Balloon Art Border)	Specifies an art border consisting of a repeated image of a heart-shaped balloon, as follows (showing two repetitions): 
heartGray (Gray Heart Art Border)	Specifies an art border consisting of a repeated image of a heart, as follows (showing two repetitions):
hearts (Hearts Art Border)	Specifies an art border consisting of a repeated image of hearts, as follows (showing two repetitions): 
heebieJeebies (Pattern Art Border)	Specifies an art border consisting of a repeated image

Enumeration Value	Description
	of a pattern as follows (showing two repetitions): 
holly (Holly Art Border)	Specifies an art border consisting of a repeated image of holly, as follows (showing two repetitions): 
houseFunky (House Art Border)	Specifies an art border consisting of a repeated image of a house, as follows (showing two repetitions): 
hypnotic (Circular Art Border)	Specifies an art border consisting of a repeated image of a series of circles, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
iceCreamCones (Ice Cream Cone Art Border)	Specifies an art border consisting of a repeated image of an ice cream cone, as follows (showing two repetitions): 
inset (Inset Line Border)	Specifies a line border consisting of an inset set of lines around the parent object. [*Example*:

Enumeration Value	Description
	end example]
lightBulb (Light Bulb Art Border)	Specifies an art border consisting of a repeated image of a light bulb as follows (showing two repetitions): 
lightning1 (Lightning Art Border)	Specifies an art border consisting of a repeated image of lightning, as follows (showing two repetitions): 
lightning2 (Lightning Art Border)	Specifies an art border consisting of a repeated image of a lightning pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
mapleLeaf (Maple Leaf Art Border)	Specifies an art border consisting of a repeated image of a black and white image of a maple leaf, as follows (showing two repetitions): 
mapleMuffins (Muffin Art Border)	Specifies an art border consisting of a repeated image of a muffin, as follows (showing two repetitions):

Enumeration Value	Description
	
mapPins (Map Pins Art Border)	Specifies an art border consisting of a repeated image of a map pin, as follows (showing two repetitions): 
marquee (Marquee Art Border)	Specifies an art border consisting of a repeated image of a pattern as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
marqueeToothed (Marquee Art Border)	Specifies an art border consisting of a repeated image of a pattern as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
moons (Moon Art Border)	Specifies an art border consisting of repeating images of phases of the moon. If the border is on the top, this image is as follows (showing two repetitions): 

Enumeration Value	Description
	If the border is on the left, this image is as follows (showing two repetitions):  If the border is on the right, this image is as follows (showing two repetitions):  If the border is on the bottom, this image is as follows (showing two repetitions):  At the top-left corner where two borders of this type intersect, the intersection shall use the following image:  At the top-right corner where two borders of this type intersect, the intersection shall use the following image:  At the bottom-left corner where two borders of this type intersect, the intersection shall use the following image:  At the bottom-right corner where two borders of this

Enumeration Value	Description
	type intersect, the intersection shall use the following image: 
mosaic (Mosaic Art Border)	Specifies an art border consisting of a repeated image of a mosaic pattern, as follows (showing two repetitions): 
musicNotes (Musical Note Art Border)	Specifies an art border consisting of a repeated image of a musical note, as follows (showing two repetitions): 
nil (No Border)	Specifies that no border shall be applied to the current item.
none (No Border)	Specifies that no border shall be applied to the current item.
northwest (Patterned Art Border)	Specifies an art border consisting of a repeated image of a pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image: 
outset (Outset Line Border)	Specifies a line border consisting of an outset set of lines around the parent object. [*Example*: *end example*]
ovals (Oval Art Border)	Specifies an art border consisting of a repeated image

Enumeration Value	Description
	of a series of ovals, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image: 
packages (Package Art Border)	Specifies an art border consisting of a repeated image of a package, as follows (showing two repetitions): palmsBlack (Black Palm Tree Art Border)	Specifies an art border consisting of a repeated image of a black and white palm tree, as follows (showing two repetitions): 
palmsColor (Color Palm Tree Art Border)	Specifies an art border consisting of a repeated image of a color palm tree, as follows (showing two repetitions): 
paperClips (Paper Clip Art Border)	Specifies an art border consisting of a repeated image of a paper clip, as follows (showing two repetitions): 
Enumeration Value	Description
papyrus (Papyrus Art Border)	Specifies an art border consisting of repeating images of ovals and an art corner. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image: 
partyFavor (Party Favor Art Border)	Specifies an art border consisting of a repeated image of a party favor, as follows (showing two repetitions): 
partyGlass (Party Glass Art Border)	Specifies an art border consisting of a repeated image of a party glass, as follows (showing two repetitions): 
pencils (Pencils Art Border)	Specifies an art border consisting of a repeated image of a pencil, as follows (showing two repetitions): 
Enumeration Value	Description
people (Character Art Border)	Specifies an art border consisting of a repeated image of a character, as follows (showing two repetitions): 
peopleHats (Character With Hat Art Border)	Specifies an art border consisting of a repeated image of a character with a hat, as follows (showing two repetitions): 
peopleWaving (Waving Character Border)	Specifies an art border consisting of a repeated image of a character waving, as follows (showing two repetitions): 
poinsettias (Poinsettia Art Border)	Specifies an art border consisting of a repeated image of a poinsettia, as follows (showing two repetitions): 
postageStamp (Postage Stamp Art Border)	Specifies an art border consisting of repeating images of a stamp-like pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
pumpkin1 (Pumpkin Art Border)	Specifies an art border consisting of a repeated image of a pumpkin, as follows (showing two repetitions):

Enumeration Value	Description
	
pushPinNote1 (Push Pin Art Border)	Specifies an art border consisting of a black line, as follows: _____ As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. If the top border is of this type, the border shall use the following image in the top left corner: 
pushPinNote2 (Push Pin Art Border)	Specifies an art border consisting of a repeated image of a black line. If the border is on the top, left or right, then the image is as follows (showing two repetitions): _____ If the border is on the bottom, then the image is as follows (showing two repetitions):  If the top border is of this type, the border shall use the following image in the top left corner: pyramids (Pyramid Art Border)	Specifies an art border consisting of repeating images of a pyramid pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the

Enumeration Value	Description
	bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
pyramidsAbove (Pyramid Art Border)	Specifies an art border consisting of a repeated image of a pyramid viewed from above, as follows (showing two repetitions): 
quadrants (Quadrants Art Border)	Specifies an art border consisting of a repeating image of a colored pattern. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
rings (Rings Art Border)	Specifies an art border consisting of a repeated image of a ring, as follows (showing two repetitions): 
safari (Safari Art Border)	Specifies an art border consisting of a repeated image of a print pattern, as follows (showing two repetitions):

Enumeration Value	Description
	
sawtooth (Saw tooth Art Border)	Specifies an art border consisting of repeating images of a saw tooth pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
sawtoothGray (Gray Saw tooth Art Border)	Specifies an art border consisting of repeating images of a saw tooth pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
scaredCat (Scared Cat Art Border)	Specifies an art border consisting of a repeated image of a frightened cat, as follows (showing two repetitions): 
seattle (Umbrella Art Border)	Specifies an art border consisting of a repeated image

Enumeration Value	Description
	of an umbrella, as follows (showing two repetitions): 
shadowedSquares (Shadowed Squares Art Border)	Specifies an art border consisting of a repeated image of squares with a drop shadow, as follows (showing two repetitions): 
sharksTeeth (Shark Tooth Art Border)	Specifies an art border consisting of a repeating image of a shark tooth pattern. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions on the top, the bottom shall be rotated 180 degrees):  At any corner where two borders of this type intersect, the intersection shall use the left and right border.
shorebirdTracks (Bird Tracks Art Border)	Specifies an art border consisting of a repeated image of bird tracks, as follows  As well, this art border shall be rotated such that the bottom of each image is always nearest the text extents.
single (Single Line Border)	Specifies a line border consisting of a single line around the parent object. [Example: _____

Enumeration Value	Description
	end example]
skyrocket (Rocket Art Border)	Specifies an art border consisting of a repeated image of a rocket, as follows (showing two repetitions): 
snowflakeFancy (Snowflake Art Border)	Specifies an art border consisting of a repeated image of a snowflake, as follows (showing two repetitions): 
snowflakes (Snowflake Art Border)	Specifies an art border consisting of a repeated image of a snowflake, as follows (showing two repetitions): sombrero (Sombrero Art Border)	Specifies an art border consisting of a repeated image of a sombrero, as follows (showing two repetitions): 
southwest (Southwest-themed Art Border)	Specifies an art border consisting of a repeated image of a pattern as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image: 
stars (Stars Art Border)	Specifies an art border consisting of a repeated image of stars, as follows (showing two repetitions):

Enumeration Value	Description
	
stars3d (3-D Stars Art Border)	Specifies an art border consisting of a repeated image of three-dimensional stars, as follows (showing two repetitions): 
starsBlack (Stars Art Border)	Specifies an art border consisting of a repeated image of black stars, as follows (showing three repetitions): 
starsShadowed (Stars With Shadows Art Border)	Specifies an art border consisting of a repeated image of stars with a shadow effect, as follows (showing two repetitions): 
starsTop (Stars On Top Art Border)	Specifies an art border consisting of repeating images of stars on the top of the page. If the border is on the left or right, no border is displayed. If the border is on the top, this image is as follows:  If the border is on the bottom, this image is as follows: 
sun (Sun Art Border)	Specifies an art border consisting of a repeated image of the sun, as follows (showing two repetitions): 
swirligig (Whirligig Art Border)	Specifies an art border consisting of a repeated image as follows (showing two repetitions):

Enumeration Value	Description
	
thick (Single Line Border)	Specifies a line border consisting of a single line around the parent object. [*Example*: *end example*]
thickThinLargeGap (Thick, Thin Line Border)	Specifies a line border consisting of a thick line contained within a thin line with a large sized intermediate gap around the parent object. [*Example*:  *end example*]
thickThinMediumGap (Thick, Thin Line Border)	Specifies a line border consisting of a thick line contained within a thin line with a medium sized intermediate gap around the parent object. [*Example*:  *end example*]
thickThinSmallGap (Thick, Thin Line Border)	Specifies a line border consisting of a thick line contained within a thin line with a small intermediate gap around the parent object. [*Example*:  *end example*]
thinThickLargeGap (Thin, Thick Line Border)	Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a large sized intermediate gap between each around the parent object. [*Example*: 

Enumeration Value	Description
	end example]
thinThickMediumGap (Thin, Thick Line Border)	Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a medium sized intermediate gap between each around the parent object. [*Example*:  *end example*]
thinThickSmallGap (Thin, Thick Line Border)	Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a small intermediate gap between each around the parent object. [*Example*:  *end example*]
thinThickThinLargeGap (Thin, Thick, Thin Line Border)	Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a large sized intermediate gap around the parent object. [*Example*:  *end example*]
thinThickThinMediumGap (Thin, Thick, Thin Line Border)	Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a medium sized intermediate gap around the parent object. [*Example*:  *end example*]

Enumeration Value	Description
thinThickThinSmallGap (Thin, Thick, Thin Line Border)	Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a small intermediate gap around the parent object. [*Example*:  *end example*]
threeDEmboss (3D Embossed Line Border)	Specifies a line border consisting of three staged gradient lines around the parent object, getting darker towards the object. [*Example*:  *end example*]
threeDEngrave (3D Engraved Line Border)	Specifies a line border consisting of three staged gradient lines around the parent object, getting darker away from the object. [*Example*:  *end example*]
tornPaper (Torn Paper Art Border)	Specifies an art border consisting of repeating images of stars on the top of the page. If the border is on the left or right, no border is displayed. If the border is on the top or bottom, this image is as follows (shown on top, flipped vertically on bottom): 
tornPaperBlack (Black Torn Paper Art Border)	Specifies an art border consisting of an image with a torn appearance. On the top (bottom border shall be flipped vertically),

Enumeration Value	Description
	this image shall be a stretched version of the following:  On the left (the right side shall be flipped horizontally), this image shall be a stretched version of the following: 
trees (Tree Art Border)	Specifies an art border consisting of a repeated image of a tree, as follows (showing two repetitions): 
triangleParty (Triangle Art Border)	Specifies an art border consisting of a repeated image of triangles, as follows (showing two repetitions):

Enumeration Value	Description
	triangles (Triangles Art Border)	Specifies an art border consisting of a repeating image of a triangle pattern. If the border is on the left or right, this image is as follows (showing two repetitions on the left, the right shall be rotated 180 degrees):  If the border is on the top or bottom, this image is as follows (showing two repetitions on the top, the bottom shall be rotated 180 degrees):  At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
tribal1 (Tribal Art Border One)	Specifies an art border consisting of a repeated image of a tribal pattern as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image: 
tribal2 (Tribal Art Border Two)	Specifies an art border consisting of a repeated image

Enumeration Value	Description
	of a tribal pattern as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
tribal3 (Tribal Art Border Three)	Specifies an art border consisting of a repeated image of a tribal pattern as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
tribal4 (Tribal Art Border Four)	Specifies an art border consisting of a repeated image of a tribal pattern as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
tribal5 (Tribal Art Border Five)	Specifies an art border consisting of a repeating image

Enumeration Value	Description
	of a tribal pattern. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image: 
tribal6 (Tribal Art Border Six)	Specifies an art border consisting of a repeated image of a tribal pattern as follows (showing two repetitions):  At any corner where two borders of this type intersect, the intersection shall use the following image: 
triple (Triple Line Border)	Specifies a line border consisting of a triple line around the parent object. [*Example*: *end example*]
twistedLines1 (Twisted Lines Art Border)	Specifies an art border consisting of a repeated image of twisted lines, as follows (showing two repetitions): 

Enumeration Value	Description
	As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
twistedLines2 (Twisted Lines Art Border)	Specifies an art border consisting of a repeated image of twisted lines, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
vine (Vine Art Border)	Specifies an art border consisting of a repeating image of a vine pattern. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):

Enumeration Value	Description
	 At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
wave (Wavy Line Border)	Specifies a line border consisting of a wavy line around the parent object. [*Example*: *end example*]
waveline (Wavy Line Art Border)	Specifies an art border consisting of a repeated image of wavy lines, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
weavingAngles (Weaving Angles Art Border)	Specifies an art border consisting of a repeated image of weaving angles, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents.

Enumeration Value	Description
	At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
weavingBraid (Weaving Braid Art Border)	Speci Specifies an art border consisting of repeating images of a weaving pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image: 
weavingRibbon (Weaving Ribbon Art Border)	Specifies an art border consisting of repeating images of a weaving ribbon, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly: 
weavingStrips (Weaving Strips Art Border)	Specifies an art border consisting of repeating images of weaving strips, as follows (showing two repetitions): 

Enumeration Value	Description
	As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly: 
whiteFlowers (White Flowers Art Border)	Specifies an art border consisting of a repeating image of white flowers. If the border is on the left or right, this image is as follows (showing two repetitions):  If the border is on the top or bottom, this image is as follows (showing two repetitions):
woodwork (Woodwork Art Border)	Specifies an art border consisting of repeating images of a woodwork pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image: 

Enumeration Value	Description
xIllusions (Crisscross Art Border)	Specifies an art border consisting of repeating images of a crisscross pattern, as follows (showing two repetitions): 
zanyTriangles (Triangle Art Border)	Specifies an art border consisting of repeating images of a triangle pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated appropriately: 
zigZag (Zigzag Art Border)	Specifies an art border consisting of repeating images of a zigzag pattern, as follows (showing two repetitions):  As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly: 
zigZagStitch (Zigzag stitch)	Specifies an art border consisting of a repeating image of a zigzag pattern, as follows (showing two repetitions):

Enumeration Value	Description
	 As well, this art border shall be rotated such that the bottom of the image above is always nearest the text extents. At any corner where two borders of this type intersect, the intersection shall use the following image, rotated accordingly:

2.18.5 ST_BrClear (Line Break Text Wrapping Restart Location)

This simple type specifies the set of possible restart locations which may be used as to determine the next available line when a break's type attribute has a value of `textWrapping`. This property only affects the restart location when the current run is being displayed on a line which does not span the full text extents due to the presence of a floating object (see enumeration values for details).

[*Example*: Consider a text wrapping break character which should force the restart location to the next line which spans the full width of the text extents of the page (there are no floating objects which interrupt the line).

This line break is of type `textWrapping`, since it shall only advance to the next line, but the clear value shall specify that this restart location shall ignore all lines which are not of the full line width by specifying a value of `all`, as follows:

```
<w:br w:type="textWrapping" w:clear="all" />
```

This break shall therefore not use the next available line, but rather the next available line ignoring all lines which do not span the full text width. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (Restart On Next Full Line)	Specifies that the text wrapping break shall advance the text to the next line in the WordprocessingML document which spans the full width of the line (i.e. the next line which is not interrupted by any floating objects when those objects are positioned on the page at display time. [*Note*: This setting is typically used to place a single line of text next to a floating object for use as a caption. *end note*]
left (Restart In Next Text Region When In Leftmost Position)	Specifies that the text wrapping break shall behave as follows: If this line is broken into multiple regions (a floating object in the center of the page has text wrapping on both sides: • If this is the leftmost region of text flow on this line, advance the text to the next position on the line • Otherwise, treat this as a text wrapping break of type `all`. If this line is not broken into multiple regions, then treat this break as a text wrapping break of type none. If the parent paragraph is right to left, then these behaviors are also reversed. [*Note*: This break type is used to control the text wrapping on the left side of a floating image without preventing text from appearing on the opposite side. *end note*]
none (Restart On Next Line)	Specifies that the text wrapping break shall advance the text to the next line in the WordprocessingML document, regardless of its position left to right or the presence of any floating objects which intersect with the line,

Enumeration Value	Description
	This is the setting for a typical line break in a document.
right (Restart In Next Text Region When In Rightmost Position)	Specifies that the text wrapping break shall behave as follows: If this line is broken into multiple regions (a floating object in the center of the page has text wrapping on both sides: • If this is the rightmost region of text flow on this line, advance the text to the next position on the next line • Otherwise, treat this as a text wrapping break of type `all`. If this line is not broken into multiple regions, then treat this break as a text wrapping break of type none. If the parent paragraph is right to left, then these behaviors are also reversed. [*Note*: This break type is used to control the text wrapping on the right side of a floating image without preventing text from appearing on the opposite side. *end note*]

Referenced By
br@clear (§2.3.3.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BrClear">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="left"/>
      <enumeration value="right"/>
      <enumeration value="all"/>
   </restriction>
</simpleType>
```

2.18.6 ST_BrType (Break Types)

This simple type specifies the possible types of break characters in a WordprocessingML document. The break type determines the next location where text shall be placed after this manual break is applied to the text contents (see enumeration values for details).

[*Example*: Consider a manual break which shall advance the text to the next text column in the document, rather than just the next available line. This break would therefore be specified as follows:

```
<w:br w:type=”column”/>
```

The type attribute specifies a value of `column`, which means that the break shall force the next character in the document to be restarted on the next line in a new text column in the document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
column (Column Break)	Specifies that the current break shall restart itself on the next column available on the current page when the document is displayed in page view. If the current section is not divided into columns, or the column break occurs in the last column on the current page when displayed, then the restart location for text shall be the next page in the document.
page (Page Break)	Specifies that the current break shall restart itself on the next page of the document when the document is displayed in page view. Page breaks shall be ignored when present in frames unless the showBreaksInFrames element (§2.15.3.42) is present in the document's compatibility settings.
textWrapping (Line Break)	Specifies that the current break shall restart itself on the next line in the document when the document is displayed in page view. The determine of the next line shall be done subject to the value of the clear attribute on the specified break character.

Referenced By
br@type (§2.3.3.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BrType">
   <restriction base="xsd:string">
      <enumeration value="page"/>
      <enumeration value="column"/>
      <enumeration value="textWrapping"/>
   </restriction>
</simpleType>
```

2.18.7 ST_CalendarType (Calendar Types)

This simple type specifies the possible types of calendars which may be used within the context of a WordprocessingML document.

[*Example*: Consider the following structured document tag properties:

```
<w:sdtPr>
  <w:date w:fullDate="01-01-2006T06:30:00Z">
    <w:calendar w:val="gregorian"/>
  </w:date>
</w:sdtPr>
```

The calendar element specifies that the calendar type for a calendar which may be displayed in the document shall be the Gregorian calendar format (gregorian). *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
gregorian (Gregorian)	Specifies that the Gregorian calendar shall be used. This calendar may be localized into the appropriate language as desired.
gregorianXlitEnglish (Gregorian transliterated English)	Specifies that the Gregorian transliterated English calendar shall be used.
gregorianXlitFrench (Gregorian transliterated French)	Specifies that the Gregorian transliterated French calendar shall be used.
hebrew (Hebrew)	Specifies that the Hebrew lunar calendar shall be used.
hijri (Hijri)	Specifies that the Hijri lunar calendar shall be used.
japan (Japanese Emperor Era)	Specifies that the Japanese Emperor Era calendar shall be used.
korea (Korean Tangun Era)	Specifies that the Korean Tangun Era calendar shall be used.
saka (Saka Era)	Specifies that the Saka Era calendar shall be used.
taiwan (Taiwan)	Specifies that the Taiwanese calendar shall be used.

Enumeration Value	Description
thai (Thai)	Specifies that the Thai calendar shall be used.

Referenced By
calendar@val (§2.5.2.3)

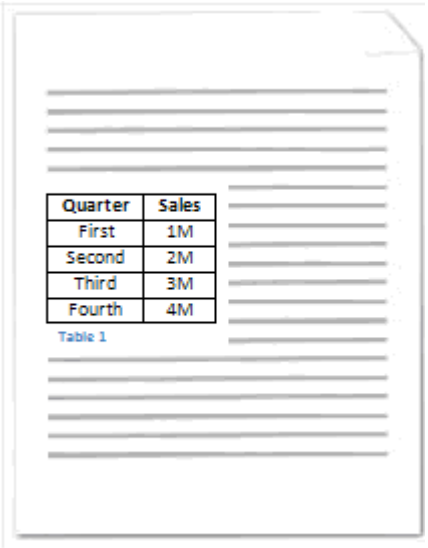
The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CalendarType">
    <restriction base="xsd:string">
        <enumeration value="gregorian"/>
        <enumeration value="hijri"/>
        <enumeration value="hebrew"/>
        <enumeration value="taiwan"/>
        <enumeration value="japan"/>
        <enumeration value="thai"/>
        <enumeration value="korea"/>
        <enumeration value="saka"/>
        <enumeration value="gregorianXlitEnglish"/>
        <enumeration value="gregorianXlitFrench"/>
    </restriction>
</simpleType>
```

2.18.8 ST_CaptionPos (Automatic Caption Positioning Values)

This simple type specifies the possible values may be used for the position of an automatically inserted caption on an object within this document. These values specify the position a given caption shall be take relative to the object it is used to label.

[*Example*: Consider a WordprocessingML document which should have all automatically inserted captions placed below the objects they are captioning, for example:



This requirement is specified using the following WordprocessingML in the document settings:

```
<w:captions>
  <w:caption w:name="Table" w:pos="below" w:numFmt="decimal" />
</w:captions>
```

The pos attribute has a value of below, specifying that the caption shall be placed below the newly inserted objects. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
above (Position Caption Above Object)	Specifies that an automatically inserted caption shall be positioned above the object that it is used to label.
below (Position Caption Below Object)	Specifies that an automatically inserted caption shall be positioned below the object that it is used to label.
left (Position Caption Left Of Object)	Specifies that an automatically inserted caption shall be positioned to the left of the object that it is used to label (the position where text typed immediately before the object would appear).
right (Position Caption Right Of Object)	Specifies that an automatically inserted caption shall be positioned to the right of the object that it is used to label (the position where text typed immediately after the object would appear).

Referenced By
caption@pos (§2.15.1.16)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CaptionPos">
   <restriction base="xsd:string">
      <enumeration value="above"/>
      <enumeration value="below"/>
      <enumeration value="left"/>
      <enumeration value="right"/>
   </restriction>
</simpleType>
```

2.18.9 ST_ChapterSep (Chapter Separator Types)

This simple type specifies the character which shall be used to separate the chapter number from the page number for page numbers in a given section, when chapter numbers are being displayed.

[*Example*: Consider a section in a document in which the chapter shall be separated from the page number using a colon character. This constraint would be specified using the following WordprocessingML:

```
<w:pgNumType w:chapSep="colon" chapStyle="1" />
```

The chapSep attribute declares that the chapter and page number shall be separated by a colon (e.g. 1:1 for chapter one, page one). *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
colon (Colon Chapter Separator)	Specifies that a colon character shall be used to separate the chapter number from the page number when page numbers are displayed. [Example: 1:1 for page one, section one. end example]
emDash (Em Dash Chapter Separator)	Specifies that an em dash character shall be used to separate the chapter number from the page number when page numbers are displayed. [*Example*: 1—1 for page one, section one. *end example*]
enDash (En Dash Chapter Separator)	Specifies that an en dash character shall be used to separate the chapter number from the page number when page numbers are displayed. [*Example*: 1–1 for page one, section one. *end example*]
hyphen (Hyphen Chapter Separator)	Specifies that a non-breaking hyphen character shall be used to separate the chapter number from the page number when page numbers are displayed. [*Example*: 1-1 for page one, section one. *end example*]
period (Period Chapter Separator)	Specifies that a period character shall be used to separate the chapter number from the page number when page numbers are displayed. [*Example*: 1.1 for page one, section one. *end example*]

Referenced By
caption@sep (§2.15.1.16); pgNumType@chapSep (§2.6.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ChapterSep">
   <restriction base="xsd:string">
      <enumeration value="hyphen"/>
      <enumeration value="period"/>
      <enumeration value="colon"/>
      <enumeration value="emDash"/>
      <enumeration value="enDash"/>
   </restriction>
</simpleType>
```

2.18.10 ST_CharacterSpacing (Character-Level Whitespace Compression Settings)

This simple type specifies the possible ways in which full-width characters in the current WordprocessingML document may be compressed to remove additional whitespace when the contents of this document are displayed, specifically by specifying the set(s) of characters which may be compressed to remove additional whitespace.

[*Example*: Consider the WordprocessingML below:

```
<w:characterSpacingControl w:val="dontCompress" />
```

The characterSpacingControl element has a val attribute value of `dontCompress`, which specifies that no character compression shall be applied to any character when the document is displayed. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
compressPunctuation (Compress Whitespace From Punctuation Characters)	Specifies that only whitespace characters shall have whitespace compression applied to them.
compressPunctuationAndJapaneseKana (Compress Whitespace From Both Japanese Kana And Punctuation Characters)	Specifies that whitespace and Japanese kana characters shall have whitespace compression applied to them.
doNotCompress (Do Not Compress Whitespace)	Specifies that characters shall not have whitespace compression applied to them.

Referenced By
characterSpacingControl@val (§2.15.1.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CharacterSpacing">
   <restriction base="xsd:string">
      <enumeration value="doNotCompress"/>
      <enumeration value="compressPunctuation"/>
      <enumeration value="compressPunctuationAndJapaneseKana"/>
   </restriction>
</simpleType>
```

2.18.11 ST_Cnf (Conditional Formatting Bitmask)

This simple type specifies the format for the set of conditional formatting properties that have been applied to this object.

These properties are expressed using a string serialization of a binary bitmask for each of the following properties (reading from the first character position right):

- First Row - Is this the first row of the table?
- Last Row - Is this the last row of the table?
- First Column - Does this belong to the first column of the table?
- Last Column - Does this belong to the last column of the table?
- Band 1 Vertical - Does this belong to a column which should receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered columns (e.g. 1,3,5,...)
- Band 2 Vertical - Does this belong to a column which should receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered columns (e.g. 2,4,6...)
- Band 1 Horizontal - Does this receive band 1 formatting? This property specifies whether the cell should receive the formatting specified for odd-numbered rows (e.g. 1,3,5,...)
- Band 2 Horizontal - Does this receive band 2 formatting? This property specifies whether the cell should receive the formatting specified for even-numbered rows (e.g. 2,4,6...)
- NE Cell - Is this part of the top-right corner of the table?
- NW Cell - Is this part of the top-left corner of the table?
- SE Cell - Is this part of the bottom-right corner of the table?
- SW Cell - Is this part of the bottom-left corner of the table?

For each of these properties, a value of `1` in the specified character position in the string means that the value is true, a value of `0` means false. All values must be specified.

[*Example*: Consider a paragraph in the top right corner of a table with a table style applied. This paragraph would need to specify the following WordprocessingML:

```
<w:p>
  <w:pPr>
    <w:cnfStyle w:val="101000000100" />
```

```
      …
    </w:pPr>
    …
  </w:p>
```

This paragraph specifies that it has the conditional properties from the table style for the first column, first row, and the NW corner of the parent table by setting the appropriate bits in the val attribute. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 12 characters.
- This simple type's contents must match the following regular expression pattern: [01]*.

Referenced By
cnfStyle@val (§2.3.1.8); cnfStyle@val (§2.4.7); cnfStyle@val (§2.4.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Cnf">
   <restriction base="xsd:string">
      <length value="12"/>
      <pattern value="[01]*"/>
   </restriction>
</simpleType>
```

2.18.12 ST_ColorSchemeIndex (Theme Color Reference)

This simple type specifies the possible set of theme color stored in the document's Theme part which can be referenced by document content. This reference is used to map the use of the theme colors in the ST_ThemeColor enumeration to the theme colors in the theme part.

[*Example*: Consider a WordprocessingML document that shall have references to the theme color `accent1` mapped to the theme color lt1 as defined in the document's theme part. This requirement would be specified using the following WordprocessingML in the document settings:

```
<w:clrSchemeMapping w:accent1="light1" />
```

The accent1 attribute has a value of `light1`, specifying that uses of the theme color value `accent1` shall be mapped to the theme color lt1. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
accent1 (Accent 1 Theme Color Reference)	Specifies a reference to the accent1 theme color in the

Enumeration Value	Description
	document's Theme part.
accent2 (Accent 2 Theme Color Reference)	Specifies a reference to the accent2 theme color in the document's Theme part.
accent3 (Accent 3 Theme Color Reference)	Specifies a reference to the accent3 theme color in the document's Theme part.
accent4 (Accent4 Theme Color Reference)	Specifies a reference to the accent4 theme color in the document's Theme part.
accent5 (Accent5 Theme Color Reference)	Specifies a reference to the accent5 theme color in the document's Theme part.
accent6 (Accent 6 Theme Color Reference)	Specifies a reference to the accent6 theme color in the document's Theme part.
dark1 (Dark 1 Theme Color Reference)	Specifies a reference to the dk1 theme color in the document's Theme part.
dark2 (Dark 2 Theme Color Reference)	Specifies a reference to the dk2 theme color in the document's Theme part.
followedHyperlink (Followed Hyperlink Theme Color Reference)	Specifies a reference to the folHlink theme color in the document's Theme part.
hyperlink (Hyperlink Theme Color Reference)	Specifies a reference to the hlink theme color in the document's Theme part.
light1 (Light 1 Theme Color Reference)	Specifies a reference to the lt1 theme color in the document's Theme part.
light2 (Light 2 Theme Color Reference)	Specifies a reference to the lt2 theme color in the document's Theme part.

Referenced By
clrSchemeMapping@accent1 (§2.15.1.20); clrSchemeMapping@accent2 (§2.15.1.20); clrSchemeMapping@accent3 (§2.15.1.20); clrSchemeMapping@accent4 (§2.15.1.20); clrSchemeMapping@accent5 (§2.15.1.20); clrSchemeMapping@accent6 (§2.15.1.20); clrSchemeMapping@bg1 (§2.15.1.20); clrSchemeMapping@bg2 (§2.15.1.20); clrSchemeMapping@followedHyperlink (§2.15.1.20); clrSchemeMapping@hyperlink (§2.15.1.20); clrSchemeMapping@t1 (§2.15.1.20); clrSchemeMapping@t2 (§2.15.1.20)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ColorSchemeIndex">
   <restriction base="xsd:string">
      <enumeration value="dark1"/>
      <enumeration value="light1"/>

      <enumeration value="accent2"/>
      <enumeration value="accent3"/>
      <enumeration value="accent4"/>
      <enumeration value="accent5"/>
      <enumeration value="accent6"/>
      <enumeration value="hyperlink"/>
      <enumeration value="followedHyperlink"/>
   </restriction>
</simpleType>
```

2.18.13 ST_CombineBrackets (Two Lines in One Enclosing Character Type)

This simple type specifies the type of bracket character which shall be used to enclose the two lines in one text within the current run when displayed

[*Example*: Consider a paragraph with the text `two lines in one`, which shall be displayed within a single logical line in the document and enclosed in curly brackets. This constraint would be specified as follows in the WordprocessingML:

```
<w:r>
  <w:rPr>
    <w:eastAsianLayout w:id="1" w:combine="on" w:combineBrackets="curly"/>
  </w:rPr>
  <w:t>two lines in one</w:t>
</w:r>
```

The resulting text would be displayed on two sub lines within the other text on this line and enclosed within `curly` brackets when displayed. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
angle (Angle Brackets)	Specifies that angle bracket characters shall be used to enclose the contents of the current run's two lines in one text. [*Example*: <…> *end example*]
curly (Curly Brackets)	Specifies that curly bracket characters shall be used to

Enumeration Value	Description
	enclose the contents of the current run's two lines in one text. [*Example*: {…} *end example*]
none (No Enclosing Brackets)	Specifies that no characters shall be used to enclose the contents of the current run's two lines in one text.
round (Round Brackets)	Specifies that round bracket characters shall be used to enclose the contents of the current run's two lines in one text. [*Example*: (…) *end example*]
square (Square Brackets)	Specifies that square bracket characters shall be used to enclose the contents of the current run's two lines in one text. [*Example*: […] *end example*]

Referenced By
eastAsianLayout@combineBrackets (§2.3.2.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CombineBrackets">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="round"/>
      <enumeration value="square"/>
      <enumeration value="angle"/>
      <enumeration value="curly"/>
   </restriction>
</simpleType>
```

2.18.14 ST_CryptProv (Cryptographic Provider Types)

This simple type specifies the possible types of cryptographic providers which may be used.

[*Example*: Consider a WordprocessingML document with the following information stored in one of its protection elements:

```
<w:… w:cryptProviderType="rsaAES"
  w:hash="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The cryptProviderType attribute value of rsaAES specifies that the cryptographic provider type shall be an Advanced Encryption Standard provider. *end example*

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
rsaAES (AES Provider)	Specifies that the provider shall support the Advanced Encryption Algorithm standard.
rsaFull (Any Provider)	Specifies that any suitable provider shall be used.

Referenced By
documentProtection@cryptProviderType (§2.15.1.28); writeProtection@cryptProviderType (§2.15.1.94)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CryptProv">
   <restriction base="xsd:string">
      <enumeration value="rsaAES"/>
      <enumeration value="rsaFull"/>
   </restriction>
</simpleType>
```

2.18.15 ST_DateTime (Standard Date and Time Storage Format)

This simple type specifies that its contents will contain a date in the standard XML Schema xsd:dateTime format, whose contents are interpreted based on the context of the parent XML element.

[*Example*: Consider the following WordprocessingML fragment:

```
<w:date w:realDate="01-01-2006T12:00:00Z">
  …
</w:date>
```

In this case, the date in the realDate attribute is the full date associated with the parent date picker structured document. In every case, the value of this type is interpreted in the context of the parent element or attribute. *end example*]

This simple type's contents are a restriction of the XML Schema dateTime datatype.

Referenced By
cellDel@date (§2.13.5.1); cellIns@date (§2.13.5.2); cellMerge@date (§2.13.5.3); comment@date (§2.13.4.2); customXmlDelRangeStart@date (§2.13.5.5); customXmlInsRangeStart@date (§2.13.5.7); customXmlMoveFromRangeStart@date (§2.13.5.9); customXmlMoveToRangeStart@date (§2.13.5.11); date@fullDate (§2.5.2.7); del@date (§2.13.5.12); del@date (§2.13.5.13); del@date (§2.13.5.14); del@date (§2.13.5.15); ins@date (§2.13.5.16); ins@date (§2.13.5.17); ins@date (§2.13.5.18); ins@date (§2.13.5.19); ins@date (§2.13.5.20); moveFrom@date (§2.13.5.21); moveFrom@date (§2.13.5.22); moveFromRangeStart@date (§2.13.5.24); moveTo@date (§2.13.5.25); moveTo@date (§2.13.5.26); moveToRangeStart@date (§2.13.5.28); numberingChange@date (§2.13.5.29); numberingChange@date (§2.13.5.30); pPrChange@date (§2.13.5.31); rPrChange@date (§2.13.5.32); rPrChange@date (§2.13.5.33);

Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DateTime">
   <restriction base="xsd:dateTime"/>
</simpleType>
```

2.18.16 ST_DecimalNumber (Decimal Number Value)

This simple type specifies that its contents will contain a whole decimal number (positive or negative), whose contents are interpreted based on the context of the parent XML element.

[*Example*: Consider the following WordprocessingML fragment:

```
<w:pPr>
  <w:divId w:val="1512645511" />
</w:pPr>
```

The value of the val attribute is the ID of the associated HTML `div`.

However, consider the following fragment:

```
<w:ilvl w:val="1">
  ...
</w:ilvl>
```

In this case, the decimal number in the val attribute is the ID of the associated numbering level. In each case, the value is interpreted in the context of the parent element. *end example*]

This simple type's contents are a restriction of the XML Schema integer datatype.

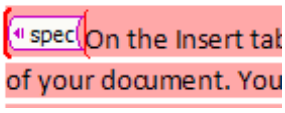
The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DecimalNumber">
   <restriction base="xsd:integer"/>
</simpleType>
```

2.18.17 ST_DisplacedByCustomXml (Location of Custom XML Markup Displacing an Annotation)

This simple type specifies the possible values for the location of a single custom XML element's start and/or end tag relative to the location of an annotation tag in document order. This enumeration shall be used to specify that the parent annotation's placement shall be directly linked with the location of the physical presentation of a custom XML element in the document.

[*Example*: Consider a paragraph with block level custom XML markup and two comment anchor annotations (one before and one after the custom XML element's physical representation), as follows:



Since all three of these items are around the entire paragraph, they are stored outside of the paragraph. However, in order to ensure that their relative positions are stored correctly, any annotation which shall be displaced by the physical custom XML element specifies this information, resulting in the following WordprocessingML:

```
<w:commentRangeStart w:id="0" />
<w:commentRangeStart w:id="1" w:displaced byCustomXml="next" />
<w:customXml w:element="spec" … />
<w:p>
  …
</w:p>
```

The displacedByCustomXml attribute specifies that even though all three of these items are around the paragraph and will be moved inside the paragraph to be represented physically, the comment with ID 0 shall be inside the custom XML, but the comment with ID 1 shall be displaced to stay outside of the relative location of the next custom XML element (the spec element). *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
next (Displaced by Next Custom XML Markup Tag)	Specifies that this annotation anchor shall be displaced by the physical representation of the next element of custom XML markup in the document. If no custom XML markup exists in the same paragraph and after this anchor, then this setting shall be ignored.
prev (Displaced by Previous Custom XML Markup Tag)	Specifies that this annotation anchor shall be displaced by the physical representation of the previous element of custom XML markup in the document. If no custom XML markup exists in the same paragraph and directly before this anchor, then this setting shall be ignored.

Referenced By
bookmarkEnd@displacedByCustomXml (§2.13.6.1); bookmarkStart@displacedByCustomXml (§2.13.6.2); commentRangeEnd@displacedByCustomXml (§2.13.4.3); commentRangeStart@displacedByCustomXml

The following XML Schema fragment defines the contents of this simple type:

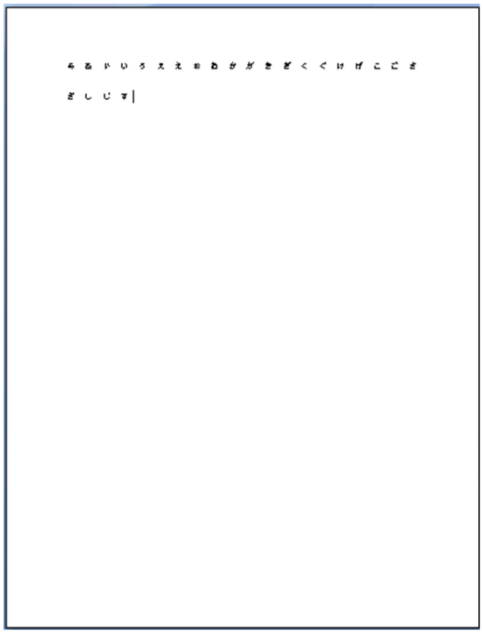
```
<simpleType name="ST_DisplacedByCustomXml">
    <restriction base="xsd:string">
        <enumeration value="next"/>
        <enumeration value="prev"/>
    </restriction>
</simpleType>
```

2.18.18 ST_DocGrid (Document Grid Types)

Specifies the type of the current document grid, which defines the grid behavior.

The grid can define a grid which snaps all East Asian characters to grid positions, but leaves Latin text with its default spacing; a grid which adds the specified character pitch to all characters on each row; or a grid which affects only the line pitch for the current section.

[*Example*: Consider the document discussed above with the document grid defined to allow 20 characters per line, and 20 lines per page by snapping characters to the grid as follows:



This document has a type attribute of type ST_DocGrid and value `snapToChars`, which specifies that the grid shall force East Asian characters to fit 20 to a line. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
default (No Document Grid)	Specifies that no document grid shall be applied to the contents of the current section in the document.
lines (Line Grid Only)	Specifies that the parent section shall have additional line pitch added to each line within it (as specified on the docGrid element (§2.6.5)) in order to maintain the specified number of lines per page.
linesAndChars (Line and Character Grid)	Specifies that the parent section shall have both the additional line pitch and character pitch added to each line and character within it (as specified on the docGrid element (§2.6.5)) in order to maintain a specific number of lines per page and characters per line. When this value is set, the input specified via the user interface may be allowed in exact number of line/character pitch units.
snapToChars (Character Grid Only)	Specifies that the parent section shall have both the additional line pitch and character pitch added to each line and character within it (as specified on the docGrid element (§2.6.5)) in order to maintain a specific number of lines per page and characters per line. When this value is set, the input specified via the user interface may be restricted to the number of lines per page and characters per line, with the consumer or producer translating this information based on the current font data to get the resulting line and character pitch values

Referenced By
docGrid@type (§2.6.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DocGrid">
   <restriction base="xsd:string">
      <enumeration value="default"/>
      <enumeration value="lines"/>
      <enumeration value="linesAndChars"/>
      <enumeration value="snapToChars"/>
   </restriction>
</simpleType>
```

2.18.19 ST_DocPartBehavior (Insertion Behavior Types)

This simple type specifies the possible sets of behaviors which may be applied to the contents of a single glossary document entry (§2.12.5) when it is added to the main document story of a WordprocessingML document.

[*Example*: Consider the WordprocessingML fragment for a glossary document entry containing a single run, defined as follows:

```
<w:docPart>
  <w:docPartPr>
    <w:behaviors>
      <w:behavior w:val="p"/>
    </w:behavior>
    …
  </w:docPartPr>
  <w:docPartBody>
    <w:p>
      <w:r>
        <w:t>Sample entry.</w:t>
      </w:r>
    </w:p>
  </w:docPartBody>
</w:docPart>
```

The behavior element of type ST_DocPartBehavior has a value of p, which specifies that the contents of the parent glossary document entry shall be inserted in their own paragraph when they are added to the contents of a document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
content (Insert Content At Specified Location)	Specifies that when the glossary document entry is inserted into the main document contents of the document, it shall be inserted normally as defined above. This includes ensuring that the final paragraph which is included in the part is not inserted, and its run content is added to the paragraph into which the current part is being inserted.
p (Ensure Entry Is In New Paragraph)	Specifies that the glossary document entry shall be added into its own unique paragraph, by failing to remove the last paragraph from the entry's contents

Enumeration Value	Description
	when they are added to the document.
pg (Ensure Entry Is On New Page)	Specifies that the glossary document entry shall be added into its own new page, by preceding the entry with a blank paragraph whose only content is a page break character.

Referenced By
behavior@val (§2.12.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DocPartBehavior">
   <restriction base="xsd:string">
      <enumeration value="content"/>
      <enumeration value="p"/>
      <enumeration value="pg"/>
   </restriction>
</simpleType>
```

2.18.20 ST_DocPartGallery (Entry Gallery Types)

This simple type specifies possible settings for the predefined gallery into which a glossary document part shall be classified. This classification, although its enumeration values may be interpreted to imply semantics around the contents of the parent glossary document entry, shall only be used to classify and sort this entry (via an application or a user interface).

[*Example*: Consider the following WordprocessingML fragment for the properties of a single glossary document entry:

```
<w:docPartPr>
  <w:category>
    <w:gallery w:val="coverPg" />
    <w:name w:val="Internal Memo Covers" />
  </w:category>
  …
<w:docPartPr>
```

The gallery element with a value of coverPg specifies that the gallery categorization applied to the current entry, for the purposes of classification or user interface sorting, puts this entry into the Cover Pages classification. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
any (All Galleries)	Specifies that this glossary document entry shall be associated with all possible gallery classification values.
autoTxt (AutoText Gallery)	Specifies that this glossary document entry shall be associated with the AutoText gallery classification.
bib (Bibliography Gallery)	Specifies that this glossary document entry shall be associated with the Bibliography gallery classification.
coverPg (Cover Page Gallery)	Specifies that this glossary document entry shall be associated with the Cover Page gallery classification.
custAutoTxt (Custom AutoText Gallery)	Specifies that this glossary document entry shall be associated with the Custom AutoText gallery classification.
custBib (Custom Bibliography Gallery)	Specifies that this glossary document entry shall be associated with the Custom Bibliography gallery classification.
custCoverPg (Custom Cover Page Gallery)	Specifies that this glossary document entry shall be associated with the Custom Cover Page gallery classification.
custEq (Custom Equation Gallery)	Specifies that this glossary document entry shall be associated with the Custom Equation gallery classification.
custFtrs (Custom Footer Gallery)	Specifies that this glossary document entry shall be associated with the Custom Footer gallery classification.
custHdrs (Custom Header Gallery)	Specifies that this glossary document entry shall be associated with the Custom Header gallery classification.
custom1 (Custom 1 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 1 gallery classification.
custom2 (Custom 2 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 2 gallery classification.
custom3 (Custom 3 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 3 gallery classification.
custom4 (Custom 4 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 4 gallery classification.
custom5 (Custom 5 Gallery)	Specifies that this glossary document entry shall be associated with the Custom 5 gallery classification.
custPgNum (Custom Page Number Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number gallery classification.

Enumeration Value	Description
custPgNumB (Custom Page Number At Bottom Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number At Bottom gallery classification.
custPgNumMargins (Custom Page Number At Margins Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number At Margins gallery classification.
custPgNumT (Custom Page Number At Top Gallery)	Specifies that this glossary document entry shall be associated with the Custom Page Number At Top gallery classification.
custQuickParts (Custom Quick Parts Gallery)	Specifies that this glossary document entry shall be associated with the Custom Quick Parts gallery classification.
custTblOfContents (Custom Table of Contents Gallery)	Specifies that this glossary document entry shall be associated with the Custom Table of Contents gallery classification.
custTbls (Custom Table Gallery)	Specifies that this glossary document entry shall be associated with the Custom Tables gallery classification.
custTxtBox (Custom Text Box Gallery)	Specifies that this glossary document entry shall be associated with the Custom Text Box gallery classification.
custWatermarks (Custom Watermark Gallery)	Specifies that this glossary document entry shall be associated with the Custom Watermark gallery classification.
default (No Gallery Classification)	Specifies that this glossary document entry shall not have a gallery classification.
docParts (Document Parts Gallery)	Specifies that this glossary document entry shall be associated with the Document Parts gallery classification.
eq (Equations Gallery)	Specifies that this glossary document entry shall be associated with the Equations gallery classification.
ftrs (Footers Gallery)	Specifies that this glossary document entry shall be associated with the Footers gallery classification.
hdrs (Headers Gallery)	Specifies that this glossary document entry shall be associated with the Headers gallery classification.
pgNum (Page Numbers Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers gallery classification.
pgNumB (Page Numbers At Bottom Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers At Bottom gallery classification.

Enumeration Value	Description
pgNumMargins (Page Numbers At Margins Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers At Margins gallery classification.
pgNumT (Page Numbers At Top Gallery)	Specifies that this glossary document entry shall be associated with the Page Numbers At Top gallery classification.
placeholder (Structured Document Tag Placeholder Text Gallery)	Specifies that this glossary document entry shall be associated with the Structured Document Tag Placeholder Text gallery classification.
tblOfContents (Table of Contents Gallery)	Specifies that this glossary document entry shall be associated with the Table of Contents gallery classification.
tbls (Table Gallery)	Specifies that this glossary document entry shall be associated with the Tables gallery classification.
txtBox (Text Box Gallery)	Specifies that this glossary document entry shall be associated with the Text Box gallery classification.
watermarks (Watermark Gallery)	Specifies that this glossary document entry shall be associated with the Watermark gallery classification.

   </restriction>
</simpleType>
```

2.18.21 ST_DocPartType (Entry Types)

This simple type specifies the possible types which may be applied to the properties of a single glossary document entry (§2.12.5). Each of these types may, based on their values, influence the visibility and behavior of the parent glossary document entry.

[*Example*: Consider the following WordprocessingML fragment for the properties of a single glossary document entry:

```
<w:docPartPr>
  <w:types>
    <w:type w:val="bbPlcHdr" />
  </w:types>
  …
<w:docPartPr>
```

The type element with a value of bbPlcHdr specifies that the parent glossary document entry shall be treated as if it was the placeholder text for one or more structured document tags in the document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autoExp (Automatically Replace Name With Content)	Specifies that the type of the current glossary document entry shall allow the entry to be automatically inserted into the document whenever its name is entered into an application.
bbPlcHdr (Structured Document Tag Placeholder Text)	Specifies that the type of the current glossary document entry shall be structured document tag placeholder text.
formFld (Form Field Help Text)	Specifies that the type of the current glossary document entry shall be form field help text.
none (No Type)	Specifies no type information for the current glossary document entry.
normal (Normal)	Specifies that the type of the current glossary document entry shall be normal (i.e. a regular glossary document entry).
speller (AutoCorrect Entry)	Specifies that the type of the current glossary document entry shall be associated with the spelling and grammar tools.
toolbar (AutoText User Interface Entry)	Specifies that the type of the current glossary document entry shall be associated with a special grouping of entries associated with a single piece of user interface.

Referenced By
type@val (§2.12.15)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DocPartType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="normal"/>
      <enumeration value="autoExp"/>
      <enumeration value="toolbar"/>
      <enumeration value="speller"/>
      <enumeration value="formFld"/>
      <enumeration value="bbPlcHdr"/>
   </restriction>
</simpleType>
```

2.18.22 ST_DocProtect (Document Protection Types)

This simple type specifies the possible set of editing restrictions which may be enforced on a given WordprocessingML document.

[*Example*: Consider a WordprocessingML document that contains the following WordprocessingML specifying that hosting applications shall enforce read-only protection for a given document:

```
<w:documentProtection w:edit="readOnly" w:enforcement="1" />
```

The edit attribute has a value of `readOnly` and an enforcement attribute with a value of `1`, specifying that read-only document protection shall be enforced on the given document. e*nd example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
comments (Allow Editing of Comments)	Specifies that the edits made to this document shall be restricted to: • The insertion and deletion of comments within the document • The editing of regions delimited by range permissions which match the editing rights of the user account which is performing the editing.
forms (Allow Editing of Form Fields)	Specifies that the edits made to this document shall be restricted to: • The editing of form fields in sections where the formProt element (§2.6.6) has a value of `true`. • No restrictions in sections where the formProt element has a value of `false`.
none (No Editing Restrictions)	Specifies that no editing restrictions have been applied to the document.

Enumeration Value	Description
readOnly (Allow No Editing)	Specifies that the edits made to this document shall be restricted to: • The editing of regions delimited by range permissions which match the editing rights of the user account which is performing the editing.
trackedChanges (Allow Editing With Revision Tracking)	Specifies that the edits made to this document shall be tracked as revisions. This value shall imply the presence of the trackRevisions element (§2.15.1.90), and applications shall not allow that element's state to be changed to `false`.

Referenced By
documentProtection@edit (§2.15.1.28)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DocProtect">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="readOnly"/>
      <enumeration value="comments"/>
      <enumeration value="trackedChanges"/>
      <enumeration value="forms"/>
   </restriction>
</simpleType>
```

2.18.23 ST_DocType (Document Classification Values)

This simple type specifies the possible classifications may be used for a WordprocessingML document.

[*Example*: Consider a set of WordprocessingML documents which should be classified as 'letters'. This classification would be specified using the following WordprocessingML in the document settings of these documents:

```
<w:documentType w:val="letter" />
```

The documentType element's val attribute is equal to `letter`, specifying that the hosting application shall apply the behaviors it has specified for letters to the given WordprocessingML document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
eMail (E-Mail Message)	Specifies that this document shall be classified as an e-

Enumeration Value	Description
	mail message.
letter (Letter)	Specifies that this document shall be classified as a letter.
notSpecified (Default Document)	Specifies that this document shall be classified as a default document.

Referenced By
documentType@val (§2.15.1.29)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DocType">
   <restriction base="xsd:string">
      <enumeration value="notSpecified"/>
      <enumeration value="letter"/>
      <enumeration value="eMail"/>
   </restriction>
</simpleType>
```

2.18.24 ST_DropCap (Text Frame Drop Cap Location)

This simple type specifies the location which shall be used to position a drop cap text frame when the contents of that text frame are displayed in the anchor paragraph at display time.

[*Note*: Although a drop cap is simply a text frame, the values of this simple type are used to determine how the cap should be positioned relative to the following non-frame paragraph in relative terms (see enumeration values), rather than relying on absolute sizing. *end note*]

[*Example*: Consider the following paragraph containing a text frame which should be positioned as a drop cap:

```
<w:p>
  <w:pPr>
    <w:framePr w:dropCap="margin" w:lines="3" w:hSpace="432" w:wrap="around"
w:vAnchor="text" w:hAnchor="page" />
  </w:pPr>
  <w:r>
    <w:t>A</w:t>
  </w:r>
</w:p>
```

The dropCap attribute specifies a value of `margin`, so this drop cap will be placed outside of the text margin before the start of the current text. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
drop (Drop Cap Inside Margin)	Specifies that the drop cap text frame shall be positioned inside the text margin on the anchor paragraph when this text frame is displayed in the document.
margin (Drop Cap Outside Margin)	Specifies that the drop cap text frame shall be positioned outside of the text margin on the anchor paragraph when this text frame is displayed in the document.
none (Not Drop Cap)	Specifies that this text frame is not a drop cap text frame.

Referenced By
framePr@dropCap (§2.3.1.11)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DropCap">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="drop"/>
      <enumeration value="margin"/>
   </restriction>
</simpleType>
```

2.18.25 ST_EdGrp (Range Permision Editing Group)

This simple type specifies the set of possible aliases (or editing groups) which may be used as aliases to determine if the current user shall be allowed to edit a single range defined by a range permission within a document. This mechanism simply provides a set of predefined editing groups which may be associated with user accounts by applications in any desired manner.

[*Example*: Consider a range permission defined as follows:

```
<w:permStart w:id="0" w:edGrp="editors" … />
…
<w:permEnd w:id="0" />
```

The edGrp attribute value of `editors` specifies that only user(s) who the current application associates with the editors group shall be allowed to edit the contents between the start and end markers when document protection is being enforced. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
administrators (Administrator Group)	Specifies that users associated with the Administrators group shall be allowed to edit range permissions using this editing group when document protection is enabled.
contributors (Contributors Group)	Specifies that users associated with the Contributors group shall be allowed to edit range permissions using this editing group when document protection is enabled.
current (Current Group)	Specifies that users associated with the Current group shall be allowed to edit range permissions using this editing group when document protection is enabled.
editors (Editors Group)	Specifies that users associated with the Editors group shall be allowed to edit range permissions using this editing group when document protection is enabled.
everyone (All Users Have Editing Permissions)	Specifies that all users that open the document shall be allowed to edit range permissions using this editing group when document protection is enabled.
none (No Users Have Editing Permissions)	Specifies that none of the users that open the document shall be allowed to edit range permissions using this editing group when document protection is enabled.
owners (Owners Group)	Specifies that users associated with the Owners group shall be allowed to edit range permissions using this editing group when document protection is enabled.

Referenced By
permStart@edGrp (§2.13.7.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_EdGrp">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="everyone"/>
      <enumeration value="administrators"/>
      <enumeration value="contributors"/>
      <enumeration value="editors"/>
      <enumeration value="owners"/>
      <enumeration value="current"/>
   </restriction>
</simpleType>
```

2.18.26 ST_EdnPos (Endnote Positioning Location)

This simple type specifies the possible positions of endnotes in a document.

[*Example*: Consider a document in which endnotes shall be positioned at the end of the section. The section properties for this section shall be declared as follows:

```
<w:settings>
  <w:endnotePr>
    <w:pos w:val="endSect" />
  </w:endnotePr>
  …
</w:settings>
```

The val attribute is endSect, therefore the position of endnotes is specified to be at the end of the section. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
docEnd (Endnotes Positioned at End of Document)	Specifies that all endnotes shall be placed at the end of the current document, regardless of which section they are referenced within.
sectEnd (Endnotes Positioned at End of Section)	Specifies that endnotes shall be placed at the end of the section in which they are referenced. An endnote which is never referenced is never displayed.

Referenced By
pos@val (§2.11.22)

```
<simpleType name="ST_EdnPos">
   <restriction base="xsd:string">
      <enumeration value="sectEnd"/>
      <enumeration value="docEnd"/>
   </restriction>
</simpleType>
```

2.18.27 ST_EighthPointMeasure (Measurement in Eighths of a Point)

This simple type specifies that its contents will contain a positive whole number, whose contents consist of a measurement in eighths of a point (equivalent to 1/576th of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of 24 whose type is ST_EighthPointMeasure. This attribute value specifies a size in eighths of a point (24 eighths of a point = 3 points). *end example*]

This simple type's contents are a restriction of the ST_UnsignedDecimalNumber simple type (§2.18.108).

Referenced By
bar@sz (§2.3.1.4); bdr@sz (§2.3.2.3); between@sz (§2.3.1.5); bottom@sz (§2.6.2); bottom@sz (§2.4.3); bottom@sz (§2.4.4); bottom@sz (§2.15.2.4); bottom@sz (§2.3.1.7); insideH@sz (§2.4.17); insideH@sz (§2.4.18); insideV@sz (§2.4.19); insideV@sz (§2.4.20); left@sz (§2.15.2.21); left@sz (§2.4.24); left@sz (§2.6.7); left@sz (§2.3.1.17); left@sz (§2.4.27); right@sz (§2.3.1.28); right@sz (§2.4.30); right@sz (§2.6.15); right@sz (§2.15.2.35); right@sz (§2.4.32); tl2br@sz (§2.4.70); top@sz (§2.4.71); top@sz (§2.3.1.42); top@sz (§2.15.2.42); top@sz (§2.4.74); top@sz (§2.6.21); tr2bl@sz (§2.4.76)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_EighthPointMeasure">
   <restriction base="ST_UnsignedDecimalNumber"/>
</simpleType>
```

2.18.28 ST_Em (Emphasis Mark Type)

This simple type specifies possible types of emphasis marks which may be displayed for each non-space character in a run. This character is rendered above or below the character glyph as specified by enumeration values.

[*Example*: Consider a run of text which shall have a dot underneath each character as an emphasis mark. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
  <w:em w:val="dot"/>
</w:rPr>
```

This run explicitly declares that the emphasis mark type is dot, so the contents of this run will have a dot emphasis mark above each character. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
circle (Circle Emphasis Mark Above Characters)	Specifies that the emphasis mark is a circle character which shall be rendered above each character in this run using Unicode character 0x02DA when the language of the text is not Traditional Chinese. For that language Unicode character 0x3002 shall be

Enumeration Value	Description
	used instead, positioned beneath the characters.
comma (Comma Emphasis Mark Above Characters)	Specifies that the emphasis mark is a comma character which shall be rendered above each character in this run, using Unicode character 0x3001.
dot (Dot Emphasis Mark Above Characters)	Specifies that the emphasis mark is a dot character which shall be rendered above each character in this run using Unicode character 0x02D9 whenever the language of the text is not Japanese, Simplified Chinese, or Traditional Chinese. For those three languages, the emphasis mark shall be rendered as follows: • Japanese = Unicode character 0xFF0E (dot beneath characters) • Simplified Chinese = Unicode character 0xFF0E (dot beneath characters) • Traditional Chinese = Unicode character 0x2027
none (No Emphasis Mark)	Specifies that there shall be no emphasis mark for any character in this run.
underDot (Dot Emphasis Mark Below Characters)	Specifies that the emphasis mark is a dot character which shall be rendered below each character in this run using Unicode character 0xFF0E.

Referenced By
em@val (§2.3.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Em">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="dot"/>
      <enumeration value="comma"/>
      <enumeration value="circle"/>
      <enumeration value="underDot"/>
   </restriction>
</simpleType>
```

2.18.29 ST_FFHelpTextVal (Help Text Value)

This simple type specifies the format of optional help text which may be associated with the parent form field.

[*Example*: Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
  <w:ffData>
    <w:helpText w:type="text" w:val="Example help text." />
    <w:ddList>
      …
    </w:ddList>
  </w:ffData>
</w:fldSimple>
```

The helpText element specifies the help text for the parent form field - in this case, literal help text consisting of the string `Example help text.` *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 256 characters.

Referenced By
helpText@val (§2.16.23)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FFHelpTextVal">
   <restriction base="xsd:string">
      <maxLength value="256"/>
   </restriction>
</simpleType>
```

2.18.30 ST_FFName (Form Field Name Value)

This simple type specifies the format of the name which may be associated with the parent form field.

[*Example*: Consider the following WordprocessingML fragment for a text box form field:

```
<w:fldSimple w:instr="FORMTEXT">
  <w:ffData>
    <w:name w:val="FirstName"/>
    <w:textInput>
      …
    </w:textInput>
  </w:ffData>
</w:fldSimple>
```

The name element specifies that the name of the current form field is `FirstName`. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 65 characters.

Referenced By
name@val (§2.16.28)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FFName">
   <restriction base="xsd:string">
      <maxLength value="65"/>
   </restriction>
</simpleType>
```

2.18.31 ST_FFStatusTextVal (Status Text Value)

This simple type specifies the format of optional status text which may be associated with the parent form field.

[*Example*: Consider the following WordprocessingML fragment for a drop-down list form field:

```
<w:fldSimple w:instr="FORMDROPDOWN">
  <w:ffData>
    <w:statusText w:type="text" w:val="Example status text." />
    <w:ddList>
      …
    </w:ddList>
  </w:ffData>
</w:fldSimple>
```

The statusText element specifies the status text for the parent form field - in this case, literal text consisting of the string `Example status text.` *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 140 characters.

Referenced By
statusText@val (§2.16.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FFStatusTextVal">
   <restriction base="xsd:string">
      <maxLength value="140"/>
   </restriction>
</simpleType>
```

2.18.32 ST_FFTextType (Text Box Form Field Type Values)

This simple type specifies the possible types of the contents of a text box form field.

[*Example*: Consider the following WordprocessingML fragment for the properties of a text box form field:

```
<w:ffData>
  <w:textInput>
    <w:type w:val="number" />
    <w:maxLength w:val="4" />
    <w:format w:val="0.00" />
  </w:textInput>
</w:ffData>
```

The type element specifies that the contents of this form field should be handled as a `number` by an application. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
calculated (Field Calculation)	Specifies that the contents of this text box form field shall be the result of the field calculation specified by the corresponding default element (§2.16.10). This field should not be directly editable when the editing of form fields is enabled.
currentDate (Current Date Display)	Specifies that the contents of this text box form field shall be the current date when the field is updated.
currentTime (Current Time Display)	Specifies that the contents of this text box form field shall be the current time when the field is updated.
date (Date)	Specifies that the contents of this text box form field shall be treated as a date.
number (Number)	Specifies that the contents of this text box form field shall be treated as a number value.
regular (Text Box)	Specifies that this text form field is a plain text field (no additional content restrictions).

Referenced By
type@val (§2.16.34)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FFTextType">
   <restriction base="xsd:string">
      <enumeration value="regular"/>
      <enumeration value="number"/>
      <enumeration value="date"/>
      <enumeration value="currentTime"/>
      <enumeration value="currentDate"/>
      <enumeration value="calculated"/>
   </restriction>
</simpleType>
```

2.18.33 ST_FldCharType (Complex Field Character Type)

This simple type specifies the possible values for the type of a single complex field character in the document.

[*Example*: Consider the following WordprocessingML for a complex field character:

```
…
<w:fldChar w:type="separate" />
…
```

The type attribute value of `separate` specifies that this is a complex field separator character; therefore it is being used to separate the field codes from the field contents in a complex field. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
begin (Start Character)	Specifies that the character is a start character, which defines the start of a complex field.
end (End Character)	Specifies that the character is an end character, which defines the end of a complex field.
separate (Separator Character)	Specifies that the character is a separator character, which defines the end of the field codes and the start of the field result for a complex field.

Referenced By
fldChar@fldCharType (§2.16.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FldCharType">
   <restriction base="xsd:string">
      <enumeration value="begin"/>
      <enumeration value="separate"/>
      <enumeration value="end"/>
   </restriction>
</simpleType>
```

2.18.34 ST_FontFamily (Font Family Value)

This simple type specifies possible values for the font family of a font.

[*Example*: Consider the following information stored for a single font:

```
<w:font w:name="Calibri">
  <w:family w:val="swiss" />
  …
</w:font>
```

The family element specifies via its val attribute value of `swiss` that this font is part of the Swiss family. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (No Font Family)	Specifies that information about a font's font family does not exist.
decorative (Novelty Font)	Specifies the Novelty font family.
modern (Monospace Font)	Specifies a monospace font with or without serifs (monospace fonts are usually modern).
roman (Proportional Font With Serifs)	Specifies a proportional font with serifs.
script (Script Font)	Specifies a script font designed to mimic the appearance of handwriting.
swiss (Proportional Font Without Serifs)	Specifies a proportional font without serifs.

Referenced By
family@val (§2.8.2.9)

The following XML Schema fragment defines the contents of this simple type:

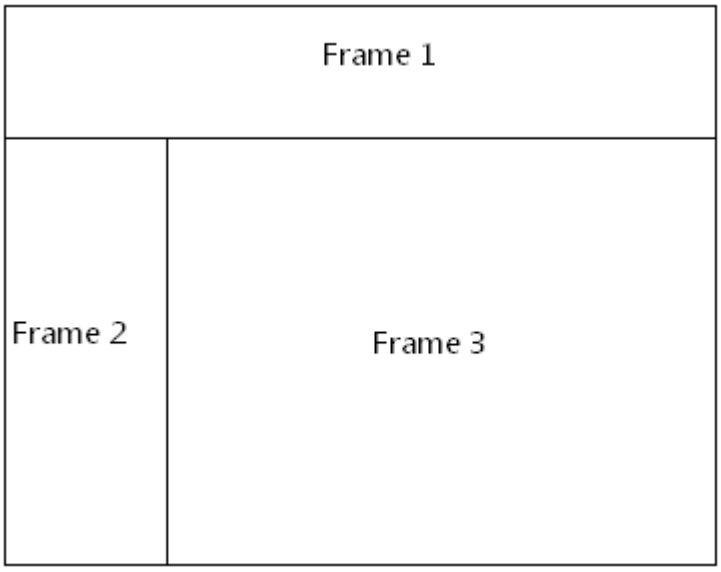
```
<simpleType name="ST_FontFamily">
   <restriction base="xsd:string">
      <enumeration value="decorative"/>
      <enumeration value="modern"/>
      <enumeration value="roman"/>
      <enumeration value="script"/>
      <enumeration value="swiss"/>
      <enumeration value="auto"/>
   </restriction>
</simpleType>
```

2.18.35 ST_FrameLayout (Frameset Layout Order)

This simple type specifies the possible order in which the frames (and nested framesets) in a frameset may be displayed. When a frameset is created, it can only contain frames which are stacked in one direction:

- Vertically (one on top of another)
- Horizontally (one next to another)

[*Example*: Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:



The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
  <w:frameLayout w:val="rows" />
  <w:frame>
    …
  </w:frame>
```

```
    <w:frameset>
      <w:frameLayout w:val="cols" />
      <w:frame>
        …
      </w:frame>
      <w:frame>
        …
      </w:frame>
    </w:frameset>
  </w:frameset>
```

The frameLayout element specifies that the outer frameset is consists of the single frame and the child frameset stacked vertically, and an inner nested frameset consisting of two frames stacked horizontally. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cols (Stack Frames Horizontally)	Specifies that the frames in the frameset shall be stacked horizontally next to each other in left to right order.
none (Do Not Stack Frames)	Specifies that no frames shall be shown in the frameset.
rows (Stack Frames Vertically)	Specifies that the frames in the frameset shall be stacked vertically next to each other in top to bottom order.

Referenced By
frameLayout@val (§2.15.2.17)

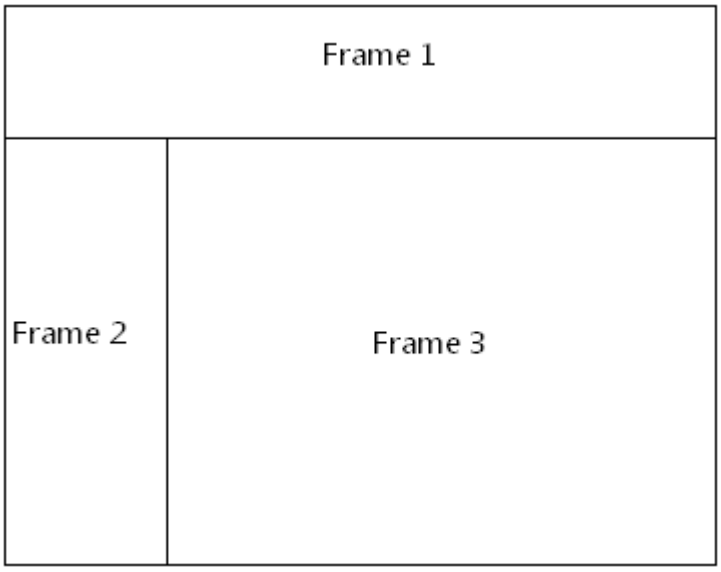
The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FrameLayout">
   <restriction base="xsd:string">
      <enumeration value="rows"/>
      <enumeration value="cols"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

2.18.36 ST_FrameScrollbar (Frame Scrollbar Visibility)

This simple type specifies the possible settings for when a scrollbar shall be visible for the contents of the current frame.

[*Example*: Consider a WordprocessingML document which serves as the frameset container for a frameset consisting of the following three frames:



The frameset properties for this document are specified by the following WordprocessingML within the web page settings:

```
<w:frameset>
  …
  <w:frameset>
    …
    <w:frame>
      <w:name w:val="Frame 2" />
      <w:scrollbar w:val="auto" />
    </w:frame>
    …
  </w:frameset>
</w:frameset>
```

The scrollbar element has a val attribute of auto, which specifies that the frame shall only display a scrollbar when it is needed to display all of its content. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatically Show Scrollbar As Needed)	Specifies that the scrollbar for a frame shall automatically be hidden and/or displayed as needed based on the length of the contents.

Enumeration Value	Description
off (Never Show Scrollbar)	Specifies that the scrollbar for a frame shall always be hidden.
on (Always Show Scrollbar)	Specifies that the scrollbar for a frame shall always be displayed (even when not needed).

Referenced By
scrollbar@val (§2.15.2.37)

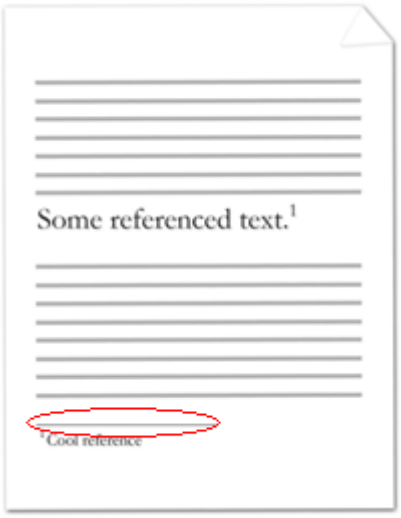
The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FrameScrollbar">
   <restriction base="xsd:string">
      <enumeration value="on"/>
      <enumeration value="off"/>
      <enumeration value="auto"/>
   </restriction>
</simpleType>
```

2.18.37 ST_FtnEdn (Footnote or Endnote Type)

This simple type specifies the possible types of footnotes and endnotes which may be specified in a WordprocessingML document.

[*Example*: Consider a document with a single footnote at the bottom of the first page. This footnote shall be separated from the text by the `separator` footnote (the footnote explicitly used to separate text from the footnote list (circled in red below):



This footnote type would be declared as follows in the WordprocessingML:

```
<w:footnote w:type="separator" w:id="0">
```

```
    …
</w:footnote>
```

In this example, the footnote has a type value of `separator`, specifies when this footnote shall be used. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
continuationNotice (Continuation Notice Separator)	Specifies that this footnote or endnote is a continuation notice footnote or endnote. *Continuation notice footnotes and endnotes* are used when the footnotes or endnotes exceed the length allowed on a single page. When this happens, this footnote or endnote shall be placed on the bottom of each page where the note shall continue to indicate that fact to the reader.
continuationSeparator (Continuation Separator)	Specifies that this footnote or endnote is a continuation separator footnote or endnote. *Continuation separator footnotes and endnotes* are used when the footnotes or endnotes exceed the length allowed on a single page. When this happens, this footnote or endnote shall be placed between the main text contents and the continued footnotes/endnotes on all subsequent pages of the document.
normal (Normal Footnote/Endnote)	Specifies that this footnote or endnote is a normal footnote or endnote, and can be referenced by main document content.
separator (Separator)	Specifies that this footnote or endnote is a separator footnote or endnote. *Separator footnotes and endnotes* are used to indicate the separation between the main document's content and the footnotes or endnotes to indicate that fact to the reader.

Referenced By
endnote@type (§2.11.2); footnote@type (§2.11.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FtnEdn">
   <restriction base="xsd:string">
      <enumeration value="normal"/>
      <enumeration value="separator"/>
      <enumeration value="continuationSeparator"/>
      <enumeration value="continuationNotice"/>
   </restriction>
</simpleType>
```

2.18.38 ST_FtnPos (Footnote Positioning Location)

This simple type specifies the position of footnotes in the document.

[*Example*: Consider a document in which footnotes shall be positioned beneath their text. The footnote properties for this document shall be declared as follows:

```
<w:sectPr>
  <w:footnotePr>
    <w:pos w:val="beneathText" />
  </w:footnotePr>
  …
</w:sectPr>
```

The val attribute is `beneathText`, therefore the position of footnotes is specified to be beneath the page's text. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
beneathText (Footnotes Positioned Beneath Text)	Specifies that footnotes shall be displayed immediately after the last line of text on the page on which the note reference mark appears.
docEnd (Footnotes Positioned At End of Document)	Specifies that all footnotes shall be placed at the end of the current document, regardless of which section they are referenced within.
pageBottom (Footnotes Positioned at Page Bottom)	Specifies that footnotes shall be displayed at the bottom margin of the page on which the note reference mark appears.
sectEnd (Footnotes Positioned At End of Section)	Specifies that all footnotes shall be placed at the end of the section in which they are referenced. A footnote which is never referenced is never displayed.

Referenced By
pos@val (§2.11.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FtnPos">
   <restriction base="xsd:string">
      <enumeration value="pageBottom"/>
      <enumeration value="beneathText"/>
      <enumeration value="sectEnd"/>
      <enumeration value="docEnd"/>
   </restriction>
</simpleType>
```

2.18.39 ST_Guid (128-Bit GUID)

This simple type specifies that its values shall be a 128-bit globally unique identifier (GUID) value.

[*Example*: Consider the following WordprocessingML fragment for the properties of a single glossary document entry:

```
<w:docPartPr>
  …
  <w:guid w:val="{00000000-5BD2-4BC8-9F70-7020E1357FB2}" />
  …
<w:docPartPr>
```

The guid element specifies that the unique identifier associated with the parent entry shall be `{00000000-5BD2-4BC8-9F70-7020E1357FB2}`. This value may be used as needed by an application, for example, to uniquely identify a part regardless of its name. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: \{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}.

Referenced By
embedBold@fontKey (§2.8.2.3); embedBoldItalic@fontKey (§2.8.2.4); embedItalic@fontKey (§2.8.2.5); embedRegular@fontKey (§2.8.2.6); guid@val (§2.12.11)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Guid">
   <restriction base="xsd:token">
      <pattern value="\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}"/>
   </restriction>
</simpleType>
```

2.18.40 ST_HAnchor (Horizontal Anchor Location)

This simple type specifies the horizontal position to which the parent object has been anchored in the document. This anchor position shall be used as the base location to determine the final horizontal position of the object in the document.

[*Example*: Consider a text frame which should be positioned one inch to the right of its column in a left-to-right document. This text frame would be specified using the following WordprocessingML:

```
<w:pPr>
  <w:framePr … w:x="1440" w:hAnchor="margin" />
</w:pPr>
```

These frame horizontal anchor properties specify that they are relative to the anchor paragraph's `margin` (the text margin excluding any indents). *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
margin (Relative To Margin)	Specifies that the parent object shall be horizontally anchored to the text margins. This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the text margin.
page (Relative to Page)	Specifies that the parent object shall be horizontally anchored to the page edge. This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the page.
text (Relative to Text Extents)	Specifies that the parent object shall be horizontally anchored to the text extents. This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the text in the anchor paragraph (including text indentations on that paragraph within the text margins).

Referenced By
framePr@hAnchor (§2.3.1.11); tblpPr@horzAnchor (§2.4.54)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HAnchor">
   <restriction base="xsd:string">
      <enumeration value="text"/>
      <enumeration value="margin"/>
      <enumeration value="page"/>
   </restriction>
</simpleType>
```

2.18.41 ST_HdrFtr (Header or Footer Type)

This simple type specifies the possible types of headers and footers which may be specified for a given header or footer reference in a document. This value determines the page(s) on which the current header or footer shall be displayed.

[*Example*: Consider a WordprocessingML section which specifies the following header reference:

```
<w:headerReference r:id="rId10" w:type="first" />
```

The resulting section shall use the specified header part for the `first` page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
default (Default Header or Footer)	Specifies that this header or footer shall appear on every page in this section which is not overridden with a specific `even` or `first` page header/footer. In a section with all three types specified, this type shall be used on all odd numbered pages (counting from the first page in the section, not the section numbering).
even (Even Numbered Pages Only)	Specifies that this header or footer shall appear on all even numbered pages in this section (counting from the first page in the section, not the section numbering). The appearance of this header or footer is contingent on the setting of the evenAndOddHeaders element (§2.10.1).
first (First Page Only)	Specifies that this header or footer shall appear on the first page in this section. The appearance of this header or footer is contingent on the setting of the titlePg element (§2.10.6).

Referenced By
footerReference@type (§2.10.2); headerReference@type (§2.10.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HdrFtr">
   <restriction base="xsd:string">
      <enumeration value="even"/>
      <enumeration value="default"/>
      <enumeration value="first"/>
   </restriction>
</simpleType>
```

2.18.42 ST_HeightRule (Height Rule)

This simple type specifies the logic which shall be used to calculate the height of the parent object when it is displayed in the document.

[*Example*: Consider the following table row:

```
<w:trPr>
  <w:trHeight w:hRule=”atLeast” w:val=”2189” />
</w:trPr>
```

The val attribute specifies a value of 2189 twentieths of a point, so this table row will be a minimum of 2189 twentieths of a point high regardless of its contents, since its hRule value is set to `atLeast`. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
atLeast (Minimum Height)	Specifies that the height of the parent object shall be at least the value specified, but may be expanded to fit its content as needed.
auto (Determine Height Based On Contents)	Specifies that the height of the parent object shall be automatically determined by the size of its contents, with no predetermined minimum or maximum size.
exact (Exact Height)	Specifies that the height of the parent object shall be exactly the value specified, regardless of the size of the contents of the object. If the contents are too large for the specified height, then they shall be clipped.

framePr@hRule (§2.3.1.11); trHeight@hRule (§2.4.77)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HeightRule">
   <restriction base="xsd:string">
      <enumeration value="auto"/>
      <enumeration value="exact"/>
      <enumeration value="atLeast"/>
   </restriction>
</simpleType>
```

2.18.43 ST_HexColor (Color Value)

This simple type specifies that its contents will contain one of the following:

- A color values in RRGGBB format (ST_HexColorRGB)
- The enumeration value `auto` (ST_HexColorAuto)

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider a border color with value `auto`, as follows:

```
<w:bottom … w:color="auto"/>
```

This color therefore may be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. *end example*]

This simple type is defined as a union of the following types:

- TheST_HexColorAuto simple type (§2.18.44).
- TheST_HexColorRGB simple type (§2.18.45).

Referenced By
background@color (§2.2.1); bar@color (§2.3.1.4); bdr@color (§2.3.2.3); between@color (§2.3.1.5); bottom@color (§2.6.2); bottom@color (§2.4.3); bottom@color (§2.4.4); bottom@color (§2.15.2.4); bottom@color (§2.3.1.7); color@val (§2.3.2.5); color@val (§2.15.2.5); insideH@color (§2.4.17); insideH@color (§2.4.18); insideV@color (§2.4.19); insideV@color (§2.4.20); left@color (§2.15.2.21); left@color (§2.4.24); left@color (§2.6.7); left@color (§2.3.1.17); left@color (§2.4.27); right@color (§2.3.1.28); right@color (§2.4.30); right@color (§2.6.15); right@color (§2.15.2.35); right@color (§2.4.32); shd@color (§2.3.2.30); shd@color (§2.4.33); shd@color (§2.4.34); shd@color (§2.4.35); shd@color (§2.3.1.31); shd@fill (§2.3.2.30); shd@fill (§2.4.33); shd@fill (§2.4.34); shd@fill (§2.4.35); shd@fill (§2.3.1.31); tl2br@color (§2.4.70); top@color (§2.4.71); top@color (§2.3.1.42); top@color (§2.15.2.42); top@color (§2.4.74); top@color (§2.6.21); tr2bl@color (§2.4.76); u@color (§2.3.2.38)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HexColor">
   <union memberTypes="ST_HexColorAuto ST_HexColorRGB"/>
</simpleType>
```

2.18.44 ST_HexColorAuto ('Automatic' Color Value)

This simple type specifies that its contents will contain the enumeration value auto. This value shall be used to specify an automatically determined color value, the meaning of which is interpreted based on the context of the parent XML element.

[*Example*: Consider a border color with value auto, as follows:

```
<w:bottom … w:color="auto"/>
```

This color therefore may be automatically be modified by a consumer as appropriate, for example, in order to ensure that the border can be distinguished against the page's background color. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatically Determined Color)	Specifies that the color value may automatically be defined when this document is processed, based on the display context.

Referenced By
ST_HexColor (§2.18.43)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HexColorAuto">
   <restriction base="xsd:string">
      <enumeration value="auto"/>
   </restriction>
</simpleType>
```

2.18.45 ST_HexColorRGB (Hexadecimal Color Value)

This simple type specifies that its contents shall contain a color value in RRGGBB hexadecimal format. This specifies that each of the red, green, and blue color values form 0-255 will be encoded as a two-digit hexadecimal number.

[*Example*: Consider a color defined as follows:

```
Red:      122
Green:    23
```

```
Blue:     209
```

The resulting RRGGBB value would be 7A17D1, as each color is transformed into its hexadecimal equivalent. *end example*]

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 3 characters.

Referenced By
ST_HexColor (§2.18.43)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HexColorRGB">
   <restriction base="xsd:hexBinary">
      <length value="3" fixed="true"/>
   </restriction>
</simpleType>
```

2.18.46 ST_HighlightColor (Text Highlight Colors)

This simple type specifies the possible values for highlighting colors which may be applied as a background behind the contents of a text run.

[*Example*: Consider a run within a paragraph which has yellow text highlighting using the highlight element. This formatting is specified using the following WordprocessingML:

```
<w:rPr>
  <w:highlight w:val="yellow" />
</w:rPr>
```

The resulting run would have yellow highlighting visible over its contents. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
black (Black Highlighting Color)	Specifies that the text highlighting color for this run shall be black. The hexadecimal RGB value for this setting shall be 000000.
blue (Blue Highlighting Color)	Specifies that the text highlighting color for this run shall be blue.

Enumeration Value	Description
	The hexadecimal RGB value for this setting shall be 0000FF.
cyan (Cyan Highlighting Color)	Specifies that the text highlighting color for this run shall be cyan. The hexadecimal RGB value for this setting shall be 00FFFF.
darkBlue (Dark Blue Highlighting Color)	Specifies that the text highlighting color for this run shall be dark blue. The hexadecimal RGB value for this setting shall be 000080.
darkCyan (Dark Cyan Highlighting Color)	Specifies that the text highlighting color for this run shall be dark cyan. The hexadecimal RGB value for this setting shall be 008080.
darkGray (Dark Gray Highlighting Color)	Specifies that the text highlighting color for this run shall be dark gray. The hexadecimal RGB value for this setting shall be 808080.
darkGreen (Dark Green Highlighting Color)	Specifies that the text highlighting color for this run shall be dark green. The hexadecimal RGB value for this setting shall be 008000.
darkMagenta (Dark Magenta Highlighting Color)	Specifies that the text highlighting color for this run shall be dark magenta. The hexadecimal RGB value for this setting shall be 800080.
darkRed (Dark Red Highlighting Color)	Specifies that the text highlighting color for this run shall be dark red. The hexadecimal RGB value for this setting shall be 800000.
darkYellow (Dark Yellow Highlighting Color)	Specifies that the text highlighting color for this run shall be dark cyan. The hexadecimal RGB value for this setting shall be 808000.

Enumeration Value	Description
green (Green Highlighting Color)	Specifies that the text highlighting color for this run shall be green. The hexadecimal RGB value for this setting shall be `00FF00`.
lightGray (Light Gray Highlighting Color)	Specifies that the text highlighting color for this run shall be light gray. The hexadecimal RGB value for this setting shall be `C0C0C0`.
magenta (Magenta Highlighting Color)	Specifies that the text highlighting color for this run shall be magenta. The hexadecimal RGB value for this setting shall be `FF00FF`.
none (No Text Highlighting)	Specifies that this text run shall have no text highlighting applied to its contents.
red (Red Highlighting Color)	Specifies that the text highlighting color for this run shall be red. The hexadecimal RGB value for this setting shall be `FF0000`.
white (White Highlighting Color)	Specifies that the text highlighting color for this run shall be white. The hexadecimal RGB value for this setting shall be `FFFFFF`.
yellow (Yellow Highlighting Color)	Specifies that the text highlighting color for this run shall be yellow. The hexadecimal RGB value for this setting shall be `FFFF00`.

Referenced By
highlight@val (§2.3.2.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HighlightColor">
   <restriction base="xsd:string">
      <enumeration value="black"/>
      <enumeration value="blue"/>
      <enumeration value="cyan"/>
      <enumeration value="green"/>
      <enumeration value="magenta"/>
      <enumeration value="red"/>
      <enumeration value="yellow"/>
      <enumeration value="white"/>
      <enumeration value="darkBlue"/>
      <enumeration value="darkCyan"/>
      <enumeration value="darkGreen"/>
      <enumeration value="darkMagenta"/>
      <enumeration value="darkRed"/>
      <enumeration value="darkYellow"/>
      <enumeration value="darkGray"/>
      <enumeration value="lightGray"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

2.18.47 ST_Hint (Font Type Hint)

Specifies the font type which shall be used to format any ambiguous characters in the current run.

There are certain characters which are not explicitly stored in the document, and may be mapped into multiple categories of the four mentioned above. This attribute shall be used to arbitrate that conflict, and determine how ambiguities in this run shall be handled. [*Note*: This is primarily used to handle the formatting on the paragraph mark glyph, and other characters that are not stored as text in the WordprocessingML document. *end note*]

[*Example*: Consider the run representing the paragraph mark glyph, which is not stored as a physical character. Since this could therefore be formatted with any of the fonts specified for the run, this ambiguity is resolved using the following WordprocessingML:

```
<w:pPr>
  <w:rPr>
    <w:rFonts w:hint="eastAsia" />
  </w:rPr>
</w:pPr>
```

The `hint` attribute specifies that the run shall use the `eastAsia` font (theme or not, whichever is in use for East Asian text) as applied for this run. *end example*]

This simple type's contents are a restriction of the XML Schema `string` datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cs (Complex Script Font)	Specifies that the font hint for this text run shall be to use the Complex Script font defined on the run via the style hierarchy.
default (High ANSI Font)	Specifies that the font hint for this text run shall be to use the High ANSI font defined on the run via the style hierarchy.
eastAsia (East Asian Font)	Specifies that the font hint for this text run shall be to use the East Asian font defined on the run via the style hierarchy.

Referenced By
rFonts@hint (§2.3.2.24)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Hint">
   <restriction base="xsd:string">
      <enumeration value="default"/>
      <enumeration value="eastAsia"/>
      <enumeration value="cs"/>
   </restriction>
</simpleType>
```

2.18.48 ST_HpsMeasure (Measurement in Half-Points)

This simple type specifies that its contents will contain a positive whole number, whose contents consist of a measurement in half-points (equivalent to 1/144th of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of 72 whose type is ST_HpsMeasure. This attribute value specifies a size of one-half of an inch or 36 points (72 halves of a point = 36 points = 0.5 inches). *end example*]

This simple type's contents are a restriction of the ST_UnsignedDecimalNumber simple type (§2.18.108).

Referenced By
hps@val (§2.3.3.10); hpsBaseText@val (§2.3.3.11); hpsRaise@val (§2.3.3.12); kern@val (§2.3.2.17); size@val (§2.16.30); sz@val (§2.3.2.36); szCs@val (§2.3.2.37)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HpsMeasure">
   <restriction base="ST_UnsignedDecimalNumber"/>
</simpleType>
```

2.18.49 ST_InfoTextType (Help or Status Text Type)

This simple type specifies the possible values for the type of help or status text which may be associated with a form field.

[*Example*: Consider the following WordprocessingML fragment for a form field:

```
<w:ffData>
  <w:helpText w:type="text" w:val="Example help text." />
</w:ffData>
```

The type attribute has a value of `text`, which specifies that the text in the val attribute is the literal help text for this form field. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autoText (Glossary Document Entry)	Specifies that the value specified by the parent XML element's val attribute shall be interpreted as the name of a glossary document entry whose contents contain the help or status text.
text (Literal Text)	Specifies that the value specified by the parent XML element's val attribute shall be interpreted as the literal text for the help or status text.

Referenced By
helpText@type (§2.16.23); statusText@type (§2.16.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_InfoTextType">
   <restriction base="xsd:string">
      <enumeration value="text"/>
      <enumeration value="autoText"/>
   </restriction>
</simpleType>
```

2.18.50 ST_Jc (Horizontal Alignment Type)

This simple type specifies all types of alignment which are available to be applied to objects in a WordprocessingML document.

[*Example*: Consider a paragraph which is right aligned. This requirement would be specified as follows in the WordprocessingML markup:

```
<w:pPr>
  <w:jc w:val="right" />
</w:pPr>
```

The val attribute's value of `right` specifies that the content shall be right aligned on the page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
both (Justified)	Specifies that the text shall be justified between both of the text margins in the document. The `lowKashida` setting shall also be applied to Arabic text when this setting is applied. This type of justification shall only affect the inter-word spacing on each line, and not the inter-character spacing between each word when justifying its contents.
center (Align Center)	Specifies that the text shall be centered on the line between both of the text margins in the document.
distribute (Distribute All Characters Equally)	Specifies that the text shall be justified between both of the text margins in the document. This type of justification shall equally affect the inter-word spacing on each line as well as the inter-character spacing between each word when justifying its contents - that is, an equal amount of additional character pitch shall be added to all characters on the line.
highKashida (Widest Kashida Length)	Specifies that the kashida length for text in the current paragraph shall be extended to its widest possible length. This setting only affects *kashidas*, which are special characters used to extend the joiner between two Arabic characters. [*Note*: They are typically used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. *end note*] [*Example*: The following example illustrates each type of kashida:

Enumeration Value	Description
	Low: هذا إمتيحان Medium: هذا إمتيحـــان High: هذا إمتيحـــــان *end example*]
left (Align Left)	Specifies that the text shall be aligned on the left text margin in the document.
lowKashida (Low Kashida Length)	Specifies that the kashida length for text in the current paragraph shall be extended to a slightly longer length. This setting shall also be applied to Arabic text when the both setting is applied. This setting only affects *kashidas*, which are special characters used to extend the joiner between two Arabic characters. [*Note*: They are typically used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. *end note*] [*Example*: The following example illustrates each type of kashida: Low: هذا إمتيحان Medium: هذا إمتيحـــان High: هذا إمتيحـــــان *end example*]
mediumKashida (Medium Kashida Length)	Specifies that the kashida length for text in the current paragraph shall be extended to a medium length determined by the consumer. This setting only affects *kashidas*, which are special characters used to extend the joiner between two Arabic characters. [*Note*: They are typically used to improve the appearance of justified text by visually lengthening words rather than increasing the spacing between words. *end note*] [*Example*: The following example illustrates each type of kashida:

Enumeration Value	Description
	Low: هذا إمتيحان Medium: هذا إمتيحـان High: هذا إمتيحـــان *end example*]
numTab (Align to List Tab)	Specifies that the text shall be aligned to the list tab, which is the tab stop after the numbering for the current paragraph. If the current paragraph has no numbering, this setting has no effect. [*Note*: This justification style is used for backwards compatibility with earlier word processors, and should be deprecated in favor of hanging paragraph indentation. *end note*]
right (Align Right)	Specifies that the text shall be aligned on the right text margin in the document.
thaiDistribute (Thai Language Justification)	Specifies that the text shall be justified with an optimization for Thai. This type of justification shall affect both the inter-word spacing on each line, and the inter-character spacing between each word when justifying its contents, unlike both justification. This difference is created in that the inter-character space is increased slightly in order to ensure that the additional space created by the justification is reduced. [*Note*: This setting is different from justification in that the reduction in inter-character spacing would be inappropriate in Western languages. *end note*]

Referenced By
jc@val (§2.4.21); jc@val (§2.4.22); jc@val (§2.3.1.13); jc@val (§2.4.23); lvlJc@val (§2.9.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Jc">
   <restriction base="xsd:string">
      <enumeration value="left"/>
      <enumeration value="center"/>
      <enumeration value="right"/>
      <enumeration value="both"/>
      <enumeration value="mediumKashida"/>
      <enumeration value="distribute"/>
      <enumeration value="numTab"/>
      <enumeration value="highKashida"/>
      <enumeration value="lowKashida"/>
      <enumeration value="thaiDistribute"/>
   </restriction>
</simpleType>
```

2.18.51 ST_Lang (Language Reference)

This simple type specifies that its contents will contain one of the following:

- A hexadecimal language code (ST_LangCode)
- An *ISO 639-1* letter code plus a dash plus an *ISO 3166-1 alpha-2* letter code (ST_String)

The contents of this language are interpreted based on the context of the parent XML element.

[*Example*: Consider a language code defined as follows :

```
<w:lang w:val=”en-CA” />
```

This language is therefore specified as English (en) and Canada (CA), resulting in use of the English (Canada) language setting. *end example*]

This simple type is defined as a union of the following types:

- TheST_LangCode simple type (§2.18.52).
- TheST_String simple type (§2.18.89).

Referenced By
activeWritingStyle@lang (§2.15.1.1); lang@bidi (§2.3.2.18); lang@eastAsia (§2.3.2.18); lang@val (§2.3.2.18); lid@val (§2.3.3.14); lid@val (§2.5.2.19); lid@val (§2.14.17); noLineBreaksAfter@lang (§2.15.1.58); noLineBreaksBefore@lang (§2.15.1.59); themeFontLang@bidi (§2.15.1.89); themeFontLang@eastAsia (§2.15.1.89); themeFontLang@val (§2.15.1.89)

   <union memberTypes="ST_LangCode ST_String"/>
</simpleType>
```

2.18.52 ST_LangCode (Two Digit Hexadecimal Language Code)

This simple type specifies that its contents will contain a two digit hexadecimal language code defined as follows:

Language Code	Language - Country/Region
1025	Arabic - Saudi Arabia
1026	Bulgarian
1027	Catalan
1028	Chinese - Taiwan
1029	Czech
1030	Danish
1031	German - Germany
1032	Greek
1033	English - United States
1034	Spanish - Spain (Traditional Sort)
1035	Finnish
1036	French - France
1037	Hebrew
1038	Hungarian
1039	Icelandic
1040	Italian - Italy
1041	Japanese
1042	Korean
1043	Dutch - Netherlands
1044	Norwegian (Bokmål)
1045	Polish
1046	Portuguese - Brazil
1047	Rhaeto-Romanic
1048	Romanian

19466	Spanish - Nicaragua
20490	Spanish - Puerto Rico
21514	Spanish - United States
58378	Spanish - Latin America
58380	French - North Africa
Any other value	Undefined. Shall not be used.

The contents of this language are interpreted based on the context of the parent XML element.

[*Example*: Consider a language code defined as follows :

```
<w:lang w:val="1033" />
```

This language is therefore specified as English (U.S.) which maps to a hexadecimal language setting of 1033. *end example*]

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 2 characters.

Referenced By
ST_Lang (§2.18.51)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LangCode">
   <restriction base="xsd:hexBinary">
      <length value="2" fixed="true"/>
   </restriction>
</simpleType>
```

2.18.53 ST_LevelSuffix (Content Between Numbering Symbol and Paragraph Text)

This simple type specifies the types of content which shall be possible between a given numbering level's text and the text of every numbered paragraph which references that numbering level.

[*Example:* Consider the numbered paragraph below:

1. Test

In this example, a space exists between the numbering symbol `1.` and the numbered paragraph text `Test`. The space would be specified in WordprocessingML as follows:

```
<w:lvl w:ilvl="0">
  …
  <w:suff w:val="space" />
  …
</w:lvl>
```

The suff element with an attribute value of space specifies that the character between the numbering's level text and the paragraph text shall be a space. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
nothing (Nothing Between Numbering and Text)	Specifies that no character shall be displayed between the numbering level's text and the contents of the paragraph when displaying the numbered paragraph.
space (Space Between Numbering and Text)	Specifies that a space character shall be displayed between the numbering level's text and the contents of the paragraph when displaying the numbered paragraph.
tab (Tab Between Numbering and Text)	Specifies that a tab character shall be displayed between the numbering level's text and the contents of the paragraph when displaying the numbered

Enumeration Value	Description
	paragraph. This tab shall follow normal tab stop rules to determine its length.

Referenced By
suff@val (§2.9.30)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LevelSuffix">
   <restriction base="xsd:string">
      <enumeration value="tab"/>
      <enumeration value="space"/>
      <enumeration value="nothing"/>
   </restriction>
</simpleType>
```

2.18.54 ST_LineNumberRestart (Line Numbering Restart Position)

This simple type specifies when the line numbering in the parent section shall be reset to its restart value. The line numbering increments for each line (even if the line number itself is not displayed) until it reaches the restart point specified by this element.

[*Example*: Consider the line numbering used on each page of this document, which specifies that line numbering shall restart at the top of each new page. This line numbering setting would be defined using the following WordprocessingML:

```
<w:lnNumType w:restart="newPage" ... />
```

The restart attribute is of type ST_LineNumberRestart, and a value of newPage specifies that the line numbers shall restart at the top of each page to the value specified by the start attribute. In this case, newPage is the default, so this value could have been omitted entirely. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
continuous (Continue Line Numbering From Previous Section)	Specifies that line numbering for the parent section shall continue from the line numbering from the end of the previous section, if any.
newPage (Restart Line Numbering on Each Page)	Specifies that line numbering for the parent section shall restart to the starting value whenever a new page is displayed.

Enumeration Value	Description
newSection (Restart Line Numbering for Each Section)	Specifies that line numbering for the parent section shall restart to the starting value whenever the parent begins.

Referenced By
lnNumType@restart (§2.6.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LineNumberRestart">
   <restriction base="xsd:string">
      <enumeration value="newPage"/>
      <enumeration value="newSection"/>
      <enumeration value="continuous"/>
   </restriction>
</simpleType>
```

2.18.55 ST_LineSpacingRule (Line Spacing Rule)

This simple type specifies the logic which shall be used to calculate the line spacing of the parent object when it is displayed in the document.

[*Example*: Consider the following WordprocessingML paragraph:

```
<w:pPr>
  <w:spacing w:line="276" w:lineRule="auto" />
</w:pPr>
```

This paragraph specifies that the spacing in each line should be automatically calculated using 1.15 times (276 divided by 240) the normal single spacing calculation. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
atLeast (Minimum Line Height)	Specifies that the height of the line shall be at least the value specified, but may be expanded to fit its content as needed.
auto (Automatically Determined Line Height)	Specifies that the line spacing of the parent object shall be automatically determined by the size of its contents, with no predetermined minimum or maximum size.
exact (Exact Line Height)	Specifies that the height of the line shall be exactly the value specified, regardless of the size of the contents

Enumeration Value	Description
	of the contents. If the contents are too large for the specified height, then they shall be clipped as necessary.

Referenced By
spacing@lineRule (§2.3.1.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LineSpacingRule">
   <restriction base="xsd:string">
      <enumeration value="auto"/>
      <enumeration value="exact"/>
      <enumeration value="atLeast"/>
   </restriction>
</simpleType>
```

2.18.56 ST_Lock (Locking Types)

This simple type specifies the possible set of locking behaviors which may be applied to the contents of the parent structured document tag when the contents of this documents are edited by an application (whether through a user interface or directly).

[*Example*: Consider the following plain text structured document tag:

```
<w:sdt>
  <w:sdtPr>
    <w:lock w:val="sdtLocked"/>
    …
    <w:text/>
  </w:sdtPr>
  …
</w:sdt>
```

This plain text structured document tag's properties contain a lock element, specifying locking behaviors for the structured document tag. Since the locking val attribute value is sdtLocked, this locking setting shall specify that the contents of the structured document tag may be edited, but the structured document tag itself shall not be deleted from the document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
contentLocked (Contents Cannot Be Edited At Runtime)	Specifies that the editing restriction applied to the parent structured document tag shall be as follows: • This structured document tag's contents shall not be editable • This structured document tag may be deleted in its entirety (but only entirely, no sub portion of it may be deleted)
sdtContentLocked (Contents Cannot Be Edited At Runtime And SDT Cannot Be Deleted)	Specifies that the editing restriction applied to the parent structured document tag shall be as follows: • This structured document tag's contents shall not be editable • This structured document tag shall not be deleted in its entirety
sdtLocked (SDT Cannot Be Deleted)	Specifies that the editing restriction applied to the parent structured document tag shall be as follows: • This structured document tag's contents shall be editable • This structured document tag shall not be deleted in its entirety
unlocked (No Locking)	Specifies that no special locking behaviors shall be applied to the parent structured document tag. The default behaviors as specified on the lock element (§2.5.2.22) shall be used.

Referenced By
lock@val (§2.5.2.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Lock">
   <restriction base="xsd:string">
      <enumeration value="sdtLocked"/>
      <enumeration value="contentLocked"/>
      <enumeration value="unlocked"/>
      <enumeration value="sdtContentLocked"/>
   </restriction>
</simpleType>
```

2.18.57 ST_LongHexNumber (Four Digit Hexadecimal Number Value)

This simple type specifies a number value specified as a four octet (eight digit) hexadecimal number), whose contents are interpreted based on the context of the parent XML element.

[*Example*: Consider the following value for a node of type ST_LongHexNumber: `00BE2C6C`.

This value is valid, as it contains four hexadecimal octets, each an encoding of an octet of the actual decimal number value. *end example*]

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 4 characters.

Referenced By
documentProtection@algIdExt (§2.15.1.28); documentProtection@cryptProviderTypeExt (§2.15.1.28); lvl@tplc (§2.9.6); lvl@tplc (§2.9.7); nsid@val (§2.9.15); p@rsidDel (§2.3.1.22); p@rsidP (§2.3.1.22); p@rsidR (§2.3.1.22); p@rsidRDefault (§2.3.1.22); p@rsidRPr (§2.3.1.22); r@rsidDel (§2.3.2.23); r@rsidR (§2.3.2.23); r@rsidRPr (§2.3.2.23); rsid@val (§2.7.3.15); rsid@val (§2.15.1.70); rsidRoot@val (§2.15.1.71); sectPr@rsidDel (§2.6.17); sectPr@rsidDel (§2.6.18); sectPr@rsidDel (§2.6.19); sectPr@rsidR (§2.6.17); sectPr@rsidR (§2.6.18); sectPr@rsidR (§2.6.19); sectPr@rsidRPr (§2.6.17); sectPr@rsidRPr (§2.6.18); sectPr@rsidRPr (§2.6.19); sectPr@rsidSect (§2.6.17); sectPr@rsidSect (§2.6.18); sectPr@rsidSect (§2.6.19); sig@csb0 (§2.8.2.16); sig@csb1 (§2.8.2.16); sig@usb0 (§2.8.2.16); sig@usb1 (§2.8.2.16); sig@usb2 (§2.8.2.16); sig@usb3 (§2.8.2.16); tmpl@val (§2.9.31); tr@rsidDel (§2.4.75); tr@rsidR (§2.4.75); tr@rsidRPr (§2.4.75); tr@rsidTr (§2.4.75); writeProtection@algIdExt (§2.15.1.94); writeProtection@cryptProviderTypeExt (§2.15.1.94)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LongHexNumber">
   <restriction base="xsd:hexBinary">
      <length value="4"/>
   </restriction>
</simpleType>
```

2.18.58 ST_MacroName (Script Subroutine Name Value)

This simple type specifies a subroutine in a scripting language which may be executed based on the context of the parent XML element. The language and location of this subroutine may be determined using any method desired by an application.

[*Example*: Consider the following WordprocessingML fragment for the properties of a form field:

```
<w:ffData>
  <w:exitMacro w:val="TestExitFunction" />
</w:ffData>
```

The exitMacro element specifies that any application which processes this file should attempt to locate and execute a scripting subroutine called `TestExitFunction` when the contents of the form field are exited. If this subroutine cannot be located or executed, then this setting is silently ignored. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 33 characters.

Referenced By
entryMacro@val (§2.16.15); exitMacro@val (§2.16.16)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MacroName">
   <restriction base="xsd:string">
      <maxLength value="33"/>
   </restriction>
</simpleType>
```

2.18.59 ST_MailMergeDataType (Mail Merge Data Source Type Values)

This simple type specifies the possible values for the types of external data sources to be connected to via the Dynamic Data Exchange (DDE) system (such as a spreadsheet or database), or the alternative method of data access if the Dynamic Data Exchange system is not used. This setting is purely a suggestion of the data source access mechanism which shall be used, and may be ignored in favor of an alternative mechanism if one is present.

[*Example*: Consider the following WordprocessingML fragment for a mail merge source or merged document:

```
<w:dataType w:val="odbc" />
```

The dataType element's val attribute is equal to odbc, specifying that the given merged WordprocessingML document has been connected to an external data source via the Open Database Connectivity interface. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
database (Database Data Source)	Specifies that a given merged WordprocessingML document has been connected to a database via the Dynamic Data Exchange (DDE) system.
native (Office Data Source Object Data Source)	Specifies that a given merged WordprocessingML document has been connected to an external data source via the Office Data Source Object (ODSO) interface.
odbc (Open Database Connectivity Data Source)	Specifies that a given merged WordprocessingML document has been connected to an external data source via the Open Database Connectivity interface.
query (Query Data Source)	Specifies that a given merged WordprocessingML document has been connected to an external data source using an external query tool.

Enumeration Value	Description
spreadsheet (Spreadsheet Data Source)	Specifies that a given merged WordprocessingML document has been connected to a database via the Dynamic Data Exchange (DDE) system.
textFile (Text File Data Source)	Specifies that a given merged WordprocessingML document has been connected to a text file via the Dynamic Data Exchange (DDE) system.

Referenced By
dataType@val (§2.14.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MailMergeDataType">
   <restriction base="xsd:string">
      <enumeration value="textFile"/>
      <enumeration value="database"/>
      <enumeration value="spreadsheet"/>
      <enumeration value="query"/>
      <enumeration value="odbc"/>
      <enumeration value="native"/>
   </restriction>
</simpleType>
```

2.18.60 ST_MailMergeDest (Merged Document Destination Types)

This simple type specifies the possible results which may be generated when a mail merge is carried out on a given WordprocessingML source document. In other words, this element is used to specify what is to be done with the merged documents that result from populating the fields within a given merged WordprocessingML document with data from the specified external data source.

[*Example*: Consider a WordprocessingML source document containing the following WordprocessingML:

```
<w:mailMerge>
  <w:destination w:val="newDocument" />
  …
</w:mailMerge>
```

The destination element's val attribute is set to `newDocument`, specifying that when the mail merge is carried out, the source document shall be used to generate a specified number of new documents, which may be handled as appropriate. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
email (Send Merged Documents as E-mail Messages)	Specifies that conforming hosting applications shall generate emails using the documents that result from populating the fields within a given merged WordprocessingML document with data from the specified external data source.
fax (Send Merged Documents as Faxes)	Specifies that conforming hosting applications shall generate faxes using the documents that result from populating the fields within a given merged WordprocessingML document with data from the specified external data source.
newDocument (Send Merged Documents to New Documents)	Specifies that conforming hosting applications shall generate new documents by populating the fields within a given merged WordprocessingML document with data from the specified external data source.
printer (Send Merged Documents to Printer)	Specifies that conforming hosting applications shall print the documents that result from populating the fields within a given merged WordprocessingML document with external data from the specified external data source.

Referenced By
destination@val (§2.14.11)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MailMergeDest">
   <restriction base="xsd:string">
      <enumeration value="newDocument"/>
      <enumeration value="printer"/>
      <enumeration value="email"/>
      <enumeration value="fax"/>
   </restriction>
</simpleType>
```

2.18.61 ST_MailMergeDocType (Source Document Types)

This simple types specifies the possible types for a given WordprocessingML source document.

[*Example*: Consider the WordprocessingML below:

```
<w:mailMerge>
  <w:mainDocumentType w:val="formLetters" />
  …
</w:mailMerge>
```

In this example, the source document is of the `formLetters` type, as specified by the mainDocumentType element's val attribute being equal to `formLetters`. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
catalog (Catalog Source Document)	Specifies that the mail merge source document is of the catalog type.
email (E-Mail Source Document)	Specifies that the mail merge source document is of the e-mail message type.
envelopes (Envelope Source Document)	Specifies that the mail merge source document is of the envelope type.
fax (Fax Source Document)	Specifies that the mail merge source document is of the fax type.
formLetters (Form Letter Source Document)	Specifies that the mail merge source document is of the form letter type.
mailingLabels (Mailing Label Source Document)	Specifies that the mail merge source document is of the mailing label type.

Referenced By
mainDocumentType@val (§2.14.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MailMergeDocType">
   <restriction base="xsd:string">
      <enumeration value="catalog"/>
      <enumeration value="envelopes"/>
      <enumeration value="mailingLabels"/>
      <enumeration value="formLetters"/>
      <enumeration value="email"/>
      <enumeration value="fax"/>
   </restriction>
</simpleType>
```

2.18.62 ST_MailMergeOdsoFMDFieldType (Merge Field Mapping Types)

This simple types specifies the possible types used to indicate if a given mail merge field has been mapped to a column in the given external data source.

[*Example*: Consider the WordprocessingML below:

```
<w:odso>
  …
  <w:fieldMapData>
    <w:type w:val="dbColumn" />
    <w:name w:val="Country" />
    <w:mappedName w:val="Country or Region" />
    <w:column w:val="9" />
    …
  </w:fieldMapData>
</w:odso>
```

In this example, the `country` column within the given external data source shall be mapped to the mail merge field `Country or Region`, as specified by the type element's val attribute being equal to `dbColumn`. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dbColumn (Field Mapping to Data Source Column)	Specifies that the mail merge field has been mapped to a column in the given external data source.
null (Field Not Mapped)	Specifies that the mail merge field has not been mapped to a column in the given external data source.

Referenced By
type@val (§2.14.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MailMergeOdsoFMDFieldType">
   <restriction base="xsd:string">
      <enumeration value="null"/>
      <enumeration value="dbColumn"/>
   </restriction>
</simpleType>
```

2.18.63 ST_MailMergeSourceType (Mail Merge ODSO Data Source Types)

This simple type specifies the type of external data source to be connected to via as part of the ODSO connection information for this mail merge. This setting is purely a suggestion of the data source type which is being used for this mail merge, and may be ignored in favor of an alternative mechanism if one is present.

[*Example*: Consider the following WordprocessingML fragment for a mail merge source or merged document:

```
<w:type w:val="database" />
```

The type element's val attribute is equal to database, specifying that the given merged WordprocessingML document has been connected to an external data source via the ODSO settings, and that the resulting data source was a database. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
addressBook (Address Book Data Source)	Specifies that a given merged WordprocesingML document has been connected to an address book of contacts.
database (Database Data Source)	Specifies that a given merged WordprocessingML document has been connected to a database.
document1 (Alternate Document Format Data Source)	Specifies that a given merged WordprocessingML document has been connected to another document format supported by the producing application. The format of this document is application-defined and outside the scope of this Office Open XML Standard.
document2 (Alternate Document Format Data Source Two)	Specifies that a given merged WordprocessingML document has been connected to another document format supported by the producing application. The format of this document is application-defined and outside the scope of this Office Open XML Standard.
email (E-Mail Program Data Source)	Specifies that a given merged WordprocessingML document has been connected to an e-mail application.
legacy (Legacy Document Format Data Source)	Specifies that a given merged WordprocessingML document has been connected to a legacy document format supported by the producing application. The format of this legacy document is application-defined and outside the scope of this Office Open XML Standard.
master (Aggregate Data Source)	Specifies that a given merged WordprocessingML document has been connected to a data source which aggregates other data sources.
native (Native Data Souce)	Specifies that a given merged WordprocessingML document has been connected to another document format native to the producing application. The format of this document is application-defined and outside the scope of this Office Open XML Standard.
text (Text File Data Source)	Specifies that a given merged WordprocessingML document has been connected to a text file.

Referenced By
type@val (§2.14.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MailMergeSourceType">
   <restriction base="xsd:string">
      <enumeration value="database"/>
      <enumeration value="addressBook"/>
      <enumeration value="document1"/>
      <enumeration value="document2"/>
      <enumeration value="text"/>
      <enumeration value="email"/>
      <enumeration value="native"/>
      <enumeration value="legacy"/>
      <enumeration value="master"/>
   </restriction>
</simpleType>
```

2.18.64 ST_Merge (Merged Cell Type)

This element specifies the way in which a cell shall be included in a merged group of cells (horizontally or vertically) within the parent table.

[*Example*: Consider a table with three rows and two columns with the last column completely vertically merged:

The second cell in the first row starts a vertical merge that is completed in the last cell, resulting in the following WordprocessingML:

```
<w:tbl>
  …
  <w:tr>
    <w:tc>
      …
    </w:tc>
    <w:tc>
      …
    </w:tc>
    <w:tc>
      <w:tcPr>
        <w:vmerge w:val="restart"/>
      </w:tcPr>
      …
    </w:tc>
  </w:tr>
  <w:tr>
    <w:tc>
      …
    </w:tc>
    <w:tc>
      …
    </w:tc>
    <w:tc>
      <w:tcPr>
        <w:vmerge w:val="continue"/>
      </w:tcPr>
      …
    </w:tc>
  </w:tr>
```

```
    <w:tr>
      <w:tc>
        …
      </w:tc>
      <w:tc>
        …
      </w:tc>
      <w:tc>
        <w:tcPr>
          <w:vmerge w:val="continue"/>
        </w:tcPr>
        …
      </w:tc>
    </w:tr>
  </w:tbl>
```

The val attribute of type ST_Merge on the vmerge element defines the cells which are vertically merged, and how each cell is merged together. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
continue (Continue Merged Region)	Specifies that the current cell continues a previously existing merged group of cells in the parent table. If the previous cell in the document (horizontally or vertically) does not either begin or continue a set of merged cells, then this value shall be ignored (i.e. a group of merged cells must start with a merge whose ST_Merge value is `restart`).
restart (Start/Restart Merged Region)	Specifies that the current cell starts (or restarts) a group of merged cells in the parent table. After this value, all following cells which have a value of `continue` shall be merged into this merged cell group.

Referenced By
hMerge@val (§2.4.16); vMerge@val (§2.4.81)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Merge">
   <restriction base="xsd:string">
      <enumeration value="continue"/>
      <enumeration value="restart"/>
   </restriction>
</simpleType>
```

2.18.65 ST_MultiLevelType (Numbering Definition Type)

This simple type specifies the possible types of numbering which may be defined by a given abstract numbering type. This information shall only be used by a consumer to determine user interface behaviors for this numbering definition, and shall not be used to limit the behavior of the list (i.e. a list with multiple levels marked as `singleLevel` shall not be prevented from using levels 2 through 9).

[*Example*: Consider the WordprocessingML below:

```
<w:abstractNum w:abstractNumId="8">
  …
  <w:multiLevelType w:val="singleLevel" />
  …
</w:abstractNum>
```

This abstract numbering definition is specified to be of the `singleLevel` type by the multiLevelType element. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hybridMultilevel (Hybrid Multilevel Numbering Definition)	Specifies that this numbering definition defines a numbering format consisting of a multiple levels, each of a potentially different type (bullets vs. level text).
multilevel (Multilevel Numbering Definition)	Specifies that this numbering definition defines a numbering format consisting of a multiple levels, each of the same type (bullets vs. level text).
singleLevel (Single Level Numbering Definition)	Specifies that this numbering definition defines a numbering format consisting of a single level only.

Referenced By
multiLevelType@val (§2.9.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MultiLevelType">
   <restriction base="xsd:string">
      <enumeration value="singleLevel"/>
      <enumeration value="multilevel"/>
      <enumeration value="hybridMultilevel"/>
   </restriction>
</simpleType>
```

2.18.66 ST_NumberFormat (Numbering Format)

This simple type specifies the numbering format which shall be used for a group of automatically numbered objects,

[*Example*: A value of `lowerLetter` for page numbering indicates that a consumer shall use lowercase letters for each page in this section: a,b,c… *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
aiueo (AIUEO Order Hiragana)	Specifies that the sequence shall consist of hiragana characters in the traditional a-i-u-e-o order. [*Example*: ア, イ, ウ. *end example*]
aiueoFullWidth (Full-Width AIUEO Order Hiragana)	Specifies that the sequence shall consist of full-width hiragana characters in the traditional a-i-u-e-o order. [*Example*: ア, イ, ウ *end example*]
arabicAbjad (Arabic Abjad Numerals)	Specifies that the sequence shall consist of ascending Abjad numerals. [*Example*: أ, ب, ج. *end example*]
arabicAlpha (Arabic Alphabet)	Specifies that the sequence shall consist of characters in the Arabic alphabet. [*Example*: أ, ب, ت. *end example*]
bullet (Bullet)	Specifies that the sequence shall consist of bullet characters. [*Example*: ●. *end example*]
cardinalText (Cardinal Text)	Specifies that the sequence shall consist of cardinal text of the run language. [*Example*: one, two, three. *end example*]

Enumeration Value	Description
chicago (Chicago Manual of Style)	Specifies that the sequence shall consist of characters as defined in the Chicago Manual of Style. [*Example*: *, †, ‡. *end example*]
chineseCounting (Chinese Counting System)	Specifies that the sequence shall consist of ascending numbers from the Chinese counting system. [*Example*: 一,二,三四*end example*]
chineseCountingThousand (Chinese Counting Thousand System)	Specifies that the sequence shall consist of sequential numbers from the Chinese counting thousand system. [*Example*: 一,二,…, 九一〇 *end example*]
chineseLegalSimplified (Chinese Legal Simplified Format)	Specifies that the sequence shall consist of sequential numbers from the Chinese simplified legal format. [*Example*: 壹…, 肆伍*end example*]
chosung (Korean Chosung Numbering)	Specifies that the sequence shall consist of sequential numbers from the Korean Chosung format. [*Example*: ㄱ , ㄴ , … *end example*]
decimal (Decimal Numbers)	Specifies that the sequence shall consist of decimal numbering. [*Example*: 1, 2, 3, … , 9, 10, 11. *end example*]
decimalEnclosedCircle (Decimal Numbers Enclosed in a Circle)	Specifies that the sequence shall consist of decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character. Once the specified sequence reaches 21, the numbers may be replaced with non-enclosed equivalents. [*Example*: ①②③.. *end example*]
decimalEnclosedCircleChinese (Decimal Numbers Enclosed in a Circle)	Specifies that the sequence shall consist of decimal numbering enclosed in a circle, using the enclosed alphanumeric glyph character. Once the specified sequence reaches 11, the numbers may be replaced with non-enclosed equivalents. [*Example*: ①②③.. *end example*]
decimalEnclosedFullstop (Decimal Numbers Followed by a Period)	Specifies that the sequence shall consist of decimal numbering followed by a period, using the enclosed alphanumeric glyph character.

Enumeration Value	Description
	Once the specified sequence reaches 21, the numbers may be replaced with non-enclosed equivalents. [*Example*: 1, 2, 3, … *end example*]
decimalEnclosedParen (Decimal Numbers Enclosed in Parenthesis)	Specifies that the sequence shall consist of decimal numbering enclosed in parenthesis, using the enclosed alphanumeric glyph character. Once the specified sequence reaches 21, the numbers may be replaced with non-enclosed equivalents. [*Example*: (1), (2), (3), … *end example*]
decimalFullWidth (Double Byte Arabic Numerals)	Specifies that the sequence shall consist of double-byte Arabic numbering. [*Example*: １, ２, ３. *end example*]
decimalFullWidth2 (Double Byte Arabic Numerals Alternate)	Specifies that the sequence shall consist of an alternative set of double-byte Arabic numbering, if one exists in the run font. [*Example*: １, ２, ３. *end example*]
decimalHalfWidth (Single Byte Arabic Numerals)	Specifies that the sequence shall consist of single-byte Arabic numbering. [*Example*: 1, 2, 3. *end example*]
decimalZero (Initial Zero Arabic Numerals)	Specifies that the sequence shall consist of Arabic numbering with a zero added to numbers one through nine. [*Example*: 01, 02, 03, …, 09, 10. *end example*]
ganada (Korean Ganada Numbering)	Specifies that the sequence shall consist of sequential numbers from the Korean Ganada format. [*Example*: 가, 나, … *end example*]
hebrew1 (Hebrew Numerals)	Specifies that the sequence shall consist of Hebrew numerals. [*Example*: א, ב, ג, … , י, יא *end example*]
hebrew2 (Hebrew Alphabet)	Specifies that the sequence shall consist of the Hebrew alphabet.

Enumeration Value	Description
	[*Example*: א, ב, ג, … *end example*]
hex (Hexadecimal Numbering)	Specifies that the sequence shall consist of hexadecimal numbering. [*Example*: 1, 2, 3, … , 9, A, B. *end example*]
hindiConsonants (Hindi Consonants)	Specifies that the sequence shall consist of Hindi consonants. [*Example*: अ, आ, इ, . *end example*]
hindiCounting (Hindi Counting System)	Specifies that the sequence shall consist of sequential numbers from the Hindi counting system. [*Example*: एक, दो, तीन, … *end example*]
hindiNumbers (Hindi Numbers)	Specifies that the sequence shall consist of Hindi numbers. [*Example*: १, २, ३, … *end example*]
hindiVowels (Hindi Vowels)	Specifies that the sequence shall consist of Hindi vowels. [*Example*: क, ख, ग, . *end example*]
ideographDigital (Ideographs)	Specifies that the sequence shall consist of sequential numerical ideographs enclosed in a circle, using the appropriate character. [*Example*: 一,二,三,四*end example*]
ideographEnclosedCircle (Ideographs Enclosed in a Circle)	Specifies that the sequence shall consist of sequential numerical ideographs enclosed in a circle, using the appropriate character. Once the specified sequence reaches 11, the numbers may be replaced with non-enclosed equivalents. [*Example*: ㊀, ㊁, ㊂,… *end example*]
ideographLegalTraditional (Traditional Legal Ideograph Format)	Specifies that the sequence shall consist of sequential numerical traditional legal ideographs. [*Example*: 壹貳參… *end example*]
ideographTraditional (Traditional Ideograph Format)	Specifies that the sequence shall consist of sequential numerical traditional ideographs.

Enumeration Value	Description
	[*Example*: 甲乙丙… *end example*]
ideographZodiac (Zodiac Ideograph Format)	Specifies that the sequence shall consist of sequential zodiac ideographs. [*Example*: 子丑寅… *end example*]
ideographZodiacTraditional (Traditional Zodiac Ideograph Format)	Specifies that the sequence shall consist of sequential traditional zodiac ideographs. [*Example*: 甲子乙丑丙寅… *end example*]
iroha (Iroha Ordered Katakana)	Specifies that the sequence shall consist of the iroha. [*Example*: イ, ロ, ハ, … *end example*]
irohaFullWidth (Full-Width Iroha Ordered Katakana)	Specifies that the sequence shall consist of the full-width forms of the iroha. [*Example*: イ, ロ ハ… *end example*]
japaneseCounting (Japanese Counting System)	Specifies that the sequence shall consist of sequential numbers from the Japanese counting system. [*Example*: 一, 二…, 九十十一 *end example*]
japaneseDigitalTenThousand (Japanese Digital Ten Thousand Counting System)	Specifies that the sequence shall consist of sequential numbers from the Japanese digital ten thousand counting system. [*Example*: 一, 二…, 九, 一〇 *end example*]
japaneseLegal (Japanese Legal Numbering)	Specifies that the sequence shall consist of sequential numbers from the Japanese legal counting system. [*Example*: 壱弐参…. *end example*]
koreanCounting (Korean Counting System)	Specifies that the sequence shall consist of sequential numbers from the Korean counting system. [*Example*: 일, 이, … *end example*]
koreanDigital (Korean Digital Counting System)	Specifies that the sequence shall consist of sequential numbers from the Korean digital counting system. [*Example*: 일, 이, … *end example*]
koreanDigital2 (Korean Digital Counting System Alternate)	Specifies that the sequence shall consist of sequential numbers from the Korean digital counting system. [*Example*: 일, 이, … *end example*]

Enumeration Value	Description
koreanLegal (Korean Legal Numbering)	Specifies that the sequence shall consist of sequential numbers from the Korean legal numbering system. [*Example*: 하나 , 둘 , … *end example*]
lowerLetter (Lowercase Latin Alphabet)	Specifies that the sequence shall consist of the letters of the Latin alphabet in lower case. [*Example*: a, b, c. *end example*]
lowerRoman (Lowercase Roman Numerals)	Specifies that the sequence shall consist of lowercase roman numerals. [*Example*: i, ii, iii. *end example*]
none (No Numbering)	Specifies that the sequence shall not display any numbering.
numberInDash (Number With Dashes)	Specifies that the sequence shall consist of the Arabic numbering surrounded by dash characters. [*Example*: - 1 -, - 2 -, - 3 -. *end example*]
ordinal (Ordinal)	Specifies that the sequence shall consist of ordinals of the run language. [*Example*: 1st, 2nd, 3rd. *end example*]
ordinalText (Ordinal Text)	Specifies that the sequence shall consist of ordinal text of the run language. [*Example*: first, second, third. *end example*]
russianLower (Lowercase Russian Alphabet)	Specifies that the sequence shall consist of the letters of the Russian alphabet in lower case. [*Example*: а, б, в. *end example*]
russianUpper (Uppercase Russian Alphabet)	Specifies that the sequence shall consist of the letters of the Russian alphabet in upper case. [*Example*: А, Б, В. *end example*]
taiwaneseCounting (Taiwanese Counting System)	Specifies that the sequence shall consist of sequential numbers from the Taiwanese counting system. [*Example*: 一,二…, 九十*end example*]
taiwaneseCountingThousand (Taiwanese Counting Thousand System)	Specifies that the sequence shall consist of sequential numbers from the Taiwanese counting thousand system.

Enumeration Value	Description
	[*Example*: 一, 二, …, 九, 〇. *end example*]
taiwaneseDigital (Taiwanese Digital Counting System)	Specifies that the sequence shall consist of sequential numbers from the Taiwanese digital counting system. [*Example*: 一, 二, …, 九, 〇. *end example*]
thaiCounting (Thai Counting System)	Specifies that the sequence shall consist of sequential numbers from the Thai counting system. [*Example*: หนึ่ง, สอง, สาม. *end example*]
thaiLetters (Thai Letters)	Specifies that the sequence shall consist of Thai letters. [*Example*: ก, ข, ค. *end example*]
thaiNumbers (Thai Numerals)	Specifies that the sequence shall consist of Thai numerals. [*Example*: ๒, ๓, ๔. *end example*]
upperLetter (Uppercase Latin Alphabet)	Specifies that the sequence shall consist of the letters of the Latin alphabet in upper case. [*Example*: A, B, C. *end example*]
upperRoman (Uppercase Roman Numerals)	Specifies that the sequence shall consist of uppercase roman numerals. [*Example*: I, II, III. *end example*]
vietnameseCounting (Vietnamese Numerals)	Specifies that the sequence shall consist of Vietnamese numerals. [*Example*: một, hai, ba. *end example*]

2.18.67 ST_OnOff (On/Off Value)

This simple type specifies a set of values for any binary (on or off) property defined in a WordprocessingML document.

A value of `on`, `1`, or `true` specifies that the property shall be turned on. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

A value of `off`, `0`, or `false` specifies that the property shall be explicitly turned off.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
0 (False)	Specifies that the binary state of this property is off (parent property is explicitly not applied).
1 (True)	Specifies that the binary state of this property is on (parent property is explicitly applied).
false (False)	Specifies that the binary state of this property is off (parent property is explicitly not applied).
off (False)	Specifies that the binary state of this property is off (parent property is explicitly not applied).
on (True)	Specifies that the binary state of this property is on (parent property is explicitly applied).
true (True)	Specifies that the binary state of this property is on (parent property is explicitly applied).

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OnOff">
   <restriction base="xsd:string">
      <enumeration value="true"/>
      <enumeration value="false"/>
      <enumeration value="on"/>
      <enumeration value="off"/>
      <enumeration value="0"/>
      <enumeration value="1"/>
   </restriction>
</simpleType>
```

2.18.68 ST_PageBorderDisplay (Page Border Display Options)

This simple type specifies the pages in the parent section on which the page border shall be printed.

[*Example*: Consider a section in a document for which the page border shall only be printed on the first page. This setting is specified using the following WordprocessingML:

```
<w:pgBorders w:display="firstPage">
  …
</w:pgBorders>
```

The display attribute with a value of `firstPage` specifies that only the first page shall display the page border defined for this section. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allPages (Display Page Border on All Pages)	Specifies that the page border shall be displayed on all pages in the parent section.

Enumeration Value	Description
firstPage (Display Page Border on First Page)	Specifies that the page border shall be displayed on only the first page in the parent section.
notFirstPage (Display Page Border on All Pages Except First)	Specifies that the page border shall be displayed on only the first page in the parent section.

Referenced By
pgBorders@display (§2.6.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PageBorderDisplay">
   <restriction base="xsd:string">
      <enumeration value="allPages"/>
      <enumeration value="firstPage"/>
      <enumeration value="notFirstPage"/>
   </restriction>
</simpleType>
```

2.18.69 ST_PageBorderOffset (Page Border Positioning Base)

This simple type specifies how the relative positioning of the page borders shall be calculated.

If the value of this attribute is `text`, then the space attribute on each page border shall be interpreted as the distance from the text margins that shall be left before the page border.

[*Example*: Consider the following WordprocessingML fragment:

```
<w:pgBorders w:offsetFrom="page">
  <w:top w:val="dashed" w:space="24" />
  <w:left w:val="dashed" w:space="24" />
  <w:bottom w:val="dashed" w:space="24"/>
  <w:right w:val="dashed" w:space="24"/>
</w:pgBorders>
```

This fragment specifies that the page borders shall be indented 24 points from the page extents.

This is distinct from the following fragment with identical space attribute values:

```
<w:pgBorders w:offsetFrom="text">
  <w:top w:val="dashed" w:space="24" />
  <w:left w:val="dashed" w:space="24" />
  <w:bottom w:val="dashed" w:space="24"/>
  <w:right w:val="dashed" w:space="24"/>
</w:pgBorders>
```

In this case, the page borders will be offset by 24 points, but in this case, that offset will be calculated relative to the text margins. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
page (Page Border Is Positioned Relative to Page Edges)	Specifies that the space attribute on each page border shall be interpreted as the distance from the edge of the page that shall be left before the page border.
text (Page Border Is Positioned Relative to Text Extents)	Specifies that the space attribute on each page border shall be interpreted as the distance from the edge of the text extents (text margins) that shall be left before the page border..

Referenced By
pgBorders@offsetFrom (§2.6.10)

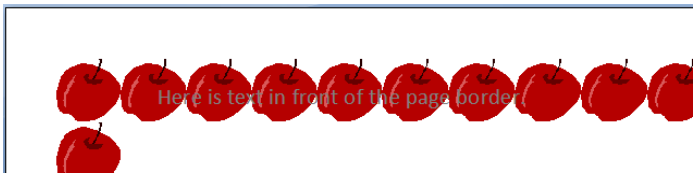
The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PageBorderOffset">
   <restriction base="xsd:string">
      <enumeration value="page"/>
      <enumeration value="text"/>
   </restriction>
</simpleType>
```

2.18.70 ST_PageBorderZOrder (Page Border Z-Order)

This simple type specifies whether the page border is positioned above or below intersecting texts and objects in this document.

[*Example*: Consider a document in which the page border shall be displayed below any intersecting text as follows:



This setting is specified by setting the value of an attribute with to back, which specifies that the page border shall be displayed behind all intersecting text and objects. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
back (Page Border Behind Text)	Specifies that the page border shall be rendered beneath any text or object which intersects it - effectively placing it at the lowest z-order on the page.
front (Page Border Ahead of Text)	Specifies that the page border shall be rendered above any text or object which intersects it - effectively placing it at the highest z-order on the page.

Referenced By
pgBorders@zOrder (§2.6.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PageBorderZOrder">
   <restriction base="xsd:string">
      <enumeration value="front"/>
      <enumeration value="back"/>
   </restriction>
</simpleType>
```

2.18.71 ST_PageOrientation (Page Orientation)

This simple type specifies the orientation of all pages in the parent section. This information is used to determine the actual paper size to use when printing the file.

[*Example*: Pages 11" wide by 8.5" long in landscape mode use 8.5"x11" paper, because the width and height are reversed for pages in this landscape section with respect to the printed page. *end example*]

[*Example*: Consider the following WordprocessingML:

```
<w:pgSz w:w="15840" w:h="12240" w:orient="landscape" />
```

Although the page width is 11", and page height is 8.5", according to the w and h attributes, because the orient attribute is set to `landscape`, pages in this section are printed on 8.5x11" paper in landscape mode. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
landscape (Landscape Mode)	Specifies that pages in this section shall be printed in landscape mode, which prints the page contents with a 90 degree rotation with respect to the normal page orientation.
portrait (Portrait Mode)	Specifies that pages in this section shall be printed in

Enumeration Value	Description
	portrait mode.

Referenced By
pgSz@orient (§2.6.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PageOrientation">
   <restriction base="xsd:string">
      <enumeration value="portrait"/>
      <enumeration value="landscape"/>
   </restriction>
</simpleType>
```

2.18.72 ST_Panose (Panose-1 Number)

This simple type specifies a number consisting of 10 hexadecimal digits which defines the Panose-1 classification number a font.

[*Example*: Consider the following information stored for a single font:

```
<w:font w:name="Times New Roman">
  <w:panose1 w:val="02020603050405020304" />
  …
</w:font>
```

The panose1 element specifies its Panose-1 number via its val attribute value of `02020603050405020304`. *end example*]

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 10 characters.

Referenced By
panose1@val (§2.8.2.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Panose">
   <restriction base="xsd:hexBinary">
      <length value="10"/>
   </restriction>
</simpleType>
```

2.18.73 ST_Pitch (Font Pitch Value)

This simple type specifies the possible values for the font pitch of a font.

[*Example*: Consider the following information stored for a single font:

```
<w:font w:name="Courier New">
  <w:pitch w:val="fixed" />
  …
</w:font>
```

The pitch element specifies via its val attribute value of `fixed` that this is a fixed width font. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
default (Default)	Specifies that no information is available about the pitch of a font.
fixed (Fixed Width)	Specifies that this is a fixed width font.
variable (Proportional Width)	Specifies that this is a proportional width font.

Referenced By
pitch@val (§2.8.2.14)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Pitch">
   <restriction base="xsd:string">
      <enumeration value="fixed"/>
      <enumeration value="variable"/>
      <enumeration value="default"/>
   </restriction>
</simpleType>
```

2.18.74 ST_PixelsMeasure (Measurement in Pixels)

This simple type specifies that its contents will contain a positive whole number, whose contents consist of a measurement in pixels.

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of 96 whose type is ST_PixelsMeasure. This attribute value specifies a size of 96 pixels (one inch on a 96 pixels per inch display). *end example*]

This simple type's contents are a restriction of the ST_UnsignedDecimalNumber simple type (§2.18.108).

Referenced By
marH@val (§2.15.2.24); marW@val (§2.15.2.28); readModeInkLockDown@h (§2.15.1.66); readModeInkLockDown@w (§2.15.1.66)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PixelsMeasure">
   <restriction base="ST_UnsignedDecimalNumber"/>
</simpleType>
```

2.18.75 ST_PointMeasure (Measurement in Points)

This simple type specifies that its contents will contain a positive whole number, whose contents consist of a measurement in points (equivalent to 1/72nd of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of 24 whose type is ST_PointMeasure. This attribute value specifies a size in points (24 points = 1/3 of an inch). *end example*]

This simple type's contents are a restriction of the ST_UnsignedDecimalNumber simple type (§2.18.108).

Referenced By
bar@space (§2.3.1.4); bdr@space (§2.3.2.3); between@space (§2.3.1.5); bottom@space (§2.6.2); bottom@space (§2.4.3); bottom@space (§2.4.4); bottom@space (§2.15.2.4); bottom@space (§2.3.1.7); insideH@space (§2.4.17); insideH@space (§2.4.18); insideV@space (§2.4.19); insideV@space (§2.4.20); left@space (§2.15.2.21); left@space (§2.4.24); left@space (§2.6.7); left@space (§2.3.1.17); left@space (§2.4.27); right@space (§2.3.1.28); right@space (§2.4.30); right@space (§2.6.15); right@space (§2.15.2.35); right@space (§2.4.32); tl2br@space (§2.4.70); top@space (§2.4.71); top@space (§2.3.1.42); top@space (§2.15.2.42); top@space (§2.4.74); top@space (§2.6.21); tr2bl@space (§2.4.76)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PointMeasure">
   <restriction base="ST_UnsignedDecimalNumber"/>
</simpleType>
```

2.18.76 ST_Proof (Proofing State Values)

This simple type specifies the values which may be used to indicate the status of a given hosting application's grammar and spell checking when a given WordprocessingML document was last saved.

[*Example*: Consider a WordprocessingML document that is saved by a hosting application whose grammar checking engine had completed checking the grammar in the given WordprocessingML document, but whose spell checking engine had not completed checking the spelling in the given WordprocessingML document . In this instance, the following WordprocessingML shall be written in the document settings:

```
<w:proofState w:spelling="dirty" w:grammar="clean" />
```

The proofState element's attributes spelling and grammar have the ST_Proof simple type enumeration values `dirty` and `clean` respectively, specifying that the hosting application's spell checking engine had not completed checking the spelling of the document, and that the hosting application's grammar checking engine had completed checking the grammar of the document, when the WordprocessingML document was last saved. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clean (Check Completed)	Specifies that the given proofing engine completed checking the document when it was last saved.
dirty (Check Not Completed)	Specifies that the given proofing engine did not complete checking the document when it was last saved.

Referenced By
proofState@grammar (§2.15.1.65); proofState@spelling (§2.15.1.65)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Proof">
   <restriction base="xsd:string">
      <enumeration value="clean"/>
      <enumeration value="dirty"/>
   </restriction>
</simpleType>
```

2.18.77 ST_ProofErr (Proofing Error Type)

This simple type specifies the possible values for the types of proofing error markers which can appear in the contents of a WordprocessingML document to indicate the last known state of any spell- and grammar-checking performed on the contents of this document.

[*Example*: Consider the following paragraph consisting of two misspelled words, where the second word has been explicitly flagged as not being a spelling error. This paragraph would consist of the following WordprocessingML markup:

```
<w:p>
  <w:proofErr w:val="spellStart"/>
  <w:r>
    <w:t>erqwt</w:t>
  </w:r>
  <w:proofErr w:val="spellEnd"/>
  <w:r>
    <w:t xml:space="preserve"> werewr</w:t>
  </w:r>
</w:p>
```

The proofErr elements with a val attribute value of `spellStart` and `spellEnd`, respectively delimit the start and end the content in this paragraph which is stored as a spelling error. Since the second word is not included in that range, it is not stored as a spelling error. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
gramEnd (End of Region Marked as Grammatical Error)	Specifies that this proofing error marker shall indicate the start of a region to be marked as a grammatical error in the document.
gramStart (Start of Region Marked as Grammatical Error)	Specifies that this proofing error marker shall indicate the end of a region to be marked as a grammatical error in the document.
spellEnd (End of Region Marked as Spelling Error)	Specifies that this proofing error marker shall indicate the end of a region to be marked as a spelling error in the document.
spellStart (Start of Region Marked as Spelling Error)	Specifies that this proofing error marker shall indicate the start of a region to be marked as a spelling error in the document.

Referenced By
proofErr@type (§2.13.8.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ProofErr">
   <restriction base="xsd:string">
      <enumeration value="spellStart"/>
      <enumeration value="spellEnd"/>
      <enumeration value="gramStart"/>
      <enumeration value="gramEnd"/>
   </restriction>
</simpleType>
```

2.18.78 ST_PTabAlignment (Absolute Position Tab Alignment)

This simple type specifies the alignment of an absolutely positioned tab character in a document. This alignment value determines the position on the line to which this absolute tab shall advance, as well as the alignment of the text entered after the alignment tab character position.

[*Example*: Consider a positional tab stop in a WordprocessingML document who shall move to the left edge of the text margins and whose subsequent text should be left aligned. This positional tab stop would be defined as follows:

```
<w:ptab w:alignment="left" w:relativeTo=”margin” … />
```

The alignment attribute has a value of `left`, which specifies that this custom tab stop shall align on the left edge of the line relative to the text margin. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center)	Specifies that the positional tab should be center aligned on the line relative to the specified base (the text margins with or without indents), and that the text at that location shall be center aligned.
left (Left)	Specifies that the positional tab should be left aligned on the line relative to the specified base (the text margins with or without indents), and that the text at that location shall be left aligned.
right (Right)	Specifies that the positional tab should be right aligned on the line relative to the specified base (the text margins with or without indents), and that the text at that location shall be right aligned.

Referenced By
ptab@alignment (§2.3.3.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PTabAlignment">
   <restriction base="xsd:string">
      <enumeration value="left"/>
      <enumeration value="center"/>
      <enumeration value="right"/>
   </restriction>
</simpleType>
```

2.18.79 ST_PTabLeader (Absolute Position Tab Leader Character)

This simple type specifies the characters which may be used to fill in the space created by a positional tab. This character shall be repeated as required to completely fill the tab spacing generated by the positional tab character.

[*Example*: Consider a positional tab stop which should be preceded by a sequence of underscore characters, as follows:

_____Text at the positional tab stop

This tab stop would have a leader attribute value of underscore, indicating that the tab stop shall be preceded by underscore characters as needed to fill the tab spacing. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dot (Dot Leader Character)	Specifies that the leader character for this positional tab stop shall be a dot. [*Example*: ..... Text at absolute tab. *end example*]
hyphen (Hyphen Leader Character)	Specifies that the leader character for this positional tab stop shall be a hyphen. [*Example*: ---------- Text at absolute tab. *end example*]
middleDot (Centered Dot Leader Character)	Specifies that the leader character for this positional tab stop shall be a centered dot.

Enumeration Value	Description
	[*Example*: ····· Text at absolute tab. *end example*]
none (No Leader Character)	Specifies that there shall be no leader character for this positional tab. [*Example*: Text at absolute tab. *end example*]
underscore (Underscore Leader Character)	Specifies that the leader character for this positional tab stop shall be an underscore. [*Example*: _____ Text at absolute tab. *end example*]

Referenced By
ptab@leader (§2.3.3.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PTabLeader">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="dot"/>
      <enumeration value="hyphen"/>
      <enumeration value="underscore"/>
      <enumeration value="middleDot"/>
   </restriction>
</simpleType>
```

2.18.80 ST_PTabRelativeTo (Absolute Position Tab Positioning Base)

Specifies the possible extents which may be used to calculate the absolute positioning of this positional tab character.

[*Example*: Consider a positional tab stop in a WordprocessingML document that should have a resulting position that is centered on the text margins, ignoring both any custom tab stops and any text indents on the paragraph. This positional tab stop would be defined as follows:

```
<w:ptab w:relativeTo="margin" … />
```

The relativeTo attribute specifies that this absolute position tab stop shall be relative to the `margin`. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
indent (Relative To Indents)	Specifies that the absolute positioning of the tab shall be relative to the indents.
margin (Relative To Text Margins)	Specifies that the absolute positioning of the tab shall be relative to the margins.

Referenced By
ptab@relativeTo (§2.3.3.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PTabRelativeTo">
   <restriction base="xsd:string">
      <enumeration value="margin"/>
      <enumeration value="indent"/>
   </restriction>
</simpleType>
```

2.18.81 ST_RestartNumber (Footnote/Endnote Numbering Restart Locations)

This simple type specifies the possible values for when the automatic numbering of footnotes or endnotes shall be restarted.

[*Example*: Consider a WordprocessingML document where the numbering for its endnotes shall be restarted after each section shall be restarted after each page. This setting is represented by the following WordprocessingML:

```
<w:footnotePr>
  …
  <w:numRestart w:val="eachSect" />
  …
</w:footnotePr>
```

The val attribute value of `eachSect` specifies that numbering shall be restarted after each section. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
continuous (Continue Numbering From Previous Section)	Specifies that the numbering of footnotes or endnotes shall continue from the previous section in the document.
eachPage (Restart Numbering On Each Page)	Specifies that the numbering of footnotes or endnotes shall be restarted to its starting value for each unique page in the document.
eachSect (Restart Numbering For Each Section)	Specifies that the numbering of footnotes or endnotes shall be restarted to its starting value for each unique section in the document.

Referenced By
numRestart@val (§2.11.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RestartNumber">
   <restriction base="xsd:string">
      <enumeration value="continuous"/>
      <enumeration value="eachSect"/>
      <enumeration value="eachPage"/>
   </restriction>
</simpleType>
```

2.18.82 ST_RubyAlign (Phonetic Guide Text Alignment)

This simple type specifies the possible alignment settings which may be used to determine the placement of phonetic guide text with respect to the base text when this phonetic guide is displayed.

[*Example*: Consider a run of phonetic guide text which shall have the ruby text positioned to the far left of the base text. This constraint is specified using the following WordprocessingML:

```
<w:rubyPr>
  …
  <w:rubyAlign w:val="left"/>
  …
</w:rubyPr>
```

The rubyAlign property is `left` for the phonetic guide, so the ruby text will be displayed on the left side of the base text. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
center (Center)	Specifies that the phonetic guide text shall be centered with respect to the base text in this document. [*Example*: guide text this is a test center *end example*]
distributeLetter (Distribute All Characters)	Specifies that the phonetic guide text shall be distributed with respect to the base text in this document. This type of justification shall equally affect the inter-word spacing on each line as well as the inter-character spacing between each word when justifying its contents - that is, an equal amount of additional character pitch shall be added to all characters on the line. [*Example*: g u i d e t e x t a test distribute letter *end example*]
distributeSpace (Distribute all Characters w/ Additional Space On Either Side)	Specifies that the phonetic guide text shall be distributed with respect to the base text in this document, with additional space added to the guide text to ensure it is indented with respect to the base text. This type of justification shall equally affect the inter-word spacing on each line as well as the inter-character spacing between each word when justifying its contents - that is, an equal amount of additional character pitch shall be added to all characters on the line. As well, an additional space is added before and after the guide text to ensure it is indented with respect to the base text. [*Example*: g u i d e t e x t a test distribute space *end example*]

Enumeration Value	Description
left (Left Aligned)	Specifies that the phonetic guide text shall be left aligned with respect to the base text in this document. [*Example*: guide text this is a test left *end example*]
right (Right Aligned)	Specifies that the phonetic guide text shall be right aligned with respect to the base text in this document. [*Example*: guide text this is a test right *end example*]
rightVertical (Vertically Aligned to Right of Base Text)	Specifies that the phonetic guide text shall be right aligned with respect to the base text in this document, and shall always be displayed vertically and to the right of the base text, regardless of the alignment of the base text. [*Example*: this is a test right vertical guide text *end example*]

Referenced By
rubyAlign@val (§2.3.3.25)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RubyAlign">
   <restriction base="xsd:string">
      <enumeration value="center"/>
      <enumeration value="distributeLetter"/>
      <enumeration value="distributeSpace"/>
      <enumeration value="left"/>
      <enumeration value="right"/>
      <enumeration value="rightVertical"/>
   </restriction>
</simpleType>
```

2.18.83 ST_SdtDateMappingType (Date Storage Format Types)

This simple type specifies then possible types of translations which may be performed on the displayed date in a date picker structured document tag when the current contents are saved into the associated custom XML data via the dataBinding element (§2.5.2.6).

[*Example*: Consider the following date picker structured document tag:

```
<w:sdt>
  <w:sdtPr>
    <w:date w:fullDate="01-01-2006T06:30:00Z">
      <w:storeMappedDateAs w:val="text"/>
      …
    </w:date>
  </w:sdtPr>
  <w:sdtContent>
    <w:r>
      <w:t>January 1</w:t>
    </w:r>
  </w:sdtContent>
</w:sdt>
```

The value of the storeMappedDateAs element's attribute value is `text`, therefore the current run contents shall be sent to the mapped XML element without any translation (in this case, the value shall be `January 1`). *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
date (XML Schema Date Format)	Specifies that the date specified in the parent date picker structured document tag shall be converted to the xsd:date format when stored in a mapped XML element.
dateTime (XML Schema DateTime Format)	Specifies that the date specified in the parent date picker structured document tag shall be converted to the xsd:dateTime format when stored in a mapped XML element.
text (Same As Display)	Specifies that no translation shall be performed on the displayed date when stored in a mapped XML element - the mapped contents shall be the same as the displayed contents.

Referenced By
storeMappedDataAs@val (§2.5.2.39)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SdtDateMappingType">
   <restriction base="xsd:string">
      <enumeration value="text"/>
      <enumeration value="date"/>
      <enumeration value="dateTime"/>
   </restriction>
</simpleType>
```

2.18.84 ST_SectionMark (Section Type)

Specifies the type of the current section.

[*Example*: Consider a section that shall start on the next page in the document. The WordprocessingML specifying this would look like:

```
<w:sectPr>
  …
  <w:type w:val="nextPage"/>
</w:sectPr>
```

The nextPage value specifies that this section starts on the next page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
continuous (Continuous Section Break)	Specifies a continuous section break, which begin the new section on the following paragraph. This means that continuous section breaks might not specify certain page-level section properties, since they must be inherited from the following section. These breaks, however, can specify other section properties, such as line numbering and footnote/endnote settings.
evenPage (Even Page Section Break)	Specifies an even page section break, which begins the new section on the next even-numbered page, leaving the next odd page blank if necessary.
nextColumn (Column Section Break)	Specifies a column section break, which begins the new section on the following column on the page.
nextPage (Next Page Section Break)	Specifies a next page section break, which begins the new section on the following page.
oddPage (Odd Page Section Break)	Specifies an odd page section break, which begins the

Enumeration Value	Description
	new section on the next odd-numbered page, leaving the next even page blank if necessary.

Referenced By
type@val (§2.6.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SectionMark">
   <restriction base="xsd:string">
      <enumeration value="nextPage"/>
      <enumeration value="nextColumn"/>
      <enumeration value="continuous"/>
      <enumeration value="evenPage"/>
      <enumeration value="oddPage"/>
   </restriction>
</simpleType>
```

2.18.85 ST_Shd (Shading Patterns)

This simple type specifies the pattern which shall be used to lay the pattern color over the background color for a shading.

This pattern consists of a mask which is applied over the background shading color to get the locations where the pattern color should be shown. Each of these possible masks are shown in the enumeration values located below. In each example, black has been used as the fill color, and white has been used as the pattern color.

[*Example*: Consider a shaded paragraph which uses a 10 percent foreground fill, resulting in the following WordprocessingML:

```
<w:shd w:val="pct10" .../>
```

This shading val is `pct10`, indicating that the border style is a 10 percent foreground fill mask. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clear (No Pattern)	Specifies that there shall be no pattern used on the current shaded region (i.e. the pattern shall be a complete fill with the background color), as follows:

Enumeration Value	Description
	
diagCross (Diagonal Cross Pattern)	Specifies that the pattern used on the current shaded region shall be a series of diagonal crosses, as follows: 
diagStripe (Diagonal Stripe Pattern)	Specifies that the pattern used on the current shaded region shall be a series of diagonal stripes, as follows: 
horzCross (Horizontal Cross Pattern)	Specifies that the pattern used on the current shaded region shall be a series of horizontal crosses, as follows: 
horzStripe (Horizontal Stripe Pattern)	Specifies that the pattern used on the current shaded region shall be a series of horizontal stripes, as follows: nil (No Pattern)	Specifies that there shall be no pattern used on the current shaded region (i.e. the pattern shall be a complete fill with the background color), as follows: 
pct10 (10% Fill Pattern)	Specifies that the pattern used for the current shaded

Enumeration Value	Description
	region shall be a 10% fill pattern, as follows: pct12 (12.5% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 12.5% fill pattern, as follows: pct15 (15% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 15% fill pattern, as follows: pct20 (20% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 20% fill pattern, as follows: pct25 (25% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 25% fill pattern, as follows: pct30 (30% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 30% fill pattern, as follows:

Enumeration Value	Description
	pct35 (35% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 35% fill pattern, as follows: pct37 (37.5% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 37.5% fill pattern, as follows: pct40 (40% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 40% fill pattern, as follows: pct45 (45% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 45% fill pattern, as follows: pct5 (5% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 5% fill pattern, as follows: pct50 (50% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 50% fill pattern, as follows:

Enumeration Value	Description
	pct55 (55% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 55% fill pattern, as follows: pct60 (60% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 60% fill pattern, as follows: pct62 (62.5% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 62.5% fill pattern, as follows: pct65 (65% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 65% fill pattern, as follows: pct70 (70% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 70% fill pattern, as follows: pct75 (75% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 75% fill pattern, as follows:

Enumeration Value	Description
	pct80 (80% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 80% fill pattern, as follows: pct85 (85% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 85% fill pattern, as follows: pct87 (87.5% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 87.5% fill pattern, as follows: pct90 (90% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 90% fill pattern, as follows: pct95 (95% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 95% fill pattern, as follows: reverseDiagStripe (Reverse Diagonal Stripe Pattern)	Specifies that the pattern used on the current shaded

Enumeration Value	Description
	region shall be a series of reverse diagonal stripes, as follows: solid (100% Fill Pattern)	Specifies that the pattern used for the current shaded region shall be a 100% fill pattern, as follows:
thinDiagCross (Thin Diagonal Cross Pattern)	Specifies that the pattern used on the current shaded region shall be a series of thin diagonal crosses, as follows: thinDiagStripe (Thin Diagonal Stripe Pattern)	Specifies that the pattern used on the current shaded region shall be a series of thin diagonal stripes, as follows: 
thinHorzCross (Thin Horizontal Cross Pattern)	Specifies that the pattern used on the current shaded region shall be a series of thin horizontal crosses, as follows: thinHorzStripe (Thin Horizontal Stripe Pattern)	Specifies that the pattern used on the current shaded region shall be a series of thin horizontal stripes, as follows:

Enumeration Value	Description
	
thinReverseDiagStripe (Thin Reverse Diagonal Stripe Pattern)	Specifies that the pattern used on the current shaded region shall be a series of thin reverse diagonal stripes, as follows: thinVertStripe (Thin Vertical Stripe Pattern)	Specifies that the pattern used on the current shaded region shall be a series of thin vertical stripes, as follows: vertStripe (Vertical Stripe Pattern)	Specifies that the pattern used on the current shaded region shall be a series of vertical stripes, as follows:

</simpleType>
```

2.18.86 ST_ShortHexNumber (Two Digit Hexadecimal Number Value)

This simple type specifies a number value specified as a two octet hexadecimal number), whose contents are interpreted based on the context of the parent XML element.

[*Example*: Consider the following value for a node of type ST_ShortHexNumber: `2F6C`.

This value is valid, as it contains two hexadecimal octets, each an encoding of an octet of the actual decimal number value. *end example*]

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 2 characters.

Referenced By
stylePaneFormatFilter@val (§2.15.1.86); stylePaneSortMethod@val (§2.15.1.87); sym@char (§2.3.3.29); tblLook@val (§2.4.51); tblLook@val (§2.4.52)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ShortHexNumber">
   <restriction base="xsd:hexBinary">
      <length value="2"/>
   </restriction>
</simpleType>
```

2.18.87 ST_SignedHpsMeasure (Signed Measurement in Half-Points)

This simple type specifies that its contents will contain a positive or negative whole number, whose contents consist of a measurement in half-points (equivalent to 1/144th of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of -72 whose type is ST_HpsMeasure. This attribute value specifies a size of negative one-half of an inch or -36 points (-72 halves of a point = -36 points = -0.5 inches). *end example*]

This simple type's contents are a restriction of the XML Schema integer datatype.

Referenced By
position@val (§2.3.2.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SignedHpsMeasure">
   <restriction base="xsd:integer"/>
</simpleType>
```

2.18.88 ST_SignedTwipsMeasure (Signed Measurement in Twentieths of a Point)

This simple type specifies that its contents will contain a positive or negative whole number, whose contents consist of a measurement in twentieths of a point (equivalent to 1/1440th of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of `720` whose type is ST_EighthPointMeasure. This attribute value specifies a size of one-half of an inch or 36 points (`720` twentieths of a point = 36 points = 0.5 inches). *end example*]

This simple type's contents are a restriction of the XML Schema integer datatype.

Referenced By
framePr@x (§2.3.1.11); framePr@y (§2.3.1.11); ind@left (§2.3.1.12); ind@right (§2.3.1.12); legacy@legacyIndent (§2.9.5); marBottom@val (§2.15.2.23); marLeft@val (§2.15.2.25); marRight@val (§2.15.2.26); marTop@val (§2.15.2.27); pgMar@bottom (§2.6.11); pgMar@top (§2.6.11); spacing@line (§2.3.1.33); spacing@val (§2.3.2.33); tab@pos (§2.3.1.37); tblpPr@tblpX (§2.4.54); tblpPr@tblpY (§2.4.54)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SignedTwipsMeasure">
   <restriction base="xsd:integer"/>
</simpleType>
```

2.18.89 ST_String (String)

This simple type specifies that its contents will contain a string. The contents of this string are interpreted based on the context of the parent XML element.

[*Example*: Consider the following WordprocessingML fragment:

```
<w:pPr>
  <w:pStyle w:val="heading1" />
</w:pPr>
```

The value of the val attribute is the ID of the associated paragraph style's `styleId`. However, consider the following fragment:

```
<w:sdtPr>
  <w:alias w:val="SDT Title Example" />
  ...
</w:sdtPr>
```

In this case, the decimal number in the val attribute is the caption of the parent structured document tag. In each case, the value is of type ST_String, and therefore must be interpreted in the context of the parent element. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_String">
   <restriction base="xsd:string"/>
</simpleType>
```

2.18.90 ST_StyleType (Style Types)

This simple type specifies the possible values for the types of style definitions defined within a WordprocessingML document. WordprocessingML supports six types of style definitions:

- Paragraph styles
- Character styles
- Table styles
- Numbering styles
- Linked styles (paragraph + character)
- Default paragraph + character properties

Each of the first four types corresponds to a different value below, and therefore defines the type of the current style. [*Note*: The last two types are unique in that they are not simply a style type: a linked style is a pairing of a character and paragraph style via the link element (§2.7.3.6); and the document default properties are defined via the docDefaults element (§2.7.4.1). *end note*]

[*Example*: Consider a style defined as follows:

```
<w:style w:type="paragraph" … >
  <w:name w:val="My Paragraph Style"/>
  <w:rPr>
    <w:b/>
  </w:rPr>
</w:style>
```

The type attribute is of type ST_StyleType, and its value of paragraph specifies that this style definition creates a paragraph style. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
character (Character Style)	Specifies that the parent style definition is a character style.
numbering (Numbering Style)	Specifies that the parent style definition is a numbering style.
paragraph (Paragraph Style)	Specifies that the parent style definition is a paragraph style.

Enumeration Value	Description
table (Table Style)	Specifies that the parent style definition is a table style.

Referenced By
style@type (§2.7.3.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StyleType">
   <restriction base="xsd:string">
      <enumeration value="paragraph"/>
      <enumeration value="character"/>
      <enumeration value="table"/>
      <enumeration value="numbering"/>
   </restriction>
</simpleType>
```

2.18.91 ST_TabJc (Custom Tab Stop Type)

This simple type specifies the available types of custom tab stop, which determines the behavior of the tab stop and the alignment which shall be applied to text entered at the current custom tab stop.

[*Example*: Consider a custom tab stops at 1.5" in a WordprocessingML document. This tab stop would be contained within a tab element defining the tab stop as follows:

```
<w:tab w:val="left" w:pos="2160" />
```

The val attribute specifies that this custom tab stop shall align all text entered at its location to its left. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bar (Bar Tab)	Specifies that the current tab is a bar tab. A *bar tab* is a tab which does not result in a custom tab stop in the parent paragraph (this tab stop location shall be skipped when positioning custom tab characters), but instead shall be used to draw a vertical line (or bar) at this location in the parent paragraph.
center (Centered Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is centered (i.e. all text runs following this tab stop and preceding the next tab stop shall be centered around the tab stop location).

Enumeration Value	Description
clear (No Tab Stop)	Specifies that the current tab stop is cleared and shall be removed and ignored when processing the contents of this document.
decimal (Decimal Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is aligned around the first decimal character in the following text runs. All text runs before the first decimal character shall be before the tab stop, all text runs after it shall be after the tab stop location.
left (Left Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is left aligned (i.e. all text runs following this tab stop and preceding the next tab stop shall be left aligned with respect to the tab stop location).
num (List Tab)	Specifies that the current tab is a list tab, which is the tab stop between the numbering and the paragraph contents in a numbered paragraph. [*Note*: This justification style is used for backwards compatibility with earlier word processors, and should be deprecated in favor of hanging paragraph indentation. *end note*]
right (Right Tab)	Specifies that the current tab stop shall result in a location in the document where all following text is right aligned (i.e. all text runs following this tab stop and preceding the next tab stop shall be right aligned with respect to the tab stop location).

Referenced By
tab@val (§2.3.1.37)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TabJc">
   <restriction base="xsd:string">
      <enumeration value="clear"/>
      <enumeration value="left"/>
      <enumeration value="center"/>
      <enumeration value="right"/>
      <enumeration value="decimal"/>
      <enumeration value="bar"/>
      <enumeration value="num"/>
   </restriction>
</simpleType>
```

2.18.92 ST_TabTlc (Custom Tab Stop Leader Character)

This simple type specifies the characters which may be used to fill in the space created by a tab which ends at this custom tab stop. The chosen character shall be repeated as required to completely fill the tab spacing generated by the tab character.

[*Example*: Consider a tab stop which should be preceded by a sequence of underscore characters, as follows:

_____Text at the tab stop

This tab stop would have a leader attribute value of underscore, indicating that the tab stop shall be preceded by underscore characters as needed to fill the tab spacing. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dot (Dotted leader line)	Specifies that the leader character for this custom tab stop shall be a dot. [*Example*: .....Text at tab stop. *end example*]
heavy (Heavy solid leader line)	Specifies that the leader character for this custom tab stop shall be a heavy solid line, or an underscore. [Note: This setting is used for backwards compatibility with earlier word processors, and should be deprecated in favor of other leader characters. It may be displayed using underscores if desired. *end note*] [*Example*:

Enumeration Value	Description
	_____Text at tab stop. *end example*]
hyphen (Dashed tab stop leader line)	Specifies that the leader character for this custom tab stop shall be a hyphen. [*Example*: ---------- Text at tab stop. *end example*]
middleDot (Middle dot leader line)	Specifies that the leader character for this custom tab stop shall be a centered dot. [*Example*: ·····Text at tab stop. *end example*]
none (No tab stop leader)	Specifies that there shall be no leader character for this custom tab. [*Example*: Text at tab stop. *end example*]
underscore (Solid leader line)	Specifies that the leader character for this custom tab stop shall be an underscore. [*Example*: _____Text at tab stop. *end example*]

Referenced By
tab@leader (§2.3.1.37)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TabTlc">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="dot"/>
      <enumeration value="hyphen"/>
      <enumeration value="underscore"/>
      <enumeration value="heavy"/>
      <enumeration value="middleDot"/>
   </restriction>
</simpleType>
```

2.18.93 ST_TargetScreenSz (Target Screen Sizes for Generated Web Pages)

This simple type specifies possible ideal minimum target screen sizes (width by height, specified in pixels) for which web pages generated may be optimized when saving this document as a web page.

[*Example*: Consider a WordprocessingML document which contains the following content within the web settings part:

```
<w:webSettings>
  <w:targetScreenSz w:val="1600x1200" />
</w:webSettings>
```

The targetScreenSz element's val attribute has a value of `1600x1200`, which specifies that a target screen size of 1600 by 1200 pixels shall be assumed when saving this document as a web page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1024x768 (Optimize for 1024x768)	Specifies that web pages produced from this document should be optimized for a screen size of 1024x768.
1152x882 (Optimize for 1152x882)	Specifies that web pages produced from this document should be optimized for a screen size of 1152x882.
1152x900 (Optimize for 1152x900)	Specifies that web pages produced from this document should be optimized for a screen size of 1152x900.
1280x1024 (Optimize for 1280x1024)	Specifies that web pages produced from this document should be optimized for a screen size of 1280x1024.
1600x1200 (Optimize for 1600x1200)	Specifies that web pages produced from this document should be optimized for a screen size of 1600x1200.

Enumeration Value	Description
1800x1440 (Optimize for 1800x1440)	Specifies that web pages produced from this document should be optimized for a screen size of 1800x1440.
1920x1200 (Optimize for 1920x1200)	Specifies that web pages produced from this document should be optimized for a screen size of 1920x1200.
544x376 (Optimize for 544x376)	Specifies that web pages produced from this document should be optimized for a screen size of 544x376.
640x480 (Optimize for 640x480)	Specifies that web pages produced from this document should be optimized for a screen size of 640x480.
720x512 (Optimize for 720x512)	Specifies that web pages produced from this document should be optimized for a screen size of 720x512.
800x600 (Optimize for 800x600)	Specifies that web pages produced from this document should be optimized for a screen size of 800x600.

Referenced By
targetScreenSz@val (§2.15.2.41)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TargetScreenSz">
   <restriction base="xsd:string">
      <enumeration value="544x376"/>
      <enumeration value="640x480"/>
      <enumeration value="720x512"/>
      <enumeration value="800x600"/>
      <enumeration value="1024x768"/>

      <enumeration value="1800x1440"/>
      <enumeration value="1920x1200"/>
   </restriction>
</simpleType>
```

2.18.94 ST_TblLayoutType (Table Layout Type)

This simple type defines the possible types of layout algorithms which may be used to lay out a table within a WordprocessingML document.

These algorithms are defined in the following paragraphs (noting, of course, that implementations are free to implement more efficient versions of each).

Fixed Width Table Layout - This method of table layout uses the preferred widths on the table items to generate the final sizing of the table, but does not change that size regardless of the contents of each table cell, hence the table is fixed width.

[*Guidance*: Although an application may choose to use a different process, this layout could be performed as follows:

- The table grid is used to create the set of shared columns in the table and their initial widths as defined in the tblGrid element (§2.4.44)
- The table's total width is defined based on the tblW property (§2.4.61) – if it is set to `auto` or `nil`, then the width is not yet determined and will be specified using the row and cell information.
- The first table row is read and the initial number of grid units before the row starts is skipped. The width of the skipped grid columns is set using the wBefore property (§2.4.83).
- The first cell is placed on the grid, and the width of the specified grid column span set by gridSpan (§2.4.13) is set based on the tcW property (§2.4.68).
- Each additional cell is placed on the grid.
- If at any stage, the preferred width requested for the cells exceeds the preferred width of the table, then each grid column is proportionally reduced in size to fit the table width.
- If the grid is exceeded (e.g. tblGrid specifies three grid columns, but the second cell has a gridSpan of three), the grid is dynamically increased with a default width for the new grid column.
- For each subsequent row, cells are placed on the grid, and each grid column is adjusted to be the maximum value of the requested widths (if the widths do not agree) by adding width to the last cell that ends with that grid column. Again, if at any point, the space requested for the cells exceeds the width of the table, then each grid column is proportionally reduced in size to fit the table width.

end guidance]

The resulting table shall be displayed regardless of its contents to the size requested.

AutoFit Table Layout - This method of table layout uses the preferred widths on the table items to generate the final sizing of the table, but then uses the contents of each cell to determine final column widths.

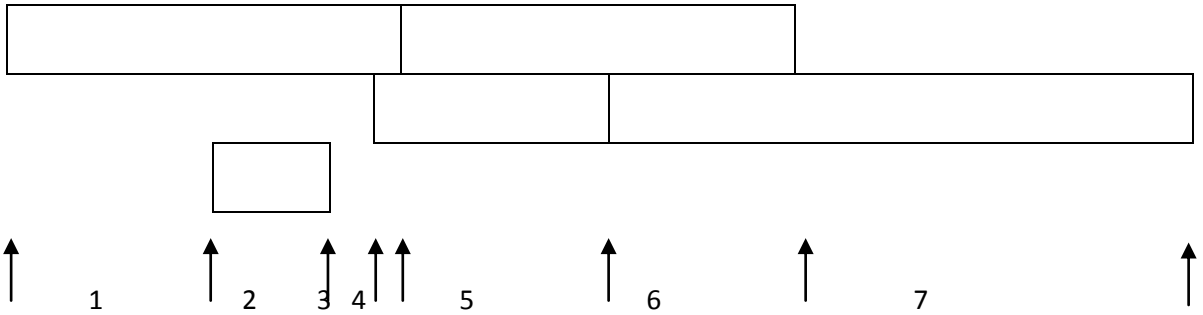
[*Guidance*: This layout may be performed in any manner available to an application, but one algorithm as follows may be used:

- Perform the steps above to lay out the fixed width version of the table.
- Calculate the minimum content width - the width of the cell's contents including all possible line breaking locations (or the cell's width, if the width of the content is smaller), and the maximum content width -the width of the cell's contents (assuming no line breaking not generated by explicit line breaks).
- The minimum and maximum content width of all cells that span a single grid column is the minimum and maximum content width of that column.

- For cells which span multiple grid columns, enlarge all cells which it spans as needed to meet that cell's minimum width.
- If any cell in a grid column has a preferred width, the first such width overrides the maximum width of the column's contents.
- Place the text in the cells in the table, respecting the minimum content width of each cell's content. If a cell's minimum content width exceeds the cell's current width, preferences are overridden as follows:
- First, override the column widths by making all other grid columns proportionally smaller until each it at its minimum width. This cell may then grow to any width between its own minimum and maximum width.
- Next, override the preferred table width until the table reaches the page width.
- Finally, force a line break in each cell's contents as needed

end guidance]

[*Example*: Consider the following fixed width table, which makes extensive use of resized and merged cells on what is actually just a seven-column grid. (The arrows point to each (invisible) vertical line of the grid and the numbers refer to the grid columns):



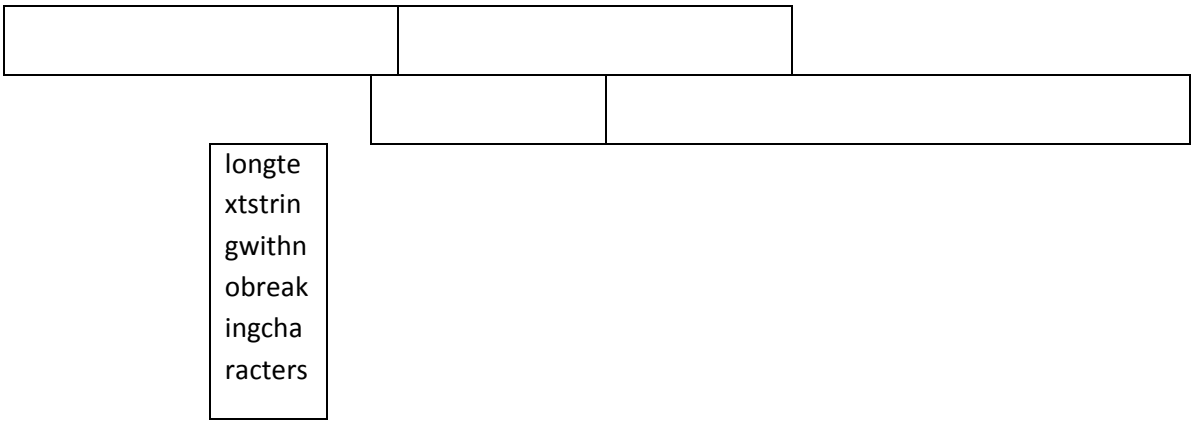
Although the table is visually complex, the standard rules apply: the first cell in the table is simply a cell which spans four grid units horizontally, as specified in the gridSpan element, and whose preferred with is 2952 twentieths of a point, specified in the tcW element:

```
<w:tc>
  <w:tcPr>
    <w:tcW w:w="2952" w:type="dxa"/>
    <w:gridSpan w:val="4"/>
  </w:tcPr>
  <w:p/>
</w:tc>
```

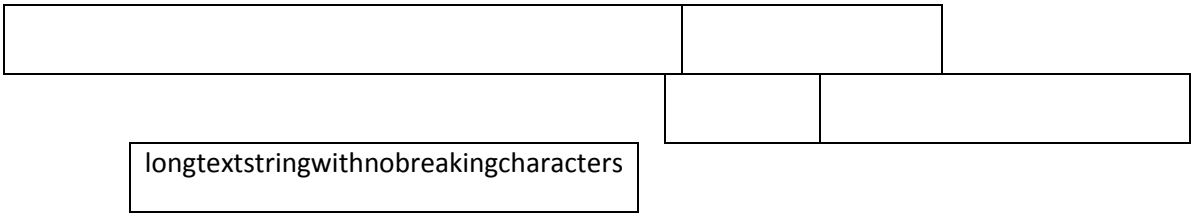
Similarly, all cells indented from the stand and end of the grid specify that indent using the gridBefore and gridAfter elements. For example, the XML for the second row in the table shows that that row starts three grid units into the table:

```
<w:tr>
  <w:trPr>
    <w:gridBefore w:val="3"/>
    <w:wBefore w:w="2748" w:type="dxa"/>
  </w:trPr>
  …
</w:tr>
```

If we take this fixed width table and introduce a long string into the single cell in row three, we see that the presence of this text does not affect cell widths:



If we now turn on the AutoFit property, we see that the algorithm for this AutoFit table causes grid column two to increase in size, proportionally decreasing the other grid columns' size to accommodate the long non-breaking string in the last cell:



Each of the other grid columns was reduced, but since all columns are not at their minimum size, the table width is not increased even though the table is not yet at the page width. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autofit (AutoFit Table Layout)	Specifies that this table shall use an AutoFit table layout algorithm.

Enumeration Value	Description
fixed (Fixed Width Table Layout)	Specifies that this table shall use the fixed width table layout algorithm described above.

Referenced By
tblLayout@type (§2.4.49); tblLayout@type (§2.4.50)

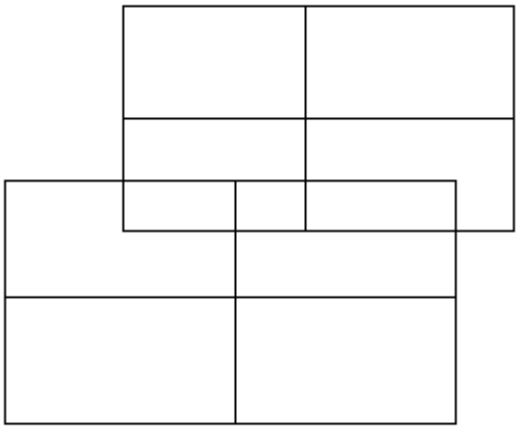
The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TblLayoutType">
   <restriction base="xsd:string">
      <enumeration value="fixed"/>
      <enumeration value="autofit"/>
   </restriction>
</simpleType>
```

2.18.95 ST_TblOverlap (Table Overlap Setting)

This simple type contains the possible settings for a floating table which shall be used to determine if the table can overlap with other floating tables when displayed in the document.

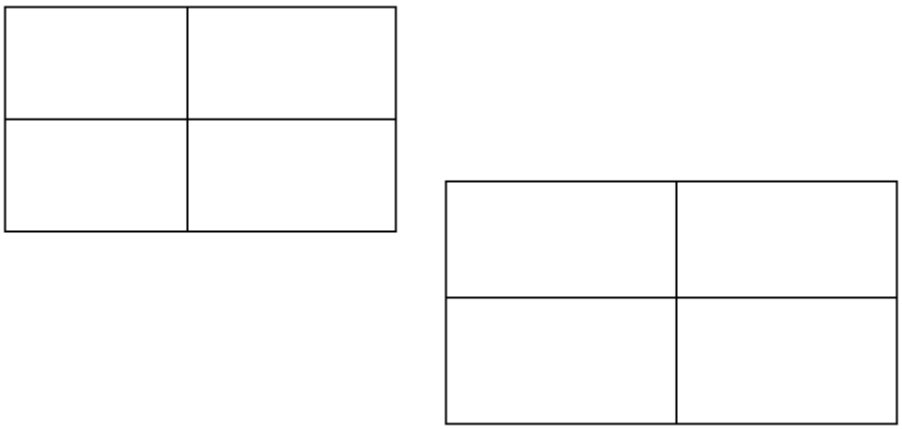
[*Example*: Consider two floating tables in a WordprocessingML document which overlap when displayed, as follows:



If either of these tables specifies that it shall not allow overlapping, using the following WordprocessingML:

```
<w:tblPr>
  <w:tblOverlap w:val="never"/>
</w:tblPr>
```

The resulting tables shall not overlap, and must be adjusted at display time to prevent any overlapping, for example:



The value of never specifies that the specified table cannot overlap with other floating tables in the document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
never (Floating Table Cannot Overlap)	Specifies that the parent table, if floating, shall never be displayed in a state where it would be overlapping another floating table in the document. If two floating tables intersect and this option is set on either of them, then one or both tables shall be adjusted as needed to ensure that the table whose value is never is not overlapped when displayed.
overlap (Floating Table Can Overlap)	Specifies that the parent table, if floating, may be displayed in a state where it would be overlapping another floating table in the document.

Referenced By
tblOverlap@val (§2.4.53)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TblOverlap">
   <restriction base="xsd:string">
      <enumeration value="never"/>
      <enumeration value="overlap"/>
   </restriction>
</simpleType>
```

2.18.96 ST_TblStyleOverrideType (Conditional Table Style Formatting Types)

This simple type specifies possible values for the sections of the table to which the current conditional formatting properties shall be applied when this table style is used.

[*Example*: Consider a table style which contains conditional formatting, defined as follows:

```
<w:style w:type="table" …>
  …
  <w:tblStylePr w:type="lastRow">
    …
  </w:tblStylePr>
</w:style>
```

The type attribute value of `lastRow` specifies that this set of conditional formatting properties shall be applied to the last row of the table only. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
band1Horz (Banded Row Conditional Formatting)	Specifies that the table formatting applies to odd numbered groupings of rows.
band1Vert (Banded Column Conditional Formatting)	Specifies that the table formatting applies to odd numbered groupings of columns.
band2Horz (Even Row Stripe Conditional Formatting)	Specifies that the table formatting applies to even numbered groupings of rows.
band2Vert (Even Column Stripe Conditional Formatting)	Specifies that the table formatting applies to even numbered groupings of columns.
firstCol (First Column Conditional Formatting)	Specifies that the table formatting applies to the first column.
firstRow (First Row Conditional Formatting)	Specifies that the table formatting applies to the first row. Any subsequent row which has the tblHeader element present (§2.4.46) shall also use this conditional format.
lastCol (Last table column formatting)	Specifies that the table formatting applies to the last column.
lastRow (Last table row formatting)	Specifies that the table formatting applies to the last row.
neCell (Top right table cell formatting)	Specifies that the table formatting applies to the top right cell.
nwCell (Top left table cell formatting)	Specifies that the table formatting applies to the top

Enumeration Value	Description
	left cell.
seCell (Bottom right table cell formatting)	Specifies that the table formatting applies to the bottom right cell.
swCell (Bottom left table cell formatting)	Specifies that the table formatting applies to the bottom left cell.
wholeTable (Whole table formatting)	Specifies that the conditional formatting applies to the whole table.

      <enumeration value="swCell"/>
   </restriction>
</simpleType>
```

2.18.97 ST_TblWidth (Table Width Units)

This simple type specifies the possible values for the units of the width property being defined by a specific table width property. These properties are used to define various properties of a table, including: cell spacing, preferred width, and table margins.

[*Example*: Consider a table with a table cell bottom cell spacing with a type of dxa, as follows:

```
<w:bottom ... w:type="dxa" />
```

This type shall therefore be used to interpret the width specified in the w attribute as a value in twentieths of a point. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatically Determined Width)	Specifies that the value for the measurement of the current table width property in the parent table shall be automatically determined by the table layout algorithm when the table is displayed (this width can be adjusted as appropriate). If this value is inappropriate for the current measurement (i.e. this measurement is not affected by that algorithm), then this type and the associated value may be ignored.
dxa (Width in Twentieths of a Point)	Specifies that the value for the measurement of the current table width property in the parent table shall be interpreted as twentieths of a point (1/1440 of an inch).
nil (No Width)	Specifies that the current width is zero, regardless of any width value specified on the parent element.
pct (Width in Fiftieths of a Percent)	Specifies that the value for the measurement of the current table width property in the parent table shall be interpreted as fiftieths of a percent. [*Example*: 4975 = 99.5% *end example*] These percentages shall be calculated relative to the extents specified by the parent XML element. If this value is inappropriate for the current measurement (i.e. this measurement is not part of the width of the table), then this type and the associated value may be ignored.

Referenced By
bottom@type (§2.4.2); bottom@type (§2.4.5); left@type (§2.4.25); left@type (§2.4.26); right@type (§2.4.29); right@type (§2.4.31); tblCellSpacing@type (§2.4.41); tblCellSpacing@type (§2.4.42); tblCellSpacing@type (§2.4.43); tblInd@type (§2.4.47); tblInd@type (§2.4.48); tblW@type (§2.4.60); tblW@type (§2.4.61); tcW@type (§2.4.68); top@type (§2.4.72); top@type (§2.4.73); wAfter@type (§2.4.82); wBefore@type (§2.4.83)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TblWidth">
   <restriction base="xsd:string">
      <enumeration value="nil"/>
      <enumeration value="pct"/>
      <enumeration value="dxa"/>
      <enumeration value="auto"/>
   </restriction>
</simpleType>
```

2.18.98 ST_TextAlignment (Vertical Text Alignment Types)

This simple type specifies the type of vertical alignment which shall be used to align the characters on each line in the parent object.

[*Example*: Consider a paragraph of text of different font sizes, as follows:

If the text on this paragraph shall be aligned based on the top point of the maximum character height, that requirement would be specified as follows in the WordprocessingML:

```
<w:pPr>
  <w:textAlignment w:val="top" />
</w:pPr>
```

The resulting text would be top aligned, as follows:

The characters are all aligned to the maximum character extent on the line. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatically Determine Alignment)	Specifies that all text in the parent object shall be aligned automatically when displayed.
baseline (Align Text at Baseline)	Specifies that all text in the parent object shall be aligned to the baseline of each character when displayed.

Enumeration Value	Description
bottom (Align Text at Bottom)	Specifies that all text in the parent object shall be aligned to the bottom of each character when displayed.
center (Align Text at Center)	Specifies that all text in the parent object shall be aligned to the center of each character when displayed.
top (Align Text at Top)	Specifies that all text in the parent object shall be aligned to the top of each character when displayed.

Referenced By
textAlignment@val (§2.3.1.39)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextAlignment">
   <restriction base="xsd:string">
      <enumeration value="top"/>
      <enumeration value="center"/>
      <enumeration value="baseline"/>
      <enumeration value="bottom"/>
      <enumeration value="auto"/>
   </restriction>
</simpleType>
```

2.18.99 ST_TextboxTightWrap (Lines To Tight Wrap Within Text Box)

This simple type specifies the lines in the parent paragraph which shall allow the text to be tight wrapped to the paragraph (and not the containing text box) extents when displaying the document.

[*Example*: Consider a paragraph in a text box which meets the criteria specified above which shall allow wrapping to the text extents on its first line only. That requirement would be specified using the following WordprocessingML:

```
<w:pPr>
  <w:textboxTightWrap w:val="firstLineOnly" />
</w:pPr>
```

The resulting paragraph would allow text to tightly wrap to the contents of its first line only. All other lines would wrap to the text box's extents. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
allLines (Tight Wrap All Lines)	Specifies that all lines in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
firstAndLastLine (Tight Wrap First and Last Lines)	Specifies that only the first and last lines in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
firstLineOnly (Tight Wrap First Line)	Specifies that only the first line in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
lastLineOnly (Tight Wrap Last Line)	Specifies that only the last line in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.
none (Do Not Tight Wrap)	Specifies that no lines in the paragraph shall allow surrounding text to be tight wrapped to their extents and not the containing text box's extents.

Referenced By
textboxTightWrap@val (§2.3.1.40)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextboxTightWrap">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="allLines"/>
      <enumeration value="firstAndLastLine"/>
      <enumeration value="firstLineOnly"/>
      <enumeration value="lastLineOnly"/>
   </restriction>
</simpleType>
```

2.18.100 ST_TextDirection (Text Flow Direction)

This simple type specifies the direction of the text flow for the parent object.

[*Example*: Consider an object in which text shall flow bottom to top vertically, and left to right horizontally. The `btLr` value in an element of type ST_TextDirection specifies that the text flow shall go bottom to top, and left to right. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
btLr (Bottom to Top, Left to Right)	Specifies that text in the parent object shall flow from bottom to top vertically, then from left to right horizontally on the page. This means that vertical lines are filled before the text expands horizontally.
lrTb (Left to Right, Top to Bottom)	Specifies that text in the parent object shall flow from left to right horizontally, then top to bottom vertically on the page. This means that horizontal lines are filled before the text expands vertically.
lrTbV (Left to Right, Top to Bottom Rotated)	Specifies that text in the parent object shall flow from left to right horizontally, then top to bottom vertically on the page. This means that horizontal lines are filled before the text expands vertically. This flow is also rotated such that any East Asian text shall be rotated 270 degrees when displayed on a page.
tbLrV (Top to Bottom, Left to Right Rotated)	Specifies that text in the parent object shall flow from top to bottom vertically, then left to right horizontally on the page. This means that vertical lines are filled before the text expands horizontally. This flow is also rotated such that all text is rotated 90 degrees when displayed on a page.
tbRl (Top to Bottom, Right to Left)	Specifies that text in the parent object shall flow from right to left horizontally, then top to bottom vertically on the page. This means that horizontal lines are filled before the text expands vertically.
tbRlV (Top to Bottom, Right to Left Rotated)	Specifies that text in the parent object shall flow from top to bottom vertically, then right to left horizontally on the page. This means that vertical lines are filled before the text expands horizontally.

Enumeration Value	Description
	This flow is also rotated such that all text is rotated 90 degrees when displayed on a page.

Referenced By
textDirection@val (§2.6.20); textDirection@val (§2.4.69); textDirection@val (§2.3.1.41)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextDirection">
   <restriction base="xsd:string">
      <enumeration value="lrTb"/>
      <enumeration value="tbRl"/>
      <enumeration value="btLr"/>
      <enumeration value="lrTbV"/>
      <enumeration value="tbRlV"/>
      <enumeration value="tbLrV"/>
   </restriction>
</simpleType>
```

2.18.101 ST_TextEffect (Animated Text Effects)

This simple type specifies the possible types of animated text effect which may be applied to a text run when it is displayed..

[*Example*: Consider a run of text which shall have an animated text effect consisting of multiple colored flashing lights. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
  <w:effect w:val="lights"/>
</w:rPr>
```

This run explicitly declares a type of text effect, using the val property, of `lights`, so the contents of this run will have the animated lights text effect. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
antsBlack (Black Dashed Line Animation)	Specifies that this text shall be surrounded by an animated black dashed line border.
antsRed (Marching Red Ants)	Specifies that this text shall be surrounded by an animated red dashed line border.
blinkBackground (Blinking Background Animation)	Specifies that this text shall be surrounded by a background color which alternates between black and

Enumeration Value	Description
	white.
lights (Colored Lights Animation)	Specifies that this text shall be surrounded by a border consisting of a series of colored lights, which constantly change colors in sequence.
none (No Animation)	Specifies that this text shall have no animated text effect.
shimmer (Shimmer Animation)	Specifies that this text shall be animated by alternating between normal and blurry states.
sparkle (Sparkling Lights Animation)	Specifies that this text shall have a background consisting of a random pattern of colored lights, which constantly change colors in sequence.

Referenced By
effect@val (§2.3.2.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextEffect">
   <restriction base="xsd:string">
      <enumeration value="blinkBackground"/>
      <enumeration value="lights"/>
      <enumeration value="antsBlack"/>
      <enumeration value="antsRed"/>
      <enumeration value="shimmer"/>
      <enumeration value="sparkle"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

2.18.102 ST_TextScale (Text Expansion/Compression Percentage)

This simple type specifies that the percentage by which the contents of a run shall be expanded or compressed with respect to its normal (100%) character width, with a minimum width of 1% and maximum width of 600%.

[*Example*: Consider a run of text which shall be compressed to 200% when displaying each character within the contents of the run. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
  <w:w w:val="50"/>
</w:rPr>
```

This run explicitly declares that the w value is 50, so the contents of this run will appear at 50% of their normal character width by compressing the width of each character. *end example*]

This simple type's contents are a restriction of the XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 600.

Referenced By
w@val (§2.3.2.41)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextScale">
   <restriction base="xsd:integer">
      <minInclusive value="0"/>
      <maxInclusive value="600"/>
   </restriction>
</simpleType>
```

2.18.103 ST_Theme (Theme Font)

This simple type specifies a theme font type which may be referenced as a theme font within the parent run properties. This theme font is a reference to one of the predefined theme fonts, located in the document's Theme part,which allows for font information to be set centrally in the document.

[*Example*: Consider a run of ASCII text which shall be displayed using the `majorASCII` theme font. This requirement would be specified as follows in the resulting WordprocessingML:

```
<w:rPr>
  <w:rFonts w:asciiTheme=”majorAscii” />
</w:rPr>
```

The ascii attribute specifies that the run shall use the `majorAscii` theme font as defined in the document's themes part for all text in the ASCII range. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
majorAscii (Major ASCII Theme Font)	Specifies that the current font is a reference to the major theme font for the ASCII range.
majorBidi (Major Complex Script Theme Font)	Specifies that the current font is a reference to the major theme font for the Complex Script range.
majorEastAsia (Major East Asian Theme Font)	Specifies that the current font is a reference to the major theme font for the East Asian range.
majorHAnsi (Major High ANSI Theme Font)	Specifies that the current font is a reference to the major theme font for the High ANSI range.
minorAscii (Minor ASCII Theme Font)	Specifies that the current font is a reference to the

Enumeration Value	Description
	minor theme font for the ASCII range.
minorBidi (Minor Complex Script Theme Font)	Specifies that the current font is a reference to the minor theme font for the Complex Script range.
minorEastAsia (Minor East Asian Theme Font)	Specifies that the current font is a reference to the minor theme font for the East Asian range.
minorHAnsi (Minor High ANSI Theme Font)	Specifies that the current font is a reference to the minor theme font for the High ANSI range.

Referenced By
rFonts@asciiTheme (§2.3.2.24); rFonts@cstheme (§2.3.2.24); rFonts@eastAsiaTheme (§2.3.2.24); rFonts@hAnsiTheme (§2.3.2.24)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Theme">
   <restriction base="xsd:string">
      <enumeration value="majorEastAsia"/>
      <enumeration value="majorBidi"/>
      <enumeration value="majorAscii"/>
      <enumeration value="majorHAnsi"/>
      <enumeration value="minorEastAsia"/>
      <enumeration value="minorBidi"/>
      <enumeration value="minorAscii"/>
      <enumeration value="minorHAnsi"/>
   </restriction>
</simpleType>
```

2.18.104 ST_ThemeColor (Theme Color)

This simple type specifies a theme color to be applied to the current object. The specified theme color is a reference to one of the predefined theme colors, located in the document's Theme part, which allows color information to be set centrally in the document.

[*Example*: Consider a set of borders configured to use the `accent2` theme color, resulting in the following WordprocessingML markup:

```
<w:top … w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
<w:bottom … w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
<w:left … w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
<w:right … w:color="FFA8A0" w:themeColor="accent2" w:themeTint="99" />
```

The borders have a themeColor attribute of type ST_ThemeColor that when specified, imports the `accent2` theme color specified for this document. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
accent1 (Accent 1 Theme Color)	Specifies that the color to be used shall be the accent1 theme color.
accent2 (Accent 2 Theme Color)	Specifies that the color to be used shall be the accent2 theme color.
accent3 (Accent 3 Theme Color)	Specifies that the color to be used shall be the accent3 theme color.
accent4 (Accent 4 Theme Color)	Specifies that the color to be used shall be the accent4 theme color.
accent5 (Accent 5 Theme Color)	Specifies that the color to be used shall be the accent5 theme color.
accent6 (Accent 6 Theme Color)	Specifies that the color to be used shall be the accent6 theme color.
background1 (Background 1 Theme Color)	Specifies that the color to be used shall be the background1 theme color.
background2 (Background 2 Theme Color)	Specifies that the color to be used shall be the background2 theme color.
dark1 (Dark 1 Theme Color)	Specifies that the color to be used shall be the dark1 theme color.
dark2 (Dark 2 Theme Color)	Specifies that the color to be used shall be the dark2 theme color.
followedHyperlink (Followed Hyperlink Theme Color)	Specifies that the color to be used shall be the followedHyperlink theme color.
hyperlink (Hyperlink Theme Color)	Specifies that the color to be used shall be the hyperlink theme color.
light1 (Light 1 Theme Color)	Specifies that the color to be used shall be the light1 theme color.
light2 (Light 2 Theme Color)	Specifies that the color to be used shall be the light1 theme color.
none (No Theme Color)	Specifies that no theme color shall be applied to the current object.
text1 (Text 1 Theme Color)	Specifies that the color to be used shall be the text1 theme color.
text2 (Text 2 Theme Color)	Specifies that the color to be used shall be the text2 theme color.

</simpleType>
```

2.18.105 ST_TwipsMeasure (Measurement in Twentieths of a Point)

This simple type specifies that its contents will contain a positive whole number, whose contents consist of a measurement in twentieths of a point (equivalent to 1/1440th of an inch).

The contents of this measurement are interpreted based on the context of the parent XML element.

[*Example*: Consider an attribute value of `720` whose type is ST_TwipsMeasure. This attribute value specifies a size of one-half of an inch or 36 points (`720` twentieths of a point = 36 points = 0.5 inches). *end example*]

This simple type's contents are a restriction of the ST_UnsignedDecimalNumber simple type (§2.18.108).

Referenced By

```
<simpleType name="ST_TwipsMeasure">
   <restriction base="ST_UnsignedDecimalNumber"/>
</simpleType>
```

2.18.106 ST_UcharHexNumber (Two Digit Hexadecimal Number Value)

This simple type specifies a number value specified as a two digit (one octet) hexadecimal number), whose contents are interpreted based on the context of the parent XML element.

[*Example*: Consider the following value for a node of type ST_LongHexNumber: `BE`.

This value is valid, as it contains two hexadecimal digits, as an encoding of an octet of the actual decimal number value. *end example*]

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 1 characters.

</simpleType>
```

2.18.107 ST_Underline (Underline Patterns)

This simple type specifies the types of patterns which may be used to create the underline applied beneath the text in a run.

[*Example*: Consider a run of text which shall have a double underline explicitly turned on for the contents of the run. This constraint is specified using the following WordprocessingML:

```
<w:rPr>
  <w:u w:val="double"/>
</w:rPr>
```

The val of the underline on this run is `double`, so the style of the underline on this run shall be a double line. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dash (Dashed Underline)	Specifies an underline consisting of a dashed line beneath all characters in this run.

Enumeration Value	Description
	[*Example*: Underline text. *end example*]
dashDotDotHeavy (Thick Dash-Dot-Dot Underline)	Specifies an underline consisting of a series of thick dash, dot, dot characters beneath all characters in this run. [*Example*: Underline text. *end example*]
dashDotHeavy (Thick Dash-Dot Underline)	Specifies an underline consisting of a series of thick dash, dot characters beneath all characters in this run. [*Example*: Underline text. *end example*]
dashedHeavy (Thick Dashed Underline)	Specifies an underline consisting of a series of thick dashes beneath all characters in this run. [*Example*: Underline text. *end example*]
dashLong (Long Dashed Underline)	Specifies an underline consisting of long dashed characters beneath all characters in this run. [*Example*: Underline text. *end example*]
dashLongHeavy (Thick Long Dashed Underline)	Specifies an underline consisting of thick long dashed characters beneath all characters in this run. [*Example*:

Enumeration Value	Description
	Underline text. *end example*]
dotDash (Dash-Dot Underline)	Specifies an underline consisting of a series of dash, dot characters beneath all characters in this run. [*Example*: Underline text. *end example*]
dotDotDash (Dash-Dot-Dot Underline)	Specifies an underline consisting of a series of dash, dot, dot characters beneath all characters in this run. [*Example*: Underline text. *end example*]
dotted (Dotted Underline)	Specifies an underline consisting of a series of dot characters beneath all characters in this run. [*Example*: Underline text. *end example*]
dottedHeavy (Thick Dotted Underline)	Specifies an underline consisting of a series of thick dot characters beneath all characters in this run. [*Example*: Underline text. *end example*]
double (Double Underline)	Specifies an underline consisting of two lines beneath all characters in this run. [*Example*: Underline text. *end example*]

Enumeration Value	Description
none (No Underline)	Specifies no underline beneath this run. [*Example*: Underline text. *end example*]
single (Single Underline)	Specifies an underline consisting of a single line beneath all characters in this run. [*Example*: Underline text. *end example*]
thick (Thick Underline)	Specifies an underline consisting of a single thick line beneath all characters in this run. [*Example*: Underline text. *end example*]
wave (Wave Underline)	Specifies an underline consisting of a single wavy line beneath all characters in this run. [*Example*: Underline text. *end example*]
wavyDouble (Double Wave Underline)	Specifies an underline consisting of a pair of wavy lines beneath all characters in this run. [*Example*: Underline text. *end example*]
wavyHeavy (Heavy Wave Underline)	Specifies an underline consisting of a single thick wavy line beneath all characters in this run.

Enumeration Value	Description
	[*Example*: Underline text. *end example*]
words (Underline Non-Space Characters Only)	Specifies an underline consisting of a single line beneath all non-space characters in the run. There shall be no underline beneath any space character (breaking or non-breaking). [*Example*: Underline text. *end example*]

Referenced By
u@val (§2.3.2.38)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Underline">
   <restriction base="xsd:string">
      <enumeration value="single"/>
      <enumeration value="words"/>
      <enumeration value="double"/>
      <enumeration value="thick"/>
      <enumeration value="dotted"/>
      <enumeration value="dottedHeavy"/>
      <enumeration value="dash"/>
      <enumeration value="dashedHeavy"/>
      <enumeration value="dashLong"/>
      <enumeration value="dashLongHeavy"/>
      <enumeration value="dotDash"/>
      <enumeration value="dashDotHeavy"/>
      <enumeration value="dotDotDash"/>
      <enumeration value="dashDotDotHeavy"/>
      <enumeration value="wave"/>
      <enumeration value="wavyHeavy"/>
      <enumeration value="wavyDouble"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

2.18.108 ST_UnsignedDecimalNumber (Unsigned Decimal Number Value)

This simple type specifies that its contents will contain a positive whole decimal number, whose contents are interpreted based on the context of the parent XML element.

[*Example*: Consider the following WordprocessingML fragment:

```
<w:pPr>
  <w:divId w:val="1512645511" />
</w:pPr>
```

The value of the val attribute is the ID of the associated HTML `div`.

However, consider the following fragment:

```
<w:ilvl w:val="1">
  ...
</w:ilvl>
```

In this case, the decimal number in the val attribute is the ID of the associated numbering level. In each case, the decimal number value is interpreted in the context of the parent element. *end example*]

This simple type's contents are a restriction of the XML Schema unsignedLong datatype.

Referenced By
ST_EighthPointMeasure (§2.18.27); ST_HpsMeasure (§2.18.48); ST_PixelsMeasure (§2.18.74); ST_PointMeasure (§2.18.75); ST_TwipsMeasure (§2.18.105)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UnsignedDecimalNumber">
   <restriction base="xsd:unsignedLong"/>
</simpleType>
```

2.18.109 ST_VAnchor (Vertical Anchor Location)

This simple type specifies the vertical position to which the parent object has been anchored in the document. This anchor position shall be used as the base location to determine the final vertical position of the object in the document.

[*Example*: Consider a text frame which should be positioned one inch to the right of its column in a left-to-right document. This text frame would be specified using the following WordprocessingML:

```
<w:pPr>
  <w:framePr … w:y="1440" w:vAnchor="page" />
</w:pPr>
```

These frame vertical anchor properties specify that they are relative to the anchor paragraph's page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
margin (Relative To Margin)	Specifies that the parent object shall be vertically anchored to the text margins. This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the text margin.
page (Relative To Page)	Specifies that the parent object shall be vertically anchored to the page edge. This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the edge of the page.
text (Relative To Vertical Text Extents)	Specifies that the parent object shall be vertically anchored to the text extents. This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the top edge of the text in the anchor paragraph.

Referenced By
framePr@vAnchor (§2.3.1.11); tblpPr@vertAnchor (§2.4.54)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VAnchor">
   <restriction base="xsd:string">
      <enumeration value="text"/>
      <enumeration value="margin"/>
      <enumeration value="page"/>
   </restriction>
</simpleType>
```

2.18.110 ST_VerticalAlignRun (Vertical Positioning Location)

This simple type specifies possible values for the alignment of the contents of this run in relation to the default appearance of the run's text. This allows the text to be repositioned as subscript or superscript without altering the font size of the run properties.

[*Example*: Consider a run which shall be positioning as superscript when displaying its contents. This requirement would be specified using the following WordprocessingML:

```
<w:rPr>
  <w:vertAlign w:val="superscript" />
</w:rPr>
```

The resulting run is positioned as `superscript`, therefore it is rendered in a smaller size above the default baseline location for the contents of the run. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
baseline (Regular Vertical Positioning)	Specifies that the text in the parent run shall be located at the baseline and presented in the same size as surrounding text.
subscript (Subscript)	Specifies that this text should be subscript. This setting shall lower the text in this run below the baseline and change it to a smaller size, if a smaller size is available.
superscript (Superscript)	Specifies that this text should be superscript. This setting shall raise the text in this run above the baseline and change it to a smaller size, if a smaller size is available.

Referenced By
vertAlign@val (§2.3.2.40)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VerticalAlignRun">
   <restriction base="xsd:string">
      <enumeration value="baseline"/>
      <enumeration value="superscript"/>
      <enumeration value="subscript"/>
   </restriction>
</simpleType>
```

2.18.111 ST_VerticalJc (Vertical Alignment Type)

This simple type specifies the vertical alignment for text between the top and bottom margins of the parent container (page or table cell).

[*Example*: Consider a region where the text shall be vertically centered in the parent element. This would require a val value of `center`, in order to specify that all justification vertically shall be centered relative to the parent. For a section, this setting would be specified as follows:

```
<w:vAlign w:val="center" />
```

The val attribute of `center` specifies that the content is centered relative to its container . *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
both (Vertical Justification)	Specifies that the text shall be vertically justified between the top and bottom margins of the parent object, by adding additional line spacing to each paragraph as required. This setting is only applied for the content of the section which is displayed on full pages. If the content does not use the full page (e.g. another section begins on the same page, or the document ends mid-page), then the value shall be ignored when rendering that page (returning to the default value of `top`) This value is only valid for page justification settings, and shall be ignored when specified on a table cell (returning to the default value of `top`).
bottom (Align Bottom)	Specifies that the text shall be vertically aligned to the bottom margin of the parent object, by moving all text to the bottom text extent within the parent object as required.
center (Align Center)	Specifies that the text shall be vertically aligned to the center of the parent object..
top (Align Top)	Specifies that the text shall be vertically aligned to the top margin of the parent object, by moving all text to the top text extent within the parent object as required.

Referenced By
vAlign@val (§2.4.80); vAlign@val (§2.6.23)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VerticalJc">
   <restriction base="xsd:string">
      <enumeration value="top"/>
      <enumeration value="center"/>
      <enumeration value="both"/>
      <enumeration value="bottom"/>
   </restriction>
</simpleType>
```

2.18.112 ST_View (Document View Values)

This simple type defines the possible views which may be used to determine how WordprocessingML documents may be rendered when displayed by an application.

[*Example*: Consider a WordprocessingML document that shall be displayed on the screen in the same form as it will be printed. This requirement would be specified using the following WordprocessingML in the document settings part:

```
<w:view w:val="print" />
```

The view element's val attribute is equal to `print` specifying that the given WordprocessingML document shall be rendered as it will be printed. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
masterPages (Master Document View)	Specifies that a given WordprocessingML document shall be rendered in a view optimized for outlining or creating long documents. [*Note*: This setting may be interpreted as functionally equivalent to the `outline` setting, as it only remains separate to support legacy applications. *end note*]
none (Default View)	Specifies that a given WordprocessingML document shall be rendered in the default view of the application.
normal (Draft View)	Specifies that a given WordprocessingML document shall be rendered in a view optimized for outlining or creating long documents.
outline (Outline View)	Specifies that a given WordprocessingML document shall be rendered in a view optimized for outlining or creating long documents.
print (Print Layout View)	Specifies that this document shall be opened in a view that displays the document as it will print.

Enumeration Value	Description
web (Web Page View)	Specifies that a given WordprocessingML document shall be rendered in a view mimicking the way this document would be displayed in a web page.

Referenced By
view@val (§2.15.1.93)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_View">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="print"/>
      <enumeration value="outline"/>
      <enumeration value="masterPages"/>
      <enumeration value="normal"/>
      <enumeration value="web"/>
   </restriction>
</simpleType>
```

2.18.113 ST_Wrap (Text Wrapping around Text Frame Type)

This simple type specifies the type of text wrapping which shall be allowed around a text frame within a document.

[*Example*: Consider the following WordprocessingML fragment specifying a text frame:

```
<w:p>
  <w:pPr>
    <w:framePr w:w="2419" w:h="2189" w:hRule="atLeast" w:hSpace="187"
w:wrap="around" w:vAnchor="text" w:hAnchor="page" w:x="1643" w:y="73" />
  </w:pPr>
  <w:r>
    <w:t>Text Frame Content.</w:t>
  </w:r>
</w:p>
```

This wrap attribute on this text frame specifies that when the frame is rendered on the page, any non-text frame paragraphs which would normally flow onto the same lines shall be allowed to wrap around it. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
around (Allow Text Wrapping Around Frame)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document.
auto (Default Text Wrapping Around Frame)	Specifies that text shall have the default application-defined behavior of the application displaying the WordprocessingML document with regard to the text wrapping displayed around the frame.
none (No Text Wrapping Around Frame)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around this text frame. Any text content shall therefore be placed on the next line following this text frame which does not intersect with the frame's extents.
notBeside (No Text Wrapping Beside Frame)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around this text frame. Any text content shall therefore be placed on the next line following this text frame which does not intersect with the frame's extents.
through (Through Text Wrapping Around Frame)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document.
tight (Tight Text Wrapping Around Frame)	Specifies that text shall be allowed to tightly wrap around the remaining space on each line around this text frame in the document.

Referenced By
framePr@wrap (§2.3.1.11)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Wrap">
   <restriction base="xsd:string">
      <enumeration value="auto"/>
      <enumeration value="notBeside"/>
      <enumeration value="around"/>
      <enumeration value="tight"/>
      <enumeration value="through"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

2.18.114 ST_XAlign (Horizontal Alignment Location)

This simple type specifies the set of possible relative horizontal positions for the parent floating object. This relative position is specified relative to the horizontal anchor specified by the parent object.

[*Example*: Consider the following WordprocessingML fragment specifying a text frame:

```
<w:p>
  <w:pPr>
    <w:framePr w:w="2419" w:h="2189" w:hRule="atLeast" w:hSpace="187"
w:wrap="around" w:vAnchor="text" w:hAnchor="page" w:xAlign="left" w:y="73" />
  </w:pPr>
  <w:r>
    <w:t>Text Frame Content.</w:t>
  </w:r>
</w:p>
```

This text frame specifies by the presence of the xAlign attribute to align the frame on the `left` side of the anchor object, in this case, the page. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Centered Horizontally)	Specifies that the parent object shall be centered with respect to the anchor settings. [*Example*: Centered on the page horizontally. *end example*]
inside (Inside)	Specifies that the parent object shall be inside of the anchor object. [*Example*: Inside the text margin horizontally. *end example*]
left (Left Aligned Horizontally)	Specifies that the parent object shall be left aligned with respect to the anchor settings. [*Example*: Left aligned on the page horizontally. *end example*]
outside (Outside)	Specifies that the parent object shall be outside of the anchor object. [*Example*: Outside the text margin horizontally. *end example*]
right (Right Aligned Horizontally)	Specifies that the parent object shall be right aligned

Enumeration Value	Description
	with respect to the anchor settings. [*Example*: Right aligned on the page horizontally. *end example*]

Referenced By
framePr@xAlign (§2.3.1.11); tblpPr@tblpXSpec (§2.4.54)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_XAlign">
   <restriction base="xsd:string">
      <enumeration value="left"/>
      <enumeration value="center"/>
      <enumeration value="right"/>
      <enumeration value="inside"/>
      <enumeration value="outside"/>
   </restriction>
</simpleType>
```

2.18.115 ST_YAlign (Vertical Alignment Location)

This simple type specifies the set of possible relative vertical positions for the parent floating object. This relative position is specified relative to the vertical anchor specified by the parent object.

[*Example*: Consider the following WordprocessingML fragment specifying a text frame:

```
<w:p>
  <w:pPr>
    <w:framePr w:w="2419" w:h="2189" w:hRule="atLeast" w:hSpace="187"
w:wrap="around" w:vAnchor="margin" w:hAnchor="page" w:x="1643" w:y="73"
w:yAlign="center" />
  </w:pPr>
  <w:r>
    <w:t>Text Frame Content.</w:t>
  </w:r>
</w:p>
```

This text frame specifies by the presence of the yAlign attribute to vertically align the frame in the `center` of the anchor object, in this case, the `margin`. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
bottom (Bottom)	Specifies that the parent object shall be vertically aligned to the bottom edge of the anchor object . [*Example*: At the bottom of the current paragraph. *end example*]
center (Centered Vertically)	Specifies that the parent object shall be vertically centered with respect to the anchor object. [*Example*: Centered on the page vertically. *end example*]
inline (In line With Text)	Specifies that the parent object shall be vertically aligned in line with the surrounding text (i.e. shall not allow any text wrapping around it when positioned in the document.
inside (Inside Anchor Extents)	Specifies that the parent object shall be vertically aligned to the edge of the anchor object, and positioned inside that object. [*Example*: Inside the text margins vertically. *end example*]
outside (Outside Anchor Extents)	Specifies that the parent object shall be vertically aligned to the edge of the anchor object, and positioned outside that object. [*Example*: Outside the text margins vertically. *end example*]
top (Top)	Specifies that the parent object shall be vertically aligned to the top edge of the anchor object . [*Example*: At the top of the current paragraph. *end example*]

Referenced By
framePr@yAlign (§2.3.1.11); tblpPr@tblpYSpec (§2.4.54)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_YAlign">
   <restriction base="xsd:string">
      <enumeration value="inline"/>
      <enumeration value="top"/>
      <enumeration value="center"/>
      <enumeration value="bottom"/>
      <enumeration value="inside"/>
      <enumeration value="outside"/>
   </restriction>
</simpleType>
```

2.18.116 ST_Zoom (Magnification Preset Values)

This simple type specifies the type of magnification settings which may be applied to a given document on open.

[*Example*: Consider a WordprocessingML document that should be visible without any horizontal scrolling when it is displayed. This requirement would be specified using the following WordprocessingML:

```
<w:zoom w:val="bestFit" w:percent="90" />
```

The val attribute is equal to the value `bestFit` specifying that an application shall dynamically calculate the magnification needed such that the given document shall be visible on the horizontal plane of the document with no horizontal scrolling required to see any part of the WordprocessingML document's pages. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bestFit (Display Page Width)	Specifies that the magnification setting shall be adjusted to ensure the width of the current page matches the available window width.
fullPage (Display One Full Page)	Specifies that the magnification setting shall be adjusted to ensure that one full page can be seen at a time.
none (No Preset Magnification)	Specifies that no preset magnification is present, and the last known cached setting shall be used.
textFit (Display Text Width)	Specifies that the magnification setting shall be adjusted to ensure the width of the text extents on the current page matches the available window width.

Referenced By
zoom@val (§2.15.1.95)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Zoom">
    <restriction base="xsd:string">
        <enumeration value="none"/>
        <enumeration value="fullPage"/>
        <enumeration value="bestFit"/>
        <enumeration value="textFit"/>
    </restriction>
</simpleType>
```

3. SpreadsheetML Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising a SpreadsheetML document, as defined by Part 1 of this Office Open XML Standard.

3.1 Table of Contents

This subclause is informative.

End of informative text.

3.2 Workbook

This subclause describes the elements and simple types that comprise the workbook main definition.

A workbook is composed of book-level properties and a collection of 1 or more sheets. The sheets are the central working surface for a spreadsheet application. The workbook part and corresponding properties comprise data used to set application and workbook-level operational state. The workbook also serves to bind all the sheets and child objects into an organized single file. The workbook properties include information about what application last saved the file, where and how the windows of the workbook were positioned, and an enumeration of the worksheets in the workbook.

It is important for the sake of simplicity to minimize the *required* set of workbook properties that must be present to compose a valid workbook. Therefore these are the required data points for the smallest possible (blank) workbook:

```
<workbook>
  <sheets>
    <sheet name="Sheet1" sheetId="1" r:id="rId1"/>
  </sheets>
</workbook>
```

Note that this workbook has a single sheet, named Sheet1. An Id for the sheet is required, and a relationship Id pointing to the location of the sheet definition is also required. Sheet1 itself will be discussed in a separate section.

3.2.1 bookViews (Workbook Views)

This element specifies the collection of workbook views. Each view can specifies a window position, filter options, and other configurations. There is no limit on the number of views that can be defined for a workbook.

[*Example*:

```
<bookViews>
  <workbookView showHorizontalScroll="0" showVerticalScroll="0"
    showSheetTabs="0" xWindow="120" yWindow="45" windowWidth="15135"
    windowHeight="8130" activeTab="2" autoFilterDateGrouping="0"/>
</bookViews>
```

end example]

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
workbookView (Workbook View)	§3.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BookViews">
   <sequence>
      <element name="workbookView" type="CT_BookView" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.2.2 calcPr (Calculation Properties)

This element defines the collection of properties the application uses to record calculation status and details. Calculation is the process of computing formulas and then displaying the results as values in the cells that contain the formulas.

[*Example*:

```
<calcPr calcId="122211" calcMode="auto" refMode="R1C1" iterate="1"
  fullPrecision="0"/>
```

end example]

Parent Elements
workbook (§3.2.27)

Attributes	Description

Attributes	Description
calcCompleted (Calc Completed)	Specifies a boolean value that determines whether workbook data was recalculated before the workbook was saved. A value of on, 1, or true indicates recalculation was completed before save. A value of off, 0, or false indicates that recalculation was not completed before save. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
calcId (Calculation Id)	Specifies the version of the calculation engine used to calculate values in the workbook. When you open a workbook created in the current version, the application recalculates only the formulas that depend on cells that have changed. When you use open a workbook that was created in a earlier version of the application, all the formulas in the workbook— those that depend on cells that have changed and those that do not— are recalculated. This ensures that the workbook is fully optimized for the current application version. The value for `calcID` depends on the application. SpreadsheetML defaults form [version][build], where [version] refers to the version of the application, and [build] refers to the build of the application when the calculation engine changed. [*Example*: `<calcPr calcId="122211"/>` *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
calcMode (Calculation Mode)	Specifies when the application should calculate formulas in the workbook. The default value for this attribute is "auto." The possible values for this attribute are defined by the ST_CalcMode simple type (§3.18.4).
calcOnSave (Calculate On Save)	Specifies a boolean value that indicates whether the application will recalculate values when the workbook is saved. A value of on, 1, or true indicates recalculation will be performed when the workbook is saved. A value of off, 0, or false indicates recalculation will not be performed when the workbook is saved.

Attributes	Description
	The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
concurrentCalc (Concurrent Calculations)	Specifies a boolean value that indicates whether concurrent calculation processes are enabled for this workbook. A value of on, 1, or true indicates concurrent calculations are enabled in this workbook. A value of off, 0, or false indicates concurrent calculations are not enabled. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
concurrentManualCount (Concurrent Thread Manual Count)	Specifies the count of concurrent calculation processes manually set by the user. If omitted, the count is set automatically by the application. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
forceFullCalc (Force Full Calculation)	Specifies a boolean value that indicates whether the application will perform a full recalculation when one was not indicated by other calculation properties. This attribute allows the application to expose mechanisms in the user interface that give users the ability to trigger when full recalculations take place. A value of on, 1, or true indicates the application will perform a full recalculation of workbook. A value of off, 0, or false indicates the application will not perform a full recalculation when the workbook. The possible values for this attribute are defined by the XML Schema boolean datatype.
fullCalcOnLoad (Full Calculation On Load)	Specifies a boolean value that indicates whether the application shall perform a full recalculation when the workbook is opened. After load and successful calculation, the application should set this value to false. The application should set this value to true when cell formulas or values are modified by another process while the application has the workbook opened. A value of on, 1, or true indicates the application will perform a full recalculation of workbook values when the workbook is opened. A value of off, 0, or false indicates the application will not perform a full recalculation when the workbook is opened. Note: If manual calcMode is `true`, then a full recalculation will not be performed on load, even when this attribute is set.

Attributes	Description
	The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
fullPrecision (Full Precision Calculation)	Specifies a boolean that indicates the precision the application will use when performing calculations in the workbook. Full precision means that the application uses the entire value(s) stored in cells referenced by the formula to perform the calculation. For example, if two cells each contain the value 10.005 and the cells are formatted to display values in currency format, the value $10.01 is displayed in each cell. If you add the two cells together, the result is $20.01 because the application adds the stored values 10.005 and 10.005, not the displayed values. You can change the precision of calculations so that the application uses the displayed value instead of the stored value when it recalculates formulas. For the above example, if fullPrecision is `false`, then the result shall be $20.02, because each cell shows $10.01, so those are the values to be added. Furthermore, when fullPrecision is `false`, the calculated value as displayed shall be saved to file. A value of on, 1, or true indicates the application uses the stored values of the referenced cells when performing calculations. A value of off, 0, or false indicates the application uses the display values of the referenced cells when performing calculations. The possible values for this attribute are defined by the XML Schema boolean datatype.
iterate (Calculation Iteration)	Specifies a boolean value that indicates whether the application should attempt to calculate formulas that contain circular references. A circular reference is a formula that refers to the cell— either directly or indirectly— that contains the formula. If a formula refers back to one of its own cells, you must determine how many times the formula should recalculate. A value of on, 1, or true indicates the application should attempt to calculate circular references. The calculation engine will perform iterative `iterateCount` calculations to before stopping. A value of off, 0, or false indicates that the application should not attempt to calculate formulas with circular references. The calculation engine will stop on the first iteration when it encounters a circular references. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
iterateCount (Iteration Count)	Specifies the number of iterations the calculation engine will attempt when calculating a workbook with circular references, when `iterate` is true. The default value for this attribute is 100.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iterateDelta (Iterative Calculation Delta)	Specifies a double that contains the maximum change for iterative calculations. The application stops calculating after iterateCount iterations or after all values in the circular reference change by less than iterateDelta between iterations, whichever comes first. The default value for this attribute is "0.001" The possible values for this attribute are defined by the XML Schema double datatype.
refMode (Reference Mode)	Specifies the reference style for this workbook. Instead of using letters for columns and numbers for rows ("A1"), this options enables using numbers for both rows and columns. Cells are then referred to in this format: R1C1. The default value for this attribute is "A1." The possible values for this attribute are defined by the ST_RefMode simple type (§3.18.66).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalcPr">
    <attribute name="calcId" type="xsd:unsignedInt"/>
    <attribute name="calcMode" type="ST_CalcMode" use="optional" default="auto"/>
    <attribute name="fullCalcOnLoad" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="refMode" type="ST_RefMode" use="optional" default="A1"/>
    <attribute name="iterate" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="iterateCount" type="xsd:unsignedInt" use="optional" default="100"/>
    <attribute name="iterateDelta" type="xsd:double" use="optional" default="0.001"/>
    <attribute name="fullPrecision" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="calcCompleted" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="calcOnSave" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="concurrentCalc" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="concurrentManualCount" type="xsd:unsignedInt" use="optional"/>
    <attribute name="forceFullCalc" type="xsd:boolean" use="optional"/>
</complexType>
```

3.2.3 customWorkbookView (Custom Workbook View)

This element specifies a single custom workbook view. A custom workbook view consists of a set of display and print settings that you can name and apply to a workbook. You can create more than one view of the same workbook without saving separate copies of the workbook. Custom workbook views are created by the end-user via tools in the application user interface.

Parent Elements
customWorkbookViews (§3.2.4)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
activeSheetId (Active Sheet in Book View)	Specifies the sheetId of a sheet in the workbook that is the active sheet in this book view. Correpsonds to a sheetId of a sheet in the sheets collection. This attribute is required. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
autoUpdate (Auto Update)	Specifies a boolean value that indicates that this application will automatically update changes at the interval specified by the `mergeInterval` attribute. This is only applicable for shared workbooks. A value of on, 1, or true indicates the application will update changes at the interval specified in the `mergeInterval` attribute. A value of off, 0, or false indicates the application will update changes whenever the workbook is saved by the user. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
changesSavedWin (Changes Saved Win)	Specifies a boolean value that indicates that when conflicts are found, the changes being saved always take precedence. This is only applicable for shared workbooks in automatic refresh mode. A value of on, 1, or true indicates that changes being saved take precedence when conflicts in data are found in a shared workbook. A value of off, 0, or false indicates that changes being saved do not take precedence over other changes if conflicts are found in a shared workbook. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
guid (Custom View GUID)	Specifies a globally unique identifier (GUID) for this custom view The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
includeHiddenRowCol (Include Hidden	Specifies a boolean value that indicates whether to include hidden rows, columns, and filter settings in this custom view.

Attributes	Description
Rows & Columns)	A value of on, 1, or true indicates that hidden rows, columns, and filter settings are included in this custom view. A value of off, 0, or false indicates that hidden rows, columns, and filter settings are not included. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
includePrintSettings (Include Print Settings)	Specifies a boolean value that indicates whether to include print settings in this custom view. A value of on, 1, or true indicates that print settings are included in this custom view. A value of off, 0, or false indicates print settings are not included in this custom view. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
maximized (Maximized)	Specifies a boolean value that indicates whether the book window is maximized. A value of on, 1, or true indicates the workbook window is maximized. A value of off, 0, or false indicates the workbook window is not maximized. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
mergeInterval (Merge Interval)	Automatic update interval (in minutes). Only applicable for shared workbooks in automatic refresh mode. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
minimized (Minimized)	Specifies a boolean value that indicates whether the workbook window is minimized. A value of on, 1, or true indicates the workbook window is minimized. A value of off, 0, or false indicates the workbook window is not minimized. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
name (Custom View	Specifies the name of the custom view.

Attributes	Description
Name)	This attribute is required. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
onlySync (Only Synch)	Specifies a boolean value that indicates, during automatic refresh, the current user's changes will not be saved. The workbook will only be updated with other users' changes. Only applicable for shared workbooks in automatic refresh mode. A value of on, 1, or true indicates the current user's changes will not be saved during automatic refresh. A value of off, 0, or false indicates the current user's will be saved during automatic refresh. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
personalView (Personal View)	Specifies a boolean value that indicates that this custom view is a personal view for a shared workbook user. Only applicable for shared workbooks. Personal views allow each user of a shared workbook to store their individual print and filter settings. A value of on, 1, or true indicates this custom view is a personal view for a shared workbook user. A value of off, 0, or false indicates this view is not a personal view. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
showComments (Show Comments)	Specifies how comments are displayed in this custom view The possible values for this attribute are defined by the ST_Comments simple type (§3.18.15).
showFormulaBar (Show Formula Bar)	Specifies a boolean value that indicates whether to display the formula bar in the application user interface. A value of on, 1, or true indicates the formula bar is shown in the user interface. A value of off, 0, or false indicates the formula bar is not shown in the user interface. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
showHorizontalScroll (Show Horizontal Scroll)	Specifies a boolean value that indicates whether to display the horizontal scroll bar in the user interface. A value of on, 1, or true indicates that the horizontal scrollbar is shown. A value of off, 0, or false indicates that the horizontal scrollbar is not shown. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
showObjects (Show Objects)	Specifies how objects are displayed in this custom view. The default value for this attribute is "all." The possible values for this attribute are defined by the ST_Objects simple type (§3.18.50).
showSheetTabs (Show Sheet Tabs)	Specifies a boolean value that indicates whether to display the sheet tabs in the user interface. A value of on, 1, or true indicates that sheet tabs shall be shown. A value of off, 0, or false indicates that sheet tabs shall not be shown. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
showStatusbar (Show Status Bar)	Specifies a boolean value that indicates whether to display the status bar in the user interface. A value of on, 1, or true indicates that the status bar is shown. A value of off, 0, or false indicates the status bar is not shown. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
showVerticalScroll (Show Vertical Scroll)	Specifies a boolean value that indicates whether to display the vertical scroll bar. A value of on, 1, or true indicates the vertical scrollbar shall be shown. A value of off, 0, or false indicates the vertical scrollbar shall not be shown. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
tabRatio (Sheet Tab Ratio)	Specified the ratio between the workbook tabs bar and the horizontal scroll bar. `tabRatio` is assumed to be out of 1000 of the horizontal window width. The default value for this attribute is 600. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
windowHeight (Window Height)	Specifies the height of the workbook window. The unit of measurement for this value is twips. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
windowWidth (Window Width)	Specifies the width of the workbook window. The unit of measurement for this value is twips. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
xWindow (Top Left Corner (X Coordinate))	Specifies the X coordinate for the upper left corner of the book window. The unit of measurement for this value is twips. The possible values for this attribute are defined by the XML Schema int datatype.
yWindow (Top Left Corner (Y Coordinate))	Specifies the Y coordinate for the upper left corner of the book window. The unit of measurement for this value is twips. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomWorkbookView">
   <sequence>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="guid" type="ST_Guid" use="required"/>
   <attribute name="autoUpdate" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="mergeInterval" type="xsd:unsignedInt" use="optional"/>
   <attribute name="changesSavedWin" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="onlySync" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="personalView" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="includePrintSettings" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="includeHiddenRowCol" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="maximized" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="minimized" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showHorizontalScroll" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showVerticalScroll" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showSheetTabs" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="xWindow" type="xsd:int" use="optional" default="0"/>
   <attribute name="yWindow" type="xsd:int" use="optional" default="0"/>
   <attribute name="windowWidth" type="xsd:unsignedInt" use="required"/>
   <attribute name="windowHeight" type="xsd:unsignedInt" use="required"/>
   <attribute name="tabRatio" type="xsd:unsignedInt" use="optional" default="600"/>
   <attribute name="activeSheetId" type="xsd:unsignedInt" use="required"/>
   <attribute name="showFormulaBar" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showStatusbar" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showComments" type="ST_Comments" use="optional" default="commIndicator"/>
   <attribute name="showObjects" type="ST_Objects" use="optional" default="all"/>
</complexType>
```

3.2.4 customWorkbookViews (Custom Workbook Views)

This element defines the collection of custom workbook views that are defined for this workbook. There is no limit on the number of custom views that a user can create. Users create custom views when there is more than one way of viewing the workbook. Each view on the workbook data might be complex and time consuming to set up. Naming and persisting view settings enables the user to switch between the views easily.

[*Example*:

```
<customWorkbookViews>
  <customWorkbookView name="CustomView"
    guid="{CE6681F1-E999-414D-8446-68A031534B57}" maximized="1" xWindow="1"
    yWindow="1" windowWidth="1024" windowHeight="547" activeSheetId="1"/>
</customWorkbookViews>
```

end example]

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
customWorkbookView (Custom Workbook View)	§3.2.3

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomWorkbookViews">
    <sequence>
        <element name="customWorkbookView" minOccurs="1" maxOccurs="unbounded"
          type="CT_CustomWorkbookView"/>
    </sequence>
</complexType>
```

3.2.5 definedName (Defined Name)

This element defines the defined names that are defined within this workbook. Defined names are descriptive text that is used to represents a cell, range of cells, formula, or constant value. Use easy-to-understand names, such as Products, to refer to hard to understand ranges, such as Sales!C20:C30.

A defined name in a formula can make it easier to understand the purpose of the formula. For example, the formula =SUM(FirstQuarterSales) might be easier to identify than =SUM(C20:C30).

Names are available to any sheet. For example, if the name ProjectedSales refers to the range A20:A30 on the first worksheet in a workbook, you can use the name ProjectedSales on any other sheet in the same workbook to refer to range A20:A30 on the first worksheet.

Names can also be used to represent formulas or values that do not change (constants). For example, you can use the name SalesTax to represent the sales tax amount (such as 6.2 percent) applied to sales transactions.

You can also link to a defined name in another workbook, or define a name that refers to cells in another workbook. For example, the formula =SUM(Sales.xls!ProjectedSales) refers to the named range ProjectedSales in the workbook named Sales.

A compliant producer or consumer will consider a defined name in the range A1-XFD1048576 to be invalid.

All other names outside this range can be defined as names and will override a cell reference if an ambiguity exists.

For clarification: LOG10 is always a cell reference, LOG10() is always formula, LOGO1000 can be a defined name that overrides a cell reference.

Parent Elements
definedNames (§3.2.6)

Attributes	Description

Attributes	Description
comment (Comment)	Specifies the comment the user provided when the name was created. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
customMenu (Custom Menu Text)	Specifies custom menu text for the defined name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
description (Description)	Specifies description text for the defined name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
function (Function)	Specifies a boolean value that indicates that the defined name refers to a user-defined function. This attribute is used when there is an add-in or other code project associated with the file. A value of on, 1, or true indicates the name refers to a function. A value of off, 0, or false indicates the name does not refer to a function. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
functionGroupId (Function Group Id)	Specifies the function group index if the defined name refers to a function. The function group defines the general category for the function. This attribute is used when there is an add-in or other code project associated with the file. The following functionGroupIds are defined in SpreadsheetML for applications that support the association of an add-in or code project for their workbook: • 1 Financial • 2 Date and Time • 3 Math and Trig • 4 Statistical • 5 Lookup and Reference • 6 Database • 7 Text • 8 Logical • 9 Information • 10 Commands • 11 Customizing • 12 Macro Control • 13 DDE / External • 14 User Defined • 15 Engineering

Attributes	Description
	• 16 Cube The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
help (Help)	Specifies the help topic to display for this defined name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
hidden (Hidden Name)	Specifies a boolean value that indicates whether the defined name is hidden in the user interface. A value of on, 1, or true indicates the name is hidden. A value of off, 0, or false indicates the name is not hidden. The possible values for this attribute are defined by the XML Schema boolean datatype.
localSheetId (Local Name Sheet Id)	Specifies the sheet index in this workbook where data from an external reference is displayed. In the following example, the defined name refers to a range whose data source is an external database called “Northwind_Database”: [*Example*: `<definedName name="Northwind_Database" localSheetId="2">Sheet5!$A$1:$T$47</definedName>` *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Defined Name)	Specifies the name that will appear in the user interface for the defined name. This attribute is required. The following built-in names are defined in this SpreadsheetML specification: **Print** • _xlnm .Print_Area: this defined name specifies the workbook's print area. • _xlnm .Print_Titles: this defined name specifies the row(s) or column(s) to repeat at the top of each printed page. **Filter & Advanced Filter** • _xlnm .Criteria: this defined name refers to a range containing the criteria values to be used in applying an advanced filter to a range of data. • _xlnm ._FilterDatabase: can be one of the following a. this defined name refers to a range to which an advanced filter has been applied. This represents the source data range, unfiltered.

Attributes	Description
	b. This defined name refers to a range to which an AutoFilter has been applied. • _xlnm .Extract: this defined name refers to the range containing the filtered output values resulting from applying an advanced filter criteria to a source range. **Miscellaneous** • _xlnm .Consolidate_Area: the defined name refers to a consolidation area. • _xlnm .Database: the range specified in the defined name is from a database data source. • _xlnm .Sheet_Title: the defined name refers to a sheet title. Built-in names reserved by SpreadsheetML begin with "_xlnm.". End users shall not use this string for custom names in the user interface. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
publishToServer (Publish To Server)	Specifies a boolean value that indicates whether the defined name is included in the version of the workbook that is published to or rendered on a Web or application server. A value of on, 1, or true indicates the name shall be published. A value of off, 0, or false indicates the name shall not be published. The possible values for this attribute are defined by the XML Schema boolean datatype.
shortcutKey (Shortcut Key)	Specifies the keyboard shortcut for the defined name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
statusBar (Status Bar)	Specifies text that is displayed on the application status bar when the user places focus on the defined name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
vbProcedure (Procedure)	Specified a boolean value that indicates whether the defined name is related to an external function, command, or other executable code. A value of on, 1, or true indicates the name is related to an external function, command, or other executable code, and the loading application can optionally decide whether to load and/or execute the commands. A value of off, 0, or false indicates the name does not refer to an external function, command, or other executable code.

Attributes	Description
	The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
workbookParameter (Workbook Parameter (Server))	Specifies a boolean value that indicates that the name is used as a workbook parameter on a version of the workbook that is published to or rendered on a Web or application server. A value of on, 1, or true indicates is a workbook parameter on the application server. A value of off, 0, or false indicates is not a workbook parameter on the application server. The possible values for this attribute are defined by the XML Schema boolean datatype.
xlm (External Function)	Specifies a boolean value that indicates whether the defined name is related to an external function, command, or other executable code. A value of on, 1, or true indicates the name is related to an external function, command, or other executable code, and the loading application can optionally decide whether to load and/or execute the commands. A value of off, 0, or false indicates the name does not refer to an external function, command, or other executable code. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DefinedName">
   <simpleContent>
      <extension base="ST_Formula">
         <attribute name="name" type="ST_Xstring" use="required"/>
         <attribute name="comment" type="ST_Xstring" use="optional"/>
         <attribute name="customMenu" type="ST_Xstring" use="optional"/>
         <attribute name="description" type="ST_Xstring" use="optional"/>
         <attribute name="help" type="ST_Xstring" use="optional"/>
         <attribute name="statusBar" type="ST_Xstring" use="optional"/>
         <attribute name="localSheetId" type="xsd:unsignedInt" use="optional"/>
         <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="function" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="vbProcedure" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="xlm" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="functionGroupId" type="xsd:unsignedInt" use="optional"/>
         <attribute name="shortcutKey" type="ST_Xstring" use="optional"/>
         <attribute name="publishToServer" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="workbookParameter" type="xsd:boolean" use="optional" default="false"/>
      </extension>
   </simpleContent>
</complexType>
```

3.2.6 definedNames (Defined Names)

This element defines the collection of defined names for this workbook. Defined names are descriptive names to represent cells, ranges of cells, formulas, or constant values. Defined names can be used to represent a range on any worksheet.

[*Example*:

```
<definedNames>
  <definedName name="NamedFormula"
    comment="Comment text for defined name.">SUM(Sheet3!$B$2:$B$9)</definedName>
  <definedName name="NamedRange">Sheet3!$A$1:$C$12</definedName>
  <definedName name="NamedRangeFromExternalReference" localSheetId="2"
    hidden="1">Sheet5!$A$1:$T$47</definedName>
</definedNames>
```

end example]

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
definedName (Defined Name)	§3.2.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DefinedNames">
   <sequence>
      <element name="definedName" type="CT_DefinedName" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.2.7 ext (Extension)

Each ext element contains extensions to the standard SpreadsheetML feature set.

Parent Elements
extLst (§3.2.10)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (URI)	A token to identify version and application information for this particular extension. The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Extension">
   <sequence>
      <any processContents="lax"/>
   </sequence>
   <attribute name="uri" type="xsd:token"/>
</complexType>
```

3.2.8 externalReference (External Reference)

This element defines an external reference that stores data for workbook elements.

Parent Elements
externalReferences (§3.2.9)

Attributes	Description
id (Relationship Id) Namespace: .../officeDocument/2006/relationshi	Specifies a unique identifier that is used to identify a relationship to another part in the file. Relationship identifiers link the element definition with the part where data for the element is stored. The possible values for this attribute are defined by the ST_RelationshipId simple type

Attributes	Description
ps	(§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalReference">
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.2.9 externalReferences (External References)

This element defines the collection of external references for this workbook.

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
externalReference (External Reference)	§3.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalReferences">
   <sequence>
      <element name="externalReference" type="CT_ExternalReference" minOccurs="1"
        maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.2.10 extLst (Future Feature Data Storage Area)

This element defines flexible storage extensions for implementing applications.

Parent Elements
autoFilter (§3.3.1.1); bk (§3.9.2); c (§3.3.1.3); cacheField (§3.10.1.3); cacheHierarchy (§3.10.1.6); cacheSource (§3.10.1.7); calcChain (§3.6.2); calculatedItem (§3.10.1.8); calculatedMember (§3.10.1.10); cellStyle (§3.8.7); cfRule (§3.3.1.9); cfvo (§3.3.1.10); chartsheet (§3.3.1.11); comments (§3.7.5); conditionalFormat (§3.10.1.18); conditionalFormatting (§3.3.1.17); connection (§3.13.1); customSheetView (§3.3.1.23); customWorkbookView (§3.2.3); dataField (§3.10.1.22); dialogsheet (§3.3.1.32); dxf (§3.8.14); externalLink (§3.14.8); filter (§3.10.1.33); filterColumn (§3.3.2.7); format (§3.10.1.35); futureMetadata (§3.9.4); groupLevel (§3.10.1.39); header (§3.11.1.1); ignoredErrors (§3.3.1.48); metadata (§3.9.8); nc (§3.11.1.3); ndxf (§3.11.1.4); oc (§3.11.1.5); odxf (§3.11.1.6); pageField (§3.10.1.62); pivotArea (§3.3.1.66); pivotCacheDefinition (§3.10.1.67); pivotCacheRecords (§3.10.1.68); pivotField (§3.10.1.69); pivotHierarchy (§3.10.1.72); pivotTableDefinition (§3.10.1.73); queryTable (§3.12.2); queryTableField (§3.12.4); queryTableRefresh (§3.12.6); rcc (§3.11.1.9); rdn (§3.11.1.13); reference (§3.10.2.1); rfmt (§3.11.1.17); row (§3.3.1.71); rsnm (§3.11.1.22); sheetView (§3.3.1.84); sheetView (§3.3.1.83); sheetViews (§3.3.1.86); sheetViews (§3.3.1.85); singleXmlCell (§3.5.2.1); sortState (§3.3.1.89); sst (§3.4.9); styleSheet (§3.8.39); table (§3.5.1.2); tableColumn (§3.5.1.3); tupleCache (§3.10.1.94); userInfo (§3.11.2.1); volTypes (§3.15.6); workbook (§3.2.27); workbookView (§3.2.30); worksheet (§3.3.1.96); xf (§3.8.45); xmlCellPr (§3.5.2.3); xmlColumnPr (§3.5.1.7);

Parent Elements
xmlPr (§3.5.2.4)

Child Elements	Subclause
ext (Extension)	§3.2.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExtensionList">
   <sequence>
      <group ref="EG_ExtensionList" minOccurs="0"/>
   </sequence>
</complexType>
```

3.2.11 fileRecoveryPr (File Recovery Properties)

This element defines properties that track the state of the workbook file, such as whether the file was saved during a crash, or whether it should be opened in auto-recover mode.

Parent Elements
workbook (§3.2.27)

Attributes	Description
autoRecover (Auto Recover)	Specifies a boolean value that indicates whether the file is mark for auto-recovery. Applications typically mark files for auto-recover following a crash. A value of on, 1, or true indicates the file is marked for auto-recover. A value of off, 0, or false indicates the file is not marked for auto-recover. The default value for this attribute is /false. The possible values for this attribute are defined by the XML Schema boolean datatype.
crashSave (Crash Save)	Specifies a boolean value that indicates whether the application last saved the workbook file after a crash. A value of on, 1, or true indicates the workbook was last saved after a crash. A value of off, 0, or false indicates was not last saved as part of a crash. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
dataExtractLoad	Specifies a boolean value that indicates whether the application last opened the

Attributes	Description
(Data Extract Load)	workbook for data recovery. A value of on, 1, or true indicates the workbook was last opened for data recovery. A value of off, 0, or false indicates was not last opened for data recovery. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
repairLoad (Repair Load)	Specifies a boolean value that indicates whether the application last opened the workbook in safe or repair mode. A value of on, 1, or true indicates the workbook was last opened in safe or repair mode. A value of off, 0, or false indicates the workbook was last opened without problems. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FileRecoveryPr">
    <attribute name="autoRecover" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="crashSave" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="dataExtractLoad" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="repairLoad" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.2.12 fileSharing (File Sharing)

This element tracks file sharing File sharing settings for the workbook.

Parent Elements
workbook (§3.2.27)

Attributes	Description
readOnlyRecommended (Read Only Recommended)	Specifies a boolean value that indicates on open, whether the application alerts the user that the file be marked as read-only. The possible values for this attribute are defined by the XML Schema boolean datatype.
reservationPassword (Write Reservation Password)	Specifies the hash of the password required for editing this workbook. This hash is optional and may be ignored. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the logic defined in the revisionsPassword attribute of §3.2.29.

Attributes	Description
	The resulting value is hashed using the algorithm defined below. [*Note*: An example algorithm to hash the user input into the value stored is as follows: `// Function Input:` `//  szPassword: NULL terminated C-Style string` `//  cchPassword: The number of characters in szPassword (not including the NULL terminator)` `WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {` `  WORD wPasswordHash;` `  const CHAR *pch;` `  wPasswordHash = 0;` `  if (cchPassword > 0)` `  {` `  pch = &szPassword[cchPassword];` `  while (pch-- != szPassword)` `  {` ` wPasswordHash = ((wPasswordHash >> 14) & 0x01)	((wPasswordHash << 1) & 0x7fff);` ` wPasswordHash ^= *pch;` ` }` ` wPasswordHash ^= (0x8000	('N' << 8)	'K');` ` }`  ` return(wPasswordHash);` `}` *end note*] The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).
userName (User Name)	Specifies the username of the person with write reservation for this workbook. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FileSharing">
   <attribute name="readOnlyRecommended" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="userName" type="ST_Xstring"/>
   <attribute name="reservationPassword" type="ST_UnsignedShortHex"/>
</complexType>
```

3.2.13 fileVersion (File Version)

This element defines properties that track which version of the application accessed the data and source code contained in the file.

Parent Elements
workbook (§3.2.27)

Attributes	Description
appName (Application Name)	Specifies the application name. When saving, applications can write their appName value and optionally write `lastEdited` and `lowestEdited` attributes to track the version of the application that performed those actions. When opening the workbook, applications can examine the value of `appName` and decide how to interpret the `lastEdited`, `lowestEdited`, and `rupBuild` attributes. The possible values for this attribute are defined by the XML Schema string datatype.
codeName (Code Name)	Specifies the GUID that identifies the code project that is associated with the workbook. [*Note*: the primary use of this attribute is to track the version of the compiled code.] The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
lastEdited (Last Edited Version)	Specifies the version of the application that last saved the workbook. This attribute is application-dependent. The possible values for this attribute are defined by the XML Schema string datatype.
lowestEdited (Lowest Edited Version)	Specifies the earliest version of the application that saved the workbook. This value is reset any time an application that can read all data in the file saves the file. This attribute is application-dependent. The possible values for this attribute are defined by the XML Schema string datatype.
rupBuild (Build Version)	Specifies the incremental public release of the application. For example, betas, service packs, and versions. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FileVersion">
    <attribute name="appName" type="xsd:string" use="optional"/>
    <attribute name="lastEdited" type="xsd:string" use="optional"/>
    <attribute name="lowestEdited" type="xsd:string" use="optional"/>
    <attribute name="rupBuild" type="xsd:string" use="optional"/>
    <attribute name="codeName" type="ST_Guid" use="optional"/>
</complexType>
```

3.2.14 functionGroup (Function Group)

This element represents a single function group.

Parent Elements
functionGroups (§3.2.15)

Attributes	Description
name (Name)	Specifies the name of the function group. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FunctionGroup">
   <attribute name="name" type="ST_Xstring"/>
</complexType>
```

3.2.15 functionGroups (Function Groups)

This element defines the collection of function groups for the workbook.

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
functionGroup (Function Group)	§3.2.14

Attributes	Description
builtInGroupCount (Built-in Function Group Count)	Specifies the count of built-in function groups that the application provides in this workbook. The default value for this attribute is 16. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FunctionGroups">
   <sequence maxOccurs="unbounded">
      <element name="functionGroup" type="CT_FunctionGroup" minOccurs="0"/>
   </sequence>
   <attribute name="builtInGroupCount" type="xsd:unsignedInt" default="16" use="optional"/>
</complexType>
```

3.2.16 oleSize (Embedded Object Size)

This element defines the embedded object server for this workbook.

Parent Elements
workbook (§3.2.27)

Attributes	Description
ref (Reference)	Specifies the reference for the embedded object. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleSize">
   <attribute name="ref" type="ST_Ref" use="required"/>
</complexType>
```

3.2.17 pivotCache (PivotCache)

This element represents a cache of data for pivot tables and formulas in the workbook.

Parent Elements
pivotCaches (§3.2.18)

Attributes	Description
cacheId (PivotCache Id)	Specifies the unique identifier for the pivot cache for this workbook in the pivot cache part. This attribute is required. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (Relationship Id) Namespace: .../officeDocument	Specifies the identifier to a pivot cache definition part where cached data is stored. This attribute is required.

Attributes	Description
/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotCache">
   <attribute name="cacheId" type="xsd:unsignedInt" use="required"/>
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.2.18 pivotCaches (PivotCaches)

This element enumerates pivot cache definition parts used by pivot tables and formulas in this workbook.

[*Example*:

```
<pivotCaches>
  <pivotCache cacheId="4" r:id="rId8"/>
</pivotCaches>
```

end example]

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
pivotCache (PivotCache)	§3.2.17

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotCaches">
   <sequence>
      <element name="pivotCache" type="CT_PivotCache" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.2.19 sheet (Sheet Information)

This element defines a sheet in this workbook. Sheet data is stored in a separate part.

Parent Elements
sheets (§3.2.20)

Attributes	Description
id (Relationship Id)	Specifies the identifier of the sheet part where the definition for this sheet is stored.

Attributes	Description
Namespace: .../officeDocument/2006/relationships	This attribute is required. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Sheet Name)	Specifies the name of the sheet. This name must be unique. This attribute is required. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
sheetId (Sheet Tab Id)	Specifies the internal identifier for the sheet. This identifier must be unique. This attribute is required. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
state (Visible State)	Specifies the visible state of this sheet. The default value for this attribute is "visible." The possible values for this attribute are defined by the ST_SheetState simple type (§3.18.70).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Sheet">
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
   <attribute name="state" type="ST_SheetState" use="optional" default="visible"/>
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.2.20 sheets (Sheets)

This element represents the collection of sheets in the workbook. There are different types of sheets you can create in SpreadsheetML. The most common sheet type is a worksheet; also called a spreadsheet. A worksheet is the primary document that you use in SpreadsheetML to store and work with data. A worksheet consists of cells that are organized into columns and rows.

Some workbooks might have a modular design where there is one sheet for data and another worksheet for each type of analysis. In a complex modular system, you might have dozens of sheets, each dedicated to a specific task.

[*Example*:

```
<sheets>
  <sheet name="Sheet1" sheetId="1" r:id="rId1"/>
  <sheet name="Sheet2" sheetId="2" r:id="rId2"/>
  <sheet name="Sheet5" sheetId="3" r:id="rId3"/>
  <sheet name="Chart1" sheetId="4" type="chartsheet" r:id="rId4"/>
</sheets>
```

end example]

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
sheet (Sheet Information)	§3.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Sheets">
   <sequence>
      <element name="sheet" type="CT_Sheet" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.2.21 smartTagPr (Smart Tag Properties)

This element defines a collection of smart tag properties that determine smart tag behavior in the workbook.

[*Example*:

```
<smartTagPr embed="1" show="noIndicator"/>
```

end example]

Parent Elements
workbook (§3.2.27)

Attributes	Description
embed (Embed SmartTags)	Specifies a boolean value that indicates whether the application saves smart tags with the workbook. Smart tag information is saved both in the workbook part and the sheet parts. A value of on, 1, or true indicates the application saves smart tags with the workbook.

Attributes	Description
	A value of off, 0, or false indicates the application does not save smart tags with the workbook. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
show (Show Smart Tags)	Specifies how the application displays smart tags in the user interface. The default value for this attribute is "all." The possible values for this attribute are defined by the ST_SmartTagShow simple type (§3.18.73).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTagPr">
   <attribute name="embed" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="show" type="ST_SmartTagShow" use="optional" default="all"/>
</complexType>
```

3.2.22 smartTagType (Smart Tag Type)

This element represents a smart tag in the workbook.

Parent Elements
smartTagTypes (§3.2.23)

Attributes	Description
name (Name)	Specifies the element name used for a smart tag that is used by the application. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
namespaceUri (SmartTag Namespace URI)	Specifies the namespace Uniform Resource Identifier (URI) for a smart tag used by the application. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
url (Smart Tag URL)	Specifies the URL for a smart tag provided by the smart tag provider in the application. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTagType">
   <attribute name="namespaceUri" type="ST_Xstring" use="optional"/>
   <attribute name="name" type="ST_Xstring" use="optional"/>
   <attribute name="url" type="ST_Xstring" use="optional"/>
</complexType>
```

3.2.23 smartTagTypes (Smart Tag Types)

This element defines the collection of smart tag types in the workbook. Smart tags represent data that is recognized and labeled as a particular type. For example, a person's name or address can be recognized and labeled with a smart tag.

[*Example*:

```
<smartTagTypes>
  <smartTagType namespaceUri="urn:schemas-openxmlformats-org:office:smarttags"
    name="date"/>
</smartTagTypes>
```

end example]

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause
smartTagType (Smart Tag Type)	§3.2.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTagTypes">
   <sequence>
      <element name="smartTagType" type="CT_SmartTagType" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.2.24 webPublishing (Web Publishing Properties)

This element defines properties that relate to publishing this workbook to the Web.

Parent Elements
workbook (§3.2.27)

Attributes	Description
allowPng (Allow PNG)	Specifies a boolean value that indicates whether the application saves images in the PNG (Portable Network Graphics) graphic format.

Attributes	Description
	A value of on, 1, or true indicates the application supports PNG . A value of off, 0, or false indicates does not support PNG. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
codePage (Code Page)	Specifies the encoding the application will use when a Web page is saved. A code is table that relates the binary character codes used by a program to keys on the keyboard or to the appearance of characters on the display. Code pages are a means of providing support for the languages used in different countries. [*Note*: There are a number of code page technologies. One example of potential values can be found at: http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WindowsBestFit/ *end note*] The default value for this attribute is the workbook's encoding. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
css (Use CSS)	Specifies a boolean value that indicates whether the application will use Cascading Style Sheet (CSS) for font formatting on Web pages. A value of on, 1, or true indicates the application will use CSS for font formats in Web pages. A value of off, 0, or false indicates the application will not use CSS for font formats. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
dpi (DPI)	Specifies the DPI (defined as the number of pixels per inch) that will be used to display images in Web pages. The specified DPI affects the size of graphics relative to the size of text on the screen. The default value for this attribute is 96. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
longFileNames (Enable Long File Names)	Specifies a boolean value that indicates whether the application allows file names longer than 8 characters for Web pages. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
targetScreenSize (Target Screen Size)	Specifies the screen size on which Web pages will be displayed. The specified screen size might affect the size and layout of images on web pages. The default value of this attribute is "800x600." The possible values for this attribute are defined by the ST_TargetScreenSize simple type (§3.18.81).
thicket (Thicket)	Specifies a boolean value that indicates that the application stores supporting files such as bullets, background textures, and graphics in a separate folder from the Web page The possible values for this attribute are defined by the XML Schema boolean datatype.
vml (VML in Browsers)	Specifies a boolean value that indicates whether the application uses VML (Vector Markup Language) to display graphics in Web browsers The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPublishing">
    <attribute name="css" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="thicket" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="longFileNames" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="vml" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="allowPng" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="targetScreenSize" type="ST_TargetScreenSize" use="optional" default="800x600"/>
    <attribute name="dpi" type="xsd:unsignedInt" use="optional" default="96"/>
    <attribute name="codePage" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.2.25 webPublishObject (Web Publishing Object)

This element defines a single Web publishing object for the workbook. This element tracks basic information about an object in the workbook, such as a named range, that is published to the Web.

Parent Elements
webPublishObjects (§3.2.26)

Attributes	Description
autoRepublish (Auto Republish)	Specifies a boolean value that indicates whether the object specified in `sourceObject` will be automatically published every time the workbook is saved. A value of on, 1, or true indicates the application will publish the `sourceObject` when the workbook is saved. A value of off, 0, or false indicates the application will not publish the `sourceObject`

Attributes	Description
	when the workbook is saved. The possible values for this attribute are defined by the XML Schema boolean datatype.
destinationFile (Destination File)	Specifies the destination file name to which the sourceObject will be published. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
divId (Div Id)	Specifies the destination bookmark (div id) for the published object. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
id (Id)	Specifies the number, in "nnnnn" format, used in generated div id, in style id's, token filenames, and other variables. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sourceObject (Source Object)	Specifies the named range to be published. If omitted, the entire workbook is published. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
title (Title)	Specifies the title of the published item. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPublishObject">
    <attribute name="id" type="xsd:unsignedInt" use="required"/>
    <attribute name="divId" type="ST_Xstring" use="required"/>
    <attribute name="sourceObject" type="ST_Xstring" use="optional"/>
    <attribute name="destinationFile" type="ST_Xstring" use="required"/>
    <attribute name="title" type="ST_Xstring" use="optional"/>
    <attribute name="autoRepublish" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.2.26 webPublishObjects (Web Publish Objects)

This element defines the collection of Web publishing objects in the workbook.

Parent Elements
workbook (§3.2.27)

Child Elements	Subclause

Child Elements	Subclause
webPublishObject (Web Publishing Object)	§3.2.25

Attributes	Description
count (Count)	Specifies the number of items in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPublishObjects">
   <sequence>
      <element name="webPublishObject" type="CT_WebPublishObject" minOccurs="1"
        maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.2.27 workbook (Workbook)

This element is the root part of the workbook in SpreadsheetML. It defines the structure of the workbook:

- Sheets: represents the collection of worksheets in the workbook. The worksheet is the primary document that you use to store and work with data.
- Views: SpreadsheetML defines a collection of Workbook views that define basic window dimensions and position of the workbook. It also defines a collection of Custom Workbook Views that allow the end-user to define a series of rich views on their workbook data. Users can create more than one view of the same workbook without saving separate copies of the workbook.
- Properties: the workbook has several property collection that store basic workbook settings, such as the date system to use, file protection settings, calculation settings, and smart tag behaviors.
- Names: represent descriptive that represent cells, ranges of cells, formulas, or constant values.

[*Example*:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<workbook xmlns="http://schemas.openxmlformats.org/spreadsheetml/2006/5/main"
mlns:r="http://schemas.openxmlformats.org/officeDocument/2006/relationships">
  <fileVersion lastEdited="4" lowestEdited="4" rupBuild="4017"/>
  <workbookPr date1904="1" vbName="ThisWorkbook" defaultThemeVersion="123820"/>
  <bookViews>
    <workbookView xWindow="120" yWindow="45" windowWidth="15135"
      windowHeight="7650" activeTab="4"/>
  </bookViews>
```

```
<sheets>
  <sheet name="Sheet1" sheetId="1" r:id="rId1"/>
  <sheet name="Sheet2" sheetId="2" r:id="rId2"/>
  <sheet name="Sheet5" sheetId="3" r:id="rId3"/>
  <sheet name="Chart1" sheetId="4" type="chartsheet" r:id="rId4"/>
</sheets>
<definedNames>
  <definedName name="MyDefinedName">Sheet3!$A$1:$C$12</definedName>
</definedNames>
<calcPr calcId="122211" calcMode="autoNoTable" refMode="R1C1" iterate="1"
  fullPrecision="0"/>
<customWorkbookViews>
  <customWorkbookView name="CustomView1"
    guid="{CE6681F1-E999-414D-8446-68A031534B57}" maximized="1" xWindow="1"
    yWindow="1" windowWidth="1024" windowHeight="547" activeSheetId="1"/>
</customWorkbookViews>
<pivotCaches>
  <pivotCache cacheId="0" r:id="rId8"/>
</pivotCaches>
<smartTagPr embed="1" show="noIndicator"/>
<smartTagTypes>
  <smartTagType namespaceUri="urn:schemas-openxmlformats-org:office:smarttags"
    name="date"/>
</smartTagTypes>
<webPublishing codePage="1252"/>
</workbook>
```

end example]

Parent Elements
Root element of SpreadsheetML Workbook part

Child Elements	Subclause

3.2.28 workbookPr (Workbook Properties)

This element defines a collection of workbook properties.

[*Example*:

```
<workbookPr date1904="1" showObjects="none" saveExternalLinkValues="0"
  defaultThemeVersion="123820"/>
```

end example]

Parent Elements
workbook (§3.2.27)

Attributes	Description
allowRefreshQuery (Allow Refresh Query)	Specifies a boolean value that indicates whether the application will refresh query table in this workbook. A value of on, 1, or true indicates the application will refresh query tables when the workbook is loaded. A value of off, 0, or false indicates the application will not refresh query tables. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
autoCompressPictures (Auto Compress Pictures)	Specifies a boolean value that indicates the application automatically compressed pictures in the workbook. A value of on, 1, or true indicates the application automatically compresses pictures of the workbook. When a picture is compresses, the application: • Reduces resolution (to 96 dots per inch (dpi) for Web and 200 dpi for print), and unnecessary information is discarded. • Discards extra information. For example, when a picture has been cropped or resized, the "hidden" parts of the picture are stored in the file. • Compress the picture, if possible. A value of off, 0, or false indicates the application does not compress pictures in this workbook. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
backupFile (Create Backup File)	Specifies a boolean value that indicates whether the application creates a backup of the workbook on save. A value of on, 1, or true indicates the application creates a backup of the workbook on save. A value of off, 0, or false indicates the application does not create a backup.

Attributes	Description
	The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
checkCompatibility (Check Compatibility On Save)	Specifies a boolean value that indicates whether the application checks for compatibility when saving this workbook to older file formats. A value of on, 1, or true indicates the application performs a compatibility check when saving to legacy binary formats. A value of off, 0, or false indicates the application does not perform a compatibility check when saving to legacy binary formats. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
codeName (Code Name)	Specifies the codename of the application that created this workbook. Use this attribute to track file content in incremental releases of the application. The possible values for this attribute are defined by the XML Schema string datatype.
date1904 (Date 1904)	Specifies a boolean value that indicates whether the date systems used in the workbook starts in 1904. A value of on, 1, or true indicates the date system starts in 1904. A value of off, 0, or false indicates the workbook uses the 1900 date system, where 1/1/1900 is the first day in the system. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
defaultThemeVersion (Default Theme Version)	Specifies the default version of themes to apply in the workbook. The value for defaultThemeVersion depends on the application. SpreadsheetML defaults to the form [version][build], where [version] refers to the version of the application, and [build] refers to the build of the application when the themes in the user interface changed. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
filterPrivacy (Filter Privacy)	Specifies a boolean value that indicates whether the application has been inspected the workbook for personally identifying information (PII). If this flag is set, the application warns the user any time the user performs do an action that will insert PII into the document. For example, inserting a comment might inserts the user's name.

Attributes	Description
	A value of on, 1, or true indicates the application will warn the user when they insert PII into the workbook. A value of off, 0, or false indicates the application will not warn the user when they insert PII into the workbook; the workbook has not been inspected for PII. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
hidePivotFieldList (Hide Pivot Field List)	Specifies a boolean value that indicates whether a list of fields is shown for pivot tables in the application user interface. A value of on, 1, or true indicates a list of fields is show for pivot tables. A value of off, 0, or false indicates a list of fields is not shown for pivot tables. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
promptedSolutions (Prompted Solutions)	Specifies a boolean value that indicates whether the user has received an alert to load Smart Document components. A value of on, 1, or true indicates the user received an alert to load SmartDoc. A value of off, 0, or false indicates the user did not receive an alert. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
publishItems (Publish Items)	Specifies a boolean value that indicates whether the publish the workbook or workbook items to the application server. A value of on, 1, or `true` indicates that workbook items are published. A value of `off`, `0`, or `false` indicates that the workbook is published. The default value for this attribute is `false`. The possible values for this attribute are defined by the XML Schema boolean datatype.
refreshAllConnections (Refresh all Connections on Open)	Specifies a boolean value that indicates whether the workbok shall refresh all the connections to data sources during load. The default value for this attribute is `false`. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
saveExternalLinkValues (Save External Link Values)	Specifies a boolean value that indicates whether the application will cache values retrieved from other workbooks via an externally linking formula. Data is cached at save. A value of on, 1, or true indicates data from externally linked formulas is cached. A supporting part is written out containing a cached cell table from the external workbook. A value of off, 0, or false indicates data from externally linked formulas is not cached. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
showBorderUnselectedTables (Show Border Unselected Table)	Specifies a boolean value that indicates whether a border is drawn around unselected tables in the workbook. A value of on, 1, or true indicates borders are drawn around unselected tables. A value of off, 0, or false indicates borders are not drawn around unselected tables. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
showInkAnnotation (Show Ink Annotations)	Specifies a boolean value that indicates whether the book shows ink annotations. A value of on, 1, or true indicates that ink annotations are shown in the workbook. A value of off, 0, or false indicates that ink annotations are not shown in the workbook. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
showObjects (Show Objects)	Specifies how the application shows embedded objects in the workbook. This attribute it optional. The default value for this attribute is "all." The possible values for this attribute are defined by the ST_Objects simple type (§3.18.50).
showPivotChartFilter (Show Pivot Chart Filter)	Specifies a boolean value that indicates whether filtering options are shown for pivot charts in the workbook. A value of on, 1, or true indicates filtering options shall be shown for pivot charts. A value of off, 0, or false indicates filtering options shall not be shown.

Attributes	Description
	The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
updateLinks (Update Links Behavior)	Specifies how the application updates external links when the workbook is opened. The default value for this attribute is userSet. The possible values for this attribute are defined by the ST_UpdateLinks simple type (§3.18.88).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WorkbookPr">
    <attribute name="date1904" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="showObjects" type="ST_Objects" use="optional" default="all"/>
    <attribute name="showBorderUnselectedTables" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="filterPrivacy" type="xsd:boolean" use="optional" default="false"/>

    <attribute name="refreshAllConnections" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="defaultThemeVersion" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.2.29 workbookProtection (Workbook Protection)

This element specifies options for protecting data in the workbook. Applications may use workbook protection to prevent anyone from accidentally changing, moving, or deleting important data. This protection may be ignored by applications which choose not to support this optional protection mechanism.

[*Note*: Worksheet or workbook element protection should not be confused with file security. It is not meant to make your workbook safe from unintentional modification, and cannot protect it from malicious modification. *end note*]

Parent Elements
workbook (§3.2.27)

Attributes	Description

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>lockRevision (Lock Revisions)</td><td>Specifies a boolean value that indicates whether the workbook is locked for revisions.

The possible values for this attribute are defined by the XML Schema boolean datatype.</td></tr>
<tr><td>lockStructure (Lock Structure)</td><td>Specifies a boolean value that indicates whether structure of workbook is locked.

A value of on, 1, or true indicates the structure of the workbook is locked. Worksheets in the workbook can't be moved, deleted, hidden, unhidden, or renamed, and new worksheets can't be inserted.

A value of off, 0, or false indicates the structure of the workbook is not locked.

The default value for this attribute is false.

The possible values for this attribute are defined by the XML Schema boolean datatype.</td></tr>
<tr><td>lockWindows (Lock Windows)</td><td>Specifies a boolean value that indicates whether the windows that comprise the workbook are locked.

A value of on, 1, or true indicates the workbook windows are locked. Windows are the same size and position each time the workbook is opened.

A value of off, 0, or false indicates the workbook windows are not locked.

The default value for this attribute is false.

The possible values for this attribute are defined by the XML Schema boolean datatype.</td></tr>
<tr><td>revisionsPassword (Revisions Password)</td><td>Specifies the hash of the password required for unlocking revisions in this workbook. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the following logic:

For SpreadsheetML password hash purposes, Unicode UTF-16 input code points are converted to an “ansi” single or double byte code page from the following list:
<table>
<tr><td>874</td><td>windows-874</td><td>ANSI/OEM Thai (same as 28605, ISO 8859-15); Thai (Windows)</td></tr>
<tr><td>932</td><td>shift_jis</td><td>ANSI/OEM Japanese; Japanese (Shift-JIS)</td></tr>
<tr><td>936</td><td>gb2312</td><td>ANSI/OEM Simplified Chinese (PRC, Singapore); Chinese Simplified (GB2312)</td></tr>
<tr><td>949</td><td>ks_c_5601-1987</td><td>ANSI/OEM Korean (Unified Hangul Code)</td></tr>
<tr><td>950</td><td>big5</td><td>ANSI/OEM Traditional Chinese (Taiwan; Hong Kong SAR, PRC); Chinese Traditional (Big5)</td></tr>
<tr><td>1250</td><td>windows-1250</td><td>ANSI Central European; Central European (Windows)</td></tr>
<tr><td>1251</td><td>windows-1251</td><td>ANSI Cyrillic; Cyrillic (Windows)</td></tr>
<tr><td>1252</td><td>windows-1252</td><td>ANSI Latin 1; Western European (Windows)</td></tr>
</table>
</td></tr>
</table>

Attributes	Description

1253	windows-1253	ANSI Greek; Greek (Windows)
1254	windows-1254	ANSI Turkish; Turkish (Windows)
1255	windows-1255	ANSI Hebrew; Hebrew (Windows)
1256	windows-1256	ANSI Arabic; Arabic (Windows)
1257	windows-1257	ANSI Baltic; Baltic (Windows)
1258	windows-1258	ANSI/OEM Vietnamese; Vietnamese (Windows)

Code points with no representation in the target code page are replaced with Unicode character 0x3f (?).

The necessary mapping tables can be found at the following location: http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WindowsBestFit/ .

Code pages 932, 936, 949, and 950 are “Double Byte” code pages. The remainder of the “ANSI” code pages supported by windows are “Single Byte” code pages.

For single byte code pages each Unicode code point is replaced by a single byte or 0x3f if an appropriate character doesn’t exist in the code page.

For double byte code pages, each Unicode code point is replaced by either a single byte, or a two byte sequence, depending on the input character, or 0x3f if an appropriate character doesn’t exist in the code page. In our tables the target is a single byte sequence if the most significant byte is 0x00, otherwise it is a double byte sequence, with the lead byte being the most significant byte.

To convert, first check if conversion is being done to a single or double byte code page and load the appropriate WCTABLE code page table.

For each input WCHAR, look up the code point in the WCTABLE. There are 3 possibilities: Not found, single byte, or double byte.

If the input WCHAR is not found, append 0x3f and continue to the next WCHAR.
If the result is a single byte, check to make sure the entry in the MBTABLE matches the input. If it matches, append the single byte to the output. If it does not match, append 0x3f to the output.

If the result is a double byte,check to make sure the entry in the DBCSENTRY table for the appropriate lead byte matches the input WCHAR. If it matches, append the lead byte and trail byte to the output. If it does not match, append 0x3f to the output.

The following pueudocode describes how this conversion should be done:

```
int WideCharToMultiByte(WCHAR* wszInput, byte* szOutput)
{
```

Attributes	Description

```
    // Remember output start so we can return length
    byte* szOutputStart = szOutput;

    // Ask the system for the current ANSI code page, which
    // on windows is a system setting.
    int iCodePage = GetCurrentAnsiCodePage();

    // Load Code Page Tables
    // This will depend on how the code pages are represented
on
    // the target machine.  TABLECLASS represents some abstract
    // representation of this structure here.
    TABLECLASS pTables = LoadCodePageTables(iCodePage);

    bool bDoubleByte = false;
    if (iCodePage == 932 ||
        iCodePage == 936 ||
        iCodePage == 949 ||
        iCodePage == 950)
        bDoubleByte = true;

    while (*wszInput != 0)
    {
        if (bDoubleByte)
            szOutput = AppendDoubleByte(pTables, *wszInput,
szOutput);
        else
            szOutput = AppendSingleByte(pTables, *wszInput,
szOutput);

        // Read next input WCHAR
        wszInput++;
    }

    // Null terminate the output
    *szOutput = 0;

    // Return output length
    return szOutput – szOutputStart;
}

byte* AppendSingleByte(TABLECLASS pTables, WCHAR wcIn, byte*
szOutput)
{
    // Look up byte that we want to append.
    byte bOut = pTables->LookUpSingleByte(wcIn);

    // Make sure that bOut matches the input, otherwise use ?
```

Attributes	Description

```
    // (ie: no best fit behavior allowed)
    if (wcIn != pTables->LookUpWideChar(bOut))
        bOut = 0x3f;

    *szOutput = bOut;
    szOutput++;

    {
        // How you access the table depends on your storage
mechanism.
        // Look up the line in MBTABLE where the first column
matches bIn,
        // and then return the WCHAR value from the second
```

Attributes	Description

```
column.
        if (exists MBTABLE{bIn})
            return MBTABLE{bIn}.SecondColumn;

        // If it doesn't exist, return ?
        return 0x003f;
    }

    // Overload that looks up wide chars from double byte code
points
    WCHAR LookUpWideChar(UINT16 bytesIn)
    {
        // How you access the table depends on your storage
mechanism.
        // First find the DBCSTABLE where the LeadByte matches
        // the lead (most significant) input byte.
        if (exists DBCSTABLE{bytesIn >> 8))
        {
            DbcsTable = DBCSTABLE{bytesIn >> 8);

            // Look up the line in DbcsTable where the first
column
            // matches the input trail (least significant)
byte,
            // and then return the WCHAR value from the second
column.
            if (exists DbcsTable{bytesIn & 0xFF})
            return DbcsTable{bytesIn & 0xFF}.SecondColumn;
        }

        // Either the lead byte table or specific trail byte
        // doesn't exist in the table, return ?
        return 0x003f;
    }
}
```

The resulting value is hashed using the algorithm defined below.

[*Note*: An example algorithm to hash the resulting single-byte user input into the value stored is as follows:

```
// Function Input:
//    szPassword: NULL terminated C-Style string
//    cchPassword: The number of characters in szPassword (not
including the NULL terminator)
WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {
      WORD wPasswordHash;
      const CHAR *pch;
```

Attributes	Description

	``
	wPasswordHash = 0;
	
	if (cchPassword > 0)
	{
	pch = &szPassword[cchPassword];
	while (pch-- != szPassword)
	{
	wPasswordHash = ((wPasswordHash >> 14) &
	0x01) | ((wPasswordHash << 1) & 0x7fff);
	wPasswordHash ^= *pch;
	}
	wPasswordHash ^= (0x8000 | ('N' << 8) | 'K');
	}
	
	return(wPasswordHash);
	}
	``
	end note]
	
	The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).

workbookPassword (Workbook Password)	Specifies the hash of the password required for unlocking revisions in this workbook. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the following logic:
	
	For SpreadsheetML password hash purposes, Unicode UTF-16 input code points are converted to an “ansi” single or double byte code page using the logic defined in the preceding revisionsPassword attribute.
	
	The resulting value is hashed using the algorithm defined below.
	
	[*Note*: An example algorithm to hash the user input into the value stored is as follows:
	
	``
	// Function Input:
	// szPassword: NULL terminated C-Style string
	// cchPassword: The number of characters in szPassword (not
	including the NULL terminator)
	WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {
	WORD wPasswordHash;
	const CHAR *pch;
	
	wPasswordHash = 0;
	
	if (cchPassword > 0)
	{
	pch = &szPassword[cchPassword];
	while (pch-- != szPassword)
	``

Attributes	Description

	{
	wPasswordHash = ((wPasswordHash >> 14) & 0x01) | ((wPasswordHash << 1) & 0x7fff);
	wPasswordHash ^= *pch;
	}
	wPasswordHash ^= (0x8000 | ('N' << 8) | 'K');
	}
	
	return(wPasswordHash);
	}
	end note]
	
	The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).

The following XML Schema fragment defines the contents of this element:

<complexType name="CT_WorkbookProtection">
   <attribute name="workbookPassword" type="ST_UnsignedShortHex" use="optional"/>
   <attribute name="revisionsPassword" type="ST_UnsignedShortHex" use="optional"/>
   <attribute name="lockStructure" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="lockWindows" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="lockRevision" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.2.30 workbookView (Workbook View)

This element specifies a single Workbook view.

Units for window widths and other dimensions are expressed in twips. Twip measurements are portable between different display resolutions. The formula is (screen pixels) * (20 * 72) / (logical device dpi), where the logical device dpi can be different for x and y coordinates.

Parent Elements
bookViews (§3.2.1)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
activeTab (Active Sheet Index)	Specifies an unsignedInt that contains the index to the active sheet in this book view. The default value for this attribute is 0.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
autoFilterDateGrouping (AutoFilter Date Grouping)	Specifies a boolean value that indicates whether to group dates when presenting the user with filtering options in the user interface. A value of on, 1, or true indicates that dates are grouped. A value of off, 0, or false indicates that dates are not grouped. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
firstSheet (First Sheet)	Specifies the index to the first sheet in this book view. The default value for this attribute is 0. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
minimized (Minimized)	Specifies a boolean value that indicates whether the book window is minimized. A value of on, 1, or true indicates the book window is minimized. A value of off, 0, or false indicates the book window is not minimized. The default value for this attribute is false. The possible values for this attribute are defined by the XML Schema boolean datatype.
showHorizontalScroll (Show Horizontal Scroll)	Specifies a boolean value that indicates whether to display the horizontal scroll bar in the user interface. A value of on, 1, or true indicates that the horizontal scrollbar shall be shown. A value of off, 0, or false indicates that the horizontal scrollbar shall not be shown. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
showSheetTabs (Show Sheet Tabs)	Specifies a boolean value that indicates whether to display the sheet tabs in the user interface. A value of on, 1, or true indicates that sheet tabs shall be shown. A value of off, 0, or false indicates that sheet tabs shall not be shown.

Attributes	Description
	The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
showVerticalScroll (Show Vertical Scroll)	Specifies a boolean value that indicates whether to display the vertical scroll bar. A value of on, 1, or true indicates the vertical scrollbar shall be shown. A value of off, 0, or false indicates the vertical scrollbar shall not be shown. The default value for this attribute is true. The possible values for this attribute are defined by the XML Schema boolean datatype.
tabRatio (Sheet Tab Ratio)	Specifies ratio between the workbook tabs bar and the horizontal scroll bar. The default value for this attribute is 600. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
visibility (Visibility)	Specifies visible state of the book window. The default value for this attribute is "visible." The possible values for this attribute are defined by the ST_Visibility simple type (§3.18.91).
windowHeight (Window Height)	Specifies the height of the workbook window. The unit of measurement for this value is twips. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
windowWidth (Window Width)	Specifies the width of the workbook window. The unit of measurement for this value is twips. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
xWindow (Upper Left Corner (X Coordinate))	Specifies the X coordinate for the upper left corner of the book window. The unit of measurement for this value is twips. The possible values for this attribute are defined by the XML Schema int datatype.
yWindow (Upper Left Corner (Y Coordinate))	Specifies the Y coordinate for the upper left corner of the book window. The unit of measurement for this value is twips. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BookView">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="visibility" type="ST_Visibility" use="optional" default="visible"/>
   <attribute name="minimized" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showHorizontalScroll" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showVerticalScroll" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showSheetTabs" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="xWindow" type="xsd:int" use="optional"/>
   <attribute name="yWindow" type="xsd:int" use="optional"/>
   <attribute name="windowWidth" type="xsd:unsignedInt" use="optional"/>
   <attribute name="windowHeight" type="xsd:unsignedInt" use="optional"/>
   <attribute name="tabRatio" type="xsd:unsignedInt" use="optional" default="600"/>
   <attribute name="firstSheet" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="activeTab" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="autoFilterDateGrouping" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.3 Worksheets

Sheets are the central structures within a workbook, and are where the user does most of their spreadsheet work. The most common type of sheet is the worksheet, which is represented as a grid of cells. Worksheet cells can contain text, numbers, dates, and formulas. Cells can be formatted as well. Sheets often have Workbooks usually contain more than one sheet. To aid in the analysis of data and making informed decisions, spreadsheet applications often implement features and objects which help calculate, sort, filter, organize, and graphically display information. Since these features are often connected very tightly with the spreadsheet grid, these are also included in the sheet definition on disk.

Other types of sheets include chart sheets and dialog sheets.

Note that sheet information is organized into three main sections:

- Top-level sheet properties (everything before sheetData)
- The cell table (sheetData)
- Supporting sheet features (everything after sheetData)

3.3.1 Worksheets

The following elements define a sheet and its contents:

3.3.1.1 autoFilter (AutoFilter Settings)

AutoFilter temporarily hides rows based on a filter criteria, which is applied column by column to a table of data in the worksheet. This collection expresses AutoFilter settings.

[*Example*: This example expresses a filter indicating to 'show only values greater than 0.5'. The filter is being applied to the range B3:E8, and the criteria is being applied to values in the column whose colId='1' (zero based

column numbering, from left to right). Therefore any rows shall be hidden if the value in that particular column is less than or equal to 0.5.

```
<autoFilter ref="B3:E8">
  <filterColumn colId="1">
    <customFilters>
      <customFilter operator="greaterThan" val="0.5"/>
    </customFilters>
  </filterColumn>
</autoFilter>
```

end example]

Parent Elements
customSheetView (§3.3.1.23); filter (§3.10.1.33); table (§3.5.1.2); worksheet (§3.3.1.96)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
filterColumn (AutoFilter Column)	§3.3.2.7
sortState (Sort State)	§3.3.1.89

Attributes	Description
ref (Cell or Range Reference)	Reference to the cell range to which the AutoFilter is applied. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AutoFilter">
   <sequence>
      <element name="filterColumn" minOccurs="0" maxOccurs="unbounded" type="CT_FilterColumn"/>
      <element name="sortState" minOccurs="0" maxOccurs="1" type="CT_SortState"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="ref" type="ST_Ref"/>
</complexType>
```

3.3.1.2 brk (Break)

Individual row or column breaks

Parent Elements

Parent Elements
colBreaks (§3.3.1.13); rowBreaks (§3.3.1.72)

Attributes	Description
id (Id)	Zero-based row or column Id of the page break. Breaks occur above the specified row and left of the specified column. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
man (Manual Page Break)	Manual Break flag. '1' means the break is a manually inserted break. The possible values for this attribute are defined by the XML Schema boolean datatype.
max (Maximum)	Zero-based index of end row or column of the break. For row breaks, specifies column index; for column breaks, specifies row index. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
min (Minimum)	Zero-based index of start row or column of the break. For row breaks, specifies column index; for column breaks, specifies row index. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
pt (Pivot-Created Page Break)	Flag indicating that a PivotTable created this break. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Break">
   <attribute name="id" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="min" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="max" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="man" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="pt" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.3 c (Cell)

This collection represents a cell in the worksheet. Information about the cell's location (reference), value, data type, formatting, and formula is expressed here.

[*Example*: This example shows the information stored for a cell whose address in the grid is C6, whose style index is '6', and whose value metadata index is '15'. The cell contains a formula as well as a calculated result of that formula.

```
<c r="C6" s="1" vm="15">
  <f>CUBEVALUE("xlextdat9 Adventure Works",C$5,$A6)</f>
  <v>2838512.355</v>
</c>
```

end example]

While a cell can have a formula element f and a value element v, when the cell's type t is `inlineStr` then only the element is is allowed as a child element.

[*Example*:

Here is an example of expressing a string in the cell rather than using the shared string table.

```
<row r="1" spans="1:1">
  <c r="A1" t="inlineStr">
    <is><t>This is inline string example</t></is>
  </c>
</row>
```

end example]

Parent Elements
row (§3.3.1.71)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
f (Formula)	§3.3.1.37
is (Rich Text Inline)	§3.3.1.50
v (Cell Value)	§3.3.1.93

Attributes	Description
cm (Cell Metadata Index)	The zero-based index of the cell metadata record associated with this cell. Metadata information is found in the Metadata Part. Cell metadata is extra information stored at the cell level, and is attached to the cell (travels through moves, copy / paste, clear, etc). Cell metadata is not accessible via formula reference. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ph (Show Phonetic)	A Boolean value indicating if the spreadsheet application should show phonetic information. Phonetic information is displayed in the same cell across the top of the cell and serves as a 'hint' which indicates how the text should be pronounced. This should

Attributes	Description
	only be used for East Asian languages. The possible values for this attribute are defined by the XML Schema boolean datatype.
r (Reference)	An A1 style reference to the location of this cell The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
s (Style Index)	The index of this cell's style. Style records are stored in the Styles Part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
t (Cell Data Type)	An enumeration representing the cell's data type. The possible values for this attribute are defined by the ST_CellType simple type (§3.18.12).
vm (Value Metadata Index)	The zero-based index of the value metadata record associated with this cell's value. Metadata records are stored in the Metadata Part. Value metadata is extra information stored at the cell level, but associated with the value rather than the cell itself. Value metadata is accessible via formula reference. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cell">
   <sequence>
      <element name="f" type="CT_CellFormula" minOccurs="0" maxOccurs="1"/>
      <element name="v" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="is" type="CT_Rst" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="r" type="ST_CellRef" use="optional"/>
   <attribute name="s" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="t" type="ST_CellType" use="optional" default="n"/>
   <attribute name="cm" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="vm" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="ph" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.4 cellSmartTag (Cell Smart Tag)

Single smart tag associated with a cell. There can be more than one cellSmartTag for a cell.

Parent Elements
cellSmartTags (§3.3.1.6)

Child Elements	Subclause
cellSmartTagPr (Smart Tag Properties)	§3.3.1.5

Attributes	Description
deleted (Deleted)	Boolean flag indicating that the application shouldn't display a particular smart tag in the cell, for example when the user has chosen to explicitly remove the Smart Tag by interacting with the application's user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
type (Smart Tag Type Index)	Book-level zero-based index of the smart tag type. This index references a `<smartTagType>` element in the `<smartTagTypes>` collection in the workbook start part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
xmlBased (XML Based)	Boolean flag indicating the Smart Tag recognition is triggered because the cell is associated with an XML map (schema-based semantic recognition), as contrasted with the more usual cell-content-based recognition type of smart tags. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellSmartTag">
   <sequence>
      <element name="cellSmartTagPr" minOccurs="0" maxOccurs="unbounded" type="CT_CellSmartTagPr"/>
   </sequence>
   <attribute name="type" type="xsd:unsignedInt" use="required"/>
   <attribute name="deleted" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="xmlBased" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.5 cellSmartTagPr (Smart Tag Properties)

Represents a single property of a smart tag in a cell; contains a key-value pair.

Parent Elements
cellSmartTag (§3.3.1.4)

Attributes	Description
key (Key Name)	Key name of a single property of a smart tag in a cell. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
val (Value)	String value of a single property of a smart tag in a cell. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellSmartTagPr">
   <attribute name="key" type="ST_Xstring" use="required"/>
   <attribute name="val" type="ST_Xstring" use="required"/>
</complexType>
```

3.3.1.6 cellSmartTags (Cell Smart Tags)

The element is used to label the cell with a smart tag. A cell may be determined to have semantic meaning and the cell containing this data can be labeled with a smart tag. The type of actions you can take depend on the semantic meaning of the data and the actions that the application decides to associate with that type of smart tag.

[*Example*: If you recently sent mail to "Chad Rothschiller", and you type the name into a cell on the worksheet, the name is recognized and given a smart tag with actions you can take including Send Mail, Schedule a Meeting, Open Contact, or Add to Contacts.

end example]

An application may decide that the smart tag indicators appear in the cell in the worksheet.

This collection represents a collection of smart tags on a cell.

[*Example*: This example expresses a smart tag associated with cell A1. The @type is used to associate this smart tag with a workbook-level smart tag type defined in the workbook start part.

```
<cellSmartTags r="A1">
  <cellSmartTag type="0"/>
</cellSmartTags>
```

end example]

Parent Elements
smartTags (§3.3.1.87)

Child Elements	Subclause
cellSmartTag (Cell Smart Tag)	§3.3.1.4

Attributes	Description
r (Reference)	Reference to the cell that contains this set of smart tags. The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellSmartTags">
   <sequence>
      <element name="cellSmartTag" type="CT_CellSmartTag" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="r" type="ST_CellRef" use="required"/>
</complexType>
```

3.3.1.7 cellWatch (Cell Watch Item)

The watch window is a single UI location where the application user can keep track of certain cell formulas & values which they have chosen to be in the set of watched cells. This element expresses the cell address of a cell being watched. It is always a reference to a single cell.

Parent Elements
cellWatches (§3.3.1.8)

Attributes	Description
r (Reference)	Cell reference of the cell being watched. The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellWatch">
   <attribute name="r" type="ST_CellRef" use="required"/>
</complexType>
```

3.3.1.8 cellWatches (Cell Watch Items)

Collection of cells on this worksheet being watched in the 'watch window'.

[*Example*: In this example, cells B3 and B4 are being watched.

```
<cellWatches>
  <cellWatch r="B3"/>
  <cellWatch r="B4"/>
</cellWatches>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
cellWatch (Cell Watch Item)	§3.3.1.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellWatches">
   <sequence>
      <element name="cellWatch" type="CT_CellWatch" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.3.1.9 cfRule (Conditional Formatting Rule)

This collection represents a description of a conditional formatting rule.

[*Example*:

This example shows a conditional formatting rule highlighting cells whose values are greater than 0.5. Note that in this case the content of `<formula>` is a static value, but can also be a formula expression.

```
<conditionalFormatting sqref="E3:E9">
  <cfRule type="cellIs" dxfId="0" priority="1" operator="greaterThan">
    <formula>0.5</formula>
  </cfRule>
</conditionalFormatting>
```

end example]

Only rules with a type value of `expression` support formula syntax.

Parent Elements
conditionalFormatting (§3.3.1.17)

Child Elements	Subclause
colorScale (Color Scale)	§3.3.1.15
dataBar (Data Bar)	§3.3.1.26
extLst (Future Feature Data Storage Area)	§3.2.10
formula (Formula)	§3.3.1.40
iconSet (Icon Set)	§3.3.1.46

Attributes	Description
aboveAverage (Above Or Below Average)	Indicates whether the rule is an "above average" rule. '1' indicates 'above average'. Valid only for type = aboveAverage. The possible values for this attribute are defined by the XML Schema boolean datatype.
bottom (Bottom N)	Indicates whether a "top/bottom n" rule is a "bottom n" rule. '1' indicates 'bottom'. Valid only for type = top10. The possible values for this attribute are defined by the XML Schema boolean datatype.
dxfId (Differential Formatting Id)	This is an index to a dxf element in the Styles Part indicating which cell formatting to apply when the conditional formatting rule criteria is met. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
equalAverage (Equal Average)	Flag indicating whether the 'aboveAverage' and 'belowAverage' criteria is inclusive of the average itself, or exclusive of that value. '1' indicates to include the average value in the criteria. Valid only for type = aboveAverage. The possible values for this attribute are defined by the XML Schema boolean datatype.
operator (Operator)	The operator in a "cell value is" conditional formatting rule. Valid only when type = cellIs The possible values for this attribute are defined by the ST_ConditionalFormattingOperator simple type (§3.18.16).
percent (Top 10 Percent)	Indicates whether a "top/bottom n" rule is a "top/bottom n percent" rule. Valid only for type = top10. The possible values for this attribute are defined by the XML Schema boolean datatype.
priority (Priority)	The priority of this conditional formatting rule. This value is used to determine which format should be evaluated and rendered. Lower numeric values are higher priority than higher numeric values, where '1' is the highest priority. The possible values for this attribute are defined by the XML Schema int datatype.
rank (Rank)	The value of "n" in a "top/bottom n" conditional formatting rule. Valid only for type = top10. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
stdDev (StdDev)	The number of standard deviations to include above or below the average in the conditional formatting rule. Valid only for type = aboveAverage. If a value is present for stdDev and the rule type = aboveAverage, then this rule is automatically an "above or below N standard deviations" rule.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema int datatype.
stopIfTrue (Stop If True)	If this flag is '1', no rules with lower priority may be applied over this rule, when this rule evaluates to true. The possible values for this attribute are defined by the XML Schema boolean datatype.
text (Text)	The text value in a "text contains" conditional formatting rule. Valid only for type = `containsText`. The possible values for this attribute are defined by the XML Schema string datatype.
timePeriod (Time Period)	The applicable time period in a "date occurring…" conditional formatting rule. Valid only for type = `timePeriod`. The possible values for this attribute are defined by the ST_TimePeriod simple type (§3.18.82).
type (Type)	Type of conditional formatting rule. The possible values for this attribute are defined by the ST_CfType simple type (§3.18.13).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CfRule">
   <sequence>
      <element name="formula" type="ST_Formula" minOccurs="0" maxOccurs="3"/>
      <element name="colorScale" type="CT_ColorScale" minOccurs="0" maxOccurs="1"/>
      <element name="dataBar" type="CT_DataBar" minOccurs="0" maxOccurs="1"/>
      <element name="iconSet" type="CT_IconSet" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="type" type="ST_CfType"/>
   <attribute name="dxfId" type="ST_DxfId" use="optional"/>
   <attribute name="priority" type="xsd:int" use="required"/>
   <attribute name="stopIfTrue" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="aboveAverage" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="percent" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="bottom" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="operator" type="ST_ConditionalFormattingOperator" use="optional"/>
   <attribute name="text" type="xsd:string" use="optional"/>
   <attribute name="timePeriod" type="ST_TimePeriod" use="optional"/>
   <attribute name="rank" type="xsd:unsignedInt" use="optional"/>
   <attribute name="stdDev" type="xsd:int" use="optional"/>
   <attribute name="equalAverage" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.10 cfvo (Conditional Format Value Object)

Describes the values of the interpolation points in a gradient scale.

[*Example*: This example demonstrates a color scale conditional formatting rule, which defines a color for the minimum value in the range of cell values, a color for the midpoint value, and a color for the maximum value in the in the range of cell values. Information is given about how to define the midpoint. In this case, it is the 50 percent mark.

```
<colorScale>
  <cfvo type="min" val="0"/>
  <cfvo type="percent" val="50"/>
  <cfvo type="max" val="0"/>
  <color rgb="FFFF0000"/>
  <color rgb="FFFFFF00"/>
  <color rgb="FF00B050"/>
</colorScale>
```

The first <cfvo> element corresponds with the first <color> definition, and so on.

end example]

Parent Elements
colorScale (§3.3.1.15); dataBar (§3.3.1.26); iconSet (§3.3.1.46)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
gte (Greater Than Or Equal)	For icon sets, determines whether this threshold value uses the greater than or equal to operator. '0' indicates 'greater than' is used instead of 'greater than or equal to'. The possible values for this attribute are defined by the XML Schema boolean datatype.
type (Type)	The type of this conditional formatting value object. For example 'min' and 'max' would be used (in conjunction with @val) to express the lower and upper values to be used in a gradient. The possible values for this attribute are defined by the ST_CfvoType simple type (§3.18.14).
val (Value)	The value of this conditional formatting value object. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cfvo">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="type" type="ST_CfvoType" use="required"/>
   <attribute name="val" type="ST_Xstring" use="optional"/>
   <attribute name="gte" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.3.1.11 chartsheet (Chart Sheet)

This is the root element of Sheet Parts that are of type 'chartsheet'.

Parent Elements
Root element of SpreadsheetML Chartsheet part

Child Elements	Subclause
customSheetViews (Custom Chart Sheet Views)	§3.3.1.24
drawing (Drawing)	§3.3.1.34
extLst (Future Feature Data Storage Area)	§3.2.10
headerFooter (Header Footer Settings)	§3.3.1.43
legacyDrawing (Legacy Drawing Reference)	§3.3.1.51
legacyDrawingHF (Legacy Drawing Reference in Header Footer)	§3.3.1.52
pageMargins (Page Margins)	§3.3.1.60
pageSetup (Chart Sheet Page Setup)	§3.3.1.62
picture (Background Image)	§3.3.1.65
sheetPr (Chart Sheet Properties)	§3.3.1.80
sheetProtection (Chart Sheet Protection)	§3.3.1.82
sheetViews (Chart Sheet Views)	§3.3.1.86
webPublishItems (Web Publishing Items)	§3.3.1.95

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Chartsheet">
   <sequence>
      <element name="sheetPr" type="CT_ChartsheetPr" minOccurs="0" maxOccurs="1"/>
      <element name="sheetViews" type="CT_ChartsheetViews" minOccurs="1" maxOccurs="1"/>
      <element name="sheetProtection" type="CT_ChartsheetProtection" minOccurs="0" maxOccurs="1"/>
      <element name="customSheetViews" type="CT_CustomChartsheetViews" minOccurs="0" maxOccurs="1"/>
      <element name="pageMargins" minOccurs="0" type="CT_PageMargins"/>
      <element name="pageSetup" type="CT_CsPageSetup" minOccurs="0" maxOccurs="1"/>
      <element name="headerFooter" minOccurs="0" type="CT_HeaderFooter"/>
      <element name="drawing" type="CT_Drawing" minOccurs="1" maxOccurs="1"/>
      <element name="legacyDrawing" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
      <element name="legacyDrawingHF" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
      <element name="picture" type="CT_SheetBackgroundPicture" minOccurs="0" maxOccurs="1"/>
      <element name="webPublishItems" type="CT_WebPublishItems" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.3.1.12 col (Column Width & Formatting)

Defines column width and column formatting for one or more columns of the worksheet.

[*Example*: This example shows that column 5 (E) has width and style information applied.

```
<col min="5" max="5" width="9.140625" style="3"/>
```

end example]

Parent Elements
cols (§3.3.1.16)

Attributes	Description
bestFit (Best Fit Column Width)	Flag indicating if the specified column(s) is set to 'best fit'. 'Best fit' is set to `true` under these conditions: • The column width has never been manually set by the user, AND • The column width is not the default width 'Best fit' means that when numbers are typed into a cell contained in a 'best fit' column, the column width should automatically resize to display the number. Note: In best fit cases, column width shall not be made smaller, only larger. The possible values for this attribute are defined by the XML Schema boolean datatype.
collapsed (Collapsed)	Flag indicating if the outlining of the affected column(s) is in the collapsed state. See description of row collapsed and outlinePr element's summaryBelow and summaryRight attributes for detailed information.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
customWidth (Custom Width)	Flag indicating that the column width for the affected column(s) is different from the default or has been manually set. The possible values for this attribute are defined by the XML Schema boolean datatype.
hidden (Hidden Columns)	Flag indicating if the affected column(s) are hidden on this worksheet. The possible values for this attribute are defined by the XML Schema boolean datatype.
max (Maximum Column)	Last column affected by this 'column info' record. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
min (Minimum Column)	First column affected by this 'column info' record. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
outlineLevel (Outline Level)	Outline level of affected column(s). Range is 0 to 7. See description of outlinePr element's summaryBelow and summaryRight attributes for detailed information. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
phonetic (Show Phonetic Information)	Flag indicating if the phonetic information should be displayed by default for the affected column(s) of the worksheet. The possible values for this attribute are defined by the XML Schema boolean datatype.
style (Style)	Default style for the affected column(s). Affects cells not yet allocated in the column(s). In other words, this style applies to new columns. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
width (Column Width)	Column width measured as the number of characters of the maximum digit width of the numbers 0, 1, 2, ..., 9 as rendered in the normal style's font. There are 4 pixels of margin padding (two on each side), plus 1 pixel padding for the gridlines. width = Truncate([{Number of Characters} * {Maximum Digit Width} + {5 pixel padding}]/{Maximum Digit Width}*256)/256 Using the Calibri font as an example, the maximum digit width of 11 point font size is 7 pixels (at 96 dpi). In fact, each digit is the same width for this font. Therefore if the cell width is 8 characters wide, the value of this attribute shall be Truncate([8*7+5]/7*256)/256 = 8.7109375. To translate the value of width in the file into the column width value at runtime

Attributes	Description
	(expressed in terms of pixels), use this calculation: =Truncate(((256 * {width} + Truncate(128/{Maximum Digit Width}))/256)*{Maximum Digit Width}) Using the same example as above, the calculation would be Truncate(((256*8.7109375+Truncate(128/7))/256)*7) = 61 pixels To translate from pixels to character width, use this calculation: =Truncate(({pixels}-5)/{Maximum Digit Width} * 100+0.5)/100 Using the example above, the calculation would be Truncate((61-5)/7*100+0.5)/100 = 8 characters. Note: when wide borders are applied, part of the left/right border shall overlap with the 2 pixel padding on each side. Wide borders do not affect the width calculation of the column. Note: When the sheet is in the mode to view formulas instead of values, the pixel width of the column is doubled. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Col">
    <attribute name="min" type="xsd:unsignedInt" use="required"/>
    <attribute name="max" type="xsd:unsignedInt" use="required"/>
    <attribute name="width" type="xsd:double" use="optional"/>
    <attribute name="style" type="xsd:unsignedInt" use="optional" default="0"/>
    <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="bestFit" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="customWidth" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="phonetic" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="outlineLevel" type="xsd:unsignedByte" use="optional" default="0"/>
    <attribute name="collapsed" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.13 colBreaks (Vertical Page Breaks)

Vertical page break information used for print layout view, page layout view, drawing print breaks in normal view, and for printing the worksheet.

[*Example*:

In this example, a page break has been inserted at C3 (the break occurs left and above C3).

```
<colBreaks count="1" manualBreakCount="1">
  <brk id="2" max="1048575" man="1"/>
</colBreaks>
```

end example]

Parent Elements
customSheetView (§3.3.1.23); worksheet (§3.3.1.96)

Child Elements	Subclause
brk (Break)	§3.3.1.2

Attributes	Description
count (Page Break Count)	Number of breaks in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
manualBreakCount (Manual Break Count)	Number of manual breaks in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageBreak">
   <sequence>
      <element name="brk" type="CT_Break" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="manualBreakCount" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.3.1.14 color (Data Bar Color)

One of the colors associated with the data bar or color scale.

Note: the auto attribute is not used in the context of data bars.

Parent Elements
bottom (§3.8.6); colorScale (§3.3.1.15); dataBar (§3.3.1.26); diagonal (§3.8.13); font (§3.8.21); horizontal (§3.8.24); left (§3.8.27); mruColors (§3.8.28); right (§3.8.35); rPr (§3.4.7); stop (§3.8.38); top (§3.8.43); vertical (§3.8.44)

Attributes	Description
auto (Automatic)	A boolean value indicating the color is automatic and system color dependent. The possible values for this attribute are defined by the XML Schema boolean datatype.
indexed (Index)	Indexed color value. Only used for backwards compatibility. References a color in indexedColors. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rgb (Alpha Red Green Blue Color Value)	Standard Alpha Red Green Blue color value (ARGB). The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
theme (Theme Color)	Index into the <clrScheme> collection, referencing a particular <sysClr> or <srgbClr> value expressed in the Theme part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
tint (Tint)	Specifies the tint value applied to the color. If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied. The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change. In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255. [*Example*: Here are some examples of how to apply tint to color: **If (tint < 0)** Lum' = Lum * (1.0 + tint) For example: Lum = 200; tint = -0.5; Darken 50% Lum‘ = 200 * (0.5) => 100 For example: Lum = 200; tint = -1.0; Darken 100% (make black) Lum‘ = 200 * (1.0-1.0) => 0 **If (tint > 0)** Lum‘ = Lum * (1.0-tint) + (HLSMAX – HLSMAX * (1.0-tint)) For example: Lum = 100; tint = 0.75; Lighten 75%

Attributes	Description
	Lum‘ = 100 * (1-.75) + (HLSMAX – HLSMAX*(1-.75)) = 100 * .25 + (255 – 255 * .25) = 25 + (255 – 63) = 25 + 192 = 217 For example: Lum = 100; tint = 1.0; Lighten 100% (make white) Lum‘ = 100 * (1-1) + (HLSMAX – HLSMAX*(1-1)) = 100 * 0 + (255 – 255 * 0) = 0 + (255 – 0) = 255 *end example*] The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <attribute name="auto" type="xsd:boolean" use="optional"/>
   <attribute name="indexed" type="xsd:unsignedInt" use="optional"/>
   <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="theme" type="xsd:unsignedInt" use="optional"/>
   <attribute name="tint" type="xsd:double" use="optional" default="0.0"/>
</complexType>
```

3.3.1.15 colorScale (Color Scale)

Describes a gradated color scale in this conditional formatting rule.

[*Example*:

```
<colorScale>
  <cfvo type="min" val="0"/>
  <cfvo type="max" val="0"/>
  <color theme="5"/>
  <color rgb="FFFFEF9C"/>
</colorScale>
```

end example]

Parent Elements
cfRule (§3.3.1.9)

Child Elements	Subclause
cfvo (Conditional Format Value Object)	§3.3.1.10
color (Data Bar Color)	§3.3.1.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorScale">
   <sequence>
      <element name="cfvo" type="CT_Cfvo" minOccurs="2" maxOccurs="unbounded"/>
      <element name="color" type="CT_Color" minOccurs="2" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.3.1.16 cols (Column Information)

Information about whole columns of the worksheet.

[*Example*:

This example shows that column 4 (D) has 'best fit' applied to it, which is also a custom width. Also, column 5 (E) is listed as having a custom width and a style applied at the column level (as opposed to the cell level).

```
<cols>
  <col min="4" max="4" width="12" bestFit="1" customWidth="1"/>
  <col min="5" max="5" width="9.140625" style="3"/>
</cols>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
col (Column Width & Formatting)	§3.3.1.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cols">
   <sequence>
      <element name="col" type="CT_Col" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.3.1.17 conditionalFormatting (Conditional Formatting)

A Conditional Format is a format, such as cell shading or font color, that a spreadsheet applicaiton can automatically apply to cells if a specified condition is true. This collection expresses conditional formatting rules applied to a particular cell or range.

[*Example*: This example applies a 'top10' rule to the cells C3:C8. The `@dxfId` references the formatting (defined in the styles part) to be applied to cells that match the criteria.

```
<conditionalFormatting sqref="C3:C8">
  <cfRule type="top10" dxfId="1" priority="3" rank="2"/>
</conditionalFormatting>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
cfRule (Conditional Formatting Rule)	§3.3.1.9
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
pivot (PivotTable Conditional Formatting)	Flag indicating if this is conditional formatting associated with a PivotTable. The possible values for this attribute are defined by the XML Schema boolean datatype.
sqref (Sequence of Refernces)	Range over which these conditional formatting rules apply. The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConditionalFormatting">
   <sequence>
      <element name="cfRule" type="CT_CfRule" minOccurs="1" maxOccurs="unbounded"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="pivot" type="xsd:boolean" default="false"/>
   <attribute name="sqref" type="ST_Sqref"/>
</complexType>
```

3.3.1.18 control (Embedded Control)

A single embedded control.

Parent Elements
controls (§3.3.1.19)

Attributes	Description
id (Relationship Id) Namespace:	This relationship ID references an Embedded Control Data part which contains control-specific properties and state information about this particular embedded control.

Attributes	Description
.../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Control Name)	The code name of the control. The possible values for this attribute are defined by the XML Schema string datatype.
shapeId (Shape Id)	ID of the drawing shape in the Legacy Drawing part with which this control is associated. The drawing is used to draw the control in the sheet. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Control">
   <attribute name="shapeId" type="xsd:unsignedInt" use="required"/>
   <attribute ref="r:id" use="required"/>
   <attribute name="name" type="xsd:string" use="optional"/>
</complexType>
```

3.3.1.19 controls (Embedded Controls)

Worksheets can have embedded controls embedded in them. This collection is a listing of embedded controls in this worksheet. This collection is used to reference individual Embedded Control Data part definitions, enumerate the code name of each control, and reference drawing information used to draw the control.

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
control (Embedded Control)	§3.3.1.18

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Controls">
   <sequence>
      <element name="control" type="CT_Control" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.3.1.20 customPr (Custom Property)

The custom property element provides a mechanism to store name/value pairs of arbitrary user-defined data. The name is stored in the attribute name, the arbitrary data is stored in the binary part referenced by the relationshipId.

[*Note*: There is nothing in the binary part except the arbitrary data itself.

Custom XML Data Properties provide a preferred mechanism for storing arbitrary data. The customPr supports legacy third-party document components, as well as those situations that have a stringent need for binary parts. *end note*]

Parent Elements
customProperties (§3.3.1.21)

Attributes	Description
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	This relationship references the binary part containing the specified custom properties. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Custom Property Name)	Name of the custom property The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomProperty">
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.3.1.21 customProperties (Custom Properties)

This collection is used to reference binary parts containing arbitrary user-defined data.

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
customPr (Custom Property)	§3.3.1.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomProperties">
   <sequence>
      <element name="customPr" type="CT_CustomProperty" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.3.1.22 customSheetView (Custom Chart Sheet View)

This element defines custom view properties for chart sheets. See customSheetView (§3.3.1.23) for an example.

Parent Elements
customSheetViews (§3.3.1.24)

Child Elements	Subclause
headerFooter (Header Footer Settings)	§3.3.1.43
pageMargins (Page Margins)	§3.3.1.60
pageSetup (Chart Sheet Page Setup)	§3.3.1.62

Attributes	Description
guid (GUID)	Unique identifier of this custom view The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
scale (Print Scale)	Print scaling, representing percent values. Valid values range from 10 to 400. Horizontal & Vertical scale together. For example: 10 - 10% 20 - 20% … 100 - 100% … 400 - 400% The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
state (Visible State)	Visibility state of the sheet. The possible values for this attribute are defined by the ST_SheetState simple type (§3.18.70).
zoomToFit (Zoom To Fit)	Flag indicating whether chart sheet is zoom to fit window. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomChartsheetView">
   <sequence>
      <element name="pageMargins" type="CT_PageMargins" minOccurs="0" maxOccurs="1"/>
      <element name="pageSetup" type="CT_CsPageSetup" minOccurs="0" maxOccurs="1"/>
      <element name="headerFooter" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="guid" type="ST_Guid" use="required"/>
   <attribute name="scale" type="xsd:unsignedInt" default="100"/>
   <attribute name="state" type="ST_SheetState" default="visible"/>
   <attribute name="zoomToFit" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.23 customSheetView (Custom Sheet View)

This collection stores information pertaining to one custom sheet view definition. A custom view is a collection of settings defining a particular view of the sheet. These views may be selected by the user for quick access to predefined views of the sheet.

[*Example*: This example indicates that there is both a horizontal and vertical split in the sheet view, and that the top left cell of the bottom right pane is F7. Page margin, print options, page setup, and header / footer information is also stored with this view.

```
<customSheetView guid="{F3A061A9-D5FD-4F9C-A7CD-483AD476BA25}"
  sizeWithWindow="0">
  <pane xSplit="5" ySplit="6" topLeftCell="F7"/>
  <selection/>
  <pageMargins left="0.7" right="0.7" top="0.75" bottom="0.75" header="0.3"
    footer="0.3"/>
  <printOptions gridLinesSet="0"/>
  <pageSetup paperSize="0" scale="0" orientation="portrait" printDriver="0"
    horizontalDpi="0" verticalDpi="0" copies="0"/>
  <headerFooter/>
</customSheetView>
```

end example]

Parent Elements
customSheetViews (§3.3.1.25)

Child Elements	Subclause
autoFilter (AutoFilter Settings)	§3.3.1.1
colBreaks (Vertical Page Breaks)	§3.3.1.13
extLst (Future Feature Data Storage Area)	§3.2.10
headerFooter (Header Footer Settings)	§3.3.1.43

Child Elements	Subclause
pageMargins (Page Margins)	§3.3.1.60
pageSetup (Page Setup Settings)	§3.3.1.61
pane (View Pane)	§3.3.1.64
printOptions (Print Options)	§3.3.1.68
rowBreaks (Horizontal Page Breaks (Row))	§3.3.1.72
selection (Selection)	§3.3.1.75

Attributes	Description
colorId (Color Id)	Index to the color value for the text in row/column headings and gridlines for this custom view. This is an 'index color value' (ICV) rather than rgb value. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
filter (Filtered List)	Flag indicating whether the view contains a filtered range. The possible values for this attribute are defined by the XML Schema boolean datatype.
filterUnique (Filter)	Indicates whether an advanced filter has been applied, and the option to filter out duplicate records from the data list has been selected, in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
fitToPage (Fit To Page)	Flag indicating whether this view should be fit to page when printing this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
guid (GUID)	Unique identifier of this custom view. This is used to ensure uniqueness. It is generated when the view is created. Must correspond to a customWorkbookView guid value in the workbook Start Part. The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
hiddenColumns (Hidden Columns)	Flag indicating that there is one or more hidden column(s) in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
hiddenRows (Hidden Rows)	Flag indicating that there is one or more hidden row(s) in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
outlineSymbols (Show Outline Symbols)	Flag indicating whether outline symbols are displayed in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
printArea (Print Area Defined)	Flag indicating whether a print area is defined as part of this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
scale (Print Scale)	Print scaling for this custom view. Valid values range from 10 to 400. For example: 10 - 10% 20 - 20% … 100 - 100% … 400 - 400% The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
showAutoFilter (Show AutoFitler Drop Down Controls)	Flag indicating whether the autofilter dropdown buttons are visible in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
showFormulas (Show Formulas)	Flag indicating whether formulas are shown in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
showGridLines (Show Grid Lines)	Flag indicating whether gridlines are shown in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
showPageBreaks (Show Page Breaks)	Flag indicating whether page breaks are shown in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
showRowCol (Show Headers)	Flag indicating whether row and column headers are shown in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.
showRuler (Show Ruler)	Flag indicating whether to show the ruler in this custom view. Only applicable if this Custom View is in Page Layout View. The possible values for this attribute are defined by the XML Schema boolean datatype.
state (Visible State)	Visibility state for this custom view. The possible values for this attribute are defined by the ST_SheetState simple type (§3.18.70).
topLeftCell (Top Left Visible Cell)	Location of the top left visible cell in the bottom right pane in this custom view (when in Left-to-Right mode). The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
view (View Type)	Indicates the view type for this Custom View

Attributes	Description
	The possible values for this attribute are defined by the ST_SheetViewType simple type (§3.18.71).
zeroValues (Show Zero Values)	Flag indicating whether the window should display 0 (zero) values in this custom view. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomSheetView">
   <sequence>
      <element name="pane" type="CT_Pane" minOccurs="0" maxOccurs="1"/>
      <element name="selection" type="CT_Selection" minOccurs="0" maxOccurs="1"/>
      <element name="rowBreaks" type="CT_PageBreak" minOccurs="0" maxOccurs="1"/>
      <element name="colBreaks" type="CT_PageBreak" minOccurs="0" maxOccurs="1"/>
      <element name="pageMargins" type="CT_PageMargins" minOccurs="0" maxOccurs="1"/>
      <element name="printOptions" type="CT_PrintOptions" minOccurs="0" maxOccurs="1"/>
      <element name="pageSetup" type="CT_PageSetup" minOccurs="0" maxOccurs="1"/>
      <element name="headerFooter" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
      <element name="autoFilter" type="CT_AutoFilter" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="guid" type="ST_Guid" use="required"/>
   <attribute name="scale" type="xsd:unsignedInt" default="100"/>
   <attribute name="colorId" type="xsd:unsignedInt" default="64"/>
   <attribute name="showPageBreaks" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showFormulas" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showGridLines" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showRowCol" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="outlineSymbols" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="zeroValues" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="fitToPage" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="printArea" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="filter" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showAutoFilter" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="hiddenRows" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="hiddenColumns" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="state" type="ST_SheetState" default="visible"/>
   <attribute name="filterUnique" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="view" type="ST_SheetViewType" default="normal"/>
   <attribute name="showRuler" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="topLeftCell" type="ST_CellRef" use="optional"/>
</complexType>
```

3.3.1.24 customSheetViews (Custom Chart Sheet Views)

Collection of custom Chart Sheet View information.

Parent Elements
chartsheet (§3.3.1.11)

Child Elements	Subclause
customSheetView (Custom Chart Sheet View)	§3.3.1.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomChartsheetViews">
   <sequence>
      <element name="customSheetView" minOccurs="0" maxOccurs="unbounded"
        type="CT_CustomChartsheetView"/>
   </sequence>
</complexType>
```

3.3.1.25 customSheetViews (Custom Sheet Views)

This is a collection of custom sheet views.

Parent Elements
dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Child Elements	Subclause
customSheetView (Custom Sheet View)	§3.3.1.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomSheetViews">
   <sequence>
      <element name="customSheetView" minOccurs="1" maxOccurs="unbounded"
        type="CT_CustomSheetView"/>
   </sequence>
</complexType>
```

3.3.1.26 dataBar (Data Bar)

Describes a data bar conditional formatting rule.

[*Example*:

In this example a data bar conditional format is expressed, which spreads across all cell values in the cell range, and whose color is blue.

```
<dataBar>
  <cfvo type="min" val="0"/>
  <cfvo type="max" val="0"/>
  <color rgb="FF638EC6"/>
</dataBar>
```

end example]

The length of the data bar for any cell can be calculated as follows:

Data bar length = minLength + (cell value - minimum value in the range) / (maximum value in the range - minimum value in the range) * (maxLength - minLength),

where min and max length are a fixed percentage of the column width (by default, 10% and 90% respectively.)

The minimum difference in length (or increment amount) is 1 pixel.

Parent Elements
cfRule (§3.3.1.9)

Child Elements	Subclause
cfvo (Conditional Format Value Object)	§3.3.1.10
color (Data Bar Color)	§3.3.1.14

Attributes	Description
maxLength (Maximum Length)	The maximum length of the data bar, as a percentage of the cell width. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
minLength (Minimum Length)	The minimum length of the data bar, as a percentage of the cell width. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
showValue (Show Values)	Indicates whether to show the values of the cells on which this data bar is applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataBar">
   <sequence>
      <element name="cfvo" type="CT_Cfvo" minOccurs="2" maxOccurs="2"/>
      <element name="color" type="CT_Color" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="minLength" type="xsd:unsignedInt" use="optional" default="10"/>
   <attribute name="maxLength" type="xsd:unsignedInt" use="optional" default="90"/>
   <attribute name="showValue" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.3.1.27 dataConsolidate (Data Consolidate)

Data consolidation settings. The dataRefs are the set of source ranges containing data to consolidate. The function indicates the function that shall be used to consolidate the data.

[*Example*:

This example demonstrates consolidating the ranges A1:C1 and A3:C3 by using the 'count' function.

```
<dataConsolidate function="count">
  <dataRefs count="2">
    <dataRef ref="A1:C1" sheet="Sheet1"/>
    <dataRef ref="A3:C3" sheet="Sheet1"/>
  </dataRefs>
</dataConsolidate>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
dataRefs (Data Consolidation References)	§3.3.1.29

Attributes	Description
function (Function Index)	Indicates which function to use when consolidating the ranges. The possible values for this attribute are defined by the ST_DataConsolidateFunction simple type (§3.18.18).
leftLabels (Use Left Column Labels)	Use labels in left column. Both leftLabels and topLabels can be true at the same time. The possible values for this attribute are defined by the XML Schema boolean datatype.
link (Link)	Create links to source data. The possible values for this attribute are defined by the XML Schema boolean datatype.
topLabels (Labels In Top Row)	Use labels in top row. Both leftLabels and topLabels can be true at the same time. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataConsolidate">
   <sequence>
      <element name="dataRefs" type="CT_DataRefs" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="function" type="ST_DataConsolidateFunction" use="optional" default="sum"/>
   <attribute name="leftLabels" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="topLabels" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="link" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.28 dataRef (Data Consolidation Reference)

A single data consolidate reference. One dataRef shall use either name or sheet & ref, but not both on the same dataRef.

Parent Elements
dataRefs (§3.3.1.29)

Attributes	Description
id (relationship Id) Namespace: .../officeDocument/2006/relationships	Used only when the source range is external to this workbook. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Named Range)	Named range, either in this workbook or the external workbook referenced by r:Id. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ref (Reference)	Cell range. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sheet (Sheet Name)	Sheet name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataRef">
   <attribute name="ref" type="ST_Ref" use="optional"/>
   <attribute name="name" type="ST_Xstring" use="optional"/>
   <attribute name="sheet" type="ST_Xstring" use="optional"/>
   <attribute ref="r:id" use="optional"/>
</complexType>
```

3.3.1.29 dataRefs (Data Consolidation References)

Data consolidate reference collection.

Parent Elements
dataConsolidate (§3.3.1.27)

Child Elements	Subclause
dataRef (Data Consolidation Reference)	§3.3.1.28

Attributes	Description
count (Data Consolidation Reference Count)	Count of data consolidate references. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataRefs">
   <sequence>
      <element name="dataRef" type="CT_DataRef" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.3.1.30 dataValidation (Data Validation)

A single item of data validation defined on a range of the worksheet.

Parent Elements
dataValidations (§3.3.1.31)

Child Elements	Subclause
formula1 (Formula 1)	§3.3.1.41
formula2 (Formula 2)	§3.3.1.42

Attributes	Description
allowBlank (Allow Blank)	A boolean value indicating whether the data validation treats empty or blank entries as valid. '1' means empty entries are OK and do not violate the validation constraints. The possible values for this attribute are defined by the XML Schema boolean datatype.
error (Error Message)	Message text of error alert. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
errorStyle (Data Validation Error Style)	The style of error alert used for this data validation. The possible values for this attribute are defined by the ST_DataValidationErrorStyle simple type (§3.18.19).
errorTitle (Error Alert Text)	Title bar text of error alert. The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§3.18.96).
imeMode (IME Mode Enforced)	The IME (input method editor) mode enforced by this data validation. Only applies for these languages: • Chinese Simplified • Chinese Traditional • Japanese • Korean When imeMode is set, the input for the cell can be restricted to specific sets of characters, as specified by the value of imeMode. See the simple type referenced below for additional details. When imeMode is set but the application's language is not one of the languages listed above, then the default value is noControl. The possible values for this attribute are defined by the ST_DataValidationImeMode simple type (§3.18.20).
operator (Operator)	The relational operator used with this data validation. The possible values for this attribute are defined by the ST_DataValidationOperator simple type (§3.18.21).
prompt (Input Prompt)	Message text of input prompt. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
promptTitle (Prompt Title)	Title bar text of input prompt. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
showDropDown (Show Drop Down)	A boolean value indicating whether to display the dropdown combo box for a list type data validation. The possible values for this attribute are defined by the XML Schema boolean datatype.
showErrorMessage (Show Error Message)	A boolean value indicating whether to display the error alert message when an invalid value has been entered, according to the criteria specified. The possible values for this attribute are defined by the XML Schema boolean datatype.
showInputMessage (Show Input Message)	A boolean value indicating whether to display the input prompt message. The possible values for this attribute are defined by the XML Schema boolean datatype.
sqref (Sequence of References)	Range over which data validation is applied. The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).

Attributes	Description
type (Data Validation Type)	The type of data validation. The possible values for this attribute are defined by the ST_DataValidationType simple type (§3.18.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataValidation">
   <sequence>
      <element name="formula1" type="ST_Formula" minOccurs="0" maxOccurs="1"/>
      <element name="formula2" type="ST_Formula" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="type" type="ST_DataValidationType" use="optional" default="none"/>
   <attribute name="errorStyle" type="ST_DataValidationErrorStyle" use="optional" default="stop"/>
   <attribute name="imeMode" type="ST_DataValidationImeMode" use="optional" default="noControl"/>
   <attribute name="operator" type="ST_DataValidationOperator" use="optional" default="between"/>
   <attribute name="allowBlank" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showDropDown" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showInputMessage" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showErrorMessage" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="errorTitle" type="ST_Xstring" use="optional"/>
   <attribute name="error" type="ST_Xstring" use="optional"/>
   <attribute name="promptTitle" type="ST_Xstring" use="optional"/>
   <attribute name="prompt" type="ST_Xstring" use="optional"/>
   <attribute name="sqref" type="ST_Sqref" use="required"/>
</complexType>
```

3.3.1.31 dataValidations (Data Validations)

This collection expresses all data validation information for cells in a sheet which have data validation features applied.

Data validation is used to specify constaints on the type of data that can be entered into a cell. Additional UI can be provided to help the user select valid values (e.g., a dropdown control on the cell or hover text when the cell is active), and to help the user understand why a particular entry was considered invalid (e.g., alerts and messages).

Various data types can be selected, and logical operators (e.g., greater than, less than, equal to, etc) can be used. Additionally, instead of specifying an explicit set of values that are valid, a cell or range reference may be used.

An input message can be specified to help the user know what kind of value is expected, and a warning message (and warning type) can be specified to alert the user when they've entered invalid data.

[*Example*:

```
<dataValidations count="1">
  <dataValidation type="whole" errorStyle="warning" operator="greaterThan"
    showInputMessage="1" showErrorMessage="1" errorTitle="Invalid Data"
    error="The value must be a whole number greater than 0."
    promptTitle="Whole Number"
    prompt="Please enter a whole number greater than 0." sqref="A1">
    <formula1>0</formula1>
  </dataValidation>
</dataValidations>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
dataValidation (Data Validation)	§3.3.1.30

Attributes	Description
count (Data Validation Item Count)	The expected number of data validation items for this worksheet. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
disablePrompts (Disable Prompts)	A boolean value indicating whether all input prompts for the worksheet are disabled. The possible values for this attribute are defined by the XML Schema boolean datatype.
xWindow (Top Left Corner (X Coodrinate))	The x-coordinate (relative to window) of top-left corner of the data validation input prompt (textbox). This is per sheet, not per cell. Units in pixels. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
yWindow (Top Left Corner (Y Coordinate))	The y-coordinate (relative to window) of top-left corner of the data validation input prompt (textbox). This is per sheet, not per cell. Units in pixels. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataValidations">
   <sequence>
      <element name="dataValidation" type="CT_DataValidation" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="disablePrompts" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="xWindow" type="xsd:unsignedInt" use="optional"/>
   <attribute name="yWindow" type="xsd:unsignedInt" use="optional"/>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.3.1.32 dialogsheet (Dialog Sheet)

This is the root element for Sheet Parts of type 'dialogsheet'.

Parent Elements
Root element of SpreadsheetML Dialogsheet part

Child Elements	Subclause
customSheetViews (Custom Sheet Views)	§3.3.1.25
drawing (Drawing)	§3.3.1.34
extLst (Future Feature Data Storage Area)	§3.2.10
headerFooter (Header Footer Settings)	§3.3.1.43
legacyDrawing (Legacy Drawing Reference)	§3.3.1.51
legacyDrawingHF (Legacy Drawing Reference in Header Footer)	§3.3.1.52
oleObjects (Embedded Objects)	§3.3.1.58
pageMargins (Page Margins)	§3.3.1.60
pageSetup (Page Setup Settings)	§3.3.1.61
printOptions (Print Options)	§3.3.1.68
sheetFormatPr (Sheet Format Properties)	§3.3.1.78
sheetPr (Sheet Properties)	§3.3.1.79
sheetProtection (Sheet Protection Options)	§3.3.1.81
sheetViews (Sheet Views)	§3.3.1.85

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dialogsheet">
   <sequence>
      <element name="sheetPr" minOccurs="0" type="CT_SheetPr"/>
      <element name="sheetViews" minOccurs="0" type="CT_SheetViews"/>
      <element name="sheetFormatPr" minOccurs="0" type="CT_SheetFormatPr"/>
      <element name="sheetProtection" type="CT_SheetProtection" minOccurs="0" maxOccurs="1"/>
      <element name="customSheetViews" minOccurs="0" type="CT_CustomSheetViews"/>
      <element name="printOptions" minOccurs="0" type="CT_PrintOptions"/>
      <element name="pageMargins" minOccurs="0" type="CT_PageMargins"/>
      <element name="pageSetup" minOccurs="0" type="CT_PageSetup"/>
      <element name="headerFooter" minOccurs="0" type="CT_HeaderFooter"/>
      <element name="drawing" minOccurs="0" type="CT_Drawing"/>
      <element name="legacyDrawing" minOccurs="0" type="CT_LegacyDrawing"/>
      <element name="legacyDrawingHF" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
      <element name="oleObjects" type="CT_OleObjects" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
</complexType>
```

3.3.1.33 dimension (Worksheet Dimensions)

This element specifies the used range of the worksheet. It specifies the row and column bounds of used cells in the worksheet. This is optional and is not required. Used cells include cells with formulas, text content, and cell formatting. When an entire column is formatted, only the first cell in that column is considered used.

[*Example*:

```
<dimension ref="A1:C2"/>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Attributes	Description
ref (Reference)	The row and column bounds of all cells in this worksheet. Corresponds to the range that would contain all c elements written under sheetData. Does not support whole column or whole row reference notation. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetDimension">
   <attribute name="ref" type="ST_Ref" use="required"/>
</complexType>
```

3.3.1.34 drawing (Drawing)

This element indicates that the sheet contains drawing components built on the drawingML platform. The relationship Id references the part containing the drawingML definitions.

Parent Elements
chartsheet (§3.3.1.11); dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
id (Relationship id) Namespace: .../officeDocument/2006/relationships	Relationship Id referencing a part containing drawingML definitions for this worksheet. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Drawing">
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.3.1.35 evenFooter (Even Page Footer)

Even page footer value. Corresponds to even printed pages. Even page(s) in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside an even page's scope.

If no even footer is specified, then the odd footer's value is assumed for even page footers. See the evenHeader element (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

3.3.1.36 evenHeader (Even Page Header)

Even page header value. Corresponds to even printed pages. Even page(s) in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside an even page's scope.

If no even header is specified, then odd header value is assumed for even page headers.

Header/Footer Formatting Syntax

There are a number of formatting codes that can be written inline with the actual header / footer text, which affect the formatting in the header or footer.

[*Example*:

This example shows the text "Center **Bold** Header" on the first line (center section), and the date on the second line (center section).

```
<headerFooter>
  <oddHeader>&amp;CCenter &amp;"-,Bold"Bold
    &amp;"-,Regular"Header_x000A_&amp;D</oddHeader>
</headerFooter>
```

end example]

General Rules:

There is no required order in which these codes must appear.

The first occurrence of the following codes turns the formatting ON, the second occurrence turns it OFF again:

- strikethrough
- superscript
- subscript

Superscript and subscript cannot both be ON at same time. Whichever comes first wins and the other is ignored, while the first is ON.

&L - code for "left section" (there are three header / footer locations, "left", "center", and "right"). When two or more occurrences of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the left section.

&P - code for "current page #"

&N - code for "total pages"

&*font size* - code for "text font size", where *font size* is a font size in points.

&K - code for "text font color"

RGB Color is specified as RRGGBB

Theme Color is specifed as TTSNN where TT is the theme color Id, S is either "+" or "-" of the tint/shade value, NN is the tint/shade value.

&S - code for "text strikethrough" on / off

&X - code for "text super script" on / off

&Y - code for "text subscript" on / off

&C - code for "center section". When two or more occurrences of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the center section.

&D - code for "date"

&T - code for "time"

&G - code for "picture as background"

&U - code for "text single underline"

&E - code for "double underline"

&R - code for "right section". When two or more occurrences of this section marker exist, the contents from all markers are concatenated, in the order of appearance, and placed into the right section.

&Z - code for "this workbook's file path"

&F - code for "this workbook's file name"

&A - code for "sheet tab name"

&+ - code for add to page #.

&- - code for subtract from page #.

&"*font name*,*font type*" - code for "text font name" and "text font type", where *font name* and *font type* are strings specifying the name and type of the font, separated by a comma. When a hyphen appears in *font name*, it means "none specified". Both of *font name* and *font type* can be localized values.

&"-,Bold" - code for "bold font style"

&B - also means "bold font style".

&"-,Regular" - code for "regular font style"

&"-,Italic" - code for "italic font style"

&I - also means "italic font style"

&"-,Bold Italic" code for "bold italic font style"

&O - code for "outline style"

&H - code for "shadow style"

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

3.3.1.37 f (Formula)

Formula for the cell. The formula expression is contained in the character node of this element.

[*Example*:

```
<f>SUM(C4:E4)</f>
```

end example]

The possible values for the t attribute have type ST_CellFormulaType, and are as follows:

- `array` (Array Entered)
- `dataTable` (Table Formula, see below)
- `normal` (Normal)
- `shared` (Shared Formula)

A *data table* is a range of cells that shows how changing certain values in one or more formulas affects the results of those formulas. A data table provides a shortcut for calculating multiple versions in one operation, and a way to view and compare the results of all of the different variations together on a worksheet.

Both one- and two-input variable data tables can be created (see attribute dt2D). [*Example*: A one-input variable data table might be used to see how different interest rates affect a monthly mortgage payment, while a two-input variable data table might be used to show how different interest rates and loan terms will affect the mortgage payment. *end example*]

Data tables shall be recalculated whenever a worksheet is recalculated.

In a one-input variable data table, values are listed either down a column (column-oriented) or across a row (row-oriented) (see attribute dtr).

Formulas that are used in a one-input variable data table shall refer to an input cell (see attribute r1), the cell in which each input value from a data table is substituted. Any cell on a worksheet can be the input cell. Although the input cell does not need to be part of the data table, the formulas in data tables shall refer to that input cell.

Two-input variable data tables use only one formula with two lists of input values. The formula shall refer to two input cells (see attributes r1 and r2).

The top-left cell in the data table is called the *master cell*.

Parent Elements
c (§3.3.1.3); nc (§3.11.1.3); oc (§3.11.1.5)

Attributes	Description
aca (Always	`true` indicates that this formula is an array formula and the entire array shall be

Attributes	Description
Calculate Array)	calculated in full. If `false` the individual cells of the array shall be calculated as needed. [*Note*: The primary case where an array formula shall be calcuated in part instead of in full is when some cells in the array depend on other cells that are semi-calculated, e.g., contains the function =RAND(). *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
bx (Assigns Value to Name)	Specifies that this formula assigns a value to a name. The possible values for this attribute are defined by the XML Schema boolean datatype.
ca (Calculate Cell)	Indicates that this formula needs to be recalculated the next time calculation is performed. For example, this is always set on volatile functions, like =RAND(), and circular references. The possible values for this attribute are defined by the XML Schema boolean datatype.
del1 (Input 1 Deleted)	Whether the first input cell for data table has been deleted. Applies to data table formula only. Written on master cell of data table formula only. The possible values for this attribute are defined by the XML Schema boolean datatype.
del2 (Input 2 Deleted)	Whether the second input cell for data table has been deleted. Applies to data table formula only. Written on master cell of data table formula only. The possible values for this attribute are defined by the XML Schema boolean datatype.
dt2D (Data Table 2-D)	Data table is two-dimentional. Only applies to the data tables function. Written on master cell of data table formula only. The possible values for this attribute are defined by the XML Schema boolean datatype.
dtr (Data Table Row)	`true` if one-dimentional data table is a row, otherwise it's a column. Only applies to the data tables function. Written on master cell of data table formula only. The possible values for this attribute are defined by the XML Schema boolean datatype.
r1 (Data Table Cell 1)	First input cell for data table. Only applies to the data tables array function "TABLE()". Written on master cell of data table formula only. The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
r2 (Input Cell 2)	Second input cell for data table when dt2D is '1'. Only applies to the data tables array function "TABLE()".Written on master cell of data table formula only. The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
ref (Range of Cells)	Range of cells which the formula applies to. Only required for shared formula, array formula or data table. Only written on the master formula, not subsequent formula's belonging to the same shared group, array, or data table.

Attributes	Description
	The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
si (Shared Group Index)	Optional attribute to optimize load performance by sharing formulas. When a formula is a shared formula (t value is shared) then this value indicates the group to which this particular cell's formula belongs. The first formula in a group of shared formulas is saved in the f element. This is considered the 'master' formula cell. Subsequent cells sharing this formula need not have the formula written in their f element. Instead, the attribute si value for a particular cell is used to figure what the formula expression should be based on the cell's relative location to the master formula cell. A cell is shared only when si is used and t is shared. The formula expression for a cell that is specified to be part of a shared formula (and is not the master) shall be ignored, and the master formula shall override. If a master cell of a shared formula range specifies that a particular cell is part of the shared formula range, and that particular cell does not use the si and t attributes to indicate that it is shared, then the particular cell's formula shall override the shared master formula. If this cell occurs in the middle of a range of shared formula cells, the earlier and later formulas shall continue sharing the master formula, and the cell in question shall not share the formula of the master cell formula. Loading and handling of a cell and formula using an si attribute and whose t value is shared, located outside the range specified in the master cell associated with the si group, is implementation defined. Master cell references on the same sheet shall not overlap with each other. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
t (Formula Type)	Type of formula. The possible values for this attribute are defined by the ST_CellFormulaType simple type (§3.18.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellFormula">
   <simpleContent>
      <extension base="ST_Formula">
         <attribute name="t" type="ST_CellFormulaType" use="optional" default="normal"/>
         <attribute name="aca" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="ref" type="ST_Ref" use="optional"/>
         <attribute name="dt2D" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="dtr" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="del1" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="del2" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="r1" type="ST_CellRef" use="optional"/>
         <attribute name="r2" type="ST_CellRef" use="optional"/>
         <attribute name="ca" type="xsd:boolean" use="optional" default="false"/>
         <attribute name="si" type="xsd:unsignedInt" use="optional"/>
         <attribute name="bx" type="xsd:boolean" use="optional" default="false"/>
      </extension>
   </simpleContent>
</complexType>
```

3.3.1.38 firstFooter (First Page Footer)

First page footer content. Only used when `headerFooter@differentFirst` is '1'. Corresponds to first printed page. The first logical page in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside the first page's scope.

See evenHeader (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

3.3.1.39 firstHeader (First Page Header)

First page header content. Only used when `headerFooter@differentFirst` is '1'. Corresponds to first printed page. The first logical page in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside the first page's scope.

See evenHeader (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

3.3.1.40 formula (Formula)

The content of this element is a formula whose calculated value specifies the criteria for the conditional formatting rule.

The possible values for this element are defined by the ST_Formula simple type (§3.18.36).

Parent Elements
cfRule (§3.3.1.9); rdn (§3.11.1.13)

3.3.1.41 formula1 (Formula 1)

The first formula in the DataValidation dropdown. It used as a bounds for 'between' and 'notBetween' relational operators, and the only formula used for other relational operators (equal, notEqual, lessThan, lessThanOrEqual, greaterThan, greaterThanOrEqual), or for custom or list type data validation. The content can be a formula or a constant or a list series (comma separated values).

The possible values for this element are defined by the ST_Formula simple type (§3.18.36).

Parent Elements
dataValidation (§3.3.1.30)

3.3.1.42 formula2 (Formula 2)

The second formula in the DataValidation dropdown. It used as a bounds for 'between' and 'notBetween' relational operators only.

The possible values for this element are defined by the ST_Formula simple type (§3.18.36).

Parent Elements
dataValidation (§3.3.1.30)

3.3.1.43 headerFooter (Header Footer Settings)

Header and footer settings.

[*Example*:

This example demonstrates "Header" at the top and "Footer" at the bottom of a page.

```
<headerFooter>
  <oddHeader>&amp;CHeader</oddHeader>
  <oddFooter>&amp;CFooter</oddFooter>
</headerFooter>
```

end example]

The tokens in the header & footer elements can be localized. An application may decide which locales are supported. Even when a locale is not supported, the header and footer text must be loaded, and only the formatting is discarded.

Parent Elements

Parent Elements
chartsheet (§3.3.1.11); customSheetView (§3.3.1.23); customSheetView (§3.3.1.22); dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Child Elements	Subclause
evenFooter (Even Page Footer)	§3.3.1.35
evenHeader (Even Page Header)	§3.3.1.36
firstFooter (First Page Footer)	§3.3.1.38
firstHeader (First Page Header)	§3.3.1.39
oddFooter (Odd Page Footer)	§3.3.1.55
oddHeader (Odd Header)	§3.3.1.56

Attributes	Description
alignWithMargins (Align Margins)	Align header footer margins with page margins. When `true`, as left/right margins grow and shrink, the header and footer edges stay aligned with the margins. When `false`, headers and footers are aligned on the paper edges, regardless of margins. The possible values for this attribute are defined by the XML Schema boolean datatype.
differentFirst (Different First Page)	Different first page header and footer. When `true` then firstHeader and firstFooter specify first page header and footer values. If `false` and firstHeader / firstFooter are present, they are ignored. The possible values for this attribute are defined by the XML Schema boolean datatype.
differentOddEven (Different Odd Even Header Footer)	Different odd and even page headers and footers. When `true` then oddHeader / oddFooter and evenHeader / evenFooter specify page header and footer values for odd and even pages. If `false` then oddHeader / oddFooter is used, even when evenHeader / evenFooter are present. The possible values for this attribute are defined by the XML Schema boolean datatype.
scaleWithDoc (Scale Header & Footer With Document)	Scale header and footer with document scaling. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HeaderFooter">
   <sequence>
      <element name="oddHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="oddFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="evenHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="evenFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="firstHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="firstFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="differentOddEven" type="xsd:boolean" default="false"/>
   <attribute name="differentFirst" type="xsd:boolean" default="false"/>
   <attribute name="scaleWithDoc" type="xsd:boolean" default="true"/>
   <attribute name="alignWithMargins" type="xsd:boolean" default="true"/>
</complexType>
```

3.3.1.44 hyperlink (Hyperlink)

A single hyperlink

Parent Elements
hyperlinks (§3.3.1.45)

Attributes	Description
display (Display String)	Display string, if different from string in string table. This is a property on the hyperlink object, but does not need to appear in the spreadsheet application UI. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	Relationship Id in this sheet's relationships part, expressing the target location of the resource. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
location (Location)	Location within target. If target is a workbook (or this workbook) this shall refer to a sheet and cell or a defined name. Can also be an HTML anchor if target is HTML file. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ref (Reference)	Cell location of hyperlink on worksheet. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
tooltip (Tool Tip)	This is additional text to help the user understand more about the hyperlink. This can be displayed as hover text when the mouse is over the link, for example.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlink">
   <attribute name="ref" type="ST_Ref" use="required"/>
   <attribute ref="r:id" use="optional"/>
   <attribute name="location" type="ST_Xstring" use="optional"/>
   <attribute name="tooltip" type="ST_Xstring" use="optional"/>
   <attribute name="display" type="ST_Xstring" use="optional"/>
</complexType>
```

3.3.1.45 hyperlinks (Hyperlinks)

Collection of hyperlinks.

[*Example*:

This example shows a hyperlink in cell A11, with hover text displaying "Search Page". The relationship Id references a relationship from the sheet to the external target resource.

```
<hyperlinks>
  <hyperlink ref="A11" r:id="rId1" tooltip="Search Page"/>
</hyperlinks>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
hyperlink (Hyperlink)	§3.3.1.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlinks">
   <sequence>
      <element name="hyperlink" type="CT_Hyperlink" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.3.1.46 iconSet (Icon Set)

Describes an icon set conditional formatting rule.

[*Example*: This example demonstrates the "3Arrows" style of icons. The first icon in the set shall be shown if the cell's value is less than the 33rd percentile. The second icon in the set shall be shown if the cell's value is less

than the 67th percentile, and greater than or equal to the 33rd percentile. The third icon in the set shall be shown if the cell's value is greater than or equal to the 67th percentile.

```
<iconSet iconSet="3Arrows">
  <cfvo type="percentile" val="0"/>
  <cfvo type="percentile" val="33"/>
  <cfvo type="percentile" val="67"/>
</iconSet>
```

end example]

Parent Elements
cfRule (§3.3.1.9)

Child Elements	Subclause
cfvo (Conditional Format Value Object)	§3.3.1.10

Attributes	Description
iconSet (Icon Set)	The icon set to display. The possible values for this attribute are defined by the ST_IconSetType simple type (§3.18.44).
percent (Percent)	Indicates whether the thresholds indicate percentile values, instead of number values. The possible values for this attribute are defined by the XML Schema boolean datatype.
reverse (Reverse Icons)	If '1', reverses the default order of the icons in this icon set. The possible values for this attribute are defined by the XML Schema boolean datatype.
showValue (Show Value)	Indicates whether to show the values of the cells on which this icon set is applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IconSet">
   <sequence>
      <element name="cfvo" type="CT_Cfvo" minOccurs="2" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="iconSet" type="ST_IconSetType" use="optional" default="3TrafficLights1"/>
   <attribute name="showValue" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="percent" type="xsd:boolean" default="true"/>
   <attribute name="reverse" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.47 ignoredError (Ignored Error)

A single ignored error type for a range of cells.

A cell is considered to have an error condition when it meets one of the conditions specified in the attribute descriptions below. For example, if a cell is formatted as text but contains a numeric value, this is considered to be a potential error because the number won't be treated as a number, for example, in calculations.

Note that this simply a guess by the implementing application, and a recommendation to the user. Cells with the errors specified below may have perfectly valid reasons for being in such a state, for example a cell formatted as text which contains numeric Postal Codes or Order numbers. It is useful to format these cells as text so that leading zeros remain as part of the value instead of being removed.

An `<ignoreError>` element is not written in the file unless the user has specifically reviewed the error and decided to keep the cell state as it is, and no longer wishes to be alerted about it for this cell. This can be helpful for the application to decide which errors should be surfaced to the user vs kept quiet because the user doesn't want these to be surfaced (e.g., because they are legitimate cell states).

[*Example*: This example shows that cells A1 and B2 both contain numbers stored as text, and this error has been reviewed and specifically flagged to be no longer surfaced as an error to the user.

```
<ignoredErrors>
  <ignoredError sqref="A1 B2" numberStoredAsText="1"/>
</ignoredErrors>
```

end example]

Note: more than one kind of error can exist on a cell. These flags are not mutually exclusive.

Parent Elements
ignoredErrors (§3.3.1.48)

Attributes	Description
calculatedColumn (Calculated Column)	Ignore errors when cells contain a value different from a calculated column formula. In other words, for a calculated column, a cell in that column is considered to have an error if its formula is different from the calculated column formula, or doesn't contain a formula at all. The possible values for this attribute are defined by the XML Schema boolean datatype.
emptyCellReference (Empty Cell Reference)	Ignore errors when formulas refer to empty cells. The possible values for this attribute are defined by the XML Schema boolean datatype.
evalError (Evaluation Error)	Ignore errors when cells contain formulas that result in an error.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
formula (Formula)	Ignore errors when a formula in a region of your worksheet differs from other formulas in the same region. The possible values for this attribute are defined by the XML Schema boolean datatype.
formulaRange (Formula Range)	Ignore errors when formulas omit certain cells in a region. The possible values for this attribute are defined by the XML Schema boolean datatype.
listDataValidation (List Data Validation)	Ignore errors when a cell's value in a Table does not comply with the Data Validation rules specified. The possible values for this attribute are defined by the XML Schema boolean datatype.
numberStoredAsText (Number Stored As Text)	Ignore errors when numbers are formatted as text or are preceded by an apostrophe. The possible values for this attribute are defined by the XML Schema boolean datatype.
sqref (Sequence of References)	Reference to a range of cells that have this ignored error. The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).
twoDigitTextYear (Two Digit Text Year)	Ignore errors when formulas contain text formatted cells with years represented as 2 digits. The possible values for this attribute are defined by the XML Schema boolean datatype.
unlockedFormula (Unlocked Formula)	Ignore errors when unlocked cells contain formulas. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IgnoredError">
    <attribute name="sqref" type="ST_Sqref" use="required"/>
    <attribute name="evalError" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="twoDigitTextYear" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="numberStoredAsText" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="formula" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="formulaRange" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="unlockedFormula" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="emptyCellReference" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="listDataValidation" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="calculatedColumn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.48 ignoredErrors (Ignored Errors)

A collection of ignored errors, by cell range.

Parent Elements

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
ignoredError (Ignored Error)	§3.3.1.47

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IgnoredErrors">
   <sequence>
      <element name="ignoredError" type="CT_IgnoredError" minOccurs="1" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.3.1.49 inputCells (Input Cells)

This collection describes each input cell for the scenario.

Parent Elements
scenario (§3.3.1.73)

Attributes	Description
deleted (Deleted)	Input cell was deleted. This input cell shall be present in the file format, but shall not be presented to the user as part of the scenario inputs, nor run as part of the scenario. The possible values for this attribute are defined by the XML Schema boolean datatype.
numFmtId (Number Format Id)	This number format Id is used only when displaying the scenario manager input UI, and is used to properly format for display the cached input values (see val attribute) for the scenario. The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).
r (Reference)	Cell reference indicating the input cell address. The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
undone (Undone)	Cell's deletion was undone. When true the r (reference) value shall not adjust in response to the cell moving due to row / column insert or delete,or cell move. The possible values for this attribute are defined by the XML Schema boolean datatype.
val (Value)	Value that should be used for the cell when this scenario is run.

Attributes	Description
	Note: val does not need a corresponding data type, the value is put into the cell when the scenario is run. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_InputCells">
   <attribute name="r" type="ST_CellRef" use="required"/>
   <attribute name="deleted" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="undone" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="val" type="ST_Xstring" use="required"/>
   <attribute name="numFmtId" type="ST_NumFmtId" use="optional"/>
</complexType>
```

3.3.1.50 is (Rich Text Inline)

This element allows for strings to be expressed directly in the cell definition instead of implementing the shared string table.

[*Example*:

```
<c r="A1">
  <is>
    <t>String</t>
  </is>
</c>
```

end example]

Parent Elements
c (§3.3.1.3); nc (§3.11.1.3); oc (§3.11.1.5)

Child Elements	Subclause
phoneticPr (Phonetic Properties)	§3.4.3
r (Rich Text Run)	§3.4.4
rPh (Phonetic Run)	§3.4.6
t (Text)	§3.4.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rst">
   <sequence>
      <element name="t" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="r" type="CT_RElt" minOccurs="0" maxOccurs="unbounded"/>
      <element name="rPh" type="CT_PhoneticRun" minOccurs="0" maxOccurs="unbounded"/>
      <element name="phoneticPr" minOccurs="0" maxOccurs="1" type="CT_PhoneticPr"/>
   </sequence>
</complexType>
```

3.3.1.51 legacyDrawing (Legacy Drawing Reference)

This element is present when the sheet contains drawing shapes defined by VML. In this case, the element contains an explicit relationship whose ID points to the part containing the VML definitions.

[*Example*:

```
<drawing r:id="rId1"/>
```

end example]

Parent Elements
chartsheet (§3.3.1.11); dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	This value references a relationship Id for the sheet. The relationship shall point to the part containing the VML definition. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LegacyDrawing">
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.3.1.52 legacyDrawingHF (Legacy Drawing Reference in Header Footer)

This element specifies the explicit relationship to the part containing the VML defining pictures rendered in the header / footer of the sheet.

Parent Elements
chartsheet (§3.3.1.11); dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description

Attributes	Description
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	This value references a relationship Id for the sheet. The relationship shall point to the part containing the VML definition. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LegacyDrawing">
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.3.1.53 mergeCell (Merged Cell)

A single merged cell

Parent Elements
mergeCells (§3.3.1.54)

Attributes	Description
ref (Reference)	Range defined by merge cell. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MergeCell">
   <attribute name="ref" type="ST_Ref" use="required"/>
</complexType>
```

3.3.1.54 mergeCells (Merge Cells)

This collection expresses all the merged cells in the sheet.

[*Example*:

This example shows that three ranges are merged. The formatting and content for the merged range is always stored in the top left cell.

```
<mergeCells>
  <mergeCell ref="C2:F2"/>
  <mergeCell ref="B19:C20"/>
  <mergeCell ref="E19:G19"/>
</mergeCells>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
mergeCell (Merged Cell)	§3.3.1.53

Attributes	Description
count (Count)	A count of merged cell collections. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MergeCells">
   <sequence>
      <element name="mergeCell" type="CT_MergeCell" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.3.1.55 oddFooter (Odd Page Footer)

Odd page footer value. Corresponds to odd printed pages. Odd page(s) in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside an odd page's scope.

See evenHeader (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

3.3.1.56 oddHeader (Odd Header)

Odd page header value. Corresponds to odd printed pages. Odd page(s) in the sheet may not be printed, for example, if the print area is specified to be a range such that it falls outside an odd page's scope.

See evenHeader (§3.3.1.36) description for full discussion of value content.

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
headerFooter (§3.3.1.43)

3.3.1.57 oleObject (Embedded Object)

Information for an individual embedded object.

Parent Elements
oleObjects (§3.3.1.58)

Attributes	Description
autoLoad (Auto Load)	Specifies whether the host application for the embedded object shall be called to load the object data automatically when the parent workbook is opened. The possible values for this attribute are defined by the XML Schema boolean datatype.
dvAspect (Data or View Aspect)	Specifies the desired Data or View Aspect of the object when drawing or getting data The possible values for this attribute are defined by the ST_DvAspect simple type (§3.18.25).
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	Relationship Id of the relationship pointing to the object persistence part. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
link (Embedded Object's Link Moniker)	The embedded object's link moniker. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
oleUpdate (Linked Embedded Object Update)	Indicates whether the linked object updates the cached data automatically or only when the container requests an update, only present if the embedded object is linked. The possible values for this attribute are defined by the ST_OleUpdate simple type (§3.18.51).
progId (Embedded Object ProgId)	ProgId of the embedded object. The possible values for this attribute are defined by the XML Schema string datatype.
shapeId (Shape Id)	Id of the shape this object is associated with. Corresponds with the shape @id in the drawingML part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleObject">
    <attribute name="progId" type="xsd:string" use="optional"/>
    <attribute name="dvAspect" type="ST_DvAspect" use="optional" default="DVASPECT_CONTENT"/>
    <attribute name="link" type="ST_Xstring" use="optional"/>
    <attribute name="oleUpdate" type="ST_OleUpdate" use="optional"/>
    <attribute name="autoLoad" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="shapeId" type="xsd:unsignedInt" use="required"/>
    <attribute ref="r:id" use="optional"/>
</complexType>
```

3.3.1.58 oleObjects (Embedded Objects)

Embedded objects collection in this worksheet.

[*Example*:

This example shows two embedded objects.

```
<oleObjects>
  <oleObject progId="Word.Document.12" shapeId="1025" r:id="rId4"/>
  <oleObject progId="PowerPoint.Show.12" shapeId="1026" r:id="rId5"/>
</oleObjects>
```

end example]

Parent Elements
dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Child Elements	Subclause
oleObject (Embedded Object)	§3.3.1.57

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleObjects">
    <sequence>
        <element name="oleObject" type="CT_OleObject" minOccurs="1" maxOccurs="unbounded"/>
    </sequence>
</complexType>
```

3.3.1.59 outlinePr (Outline Properties)

Outline properties of the worksheet.

[*Example*: This example indicates that when an outline is applied to data, formatting shall be applied to the outline result.

```
<sheetPr>
  <outlinePr applyStyles="1"/>
</sheetPr>
```

end example]

Parent Elements
sheetPr (§3.3.1.79)

Attributes	Description
applyStyles (Apply Styles in Outline)	Flag indicating whether to apply styles in an outline, when outline is applied. Outline styles are described in Styles (§3.8). The possible values for this attribute are defined by the XML Schema boolean datatype.
showOutlineSymbols (Show Outline Symbols)	Flag indicating whether the sheet has outline symbols visible. This flag shall always be overridden by the showOutlineSymbols attribute on sheetView when there is a conflict. The possible values for this attribute are defined by the XML Schema boolean datatype.
summaryBelow (Summary Below)	Flag indicating whether summary rows appear below detail in an outline, when applying an outline. When `true` a summary row is inserted below the detailed data being summarized and a new outline level is established on that row. When `false` a summary row is inserted above the detailed data being summarized and a new outline level is established on that row. Note that toggling this flag on existing outlines requires an update to cell table, specifically, putting the summary functions in the proper rows, and flagging these rows as new outline levels, and possibly resetting their collapsed state. The possible values for this attribute are defined by the XML Schema boolean datatype.
summaryRight (Summary Right)	Flag indicating whether summary columns appear to the right of detail in an outline, when applying an outline. When `true` a summary column is inserted to the right of the detailed data being summarized and a new outline level is established on that column. When `false` a summary column is inserted to the left of the detailed data being summarized and a new outline level is established on that column. Note that toggling this flag on existing outlines requires an update to cell table, specifically, putting the summary functions in the proper columns, and flagging these columns as new outline levels, and possibly resetting their collapsed state.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OutlinePr">
   <attribute name="applyStyles" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="summaryBelow" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="summaryRight" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showOutlineSymbols" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.3.1.60 pageMargins (Page Margins)

Page margins for a sheet or a custom sheet view.

[*Example*:

```
<pageMargins left="0.7" right="0.7" top="0.75" bottom="0.75" header="0.3"
  footer="0.3"/>
```

end example]

Parent Elements
chartsheet (§3.3.1.11); customSheetView (§3.3.1.23); customSheetView (§3.3.1.22); dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
bottom (Bottom Page Margin)	Bottom Page Margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
footer (Footer Page Margin)	Footer Page Margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
header (Header Page Margin)	Header Page Margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
left (Left Page Margin)	Left Page Margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
right (Right Page Margin)	Right page margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
top (Top Page	Top Page Margin in inches.

Attributes	Description
Margin)	The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageMargins">
   <attribute name="left" type="xsd:double" use="required"/>
   <attribute name="right" type="xsd:double" use="required"/>
   <attribute name="top" type="xsd:double" use="required"/>
   <attribute name="bottom" type="xsd:double" use="required"/>
   <attribute name="header" type="xsd:double" use="required"/>
   <attribute name="footer" type="xsd:double" use="required"/>
</complexType>
```

3.3.1.61 pageSetup (Page Setup Settings)

Page setup settings for the worksheet.

Parent Elements
customSheetView (§3.3.1.23); dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
blackAndWhite (Black And White)	Print black and white. The possible values for this attribute are defined by the XML Schema boolean datatype.
cellComments (Print Cell Comments)	This attribute specifies how to print cell comments. The possible values for this attribute are defined by the ST_CellComments simple type (§3.18.6).
copies (Number Of Copies)	Number of copies to print. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
draft (Draft)	Print without graphics. The possible values for this attribute are defined by the XML Schema boolean datatype.
errors (Print Error Handling)	Specifies how to print cell values for cells with errors. The possible values for this attribute are defined by the ST_PrintError simple type (§3.18.62).
firstPageNumber (First Page Number)	Page number for first printed page. If no value is specified, then 'automatic' is assumed. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
fitToHeight (Fit To Height)	Number of vertical pages to fit on. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
fitToWidth (Fit To Width)	Number of horizontal pages to fit on. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
horizontalDpi (Horizontal DPI)	Horizontal print resolution of the device. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (Id) Namespace: .../officeDocument/2006/relationships	Relationship Id of the devMode printer settings part. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
orientation (Orientation)	Orientation of the page. The possible values for this attribute are defined by the ST_Orientation simple type (§3.18.52).
pageOrder (Page Order)	Order of printed pages. The possible values for this attribute are defined by the ST_PageOrder simple type (§3.18.53).
paperSize (Paper Size)	Paper size 1 = Letter paper (8.5 in. by 11 in.) 2 = Letter small paper (8.5 in. by 11 in.) 3 = Tabloid paper (11 in. by 17 in.) 4 = Ledger paper (17 in. by 11 in.) 5 = Legal paper (8.5 in. by 14 in.) 6 = Statement paper (5.5 in. by 8.5 in.) 7 = Executive paper (7.25 in. by 10.5 in.) 8 = A3 paper (297 mm by 420 mm) 9 = A4 paper (210 mm by 297 mm) 10 = A4 small paper (210 mm by 297 mm) 11 = A5 paper (148 mm by 210 mm) 12 = B4 paper (250 mm by 353 mm) 13 = B5 paper (176 mm by 250 mm) 14 = Folio paper (8.5 in. by 13 in.) 15 = Quarto paper (215 mm by 275 mm) 16 = Standard paper (10 in. by 14 in.) 17 = Standard paper (11 in. by 17 in.)

Attributes	Description
	18 = Note paper (8.5 in. by 11 in.) 19 = #9 envelope (3.875 in. by 8.875 in.) 20 = #10 envelope (4.125 in. by 9.5 in.) 21 = #11 envelope (4.5 in. by 10.375 in.) 22 = #12 envelope (4.75 in. by 11 in.) 23 = #14 envelope (5 in. by 11.5 in.) 24 = C paper (17 in. by 22 in.) 25 = D paper (22 in. by 34 in.) 26 = E paper (34 in. by 44 in.) 27 = DL envelope (110 mm by 220 mm) 28 = C5 envelope (162 mm by 229 mm) 29 = C3 envelope (324 mm by 458 mm) 30 = C4 envelope (229 mm by 324 mm) 31 = C6 envelope (114 mm by 162 mm) 32 = C65 envelope (114 mm by 229 mm) 33 = B4 envelope (250 mm by 353 mm) 34 = B5 envelope (176 mm by 250 mm) 35 = B6 envelope (176 mm by 125 mm) 36 = Italy envelope (110 mm by 230 mm) 37 = Monarch envelope (3.875 in. by 7.5 in.). 38 = 6 3/4 envelope (3.625 in. by 6.5 in.) 39 = US standard fanfold (14.875 in. by 11 in.) 40 = German standard fanfold (8.5 in. by 12 in.) 41 = German legal fanfold (8.5 in. by 13 in.) 42 = ISO B4 (250 mm by 353 mm) 43 = Japanese double postcard (200 mm by 148 mm) 44 = Standard paper (9 in. by 11 in.) 45 = Standard paper (10 in. by 11 in.) 46 = Standard paper (15 in. by 11 in.) 47 = Invite envelope (220 mm by 220 mm) 50 = Letter extra paper (9.275 in. by 12 in.) 51 = Legal extra paper (9.275 in. by 15 in.) 52 = Tabloid extra paper (11.69 in. by 18 in.) 53 = A4 extra paper (236 mm by 322 mm) 54 = Letter transverse paper (8.275 in. by 11 in.) 55 = A4 transverse paper (210 mm by 297 mm) 56 = Letter extra transverse paper (9.275 in. by 12 in.) 57 = SuperA/SuperA/A4 paper (227 mm by 356 mm) 58 = SuperB/SuperB/A3 paper (305 mm by 487 mm) 59 = Letter plus paper (8.5 in. by 12.69 in.) 60 = A4 plus paper (210 mm by 330 mm) 61 = A5 transverse paper (148 mm by 210 mm) 62 = JIS B5 transverse paper (182 mm by 257 mm) 63 = A3 extra paper (322 mm by 445 mm) 64 = A5 extra paper (174 mm by 235 mm) 65 = ISO B5 extra paper (201 mm by 276 mm)

Attributes	Description
	66 = A2 paper (420 mm by 594 mm) 67 = A3 transverse paper (297 mm by 420 mm) 68 = A3 extra transverse paper (322 mm by 445 mm) The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
scale (Print Scale)	Print scaling. Valid values range from 10 to 400. For example: 10 - 10% 20 - 20% … 100 - 100% … 400 - 400% This setting is overridden when fitToWidth and/or fitToHeight are in use. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
useFirstPageNumber (Use First Page Number)	Use firstPageNumber value for first page number, and do not auto number the pages. The possible values for this attribute are defined by the XML Schema boolean datatype.
usePrinterDefaults (Use Printer Defaults)	Use the printer's defaults settings for page setup values and don't use the default values specified in the schema. For example, if dpi is not present or specified in the XML, the application shall not assume 600dpi as specified in the schema as a default and instead shall let the printer specify the default dpi. The possible values for this attribute are defined by the XML Schema boolean datatype.
verticalDpi (Vertical DPI)	Vertical print resolution of the device. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageSetup">
    <attribute name="paperSize" type="xsd:unsignedInt" use="optional" default="1"/>
    <attribute name="scale" type="xsd:unsignedInt" use="optional" default="100"/>
    <attribute name="firstPageNumber" type="xsd:unsignedInt" use="optional" default="1"/>
    <attribute name="fitToWidth" type="xsd:unsignedInt" use="optional" default="1"/>
    <attribute name="fitToHeight" type="xsd:unsignedInt" use="optional" default="1"/>
    <attribute name="pageOrder" type="ST_PageOrder" use="optional" default="downThenOver"/>
    <attribute name="orientation" type="ST_Orientation" use="optional" default="default"/>
    <attribute name="usePrinterDefaults" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="blackAndWhite" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="draft" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="cellComments" type="ST_CellComments" use="optional" default="none"/>
    <attribute name="useFirstPageNumber" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="errors" type="ST_PrintError" use="optional" default="displayed"/>
    <attribute name="horizontalDpi" type="xsd:unsignedInt" use="optional" default="600"/>
    <attribute name="verticalDpi" type="xsd:unsignedInt" use="optional" default="600"/>
    <attribute name="copies" type="xsd:unsignedInt" use="optional" default="1"/>
    <attribute ref="r:id" use="optional"/>
</complexType>
```

3.3.1.62 pageSetup (Chart Sheet Page Setup)

This element provides page setup properties for chart sheets.

Parent Elements
chartsheet (§3.3.1.11); customSheetView (§3.3.1.22)

Attributes	Description
blackAndWhite (Black And White)	Print black and white. The possible values for this attribute are defined by the XML Schema boolean datatype.
copies (Number Of Copies)	Number of copies to print. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
draft (Draft)	Print draft quality. The possible values for this attribute are defined by the XML Schema boolean datatype.
firstPageNumber (First Page Number)	Page number for first printed page. If no value is specified, then 'automatic' is assumed. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
horizontalDpi (Horizontal DPI)	Horizontal print resolution of the device. The possible values for this attribute are defined by the XML Schema unsignedInt

Attributes	Description
	datatype.
id (Id) Namespace: .../officeDocument/2006/relationships	Relationship Id of the devMode printer settings part. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
orientation (Orientation)	Orientation of the page. The possible values for this attribute are defined by the ST_Orientation simple type (§3.18.52).
paperSize (Paper Size)	1 = Letter paper (8.5 in. by 11 in.) 2 = Letter small paper (8.5 in. by 11 in.) 3 = Tabloid paper (11 in. by 17 in.) 4 = Ledger paper (17 in. by 11 in.) 5 = Legal paper (8.5 in. by 14 in.) 6 = Statement paper (5.5 in. by 8.5 in.) 7 = Executive paper (7.25 in. by 10.5 in.) 8 = A3 paper (297 mm by 420 mm) 9 = A4 paper (210 mm by 297 mm) 10 = A4 small paper (210 mm by 297 mm) 11 = A5 paper (148 mm by 210 mm) 12 = B4 paper (250 mm by 353 mm) 13 = B5 paper (176 mm by 250 mm) 14 = Folio paper (8.5 in. by 13 in.) 15 = Quarto paper (215 mm by 275 mm) 16 = Standard paper (10 in. by 14 in.) 17 = Standard paper (11 in. by 17 in.) 18 = Note paper (8.5 in. by 11 in.) 19 = #9 envelope (3.875 in. by 8.875 in.) 20 = #10 envelope (4.125 in. by 9.5 in.) 21 = #11 envelope (4.5 in. by 10.375 in.) 22 = #12 envelope (4.75 in. by 11 in.) 23 = #14 envelope (5 in. by 11.5 in.) 24 = C paper (17 in. by 22 in.) 25 = D paper (22 in. by 34 in.) 26 = E paper (34 in. by 44 in.) 27 = DL envelope (110 mm by 220 mm) 28 = C5 envelope (162 mm by 229 mm) 29 = C3 envelope (324 mm by 458 mm) 30 = C4 envelope (229 mm by 324 mm) 31 = C6 envelope (114 mm by 162 mm) 32 = C65 envelope (114 mm by 229 mm) 33 = B4 envelope (250 mm by 353 mm) 34 = B5 envelope (176 mm by 250 mm)

Attributes	Description
	35 = B6 envelope (176 mm by 125 mm) 36 = Italy envelope (110 mm by 230 mm) 37 = Monarch envelope (3.875 in. by 7.5 in.). 38 = 6 3/4 envelope (3.625 in. by 6.5 in.) 39 = US standard fanfold (14.875 in. by 11 in.) 40 = German standard fanfold (8.5 in. by 12 in.) 41 = German legal fanfold (8.5 in. by 13 in.) 42 = ISO B4 (250 mm by 353 mm) 43 = Japanese double postcard (200 mm by 148 mm) 44 = Standard paper (9 in. by 11 in.) 45 = Standard paper (10 in. by 11 in.) 46 = Standard paper (15 in. by 11 in.) 47 = Invite envelope (220 mm by 220 mm) 50 = Letter extra paper (9.275 in. by 12 in.) 51 = Legal extra paper (9.275 in. by 15 in.) 52 = Tabloid extra paper (11.69 in. by 18 in.) 53 = A4 extra paper (236 mm by 322 mm) 54 = Letter transverse paper (8.275 in. by 11 in.) 55 = A4 transverse paper (210 mm by 297 mm) 56 = Letter extra transverse paper (9.275 in. by 12 in.) 57 = SuperA/SuperA/A4 paper (227 mm by 356 mm) 58 = SuperB/SuperB/A3 paper (305 mm by 487 mm) 59 = Letter plus paper (8.5 in. by 12.69 in.) 60 = A4 plus paper (210 mm by 330 mm) 61 = A5 transverse paper (148 mm by 210 mm) 62 = JIS B5 transverse paper (182 mm by 257 mm) 63 = A3 extra paper (322 mm by 445 mm) 64 = A5 extra paper (174 mm by 235 mm) 65 = ISO B5 extra paper (201 mm by 276 mm) 66 = A2 paper (420 mm by 594 mm) 67 = A3 transverse paper (297 mm by 420 mm) 68 = A3 extra transverse paper (322 mm by 445 mm) The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
useFirstPageNumber (Use First Page Number)	Use firstPageNumber value for first page number, and do not auto number the pages. The possible values for this attribute are defined by the XML Schema boolean datatype.
usePrinterDefaults (Use Printer Defaults)	Use the printer's defaults settings for page setup values and don't use the default values specified in the schema. For example, if dpi is not present or specified in the XML, the application shall not assume 600dpi as specified in the schema as a default and instead shall let the printer specify the default dpi. The possible values for this attribute are defined by the XML Schema boolean datatype.
verticalDpi	Vertical print resolution of the device.

Attributes	Description
(Vertical DPI)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CsPageSetup">
   <attribute name="paperSize" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute name="firstPageNumber" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute name="orientation" type="ST_Orientation" use="optional" default="default"/>
   <attribute name="usePrinterDefaults" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="blackAndWhite" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="draft" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="useFirstPageNumber" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="horizontalDpi" type="xsd:unsignedInt" use="optional" default="600"/>
   <attribute name="verticalDpi" type="xsd:unsignedInt" use="optional" default="600"/>
   <attribute name="copies" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute ref="r:id" use="optional"/>
</complexType>
```

3.3.1.63 pageSetUpPr (Page Setup Properties)

Page setup properties of the worksheet

Parent Elements
sheetPr (§3.3.1.79)

Attributes	Description
autoPageBreaks (Show Auto Page Breaks)	Flag indicating whether the sheet displays Automatic Page Breaks. The possible values for this attribute are defined by the XML Schema boolean datatype.
fitToPage (Fit To Page)	Flag indicating whether the Fit to Page print option is enabled. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageSetUpPr">
   <attribute name="autoPageBreaks" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="fitToPage" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.64 pane (View Pane)

Worksheet view pane

Parent Elements

Parent Elements
customSheetView (§3.3.1.23); sheetView (§3.3.1.83)

Attributes	Description
activePane (Active Pane)	The pane that is active. The possible values for this attribute are defined by the ST_Pane simple type (§3.18.54).
state (Split State)	Indicates whether the pane has horizontal / vertical splits, and whether those splits are frozen. The possible values for this attribute are defined by the ST_PaneState simple type (§3.18.55).
topLeftCell (Top Left Visible Cell)	Location of the top left visible cell in the bottom right pane (when in Left-To-Right mode). The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
xSplit (Horizontal Split Position)	Horizontal position of the split, in 1/20th of a point; 0 (zero) if none. If the pane is frozen, this value indicates the number of columns visible in the top pane. The possible values for this attribute are defined by the XML Schema double datatype.
ySplit (Vertical Split Position)	Vertical position of the split, in 1/20th of a point; 0 (zero) if none. If the pane is frozen, this value indicates the number of rows visible in the left pane. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Pane">
   <attribute name="xSplit" type="xsd:double" use="optional" default="0"/>
   <attribute name="ySplit" type="xsd:double" use="optional" default="0"/>
   <attribute name="topLeftCell" type="ST_CellRef" use="optional"/>
   <attribute name="activePane" type="ST_Pane" use="optional" default="topLeft"/>
   <attribute name="state" type="ST_PaneState" use="optional" default="split"/>
</complexType>
```

3.3.1.65 picture (Background Image)

Background sheet image.

[*Example*:

```
<picture r:id="rId1"/>
```

end example]

Parent Elements
chartsheet (§3.3.1.11); worksheet (§3.3.1.96)

Attributes	Description
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	Relationship Id pointing to the image part. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetBackgroundPicture">
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.3.1.66 pivotArea (Pivot Area)

Rule describing a PivotTable selection.

Parent Elements
autoSortScope (§3.10.1.1); calculatedItem (§3.10.1.8); chartFormat (§3.10.1.12); format (§3.10.1.35); pivotAreas (§3.10.1.66); pivotSelection (§3.3.1.67)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
references (References)	§3.10.2.2

Attributes	Description
axis (Axis)	The region of the PivotTable to which this rule applies. The possible values for this attribute are defined by the ST_Axis simple type (§3.18.1).
cacheIndex (Cache Index)	Flag indicating whether any indexes refer to fields or items in the Pivot cache and not the view. The possible values for this attribute are defined by the XML Schema boolean datatype.
collapsedLevelsAreSubtotals (Collapsed Levels Are Subtotals)	Flag indicating if collapsed levels/dimensions are considered subtotals. The possible values for this attribute are defined by the XML Schema boolean datatype.
dataOnly (Data Only)	Flag indicating whether only the data values (in the data area of the view) for an item selection are selected and does not include the item labels. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
field (Field Index)	Index of the field that this selection rule refers to. The possible values for this attribute are defined by the XML Schema int datatype.
fieldPosition (Field Position)	Position of the field within the axis to which this rule applies. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
grandCol (Include Column Grand Total)	Flag indicating whether the column grand total is included. The possible values for this attribute are defined by the XML Schema boolean datatype.
grandRow (Include Row Grand Total)	Flag indicating whether the row grand total is included. The possible values for this attribute are defined by the XML Schema boolean datatype.
labelOnly (Labels Only)	Flag indicating whether only the item labels for an item selection are selected and does not include the data values (in the data area of the view). The possible values for this attribute are defined by the XML Schema boolean datatype.
offset (Offset Reference)	A Reference that specifies a subset of the selection area. Points are relative to the top left of the selection area. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
outline (Outline)	Flag indicating whether the rule refers to an area that is in outline mode. The possible values for this attribute are defined by the XML Schema boolean datatype.
type (Rule Type)	Indicates the type of selection rule. The possible values for this attribute are defined by the ST_PivotAreaType simple type (§3.18.60).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotArea">
   <sequence>
      <element name="references" minOccurs="0" type="CT_PivotAreaReferences"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="field" use="optional" type="xsd:int"/>
   <attribute name="type" type="ST_PivotAreaType" default="normal"/>
   <attribute name="dataOnly" type="xsd:boolean" default="true"/>
   <attribute name="labelOnly" type="xsd:boolean" default="false"/>
   <attribute name="grandRow" type="xsd:boolean" default="false"/>
   <attribute name="grandCol" type="xsd:boolean" default="false"/>
   <attribute name="cacheIndex" type="xsd:boolean" default="false"/>
   <attribute name="outline" type="xsd:boolean" default="true"/>
   <attribute name="offset" type="ST_Ref"/>
   <attribute name="collapsedLevelsAreSubtotals" type="xsd:boolean" default="false"/>
   <attribute name="axis" type="ST_Axis" use="optional"/>
   <attribute name="fieldPosition" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.3.1.67 pivotSelection (PivotTable Selection)

A collection of PivotTable structure selections. A PivotTable structure selection is a way of specifying what cells in the PivotTable are selected. Instead of specifying cell addresses in a sqref, a particular area or structure within the PivotTable is specified. In this way there is semantic meaning regarding what is selected, rather than simply a list of cell or ranges contained in the selection. Typically fields on the row or column axis are selected.

[*Example*: For example, the innermost field (Product SubCategory) is selected in this PivotTable:

	A	B	C
1			
2		State	(All)
3		City	(All)
4			
5			Column Labels
6			⊟2001
7			⊟3
8			July
9		Row Labels	Sum of Sales Amount
10		⊟Bikes	209652.9046
11		⊟Mountain Bikes	64424.81
12		Mountain-100 Black, 38	3374.99
13		Mountain-100 Black, 42	3374.99
14		Mountain-100 Black, 44	13499.96
15		Mountain-100 Black, 48	3374.99
16		Mountain-100 Silver, 38	6799.98
17		Mountain-100 Silver, 42	6799.98
18		Mountain-100 Silver, 44	16999.95
19		Mountain-100 Silver, 48	10199.97
20		⊟Road Bikes	145228.0946
21		Road-150 Red, 44	25047.89
22		Road-150 Red, 48	42939.24
23		Road-150 Red, 52	21469.62
24		Road-150 Red, 56	25047.89
25		Road-150 Red, 62	28626.16
26		Road-650 Black, 44	699.0982
27		Road-650 Black, 52	
28		Road-650 Black, 62	699.0982
29		Road-650 Red, 44	699.0982
30		Road-650 Red, 48	
31		Road-650 Red, 52	
32		Road-650 Red, 58	
33		Road-650 Red, 60	
34		Grand Total	209652.9046

The corresponding pivotSelection XML should look like this:

```
<pivotSelection pane="bottomRight" showHeader="1" axis="axisRow" dimension="2"
  activeRow="11" activeCol="1" previousRow="11" previousCol="1" click="1"
  r:id="rId1">
```

```
    <pivotArea dataOnly="0" labelOnly="1" fieldPosition="0">
      <references count="1">
        <reference field="9" count="0"/>
      </references>
    </pivotArea>
  </pivotSelection>
```

axis indicates that this selection is on the row axis, dimension indicates the field level within the row axis that is selected (zero-based index), activeCol and activeRow respectively indicate where in the grid the selection is located, and reference field indicates to which particular field the selection corresponds.

end example]

Parent Elements
sheetView (§3.3.1.83)

Child Elements	Subclause
pivotArea (Pivot Area)	§3.3.1.66

Attributes	Description
activeCol (Active Column)	The column (zero-based) of active cell for structure selection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
activeRow (Active Row)	The row (zero-based) of active cell for structure selection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
axis (Axis)	Axis of the PivotTable on which this selection lies. The possible values for this attribute are defined by the ST_Axis simple type (§3.18.1).
click (Click Count)	Number of clicks for this structure selection. For some selection combinations, subsequent clicks on the same target area cycles the actual selection through some variances. Therefore number of clicks on the selection must be recorded, if it is desirable to restore this state of the selection cycle on load. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
count (Selection Count)	Number of selections for the structure selection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
data (Data Selection)	Flag indicating whether the structure selection is for data only. The possible values for this attribute are defined by the XML Schema boolean datatype.
dimension (Dimension)	Indicates the field level within the axis that is selected (zero-based index). The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
extendable (Extendable)	Flag indicating whether the structure selection can have additional selections added to it. The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	Relationship Id pointing to the particular PivotTable Part corresponding to this selection. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
label (Label)	Flag indicating whether the structure selection is for labels only (e.g., a grand total row is selected). The possible values for this attribute are defined by the XML Schema boolean datatype.
max (Maximum)	The maximum line the structure selection contains. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
min (Minimum)	The minimum line the structure selection contains. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
pane (Pane)	The pane to which this PivotTable structure selection belongs. The possible values for this attribute are defined by the ST_Pane simple type (§3.18.54).
previousCol (Previous Column Selection)	1-based index to the column immediately left of the structure selection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
previousRow (Previous Row)	1-based index to the row immediately above the structure selection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
showHeader (Show Header)	Flag indicating whether selection toggle from data only to header only to both is enabled. `False` means disabled. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
start (Start)	The line the structure selection begins (zero-based). This is the line clicked to initiate the structure selection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotSelection">
   <sequence>
      <element name="pivotArea" type="CT_PivotArea"/>
   </sequence>
   <attribute name="pane" type="ST_Pane" use="optional" default="topLeft"/>
   <attribute name="showHeader" type="xsd:boolean" default="false"/>
   <attribute name="label" type="xsd:boolean" default="false"/>
   <attribute name="data" type="xsd:boolean" default="false"/>
   <attribute name="extendable" type="xsd:boolean" default="false"/>
   <attribute name="count" type="xsd:unsignedInt" default="0"/>
   <attribute name="axis" type="ST_Axis" use="optional"/>
   <attribute name="dimension" type="xsd:unsignedInt" default="0"/>
   <attribute name="start" type="xsd:unsignedInt" default="0"/>
   <attribute name="min" type="xsd:unsignedInt" default="0"/>
   <attribute name="max" type="xsd:unsignedInt" default="0"/>
   <attribute name="activeRow" type="xsd:unsignedInt" default="0"/>
   <attribute name="activeCol" type="xsd:unsignedInt" default="0"/>
   <attribute name="previousRow" type="xsd:unsignedInt" default="0"/>
   <attribute name="previousCol" type="xsd:unsignedInt" default="0"/>
   <attribute name="click" type="xsd:unsignedInt" default="0"/>
   <attribute ref="r:id" use="optional"/>
</complexType>
```

3.3.1.68 printOptions (Print Options)

Print options for the sheet. Printer-specific settings are stored separately in the Printer Settings part as defined in Part 1.

Parent Elements
customSheetView (§3.3.1.23); dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
gridLines (Print Grid Lines)	Used in conjunction with gridLinesSet. If both gridLines and gridlinesSet are `true`, then grid lines shall print. Otherwise, they shall not (i.e., one or both have `false` values). The possible values for this attribute are defined by the XML Schema boolean datatype.
gridLinesSet (Grid Lines Set)	Used in conjunction with gridLines. If both gridLines and gridLinesSet are `true`, then grid lines shall print. Otherwise, they shall not (i.e., one or both have `false` values).

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
headings (Print Headings)	Print row and column headings. The possible values for this attribute are defined by the XML Schema boolean datatype.
horizontalCentered (Horizontal Centered)	Center on page horizontally when printing. The possible values for this attribute are defined by the XML Schema boolean datatype.
verticalCentered (Vertical Centered)	Center on page vertically when printing. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PrintOptions">
    <attribute name="horizontalCentered" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="verticalCentered" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="headings" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="gridLines" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="gridLinesSet" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.3.1.69 protectedRange (Protected Range)

A specified range to be protected. Ranges listed here are protected only when the sheet protection is ON and the cell is flagged as being locked. If no password is specified here, then read/write permissions are automatically given to all users, regardless of additional security descriptor information. In other words, the security descriptor information (specific types of access) at the user level is only applied if a password for this range is specified.

When a password is specified, then users not listed specifically as having access should be prompted with a password. If that user supplies the correct password, then they may edit the range or cell in question. This protection is optional and may be ignored by applications who choose not to support this functionality.

Parent Elements
protectedRanges (§3.3.1.70)

Attributes	Description
name (Name)	Range title. This is used as a descriptor, not as a named range definition. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
password (Password)	Specifies the hash of the password required for editing this range. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the logic defined in the revisionsPassword

Attributes	Description
	attribute of §3.2.29. The resulting value is hashed using the algorithm defined below. [*Note*: An example algorithm to hash the user input into the value stored is as follows: `// Function Input:` `//  szPassword: NULL terminated C-Style string` `//  cchPassword: The number of characters in szPassword (not including the NULL terminator)` `WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {` `  WORD wPasswordHash;` `  const CHAR *pch;` `  wPasswordHash = 0;` `  if (cchPassword > 0)` `  {` `  pch = &szPassword[cchPassword];` `  while (pch-- != szPassword)` `  {` ` wPasswordHash = ((wPasswordHash >> 14) & 0x01)	((wPasswordHash << 1) & 0x7fff);` ` wPasswordHash ^= *pch;` ` }` ` wPasswordHash ^= (0x8000	('N' << 8)	'K');` ` }`  ` return(wPasswordHash);` `}` *end note*] The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).
securityDescriptor (Security Descriptor)	Optional setting to specify the relative security descriptor. The security descriptor defines user accounts who may edit this range without providing a password to access the range. Removing this attribute shall remove all permissions granted or denied to users for this range. The possible values for this attribute are defined by the XML Schema string datatype.
sqref (Sequence of References)	The range to be protected. The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ProtectedRange">
   <attribute name="password" type="ST_UnsignedShortHex" use="optional"/>
   <attribute name="sqref" type="ST_Sqref" use="required"/>
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="securityDescriptor" type="xsd:string" use="optional"/>
</complexType>
```

3.3.1.70 protectedRanges (Protected Ranges)

This collection specifies all protected ranges on this worksheet.

[*Example*:

This example demonstrates that A1:C5 have been protected, with no password specified.

```
<protectedRanges>
  <protectedRange sqref="A1:C5" name="Range1"/>
</protectedRanges>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
protectedRange (Protected Range)	§3.3.1.69

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ProtectedRanges">
   <sequence>
      <element name="protectedRange" type="CT_ProtectedRange" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.3.1.71 row (Row)

The element expresses information about an entire row of a worksheet, and contains all cell definitions for a particular row in the worksheet.

[*Example*:

This row expresses information about row 2 in the worksheet, and contains 3 cell definitions.

```
<row r="2" spans="2:12">
  <c r="C2" s="1">
    <f>PMT(B3/12,B4,-B5)</f>
    <v>672.68336574300008</v>
  </c>
  <c r="D2">
    <v>180</v>
  </c>
  <c r="E2">
    <v>360</v>
  </c>
</row>
```

end example]

Parent Elements
sheetData (§3.3.1.77)

Child Elements	Subclause
c (Cell)	§3.3.1.3
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
collapsed (Collapsed)	'1' if the rows 1 level of outlining deeper than the current row are in the collapsed outline state. It means that the rows which are 1 outline level deeper (numerically higher value) than the current row are currently hidden due to a collapsed outline state. It is possible for collapsed to be `false` and yet still have the rows in question hidden. This can be achieved by having a lower outline level collapsed, thus hiding all the child rows. [*Example*: This example shows 3 levels of outlining:

Attributes	Description

		
	In the XML shall be:
	`<sheetData>`
	`<row r="6" outlineLevel="3"/>`
	`<row r="7" outlineLevel="3"/>`
	`<row r="8" outlineLevel="2"/>`
	`<row r="9" outlineLevel="1"/>`
	`</sheetData>`
	
	end example]
	
	[*Example*:
	This example shows the same outline feature, with the middle level collapsed:
	
	 	
	In the XML shall be:
	`<sheetData>`
	`<row r="6" hidden="1" outlineLevel="3"/>`
	`<row r="7" hidden="1" outlineLevel="3"/>`
	`<row r="8" hidden="1" outlineLevel="2"/>`
	`<row r="9" outlineLevel="1" collapsed="1"/>`
	`</sheetData>`

Attributes	Description

	end example]
	
	[*Example*:
	This example shows the same outline feature as above, where both the middle and lowest level are collapsed:
	
	 	
	In the XML shall be:
	
	`<sheetData>`
	`  <row r="6" hidden="1" outlineLevel="3"/>`
	`  <row r="7" hidden="1" outlineLevel="3"/>`
	`  <row r="8" hidden="1" outlineLevel="2"/>`
	`  <row r="9" hidden="1" outlineLevel="1" collapsed="1"/>`
	`  <row r="10" collapsed="1"/>`
	`</sheetData>`
	
	Note that in this case, if the lowest level were expanded, the middle level would remain collapsed due to collapsed being `true` on row 9.
	
	end example]
	
	See description of outlinePr element's summaryBelow and summaryRight attributes for detailed information.
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

customFormat (Custom Format)	'1' if the row style should be applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
customHeight (Custom Height)	'1' if the row height has been manually set. The possible values for this attribute are defined by the XML Schema boolean datatype.
hidden (Hidden)	'1' if the row is hidden, e.g., due to a collapsed outline or by manually selecting and hiding a row. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
ht (Row Height)	Row height measured in point size. There is no margin padding on row height. The possible values for this attribute are defined by the XML Schema double datatype.
outlineLevel (Outline Level)	Outlining level of the row, when outlining is on. See description of outlinePr element's summaryBelow and summaryRight attributes for detailed information. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
ph (Show Phonetic)	'1' if the row should show phonetic. The possible values for this attribute are defined by the XML Schema boolean datatype.
r (Row Index)	Row index. Indicates to which row in the sheet this <row> definition corresponds. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
s (Style Index)	Index to style record for the row (only applied if customFormat attribute is '1') The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

spans (Spans)	Optimization only, and not required. Specifies the range of non-empty columns (in the format X:Y) for the block of rows to which the current row belongs. To achieve the optimization, span attribute values in a single block should be the same.
	
	There are 16 rows per block, beginning with the first row.
	
	Note: this is an optimization, and is purely optional. Different span values within the same row block is allowed. Not writing the span value at all is also allowed.
	
	Blank rows are not required to write out span values.
	
	For example, if cells F8, E9, and D10 have data in them and the rest of the sheet is empty, then for those three rows (8,9, and 10), the spans value should each be "4:6":
	
	`<sheetData>`
	`<row r="8" spans="4:6">`
	`<c r="F8">`
	`<v>1</v>`
	`</c>`
	`</row>`
	`<row r="9" spans="4:6">`
	`<c r="E9">`
	`<v>2</v>`
	`</c>`
	`</row>`
	`<row r="10" spans="4:6">`

Attributes	Description
	<c r="D10"> <v>3</v> </c> </row> </sheetData> For example, if cells A1 and J10 have data in them and the rest of the sheet is empty, then the rows should be written like this: <sheetData> <row r="1" spans="1:10"> <c r="A1"> <v>1</v> </c> </row> <row r="10" spans="1:10"> <c r="J10"> <v>2</v> </c> </row> </sheetData> The possible values for this attribute are defined by the ST_CellSpans simple type (§3.18.10).
thickBot (Thick Bottom)	'1' if any cell in the row has a medium or thick bottom border, or if any cell in the row directly below the current row has a thick top border. When `true` and customHeight is `false`, this flag means that the row height has been adjusted higher by .75 points of the normal style font height. This also means that if the row no longer contains these borders, then the height is automatically re-adjusted down. This adjustment is in addition to any adjustment of height due to thickTop. Medium borders are these enumeration values from the Styles Part: • mediumDashDotDot • slantDashDot • mediumDashDot • mediumDashed • medium Thick borders are these enumeration values from the Styles Part: • thick • double The possible values for this attribute are defined by the XML Schema boolean datatype.
thickTop (Thick Top Border)	`True` if the row has a medium or thick top border, or if any cell in the row directly above the current row has a thick bottom border. When `true` and customHeight is `false`, this

Attributes	Description
	flag means that the row height has been adjusted higher by .75 points of the normal style font height. This also means that if the row no longer contains these borders, then the height is automatically re-adjusted down. This adjustment is in addition to any adjustment of height due to thickBot. Medium borders are these enumeration values from the Styles Part: • mediumDashDotDot • slantDashDot • mediumDashDot • mediumDashed • medium Thick borders are these enumeration values from the Styles Part: • thick • double The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Row">
   <sequence>
      <element name="c" type="CT_Cell" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="r" type="xsd:unsignedInt" use="optional"/>
   <attribute name="spans" type="ST_CellSpans" use="optional"/>
   <attribute name="s" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="customFormat" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="ht" type="xsd:double" use="optional"/>
   <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="customHeight" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="outlineLevel" type="xsd:unsignedByte" use="optional" default="0"/>
   <attribute name="collapsed" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="thickTop" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="thickBot" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="ph" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.72 rowBreaks (Horizontal Page Breaks (Row))

Horizontal page break information used for print layout view, page layout view, drawing print breaks in normal view, and for printing the worksheet.

[*Example*: This example shows a break inserted at cell B25:

```
<rowBreaks count="1" manualBreakCount="1">
  <brk id="24" max="16383" man="1"/>
</rowBreaks>
```

end example]

Parent Elements
customSheetView (§3.3.1.23); worksheet (§3.3.1.96)

Child Elements	Subclause
brk (Break)	§3.3.1.2

Attributes	Description
count (Page Break Count)	Number of breaks in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
manualBreakCount (Manual Break Count)	Number of manual breaks in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageBreak">
    <sequence>
        <element name="brk" type="CT_Break" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
    <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
    <attribute name="manualBreakCount" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.3.1.73 scenario (Scenario)

An individual scenario description. See parent element for example.

Parent Elements
scenarios (§3.3.1.74)

Child Elements	Subclause
inputCells (Input Cells)	§3.3.1.49

Attributes	Description
comment (Scenario Comment)	Comment for this scenario, rich text not supported. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
count (Changing Cell Count)	Number of input cells. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
hidden (Hidden Scenario)	Scenario is hidden when the sheet is protected and 'edit scenarios' is not enabled in sheet protection options. If the scenario is marked as hidden but sheet protection options specify to allow editing scenarios, then the scenario shall not be hidden. The possible values for this attribute are defined by the XML Schema boolean datatype.
locked (Scenario Locked)	Scenario is locked for editing when the sheet is protected. If sheet is protected and "edit scenarios" is enabled, then this setting is ignored. The possible values for this attribute are defined by the XML Schema boolean datatype.
name (Scenario Name)	Scenario's name (user input). Must be unique for the workbook. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
user (User Name)	Name of user who last changed the scenario. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Scenario">
   <sequence>
      <element name="inputCells" type="CT_InputCells" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="locked" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
   <attribute name="user" type="ST_Xstring" use="optional"/>
   <attribute name="comment" type="ST_Xstring" use="optional"/>
</complexType>
```

3.3.1.74 scenarios (Scenarios)

A collection of Scenarios. A scenario is a named what-if model that includes variable cells linked together by one or more formulas. For example, you might want to compare best-case and worst-case scenarios for sales in a coffee shop, based on the number of cups of coffee sold in a week.

[*Example*:

```
<scenarios current="1" show="0" sqref="G4 G6 G7 G8">
  <scenario name="Best Case" locked="1" count="3" user="anonymous"
    comment="Created on 6/9/2006_x000a_Modified on 6/9/2006">
    <inputCells r="D5" val="151" numFmtId="37"/>
    <inputCells r="D9" val="226"/>
    <inputCells r="D13" val="126"/>
  </scenario>
  <scenario name="Worst Case" locked="1" count="3" user="anonymous"
    comment="Created on 6/9/2006">
    <inputCells r="D5" val="50" numFmtId="37"/>
    <inputCells r="D9" val="40"/>
    <inputCells r="D13" val="30"/>
  </scenario>
</scenarios>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
scenario (Scenario)	§3.3.1.73

Attributes	Description
current (Current Scenario)	Zero-based index to current scenario selected. Can correspond to selection UI. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
show (Last Shown Scenario)	Zero-based index to last shown scenario. Indicates which scenario was last selected by the user to be run/shown. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sqref (Sequence of References)	Range or sequence of cells used for scenario results summary. The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Scenarios">
   <sequence>
      <element name="scenario" type="CT_Scenario" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="current" type="xsd:unsignedInt" use="optional"/>
   <attribute name="show" type="xsd:unsignedInt" use="optional"/>
   <attribute name="sqref" type="ST_Sqref" use="optional"/>
</complexType>
```

3.3.1.75 selection (Selection)

Worksheet view selection.

Parent Elements
customSheetView (§3.3.1.23); sheetView (§3.3.1.83)

Attributes	Description
activeCell (Active Cell Location)	Location of the active cell. The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
activeCellId (Active Cell Index)	0-based index of the range reference (in the array of references listed in sqref) containing the active cell. Only used when the selection in sqref is not contiguous. Therefore, this value needs to be aware of the order in which the range references are written in sqref. When this value is out of range then activeCell can be used. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
pane (Pane)	The pane to which this selection belongs. The possible values for this attribute are defined by the ST_Pane simple type (§3.18.54).
sqref (Sequence of References)	Range of the selection. Can be non-contiguous set of ranges. The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Selection">
   <attribute name="pane" type="ST_Pane" use="optional" default="topLeft"/>
   <attribute name="activeCell" type="ST_CellRef" use="optional"/>
   <attribute name="activeCellId" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="sqref" type="ST_Sqref" use="optional" default="A1"/>
</complexType>
```

3.3.1.76 sheetCalcPr (Sheet Calculation Properties)

This element contains calculation properties for the worksheet.

Parent Elements
worksheet (§3.3.1.96)

Attributes	Description
fullCalcOnLoad (Full Calculation On Load)	Indicates whether the application should do a full calculate on load due to contents on this sheet. After load and successful calc, the application shall set this value to false. Set this to true when the application should calculate the workbook on load. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetCalcPr">
   <attribute name="fullCalcOnLoad" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.77 sheetData (Sheet Data)

This collection represents the cell table itself. This collection expresses information about each cell, grouped together by rows in the worksheet.

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
row (Row)	§3.3.1.71

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetData">
   <sequence>
      <element name="row" type="CT_Row" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.3.1.78 sheetFormatPr (Sheet Format Properties)

Sheet formatting properties.

Parent Elements
dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
baseColWidth (Base Column Width)	Specifies the number of characters of the maximum digit width of the normal style's font. This value does not include margin padding or extra padding for gridlines. It is only the number of characters. See defaultColWidth description in this section for details on calculating this value. See the col element description, particularly the width attribute description, for more information on what is meant by "maximum digit width". The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
customHeight (Custom Height)	'True' if defaultRowHeight value has been manually set, or is different from the default value. The possible values for this attribute are defined by the XML Schema boolean datatype.
defaultColWidth (Default Column Width)	Default column width measured as the number of characters of the maximum digit width of the normal style's font. If the user has not set this manually, then it can be calculated: defaultColWidth = baseColumnWidth + {margin padding (2 pixels on each side, totalling 4 pixels)} + {gridline (1pixel)} If the user has set this manually, then there is no calculation, and simply a value is specified. The possible values for this attribute are defined by the XML Schema double datatype.
defaultRowHeight (Default Row Height)	Default row height measured in point size. Optimization so we don't have to write the height on all rows. This can be written out if most rows have custom height, to achieve the optimization. When the row height of all rows in a sheet is the default value, then that value is written here, and customHeight is not set. If a few rows have a different height, that information is written directly on each row. However, if most or all of the rows in the sheet have the same height, but that height isn't the default height, then that height value should be written here (as an optimization), and the customHeight flag should also be set. In this case, all rows having this height do not need to express the height, only rows whose height differs from this value need to be explicitly expressed. The possible values for this attribute are defined by the XML Schema double datatype.
outlineLevelCol (Column Outline Level)	Highest number of outline levels for columns in this sheet. These values must be in synch with the actual sheet outline levels. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.

Attributes	Description
outlineLevelRow (Maximum Outline Row)	Highest number of outline level for rows in this sheet. These values must be in synch with the actual sheet outline levels. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
thickBottom (Thick Bottom Border)	'True' if rows have a thick bottom border by default. The possible values for this attribute are defined by the XML Schema boolean datatype.
thickTop (Thick Top Border)	'True' if rows have a thick top border by default. The possible values for this attribute are defined by the XML Schema boolean datatype.
zeroHeight (Hidden By Default)	'True' if rows are hidden by default. This setting is an optimization used when most rows of the sheet are hidden. In this case, instead of writing out every row and specifying hidden, it is much shorter to only write out the rows that are not hidden, and specify here that rows are hidden by default, and only not hidden if specified. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetFormatPr">
    <attribute name="baseColWidth" type="xsd:unsignedInt" use="optional" default="8"/>
    <attribute name="defaultColWidth" type="xsd:double" use="optional"/>
    <attribute name="defaultRowHeight" type="xsd:double" use="required"/>
    <attribute name="customHeight" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="zeroHeight" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="thickTop" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="thickBottom" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="outlineLevelRow" type="xsd:unsignedByte" use="optional" default="0"/>
    <attribute name="outlineLevelCol" type="xsd:unsignedByte" use="optional" default="0"/>
</complexType>
```

3.3.1.79 sheetPr (Sheet Properties)

Sheet-level properties.

Parent Elements
dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Child Elements	Subclause
outlinePr (Outline Properties)	§3.3.1.59
pageSetUpPr (Page Setup Properties)	§3.3.1.63
tabColor (Sheet Tab Color)	§3.3.1.90

Attributes	Description
codeName (Code Name)	Specifies a stable name of the sheet, which should not change over time, and does not change from user input. This name should be used by code to reference a particular sheet. The possible values for this attribute are defined by the XML Schema string datatype.
enableFormatConditionsCalculation (Enable Conditional Formatting Calculations)	Flag indicating whether the conditional formatting calculations shall be evaluated. If set to `false`, then the min/max values of color scales or databars or threshold values in Top N rules shall not be updated. Essentially the conditional formatting "calc" is off. This is useful when conditional formats are being set programmatically at runtime, recalculation of the conditional formatting does not need to be done until the program execution has finished setting all the conditional formatting properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
filterMode (Filter Mode)	Flag indicating whether the worksheet has one or more autofilters or advanced filters on. The possible values for this attribute are defined by the XML Schema boolean datatype.
published (Published)	Flag indicating whether the worksheet is published. The possible values for this attribute are defined by the XML Schema boolean datatype.
syncHorizontal (Synch Horizontal)	Flag indicating whether this worksheet is horizontally synced to the synchRef anchor point. When true and scroll location is missing from the window properties, the window view shall be scrolled to the horizontal (row) aspect of the synchRef value. The possible values for this attribute are defined by the XML Schema boolean datatype.
syncRef (Synch Reference)	Anchor point for worksheet's window. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
syncVertical (Synch Vertical)	Flag indicating whether this worksheet is vertically synced to the synchRef anchor point. When true and scroll location is missing from the window properties, the window view shall be scrolled to the vertical (column) aspect of the synchRef value. The possible values for this attribute are defined by the XML Schema boolean datatype.
transitionEntry (Transition Formula Entry)	Flag indicating whether the Transition Formula Entry (Lotus compatibility) option is enabled. The possible values for this attribute are defined by the XML Schema boolean datatype.
transitionEvaluation (Transition Formula Evaluation)	Flag indicating whether the Transition Formula Evaluation (Lotus compatibility) option is enabled. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetPr">
   <sequence>
      <element name="tabColor" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="outlinePr" type="CT_OutlinePr" minOccurs="0" maxOccurs="1"/>
      <element name="pageSetUpPr" type="CT_PageSetUpPr" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="syncHorizontal" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="syncVertical" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="syncRef" type="ST_Ref" use="optional"/>
   <attribute name="transitionEvaluation" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="transitionEntry" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="published" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="codeName" type="xsd:string" use="optional"/>
   <attribute name="filterMode" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="enableFormatConditionsCalculation" type="xsd:boolean" use="optional"
     default="true"/>
</complexType>
```

3.3.1.80 sheetPr (Chart Sheet Properties)

This element specifies chart sheet properties.

Parent Elements
chartsheet (§3.3.1.11)

Child Elements	Subclause
tabColor (Sheet Tab Color)	§3.3.1.90

Attributes	Description
codeName (Code Name)	Specifies a stable name of the sheet, which should not change over time, and does not change from user input. This name should be used by code to reference a particular sheet. The possible values for this attribute are defined by the XML Schema string datatype.
published (Published)	Flag indicating whether the chart sheet is published. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartsheetPr">
   <sequence>
      <element name="tabColor" type="CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="published" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="codeName" type="xsd:string" use="optional"/>
</complexType>
```

3.3.1.81 sheetProtection (Sheet Protection Options)

This collection expresses the sheet protection options to enforce when the sheet is protected.

[*Example*:

This example demonstrates that the sheet is protected, objects and scenarios may be edited, and

```
<sheetProtection sheet="1" objects="1" scenarios="1" formatCells="0"
  selectLockedCells="1"/>
```

end example]

Parent Elements
dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Attributes	Description
autoFilter (AutoFilter Locked)	Autofilters are locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
deleteColumns (Delete Columns Locked)	Deleting columns is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
deleteRows (Delete Rows Locked)	Deleting rows is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
formatCells (Format Cells Locked)	Formatting cells is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
formatColumns (Format Columns Locked)	Formatting columns is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
formatRows (Format Rows Locked)	Formatting rows is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
insertColumns	Inserting columns is locked when the sheet is protected.

Attributes	Description
(Insert Columns Locked)	The possible values for this attribute are defined by the XML Schema boolean datatype.
insertHyperlinks (Insert Hyperlinks Locked)	Inserting hyperlinks is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
insertRows (Insert Rows Locked)	Inserting rows is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
objects (Objects Locked)	Objects are locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
password (Password)	Specifies the hash of the password required for editing this worksheet. This protection is optional and may be ignored by applications that choose not to support this functionality. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the logic defined in the revisionsPassword attribute of §3.2.29. The resulting value is hashed using the algorithm defined below. [*Note*: An example algorithm to hash the user input into the value stored is as follows: `// Function Input:` `//  szPassword: NULL terminated C-Style string` `//  cchPassword: The number of characters in szPassword (not including the NULL terminator)` `WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {` `  WORD wPasswordHash;` `  const CHAR *pch;` `  wPasswordHash = 0;` `  if (cchPassword > 0)` `  {` `  pch = &szPassword[cchPassword];` `  while (pch-- != szPassword)` `  {` ` wPasswordHash = ((wPasswordHash >> 14) & 0x01)	((wPasswordHash << 1) & 0x7fff);` ` wPasswordHash ^= *pch;` ` }` ` wPasswordHash ^= (0x8000	('N' << 8)	'K');` ` }`  ` return(wPasswordHash);` `}` *end note*]

Attributes	Description
	The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).
pivotTables (Pivot Tables Locked)	Pivot tables are locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
scenarios (Scenarios Locked)	Scenarios are locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
selectLockedCells (Select Locked Cells Locked)	Selection of locked cells is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
selectUnlockedCells (Select Unlocked Cells Locked)	Selection of unlocked cells is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
sheet (Sheet Locked)	Sheet is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
sort (Sort Locked)	Sorting is locked when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetProtection">
    <attribute name="password" type="ST_UnsignedShortHex" use="optional"/>
    <attribute name="sheet" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="objects" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="scenarios" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="formatCells" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="formatColumns" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="formatRows" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="insertColumns" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="insertRows" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="insertHyperlinks" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="deleteColumns" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="deleteRows" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="selectLockedCells" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="sort" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="autoFilter" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="pivotTables" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="selectUnlockedCells" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.82 sheetProtection (Chart Sheet Protection)

This collection expresses the chart sheet protection options to enforce when the chart sheet is protected.

Parent Elements
chartsheet (§3.3.1.11)

Attributes	Description
content (Contents)	When true prevents users from making changes to items that are part of the chart, such as data series, axes, and legends. The chart continues to reflect changes made to its source data. The possible values for this attribute are defined by the XML Schema boolean datatype.
objects (Objects Locked)	When true prevents users from making changes to graphic objects— including shapes, text boxes, and controls— unless you unlock the specific objects before you protect the chart sheet. The possible values for this attribute are defined by the XML Schema boolean datatype.
password (Password)	Specifies the hash of the password required for editing this chart sheet. This protection is optional and may be ignored by applications that choose not to support this functionality. The hash is generated from an 8-bit wide character. 16-bit Unicode characters must be converted down to 8 bits before the hash is computed, using the logic defined in the revisionPassword attribute of §3.2.29. The resulting value is hashed using the algorithm defined below. [*Note*: An example algorithm to hash the user input into the value stored is as follows: `// Function Input:` `//  szPassword: NULL terminated C-Style string` `//  cchPassword: The number of characters in szPassword (not including the NULL terminator)` `WORD GetPasswordHash(const CHAR *szPassword, int cchPassword) {` `  WORD wPasswordHash;` `  const CHAR *pch;` `  wPasswordHash = 0;` `  if (cchPassword > 0)` `  {` `  pch = &szPassword[cchPassword];` `  while (pch-- != szPassword)` `  {` ` wPasswordHash = ((wPasswordHash >> 14) & 0x01)	((wPasswordHash << 1) & 0x7fff);` ` wPasswordHash ^= *pch;` ` }` ` wPasswordHash ^= (0x8000	('N' << 8)	'K');` ` }`

Attributes	Description

	return(wPasswordHash);
	}
	end note]
	
	The possible values for this attribute are defined by the ST_UnsignedShortHex simple type (§3.18.87).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartsheetProtection">
   <attribute name="password" type="ST_UnsignedShortHex" use="optional"/>
   <attribute name="content" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="objects" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.83 sheetView (Worksheet View)

A single sheet view definition. When more than 1 sheet view is defined in the file, it means that when opening the workbook, each sheet view corresponds to a separate window within the spreadsheet application, where each window is showing the particular sheet. containing the same workbookViewId value, the last sheetView definition is loaded, and the others are discarded. When multiple windows are viewing the same sheet, multiple sheetView elements (with corresponding workbookView entries) are saved.

Parent Elements
sheetViews (§3.3.1.85)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
pane (View Pane)	§3.3.1.64
pivotSelection (PivotTable Selection)	§3.3.1.67
selection (Selection)	§3.3.1.75

Attributes	Description
colorId (Color Id)	Index to the color value for row/column text headings and gridlines. This is an 'index color value' (ICV) rather than rgb value. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
defaultGridColor (Default Grid Color)	Flag indicating that the consuming application should use the default grid lines color (system dependent). Overrides any color specified in colorId. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
rightToLeft (Right To Left)	Flag indicating whether the sheet is in 'right to left' display mode. When in this mode, Column A is on the far right, Column B ;is one column left of Column A, and so on. Also, information in cells is displayed in the Right to Left format. The possible values for this attribute are defined by the XML Schema boolean datatype.
showFormulas (Show Formulas)	Flag indicating whether this sheet should display formulas. The possible values for this attribute are defined by the XML Schema boolean datatype.
showGridLines (Show Grid Lines)	Flag indicating whether this sheet should display gridlines. The possible values for this attribute are defined by the XML Schema boolean datatype.
showOutlineSymbols (Show Outline Symbols)	Flag indicating whether the sheet has outline symbols visible. This flag shall always override SheetPr element's outlinePr child element whose attribute is named showOutlineSymbols when there is a conflict. The possible values for this attribute are defined by the XML Schema boolean datatype.
showRowColHeaders (Show Headers)	Flag indicating whether the sheet should display row and column headings. The possible values for this attribute are defined by the XML Schema boolean datatype.
showRuler (Show Ruler)	Show the ruler in Page Layout View. The possible values for this attribute are defined by the XML Schema boolean datatype.
showWhiteSpace (Show White Space)	Flag indicating whether page layout view shall display margins. False means do not display left, right, top (header), and bottom (footer) margins (even when there is data in the header or footer). The possible values for this attribute are defined by the XML Schema boolean datatype.
showZeros (Show Zero Values)	Flag indicating whether the window should show 0 (zero) in cells containing zero value. When false, cells with zero value appear blank instead of showing the number zero. The possible values for this attribute are defined by the XML Schema boolean datatype.
tabSelected (Sheet Tab Selected)	Flag indicating whether this sheet is selected. When only 1 sheet is selected and active, this value should be in synch with the activeTab value. In case of a conflict, the Start Part setting wins and sets the active sheet tab. Note: multiple sheets can be selected, but only one sheet can be active at one time. The possible values for this attribute are defined by the XML Schema boolean datatype.
topLeftCell (Top Left Visible Cell)	Location of the top left visible cell Location of the top left visible cell in the bottom right pane (when in Left-to-Right mode). The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).

Attributes	Description
view (View Type)	Indicates view type. The possible values for this attribute are defined by the ST_SheetViewType simple type (§3.18.71).
windowProtection (Window Protection)	Flag indicating whether the panes in the window are locked due to workbook protection. This is an option when the workbook structure is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
workbookViewId (Workbook View Index)	Zero-based index of this workbook view, pointing to a workbookView element in the bookViews collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
zoomScale (Zoom Scale)	Window zoom magnification for current view representing percent values. Valid values range from 10 to 400. Horizontal & Vertical scale together. For example: 10 - 10% 20 - 20% … 100 - 100% … 400 - 400% Current view can be Normal, Page Layout, or Page Break Preview. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
zoomScaleNormal (Zoom Scale Normal View)	Zoom magnification to use when in normal view, representing percent values. Valid values range from 10 to 400. Horizontal & Vertical scale together. For example: 10 - 10% 20 - 20% … 100 - 100% … 400 - 400% Applies for worksheet sheet type only; zero implies the automatic setting. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
zoomScalePageLayoutView (Zoom Scale Page Layout View)	Zoom magnification to use when in page layout view, representing percent values. Valid values range from 10 to 400. Horizontal & Vertical scale together. For example: 10 - 10% 20 - 20% … 100 - 100% … 400 - 400% Applies for worksheet sheet type only; zero implies the automatic setting. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
zoomScaleSheetLayoutView (Zoom Scale Page Break Preview)	Zoom magnification to use when in page break preview, representing percent values. Valid values range from 10 to 400. Horizontal & Vertical scale together. For example: 10 - 10% 20 - 20% … 100 - 100% … 400 - 400% Applies for worksheet only; zero implies the automatic setting. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetView">
   <sequence>
      <element name="pane" type="CT_Pane" minOccurs="0" maxOccurs="1"/>
      <element name="selection" type="CT_Selection" minOccurs="0" maxOccurs="4"/>
      <element name="pivotSelection" type="CT_PivotSelection" minOccurs="0" maxOccurs="4"/>
      <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="windowProtection" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showFormulas" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showGridLines" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showRowColHeaders" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showZeros" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="rightToLeft" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="tabSelected" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showRuler" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showOutlineSymbols" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="defaultGridColor" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="showWhiteSpace" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="view" type="ST_SheetViewType" use="optional" default="normal"/>
   <attribute name="topLeftCell" type="ST_CellRef" use="optional"/>
   <attribute name="colorId" type="xsd:unsignedInt" use="optional" default="64"/>
   <attribute name="zoomScale" type="xsd:unsignedInt" use="optional" default="100"/>
   <attribute name="zoomScaleNormal" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="zoomScaleSheetLayoutView" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="zoomScalePageLayoutView" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="workbookViewId" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.3.1.84 sheetView (Chart Sheet View)

This element specifies a chart sheet view. See sheetView (§3.3.1.83) for an example.

Parent Elements
sheetViews (§3.3.1.86)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
tabSelected (Sheet Tab Selected)	Flag indicating whether the sheet tab is selected. The possible values for this attribute are defined by the XML Schema boolean datatype.
workbookViewId (Workbook View Id)	Zero-based index of this workbook view, pointing to a workbookView element in the bookViews collection.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
zoomScale (Window Zoom Scale)	Window zoom magnification, representing percent values. Valid values range from 10 to 400. Horizontal & Vertical scale together. For example: 10 - 10% 20 - 20% … 100 - 100% … 400 - 400% The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
zoomToFit (Zoom To Fit)	Flag indicating whether chart sheet is zoom to fit window. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartsheetView">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="tabSelected" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="zoomScale" type="xsd:unsignedInt" default="100" use="optional"/>
   <attribute name="workbookViewId" type="xsd:unsignedInt" use="required"/>
   <attribute name="zoomToFit" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.85 sheetViews (Sheet Views)

Worksheet views collection.

[*Example*:

This example shows one sheet view definition. The definition indicates that the current sheet is the active/selected sheet, and that there is a split pane applied to the view. This definition also indicates for each of the four window panes of the split which cell is the active cell for that pane.

```
<sheetViews>
  <sheetView tabSelected="1" workbookViewId="0">
    <pane xSplit="2310" ySplit="2070" topLeftCell="C1"
      activePane="bottomRight"/>
    <selection/>
    <selection pane="bottomLeft" activeCell="A6" sqref="A6"/>
    <selection pane="topRight" activeCell="C1" sqref="C1"/>
    <selection pane="bottomRight" activeCell="E13" sqref="E13"/>
  </sheetView>
</sheetViews>
```

end example]

Parent Elements
dialogsheet (§3.3.1.32); worksheet (§3.3.1.96)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
sheetView (Worksheet View)	§3.3.1.83

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetViews">
   <sequence>
      <element name="sheetView" type="CT_SheetView" minOccurs="1" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.3.1.86 sheetViews (Chart Sheet Views)

This element specifies chart sheet views.

Parent Elements
chartsheet (§3.3.1.11)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
sheetView (Chart Sheet View)	§3.3.1.84

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartsheetViews">
   <sequence>
      <element name="sheetView" type="CT_ChartsheetView" minOccurs="1" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.3.1.87 smartTags (Smart Tags)

This collection expresses all smart tags associated with cells on this sheet. There can be multiple smart tags associated with a particular cell, and many cells with smart tags for a given worksheet.

[*Example*:

This example shows three smart tags, each one associated with a unique cell on the worksheet.

```
<smartTags>
  <cellSmartTags r="A1">
    <cellSmartTag type="0"/>
  </cellSmartTags>
  <cellSmartTags r="B1">
    <cellSmartTag type="0"/>
  </cellSmartTags>
  <cellSmartTags r="B2">
    <cellSmartTag type="0"/>
  </cellSmartTags>
</smartTags>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
cellSmartTags (Cell Smart Tags)	§3.3.1.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTags">
   <sequence>
      <element name="cellSmartTags" type="CT_CellSmartTags" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.3.1.88 sortCondition (Sort Condition)

Sort condition. When more than one sortCondition is specified, the first condition is applied first, then the second condition is applied, and so on.

Parent Elements
sortState (§3.3.1.89)

Attributes	Description
customList (Custom List)	Sort by a custom list. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
descending (Descending)	Sort descending. The possible values for this attribute are defined by the XML Schema boolean datatype.
dxfId (Format Id)	Format Id when sortBy=cellColor or fontColor The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
iconId (Icon Id)	Zero-based index of an icon in an icon set. The absence of this attribute means "no icon" The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iconSet (Icon Set)	Icon set index when sortBy=icon. The possible values for this attribute are defined by the ST_IconSetType simple type (§3.18.44).
ref (Reference)	Column/Row that this sort condition applies to. This must be contained within the ref in CT_SortState. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sortBy (Sort By)	Type of sort. The possible values for this attribute are defined by the ST_SortBy simple type (§3.18.74).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SortCondition">
    <attribute name="descending" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="sortBy" type="ST_SortBy" use="optional" default="value"/>
    <attribute name="ref" type="ST_Ref" use="required"/>
    <attribute name="customList" type="ST_Xstring" use="optional"/>
    <attribute name="dxfId" type="ST_DxfId" use="optional"/>
    <attribute name="iconSet" type="ST_IconSetType" use="optional" default="3Arrows"/>
    <attribute name="iconId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.3.1.89 sortState (Sort State)

This collection preserves the AutoFilter sort state.

[*Example*: This example shows a sort which is case-sensitive, descending sort. While the range of data to sort is B4:E8, the range to sort by is B4:B8.

```
<sortState caseSensitive="1" ref="B4:E8">
  <sortCondition descending="1" ref="B4:B8"/>
</sortState>
```

end example]

Parent Elements
autoFilter (§3.3.1.1); queryTableRefresh (§3.12.6); table (§3.5.1.2); worksheet (§3.3.1.96)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
sortCondition (Sort Condition)	§3.3.1.88

Attributes	Description
caseSensitive (Case Sensitive)	Flag indicating whether or not the sort is case-sensitive. The possible values for this attribute are defined by the XML Schema boolean datatype.
columnSort (Sort by Columns)	Flag indicating whether or not to sort by columns. Only applies to ranges that don't have AutoFilter applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
ref (Sort Range)	The whole range of data to sort (not just the sort-by column). The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sortMethod (Sort Method)	Strokes or PinYin sort method. Applies only to these application UI languages: • Chinese Simplified

Attributes	Description
	• Chinese Traditional • Japanese For these languages, alternate sort methods can be selected, affecting how the data is sorted. The possible values for this attribute are defined by the ST_SortMethod simple type (§3.18.75).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SortState">
   <sequence>
      <element name="sortCondition" minOccurs="0" maxOccurs="64" type="CT_SortCondition"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="columnSort" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="caseSensitive" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="sortMethod" type="ST_SortMethod" use="optional" default="none"/>
   <attribute name="ref" type="ST_Ref" use="required"/>
</complexType>
```

3.3.1.90 tabColor (Sheet Tab Color)

Background color of the sheet tab.

Parent Elements
sheetPr (§3.3.1.79); sheetPr (§3.3.1.80)

Attributes	Description
auto (Automatic)	A boolean value indicating the color is automatic and system color dependent. The possible values for this attribute are defined by the XML Schema boolean datatype.
indexed (Index)	Indexed color value. Only used for backwards compatibility. References a color in indexedColors. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rgb (Alpha Red Green Blue Color Value)	Standard Alpha Red Green Blue color value (ARGB). The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
theme (Theme Color)	Index into the <clrScheme> collection, referencing a particular <sysClr> or <srgbClr> value expressed in the Theme part.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
tint (Tint)	Specifies the tint value applied to the color. If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied. The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change. In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255. [*Example*: Here are some examples of how to apply tint to color: **If (tint < 0)** Lum' = Lum * (1.0 + tint) For example: Lum = 200; tint = -0.5; Darken 50% Lum‘ = 200 * (0.5) => 100 For example: Lum = 200; tint = -1.0; Darken 100% (make black) Lum‘ = 200 * (1.0-1.0) => 0 **If (tint > 0)** Lum‘ = Lum * (1.0-tint) + (HLSMAX – HLSMAX * (1.0-tint)) For example: Lum = 100; tint = 0.75; Lighten 75% Lum‘ = 100 * (1-.75) + (HLSMAX – HLSMAX*(1-.75)) = 100 * .25 + (255 – 255 * .25) = 25 + (255 – 63) = 25 + 192 = 217 For example: Lum = 100; tint = 1.0; Lighten 100% (make white) Lum‘ = 100 * (1-1) + (HLSMAX – HLSMAX*(1-1)) = 100 * 0 + (255 – 255 * 0) = 0 + (255 – 0) = 255 *end example*] The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <attribute name="auto" type="xsd:boolean" use="optional"/>
   <attribute name="indexed" type="xsd:unsignedInt" use="optional"/>
   <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="theme" type="xsd:unsignedInt" use="optional"/>
   <attribute name="tint" type="xsd:double" use="optional" default="0.0"/>
</complexType>
```

3.3.1.91 tablePart (Table Part)

A single Table Part reference.

Parent Elements
tableParts (§3.3.1.92)

Attributes	Description
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	This relationship Id is used to locate a particular table definition part. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePart">
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.3.1.92 tableParts (Table Parts)

This collection expresses a relationship Id pointing to every table on this sheet.

[*Example*: This example indicates that the current sheet has two tables, and their definitions can be found by locating the appropriate relationships from the sheet:

```
<tableParts count="2">
  <tablePart r:id="rId1"/>
  <tablePart r:id="rId2"/>
</tableParts>
```

end example]

Parent Elements
worksheet (§3.3.1.96)

Child Elements	Subclause
tablePart (Table Part)	§3.3.1.91

Attributes	Description
count (Count)	A count of table elements in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableParts">
   <sequence>
      <element name="tablePart" type="CT_TablePart" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.3.1.93 v (Cell Value)

This element expresses the value contained in a cell. If the cell contains a string, then this value is an index into the shared string table, pointing to the actual string value. Otherwise, the value of the cell is expressed directly in this element. Cells containing formulas express the last calculated result of the formula in this element.

For applications not wanting to implement the shared string table, an 'inline string' may be expressed in an <is> element under <c> (instead of a <v> element under <c>),in the same way a string would be expressed in the shared string table. See <is> for an example.

[*Example*: In this example cell B4 contains the number "360".

```
<c r="B4">
  <v>360</v>
</c>
```

end example]

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
c (§3.3.1.3); cell (§3.14.1); nc (§3.11.1.3); oc (§3.11.1.5); tp (§3.15.3)

3.3.1.94 webPublishItem (Web Publishing Item)

This element represents information for a single item or object which can be published to HTML.

Parent Elements
webPublishItems (§3.3.1.95)

Attributes	Description
autoRepublish (Automatically Publish)	Automatically publish this item every time the workbook is saved. The possible values for this attribute are defined by the XML Schema boolean datatype.
destinationFile (Destination File Name)	Destination file name. Indicates where to save the HTML publish file. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
divId (Destination Bookmark)	Destination bookmark. Identifies a specific section in the published HTML file when a subset of the workbook is published to HTML. Each item that has been published from a workbook is written to a unique element in HTML. On re-publishing a particular item from the workbook, only that item's corresponding content is updated. Therefore each publish item corresponds to a unique element. It is possible to add new publish items to an existing published page, and it is possible to re-publish individual items without republishing the entire workbook. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
id (Id)	This is a unique number "nnnnn" of the webPublishItem. This value is used to generate the divId and styleId values. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sourceObject (Source Object Name)	Source object name (required for sourceType = pivotTable, query, or label). The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
sourceRef (Source Id)	Source range (required for sourceType = 'range'). The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sourceType (Web Source Type)	Type of web source (or objects to publish). The possible values for this attribute are defined by the ST_WebSourceType simple type (§3.18.94).
title (Title)	HTML title of published item. For example, this value can appear in the web browser window's title bar. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPublishItem">
    <attribute name="id" type="xsd:unsignedInt" use="required"/>
    <attribute name="divId" type="ST_Xstring" use="required"/>
    <attribute name="sourceType" type="ST_WebSourceType" use="required"/>
    <attribute name="sourceRef" type="ST_Ref" use="optional"/>
    <attribute name="sourceObject" type="ST_Xstring" use="optional"/>
    <attribute name="destinationFile" type="ST_Xstring" use="required"/>
    <attribute name="title" type="ST_Xstring" use="optional"/>
    <attribute name="autoRepublish" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.1.95 webPublishItems (Web Publishing Items)

This represents a listing of individual objects in this workbook that have been published (to HTML).

Note:When one of these objects is selected to be published, just the object is published to HTML, not the entire workbook contents.

[*Example*: This example shows two items which have been previously selected for publishing. One is a range (A6:C6), the other is a chart, named "Chart 1".

```
<webPublishItems count="2">
  <webPublishItem id="11289" divId="Views_11289" sourceType="range"
    sourceRef="A6:C6" destinationFile="D:\Publish.htm" published="0"/>
  <webPublishItem id="6433" divId="Views_6433" sourceType="chart"
    sourceObject="Chart 1" destinationFile="D:\Publish.mht" published="0"/>
</webPublishItems>
```

end example]

Parent Elements
chartsheet (§3.3.1.11); worksheet (§3.3.1.96)

Child Elements	Subclause
webPublishItem (Web Publishing Item)	§3.3.1.94

Attributes	Description
count (Web Publishing Items Count)	Number of items. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPublishItems">
   <sequence>
      <element name="webPublishItem" type="CT_WebPublishItem" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.3.1.96 worksheet (Worksheet)

This is the root element of Sheet Parts that are of type 'worksheet'.

Parent Elements
Root element of SpreadsheetML Worksheet part

Child Elements	Subclause
autoFilter (AutoFilter Settings)	§3.3.1.1
cellWatches (Cell Watch Items)	§3.3.1.8
colBreaks (Vertical Page Breaks)	§3.3.1.13
cols (Column Information)	§3.3.1.16
conditionalFormatting (Conditional Formatting)	§3.3.1.17
controls (Embedded Controls)	§3.3.1.19
customProperties (Custom Properties)	§3.3.1.21
customSheetViews (Custom Sheet Views)	§3.3.1.25
dataConsolidate (Data Consolidate)	§3.3.1.27
dataValidations (Data Validations)	§3.3.1.31
dimension (Worksheet Dimensions)	§3.3.1.33
drawing (Drawing)	§3.3.1.34
extLst (Future Feature Data Storage Area)	§3.2.10
headerFooter (Header Footer Settings)	§3.3.1.43
hyperlinks (Hyperlinks)	§3.3.1.45
ignoredErrors (Ignored Errors)	§3.3.1.48
legacyDrawing (Legacy Drawing Reference)	§3.3.1.51
legacyDrawingHF (Legacy Drawing Reference in Header Footer)	§3.3.1.52
mergeCells (Merge Cells)	§3.3.1.54
oleObjects (Embedded Objects)	§3.3.1.58
pageMargins (Page Margins)	§3.3.1.60
pageSetup (Page Setup Settings)	§3.3.1.61
phoneticPr (Phonetic Properties)	§3.4.3

Child Elements	Subclause
picture (Background Image)	§3.3.1.65
printOptions (Print Options)	§3.3.1.68
protectedRanges (Protected Ranges)	§3.3.1.70
rowBreaks (Horizontal Page Breaks (Row))	§3.3.1.72
scenarios (Scenarios)	§3.3.1.74
sheetCalcPr (Sheet Calculation Properties)	§3.3.1.76
sheetData (Sheet Data)	§3.3.1.77
sheetFormatPr (Sheet Format Properties)	§3.3.1.78
sheetPr (Sheet Properties)	§3.3.1.79
sheetProtection (Sheet Protection Options)	§3.3.1.81
sheetViews (Sheet Views)	§3.3.1.85
smartTags (Smart Tags)	§3.3.1.87
sortState (Sort State)	§3.3.1.89
tableParts (Table Parts)	§3.3.1.92
webPublishItems (Web Publishing Items)	§3.3.1.95

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Worksheet">
    <sequence>
        <element name="sheetPr" type="CT_SheetPr" minOccurs="0" maxOccurs="1"/>
        <element name="dimension" type="CT_SheetDimension" minOccurs="0" maxOccurs="1"/>
        <element name="sheetViews" type="CT_SheetViews" minOccurs="0" maxOccurs="1"/>
        <element name="sheetFormatPr" type="CT_SheetFormatPr" minOccurs="0" maxOccurs="1"/>
        <element name="cols" type="CT_Cols" minOccurs="0" maxOccurs="unbounded"/>
        <element name="sheetData" type="CT_SheetData" minOccurs="1" maxOccurs="1"/>
        <element name="sheetCalcPr" type="CT_SheetCalcPr" minOccurs="0" maxOccurs="1"/>
        <element name="sheetProtection" type="CT_SheetProtection" minOccurs="0" maxOccurs="1"/>
        <element name="protectedRanges" type="CT_ProtectedRanges" minOccurs="0" maxOccurs="1"/>
        <element name="scenarios" type="CT_Scenarios" minOccurs="0" maxOccurs="1"/>
        <element name="autoFilter" type="CT_AutoFilter" minOccurs="0" maxOccurs="1"/>
        <element name="sortState" type="CT_SortState" minOccurs="0" maxOccurs="1"/>
        <element name="dataConsolidate" type="CT_DataConsolidate" minOccurs="0" maxOccurs="1"/>
        <element name="customSheetViews" type="CT_CustomSheetViews" minOccurs="0" maxOccurs="1"/>
        <element name="mergeCells" type="CT_MergeCells" minOccurs="0" maxOccurs="1"/>
        <element name="phoneticPr" type="CT_PhoneticPr" minOccurs="0" maxOccurs="1"/>
        <element name="conditionalFormatting" type="CT_ConditionalFormatting" minOccurs="0"
          maxOccurs="unbounded"/>
        <element name="dataValidations" type="CT_DataValidations" minOccurs="0" maxOccurs="1"/>
        <element name="hyperlinks" type="CT_Hyperlinks" minOccurs="0" maxOccurs="1"/>
        <element name="printOptions" type="CT_PrintOptions" minOccurs="0" maxOccurs="1"/>
        <element name="pageMargins" type="CT_PageMargins" minOccurs="0" maxOccurs="1"/>
        <element name="pageSetup" type="CT_PageSetup" minOccurs="0" maxOccurs="1"/>
        <element name="headerFooter" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
        <element name="rowBreaks" type="CT_PageBreak" minOccurs="0" maxOccurs="1"/>
        <element name="colBreaks" type="CT_PageBreak" minOccurs="0" maxOccurs="1"/>
        <element name="customProperties" type="CT_CustomProperties" minOccurs="0" maxOccurs="1"/>
        <element name="cellWatches" type="CT_CellWatches" minOccurs="0" maxOccurs="1"/>
        <element name="ignoredErrors" type="CT_IgnoredErrors" minOccurs="0" maxOccurs="1"/>
        <element name="smartTags" type="CT_SmartTags" minOccurs="0" maxOccurs="1"/>
        <element name="drawing" type="CT_Drawing" minOccurs="0" maxOccurs="1"/>
        <element name="legacyDrawing" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
        <element name="legacyDrawingHF" type="CT_LegacyDrawing" minOccurs="0" maxOccurs="1"/>
        <element name="picture" type="CT_SheetBackgroundPicture" minOccurs="0" maxOccurs="1"/>
        <element name="oleObjects" type="CT_OleObjects" minOccurs="0" maxOccurs="1"/>
        <element name="controls" type="CT_Controls" minOccurs="0" maxOccurs="1"/>
        <element name="webPublishItems" type="CT_WebPublishItems" minOccurs="0" maxOccurs="1"/>
        <element name="tableParts" type="CT_TableParts" minOccurs="0" maxOccurs="1"/>
        <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
    </sequence>
</complexType>
```

3.3.2 AutoFilter Settings

The following subclause defines the settings which can be specified as part of an AutoFilter definition. An *AutoFilter* temporarily hides rows based on a filter criteria, which is applied column by column to a table of data in the worksheet.

3.3.2.1 colorFilter (Color Filter Criteria)

This element specifies the color to filter by and whether to use the cell's fill or font color in the filter criteria. If the cell's font or fill color does not match the color specified in the criteria, the rows corresponding to those cells are hidden from view.

[*Example*:

```
<filterColumn colId="1">
  <colorFilter dxfId="0" cellColor="0"/>
</filterColumn>
```

end example]

Parent Elements
filterColumn (§3.3.2.7)

Attributes	Description
cellColor (Filter By Cell Color)	Flag indicating whether or not to filter by the cell's fill color. '1' indicates to filter by cell fill. '0' indicates to filter by the cell's font color. For rich text in cells, if the color specified appears in the cell at all, it shall be included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
dxfId (Differential Format Record Id)	Id of differential format record (dxf) in the Styles Part which expresses the color value to filter by. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorFilter">
   <attribute name="dxfId" type="ST_DxfId" use="optional"/>
   <attribute name="cellColor" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.3.2.2 customFilter (Custom Filter Criteria)

A custom AutoFilter specifies an operator and a value. There can be at most two customFilters specified, and in that case the parent element specifies whether the two conditions are joined by 'and' or 'or'. For any cells whose values do not meet the specified criteria, the corresponding rows shall be hidden from view when the fitler is applied.

[*Example*:

```
<customFilters and="1">
  <customFilter operator="greaterThanOrEqual" val="0.2"/>
  <customFilter operator="lessThanOrEqual" val="0.5"/>
</customFilters>
```

end example]

Parent Elements
customFilters (§3.3.2.3)

Attributes	Description
operator (Filter Comparison Operator)	Operator used by the filter comparison. The possible values for this attribute are defined by the ST_FilterOperator simple type (§3.18.32).
val (Top or Bottom Value)	Top or bottom value used in the filter criteria. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomFilter">
   <attribute name="operator" type="ST_FilterOperator" default="equal" use="optional"/>
   <attribute name="val" type="ST_Xstring"/>
</complexType>
```

3.3.2.3 customFilters (Custom Filters)

When there is more than one custom filter criteria to apply (an 'and' or 'or' joining two criteria), then this element groups the customFilter elements together.

Parent Elements
filterColumn (§3.3.2.7)

Child Elements	Subclause
customFilter (Custom Filter Criteria)	§3.3.2.2

Attributes	Description
and (And)	Flag indicating whether the two criterias have an "and" relationship. '1' indicates "and", '0' indicates "or". The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomFilters">
   <sequence>
      <element name="customFilter" type="CT_CustomFilter" minOccurs="1" maxOccurs="2"/>
   </sequence>
   <attribute name="and" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.3.2.4 dateGroupItem (Date Grouping)

This collection is used to express a group of dates or times which are used in an AutoFilter criteria. See parent element for an example. Values are always written in the calendar type of the first date encountered in the filter range, so that all subsequent dates, even when formatted or represented by other calendar types, can be correctly compared for the purposes of filtering.

Parent Elements
filters (§3.3.2.8)

Attributes	Description
dateTimeGrouping (Date Time Grouping)	Grouping level. The possible values for this attribute are defined by the ST_DateTimeGrouping simple type (§3.18.23).
day (Day)	Day (1-31) The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
hour (Hour)	Hour (0-23) The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
minute (Minute)	Minute (0-59) The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
month (Month)	Month (1-12) The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
second (Second)	Second (0-59) The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
year (Year)	Year (4 digits)

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedShort datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DateGroupItem">
   <attribute name="year" type="xsd:unsignedShort" use="required"/>
   <attribute name="month" type="xsd:unsignedShort" use="optional"/>
   <attribute name="day" type="xsd:unsignedShort" use="optional"/>
   <attribute name="hour" type="xsd:unsignedShort" use="optional"/>
   <attribute name="minute" type="xsd:unsignedShort" use="optional"/>
   <attribute name="second" type="xsd:unsignedShort" use="optional"/>
   <attribute name="dateTimeGrouping" type="ST_DateTimeGrouping" use="required"/>
</complexType>
```

3.3.2.5 dynamicFilter (Dynamic Filter)

This collection specifies dynamic filter criteria. These criteria are considered dynamic because they can change, either with the data itself (e.g., "above average") or with the current system date (e.g., show values for "today"). For any cells whose values do not meet the specified criteria, the corresponding rows shall be hidden from view when the fitler is applied.

[*Example*:

```
<filterColumn colId="0">
  <dynamicFilter type="today"/>
</filterColumn>
```

end example]

Parent Elements
filterColumn (§3.3.2.7)

Attributes	Description
maxVal (Max Value)	A maximum value for dynamic filter. It shall be required for today, yesterday, tomorrow, nextWeek, thisWeek, lastWeek, nextMonth, thisMonth, lastMonth, nextQuarter, thisQuarter, lastQuarter, nextYear, thisYear, lastYear, and yearToDate. The above criteria are based on a value range. For example, if today's date is September 22nd, then the range for thisWeek is the values greater than or equal to September 17 and less than September 24. In the thisWeek range, the lower value is expressed using val. The higher value is expressed using maxVal. These dynamic filter shall not require val / maxVal: Q1, Q2, Q3, Q4,

Attributes	Description
	M1, M2, M3, M4, M5, M6, M7, M8, M9, M10, M11 and M12. The above criteria shall not specify the range using val and maxVal because Q1 always starts from M1 to M3, and M1 is always January. These types of dynamic filters shall use val and shall not use maxVal: aboveAverage and belowAverage The possible values for this attribute are defined by the XML Schema double datatype.
type (Dynamic filter type)	Dynamic filter type, e.g., “today” or “nextWeek”. The possible values for this attribute are defined by the ST_DynamicFilterType simple type (§3.18.27).
val (Value)	A minimum value for dynamic filter. See description of maxVal to understand when val is required. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DynamicFilter">
   <attribute name="type" type="ST_DynamicFilterType" use="required"/>
   <attribute name="val" type="xsd:double" use="optional"/>
   <attribute name="maxVal" type="xsd:double" use="optional"/>
</complexType>
```

3.3.2.6 filter (Filter)

This element expresses a filter criteria value.

[*Example*:

```
<filters>
  <filter val="0.316588716"/>
  <filter val="0.667439395"/>
  <filter val="0.823086999"/>
</filters>
```

end example]

Parent Elements
filters (§3.3.2.8)

Attributes	Description
val (Filter Value)	Filter value used in the criteria.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Filter">
   <attribute name="val" type="ST_Xstring"/>
</complexType>
```

3.3.2.7 filterColumn (AutoFilter Column)

The filterColumn collection identifies a particular column in the AutoFilter range and specifies filter information that has been applied to this column. If a column in the AutoFilter range has no criteria specified, then there is no corresponding filterColumn collection expressed for that column.

Parent Elements
autoFilter (§3.3.1.1)

Child Elements	Subclause
colorFilter (Color Filter Criteria)	§3.3.2.1
customFilters (Custom Filters)	§3.3.2.3
dynamicFilter (Dynamic Filter)	§3.3.2.5
extLst (Future Feature Data Storage Area)	§3.2.10
filters (Filter Criteria)	§3.3.2.8
iconFilter (Icon Filter)	§3.3.2.9
top10 (Top 10)	§3.3.2.10

Attributes	Description
colId (Filter Column Data)	Zero-based index indicating the AutoFilter column to which this filter information applies. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
hiddenButton (Hidden AutoFilter Button)	Flag indicating whether the AutoFilter button for this column is hidden. The possible values for this attribute are defined by the XML Schema boolean datatype.
showButton (Show Filter Button)	Flag indicating whether the filter button is visible. For example, when the cell containing the filter button is merged with another cell, the filter button may be hidden, and not drawn. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FilterColumn">
   <choice minOccurs="0" maxOccurs="1">
      <element name="filters" type="CT_Filters" minOccurs="0" maxOccurs="1"/>
      <element name="top10" type="CT_Top10" minOccurs="0" maxOccurs="1"/>
      <element name="customFilters" type="CT_CustomFilters" minOccurs="0" maxOccurs="1"/>
      <element name="dynamicFilter" type="CT_DynamicFilter" minOccurs="0" maxOccurs="1"/>
      <element name="colorFilter" type="CT_ColorFilter" minOccurs="0" maxOccurs="1"/>
      <element name="iconFilter" minOccurs="0" maxOccurs="1" type="CT_IconFilter"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </choice>
   <attribute name="colId" type="xsd:unsignedInt" use="required"/>
   <attribute name="hiddenButton" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showButton" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.3.2.8 filters (Filter Criteria)

When multiple values are chosen to filter by, or when a group of date values are chosen to filter by, this element groups those criteria together.

[*Example*:

```
<filters>
  <dateGroupItem year="2006" month="1" day="2" dateTimeGrouping="day"/>
  <dateGroupItem year="2005" month="1" day="2" dateTimeGrouping="day"/>
</filters>
```

end example]

Parent Elements
filterColumn (§3.3.2.7)

Child Elements	Subclause
dateGroupItem (Date Grouping)	§3.3.2.4
filter (Filter)	§3.3.2.6

Attributes	Description
blank (Filter by Blank)	Flag indicating whether to filter by blank. The possible values for this attribute are defined by the XML Schema boolean datatype.
calendarType (Calendar Type)	Calendar type for date grouped items. Used to interpret the values in dateGroupItem. This is the calendar type used to evaluate all dates in the filter column, even when those dates are not using the same calendar system / date formatting.

Attributes	Description
	The possible values for this attribute are defined by the ST_CalendarType simple type (§3.18.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Filters">
   <sequence>
      <element name="filter" type="CT_Filter" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dateGroupItem" type="CT_DateGroupItem" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="blank" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="calendarType" type="ST_CalendarType" use="optional" default="none"/>
</complexType>
```

3.3.2.9 iconFilter (Icon Filter)

This element specifies the icon set and particular icon within that set to filter by. For any cells whose icon does not match the specified criteria, the corresponding rows shall be hidden from view when the filter is applied.

[*Example*:

```
<filterColumn colId="3">
  <iconFilter iconSet="3Arrows" iconId="0"/>
</filterColumn>
```

end example]

Parent Elements
filterColumn (§3.3.2.7)

Attributes	Description
iconId (Icon Id)	Zero-based index of an icon in an icon set. The absence of this attribute means "no icon" The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iconSet (Icon Set)	Specifies which icon set is used in the filter criteria. The possible values for this attribute are defined by the ST_IconSetType simple type (§3.18.44).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IconFilter">
   <attribute name="iconSet" type="ST_IconSetType" use="required"/>
   <attribute name="iconId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.3.2.10 top10 (Top 10)

This element specifies the top N (percent or number of items) to filter by.

[*Example*: This example filters the first column by the top 10 percent of the values in that column. For all cells in the column whose value falls outside the top 10 percent of the value in that column, the rows corresponding to those cells are hidden from the view. In this example, there are 6 cells in the range, containing 1, 2, 3, 4, 5, 6 repsectively.

```
<filterColumn colId="0">
  <top10 percent="1" val="5" filterVal="6"/>
</filterColumn
```

end example]

Parent Elements
filterColumn (§3.3.2.7)

Attributes	Description
filterVal (Filter Value)	The actual cell value in the range which is used to perform the comparison for this filter. The possible values for this attribute are defined by the XML Schema double datatype.
percent (Filter by Percent)	Flag indicating whether or not to filter by percent value of the column. A false value filters by number of items. The possible values for this attribute are defined by the XML Schema boolean datatype.
top (Top)	Flag indicating whether or not to filter by top order. A false value filters by bottom order. The possible values for this attribute are defined by the XML Schema boolean datatype.
val (Top or Bottom Value)	Top or bottom value to use as the filter criteria. For example "Filter by Top 10 Percent" or "Filter by Top 5 Items". The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Top10">
   <attribute name="top" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="percent" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="val" type="xsd:double" use="required"/>
   <attribute name="filterVal" type="xsd:double" use="optional"/>
</complexType>
```

3.4 Shared String Table

A workbook may contain thousands of cells containing string (non-numeric) data. Furthermore this data is very likely to be repeated across many rows or columns. The goal of implementing a single string table that is shared across the workbook is to improve performance in opening and saving the file by only reading and writing the repetitive information once.

Consider for example a workbook summarizing information for cities within various countries. There may be a column for the name of the country, a column for the name of each city in that country, and a column containing the data for each city. In this case the country name is repetitive, being duplicated in many cells. In many cases the repetition is extensive, and a tremendous savings is realized by making use of a shared string table when saving the workbook. When displaying text in the spreadsheet, the cell table will just contain an index into the string table as the value of a cell, instead of the full string.

The shared string table contains all the necessary information for displaying the string: the text, formatting properties, and phonetic properties (for East Asian languages).

Most strings in a workbook have formatting applied at the cell level, that is, the entire string in the cell has the same formatting applied. In these cases, the formatting for the cell is stored in the styles part, and the string for the cell can be stored in the shared strings table. In this case, the strings stored in the shared strings table are very simple text elements, and the following xml illustrates the example.

[*Example*:

```
<sst xmlns=http://schemas.openxmlformats.org/spreadsheetml/2006/5/main
  count="8" uniqueCount="4">
  <si>
    <t>United States</t>
  </si>
  <si>
    <t>Seattle</t>
  </si>
  <si>
    <t>Denver</t>
  </si>
  <si>
    <t>New York</t>
  </si>
</sst>
```

end example]

In the above example we can see that the string table is just a collection of string items that consist of simple text elements. Note that any numeric data in the workbook is not shown in the shared string table.

Some strings in the workbook may have formatting applied at a level that is more granular than the cell level. For instance, specific characters within the string may be bolded, have coloring, italicizing, etc. In these cases, the formatting is stored along with the text in the string table, and is treated as a unique entry in the table. The following xml illustrates this.

[*Example*:

```
<sst xmlns=http://schemas.openxmlformats.org/spreadsheetml/2006/5/main
  count="8" uniqueCount="4">
  <si>
    <r>
      <t xml:space="preserve">United </t>
    </r>
    <r>
      <rPr>
        <sz val="11"/>
        <color rgb="FFFF0000"/>
        <rFont val="Calibri"/>
        <family val="2"/>
        <scheme val="minor"/>
      </rPr>
      <t>States</t>
    </r>
  </si>
  <si>
    <t>Seattle</t>
  </si>
  <si>
    <t>Denver</t>
  </si>
  <si>
    <t>New York</t>
  </si>
</sst>
```

In the above example you can see that this time, the text "United States" has specific, colored, formatting applied to the text, "States." *end example*]

3.4.1 charset (Character Set)

This element defines the font character set of this font.

This field is used in font creation and selection if a font of the given facename is not available on the system. Although it is not required to have around when resolving font facename, the information can be stored for when needed to help resolve which font face to use of all available fonts on a system.

Charset represents the basic set of characters associated with a font (that it can display), and roughly corresponds to the ANSI codepage (8-bit or DBCS) of that character set used by a given language. Given more common use of Unicode where many fonts support more than one of the traditional charset categories, and the use of font linking, using charset to resolve font name is less and less common, but still can be useful.

These are operating-system-dependent values.

[*Note*: The following are some of the possible the character sets:

INT Value	Character Set
0	ANSI_CHARSET
1	DEFAULT_CHARSET
2	SYMBOL_CHARSET
77	MAC_CHARSET
128	SHIFTJIS_CHARSET
129	HANGEUL_CHARSET
129	HANGUL_CHARSET
130	JOHAB_CHARSET
134	GB2312_CHARSET
136	CHINESEBIG5_CHARSET
161	GREEK_CHARSET
162	TURKISH_CHARSET
163	VIETNAMESE_CHARSET
177	HEBREW_CHARSET
178	ARABIC_CHARSET
186	BALTIC_CHARSET
204	RUSSIAN_CHARSET
222	THAI_CHARSET
238	EASTEUROPE_CHARSET
255	OEM_CHARSET

The OEM_CHARSET value specifies a character set that is operating-system dependent. *end note*]

Fonts with other character sets may exist in the operating system. If an application uses a font with an unknown character set, it should not attempt to translate or interpret strings that are rendered with that font.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	The value of an integer, where each value corresponds to a different character set. Valid values are 0 to 255. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IntProperty">
   <attribute name="val" type="xsd:int" use="required"/>
</complexType>
```

3.4.2 outline (Outline)

This element displays only the inner and outer borders of each character. This is very similar to Bold in behavior.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is `true`. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.4.3 phoneticPr (Phonetic Properties)

This element represents a collection of phonetic properties that affect the display of phonetic text for this String Item (si).

Phonetic text is used to give hints as to the pronunciation of an East Asian language, and the hints are displayed as text within the spreadsheet cells across the top portion of the cell. Since the phonetic hints are text, every phonetic hint is expressed as a phonetic run (rPh), and these properties specify how to display that phonetic run.

[*Example*:

```
<si>
  <t>課く 毛</t>
  <rPh sb="0" eb="1">
    <t>カ</t>
  </rPh>
  <rPh sb="4" eb="5">
    <t>ケ</t>
  </rPh>
  <phoneticPr fontId="1"/>
</si>
```

end example]

The above example shows a String Item that displays some Japanese text "課く 毛" It also displays some phonetic text across the top of the cell. The phonetic text character, "カ' is displayed over the "課 character and the phonetic text "ゲ is displayed above the "毛 character, using the font record in the style sheet at index 1.

Parent Elements
is (§3.3.1.50); si (§3.4.8); text (§3.7.6); worksheet (§3.3.1.96)

Attributes	Description
alignment (Alignment)	Specifies how the text for the phonetic run is aligned across the top of the cells, with respect to the main text in the body of the cell. The possible values for this attribute are defined by the ST_PhoneticAlignment simple type (§3.18.58).
fontId (Font Id)	An integer that is a zero-based index into the font record in the style sheet. Represents the font to be used to display this phonetic run. If this index is out of bounds, then the default font of the Normal style should be used in its place. This default font should be at index 0. The possible values for this attribute are defined by the ST_FontId simple type (§3.18.33).
type (Character Type)	An enumeration which specifies which type of East Asian character set should be used to display the phonetic run The possible values for this attribute are defined by the ST_PhoneticType simple type (§3.18.59).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PhoneticPr">
   <attribute name="fontId" type="ST_FontId" use="required"/>
   <attribute name="type" type="ST_PhoneticType" use="optional" default="fullwidthKatakana"/>
   <attribute name="alignment" type="ST_PhoneticAlignment" use="optional" default="left"/>
</complexType>
```

3.4.4 r (Rich Text Run)

This element represents a run of rich text. A rich text run is a region of text that share a common set of properties, such as formatting properties. The properties are defined in the rPr element, and the text displayed to the user is defined in the Text (t) element.

Parent Elements
is (§3.3.1.50); si (§3.4.8); text (§3.7.6)

Child Elements	Subclause
rPr (Run Properties)	§3.4.7
t (Text)	§3.4.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RElt">
   <sequence>
      <element name="rPr" type="CT_RPrElt" minOccurs="0" maxOccurs="1"/>
      <element name="t" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.4.5 rFont (Font)

This element is a string representing the name of the font assigned to display this run.

Parent Elements
rPr (§3.4.7)

Attributes	Description
val (String Value)	A string representing the name of the font. If the font doesn't exist (because it isn't installed on the system), or the charset is invalid for that font, then another font should be substituted. The string length for this attribute shall be 0 to 31 characters. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontName">
   <attribute name="val" type="ST_Xstring" use="required"/>
</complexType>
```

3.4.6 rPh (Phonetic Run)

This element represents a run of text which displays a phonetic hint for this String Item (si).

Phonetic hints are used to give information about the pronunciation of an East Asian language. The hints are displayed as text within the spreadsheet cells across the top portion of the cell.

Parent Elements
is (§3.3.1.50); si (§3.4.8); text (§3.7.6)

Child Elements	Subclause
t (Text)	§3.4.12

Attributes	Description
eb (Base Text End Index)	An integer used as a zero-based index representing the ending offset into the base text for this phonetic run. This represents the ending point in the base text the phonetic hint applies to. This value shall be between 0 and the total length of the base text. The following condition shall be true: `sb < eb`. It is recommended that the following condition also be satisfied: That for any two consecutive phonetic runs, `sb1 < eb1 <= sb2 < eb2` to avoid overlapping phonetic runs The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sb (Base Text Start Index)	An integer used as a zero-based index representing the starting offset into the base text for this phonetic run. This represents the starting point in the base text the phonetic hint applies to. This value shall be between 0 and the total length of the base text. The following condition shall be true: `sb < eb`. It is recommended that the following condition also be satisfied: That for any two consecutive phonetic runs, `sb1 < eb1 <= sb2 < eb2` to avoid overlapping phonetic runs. The possible values for this attribute are defined by the XML Schema unsignedInt

Attributes	Description
	datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PhoneticRun">
   <sequence>
      <element name="t" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="sb" type="xsd:unsignedInt" use="required"/>
   <attribute name="eb" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.4.7 rPr (Run Properties)

This element represents a set of properties to apply to the contents of this rich text run.

Parent Elements
r (§3.4.4)

Child Elements	Subclause
b (Bold)	§3.8.2
charset (Character Set)	§3.4.1
color (Data Bar Color)	§3.3.1.14
condense (Condense)	§3.8.12
extend (Extend)	§3.8.16
family (Font Family)	§3.8.17
i (Italic)	§3.8.25
outline (Outline)	§3.4.2
rFont (Font)	§3.4.5
scheme (Scheme)	§3.8.36
shadow (Shadow)	§3.8.37
strike (Strike Through)	§3.4.10
sz (Font Size)	§3.4.11
u (Underline)	§3.4.13
vertAlign (Vertical Alignment)	§3.4.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RPrElt">
   <choice maxOccurs="unbounded">
      <element name="rFont" type="CT_FontName" minOccurs="0" maxOccurs="1"/>
      <element name="charset" type="CT_IntProperty" minOccurs="0" maxOccurs="1"/>
      <element name="family" type="CT_IntProperty" minOccurs="0" maxOccurs="1"/>
      <element name="b" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="i" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="strike" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="outline" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="shadow" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="condense" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="extend" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="sz" type="CT_FontSize" minOccurs="0" maxOccurs="1"/>
      <element name="u" type="CT_UnderlineProperty" minOccurs="0" maxOccurs="1"/>
      <element name="vertAlign" type="CT_VerticalAlignFontProperty" minOccurs="0" maxOccurs="1"/>
      <element name="scheme" type="CT_FontScheme" minOccurs="0" maxOccurs="1"/>
   </choice>
</complexType>
```

3.4.8 si (String Item)

This element is the representation of an individual string in the Shared String table.

If the string is just a simple string with formatting applied at the cell level, then the String Item (si) should contain a single text element used to express the string. However, if the string in the cell is more complex - i.e., has formatting applied at the character level - then the string item shall consist of multiple rich text runs which collectively are used to express the string.

Parent Elements
sst (§3.4.9)

Child Elements	Subclause
phoneticPr (Phonetic Properties)	§3.4.3
r (Rich Text Run)	§3.4.4
rPh (Phonetic Run)	§3.4.6
t (Text)	§3.4.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rst">
   <sequence>
      <element name="t" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="r" type="CT_RElt" minOccurs="0" maxOccurs="unbounded"/>
      <element name="rPh" type="CT_PhoneticRun" minOccurs="0" maxOccurs="unbounded"/>
      <element name="phoneticPr" minOccurs="0" maxOccurs="1" type="CT_PhoneticPr"/>
   </sequence>
</complexType>
```

3.4.9 sst (Shared String Table)

This element is the root of the Shared String Table, which serves as a collection of individual String Items (si).

Parent Elements
Root element of SpreadsheetML Shared String Table part

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
si (String Item)	§3.4.8

Attributes	Description
count (String Count)	An integer representing the total count of strings in the workbook. This count does not include any numbers, it counts only the total of text strings in the workbook. This attribute is optional unless `uniqueCount` is used, in which case it is required. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
uniqueCount (Unique String Count)	An integer representing the total count of unique strings in the Shared String Table. A string is unique even if it is a copy of another string, but has different formatting applied at the character level. [*Example*: World, *World*, and *W*orld. The `count` would be 3, and the `uniqueCount` would be 2. Only one entry for "World" would show in the table because it is the same string, just with different formatting applied at the cell level (i.e., applied to the entire string in the cell). The "*W*orld" string would get a separate unique entry in the shared string table because it has different formatting applied to specific characters. *end example*] This attribute is optional unless `count` is used, in which case it is required.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Sst">
   <sequence>
      <element name="si" type="CT_Rst" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
   <attribute name="uniqueCount" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.4.10 strike (Strike Through)

This element draws a strikethrough line through the horizontal middle of the text.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is `true`. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.4.11 sz (Font Size)

This element represents the point size (1/72 of an inch) of the Latin and East Asian text.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A double representing the value of a positive measurement in points (1/72 of an inch).

Attributes	Description
	The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontSize">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

3.4.12 t (Text)

This element represents the text content shown as part of a string.

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
is (§3.3.1.50); r (§3.4.4); rPh (§3.4.6); si (§3.4.8); text (§3.7.6)

3.4.13 u (Underline)

This element represents the underline formatting style.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Underline Value)	An enumeration representing the style of underlining that is used. The none style is equivalent to not using underlining at all. The possible values for this attribute are defined by the ST_UnderlineValues simple type (§3.18.85).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnderlineProperty">
   <attribute name="val" type="ST_UnderlineValues" use="optional" default="single"/>
</complexType>
```

3.4.14 vertAlign (Vertical Alignment)

This element adjusts the vertical position of the text relative to the text's default appearance for this run. It is used to get 'superscript' or 'subscript' texts, and shall reduce the font size (if a smaller size is available) accordingly.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	An enumeration representing the vertical-alignment setting. Setting this to either `subscript` or `superscript` shall make the font size smaller if a smaller font size is available. The possible values for this attribute are defined by the ST_VerticalAlignRun simple type (§3.18.90).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VerticalAlignFontProperty">
   <attribute name="val" type="ST_VerticalAlignRun" use="required"/>
</complexType>
```

3.5 Tables

A table helps organize and provide structure to lists of information in a worksheet. Tables have clearly labeled columns, rows, and data regions. Tables make it easier for users to sort, analyze, format, manage, add, and delete information.

If a region of data is designated as a Table, then special behaviors can be applied which help the user perform useful actions. For example, if the user types additional data in the row adjacent to the bottom of the table, the table can expand and automatically add that data to the data region of the table. Similarly, adding a column is as easy as typing a new column heading to the right or left of the current column headings. Filter and sort abilities can automatically be surfaced to the user via the drop down arrows. Special calculated columns can be created which summarize or calculate data in the table. These columns have the ability to expand and shrink according to size of the table, and maintain proper formula referencing.

Tables can be created from data already present in the worksheet, from an external data query, or from mapping a collection of repeating XML elements to a worksheet range.

The sheet XML stores the numeric and textual data. The table XML records the various attributes for the particular table object.

[*Example*:

```
<table xmlns=http://schemas.openxmlformats.org/spreadsheetml/2006/5/main
  id="1" name="MarginTable" displayName="MarginTable" ref="D3:G6"
  totalsRowShown="0">
```

```
    <autoFilter ref="D3:G6"/>
    <tableColumns count="4">
      <tableColumn id="1" name="Product"/>
      <tableColumn id="2" name="Wholesale"/>
      <tableColumn id="3" name="Retail"/>
      <tableColumn id="4" name="Margin" dataDxfId="0">
        <calculatedColumnFormula d="1">[Retail]-
          [Wholesale]</calculatedColumnFormula>
      </tableColumn>
    </tableColumns>
    <tableStyleInfo name="TableStyleMedium9" showFirstColumn="0"
      showLastColumn="0" showRowStripes="1" showColumnStripes="0"/>
  </table>
```

end example]

The above xml example shows a table that spans cells D3 through G6, and has four columns: Product, Wholesale, Retail, and Margin. Margin is a column where each cell has its values calculated based on the formula (Retail - Wholesale), where those values are taken from the cells in the table columns on the corresponding row. The table has a style applied, "TableStyleMedium9", but the styles formatting isn't applied to the first column and the column striping isn't shown. Note that all the data and text values are stored in the sheet xml; the table xml just stores the properties that are specific to this table, and it is referenced by the sheet.

3.5.1 Tables

Tables are ranges of data in the worksheet that have special behavior applied which allow users to better sort, analyze, format, manage, add, and delete data. Tables and table columns can also be referenced through formulas by the spreadsheet application using friendly names, making formula calculations that use tables much easier to understand and maintain. Tables provide a natural way for working with large sets of tabular data.

The tables described in this section are of the multi cell variety, as opposed to single cell tables created from XML mappings.

Each table gets its own xml part, and the relationship between a table part and the sheet is defined in the sheet's _rels directory. The sheet xml also references this id since there can be more than one table on a sheet. The sheet xml contains all the numeric and textual data, and the table xml records properties of the table as well as some formatting rules for data and text displayed in the table cells.

3.5.1.1 calculatedColumnFormula (Calculated Column Formula)

Columns in a table can have cells that are calculated, usually based on values in other cells in the table. This element stores the formula that is used to perform the calculation for each cell in this column.

It shall be understood that formulas which reference columns of this table, shall be calculated using the cells in those columns on the same row of the table as the cell that the formula resides in.

See §3.17 for details on valid/invalid formulas.

Parent Elements
tableColumn (§3.5.1.3)

Attributes	Description
array (Array)	A Boolean value that indicates whether this formula is an array style formula. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableFormula">
   <simpleContent>
      <extension base="ST_Formula">
         <attribute name="array" type="xsd:boolean" default="false"/>
      </extension>
   </simpleContent>
</complexType>
```

3.5.1.2 table (Table)

This element is the root element for a table that is not a single cell XML table.

Parent Elements
Root element of SpreadsheetML Table Definitions part

Child Elements	Subclause
autoFilter (AutoFilter Settings)	§3.3.1.1
extLst (Future Feature Data Storage Area)	§3.2.10
sortState (Sort State)	§3.3.1.89
tableColumns (Table Columns)	§3.5.1.4
tableStyleInfo (Table Style)	§3.5.1.5

Attributes	Description
comment (Table Comment)	A string representing a textual comment about the table. Note: this can be used by the spreadsheet application in other UI. For example, there may be name UI that is used to organize defined names and function references, if tables are listed in that UI the comment can give more information about the table. The maximum length of this string should be 32767 characters.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
connectionId (Connection ID)	An integer representing an ID to indicate which connection from the connections collection is used by this table. This shall only be used for tables that are based off of xml maps. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
dataCellStyle (Data Style Name)	A string representing the name of the cell style that is applied to the data area cells of the table. If this string is missing or invalid, then the data cell style specified by the current table style should be applied. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
dataDxfId (Data Area Format Id)	A zero based integer index into the differential formatting records `<dxfs>` in the styleSheet indicating which format to apply to the data area of this table. The spreadsheet should fail to load if this index is out of bounds. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
displayName (Table Name)	A string representing the name of the table. This is the name that shall be used in formula references, and displayed in the UI to the spreadsheet user. This name shall not have any spaces in it, and it must be unique amongst all other `displayNames` and `definedNames` in the workbook. The character lengths and restrictions are the same as for `definedNames`. See *SpreadsheetML Reference - Workbook definedNames* section for details The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
headerRowBorderDxfId (Header Row Border Format Id)	A zero based integer index into the differential formatting records `<dxfs>` in the styleSheet indicating what border formatting to apply to the header row of this table. The spreadsheet should fail to load if this index is out of bounds. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
headerRowCellStyle (Header Row Style)	A string representing the name of the cell style that is applied to the header row cells of the table. If this string is missing or invalid, then the header row style specified by the current table

Attributes	Description
	style should be applied. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
headerRowCount (Header Row Count)	An integer representing the number of header rows showing at the top of the table. 0 means that the header row is not shown. It is up to the spreadsheet application to determine if numbers greater than 1 are allowed. Unless the spreadsheet application has a feature where there may ever be more than one header row, this number should not be higher than 1. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
headerRowDxfId (Header Row Format Id)	A zero based integer index into the differential formatting records <dxfs>in the styleSheet indicating which format to apply to the header row of this table. The spreadsheet should fail to load if this index is out of bounds. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
id (Table Id)	A non zero integer representing the unique identifier for this table. Each table in the workbook shall have a unique id. Note: Ids can be used to refer to the specific table in the workbook. For instance a future records bucket could refer to the table using this id. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
insertRow (Insert Row Showing)	A Boolean value indicating whether the insert row is showing. True when the insert row is showing, false otherwise. The insert row should only be shown if the table has no data. Note: When a user clicks the insert row in the UI, it provides them an easy way to enter data into a table. The possible values for this attribute are defined by the XML Schema boolean datatype.
insertRowShift (Insert Row Shift)	A Boolean that indicates whether cells in the sheet had to be inserted when the insert row was shown for this table. True if the cells were shifted, false otherwise. Note: This happens when there are values in cells immediately below the table when the table is created and the insert row is shown. In this case blank cells for the insert row are inserted, and the existing values in the sheet are shifted down by one row to make room. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
name (Name)	A string representing the name of the table that is used to reference the table programmatically through the spreadsheet applications object model. This string shall be unique per table per sheet. It has the same length and character restrictions as for displayName. By default this should be the same as the table's `displayName`. This name should also be kept in synch with the `displayName` when the `displayName` is updated in the UI by the spreadsheet user. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
published (Published)	A Boolean representing whether this table is marked as published for viewing by a server based spreadsheet application. True if it should be viewed by the server spreadsheet application, false otherwise. Note: Such an application might only display objects from the workbook that are marked as published, thus being able to load and calculate the entire workbook but only show the specific items that are marked as published. This can allow the server spreadsheet rendering to provide a more restricted view of the workbook. The possible values for this attribute are defined by the XML Schema boolean datatype.
ref (Reference)	The range on the relevant sheet that the table occupies expressed using A1 style referencing. The reference shall include the totals row if it is shown. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
tableBorderDxfId (Table Border Format Id)	A zero based integer index into the differential formatting records <dxfs> in the styleSheet indicating what border formatting to apply to the borders of this table. The spreadsheet should fail to load if this index is out of bounds. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
tableType (Table Type)	An optional enumeration specifying the type or source of the table. Indicates whether the table is based off of an external data query, data in a worksheet, or from an xml data mapped to a worksheet. The possible values for this attribute are defined by the ST_TableType simple type (§3.18.80).
totalsRowBorderDxfId (Totals Row Border Format Id)	A zero based integer index into the differential formatting records <dxfs> in the styleSheet indicating what border formatting to apply to the totals row of this table. The spreadsheet should fail to load if this index is out of bounds.

Attributes	Description
	The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
totalsRowCellStyle (Totals Row Style)	A string representing the name of the cell style that is applied to the totals row cells of the table. If this string is missing or invalid, then the totals row style specified by the current table style should be applied. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
totalsRowCount (Totals Row Count)	An integer representing the number of totals rows that shall be shown at the bottom of the table. 0 means that the totals row is not shown. It is up to the spreadsheet application to determine if numbers greater than 1 are allowed. Unless the spreadsheet application has a feature where they may ever be more than one totals row, this number should not be higher than 1. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
totalsRowDxfId (Totals Row Format Id)	A zero based integer index into the differential formatting records <dxfs> in the styleSheet indicating which format to apply to the totals row of this table. The spreadsheet should fail to load if this index is out of bounds. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
totalsRowShown (Totals Row Shown)	A Boolean indicating whether the totals row has ever been shown in the past for this table. True if the totals row has been shown, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Table">
   <sequence>
      <element name="autoFilter" type="CT_AutoFilter" minOccurs="0" maxOccurs="1"/>
      <element name="sortState" type="CT_SortState" minOccurs="0" maxOccurs="1"/>
      <element name="tableColumns" type="CT_TableColumns" minOccurs="1" maxOccurs="1"/>
      <element name="tableStyleInfo" type="CT_TableStyleInfo" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="xsd:unsignedInt" use="required"/>
   <attribute name="name" type="ST_Xstring" use="optional"/>
   <attribute name="displayName" type="ST_Xstring" use="required"/>
   <attribute name="comment" type="ST_Xstring" use="optional"/>
   <attribute name="ref" type="ST_Ref" use="required"/>
   <attribute name="tableType" type="ST_TableType" use="optional" default="worksheet"/>
   <attribute name="headerRowCount" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute name="insertRow" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="insertRowShift" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="totalsRowCount" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="totalsRowShown" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="published" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="headerRowDxfId" type="ST_DxfId" use="optional"/>
   <attribute name="dataDxfId" type="ST_DxfId" use="optional"/>
   <attribute name="totalsRowDxfId" type="ST_DxfId" use="optional"/>
   <attribute name="headerRowBorderDxfId" type="ST_DxfId" use="optional"/>
   <attribute name="tableBorderDxfId" type="ST_DxfId" use="optional"/>
   <attribute name="totalsRowBorderDxfId" type="ST_DxfId" use="optional"/>
   <attribute name="headerRowCellStyle" type="ST_Xstring" use="optional"/>
   <attribute name="dataCellStyle" type="ST_Xstring" use="optional"/>
   <attribute name="totalsRowCellStyle" type="ST_Xstring" use="optional"/>
   <attribute name="connectionId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.5.1.3 tableColumn (Table Column)

An element representing a single column for this table.

Parent Elements
tableColumns (§3.5.1.4)

Child Elements	Subclause
calculatedColumnFormula (Calculated Column Formula)	§3.5.1.1
extLst (Future Feature Data Storage Area)	§3.2.10
totalsRowFormula (Totals Row Formula)	§3.5.1.6
xmlColumnPr (XML Column Properties)	§3.5.1.7

Attributes	Description

Attributes	Description
dataCellStyle (Data Area Style Name)	A string representing the name of the cell style that is applied to the cells in the data area of this table column. If this string is missing or invalid, then the data cell style specified by the current table style should be applied. This cell style should get precedence over the `dataCellStyle` defined by the `table`. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
dataDxfId (Data & Insert Row Format Id)	A zero based integer index into the differential formatting records <dxfs> in the styleSheet indicating which format to apply to the data area of this column. This formatting shall also apply to cells on the insert row for this column. The spreadsheet should fail to load if this index is out of bounds. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
headerRowCellStyle (Header Row Cell Style)	A string representing the name of the cell style that is applied to the header row cell of this column. If this string is missing or invalid, then header row style specified by the current table style should be applied. This cell style should get precedence over the `headerRowCellStyle` defined by the `table`. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
headerRowDxfId (Header Row Cell Format Id)	A zero based integer index into the differential formatting records <dxfs> in the styleSheet indicating which format to apply to the header cell of this column. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
id (Table Field Id)	An integer representing the unique identifier of this column. This shall be unique per table. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Column name)	A string representing the unique caption of the table column. This is what shall be displayed in the header row in the UI, and is referenced through functions. This name shall be unique per table. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
queryTableFieldId	An integer representing the query table field ID corresponding to this table column.

Attributes	Description
(Query Table Field Id)	The relationship between this table and the corresponding query table is expressed in _rels part for this table. Each queryTableField has a unique `id` attribute, and this `id` is what is referenced here. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
totalsRowCellStyle (Totals Row Style Name)	A string representing the name of the cell style that is applied to the Totals Row cell of this column. If this string is missing or invalid, then the totals row cell style specified by the current table style should be applied. This cell style should get precedence over the `totalsRowCellStyle` defined by the `table`. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
totalsRowDxfId (Totals Row Format Id)	A zero based integer index into the differential formatting records <dxfs> in the styleSheet indicating which format to apply to the totals row cell of this column. The spreadsheet shall not load if this index is out of bounds. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
totalsRowFunction (Totals Row Function)	An enumeration indicating which type of aggregation to show in the totals row cell for this column. The possible values for this attribute are defined by the ST_TotalsRowFunction simple type (§3.18.83).
totalsRowLabel (Totals Row Label)	A String to show in the totals row cell for this column. This string shall be ignored unless the `totalsRowFunction`="none" for this column, in which case it is displayed in the totals row. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
uniqueName (Unique Name)	An optional string representing the unique name of the table column. This string is used to bind the column to a field in an data table, so it shall should only be used when this table's `tableType` is `queryTable` or `xml`. This name shall be unique per table when it is used. For tables created from xml mappings, by default this should be the same as the name of the column, and should be kept in synch with the name of the column if that name is

Attributes	Description
	altered by the spreadsheet application. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableColumn">
   <sequence>
      <element name="calculatedColumnFormula" type="CT_TableFormula" minOccurs="0" maxOccurs="1"/>
      <element name="totalsRowFormula" type="CT_TableFormula" minOccurs="0" maxOccurs="1"/>
      <element name="xmlColumnPr" type="CT_XmlColumnPr" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="xsd:unsignedInt" use="required"/>
   <attribute name="uniqueName" type="ST_Xstring" use="optional"/>
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="totalsRowFunction" type="ST_TotalsRowFunction" use="optional" default="none"/>
   <attribute name="totalsRowLabel" type="ST_Xstring" use="optional"/>
   <attribute name="queryTableFieldId" type="xsd:unsignedInt" use="optional"/>
   <attribute name="headerRowDxfId" type="ST_DxfId" use="optional"/>
   <attribute name="dataDxfId" type="ST_DxfId" use="optional"/>
   <attribute name="totalsRowDxfId" type="ST_DxfId" use="optional"/>
   <attribute name="headerRowCellStyle" type="ST_Xstring" use="optional"/>
   <attribute name="dataCellStyle" type="ST_Xstring" use="optional"/>
   <attribute name="totalsRowCellStyle" type="ST_Xstring" use="optional"/>
</complexType>
```

3.5.1.4 tableColumns (Table Columns)

An element representing the collection of all table columns for this table.

Parent Elements
table (§3.5.1.2)

Child Elements	Subclause
tableColumn (Table Column)	§3.5.1.3

Attributes	Description
count (Column Count)	An integer representing the total count of how many columns there are in this Table. This count shall include both query-defined and user-defined columns. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableColumns">
   <sequence>
      <element name="tableColumn" type="CT_TableColumn" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.5.1.5 tableStyleInfo (Table Style)

This element describes which style is used to display this table, and specifies which portions of the table have the style applied.

Styles define set of formatting properties that may be easily referenced by cells or other objects in the spreadsheet application. A style can be applied to a table, but tables can define specific parts of the table that should not have the style applied independently of other table parts. For instance a table may not apply the row striping of the style, and may not show the style's formatting of the last column, but will apply the column striping and the formatting to the first column.

Parent Elements
table (§3.5.1.2)

Attributes	Description
name (Style Name)	A string representing the name of the table style to use with this table. If the style name isn't valid then the spreadsheet application should use default style. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
showColumnStripes (Show Column Stripes)	A Boolean indicating whether column stripe formatting is applied. True when style column stripe formatting is applied, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
showFirstColumn (Show First Column)	A Boolean indicating whether the first column in the table should have the style applied. True if the first column has the style applied, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
showLastColumn (Show Last Column)	A Boolean indicating whether the last column in the table should have the style applied. True if the last column has the style applied, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
showRowStripes (Show Row Stripes)	A Boolean indicating whether row stripe formatting is applied. True when style row stripe formatting is applied, false otherwise.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyleInfo">
    <attribute name="name" type="ST_Xstring" use="optional"/>
    <attribute name="showFirstColumn" type="xsd:boolean" use="optional"/>
    <attribute name="showLastColumn" type="xsd:boolean" use="optional"/>
    <attribute name="showRowStripes" type="xsd:boolean" use="optional"/>
    <attribute name="showColumnStripes" type="xsd:boolean" use="optional"/>
</complexType>
```

3.5.1.6 totalsRowFormula (Totals Row Formula)

This element contains a custom formula for aggregating values from the column.

Each tableColumn has a `totalsRowFunction` that can be used for simple aggregations such as average, standard deviation, min, max, count, and others. If a more custom calculation is desired, then this element should be used, and the `totalsRowFunction` shall be set to "`custom`".

Parent Elements
tableColumn (§3.5.1.3)

Attributes	Description
array (Array)	A Boolean value that indicates whether this formula is an array style formula. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableFormula">
    <simpleContent>
        <extension base="ST_Formula">
            <attribute name="array" type="xsd:boolean" default="false"/>
        </extension>
    </simpleContent>
</complexType>
```

3.5.1.7 xmlColumnPr (XML Column Properties)

An element defining the XML column properties for a column. This is only used for tables created from XML mappings.

[*Example*: Here is a simple example showing a table column that has an xmlColumPr.

```
<tableColumn id="1" uniqueName="SomeElement" name="SomeElement">
  <xmlColumnPr mapId="1" xpath="/xml/foo/element" xmlDataType="string"/>
</tableColumn>
```

end example]

Parent Elements
tableColumn (§3.5.1.3)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description

denormalized (Denormalized)	A Boolean that indicates whether the contents of the column have been filled down due to flattening. `True` if it has been filled down (denormilized), `false` otherwise.
	
	This should be used when an XML mapping parent value has many children, and both the parent and child fields are mapped to their own column in the table.
	
	[*Example*:
	`<Order ID="3">`
	`<Item>Milk</Item>`
	`<Item>Bread</Item>`
	`<Item>Cheese</Item>`
	`</Order>`
	
	The resulting table in the spreadsheet application would have two columns, the first with the item ID, filled down for each item in the table as follows:
	
	Item ID Item
	3 Milk
	3 Bread
	3 Cheese
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

mapId (XML Map Id)	An integer representing the ID of the XML map this table field is associated with. The XML map will be defined in the xml maps part, and the Map element should have the corresponding `id`. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
xmlDataType (XML Data Type)	An enumeration indicating which XML data type is used by this column. The possible values for this attribute are defined by the ST_XmlDataType simple type

Attributes	Description
	(§3.18.95).
xpath (XPath)	A string representing the XML path to the element this column is associated with. The spreadsheet application should support XPath limited to the following • The XPath is an absolute path to a simple-content element or attribute [*Example*: "/ns1:root/ns1:row/ns1:column1" is supported if 'column1' is a child-most node, but not "/ns1:root/ns1:row" for the same document since 'row' is not a child. *end example*] • The XPath does not express axes, but uses the default child axes [*Example*: "/ns1:root/ns1:row" is supported but not "/ns1:root/child::ns1:row *end example*] • An optional filter can be expressed at the end of the xpath [*Example*: "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported but not "/ns1:root/ns1:row[@foo='abc']/ns1:column1" *end example*] • The filter can only contain a single expression comparing a named attribute to a specific value • Filters are only supported on XPaths that resolve to a simple-content element (not attributes) • The named attribute must be defined as an attribute of the simple-content element • The attribute name must be preceded by the short-hand (@) symbol representing the axes 'attribute' [*Example*: "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported not "/ns1:root/ns1:row/ns1:column1[attribute::foo='abc']" *end example*] • An arbitrary amount of white-space can be embedded between filter tokens [*Example*: "/ns1:root/ns1:row/ns1:column1[@ foo='abc']" is valid

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_XmlColumnPr">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="mapId" type="xsd:unsignedInt" use="required"/>
   <attribute name="xpath" type="ST_Xstring" use="required"/>
   <attribute name="denormalized" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="xmlDataType" type="ST_XmlDataType" use="required"/>
</complexType>
```

3.5.2 Single Cell Tables

A single cell table is generated from an XML mapping. These really just look like regular cells to the spreadsheet user, but shall be implemented as Tables "under the covers."

These tables don't have the full set of properties that multi cell tables do. They only have the various XML properties, and core table properties (such as `id` and `name`) that are needed to create a table and XML mapping. For instance the formatting properties, totals row, and headers row don't exist for the single cell XML tables. The formatting for these cells is maintained in the style sheet.

3.5.2.1 singleXmlCell (Table Properties)

This element represents the table properties for a single cell XML table.

Parent Elements
singleXmlCells (§3.5.2.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
xmlCellPr (Cell Properties)	§3.5.2.3

Attributes	Description
connectionId (Connection ID)	An integer representing an ID to indicate which connection from the connections collection is used by this table. This is only used for tables that are based off of xml maps

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (Table Id)	An integer representing the unique identifier of the table. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
r (Reference)	An A1 cell style reference to the cell that the single cell xml table occupies. The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SingleXmlCell">
   <sequence>
      <element name="xmlCellPr" type="CT_XmlCellPr" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="xsd:unsignedInt" use="required"/>
   <attribute name="r" type="ST_CellRef" use="required"/>
   <attribute name="connectionId" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.5.2.2 singleXmlCells (Single Cells)

This element is a container for a collection of singleXmlCell tables.

Parent Elements
Root element of SpreadsheetML Single Cell Table Definitions part

Child Elements	Subclause
singleXmlCell (Table Properties)	§3.5.2.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SingleXmlCells">
   <sequence>
      <element name="singleXmlCell" type="CT_SingleXmlCell" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.5.2.3 xmlCellPr (Cell Properties)

This element stores the XML properties for the cell of a single cell xml table.

Parent Elements
singleXmlCell (§3.5.2.1)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
xmlPr (Column XML Properties)	§3.5.2.4

Attributes	Description
id (Table Field Id)	The unique identifier of the XML properties for the cell. This should always be set to the value of 1 since this id is always meant to be for a single cell xml table. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
uniqueName (Unique Table Name)	An optional string representing the unique name of the table column. By default this is the same as the name of the column. This should hold the name of the element or attribute that this cell is referring to in the XML. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_XmlCellPr">
   <sequence>
      <element name="xmlPr" type="CT_XmlPr" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="xsd:unsignedInt" use="required"/>
   <attribute name="uniqueName" type="ST_Xstring" use="optional"/>
</complexType>
```

3.5.2.4 xmlPr (Column XML Properties)

This element represents the column properties for single cell XML tables.

Parent Elements
xmlCellPr (§3.5.2.3)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description

Attributes	Description
mapId (XML Map Id)	An integer representing the ID of the XML map this table field is associated with. The XML map will be defined in the xml maps part, and the Map element should have the corresponding id. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
xmlDataType (XML Data Type)	An enumeration indicating which XML data type is used by this column. The possible values for this attribute are defined by the ST_XmlDataType simple type (§3.18.95).
xpath (XPath)	A string representing the XML path to the element this column is associated with. The spreadsheet application should support XPath limited to the following: • The XPath is an absolute path to a simple-content element or attribute [*Example*: "/ns1:root/ns1:row/ns1:column1" is supported if 'column1' is a child-most node, but not "/ns1:root/ns1:row" for the same document since 'row' is not a child. *end example*] • The XPath does not express axes, but uses the default child axes [*Example*: "/ns1:root/ns1:row" is supported but not "/ns1:root/child::ns1:row *end example*] • An optional filter can be expressed at the end of the xpath [*Example*: "/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported but not "/ns1:root/ns1:row[@foo='abc']/ns1:column1" *end example*] • The filter can only contain a single expression comparing a named attribute to a specific value • Filters are only supported on XPaths that resolve to a simple-content element (not attributes) • The named attribute must be defined as an attribute of the simple-content element • The attribute name must be preceded by the short-hand (@) symbol representing the axes 'attribute' [*Example*:

Attributes	Description
	"/ns1:root/ns1:row/ns1:column1[@foo='abc']" is supported not "/ns1:root/ns1:row/ns1:column1[attribute::foo='abc']" *end example*] • An arbitrary amount of white-space can be embedded between filter tokens [*Example*: "/ns1:root/ns1:row/ns1:column1[@ foo='abc']" is valid *end example*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_XmlPr">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="mapId" type="xsd:unsignedInt" use="required"/>
   <attribute name="xpath" type="ST_Xstring" use="required"/>
   <attribute name="xmlDataType" type="ST_XmlDataType" use="required"/>
</complexType>
```

3.6 Calculation Chain

The cells in a workbook can be calculated in different orders depending on various optimizations and dependencies. The calculation chain specifies the order in which the cells in a workbook were last calculated.

The calculation chain only deals with cells that require calculation - i.e., it only deals with cells that contain formulas. It does not track or express dependencies amongst the formulas, but rather only records the order in which the cells were last calculated.

The calculation chain order may change over time. One obvious way this can happen is that new formulas can be added, formulas can be removed or updated. The spreadsheet application may also optionally implement partial calculation as an optimization. Partial calculation is when the spreadsheet only recalculates cells that have had their dependencies or values changed. This way, when a number in a cell is changed, requiring an update to a dependent formula, only the cells that are affected by the update will be recalculated, as opposed to recalculating the entire workbook.

The calculation chain described in this section is not required by the spreadsheet application, but can be used if the spreadsheet application finds it useful. It can be loaded by a spreadsheet application, or the application may optionally construct it at run time in memory based on formula dependencies. Since the xml data described in this section is not strictly required, the spreadsheet application is free to ignore the order in which the calculation chain specifies calculations - i.e., even if the calculation chain is loaded, the spreadsheet application is free to perform calculations in a different order at run time.

[*Example*:

Consider the following workbook (the formulas shown instead of cell values):

	A	B	C	D	E
1	1	=A1	=B1+A1	=C1+B1+A1	=D1+C1+B1+A1
2					
3					
4					
5	1	=A5	=B5+A5	=C5+B5+A5	=D5+C5+B5+A5
6					
7					

There is a constant entered in A1 and A5, and next to each of those cells are a series of cells which contain formulas that depend on those cells.

After entering the cells on the first row, and then the cells on the 5th row, the calc chain xml looks like this:

```
<calcChain xmlns="http://schemas.openxmlformats.org/spreadsheetml/2006/5/main">
  <c r="E5" i="1"/>
  <c r="D5"/>
  <c r="C5"/>
  <c r="B5"/>
  <c r="E1"/>
  <c r="D1"/>
  <c r="C1"/>
  <c r="B1"/>
</calcChain>
```

It is in this order because B1 was calced first (it was the first formula enterd in the workbook), followed by C1, D1, and so on. Then B5 was entered in the 5th row, followed by the other cells in the 5th row, ending with E5.

But, after a full recalculation, the spreadsheet application has realized that cells B5:E5 are on the same child chain, and cells B1:E1 are likewise on their own child chain. The xml now looks like this:

```
<calcChain xmlns="http://schemas.openxmlformats.org/spreadsheetml/2006/5/main">
  <c r="B1" i="1"/>
  <c r="C1" s="1"/>
  <c r="D1" s="1"/>
  <c r="E1" s="1"/>
  <c r="B5"/>
  <c r="C5" s="1"/>
  <c r="D5" s="1"/>
  <c r="E5" s="1"/>
</calcChain>
```

end example]

3.6.1 c (Cell)

This element represents a single cell, which shall contain a formula, in the calc chain. Cell's are calculated in the same order as c attribute is listed in the xml, starting from the top.

Parent Elements
calcChain (§3.6.2)

Attributes	Description
a (Array)	A Boolean flag indicating whether the cell's formula is an array formula. True if this cell's formula is an array entered formula, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
i (Sheet Id)	A sheet Id of a sheet the cell belongs to. If this is omitted, it is assumed to be the same as the i value of the previous cell. The possible values for this attribute are defined by the XML Schema int datatype.
l (New Dependency Level)	A Boolean flag indicating that the cell's formula starts a new dependency level. True if the formula starts a new dependency level, false otherwise. Starting a new dependency level means that all concurrent calculations, and child calculations, must be completed - and the cells have new values - before the calc chain can continue. In other words, this dependency level may depend on levels that came before it, and any later dependency levels may depend on this level; but not later dependency levels can have any calculations started until this dependency level completes. The possible values for this attribute are defined by the XML Schema boolean datatype.
r (Cell Reference)	An A-1 style reference to a cell. The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
s (Child Chain)	A Boolean flag indicating whether the cell's formula is on a child chain. True if this cell is part of a child chain, false otherwise. If this is omitted, it is assumed to be the same as the s value of the previous cell . A child chain is a list of calculations that occur which depend on the parent to the chain. There shall not be cross dependencies between child chains. Child chains are not the same as dependency levels - a child chain and its parent are all on the same dependency level. Child chains are series of calculations that can be independently farmed out to other threads or processors. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
t (New Thread)	A Boolean flag indicating whether the cell's formula starts a new thread. True if the cell's formula starts a new thread, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalcCell">
   <attribute name="r" type="ST_CellRef" use="required"/>
   <attribute name="i" type="xsd:int" use="optional" default="0"/>
   <attribute name="s" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="l" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="t" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="a" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.6.2 calcChain (Calculation Chain Info)

This element represents the root of the calculation chain.

Parent Elements
Root element of SpreadsheetML Calculation Chain part

Child Elements	Subclause
c (Cell)	§3.6.1
extLst (Future Feature Data Storage Area)	§3.2.10

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalcChain">
   <sequence>
      <element name="c" type="CT_CalcCell" minOccurs="1" maxOccurs="unbounded"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
</complexType>
```

3.7 Comments

A comment is a rich text note that is attached to & associated with a cell, separate from other cell content. Comment content is stored separate from the cell, and is displayed in a drawing object (like a text box) that is separate from, but associated with, a cell. Comments are used as reminders, such as noting how a complex formula works, or to provide feedback to other users. Comments can also be used to explain assumptions made in a formula or to call out something special about the cell.

[*Example*:

```
<comments>
  <authors>
    <author>Bob</author>
    <author>CBR</author>
  </authors>
  <commentList>
    <comment ref="D4" authorId="0">
      <text>
        <r>
          <rPr>
            <b/>
            <sz val="8"/>
            <color indexed="81"/>
            <rFont val="Calibri"/>
            <charset val="1"/>
            <scheme val="minor"/>
          </rPr>
          <t>Bob:</t>
        </r>
        <r>
          <rPr>
            <sz val="8"/>
           <color indexed="81"/>
           <rFont val="Calibri"/>
           <charset val="1"/>
           <scheme val="minor"/>
         </rPr>
         <t xml:space="preserve">Why such high expense?</t>
        </r>
     </text>
    </comment>
  </commentList>
</comments>
```

end example]

This xml sample displays a comment by "Bob" (bolded) that says, "Why such high expense?" (non bolded).

3.7.1 author (Author)

This element holds a string representing the name of a single author of comments. Every comment must have an author. The maximum length of the author string is an implementation detail, but a good guideline is 255 chars.

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
authors (§3.7.2)

3.7.2 authors (Authors)

This element is a container that holds a list of comment author names. There may be many comment authors per sheet, but each author name must be unique per sheet. The information for each author is stored only once for that sheet, and comments refer to the author by zero based index.

Note that there can be multiple lists of authors per workbook since each sheet contains its own comments part, and each comments part defines a list of authors for comments on that sheet.

Parent Elements
comments (§3.7.5)

Child Elements	Subclause
author (Author)	§3.7.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Authors">
   <sequence>
      <element name="author" type="ST_Xstring" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.7.3 comment (Comment)

This element represents a single user entered comment.. Each comment shall have an author and can optionally contain richly formatted text.

Parent Elements
commentList (§3.7.4)

Child Elements	Subclause
text (Comment Text)	§3.7.6

Attributes	Description
authorId (Author Id)	Required. An unsigned integer which is used as the zero based index into the list of authors for this set of comments. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
guid (Unique Identifier for Comment)	Unique identifier for this comment. The attribute is required and shall be unique across all comments in shared workbooks. The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
ref (Cell Reference)	Required. A string that serves as the A1 style reference to the cell that the comment is associated with. May only reference a single cell, not a range of cells, since comments are on a per cell basis. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Comment">
   <sequence>
      <element name="text" type="CT_Rst" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="ref" type="ST_Ref" use="required"/>
   <attribute name="authorId" type="xsd:unsignedInt" use="required"/>
   <attribute name="guid" type="ST_Guid" use="optional"/>
</complexType>
```

3.7.4 commentList (List of Comments)

This element is a container that holds a list of comments for the sheet.

Parent Elements
comments (§3.7.5)

Child Elements	Subclause
comment (Comment)	§3.7.3

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommentList">
   <sequence>
      <element name="comment" type="CT_Comment" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.7.5 comments (Comments)

This element is the root container of a set of comments and comment authors for a particular sheet. Each set of comments for a sheet is stored in a separate xml part. The relationship part for a sheet defines a link to the correct comment part for that sheet.

Parent Elements

Parent Elements
Root element of SpreadsheetML Comments part

Child Elements	Subclause
authors (Authors)	§3.7.2
commentList (List of Comments)	§3.7.4
extLst (Future Feature Data Storage Area)	§3.2.10

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Comments">
    <sequence>
        <element name="authors" type="CT_Authors" minOccurs="1" maxOccurs="1"/>
        <element name="commentList" type="CT_CommentList" minOccurs="1" maxOccurs="1"/>
        <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
    </sequence>
</complexType>
```

3.7.6 text (Comment Text)

This element contains rich text which represents the text of a comment. The maximum length for this text is a spreadsheet application implementation detail. A recommended guideline is 32767 chars.

Parent Elements
comment (§3.7.3)

Child Elements	Subclause
phoneticPr (Phonetic Properties)	§3.4.3
r (Rich Text Run)	§3.4.4
rPh (Phonetic Run)	§3.4.6
t (Text)	§3.4.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rst">
    <sequence>
        <element name="t" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
        <element name="r" type="CT_RElt" minOccurs="0" maxOccurs="unbounded"/>
        <element name="rPh" type="CT_PhoneticRun" minOccurs="0" maxOccurs="unbounded"/>
        <element name="phoneticPr" minOccurs="0" maxOccurs="1" type="CT_PhoneticPr"/>
    </sequence>
</complexType>
```

3.8 Styles

This subclause specifies the possible formatting information for the contents of the cells on a sheet in a SpreadsheetML document.

3.8.1 alignment (Alignment)

Formatting information pertaining to text alignment in cells. There are a variety of choices for how text is aligned both horizontally and vertically, as well as indentation settings, and so on.

Parent Elements
dxf (§3.8.14); ndxf (§3.11.1.4); odxf (§3.11.1.6); xf (§3.8.45)

Attributes	Description
horizontal (Horizontal Alignment)	Specifies the type of horizontal alignment in cells. The possible values for this attribute are defined by the ST_HorizontalAlignment simple type (§3.18.42).
indent (Indent)	An integer value, where an increment of 1 represents 3 spaces. Indicates the number of spaces (of the normal style font) of indentation for text in a cell. The number of spaces to indent is calculated as following: Number of spaces to indent = indent value * 3 [*Example*: For example, an indent value of '1' means that the text begins 3 space widths (of the normal style font) from the edge of the cell. *end example*] [*Note*: The width of one space character is defined by the font. *end note*] Only `left`, `right`, and `distributed` horizontal alignments are supported. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
justifyLastLine (Justify Last Line)	A boolean value indicating if the cells justified or distributed alignment should be used on the last line of text. (This is typical for East Asian alignments but not typical in other contexts.) The possible values for this attribute are defined by the XML Schema boolean datatype.
readingOrder	An integer value indicating whether the reading order (bidirectionality) of the cell is left-

Attributes	Description
(Reading Order)	to-right, right-to-left, or context dependent. 0 - Context Dependent 1 - Left-to-Right 2 - Right-to-Left The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
relativeIndent (Relative Indent)	An integer value (used only in a dxf element) to indicate the additional number of spaces of indentation to adjust for text in a cell. The possible values for this attribute are defined by the XML Schema int datatype.
shrinkToFit (Shrink To Fit)	A boolean value indicating if the displayed text in the cell should be shrunk to fit the cell width. Not applicable when a cell contains multiple lines of text. The possible values for this attribute are defined by the XML Schema boolean datatype.
textRotation (Text Rotation)	Text rotation in cells. Expressed in degrees. Values range from 0 to 180. The first letter of the text is considered the center-point of the arc. For 0 - 90, the value represents degrees above horizon. For 91-180 the degrees below the horizon is calculated as: [degrees below horizon] = 90 - textRotation. 0  45  90

Attributes	Description
	 135  180  The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
vertical (Vertical Alignment)	Vertical alignment in cells. The possible values for this attribute are defined by the ST_VerticalAlignment simple

Attributes	Description
	type (§3.18.89).
wrapText (Wrap Text)	A boolean value indicating if the text in a cell should be line-wrapped within the cell. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellAlignment">
   <attribute name="horizontal" type="ST_HorizontalAlignment" use="optional"/>
   <attribute name="vertical" type="ST_VerticalAlignment" use="optional"/>
   <attribute name="textRotation" type="xsd:unsignedInt" use="optional"/>
   <attribute name="wrapText" type="xsd:boolean" use="optional"/>
   <attribute name="indent" type="xsd:unsignedInt" use="optional"/>
   <attribute name="relativeIndent" type="xsd:int" use="optional"/>
   <attribute name="justifyLastLine" type="xsd:boolean" use="optional"/>
   <attribute name="shrinkToFit" type="xsd:boolean" use="optional"/>
   <attribute name="readingOrder" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.2 b (Bold)

Displays characters in bold face font style.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is `true`. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.8.3 bgColor (Background Color)

Background color of the cell fill pattern. Cell fill patterns operate with two colors: a background color and a foreground color. These combine together to make a patterned cell fill.

Parent Elements
patternFill (§3.8.32)

Attributes	Description
auto (Automatic)	A boolean value indicating the color is automatic and system color dependent. The possible values for this attribute are defined by the XML Schema boolean datatype.
indexed (Index)	Indexed color value. Only used for backwards compatibility. References a color in indexedColors. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rgb (Alpha Red Green Blue Color Value)	Standard Alpha Red Green Blue color value (ARGB). The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
theme (Theme Color)	Index into the <clrScheme> collection, referencing a particular <sysClr> or <srgbClr> value expressed in the Theme part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
tint (Tint)	Specifies the tint value applied to the color. If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied. The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change. In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255. [*Example*: Here are some examples of how to apply tint to color: **If (tint < 0)** Lum' = Lum * (1.0 + tint) For example: Lum = 200; tint = -0.5; Darken 50% Lum‘ = 200 * (0.5) => 100 For example: Lum = 200; tint = -1.0; Darken 100% (make black) Lum‘ = 200 * (1.0-1.0) => 0 **If (tint > 0)** Lum‘ = Lum * (1.0-tint) + (HLSMAX – HLSMAX * (1.0-tint)) For example: Lum = 100; tint = 0.75; Lighten 75%

Attributes	Description
	Lum‘ = 100 * (1-.75) + (HLSMAX – HLSMAX*(1-.75)) = 100 * .25 + (255 – 255 * .25) = 25 + (255 – 63) = 25 + 192 = 217 For example: Lum = 100; tint = 1.0; Lighten 100% (make white) Lum‘ = 100 * (1-1) + (HLSMAX – HLSMAX*(1-1)) = 100 * 0 + (255 – 255 * 0) = 0 + (255 – 0) = 255 *end example*] The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <attribute name="auto" type="xsd:boolean" use="optional"/>
   <attribute name="indexed" type="xsd:unsignedInt" use="optional"/>
   <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="theme" type="xsd:unsignedInt" use="optional"/>
   <attribute name="tint" type="xsd:double" use="optional" default="0.0"/>
</complexType>
```

3.8.4 border (Border)

Expresses a single set of cell border formats (left, right, top, bottom, diagonal). Color is optional. When missing, 'automatic' is implied.

Parent Elements
borders (§3.8.5); dxf (§3.8.14); ndxf (§3.11.1.4); odxf (§3.11.1.6)

Child Elements	Subclause
bottom (Bottom Border)	§3.8.6
diagonal (Diagonal)	§3.8.13
horizontal (Horizontal Inner Borders)	§3.8.24
left (Left Border)	§3.8.27
right (Right Border)	§3.8.35
top (Top Border)	§3.8.43
vertical (Vertical Inner Border)	§3.8.44

Attributes	Description
diagonalDown	A boolean value indicating if the cell's diagonal border includes a diagonal line, starting at

Attributes	Description
(Diagonal Down)	the top left corner of the cell and moving down to the bottom right corner of the cell. [*Example*: This example shows a thin diagonal down line:  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
diagonalUp (Diagonal Up)	A boolean value indicating if the cell's diagonal border includes a diagonal line, starting at the bottom left corner of the cell and moving up to the top right corner of the cell. [*Example*: This example shows a thin diagonal up line:  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
outline (Outline)	A boolean value indicating if left, right, top, and bottom borders should be applied only to outside borders of a cell range. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
   <sequence>
      <element name="left" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
      <element name="right" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
      <element name="top" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
      <element name="bottom" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
      <element name="diagonal" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
      <element name="vertical" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
      <element name="horizontal" type="CT_BorderPr" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="diagonalUp" type="xsd:boolean" use="optional"/>
   <attribute name="diagonalDown" type="xsd:boolean" use="optional"/>
   <attribute name="outline" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.8.5 borders (Borders)

This element contains borders formatting information, specifying all border definitions for all cells in the workbook.

[*Example*: In this example the first border definition specifies that there are no borders, the second definition specifies that a there is a thin bottom border and medium right border, and the third definition specifies that there is a double top border.

```
<borders count="3">
  <border>
    <left/>
    <right/>
    <top/>
    <bottom/>
    <diagonal/>
  </border>
  <border>
    <left/>
    <right style="medium">
      <color indexed="64"/>
    </right>
    <top/>
    <bottom style="thin">
      <color indexed="64"/>
    </bottom>
    <diagonal/>
  </border>
```

```
    <border>
      <left/>
      <right/>
      <top style="double">
        <color auto="1"/>
      </top>
      <bottom/>
      <diagonal/>
    </border>
  </borders>
```

end example]

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
border (Border)	§3.8.4

Attributes	Description
count (Border Count)	Count of border elements. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Borders">
   <sequence>
      <element name="border" type="CT_Border" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.6 bottom (Bottom Border)

This element specifies the color and line style for the bottom border of a cell.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
   <sequence>
      <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

3.8.7 cellStyle (Cell Style)

This element expresses the name and related formatting records for a named cell style in this workbook.

The built-in cell styles are written here by name, but the corresponding formatting records are assumed rather than explicitly written. Following is a listing of each of the built-in cell style definitions, whose normative definition is in Annex D. Also following is a table mapping the builtinId value to the cell style name.

For all built-in cell styles, the builtinId determines the style, not the name. For all cell styles, Normal is applied by default.

builtinId	Cell Style Name	[*Example*: (informative)
0	Normal	1	RowLevel_ + level #	Depends on level: 1 =  2 =  3 =  4 =  5 =  6 = 
builtinId	Cell Style Name	[*Example*: (informative)
		7 = RowLevel_7
2	ColLevel_ + level #	Depends on level: 1 = **ColLevel_1** 2 = *ColLevel_2* 3 = ColLevel_3 4 = ColLevel_4 5 = ColLevel_5 6 = ColLevel_6 7 = ColLevel_7
3	Comma	1,234.00
4	Currency	$1,234.00
5	Percent	123400%
6	Comma [0]	1,234
7	Currency [0]	$ 1,234
8	Hyperlink	hyperlink
9	Followed Hyperlink	followed hyperlink
10	Note	Cell Style
11	Warning Text	Cell Style

builtinId	Cell Style Name	[*Example*: (informative)
15	Title	
16	Heading 1	
17	Heading 2	
18	Heading 3	
19	Heading 4	
20	Input	21	Output	22	Calculation	
23	Check Cell	
24	Linked Cell	
25	Total	26	Good	27	Bad	28	Neutral	29	Accent1	30	20% - Accent1	
builtinId	Cell Style Name	[*Example*: (informative)
31	40% - Accent1	32	60% - Accent1	33	Accent2	
34	20% - Accent2	35	40% - Accent2	36	60% - Accent2	
37	Accent3	
38	20% - Accent3	39	40% - Accent3	40	60% - Accent3	
41	Accent4	
42	20% - Accent4	43	40% - Accent4	44	60% - Accent4	45	Accent5	
46	20% - Accent5	47	40% - Accent5	
builtinId	Cell Style Name	[*Example*: (informative)
48	60% - Accent5	
49	Accent6	
50	20% - Accent6	51	40% - Accent6	52	60% - Accent6	
53	Explanatory Text	

Parent Elements
cellStyles (§3.8.8)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
builtinId (Built-In Style Id)	The index of a built-in cell style: The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
customBuiltin (Custom Built In)	True indicates that this built-in cell style has been customized. By default built-in styles are not persisted when not in use. This flag indicates that a built-in style has been modified, and therefore should be saved with the workbook, even if not currently in use. The possible values for this attribute are defined by the XML Schema boolean datatype.
hidden (Hidden Style)	If `'true'` do not show this style in the application UI. The possible values for this attribute are defined by the XML Schema boolean datatype.
iLevel (Outline Style)	Indicates that this formatting is for an outline style . When styles are applied to outline levels (using the outline feature), this value is set and the formatting specified on this cell

Attributes	Description
	style is applied to the corresponding level of the outline. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (User Defined Cell Style)	The name of the cell style. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
xfId (Format Id)	Zero-based index referencing an xf record in the cellStyleXfs collection. This is used to determine the formatting defined for this named cell style. The possible values for this attribute are defined by the ST_CellStyleXfId simple type (§3.18.11).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellStyle">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="ST_Xstring" use="optional"/>
   <attribute name="xfId" type="ST_CellStyleXfId" use="required"/>
   <attribute name="builtinId" type="xsd:unsignedInt" use="optional"/>
   <attribute name="iLevel" type="xsd:unsignedInt" use="optional"/>
   <attribute name="hidden" type="xsd:boolean" use="optional"/>
   <attribute name="customBuiltin" type="xsd:boolean" use="optional"/>
</complexType>
```

3.8.8 cellStyles (Cell Styles)

This element contains the named cell styles, consisting of a sequence of named style records. A named cell style is a collection of direct or themed formatting (e.g., cell border, cell fill, and font type/size/style) grouped together into a single named style, and can be applied to a cell.

[*Example*: For example, "Normal", "Heading 1", "Title", and "20% Accent1" are named cell styles expressed below. They have builtInId's associated with them, and use xfId to reference the specific formatting elements pertaining to the particular style. The xfId is a zero-based index, referencing an xf record in the cellStyleXfs collection.

```
<cellStyles count="4">
  <cellStyle name="20% - Accent1" xfId="3" builtinId="30"/>
  <cellStyle name="Heading 1" xfId="2" builtinId="16"/>
  <cellStyle name="Normal" xfId="0" builtinId="0"/>
  <cellStyle name="Title" xfId="1" builtinId="15"/>
</cellStyles>
```

end example]

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
cellStyle (Cell Style)	§3.8.7

Attributes	Description
count (Style Count)	Count of style elements. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellStyles">
   <sequence>
      <element name="cellStyle" type="CT_CellStyle" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.9 cellStyleXfs (Formatting Records)

This element contains the master formatting records (xf's) which define the formatting for all named cell styles in this workbook. Master formatting records reference individual elements of formatting (e.g., number format, font definitions, cell fills, etc) by specifying a zero-based index into those collections. Master formatting records also specify whether to apply or ignore particular aspects of formatting, for example whether to apply a border or not.

A cell can have both direct formatting (e.g., bold) and a cell style (e.g., Explanatory) applied to it. Therefore, both the cell style xf records and cell xf records must be read to understand the full set of formatting applied to a cell.

[*Example*: This example shows 4 master formatting records, each defining formatting for a named cell style (expressed in the cellStyles collection). Note that 0th record does not express any "apply" attributes, while the other records do express "apply" attribute values. For example, the last record specifies that number format, alignment, and protection formatting will not be applied to the cell, even when that information is specified in related formatting records.

```
<cellStyleXfs count="4">
  <xf numFmtId="0" fontId="0" fillId="0" borderId="0"/>
  <xf numFmtId="0" fontId="2" fillId="0" borderId="0" applyNumberFormat="0"
    applyFill="0" applyBorder="0" applyAlignment="0" applyProtection="0"/>
  <xf numFmtId="0" fontId="3" fillId="0" borderId="1" applyNumberFormat="0"
    applyFill="0" applyAlignment="0" applyProtection="0"/>
```

```
    <xf numFmtId="0" fontId="4" fillId="2" borderId="2" applyNumberFormat="0"
      applyAlignment="0" applyProtection="0"/>
  </cellStyleXfs>
```

end example]

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
xf (Format)	§3.8.45

Attributes	Description
count (Style Count)	Count of cell style (xf) elements. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellStyleXfs">
   <sequence>
      <element name="xf" type="CT_Xf" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.10 cellXfs (Cell Formats)

This element contains the master formatting records (xf) which define the formatting applied to cells in this workbook. These records are the starting point for determining the formatting for a cell. Cells in the Sheet Part reference the xf records by zero-based index.

A cell can have both direct formatting (e.g., bold) and a cell style (e.g., Explanatory) applied to it. Therefore, both the cell style xf records and cell xf records must be read to understand the full set of formatting applied to a cell.

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
xf (Format)	§3.8.45

Attributes	Description
count (Format Count)	Count of xf elements. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellXfs">
   <sequence>
      <element name="xf" type="CT_Xf" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.11 colors (Colors)

Color information associated with this stylesheet. This collection is written whenever the legacy color palette has been modified (backwards compatibility settings) or a custom color has been selected while using this workbook.

When the color palette is modified, the indexedColors collection is written. When a custom color has been selected, the mruColors collection is written.

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
indexedColors (Color Indexes)	§3.8.26
mruColors (MRU Colors)	§3.8.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Colors">
   <sequence>
      <element name="indexedColors" type="CT_IndexedColors" minOccurs="0" maxOccurs="1"/>
      <element name="mruColors" type="CT_MRUColors" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.8.12 condense (Condense)

Macintosh compatibility setting. Represents special word/character rendering on Macintosh, when this flag is set. The effect is to condense the text (squeeze it together). SpreadsheetML applications are not required to render according to this flag.

Parent Elements

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is `true`. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.8.13 diagonal (Diagonal)

This element specifies the color and line style for the diagonal border(s) of a cell, possibly including diagonally up and diagonally down. The line style for diagonal up and diagonal down lines must be the same.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
   <sequence>
      <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

3.8.14 dxf (Formatting)

A single dxf record, expressing incremental formatting to be applied.

Parent Elements
dxfs (§3.8.15); rfmt (§3.11.1.17)

Child Elements	Subclause
alignment (Alignment)	§3.8.1
border (Border)	§3.8.4
extLst (Future Feature Data Storage Area)	§3.2.10
fill (Fill)	§3.8.19
font (Font)	§3.8.21
numFmt (Number Format)	§3.8.30
protection (Protection Properties)	§3.8.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dxf">
   <sequence>
      <element name="font" type="CT_Font" minOccurs="0" maxOccurs="1"/>
      <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="1"/>
      <element name="fill" type="CT_Fill" minOccurs="0" maxOccurs="1"/>
      <element name="alignment" type="CT_CellAlignment" minOccurs="0" maxOccurs="1"/>
      <element name="border" type="CT_Border" minOccurs="0" maxOccurs="1"/>
      <element name="protection" type="CT_CellProtection" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.8.15 dxfs (Formats)

This element contains the master differential formatting records (dxf's) which define formatting for all non-cell formatting in this workbook. Whereas xf records fully specify a particular aspect of formatting (e.g., cell borders) by referencing those formatting definitions elsewhere in the Styles part, dxf records specify incremental (or differential) aspects of formatting directly inline within the dxf element. The dxf formatting is to be applied on top of or in addition to any formatting already present on the object using the dxf record.

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
dxf (Formatting)	§3.8.14

Attributes	Description

Attributes	Description
count (Format Count)	Count of dxf elements. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dxfs">
   <sequence>
      <element name="dxf" type="CT_Dxf" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.16 extend (Extend)

This element specifies a compatibility setting used for previous spreadsheet applications, resulting in special word/character rendering on those legacy applications, when this flag is set. The effect extends or stretches out the text. SpreadsheetML applications are not required to render according to this flag.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is `true`. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.8.17 family (Font Family)

The font family this font belongs to. A font family is a set of fonts having common stroke width and serif characteristics. This is system level font information. The font name overrides when there are conflicting values.

Value	Font Family
0	Not applicable.
1	Roman
2	Swiss

Value	Font Family
3	Modern
4	Script
5	Decorative

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	The value of an integer, where each value corresponds to a different character set. Valid values are 0 to 255. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IntProperty">
   <attribute name="val" type="xsd:int" use="required"/>
</complexType>
```

3.8.18 fgColor (Foreground Color)

Foreground color of the cell fill pattern. Cell fill patterns operate with two colors: a background color and a foreground color. These combine together to make a patterned cell fill.

Parent Elements
patternFill (§3.8.32)

Attributes	Description
auto (Automatic)	A boolean value indicating the color is automatic and system color dependent. The possible values for this attribute are defined by the XML Schema boolean datatype.
indexed (Index)	Indexed color value. Only used for backwards compatibility. References a color in indexedColors. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rgb (Alpha Red Green Blue Color Value)	Standard Alpha Red Green Blue color value (ARGB). The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).

Attributes	Description
theme (Theme Color)	Index into the <clrScheme> collection, referencing a particular <sysClr> or <srgbClr> value expressed in the Theme part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
tint (Tint)	Specifies the tint value applied to the color. If tint is supplied, then it is applied to the RGB value of the color to determine the final color applied. The tint value is stored as a double from -1.0 .. 1.0, where -1.0 means 100% darken and 1.0 means 100% lighten. Also, 0.0 means no change. In loading the RGB value, it is converted to HLS where HLS values are (0..HLSMAX), where HLSMAX is currently 255. [*Example*: Here are some examples of how to apply tint to color: **If (tint < 0)** Lum' = Lum * (1.0 + tint) For example: Lum = 200; tint = -0.5; Darken 50% Lum‘ = 200 * (0.5) => 100 For example: Lum = 200; tint = -1.0; Darken 100% (make black) Lum‘ = 200 * (1.0-1.0) => 0 **If (tint > 0)** Lum‘ = Lum * (1.0-tint) + (HLSMAX – HLSMAX * (1.0-tint)) For example: Lum = 100; tint = 0.75; Lighten 75% Lum‘ = 100 * (1-.75) + (HLSMAX – HLSMAX*(1-.75)) = 100 * .25 + (255 – 255 * .25) = 25 + (255 – 63) = 25 + 192 = 217 For example: Lum = 100; tint = 1.0; Lighten 100% (make white) Lum‘ = 100 * (1-1) + (HLSMAX – HLSMAX*(1-1)) = 100 * 0 + (255 – 255 * 0) = 0 + (255 – 0) = 255 *end example*] The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
    <attribute name="auto" type="xsd:boolean" use="optional"/>
    <attribute name="indexed" type="xsd:unsignedInt" use="optional"/>
    <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
    <attribute name="theme" type="xsd:unsignedInt" use="optional"/>
    <attribute name="tint" type="xsd:double" use="optional" default="0.0"/>
</complexType>
```

3.8.19 fill (Fill)

This element specifies fill formatting.

Parent Elements
dxf (§3.8.14); fills (§3.8.20); ndxf (§3.11.1.4); odxf (§3.11.1.6)

Child Elements	Subclause
gradientFill (Gradient)	§3.8.23
patternFill (Pattern)	§3.8.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Fill">
    <choice minOccurs="1" maxOccurs="1">
        <element name="patternFill" type="CT_PatternFill" minOccurs="0" maxOccurs="1"/>
        <element name="gradientFill" type="CT_GradientFill" minOccurs="0" maxOccurs="1"/>
    </choice>
</complexType>
```

3.8.20 fills (Fills)

This element defines the cell fills portion of the Styles part, consisting of a sequence of fill records. A cell fill consists of a background color, foreground color, and pattern to be applied across the cell.

[*Example*: This cell has a yellow fill:

This is the corresponding XML:

```
<fill>
  <patternFill patternType="solid">
    <fgColor rgb="FFFFFF00"/>
    <bgColor indexed="64"/>
  </patternFill>
</fill>
```

This cell has a yellow fill with a thin horizontal crosshatch pattern applied (patternType = `lightGrid`):

This is the corresponding XML:

```
<fill>
  <patternFill patternType="lightGrid">
  <bgColor rgb="FFFFFF00"/>
  </patternFill>
</fill>
```

end example]

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
fill (Fill)	§3.8.19

Attributes	Description
count (Fill Count)	Count of fill elements. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Fills">
   <sequence>
      <element name="fill" type="CT_Fill" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.21 font (Font)

This element defines the properties for one of the fonts used in this workbook.

Parent Elements
dxf (§3.8.14); fonts (§3.8.22); ndxf (§3.11.1.4); odxf (§3.11.1.6)

Child Elements	Subclause

Child Elements	Subclause
b (Bold)	§3.8.2
charset (Character Set)	§3.4.1
color (Data Bar Color)	§3.3.1.14
condense (Condense)	§3.8.12
extend (Extend)	§3.8.16
family (Font Family)	§3.8.17
i (Italic)	§3.8.25
name (Font Name)	§3.8.29
outline (Outline)	§3.4.2
scheme (Scheme)	§3.8.36
shadow (Shadow)	§3.8.37
strike (Strike Through)	§3.4.10
sz (Font Size)	§3.4.11
u (Underline)	§3.4.13
vertAlign (Vertical Alignment)	§3.4.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Font">
   <choice maxOccurs="unbounded">
      <element name="name" type="CT_FontName" minOccurs="0" maxOccurs="1"/>
      <element name="charset" type="CT_IntProperty" minOccurs="0" maxOccurs="1"/>
      <element name="family" type="CT_IntProperty" minOccurs="0" maxOccurs="1"/>
      <element name="b" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="i" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="strike" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="outline" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="shadow" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="condense" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="extend" type="CT_BooleanProperty" minOccurs="0" maxOccurs="1"/>
      <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="sz" type="CT_FontSize" minOccurs="0" maxOccurs="1"/>
      <element name="u" type="CT_UnderlineProperty" minOccurs="0" maxOccurs="1"/>
      <element name="vertAlign" type="CT_VerticalAlignFontProperty" minOccurs="0" maxOccurs="1"/>
      <element name="scheme" type="CT_FontScheme" minOccurs="0" maxOccurs="1"/>
   </choice>
</complexType>
```

3.8.22 fonts (Fonts)

This element contains all font definitions for this workbook.

[*Example*: This example expresses two fonts in the workbook. A Calibri family font, with font size of 11, and an Arial family font, with font size 12. The second font has strikethrough applied.

```
<fonts count="2">
  <font>
    <sz val="11"/>
    <color theme="1"/>
    <name val="Calibri"/>
    <family val="2"/>
    <scheme val="minor"/>
  </font>
  <font>
    <strike/>
    <sz val="12"/>
    <color theme="1"/>
    <name val="Arial"/>
    <family val="2"/>
  </font>
</fonts>
```

end example]

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
font (Font)	§3.8.21

Attributes	Description
count (Font Count)	Count of font elements. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Fonts">
   <sequence>
      <element name="font" type="CT_Font" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.23 gradientFill (Gradient)

This element defines a gradient-style cell fill. Gradient cell fills can use one or two colors as the end points of color interpolation.

[*Example*:

This example shows a gradient cell fill, with color green at the top transitioning into blue at the bottom.

This is the XML:

```
<fill>
  <gradientFill degree="90">
    <stop position="0">
      <color rgb="FF92D050"/>
    </stop>
    <stop position="1">
      <color rgb="FF0070C0"/>
    </stop>
  </gradientFill>
</fill>
```

This example shows a gradient cell fill, from the center. Note the left, right, top, and bottom values (and see explanation in the attribute section):

```
<fill>
  <gradientFill type="path" left="0.2" right="0.8" top="0.2" bottom="0.8">
    <stop position="0">
      <color theme="0"/>
    </stop>
    <stop position="1">
      <color theme="4"/>
    </stop>
  </gradientFill>
</fill>
```

end example]

Parent Elements

Parent Elements
fill (§3.8.19)

Child Elements	Subclause
stop (Gradient Stop)	§3.8.38

Attributes	Description
bottom (Bottom Convergence)	Valid values are 0 to 1. Specifies in percentage format (from the top to the bottom) the position of the bottom edge of the inner rectangle (color 1). For bottom, 0 means the bottom edge of the inner rectangle is on the top edge of the cell, and 1 means it is on the bottom edge of the cell. The possible values for this attribute are defined by the XML Schema double datatype.
degree (Linear Gradient Degree)	Angle of the linear gradient - vertical, horizontal, diagonal. [*Example*: Note: in these examples, color 1 is white and color 2 is blue. 90 = Horizontal & color 1 to color 2  270 = Horizontal & color 1 to color 2  0 = Vertical & color 1 to color 2  180 = Vertical & color 1 to color 2  45 = Diagonal Up & top to bottom (color 1 to color 2) 225 = Diagonal Up & bottom to top (color 1 to color 2) 135 = Diagonal Down & top to bottom (color 1 to color 2) 315 = Diagonal Down & bottom to top (color 1 to color 2) *end example*]

Attributes	Description
	The possible values for this attribute are defined by the XML Schema double datatype.
left (Left Convergence)	Valid values are 0 to 1. Specifies in percentage format (from the left to the right) the position of the left edge of the inner rectangle (color 1). For left, 0 means the left edge of the inner rectangle is on the left edge of the cell, and 1 means it is on the right edge of the cell. (applies to From Corner and From Center gradients). The possible values for this attribute are defined by the XML Schema double datatype.
right (Right Convergence)	Valid values are 0 to 1. Specifies in percentage format (from the left to the right) the position of the right edge of the inner rectangle (color 1). For right, 0 means the right edge of the inner rectangle is on the left edge of the cell, and 1 means it is on the right edge of the cell. (applies to From Corner and From Center gradients). The possible values for this attribute are defined by the XML Schema double datatype.
top (Top Gradient Convergence)	Valid values are 0 to 1. Specifies in percentage format (from the top to the bottom) the position of the top edge of the inner rectangle (color 1). For top, 0 means the top edge of the inner rectangle is on the top edge of the cell, and 1 means it is on the bottom edge of the cell. (applies to From Corner and From Center gradients). The possible values for this attribute are defined by the XML Schema double datatype.
type (Gradient Fill Type)	Type of this gradient fill. The possible values for this attribute are defined by the ST_GradientType simple type (§3.18.38).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GradientFill">
   <sequence>
      <element name="stop" type="CT_GradientStop" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="type" type="ST_GradientType" use="optional" default="linear"/>
   <attribute name="degree" type="xsd:double" use="optional" default="0"/>
   <attribute name="left" type="xsd:double" use="optional" default="0"/>
   <attribute name="right" type="xsd:double" use="optional" default="0"/>
   <attribute name="top" type="xsd:double" use="optional" default="0"/>
   <attribute name="bottom" type="xsd:double" use="optional" default="0"/>
</complexType>
```

3.8.24 horizontal (Horizontal Inner Borders)

This element specifies the color and line style for the horizontal inner border(s) of a range of cells. Used in the context of dxf elements only. For example, see the borders definitions for **TableStyleMedium28**.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
   <sequence>
      <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

3.8.25 i (Italic)

Displays characters in italic font style. The italic style is defined by the font at a system level and is not specified by this specification.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is `true`. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.8.26 indexedColors (Color Indexes)

A deprecated indexing scheme for colours that is still required for some records, and for backwards compatibility with legacy formats.

This element contains a sequence of RGB color values that correspond to color indexes (zero-based). When using the default indexed color palette, the values are not written out, but instead are implied. When the color palette has been modified from default, then the entire color palette is written out.

Here is the table of default mappings from indexed color value to ARGB value. Note that 0-7 are redundant of 8-15 to preserve backwards compatibility.

Color Index	**ARGB Value**	[*Example*:
indexed="0"	00000000	
indexed="1"	00FFFFFF	
indexed="2"	00FF0000	
indexed="3"	0000FF00	indexed="4"	000000FF	
indexed="5"	00FFFF00	indexed="6"	00FF00FF	
indexed="7"	0000FFFF	
(none)	(none)	
indexed="8"	00000000	
indexed="9"	00FFFFFF	
indexed="10"	00FF0000	
indexed="11"	0000FF00	indexed="12"	000000FF	
indexed="13"	00FFFF00	indexed="14"	00FF00FF	
indexed="15"	0000FFFF	
indexed="16"	00800000	
indexed="17"	00008000	
indexed="18"	00000080	

indexed="19"	00808000	
indexed="20"	00800080	
indexed="21"	00008080	
indexed="22"	00C0C0C0	
indexed="23"	00808080	
indexed="24"	009999FF	
indexed="25"	00993366	
indexed="26"	00FFFFCC	
indexed="27"	00CCFFFF	
indexed="28"	00660066	
indexed="29"	00FF8080	
indexed="30"	000066CC	
indexed="31"	00CCCCFF	
indexed="32"	00000080	
indexed="33"	00FF00FF	
indexed="34"	00FFFF00	
indexed="35"	0000FFFF	
indexed="36"	00800080	
indexed="37"	00800000	
indexed="38"	00008080	
indexed="39"	000000FF	
indexed="40"	0000CCFF	
indexed="41"	00CCFFFF	
indexed="42"	00CCFFCC	
indexed="43"	00FFFF99	

indexed="44"	0099CCFF	
indexed="45"	00FF99CC	
indexed="46"	00CC99FF	
indexed="47"	00FFCC99	
indexed="48"	003366FF	
indexed="49"	0033CCCC	
indexed="50"	0099CC00	
indexed="51"	00FFCC00	
indexed="52"	00FF9900	
indexed="53"	00FF6600	
indexed="54"	00666699	
indexed="55"	00969696	
indexed="56"	00003366	
indexed="57"	00339966	
indexed="58"	00003300	
indexed="59"	00333300	
indexed="60"	00993300	
indexed="61"	00993366	
indexed="62"	00333399	
indexed="63"	00333333	
indexed="64"	System Foreground	n/a
indexed="65"	System Background	n/a

Parent Elements
colors (§3.8.11)

Child Elements	Subclause
rgbColor (RGB Color)	§3.8.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IndexedColors">
   <sequence>
      <element name="rgbColor" type="CT_RgbColor" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.8.27 left (Left Border)

This element specifies the color and line style for the left border of a cell.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
   <sequence>
      <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

3.8.28 mruColors (MRU Colors)

This element contains sequence of RGB values that correspond to custom colors selected by the user for this workbook.

Parent Elements
colors (§3.8.11)

Child Elements	Subclause

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MRUColors">
   <sequence>
      <element name="color" type="CT_Color" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.8.29 name (Font Name)

This element specifies the face name of this font.

Parent Elements
font (§3.8.21)

Attributes	Description
val (String Value)	A string representing the name of the font. If the font doesn't exist (because it isn't installed on the system), or the charset is invalid for that font, then another font should be substituted. The string length for this attribute shall be 0 to 31 characters. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontName">
   <attribute name="val" type="ST_Xstring" use="required"/>
</complexType>
```

3.8.30 numFmt (Number Format)

This element specifies number format properties which indicate how to format and render the numeric value of a cell.

Following is a listing of number formats whose formatCode value is implied rather than explicitly saved in the file. In this case a numFmtId value is written on the xf record, but no corresponding numFmt element is written. Some of these Ids are interpreted differently, depending on the UI language of the implementing application.

All Languages

ID	formatCode

ID	formatCode
0	General
1	0
2	0.00
3	#,##0
4	#,##0.00
9	0%
10	0.00%
11	0.00E+00
12	# ?/?
13	# ??/??
14	mm-dd-yy
15	d-mmm-yy
16	d-mmm
17	mmm-yy
18	h:mm AM/PM
19	h:mm:ss AM/PM
20	h:mm
21	h:mm:ss
22	m/d/yy h:mm
37	#,##0 ;(#,##0)
38	#,##0 ;[Red](#,##0)

40	#,##0.00;[Red](#,##0.00)
45	mm:ss
46	[h]:mm:ss
47	mmss.0
48	##0.0E+0
49	@

"General" Format

Some additional comments about the "General" number format are appropriate.

The primary goal when a cell is using "General" formatting is to render the cell content without user-specified guidance to the best ability of the application.

Alignment

(Specified for Left-to-Right mode)

- Strings: left aligned
- Boolean/error values: centered
- Numbers: right aligned
- Dates: do not follow the "General" format, instead automatically convert to date formatting.

Numbers

The application shall attempt to display the full number up to 11 digits (inc. decimal point). If the number is too large, the application shall attempt to show exponential format. If the number has too many significant digits, the display shall be truncated. The optimal method of display is based on the available cell width. If the number cannot be displayed using any of these formats in the available width, the application shall show "#" across the width of the cell.

Conditions for switching to exponential format:

14. The cell value must have at least five digits for xE-xx
15. If the exponent is bigger than the size allowed, a floating point number cannot fit, so try exponential notation.
16. Similarly, for negative exponents, check if there is space for even one (non-zero) digit in floating point format.
17. Finally, if there isn't room for all of the significant digits in floating point format (for a negative exponent), exponential format shall display more digits if the exponent is less than -3. (The 3 is because E-xx takes 4 characters, and the leading 0 in floating point takes only 1 character. Thus, for an exponent less than -3, there is more than 3 additional leading 0's, more than enough to compensate for the size of the E-xx.)

Floating point rule:

For general formatting in cells, max overall length for cell display is 11, not including negative sign, but includes leading zeros and decimal separator.

81	d/m/bb

Parent Elements
dxf (§3.8.14); ndxf (§3.11.1.4); numFmts (§3.8.31); odxf (§3.11.1.6)

Attributes	Description
formatCode (Number Format Code)	The number format code for this number format. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
numFmtId (Number Format Id)	Id used by the master style records (xf's) to reference this number format. The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumFmt">
   <attribute name="numFmtId" type="ST_NumFmtId" use="required"/>
   <attribute name="formatCode" type="ST_Xstring" use="required"/>
</complexType>
```

3.8.31 numFmts (Number Formats)

This element defines the number formats in this workbook, consisting of a sequence of numFmt records, where each numFmt record defines a particular number format, indicating how to format and render the numeric value of a cell.

[*Example*:

This cell is formatting as US currency:

The XML expressing this format shows that the formatId is "166" and the decoded formatCode is `$#,##0.00`

```
<numFmts count="1">
  <numFmt numFmtId="166" formatCode="&quot;$&quot;#,##0.00"/>
</numFmts>
```

end example]

Number Format Codes

Up to four sections of format codes can be specified. The format codes, separated by semicolons, define the formats for positive numbers, negative numbers, zero values, and text, in that order. If only two sections are specified, the first is used for positive numbers and zeros, and the second is used for negative numbers. If only one section is specified, it is used for all numbers. To skip a section, the ending semicolon for that section must be written.

The first section, "Format for positive numbers", is the format code that applies to the cell when the cell value contains a positive number.

The second section, "Format for negative numbers", is the format code that applies to the cell when the cell value contains a negative number.

The third section, "Format for zeros", is the format code that applies to the cell when the cell value is zero.

The fourth, and last, section, "Format for text", is the format code that applies to the cell when the cell value is text.

The & (ampersand) text operator is used to join, or concatenate, two values.

The following table describes the different symbols that are available for use in custom number formats.

Format symbol	Description and result
0	Digit placeholder. For example, if the value 8.9 is to be displayed as 8.90, use the format #.00
#	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall not display extra zeros when the number typed has fewer digits on either side of the decimal than there are # symbols in the format. For example, if the custom format is #.##, and 8.9 is in the cell, the number 8.9 is displayed.
?	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall put a space for insignificant zeros on either side of the decimal point so that decimal points are aligned in the column. For example, the custom format 0.0? aligns

Format symbol	Description and result
	the decimal points for the numbers 8.9 and 88.99 in a column.
. (period)	Decimal point.
%	Percentage. If the cell contains a number between 0 and 1, and the custom format 0% is used, the application shall multiply the number by 100 and adds the percentage symbol in the cell.
, (comma)	Thousands separator. The application shall separate thousands by commas if the format contains a comma that is enclosed by number signs (#) or by zeros. A comma that follows a placeholder scales the number by one thousand. For example, if the format is #.0,, and the cell value is 12,200,000 then the number 12.2 is displayed.
E- E+ e- e+	Scientific format. The application shall display a number to the right of the "E" symbol that corresponds to the number of places that the decimal point was moved. For example, if the format is 0.00E+00, and the value 12,200,000 is in the cell, the number 1.22E+07 is displayed. If the number format is #0.0E+0, then the number 12.2E+6 is displayed.
$-+/():space	Displays the symbol. If it is desired to display a character that differs from one of these symbols, precede the character with a backslash (\). Alternatively, enclose the character in quotation marks. For example, if the number format is (000), and the value 12 is in the cell, the number (012) is displayed.
\	Display the next character in the format. The application shall not display the backslash. For example, if the number format is 0\!, and the value 3 is in the cell, the value 3! is displayed.
*	Repeat the next character in the format enough times to fill the column to its current width. There shall not be more than one asterisk in one section of the format. If more than one asterisk appears in one section of the format, all but the last asterisk shall be ignored. For example, if the number format is 0*x, and the value 3 is in the cell, the value 3xxxxxx is displayed. The number of x characters that are displayed in the cell varies based on the width of the column.
_ (underline)	Skip the width of the next character. This is useful for lining up negative and positive values in different cells of the same column. For example, the number format _(0.0_);(0.0) aligns the numbers 2.3 and -4.5 in the column even though the negative number is enclosed by parentheses.
"text"	Display whatever text is inside the quotation marks. For example, the format 0.00 "dollars" displays 1.23 dollars when the value 1.23 is in the cell.
@	Text placeholder. If text is typed in the cell, the text from the cell is placed in the format where the at symbol (@) appears. For example, if the number format is "Bob "@" Smith" (including quotation marks), and the value "John" is in the cell, the value Bob John Smith is displayed.

Text and spacing

Display both text and numbers

To display both text and numbers in a cell, enclose the text characters in double quotation marks (" ") or precede a single character with a backslash (\). Single quotation marks shall not be used to denote text. Characters inside double quotes, or immediately following backslash shall never be interpreted as part of the format code lexicon; instead they shall always be treated as literal strings. Remember to include the characters in the appropriate section of the format codes. For example, type the format $0.00" Surplus";$-0.00" Shortage" to display a positive amount as "$125.74 Surplus" and a negative amount as "$-125.74 Shortage."

The following characters are displayed without the use of quotation marks.

$	Dollar sign				-	Minus sign
+	Plus sign				/	Slash mark
(	Left parenthesis				)	Right parenthesis
:	Colon				!	Exclamation point
^	Circumflex accent (caret)				&	Ampersand
'	Apostrophe				~	Tilde
{	Left curly bracket				}	Right curly bracket
<	Less-than sign				>	Greater-than sign
=	Equal sign					Space character

Include a section for text entry

If included, a text section must be the last section in the number format. Include an "at" sign (@) in the section, precisely where the cell's text value should be displayed. If the @ character is omitted from the text section, text typed in the cell will not be displayed. To always display specific text characters with the typed text, enclose the additional text in double quotation marks (" "). For example, if "June" is typed into the cell, and the text format is "gross receipts for "@ , then the cell will display "gross receipts for June".

If the format does not include a text section, text entered in a cell is not affected by the format code.

Add spaces

To create a space that is the width of a character in a number format, include an underscore, followed by the character. For example, when an underscore is followed with a right parenthesis, such as _), positive numbers line up correctly with negative numbers that are enclosed in parentheses because positive numbers are displayed with a blank space after them exactly the width of the right parenthesis character.

Repeat characters

To repeat the next character in the format to fill the column width, include an asterisk (*) in the number format. For example, type 0*- to include enough dashes after a number to fill the cell, or type *0 before any format to include leading zeros.

Decimal places, spaces, colors, and conditions

Include decimal places and significant digits

To format fractions or numbers with decimal points, include the following digit placeholders in a section. If a number has more digits to the right of the decimal point than there are placeholders in the format, the number rounds to as many decimal places as there are placeholders. If there are more digits to the left of the decimal point than there are placeholders, the extra digits are displayed. If the format contains only number signs (#) to the left of the decimal point, numbers less than 1 begin with a decimal point.

(number sign) displays only significant digits and does not display insignificant zeros.

0 (zero) displays insignificant zeros if a number has fewer digits than there are zeros in the format.

? (question mark) adds spaces for insignificant zeros on either side of the decimal point so that decimal points align when they are formatted with a fixed-width font, such as Courier New. ? can also be used for fractions that have varying numbers of digits.

To display	As	Use this code
1234.59	1234.6	####.#
8.9	8.900	#.000
.631	0.6	0.#
12 1234.568	12.0 1234.57	#.0#
44.398 102.65 2.8	44.398 102.65 2.8 (with aligned decimals)	???.???
5.25 5.3	5 1/4 5 3/10 (with aligned fractions)	# ???/???

Display a thousands separator

To display a comma as a thousands separator or to scale a number by a multiple of 1,000, include a comma in the number format.

To display	As	Use this code
12000	12,000	#,###
12000	12	#,
12200000	12.2	0.0,,

Specify colors

To set the text color for a section of the format, type the name of one of the following eight colors in square brackets in the section. The color code must be the first item in the section.

[Black]			[Blue]			[Cyan]
[Green]			[Magenta]			[Red]
[White]			[Yellow]			

Instead of using the name of the color, the color index can be used, like this [Color3] for Red. Valid numeric indexes for color range from 1 to 56, which reference by index to the legacy color palette.

[*Note*: the default legacy color palette values are listed in §3.8.26. In the format codes, [Color1] refers to the color associated with indexed="8", or black (by default), [Color2] refers to the color associated with indexed="9", or white (by default), and so on up to [Color56] referring to the color associated with indexed="63". If the color palette has been customized from default values, then the colors associated with these indexes will reflect those customizations.

Specify conditions

To set number formats that will be applied only if a number meets a specified condition, enclose the condition in square brackets. The condition consists of a comparison operator and a value. Comparison operators include: = Equal to; > Greater than; < Less than; >= Greater than or equal to, <= Less than or equal to, and <> Not equal to. For example, the following format displays numbers that are less than or equal to 100 in a red font and numbers that are greater than 100 in a blue font.

[Red][<=100];[Blue][>100]

If the cell value does not meet any of the criteria, then pound signs ("#") are displayed across the width of the cell.

Currency, percentages, and scientific notation

Include currency symbols

To include currency symbols, place the currency symbol in the location it should when displayed.

Display percentages

To display numbers as a percentage of 100 — for example, to display .08 as 8% or 2.8 as 280% — include the percent sign (%) in the number format.

Display scientific notations

To display numbers in scientific format, use exponent codes in a section — for example, E-, E+, e-, or e+.

If a format contains a zero (0) or number sign (#) to the right of an exponent code, the application displays the number in scientific format and inserts an "E" or "e". The number of zeros or number signs to the right of a code determines the number of digits in the exponent. "E-" or "e-" places a minus sign by negative exponents. "E+" or "e+" places a minus sign by negative exponents and a plus sign by positive exponents.

Dates and times

Display days, months, and years

To display	As	Use this code
Months	1–12	m
Months	01–12	mm
Months	Jan–Dec	mmm
Months	January–December	mmmm
Months	J–D	mmmmm
Days	1–31	d
Days	01–31	dd
Days	Sun–Sat	ddd
Days	Sunday–Saturday	dddd
Years	00–99	yy
Years	1900–9999	yyyy

See §3.17.4.1 for special handling of certain days in the year 1900.

Month versus minutes

If "m" or "mm" code is used immediately after the "h" or "hh" code (for hours) or immediately before the "ss" code (for seconds), the application shall display minutes instead of the month.

Display hours, minutes, and seconds

To display	As	Use this code

Hours	0–23	h
Hours	00–23	hh
Minutes	0–59	m
Minutes	00–59	mm
Seconds	0–59	s
Seconds	00–59	ss
Time	4 AM	h AM/PM
Time	4:36 PM	h:mm AM/PM
Time	4:36:03 P	h:mm:ss A/P
Time	4:36:03.75	h:mm:ss.00
Elapsed time (hours and minutes)	1:02	[h]:mm
Elapsed time (minutes and seconds)	62:16	[mm]:ss
Elapsed time (seconds and hundredths)	3735.80	[ss].00

Minutes versus month

The "m" or "mm" code must appear immediately after the "h" or "hh" code or immediately before the "ss" code; otherwise, these will display as the month instead of minutes.

AM and PM

If the format contains AM or PM, the hour is based on the 12-hour clock, where "AM" or "A" indicates times from midnight until noon and "PM" or "P" indicates times from noon until midnight. Otherwise, the hour is based on the 24-hour clock.

Invalid date and time values

Cells formatted with a date or time format and which contain invalid date or time values shall show the pound sign ("#") across the width of the cell.

International Considerations

Format Code	Description
r	JPN/CHT Only. When loading in JPN locale, code becomes "ee". When loading in CHT locale, code becomes "e".
rr	JPN/CHT Only. When loading in JPN locale, code becomes "gggee". When loading in CHT locale, code becomes "e".
g	When loading in JPN locale: Single Roman character emperor reign When loading in CHT (Taiwan only) locale: treat same as "gg".
gg	When loading in JPN locale: Single Kanji character emperor reign When loading in CHT locale: Last era short name (since 1911)
ggg	When loading in JPN locale: Tow Kanji character emperor reign When loading in CHT locale: Last era long name (since 1911)
e	When loading in JPN locale: Era year When laoding in CHT (Tawian only) locale: Era year since 1912. If preceeded by “g”, “gg”, or “ggg” then year of 1912, and year before 1912 are special, otherwise years less than 1912 are gregorian. OTHER locales: becomes "yy"
ee	When loading in JPN locale: Era year w/ leading zero When loading in CHT (Tawian only) locale: Era year since 1911 OTHER locales: becomes "yy"
b2	Hijri calander
b1	Gregorian calendar
[$USD-409]	Specifies currency and locale/date system/number system information. Syntax is [$<Currency String>-<language info>]. Currency string is a string to use as a currency symbol. Language info is a 32-bit value entered in hexidecimal format. Language info format (byte 3 is most significant byte): Bytes 0,1: 16-bit Language ID (LID). Byte 2: Calendar type. High bit indicates that input is parsed using specified calendar. Byte 3: Number system type. High bit indicates that input is parsed using specified number system.

Format Code	Description
	Special language info values: 0xf800: System long date format 0xf400: System time format

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
numFmt (Number Format)	§3.8.30

Attributes	Description
count (Number Format Count)	Count of number format elements. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumFmts">
   <sequence>
      <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.32 patternFill (Pattern)

This element is used to specify cell fill information for pattern and solid color cell fills. For solid cell fills (no pattern), fgColor is used. For cell fills with patterns specified, then the cell fill color is specified by the bgColor element.

Parent Elements
fill (§3.8.19)

Child Elements	Subclause
bgColor (Background Color)	§3.8.3
fgColor (Foreground Color)	§3.8.18

Attributes	Description
patternType (Pattern Type)	Specifies the fill pattern type (including solid and none) Default is none, when missing. The possible values for this attribute are defined by the ST_PatternType simple type (§3.18.57).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PatternFill">
   <sequence>
      <element name="fgColor" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="bgColor" type="CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="patternType" type="ST_PatternType" use="optional"/>
</complexType>
```

3.8.33 protection (Protection Properties)

Contains protection properties associated with the cell. Each cell has protection properties that can be set. The cell protection properties do not take effect unless the sheet has been protected.

Parent Elements
dxf (§3.8.14); ndxf (§3.11.1.4); odxf (§3.11.1.6); xf (§3.8.45)

Attributes	Description
hidden (Hidden Cell)	A boolean value indicating if the cell is hidden. When the cell is hidden and the sheet on which the cell resides is protected, then the cell value will be displayed in the cell grid location, but the contents of the cell will not be displayed in the formula bar. This is true for all types of cell content, including formula, text, or numbers. Therefore the cell A4 may contain a formula "=SUM(A1:A3)", but if the cell protection property of A4 is marked as hidden, and the sheet is protected, then the cell should display the calculated result (for example, "6"), but will not display the formula used to calculate the result. The possible values for this attribute are defined by the XML Schema boolean datatype.
locked (Cell Locked)	A boolean value indicating if the cell is locked. When cells are marked as "locked" and the sheet is protected, then the options specified in the Sheet Part's sheetProtection element (§3.3.1.81) are prohibited for these cells. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CellProtection">
   <attribute name="locked" type="xsd:boolean" use="optional"/>
   <attribute name="hidden" type="xsd:boolean" use="optional"/>
</complexType>
```

3.8.34 rgbColor (RGB Color)

A single ARGB entry for the corresponding color index.

Parent Elements
indexedColors (§3.8.26)

Attributes	Description
rgb (Alpha Red Green Blue)	Color value expressed in Alpha Red Green Blue format (ARGB). The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RgbColor">
   <attribute name="rgb" type="ST_UnsignedIntHex" use="optional"/>
</complexType>
```

3.8.35 right (Right Border)

This element specifies the color and line style for the right border of a cell.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
   <sequence>
      <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

3.8.36 scheme (Scheme)

Defines the font scheme, if any, to which this font belongs. When a font definition is part of a theme definition, then the font is categorized as either a major or minor font scheme component. When a new theme is chosen, every font that is part of a theme definition is updated to use the new major or minor font definition for that theme. Usually major fonts are used for styles like headings, and minor fonts are used for body & paragraph text.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Font Scheme)	Sets font scheme property. The possible values for this attribute are defined by the ST_FontScheme simple type (§3.18.34).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontScheme">
   <attribute name="val" type="ST_FontScheme" use="required"/>
</complexType>
```

3.8.37 shadow (Shadow)

Macintosh compatibility setting. Represents special word/character rendering on Macintosh, when this flag is set. The effect is to render a shadow behind, beneath and to the right of the text. SpreadsheetML applications are not required to render according to this flag.

Parent Elements
font (§3.8.21); rPr (§3.4.7)

Attributes	Description
val (Value)	A boolean value for the property specified by the parent XML element. If omitted, the default value is `true`. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BooleanProperty">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

3.8.38 stop (Gradient Stop)

One of a sequence of two or more gradient stops, constituting this gradient fill.

Parent Elements
gradientFill (§3.8.23)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
position (Gradient Stop Position)	Position information for this gradient stop. Interpreted exactly like gradientFill left, right, bottom, top. The position indicated here indicates the point where the color is pure. Before and and after this position the color can be in transition (or pure, depending on if this is the last stop or not). The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GradientStop">
   <sequence>
      <element name="color" type="CT_Color" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="position" type="xsd:double" use="required"/>
</complexType>
```

3.8.39 styleSheet (Style Sheet)

This is the root element of the Styles part.

Parent Elements
Root element of SpreadsheetML Styles part

Child Elements	Subclause
borders (Borders)	§3.8.5
cellStyles (Cell Styles)	§3.8.8
cellStyleXfs (Formatting Records)	§3.8.9
cellXfs (Cell Formats)	§3.8.10
colors (Colors)	§3.8.11
dxfs (Formats)	§3.8.15
extLst (Future Feature Data Storage Area)	§3.2.10

Child Elements	Subclause
fills (Fills)	§3.8.20
fonts (Fonts)	§3.8.22
numFmts (Number Formats)	§3.8.31
tableStyles (Table Styles)	§3.8.42

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Stylesheet">
   <sequence>
      <element name="numFmts" type="CT_NumFmts" minOccurs="0" maxOccurs="1"/>
      <element name="fonts" type="CT_Fonts" minOccurs="0" maxOccurs="1"/>
      <element name="fills" type="CT_Fills" minOccurs="0" maxOccurs="1"/>
      <element name="borders" type="CT_Borders" minOccurs="0" maxOccurs="1"/>
      <element name="cellStyleXfs" type="CT_CellStyleXfs" minOccurs="0" maxOccurs="1"/>
      <element name="cellXfs" type="CT_CellXfs" minOccurs="0" maxOccurs="1"/>
      <element name="cellStyles" type="CT_CellStyles" minOccurs="0" maxOccurs="1"/>
      <element name="dxfs" type="CT_Dxfs" minOccurs="0" maxOccurs="1"/>
      <element name="tableStyles" type="CT_TableStyles" minOccurs="0" maxOccurs="1"/>
      <element name="colors" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.8.40 tableStyle (Table Style)

This element represents a single table style definition. The built-in table styles are written in the tableStyle element by name, but the corresponding tableStyleElement elements are assumed rather than explicitly written. Following is a listing of each of the built-in table style definitions, whose normative definition is in Annex D.

Any of the built-in tables styles, along with any additional table styles explicitly defined shall be supported by applications implementing table styles.

[*Note*: Each of the table styles is made up of a collection of formatting definitions, each of which corresponds to a particular structured region of the table. An application can decide to support these built-in types, and can also decide to define more styles, each with their own definitions. An application can also decide whether the user will be allowed to customize or further define additional table styles. *end note*]

Table Style	[*Example*: (informative)

Table Style	[*Example*: (informative)
TableStyleMedium28	TableStyleMedium27	TableStyleMedium26	TableStyleMedium25

PivotTable Style	[*Example*: (informative)
PivotStyleDark2	PivotStyleDark1	
Parent Elements
tableStyles (§3.8.42)

Child Elements	Subclause
tableStyleElement (Table Style)	§3.8.41

Attributes	Description
count (Table Style Count)	Count of table style elements defined for this table style. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Table Style Name)	Name of this table style. The possible values for this attribute are defined by the XML Schema string datatype.
pivot (Pivot Style)	'True' if this table style should be shown as an available pivot table style. Not mutually exclusive with table - both can be true. The possible values for this attribute are defined by the XML Schema boolean datatype.
table (Table)	True if this table style should be shown as an available table style. Not mutually exclusive with pivot - both can be true. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyle">
   <sequence>
      <element name="tableStyleElement" type="CT_TableStyleElement" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
   <attribute name="name" type="xsd:string" use="required"/>
   <attribute name="pivot" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="table" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.8.41 tableStyleElement (Table Style)

This element specifies formatting for one area of a table or PivotTable. Together the sequence of these elements makes up one entire Table style or PivotTable style definition.

The order in which table style element formatting is applied is as follows:

Table Style Element Order

- Whole Table
- First Column Stripe
- Second Column Stripe
- First Row Stripe
- Second Row Stripe

- Last Column
- First Column
- Header Row
- Total Row
- First Header Cell
- Last Header Cell
- First Total Cell
- Last Total Cell

For instance, row stripe formatting 'wins' over column stripe formatting, and both 'win' over whole table formatting.

PivotTable Style Element Order

- Whole Table
- Page Field Labels
- Page Field Values
- First Column Stripe
- Second Column Stripe
- First Row Stripe
- Second Row Stripe
- First Column
- Header Row
- First Header Cell
- Subtotal Column 1
- Subtotal Column 2
- Subtotal Column 3
- Blank Row
- Subtotal Row 1
- Subtotal Row 2
- Subtotal Row 3
- Column Subheading 1
- Column Subheading 2
- Column Subheading 3
- Row Subheading 1
- Row Subheading 2
- Row Subheading 3
- Grand Total Column
- Grand Total Row

Parent Elements

Parent Elements
tableStyle (§3.8.40)

Attributes	Description
dxfId (Formatting Id)	Zero-based index to a dxf record in the dxfs collection, specifying differential formatting to use with this Table or PivotTable style element. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).
size (Band Size)	Number of rows or columns in a single band of striping. Applies only when type is `firstRowStripe`, `secondRowStripe`, `firstColumnStripe`, or `secondColumnStripe`. [*Example*: In this example, the `firstRowStripe` size is set to `2`, and the `secondRowStripe` size is set to `1`:  *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Table Style Type)	Identifies this table style element's type. The possible values for this attribute are defined by the ST_TableStyleType simple type (§3.18.79).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyleElement">
   <attribute name="type" type="ST_TableStyleType" use="required"/>
   <attribute name="size" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute name="dxfId" type="ST_DxfId" use="optional"/>
</complexType>
```

3.8.42 tableStyles (Table Styles)

This element represents a collection of Table style definitions for Table styles and PivotTable styles used in this workbook. It consists of a sequence of tableStyle records, each defining a single Table style.

A Table style is a collection of formatting that applies to structured regions of a Table or PivotTable [*Example*: make the header row & totals bold face, and apply light gray fill to alternating rows in the data portion of the table to achieve striped or banded rows. *end example*]

See the enumeration values in ST_TableStyleType for a listing of structured Table regions to which formatting can be applied, and which together make up a single Table style definition.

Parent Elements
styleSheet (§3.8.39)

Child Elements	Subclause
tableStyle (Table Style)	§3.8.40

Attributes	Description
count (Table Style Count)	Count of table styles defined in this collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
defaultPivotStyle (Default Pivot Style)	Name of the default table style to apply to new PivotTables. This can be set by the user interface. The possible values for this attribute are defined by the XML Schema string datatype.
defaultTableStyle (Default Table Style)	Name of default table style to apply to new Tables. This can be set by the user interface. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyles">
   <sequence>
      <element name="tableStyle" type="CT_TableStyle" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
   <attribute name="defaultTableStyle" type="xsd:string" use="optional"/>
   <attribute name="defaultPivotStyle" type="xsd:string" use="optional"/>
</complexType>
```

3.8.43 top (Top Border)

This element specifies the color and line style for the top border of a cell.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
   <sequence>
      <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

3.8.44 vertical (Vertical Inner Border)

This element specifies the color and line style for the vertical inner border(s) of a range of cells. Used in the context of dxf elements only. For example, see the borders definitions for **TableStyleMedium28**.

Parent Elements
border (§3.8.4)

Child Elements	Subclause
color (Data Bar Color)	§3.3.1.14

Attributes	Description
style (Line Style)	The line style for this border. The possible values for this attribute are defined by the ST_BorderStyle simple type (§3.18.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderPr">
   <sequence>
      <element name="color" type="CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="style" type="ST_BorderStyle" use="optional" default="none"/>
</complexType>
```

3.8.45 xf (Format)

A single xf element describes all of the formatting for a cell.

Parent Elements
cellStyleXfs (§3.8.9); cellXfs (§3.8.10)

Child Elements	Subclause
alignment (Alignment)	§3.8.1
extLst (Future Feature Data Storage Area)	§3.2.10
protection (Protection Properties)	§3.8.33

Attributes	Description
applyAlignment (Apply Alignment)	A boolean value indicating whether the alignment formatting specified for this xf should be applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyBorder (Apply Border)	A boolean value indicating whether the border formatting specified for this xf should be applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyFill (Apply Fill)	A boolean value indicating whether the fill formatting specified for this xf should be applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyFont (Apply Font)	A boolean value indicating whether the font formatting specified for this xf should be applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyNumberFormat (Apply Number Format)	A boolean value indicating whether the number formatting specified for this xf should be applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyProtection	A boolean value indicating whether the protection formatting specified for this xf should

Attributes	Description
(Apply Protection)	be applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
borderId (Border Id)	Zero-based index of the border record used by this cell format. The possible values for this attribute are defined by the ST_BorderId simple type (§3.18.2).
fillId (Fill Id)	Zero-based index of the fill record used by this cell format. The possible values for this attribute are defined by the ST_FillId simple type (§3.18.31).
fontId (Font Id)	Zero-based index of the font record used by this cell format. The possible values for this attribute are defined by the ST_FontId simple type (§3.18.33).
numFmtId (Number Format Id)	Id of the number format (numFmt) record used by this cell format. The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).
pivotButton (Pivot Button)	A boolean value indicating whether the cell rendering includes a pivot table dropdown button. The possible values for this attribute are defined by the XML Schema boolean datatype.
quotePrefix (Quote Prefix)	A boolean value indicating whether the text string in a cell should be prefixed by a single quote mark (e.g., 'text). In these cases, the quote is not stored in the Shared Strings Part. The possible values for this attribute are defined by the XML Schema boolean datatype.
xfId (Format Id)	For xf records contained in cellXfs this is the zero-based index of an xf record contained in cellStyleXfs corresponding to the cell style applied to the cell. Not present for xf records contained in cellStyleXfs. The possible values for this attribute are defined by the ST_CellStyleXfId simple type (§3.18.11).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Xf">
    <sequence>
        <element name="alignment" type="CT_CellAlignment" minOccurs="0" maxOccurs="1"/>
        <element name="protection" type="CT_CellProtection" minOccurs="0" maxOccurs="1"/>
        <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
    </sequence>
    <attribute name="numFmtId" type="ST_NumFmtId" use="optional"/>
    <attribute name="fontId" type="ST_FontId" use="optional"/>
    <attribute name="fillId" type="ST_FillId" use="optional"/>
    <attribute name="borderId" type="ST_BorderId" use="optional"/>
    <attribute name="xfId" type="ST_CellStyleXfId" use="optional"/>
    <attribute name="quotePrefix" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="pivotButton" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="applyNumberFormat" type="xsd:boolean" use="optional"/>
    <attribute name="applyFont" type="xsd:boolean" use="optional"/>
    <attribute name="applyFill" type="xsd:boolean" use="optional"/>
    <attribute name="applyBorder" type="xsd:boolean" use="optional"/>
    <attribute name="applyAlignment" type="xsd:boolean" use="optional"/>
    <attribute name="applyProtection" type="xsd:boolean" use="optional"/>
</complexType>
```

3.9 Metadata

A cell in a spreadsheet application can have metadata associated with it. Metadata is just a set of additional properties about the particular cell, and this metadata is stored in the metadata xml part.

There are two types of metadata: cell metadata and value metadata. Cell metadata contains information about the cell itself, and this metadata can be carried along with the cell as it moves (insert, shift, copy/paste, merge, unmerge, etc). Value metadata is information about the value of a particular cell. Value metadata properties can be propagated along with the value as it is referenced in formulas.

The file format is architected such that it supports both value and cell metadata, as well as even allowing for future extensions. Formulas, such as CUBEMEMBER() or CUBE*, shall make use of value metadata as part of the SpreadsheetML standard. So, only value metadata must be implemented as it is used by MDX cube functions for retrieving data from OLAP data sources. The other parts are allowed for future extensibility.

See the informative material for background information on OLAP and the various CUBE* functions.

[*Example*: The CUBEMEMBER() function is used to return a specific member from an OLAP cube. The metadata will express the connection name (used as a friendly identifier for the external data connection to the OLAP server and cube), the mdx statement retrieving that member, and a set of operational attributes of the metadata that sepcify how it behaves in the spreadsheet application (i.e., whether it propagates through formula assignment, is able to be copy/pasted, etc).

```
<metadata xmlns="http://schemas.openxmlformats.org/spreadsheetml/2006/main">
```

```
  <metadataTypes count="1">
    <metadataType name="XLMDX" minSupportedVersion="120000" copy="1"
      pasteAll="1" pasteValues="1" merge="1" splitFirst="1" rowColShift="1"
      clearFormats="1" clearComments="1" assign="1" coerce="1"/>
  </metadataTypes>
  <metadataStrings count="2">
    <s v="My Connection"/>
    <s v="[Measures].[Internet Sales Amount]"/>
  </metadataStrings>
  <mdxMetadata count="1">
    <mdx n="0" f="m">
      <t c="1">
        <n x="1"/>
      </t>
    </mdx>
  </mdxMetadata>
  <valueMetadata count="1">
    <bk>
      <rc t="1" v="0"/>
    </bk>
  </valueMetadata>
</metadata>
```

As seen above, the metadata string table contains two entries: the name of the connection (My Connection), and the expression that returns the Internet Sales Amount member from the cube. The metadataType specifies that the metadata persists with assignment, cell merging, copy/pasting, shifting rows/columns, when the formatting or comments are deleted from the cell, and is assigned to the upper left most cell if a merged cell is split. In the valueMetadata collection, the metadata block specifies that the first `metadataType` is used, and indexes the first (0th) entry in the mdxMetadata collection. This mdx element in the mdxMetadata collection in turn specifies the cube function type (m= cube member) and an index into the string table that specifies the connection name. It also contains a tuple (t) element which specifies, via index into the string table, which tuple is returned. *end example*]

[*Note*: When copying a cell with metadata, and the cell contains an array formula, each pasted cell shall contain the value from the corresponding position in the array and should contain the metadata corresponding to that cell. *end note*]

3.9.1 bk (Metadata Block)

This element represents a block of metadata records.

Parent Elements
cellMetadata (§3.9.3); valueMetadata (§3.9.17)

Child Elements	Subclause
rc (Metadata Record)	§3.9.15

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataBlock">
   <sequence>
      <element name="rc" type="CT_MetadataRecord" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.9.2 bk (Future Metadata Block)

This element represents a block of future metadata information. This is a location for storing feature extension information.

Parent Elements
futureMetadata (§3.9.4)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FutureMetadataBlock">
   <sequence>
      <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
   </sequence>
</complexType>
```

3.9.3 cellMetadata (Cell Metadata)

This element represents cell metadata information. Cell metadata is information metadata about a specific cell, and it stays tied to that cell position.

[*Note*: Applications should not use this for storing metadata, but instead us `valueMetadata`. Cell metadata is included for storing information from future application. *end note*]

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
bk (Metadata Block)	§3.9.1

Attributes	Description

Attributes	Description
count (Metadata Block Count)	Number of blocks of metadata records. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataBlocks">
    <sequence>
        <element name="bk" type="CT_MetadataBlock" minOccurs="1" maxOccurs="unbounded"/>
    </sequence>
    <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.9.4 futureMetadata (Future Metadata)

This element represents future metadata information.

Future data storage areas are xml storage areas that a later version of the spreadsheet application can store data into. So a V2 spreadsheet application may store data for new features that don't exist in the V1 version in a future storage area when saving to a format that the V1 version can open. The V1 version may be able to open the file, but won't necessarily be able to understand data that is stored in a future storage area. So the V1 version may ignore this data, but still round trip it in the file format so that V2 and V1 users can collaborate on the same spreadsheet.

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
bk (Future Metadata Block)	§3.9.2
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
count (Future Metadata Block Count)	Number of future metadata blocks. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Metadata Type Name)	Metadata type name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FutureMetadata">
   <sequence>
      <element name="bk" type="CT_FutureMetadataBlock" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.9.5 k (KPI MDX Metadata)

This element represents key performance indicator (KPI) MDX metadata. A KPI is typically an image that represents the state of some specific business measure at a given point in time. For instance, an image of a green traffic light indicating that customer satisfaction is good.

Parent Elements
mdx (§3.9.6)

Attributes	Description
n (Member Unique Name Index)	Index of member unique name in string store. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
np (KPI Index)	Index of key performance indicator name in string store. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
p (KPI Property)	Key performance indicator property. The possible values for this attribute are defined by the ST_MdxKPIProperty simple type (§3.18.47).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MdxKPI">
   <attribute name="n" type="xsd:unsignedInt" use="required"/>
   <attribute name="np" type="xsd:unsignedInt" use="required"/>
   <attribute name="p" type="ST_MdxKPIProperty" use="required"/>
</complexType>
```

3.9.6 mdx (MDX Metadata Record)

This element represents a single record of MDX metadata information which can express a tuple, KPI, set, or member property.

Parent Elements

Parent Elements
mdxMetadata (§3.9.7)

Child Elements	Subclause
k (KPI MDX Metadata)	§3.9.5
ms (Set MDX Metadata)	§3.9.12
p (Member Property MDX Metadata)	§3.9.14
t (Tuple MDX Metadata)	§3.9.16

Attributes	Description
f (Cube Function Tag)	This is an enumeration representing the type of the calling cube function from the spreadsheet. The possible values for this attribute are defined by the ST_MdxFunctionType simple type (§3.18.46).
n (Connection Name Index)	The zero based index of connection name in metadata string store, `metadataStrings`. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Mdx">
   <choice minOccurs="1" maxOccurs="1">
      <element name="t" type="CT_MdxTuple"/>
      <element name="ms" type="CT_MdxSet"/>
      <element name="p" type="CT_MdxMemeberProp"/>
      <element name="k" type="CT_MdxKPI"/>
   </choice>
   <attribute name="n" type="xsd:unsignedInt" use="required"/>
   <attribute name="f" type="ST_MdxFunctionType" use="required"/>
</complexType>
```

3.9.7 mdxMetadata (MDX Metadata Information)

This element represents a collection of specific MDX metadata records for the spreadsheet. This is used to build up the members, sets, tuples, KPIs, and member properties for the spreadsheet.

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause

Child Elements	Subclause
mdx (MDX Metadata Record)	§3.9.6

Attributes	Description
count (MDX Metadata Record Count)	Number of MDX metadata metadata records. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MdxMetadata">
   <sequence>
      <element name="mdx" type="CT_Mdx" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.9.8 metadata (Metadata)

This element represents the root node for all metadata information in the spreadsheet.

Parent Elements
Root element of SpreadsheetML Metadata part

Child Elements	Subclause
cellMetadata (Cell Metadata)	§3.9.3
extLst (Future Feature Data Storage Area)	§3.2.10
futureMetadata (Future Metadata)	§3.9.4
mdxMetadata (MDX Metadata Information)	§3.9.7
metadataStrings (Metadata String Store)	§3.9.9
metadataTypes (Metadata Types Collection)	§3.9.11
valueMetadata (Value Metadata)	§3.9.17

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Metadata">
    <sequence>
        <element name="metadataTypes" type="CT_MetadataTypes" minOccurs="0" maxOccurs="1"/>
        <element name="metadataStrings" type="CT_MetadataStrings" minOccurs="0" maxOccurs="1"/>
        <element name="mdxMetadata" type="CT_MdxMetadata" minOccurs="0" maxOccurs="1"/>
        <element name="futureMetadata" type="CT_FutureMetadata" minOccurs="0" maxOccurs="unbounded"/>
        <element name="cellMetadata" type="CT_MetadataBlocks" minOccurs="0" maxOccurs="1"/>
        <element name="valueMetadata" type="CT_MetadataBlocks" minOccurs="0" maxOccurs="1"/>
        <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
    </sequence>
</complexType>
```

3.9.9 metadataStrings (Metadata String Store)

This element represents the metadata string store. This is a collection of strings that are used as a resource for the rest of the metadata part. It contains all the required OLAP strings used in the spreadsheet including the connection name, as well as mdx expressions identifying specific members and sets. It is indexed from individual metadata records so that the records can use these strings to build up the necessary mdx statements to retrieve the correct data from the OLAP cube.

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
s (Character Value)	§3.13.8

Attributes	Description
count (MDX Metadata String Count)	Number of records in the string store. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataStrings">
    <sequence>
        <element name="s" type="CT_XStringElement" minOccurs="1" maxOccurs="unbounded"/>
    </sequence>
    <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.9.10 metadataType (Metadata Type Information)

This element represents information about metadata on cells - it defines a specific set of behaviors that the metadata shall adhere to when subject to other spreadsheet operations.

In general, many of these attributes represent operations that can be performed on a cell that allow the metadata to remain associated with the cell. Operations that are set to 0 or false, will cause the metadata to be disassociated from the cell when that operation is performed.

Parent Elements
metadataTypes (§3.9.11)

Attributes	Description
adjust (Adjust Metadata)	A Boolean flag indicating that metadata corresponding to a particular cell needs to be notified when that cell's location is changed. [*Note*: This is included in the file format for future extensibility.*end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
assign (Metadata Formula Assignment)	A Boolean flag indicating whether metadata is propagated by formula assignment operation. True when metadata should be propagated by assignment, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
cellMeta (Cell Metadata)	A Boolean flag indicating whether metadata is cell metadata. True when the metadata is cell metadata, false otherwise - in the false case it is considered to be value metadata. The possible values for this attribute are defined by the XML Schema boolean datatype.
clearAll (Metadata Clear All)	A Boolean flag indicating whether metadata survives a "Clear: All" operation. True if the metadata persists after a clear all, false otherwise. The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item. The possible values for this attribute are defined by the XML Schema boolean datatype.
clearComments (Metadata Clear Comments)	A Boolean flag indicating whether metadata remains after comments have been cleared from the cell. True if the metadata persists after Clear:Comments, false otherwise. The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item. The possible values for this attribute are defined by the XML Schema boolean datatype.
clearContents	A Boolean flag indicating whether metadata remains after the contents of a cell are

Attributes	Description
(Metadata Clear Contents)	removed. True if metadata persists after a "Clear: Contents" action, false otherwise. The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item. The possible values for this attribute are defined by the XML Schema boolean datatype.
clearFormats (Metadata Clear Formats)	A Boolean flag indicating whether metadata remains after formatting is removed from a cell. True if metadata persists after a "Clear: Formats", false otherwise. The Clear operations can be implemented by the run time application to provide an easy way to allow users to delete everything from a cell (Clear: All), remove only comments (Clear: Comments), only remove formats (Clear: Formats), or only remove the contents but leave the comments and formatting (Clear: Contents). Note these operations can also be performed by the user manually deleting each item. The possible values for this attribute are defined by the XML Schema boolean datatype.
coerce (Metadata Coercion)	A Boolean flag indicating whether value metadata can be removed when this metadata data type is coerced to another type. True if the value metadata is removed upon coercion, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
copy (Metadata Copy)	A Boolean flag indicating whether metadata is copied with a cell. True if the metadata is copied to other cells when this cell is copied, false otherwise. This shall be set to `true` if the paste attributes for the `metadataType` are going to be used. The possible values for this attribute are defined by the XML Schema boolean datatype.
delete (Metadata Cell Value Delete)	A Boolean flag indicating whether metadata survives deletion of a cell value. True when the metadata persists after the deletion of a cell value, false otherwise. This attribute is equivalent to the `clearContents` attribute. The possible values for this attribute are defined by the XML Schema boolean datatype.
edit (Metadata Edit)	A Boolean flag indicating whether metadata survives the editing of the cell's value. True if the metadata remains unchanged after the cell's value edit, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
ghostCol (Metadata Ghost Column)	A Boolean flag indicating whether metadata is copied to/from a ghost column. True when the metadata is copied to/from a ghost column, false otherwise.

Attributes	Description
	A ghost column is a single column that exists for the row header. It is not displayed to the end user. It is used to store default formatting for an entire row (i.e. the row gets the formatting for the corresponding cell in the ghost column). For instance, when an entire row is selected and a cell color is applied, this is stored once for the cell in the ghost column instead of for each cell in the row. The possible values for this attribute are defined by the XML Schema boolean datatype.
ghostRow (Metadata Ghost Row)	A Boolean flag indicating whether metadata is copied to/from a ghost row. True when the metadata is copied to/from a ghost row, false otherwise. A ghost row is a single row that exists for the column header. It is not displayed to the end user. It is used to store default formatting for an entire column (i.e. the column gets the formatting for the corresponding cell in the ghost row). For instance, when an entire column is selected and a cell color is applied, this is stored once for the cell in the ghost row instead of for each cell in the column. The possible values for this attribute are defined by the XML Schema boolean datatype.
merge (Metadata Merge)	A Boolean flag indicating whether metadata survives cell merge. True if the metadata persists after a cell merge, false otherwise. It is up to the spreadsheet application on how to deal with conflicts when two cells that each have metadata are merged. The guidance here is to treat it the same as a 'regular' cell merge with the default behavior being that the data in the upper left cell wins. The possible values for this attribute are defined by the XML Schema boolean datatype.
minSupportedVersion (Minimum Supported Version)	The earliest version of the spreadsheet application that supports this metadata type. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Metadata Type Name)	Represents the name of this particular metadata type. This name shall be unique amongst all other `metadataTypes`. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
pasteAll (Metadata Paste All)	A Boolean flag indicating whether metadata is populated to a new cell by "Paste: All". True when the metadata is populated on a Paste:All, false otherwise. Paste:All and regular paste should be implemented so that they are equivalent by the spreadsheet application. The `copy` flag shall be set to `true` for this paste behavior to be respected. Note: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
pasteBorders (Metadata Paste Borders)	A Boolean flag indicating whether metadata is populated with Paste: Borders. True when the metadata is populated when only borders are pasted, false otherwise. The copy flag shall be set to `true` for this paste behavior to be respected. [*Note*: The spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
pasteColWidths (Metadata Paste Column Widths)	A Boolean flag indicating whether metadata is populated by Paste: Column Widths. True if the metadata is populated when only column widths are pasted, false otherwise. The copy flag shall be set to `true` for this paste behavior to be respected. [*Note*: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
pasteComments (Metadata Paste Comments)	A Boolean flag indicating whether metadata is populated by Paste: Comments. True when metadata is populated when only comments are pasted, false otherwise. The copy flag shall be set to `true` for this paste behavior to be respected. [*Note*: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
pasteDataValidation (Metadata Paste Data Validation)	A Boolean flag indicating whether metadata is populated by Paste: Validation. True when metadata is populated when only data validation is pasted, false otherwise. The copy flag shall be set to `true` for this paste behavior to be respected. [*Note*: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
pasteFormats (Metadata Paste Formats)	A Boolean flag indicating whether metadata is populated by Paste Special: Formats. True when metadata is populated when only formatting is pasted, false otherwise. The copy flag shall be set to true for this paste behavior to be respected. [*Note*: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
pasteFormulas (Metadata Paste Formulas)	A Boolean flag indicating whether metadata is populated by Paste: Formulas. True when the metadata is populated when only formulas are pasted, false otherwise. The copy flag shall be set to true for this paste behavior to be respected. [*Note*: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
pasteNumberFormats (Metadata Paste Number Formats)	A Boolean flag indicating whether metadata is populated with Paste: Number Formats. True when metadata is populated when only number formatting is pasted, false otherwise. The copy flag shall be set to true for this paste behavior to be respected. [*Note*: the spreadsheet application can implement special pasting behavior, such as pasting everything from a cell (paste all/normal paste), pasting only borders, pasting only comments, or pasting only any other specific cell property. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
pasteValues (Metadata Paste Special Values)	A Boolean flag indicating whether metadata is populated by Paste: Values. The possible values for this attribute are defined by the XML Schema boolean datatype.
rowColShift (Metadata Insert Delete)	A Boolean flag indicating whether metadata survives shifting due to row/column insertion/deletion. True if the metadata persists after the cell has been shifted, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
splitAll (Metadata Split All)	A Boolean flag indicating whether a merged cell split action has its metadata copied to all of the resulting cells. True if the metadata is copied to all new cells resulting from a split, false otherwise. If splitFirst is also set to true, splitAll wins - that is all the cells shall have the

Attributes	Description
	metadata copied to them. The possible values for this attribute are defined by the XML Schema boolean datatype.
splitFirst (Meatadata Split First)	A Boolean flag indicating whether when a merged cell is split its metadata is copied to only the first resulting cell. True when the metadata from a split cell is only copied to the first resulting cell, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataType">
    <attribute name="name" type="ST_Xstring" use="required"/>
    <attribute name="minSupportedVersion" type="xsd:unsignedInt" use="required"/>
    <attribute name="ghostRow" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="ghostCol" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="edit" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="delete" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="copy" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="pasteAll" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="pasteFormulas" type="xsd:boolean" use="optional" default="false"/>

    <attribute name="coerce" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="adjust" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="cellMeta" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.9.11 metadataTypes (Metadata Types Collection)

This element is a collection of metadata types.

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
metadataType (Metadata Type Information)	§3.9.10

Attributes	Description
count (Metadata Type Count)	Number of metadata types. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataTypes">
   <sequence>
      <element name="metadataType" type="CT_MetadataType" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.9.12 ms (Set MDX Metadata)

This element represents an MDX set.

Parent Elements
mdx (§3.9.6)

Child Elements	Subclause
n (Member Unique Name Index)	§3.9.13

Attributes	Description
c (Sort By Member Index Count)	Number of sort-by member indices. This is essentially the number of coordinates in the cube that this member is defined by. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ns (Set Definition Index)	Zero based index of the set definition in the metadata string store. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
o (Set Sort Order)	An enumeration specifying what sort order is used to sort the set. The possible values for this attribute are defined by the ST_MdxSetOrder simple type (§3.18.48).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MdxSet">
    <sequence>
        <element name="n" type="CT_MetadataStringIndex" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
    <attribute name="ns" type="xsd:unsignedInt" use="required"/>
    <attribute name="c" type="xsd:unsignedInt" use="optional" default="0"/>
    <attribute name="o" type="ST_MdxSetOrder" use="optional" default="u"/>
</complexType>
```

3.9.13 n (Member Unique Name Index)

This element represents an index of a member unique name in metadata string store that is used to define the sort-by set.

Parent Elements
ms (§3.9.12); t (§3.9.16)

Attributes	Description
s (String is a Set)	A Boolean flag indicating whether this string represents a set. True if the string represents a set, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
x (Index Value)	Value of the zero based index. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataStringIndex">
    <attribute name="x" type="xsd:unsignedInt" use="required"/>
    <attribute name="s" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.9.14 p (Member Property MDX Metadata)

This element represents an MDX member property.

Parent Elements
mdx (§3.9.6)

Attributes	Description
n (Member Unique Name Index)	The zero based index of member unique name in the metadata string store.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
np (Property Name Index)	The zero based index of the property name in metadata string store. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MdxMemeberProp">
   <attribute name="n" type="xsd:unsignedInt" use="required"/>
   <attribute name="np" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.9.15 rc (Metadata Record)

This element represents a reference to a specific metadata record.

Parent Elements
bk (§3.9.1)

Attributes	Description
t (Metadata Record Type Index)	A 1-based index to the metadata record type in `metadataTypes`. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
v (Metadata Record Value Index)	A zero based index to a specific metadata record. If the corresponding metadataType has `name`="XLMDX", then this is an index to a record in mdxMetadata, otherwise this is an index to a record in the futureMetadata section whose `name` matches the name of the metadataType. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MetadataRecord">
   <attribute name="t" type="xsd:unsignedInt" use="required"/>
   <attribute name="v" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.9.16 t (Tuple MDX Metadata)

This element represents an mdx tuple. A tuple is the intersection of two or more members of distinct dimensions in the cube. For instance, the three members (product, City, month) that are used to show the data point for how many products were sold.

The spreadsheet application should allow the values for the attributes of this element to be specified by the OLAP server.

Parent Elements
mdx (§3.9.6)

Child Elements	Subclause
n (Member Unique Name Index)	§3.9.13

Attributes	Description
b (Server Formatting Bold Font)	A Boolean flag indicating whether the bold style is applied. True if bold shall be applied, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
bc (Server Formatting Background Color)	Specifies the background color in RGB values. It is in hex and is read in the form of 0x00RRGGBB. The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
c (Member Index Count)	The number of member expressions in the tuple. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ct (Server Formatting Culture Currency)	The culture tag to use for currency number format. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
fc (Server Formatting Foreground Color)	Represents the foreground color in RGB. It is in hex and is read in the form of 0x00RRGGBB. The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
fi (Server Formatting Built-In Number Format Index)	Server formatting built-in number format index. This is an index into the spreadsheet application's built in number formats that is used to specify formatting. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
i (Server Formatting Italic Font)	A Boolean flag indicating that the italic formatting shall be applied. True if italic formatting is applied, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
si (Server Formatting String Index)	Server formatting string index in the metadata string store, used to index to a string that contains information on how to format the number. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
st (Server Formatting Strikethrough Font)	A Boolean flag indicating whether the strikethrough font style is applied. True if strikethrough shall be applied, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
u (Server Formatting Underline Font)	A Boolean flag indicating whether the underline font style is applied. True if underline shall be applied, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MdxTuple">
   <sequence>
      <element name="n" type="CT_MetadataStringIndex" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="c" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="ct" type="ST_Xstring" use="optional"/>
   <attribute name="si" type="xsd:unsignedInt" use="optional"/>
   <attribute name="fi" type="xsd:unsignedInt" use="optional"/>
   <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="u" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.9.17 valueMetadata (Value Metadata)

This element represents the value metadata information for the spreadsheet. It is essentially a collection of block elements that each define the value metadata for a particular cell. Cells in the workbook index into this collection, and each block element in this collection in turn references the `mdxMetadata` records.

Parent Elements
metadata (§3.9.8)

Child Elements	Subclause
bk (Metadata Block)	§3.9.1

Attributes	Description
count (Metadata Block Count)	Number of blocks of metadata records. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

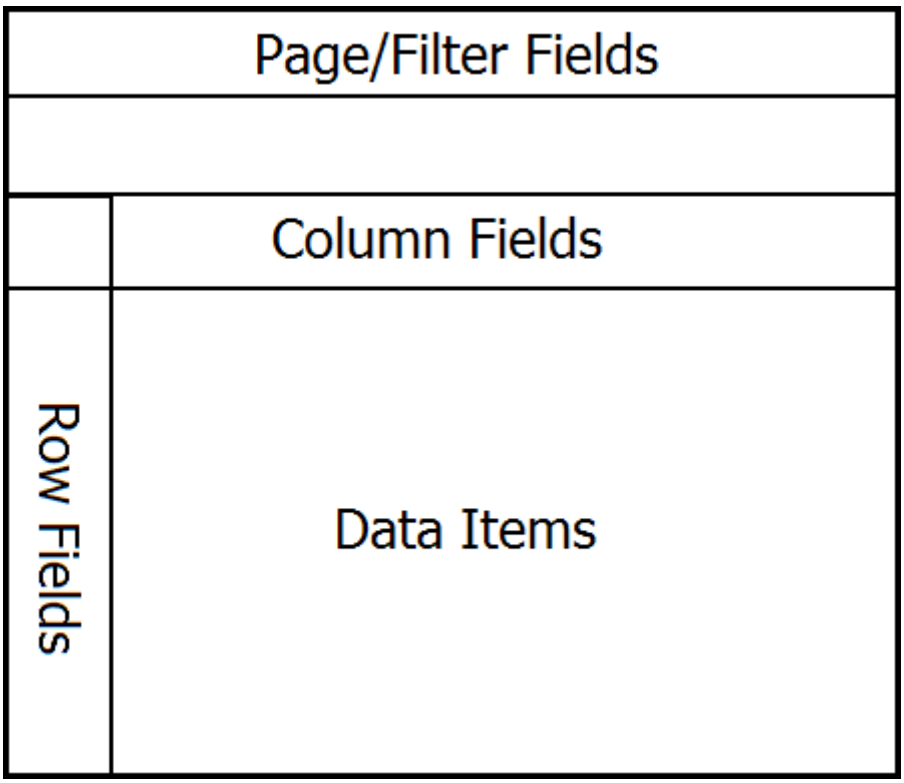
```
<complexType name="CT_MetadataBlocks">
    <sequence>
        <element name="bk" type="CT_MetadataBlock" minOccurs="1" maxOccurs="unbounded"/>
    </sequence>
    <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.10 Pivot Tables

PivotTables display aggregated views of data easily and in an understandable layout. Hundreds or thousands of pieces of underlying information can be aggregated on row & column axes, revealing the meanings behind the data. PivotTable reports are used to organize and summarize your data in different ways. Creating a PivotTable report is about moving pieces of information around to see how they fit together. In a few gestures the pivot rows and columns can be moved into different arrangements and layouts.

A PivotTable object has a row axis area, a column axis area, a data area, and a page/report filter area. Additionally, PivotTables have a corresponding field list pane, or similar user interface, that displays all the fields of data that can be placed on one of the PivotTable areas. In SpreadsheetML, each PivotTable area maps to a collection of fields in the PivotTableDefinition that correspond to each area.

The following image shows the layout for the PivotTable areas.



[*Example*:

The following image shows a table of data in a worksheet.

	A	C	F	H	I	O	P	Q	Z	AA	AB
1	Customer Name	Country	City	Product Category	Product Subcategory	Year	Quarter	Month	Sales Amount	Tax Amount	Freight
2	Michele Raman	Australia	Bendigo	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
3	Misty Raji	Australia	Bendigo	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
4	Tabitha E Arthur	Australia	Bendigo	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
5	Clarence D Rai	Australia	Bendigo	Bikes	Mountain Bikes	2001	3	July	3399.99	271.9992	84.9998
6	Jimmy L Moreno	Australia	Bendigo	Bikes	Mountain Bikes	2001	3	July	3399.99	271.9992	84.9998
7	Rob Verhoff	Australia	Bendigo	Bikes	Mountain Bikes	2001	3	July	3374.99	269.9992	84.3748
8	Levi Sai	Australia	Bendigo	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
9	Logan Gonzales	Australia	Brisbane	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
10	Dalton J Lee	Australia	Brisbane	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
11	Jessie J Ortega	Australia	Brisbane	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
12	Paul J. Shakespear	Australia	Caloundra	Bikes	Road Bikes	2001	3	September	3578.27	286.2616	89.4568
13	Joan R Martin	Australia	Caloundra	Bikes	Road Bikes	2001	3	September	699.0982	55.9279	17.4775
14	Casey Pal	Australia	Caloundra	Bikes	Road Bikes	2001	3	July	3578.27	286.2616	89.4568
15	Ethan G Coleman	Australia	Caloundra	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
16	Kendra Rubio	Australia	Caloundra	Bikes	Road Bikes	2001	3	August	3578.27	286.2616	89.4568
17	Bethany G Yuan	Australia	Cloverdal	Bikes	Mountain Bikes	2001	3	August	3399.99	271.9992	84.9998

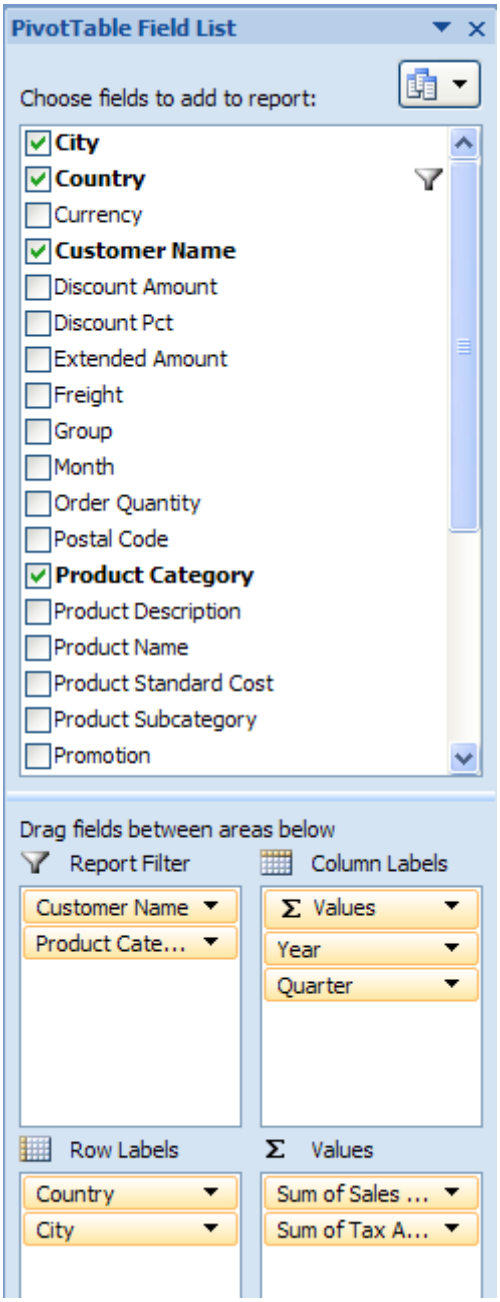
The following image shows a PivotTable summary of the worksheet table data.

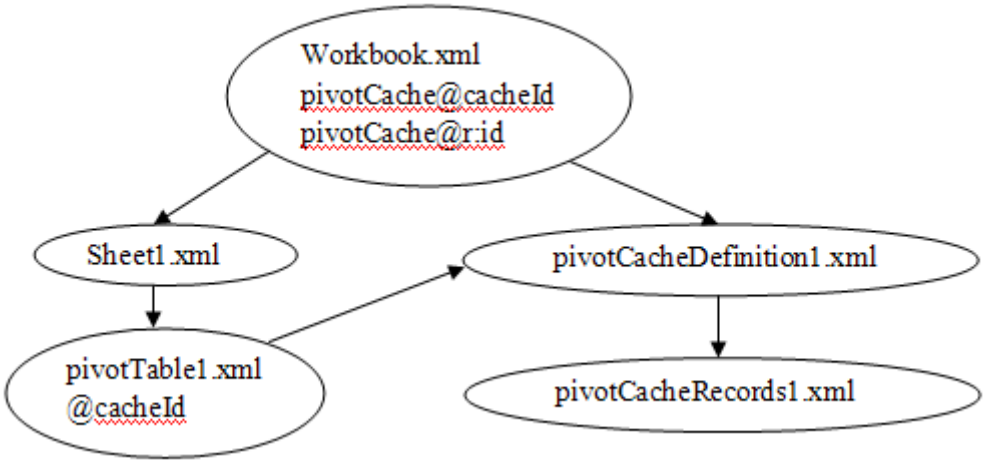
	A	B	C	D	E	F	G
1							
2		Country	(All)				
3		State	(All)				
4		City	(All)				
5							
6		Sum of Sales Amount	Column Labels				
7			2001				2001 Total
8			3			3 Total	
9		Row Labels	July	August	September		
10		Bikes	209652.9046	222538.2892	173993.5128	606184.7066	606184.7066
11		Mountain Bikes	64424.81	60899.82	10174.97	135499.6	135499.6
12		Road Bikes	145228.0946	161638.4692	163818.5428	470685.1066	470685.1066
13		Grand Total	209652.9046	222538.2892	173993.5128	606184.7066	606184.7066

The filter area consists of the "Country", "State", and "City" fields. The row area consists of the "Product Category" and "Product Subcategory" fields. "Bikes" belongs to the "Product Category" field and both "Mountain Bikes" and "Road Bikes" belong to the "Product Subcategory" field. The column consists of the "Year" ("2001"), "Quarter" ("3"), and "Month" ("July", "August", and "September") fields.

The following image shows the field list for the PivotTable in the previous image.



File Structure



The workbook points to (and owns the longevity of) the *pivotCacheDefinition* part, which in turn points to and owns the *pivotCacheRecords* part. The workbook also points to and owns the sheet part, which in turn points to and owns a *pivotTable* part definition, when a PivotTable is on the sheet. There can be multiple PivotTables on a sheet. The *pivotTable* part points to the appropriate *pivotCacheDefinition* which it is using. Since multiple PivotTables can use the same cache, the *pivotTable* part does not own the longevity of the *pivotCacheDefinition*.

The *pivotTable* part describes the particulars of the layout of the PivotTable on the sheet. It indicates what fields are on the row axis, the column axis, report filter, and values areas of the PivotTable. It also indicates formatting information about the PivotTable. If conditional formatting has been applied to the PivotTable, that is also expressed in the *pivotTable* part.

Outline of XML for pivotTableDefinition

```
<pivotTableDefinition>
  <location/>
  <pivotFields/>
  <rowFields/>
  <rowItems/>
  <colFields/>
  <colItems/>
  <pageFields/>
  <dataFields/>
  <conditionalFormats/>
  <pivotTableStyleInfo/>
</pivotTableDefinition>
```

The *pivotCacheRecords* part contains the underlying data to be aggregated. It is a cache of the source data.

Outline of XML for pivotCacheRecords

```
<pivotCacheRecords/>
  <r/>
</pivotCacheRecords>
```

The *pivotCacheDefinition* part defines each field in the *pivotCacheRecords* part, including field name and information about the data contained in the field. The *pivotCacheDefinition* part also defines pivot items that are shared among the *pivotTableDefinition* and *pivotCacheRecords* parts.

Outline of XML for pivotCacheDefinition

```
<pivotCacheDefinition>
  <cacheSource/>
  <cacheFields>
    <cacheField>
      <sharedItems>
        <d/>
      </sharedItems>
      <fieldGroup/>
    </cacheField>
  </cacheFields>
</pivotCacheDefinition>
```

3.10.1 Pivot Tables

This section describes the definition of PivotTables in SpreadsheetML.

3.10.1.1 autoSortScope (AutoSort Scope)

Represents the sorting scope for the PivotTable.

Parent Elements
pivotField (§3.10.1.69)

Child Elements	Subclause
pivotArea (Pivot Area)	§3.3.1.66

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AutoSortScope">
   <sequence>
      <element name="pivotArea" type="CT_PivotArea"/>
   </sequence>
</complexType>
```

3.10.1.2 b (Boolean)

Represents a boolean value for an item in the PivotTable.

Parent Elements
groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

Child Elements	Subclause
x (Member Property Index)	§3.10.1.96

Attributes	Description
c (Caption)	Specifies the caption for the item. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
cp (Member Property Count)	Specifies the number of property values for this item. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
f (Calculated Item)	Specifies a boolean value that indicates whether this item has a calculated value. A value of on, 1, or true indicates the item has a calculated value. A value of off, 0, or false indicates the item does not have a calculated value. The possible values for this attribute are defined by the XML Schema boolean datatype.
u (Unused Item)	Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached. A value of on, 1, or true indicates this item is unused. A value of off, 0, or false indicates this item is used. The possible values for this attribute are defined by the XML Schema boolean datatype.
v (Value)	Specifies the value of the item. This attribute is required. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <sequence>
      <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
   </sequence>
   <attribute name="v" use="required" type="xsd:boolean"/>
   <attribute name="u" type="xsd:boolean"/>
   <attribute name="f" type="xsd:boolean"/>
   <attribute name="c" type="ST_Xstring"/>
   <attribute name="cp" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.3 cacheField (PivotCache Field)

Represent a single field in the PivotCache. This definition contains information about the field, such as its source, data type, and location within a level or hierarchy. The sharedItems complex type stores additional information about the data in this field. If there are no shared items, then values are stored directly in the pivotCacheRecords part.

[*Example*:

```
<cacheField name="Group" numFmtId="0">
  <sharedItems count="3">
    <s v="Pacific"/>
    <s v="North America"/>
    <s v="Europe"/>
  </sharedItems>
</cacheField>
```

end example]

Parent Elements
cacheFields (§3.10.1.4)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
fieldGroup (Field Group Properties)	§3.10.1.30
mpMap (Member Properties Map)	§3.10.1.58
sharedItems (Shared Items)	§3.10.1.90

Attributes	Description
caption (PivotCache Field Caption)	Specifies the caption of the cache field.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
databaseField (Database Field)	Specifies a boolean value that indicates whether this field came from the source database rather having been created by the application. A value of on, 1, or true indicates the field is from the source database. A value of off, 0, or false indicates the field was created by the application. [*Note*: This attribute could be used for a defined grouped or calculated field. In this case, source database fields should precede defined grouped or calculated fields. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
formula (Calculated Field Formula)	Specifies the formula for the calculated field. This formula is specified by the end-user. Calculated fields can perform calculations by using the contents of other fields in the PivotTable. In formulas you create for calculated fields or calculated items, you can use operators and expressions as you do in other worksheet formulas. You can use constants and refer to data from the PivotTable, but you cannot use cell references or defined names. You cannot use worksheet functions that require cell references or defined names as arguments, and you cannot use array functions. Further behaviors and restrictions apply to formulas for calculated fields: • Formulas for calculated fields operate on the sum of the underlying data for any fields in the formula. For example, the formula =Sales * 1.2 multiplies the sum of the sales for each type and region by 1.2; it does not multiply each individual sale by 1.2 and then sum the multiplied amounts. • Formulas cannot refer to totals. For more information about formulas see §3.17 in Formulas. For more information about defined names see §3.2.6 in Workbook. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
hierarchy (Hierarchy)	Specifies the hierarchy that this field is part of. The possible values for this attribute are defined by the XML Schema int datatype.
level (Hierarchy Level)	Specifies the hierarchy level that this field is part of. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
mappingCount (Member Property	Specifies the number of property mappings for this field.

Attributes	Description
Count)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
memberPropertyField (Member Property Field)	Specifies a boolean value that indicates whether the field contains OLAP member property information. A value of on, 1, or true indicates this field contains OLAP member property information. A value of off, 0, or false indicates this field does not contain OLAP member property information. The possible values for this attribute are defined by the XML Schema boolean datatype.
name (PivotCache Field Name)	Specifies the name of the cache field. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
numFmtId (Number Format Id)	Specifies the number format that is applied to all items in the field. Number formats are written to the styles part. For more information see §3.8.31 in Styles. Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout of the PivotTable, the PivotTable formatting will then take precedence. The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).
propertyName (Property Name)	Specifies the name of the property if this field is an OLAP property field. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
serverField (Server-based Field)	Specifies a boolean value that indicates whether the field is a server-based page field. A value of on, 1, or true indicates this field is a server-based page field. A value of off, 0, or false indicates this field is not a server-based page field. Note: this attribute applies to ODBC sources only. The possible values for this attribute are defined by the XML Schema boolean datatype.
sqlType (SQL Data Type)	Specifies the SQL data type of the field. This attribute stores an ODBC data type and applies to ODBC data sources only. A value is supplied for this attribute only if it is provided to the application. The following are data types supported by ODBC. For a more information, see the ODBC specification. • 0 SQL_UNKNOWN_TYPE

Attributes	Description
	• 1 SQL_CHAR • 2 SQL_VARCHAR • -1 SQL_LONGVARCHAR • -8 SQL_WCHAR • -9 SQL_WVARCHAR • -10 SQL_WLONGVARCHAR • 3 SQL_DECIMAL • 2 SQL_NUMERIC • 5 SQL_SMALLINT • 4 SQL_INTEGER • 7 SQL_REAL • 6 SQL_FLOAT • 8 SQL_DOUBLE • -7 SQL_BIT • -6 SQL_TINYINT • -5 SQL_BIGINT • -2 SQL_BINARY • -3 SQL_VARBINARY • -4 SQL_LONGVARBINARY • 9 SQL_TYPE_DATE or SQL_DATE • 10 SQL_TYPE_TIME or SQL_TIME • 11 SQL_TYPE_TIMESTAMP or SQL_TIMESTAMP • 102 SQL_INTERVAL_MONTH • 101 SQL_INTERVAL_YEAR • 107 SQL_INTERVAL_YEAR_TO_MONTH • 103 SQL_INTERVAL_DAY • 104 SQL_INTERVAL_HOUR • 105 SQL_INTERVAL_MINUTE • 106 SQL_INTERVAL_SECOND • 108 SQL_INTERVAL_DAY_TO_HOUR • 109 SQL_INTERVAL_DAY_TO_MINUTE • 110 SQL_INTERVAL_DAY_TO_SECOND • 111 SQL_INTERVAL_HOUR_TO_MINUTE • 112 SQL_INTERVAL_HOUR_TO_SECOND • 113 SQL_INTERVAL_MINUTE_TO_SECOND • -11 SQL_GUID • -20 SQL_SIGNED_OFFSET • -22 SQL_UNSIGNED_OFFSET The possible values for this attribute are defined by the XML Schema int datatype.
uniqueList (Unique List Retrieved)	Specifies a boolean value that indicates whether the application was able to get a list of unique items for the field. The attribute only applies to PivotTables that use ODBC and is intended to be used in conjunction with optimization features in the application. For example, the application can optimize memory usage when populating PivotCache

Attributes	Description
	records if it has a list of unique items for a field before all the records are retrieved from ODBC. A value of on, 1, or true indicates the application was able to get a list of unique values for the field. A value of off, 0, or false indicates the application was unable to get a list of unique values for the field. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CacheField">
   <sequence>
      <element name="sharedItems" type="CT_SharedItems" minOccurs="0" maxOccurs="1"/>
      <element name="fieldGroup" minOccurs="0" type="CT_FieldGroup"/>
      <element name="mpMap" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="caption" type="ST_Xstring" use="optional"/>
   <attribute name="propertyName" type="ST_Xstring" use="optional"/>
   <attribute name="serverField" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="uniqueList" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="numFmtId" type="ST_NumFmtId" use="optional"/>
   <attribute name="formula" type="ST_Xstring" use="optional"/>
   <attribute name="sqlType" type="xsd:int" use="optional" default="0"/>
   <attribute name="hierarchy" type="xsd:int" use="optional" default="0"/>
   <attribute name="level" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="databaseField" type="xsd:boolean" default="true"/>
   <attribute name="mappingCount" type="xsd:unsignedInt" use="optional"/>
   <attribute name="memberPropertyField" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.4 cacheFields (PivotCache Fields)

Represents the collection of field definitions in the source data.

[*Example*:

```
<cacheFields count="1">
  <cacheField name="Group" numFmtId="0">
    <sharedItems count="3">
      <s v="One"/>
      <s v="Two"/>
      <s v="Three"/>
    </sharedItems>
  </cacheField>
</cacheFields>
```

end example]

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
cacheField (PivotCache Field)	§3.10.1.3

Attributes	Description
count (Field Count)	Specifies the number of fields in the cache. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CacheFields">
   <sequence>
      <element name="cacheField" type="CT_CacheField" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.5 cacheHierarchies (PivotCache Hierarchies)

Represents the collection of OLAP hierarchies in the PivotCache.

[*Example*:

```
<cacheHierarchies count="2">
  <cacheHierarchy uniqueName="[Account].[Account]" caption="Account"
    attribute="1" keyAttribute="1"
    defaultMemberUniqueName="[Account].[Account].[All Accounts]"
    allUniqueName="[Account].[Account].[All Accounts]"
    dimensionUniqueName="[Account]" count="0"/>
```

```
  <cacheHierarchy uniqueName="[Account].[Account Number]" caption="Account
    Number" attribute="1" defaultMemberUniqueName="[Account].[Account
    Number].[All Accounts]" allUniqueName="[Account].[Account Number].[All
    Accounts]" dimensionUniqueName="[Account]" count="0"/>
</cacheHierarchies>
```

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
cacheHierarchy (PivotCache Hierarchy)	§3.10.1.6

Attributes	Description
count (Hierarchy Count)	Specifies the number of OLAP hierarchies in the cache. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CacheHierarchies">
   <sequence>
      <element name="cacheHierarchy" minOccurs="0" maxOccurs="unbounded" type="CT_CacheHierarchy"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.6 cacheHierarchy (PivotCache Hierarchy)

Represents an OLAP hierarchy in the PivotCache.

[*Example*:

```
<cacheHierarchy uniqueName="[Account].[Account Number]" caption="Account Number"
  attribute="1" defaultMemberUniqueName="[Account].[Account Number].[All
  Accounts]" allUniqueName="[Account].[Account Number].[All Accounts]"
  dimensionUniqueName="[Account]" count="0"/>
```

end example]

Parent Elements
cacheHierarchies (§3.10.1.5)

Child Elements	Subclause

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
fieldsUsage (Fields Usage)	§3.10.1.31
groupLevels (OLAP Grouping Levels)	§3.10.1.40

Attributes	Description
allCaption (Display Name of 'All')	Specifies the display name of the "all" member of this hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
allUniqueName (Unique Name of 'All')	Specifies the unique name of the "all" member of this hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
attribute (Attribute Hierarchy)	Specifies a boolean value that indicates whether this hierarchy is an attribute hierarchy. An attribute hierarchy is an OLAP member that is exposed as a flat, single-level hierarchy on the OLAP server. A value of on, 1, or true indicates this hierarchy is an attribute hierarchy. A value of off, 0, or false indicates this hierarchy is not an attribute hierarchy. The possible values for this attribute are defined by the XML Schema boolean datatype.
caption (Hierarchy Display Name)	Specifies the display name of the hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
count (Levels Count)	Specifies the number of levels in this hierarchy. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
defaultMemberUniqueName (Default Member Unique Name)	Specifies the unique name of the default member of this hierarchy The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
dimensionUniqueName (Dimension Unique Name)	Specifies the unique name of the dimension to which this hierarchy belongs. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
displayFolder (Display Folder)	Specifies the display folder in which this hierarchy should be displayed. The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§3.18.96).
hidden (Hidden)	Specifies a boolean value that indicates whether the hierarchy is hidden. A value of on, 1, or true indicates this hierarchy is hidden. The possible values for this attribute are defined by the XML Schema boolean datatype.
iconSet (KPI Icon Set)	Specifies the icon set to use to visualize a KPI trend or status expression. PivotTables use the icon sets available for conditional formatting in SpreadsheetML. See associated simple type definition for details. The following values are used by PivotTables: • no value: default iconset. For status KPI this corresponds to 3 traffic lights. For trend KPI this corresponds to 3-arrows. • 1: Variance Arrow - 3 arrow. • 2: 3 arrows • 3: Status Arrow Ascending - 5 arrows. • 4: Status Arrow Descending - 5 arrows • 5: Standard Arrow - 5 arrows gray. • 6: Traffic Light Single - 3 traffic lights 1. • 7: Traffic Light, Traffic Light Multiple - 3 traffic lights 2. • 8: Gauge Ascending - 5 quarters. • 9: Gauge Descending - 5 quarters. • 10: Thermometer, Cylinder, Smiley Face - 3 signs. • 11: Road Signs - 3 symbols. The possible values for this attribute are defined by the XML Schema int datatype.
keyAttribute (Key Attribute Hierarchy)	Specifies a boolean value that indicates whether this hierarchy is the key attribute hierarchy in an OLAP dimension. A value of on, 1, or true indicates this hierarchy is the key attribute hierarchy in an OLAP dimension. A value of off, 0, or false indicates this hierarchy is not a key attribute hierarchy. The possible values for this attribute are defined by the XML Schema boolean datatype.
measure (Measure Hierarchy)	Specifies a boolean value that indicates whether this hierarchy is a measure. A value of on, 1, or true indicates this hierarchy is a measure. A value of off, 0, or false indicates this hierarchy is not a measure. The possible values for this attribute are defined by the XML Schema boolean datatype.
measureGroup (Measure Group Name)	Specifies the name of the measure group to which this hierarchy belongs. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
measures (Measures)	Specifies a boolean value that indicates whether this hierarchy contains all the measures. A value of on, 1, or true indicates this hierarchy contains all the measures. A value of off, 0, or false indicates this hierarchy does not contain all the measures. The possible values for this attribute are defined by the XML Schema boolean datatype.
memberValueDatatype (Member Value Data Type)	Specifies the data type of the member value. This attribute stores an OLEDB data type. [*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbtype_indicators.asp *end note*] `memberValueDataType` is stored for key attribute hierarchies in order to tell when the application will offer date filtering instead of label filtering in OLAP PivotTables. Date filtering is only offered when the data type is Date/Time. `memberValueDatatype="7"` indicates a date/time data type. The possible values for this attribute are defined by the XML Schema unsignedShort datatype.
oneField (One Field)	Specifies a boolean value that indicates whether this hierarchy is associated with only one field due to its position in the view. A value of on, 1, or true indicates this hierarchy is associated with only one field. A value of off, 0, or false indicates this field is not restricted to only one association due to its position in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
parentSet (Parent Set)	Specifies the parent hierarchy of the set. If the attribute is missing it means that the parent hierarchy is unknown or doesn't exist in the cache. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
set (Set)	Specifies a boolean value that indicates whether this hierarchy is a set. A value of on, 1, or true indicates this hierarchy is a set. A value of off, 0, or false indicates this hierarchy is not a set. The possible values for this attribute are defined by the XML Schema boolean datatype.
time (Time)	Specifies a boolean value that indicates whether this hierarchy is of type time.

Attributes	Description
	A value of on, 1, or true indicates this hierarchy is of type time. A value of off, 0, or false indicates is of a different type. The possible values for this attribute are defined by the XML Schema boolean datatype.
unbalanced (Unbalanced)	Specifies a boolean value that indicates whether this hierarchy is an unbalanced hierarchy. If value is not written, then this attribute either cannot be determined or does not apply to the current hierarchy. A value of on, 1, or true indicates this hierarchy is unbalanced. A value of off, 0, or false indicates is balanced. For more information on balanced hierarchies, see the documentation provided for your OLAP server. The possible values for this attribute are defined by the XML Schema boolean datatype.
unbalancedGroup (Unbalanced Group)	Specifies a boolean value that indicated whether the grouped version of this hierarchy is an unbalanced hierarchy. If value is not written, then this attribute either cannot be determined or does not apply to the current hierarchy. A value of on, 1, or true indicates this hierarchy is unbalanced when grouped. A value of off, 0, or false indicates is balanced when grouped. For more information on balanced hierarchies, see the documentation provided for your OLAP server. The possible values for this attribute are defined by the XML Schema boolean datatype.
uniqueName (Hierarchy Unique Name)	Specifies the unique name of the hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CacheHierarchy">
    <sequence>
        <element name="fieldsUsage" minOccurs="0" type="CT_FieldsUsage"/>
        <element name="groupLevels" minOccurs="0" type="CT_GroupLevels"/>
        <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
    </sequence>
    <attribute name="uniqueName" use="required" type="ST_Xstring"/>
    <attribute name="caption" use="optional" type="ST_Xstring"/>
    <attribute name="measure" type="xsd:boolean" default="false"/>
    <attribute name="set" type="xsd:boolean" default="false"/>
    <attribute name="parentSet" type="xsd:unsignedInt" use="optional"/>
    <attribute name="iconSet" type="xsd:int" default="0"/>
    <attribute name="attribute" type="xsd:boolean" default="false"/>
    <attribute name="time" type="xsd:boolean" default="false"/>
    <attribute name="keyAttribute" type="xsd:boolean" default="false"/>
    <attribute name="defaultMemberUniqueName" type="ST_Xstring"/>
    <attribute name="allUniqueName" type="ST_Xstring"/>
    <attribute name="allCaption" type="ST_Xstring"/>
    <attribute name="dimensionUniqueName" type="ST_Xstring"/>
    <attribute name="displayFolder" type="ST_Xstring"/>
    <attribute name="measureGroup" type="ST_Xstring"/>
    <attribute name="measures" type="xsd:boolean" default="false"/>
    <attribute name="count" use="required" type="xsd:unsignedInt"/>
    <attribute name="oneField" type="xsd:boolean" default="false"/>
    <attribute name="memberValueDatatype" use="optional" type="xsd:unsignedShort"/>
    <attribute name="unbalanced" use="optional" type="xsd:boolean"/>
    <attribute name="unbalancedGroup" use="optional" type="xsd:boolean"/>
    <attribute name="hidden" type="xsd:boolean" default="false"/>
</complexType>
```

3.10.1.7 cacheSource (PivotCache Source Description)

Represents the description of data source whose data is stored in the pivot cache. The data source refers to the underlying rows or database records that provide the data for a PivotTable. You can create a PivotTable report from a SpreadsheetML table, an external database (including OLAP cubes), multiple SpreadsheetML worksheets, or another PivotTable.

Quarter	Region	Sport	Sales
Qtr1	East	Golf	$5,000
Qtr1	East	Safari	$9,000
Qtr1	East	Tennis	$1,500
Qtr2	East	Golf	$2,000
Qtr2	East	Safari	$6,000
Qtr2	East	Tennis	$500
Qtr1	West	Golf	$3,500
Qtr1	West	Tennis	$6,000
Qtr2	West	Golf	$2,500
Qtr2	West	Tennis	$3,200

Information about the data source is stored in the connection element and is retrieved using the connectionId attribute.

[*Example*:

```
<cacheSource type="external" connectionId="1"/>
```

end example]

OLAP data sources are distinguished from other data sources in SpreadsheetML. OLAP records are not stored in the *pivotCacheRecords* part, whereas all records for non-OLAP data sources are stored in the cache.

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
consolidation (Consolidation Source)	§3.10.1.20
extLst (Future Feature Data Storage Area)	§3.2.10
worksheetSource (Worksheet PivotCache Source)	§3.10.1.95

Attributes	Description
connectionId (Connection Index)	Specifies the index to the workbook connection. This attribute is used when the cache type is 'External.' See §3.13.1 for more information about the connection element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Cache Type)	Specifies the cache type. The possible values for this attribute are defined by the ST_SourceType simple type (§3.18.77).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CacheSource">
   <choice minOccurs="0" maxOccurs="1">
      <element name="worksheetSource" type="CT_WorksheetSource" minOccurs="1" maxOccurs="1"/>
      <element name="consolidation" type="CT_Consolidation" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0"/>
   </choice>
   <attribute name="type" type="ST_SourceType" use="required"/>
   <attribute name="connectionId" type="xsd:unsignedInt" default="0" use="optional"/>
</complexType>
```

3.10.1.8 calculatedItem (Calculated Item)

Represents an item within a PivotTable field that uses a formula . The formula is specified in the formula attribute.

Calculations and options available for a PivotTable depend on whether the source data came from an OLAP database or another type of database. This complex type applies to non-OLAP external data or on worksheet data. See calculatedMember for information on calculations on OLAP data sources.

Parent Elements
calculatedItems (§3.10.1.9)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
pivotArea (Pivot Area)	§3.3.1.66

Attributes	Description
field (Field Index)	Specifies the index of the pivotField with which this calculated item is associated. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
formula (Calculated Item Formula)	Specifies the formula of the calculated item. In formulas you create for calculated items, you can use operators and expressions as you do in other worksheet formulas. You can use constants and refer to data from the PivotTable, but you cannot use cell references or defined names. You cannot use worksheet functions that require cell references or defined names as arguments, and you cannot use array functions. Further behaviors and restrictions apply to formulas for `calculatedItems`: • Formulas for calculated items operate on the individual records; the calculated item formula =Dairy *115% multiplies each individual sale of Dairy times 115%, after which the multiplied amounts are summarized together in the data area. • Formulas cannot refer to totals. • You can include the field name in a reference to an item. The item name must be in square brackets. Use this format to avoid #NAME? errors when two items in two different fields in a report have the same name. • You can refer to an item by its position in the PivotTable as currently sorted and displayed. The item referred to in this way can change whenever the positions of items change or different items are displayed or hidden. Hidden items are not counted in this index. • You can use relative positions to refer to items. The positions are determined relative to the calculated item that contains the formula. If the position you give is before the first item or after the last item in the field, the formula results in a #REF! error. For more information about formulas see §3.17 in Formulas. For more information about defined names see §3.2.6 in Workbook. The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalculatedItem">
    <sequence>
        <element name="pivotArea" type="CT_PivotArea"/>
        <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
    </sequence>
    <attribute name="field" type="xsd:unsignedInt" use="optional"/>
    <attribute name="formula" type="ST_Xstring"/>
</complexType>
```

3.10.1.9 calculatedItems (Calculated Items)

Represents the collection of calculated items.

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
calculatedItem (Calculated Item)	§3.10.1.8

Attributes	Description
count (Calculated Item Formula Count)	Specifies the number of calculated item formulas in the cache. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalculatedItems">
    <sequence>
        <element name="calculatedItem" maxOccurs="unbounded" type="CT_CalculatedItem"/>
    </sequence>
    <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.10 calculatedMember (Calculated Member)

Represents a calculated OLAP hierarchy. A calculated member is a member of an OLAP-based PivotTable whose value is calculated on the OLAP server. For PivotTables that are created from OLAP cubes the summarized values are precalculated on the OLAP server before the SpreadsheetML application displays the results. These fields appear in the PivotTable field list but cannot be changed from within the PivotTable. You cannot change the summary function used to calculate data fields or subtotals, or add calculated items.

Calculated members are defined by the Multidimensional Expressions (MDX) expression in the mdx attribute.

[*Example*:

```
<calculatedMembers count="1">
  <calculatedMember name="[Product].[Product Categories].[All
    Products].[Calculated Member]" mdx="'[Product].[Product Categories].[All
    Products].[Accessories]'" memberName="Calculated Member"
    hierarchy="[Product].[Product Categories]" parent="[Product].[Product
    Categories].[All Products]"/>
</calculatedMembers>
```

end example]

Parent Elements
calculatedMembers (§3.10.1.11)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
hierarchy (Hierarchy Name)	Specifies the name of the hierarchy to which the calculated member belongs. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
mdx (Calculated Member MDX Formula)	Specifies the MDX formula for the calculated member. [*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn2.microsoft.com/en-us/library/ms145595.aspx *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
memberName (OLAP Calculated Member Name)	Specifies the OLAP member name for the calculated member. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
name (Calculated Member Name)	Specifies the name of the calculated member. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
parent (Parent	Specifies the name of the parent of the calculated member.

Attributes	Description
Name)	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
set (Set)	Specifies a boolean value that indicates whether this calculated member describes a calculated set rather than a calculated member. A value of on, 1, or true indicates this is a calculated set. A value of off, 0, or false indicates this is a calculated member. The possible values for this attribute are defined by the XML Schema boolean datatype.
solveOrder (Calculated Members Solve Order)	Specifies the order in which this calculated member is calculated in relation to other calculated members. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalculatedMember">
   <sequence minOccurs="0">
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="name" use="required" type="ST_Xstring"/>
   <attribute name="mdx" use="required" type="ST_Xstring"/>
   <attribute name="memberName" type="ST_Xstring"/>
   <attribute name="hierarchy" type="ST_Xstring"/>
   <attribute name="parent" type="ST_Xstring"/>
   <attribute name="solveOrder" type="xsd:int" default="0"/>
   <attribute name="set" type="xsd:boolean" default="false"/>
</complexType>
```

3.10.1.11 calculatedMembers (Calculated Members)

Represents the collection of calculated members in an OLAP PivotTable.

[*Example*:

```
<calculatedMembers count="1">
  <calculatedMember name="[Product].[Product Categories].[All
    Products].[Calculated Member]" mdx="'[Product].[Product Categories].[All
    Products].[Accessories]'" memberName="Calculated Member"
    hierarchy="[Product].[Product Categories]" parent="[Product].[Product
    Categories].[All Products]"/>
</calculatedMembers>
```

end example]

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
calculatedMember (Calculated Member)	§3.10.1.10

Attributes	Description
count (Calculated Members Count)	Specifies the number of calculated members. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CalculatedMembers">
   <sequence>
      <element name="calculatedMember" maxOccurs="unbounded" type="CT_CalculatedMember"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.12 chartFormat (PivotChart Format)

Represents the format defined in the PivotChart that is associated with this PivotTable.

[*Example*:

```
<sh:pivotTableDefinition xmlns:sh="…" name="PivotTable1" cacheId="0"
  applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="0"
  applyPatternFormats="0" applyAlignmentFormats="0" applyWidthHeightFormats="1"
  dataCaption="Values" updatedVersion="3" minRefreshableVersion="3"
  showCalcMbrs="0" useAutoFormatting="1" colGrandTotals="0" itemPrintTitles="1"
  createdVersion="3" indent="0" outline="1" outlineData="1"
  multipleFieldFilters="0" chartFormat="1" fieldListSortAscending="1">
```

end example]

Parent Elements
chartFormats (§3.10.1.13)

Child Elements	Subclause
pivotArea (Pivot Area)	§3.3.1.66

Attributes	Description
chart (Chart Index)	Specifies the index of the chart part to which the formatting applies. For more information see the DrawingML specification for more information on the chart part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
format (Pivot Format Id)	Specifies the index of the pivot format that is currently in use. This index corresponds to a dxf element in the Styles part. For more information see the Styles section (§3.8). The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
series (Series Format)	Specifies a boolean value that indicates whether format applies to a series. A value of on, 1, or true indicates this format applies to a series. A value of off, 0, or false indicates this format applies to a data point. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartFormat">
   <sequence>
      <element name="pivotArea" type="CT_PivotArea"/>
   </sequence>
   <attribute name="chart" use="required" type="xsd:unsignedInt"/>
   <attribute name="format" use="required" type="xsd:unsignedInt"/>
   <attribute name="series" type="xsd:boolean" default="false"/>
</complexType>
```

3.10.1.13 chartFormats (PivotChart Formats)

Represents the collection of formats applied to PivotChart.

[*Example*:

```
<sh:chartFormats count="4">
  <sh:chartFormat chart="0" format="0" series="1">
    <sh:pivotArea type="data" outline="0">
      <sh:references count="3">
        <sh:reference field="4294967294" count="1" selected="0">
          <sh:x v="0"/>
        </sh:reference>
        <sh:reference field="14" count="1" selected="0">
          <sh:x v="0"/>
        </sh:reference>
```

```
      <sh:reference field="15" count="1" selected="0">
        <sh:x v="2"/>
      </sh:reference>
    </sh:references>
  </sh:pivotArea>
</sh:chartFormat>
<sh:chartFormat chart="0" format="1" series="1">
  <sh:pivotArea type="data" outline="0">
    <sh:references count="3">
      <sh:reference field="4294967294" count="1" selected="0">
        <sh:x v="0"/>
      </sh:reference>
      <sh:reference field="14" count="1" selected="0">
        <sh:x v="0"/>
      </sh:reference>
      <sh:reference field="15" count="1" selected="0">
        <sh:x v="3"/>
      </sh:reference>
    </sh:references>
  </sh:pivotArea>
</sh:chartFormat>
<sh:chartFormat chart="0" format="2" series="1">
  <sh:pivotArea type="data" outline="0">
    <sh:references count="3">
      <sh:reference field="4294967294" count="1" selected="0">
        <sh:x v="1"/>
      </sh:reference>
      <sh:reference field="14" count="1" selected="0">
        <sh:x v="0"/>
      </sh:reference>
      <sh:reference field="15" count="1" selected="0">
        <sh:x v="2"/>
      </sh:reference>
    </sh:references>
  </sh:pivotArea>
</sh:chartFormat>
<sh:chartFormat chart="0" format="3" series="1">
  <sh:pivotArea type="data" outline="0">
    <sh:references count="3">
      <sh:reference field="4294967294" count="1" selected="0">
        <sh:x v="1"/>
      </sh:reference>
```

```
          <sh:reference field="14" count="1" selected="0">
            <sh:x v="0"/>
          </sh:reference>
          <sh:reference field="15" count="1" selected="0">
            <sh:x v="3"/>
          </sh:reference>
        </sh:references>
      </sh:pivotArea>
    </sh:chartFormat>
  </sh:chartFormats>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
chartFormat (PivotChart Format)	§3.10.1.12

Attributes	Description
count (Format Count)	Specifies the number of formats in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartFormats">
   <sequence>
      <element name="chartFormat" maxOccurs="unbounded" type="CT_ChartFormat"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.10.1.14 colFields (Column Fields)

Represents the collection of fields that are on the column axis of the PivotTable.

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

In the image above, the blue field is a column field.

In the following SpreadsheetML example, "Year", "Quarter" and "Month" are on the column axis of the PivotTable, in that order.

[*Example*:

```
<colFields count="3">
  <field x="14"/>
  <field x="15"/>
  <field x="16"/>
</colFields>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
field (Field)	§3.10.1.29

Attributes	Description
count (Repeated Items Count)	Specifies the number of items in this collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColFields">
   <sequence>
      <element name="field" maxOccurs="unbounded" type="CT_Field"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.10.1.15 colHierarchiesUsage (Column OLAP Hierarchy References)

Represents the collection of references to OLAP hierarchies on the column axis of a PivotTable.

[*Example*:

```
<sh:colHierarchiesUsage count="2">
  <sh:colHierarchyUsage hierarchyUsage="33"/>
  <sh:colHierarchyUsage hierarchyUsage="-2"/>
</sh:colHierarchiesUsage>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
colHierarchyUsage (Column OLAP Hierarchies)	§3.10.1.16

Attributes	Description
count (Items Count)	Specifies the number of items in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColHierarchiesUsage">
   <sequence>
      <element name="colHierarchyUsage" minOccurs="1" maxOccurs="unbounded"
        type="CT_HierarchyUsage"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.16 colHierarchyUsage (Column OLAP Hierarchies)

Represents the collection of references to OLAP Hierarchies on the column axis of a PivotTable.

[*Example*:

<sh:colHierarchyUsage hierarchyUsage="33"/>

end example]

Parent Elements
colHierarchiesUsage (§3.10.1.15)

Attributes	Description
hierarchyUsage (Hierarchy Usage)	Specifies the reference to an OLAP hierarchy in a PivotTable. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HierarchyUsage">
   <attribute name="hierarchyUsage" type="xsd:int" use="required"/>
</complexType>
```

3.10.1.17 colItems (Column Items)

Represents the collection of column items of the PivotTable.

In the following SpreadsheetML example the item values are found in cells C6:H8. For example "2001" / "3" / "July" values are in C7:C9. Those are the first column item values and are referenced by the first <i> element below.

[*Example*:

```
<colItems count="5">
  <i>
    <x/>
    <x/>
    <x/>
  </i>
  <i r="2">
    <x v="1"/>
  </i>
  <i r="2">
    <x v="2"/>
  </i>
  <i t="default" r="1">
    <x/>
  </i>
  <i t="default">
    <x/>
  </i>
</colItems>
```

end example]

The first <i> collection represents all item values for the first column in the column axis area of the PivotTable. The first <x> in the first <i> corresponds to the first field in the columns area of the PivotTable, namely "Year". The implied index value of '0' on this <x> indicates that the item value for this first item in the column is the 0th item for this pivotField. The 0th item for this pivotField is itself an index to an item value into this field's shared items collection in the pivotCacheDefinition part, namely "2001".

The item values corresponding to the second and third <x> elements can be found in the same way, arriving at "3" for the second item value, and arriving at "July" for the third item value for this first column.

The second <i> collection expresses all 3 item values for the second column in the column axis area. The @r value of '2' indicates that the first two item values from the previous column will be repeated here, which means that the first item value for this second column will be "2001" again and the second item value for this second column will be "3". The third item value is expressed by the only <x> element under this second <i> element, and without further explanation is understood to reference the item value "August".

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
i (Row Items)	§3.10.1.44

Attributes	Description
count (Column Item Count)	Specifies the number of items on the column axis of the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_colItems">
   <sequence>
      <element name="i" maxOccurs="unbounded" type="CT_I"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.18 conditionalFormat (Conditional Formatting)

Represents the conditional formatting defined in the PivotTable.

Parent Elements
conditionalFormats (§3.10.1.19)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
pivotAreas (Pivot Areas)	§3.10.1.66

Attributes	Description
priority (Priority)	Specifies the priority of PivotTable conditional formatting rule. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
scope (Conditional Formatting Scope)	Specifies the scope of PivotTable conditional formatting rule.

Attributes	Description
	The possible values for this attribute are defined by the ST_Scope simple type (§3.18.69).
type (Conditional Formatting Rule Type)	Specifies the type of PivotTable conditional formatting rule. See associated simple type definition for details. The possible values for this attribute are defined by the ST_Type simple type (§3.18.84).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConditionalFormat">
   <sequence>
      <element name="pivotAreas" type="CT_PivotAreas"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="scope" type="ST_Scope" default="selection"/>
   <attribute name="type" type="ST_Type" default="none"/>
   <attribute name="priority" use="required" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.19 conditionalFormats (Conditional Formats)

Represents the collection of conditional formats applied to a PivotTable.

[*Example*:

```
<sh:conditionalFormats count="1">
  <sh:conditionalFormat priority="1">
    <sh:pivotAreas count="1">
      <sh:pivotArea type="data" collapsedLevelsAreSubtotals="1">
        <sh:references count="5">
          <sh:reference field="4294967294" count="1" selected="0">
            <sh:x v="0"/>
          </sh:reference>
          <sh:reference field="2" count="1" selected="0">
            <sh:x v="0"/>
          </sh:reference>
          <sh:reference field="14" count="1" selected="0">
            <sh:x v="0"/>
          </sh:reference>
```

```
            <sh:reference field="15" count="2" selected="0">
              <sh:x v="2"/>
              <sh:x v="3"/>
            </sh:reference>
          </sh:references>
        </sh:pivotArea>
      </sh:pivotAreas>
    </sh:conditionalFormat>
  </sh:conditionalFormats>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
conditionalFormat (Conditional Formatting)	§3.10.1.18

Attributes	Description
count (Conditional Format Count)	Specifies the number of conditional formats defined for the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConditionalFormats">
   <sequence>
      <element name="conditionalFormat" maxOccurs="unbounded" type="CT_ConditionalFormat"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.10.1.20 consolidation (Consolidation Source)

Represents the description of the PivotCache source using multiple consolidation ranges. This element is used when the source of the PivotTable is a collection of ranges in the workbook. The ranges are specified in the rangeSets collection. The logic for how the application consolidates the data in the ranges is application-specific. For example, the application may consolidate data based on its position in the worksheet that the end-user specifies.

Parent Elements
cacheSource (§3.10.1.7)

Child Elements	Subclause
pages (Page Item Values)	§3.10.1.65
rangeSets (Range Sets)	§3.10.1.80

Attributes	Description
autoPage (Auto Page)	Specifies a boolean value that indicates whether the application will automatically create one additional page field to describe/qualify the source ranges. A value of on, 1, or true indicates the application will create an additional page field. A value of off, 0, or false indicates will not create an additional page field. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Consolidation">
   <sequence>
      <element name="pages" type="CT_Pages" minOccurs="0" maxOccurs="1"/>
      <element name="rangeSets" type="CT_RangeSets" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="autoPage" type="xsd:boolean" default="true" use="optional"/>
</complexType>
```

3.10.1.21 d (Date Time)

Represents a date-time value in the PivotTable.

Parent Elements
groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

Child Elements	Subclause
x (Member Property Index)	§3.10.1.96

Attributes	Description
c (Caption)	Specifies the caption for the item. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
cp (Member Property Count)	Specifies the number of member property values. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

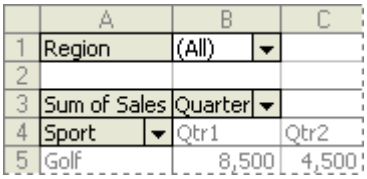
Attributes	Description
f (Calculated Item Value)	Specifies a boolean value that indicates whether this is a calculated item value. A value of on, 1, or true indicates this is a calculated item value. A value of off, 0, or false indicates this is not a calculated item value. The possible values for this attribute are defined by the XML Schema boolean datatype.
u (Unused Item)	Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached. A value of on, 1, or true indicates this is an unused item. A value of off, 0, or false indicates this item is used. The possible values for this attribute are defined by the XML Schema boolean datatype.
v (Value)	Specifies the value of the item. The possible values for this attribute are defined by the XML Schema dateTime datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DateTime">
   <sequence>
      <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
   </sequence>
   <attribute name="v" use="required" type="xsd:dateTime"/>
   <attribute name="u" type="xsd:boolean"/>
   <attribute name="f" type="xsd:boolean"/>
   <attribute name="c" type="ST_Xstring"/>
   <attribute name="cp" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.22 dataField (Data Field Item)

Represents a field from a source list, table, or database that contains data that is summarized in a PivotTable.



A data field represents data that's derived from a field in the source list or database. The Sport field, for example, might come from a column in the source list that's labeled Sport and contains the names of various sports (Golf, Tennis) for which the source list has sales figures. Source data can be taken from an SpreadsheetML list or range, an external database or cube, or another PivotTable. Data fields use summary functions to

combine values from the underlying source data. You can also use custom calculations to compare data values, or add your own formulas that use elements of the report or other worksheet data.

[*Example*:

```
<dataFields count="1">
  <dataField name="Sum of Sales Amount" fld="25" baseField="0" baseItem="0"/>
</dataFields>
```

end example]

Parent Elements
dataFields (§3.10.1.23)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
baseField ('Show Data As' Base Field)	Specifies the index to the base field when the ShowDataAs calculation is in use. The possible values for this attribute are defined by the XML Schema int datatype.
baseItem ('Show Data As' Base Setting)	Specifies the index to the base item when the ShowDataAs calculation is in use. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
fld (Field)	Specifies the index to the field (<r>) in the pivotCacheRecords part that this data item summarizes. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Data Field Name)	Specifies the name of the data field. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
numFmtId (Number Format Id)	Specifies the index to the number format applied to this data field. Number formats are written to the styles part. See the Styles section(§3.8) for more information on number formats. Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence.

Attributes	Description
	The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).
showDataAs (Show Data As Display Format)	Specifies the display format for this data field. Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence. The possible values for this attribute are defined by the ST_ShowDataAs simple type (§3.18.72).
subtotal (Subtotal)	Specifies the aggregation function that applies to this data field. The possible values for this attribute are defined by the ST_DataConsolidateFunction simple type (§3.18.18).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataField">
   <sequence>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="name" use="optional" type="ST_Xstring"/>
   <attribute name="fld" type="xsd:unsignedInt" use="required"/>
   <attribute name="subtotal" type="ST_DataConsolidateFunction" default="sum"/>
   <attribute name="showDataAs" type="ST_ShowDataAs" default="normal"/>
   <attribute name="baseField" type="xsd:int" default="-1"/>
   <attribute name="baseItem" type="xsd:unsignedInt" default="1048832"/>
   <attribute name="numFmtId" type="ST_NumFmtId" use="optional"/>
</complexType>
```

3.10.1.23 dataFields (Data Fields)

Represents the collection of items in the data region of the PivotTable.

[*Example*:

```
<dataFields count="1">
  <dataField name="Sum of Sales Amount" fld="25" baseField="0" baseItem="0"/>
</dataFields>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause

Child Elements	Subclause
dataField (Data Field Item)	§3.10.1.22

Attributes	Description
count (Data Items Count)	Specifies the number of items in the data region of the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataFields">
   <sequence>
      <element name="dataField" maxOccurs="unbounded" type="CT_DataField"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.24 dimension (OLAP Dimension)

Represents a PivotTable OLAP Dimension. A dimension is a field that organizes a single type of data into a hierarchy with levels of detail. For example, an OLAP database could contain a Time dimension providing data for levels Year, Month, Week, and Day, allowing you to create reports that let you compare day-to-day sales results or view a summary of your sales for an entire year.

Parent Elements
dimensions (§3.10.1.25)

Attributes	Description
caption (Dimension Display Name)	Specifies the display name of the dimension. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
measure (Measure)	Specifies a boolean value that indicates whether this is a measure dimension. A value of on, 1, or true indicates this dimension is a measure dimension. A value of off, 0, or false indicates this dimension is not a measure dimension. The possible values for this attribute are defined by the XML Schema boolean datatype.
name (Dimension Name)	Specifies the name of the dimension. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
uniqueName (Dimension Unique Name)	Specifies the unique name of the dimension. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotDimension">
   <attribute name="measure" type="xsd:boolean" default="false"/>
   <attribute name="name" use="required" type="ST_Xstring"/>
   <attribute name="uniqueName" use="required" type="ST_Xstring"/>
   <attribute name="caption" use="required" type="ST_Xstring"/>
</complexType>
```

3.10.1.25 dimensions (OLAP Dimensions)

Represents the collection of PivotTable OLAP dimensions.

[*Example*:

```
<dimensions count="22">
  <dimension name="Account" uniqueName="[Account]" caption="Account"/>
  <dimension name="Customer" uniqueName="[Customer]" caption="Customer"/>
  <dimension name="Date" uniqueName="[Date]" caption="Date"/>
  <dimension name="Delivery Date" uniqueName="[Delivery Date]"
    caption="Delivery Date"/>
  <dimension name="Department" uniqueName="[Department]" caption="Department"/>
  <dimension name="Destination Currency" uniqueName="[Destination Currency]"
    caption="Destination Currency"/>
  <dimension name="Employee" uniqueName="[Employee]" caption="Employee"/>
  <dimension name="Geography" uniqueName="[Geography]" caption="Geography"/>
  <dimension name="Internet Sales Order Details" uniqueName="[Internet Sales
    Order Details]" caption="Internet Sales Order Details"/>
  <dimension measure="1" name="Measures" uniqueName="[Measures]"
    caption="Measures"/>
  <dimension name="Organization" uniqueName="[Organization]"
    caption="Organization"/>
  <dimension name="Product" uniqueName="[Product]" caption="Product"/>
  <dimension name="Promotion" uniqueName="[Promotion]" caption="Promotion"/>
  <dimension name="Reseller" uniqueName="[Reseller]" caption="Reseller"/>
  <dimension name="Reseller Sales Order Details" uniqueName="[Reseller Sales
    Order Details]" caption="Reseller Sales Order Details"/>
  <dimension name="Sales Channel" uniqueName="[Sales Channel]" caption="Sales
    Channel"/>
  <dimension name="Sales Reason" uniqueName="[Sales Reason]" caption="Sales
    Reason"/>
```

```
    <dimension name="Sales Summary Order Details" uniqueName="[Sales Summary Order
      Details]" caption="Sales Summary Order Details"/>
    <dimension name="Sales Territory" uniqueName="[Sales Territory]"
      caption="Sales Territory"/>
    <dimension name="Scenario" uniqueName="[Scenario]" caption="Scenario"/>
    <dimension name="Ship Date" uniqueName="[Ship Date]" caption="Ship Date"/>
    <dimension name="Source Currency" uniqueName="[Source Currency]"
      caption="Source Currency"/>
  </dimensions>
```

end example]

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
dimension (OLAP Dimension)	§3.10.1.24

Attributes	Description
count (OLAP Dimensions Count)	Specifies the number of OLAP dimensions in the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dimensions">
   <sequence>
      <element name="dimension" minOccurs="0" maxOccurs="unbounded" type="CT_PivotDimension"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.26 discretePr (Discrete Grouping Properties)

Represents the collection of discrete grouping properties for a field group.

[*Example*:

```
  …
    <fieldGroup par="6" base="0">
      <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
        endDate="2006-05-06T00:00:00"/>
```

```
    <groupItems count="14">
      <s v="&lt;1/1/2002"/>
      <s v="Jan"/>
      <s v="Feb"/>
      <s v="Mar"/>
      <s v="Apr"/>
      <s v="May"/>
      <s v="Jun"/>
      <s v="Jul"/>
      <s v="Aug"/>
      <s v="Sep"/>
      <s v="Oct"/>
      <s v="Nov"/>
      <s v="Dec"/>
      <s v="&gt;5/6/2006"/>
    </groupItems>
  </fieldGroup>
</cacheField>
<cacheField name="Name" numFmtId="0">
  <sharedItems count="4">
    <s v="Joe"/>
    <s v="John"/>
    <s v="Bob"/>
    <s v="Robert"/>
  </sharedItems>
  <fieldGroup par="4"/>
</cacheField>
<cacheField name="ProductID" numFmtId="0">
  <sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
    containsInteger="1" minValue="1" maxValue="4" count="4">
    <n v="1"/>
    <n v="2"/>
    <n v="3"/>
    <n v="4"/>
  </sharedItems>
```

```
    <fieldGroup base="2">
      <rangePr startNum="1" endNum="4" groupInterval="2"/>
      <groupItems count="4">
        <s v="&lt;1"/>
        <s v="1-2"/>
        <s v="3-4"/>
        <s v="&gt;5"/>
      </groupItems>
    </fieldGroup>
  </cacheField>
```

end example]

Parent Elements
fieldGroup (§3.10.1.30)

Child Elements	Subclause
x (Shared Items Index)	§3.10.1.97

Attributes	Description
count (Mapping Index Count)	Specifies the number of mapping indexes for this grouped field. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DiscretePr">
   <sequence>
      <element name="x" maxOccurs="unbounded" type="CT_Index"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.27 e (Error Value)

Represents an error value. The use of this item indicates that an error value is present in the PivotTable source. The error is recorded in the `value` attribute.

Parent Elements
entries (§3.10.1.28); groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

Child Elements	Subclause

Child Elements	Subclause
tpls (Tuples)	§3.10.1.93
x (Member Property Index)	§3.10.1.96

Attributes	Description
b (Bold)	Specifies a boolean value that indicates whether the value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains bold formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
bc (background Color)	Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space. The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
c (Item Caption)	Specifies the item/member caption The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
cp (Member Property Count)	Specifies the number of member property values. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
f (Calculated Item)	Specifies a boolean value that indicates whether this is a calculated item value. A value of on, 1, or true indicates value is a calculated item value. A value of off, 0, or false indicates this value is not a calculated item value. The possible values for this attribute are defined by the XML Schema boolean datatype.
fc (Foreground Color)	Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space. The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
i (Italic)	Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains italic formatting on the server.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
in (Format Index)	Specifies the index to the OLAP serverformat element where the format string for this entry is stored. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
st (Strikethrough)	Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains strikethrough formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
u (Unused Item)	Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached. A value of on, 1, or true indicates this item is not used. A value of off, 0, or false indicates this item is used. The possible values for this attribute are defined by the XML Schema boolean datatype.
un (Underline)	Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains underline formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
v (Value)	Specifies the value of the item. This attribute depends on how the application records errors. [*Note*: While the error values are determined by the application, the following are some example error values that could be used: • #DIV/0! • #NAME? • #VALUE! • #NULL! • #NUM! • #REF! • #N/A • #GETTING_DATA *end note*] The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Error">
   <sequence>
      <element name="tpls" minOccurs="0" type="CT_Tuples"/>
      <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
   </sequence>
   <attribute name="v" use="required" type="ST_Xstring"/>
   <attribute name="u" type="xsd:boolean"/>
   <attribute name="f" type="xsd:boolean"/>
   <attribute name="c" type="ST_Xstring"/>
   <attribute name="cp" type="xsd:unsignedInt"/>
   <attribute name="in" type="xsd:unsignedInt" use="optional"/>
   <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="un" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.28 entries (Entries)

Represents the collection of OLAP sheet data entries.

Parent Elements
tupleCache (§3.10.1.94)

Child Elements	Subclause
e (Error Value)	§3.10.1.27
m (No Value)	§3.10.1.50
n (Numeric)	§3.10.1.60
s (Character Value)	§3.10.1.85

Attributes	Description
count (Tuple Count)	Specifies the number of tuple entries. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PCDSDTCEntries">
   <choice maxOccurs="unbounded">
      <element name="m" type="CT_Missing"/>
      <element name="n" type="CT_Number"/>
      <element name="e" type="CT_Error"/>
      <element name="s" type="CT_String"/>
   </choice>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.29 field (Field)

Represents a generic field that can appear either on the column or the row region of the PivotTable. There will be as many <x> elements as there are item values in any particular column or row.

[*Example*:

```
<sh:field x="2"/>
```

end example]

Parent Elements
colFields (§3.10.1.14); rowFields (§3.10.1.81)

Attributes	Description
x (Field Index)	Specifies the index to a pivotField item value. There will be as many x elements as there are item values in any particular column. Note that these x elements sometimes are not explicitly written, but instead "inherited" from the previous column or i element, via the value of @r. The pivotField items don't list values explicitly, but instead reference a shared item value in the pivotCacheDefinition part. The first instance of x has no attribute value @v associated with it, so the default value for @v is assumed to be "0". The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Field">
   <attribute name="x" type="xsd:int" use="required"/>
</complexType>
```

3.10.1.30 fieldGroup (Field Group Properties)

Represents the collection of properties for a field group.

[*Example*:

```
…
  <fieldGroup par="6" base="0">
    <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
      endDate="2006-05-06T00:00:00"/>
    <groupItems count="14">
      <s v="&lt;1/1/2002"/>
      <s v="Jan"/>
      <s v="Feb"/>
      <s v="Mar"/>
      <s v="Apr"/>
      <s v="May"/>
      <s v="Jun"/>
      <s v="Jul"/>
      <s v="Aug"/>
      <s v="Sep"/>
      <s v="Oct"/>
      <s v="Nov"/>
      <s v="Dec"/>
      <s v="&gt;5/6/2006"/>
    </groupItems>
  </fieldGroup>
</cacheField>
<cacheField name="Name" numFmtId="0">
  <sharedItems count="4">
    <s v="Joe"/>
    <s v="John"/>
    <s v="Bob"/>
    <s v="Robert"/>
  </sharedItems>
  <fieldGroup par="4"/>
</cacheField>
<cacheField name="ProductID" numFmtId="0">
  <sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
    containsInteger="1" minValue="1" maxValue="4" count="4">
    <n v="1"/>
    <n v="2"/>
    <n v="3"/>
    <n v="4"/>
  </sharedItems>
```

```
    <fieldGroup base="2">
      <rangePr startNum="1" endNum="4" groupInterval="2"/>
      <groupItems count="4">
        <s v="&lt;1"/>
        <s v="1-2"/>
        <s v="3-4"/>
        <s v="&gt;5"/>
      </groupItems>
    </fieldGroup>
  …
```

end example]

Parent Elements
cacheField (§3.10.1.3)

Child Elements	Subclause
discretePr (Discrete Grouping Properties)	§3.10.1.26
groupItems (OLAP Group Items)	§3.10.1.38
rangePr (Range Grouping Properties)	§3.10.1.78

Attributes	Description
base (Field Base)	Specifies the base of this field, if any. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
par (Parent)	Specifies the parent of this field, if any. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FieldGroup">
   <sequence>
      <element name="rangePr" minOccurs="0" type="CT_RangePr"/>
      <element name="discretePr" minOccurs="0" type="CT_DiscretePr"/>
      <element name="groupItems" minOccurs="0" type="CT_GroupItems"/>
   </sequence>
   <attribute name="par" type="xsd:unsignedInt" use="optional"/>
   <attribute name="base" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.10.1.31 fieldsUsage (Fields Usage)

Represents the fields in the cache that are being used by this hierarchy.

[*Example*:

```
<fieldsUsage count="6">
  <fieldUsage x="-1"/>
  <fieldUsage x="2"/>
  <fieldUsage x="3"/>
  <fieldUsage x="4"/>
  <fieldUsage x="5"/>
  <fieldUsage x="6"/>
</fieldsUsage>
```

end example]

Parent Elements
cacheHierarchy (§3.10.1.6)

Child Elements	Subclause
fieldUsage (PivotCache Field Id)	§3.10.1.32

Attributes	Description
count (Field Count)	Specifies the number of fields that are being used by this hierarchy. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FieldsUsage">
   <sequence>
      <element name="fieldUsage" minOccurs="0" maxOccurs="unbounded" type="CT_FieldUsage"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.32 fieldUsage (PivotCache Field Id)

Represents a cache field used in this hierarchy.

[*Example*:

```
<fieldUsage x="-1"/>
```

end example]

Parent Elements
fieldsUsage (§3.10.1.31)

Attributes	Description
x (Field Index)	Specifies the index of a field. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FieldUsage">
   <attribute name="x" use="required" type="xsd:int"/>
</complexType>
```

3.10.1.33 filter (PivotTable Advanced Filter)

Represents a PivotTable advanced filter.

[*Example*:

```
<sh:filter fld="3" type="count" id="1" iMeasureHier="187">
  <sh:autoFilter ref="A1">
    <sh:filterColumn colId="0">
      <sh:top10 val="5"/>
    </sh:filterColumn>
  </sh:autoFilter>
</sh:filter>
```

end example]

Parent Elements
filters (§3.10.1.34)

Child Elements	Subclause
autoFilter (AutoFilter Settings)	§3.3.1.1
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
description (Pivot Filter Description)	Specifies the description of the pivot filter. The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§3.18.96).
evalOrder (Evaluation Order)	Specifies the evaluation order of the pivot filter. This attribute is zero-based. The possible values for this attribute are defined by the XML Schema int datatype.
fld (Field Index)	Specifies the index of the field to which this pivot filter belongs. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (Pivot Filter Id)	Specifies the unique identifier of the pivot filter as assigned by the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iMeasureFld (Measure Field Index)	Specifies the index of the measure field. This attribute is used only by filters in Relational pivots and specifies on which measure a value filter should apply. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
iMeasureHier (Measure Index)	Specifies the index of the measure cube field. This attribute is used only by filters in OLAP pivots and specifies on which measure a value filter should apply. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
mpFld (Member Property Field Id)	Specifies the index of the field representing the member property field on which this pivot filter is defined. This attribute is used only by label pivot filters. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Pivot Filter Name)	Specifies the name of the pivot filter. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
stringValue1 (Label Pivot)	Specifies the string value "1" used by label pivot filters. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
stringValue2 (Label Pivot Filter String Value 2)	Specifies the string value "2" used by label pivot filters. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
type (Pivot Filter Type)	Specifies the type of the pivot filter. The possible values for this attribute are defined by the ST_PivotFilterType simple type

Attributes	Description
	(§3.18.61).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotFilter">
   <sequence>
      <element name="autoFilter" minOccurs="1" maxOccurs="1" type="CT_AutoFilter"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="fld" use="required" type="xsd:unsignedInt"/>
   <attribute name="mpFld" type="xsd:unsignedInt" use="optional"/>
   <attribute name="type" use="required" type="ST_PivotFilterType"/>
   <attribute name="evalOrder" use="optional" type="xsd:int" default="0"/>
   <attribute name="id" use="required" type="xsd:unsignedInt"/>
   <attribute name="iMeasureHier" use="optional" type="xsd:unsignedInt"/>
   <attribute name="iMeasureFld" use="optional" type="xsd:unsignedInt"/>
   <attribute name="name" type="ST_Xstring"/>
   <attribute name="description" type="ST_Xstring"/>
   <attribute name="stringValue1" type="ST_Xstring"/>
   <attribute name="stringValue2" type="ST_Xstring"/>
</complexType>
```

3.10.1.34 filters (Filters)

Represents the collection of filters that apply to this PivotTable.

[*Example*:

```
<sh:filters count="1">
  <sh:filter fld="3" type="count" id="1" iMeasureHier="187">
    <sh:autoFilter ref="A1">
      <sh:filterColumn colId="0">
        <sh:top10 val="5"/>
      </sh:filterColumn>
    </sh:autoFilter>
  </sh:filter>
</sh:filters>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
filter (PivotTable Advanced Filter)	§3.10.1.33

Attributes	Description
count (Pivot Filter Count)	Specifies the number of pivot filters in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotFilters">
   <sequence>
      <element name="filter" minOccurs="0" maxOccurs="unbounded" type="CT_PivotFilter"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.10.1.35 format (PivotTable Format)

Represents the format defined in the PivotTable.

Parent Elements
formats (§3.10.1.36)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
pivotArea (Pivot Area)	§3.3.1.66

Attributes	Description
action (Format Action)	Specifies the formatting behavior for the area indicated in the pivotArea element. The default value for this attribute is "formatting," which indicates that the specified cells have some formatting applied. The format is specified in the dxfId attribute. If the formatting is cleared from the cells, then the value of this attribute becomes "blank." The possible values for this attribute are defined by the ST_FormatAction simple type (§3.18.35).
dxfId (Format Id)	Specifies the identifier of the format the application is currently using for the PivotTable. Formatting information is written to the styles part. See the Styles section (§3.8) for more information on formats. Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence. The possible values for this attribute are defined by the ST_DxfId simple type (§3.18.26).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Format">
   <sequence>
      <element name="pivotArea" type="CT_PivotArea"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="action" type="ST_FormatAction" default="formatting"/>
   <attribute name="dxfId" type="ST_DxfId" use="optional"/>
</complexType>
```

3.10.1.36 formats (PivotTable Formats)

Represents the collection of formats applied to PivotTable.

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
format (PivotTable Format)	§3.10.1.35

Attributes	Description
count (Formats Count)	Specifies the number of formats in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Formats">
   <sequence>
      <element name="format" maxOccurs="unbounded" type="CT_Format"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.10.1.37 group (OLAP Group)

Represents an OLAP level group.

[*Example*:

```
<group name="CategoryXl_Grp_1" uniqueName="[Product].[Product Categories].
  [Product Categories1].[GROUPMEMBER.[CategoryXl_Grp_1]].[Product]].
  [Product Categories]].[All Products]]]" caption="Group1"
  uniqueParent="[Product].[Product Categories].[All Products]" id="1">
```

```
    <groupMembers count="2">
      <groupMember
        uniqueName="[Product].[Product Categories].[Category].&amp;[4]"/>
      <groupMember
        uniqueName="[Product].[Product Categories].[Category].&amp;[1]"/>
    </groupMembers>
  </group>
```

end example]

Parent Elements
groups (§3.10.1.43)

Child Elements	Subclause
groupMembers (OLAP Group Members)	§3.10.1.42

Attributes	Description
caption (Group Caption)	Specifies the caption for this group. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
id (Group Id)	Specifies the unique number for this group within the level. The possible values for this attribute are defined by the XML Schema int datatype.
name (Group Name)	Specifies the name of this group. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
uniqueName (Unique Group Name)	Specifies the unique name of this group. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
uniqueParent (Parent Unique Name)	Specifies the unique name of the parent of this group. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LevelGroup">
   <sequence>
      <element name="groupMembers" type="CT_GroupMembers"/>
   </sequence>
   <attribute name="name" use="required" type="ST_Xstring"/>
   <attribute name="uniqueName" use="required" type="ST_Xstring"/>
   <attribute name="caption" use="required" type="ST_Xstring"/>
   <attribute name="uniqueParent" type="ST_Xstring"/>
   <attribute name="id" type="xsd:int"/>
</complexType>
```

3.10.1.38 groupItems (OLAP Group Items)

Represents the collection of items in a field group.

[*Example*:

```
…
  <fieldGroup par="6" base="0">
    <rangePr groupBy="months" startDate="2002-01-01T00:00:00"
      endDate="2006-05-06T00:00:00"/>
    <groupItems count="14">
      <s v="&lt;1/1/2002"/>
      <s v="Jan"/>
      <s v="Feb"/>
      <s v="Mar"/>
      <s v="Apr"/>
      <s v="May"/>
      <s v="Jun"/>
      <s v="Jul"/>
      <s v="Aug"/>
      <s v="Sep"/>
      <s v="Oct"/>
      <s v="Nov"/>
      <s v="Dec"/>
      <s v="&gt;5/6/2006"/>
    </groupItems>
  </fieldGroup>
</cacheField>
```

```
<cacheField name="Name" numFmtId="0">
  <sharedItems count="4">
    <s v="Joe"/>
    <s v="John"/>
    <s v="Bob"/>
    <s v="Robert"/>
  </sharedItems>
  <fieldGroup par="4"/>
</cacheField>
<cacheField name="ProductID" numFmtId="0">
  <sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
    containsInteger="1" minValue="1" maxValue="4" count="4">
    <n v="1"/>
    <n v="2"/>
    <n v="3"/>
    <n v="4"/>
  </sharedItems>
  <fieldGroup base="2">
    <rangePr startNum="1" endNum="4" groupInterval="2"/>
    <groupItems count="4">
      <s v="&lt;1"/>
      <s v="1-2"/>
      <s v="3-4"/>
      <s v="&gt;5"/>
    </groupItems>
  </fieldGroup>
…
```

end example]

Parent Elements
fieldGroup (§3.10.1.30)

Child Elements	Subclause
b (Boolean)	§3.10.1.2
d (Date Time)	§3.10.1.21
e (Error Value)	§3.10.1.27
m (No Value)	§3.10.1.50
n (Numeric)	§3.10.1.60
s (Character Value)	§3.10.1.85

Attributes	Description
count (Items Created Count)	Specifies the number of items created for this grouped field. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupItems">
   <choice maxOccurs="unbounded">
      <element name="m" type="CT_Missing"/>
      <element name="n" type="CT_Number"/>
      <element name="b" type="CT_Boolean"/>
      <element name="e" type="CT_Error"/>
      <element name="s" type="CT_String"/>
      <element name="d" type="CT_DateTime"/>
   </choice>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.39 groupLevel (OLAP Grouping Levels)

Represents the collection of OLAP grouping levels.

[*Example*:

```
<groupLevel uniqueName="[Product].[Product Categories].[Category]"
  caption="Category">
  <groups count="1">
    <group name="CategoryXl_Grp_1" uniqueName="[Product].[Product
      Categories].[Product Categories1].
      [GROUPMEMBER.[CategoryXl_Grp_1]].[Product]].[Product Categories]].
      [All Products]]]" caption="Group1" uniqueParent="[Product].
      [Product Categories].[All Products]" id="1">
      <groupMembers count="2">
        <groupMember
          uniqueName="[Product].[Product Categories].[Category].&amp;[4]"/>
        <groupMember
          uniqueName="[Product].[Product Categories].[Category].&amp;[1]"/>
      </groupMembers>
    </group>
  </groups>
</groupLevel>
```

end example]

Parent Elements
groupLevels (§3.10.1.40)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
groups (OLAP Level Groups)	§3.10.1.43

Attributes	Description
caption (Grouping Level Display Name)	Specifies the display name for this grouping level. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
customRollUp (Custom Roll Up)	Specifies a boolean value that indicates whether this group level has a custom roll up. A value of on, 1, or true indicates this group level has a custom roll up. A value of off, 0, or false indicates this group level does not have a custom roll up. The possible values for this attribute are defined by the XML Schema boolean datatype.
uniqueName (Unique Name)	Specifies the unique name for this grouping level. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
user (User-Defined Group Level)	Specifies a boolean value that indicates whether this is a user-defined group level. A value of on, 1, or true indicates this is a user-defined group. A value of off, 0, or false indicates this group is not user-defined. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupLevel">
   <sequence>
      <element name="groups" minOccurs="0" type="CT_Groups"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="uniqueName" use="required" type="ST_Xstring"/>
   <attribute name="caption" use="required" type="ST_Xstring"/>
   <attribute name="user" type="xsd:boolean" default="false"/>
   <attribute name="customRollUp" type="xsd:boolean" default="false"/>
</complexType>
```

3.10.1.40 groupLevels (OLAP Grouping Levels)

Represents the collection of OLAP grouping levels.

[*Example*:

```
<groupLevels count="5">
  <groupLevel uniqueName="[Product].[Product Categories].[(All)]"
    caption="(All)"/>
  <groupLevel uniqueName="[Product].[Product Categories].[Product Categories1]"
    caption="Product Categories1" user="1"/>
  <groupLevel uniqueName="[Product].[Product Categories].[Category]"
    caption="Category">
    <groups count="1">
      <group name="CategoryXl_Grp_1" uniqueName="[Product].[Product Categories].
        [Product Categories1].[GROUPMEMBER.[CategoryXl_Grp_1]].
        [Product]].[Product Categories]].[All Products]]]" caption="Group1"
        uniqueParent="[Product].[Product Categories].[All Products]" id="1">
        <groupMembers count="2">
          <groupMember
            uniqueName="[Product].[Product Categories].[Category].&amp;[4]"/>
          <groupMember
            uniqueName="[Product].[Product Categories].[Category].&amp;[1]"/>
        </groupMembers>
      </group>
    </groups>
  </groupLevel>
  <groupLevel uniqueName="[Product].[Product Categories].[Subcategory]"
    caption="Subcategory"/>
  <groupLevel uniqueName="[Product].[Product Categories].[Product]"
    caption="Product"/>
</groupLevels>
```

end example]

Parent Elements
cacheHierarchy (§3.10.1.6)

Child Elements	Subclause
groupLevel (OLAP Grouping Levels)	§3.10.1.39

Attributes	Description
count (Grouping Level Count)	Specifies the number of grouping levels. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupLevels">
    <sequence>
        <element name="groupLevel" maxOccurs="unbounded" type="CT_GroupLevel"/>
    </sequence>
    <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.41 groupMember (OLAP Group Member)

Represents an OLAP group member.

[*Example*:

```
<groupMember uniqueName="[Product].[Product Categories].[Category].&amp;[1]"/>
```

end example]

Parent Elements
groupMembers (§3.10.1.42)

Attributes	Description
group (Group)	Specifies a boolean value that indicates whether this member represents a group. A value of on, 1, or true indicates this member represents a group. A value of off, 0, or false indicates this member does not represent a group. The possible values for this attribute are defined by the XML Schema boolean datatype.
uniqueName (Group Member Unique Name)	Specifies the unique name of this group member. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupMember">
    <attribute name="uniqueName" use="required" type="ST_Xstring"/>
    <attribute name="group" type="xsd:boolean" default="false"/>
</complexType>
```

3.10.1.42 groupMembers (OLAP Group Members)

Represents the collection of OLAP group members.

[*Example*:

```
<groupMembers count="2">
  <groupMember uniqueName="[Product].[Product Categories].[Category].&amp;[4]"/>
  <groupMember uniqueName="[Product].[Product Categories].[Category].&amp;[1]"/>
</groupMembers>
```

end example]

Parent Elements
group (§3.10.1.37)

Child Elements	Subclause
groupMember (OLAP Group Member)	§3.10.1.41

Attributes	Description
count (Group Member Count)	Specifies the number of group members in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupMembers">
   <sequence>
      <element name="groupMember" maxOccurs="unbounded" type="CT_GroupMember"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.43 groups (OLAP Level Groups)

Represents the collection of OLAP level groups.

[*Example*:

```
<groups count="1">
  <group name="CategoryXl_Grp_1" uniqueName="[Product].[Product Categories].
    [Product Categories1].[GROUPMEMBER.[CategoryXl_Grp_1]].[Product]].
    [Product Categories]].[All Products]]]" caption="Group1"
    uniqueParent="[Product].[Product Categories].[All Products]" id="1">
```

```
      <groupMembers count="2">
        <groupMember
          uniqueName="[Product].[Product Categories].[Category].&amp;[4]"/>
        <groupMember
          uniqueName="[Product].[Product Categories].[Category].&amp;[1]"/>
      </groupMembers>
    </group>
  </groups>
```

end example]

Parent Elements
groupLevel (§3.10.1.39)

Child Elements	Subclause
group (OLAP Group)	§3.10.1.37

Attributes	Description
count (Level Group Count)	Specifies the number of level groups in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Groups">
   <sequence>
      <element name="group" maxOccurs="unbounded" type="CT_LevelGroup"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.44 i (Row Items)

Represents the collection of items in the row region of the PivotTable. In this example the item values are found in cells B10:B13. For example "Bikes" is in B10, and corresponds to the first <i> element below.

[*Example*:

```
  <rowItems count="4">
    <i>
      <x/>
    </i>
```

```
    <i r="1">
      <x/>
    </i>
    <i r="1">
      <x v="1"/>
    </i>
    <i t="grand">
      <x/>
    </i>
  </rowItems>
```

end example]

Parent Elements
colItems (§3.10.1.17); rowItems (§3.10.1.84)

Child Elements	Subclause
x (Member Property Index)	§3.10.1.96

Attributes	Description
i (Data Field Index)	Specifies a zero-based index indicating the referenced data item it in a data field with multiple data items. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
r (Repeated Items Count)	Specifies the number of items to repeat from the previous row item. Note: The first item has no @r explicitly written. Since a default of "0" is specified in the schema, for any item whose @r is missing, a default value of "0" is implied. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
t (Item Type)	Specifies the type of the item. Value of 'default' indicates a grand total as the last row item value The possible values for this attribute are defined by the ST_ItemType simple type (§3.18.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_I">
   <sequence>
      <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
   </sequence>
   <attribute name="t" type="ST_ItemType" default="data"/>
   <attribute name="r" type="xsd:unsignedInt" default="0"/>
   <attribute name="i" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.10.1.45 item (PivotTable Field Item)

Represents a single item in PivotTable field.

[*Example*:

```
<sh:item x="66"/>
```

end example]

Parent Elements
items (§3.10.1.46)

Attributes	Description
c (Child Items)	Specifies a boolean value that indicates whether the approximate number of child items for this item is greater than zero. A value of on, 1, or true indicates the approximate number of child items for this item is greater than zero. A value of off, 0, or false indicates the approximate number of child items for this item is zero. The possible values for this attribute are defined by the XML Schema boolean datatype.
d (Expanded)	Specifies a boolean value that indicates whether this item has been expanded in the PivotTable view. A value of on, 1, or true indicates this item has been expanded. A value of off, 0, or false indicates this item is collapsed. The possible values for this attribute are defined by the XML Schema boolean datatype.
e (Drill Across Attributes)	Specifies a boolean value that indicates whether attribute hierarchies nested next to each other on a PivotTable row or column will offer drilling "across" each other or not. For example, if the application offers drill across for attribute hierarchies and not for user hierarchies, this attribute would only be written when two attribute hierarchies are

Attributes	Description
	placed next to each other on an axis. A value of on, 1, or true indicates there is a drill across attribute hierarchies positioned next to each other on a pivot axis. A value of off, 0, or false indicates there is not drill across attribute hierarchies. The possible values for this attribute are defined by the XML Schema boolean datatype.
f (Calculated Member)	Specifies a boolean value that indicates whether this item is a calculated member. A value of on, 1, or true indicates this item is a calculated member. A value of off, 0, or false indicates this item is not calculated. The possible values for this attribute are defined by the XML Schema boolean datatype.
h (Hidden)	Specifies a boolean value that indicates whether the item is hidden. A value of on, 1, or true indicates item is hidden. The possible values for this attribute are defined by the XML Schema boolean datatype.
m (Missing)	Specifies a boolean value that indicate whether the item has a missing value. A value of on, 1, or true indicates the item value is missing. The application should still retain the item settings in case the item reappears during a later refresh. The possible values for this attribute are defined by the XML Schema boolean datatype.
n (Item User Caption)	Specifies the user caption of the item. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
s (Character)	Specifies a boolean value that indicates whether the item has a character value. A value of on, 1, or true indicates the item has a string/character value. A value of off, 0, or false indicates item the item has a value of a different type. The possible values for this attribute are defined by the XML Schema boolean datatype.
sd (Hide Details)	Specifies a boolean value that indicates whether the details are hidden for this item. A value of on, 1, or true indicates item details are hidden. A value of off, 0, or false indicates item details are shown. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
t (Item Type)	Specifies the type of this item. A value of 'default' indicates the subtotal or total item. The possible values for this attribute are defined by the ST_ItemType simple type (§3.18.45).
x (Item Index)	Specifies the item index in pivotFields collection in the PivotCache. Applies only non-OLAP PivotTables. In the following example, "Product Category" and "Product Subcategory" are on the row axis of the PivotTable, in that order. *<rowFields count="2"> <field x="7"/> <x="8"/> </rowFieldsfield >* The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

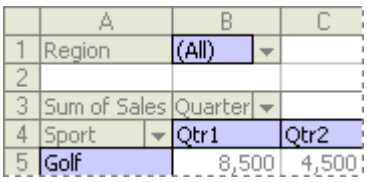
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Item">
   <attribute name="n" type="ST_Xstring"/>
   <attribute name="t" type="ST_ItemType" default="data"/>
   <attribute name="h" type="xsd:boolean" default="false"/>
   <attribute name="s" type="xsd:boolean" default="false"/>
   <attribute name="sd" type="xsd:boolean" default="true"/>
   <attribute name="f" type="xsd:boolean" default="false"/>
   <attribute name="m" type="xsd:boolean" default="false"/>
   <attribute name="c" type="xsd:boolean" default="false"/>
   <attribute name="x" type="xsd:unsignedInt" use="optional"/>
   <attribute name="d" type="xsd:boolean" default="false"/>
   <attribute name="e" type="xsd:boolean" default="true"/>
</complexType>
```

3.10.1.46 items (Field Items)

Represents the collection of items in a PivotTable field. The items in the collection are ordered by index. Items represent the unique entries from the field in the source data.

In the following image, the item Golf represents all rows of data in the source list for which the Sport field contains the entry Golf.



The order in which the items are listed is the order they would appear on a particular axis (row or column, for example).

In the following SpreadsheetML example, the first field is "Customer Name" and the first item referenced here is <item x="66"/> which references the value "Adam L Flores" in the pivotCacheDefinition. Therefore f you added "Customer Name" to the row axis, "Adam L Flores" would be the first row item listed.

[*Example*:

```
<pivotFields count="28">
  <pivotField showAll="0" includeNewItemsInFilter="1">
    <items count="8">
      <item x="66"/>
      <item x="133"/>
      <item x="74"/>
      <item x="27"/>
      <item x="118"/>
      <item x="63"/>
      <item x="141"/>
      <item t="default"/>
    </items>
  </pivotField>
  <pivotField showAll="0" includeNewItemsInFilter="1"/>
  <pivotField axis="axisPage" showAll="0" includeNewItemsInFilter="1">
    <items count="2">
      <item x="0"/>
      <item t="default"/>
    </items>
  </pivotField>
<pivotField showAll="0" includeNewItemsInFilter="1"/>
```

end example]

Parent Elements
pivotField (§3.10.1.69)

Child Elements	Subclause
item (PivotTable Field Item)	§3.10.1.45

Attributes	Description
count (Field Count)	Specifies the number of fields in the PivotTable.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Items">
   <sequence>
      <element name="item" maxOccurs="unbounded" type="CT_Item"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.47 kpi (OLAP KPI)

Represents the KPI defined on the OLAP server and stored in the PivotCache.

[*Example*:

```
<kpi uniqueName="Growth in Customer Base" caption="Growth in Customer Base"
  displayFolder="Customer Perspective\Expand Customer Base"
  measureGroup="Internet Sales" value="[Measures].[Growth in Customer Base]"
  goal="[Measures].[Growth in Customer Base Goal]"
  status="[Measures].[Growth in Customer Base Status]"
  trend="[Measures].[Growth in Customer Base Trend]"/>
```

end example]

Parent Elements
kpis (§3.10.1.48)

Attributes	Description
caption (KPI Display Name)	Specifies the display name of the KPI. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
displayFolder (KPI Display Folder)	Specifies the folder where this KPI will be displayed in a list of fields for the PivotTable. This attribute depends on how the application exposes a list of fields in the user interface. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
goal (KPI Goal Unique Name)	Specifies the unique name of the KPI goal measure. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
measureGroup (KPI Measure Group Name)	Specifies the name of the measure group to which this KPI belongs. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
parent (Parent KPI)	Specifies the name of the parent KPI for this KPI. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
status (KPI Status Unique Name)	Specifies the unique name of the KPI status measure. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
time (Time Member KPI Unique Name)	Specifies the unique name of the KPI current time member. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
trend (KPI Trend Unique Name)	Specifies the unique name of the KPI trend measure. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
uniqueName (KPI Unique Name)	Specifies the unique name of the KPI. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
value (KPI Value Unique Name)	Specifies the unique name of the KPI value measure. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
weight (KPI Weight Unique Name)	Specifies the unique name of the KPI weight measure. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PCDKPI">
   <attribute name="uniqueName" use="required" type="ST_Xstring"/>
   <attribute name="caption" use="optional" type="ST_Xstring"/>
   <attribute name="displayFolder" type="ST_Xstring"/>
   <attribute name="measureGroup" type="ST_Xstring"/>
   <attribute name="parent" type="ST_Xstring"/>
   <attribute name="value" use="required" type="ST_Xstring"/>
   <attribute name="goal" type="ST_Xstring"/>
   <attribute name="status" type="ST_Xstring"/>
   <attribute name="trend" type="ST_Xstring"/>
   <attribute name="weight" type="ST_Xstring"/>
   <attribute name="time" type="ST_Xstring"/>
</complexType>
```

3.10.1.48 kpis (OLAP KPIs)

Represents the collection of Key Performance Indicators (KPIs) defined on the OLAP server and stored in the PivotCache.

[*Example*:

```
<kpis count="3">
  <kpi uniqueName="Growth in Customer Base" caption="Growth in Customer Base"
    displayFolder="Customer Perspective\Expand Customer Base"
    measureGroup="Internet Sales" value="[Measures].[Growth in Customer Base]"
    goal="[Measures].[Growth in Customer Base Goal]"
    status="[Measures].[Growth in Customer Base Status]"
    trend="[Measures].[Growth in Customer Base Trend]"/>
  <kpi uniqueName="Net Income" caption="Net Income"
    displayFolder="Financial Perspective\Maintain Overall Margins"
    measureGroup="Financial Reporting" value="[Measures].[Net Income Value]"
    goal="[Measures].[Net Income Goal]" status="[Measures].[Net Income Status]"
    trend="[Measures].[Net Income Trend]"/>
  <kpi uniqueName="Operating Profit" caption="Operating Profit"
    displayFolder="Financial Perspective\Maintain Overall Margins"
    measureGroup="Financial Reporting" parent="Net Income"
    value="[Measures].[Operating Profit Value]"
    goal="[Measures].[Operating Profit Goal]"
    status="[Measures].[Operating Profit Status]"
    trend="[Measures].[Operating Profit Trend]"/>
…
```

end example]

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
kpi (OLAP KPI)	§3.10.1.47

Attributes	Description
count (KPI Count)	Specifies the number of KPIs stored in the PivotCache. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PCDKPIs">
   <sequence>
      <element name="kpi" minOccurs="0" maxOccurs="unbounded" type="CT_PCDKPI"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.49 location (PivotTable Location)

Represents location information for the PivotTable.

[*Example*:

```
<location ref="B6:G13" firstHeaderRow="1" firstDataRow="4" firstDataCol="1"
  rowPageCount="3" colPageCount="1"/>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Attributes	Description
colPageCount (Columns Per Page)	Specifies the number of columns per page for this PivotTable that the filter area will occupy. By default there is a single column of filter fields per page and the fields occupy as many rows as there are fields. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
firstDataCol (First Data Column)	Specifies the first column of the PivotTable data, relative to the top left cell in the `ref` value. The possible values for this attribute are defined by the XML Schema unsignedInt

Attributes	Description
	datatype.
firstDataRow (PivotTable Data First Row)	Specifies the first row of the PivotTable data, relative to the top left cell in the `ref` value. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
firstHeaderRow (First Header Row)	Specifies the first row of the PivotTable header, relative to the top left cell in the `ref` value. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ref (Reference)	Specifies the first row of the PivotTable. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
rowPageCount (Rows Per Page Count)	Specifies the number of rows per page for this PivotTable that the filter area will occupy. By default there is a single column of filter fields per page and the fields occupy as many rows as there are fields. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Location">
   <attribute name="ref" use="required" type="ST_Ref"/>
   <attribute name="firstHeaderRow" use="required" type="xsd:unsignedInt"/>
   <attribute name="firstDataRow" use="required" type="xsd:unsignedInt"/>
   <attribute name="firstDataCol" use="required" type="xsd:unsignedInt"/>
   <attribute name="rowPageCount" type="xsd:unsignedInt" default="0"/>
   <attribute name="colPageCount" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.10.1.50 m (No Value)

Represents a value that was not specified.

[*Example*:

```
<sharedItems containsString="0" containsBlank="1" count="1">
  <m/>
</sharedItems>
```

end example]

Parent Elements
entries (§3.10.1.28); groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

Child Elements	Subclause
tpls (Tuples)	§3.10.1.93
x (Member Property Index)	§3.10.1.96

Attributes	Description
b (Bold)	Specifies a boolean value that indicates whether the value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains bold formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
bc (background Color)	Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space. The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
c (Caption)	Specifies the caption for this item. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
cp (Member Property Count)	Specifies the number of member property values for this item. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
f (Calculated Item)	Specifies a boolean value that indicates whether this is a calculated item value. A value of on, 1, or true indicates this item is a calculated value. A value of off, 0, or false indicates this item is not calculated. The possible values for this attribute are defined by the XML Schema boolean datatype.
fc (Foreground Color)	Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space. The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
i (Italic)	Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains underline formatting on the server.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
in (Format Index)	Specifies the index to the OLAP serverformat element where the format string for this entry is stored. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
st (Strikethrough)	Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains underline formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
u (Unused Item)	Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached. A value of on, 1, or true indicates this item is unused. A value of off, 0, or false indicates this item is used. The possible values for this attribute are defined by the XML Schema boolean datatype.
un (Underline)	Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains underline formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Missing">
   <sequence>
      <element name="tpls" minOccurs="0" maxOccurs="unbounded" type="CT_Tuples"/>
      <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
   </sequence>
   <attribute name="u" type="xsd:boolean"/>
   <attribute name="f" type="xsd:boolean"/>
   <attribute name="c" type="ST_Xstring"/>
   <attribute name="cp" type="xsd:unsignedInt"/>
   <attribute name="in" type="xsd:unsignedInt" use="optional"/>
   <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="un" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.51 map (OLAP Measure Group)

Represents a PivotTable OLAP measure group - Dimension map.

[*Example*:

```
<map measureGroup="0" dimension="2"/>
```

end example]

Parent Elements
maps (§3.10.1.52)

Attributes	Description
dimension (Dimension Id)	Specifies the identifier for the dimension. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
measureGroup (Measure Group Id)	Specifies the identifier of the measure group. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MeasureDimensionMap">
   <attribute name="measureGroup" use="optional" type="xsd:unsignedInt"/>
   <attribute name="dimension" use="optional" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.52 maps (OLAP Measure Group)

Represents the PivotTable OLAP measure group - Dimension maps.

[*Example*:

```
<maps count="3">
  <map measureGroup="0" dimension="2"/>
  <map measureGroup="1" dimension="19"/>
  <map measureGroup="2" dimension="8"/>
</maps>
```

end example]

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
map (OLAP Measure Group)	§3.10.1.51

Attributes	Description
count (Measure Group Count)	Specifies the number of measure groups, or dimension maps, in the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MeasureDimensionMaps">
    <sequence>
        <element name="map" minOccurs="0" maxOccurs="unbounded" type="CT_MeasureDimensionMap"/>
    </sequence>
    <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.53 measureGroup (OLAP Measure Group)

Represents a PivotTable OLAP measure group.

[*Example*:

```
<measureGroup name="Sales Orders" caption="Sales Orders"/>
```

end example]

Parent Elements

Parent Elements
measureGroups (§3.10.1.54)

Attributes	Description
caption (Measure Group Display Name)	Specifies the display name of the measure group. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
name (Measure Group Name)	Specifies the name of the measure group. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MeasureGroup">
   <attribute name="name" use="required" type="ST_Xstring"/>
   <attribute name="caption" use="required" type="ST_Xstring"/>
</complexType>
```

3.10.1.54 measureGroups (OLAP Measure Groups)

Represents the collection of PivotTable OLAP measure groups.

[*Example*:

```
<measureGroups count="11">
  <measureGroup name="Exchange Rates" caption="Exchange Rates"/>
  <measureGroup name="Financial Reporting" caption="Financial Reporting"/>
  <measureGroup name="Internet Customers" caption="Internet Customers"/>
  <measureGroup name="Internet Orders" caption="Internet Orders"/>
  <measureGroup name="Internet Sales" caption="Internet Sales"/>
  <measureGroup name="Reseller Orders" caption="Reseller Orders"/>
  <measureGroup name="Reseller Sales" caption="Reseller Sales"/>
  <measureGroup name="Sales Orders" caption="Sales Orders"/>
  <measureGroup name="Sales Reasons" caption="Sales Reasons"/>
  <measureGroup name="Sales Summary" caption="Sales Summary"/>
  <measureGroup name="Sales Targets" caption="Sales Targets"/>
</measureGroups>
```

end example]

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
measureGroup (OLAP Measure Group)	§3.10.1.53

Attributes	Description
count (Measure Group Count)	Specifies the number of measure groups in the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MeasureGroups">
   <sequence>
      <element name="measureGroup" minOccurs="0" maxOccurs="unbounded" type="CT_MeasureGroup"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.55 member (Member)

Represents an item that may be included or excluded.

Parent Elements
members (§3.10.1.56)

Attributes	Description
name (Hidden Item Name)	Specifies the name of a hidden item. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Member">
   <attribute name="name" use="required" type="ST_Xstring"/>
</complexType>
```

3.10.1.56 members (Members)

Represents the collection of items that may be included or excluded.

Parent Elements
pivotHierarchy (§3.10.1.72)

Child Elements	Subclause

Child Elements	Subclause
member (Member)	§3.10.1.55

Attributes	Description
count (Item Count)	Specifies the number of items in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
level (Hierarchy Level)	Specifies the hierarchy level with which these items are associated. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Members">
   <sequence>
      <element name="member" maxOccurs="unbounded" type="CT_Member"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
   <attribute name="level" use="optional" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.57 mp (OLAP Member Property)

Represents an OLAP member property.

[*Example*:

```
<sh:mp field="7"/>
```

end example]

Parent Elements
mps (§3.10.1.59)

Attributes	Description
field (Field Index)	Specifies the index of the field with which this member property is associated. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
level (Level Index)	Specifies the index of the level to which this member property applies. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
name (OLAP Member Property Unique Name)	Specifies the unique name of the OLAP member property. The following attributes depend on the name attribute: • nameLen • pLen • pPos These attributes consist of metadata about a member in an OLAP cube and are usually displayed in a tooltip or mechanism in the user interface. For example, if the value for name equals "[Store].[Store Name].[Store Manager]": • nameLen will equal 20. This would refer to "[Store].[Store Name]" • pPos will equal 22. This would refer to starting character of "Store Manager" • pLen will equal 13. This would to length of "Store Manager" The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
nameLen (Name Length)	Specifies the length of the unique name portion of name. For example, if the value for name equals "[Store].[Store Name].[Store Manager]", nameLen will equal 20. This would refer to "[Store].[Store Name]". The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
pLen (Property Name Length)	Specifies the length of the property name portion of name. For example, if the value for name equals "[Store].[Store Name].[Store Manager]", pLen will equal 13. This would to length of "Store Manager". The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
pPos (Property Name Character Index)	Specifies the index of the character where the property name portion begins in name. For example, if the value for name equals "[Store].[Store Name].[Store Manager]", pPos will equal 22. This would refer to starting character of "Store Manager". The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
showAsCaption (Show As Caption)	Specifies a boolean value that indicates whether to show the property a member caption. A value of on, 1, or true indicates member property value will be shown in as a caption. A value of off, 0, or false indicates member property value will not be shown. The possible values for this attribute are defined by the XML Schema boolean datatype.
showCell (Show Cell)	Specifies a boolean value that indicates whether to show the member property value in a PivotTable cell.

Attributes	Description
	A value of on, 1, or true indicates member property value will be shown in a cell. A value of off, 0, or false indicates member property value will not be shown. The possible values for this attribute are defined by the XML Schema boolean datatype.
showTip (Show Tooltip)	Specifies a boolean value that indicates whether to show the member property value in a tooltip on the appropriate PivotTable view cells. A value of on, 1, or true indicates member property value will be shown in a tooltip. A value of off, 0, or false indicates member property value will not be shown. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MemberProperty">
    <attribute name="name" type="ST_Xstring" use="optional"/>
    <attribute name="showCell" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="showTip" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="showAsCaption" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="nameLen" type="xsd:unsignedInt" use="optional"/>
    <attribute name="pPos" type="xsd:unsignedInt" use="optional"/>
    <attribute name="pLen" type="xsd:unsignedInt" use="optional"/>
    <attribute name="level" type="xsd:unsignedInt" use="optional"/>
    <attribute name="field" use="required" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.58 mpMap (Member Properties Map)

Represents a mapping to cached member properties.

[*Example*:

```
<mpMap v="7"/>
```

end example]

Parent Elements
cacheField (§3.10.1.3)

Attributes	Description
v (Shared Items Index)	Specifies the index into the shared items table in the PivotCache that identifies this item.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_X">
   <attribute name="v" type="xsd:int" default="0"/>
</complexType>
```

3.10.1.59 mps (OLAP Member Properties)

Represents the collection of OLAP member property. Member properties contain additional information that's available about the items in an OLAP dimension field. For example, if a Geography dimension has property fields Population and Average Income available, you could create a PivotTable report that displays the sales figures for cities where your products are selling well. By displaying and analyzing the population and income figures for these cities, you could target cities with similar demographics for your marketing campaign.

[*Example*:

```
<sh:mps count="3">
  <sh:mp field="7"/>
  <sh:mp field="8"/>
  <sh:mp field="9"/>
</sh:mps>
```

end example]

Parent Elements
pivotHierarchy (§3.10.1.72)

Child Elements	Subclause
mp (OLAP Member Property)	§3.10.1.57

Attributes	Description
count (OLAP Member Properties Count)	Specifies the number of OLAP member properties in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MemberProperties">
   <sequence>
      <element name="mp" maxOccurs="unbounded" type="CT_MemberProperty"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.60 n (Numeric)

Represents a numeric value in the PivotTable.

[*Example*:

```
<sharedItems containsSemiMixedTypes="0" containsString="0" containsNumber="1"
  containsInteger="1" minValue="3" maxValue="3" count="1">
  <n v="3"/>
</sharedItems>
```

end example]

Parent Elements
entries (§3.10.1.28); groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

Child Elements	Subclause
tpls (Tuples)	§3.10.1.93
x (Member Property Index)	§3.10.1.96

Attributes	Description
b (Bold)	Specifies a boolean value that indicates whether this value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains italic formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
bc (Background Color)	Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space. The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
c (Caption)	Specifies the caption for this item. The possible values for this attribute are defined by the ST_Xstring simple type

Attributes	Description
	(§3.18.96).
cp (Member Property Count)	Specifies the number of member property values for this item. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
f (Calculated Item)	Specifies a boolean value that indicates whether this is a calculated item value. A value of on, 1, or true indicates this item is a calculated value. A value of off, 0, or false indicates this item is not calculated. The possible values for this attribute are defined by the XML Schema boolean datatype.
fc (Foreground Color)	Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space. The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
i (Italic)	Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains italic formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
in (Format Index)	Specifies the index to the OLAP serverformat element where the format string for this entry is stored. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
st (Strikethrough)	Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains strikethrough formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
u (Unused Item)	Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached. A value of on, 1, or true indicates this item is not used. A value of off, 0, or false indicates this item is used.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
un (Underline)	Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains underline formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
v (Value)	Specified the value of this item. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Number">
   <sequence>
      <element name="tpls" minOccurs="0" maxOccurs="unbounded" type="CT_Tuples"/>
      <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
   </sequence>
   <attribute name="v" use="required" type="xsd:double"/>
   <attribute name="u" type="xsd:boolean"/>
   <attribute name="f" type="xsd:boolean"/>
   <attribute name="c" type="ST_Xstring"/>
   <attribute name="cp" type="xsd:unsignedInt"/>
   <attribute name="in" type="xsd:unsignedInt" use="optional"/>
   <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="un" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.61 page (Page Items)

Represents the collection of page item values for a page field.

Parent Elements
pages (§3.10.1.65)

Child Elements	Subclause
pageItem (Page Item)	§3.10.1.64

Attributes	Description
count (Page Item	Specifies the number of page item strings in the collectoin.

Attributes	Description
String Count)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PCDSCPage">
   <sequence>
      <element name="pageItem" type="CT_PageItem" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.10.1.62 pageField (Page Field)

Represents a field on the page or report filter of the PivotTable.

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

In the image above, the blue field is a page or report filter field. Page/filter fields allow you to filter the entire PivotTable to display data for a single item or all the items.

[*Example*:

```
<sh:pageField fld="43" hier="103"
  name="[Product].[Product Categories].[All Products]" cap="All Products"/>
```

end example]

Parent Elements
pageFields (§3.10.1.63)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
cap (Hierarchy Display Name)	Specifies the display name of the hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
fld (Field)	Specifies the index of the field that appears on the page or filter report area of the PivotTable. The possible values for this attribute are defined by the XML Schema int datatype.
hier (OLAP Hierarchy Index)	Specifies the index of the OLAP hierarchy to which this item belongs. The possible values for this attribute are defined by the XML Schema int datatype.
item (Item Index)	Specifies the index of the item in the PivotCache. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Hierarchy Unique Name)	Specifies the unique name of the hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageField">
   <sequence minOccurs="0">
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="fld" use="required" type="xsd:int"/>
   <attribute name="item" use="optional" type="xsd:unsignedInt"/>
   <attribute name="hier" type="xsd:int"/>
   <attribute name="name" type="ST_Xstring"/>
   <attribute name="cap" type="ST_Xstring"/>
</complexType>
```

3.10.1.63 pageFields (Page Field Items)

Represents the collection of items in the page or report filter region of the PivotTable.

[*Example*:

```
<sh:pageFields count="2">
  <sh:pageField fld="43" hier="103"
    name="[Product].[Product Categories].[All Products]" cap="All Products"/>
  <sh:pageField fld="66" hier="126"
    name="[Promotion].[Promotions].[All Promotions]" cap="All Promotions"/>
</sh:pageFields>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
pageField (Page Field)	§3.10.1.62

Attributes	Description
count (Page Item Count)	Specifies the number of items in the page region of the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageFields">
   <sequence>
      <element name="pageField" maxOccurs="unbounded" type="CT_PageField"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.64 pageItem (Page Item)

Represents an item value for a PivotTable page.

Parent Elements
page (§3.10.1.61)

Attributes	Description
name (Page Item Name)	Specifies the name of this page item. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageItem">
   <attribute name="name" type="ST_Xstring" use="required"/>
</complexType>
```

3.10.1.65 pages (Page Item Values)

Represents the collection of page item values for each page field.

Parent Elements
consolidation (§3.10.1.20)

Child Elements	Subclause

Child Elements	Subclause
page (Page Items)	§3.10.1.61

Attributes	Description
count (Page Item String Count)	Specifies the number of page item strings in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Pages">
   <sequence>
      <element name="page" type="CT_PCDSCPage" minOccurs="1" maxOccurs="4"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.10.1.66 pivotAreas (Pivot Areas)

Represents the collection of pivot areas that comprise the PivotTable location.

[*Example*:

```
<sh:pivotAreas count="1">
  <sh:pivotArea field="2" dataOnly="0" outline="0"/>
</sh:pivotAreas>
```

end example]

Parent Elements
conditionalFormat (§3.10.1.18)

Child Elements	Subclause
pivotArea (Pivot Area)	§3.3.1.66

Attributes	Description
count (Pivot Area Count)	Specifies the number of PivotAreas for the PivotTable location. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotAreas">
   <sequence>
      <element name="pivotArea" minOccurs="0" maxOccurs="unbounded" type="CT_PivotArea"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.67 pivotCacheDefinition (PivotCache Definition)

Represents the pivotCacheDefinition part. This part defines each field in the source data, including the name, the string resources of the instance data (for shared items), and information about the type of data that appears in the field.

[*Example*:

```
<pivotCacheDefinition xmlns="…" xmlns:r="…" r:id="rId1" refreshedBy="AnonUser"
  refreshedDate="2006-05-22T10:07:16" createdVersion="3" refreshedVersion="3"
  minRefreshableVersion="3" recordCount="182">
  <cacheSource type="worksheet">
    <worksheetSource name="Table1"/>
  </cacheSource>
  <cacheFields count="28">
    <cacheField name="Customer Name" numFmtId="0">
    <cacheField name="Postal Code" numFmtId="0">
      <sharedItems/>
    </cacheField>
    <cacheField name="Product Category" numFmtId="0">
      <sharedItems count="1">
        <s v="Bikes"/>
      </sharedItems>
    </cacheField>
    <cacheField name="Year" numFmtId="0">
      <sharedItems count="1">
        <s v="2001"/>
      </sharedItems>
    </cacheField>
    <cacheField name="Quarter" numFmtId="0">
      <sharedItems containsSemiMixedTypes="0" containsString="0"
        containsNumber="1" containsInteger="1" minValue="3" maxValue="3"
        count="1">
        <n v="3"/>
      </sharedItems>
    </cacheField>
  </cacheFields>
</pivotCacheDefinition>
```

end example]

Parent Elements
Root element of SpreadsheetML Pivot Table Cache Definition part

Child Elements	Subclause
cacheFields (PivotCache Fields)	§3.10.1.4
cacheHierarchies (PivotCache Hierarchies)	§3.10.1.5
cacheSource (PivotCache Source Description)	§3.10.1.7
calculatedItems (Calculated Items)	§3.10.1.9
calculatedMembers (Calculated Members)	§3.10.1.11
dimensions (OLAP Dimensions)	§3.10.1.25
extLst (Future Feature Data Storage Area)	§3.2.10
kpis (OLAP KPIs)	§3.10.1.48
maps (OLAP Measure Group)	§3.10.1.52
measureGroups (OLAP Measure Groups)	§3.10.1.54
tupleCache (Tuple Cache)	§3.10.1.94

Attributes	Description
backgroundQuery (Background Query)	Specifies a boolean value that indicates whether the application should query and retrieve records asynchronously from the cache. A value of on, 1, or true indicates the application will retrieve records asynchronously from the cache. A value of off, 0, or false indicates the application will retrieve records synchronously. The possible values for this attribute are defined by the XML Schema boolean datatype.
createdVersion (PivotCache Created Version)	Specifies the version of the application that created the cache. This attribute is application-dependent. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
enableRefresh (Enable PivotCache Refresh)	Specifies a boolean value that indicates whether the end-user can refresh the cache. This attribute depends on whether the application exposes a method for allowing end-users control over refreshing the cache via the user interface. A value of on, 1, or true indicates the end-user can refresh the cache. A value of off, 0, or false indicates the end-user cannot refresh the cache.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Relationship Identifier) Namespace: .../officeDocument/2006/relationships	Specifies the unique identifier that corresponds to the related `pivotCacheRecords` part. See (§3.10.1.68) for more information. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
invalid (Invalid Cache)	Specifies a boolean value that indicates whether the cache is invalid and needs to be refreshed. A value of on, 1, or true indicates the cache is invalid and needs to be refreshed. A value of off, 0, or false indicates the cache does not need to be refreshed. The possible values for this attribute are defined by the XML Schema boolean datatype.
minRefreshableVersion (Minimum Version Required for Refresh)	Specifies the earliest version of the application that is required to refresh the cache. This attribute is application-dependent. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
missingItemsLimit (Missing Items Limit)	Specifies the number of unused items to allow before discarding unused items. This attribute is application-dependent. The application must specify a threshold for unused items. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
optimizeMemory (Optimize Cache for Memory)	Specifies a boolean value that indicates whether the application will apply optimizations to the cache to reduce memory usage. This attribute is application-dependent. This application must define its own cache optimization methods. The application must also decide whether to expose cache optimization status via the user interface or an object model. A value of on, 1, or true indicates the application will apply optimizations to the cache. A value of off, 0, or false indicates the application will not apply optimizations to the cache. The possible values for this attribute are defined by the XML Schema boolean datatype.
recordCount (PivotCache Record Count)	Specifies the number of records in the cache. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
refreshedBy (Last Refreshed By)	Specifies the name of the end-user who last refreshed the cache. This attribute is application-dependent and is specified by applications that track and store the identity of the current user. This attribute also depends on whether the application exposes mechanisms via the user interface whereby the end-user can refresh the cache. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
refreshedDate (PivotCache Last Refreshed Date)	Specifies the date when the cache was last refreshed. This attribute depends on whether the application exposes mechanisms via the user interface whereby the end-user can refresh the cache. The possible values for this attribute are defined by the XML Schema double datatype.
refreshedVersion (PivotCache Last Refreshed Version)	Specifies the version of the application that last refreshed the cache. This attribute depends on whether the application exposes mechanisms via the user interface whereby the end-user can refresh the cache. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
refreshOnLoad (Refresh On Load)	Specifies a boolean value that indicates whether the application will refresh the cache when the workbook has been opened. A value of on, 1, or true indicates that application will refresh the cache when the workbook is loaded. A value of off, 0, or false indicates the application will not automatically refresh cached data. The end user must trigger refresh of the cache manually via the application user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
saveData (Save Pivot Records)	Specifies a boolean value that indicates whether the pivot records are saved with the cache. A value of on, 1, or true indicates pivot records are saved in the cache. A value of off, 0, or false indicates are not saved in the cache. The possible values for this attribute are defined by the XML Schema boolean datatype.
supportAdvancedDrill (Supports Attribute Drilldown)	Specifies whether the cache's data source supports attribute drilldown. The possible values for this attribute are defined by the XML Schema boolean datatype.
supportSubquery (Supports Subqueries)	Specifies whether the cache's data source supports subqueries. The possible values for this attribute are defined by the XML Schema boolean datatype.
tupleCache (Stores	Specifies a boolean value that indicates whether the PivotCache is used store information

Attributes	Description
Cache for OLAP Functions)	for OLAP sheet data functions. A value of on, 1, or true indicates information about OLAP sheet data functions are stored in the cache. A value of off, 0, or false indicates the PivotCache does not contain information about OLAP sheet data functions. The possible values for this attribute are defined by the XML Schema boolean datatype.
upgradeOnRefresh (Upgrade PivotCache on Refresh)	Specifies a boolean value that indicates whether the cache is scheduled for version upgrade. This attribute depends on whether the application exposes mechanisms via the user interface whereby the cache may be upgraded. A value of on, 1, or true indicates the cache is scheduled for upgrade. A value of off, 0, or false indicates the cache is not scheduled for upgrade. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotCacheDefinition">
   <sequence>
      <element name="cacheSource" type="CT_CacheSource" minOccurs="1" maxOccurs="1"/>
      <element name="cacheFields" type="CT_CacheFields" minOccurs="1" maxOccurs="1"/>
      <element name="cacheHierarchies" minOccurs="0" type="CT_CacheHierarchies"/>
      <element name="kpis" minOccurs="0" type="CT_PCDKPIs"/>
      <element name="tupleCache" minOccurs="0" type="CT_TupleCache"/>
      <element name="calculatedItems" minOccurs="0" type="CT_CalculatedItems"/>
      <element name="calculatedMembers" type="CT_CalculatedMembers" minOccurs="0"/>
      <element name="dimensions" type="CT_Dimensions" minOccurs="0"/>
      <element name="measureGroups" type="CT_MeasureGroups" minOccurs="0"/>
      <element name="maps" type="CT_MeasureDimensionMaps" minOccurs="0"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute ref="r:id" use="optional"/>
   <attribute name="invalid" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="saveData" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="refreshOnLoad" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="optimizeMemory" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="enableRefresh" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="refreshedBy" type="ST_Xstring" use="optional"/>
   <attribute name="refreshedDate" type="xsd:double" use="optional"/>
   <attribute name="backgroundQuery" type="xsd:boolean" default="false"/>
   <attribute name="missingItemsLimit" type="xsd:unsignedInt" use="optional"/>
   <attribute name="createdVersion" type="xsd:unsignedByte" use="optional" default="0"/>
   <attribute name="refreshedVersion" type="xsd:unsignedByte" use="optional" default="0"/>
   <attribute name="minRefreshableVersion" type="xsd:unsignedByte" use="optional" default="0"/>
   <attribute name="recordCount" type="xsd:unsignedInt" use="optional"/>
   <attribute name="upgradeOnRefresh" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="tupleCache" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="supportSubquery" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="supportAdvancedDrill" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.68 pivotCacheRecords (PivotCache Records)

Represents the collection of records in the PivotCache. This part stores the underlying source data that the PivotTable aggregates.

[*Example*:

```
<pivotCacheRecords xmlns="…" xmlns:r="…" count="2">
  <r>
    <x v="0"/>
    <s v="Pacific"/>
    <x v="0"/>
    <s v="Australia"/>
    <x v="0"/>
```

```
      <x v="0"/>
      <s v="3550"/>
      <x v="0"/>
      <x v="0"/>
      <s v="Road-150 Red, 62"/>
      <s v="This bike is ridden by race winners. Developed with the Adventure
        Works Cycles professional race team, it has a extremely light
        heat-treated aluminum frame, and steering that allows precision
        control."/>
      <s v="No Discount"/>
…
      <n v="89.456800000000001"/>
    </r>
…
```

end example]

Parent Elements
Root element of SpreadsheetML Pivot Table Cache Records part

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
r (PivotCache Record)	§3.10.1.77

Attributes	Description
count (PivotCache Records Count)	Specifies the number of records in the cache. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotCacheRecords">
   <sequence>
      <element name="r" minOccurs="0" maxOccurs="unbounded" type="CT_Record"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.69 pivotField (PivotTable Field)

Represents a single field in the PivotTable. This complex type contains information about the field, including the collection of items in the field.

[*Example*:

```
<pivotField axis="axisRow" allDrilled="1" showAll="0" measureFilter="1"
  sortType="descending">
  <items count="8">
    <item s="1" c="1" x="0"/>
    <item s="1" c="1" x="1"/>
    <item c="1" x="2"/>
    <item c="1" x="3"/>
    <item c="1" x="4"/>
    <item c="1" x="5"/>
    <item c="1" x="6"/>
    <item t="default"/>
  </items>
  <autoSortScope>
    <pivotArea dataOnly="0" outline="0" fieldPosition="0">
      <references count="2">
        <reference field="4294967294" count="1" selected="0">
          <x v="0"/>
        </reference>
        <reference field="25" count="1" selected="0">
          <x v="0"/>
        </reference>
      </references>
    </pivotArea>
  </autoSortScope>
</pivotField>
```

end example]

Parent Elements
pivotFields (§3.10.1.70)

Child Elements	Subclause
autoSortScope (AutoSort Scope)	§3.10.1.1
extLst (Future Feature Data Storage Area)	§3.2.10
items (Field Items)	§3.10.1.46

Attributes	Description
allDrilled (All Items Expanded)	Specifies a boolean value that indicates whether all items in the field are expanded. Applies only to OLAP PivotTables.

Attributes	Description
	A value of on, 1, or true indicates all items in the field are expanded. A value of off, 0, or false indicates all items are not expanded. However some items may be expanded. The possible values for this attribute are defined by the XML Schema boolean datatype.
autoShow (Auto Show)	Specifies a boolean value that indicates whether an "AutoShow" filter is applied to this field. This attribute depends on the implementation of filtering in the application. A value of on, 1, or true indicates an "AutoShow" filter is applied to the field. A value of off, 0, or false indicates an "AutoShow" filter is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
avgSubtotal (Average)	Specifies a boolean value that indicates whether to apply the 'Average' aggregation function in the subtotal of this field. A value of on, 1, or true indicates the subtotal for this field is 'Average.' A value of off, 0, or false indicates a different aggregation function is applied to the subtotal for this field. The possible values for this attribute are defined by the XML Schema boolean datatype.
axis (Axis)	Specifies the region of the PivotTable that this field is displayed. The possible values for this attribute are defined by the ST_Axis simple type (§3.18.1).
compact (Compact)	Specifies a boolean value that indicates whether the application will display fields compactly in the sheet on which this PivotTable resides. A value of on, 1, or true indicates the next field should be displayed in the same column of the sheet. A value of off, 0, or false indicates each pivot field will display in its own column in the sheet. The possible values for this attribute are defined by the XML Schema boolean datatype.
countASubtotal (CountA)	Specifies a boolean value that indicates whether to apply the 'countA' aggregation function in the subtotal of this field. A value of on, 1, or true indicates the subtotal for this field is 'countA.' A value of off, 0, or false indicates a different aggregation function is applied to the subtotal for this field.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
countSubtotal (Count)	Specifies a boolean value that indicates whether to apply the 'count' aggregation function in the subtotal of this field. A value of on, 1, or true indicates the subtotal for this field is 'count.' A value of off, 0, or false indicates a different aggregation vfunction is applied to the subtotal for this field. The possible values for this attribute are defined by the XML Schema boolean datatype.
dataField (Data Field)	Specifies a boolean value that indicates whether this field appears in the data region of the PivotTable. A value of on, 1, or true indicates this field appears in the data region of the PivotTable. A value of off, 0, or false indicates this field appears in another region of the PivotTable. The possible values for this attribute are defined by the XML Schema boolean datatype.
dataSourceSort (Data Source Sort)	Specifies a boolean value that indicates whether sort is applied to this field in the data source. A value of on, 1, or true indicates this field is sorted in the data source. A value of off, 0, or false indicates this field is not sorted in the data source. The possible values for this attribute are defined by the XML Schema boolean datatype.
defaultAttributeDrillState (Drill State)	Specifies a boolean value that indicates the drill state of the attribute hierarchy in an OLAP-based PivotTable. A value of on, 1, or true indicates the attribute hierarchy is expanded. A value of off, 0, or false indicates the attribute hierarchy is collapsed. This attribute is designed to allow the application to issue more optimized queries when all items of each field have the same drill state. The possible values for this attribute are defined by the XML Schema boolean datatype.
defaultSubtotal (Show Default Subtotal)	Specifies a boolean value that indicates whether the default subtotal aggregation function is displayed for this field. A value of on, 1, or true indicates the default subtotal aggregation function is displayed for this field.

Attributes	Description
	A value of off, 0, or false indicates the default aggregation function is not displayed. The possible values for this attribute are defined by the XML Schema boolean datatype.
dragOff (Drag Off)	Specifies a boolean value that indicates whether the field can be removed from the PivotTable. A value of on, 1, or true indicates the field can be removed from the PivotTable. A value of off, 0, or false indicates the field cannot be removed from the PivotTable. The possible values for this attribute are defined by the XML Schema boolean datatype.
dragToCol (Drag To Column)	Specifies a boolean value that indicates whether the field can be dragged to the column axis. A value of on, 1, or true indicates the field can be dragged to the column axis. A value of off, 0, or false indicates the field cannot be dragged to the column axis. The possible values for this attribute are defined by the XML Schema boolean datatype.
dragToData (Field Can Drag to Data)	Specifies a boolean value that indicates whether the field can be dragged to the data region. A value of on, 1, or true indicates the field can be dragged to the data region. A value of off, 0, or false indicates the field cannot be dragged to the data region. The possible values for this attribute are defined by the XML Schema boolean datatype.
dragToPage (Drag Field to Page)	Specifies a boolean value that indicates whether the field can be dragged to the page region. A value of on, 1, or true indicates the field can be dragged to the page region. A value of off, 0, or false indicates the field cannot be dragged to the page region. The possible values for this attribute are defined by the XML Schema boolean datatype.
dragToRow (Drag To Row)	Specifies a boolean value that indicates whether the field can be dragged to the row axis. A value of on, 1, or true indicates the field can be dragged to the row axis. A value of off, 0, or false indicates the field cannot be dragged to the row axis. The possible values for this attribute are defined by the XML Schema boolean datatype.
hiddenLevel	Specifies a boolean value that indicates whether there is a hidden level in the PivotTable.

Attributes	Description
(Hidden Level)	This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates the OLAP PivotTable contains a hidden level. A value of off, 0, or false indicates the OLAP PivotTable does not contain any hidden levels. The possible values for this attribute are defined by the XML Schema boolean datatype.
hideNewItems (Hide New Items)	Specifies a boolean value that indicates whether new items that appear after a refresh should be hidden by default. A value of on, 1, or true indicates that items that appear after a refresh should be hidden by default. A value of off, 0, or false indicates that items that appear after a refresh should be shown by default. The possible values for this attribute are defined by the XML Schema boolean datatype.
includeNewItemsInFilter (Inclusive Manual Filter)	Specifies a boolean value that indicates whether manual filter is in inclusive mode. A value of on, 1, or true indicates the manual filter is inclusive. A value of off, 0, or false indicates the manual filter is not inclusive. The possible values for this attribute are defined by the XML Schema boolean datatype.
insertBlankRow (Insert Blank Row)	Specifies a boolean value that indicates whether to insert a blank row after each item. A value of on, 1, or true indicates that a blank row will be inserted after each item. A value of off, 0, or false indicates no additional rows will be inserted after each item. The possible values for this attribute are defined by the XML Schema boolean datatype.
insertPageBreak (Insert Item Page Break)	Specifies a boolean value that indicates whether to insert a page break after each item. A value of on, 1, or true indicates that a page break will be inserted after each item. A value of off, 0, or false indicates no page breaks will be inserted after items. The possible values for this attribute are defined by the XML Schema boolean datatype.
itemPageCount (Items Per Page Count)	Specifies the number of items showed per page in the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
maxSubtotal (Max	Specifies a boolean value that indicates whether to apply the 'max' aggregation function

Attributes	Description
Subtotal)	in the subtotal of this field. A value of on, 1, or true indicates that the 'max' aggregation function is applied in the subtotal for this field. A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field. The possible values for this attribute are defined by the XML Schema boolean datatype.
measureFilter (Measure Filter)	Specifies a boolean value that indicates whether field has a measure based filter. A value of on, 1, or true indicates the field has a measure-based filter. A value of off, 0, or false indicates does not have a measure-based filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
minSubtotal (Min Subtotal)	Specifies a boolean value that indicates whether to apply the 'min' aggregation function in the subtotal of this field. A value of on, 1, or true indicates that the 'min' aggregation function is applied in the subtotal for this field. A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field. The possible values for this attribute are defined by the XML Schema boolean datatype.
multipleItemSelectionAllowed (Multiple Field Filters)	Specifies a boolean value that indicates whether the field can have multiple items selected in the page field. A value of on, 1, or true indicates the PivotTable can have multiple items selected in the page field. A value of off, 0, or false indicates the PivotTable cannot have multiple items selected in the page field. This attribute depends on the application support for selecting multiple items in page fields. The possible values for this attribute are defined by the XML Schema boolean datatype.
name (Field Name)	Specifies the name of the field. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
nonAutoSortDefault (Auto Sort)	Specifies a boolean value that indicates whether sort operation that will be applied to field should be AutoSort operation or simple data sort operation.

Attributes	Description
	A value of on, 1, or true indicates that an AutoSort operation will be applied to the field. A value of off, 0, or false indicates a simple data sort operation will be applied to the field. The possible values for this attribute are defined by the XML Schema boolean datatype.
numFmtId (Number Format Id)	Specifies the identifier of the number format to apply to this field. Number formats are written to the styles part. See the Styles section (§3.8) for more information on number formats. Note: Formatting information provided by cell table and by PivotTable need not agree. If the two formats differ, the cell-level formatting takes precedence. If you change the layout the PivotTable, the PivotTable formatting will then take precedence. The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).
outline (Outline Items)	Specifies a boolean value that indicates whether the items in this field should be shown in Outline form. A value of on, 1, or true indicates the items in this field will be shown in Outline form. A value of off, 0, or false indicates the items in this field will not be shown in Outline form. This attribute depends on the application support for displaying items in Outline form. The possible values for this attribute are defined by the XML Schema boolean datatype.
productSubtotal (Product Subtotal)	Specifies a boolean value that indicates whether to apply 'product' aggregation function in the subtotal of this field. A value of on, 1, or true indicates that the 'product' aggregation function is applied in the subtotal for this field. A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field. The possible values for this attribute are defined by the XML Schema boolean datatype.
rankBy (Auto Show Rank By)	Specifies the index of the data field by which AutoShow will rank. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
serverField (Server-based Page Field)	Specifies a boolean value that indicates whether this is a server-based page field. A value of on, 1, or true indicates this is a server-based page field.

Attributes	Description
	A value of off, 0, or false indicates this is a local page field. The possible values for this attribute are defined by the XML Schema boolean datatype.
showAll (Show All Items)	Specifies a boolean value that indicates whether to show all items for this field. A value of on, 1, or true indicates that all items be shown. A value of off, 0, or false indicates items be shown according to user specified criteria. The possible values for this attribute are defined by the XML Schema boolean datatype.
showDropDowns (Show PivotField Header Drop Downs)	Specifies a boolean value that indicates whether to hide drop down buttons on PivotField headers. This attribute depends on the application implementation for filtering in the user interface. A value of on, 1, or true indicates the application will display some mechanism for selecting and applying filters--for example, a dropdown menu--in the user interface. A value of off, 0, or false indicates for mechanism for applying a filter will be displayed in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
showPropAsCaption (Show As Caption)	Specifies a boolean value that indicates whether to show the property as a member caption. A value of on, 1, or true indicates the property will be shown as a member caption. A value of off, 0, or false indicates the property will not be shown as a member caption. The possible values for this attribute are defined by the XML Schema boolean datatype.
showPropCell (Show Member Property in Cell)	Specifies a boolean value that indicates whether to show the member property value in a PivotTable cell. A value of on, 1, or true indicates the property value will be shown in a PivotTable cell. A value of off, 0, or false indicates the property value will not be shown in a PivotTable cell. The possible values for this attribute are defined by the XML Schema boolean datatype.
showPropTip (Show Member Property ToolTip)	Specifies a boolean value that indicates whether to show the member property value in a tooltip on the appropriate PivotTable cells. A value of on, 1, or true indicates the property value will be shown in a tooltip in the user interface.

Attributes	Description
	A value of off, 0, or false indicates the property will not be shown in a tooltip. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
sortType (Auto Sort Type)	Specifies the type of sort that is applied to this field. The possible values for this attribute are defined by the ST_FieldSortType simple type (§3.18.29).
stdDevPSubtotal (StdDevP Subtotal)	Specifies a boolean value that indicates whether to apply the 'stdDevP' aggregation function in the subtotal of this field. A value of on, 1, or true indicates that the 'stdDevP' aggregation function is applied in the subtotal for this field. A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field. The possible values for this attribute are defined by the XML Schema boolean datatype.
stdDevSubtotal (StdDev Subtotal)	Specifies a boolean value that indicates whether to use 'stdDev' in the subtotal of this field. A value of on, 1, or true indicates that the 'stdDev' aggregation function is applied in the subtotal for this field. A value of off, 0, or false indicates another aggregation function is applied in the subtotal for this field. The possible values for this attribute are defined by the XML Schema boolean datatype.
subtotalCaption (Custom Subtotal Caption)	Specifies the custom text that is displayed for the subtotals label. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
subtotalTop (Subtotals At Top)	Specifies a boolean value that indicates whether to display subtotals at the top of the group. Applies only when `Outline` its true. A value of on, 1, or true indicates a subtotal will be display at the top of the group. A value of off, 0, or false indicates subtotal will not be displayed at the top of the group. The possible values for this attribute are defined by the XML Schema boolean datatype.
sumSubtotal (Sum Subtotal)	Specifies a boolean value that indicates whether apply the 'sum' aggregation function in the subtotal of this field.

Attributes	Description
	A value of on, 1, or true indicates the 'sum' aggregation function will be applied in the subtotal of this field. A value of off, 0, or false indicates another aggregation function will be applied in the subtotal of this field. The possible values for this attribute are defined by the XML Schema boolean datatype.
topAutoShow (Top Auto Show)	Specifies a boolean value that indicates whether an AutoShow filter applied to this field is set to show the top ranked values. A value of on, 1, or true indicates whether an AutoShow filter will show top values for this field. A value of off, 0, or false indicates bottom ranked values will be shown. The possible values for this attribute are defined by the XML Schema boolean datatype.
uniqueMemberProperty (Unique Member Property)	Specifies the unique name of the member property to be used as a caption for the field and field items. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
varPSubtotal (VarP Subtotal)	Specifies a boolean value that indicates whether to apply the 'varP' aggregation function in the subtotal of this field. A value of on, 1, or true indicates the 'varP' aggregation function will be applied in the subtotal of this field. A value of off, 0, or false indicates another aggregation function will be applied in the subtotal of this field. The possible values for this attribute are defined by the XML Schema boolean datatype.
varSubtotal (Variance Subtotal)	Specifies a boolean value that indicates whether to apply the 'variance' aggregation function in the subtotal of this field. A value of on, 1, or true indicates the 'variance' aggregation function will be applied in the subtotal of this field. A value of off, 0, or false indicates another aggregation function will be applied in the subtotal of this field. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotField">
   <sequence>
      <element name="items" minOccurs="0" type="CT_Items"/>
      <element name="autoSortScope" minOccurs="0" type="CT_AutoSortScope"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>

    <attribute name="defaultAttributeDrillState" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.70 pivotFields (PivotTable Fields)

Represents the collection of fields that appear on the PivotTable.

[*Example*:

```
<pivotFields count="28">
  <pivotField showAll="0" includeNewItemsInFilter="1">
    <items count="8">
      <item x="66"/>
      <item x="133"/>
      <item x="74"/>
      <item x="27"/>
      <item x="118"/>
      <item x="63"/>
      <item x="141"/>
      <item t="default"/>
    </items>
  </pivotField>
  <pivotField showAll="0" includeNewItemsInFilter="1"/>
  <pivotField axis="axisPage" showAll="0" includeNewItemsInFilter="1">
    <items count="2">
      <item x="0"/>
      <item t="default"/>
    </items>
  </pivotField>
<pivotField showAll="0" includeNewItemsInFilter="1"/>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
pivotField (PivotTable Field)	§3.10.1.69

Attributes	Description
count (Field Count)	Specifies the number of fields in the PivotTable.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotFields">
   <sequence>
      <element name="pivotField" maxOccurs="unbounded" type="CT_PivotField"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.71 pivotHierarchies (PivotTable OLAP Hierarchies)

Represents the collection of OLAP hierarchies associated with the PivotTable.

[*Example*:

```
<sh:pivotHierarchies count="3">
  <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
  <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
  <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
  <sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
</sh:pivotHierarchies>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
pivotHierarchy (OLAP Hierarchy)	§3.10.1.72

Attributes	Description
count (OLAP Hierarchy Count)	Specifies the number of OLAP hierarchies in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotHierarchies">
   <sequence>
      <element name="pivotHierarchy" maxOccurs="unbounded" type="CT_PivotHierarchy"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.72 pivotHierarchy (OLAP Hierarchy)

Represents a OLAP hierarchy associated with the PivotTable. A hierarchy is a hierarchical representation of related OLAP dimensions. Hierarchies are defined on the OLAP server and cannot be changed in the PivotTable. For example, hierarchy "A" might be defined as follows:

Level 1 Country/Region

Level 2 State\Provence

Level 3 City

[*Example*:

```
<sh:pivotHierarchy dragToRow="0" dragToCol="0" dragToPage="0" dragToData="1"/>
```

end example]

Parent Elements
pivotHierarchies (§3.10.1.71)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
members (Members)	§3.10.1.56
mps (OLAP Member Properties)	§3.10.1.59

Attributes	Description
caption (Hierarchy Caption)	Specifies the user defined caption of the hierarchy. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
dragOff (Drag Off)	Specifies a boolean value that indicates whether the user is allowed to remove this hierarchy from the PivotTable. A value of on, 1, or true indicates the user can remove this hierarchy from the PivotTable.

Attributes	Description
	A value of off, 0, or false indicates the user cannot remove the hierarchy from the PivotTable. The possible values for this attribute are defined by the XML Schema boolean datatype.
dragToCol (Drag To Column)	Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the column area of the PivotTable. A value of on, 1, or true indicates the user can put this hierarchy into the column area of the PivotTable. A value of off, 0, or false indicates the user cannot remove this hierarchy. The possible values for this attribute are defined by the XML Schema boolean datatype.
dragToData (Drag To Data)	Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the data area of the view. A value of on, 1, or true indicates A value of off, 0, or false indicates The possible values for this attribute are defined by the XML Schema boolean datatype.
dragToPage (Drag to Page)	Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the page area of the PivotTable. A value of on, 1, or true indicates the user can put this hierarchy into the page area of the PivotTable. A value of off, 0, or false indicates cannot put this hierarchy into the page area. The possible values for this attribute are defined by the XML Schema boolean datatype.
dragToRow (Drag To Row)	Specifies a boolean value that indicates whether the user is allowed to put this hierarchy into the row area of the PivotTable. A value of on, 1, or true indicates the user can put this hierarchy into the row area of the PivotTable. A value of off, 0, or false indicates cannot put this hierarchy into the row area. The possible values for this attribute are defined by the XML Schema boolean datatype.
includeNewItemsInFilter (Inclusive Manual Filter)	Specifies a boolean value that indicates whether the application will show only the items the user has selected. A value of on, 1, or true indicates the application will show only items the user has

Attributes	Description
	selected; all other items will be hidden. A value of off, 0, or false indicates the application will show all items. The possible values for this attribute are defined by the XML Schema boolean datatype.
multipleItemSelectionAllowed (Multiple Field Filters)	Specifies a boolean value that indicates whether the user can select multiple members when the hierarchy is in the page field area of the view. A value of on, 1, or true indicates the user can select multiple members. A value of off, 0, or false indicates the user cannot select multiple members. The possible values for this attribute are defined by the XML Schema boolean datatype.
outline (Outline New Levels)	Specifies a boolean value that indicates whether new levels added to the PivotTable are shown in Outline mode. A value of on, 1, or true indicates new levels are shown in Outline mode. A value of off, 0, or false indicates new items are not shown in Outline mode. The possible values for this attribute are defined by the XML Schema boolean datatype.
showInFieldList (Show In Field List)	Specifies a boolean value that indicates whether this hierarchy is omitted from the field list. This attribute depends on how the application exposes a list of fields for PivotTables in the user interface. A value of on, 1, or true indicates this hierarchy is show in the field list or similar mechanism in the user interface. A value of off, 0, or false indicates is not shown in the field list. The possible values for this attribute are defined by the XML Schema boolean datatype.
subtotalTop (New Levels Subtotals At Top)	Specifies a boolean value that indicates whether new levels added to the view will show their subtotals at the top. A value of on, 1, or true indicates new levels added to the view show their subtotals at the top. A value of off, 0, or false indicates new levels added to the view show their subtotals at the bottom. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotHierarchy">
   <sequence>
      <element name="mps" minOccurs="0" type="CT_MemberProperties"/>
      <element name="members" minOccurs="0" maxOccurs="unbounded" type="CT_Members"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="outline" type="xsd:boolean" default="false"/>
   <attribute name="multipleItemSelectionAllowed" type="xsd:boolean" default="false"/>
   <attribute name="subtotalTop" type="xsd:boolean" default="false"/>
   <attribute name="showInFieldList" type="xsd:boolean" default="true"/>
   <attribute name="dragToRow" type="xsd:boolean" default="true"/>
   <attribute name="dragToCol" type="xsd:boolean" default="true"/>
   <attribute name="dragToPage" type="xsd:boolean" default="true"/>
   <attribute name="dragToData" type="xsd:boolean" default="false"/>
   <attribute name="dragOff" type="xsd:boolean" default="true"/>
   <attribute name="includeNewItemsInFilter" type="xsd:boolean" default="false"/>
   <attribute name="caption" type="ST_Xstring" use="optional"/>
</complexType>
```

3.10.1.73 pivotTableDefinition (PivotTable Definition)

Represents the PivotTable root element for non-null PivotTables. There exists one pivotTableDefinition for each PivotTableDefinition part. The PivotTable definition encompasses the following information:

Structure

- Top-level attributes
- Location information
- Collection of fields
- Fields on the row axis
- Items on the row axis (specific values)
- Fields on the column axis
- Items on the column axis (specific values)
- Fields on the report filter region
- Fields in the values region
- Style information

Outline of the XML for a pivotTableDefinition

```
<pivotTableDefinition>
  <location/>
  <pivotFields/>
  <rowFields/>
  <rowItems/>
```

```
    <colFields/>
    <colItems/>
    <pageFields/>
    <dataFields/>
    <conditionalFormats/>
    <pivotTableStyleInfo/>
  </pivotTableDefinition>
```

Illustrations

Layout

Row field

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

The blue field is a row field.

A PivotTable report that has more than one row field has one inner row field (Sport, in the example below), the one closest to the data area. Any other row fields are outer row fields (Region, in the example below). Items in the outermost row field are displayed only once, but items in the rest of the row fields are repeated as needed.

	A	B	C
3	Sum of Sales		Quarter
4	Region	Sport	Qtr1
5	East	Golf	5,000
6		Safari	9,000
7		Tennis	1,500
8	East Total		15,500
9	West	Golf	3,500

Region is an outer row field; Sport is an inner row field.

Column field

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

The blue field is a column field.

Page field

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

The blue field is a page field.

Page fields allow you to filter the entire PivotTable report to display data for a single item or all the items.

Data field

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

The blue field is a data field.

Data fields provide the data values to be summarized. Usually data fields contain numbers, which are combined with the Sum summary function, but data fields can also contain text, in which case the PivotTable report uses the Count summary function.

If a report has more than one data field, a single field button named Data appears in the report for access to all of the data fields.

[*Example*:

```
<?xml …?>
<sh:pivotTableDefinition xmlns:sh="…" name="PivotTable1" cacheId="3"
  applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="0"
  applyPatternFormats="0" applyAlignmentFormats="0" applyWidthHeightFormats="1"
  dataCaption="Values" updatedVersion="3" minRefreshableVersion="3"
  showCalcMbrs="0" useAutoFormatting="1" colGrandTotals="0" itemPrintTitles="1"
  createdVersion="3" indent="0" outline="1" outlineData="1"
  multipleFieldFilters="0" fieldListSortAscending="1">
    <sh:location ref="B5:H49" firstHeaderRow="1" firstDataRow="4"
      firstDataCol="1" rowPageCount="2" colPageCount="1"/>
```

```
<sh:pivotFields count="28">
  <sh:pivotField axis="axisPage" showAll="0" includeNewItemsInFilter="1">
    <sh:items count="5">
      <sh:item x="1"/>
      <sh:item x="2"/>
      <sh:item x="3"/>
      <sh:item x="4"/>
      <sh:item x="5"/>
    </sh:items>
  </sh:pivotField>
  <sh:pivotField compact="0" showAll="0" includeNewItemsInFilter="1"/>
  <sh:pivotField showAll="0" includeNewItemsInFilter="1"/>
  <sh:pivotField axis="axisCol" showAll="0" includeNewItemsInFilter="1">

<tr><th>autoFormatId</th><th>Description</th></tr>
<tr><td>0</td><td> </td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	1 	2 	3 	4 	5 	6 	7 	8 
Attributes	Description
	9 	10 	11 	12 	13 	14 	15 	16 
The possible values for this attribute are defined by the XML Schema unsignedInt

Attributes	Description
	datatype.
cacheId (PivotCache Definition Id)	Specifies the identifier of the related PivotCache definition. This Id is listed in the pivotCaches collection in the workbook part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
chartFormat (Chart Format Id)	Specifies the next chart formatting identifier to use on the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
colGrandTotals (Grand Totals On Columns)	Specifies a boolean value that indicates whether grand totals should be displayed for the PivotTable columns. A value of on, 1, or true indicates grand totals should be displayed. A value of off, 0, or false indicates grand totals should not be displayed for PivotTable columns. The possible values for this attribute are defined by the XML Schema boolean datatype.
colHeaderCaption (Column Header Caption)	Specifies the string to be displayed in column header in compact mode. This attribute depends on whether the application implements a compact mode for displaying PivotTables in the user interface. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
compact (Compact New Fields)	Specifies a boolean value that indicates whether new fields should have their `compact` flag set to true. A value of on, 1, or true indicates new fields should default to `compact` mode equal to true. A value of off, 0, or false indicates new fields should default to `compact` mode equal to false. This attribute depends on whether the application implements a compact mode in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
compactData (Compact Data)	Specifies a boolean value that indicates whether the field next to the data field in the PivotTable should be displayed in the same column of the spreadsheet The possible values for this attribute are defined by the XML Schema boolean datatype.
createdVersion (PivotCache Created Version)	Specifies the version of the application that created the cache. This attribute is application-dependent. The possible values for this attribute are defined by the XML Schema unsignedByte

Attributes	Description
	datatype.
customListSort (Custom List AutoSort)	Specifies a boolean value that indicates whether the "custom lists" option is offered when sorting this PivotTable. A value of on, 1, or true indicates custom lists are offered when sorting this PivotTable. A value of off, 0, or false indicates custom lists are not offered. This attribute depends on the implementation of sorting features in the application. The possible values for this attribute are defined by the XML Schema boolean datatype.
dataCaption (Data Field Header Name)	Specifies the name of the value area field header in the PivotTable. This caption is shown when the PivotTable when two or more fields are in the values area. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
dataOnRows (Data On Rows)	Specifies a boolean value that indicates the default orientation for fields in the data region. A value of on, 1, or true indicates vertical orientation. A value of off, 0, or false indicates horizontal orientation. The possible values for this attribute are defined by the XML Schema boolean datatype.
dataPosition (Default Data Field Position)	Specifies the default position for the data field in the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
disableFieldList (Disable Field List)	Specifies a boolean value that indicates whether to disable the PivotTable field list. A value of on, 1, or true indicates the field list, or similar mechanism for selecting fields in the user interface, is disabled. A value of off, 0, or false indicates the field list is enabled. The possible values for this attribute are defined by the XML Schema boolean datatype.
editData (Allow Edit Data)	Specifies a boolean value that indicates whether the user is allowed to edit the cells in the data area of the PivotTable. A value of on, 1, or true indicates the user can edit values in the data area. A value of off, 0, or false indicates the cells in the data area are not editable. The possible values for this attribute are defined by the XML Schema boolean datatype.
enableDrill (Enable	Specifies a boolean value that indicates whether the user is prevented from drilling down

Attributes	Description
Drill Down)	on a PivotItem or aggregate value. A value of on, 1, or true indicates the user can drill down on a pivot item or aggregate value. A value of off, 0, or false indicates the user is prevented from drilling down pivot item. The possible values for this attribute are defined by the XML Schema boolean datatype.
enableFieldProperties (Enable Field Properties)	Specifies a boolean value that indicates whether the user is prevented from displaying PivotField properties. A value of on, 1, or true indicates the user can display pivot field properties. A value of off, 0, or false indicates the user cannot display pivot field properties. This attribute depends on how pivot field properties are exposed in the application user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
enableWizard (Enable PivotTable Wizard)	Specifies a boolean value that indicates whether the user is prevented from displaying the PivotTable wizard. A value of on, 1, or true indicates the user may display the PivotTable wizard. A value of off, 0, or false indicates the user may not display the PivotTable wizard. This attribute depends on whether the application exposes a wizard or similar mechanism for creating and working with PivotTables in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
errorCaption (Error Caption)	Specifies the string to be displayed in cells that contain errors. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
fieldListSortAscending (Default Sort Order)	Specifies a boolean value that indicates whether fields in the PivotTable are sorted in non-default order in the field list. A value of on, 1, or true indicates fields for the PivotTable are sorted in the field list. The sort order from the data source is applied for range-based PivotTables. Alphabetical sorting is applied for external data PivotTables. A value of off, 0, or false indicates fields in the field list are not sorted. The possible values for this attribute are defined by the XML Schema boolean datatype.
fieldPrintTitles (Field Print Titles)	Specifies a boolean value that indicates whether the row and column titles from the PivotTable should be printed.

Attributes	Description
	A value of on, 1, or true indicates row and column titles should be printed. A value of off, 0, or false indicates row and column titles should not be printed. The possible values for this attribute are defined by the XML Schema boolean datatype.
grandTotalCaption (Grand Totals Caption)	Specifies the string to be displayed for grand totals. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
gridDropZones (Enable Drop Zones)	Specifies a boolean value that indicates whether the in-grid drop zones should be enabled. A value of on, 1, or true indicates in-grid drop zones should be enabled. A value of off, 0, or false indicates in-grid drop zones should be disabled. This attribute depends on how the application implements drop zones in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
immersive (Stop Immersive UI)	Specifies a boolean value that indicates whether PivotTable immersive experience user interface should be turned off. A value of on, 1, or true indicates the PivotTable immersive experience should be turned off for this PivotTable. A value of off, 0, or false indicates the immersive experience should be left on. This attribute depends on whether the application implements an immersive experience in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
indent (Indentation for Compact Axis)	Specifies the indentation increment for compact axis and can be used to set the Report Layout to Compact Form. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
itemPrintTitles (Item Print Titles)	Specifies a boolean value that indicates whether PivotItem names should be repeated at the top of each printed page. A value of on, 1, or true indicates pivot items names should be repeated at the top of each page. A value of off, 0, or false indicates should not be repeated. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
mdxSubqueries (MDX Subqueries Supported)	Specifies a boolean value that indicates whether MDX sub-queries are supported by OLAP data provider for this PivotTable. A value of on, 1, or true indicates MDX sub-queries are supported by the OLAP data provider. A value of off, 0, or false indicates MDX sub-queries are not supported. The possible values for this attribute are defined by the XML Schema boolean datatype.
mergeItem (Merge Titles)	Specifies a boolean value that indicates whether row or column titles that span multiple cells should be merged into a single cell. A value of on, 1, or true indicates that titles that span multiple cells will be merged into a single cell. A value of off, 0, or false indicates titles are not merged. The possible values for this attribute are defined by the XML Schema boolean datatype.
minRefreshableVersion (Minimum Refreshable Version)	Specifies the minimum version of the application required to update this PivotTable view. This attribute is application-dependent. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
missingCaption (Caption for Missing Values)	Specifies the string to be displayed in cells with no value The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
multipleFieldFilters (Multiple Field Filters)	Specifies a boolean value that indicates whether the fields of a PivotTable can have multiple filters set on them. A value of on, 1, or true indicates the fields of a PivotTable can have multiple filters. A value of off, 0, or false indicates the fields of a PivotTable can only have a simple filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
name (Name)	Specifies the PivotTable name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
outline (Outline New Fields)	Specifies a boolean value that indicates whether new fields should have their `outline` flag set to true. A value of on, 1, or true indicates new fields will be created with `outline` equal to true.

Attributes	Description
	A value of off, 0, or false indicates new fields will be created with `outline` equal to false. The possible values for this attribute are defined by the XML Schema boolean datatype.
outlineData (Outline Data Fields)	Specifies a boolean value that indicates whether data fields in the PivotTable should be displayed in outline form. A value of on, 1, or true indicates data fields will display in outline form. A value of off, 0, or false indicates data fields will not display in outline form. The possible values for this attribute are defined by the XML Schema boolean datatype.
pageOverThenDown (Page Over Then Down)	Specifies a boolean value that indicates how the page fields are laid out when there are multiple PivotFields in the page area. A value of on, 1, or true indicates the fields will display "Over, then down" A value of off, 0, or false indicates the fields will display "down, then Over" The possible values for this attribute are defined by the XML Schema boolean datatype.
pageStyle (Page Header Style Name)	Specifies the name of the style to apply to each of the field item headers in the page area of the PivotTable. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
pageWrap (Page Wrap)	Specifies the number of page fields to display before starting another row or column. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
pivotTableStyle (Table Style Name)	Specifies the name of the style to apply to the main table area of the PivotTable. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
preserveFormatting (Preserve Formatting)	Specifies a boolean value that indicates whether the formatting applied by the user to the PivotTable cells is discarded on refresh. A value of on, 1, or true indicates the formatting applied by the end user is discarded on refresh. A value of off, 0, or false indicates the end-user formatting is retained on refresh. The possible values for this attribute are defined by the XML Schema boolean datatype.
printDrill (Print Drill Indicators)	Specifies a boolean value that indicates whether drill indicators should be printed. A value of on, 1, or true indicates

Attributes	Description
	A value of off, 0, or false indicates The possible values for this attribute are defined by the XML Schema boolean datatype.
published (Data Fields Published)	Specifies a boolean value that indicates whether data fields in the PivotTable are published. A value of on, 1, or true indicates A value of off, 0, or false indicates The possible values for this attribute are defined by the XML Schema boolean datatype.
rowGrandTotals (Row Grand Totals)	Specifies a boolean value that indicates whether grand totals should be displayed for the PivotTable rows. The default value for this attribute is true. A value of on, 1, or true indicates grand totals will be displayed for the PivotTable rows. A value of off, 0, or false indicates grand totals will not be displayed. The possible values for this attribute are defined by the XML Schema boolean datatype.
rowHeaderCaption (Row Header Caption)	Specifies the string to be displayed in row header in `compact` mode. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
showCalcMbrs (Show Calculated Members)	Specifies a boolean value that indicates whether calculated members should be shown in the PivotTable view. This attribute applies to PivotTables from OLAP-sources only. A value of on, 1, or true indicates that calculated members should be shown. A value of off, 0, or false indicates calculated members should not be shown. The possible values for this attribute are defined by the XML Schema boolean datatype.
showDataDropDown (Show Drop Down)	Specifies a boolean value that indicates whether the drop-down lists for the fields in the PivotTable should be hidden. This attribute depends on whether the application implements drop down lists or similar mechanism in the user interface. A value of on, 1, or true indicates drop down lists will be displayed for fields. A value of off, 0, or false indicates drop down lists will not be displayed. The possible values for this attribute are defined by the XML Schema boolean datatype.
showDataTips (Show ToolTips on Data)	Specifies a boolean value that indicates whether tooltips should be displayed for PivotTable data cells.

Attributes	Description
	A value of on, 1, or true indicates tooltips will be displayed. A value of off, 0, or false indicates tooltips will not be displayed. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
showDrill (Show Expand Collapse)	Specifies a boolean value that indicates whether drill indicators should be hidden. A value of on, 1, or true indicates drill indicators will be displayed. A value of off, 0, or false indicates drill indicators will not be displayed. The possible values for this attribute are defined by the XML Schema boolean datatype.
showDropZones (Show Drop Zones)	Specifies a boolean value that indicates whether the PivotTable should display large drop zones when there are no fields in the data region. A value of on, 1, or true indicates a large drop zone will be displayed. A value of off, 0, or false indicates a large drop zone will not be displayed. The possible values for this attribute are defined by the XML Schema boolean datatype.
showEmptyCol (Show Empty Column)	Specifies a boolean value that indicates whether to include empty columns in the table. A value of on, 1, or true indicates empty columns will be included in the PivotTable. A value of off, 0, or false indicates empty columns will be excluded. The possible values for this attribute are defined by the XML Schema boolean datatype.
showEmptyRow (Show Empty Row)	Specifies a boolean value that indicates whether to include empty rows in the table. A value of on, 1, or true indicates empty rows will be included in the PivotTable. A value of off, 0, or false indicates empty rows will be excluded. The possible values for this attribute are defined by the XML Schema boolean datatype.
showError (Show Error)	Specifies a boolean value that indicates whether to show error messages in cells. A value of on, 1, or true indicates error messages will be shown in cells. A value of off, 0, or false indicates error messages will be shown through another mechanism the application provides in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
showHeaders	Specifies a boolean value that indicates whether to suppress display of pivot field

Attributes	Description
(Show Field Headers)	headers. A value of on, 1, or true indicates field headers will be shown in the PivotTable. A value of off, 0, or false indicates field headers will be excluded. The possible values for this attribute are defined by the XML Schema boolean datatype.
showItems (Show Item Names)	Specifies a boolean value that indicates whether to display item names when adding a field onto a PivotTable that has no data fields. A value of on, 1, or true indicates item names will be displayed. A value of off, 0, or false indicates item names will not be displayed. The possible values for this attribute are defined by the XML Schema boolean datatype.
showMemberPropertyTips (Show Member Property ToolTips)	Specifies a boolean value that indicates whether member property information should be omitted from PivotTable tooltips. A value of on, 1, or true indicates member property information will be included. A value of off, 0, or false indicates member property information will be excluded. This attribute depends on whether the application employs tooltips or similar mechanism in the user interface. The possible values for this attribute are defined by the XML Schema boolean datatype.
showMissing (Show Missing)	Specifies a boolean value that indicates whether to show a message in cells with no value. A value of on, 1, or true indicates to show a message string in cells without values. A value of off, 0, or false indicates no message string will shown in cells without values. The possible values for this attribute are defined by the XML Schema boolean datatype.
showMultipleLabel (Show Multiple Labels)	Specifies a boolean value that indicates whether a page field with multiple selected items should display "(multiple items)" instead of "All". This attribute applies only to non-OLAP PivotTables. The messages displayed depend on the application implementation. A value of on, 1, or true indicates a different message string will be displayed for a page field with multiple items. A value of off, 0, or false indicates the same message string will be displayed for all page fields. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
subtotalHiddenItems (Subtotal Hidden Items)	Specifies a boolean value that indicates whether data for hidden pivotItems for PivotFields in the data area should be included in subtotals. A value of on, 1, or true indicates that data for hidden pivot items in the data area will be included in subtotals. A value of off, 0, or false indicates hidden pivot items will not be included in subtotals. The possible values for this attribute are defined by the XML Schema boolean datatype.
tag (PivotTable Custom String)	Specifies a user-defined string that is associated with this PivotTable. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
updatedVersion (PivotTable Last Updated Version)	Specifies the version of the application that last updated the PivotTable view. This attribute is application-dependent. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
useAutoFormatting (Auto Formatting)	Specifies a boolean value that indicates whether auto formatting has been applied to the PivotTable view. A value of on, 1, or true indicates A value of off, 0, or false indicates The possible values for this attribute are defined by the XML Schema boolean datatype.
vacatedStyle (Vacated Style)	Specifies the name of the style to apply to the cells left blank when a PivotTable shrinks during a refresh operation The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
visualTotals (Total Visual Data)	Specifies a boolean value that indicates whether totals should be based on visible data only. This attribute applies to OLAP PivotTables only. A value of on, 1, or true indicates subtotals will be computed on visible data only. A value of off, 0, or false indicates subtotals will be computed on all data. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_pivotTableDefinition">
    <sequence>

```

3.10.1.74 pivotTableStyleInfo (PivotTable Style)

Represent information on style applied to the PivotTable.

[*Example*:

```
<sh:pivotTableStyleInfo name="PivotStyleLight16" showRowHeaders="1"
  showColHeaders="1" showRowStripes="0" showColStripes="0" showLastColumn="1"/>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Attributes	Description

Attributes	Description
name (Table Style Name)	Specifies the name of the table style to use with this table. The possible values for this attribute are defined by the XML Schema string datatype.
showColHeaders (Show Table Style Column Header Formatting)	Specifies a boolean value that indicates whether to show column headers for the table. A value of on, 1, or true indicates column headers will be shown. A value of off, 0, or false indicates column headers will be omitted. 'True' if table style column header formatting should be displayed. The possible values for this attribute are defined by the XML Schema boolean datatype.
showColStripes (Show Column Stripes)	Specifies a boolean value that indicates whether to show column stripe formatting for the table. A value of on, 1, or true indicates column stripe formatting will be shown. A value of off, 0, or false indicates no column formatting will be shown. True if table style column stripe formatting should be displayed. The possible values for this attribute are defined by the XML Schema boolean datatype.
showLastColumn (Show Last Column)	Specifies a boolean value that indicates whether to show the last column. The possible values for this attribute are defined by the XML Schema boolean datatype.
showRowHeaders (Show Row Header Formatting)	Specifies a boolean value that indicates whether to show row headers for the table. A value of on, 1, or true indicates table style formatting will be displayed. A value of off, 0, or false indicates table style formatting will not be displayed. The possible values for this attribute are defined by the XML Schema boolean datatype.
showRowStripes (Show Row Stripes)	Specifies a boolean value that indicates whether to show row stripe formatting for the table. A value of on, 1, or true indicates row stripe formatting will be displayed. A value of off, 0, or false indicates no row formatting will be shown. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotTableStyle">
   <attribute name="name" type="xsd:string"/>
   <attribute name="showRowHeaders" type="xsd:boolean"/>
   <attribute name="showColHeaders" type="xsd:boolean"/>
   <attribute name="showRowStripes" type="xsd:boolean"/>
   <attribute name="showColStripes" type="xsd:boolean"/>
   <attribute name="showLastColumn" type="xsd:boolean" use="optional"/>
</complexType>
```

3.10.1.75 query (Query)

Represents an OLAP sheet data cached query.

Parent Elements
queryCache (§3.10.1.76)

Child Elements	Subclause
tpls (Tuples)	§3.10.1.93

Attributes	Description
mdx (MDX Query String)	Specifies the Multidimensional Expressions (MDX) query string. [*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn2.microsoft.com/en-us/library/ms145595.aspx *end note*] See the MDX Language Reference for more information: The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Query">
   <sequence>
      <element name="tpls" minOccurs="0" type="CT_Tuples"/>
   </sequence>
   <attribute name="mdx" use="required" type="ST_Xstring"/>
</complexType>
```

3.10.1.76 queryCache (OLAP Query Cache)

Represents the cache of OLAP sheet data queries.

Parent Elements

Parent Elements
tupleCache (§3.10.1.94)

Child Elements	Subclause
query (Query)	§3.10.1.75

Attributes	Description
count (Cached Query Count)	Specifies the number of cached queries in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryCache">
   <sequence>
      <element name="query" maxOccurs="unbounded" type="CT_Query"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.77 r (PivotCache Record)

Represents a single record of data in the PivotCache.

[*Example*:

```
<r>
  <s v="3550"/>
  <s v="Road-150 Red, 62"/>
  <s v="This bike is ridden by race winners. Developed with the Adventure Works
    Cycles professional race team, it has a extremely light heat-treated
    aluminum frame, and steering that allows precision control."/>
  <s v="No Discount"/>
  <x v="0"/>
  <s v="Australian Dollar"/>
  <n v="1"/>
  <n v="3578.27"/>
  <n v="0"/>
  <n v="2171.2941999999998"/>
  <n v="3578.27"/>
  <n v="89.456800000000001"/>
</r>
```

end example]

Parent Elements
pivotCacheRecords (§3.10.1.68)

Child Elements	Subclause
b (Boolean)	§3.10.1.2
d (Date Time)	§3.10.1.21
e (Error Value)	§3.10.1.27
m (No Value)	§3.10.1.50
n (Numeric)	§3.10.1.60
s (Character Value)	§3.10.1.85
x (Shared Items Index)	§3.10.1.97

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Record">
   <choice maxOccurs="unbounded">
      <element name="m" type="CT_Missing"/>
      <element name="n" type="CT_Number"/>
      <element name="b" type="CT_Boolean"/>
      <element name="e" type="CT_Error"/>
      <element name="s" type="CT_String"/>
      <element name="d" type="CT_DateTime"/>
      <element name="x" type="CT_Index"/>
   </choice>
</complexType>
```

3.10.1.78 rangePr (Range Grouping Properties)

Represents the collection of range grouping properties.

[*Example*:

```
<rangePr groupBy="months" startDate="2002-01-01T00:00:00"
  endDate="2006-05-06T00:00:00"/>
```

end example]

Parent Elements
fieldGroup (§3.10.1.30)

Attributes	Description
autoEnd (Source Data Ending Range)	Specifies a boolean value that indicates whether the application will use the source data to set the ending range value.

Attributes	Description
	A value of on, 1, or true indicates the ending range value will be set from the source data. A value of off, 0, or false indicates ending range values will be set by the value specified in endDate or endNum. The possible values for this attribute are defined by the XML Schema boolean datatype.
autoStart (Source Data Set Beginning Range)	Specifies a boolean value that indicates whether we use source data to set the beginning range value. A value of on, 1, or true indicates the beginning range value will be set from the source data. A value of off, 0, or false indicates the beginning range value will be set from the value specified in startDate or startNum. The possible values for this attribute are defined by the XML Schema boolean datatype.
endDate (Date Grouping End Value)	Specifies the ending value for date grouping if autoEnd is false. The possible values for this attribute are defined by the XML Schema dateTime datatype.
endNum (Numeric Grouping End Value)	Specifies the ending value for numeric grouping if autoEnd is false. The possible values for this attribute are defined by the XML Schema double datatype.
groupBy (Group By)	Specifies the grouping. The possible values for this attribute are defined by the ST_GroupBy simple type (§3.18.39).
groupInterval (Grouping Interval)	Specifies the grouping interval for numeric range grouping. Specifies the number of days to group by in date range grouping. The possible values for this attribute are defined by the XML Schema double datatype.
startDate (Date Grouping Start Value)	Specifies the starting value for date grouping if autoStart is false. The possible values for this attribute are defined by the XML Schema dateTime datatype.
startNum (Numeric Grouping Start Value)	Specifies the starting value for numeric grouping if autoStart is false. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RangePr">
    <attribute name="autoStart" type="xsd:boolean" default="true"/>
    <attribute name="autoEnd" type="xsd:boolean" default="true"/>
    <attribute name="groupBy" type="ST_GroupBy" default="range"/>
    <attribute name="startNum" type="xsd:double"/>
    <attribute name="endNum" type="xsd:double"/>
    <attribute name="startDate" type="xsd:dateTime"/>
    <attribute name="endDate" type="xsd:dateTime"/>
    <attribute name="groupInterval" type="xsd:double" default="1"/>
</complexType>
```

3.10.1.79 rangeSet (Range Set)

Represents a single range in the rangeSets collection. This complex type is intended to facilitate creating a PivotTable report by consolidating SpreadsheetML ranges that have similar categories of data to be summarized. The simplest layout for the data source is for each rangeSets of data to be in list-like format, with column labels in the first row, row labels in the first column, the rest of the rows having similar items in the same row and column, and no blank rows or columns within the range. A particular rangeSet can consist of a built-in named range that is provided by the application, a user defined named range, a range reference, or a reference to an external workbook.

When multiple ranges are consolidated using this functionality, up to 4 custom report filters (also known as page fields) can be created to help filter the PivotTable report, by specifically enabling one or more of the individual ranges to be selected in the report filter. For each custom page field created, a custom label can be specified and assigned to each range participating in the consolidation range, so that the PivotTable can be filtered by one or more of the ranges being summarized.

[*Example*: Consider a workbook with 6 worksheets. On Sheet1 we have:

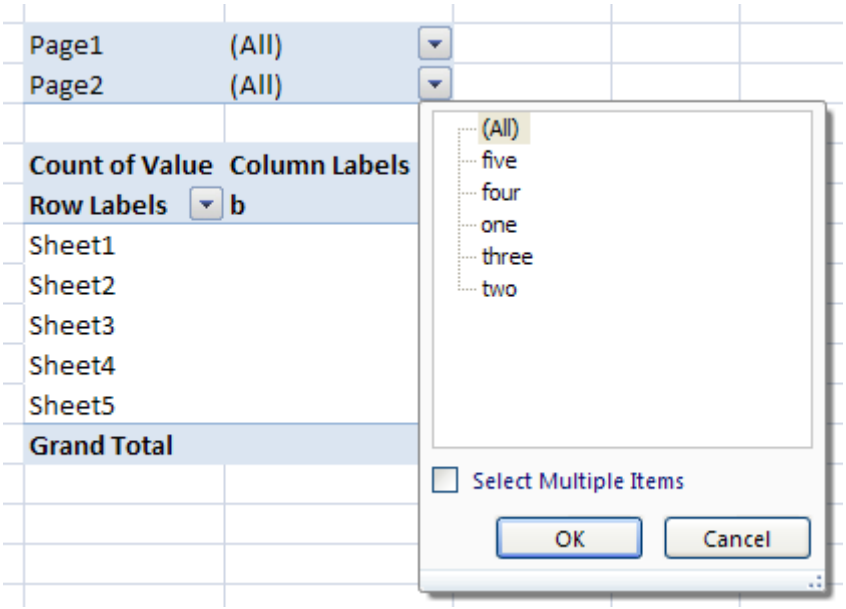
a	b
Sheet1	Sheet1
Sheet1	Sheet1

On Sheet2 we have:

a	b
Sheet2	Sheet2
Sheet2	Sheet2

... and so on up through Sheet5.

On Sheet6, we have the consolidated ranges being summarized by a PivotTable, and two page filters exist for the PivotTable.



Notice that for the second page filter, the items have been assigned a custom label, "one", "two", ..., "five", for each of Sheet1, Sheet2, ..., Sheet5 data sources, respectively. Similarly, the items have been assigned a custom label, "1", "2", ..., "5" for each of Sheet1, Sheet2, ..., Shet5 data sources, respectively.

The XML representing these custom page filters shall be like the following:

```
<cacheSource type="consolidation">
  <consolidation autoPage="0">
    <pages count="2">
      <page count="5">
        <pageItem name="1"/>
        <pageItem name="2"/>
        <pageItem name="3"/>
        <pageItem name="4"/>
        <pageItem name="5"/>
      </page>
      <page count="5">
        <pageItem name="one"/>
        <pageItem name="two"/>
        <pageItem name="three"/>
        <pageItem name="four"/>
        <pageItem name="five"/>
      </page>
    </pages>
```

```
      <rangeSets count="5">
        <rangeSet i1="0" i2="0" ref="A1:B3" sheet="Sheet1"/>
        <rangeSet i1="1" i2="1" ref="A1:B3" sheet="Sheet2"/>
        <rangeSet i1="2" i2="2" ref="A1:B3" sheet="Sheet3"/>
        <rangeSet i1="3" i2="3" ref="A1:B3" sheet="Sheet4"/>
        <rangeSet i1="4" i2="4" ref="A1:B3" sheet="Sheet5"/>
      </rangeSets>
    </consolidation>
  </cacheSource>
```

end example]

[*Note*: Attributes i1, i2, i3, and i4 correspond to custom page fields created in the user interface. Spreadsheet ML only supports 4 custom page fields. *end note*]

Parent Elements
rangeSets (§3.10.1.80)

Attributes	Description
i1 (Field Item Index Page 1)	Specifies the index of a page field item in page filter one. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
i2 (Field Item Index Page 2)	Specifies the index of a page field item in page filter two. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
i3 (Field Item index Page 3)	Specifies the index of a page field item in page filter three. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
i4 (Field Item Index Page 4)	Specifies the index of a page field item in page filter four. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	Specifies the unique identifier of the Workbook part where the range set is stored. See Workbook (§) for more information. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Named Range)	Specifies the named range.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ref (Reference)	Specifies the cell range. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sheet (Sheet Name)	Specifies the sheet name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RangeSet">
   <attribute name="i1" type="xsd:unsignedInt" use="optional"/>
   <attribute name="i2" type="xsd:unsignedInt" use="optional"/>
   <attribute name="i3" type="xsd:unsignedInt" use="optional"/>
   <attribute name="i4" type="xsd:unsignedInt" use="optional"/>
   <attribute name="ref" type="ST_Ref" use="optional"/>
   <attribute name="name" type="ST_Xstring" use="optional"/>
   <attribute name="sheet" type="ST_Xstring" use="optional"/>
   <attribute ref="r:id" use="optional"/>
</complexType>
```

3.10.1.80 rangeSets (Range Sets)

Represents the collection of reference-page items pairs.

Parent Elements
consolidation (§3.10.1.20)

Child Elements	Subclause
rangeSet (Range Set)	§3.10.1.79

Attributes	Description
count (Reference and Page Item Count)	Specifies the number of reference and page items. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RangeSets">
   <sequence>
      <element name="rangeSet" type="CT_RangeSet" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.10.1.81 rowFields (Row Fields)

Represents the collection of row fields for the PivotTable.

	A	B	C
1	Region	(All)	
2			
3	Sum of Sales	Quarter	
4	Sport	Qtr1	Qtr2
5	Golf	8,500	4,500

In the image above, the blue field is a row field. A PivotTable report that has more than one row field has one inner row field (Sport, in the example below), the one closest to the data area. Any other row fields are outer row fields (Region, in the example below). Items in the outermost row field are displayed only once, but items in the rest of the row fields are repeated as needed.

	A	B	C
3	Sum of Sales		Quarter
4	Region	Sport	Qtr1
5	East	Golf	5,000
6		Safari	9,000
7		Tennis	1,500
8	East Total		15,500
9	West	Golf	3,500

In the image above, Region is an outer row field. Sport is an inner row field.

[*Example*:

```
<rowFields count="2">
  <field x="7"/>
  <field x="8"/>
</rowFields>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
field (Field)	§3.10.1.29

Attributes	Description
count (Repeated Items Count)	Specifies the number of repeated items in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RowFields">
   <sequence>
      <element name="field" maxOccurs="unbounded" type="CT_Field"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.10.1.82 rowHierarchiesUsage (Row OLAP Hierarchy References)

Represents the collection of references to OLAP hierarchies on the row axis of a PivotTable.

[*Example*:

```
<sh:rowHierarchiesUsage count="1">
  <sh:rowHierarchyUsage hierarchyUsage="9"/>
</sh:rowHierarchiesUsage>
```

end example]

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
rowHierarchyUsage (Row OLAP Hierarchies)	§3.10.1.83

Attributes	Description
count (Item Count)	Specifies the number of items in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RowHierarchiesUsage">
   <sequence>
      <element name="rowHierarchyUsage" minOccurs="1" maxOccurs="unbounded"
        type="CT_HierarchyUsage"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.83 rowHierarchyUsage (Row OLAP Hierarchies)

Represents a references to an OLAP Hierarchy on the row axis of a PivotTable.

[*Example*:

```
<sh:rowHierarchyUsage hierarchyUsage="9"/>
```

end example]

Parent Elements
rowHierarchiesUsage (§3.10.1.82)

Attributes	Description
hierarchyUsage (Hierarchy Usage)	Specifies the reference to an OLAP hierarchy in a PivotTable. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HierarchyUsage">
   <attribute name="hierarchyUsage" type="xsd:int" use="required"/>
</complexType>
```

3.10.1.84 rowItems (Row Items)

Represents the collection of items in row axis of the PivotTable.

In the SpreadsheetML example below, the item values are found in cells B10:B13. For example "Bikes" is in B10, and corresponds to the first `<i>` element below.

[*Example*:*L*

```
<rowItems count="4">
  <i>
    <x/>
  </i>
```

```
    <i r="1">
      <x/>
    </i>
    <i r="1">
      <x v="1"/>
    </i>
    <i t="grand">
      <x/>
    </i>
  </rowItems>
```

end example]

Looking at the layout of the PivotTable in this example, "Bikes" is the first (and only) item value in the first row, in cell B10. In the XML defining the PivotTable row item values, the first <i> element corresponds to the first row. There is a single index element <x>. The first (and only) <x> element corresponds to the first field on the row axis, namely "Product Category", and an index value of "0" indicates that the 0th item in the items collection for that pivotField definition is how to obtain the item value. Note that "Bikes" isn't explicitly listed as a value here, but instead the 0th item is an index to this field's shared items collection in the pivotCacheDefinition part.

For the second row there are two item values, one item value (Bikes) from the first field in that row (Product Category) and one item value (Mountain Bikes) from the second field in that row (Product Subcategory). In the PivotTable, the first item value "Bikes" is hidden from view. In the XML for this example, the second <i> element expresses both item values for this row. The first item value "Bikes" is expressed implicitly, because the value of @r on the second <i> element is '1', indicating that the first item value from the previous row will be reused again as the first item value for the current row. The second item value is expressed explicitly via the <x> element under the second <i> element. The index of '0' indicates that the 0th item in the <pivotField> element for that field is how to obtain the item value. Note again that the 0th item is itself an index into this field's shared items collection in the pivotCacheDefinition part.

The item values for the third row can be discovered in a similar way.

Parent Elements
pivotTableDefinition (§3.10.1.73)

Child Elements	Subclause
i (Row Items)	§3.10.1.44

Attributes	Description
count (Items in a	Specifies the number of items in the row axis of the PivotTable.

Attributes	Description
Row Count)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_rowItems">
   <sequence>
      <element name="i" maxOccurs="unbounded" type="CT_I"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.85 s (Character Value)

Represents a character value in a PivotTable.

[*Example*:

```
<sharedItems count="2">
  <s v="7527 Brook Way"/>
  <s v="3310 Harvey Way"/>
</sharedItems>
```

end example]

Parent Elements
entries (§3.10.1.28); groupItems (§3.10.1.38); r (§3.10.1.77); sharedItems (§3.10.1.90)

Child Elements	Subclause
tpls (Tuples)	§3.10.1.93
x (Member Property Index)	§3.10.1.96

Attributes	Description
b (Bold)	Specifies a boolean value that indicates whether this value contains bold formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains bold formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
bc (Background Color)	Specifies the background color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.

Attributes	Description
	The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
c (Item Caption)	Specifies the caption for the this item. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
cp (Member Property Count)	Specifies the number of member property values. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
f (Calculated Item)	Specifies a boolean value that indicates whether this is a calculated item value. A value of on, 1, or true indicates this item is a calculated value. A value of off, 0, or false indicates this item is not a calculated value. The possible values for this attribute are defined by the XML Schema boolean datatype.
fc (Foreground Color)	Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space. The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§3.18.86).
i (Italic)	Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains italic formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
in (Format Index)	Specifies the index to the OLAP serverformat element where the format string for this entry is stored. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
st (Strikethrough)	Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains strikethrough formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
u (Unused Item)	Specifies a boolean value that indicates whether this is an unused item. The application

Attributes	Description
	marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached. A value of on, 1, or true indicates this item is unused. A value of off, 0, or false indicates this item is used. The possible values for this attribute are defined by the XML Schema boolean datatype.
un (Underline)	Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only. A value of on, 1, or true indicates this value contains underline formatting on the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
v (Value)	Specifies the value of the item. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
   <sequence>
      <element name="tpls" minOccurs="0" maxOccurs="unbounded" type="CT_Tuples"/>
      <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_X"/>
   </sequence>
   <attribute name="v" use="required" type="ST_Xstring"/>
   <attribute name="u" type="xsd:boolean"/>
   <attribute name="f" type="xsd:boolean"/>
   <attribute name="c" type="ST_Xstring"/>
   <attribute name="cp" type="xsd:unsignedInt"/>
   <attribute name="in" type="xsd:unsignedInt" use="optional"/>
   <attribute name="bc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="fc" type="ST_UnsignedIntHex" use="optional"/>
   <attribute name="i" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="un" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="st" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="b" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.86 serverFormat (Server Format)

Represents the numeric format specified by the OLAP server for a tuple.

Parent Elements
serverFormats (§3.10.1.87)

Attributes	Description
culture (Culture)	Specifies a language used to determine the currency symbol to display for currency values. For example, if the culture is "en-us", the values in the application will format the values with a dollar sign. If the culture is "fr-fr" the application will format the values with a euro sign. This value conforms to the language tagging conventions of RFC 3066 and later. The pattern <language>-<REGION> is used, e.g., "en-us" or "fr-fr". The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
format (Format)	Specifies the format string to use for all other numeric values. This string is supplied by the OLAP server. Therefore, the syntax for reading the format string depends on the server implementation. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ServerFormat">
   <attribute name="culture" use="optional" type="ST_Xstring"/>
   <attribute name="format" use="optional" type="ST_Xstring"/>
</complexType>
```

3.10.1.87 serverFormats (Server Formats)

Represents the collection of numeric and currency formats specified by the OLAP server for a tuple

Parent Elements
tupleCache (§3.10.1.94)

Child Elements	Subclause
serverFormat (Server Format)	§3.10.1.86

Attributes	Description
count (Format Count)	Specifies the number of formats in the collection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ServerFormats">
   <sequence>
      <element name="serverFormat" type="CT_ServerFormat" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.88 set (OLAP Set)

Represents an OLAP sheet data set or tuple set. The set is defined by a Multidimensional Expressions (MDX) query that specifies criteria for the dimension members that belong to the set.

For example, the following MDX expression defines the set for the 10 salespersons with the lowest sales:

BottomCount([Salesperson].[Salesperson Name].Members,10,[Measures].[Sales])

The MDX expression is specified in the setDefinition attribute.

Parent Elements
sets (§3.10.1.89)

Child Elements	Subclause
sortByTuple (Sort By Tuple)	§3.10.1.91
tpls (Tuples)	§3.10.1.93

Attributes	Description
count (Number of Tuples)	Specifies the number of tuples in the set. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
maxRank (Maximum Rank Requested)	Specifies the largest rank entry the user has requested. The possible values for this attribute are defined by the XML Schema int datatype.
queryFailed (Query Failed)	Specifies a boolean value that indicates whether querying on this set failed. A value of on, 1, or true indicates a query against this set failed. A value of off, 0, or false indicates a query against this set succeeded. The possible values for this attribute are defined by the XML Schema boolean datatype.
setDefinition (MDX	Specifies the Multidimensional Expressions (MDX) set definition.

Attributes	Description
Set Definition)	[*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn2.microsoft.com/en-us/library/ms145595.aspx *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
sortType (Set Sort Order)	Specifies the sort order of the set. The possible values for this attribute are defined by the ST_SortType simple type (§3.18.76).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Set">
   <sequence>
      <element name="tpls" minOccurs="0" maxOccurs="unbounded" type="CT_Tuples"/>
      <element name="sortByTuple" minOccurs="0" type="CT_Tuples"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
   <attribute name="maxRank" use="required" type="xsd:int"/>
   <attribute name="setDefinition" use="required" type="ST_Xstring"/>
   <attribute name="sortType" type="ST_SortType" default="none"/>
   <attribute name="queryFailed" type="xsd:boolean" default="false"/>
</complexType>
```

3.10.1.89 sets (Sets)

Represents the collection of OLAP sheet data entries or tuple sets.

Parent Elements
tupleCache (§3.10.1.94)

Child Elements	Subclause
set (OLAP Set)	§3.10.1.88

Attributes	Description
count (Tuple Set Count)	Specifies the number of tuple sets. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Sets">
   <sequence>
      <element name="set" maxOccurs="unbounded" type="CT_Set"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.10.1.90 sharedItems (Shared Items)

Represents the collection of unique items for a field in the PivotCacheDefinition. The sharedItems complex type stores data type and formatting information about the data in a field. Items in the PivotCacheDefinition can be shared in order to reduce the redundancy of those values that are referenced in multiple places across all the PivotTable parts. For example, a value might be part of a filter, it might appear on a row or column axis, and will appear in the pivotCacheRecords definition as well. However, because of the performance cost of creating the optimized shared items, items are only shared if they are actually in use in the PivotTable. Therefore, depending on user actions on the PivotTable layout, the pivotCacheDefinition and underlying PivotCacheRecords part may be updated.

If there are no shared items, then field values are stored directly in the pivotCacheRecords part.

[*Example*:

```
<sharedItems count="1">
  <s v="[Customer].[Customer Geography].[Country].&amp;[United States]"
    c="United States"/>
</sharedItems>
```

end example]

The following attributes are not required or validated if there are no items in sharedItems.

- containsBlank
- containsSemiMixedTypes
- containsMixedTypes
- longText

The following attributes not validated unless there is more than one item in sharedItems or the one and only item is not a blank item. If the first item is a blank item the data type the field cannot be verified.

- containsNumber
- containsDates
- containsString
- containsInteger

The following attributes are not validated and can be omitted without loss of functionality.

- containsNonDate
- count

The following attributes are not required and can be omitted. However, refreshing the PivotTable could produce different groupings than before.

- maxDate
- minDate
- maxValue
- minValue

Note: validation is performed to ensure that “date” attributes are not mixed with “value” attributes.

Parent Elements
cacheField (§3.10.1.3)

Child Elements	Subclause
b (Boolean)	§3.10.1.2
d (Date Time)	§3.10.1.21
e (Error Value)	§3.10.1.27
m (No Value)	§3.10.1.50
n (Numeric)	§3.10.1.60
s (Character Value)	§3.10.1.85

Attributes	Description
containsBlank (Contains Blank)	Specifies a boolean value that indicates whether this field contains a blank value. A value of on, 1, or true indicates this field contains one or more blank values. A value of off, 0, or false indicates this field does not contain blank values. The possible values for this attribute are defined by the XML Schema boolean datatype.
containsDate (Contains Date)	Specifies a boolean value that indicates that the field contains at least one date. A value of on, 1, or true indicates the field contains at least one date value. A value of off, 0, or false indicates the field does not contain any date values. The possible values for this attribute are defined by the XML Schema boolean datatype.
containsInteger (Contains Integer)	Specifies a boolean value that indicates whether this field contains integer values.

Attributes	Description
	A value of on, 1, or true indicates this field contains integer values. A value of off, 0, or false indicates non-integer or mixed values. The possible values for this attribute are defined by the XML Schema boolean datatype.
containsMixedTypes (Contains Mixed Data Types)	Specifies a boolean value that indicates whether this field contains more than one data type. A value of on, 1, or true indicates this field contains more than one data type. A value of off, 0, or false indicates contains only one data type. The field may still contain blank values. The possible values for this attribute are defined by the XML Schema boolean datatype.
containsNonDate (Contains Non Date)	Specifies a boolean value that indicates that the field contains at least one value that is not a date. A value of on, 1, or true indicates the field contains at least one non-date values. A value of off, 0, or false indicates this field contains no date fields. The possible values for this attribute are defined by the XML Schema boolean datatype.
containsNumber (Contains Numbers)	Specifies a boolean value that indicates whether this field contains numeric values. A value of on, 1, or true indicates this field contains at least one numeric value. A value of off, 0, or false indicates this field contains no numeric values. The possible values for this attribute are defined by the XML Schema boolean datatype.
containsSemiMixedTypes (Contains Semi Mixed Data Types)	Specifies a boolean value that indicates that this field contains text values. The field may also contain a mix of other data type and blank values. A value of on, 1, or true indicates at least one text value, and may also contain a mix of other data types and blank values. A value of off, 0, or false indicates the field does not have a mix of text and other values. The possible values for this attribute are defined by the XML Schema boolean datatype.
containsString (Contains String)	Specifies a boolean value that indicates whether this field contains a text value. A value of on, 1, or true indicates this field contains at least one text value. A value of off, 0, or false indicates this field does not contain any text values.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
count (Shared Items Count)	Specifies the number of shared items to load for this field. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
longText (Long Text)	Specifies a boolean value that indicates whether this field contains a long text value. A string is considered long if it is over 255 characters. A value of on, 1, or true indicates the value contains more than 255 characters of text. A value of off, 0, or false indicates the value contains less than 255 characters. [*Note*: This is used as many legacy spreadsheet application support a limit of 255 characters for text values. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
maxDate (Maximum Date Time Value)	Specifies the maximum date/time value found in a date field. The possible values for this attribute are defined by the XML Schema dateTime datatype.
maxValue (Maximum Numeric Value)	Specifies the maximum numeric value found in a numeric field. The possible values for this attribute are defined by the XML Schema double datatype.
minDate (Minimum Date Time)	Specifies the minimum date/time value found in a date field. The possible values for this attribute are defined by the XML Schema dateTime datatype.
minValue (Minimum Numeric Value)	Specifies the minimum numeric value found in a numeric field. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SharedItems">
   <choice minOccurs="0" maxOccurs="unbounded">
      <element name="m" type="CT_Missing" minOccurs="1" maxOccurs="1"/>
      <element name="n" type="CT_Number" minOccurs="1" maxOccurs="1"/>
      <element name="b" type="CT_Boolean" minOccurs="1" maxOccurs="1"/>
      <element name="e" type="CT_Error" minOccurs="1" maxOccurs="1"/>
      <element name="s" type="CT_String" minOccurs="1" maxOccurs="1"/>
      <element name="d" type="CT_DateTime" minOccurs="1" maxOccurs="1"/>
   </choice>
   <attribute name="containsSemiMixedTypes" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="containsNonDate" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="containsDate" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="containsString" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="containsBlank" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="containsMixedTypes" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="containsNumber" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="containsInteger" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="minValue" type="xsd:double" use="optional"/>
   <attribute name="maxValue" type="xsd:double" use="optional"/>
   <attribute name="minDate" type="xsd:dateTime" use="optional"/>
   <attribute name="maxDate" type="xsd:dateTime" use="optional"/>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
   <attribute name="longText" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.10.1.91 sortByTuple (Sort By Tuple)

Represents the sort applied to a tuple.

Parent Elements
set (§3.10.1.88)

Child Elements	Subclause
tpl (Tuple)	§3.10.1.92

Attributes	Description
c (Member Name Count)	Specifies the number of member names. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tuples">
   <sequence>
      <element name="tpl" type="CT_Tuple" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="c" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.10.1.92 tpl (Tuple)

Represents an OLAP sheet data entry member.

Parent Elements
sortByTuple (§3.10.1.91); tpls (§3.10.1.93)

Attributes	Description
fld (Field Index)	Specifies the index of the field to which the member belongs. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
hier (Hierarchy Index)	Specified the index of the hierarchy to which the member belongs. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
item (Item Index)	Specifies the index of the item in the field that represents this item. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tuple">
   <attribute name="fld" type="xsd:unsignedInt"/>
   <attribute name="hier" type="xsd:unsignedInt"/>
   <attribute name="item" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.10.1.93 tpls (Tuples)

Represents members for the OLAP sheet data entry, also known as a tuple.

Parent Elements
e (§3.10.1.27); m (§3.10.1.50); n (§3.10.1.60); query (§3.10.1.75); s (§3.10.1.85); set (§3.10.1.88)

Child Elements	Subclause

Child Elements	Subclause
tpl (Tuple)	§3.10.1.92

Attributes	Description
c (Member Name Count)	Specifies the number of member names. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tuples">
   <sequence>
      <element name="tpl" type="CT_Tuple" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="c" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.10.1.94 tupleCache (Tuple Cache)

Represents the cache of OLAP sheet data members, or tuples.

Parent Elements
pivotCacheDefinition (§3.10.1.67)

Child Elements	Subclause
entries (Entries)	§3.10.1.28
extLst (Future Feature Data Storage Area)	§3.2.10
queryCache (OLAP Query Cache)	§3.10.1.76
serverFormats (Server Formats)	§3.10.1.87
sets (Sets)	§3.10.1.89

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TupleCache">
   <sequence>
      <element name="entries" minOccurs="0" type="CT_PCDSDTCEntries"/>
      <element name="sets" minOccurs="0" type="CT_Sets"/>
      <element name="queryCache" minOccurs="0" type="CT_QueryCache"/>
      <element name="serverFormats" minOccurs="0" maxOccurs="1" type="CT_ServerFormats"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
</complexType>
```

3.10.1.95 worksheetSource (Worksheet PivotCache Source)

Represents the location of the source of the data that is stored in the cache.

[*Example*:

```
<cacheSource type="worksheet">
  <worksheetSource name="Table1" r:id="rId2"/>
</cacheSource>
```

end example]

Parent Elements
cacheSource (§3.10.1.7)

Attributes	Description
id (Relationship Id) Namespace: .../officeDocument/2006/relationships	Specifies the identifier to the Sheet part whose data is stored in the cache. See the Sheet section (§3.2) for more information. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Named Range)	Specifies the named range that is the source of the data. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ref (Reference)	Specifies the reference that defines a cell range that is the source of the data. This attribute depends on how the application implements cell references. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sheet (Sheet Name)	Specifies the name of the sheet that is the source for the cached data. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WorksheetSource">
   <attribute name="ref" type="ST_Ref" use="optional"/>
   <attribute name="name" type="ST_Xstring" use="optional"/>
   <attribute name="sheet" type="ST_Xstring" use="optional"/>
   <attribute ref="r:id" use="optional"/>
</complexType>
```

3.10.1.96 x (Member Property Index)

Represents an array of indexes to cached member property values.

Parent Elements
b (§3.10.1.2); d (§3.10.1.21); e (§3.10.1.27); i (§3.10.1.44); m (§3.10.1.50); n (§3.10.1.60); s (§3.10.1.85)

Attributes	Description
v (Shared Items Index)	Specifies the index into the shared items table in the PivotCache that identifies this item. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_X">
   <attribute name="v" type="xsd:int" default="0"/>
</complexType>
```

3.10.1.97 x (Shared Items Index)

This element represents an array of indexes to cached shared item values

Parent Elements
discretePr (§3.10.1.26); r (§3.10.1.77); reference (§3.10.2.1); tables (§3.13.9)

Attributes	Description
v (Shared Items Index)	Specifies the index into the shared items table in the PivotCache that identifies this item. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Index">
   <attribute name="v" use="required" type="xsd:unsignedInt"/>
</complexType>
```

3.10.2 Shared Pivot Table Data

This section defines the part where shared PivotTable data is stored.

3.10.2.1 reference (Reference)

Represents a set of selected fields and selected items within those fields.

[*Example*:

```
<sh:reference field="4294967294" count="1" selected="0">
  <sh:x v="0"/>
</sh:reference>
```

end example]

Parent Elements
references (§3.10.2.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
x (Shared Items Index)	§3.10.1.97

Attributes	Description
avgSubtotal (Include Average Filter)	Specifies a boolean value that indicates whether the 'average' aggregate function is included in the filter. A value of on, 1, or true indicates the average aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
byPosition (Positional Reference)	Specifies a boolean value that indicates whether the item is referred to by position rather than item index. A value of on, 1, or true indicates the item is referred to by position. A value of off, 0, or false indicates the item is referred to by index. The possible values for this attribute are defined by the XML Schema boolean datatype.
count (Item Index Count)	Specifies the number of item indexes in the collection of indexes (x tags). The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
countASubtotal (Include CountA Filter)	Specifies a boolean value that indicates whether the 'countA' subtotal is included in the filter. A value of on, 1, or true indicates the count aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
countSubtotal (Include Count	Specifies a boolean value that indicates whether the count aggregate function is included in the filter.

Attributes	Description
Subtotal)	A value of on, 1, or true indicates the count aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
defaultSubtotal (Include Default Filter)	Specifies a boolean value that indicates whether the default subtotal is included in the filter. A value of on, 1, or true indicates the default subtotal will is included in the filter. The default is to display the total or the grand total. A value of off, 0, or false indicates another subtotal or aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
field (Field Index)	Specifies the index of the field to which this filter refers. A value of -2 indicates the 'data' field. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
maxSubtotal (Include Maximum Filter)	Specifies a boolean value that indicates whether the 'maximum' aggregate function is included in the filter. A value of on, 1, or true indicates the maximum aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
minSubtotal (Include Minimum Filter)	Specifies a boolean value that indicates whether the 'minimum' aggregate function is included in the filter. A value of on, 1, or true indicates the minimum aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
productSubtotal (Include Product Filter)	Specifies a boolean value that indicates whether the 'product' aggregate function is included in the filter. A value of on, 1, or true indicates the product aggregation function will is included in the

Attributes	Description
	filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
relative (Relative Reference)	Specifies a boolean value that indicates whether the item is referred to by a relative reference rather than an absolute reference. This attribute is used if posRef is set to true. A value of on, 1, or true indicates the item is referred to by a relative reference. A value of off, 0, or false indicates the item is referred to by an absolute reference. The possible values for this attribute are defined by the XML Schema boolean datatype.
selected (Selected)	Specifies a boolean value that indicates whether this field has selection. This attribute is used when the PivotTable is in Outline view. It is also used when both header and data cells have selection. A value of on, 1, or true indicates the field has selection. A value of off, 0, or false indicates the field does not have selection. The possible values for this attribute are defined by the XML Schema boolean datatype.
stdDevPSubtotal (Include StdDevP Filter)	Specifies a boolean value that indicates whether the population standard deviation aggregate function is included in the filter. A value of on, 1, or true indicates the population standard deviation aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
stdDevSubtotal (Include StdDev Filter)	Specifies a boolean value that indicates whether the standard deviation aggregate function is included in the filter. A value of on, 1, or true indicates the standard deviation aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
sumSubtotal (Include Sum Filter)	Specifies a boolean value that indicates whether the sum aggregate function is included in the filter.

Attributes	Description
	A value of on, 1, or true indicates the sum aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
varPSubtotal (Include VarP Filter)	Specifies a boolean value that indicates whether the population variance aggregate function is included in the filter. A value of on, 1, or true indicates the population variance aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.
varSubtotal (Include Var Filter)	Specifies a boolean value that indicates whether the variance aggregate function is included in the filter. A value of on, 1, or true indicates the variance aggregation function will is included in the filter. A value of off, 0, or false indicates another aggregation function is included in the filter. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotAreaReference">
   <sequence>
      <element name="x" minOccurs="0" maxOccurs="unbounded" type="CT_Index"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="field" use="optional" type="xsd:unsignedInt"/>
   <attribute name="count" type="xsd:unsignedInt"/>
   <attribute name="selected" type="xsd:boolean" default="true"/>
   <attribute name="byPosition" type="xsd:boolean" default="false"/>
   <attribute name="relative" type="xsd:boolean" default="false"/>
   <attribute name="defaultSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="sumSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="countASubtotal" type="xsd:boolean" default="false"/>
   <attribute name="avgSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="maxSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="minSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="productSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="countSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="stdDevSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="stdDevPSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="varSubtotal" type="xsd:boolean" default="false"/>
   <attribute name="varPSubtotal" type="xsd:boolean" default="false"/>
</complexType>
```

3.10.2.2 references (References)

Represents the set of selected fields and the selected items within those fields.

[*Example*:

```
<sh:references count="5">
  <sh:reference field="4294967294" count="1" selected="0">
    <sh:x v="0"/>
  </sh:reference>
  <sh:reference field="2" count="1" selected="0">
    <sh:x v="0"/>
  </sh:reference>
  <sh:reference field="14" count="1" selected="0">
    <sh:x v="0"/>
  </sh:reference>
  <sh:reference field="15" count="2" selected="0">
    <sh:x v="2"/>
    <sh:x v="3"/>
  </sh:reference>
</sh:references>
```

end example]

Parent Elements
pivotArea (§3.3.1.66)

Child Elements	Subclause
reference (Reference)	§3.10.2.1

Attributes	Description
count (Pivot Filter Count)	Specifies the number of filtered records available in the PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotAreaReferences">
   <sequence>
      <element name="reference" maxOccurs="unbounded" type="CT_PivotAreaReference"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt"/>
</complexType>
```

3.11 Shared Workbook Data

The Shared Workbooks architecture enables a spreadsheet application to record revisions made to a workbook (e.g., track changes), and is designed to enable either single, or multiple users editing the same workbook at the same time. Therefore the application needs to support the ability to read changes made by another user and update it's own state of the same workbook with those changes, even when those changes are made concurrently with other changes made by other users. Inevitably there will be conflicts, and therefore merge conflict resolution should be supported the runtime application. The file format only contains enough information so that the spreadsheet application can deal with conflicts, and can undo/redo changes from the change history at run time.

3.11.1 Shared Workbook Data

Within a shared workbook, the changes made to the spreadsheet at runtime are persisted as sets of different revisions collectively forming a revision history. These are persisted to the file on disk during a save event, and are saved in different xml parts known as revision logs. There is a headers table xml part that summarizes when changes were made, who made them, and it lists the relationship from each header to the individual revision log that records the specific changes.

[*Example*: This example shows the header and revision log for two simple events: adding text to a cell, and inserting a new sheet.

First, take a look at the header table, and revision log:

```
<headers xmlns="…" xmlns:r="…" guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}">
  <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
    dateTime="2006-07-14T13:42:54" maxSheetId="4" userName="UserName"
    r:id="rId1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
</headers>
```

And the revision log is essentially empty:

```
<revisions xmlns="…" xmlns:r="…"/>
```

Now, after inserting the text "foo" into cell A1, and saving, the header looks like this:

```
<headers xmlns="…" xmlns:r="…" guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
  diskRevisions="1" revisionId="1" version="2">
  <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
    dateTime="2006-07-14T13:42:54" maxSheetId="4" userName="UserName"
    r:id="rId1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
  <header guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
    dateTime="2006-07-14T13:44:40" maxSheetId="4" userName="UserName"
    r:id="rId2" minRId="1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
</headers>
```

A new header entry is added, with a GUID and a revision ID (rId2) that specifies which log to look into to see the details about the revision.

The old log is saved, and the newly created log (corresponding to rId2) now looks like this:

```
<revisions xmlns="…" xmlns:r="…">
  <rcc rId="1" sId="1">
    <nc r="A1" t="inlineStr">
      <is>
        <t>foo</t>
        <phoneticPr fontId="0"/>
      </is>
    </nc>
  </rcc>
</revisions>
```

The log shows that the contents of a cell were revised, and the new cell contents is text containg "foo" as the string.

After inserting a new sheet, the header looks like this:

```
<headers xmlns="…" xmlns:r="…" guid="{7E1DAFA8-EF95-4865-8FE8-CC17B28635CF}"
  diskRevisions="1" revisionId="2" version="3">
  <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
    dateTime="2006-07-14T13:42:54" maxSheetId="4"
    userName="UserName" r:id="rId1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
  <header guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
    dateTime="2006-07-14T13:44:40" maxSheetId="4" userName="UserName"
    r:id="rId2" minRId="1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
  <header guid="{7E1DAFA8-EF95-4865-8FE8-CC17B28635CF}"
    dateTime="2006-07-14T13:48:56" maxSheetId="5" userName="UserName"
    r:id="rId3" minRId="2">
```

```
      <sheetIdMap count="4">
        <sheetId val="1"/>
        <sheetId val="2"/>
        <sheetId val="3"/>
        <sheetId val="4"/>
      </sheetIdMap>
    </header>
  </headers>
```

You can see that the last, most recent, header entry shows an entry for the new sheet. The most recent log looks like this:

```
  <revisions xmlns="…" xmlns:r="…">
    <ris rId="2" sheetId="4" name="[shared example.xlsx]Sheet4"
      sheetPosition="3"/>
    <rcv guid="{841DBE00-ECD0-478E-893B-30CE5DABBEF5}" action="delete"/>
    <rcv guid="{841DBE00-ECD0-478E-893B-30CE5DABBEF5}" action="add"/>
  </revisions>
```

This shows the new sheet, sheetId 4, is added to the workbook. The custom view (rcv) for the user is updated as a new sheet was added.

end example]

3.11.1.1 header (Header)

This element is essentially a table that contains metadata about a list of specific changes that have taken place for this workbook. It lists when the changes were made, who made them, and the relationship IDs so that the log detailing the specific change can be found. If tracking changes, or sharing workbooks, are enabled, then changes are persisted on the Save event, or at a specified time interval. A header is created for each set of changes.

Parent Elements
Root element of SpreadsheetML Shared Workbook Revision Headers partheaders (§3.11.1.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
reviewedList (Reviewed List)	§3.11.1.15
sheetIdMap (Sheet Id Map)	§3.11.1.24

Attributes	Description
dateTime (Date	The date and time when this set of revisions was saved.

Attributes	Description
Time)	Note: This can happen when the user explicitly saves, or the save can occur due to a time interval, specified in the spreadsheet application, elapsing. The possible values for this attribute are defined by the XML Schema dateTime datatype.
guid (GUID)	A globally unique identifier for this set of revisions. The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
id (Relationship ID) Namespace: .../officeDocument/2006/relationships	This is the ID that is used to find the corresponding log record of the changes made for this header. Use the corresponding relationship expressed in the revisionHeaders part to locate the log record that lists the specific changes. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
maxRId (Max Revision Id)	The highest revision Id that belongs to this header. Note: this can be used when, given a revision ID, the spreadsheet application needs to determine which revision log to access. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
maxSheetId (Last Sheet Id)	Internal identifier of the next available sheet in this workbook. Note: the numbering here should be the index of the next available sheet in the workbook in a 1-based index system. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
minRId (Minimum Revision Id)	The lowest revision id that belongs to this header. Note: this can be used when, given a revision ID, the spreadsheet application needs to determine which revision log to access. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
userName (User Name)	A string representing the name of the user making the revision.. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionHeader">
   <sequence>
      <element name="sheetIdMap" minOccurs="1" maxOccurs="1" type="CT_SheetIdMap"/>
      <element name="reviewedList" minOccurs="0" maxOccurs="1" type="CT_ReviewedRevisions"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="guid" type="ST_Guid" use="required"/>
   <attribute name="dateTime" type="xsd:dateTime" use="required"/>
   <attribute name="maxSheetId" type="xsd:unsignedInt" use="required"/>
   <attribute name="userName" type="ST_Xstring" use="required"/>
   <attribute ref="r:id" use="required"/>
   <attribute name="minRId" type="xsd:unsignedInt" use="optional"/>
   <attribute name="maxRId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.11.1.2 headers (Revision Headers)

This element represents the list of revision headers.

This section contains many references to history, versions, and revisions, and it is helpful to clarify the relationships here. In general, a series of changes (revisions) can be made to a spreadsheet. When a batch of those revisions is saved to disk, the version number of the spreadsheet is incremented. The batch of changes is saved to the revision history, which is persisted on disk with the file in the form of different log files and headers.

There are some attributes that deal with history which may seem redundant (such as `diskRevisions`, and `history`, among others) - these are there for backwards compatibility with older versions of spreadsheet applications and do not need to be used for creating new files.

Child Elements	Subclause
header (Header)	§3.11.1.1

Attributes	Description
diskRevisions (Disk Revisions)	A Boolean value indicating that this shared workbook file contains revisions. `True` when the workbook does have revisions, `false` otherwise. [*Note*: this attribute is used for backwards compatibility. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
exclusive (Exclusive Mode)	A Boolean value indicating that this shared workbook is in exclusive mode. A workbook is in exclusive mode when a user has a lock on it for appending revisions to the file. [*Note*: This is used for backwards compatibility with older spreadsheet applications. *end*

Attributes	Description
	note] The possible values for this attribute are defined by the XML Schema boolean datatype.
guid (Last Revision GUID)	The globally unique identifier of the last set of revisions. This shall match the GUID for the most recent header. The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
history (History)	A Boolean value indicating that this shared workbook maintains a revision history. True if a history is maintained, false otherwise. [*Note*: This is used for backwards compatibility with older spreadsheet applications. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
keepChangeHistory (Keep Change History)	A Boolean value indicating whether the revision history should be kept for this shared workbook. True if the history should be kept, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
lastGuid (Last GUID)	Unique identifier of the last set of revisions that was saved into the file. Note: The spreadsheet application may have certain modes, such as a timed save mode, where the application doesn't do a full save, but instead just appends the most recent revision records. In cases like this, for a new user that opens such a file while it is being edited, the file that was loaded from disk will only have the changes that were saved during a full save. To get the current state of the file which includes edits by other users, the spreadsheet application would need to apply all the revisions from `lastGuid` to `guid`. The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
preserveHistory (Preserve History)	An integer representing the number of days the spreadsheet application will keep the change history for this workbook. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
protected (Protected)	A Boolean value indicating whether the change tracking in this shared workbook can be removed. True if the tracking can be removed, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
revisionId (Revision Id)	The current revision number of this shared workbook. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
shared (Shared Workbook)	A Boolean value indicating that this workbook is shared. True when the workbook is shared, false otherwise.

Attributes	Description
	[*Note*: This is used for backwards compatibility with older spreadsheet applications. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
trackRevisions (Track Revisions)	A Boolean value indicating that revisions are tracked in this shared workbook. True when revisions are tracked, false otherwise. [*Note*: This is used for backwards compatibility with older spreadsheet applications. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
version (Version)	An integer representing the current version of this shared workbook. The integer should begin counting from 1 for the first version. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionHeaders">
    <sequence>
        <element name="header" type="CT_RevisionHeader" minOccurs="1" maxOccurs="unbounded"/>
    </sequence>
    <attribute name="guid" type="ST_Guid" use="required"/>
    <attribute name="lastGuid" type="ST_Guid" use="optional"/>
    <attribute name="shared" type="xsd:boolean" default="true"/>
    <attribute name="diskRevisions" type="xsd:boolean" default="false"/>
    <attribute name="history" type="xsd:boolean" default="true"/>
    <attribute name="trackRevisions" type="xsd:boolean" default="true"/>
    <attribute name="exclusive" type="xsd:boolean" default="false"/>
    <attribute name="revisionId" type="xsd:unsignedInt" default="0"/>
    <attribute name="version" type="xsd:int" default="1"/>
    <attribute name="keepChangeHistory" type="xsd:boolean" use="optional" default="true"/>
    <attribute name="protected" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="preserveHistory" type="xsd:unsignedInt" default="30"/>
</complexType>
```

3.11.1.3 nc (New Cell Data)

This element represents new cell data that was added to the worksheet.

For most spreadsheet application purposes, only the data type and reference will need to be used for revision tracking purposes. The rest of the cell properties can be written out, but are not necessarily needed as they can be recorded in other areas of the spreadsheet. For instance the <rfmt> element can be used to record style information instead of the `S (style index)` attribute.

Parent Elements

Parent Elements
rcc (§3.11.1.9)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
f (Formula)	§3.3.1.37
is (Rich Text Inline)	§3.3.1.50
v (Cell Value)	§3.3.1.93

Attributes	Description
cm (Cell Metadata Index)	The zero-based index of the cell metadata record associated with this cell. Metadata information is found in the Metadata Part. Cell metadata is extra information stored at the cell level, and is attached to the cell (travels through moves, copy / paste, clear, etc). Cell metadata is not accessible via formula reference. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ph (Show Phonetic)	A Boolean value indicating if the spreadsheet application should show phonetic information. Phonetic information is displayed in the same cell across the top of the cell and serves as a 'hint' which indicates how the text should be pronounced. This should only be used for East Asian languages. The possible values for this attribute are defined by the XML Schema boolean datatype.
r (Reference)	An A1 style reference to the location of this cell The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
s (Style Index)	The index of this cell's style. Style records are stored in the Styles Part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
t (Cell Data Type)	An enumeration representing the cell's data type. The possible values for this attribute are defined by the ST_CellType simple type (§3.18.12).
vm (Value Metadata Index)	The zero-based index of the value metadata record associated with this cell's value. Metadata records are stored in the Metadata Part. Value metadata is extra information stored at the cell level, but associated with the value rather than the cell itself. Value metadata is accessible via formula reference. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cell">
   <sequence>
      <element name="f" type="CT_CellFormula" minOccurs="0" maxOccurs="1"/>
      <element name="v" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="is" type="CT_Rst" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="r" type="ST_CellRef" use="optional"/>
   <attribute name="s" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="t" type="ST_CellType" use="optional" default="n"/>
   <attribute name="cm" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="vm" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="ph" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.11.1.4 ndxf (New Formatting Information)

This element represents new differential formatting information for this cell. This formatting is applied to the existing formatting of the cell.

Parent Elements
rcc (§3.11.1.9)

Child Elements	Subclause
alignment (Alignment)	§3.8.1
border (Border)	§3.8.4
extLst (Future Feature Data Storage Area)	§3.2.10
fill (Fill)	§3.8.19
font (Font)	§3.8.21
numFmt (Number Format)	§3.8.30
protection (Protection Properties)	§3.8.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dxf">
   <sequence>
      <element name="font" type="CT_Font" minOccurs="0" maxOccurs="1"/>
      <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="1"/>
      <element name="fill" type="CT_Fill" minOccurs="0" maxOccurs="1"/>
      <element name="alignment" type="CT_CellAlignment" minOccurs="0" maxOccurs="1"/>
      <element name="border" type="CT_Border" minOccurs="0" maxOccurs="1"/>
      <element name="protection" type="CT_CellProtection" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.11.1.5 oc (Old Cell Data)

This element represents old cell data. Old cell data is data that was previously stored in the cell.

For most spreadsheet application purposes, only the data type and reference will need to be used for revision tracking purposes. The rest of the cell properties can be written out, but are not necessarily needed as they can be recorded in other areas of the spreadsheet. For instance the <rfmt> element can be used to record style information instead of the `S (style index)` attribute.

f (Formula)	§3.3.1.37
is (Rich Text Inline)	§3.3.1.50
v (Cell Value)	§3.3.1.93

Attributes	Description
cm (Cell Metadata Index)	The zero-based index of the cell metadata record associated with this cell. Metadata information is found in the Metadata Part. Cell metadata is extra information stored at the cell level, and is attached to the cell (travels through moves, copy / paste, clear, etc). Cell metadata is not accessible via formula reference. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ph (Show Phonetic)	A Boolean value indicating if the spreadsheet application should show phonetic information. Phonetic information is displayed in the same cell across the top of the cell and serves as a 'hint' which indicates how the text should be pronounced. This should only be used for East Asian languages. The possible values for this attribute are defined by the XML Schema boolean datatype.
r (Reference)	An A1 style reference to the location of this cell The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
s (Style Index)	The index of this cell's style. Style records are stored in the Styles Part. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
t (Cell Data Type)	An enumeration representing the cell's data type.

Attributes	Description
	The possible values for this attribute are defined by the ST_CellType simple type (§3.18.12).
vm (Value Metadata Index)	The zero-based index of the value metadata record associated with this cell's value. Metadata records are stored in the Metadata Part. Value metadata is extra information stored at the cell level, but associated with the value rather than the cell itself. Value metadata is accessible via formula reference. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cell">
   <sequence>
      <element name="f" type="CT_CellFormula" minOccurs="0" maxOccurs="1"/>
      <element name="v" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="is" type="CT_Rst" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="r" type="ST_CellRef" use="optional"/>
   <attribute name="s" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="t" type="ST_CellType" use="optional" default="n"/>
   <attribute name="cm" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="vm" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="ph" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.11.1.6 odxf (Old Formatting Information)

This element represents the old differential formatting information for this cell. Old differential formatting is differential formatting that was previously applied to the cell.

Parent Elements
rcc (§3.11.1.9)

Child Elements	Subclause
alignment (Alignment)	§3.8.1
border (Border)	§3.8.4
extLst (Future Feature Data Storage Area)	§3.2.10
fill (Fill)	§3.8.19
font (Font)	§3.8.21
numFmt (Number Format)	§3.8.30
protection (Protection Properties)	§3.8.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Dxf">
   <sequence>
      <element name="font" type="CT_Font" minOccurs="0" maxOccurs="1"/>
      <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="1"/>
      <element name="fill" type="CT_Fill" minOccurs="0" maxOccurs="1"/>
      <element name="alignment" type="CT_CellAlignment" minOccurs="0" maxOccurs="1"/>
      <element name="border" type="CT_Border" minOccurs="0" maxOccurs="1"/>
      <element name="protection" type="CT_CellProtection" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

3.11.1.7 oldFormula (Old Formula)

This element represents the old formula for a defined name in this cell. This is only used for named cells. Formulas that are entered in a cell with no name are represented by the formula element `<f>`.

The possible values for this element are defined by the ST_Formula simple type (§3.18.36).

Parent Elements
rdn (§3.11.1.13)

3.11.1.8 raf (Revision AutoFormat)

This element represents a revision record of auto formatting change information for a table.

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
applyAlignmentFormats (Apply Alignment Formats)	If `true` apply legacy table autoformat alignment properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyBorderFormats (Apply Border Formats)	If `true` apply legacy table autoformat border properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyFontFormats (Apply Font Formats)	If `true` apply legacy table autoformat font properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyNumberFormats (Apply Number Formats)	If `true` apply legacy table autoformat number format properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyPatternFormats (Apply Pattern Formats)	If `true` apply legacy table autoformat pattern properties. The possible values for this attribute are defined by the XML Schema boolean datatype.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>applyWidthHeightFormats (Apply Width / Height Formats)</td><td>If <code>true</code> apply legacy table autoformat width/height properties.

The possible values for this attribute are defined by the XML Schema boolean datatype.</td></tr>
<tr><td>autoFormatId (Auto Format Id)</td><td>Identifies which legacy table autoformat to apply.

Here are representations of the supported table autoformats:

<table>
<tr><th>autoFormatId</th><th>Description</th></tr>

Attributes	Description
	14 	15 	16 	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ref (Reference)	A-1 style reference to the location where the formatting was applied The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionAutoFormatting">
   <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
   <attributeGroup ref="AG_AutoFormat"/>
   <attribute name="ref" type="ST_Ref" use="required"/>
</complexType>
```

3.11.1.9 rcc (Revision Cell Change)

This element stores information about the contents of the cell that was replaced.

Parent Elements
revisions (§3.11.1.16); rm (§3.11.1.19); rrc (§3.11.1.21)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Child Elements	Subclause
nc (New Cell Data)	§3.11.1.3
ndxf (New Formatting Information)	§3.11.1.4
oc (Old Cell Data)	§3.11.1.5
odxf (Old Formatting Information)	§3.11.1.6

Attributes	Description
dxf (Formatting)	A Boolean flag indicating that there was a differential formatting change for this cell - true if there was a formatting change, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
endOfListFormulaUpdate (End of List Formula Update)	A Boolean flag indicating that indicates that the formula used at the end of a list has been updated. True if the formula was updated, false otherwise. Note: List in this context does not mean table, rather it refers to the feature where the spreadsheet application automatically creates an internal structure for making data input more consistent on adjacent rows or columns. For instance, if 3 cells in a row are entered with the same format, then when entering data into the 4th adjacent cell, the spreadsheet application might automatically apply that same format. In this case, those cells are treated as a list. The possible values for this attribute are defined by the XML Schema boolean datatype.
numFmtId (Number Format Id)	Zero-based index of the number format (Fmt) record used by this cell format (XF). The possible values for this attribute are defined by the ST_NumFmtId simple type (§3.18.49).
odxf (Old Formatting)	Flag indicating that there is old formatting information available for this cell. The possible values for this attribute are defined by the XML Schema boolean datatype.
oldPh (Old Phonetic Text)	A Boolean flag indicating whether there is old phonetic text information available. True when there is old phonetic text information available, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
oldQuotePrefix (Old Quote Prefix)	A Boolean value indicating if a single quote prefix is was used on this cell previously. Single quote prefixes are used to cause a formula to be evaluated as a string. True if a single quote prefix was used previously, false otherwise The possible values for this attribute are defined by the XML Schema boolean datatype.
ph (Phonetic Text)	A Boolean flag indicating whether this cell contains phonetic text or not. True when the cell contains phonetic text, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
quotePrefix (Quote Prefix)	A Boolean value indicating if a single quote prefix is used. Single quote prefixes are used to cause a formula to be evaluated as a string. True if a single quote prefix is used, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
s (Style Revision)	Flag indicating that formatting change for this cell affected the cell's style. (Only applicable for Undo operations) The possible values for this attribute are defined by the XML Schema boolean datatype.
sId (Sheet Id)	Internal identifier of the sheet on which the revision occurred. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the XML Schema boolean datatype.
xfDxf (Row Column Formatting Change)	Flag indicating that the formatting change had an effect on the formatting of the entire row or column that this cell belongs to. (Only applicable for Undo operations). The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionCellChange">
   <sequence>
      <element name="oc" type="CT_Cell" minOccurs="0" maxOccurs="1"/>
      <element name="nc" type="CT_Cell" minOccurs="1" maxOccurs="1"/>

   <attribute name="oldPh" type="xsd:boolean" default="false"/>
   <attribute name="endOfListFormulaUpdate" type="xsd:boolean" default="false"/>
</complexType>
```

3.11.1.10 rcft (Revision Merge Conflict)

This element represents a revision record which indicates that there was a merge conflict.

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionConflict">
   <attributeGroup ref="AG_RevData"/>
   <attribute name="sheetId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.11.1.11 rcmt (Revision Cell Comment)

This element represents a revision record of a cell comment change.

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
action (User Action)	An enumeration identifying what kind of an operation the user performed on the comment. The possible values for this attribute are defined by the ST_RevisionAction simple type (§3.18.67).
alwaysShow (Always Show Comment)	A Boolean value indicating that the user has set this comment to always be visible. True if the comment is set to always be visible, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
author (Author)	A string representing the name of the author who changed this comment. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
cell (Cell)	An A-1 style reference to the cell where the comment was changed. The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
guid (GUID)	A globally unique identifier of this comment. The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
hiddenColumn (Hidden Column)	A Boolean value indicating that the comment belongs to a cell in a hidden column. True if the comment is in a hidden column, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
hiddenRow (Comment In Hidden Row)	A Boolean value indicating that the comment belongs to a cell in a hidden row. True if the comment is in a hidden row, false otherwise.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
newLength (New Comment Length)	Length of the comment text added in this revision. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
old (Old Comment)	An ignorable Boolean value used for backwards compatibility that indicates that the original comment was created by a legacy spreadsheet application. The possible values for this attribute are defined by the XML Schema boolean datatype.
oldLength (Original Comment Length)	Length of the comment before this revision was made. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionComment">
   <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
   <attribute name="cell" type="ST_CellRef" use="required"/>
   <attribute name="guid" type="ST_Guid" use="required"/>
   <attribute name="action" type="ST_RevisionAction" default="add"/>
   <attribute name="alwaysShow" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="old" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="hiddenRow" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="hiddenColumn" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="author" type="ST_Xstring" use="required"/>
   <attribute name="oldLength" type="xsd:unsignedInt" default="0"/>
   <attribute name="newLength" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.11.1.12 rcv (Revision Custom View)

This element represents a revision record of adding or removing a custom view to the workbook

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
action (User Action)	An enumeration representing the type of action that the user performed. The possible values for this attribute are defined by the ST_RevisionAction simple type

Attributes	Description
	(§3.18.67).
guid (GUID)	A globally unique identifier of the custom view. The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionCustomView">
   <attribute name="guid" type="ST_Guid" use="required"/>
   <attribute name="action" type="ST_RevisionAction" use="required"/>
</complexType>
```

3.11.1.13 rdn (Revision Defined Name)

This element represents a revision record of a defined name change.

Parent Elements
revisions (§3.11.1.16)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
formula (Formula)	§3.3.1.40
oldFormula (Old Formula)	§3.11.1.7

Attributes	Description
comment (Name Comment)	A string representing a comment about the defined name. Note: This comment can be shown by the spreadsheet application in a names management UI so that users have more information about what the defined name is used for. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
customMenu (New Custom Menu)	A string representing the new custom menu text The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
customView (Custom View)	A Boolean flag indicating that this named range belongs to a custom view The possible values for this attribute are defined by the XML Schema boolean datatype.
description (Description)	A string representing the new description text for the defined name.

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
function (Function)	A Boolean value indicating that the defined name refers to a function. True if the defined name is a function, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
functionGroupId (Function Group Id)	Represents the new function group id. Function group ids are used to help classify functions. For instance, functions in the same group can be searched or selected easily from the spreadsheet applications UI. For instance, filtering the list of all functions to allow the user to choose from functions used for financial data. The following group ids should be used: ID Function group 1 Financial 2 Date and Time 3 Math and Trig 4 Statistical 5 Lookup & Reference 6 Database 7 Text 8 Logical 9 Information 10 Commands 11 Customizing 12 Macro Control 13 DDE/External 14 User Defined 15 Engineering 14 Cube The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
help (New Help Topic)	A string representing the new help topic text. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
hidden (Named Range Hidden)	A Boolean value indicating whether the named range is now hidden. Note: hidden refers to whether the defined name is of a 'hidden' type. This applies to things like a custom filter on a cell, it has a name, but is hidden and so is not visible in any name management UI. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
localSheetId (Local Name Sheet Id)	An integer representing the id of the sheet to which this defined name belongs. This shall be used local defined names only. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Name)	A string representing the name for this defined name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
oldComment (Old Name Comment)	A string representing the old comment about the defined name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
oldCustomMenu (Old Custom Menu Text)	A string representing the old custom menu text The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
oldDescription (Old Description)	A string representing the old description text The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
oldFunction (Old Function)	A Boolean flag indicating that the old name was a function The possible values for this attribute are defined by the XML Schema boolean datatype.
oldFunctionGroupId (Old Function Group Id)	Old function group ID. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
oldHelp (Old Help Topic)	A string representing the old help topic text The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
oldHidden (Old Hidden)	A Boolean flag indicating whether the named range was hidden Note: hidden refers to whether the defined name is of a 'hidden' type. This applies to things like a custom filter on a cell, it has a name, but is hidden and so is not visible in any name management UI. The possible values for this attribute are defined by the XML Schema boolean datatype.
oldShortcutKey (Old Short Cut Key)	Old keyboard shortcut. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.

Attributes	Description
oldStatusBar (Old Status Bar)	A string representing the old status bar text The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
shortcutKey (Shortcut Key)	Represents the new keyboard shortcut. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
statusBar (Status Bar)	A string representing the new status bar text. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionDefinedName">
   <sequence>
      <element name="formula" type="ST_Formula" minOccurs="0" maxOccurs="1"/>
      <element name="oldFormula" type="ST_Formula" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attributeGroup ref="AG_RevData"/>
   <attribute name="localSheetId" type="xsd:unsignedInt" use="optional"/>
   <attribute name="customView" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="function" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="oldFunction" type="xsd:boolean" default="false"/>
   <attribute name="functionGroupId" type="xsd:unsignedByte" use="optional"/>
   <attribute name="oldFunctionGroupId" type="xsd:unsignedByte" use="optional"/>
   <attribute name="shortcutKey" type="xsd:unsignedByte" use="optional"/>
   <attribute name="oldShortcutKey" type="xsd:unsignedByte" use="optional"/>
   <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="oldHidden" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="customMenu" type="ST_Xstring" use="optional"/>
   <attribute name="oldCustomMenu" type="ST_Xstring" use="optional"/>
   <attribute name="description" type="ST_Xstring" use="optional"/>
   <attribute name="oldDescription" type="ST_Xstring" use="optional"/>
   <attribute name="help" type="ST_Xstring" use="optional"/>
   <attribute name="oldHelp" type="ST_Xstring" use="optional"/>
   <attribute name="statusBar" type="ST_Xstring" use="optional"/>
   <attribute name="oldStatusBar" type="ST_Xstring" use="optional"/>
   <attribute name="comment" type="ST_Xstring" use="optional"/>
   <attribute name="oldComment" type="ST_Xstring" use="optional"/>
</complexType>
```

3.11.1.14 reviewed (Reviewed)

This element represents an identifier of a single reviewed revision. A reviewed revision, is a revision that has been reviewed via the spreadsheet application's track changes feature, has been accepted, and has been saved.

Parent Elements
reviewedList (§3.11.1.15)

Attributes	Description
rId (revision Id)	ID of a reviewed revision. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Reviewed">
   <attribute name="rId" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.11.1.15 reviewedList (Reviewed List)

This element maintains a list of reviewed revisions.

Parent Elements
header (§3.11.1.1)

Child Elements	Subclause
reviewed (Reviewed)	§3.11.1.14

Attributes	Description
count (Reviewed Revisions Count)	Number of reviewed revisions. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ReviewedRevisions">
   <sequence>
      <element name="reviewed" type="CT_Reviewed" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.11.1.16 revisions (Revisions)

This element represents the root node of a list of revisions made in this shared workbook. This root node shows up at the beginning of every log file that contains specific revisions made to the workbook.

When multiple users are sharing, and editing, a workbook at the same time, there may be conflicting changes. The spreadsheet application should have logic to resolve such conflicts, and the file format should only contain enough information so that the spreadsheet application can restore the workbook to the correct state after conflict resolution. Revisions can also be tracked by the spreadsheet application for review by the user at a later time (as opposed to only dealing with conflicts on a save event.) Some edits to workbooks will be made as a result of this conflict resolution. So, there will be cases where a revision is effectively undone by another user, and as a result that undoing is itself a revision that adds or changes data in the file. These types of operations are tracked by the ua and ra attributes of many different elements.

[*Example*:

Step 1:

User 1 inserts Column A. So the XML in the revision log would look like this:

```
<revisions xmlns="…" xmlns:r="…">
  <rrc rId="1" sId="1" ref="A1:A1048576" action="insertCol"/>
</revisions>
```

Step 2:

User 2 synchronizes the file to pick up that change, but then activates the Track Changes feature, and rejects that change. This effectively performs an undo on User 1's insertion. This is denoted in the file with the ua attribute meaning that this change happened as the result of an undo. The XML for the revision log would look like this:

```
<revisions xmlns="…" xmlns:r="…">
  <rrc rId="2" ua="1" sId="1" ref="A1:A1048576" action="deleteCol"/>
  <rcft rId="1" ua="1" sheetId="1"/>
</revisions>
```

Step 3:

User 1 types "foo" in A1, and saves the file. A conflict resolution dialog is shown since User 2's version of the file removed the inserted Column A. User 1 chooses to accept their own changes. This undoes the change that User 2 made. So, in effect, it performed an undo on a previous undo operation. This is denoted in the file format by the ra attribute meaning that a the change occurred because a previous undo was undone. So the resulting XML for the newest log file looks like this:

```
<revisions xmlns="…" xmlns:r="…">
  <rrc rId="3" ua="1" ra="1" sId="1" ref="A1:A1048576" action="insertCol"/>
  <rcft rId="2" ua="1" sheetId="1"/>
  <rcc rId="4" sId="1">
    <nc r="A1" t="inlineStr">
      <is>
        <t>foo</t>
      </is>
    </nc>
  </rcc>
  <rcft rId="2" sheetId="1"/>
</revisions>
```

end example]

Parent Elements
Root element of SpreadsheetML Shared Workbook Revision Log part

Child Elements	Subclause
raf (Revision AutoFormat)	§3.11.1.8

Child Elements	Subclause
rcc (Revision Cell Change)	§3.11.1.9

      <element name="rcmt" type="CT_RevisionComment" minOccurs="0" maxOccurs="unbounded"/>
      <element name="rqt" type="CT_RevisionQueryTableField" minOccurs="0" maxOccurs="unbounded"/>
      <element name="rcft" type="CT_RevisionConflict" minOccurs="0" maxOccurs="unbounded"/>
   </choice>
</complexType>
```

3.11.1.17 rfmt (Revision Format)

This element represents a revision record of information about a formatting change.

Parent Elements
revisions (§3.11.1.16); rm (§3.11.1.19); rrc (§3.11.1.21)

Child Elements	Subclause
dxf (Formatting)	§3.8.14
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
length (Length)	The number of characters that were affected by a string change, counting from `start`. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
s (Style)	Flag indicating that this formatting change affected a cell's style. (Only applicable for Undo operations). The possible values for this attribute are defined by the XML Schema boolean datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sqref (Sequence Of References)	A worksheet range to which this formatting was applied. [*Note*: For applications supporting the default grid size (see §3.17.5), full column and row references shall explicitly state the row and column components, e.g., "A1:A1048576" For column "A", and A1:XFD1 for row "1". Applications with larger grid sizes shall interpret these to mean "column A" and "row 1" respectively, for their larger grid size. *end note*] The possible values for this attribute are defined by the ST_Sqref simple type (§3.18.78).
start (Start index)	An integer representing an index showing which character a string change starts at within the string in the cell. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
xfDxf (Row or Column Formatting Change)	A Boolean flag indicating that this formatting change had an affect on the formatting of an entire row or column that an affected cell(s) belongs to. (Only applicable for Undo operations) The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionFormatting">
   <sequence>
      <element name="dxf" type="CT_Dxf" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
   <attribute name="xfDxf" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="s" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="sqref" type="ST_Sqref" use="required"/>
   <attribute name="start" type="xsd:unsignedInt" use="optional"/>
   <attribute name="length" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.11.1.18 ris (Revision Insert Sheet)

This element represents a revision record of a sheet that was inserted.

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
name (Sheet Name)	The name of the new sheet. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetPosition (Sheet Position)	An integer representing the zero based position of the new sheet in the sheet tab bar. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionInsertSheet">
   <attributeGroup ref="AG_RevData"/>
   <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="sheetPosition" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.11.1.19 rm (Revision Cell Move)

This element represents a revision record on a cell(s) that moved.

Parent Elements
revisions (§3.11.1.16)

Child Elements	Subclause
rcc (Revision Cell Change)	§3.11.1.9
rfmt (Revision Format)	§3.11.1.17
undo (Undo)	§3.11.1.25

Attributes	Description
destination (Destination)	New A1 style location of the cell(s) that were moved The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
source (Source)	The original A1 style location of the cell(s) that were moved The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sourceSheetId (Source Sheet Id)	An integer representing the internal id of the sheet where the cell(s) originally resided. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionMove">
    <choice minOccurs="0" maxOccurs="unbounded">
        <element name="undo" type="CT_UndoInfo" minOccurs="0" maxOccurs="unbounded"/>
        <element name="rcc" type="CT_RevisionCellChange" minOccurs="0" maxOccurs="unbounded"/>
        <element name="rfmt" type="CT_RevisionFormatting" minOccurs="0" maxOccurs="unbounded"/>
    </choice>
    <attributeGroup ref="AG_RevData"/>
    <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
    <attribute name="source" type="ST_Ref" use="required"/>
    <attribute name="destination" type="ST_Ref" use="required"/>
    <attribute name="sourceSheetId" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.11.1.20 rqt (Revision Query Table)

This element represents a revision record of a query table field change.

Parent Elements
revisions (§3.11.1.16)

Attributes	Description
fieldId (Field Id)	ID of the specific query table field that was removed. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ref (QueryTable Reference)	Location of the affected query table. The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionQueryTableField">
    <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
    <attribute name="ref" type="ST_Ref" use="required"/>
    <attribute name="fieldId" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.11.1.21 rrc (Revision Row Column Insert Delete)

This element represents a revision record of a row/column insert/delete action.

Parent Elements
revisions (§3.11.1.16)

Child Elements	Subclause
rcc (Revision Cell Change)	§3.11.1.9
rfmt (Revision Format)	§3.11.1.17
undo (Undo)	§3.11.1.25

Attributes	Description
action (User Action)	Indicates what type of action the user just performed on the row or column. The possible values for this attribute are defined by the ST_rwColActionType simple type (§3.18.68).
edge (Edge Deleted)	A Boolean flag indicating that a row or column is being deleted at the edge of a sorted range (only applicable to a Delete Row/Column revision types). The possible values for this attribute are defined by the XML Schema boolean datatype.
eol (End Of List)	A Boolean flag indicating that a row or a column is being inserted at the end of a list of data. Note: List in this context does not mean table, rather it refers to the feature where the spreadsheet application automatically creates an internal structure for making data input more consistent on adjacent rows or columns. For instance, if 3 cells in a row are entered with the same format, then when entering data into the 4th adjacent cell, the spreadsheet application might automatically apply that same format. In this case, those cells are treated as a list. The possible values for this attribute are defined by the XML Schema boolean datatype.
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the XML Schema boolean datatype.
ref (Reference)	A reference to the location of the rows/columns that were inserted or deleted. [*Note*: A reference to a whole column or row shall include both the column and row components. For example, column A is referenced by "A1:A1048576", and row 1 is referenced by "A1:XFD1". However, because this attribute value is occurring in the context of an entire row or column insert, the column component of a row reference can be ignored, and the row component of a column reference can be ignored. *end note*] The possible values for this attribute are defined by the ST_Ref simple type (§3.18.64).
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionRowColumn">
    <choice minOccurs="0" maxOccurs="unbounded">
        <element name="undo" type="CT_UndoInfo" minOccurs="0" maxOccurs="unbounded"/>
        <element name="rcc" type="CT_RevisionCellChange" minOccurs="0" maxOccurs="unbounded"/>
        <element name="rfmt" type="CT_RevisionFormatting" minOccurs="0" maxOccurs="unbounded"/>
    </choice>
    <attributeGroup ref="AG_RevData"/>
    <attribute name="sId" type="xsd:unsignedInt" use="required"/>
    <attribute name="eol" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="ref" type="ST_Ref" use="required"/>
    <attribute name="action" type="ST_rwColActionType" use="required"/>
    <attribute name="edge" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.11.1.22 rsnm (Revision Sheet Name)

This element represents a revision record tracking the renaming a sheet.

Parent Elements
revisions (§3.11.1.16)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
newName (New Sheet Name)	A string representing the new sheet name The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
oldName (Old Sheet Name)	A string representing the old sheet name

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ra (Revision Undo Rejected)	A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the XML Schema boolean datatype.
rId (Revision Id)	An integer representing the number of this revision. This id shall apply to reviewable revision types only. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sheetId (Sheet Id)	An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
ua (Revision From Rejection)	A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RevisionSheetRename">
   <sequence>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
   <attributeGroup ref="AG_RevData"/>
   <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
   <attribute name="oldName" type="ST_Xstring" use="required"/>
   <attribute name="newName" type="ST_Xstring" use="required"/>
</complexType>
```

3.11.1.23 sheetId (Sheet Id)

This element represents a sheet that revision may take place on. Each sheet in the workbook should be represented by one of these elements, and each sheet has an id associated with it. Sheet ids are used to refer to sheets internally by the spreadsheet application.

Parent Elements
sheetIdMap (§3.11.1.24)

Attributes	Description
val (Sheet Id)	An integer serving as a number by which to reference the sheet internally.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetId">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.11.1.24 sheetIdMap (Sheet Id Map)

This element represents a list of sheets and corresponding ids that are used for tracking revision records.

Parent Elements
header (§3.11.1.1)

Child Elements	Subclause
sheetId (Sheet Id)	§3.11.1.23

Attributes	Description
count (Sheet Count)	Number of sheets. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SheetIdMap">
   <sequence>
      <element name="sheetId" type="CT_SheetId" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.11.1.25 undo (Undo)

This element represents undo information for row/column deletion when there are functions in the spreadsheet that reference the deleted rows/columns. This element is not applicable for insert revisions.

Parent Elements
rm (§3.11.1.19); rrc (§3.11.1.21)

Attributes	Description

Attributes	Description
array (Array Entered)	Flag indicating that the affected formula was array-entered. The possible values for this attribute are defined by the XML Schema boolean datatype.
cs (Cross Sheet Move)	A Boolean flag indicating this was a cross-sheet move. True if it was a cross sheet move, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
dn (Defined Name)	Identifies the named range that referenced the deleted cell range. Mutually exclusive with the cell reference attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
dr (Range)	The range which was deleted that is referenced by the affected formula. The possible values for this attribute are defined by the ST_RefA simple type (§3.18.65).
exp (Expression)	Identifies the type of the expression that should be adjusted in the corresponding formula. The possible values for this attribute are defined by the ST_FormulaExpression simple type (§3.18.37).
index (Index)	Index of the expression within the corresponding formula that was affected by this change. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
nf (Defined Name Formula)	A Boolean flag indicating that the corresponding formula is part of a defined name. True if this formula is part of a defined name, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
r (Cell Reference)	Location of the cell whose formula referenced the deleted cell range. Mutually exclusive with the defined name attribute The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
ref3D (Reference 3D)	A Boolean flag indicating that the expression contained the sheet name in addition to the cell reference. True if it contained the sheet name, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.
sId (Sheet Id)	Internal Id of the worksheet that contained the formula that referenced the deleted cell range. Mutually exclusive with the defined name attribute. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

Attributes	Description
v (Value Needed)	A Boolean flag indicating the formula needs the actual value of the cell(s) it's referencing. True if the formula requires the value of the cell it references, false otherwise. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UndoInfo">
    <attribute name="index" type="xsd:unsignedInt" use="required"/>
    <attribute name="exp" type="ST_FormulaExpression" use="required"/>
    <attribute name="ref3D" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="array" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="v" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="nf" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="cs" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="dr" type="ST_RefA" use="required"/>
    <attribute name="dn" type="ST_Xstring" use="optional"/>
    <attribute name="r" type="ST_CellRef" use="optional"/>
    <attribute name="sId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.11.2 Shared Workbook User Data

This subclause specifies information about the users of a shared workbook.

3.11.2.1 userInfo (User Information)

This element represents a user, and it stores information about a specific user as it relates to revisions.

Parent Elements
users (§3.11.2.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
dateTime (Date Time)	Date and time when this user opened the shared workbook. The possible values for this attribute are defined by the XML Schema dateTime datatype.
guid (User Revisions GUID)	A globally unique identifier identifying the last set of revisions that this uses is synchronized to. This attribute can be used by the spreadsheet application to ensure that revisions this user depends on aren't deleted.

Attributes	Description
	The possible values for this attribute are defined by the ST_Guid simple type (§3.18.41).
id (User Id)	An integer representing an internal user id for this user. Note: this number is allowed to be negative. The possible values for this attribute are defined by the XML Schema int datatype.
name (User Name)	Display name for this user [*Note*: User name strings should not be longer than 54 characters. *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SharedUser">
    <sequence>
        <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
    </sequence>
    <attribute name="guid" type="ST_Guid" use="required"/>
    <attribute name="name" type="ST_Xstring" use="required"/>
    <attribute name="id" type="xsd:int" use="required"/>
    <attribute name="dateTime" type="xsd:dateTime" use="required"/>
</complexType>
```

3.11.2.2 users (User List)

This element represents a list of users who currently have this shared workbook open. This list does not include any users who have the workbook open in Read-Only mode.

Parent Elements
Root element of SpreadsheetML Shared Workbook User Data part

Child Elements	Subclause
userInfo (User Information)	§3.11.2.1

Attributes	Description
count (Active User Count)	Number of users who currently have this shared workbook open. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Users">
   <sequence>
      <element name="userInfo" minOccurs="0" maxOccurs="256" type="CT_SharedUser"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.12 QueryTable Data

Query tables are 2 dimensional tables of data bound to an external query of some kind. A query table could for example show specific data from a text file, from a web query, or from a database query.

[*Example*:

Data connectivity can use a number of different technologies. The following spreadsheetML fragment is one an example of a query table connected to a database:

```
<queryTable xmlns="…" name="Northwind Orders" rowNumbers="1"
  growShrinkType="overwriteClear" connectionId="1" autoFormatId="16"
  applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="0"
  applyPatternFormats="0" applyAlignmentFormats="0" applyWidthHeightFormats="0">
  <queryTableRefresh nextId="15">
    <queryTableFields count="12">
      <queryTableField id="1" name="OrderID" tableColumnId="1"/>
      <queryTableField id="2" name="CustomerID" tableColumnId="2"/>
      <queryTableField id="3" name="EmployeeID" tableColumnId="3"/>
      <queryTableField id="4" name="OrderDate" tableColumnId="4"/>
      <queryTableField id="5" name="RequiredDate" tableColumnId="5"/>
      <queryTableField id="6" name="ShippedDate" tableColumnId="6"/>
      <queryTableField id="7" name="ShipName" tableColumnId="7"/>
      <queryTableField id="8" name="ShipAddress" tableColumnId="8"/>
      <queryTableField id="9" name="ShipCity" tableColumnId="9"/>
      <queryTableField id="10" name="ShipRegion" tableColumnId="10"/>
      <queryTableField id="11" name="ShipPostalCode" tableColumnId="11"/>
      <queryTableField id="12" name="ShipCountry" tableColumnId="12"/>
    </queryTableFields>
  </queryTableRefresh>
</queryTable>
```

end example]

And here's an example of the spreadsheetML fragment defining a query table connected to a text import:

[*Example*:

```
<queryTable xmlns="…" name="data in text" connectionId="1" autoFormatId="16"
  applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="1"
  applyPatternFormats="1" applyAlignmentFormats="0"
  applyWidthHeightFormats="0"/>
```

end example]

Elsewhere in the spreadsheetML file, a connection element is defined with the name "Northwind Orders" that describes how to connect to the appropriate database to refresh data for the query table.

3.12.1 deletedField (Deleted Field)

This element specifies a field that has been deleted from the query table.

[*Example*:

```
<queryTableDeletedFields count="2">
  <deletedField name="ShipVia"/>
  <deletedField name="Freight"/>
</queryTableDeletedFields>
```

end example]

Parent Elements
queryTableDeletedFields (§3.12.3)

Attributes	Description
name (Deleted Fields Name)	Specifies the name of the deleted field. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DeletedField">
   <attribute name="name" type="ST_Xstring" use="required"/>
</complexType>
```

3.12.2 queryTable (Query Table)

This element specifies all the relevant properties for a query table, one query table element is stored for each query table object in the spreadsheetML document.

Parent Elements
Root element of SpreadsheetML Query Table part

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
queryTableRefresh (QueryTable Refresh Information)	§3.12.6

Attributes	Description
adjustColumnWidth (Adjust Column Width On Refresh)	Specifies whether to automatically adjust column widths on refresh to fit the data retrieved. `true` if column widths should be adjusted. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyAlignmentFormats (Apply Alignment Formats)	If `true` apply legacy table autoformat alignment properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyBorderFormats (Apply Border Formats)	If `true` apply legacy table autoformat border properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyFontFormats (Apply Font Formats)	If `true` apply legacy table autoformat font properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyNumberFormats (Apply Number Formats)	If `true` apply legacy table autoformat number format properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyPatternFormats (Apply Pattern Formats)	If `true` apply legacy table autoformat pattern properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
applyWidthHeightFormats (Apply Width / Height Formats)	If `true` apply legacy table autoformat width/height properties. The possible values for this attribute are defined by the XML Schema boolean datatype.
autoFormatId (Auto Format Id)	Identifies which legacy table autoformat to apply. Here are representations of the supported table autoformats: autoFormatId: 0 Description: 
Attributes	Description
	1 	2 	3 	4 	5 	6 	7 	8 
Attributes	Description
	9 	10 	11 	12 	13 	14 	15 	16 
The possible values for this attribute are defined by the XML Schema unsignedInt

Attributes	Description
	datatype.
backgroundRefresh (Background Refresh)	Specifies whether or not the query table shall try to refresh data in the background. The possible values for this attribute are defined by the XML Schema boolean datatype.
connectionId (Connection Id)	Specifies the ID number of the external data connection to use to refresh data in the query table. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
disableEdit (Disable Edit)	Specifies whether the connection element used with this query table shall be editable. If `true`, then the connection is not editable. The possible values for this attribute are defined by the XML Schema boolean datatype.
disableRefresh (Disable Refresh)	Specifies whether the query table shall be refreshable. If `true`, then then query table is not refreshable. The possible values for this attribute are defined by the XML Schema boolean datatype.
fillFormulas (Fill Adjacent Formulas)	Specifies whether or not formulas in columns adjacent to the query table should be filled down whenever the query table is refreshed. This is helpful since the number of rows returned by a query table refresh operation can vary. The possible values for this attribute are defined by the XML Schema boolean datatype.
firstBackgroundRefresh (First Background Refresh)	Specifies whether or not data has ever been refreshed for this query table. If the very first background data refresh had not completed at the time the file was saved, this attribute will be set to `true`. The possible values for this attribute are defined by the XML Schema boolean datatype.
growShrinkType (Grow Shrink Type)	Specifies the type of behavior expected for dealing with a variable number of rows of data in the query table between refresh operations. The meaning of the possible values of this attribute {`insertClear`, `insertDelete`, `overwriteClear`} are explained in detail in the definition of the simple type. The possible values for this attribute are defined by the ST_GrowShrinkType simple type (§3.18.40).
headers (First Row Column Titles)	Specifies whether or not the query table has first row with column titles. The possible values for this attribute are defined by the XML Schema boolean datatype.
intermediate (Intermediate)	Specifies whether this query table is in an intermediate state, having been defined but not fully formed and populated with data. In this state, fields and ranges of the query table may be unknown.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
name (QueryTable Name)	Specifies the name of the query table. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
preserveFormatting (Preserve Formatting On Refresh)	Specifies whether the application should try to preserve formatting in the query table and copy this formatting to any new rows of data. The possible values for this attribute are defined by the XML Schema boolean datatype.
refreshOnLoad (Refresh On Load)	Specifies whether the query table shall refresh its data automatically when the spreadsheetML document is loaded or opened. The possible values for this attribute are defined by the XML Schema boolean datatype.
removeDataOnSave (Remove Data On Save)	Specifies whether the query table shall remove all data from the worksheet before the spreadsheetML document is saved. Note: this is very helpful for situations where people who have different permissions to view data want to share the same spreadsheetML document. All data from the last user will be removed, and new users re-query the external data sources with their own credentials. The possible values for this attribute are defined by the XML Schema boolean datatype.
rowNumbers (Row Numbers)	Specifies whether the query table shall include a first column of row numbers. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryTable">
   <sequence>
      <element name="queryTableRefresh" type="CT_QueryTableRefresh" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="headers" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="rowNumbers" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="disableRefresh" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="backgroundRefresh" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="firstBackgroundRefresh" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="refreshOnLoad" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="growShrinkType" type="ST_GrowShrinkType" use="optional" default="insertDelete"/>
   <attribute name="fillFormulas" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="removeDataOnSave" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="disableEdit" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="preserveFormatting" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="adjustColumnWidth" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="intermediate" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="connectionId" type="xsd:unsignedInt" use="required"/>
   <attributeGroup ref="AG_AutoFormat"/>
</complexType>
```

3.12.3 queryTableDeletedFields (Deleted Fields)

This element is the collection for deletedField (§3.12.1) elements, each of which represents a column or field that has been deleted from the query table.

[*Example*:

```
<queryTableDeletedFields count="2">
  <deletedField name="ShipVia"/>
  <deletedField name="Freight"/>
</queryTableDeletedFields>
```

end example]

Parent Elements
queryTableRefresh (§3.12.6)

Child Elements	Subclause
deletedField (Deleted Field)	§3.12.1

Attributes	Description
count (Deleted	Specifies how many deleted fields there are.

Attributes	Description
Fields Count)	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryTableDeletedFields">
   <sequence>
      <element name="deletedField" type="CT_DeletedField" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.12.4 queryTableField (QueryTable Field)

This element holds the properties related to a specific field or column in a query table.

Parent Elements
queryTableFields (§3.12.5)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10

Attributes	Description
clipped (Clipped Column)	Specifies whether this field/column is currently clipped and thus not visible in the worksheet. Note: this state might occur for example when a query table is defined near the edge of a worksheet or other object in the spreadsheet that can't be overwritten with external data. In this case some of the fields are displayed, but not all of them. The possible values for this attribute are defined by the XML Schema boolean datatype.
dataBound (Data Bound Column)	Specifies whether this column is a user-defined column or comes from the external data query. User defined columns shall be preserved during data refresh operations. User-defined columns are only supported on query tables that are attached to table objects. The possible values for this attribute are defined by the XML Schema boolean datatype.
fillFormulas (Fill This Formula On Refresh)	Specifies whether the formula in this field/column should be filled down on data refresh. The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Field Id)	Specifies the unique identifier of the query table field.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Name)	Specifies the unique name of the query table field. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
rowNumbers (Row Numbers)	true if this column contains the row numbers for the records returned. The possible values for this attribute are defined by the XML Schema boolean datatype.
tableColumnId (Table Column Id)	Specifies the unique identifier for the table column if the query table is attached to a table object rather than just a range in the sheet. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryTableField">
   <sequence minOccurs="0">
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="xsd:unsignedInt" use="required"/>
   <attribute name="name" type="ST_Xstring" use="optional"/>
   <attribute name="dataBound" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="rowNumbers" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="fillFormulas" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="clipped" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="tableColumnId" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.12.5 queryTableFields (Query table fields)

This element is the collection for queryTableField elements.

Parent Elements
queryTableRefresh (§3.12.6)

Child Elements	Subclause
queryTableField (QueryTable Field)	§3.12.4

Attributes	Description
count (Column Count)	Specifies the number of columns there are in this query table. Includes both query-defined and user-defined columns, but not deleted columns.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryTableFields">
   <sequence>
      <element name="queryTableField" type="CT_QueryTableField" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
   <attribute name="count" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.12.6 queryTableRefresh (QueryTable Refresh Information)

This element contains information related to refreshing the query table.

Parent Elements
queryTable (§3.12.2)

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
queryTableDeletedFields (Deleted Fields)	§3.12.3
queryTableFields (Query table fields)	§3.12.5
sortState (Sort State)	§3.3.1.89

Attributes	Description
fieldIdWrapped (Next Field Id Wrapped)	Whether or not the idFieldNext value wrapped around. The possible values for this attribute are defined by the XML Schema boolean datatype.
headersInLastRefresh (Headers In Last Refresh)	Whether or not the Query Table had titles last refresh. The possible values for this attribute are defined by the XML Schema boolean datatype.
minimumVersion (Minimum Refresh Version)	For backward compatibility with legacy versions of spreadsheet applications, this attribute specifies the minimum version of the application that is expected to correctly refresh the data in the query table without any problems. Note: if this attribute is specified, an earlier version of a spreadsheet application should alert the user to the potential incompatibilities when a refresh is attempted. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.

Attributes	Description
nextId (Next field id)	Specifies the next unique queryTableField (§3.12.4) id number available for assignment. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
preserveSortFilterLayout (Preserve Sort & Filter Layout)	Specifies whether sorting, autofilter, layout, and table block formatting should be preserved for this query table across data refresh operations. Note: if this attribute is set to `false`, the query table might be more or less recreated from scratch when data is refreshed. In this case, all user deleted or rearranged columns, user inserted columns that aren't bound to external data, and table column formatting are discarded. The possible values for this attribute are defined by the XML Schema boolean datatype.
unboundColumnsLeft (Columns Left)	Specifies the number of extra columns included at the left end of the field array that aren't bound to external data. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
unboundColumnsRight (Columns Right)	Specifies the number of extra columns included at the right end of the Table that aren't bound to external data. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QueryTableRefresh">
   <sequence>
      <element name="queryTableFields" type="CT_QueryTableFields" minOccurs="1" maxOccurs="1"/>
      <element name="queryTableDeletedFields" type="CT_QueryTableDeletedFields" minOccurs="0"
        maxOccurs="1"/>
      <element name="sortState" minOccurs="0" maxOccurs="1" type="CT_SortState"/>
      <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="preserveSortFilterLayout" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="fieldIdWrapped" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="headersInLastRefresh" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="minimumVersion" type="xsd:unsignedByte" use="optional" default="0"/>
   <attribute name="nextId" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute name="unboundColumnsLeft" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="unboundColumnsRight" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.13 External Data Connections

SpreadsheetML allows for the definition of top level data connection objects that describe how to retrieve data from external sources. These connection objects are independent of the constructs in the spreadsheet application that display data such as tables, PivotTables, etc.

Some information about a connection is considered part of the connection's definition. Other information is not inherently part of the connection, but it describes the way the connection is to be used by the containing workbook. Note that in many cases, the spreadsheet application does not need knowledge of the command syntax for the external data source (e.g., database query language), and simply stores a command string that was created by a data provider API (e.g., an ODBC driver).

A connection's definition can be established in a standalone connection file for easier sharing and reuse, but this reference documentation deals with the XML representation for external data connections that is directly embedded within a SpreadsheetML document. This embedded representation is expected whenever external data is used, and ensures portability of the document and continued operation of the external query in the most cases.

3.13.1 connection (Connection)

This element contains both the definition of how to get at an external data source as well as information describing how the connection is used within the workbook. Specific constructs in a worksheet, such as OLAP formulas, QueryTables, or PivotTables make use of information in the connection to retrieve or refresh data based on default events or the user's explicit request.

Parent Elements
connections (§3.13.2)

Child Elements	Subclause
dbPr (Database Properties)	§3.13.3
extLst (Future Feature Data Storage Area)	§3.2.10
olapPr (OLAP Properties)	§3.13.5
parameters (Query Parameters)	§3.13.7
textPr (Text Import Settings)	§3.13.12
webPr (Web Query Properties)	§3.13.13

Attributes	Description
background (Background Refresh)	Indicates whether the connection can be refreshed in the background (asynchronously). `true` if preferred usage of the connection is to refresh asynchronously in the background; `false` if preferred usage of the connection is to refresh synchronously in the foreground.

Attributes	Description
	This flag should be intentionally ignored in specific cases. [*Example*: An example of when the flag would be ignored is in the case of a connection to OLAP data on Microsoft SQL Server Analysis Services, where the connection is used by both a PivotTable and also by CUBE functions within the workbook. That connection will always be refreshed synchronously by the PivotTable and will always be refreshed asynchronously by the CUBE functions. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
credentials (Reconnection Method)	Specifies the authentication method to be used when establishing (or re-establishing) the connection. The possible values for this attribute are defined by the ST_CredMethod simple type (§3.18.17).
deleted (Deleted Connection)	Indicates whether the associated workbook connection has been deleted. `true` if the connection has been deleted; otherwise, `false`. Deleted connections contain only the attributes name and deleted=`true`, all other information is removed from the SpreadsheetML file. If a new connection is created with the same name as a deleted connection, then the deleted connection is overwritten by the new connection. The possible values for this attribute are defined by the XML Schema boolean datatype.
description (Connection Description)	Specifies the user description for this connection. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
id (Connection Id)	Specifies The unique identifier of this connection. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
interval (Automatic Refresh Interval)	Specifies the number of minutes between automatic refreshes of the connection. When this attribute is not present, the connection is not automatically refreshed. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
keepAlive (Keep Connection Open)	`true` when the spreadsheet application should make efforts to keep the connection open. When `false`, the application should close the connection after retrieving the information. This corresponds to the MaintainConnection property of a PivotCache object. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
minRefreshableVersion (Minimum Version Required for Refresh)	For compatibility with legacy spreadsheet applications. This represents the minimum version # that is required to be able to correctly refresh the data connection. This attribute applies to connections that are used by a QueryTable. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
name (Connection Name)	Specifies the name of the connection. Each connection must have a unique name. When a connection has been marked as deleted and then a new connection is added with the same name, the deleted connection is replaced with the new connection. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
new (New Connection)	`true` if the connection has not been refreshed for the first time; otherwise, `false`. This state can happen when the user saves the file before a query has finished returning. The possible values for this attribute are defined by the XML Schema boolean datatype.
odcFile (Connection File)	Specifies the full path to external connection file from which this connection was created. If a connection fails during an attempt to refresh data, and reconnectionMethod=1, then the spreadsheet application will try again using information from the external connection file instead of the connection object embedded within the workbook. This is a benefit for data source and spreadsheetML document manageability. If the definition in the external connection file is changed (e.g., because of a database server name change), then the workbooks that made use of that connection will fail to connect with their internal connection information, and reload the new connection information from this file. This attribute is cleared by the spreadsheet application when the user manually edits the connection definition within the workbook. May be expressed in URI or system-specific file path notation. [*Note*: Applications can decide what forms of URI they support, and whether system-specific file path notations will be supported. *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
onlyUseConnectionFile (Only Use Connection File)	Indicates whether the spreadsheet application should always and only use the connection information in the external connection file indicated by the odcFile attribute when the connection is refreshed. If `false`, then the spreadsheet application should follow the procedure indicated by the reconnectionMethod attribute described below.

Attributes	Description
	Applies only to OLE DB and ODBC connections, this attribute is ignored for other types of connections. The possible values for this attribute are defined by the XML Schema boolean datatype.
reconnectionMethod (Reconnection Method)	Specifies what the spreadsheet application should do when a connection fails. The values are as follows: `1 = As required`: On refresh use the existing connection information and if it ends up being invalid then get updated connection information, if available from the external connection file. `2 = Always`: On every refresh get updated connection information from the external connection file, if available, and use that instead of the existing connection information. In this case the data refresh will fail if the external connection file is unavailable. `3 = Never`: Never get updated connection information from the external connection file even if it is available and even if the existing connection information is invalid. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
refreshedVersion (Last Refresh Version)	For backward compatibility purposes, this attribute indicates the version of the spreadsheet application that last refreshed the connection. This attribute applies to connections that are used by a query table. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.
refreshOnLoad (Refresh on Open)	`true` if this connection should be refreshed when opening the file; otherwise, `false`. The possible values for this attribute are defined by the XML Schema boolean datatype.
saveData (Save Data)	`true` if the external data fetched over the connection to populate a table is to be saved with the workbook; otherwise, `false`. This exists for data security purposes - if no external data is saved in (or "cached") in the workbook, then current user credentials can be required every time to retrieve the relevant data, and people won't see the data the workbook author had last been using before saving the file. The possible values for this attribute are defined by the XML Schema boolean datatype.
savePassword (Save Password)	`true` if the password is to be saved as part of the connection string; otherwise, False. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
singleSignOnId (SSO Id)	Identifier for Single Sign On (SSO) used for authentication between an intermediate spreadsheetML server and the external data source. [*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/spptsdk/html/cSSOReturnCodes_SV01001109.asp *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
sourceFile (Source Database File)	Used when the external data source is file-based. When a connection to such a data source fails, the spreadsheet application attempts to connect directly to this file. May be expressed in URI or system-specific file path notation. [*Note*: Applications can decide what forms of URI they support, and whether system-specific file path notations will be supported. *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
type (Database Source Type)	Specifies the data source type. Values are as follows: 1. ODBC-based source 2. DAO-based source 3. File based database source 4. Web query 5. OLE DB-based source 6. Text-based source 7. ADO record set 8. DSP The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connection">
   <sequence>
      <element name="dbPr" minOccurs="0" maxOccurs="1" type="CT_DbPr"/>
      <element name="olapPr" minOccurs="0" maxOccurs="1" type="CT_OlapPr"/>
      <element name="webPr" minOccurs="0" maxOccurs="1" type="CT_WebPr"/>
      <element name="textPr" minOccurs="0" maxOccurs="1" type="CT_TextPr"/>
      <element name="parameters" minOccurs="0" maxOccurs="1" type="CT_Parameters"/>
      <element name="extLst" minOccurs="0" maxOccurs="1" type="CT_ExtensionList"/>
   </sequence>
   <attribute name="id" use="required" type="xsd:unsignedInt"/>
   <attribute name="sourceFile" use="optional" type="ST_Xstring"/>
   <attribute name="odcFile" use="optional" type="ST_Xstring"/>
   <attribute name="keepAlive" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="interval" use="optional" type="xsd:unsignedInt" default="0"/>
   <attribute name="name" use="optional" type="ST_Xstring"/>
   <attribute name="description" use="optional" type="ST_Xstring"/>
   <attribute name="type" use="optional" type="xsd:unsignedInt"/>
   <attribute name="reconnectionMethod" use="optional" type="xsd:unsignedInt" default="1"/>
   <attribute name="refreshedVersion" use="required" type="xsd:unsignedByte"/>
   <attribute name="minRefreshableVersion" use="optional" type="xsd:unsignedByte" default="0"/>
   <attribute name="savePassword" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="new" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="deleted" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="onlyUseConnectionFile" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="background" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="refreshOnLoad" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="saveData" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="credentials" use="optional" type="ST_CredMethod" default="integrated"/>
   <attribute name="singleSignOnId" use="optional" type="ST_Xstring"/>
</complexType>
```

3.13.2 connections (Connections)

This element exists when there are one or more connections in the workbook. It is a container for the individual connection objects.

Parent Elements
Root element of SpreadsheetML Connections part

Child Elements	Subclause
connection (Connection)	§3.13.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connections">
   <sequence>
      <element name="connection" minOccurs="1" maxOccurs="unbounded" type="CT_Connection"/>
   </sequence>
</complexType>
```

3.13.3 dbPr (Database Properties)

This element stores all properties associated with an ODBC or OLE DB external data connection.

[*Example*:

Data connectivity can use a number of different technologies. The following is one example XML fragment defining an OLE DB connection and the associated dbPr element:

```
<connection id="2"
  odcFile="C:\My Documents\My Data Sources\Northwind Orders.odc" keepAlive="1"
  name="Northwind Orders" description="northwind" type="5" refreshedVersion="3">
  <dbPr connection="Provider=SQLOLEDB.1;Integrated Security=SSPI;Persist
    Security Info=True;Initial Catalog=Northwind;Data Source=dataserver1;Use
    Procedure for Prepare=1;Auto Translate=True;Packet Size=4096;Workstation
    ID=LOCAL_MACHINE_NAME;Use Encryption for Data=False;Tag with column
    collation when possible=False"
    command="&amp;quot;Northwind&amp;quot;.&amp;quot;dbo&amp;quot;.&amp;quot;Orders&amp;quot;"
    commandType="3"/>
</connection>
```

end example]

Parent Elements
connection (§3.13.1)

Attributes	Description
command (Command Text)	The string containing the database command to pass to the data provider API that will interact with the external source in order to retrieve data. These strings can be constructed in a variety of ways (from simple UIs built into the spreadsheet application for browsing and choosing tables and fields, to external applications providing user interface to build up complex queries, to advanced users editing text queries). The spreadsheetML application need not understand the command syntax; it can simply pass the command string to the data provider API in order to retrieve the latest external data. [*Example*: Data connectivity can use a number of different technologies. The following is one example of an ODBC command string of commandType=2 (for a Microsoft SQL Server database): `command="SELECT Orders.OrderID, Orders.OrderDate, Orders.ShipName, Orders.ShipAddress, Orders.ShipCity, Orders.ShipRegion, Orders.ShipPostalCode, Orders.ShipCountry_x000d__x000a_FROM Northwind.dbo.Orders Orders_x000d__x000a_WHERE (Orders.ShipCountry=?)"`

Attributes	Description
	Some characters in this string have been escaped - for more information on the escaping scheme, please refer to the ST_Xstring type definition. *end example*] [*Note*: the "?" syntax in the string is something that the ODBC data provider is aware of and may replace with a parameter before execution. *end note*] [*Example*: Data connectivity can use a number of different technologies. The following is one example of an OLE DB command string of commandType=3 (for an Oracle database): `command="&quot;TESTDB&quot;.&quot;ShippersTable&quot;"` *end example*] [*Note*: Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at: • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_statements.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_minimum_grammar.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbusing_commands.asp *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
commandType (OLE DB Command Type)	Specifies the OLE DB command type. Supported values are as follows: 1. Query specifies a cube name 2. Query specifies a SQL statement 3. Query specifies a table name 4. Query specifies that default information has been given, and it is up to the provider how to interpret. 5. Query is against a web based List Data Provider. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
connection (Connection String)	The connection string is used to make contact with an OLE DB or ODBC data source. These can be constructed in a variety of ways (from UI wizards built into the data provider code, to external query applications, to advanced users editing text files). The spreadsheetML application need not understand the connection syntax at all; it can simply pass the command string to the data provider API in order to re-establish a connection with the external data source.

Attributes	Description

	[*Example*: ODBC connection string to a database:
	
	`connection="DRIVER=SQL Server;SERVER=example_server;UID=example_useralias;APP=Microsoft Office 2007;WSID=user_alias;Trusted_Connection=Yes"`
	
	end example]
	
	[*Example*: of an OLE DB connection string to an Oracle database:
	
	`connection="Provider=OraOLEDB.Oracle.1;Password=example_password;Persist Security Info=True;User ID=example_useralias;Data Source=example_server;Extended Properties=&quot;&quot;"`
	
	end example]
	
	[*Note*: Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at:
	• http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/dasdkodbcoverview.asp
	• http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbcsql/od_odbc_d_4x4k.asp
	• http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/htm/mdreforacleprovspec.asp
	end note]
	
	Connection strings syntaxes are specific to individual ODBC or OLE DB data provider drivers.
	
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

serverCommand (Command Text)	Specifies a second command text string that is persisted when PivotTable server-based page fields are in use. For ODBC connections, serverCommand is usually a broader query than command (no WHERE clause is present in the former). Based on these 2 commands, parameter UI can be populated and parameterized queries can be constructed. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DbPr">
    <attribute name="connection" use="required" type="ST_Xstring"/>
    <attribute name="command" use="optional" type="ST_Xstring"/>
    <attribute name="serverCommand" use="optional" type="ST_Xstring"/>
    <attribute name="commandType" use="optional" type="xsd:unsignedInt" default="2"/>
</complexType>
```

3.13.4 m (No Value)

This element is present when tables in a web query are missing.

Parent Elements
tables (§3.13.9)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableMissing"/>
```

3.13.5 olapPr (OLAP Properties)

This element contains all the properties needed for an OLAP data connection. OLE DB for OLAP is the data provider, and OLAP connections contain both the dbPr and olapPr child elements.

[*Example*:

Data connectivity can use a number of different technologies. The following is an example of a connection to an SAP BW OLAP data source:

```
<connection id="1" odcFile="C:\My Documents\My Data Sources\$INFOCUBE.odc"
  keepAlive="1" name="SAP demo cube" description="SAP DemoCube" type="5"
  refreshedVersion="3" background="1">
  <dbPr connection="Provider=MDrmSap.2;Data Source=BI2;User
    ID=TESTUSER;Location=TESTSERVERNAME;Cache Authentication=False;Encrypt
    Password=False;Integrated Security=&amp;quot;&amp;quot;;Mask Password=False;Persist
    Encrypted=False;Persist Security Info=True;Impersonation
    Level=Anonymous;Mode=Read;Protection Level=None;Extended
    Properties=&amp;quot;SFC_CLIENT=800;&amp;quot;;Initial Catalog=$INFOCUBE"
    command="$0D_DECU" commandType="1"/>
  <olapPr sendLocale="1" rowDrillCount="1000" serverFill="0"
    serverNumberFormat="0" serverFont="0" serverFontColor="0"/>
</connection>
```

end example]

[*Example*:

Data connectivity can use a number of different technologies. The following is an example of a connection to a Microsoft SQL Server Analysis Services OLAP data source:

```
<connection id="1"
  odcFile="C:\My Documents\My Data Sources\Adventure Works DW.odc" keepAlive="1"
  name="Adventure Works DW" type="5" refreshedVersion="3" background="1">
  <dbPr connection="Provider=MSOLAP.3;Cache Authentication=False;Integrated
    Security=SSPI;Persist Security Info=True;Initial Catalog=Adventure Works
    DW;Data Source=DATASERVER1;Impersonation
    Level=Impersonate;Mode=ReadWrite;Protection Level=Pkt Privacy;Auto Synch
    Period=20000;Default Isolation Mode=0;Default MDX Visual Mode=0;MDX
    Compatibility=1;MDX Unique Name Style=0;Non Empty
    Threshold=0;SQLQueryMode=Calculated;Safety Options=2;Secured Cell
    Value=0;SOURCE_DSN_SUFFIX=&quot;Prompt=CompleteRequired;Window
    Handle=0x6A903CC;&quot;;SQL Compatibility=0;Compression Level=0;Real Time
    Olap=False;Packet Size=4096" command="Adventure Works" commandType="1"/>
  <olapPr sendLocale="1" rowDrillCount="1000"/>
</connection>
```

end example]

[*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/dasdkoledboverview.asp *end note*]

Parent Elements
connection (§3.13.1)

Attributes	Description
local (Local Cube)	Flag indicating whether we should get data from the local cube on refresh versus the original data source. `true` if a local cube has been created for OLAP data, and it should be used instead of the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
localConnection (Local Cube Connection)	Specifies a connection string to use when a local cube is available. This is used when local is set to `true`. [*Example*: *<olapPr local="true" localConnection="OLEDB;Provider=MSOLAP;Data Source=C:\Data\DataCube.cub" >* *… end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
localRefresh (Local Refresh)	Flag indicating whether we should refresh the local cube from the original data source. When `true`, the original OLAP data source is queried each time the user explicitly refreshes the data in the application, and a new local cube is constructed from this query. The possible values for this attribute are defined by the XML Schema boolean datatype.
rowDrillCount (Drill Through Count)	Maximum number of drill-through rows to return when the user drills through an aggregate value in a PivotTable. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
sendLocale (Send Locale to OLAP)	When `true`, the spreadsheetML app should send the user interface locale ID to the OLAP provider to retrieve localized member names and properties, etc. When `false`, no locale ID is expected. The possible values for this attribute are defined by the XML Schema boolean datatype.
serverFill (OLAP Fill Formatting)	When `true` a PivotTable based on an OLAP source should format the data and aggregate cells in the PivotTable view using the background color from the OLAP source if this information is available. When `false`, OLAP server background fill colors are ignored, and standard formatting rules within the worksheet are followed. The possible values for this attribute are defined by the XML Schema boolean datatype.
serverFont (OLAP Server Font)	When `true`, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font from the OLAP source (e.g., Arial or Tahoma). When `false`, OLAP server fonts are ignored, and standard formatting rules within the worksheet are followed. The possible values for this attribute are defined by the XML Schema boolean datatype.
serverFontColor (OLAP Font Formatting)	When `true` a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font color from the OLAP source. When `false`, OLAP server font colors are ignored, and standard formatting rules within the worksheet are followed. The possible values for this attribute are defined by the XML Schema boolean datatype.
serverNumberFormat (OLAP Number Format)	When `true`, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the number format from the OLAP source. When `false`, OLAP server number formats are ignored, and standard formatting rules within the worksheet are followed. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OlapPr">
   <attribute name="local" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="localConnection" use="optional" type="ST_Xstring"/>
   <attribute name="localRefresh" use="optional" type="xsd:boolean" default="true"/>
   <attribute name="sendLocale" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="rowDrillCount" use="optional" type="xsd:unsignedInt"/>
   <attribute name="serverFill" use="optional" type="xsd:boolean" default="true"/>
   <attribute name="serverNumberFormat" use="optional" type="xsd:boolean" default="true"/>
   <attribute name="serverFont" use="optional" type="xsd:boolean" default="true"/>
   <attribute name="serverFontColor" use="optional" type="xsd:boolean" default="true"/>
</complexType>
```

3.13.6 parameter (Parameter Properties)

This element stores properties about any parameters used with external data connections. Parameters are used to change the query executed externally and cause different data to be retrieved into the workbook. The type of parameter used – see ST_parameterType (§3.18.56) – determines whether the user will be prompted for a value before data is refreshed, or the value will be pulled from a cell in the workbook, or whether the same value should be used until explicitly changed in the data connection. Parameters are valid for ODBC and web queries.

[*Example*:

Data connectivity can use a number of different technologies. The following is an example of XML defining a connection to a Microsoft Access database, with a parameter based on the value in cell C1 on the first sheet.

```
<connection id="1" name="Connection" type="1" refreshedVersion="2"
  background="1" saveData="1">
  <dbPr connection="DSN=MS Access
    Database;DBQ=C:\Desktop\db1.mdb;DefaultDir=C:\Desktop;DriverId=25;FIL=MS
    Access;MaxBufferSize=2048;PageTimeout=5;" command="SELECT Table1.Field1,
    Table1.Field2_x000d__x000a_FROM `C:\Desktop\db1`.Table1
    Table1_x000d__x000a_WHERE (Table1.Field2=?)"/>
  <parameters count="1">
    <parameter name="user specified value" sqlType="4" parameterType="cell"
      cell="Sheet1!$C$1"/>
  </parameters>
</connection>
```

end example]

Note that the command string in the dbPr element contains a "?" character. This character serves as a parameter marker.

[*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcstatement_parameters.asp *end note*]

Parent Elements
parameters (§3.13.7)

Attributes	Description
boolean (Boolean)	Boolean value to use as the query parameter. Used only when parameterType = value. The possible values for this attribute are defined by the XML Schema boolean datatype.
cell (Cell Reference)	Cell reference indicating which cell's value to use for the query parameter. Used only when parameterType = cell. [*Example*: `<Parameter parameterType="cell" cell="Sheet1!$C$1">` *end example*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
double (Double)	Non-integer numeric value to use as the query parameter. Used only when parameterType = value. The possible values for this attribute are defined by the XML Schema double datatype.
integer (Integer)	Integer value to use as the query parameter. Used when parameterType = value. The possible values for this attribute are defined by the XML Schema int datatype.
name (Parameter Name)	The name of the parameter. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
parameterType (Parameter Type)	Type of parameter used. If the parameterType=value, then the value from boolean, double, integer, or string will be used. In this case, it is expected that only one of {boolean, double, integer, or string} will be specified. The possible values for this attribute are defined by the ST_ParameterType simple type (§3.18.56).
prompt (Parameter Prompt String)	Prompt string for the parameter. Presented to the spreadsheet user along with input UI to collect the parameter value before refreshing the external data. Used only when parameterType = prompt.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</td></tr>
<tr><td>refreshOnChange (Refresh on Change)</td><td>Flag indicating whether the query should automatically refresh when the contents of a cell that provides the parameter value changes. If <code>true</code>, then external data is refreshed using the new parameter value every time there's a change. If <code>false</code>, then external data is only refreshed when requested by the user, or some other event triggers refresh (e.g., workbook opened).

The possible values for this attribute are defined by the XML Schema boolean datatype.</td></tr>
<tr><td>sqlType (SQL Data Type)</td><td>SQL data type of the parameter. Only valid for ODBC sources.

Supported values include:
<table>
<tr><th>-22</th><th>SQL_UNSIGNED_OFFSET</th></tr>
<tr><td>-20</td><td>SQL_SIGNED_OFFSET</td></tr>
<tr><td>-11</td><td>SQL_GUID</td></tr>
<tr><td>-10</td><td>SQL_WLONGVARCHAR</td></tr>
<tr><td>-9</td><td>SQL_WVARCHAR</td></tr>
<tr><td>-8</td><td>SQL_WCHAR</td></tr>
<tr><td>-7</td><td>SQL_BIT</td></tr>
<tr><td>-6</td><td>SQL_TINYINT</td></tr>
<tr><td>-5</td><td>SQL_BIGINT</td></tr>

</table>

The possible values for this attribute are defined by the XML Schema int datatype.
</td></tr>
<tr><td>string (String)</td><td>String value to use as the query parameter. Used only when parameterType = value.

The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</td></tr>
</table>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Parameter">
   <attribute name="name" use="optional" type="ST_Xstring"/>
   <attribute name="sqlType" use="optional" type="xsd:int" default="0"/>
   <attribute name="parameterType" use="optional" type="ST_ParameterType" default="prompt"/>
   <attribute name="refreshOnChange" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="prompt" use="optional" type="ST_Xstring"/>
   <attribute name="boolean" use="optional" type="xsd:boolean"/>
   <attribute name="double" use="optional" type="xsd:double"/>
   <attribute name="integer" use="optional" type="xsd:int"/>
   <attribute name="string" use="optional" type="ST_Xstring"/>
   <attribute name="cell" use="optional" type="ST_Xstring"/>
</complexType>
```

3.13.7 parameters (Query Parameters)

This element serves as a collection of parameters for an ODBC or web query.

Parent Elements
connection (§3.13.1)

Child Elements	Subclause
parameter (Parameter Properties)	§3.13.6

Attributes	Description
count (Parameter Count)	The number of parameters used. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Parameters">
   <sequence>
      <element name="parameter" minOccurs="1" maxOccurs="unbounded" type="CT_Parameter"/>
   </sequence>
   <attribute name="count" use="optional" type="xsd:unsignedInt"/>
</complexType>
```

3.13.8 s (Character Value)

This element is used to specify an HTML table to import by name. If the tables are not named, they'll be specified with the <x v="[index]">syntax instead.

Parent Elements
metadataStrings (§3.9.9); tables (§3.13.9)

Attributes	Description
v (Value)	The name of the table to retrieve when the web query is refreshed. This corresponds to the string used for the id attribute of the HTML <table> tag. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_XStringElement">
   <attribute name="v" type="ST_Xstring" use="required"/>
</complexType>
```

3.13.9 tables (Tables)

This element serves as the collection of tables to be returned via a web query data connection. Tables are then most commonly referenced by <x> via their indices (in order of the <Table> tags in the HTML page).

Parent Elements
webPr (§3.13.13)

Child Elements	Subclause
m (No Value)	§3.13.4
s (Character Value)	§3.13.8
x (Shared Items Index)	§3.10.1.97

Attributes	Description
count (Count of Tables)	Number of tables to pull data from when refreshing from a web query. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tables">
   <choice minOccurs="1" maxOccurs="unbounded">
      <element name="m" type="CT_TableMissing"/>
      <element name="s" type="CT_XStringElement"/>
      <element name="x" type="CT_Index"/>
   </choice>
   <attribute name="count" use="optional" type="xsd:unsignedInt"/>
</complexType>
```

3.13.10 textField (Text Import Field Settings)

This element specifies field settings for text import.

Parent Elements
textFields (§3.13.11)

Attributes	Description

Attributes	Description
position (Position)	The character position the field starts at for fixed-length fields. The index is 0-based. If this attribute does not exist, position=0 is assumed. Subsequent textField elements or carriage returns in the text stream serve to denote endpoints for text fields. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Field Type)	Specifies the field Type. When text is imported into cells in the worksheet, the data in the cells are converted to the type defined here. Types can be specified by the user, or determined algorithmically via heuristics and text analysis. The possible values for this attribute are defined by the ST_ExternalConnectionType simple type (§3.18.28).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextField">
   <attribute name="type" use="optional" type="ST_ExternalConnectionType" default="general"/>
   <attribute name="position" use="optional" type="xsd:unsignedInt" default="0"/>
</complexType>
```

3.13.11 textFields (Fields)

This element that denotes a set of fields to retrieve from a text file. Contains 1 or more textField elements.

Parent Elements
textPr (§3.13.12)

Child Elements	Subclause
textField (Text Import Field Settings)	§3.13.10

Attributes	Description
count (Count of Fields)	Number of distinct fields to retrieve. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFields">
   <sequence>
      <element name="textField" minOccurs="1" maxOccurs="unbounded" type="CT_TextField"/>
   </sequence>
   <attribute name="count" use="optional" type="xsd:unsignedInt" default="1"/>
</complexType>
```

3.13.12 textPr (Text Import Settings)

This element contains all of the text import settings.

Here's an example of the XML for a text connection:

[*Example*:

```
<connection id="1" name="text data" type="6" refreshedVersion="3" background="1"
  saveData="1">
  <textPr prompt="0" codePage="437" sourceFile="C:\Desktop\text data.txt"
    delimiter="|">
    <textFields count="5">
      <textField/>
      <textField type="text" position="7"/>
      <textField type="text" position="28"/>
      <textField position="36"/>
      <textField type="text" position="41"/>
    </textFields>
  </textPr>
</connection>
```

example]

Parent Elements
connection (§3.13.1)

Child Elements	Subclause
textFields (Fields)	§3.13.11

Attributes	Description
codePage (Code Page)	Code page associated with the text file. [*Example*:s of supported values include: 1256: Arabic (Windows) 775: Baltic (DOS)

Attributes	Description
	28594: Baltic (ISO) 1257: Baltic (Windows) 852: Central European (DOS) 28592: Central European (ISO) 10029: Central European (Mac) 1250: Central European (Windows) 936: Chinese Simplified (GB2312) 950: Chinese Traditional (Big5) 10082: Croatian (Mac) 866: Cyrillic (DOS) 28595: Cyrillic (ISO) 20866: Cyrillic (KOI8-R) 21866: Cyrillic (KOI8-U) 10007: Cyrillic (Mac) 1251: Cyrillic (Windows) 28603: Estonian (ISO) 863: French Canadian (DOC) 737: Greek (DOS) 28597: Greek (ISO) 10006: Greek (Mac) 1253: Greek (Windows) 869: Greek, Modern (DOS) 1255: Hebrew (Windows) 861: Icelandic (DOS) 10079: Icelandic (Mac) 932: Japanese (Shift-JIS) 949: Korean 1361: Korean (Johab) 28605: Latin 9 (ISO) 865: Nordic (DOS) 855: OEM Cyrillic 437: OEM United States 860: Portuguese (DOS) 10010: Romanian (Mac) 20261: T.61 874: Thai (Windows) 857: Turkish (DOS) 28599: Turkish (ISO) 10081: Turkish (Mac) 1254: Turkish (Windows) 10017: Ukrainian (Mac) 65000: Unicode (UTF-7) 65001: Unicode (UTF-8) 20127: US-ASCII 1258: Vietnamese (Windows) 850: Western European (DOS)

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>28591: Western European (ISO)
10000: Western European (Mac)
1252: Western European (Windows)

The possible values for this attribute are defined by the XML Schema unsignedInt datatype.</td></tr>
<tr><td>comma (Comma is Delimiter)</td><td>Flag indicating whether to treat comma characters as field delimiters.

The possible values for this attribute are defined by the XML Schema boolean datatype.</td></tr>
<tr><td>consecutive (Consecutive Delimiters)</td><td>Flag indicating whether consecutive delimiters should be treated as just one delimiter. If this flag is true than it's possible or even likely that some rows will return more fields than others, and these fields will always fill cells in the worksheet from left to right.

The possible values for this attribute are defined by the XML Schema boolean datatype.</td></tr>
<tr><td>decimal (Decimal Separator)</td><td>The decimal separator character. This and the thousands attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used.

The following table shows the results when you import text into a spreadsheet application using various separators. Numeric results are displayed in the rightmost column.

<table>
<tr><th>System decimal separator</th><th>System thousands separator</th><th>Text file decimal separator value</th><th>Text file thousands Separator value</th><th>Text imported</th><th>Cell value (d</th></tr>
<tr><td>Period</td><td>Comma</td><td>Comma</td><td>Period</td><td>123.123,45</td><td>123,123.45 (n</td></tr>
<tr><td>Period</td><td>Comma</td><td>Comma</td><td>Comma</td><td>123.123,45</td><td>123.123,45 (t</td></tr>
<tr><td>Comma</td><td>Period</td><td>Comma</td><td>Period</td><td>123,123.45</td><td>123,123.45 (n</td></tr>
<tr><td>Period</td><td>Comma</td><td>Period</td><td>Comma</td><td>123 123.45</td><td>123 123.45 (t</td></tr>
<tr><td>Period</td><td>Comma</td><td>Period</td><td>Space</td><td>123 123.45</td><td>123,123.45 (n</td></tr>
</table>
Strings values of this attribute are expected to be one character in length.

The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).</td></tr>
<tr><td>delimited (Delimited File)</td><td>true if the file is Tab or character delimited. false if the file should be parsed according to fixed length fields.

The possible values for this attribute are defined by the XML Schema boolean datatype.</td></tr>
</table>

Attributes	Description
delimiter (Custom Delimiter)	User-specified character to be treated as a field delimiter. Only single characters are supported. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
fileType (File Type)	Ignorable attribute with enum value that equals either "Macintosh," "Windows (ANSI)," or "MS-DOS (PC-8)" (see the definition of ST_FileType) and determines the kind of character set to use during import. Only one of fileType and codePage should be specified for a textPr. The possible values for this attribute are defined by the ST_FileType simple type (§3.18.30).
firstRow (First Row)	Indicates at what row of the file to start the data import. All unsignedInt values are valid, although it's possible that firstRow will be higher than the number of rows in the text file, in which case no data will be imported. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
prompt (Prompt for File Name)	Flag indicating whether the user wants to be prompted for the file name on refresh. If `false`, then the user is not prompted. If `true` or not present, then the user is prompted. The possible values for this attribute are defined by the XML Schema boolean datatype.
qualifier (Qualifier)	Character used as the text string qualifier. The possible values for this attribute are defined by the ST_Qualifier simple type (§3.18.63).
semicolon (Semicolon is Delimiter)	Flag indicating whether to treat semicolon characters as field delimiters. The possible values for this attribute are defined by the XML Schema boolean datatype.
sourceFile (Source File Name)	Path to the text file to use to import external data. May be expressed in URI or system-specific file path notation. [*Note*: Applications can decide what forms of URI they support, and whether system-specific file path notations will be supported. *end note*] The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
space (Space is Delimiter)	Flag indicating whether to treat space characters as field delimiters. The possible values for this attribute are defined by the XML Schema boolean datatype.
tab (Tab as	Flag indicating whether to treat tab characters as field delimiters. If `false`, then tabs will

Attributes	Description
Delimiter)	not be used as delimiters. If `true` or not present, then they will be used as delimiters. The possible values for this attribute are defined by the XML Schema boolean datatype.
thousands (Thousands Separator)	The thousands separator character. This and the decimal attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used. Please refer to the decimal attribute description above for a Table describing the behavior. Strings values of this attribute are expected to be one character in length. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextPr">
   <sequence>
      <element name="textFields" minOccurs="0" maxOccurs="1" type="CT_TextFields"/>
   </sequence>
   <attribute name="prompt" use="optional" type="xsd:boolean" default="true"/>
   <attribute name="fileType" use="optional" type="ST_FileType" default="win"/>
   <attribute name="codePage" use="optional" type="xsd:unsignedInt" default="1252"/>
   <attribute name="firstRow" use="optional" type="xsd:unsignedInt" default="1"/>
   <attribute name="sourceFile" use="optional" type="ST_Xstring" default=""/>
   <attribute name="delimited" use="optional" type="xsd:boolean" default="true"/>
   <attribute name="decimal" use="optional" type="ST_Xstring" default="."/>
   <attribute name="thousands" use="optional" type="ST_Xstring" default=","/>
   <attribute name="tab" use="optional" type="xsd:boolean" default="true"/>
   <attribute name="space" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="comma" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="semicolon" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="consecutive" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="qualifier" use="optional" type="ST_Qualifier" default="doubleQuote"/>
   <attribute name="delimiter" use="optional" type="ST_Xstring"/>
</complexType>
```

3.13.13 webPr (Web Query Properties)

This element specifies the properties for a web query source. A web query will retrieve data from HTML tables, and can also supply HTTP "Get" parameters to be processed by the web server in generating the HTML by including the parameters and parameter elements.

Here's an example of a web query connection:

[*Example*:

```
<connection id="1" name="Connection" type="4" refreshedVersion="0"
  background="1" saveData="1">
  <webPr sourceData="1" parsePre="1" consecutive="1"
    url="http://ServerName/Image%20Library/Forms/AllItems.aspx" htmlTables="1">
    <tables count="1">
      <s v="contentthumbnail"/>
    </tables>
  </webPr>
</connection>
```

end example]

Parent Elements
connection (§3.13.1)

Child Elements	Subclause
tables (Tables)	§3.13.9

Attributes	Description
consecutive (Consecutive Delimiters)	Flag indicating whether consecutive delimiters should be treated as just one delimiter. The possible values for this attribute are defined by the XML Schema boolean datatype.
editPage (Edit Query URL)	The URL of the user-facing web page showing the web query data. This URL is persisted in the case that sourceData="true" and url has been redirected to reference an XML file. Then the user-facing page can be shown in the UI, and the XML data can be retrieved behind the scenes. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
firstRow (Use First Row)	Flag indicating whether to parse all tables inside a PRE block with the same width settings as the first row. The possible values for this attribute are defined by the XML Schema boolean datatype.
htmlFormat (HTML Formatting Handling)	How to handle formatting from the HTML source when bringing web query data into the worksheet. Relevant when sourceData is True. Values are as follows: 1. None - no formatting at all 2. RTF - honor just rich text formatting 3. All - honor all html formatting. The possible values for this attribute are defined by the ST_HtmlFmt simple type

Attributes	Description
	(§3.18.43).
htmlTables (HTML Tables Only)	Flag indicating whether web queries should only work on HTML tables. The possible values for this attribute are defined by the XML Schema boolean datatype.
parsePre (Parse PRE)	Flag indicating whether data contained within HTML <PRE> tags in the web page is parsed into columns when you import the page into a query table. The possible values for this attribute are defined by the XML Schema boolean datatype.
post (Web Post)	Returns or sets the string used with the post method of inputting data into a web server to return data from a web query. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
sourceData (Import XML Source Data)	Flag indicating that XML source data should be imported instead of the HTML table itself. Used when a web query exists to an HTML table with the following attribute. `<TABLE ... o:WebQuerySourceHRef="http://..." ... > ... </TABLE>` The possible values for this attribute are defined by the XML Schema boolean datatype.
textDates (Dates as Text)	Flag indicating whether dates should be imported into cells in the worksheet as text rather than dates. The possible values for this attribute are defined by the XML Schema boolean datatype.
url (URL)	URL to use to refresh external data. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
xl2000 (Refreshed in Excel 2000)	This flag exists for backward compatibility with older existing spreadsheet files, and is set to `true` if this web query was refreshed in a spreadsheet application newer than or equal to Microsoft Excel 2000. This is an optional attribute that can be ignored. The possible values for this attribute are defined by the XML Schema boolean datatype.
xl97 (Created in Excel 97)	This flag exists for backward compatibility with older existing spreadhseet files, and is set to `true` if this web query was created in Microsoft Excel 97. This is an optional attribute that can be ignored. The possible values for this attribute are defined by the XML Schema boolean datatype.
xml (XML Source)	`true` if the web query source is XML (versus HTML), otherwise `false`. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebPr">
   <sequence>
      <element name="tables" minOccurs="0" maxOccurs="1" type="CT_Tables"/>
   </sequence>
   <attribute name="xml" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="sourceData" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="parsePre" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="consecutive" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="firstRow" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="xl97" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="textDates" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="xl2000" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="url" use="optional" type="ST_Xstring"/>
   <attribute name="post" use="optional" type="ST_Xstring"/>
   <attribute name="htmlTables" use="optional" type="xsd:boolean" default="false"/>
   <attribute name="htmlFormat" use="optional" type="ST_HtmlFmt" default="none"/>
   <attribute name="editPage" use="optional" type="ST_Xstring"/>
</complexType>
```

3.14 Supplementary Workbook Data

External links are used when linking the workbook to other workbooks or external data. The most frequent feature for linking a workbook to other workbooks is through the use of formulas. In this case the formula references a range or defined name in another workbook. Hyperlinks on cells and other spreadsheet objects are also considered an external link. OLE links are yet another technology used to link the workbook to another object. Finally, Dynamic Data Exchange, or DDE, servers can be used to access external data. DDE servers are accessed through formulas in the workbook.

External links are saved with the target source in a relationship file so that external resources are easily discoverable in lightweight relationship XML rather than deep in the application's XML.

For a workbook consumer.xlsx that makes use of data in another workbook called data.xlsx, the following XML would exist in consumer.xlsx to describe the external link:

[*Example*:

```
<Relationships xmlns="…">
  <Relationship Id="rId1" Type="…/externalLinkPath" Target="data.xlsx"
    TargetMode="External"/>
</Relationships>
```

end example]

And the following XML would exist to describe cached data retrieved from the external workbook:

[*Example*:

```
<externalLink xmlns="…">
  <externalBook xmlns:r="…" r:id="rId1">
    <sheetNames>
      <sheetName val="Sheet1"/>
      <sheetName val="Sheet2"/>
      <sheetName val="Sheet3"/>
    </sheetNames>
    <sheetDataSet>
      <sheetData sheetId="0"/>
      <sheetData sheetId="1"/>
      <sheetData sheetId="2">
        <row r="11">
          <cell r="B11">
            <v>47</v>
          </cell>
        </row>
        <row r="12">
          <cell r="B12">
            <v>19</v>
          </cell>
        </row>
        <row r="13">
          <cell r="B13">
            <v>38</v>
          </cell>
        </row>
      </sheetData>
    </sheetDataSet>
  </externalBook>
</externalLink>
```

end example]

The Supplementary Workbook Data section of SpreadsheetML is complimentary to the External Data Connnections (§3.13) section in maintaining all the information about external information that impacts the workbook.

3.14.1 cell (External Cell Data)

This element is used to store cached values from external sources such as other workbooks. Formulas from external cells are not stored in the consuming workbook. Also, for this context, the attribute t cannot have a value of `inlineStr`. Rich text is not supported in this context either.

Parent Elements

Parent Elements
row (§3.14.12)

Child Elements	Subclause
v (Cell Value)	§3.3.1.93

Attributes	Description

r (Reference)	Describes the cell location in the external book.
	
	[*Example*:
	
	`<cell r="B12">`
	`  <v>74</v>`
	`</cell>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).

t (Type)	Indicates the data type of the cell value. The possible values for this attribute are defined by the ST_CellType simple type (§3.18.12).
vm (Value Metadata)	The index of the cell's value metadata, if any exists. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalCell">
   <sequence>
      <element name="v" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="r" type="ST_CellRef" use="optional"/>
   <attribute name="t" type="ST_CellType" use="optional" default="n"/>
   <attribute name="vm" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

3.14.2 ddeItem (DDE Item definition)

This element represents a DDE item.

Parent Elements
ddeItems (§3.14.3)

Child Elements	Subclause
values (DDE Name Values)	§3.14.19

Attributes	Description
advise (Advise)	Specifies whether the DDE server should notify the application when the external data changes. Default value is `false`. The possible values for this attribute are defined by the XML Schema boolean datatype.
name (DDE Name)	Specifies the DDE item name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
ole (OLE)	Set to `true` if this is item uses OLE. Default value is `false`. The possible values for this attribute are defined by the XML Schema boolean datatype.
preferPic (Data is an Image)	Set to `true` if data from this DDE item is an image format. Default value is `false`. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DdeItem">
    <sequence>
        <element name="values" type="CT_DdeValues" minOccurs="0" maxOccurs="1"/>
    </sequence>
    <attribute name="name" type="ST_Xstring" default="0"/>
    <attribute name="ole" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="advise" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="preferPic" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.14.3 ddeItems (DDE Items Collection)

This element serves as a collection for ddeItem elements.

Parent Elements
ddeLink (§3.14.4)

Child Elements	Subclause
ddeItem (DDE Item definition)	§3.14.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DdeItems">
   <sequence>
      <element name="ddeItem" type="CT_DdeItem" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.14.4 ddeLink (DDE Connection)

This element represents a connection to an external Dynamic Data Exchange (DDE) server. DDE is a method of sending data between applications using Windows messages according to a documented protocol that has been stable since about 1990.

The hierarchy of names defined by a DDE server is Application, Topics, and Items. Topics often correspond to units such as files or documents or database names, and Items refer to subsets of the data such as cell ranges, rows, fields, columns. DDE items can have multiple values as well.

[*Example*:

Data connectivity can use a number of different technologies.The following is just one example of a spreadsheetML fragment describing the product Microsoft Excel being used as a DDE server to provide data to the current spreadsheet document:

```
<ddeLink xmlns:r="…" ddeService="excel" ddeTopic="[ddesource.xls]Sheet1">
  <ddeItems>
    <ddeItem name="R1C1" advise="1"/>
    <ddeItem name="StdDocumentName" ole="1" advise="1"/>
  </ddeItems>
</ddeLink>
```

end example]

Parent Elements
externalLink (§3.14.8)

Child Elements	Subclause
ddeItems (DDE Items Collection)	§3.14.3

Attributes	Description
ddeService (Service name)	Service name (i.e., application name) for the DDE connection. This is a required attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

Attributes	Description
ddeTopic (Topic for DDE server)	Describes something for the DDE application to which the channel pertains— usually a document of that application. This is a required attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DdeLink">
   <sequence>
      <element name="ddeItems" type="CT_DdeItems" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="ddeService" type="ST_Xstring" use="required"/>
   <attribute name="ddeTopic" type="ST_Xstring" use="required"/>
</complexType>
```

3.14.5 definedName (Defined Name)

This element contains information about a named range in an external workbook.

Parent Elements
definedNames (§3.14.6)

Attributes	Description
name (Defined Name)	The defined name. This attribute is required. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

refersTo (Refers To)	Name range definition string.
	
	[*Example*:
	
	`<definedNames>`
	`  <definedName name="namedrange"`
	`  refersTo="='Sheet1'!$D$5:$D$10"/>`
	`</definedNames>`
	
	…end example]
	
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

sheetId (Sheet Id)	The index of the worksheet that the named range applies to for named ranges that are scoped to a particular worksheet rather than the full workbook. This attribute is optional.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalDefinedName">
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="refersTo" type="ST_Xstring" use="optional"/>
   <attribute name="sheetId" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

3.14.6 definedNames (Named Links)

This element is a collection of the defined names associated with the supporting workbook.

Parent Elements
externalBook (§3.14.7)

Child Elements	Subclause
definedName (Defined Name)	§3.14.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalDefinedNames">
   <sequence>
      <element name="definedName" type="CT_ExternalDefinedName" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.14.7 externalBook (External Workbook)

This element represents an external workbook which is supplying data to the current workbook.

Parent Elements
externalLink (§3.14.8)

Child Elements	Subclause
definedNames (Named Links)	§3.14.6
sheetDataSet (Cached Worksheet Data)	§3.14.14
sheetNames (Supporting Workbook Sheet Names)	§3.14.16

Attributes	Description

Attributes	Description
id (Relationship to supporting book file path) Namespace: .../officeDocument/2006/relationships	Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the worksheet XML file in the current spreadsheetML document ZIP archive that makes use of this externalbook. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalBook">
   <sequence>
      <element name="sheetNames" type="CT_ExternalSheetNames" minOccurs="0" maxOccurs="1"/>
      <element name="definedNames" type="CT_ExternalDefinedNames" minOccurs="0" maxOccurs="1"/>
      <element name="sheetDataSet" type="CT_ExternalSheetDataSet" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:id" use="required"/>
</complexType>
```

3.14.8 externalLink (External Reference)

This element is a container for specific types of external links.

Parent Elements
Root element of SpreadsheetML External Workbook References part

Child Elements	Subclause
ddeLink (DDE Connection)	§3.14.4
externalBook (External Workbook)	§3.14.7
extLst (Future Feature Data Storage Area)	§3.2.10
oleLink (OLE Link)	§3.14.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalLink">
   <choice>
      <element name="externalBook" type="CT_ExternalBook" minOccurs="0" maxOccurs="1"/>
      <element name="ddeLink" type="CT_DdeLink" minOccurs="0" maxOccurs="1"/>
      <element name="oleLink" type="CT_OleLink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </choice>
</complexType>
```

3.14.9 oleItem (OLE Link Item)

This element represents an OLE link.

Parent Elements
oleItems (§3.14.10)

Attributes	Description
advise (Advise)	Set to `true` if the OLE server should notify the application when the external data changes. Default value is `false`. The possible values for this attribute are defined by the XML Schema boolean datatype.
icon (Icon)	Set to `true` if the object is represented by an icon. The possible values for this attribute are defined by the XML Schema boolean datatype.
name (Object Name)	The object's name. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).
preferPic (Object is an Image)	Set to `true` if the object is represented by an image. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleItem">
   <attribute name="name" type="ST_Xstring" use="required"/>
   <attribute name="icon" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="advise" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="preferPic" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.14.10 oleItems (OLE Link Items)

This element is a collection of OLE items.

Parent Elements
oleLink (§3.14.11)

Child Elements	Subclause
oleItem (OLE Link Item)	§3.14.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleItems">
   <sequence>
      <element name="oleItem" type="CT_OleItem" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.14.11 oleLink (OLE Link)

This element represents an external link to an OLE2 connection, specified by a progID/object pair.

Parent Elements
externalLink (§3.14.8)

Child Elements	Subclause
oleItems (OLE Link Items)	§3.14.10

Attributes	Description
id (OLE Link Relationship) Namespace: .../officeDocument/2006/relationships	Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the external file name used for this oleLink. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
progId (OLE Link ProgID)	The progID for the OLE connection. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleLink">
   <sequence>
      <element name="oleItems" type="CT_OleItems" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:id" use="required"/>
   <attribute name="progId" type="ST_Xstring" use="required"/>
</complexType>
```

3.14.12 row (Row)

This element contains data for an external worksheet row.

Parent Elements
sheetData (§3.14.13)

Child Elements	Subclause
cell (External Cell Data)	§3.14.1

Attributes	Description
r (Row)	Row number of the row in the external book containing the cell data referenced. This attribute is required. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalRow">
   <sequence>
      <element name="cell" type="CT_ExternalCell" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="r" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.14.13 sheetData (External Sheet Data Set)

This element contains the cached worksheet data associated with a supporting workbook.

For an example, please refer to example at the beginning of this section.

Parent Elements
sheetDataSet (§3.14.14)

Child Elements	Subclause
row (Row)	§3.14.12

Attributes	Description
refreshError (Last Refresh Resulted in Error)	Specifies that the last external data refresh for this sheet did not succeed. The possible values for this attribute are defined by the XML Schema boolean datatype.
sheetId (Sheet Id)	Index of sheet in the external workbook that is referenced and partially cached in this data set. This is a 1-based index. This attribute is required. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalSheetData">
   <sequence>
      <element name="row" type="CT_ExternalRow" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="sheetId" type="xsd:unsignedInt" use="required"/>
   <attribute name="refreshError" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

3.14.14 sheetDataSet (Cached Worksheet Data)

This element serves as the collection for 1 or more sheetData elements.

Parent Elements
externalBook (§3.14.7)

Child Elements	Subclause
sheetData (External Sheet Data Set)	§3.14.13

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalSheetDataSet">
   <sequence>
      <element name="sheetData" type="CT_ExternalSheetData" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

3.14.15 sheetName (Sheet Name)

Name of a worksheet in the supporting workbook

Parent Elements
sheetNames (§3.14.16)

Attributes	Description
val (Sheet Name Value)	Name of the sheet. This attribute is required. The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalSheetName">
   <attribute name="val" type="ST_Xstring"/>
</complexType>
```

3.14.16 sheetNames (Supporting Workbook Sheet Names)

This element is the container for all of the worksheet names in a supporting workbook.

Parent Elements
externalBook (§3.14.7)

Child Elements	Subclause
sheetName (Sheet Name)	§3.14.15

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalSheetNames">
   <sequence>
      <element name="sheetName" minOccurs="1" maxOccurs="unbounded" type="CT_ExternalSheetName"/>
   </sequence>
</complexType>
```

3.14.17 val (DDE Link Value)

This element specifies a value associated with a particular DDE item.

Here's an example of how values, value, and val elements are written out in the spreadsheetML for a ddeItem supplied by a DDE server. In this example different cells in the workbook are bound to these specific DDE items

[*Example*:

```
<ddeLink xmlns:r="…" ddeService="StockSrv" ddeTopic="Prices">
  <ddeItems>
    <ddeItem name="Bread" advise="1">
      <values>
        <value>
          <val>3.5</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="Milk" advise="1">
      <values>
        <value>
          <val>5.7400000000000002</val>
        </value>
      </values>
    </ddeItem>
```

```
      <ddeItem name="MSFT" advise="1">
        <values>
          <value>
            <val>54.130000000000003</val>
          </value>
        </values>
      </ddeItem>
      <ddeItem name="StdDocumentName" ole="1" advise="1"/>
    </ddeItems>
  </ddeLink>
```

example]

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
value (§3.14.18)

3.14.18 value (Value)

This element contains a value associated with a particular DDE item. This serves as a container for the val element.

Parent Elements
values (§3.14.19)

Child Elements	Subclause
val (DDE Link Value)	§3.14.17

Attributes	Description
t (DDE Value Type)	Indicates the type of the DDE value. The possible values for this attribute are defined by the ST_DdeValueType simple type (§3.18.24).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DdeValue">
   <sequence>
      <element name="val" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="t" type="ST_DdeValueType" use="optional" default="n"/>
</complexType>
```

3.14.19 values (DDE Name Values)

This element defines a collection of values associated with DDE item.

Parent Elements
ddeItem (§3.14.2)

Child Elements	Subclause
value (Value)	§3.14.18

Attributes	Description
cols (Columns)	The number of columns of data that will be returned by the DDE server for this DDE item. The default value of this attribute is 1. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rows (Rows)	The number of rows of data that will be returned by the DDE server for this DDE item. The default value of this attribute is 1. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DdeValues">
    <sequence>
        <element name="value" minOccurs="1" maxOccurs="unbounded" type="CT_DdeValue"/>
    </sequence>
    <attribute name="rows" type="xsd:unsignedInt" use="optional" default="1"/>
    <attribute name="cols" type="xsd:unsignedInt" use="optional" default="1"/>
</complexType>
```

3.15 Volatile Dependencies

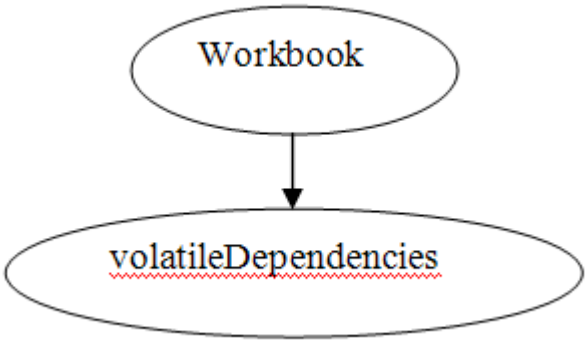
The volatileDependencies part provides a cache of data that supports Real Time Data (RTD) and CUBE functions in the workbook. Both of these types of functions require connectivity to external servers to retrieve their data. For RTD functions, an RTD interface defines how data is provided on the server, and how it is retrieved on the client. Similarly, CUBE functions access data in OLAP cubes via their own function syntax. The volatileDependencies part provides that cache of data and supporting information about these functions and their data servers and connections. This allows the spreadsheet application to work with cached values when recalculating the workbook when the external server is not available.

[*Note*: How users of SpreadsheetML access RTD data depends on the integration the user's spreadsheet application provides for RTD. *end note*]

[*Note*: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/vbaxl11/html/xlobjIRtdServer_HV03085058.asp *end note*]

File Architecture

The workbook holds the relationship to the volatile dependencies part.



Illustration

The following image shows an example implementation of CUBE and Real Time Data (RTD) functions in a worksheet.

	A
1	=RTD("jrtdx.rtd",,"aaa")
2	
3	=CUBEMEMBER("xlextdat9 Adventure Works DW Adventure Works","[Department].[Departments].[Corporate]")
4	=CUBEVALUE("xlextdat9 Adventure Works DW Adventure Works",A3)
5	=CUBESET("xlextdat9 Adventure Works DW Adventure Works","[Customer].[Customer Geography].[All Customers].[United Kingdom].children","Set")
6	=CUBERANKEDMEMBER("xlextdat9 Adventure Works DW Adventure Works",$A$3,ROW(A1))
7	=CUBESETCOUNT(A3)
8	=CUBEMEMBERPROPERTY("xlextdat9 Adventure Works DW Adventure Works","[Product].[Product].[All Products].[Blade]","Class")
9	=CUBEKPIMEMBER("xlextdat9 Adventure Works DW Adventure Works","Growth in Customer Base",2)
10	

The following example shows the XML that describes the functions in the illustration.

[*Example*:

```
<volTypes xmlns="…">
  <volType type="realTimeData">
    <main first="jrtdx.rtd">
      <tp t="s">
        <v>aaa: 4447</v>
        <stp/>
        <stp>aaa</stp>
        <tr r="A1" s="1"/>
      </tp>
    </main>
  </volType>
  <volType type="olapFunctions">
    <main first="xlextdat9 Adventure Works DW Adventure Works">
      <tp t="e">
        <v>#N/A</v>
        <stp>1</stp>
        <tr r="A6" s="1"/>
        <tr r="A9" s="1"/>
        <tr r="A8" s="1"/>
        <tr r="A5" s="1"/>
        <tr r="A4" s="1"/>
        <tr r="A3" s="1"/>
      </tp>
    </main>
  </volType>
</volTypes>
```

end example]

While RTD and Cube functions share the cache, there are differences in how the data is interpreted. For example, RTD dependencies, volTypes/volType/main@first specifies the ProgId of the RTD server. Whereas for OLAP dependencies, main@first indicates the connection name.

3.15.1 main (Main)

Represents dependency information for all topics within a type that share the same first string or function argument.

Parent Elements
volType (§3.15.5)

Child Elements	Subclause
tp (Topic)	§3.15.3

Attributes	Description

first (First String)	Specifies the first string of all topics within this main. This string corresponds to the first argument to the RTD or CUBE function.
	
	For RTD functions, this argument represents the progID of the IRTDServer.
	
	[*Example*:
	`<main first="jrtdx.rtd">`
	end example]
	
	For CUBE functions, this argument represents the CUBE connection.
	
	[*Example*:
	`<main first="xlextdat9 Adventure Works DW Adventure Works">`
	end example]
	
	For more information on RTD and CUBE functions in SpreadsheetML, see §3.17 in Formulas.
	
	The possible values for this attribute are defined by the ST_Xstring simple type (§3.18.96).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VolMain">
   <sequence>
      <element name="tp" type="CT_VolTopic" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="first" type="ST_Xstring" use="required"/>
</complexType>
```

3.15.2 stp (Strings in Subtopic)

Represents all strings in the topic except for the first. An stp is allocated for each additional argument. For example, for the topic {"progid","","foo"}, there would be two STPs: "" and "foo".

For Cube functions, value of "1" indicates that all of the related cells with calling cube functions have been refreshed.

The possible values for this element are defined by the ST_Xstring simple type (§3.18.96).

Parent Elements
tp (§3.15.3)

3.15.3 tp (Topic)

Represents dependency information for all topics within a volatile dependency type that share the same first string or argument.

For the RTD function, this collection will contain the remaining parameters of the function, and indicate the last known value and data type of that value.

Parent Elements
main (§3.15.1)

Child Elements	Subclause
stp (Strings in Subtopic)	§3.15.2
tr (References)	§3.15.4
v (Cell Value)	§3.3.1.93

Attributes	Description

t (Type)	Specifies the type of the cell value. This value corresponds to the type of data returned by the RTD or CUBE function.
	
	In the following RTD example, the value "aaa: 4447" has a string data type.
	
	[*Example*:
	`<tp t="s">`
	`  <v>aaa: 4447</v>`
	`</tp>`
	end example]
	
	For Cube functions, this attribute can be ignored when stp value is "1".
	
	The possible values for this attribute are defined by the ST_VolValueType simple type (§3.18.93).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VolTopic">
   <sequence>
      <element name="v" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
      <element name="stp" type="ST_Xstring" minOccurs="0" maxOccurs="unbounded"/>
      <element name="tr" type="CT_VolTopicRef" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="t" type="ST_VolValueType" use="optional" default="n"/>
</complexType>
```

3.15.4 tr (References)

Represents the reference to a cell that depends on this topic. Each topic may have one or more cells dependencies.

For CUBE functions, each <tr> element contains a cell whose cube function call dependent on the connection in main@first.

Parent Elements
tp (§3.15.3)

Attributes	Description
r (Reference)	Specifies a reference to the cell location. The location is scoped to the sheet specified in s. [*Example*: `<tr r="A6" s="1"/>` *end example*] The possible values for this attribute are defined by the ST_CellRef simple type (§3.18.8).
s (Sheet Id)	Specifies the sheet index. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VolTopicRef">
   <attribute name="r" type="ST_CellRef" use="required"/>
   <attribute name="s" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.15.5 volType (Volatile Dependency Type)

Represents dependency information for a specific type or external data server. There is no limit on the number of external dependencies that may exist for a workbook in SpreadsheetML.

Parent Elements
volTypes (§3.15.6)

Child Elements	Subclause
main (Main)	§3.15.1

Attributes	Description
type (Type)	Specifies the type of the external dependency. [*Example*: <volType type="olapFunctions"> *end example*] The possible values for this attribute are defined by the ST_VolDepType simple type (§3.18.92).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VolType">
   <sequence>
      <element name="main" type="CT_VolMain" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="type" type="ST_VolDepType" use="required"/>
</complexType>
```

3.15.6 volTypes (Volatile Dependency Types)

Represents the collection of external dependencies for a workbook. This element defines the structure of the volatilateDependencies part. There can only be one volatileDependencies part for each workbook. However, the part may contain one or more dependency types.

The volatileDependencies part stores the following information for Real Time Data (RTD) and CUBE functions:

- Cached values
- Parameters used
- Connection and Server names

[*Example*: *Outline of XML Structure*

```
<volTypes xmlns="…">
  <volType type="realTimeData">
  </volType>
  <volType type="olapFunctions">
  </volType>
</volTypes>
```

end example]

Parent Elements
Root element of SpreadsheetML Volatile Dependencies part

Child Elements	Subclause

Child Elements	Subclause
extLst (Future Feature Data Storage Area)	§3.2.10
volType (Volatile Dependency Type)	§3.15.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VolTypes">
   <sequence>
      <element name="volType" type="CT_VolType" minOccurs="1" maxOccurs="unbounded"/>
      <element name="extLst" minOccurs="0" type="CT_ExtensionList"/>
   </sequence>
</complexType>
```

3.16 Custom XML Mappings

Custom XML Mappings enable binding of arbitrary XML data structures and arbitrary XML schema definitions to the workbook. Once a DataBinding has been established, then various XML nodes can be mapped to table columns, ranges of cells, or even single cells (for non-repeating attributes and elements). Once an XML Mapping is fully defined, the application is able to import and export XML instance structures according to the schema definition.

While the original schema or XML definition may reside on disk or at some file location outside the workbook, a copy of the schema is stored in the workbook.

Every time an XML instance or schema is added to the workbook, a new map object is created which ties together the schemas and where the various elements are mapped in the workbook.

[*Example*:

```
<MapInfo SelectionNamespaces="">
  <Schema ID="Schema1">
    <xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema">
      <xsd:element nillable="true" name="Root">
        <xsd:complexType>
          <xsd:sequence minOccurs="0">
            <xsd:element minOccurs="0" nillable="true" name="EmployeeInfo"
              form="unqualified">
```

```
            <xsd:complexType>
              <xsd:sequence minOccurs="0">
                <xsd:element minOccurs="0" nillable="true" type="xsd:string"
                  name="Name" form="unqualified"></xsd:element>
                <xsd:element minOccurs="0" nillable="true" type="xsd:date"
                  name="Date" form="unqualified"></xsd:element>
                <xsd:element minOccurs="0" nillable="true" type="xsd:integer"
                  name="Code" form="unqualified"></xsd:element>
              </xsd:sequence>
            </xsd:complexType></xsd:element>

            <xsd:element minOccurs="0" maxOccurs="unbounded" nillable="true"
              name="ExpenseItem" form="unqualified">
              <xsd:complexType>
                <xsd:sequence minOccurs="0">
                  <xsd:element minOccurs="0" nillable="true" type="xsd:date"
                    name="Date" form="unqualified"></xsd:element>
                  <xsd:element minOccurs="0" nillable="true" type="xsd:string"
                    name="Description" form="unqualified"></xsd:element>
                  <xsd:element minOccurs="0" nillable="true" type="xsd:double"
                    name="Amount" form="unqualified"></xsd:element>
                </xsd:sequence>
              </xsd:complexType></xsd:element>
          </xsd:sequence>
          <xsd:attribute name="Currency" form="unqualified"
            type="xsd:string"></xsd:attribute>
          <xsd:attribute name="Approved" form="unqualified"
            type="xsd:string"></xsd:attribute>
        </xsd:complexType>
      </xsd:element>
    </xsd:schema>
  </Schema>
  <Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
    ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
    PreserveSortAFLayout="true" PreserveFormat="true">
    <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
  </Map>
</MapInfo>
```

end example]

For XML mapped into a SpreadsheetML Table there will also be additional information in the SpreadsheetML file which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in a xmlColumnPr element, under the tableColumn node.

[*Example*:

```
<table xmlns="…" id="1" name="Table1" displayName="Table1" ref="A1:H11"
  tableType="xml" totalsRowShown="0" connectionId="1">
  <tableColumns count="5">
    <tableColumn id="1" uniqueName="Name" name="Name">
      <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Name"
        xmlDataType="string"/>
    </tableColumn>
    <tableColumn id="2" uniqueName="Date" name="Date">
      <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Date"
        xmlDataType="date"/>
    </tableColumn>
    <tableColumn id="3" uniqueName="Code" name="Code">
      <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Code"
        xmlDataType="integer"/>
    </tableColumn>
    <tableColumn id="4" uniqueName="Description" name="Description">
      <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Description"
        xmlDataType="string"/>
    </tableColumn>
    <tableColumn id="5" uniqueName="Amount" name="Amount">
      <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Amount"
        xmlDataType="double"/>
    </tableColumn>
  </tableColumns>
  <tableStyleInfo name="TableStyleMedium9" showFirstColumn="0"
    showLastColumn="0" showRowStripes="1" showColumnStripes="0"/>
</table>
```

end example]

For XML mapped into a single SpreadsheetML cell there will also be additional information in the TableSingleCells part which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in the xmlPr element under the xmlCellPr node.

[*Example*:

```
<singleXmlCells xmlns="…">
  <singleXmlCell id="2" name="Table2" displayName="Table2" r="D19"
    connectionId="1">
    <xmlCellPr id="1" uniqueName="Currency">
      <xmlPr mapId="1" xpath="/Root/@Currency" xmlDataType="string"/>
    </xmlCellPr>
  </singleXmlCell>
```

```
    <singleXmlCell id="3" name="Table3" displayName="Table3" r="D20"
      connectionId="1">
      <xmlCellPr id="1" uniqueName="Approved">
        <xmlPr mapId="1" xpath="/Root/@Approved" xmlDataType="string"/>
      </xmlCellPr>
    </singleXmlCell
    <singleXmlCell id="4" name="Table4" displayName="Table4" r="D18"
      connectionId="1">
      <xmlCellPr id="1" uniqueName="Name">
        <xmlPr mapId="1" xpath="/Root/EmployeeInfo/Name" xmlDataType="string"/>
      </xmlCellPr>
    </singleXmlCell>
  </singleXmlCells>
```

end example]

3.16.1 DataBinding (XML Mapping)

This element contains properties which specify how the XML mapping should work.

[*Example*:

```
  <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
```

end example]

Parent Elements
Map (§3.16.2)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
ConnectionID (Reference to Connection ID)	Specifies the Connection ID to the external connection in the External Data Connections part. Required if FileBinding is true. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
DataBindingLoadMode (XML Data Loading Behavior)	Specifies the mode for loading XML data related to this DataBinding. Supported values are as follows:

Attributes	Description
	0 - None 1 - Normal 2 - Delay Load 3 - Asynchronous 4 - Object Model The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
DataBindingName (Unique Identifer)	Specifies the data binding name. These must be unique for each DataBinding. [*Example*: `<DataBinding DataBindingName="Binding1" FileBinding="true" FileBindingName="Binding1" DataBindingLoadMode="1"/>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
FileBinding (Binding to External File)	Specifies whether the data should be retrieved directly from an XML file. The path to the file is in the corresponding connection element The possible values for this attribute are defined by the XML Schema boolean datatype.
FileBindingName (File Binding Name)	Specifies the file binding name. These must be unique for each DataBinding. [*Example*: `<DataBinding DataBindingName="Binding1" FileBinding="true" FileBindingName="Binding1" DataBindingLoadMode="1"/>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataBinding">
   <sequence>
      <any/>
   </sequence>
   <attribute name="DataBindingName" type="xsd:string" use="optional"/>
   <attribute name="FileBinding" type="xsd:boolean" use="optional"/>
   <attribute name="ConnectionID" type="xsd:unsignedInt" use="optional"/>
   <attribute name="FileBindingName" type="xsd:string" use="optional"/>
   <attribute name="DataBindingLoadMode" type="xsd:unsignedInt" use="required"/>
</complexType>
```

3.16.2 Map (XML Mapping Properties)

This element contains all of the properties related to the XML map, and the behaviors expected during data refresh operations.

[*Example*:

```
<Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
  ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
  PreserveSortAFLayout="true" PreserveFormat="true">
  <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
</Map>
```

end example]

Parent Elements
MapInfo (§3.16.3)

Child Elements	Subclause
DataBinding (XML Mapping)	§3.16.1

Attributes	Description
Append (Append Data to Table)	Specifies whether XML data should overwrite or be appended to the end of the table or range of mapped cells when data is refreshed. The possible values for this attribute are defined by the XML Schema boolean datatype.
AutoFit (AutoFit Table on Refresh)	Specifies whether columns should be resized to fit the XML data after a data refresh operation. The possible values for this attribute are defined by the XML Schema boolean datatype.
ID (XML Mapping ID)	Specifies the ID of the XML map. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
Name (XML Mapping Name)	Specifies the name of the XML map. The possible values for this attribute are defined by the XML Schema string datatype.
PreserveFormat (Preserve Cell Formatting)	Specifies whether cell number formatting in the sheet should be preserved during data refresh operations, or whether the number formatting defined by the XML data type should be used. The possible values for this attribute are defined by the XML Schema boolean datatype.
PreserveSortAFLayout (Preserve AutoFilter State)	Specifies whether to keep the filter state of the Table or cell range intact during a data refresh. The possible values for this attribute are defined by the XML Schema boolean datatype.
RootElement (Root	Specifies the names of the root XML element.

Attributes	Description
Element Name)	The possible values for this attribute are defined by the XML Schema string datatype.
SchemaID (Schema Name)	Specifies the unique name of the schema used for the mapping. The possible values for this attribute are defined by the XML Schema string datatype.
ShowImportExportValidationErrors (Show Validation Errors)	Specifies whether validation errors should be displayed during data refresh or data export. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Map">
   <sequence>
      <element name="DataBinding" type="CT_DataBinding" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="ID" type="xsd:unsignedInt" use="required"/>
   <attribute name="Name" type="xsd:string" use="required"/>
   <attribute name="RootElement" type="xsd:string" use="required"/>
   <attribute name="SchemaID" type="xsd:string" use="required"/>
   <attribute name="ShowImportExportValidationErrors" type="xsd:boolean" use="required"/>
   <attribute name="AutoFit" type="xsd:boolean" use="required"/>
   <attribute name="Append" type="xsd:boolean" use="required"/>
   <attribute name="PreserveSortAFLayout" type="xsd:boolean" use="required"/>
   <attribute name="PreserveFormat" type="xsd:boolean" use="required"/>
</complexType>
```

3.16.3 MapInfo (XML Mapping)

This element acts as the container for all of the XML schemas and maps attached to the SpreadsheetML document.

Parent Elements
Root element of SpreadsheetML Custom XML Mappings part

Child Elements	Subclause
Map (XML Mapping Properties)	§3.16.2
Schema (XML Schema)	§3.16.4

Attributes	Description
SelectionNamespaces (Prefix Mappings for XPath Expressions)	Specifies namespaces for use in XPath expressions when it is necessary to define new namespaces externally. Namespaces are defined in the XML style, as a space-separated list of namespace declaration attributes

Attributes	Description

	[*Example*: The following example contains elements that belong to "a" and "b", in addition to elements that do not belong to any namespace.
	
	`<?xml version="1.0"?>`
	`<root>`
	`<branch>branch</branch>`
	`<a:root xmlns:a="http://myserver.com">`
	`<a:branch>a-branch</a:branch>`
	`<b:branch xmlns:b="http://yourserver.com">`
	`b-branch</b:branch>`
	`</a:root>`
	`</root>`
	end example]
	
	Note: This is used when writing Xpath expressions at runtime against the XML instance structures, because the Xpath expressions use namespace prefixes instead of the fully spelled out namespace.
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MapInfo">
   <sequence>
      <element name="Schema" type="CT_Schema" minOccurs="1" maxOccurs="unbounded"/>
      <element name="Map" type="CT_Map" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="SelectionNamespaces" type="xsd:string" use="required"/>
</complexType>
```

3.16.4 Schema (XML Schema)

This element contains the XML tree for an attached schema.

Parent Elements
MapInfo (§3.16.3)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
ID (Schema ID)	Specifies the unique name or ID for this attached schema. [*Example*: `ID = "Schema1"` *end example*]

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.

Namespace (Schema Root Namespace)	Specifies the namespace used by the schema.
	
	[*Example*:
	
	`<MapInfo SelectionNamespaces="…">`
	`  <Schema ID="Schema1" Namespace="…">`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

SchemaRef (Schema Reference)	The schemaRef attribute is used in the specific case where the schema definition happens to include another XSD that contributes to the same namespace. The value of this attribute is the relative path to a "root" XSD on disk which in turn references the other XDS files contributing type definitions to the same namespace. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Schema">
   <sequence>
      <any/>
   </sequence>
   <attribute name="ID" type="xsd:string" use="required"/>
   <attribute name="SchemaRef" type="xsd:string" use="optional"/>
   <attribute name="Namespace" type="xsd:string" use="optional"/>
</complexType>
```

3.17 Formulas

3.17.1 Introduction

A SpreadsheetML *formula* is an equation that performs a calculation that typically involves the values of one or more cells in one or more worksheets.

A formula is an expression that can contain the following: constants, operators, cell references, calls to functions, and names.

[*Example*: Consider the formula `PI()*(A2^2)`. In this case,

- `PI()` results in a call to the function `PI`, which returns the value of π.
- The cell reference A2 returns the value in that cell.
- 2 is a numeric constant.
- The caret (^) operator raises its left operand to the power of its right operand.
- The parentheses, `(` and `)`, are used for grouping.

- The asterisk (*) operator performs multiplication of its two operands.

end example]

3.17.2 Syntax

The general syntax of a formula is as follows:

formula:
expression

expression:
(*expression*)
constant
prefix-operator *expression*
expression *infix-operator* *expression*
expression *postfix-operator*
cell-reference
function-call
name

where *expression* is an arbitrarily complex expression involving constants (§3.17.2.1), operators (§0), cell references (§3.17.2.3), calls to functions (§3.17.2.4), and names (§3.17.2.5).

A *token* is the minimal lexical element of a formula. The categories of tokens are: constants (except for *array-constant*), operators, cell references, function names, names, and punctuators. The *punctuator*s are:

- Left parenthesis (`(`) and right parenthesis (`)`) used for expression grouping and in a function call.
- Comma (`,`) used in a function call and an *array-constant*.
- Left brace (`{`), right brace (`}`), and semicolon (`;`) used in an *array-constant*.

In a formula, an arbitrary number of space characters (`U+0020`) can precede the first token or follow the final token. An arbitrary number of space characters can separate two adjacent tokens, except that no space characters shall separate a *function-name* from the left parenthesis (`(`) that follows it. Such space characters have no effect on the semantics of a formula; however, such spaces shall be distinguished from the space operator (§0).

All arithmetic terms in an *expression* are real numbers. [*Example*: In the expression `1/3`, although the operands appear to be integers, they are, in fact, real numbers, and the result is `0.33`…, not `0`, as would result from integer division. *end example*]

As ranges of data are fundamental to spreadsheet calculations, many SpreadsheetML functions are able to take arrays as inputs and to return arrays as outputs. The way in which formula return values are returned into the worksheet differs based on whether the formula in a given cell was *array entered* or not, but intermediate calculations are always done for the full arrays when they are used as inputs. The differences with an array-entered formula are:

- No implicit intersection is performed on cell range inputs.

- The results of the formula's calculation can be returned across multiple cells in the sheet.

When a range of cell references is used in a formula that is array-entered in an area larger than that range, the excess cells take on a value of #N/A.

[*Example*: Here are some formulas taking array constants and ranges:

- (B2:B4*C2:C4)+10.5 performs three calculations: (B2*C2)+10.5, (B3*C3)+10.5, and (B4*C4)+10.5.
- SQRT({1,2,3,4}) returns 1 when entered normally.
- SQRT({1,2,3,4}) returns 1 when array-entered into a single cell, but if it's array-entered in four or more cells in a contiguous row, it will return 1, 1.41, 1.73, and 2 in the first four cells, respectively, and #N/A in any additional cells in the horizontal range for which it was array-entered. (For display purposes, the values returned have been truncated to two decimal places.)
- SUM(SQRT({1,2,3,4})) returns 6.14 when entered normally, since array calculations are always performed by the SQRT function, and the array output is understood as a valid input by the SUM function.

With A1:A4 holding the values 1, 2, 3, and 4, respectively:

- SQRT(A1:A4) entered normally will do implicit intersection if it is in any of the rows 1–4, and return the SQRT of the number in the same row.
- SQRT(A1:A4) returns 1 when array-entered into a single cell, since it does not do implicit intersection in this case. If it's array-entered in multiple cells in a contiguous column, it will return 1, 1.41, 1.73, 2, #N/A, …, respectively, in the cells in its vertical output range. *end example*]

3.17.2.1 Constants

A *constant* is a predefined value that is not calculated, and, therefore, does not change. A constant has the following form:

constant:
error-constant
logical-constant
numerical-constant
string-constant
array-constant

error-constant:
#DIV/0! | #N/A | #NAME? | #NULL! | #NUM! | #REF! | #VALUE!

logical-constant:
FALSE
TRUE

numerical-constant:
whole-number-part [.] [*exponent-part*]
. *fractional-part* [*exponent-part*]
whole-number-part . *fractional-part* [*exponent-part*]

whole-number-part:
digit-sequence

fractional-part:
digit-sequence

exponent-part:
e [*sign*] *digit-sequence*
E [*sign*] *digit-sequence*

sign:
+
–

digit-sequence:
a series of one or more decimal digits

string-constant:
" [*string-chars*] "

string-chars
string-char
string-chars string-char

string-char
""
any character except "

To include a double-quote character (") in *string-chars*, precede it with another double-quote character. [*Example*: "ab""cd" contains the characters ab"cd, and """abcd""" contains the characters "abcd". *end example*]

An *array constant* is a list of one or more constants organized in one or two dimensions, and delimited by braces. An array constant has the following form:

array-constant:
{ *constant-list-rows* }

constant-list-rows:
constant-list-row
constant-list-rows ; *constant-list-row*

constant-list-row:
constant
constant-list-row , *constant*

An *array-constant* shall not contain

- An *array-constant*.
- Columns or rows of unequal length.

Any *numerical-constant* in an *array-constant* can be preceded immediately by a *prefix-operator*.

The *constant*s in an *array-constant* can have different types.

[G*uidance* An implementation is encouraged to not unnecessarily limit the number of rows and columns in an *array-constant*. *end guidance*]

[*Example*: `{1,3.5,TRUE,"Hello"}` is a 1x4 array of constants.

To represent the values 10, 20, 30, and 40, as a 1x4 array, use `{10,20,30,40}`.

To represent the values 10, 20, 30, and 40 in the first row, and 50, 60, 70, and 80 in the second row, use the following 2x4 array constant: `{10,20,30,40;50,60,70,80}`. *end example*]

error-constant is described in §3.17.2.7.

Each *constant* has a corresponding type (§3.17.2.6), as follows:

Constant Form	Type
array-constant	array
error-constant	error
logical-constant	logical
numerical-constant	number
string-constant	text

In the context of cell formulas and values in SpreadsheetML, the following definition of precision shall apply:

By default, default representation of precision shall be as defined by the XML schema double type http://www.w3.org/TR/xmlschema-2/#double. The default is therefore 53-bits of mantissa precision.

An application that uses XML schema double can optionally state the precision in the Additional Characteristics part by writing out the number of bits in the mantissa and exponent.

A compliant consumer shall parse numbers of arbitrary precision without error.

3.17.2.2 Operators

An *operator* is a symbol that specifies the type of operation to perform on one or more operands. There are arithmetic, comparison, text, and reference operators.

infix-operator:
: | , | space | ^ | * | / | + | - | & | = | <> | < | <= | > | >=

postfix-operator:
%

prefix-operator:
-

The *operator*s permitted in *expression* are:

Operators			
Family	Operator	Description	Precedence

Operators			
Reference operators	:	Binary range operator, which takes two cell reference (§3.17.2.3) operands, and results in one reference to the cells inclusive of, and between, those references. [*Example*: `SUM(B5:C15)`, which references 11 cells. *end example*]	highest
	,	Binary union operator, which takes two cell reference (§3.17.2.3) operands, and results in one reference to all those, possibly non-contiguous, cells. [*Example*: `SUM((B5:B15,D5:D15))`, which references 22 cells, 11 from column B, and 11 from column D. The grouping parentheses are necessary to indicate that the comma is an operator rather than a punctuator separating two arguments. *end example*]	
	space	Binary intersection operator, which takes two cell reference (§3.17.2.3) operands, and results in one reference to those, possibly non-contiguous, cells that are common. If the intersection is empty, the result is `#NULL!`. [*Example*: `COUNT((B1:C1) (C1:D1))`, which results in a reference to `C1`, while `COUNT((B1:D1) (B1,D1))` results in a single reference to `B1` and `D1`. *end example*]	
Arithmetic operators	-	Unary minus	
	%	Percentage (unary postfix), which divides its operand by 100. [*Example*: `10.5%`, which results in `0.105`. *end example*]	
	^	Exponentiation	
	*	Multiplication	
	/	Division	
	+	Addition	
	-	Subtraction	
Text operator	&	Text concatenation (Each of the two operands is converted to text, if necessary, before concatenation.)	
Comparison operators	=	Equal-to	lowest
	<>	Not-equal-to	
	<	Less-than	

Operators			
	<=	Less-than or equal-to	
	>	Greater-than	
	>=	Greater-than-or-equal-to	

expression can contain grouping parentheses to document the default precedence or to override it.

*operator*s in *expression* having the same precedence associate left-to-right.

[*Example*: Given that cell E38 contains the value 4, and cell F38 contains the value 2, the formula

```
((-1+E38^2)*3-F38)/2
```

produces the result 21.5. *end example*]

The comparison operators yield TRUE for true and FALSE for false. An expression with value 0 tests logically false while one with any non-zero value tests true.

For any given operator in an expression, if only one operand is an error value, the result is that error value. If more than one operand has an error value and those error values are the same, the result is that error value. If more than one operand has an error value and those error values are not all the same, as to which of those error values is used as the result is unspecified.

It the semantics of an operator having a given operand are not specified by this Standard, the result is #VALUE!. [*Example*: "abc"+1 results in #VALUE!, and "abc"/0 results in #VALUE! rather than #DIV/0!. *end example*]

3.17.2.3 Cell References

Each set of horizontal cells in a worksheet is a *row*, and each set of vertical cells is a *column*. A cell's row and column combination designates the location of that cell. [G*uidance* An implementation is encouraged to not unnecessarily limit the number of rows and columns in a worksheet. *end guidance*]

A *cell reference* designates one or more cells on the same worksheet. Using references, one can:

- Use data contained in different parts of the same worksheet in a single formula.
- Use the value from a single cell in several formulas.
- Refer to cells on other sheets in the same workbook, and even to other workbooks. (References to cells in other workbooks are called *links*.)

A cell reference has the following form:

cell-reference:
name
[[[[[*workbook-name*]] [*sheet-name* :]] *sheet-name* !] *A1-reference*
[[[[[*workbook-name*]] [*sheet-name* :]] *sheet-name* !]
A1-reference : *A1-reference*
[[[[[*workbook-name*]] [*sheet-name* :]] *sheet-name* !] *R1C1-reference*
[[[[[*workbook-name*]] [*sheet-name* :]] *sheet-name* !]
R1C1-reference : *R1C1-reference*

workbook-name:
book-name-start-character [*book-name-characters*]

book-name-start-character:
any character except ', *, [,], :, and ?

book-name-characters:
book-name-characters book-name-character

book-name-character:
any character except *, [,], :, and ?

sheet-name:
sheet-name-start-character [*sheet-name-characters*]

sheet-name-start-character:
any character except ', *, [,], \, :, /, and ?

sheet-name-characters:
sheet-name-characters sheet-name-character

sheet-name-character:
any character except *, [,], \, :, /, and ?

A *relative cell reference* is based on the relative position of the cell that contains the formula and the cell to which the reference refers. If the position of the cell that contains the formula changes, the reference is changed along with it.

An *absolute cell reference* always refers to the absolute location of a cell. If the position of the cell that contains the formula changes, the absolute reference remains the same.

A *mixed cell reference* has either an absolute column and relative row, or an absolute row and relative column.

It is possible to process the same cell or set of cells on multiple worksheets within a workbook, using a *3-D reference*. A reference of this type is made up of the cell reference, preceded by a range of worksheet names, and an exclamation mark character (!), in that order. A 3-D reference can be used to refer to cells on other sheets, to defined names, and to create formulas by using the following functions: AVERAGE, AVERAGEA, COUNT, COUNTA, MAX, MAXA, MIN, MINA, PRODUCT, STDEV, STDEVA, STDEVP, STDEVPA, SUM, VAR, VARA, VARP, and VARPA.

3-D references shall not be used in multi-cell formulas.

By default, a cell reference is understood to refer to one or more cells in the current worksheet. However, a cell reference can be preceded by its parent worksheet name and an exclamation mark (!), in that order. This allows

cells in one worksheet to be referenced in another worksheet of the same workbook. [*Example*: The cell reference `MonthlyTotals!D1:D12` might be used from within a sibling (or the same) worksheet of `MonthlyTotals` to refer to those 12 cells. *end example*]

An *area* is a set of rectangular-shaped contiguous cells. An area can be a single cell. [*Example*: `A5` and `B6:C10` each designate one area, and `D3:D5,E12:F15` designates two areas (the comma (`,`) being the union operator). *end example*] [*Note*: The number of areas designated by a cell reference can be obtained by calling the function AREAS (§3.17.7.10). *end note*]

There are two cell reference styles: A1 (§3.17.2.3.1) and R1C1 (§3.17.2.3.2).

3.17.2.3.1 A1-Style Cell References

A cell reference using the A1 reference style has the following form:

A1-reference:
A1-column
A1-row
A1-column *A1-row*

A1-column:
A1-relative-column
A1-absolute-column

A1-relative-column:
A Latin letter A–Z
The Latin letters AA–AZ, BA–BZ, …, ZA–ZZ, AAA-AAZ, ABA–ABZ, …, and so on

A1-absolute-column:
$ *A1-relative-column*

A1-row:
A1-relative-row
A1-absolute-row

A1-relative-row:
A positive decimal number

A1-absolute-row:
$ *relative-row*

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has an alphabetic heading named sequentially from left-to-right, A–Z, then AA–AZ, BA–BZ, …, ZA–ZZ, AAA–AAZ, ABA–ABZ, and so on. Column letters are not case-sensitive.

A relative reference to a single cell is written as its column letter immediately followed by its row number. A relative reference to a whole row is written as its row number. A relative reference to a whole column is written as its column letter. A reference to a range of two or more cells is written as two single-cell references separated by the binary range operator (`:`). An absolute A1 reference is made up of a cell's column letter followed by its row number, with each being preceded by a dollar character (`$`). [*Example*: `A2`, `B34`, and `B5:D8` are relative A1 references. `$A$2`, `$B$34`, and `$B$5:$D$8` are absolute A1 references. `$A2`, `B$34`, and `$B5:D$8` are mixed A1 references. *end example*]

[*Example*: `SUM(Sheet2:Sheet13!B5)` adds all the values contained in cell B5 on all the worksheets between and including Sheet2 and Sheet13. *end example*]

For rules on how deal with potential ambiguities between cell references and defined names, see §3.17.5.1.

3.17.2.3.2 R1C1-Style Cell Reference

A cell reference using the R1C1 reference style has the following form:

R1C1-reference:
R1C1-row
R1C1-column
R1C1-row *R1C1-column*

R1C1-row:
R1C1-relative-row
R1C1-absolute-row

R1C1-relative-row:
R [*R1C1-relative-number*]

R1C1-absolute-row:
R
R *R1C1-absolute-number*

R1C1-column:
R1C1-relative-column
R1C1-absolute-column

R1C1-relative-column:
C [*R1C1-relative-number*]

R1C1-absolute-column:
C
C *R1C1-absolute-number*

R1C1-relative-number:
An optionally signed decimal number

R1C1-absolute-number:
A positive decimal number

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has a numeric heading numbered sequentially from left-to-right, starting at 1.

A whole row is referenced by omitting the column, and a whole column is referenced by omitting the row. An absolute row or column reference uses absolute row or column numbers, respectively. A relative row or column reference uses, respectively, row or column offsets from the cell containing the formula, with a negative offset indicating a row to the left or a column above, and a positive offset indicateing a row to the right or a column below. Specifying an offset of zero is equivalent to omitting that offset and its delimiting brackets. [*Example*: `R[-2]C` refers to the cell two rows up and in the same column, `R[2]C[2]` refers to the cell two rows down and two columns to the right, R2C2 refers to the cell in the second row and in the second column, `R[-1]` refers to the entire row above the active cell, and R refers to the current row. *end example*]

The R1C1 alternate reference style can only be used at runtime. See §3.17.6.1 for XML-related details.

3.17.2.4 Functions

A *function* is a named formula that takes zero or more arguments, performs an operation, and, optionally, returns a result. A function call has the following form:

function-call:
function-name ([*argument-list*])

function-name:
predefined-function-name
user-defined-function-name

predefined-function-name:
ABS | ACOS | ACOSH | any of the other functions defined in §3.17.7

user-defined-function-name:
letter [*user-defined-name-characters*]

user-defined-name-characters:
user-defined-name-characters user-defined-name-character

user-defined-name-character:
letter
any decimal digit 0–9
.

letter:
any Latin letter A–Z, a–z

argument-list:
argument
argument-list , *argument*

argument:
expression

*predefined-function-name*s and *user-defined-function-name*s are not case-sensitive.

A *user-defined-function-name* shall not have any of the following forms:

- TRUE or FALSE
- *name*
- *cell-reference*

[*Guidance*: An implementation is encouraged to support *user-defined-function-name*s at least as long as 255 characters. *end guidance*]

The semantics of a call to a function having a *user-defined-function-name* are unspecified.

[*Example*: Here are some function calls: `PI(), POWER(A1,B3)`, and `SUM(C6:C10)`. *end example*]

An argument to a function can be a call to a function. That is, function calls can nest. [G*uidance* An implementation is encouraged to support at least 64 levels of nested function calls. *end guidance*]

Some functions take a variable number of arguments. This is indicated in the Syntax sections of §3.17.7 by their having *argument-list* as all, or the trailing part, of their argument list. The total number of arguments that shall be passed to such functions is at least 1.

[*Guidance* An implementation is encouraged to support function calls having at least 255 arguments. *end guidance*]

Expressions can have one or more values. Scalar expressions designate a single value, and cell references and array constants can designate multiple values. In the case of a multi-value expression, the way in which this is handled by a function when passed as an argument depends on a number of factors.

Most functions and operators expect either single- or multi-valued arguments and perform all of the array calculations whenever multi-valued arguments are present. [*Example*: `SQRT({1;2;3;4})`; see the examples in §3.17.2. *end example*]

When a function expects a single-valued argument but a multi-valued expression is passed, an attempt can be made to convert that set of values to a single value. For an array value or constant, the value of the expression is the value of the first element within that array value or constant. For a cell range, the first element can be used, or implicit intersection can be performed—the exact behavior is unspecified.

When a function expects a multi-valued argument but a single-valued expression is passed, that single-valued argument is treated as a 1x1 array.

For rules on how deal with potential ambiguities between function names and defined names, see §3.17.5.1.

3.17.2.5 Names

A *name* is an alias for a constant, a cell reference, or a formula. [*Note*: A name in a formula can make it easier to understand the purpose of that formula. For example, the formula `SUM(FirstQuarterSales)` is easier to identify than `SUM(C20:C30)`. *end note*]

Here is the syntax for *name*:

name:
[*workbook-name* !] *name-start-character* [*name-characters*]

name-start-character:
letter
_
\

name-characters:
name-characters name-character

name-character:
letter
any decimal digit 0–9
_
.

*name*s are not case-sensitive.

All *name*s within a workbook shall be unique. If the same *name*s are defined in two workbooks, both *name*s can be used in the same context be prefixing them with their corresponding workbook name and an exclamation mark (`!`). [*Example*: `SUM(Sales.xlsx!ProjectedSales)` refers to the named range `ProjectedSales` in the workbook named `Sales.xlsx`. *end example*]

A *name* shall not have any of the following forms:

- TRUE or FALSE
- *user-defined-function-name*
- *cell-reference*

[*Guidance* An implementation is encouraged to support *name*s at least as long as 255 characters. *end guidance*]

For rules on how deal with potential ambiguities between function names and defined names, or between cell references and defined names, see §3.17.5.1.

3.17.2.6 Types and Values

Each *expression* has a type. SpreadsheetML formulas support the following types: array, error, logical, number, and text.

An array value or constant represents a collection of one or more elements, whose values can have any type (i.e., the elements of an array need not all have the same type).

An error value (§3.17.2.7) or constant represents an error, and can have any value defined for *error-constant* (§3.17.2.1).

A logical value or constant represents a truth value, and can have any value defined for *logical-constant* (§3.17.2.1).

A numeric value or constant represents a real number, and can have any value defined for *numeric-constant* (§3.17.2.1). The term "number" is used as a generic name for any expression of type *number*.

A text value or constant represents arbitrary text, and can have any value defined for *string-constant* (§3.17.2.1). The term "string" is used as a generic name for any expression of type *text*.

An implementation is permitted to provide an implicit conversion from *string-constant* to number. However, the rules by which such conversions take place are implementation-defined. [*Example*: An implementation might choose to accept "123"+10 by converting the string "123" to the number 123. Such conversions might be locale-specific in that a *string-constant* such as "10,56" might be converted to 10.56 in some locales, but not in others, depending on the radix point character. *end example*]

[*Guidance* An implementation is encouraged to support strings at least as long as 32,767 characters. *end guidance*]

A complex number is represented as a string in one of two equivalent text formats: *x* + *y*`i` or *x* + *y*`j`, where *x* is the real part, and *y* is the imaginary part. [*Example*: `"3+4i"` and `"-2.5-34.6j"` *end example*]

3.17.2.7 Single- and Multi-Cell Formulas

A single-cell formula is applied to a single cell while a multi-cell formula is applied to a range of cells as a group.

When a single-cell formula results in a single value, the designated cell takes on that value. [*Example*: When cell `A10` contains `SIN(0.3)`, the result stored in that cell is `0.295520207`. *end example*]

When a multi-cell formula results in a single value, each of the designated cells takes on that value. [*Example*: When the group of cells `A10:A12` contains `SIN(0.3)`, the result stored in each of those cells is `0.295520207`. *end example*]

When a single-cell formula results in multiple values, the designated cell takes on the first of those values. [*Example*: When cell `A10` contains `SIN({0.3,0.4,0.5})`, the result stored in that cell is `0.295520207` (`SIN(0.3)`). *end example*]

When a multi-cell formula results in multiple values (such as when the multi-cell formula is array-entered), the designated cells take on corresponding values, according to the shape of the cell group and the values. Specifically,

- If the cell group and values have the same shape (i.e., the same number of rows and columns), each cell takes on the value corresponding to its relative position.
- If the cell group has fewer columns than the values, the left-most columns of the values are stored in the cells.
- If the cell group has fewer rows than the values, the top-most rows of the values are stored in the cells.
- If the cell group has more columns than the values, each cell takes on the value corresponding to its relative position, except that
    - For a cell group 1x*N* array or a two-dimensional array, the excess right-most cells take on an unspecified value.
    - For a cell group *N*x1 array, the excess columns are clones of the first column.
- If the cell group has more rows than the values, each cell takes on the value corresponding to its relative position, except that:
    - For a cell group *N*x1 array or a two-dimensional array, the excess bottom-most cells take on an unspecified value.
    - For a cell group 1x*N* array, the excess rows are clones of the first row.

[*Example*: Case 1: The 1x3 group of cells `A20:C20` has applied to it the formula `SIN({0.3,0.4,0.5})`. The number of rows and columns in the group exactly matches the number of rows and columns in the result. Those cells then contain 0.295520207, 0.389418342, and 0.479425539, which correspond to `SIN(0.3)`, `SIN(0.4)`, and `SIN(0.5)`, respectively.

Case 2: The 1x2 group of cells A20:B20 has applied to it the formula SIN({0.3,0.4,0.5}). The number of columns in the group is less than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207 and 0.389418342, which correspond to SIN(0.3) and SIN(0.4), respectively, the left-most part of the set of values.

Case 3: The 1x4 group of cells A20:D20 has applied to it the formula SIN({0.3,0.4,0.5}). The number of columns in the group is greater than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207, 0.389418342, 0.479425539, and an unspecified value, which correspond to SIN(0.3), SIN(0.4), and SIN(0.5), respectively, with the fourth value being unspecified.

Case 4: The 2x2 group of cells A30:B31 has applied to it the formula SIN({0.1,0.2,0.3}). The number of columns in the group is less than the number of columns in the result. As a result, the cells in row 30 contain 0.295520207 and 0.389418342, which correspond to SIN(0.3) and SIN(0.4), respectively. The number of rows in the group is greater than the number of rows in the result, so the cells in 31 are a copy of the cells in row 30. The left-most part of the set of values is propagated into the cells.

Case 5: The 2x2 group of cells A40:B41 has applied to it the formula SIN({0.1,0.2,0.3; 0.4,0.5,0.6; 0.7,0.8,0.9}). The number of columns in the group is less than the number of columns in the result. As a result, the left-most column values are stored. The number of rows in the group is less than the number of rows in the result. As a result, the top-most column values are stored. *example*]

3.17.3 Error values

The evaluation of an expression can result in an error having one of a number of *error value*s. These error values are:

Error Value	Reason for Occurrence
#DIV/0!	Intended to indicate when any number, including zero, is divided by zero. [*Note*: However, any error code divided by zero results in that error code. *end note*]
#N/A	Intended to indicate when a designated value is not available. [*Example*: Some functions, such as SUMX2MY2, perform a series of operations on corresponding elements in two arrays. If those arrays do not have the same number of elements, then for some elements in the longer array, there are no corresponding elements in the shorter one; that is, one or more values in the shorter array are not available. *end example*] This error value can be produced by calling the function NA (§3.17.7.221).
#NAME?	Intended to indicate when what looks like a name is used, but no such name has been defined. [*Example*: XYZ/3, where XYZ is not a defined name. Total is & A10, where neither Total nor is is a defined name. Presumably, "Total is " & A10 was intended. SUM(A1C10), where the range A1:C10 was intended. *end example*]
#NULL!	Intended to indicate when two areas are required to intersect, but do not. [*Example*: In the case of SUM(B1 C1), the space between B1 and C1 is treated as the binary intersection operator, when a comma was intended. *end example*]
#NUM!	Intended to indicate when an argument to a function has a compatible type, but has a

Error Value	Reason for Occurrence
	value that is outside the domain over which that function is defined. (This is known as a *domain error*.) [*Example*: Certain calls to ASIN, ATANH, FACT, and SQRT might result in domain errors. *end example*] Intended to indicate that the result of a function cannot be represented in a value of the specified type, typically due to extreme magnitude. (This is known as a *range error*.) [*Example*: FACT(1000) might result in a range error. *end example*]
#REF!	Intended to indicate when a cell reference is invalid. [*Example*: If a formula contains a reference to a cell, and then the row or column containing that cell is deleted, a #REF! error results. If a worksheet does not support 20,001 columns, OFFSET(A1,0,20000) will result in a #REF! error. *end example*]
#VALUE!	Intended to indicate when an incompatible type argument is passed to a function, or an incompatible type operand is used with an operator. [*Example*: In the case of a function argument, text was expected, but a number was provided *end example*]

Each error value has a corresponding *error-constant* (§3.17.2.1).

[*Note*: A number of functions operate on error values: They include ERROR.TYPE (§3.17.7.109), ISERR (§3.17.7.174), ISERROR (§3.17.7.175), and ISNA (§3.17.7.178). *end note*]

3.17.4 Dates and Times

Each unique instant in SpreadsheetML time is represented as a distinct non-negative numeric *serial value*, which is made up of an integer date component and a fractional time component. As dates and times are numeric values, they can take part in arithmetic operations.

Numerous functions take as arguments one or more serial values or strings representing dates and/or times. Functions that care only about the date shall ignore any time information that is provided. Functions that care only about the time shall ignore any date information that is provided.

3.17.4.1 Date Representation

Going forward in time, the date component of a serial value increases by 1 each day.

There are two different bases for serial values:

- In the *1900 date base system*, the lower limit is January 1, 1900, which has serial value 1. The upper-limit is December 31, 9999, which has serial value 2,958,465.
- In the *1904 date base system*, the lower limit is January 1, 1904, which has serial value 0. The upper-limit is December 31, 9999, which has serial value 2,957,003.

A serial value outside of the range for its date base system is ill-formed.

As to which date base system an implementation uses by default or whether it allows its users to switch between date base systems, is unspecified. See §3.17.6.7 for XML-related details. [*Note*: As the XML allows either date base system to be used, an implementation must be able to deal with both systems. *end note*]

For legacy reasons, an implementation using the 1900 date base system shall treat 1900 as though it was a leap year. [*Note*: That is, serial value 59 corresponds to February 28, and serial value 61 corresponds to March 1, the next day, allowing the (non-existent) date February 29 to have the serial value 60. *end note*] A consequence of this is that for dates between January 1 and February 28, `WEEKDAY` shall return a value for the day immediately prior to the correct day, so that the (non-existent) date February 29 has a day-of-the-week that immediately follows that of February 28, and immediately precedes that of March 1.

[*Example*: For the 1900 date base system:

`DATEVALUE("01-Jan-1900")` results in the serial value `1.0000000`…
`DATEVALUE("03-Feb-1910")` results in the serial value `3687.0000000`…
`DATEVALUE("01-Feb-2006")` results in the serial value `38749.0000000`…
`DATEVALUE("31-Dec-9999")` results in the serial value `2958465.0000000`…

For the 1904 date base system:

`DATEVALUE("01-Jan-1904")` results in the serial value `0.0000000`…
`DATEVALUE("03-Feb-1910")` results in the serial value `2225.0000000`…
`DATEVALUE("01-Feb-2006")` results in the serial value `37287.0000000`…
`DATEVALUE("31-Dec-9999")` results in the serial value `2957003.0000000`…

end example]

3.17.4.2 Time Representation

The time component of a serial value ranges in value from 0–0.99999999, and represents times from 0:00:00 (12:00:00 AM) to 23:59:59 (11:59:59 P.M.), respectively.

Going forward in time, the time component of a serial value increases by 1/86,400 each second. [*Note*: As such, the time 12:00 has a serial value time component of 0.5. *end note*]

[*Example*:

`TIMEVALUE("00:00:00")` results in the serial value `0.0000000`…
`TIMEVALUE("00:00:01")` results in the serial value `0.0000115`…
`TIMEVALUE("10:05:54")` results in the serial value `0.4207639`…
`TIMEVALUE("12:00:00")` results in the serial value `0.5000000`…
`TIMEVALUE("23:59:59")` results in the serial value `0.9999884`…

end example]

3.17.4.3 Combined Date and Time Representation

Any date component can be added to any time component to produce a serial value for that date/time combination.

[*Example*: For the 1900 date base system:

`DATE(1910,2,3)+TIME(10,5,54)` results in the serial value `3687.4207639…`
`DATE(1900,1,1)+TIME(12,0,0)` results in the serial value `1.5000000…`
`DATE(9999,12,31)+TIME(23,59,59)` results in the serial value `2958465.9999884…`

For the 1904 date base system:

`DATE(1910,2,3)+TIME(10,5,54)` results in the serial value `2225.4207639…`
`DATE(1904,1,1)+TIME(12,0,0)` results in the serial value `0.5000000…`
`DATE(9999,12,31)+TIME(23,59,59)` results in the serial value `2957003.9999884…`

end example]

3.17.5 Limits and Precision

3.17.5.1 Limits

In SpreadsheetML, cell references range from column A1–A1048576 (column A:A) to column XFD1–XFD1048576 (column XFD:XFD).

An implementation can extend this range. However, to avoid ambiguities, it is necessary to ensure that defined names are distinct from cell references, or that one takes precedence over the other. With this in mind, the following rules apply:

- A producer or consumer shall consider a defined name of the form used by cells in the range A1–XFD1048576 to be invalid.
- All other names outside this range can be defined names and shall override a cell reference if an ambiguity exists.

[*Example*: `LOG10` is always a cell reference, `LOG10(…)` is always a formula, and `LOGO1000` can be a defined name that overrides a cell reference. *end example*]

3.17.5.2 Precision

In order to clarify the semantics of cell formulas and values in SpreadsheetML, it is necessary to specify the precision of the numbers being represented in the file format. These numbers are therefore regarded as ranging over a specific value space, which defaults to the following:

The *value space* consists of the values m × 2^n, where m is an integer whose absolute value is less than 2^53, and n is an integer between -1075 and 970, inclusive. m is herein referred to as the *binary mantissa*, and n is herein referred to as the *binary exponent*.

[*Note*: The default precision is patterned after the IEEE double-precision 64-bit floating-point type [IEEE 754-1985]. *end note*]

Implementing applications can use the characteristics markup (§7.7) to specify other value spaces to replace the default in a given workbook. When present in the workbook, the value space defined using the characteristics markup overrides the default value space.

Regardless of the specific value space in use, values shall have a lexical representation as described in §3.17.5.3. Any numerical expression conforming to this lexical description is valid. However, numbers of higher precision than available in the value space, and numbers that lie outside the range representable in the value space shall be loaded as numbers in the value space or otherwise handled according to the prescription in §3.17.5.4.

3.17.5.3 Lexical Representation

The value space shall have a lexical representation consisting of a base 10 mantissa followed, optionally, by the character "E" or "e", followed by a base 10 exponent. The exponent shall be an integer. The mantissa shall be a decimal number. The representations for exponent and mantissa shall follow the lexical rules for integer and decimal below. If the "E" or "e" and the following exponent are omitted, an exponent value of 0 is assumed.

Lexical representations for zero can take a positive or negative sign.

[*Example*: -1E4, 1267.43233E12, 12.78e-2, 12 , -0, and 0 are all valid literals for numbers in the default value space. 4503599627370497.5 is also a valid literal, although it represents the same value as 4503599627370497 (2^52 + 1) in the default value space (as explained in §3.17.5.4). *end example*]

An *Integer* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) with an optional leading sign. If the sign is omitted, "+" is assumed. [*Example*: -1, 0, 12678967543233, +100000. *end example*]

A *Decimal Number* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) separated by a period as a decimal indicator. An optional leading sign is allowed. If the sign is omitted, "+" is assumed. Leading and trailing zeroes are optional. If the fractional part is zero, the period and following zero(s) can be omitted. [*Example*: -1.23, 12678967.543233, +100000.00, 210. *end example*]

3.17.5.4 Interpretation

Strings that are valid according to the lexical definition in §3.17.5.3 shall be interpreted as values in the value space as follows:

18. The mantissa shall be interpreted as a real number expressed in base 10
19. The exponent shall be interpreted as an integer expressed in base 10
20. The raw value for a numerical expression shall be interpreted as mantissa x $10^{exponent}$
21. If the raw value is larger than the largest value in the value space (2^1023 - 1, by default), or smaller than the smallest value in the value space (- 2^1023 + 1, by default), then a consuming application shall treat this as equivalent to the error value `#NUM!` (§3.17.3). Otherwise the value in the value space that is closest to the raw value is chosen as the interpretation. In the case that two values are equally close, the one with the smaller absolute value is chosen.

3.17.6 XML Representation

3.17.6.1 Cell Reference Style

A workbook saved with reference style A1 (§3.17.2.3.1), shall have the refMode attribute of the calcPr element (§3.2.2) in the Workbook part's XML omitted or set to A1. A workbook saved with reference style R1C1 (§3.17.2.3.2) shall have that refMode attribute set to R1C1. [*Example*: With R1C1 mode set, here is how the XML might look:

```
<workbook …>
  …
  <calcPr calcId="122211" fullCalcOnLoad="1" refMode="R1C1"/>
  …
</workbook>
```

end example]

Regardless of the value of the refMode attribute, cell references shall be stored in XML in the A1 form. [*Note*: This attribute's value tells an implementation which reference style to use at runtime. *end note*]

3.17.6.2 Scalar Formulas

A scalar formula shall be represented in a worksheet's XML by an f element that contains the text of the formula, and a v element that contains the text version of the last computed value for that formula. This pair of elements shall be inside a c element, which is, in turn, shall be inside a row element. [*Example*: Consider the scalar formula SQRT(C2^2+D2^2), where C2 refers to a cell containing the number 12.5, and D2 refers to a cell containing the number 9.6. The corresponding XML might be as follows:

```
<row r="2" spans="2:4">
  <c r="B2" s="40">
    <f>SQRT(C2^2+D2^2)</f>
    <v>15.761027885261798</v>
  </c>
  <c r="C2" s="0">
    <v>12.5</v>
  </c>
  <c r="D2" s="0">
    <v>9.6</v>
  </c>
</row>
```

In the scalar formula CONCATENATE("The total is ",C7," units"), C7 refers to a cell containing the number 23. The corresponding XML might be as follows:

```
<row r="7" spans="2:4" ht="285">
  <c r="B7" s="4" t="str">
    <f>CONCATENATE("The total is ",C7," units")</f>
    <v>The total is 23 units</v>
  </c>
  <c r="C7" s="0">
    <v>23</v>
  </c>
</row>
```

As the function CONCATENATE returns a string, the value for the cell's t attribute is `str`.

end example]

3.17.6.3 Array Formulas

An array-entered formula shall be represented in XML just like other formulas, except that the array-entered formula's f element shall contain an attribute t, whose value shall be `array`.

For a single-cell formula, the r attribute shall designate that cell. [*Example*: Consider the array formula `SUM(C11:C12*D11:D12)`. The corresponding XML might be as follows:

```
<row r="11" spans="2:4" ht="300">
  <c r="B11" s="16">
    <f t="array" r="B11">SUM(C11:C12*D11:D12)</f>
    <v>110</v>
  </c>
  <c r="C11" s="4">
    <v>10</v>
  </c>
  <c r="D11" s="0">
    <v>3</v>
  </c>
</row>
<row r="12" spans="2:4" ht="285">
  <c r="C12" s="4">
    <v>20</v>
  </c>
  <c r="D12" s="0">
    <v>4</v>
  </c>
</row>
```

As this formula is a single-cell formula, the r attribute contains the name of that cell, B11. *end example*]

For a multi-cell formula, the r attribute of the top-left cell of the range of cells to which that formula applies shall designate the range of cells to which that formula applies. The c elements for all cells except the top-left cell in that range shall not have an f element; however, they shall each have a v element. [*Example*: Consider the array formula A1:A3*B1:B3, which is applied to the cell range C1:C3. The corresponding XML might be as follows:

```
<row r="1" spans="1:3">
  <c r="A1" s="0">
    <v>112</v>
  </c>
  <c r="B1" s="0">
    <v>2.34</v>
  </c>
  <c r="C1" s="0">
    <f t="array" r="C1:C3">A1:A3*B1:B3</f>
    <v>262.08</v>
  </c>
</row>
<row r="2" spans="1:3">
  <c r="A2" s="0">
    <v>209</v>
  </c>
  <c r="B2" s="0">
    <v>1.28</v>
  </c>
  <c r="C2" s="0">
    <v>267.52</v>
  </c>
</row>
<row r="3" spans="1:3">
  <c r="A3" s="0">
    <v>128</v>
  </c>
  <c r="B3" s="0">
    <v>3.12</v>
  </c>
  <c r="C3" s="0">
    <v>399.36</v>
  </c>
</row>
```

As this formula is a multi-cell formula, the r attribute of cell C1 contains the name of that cell range, C1:C3, and cells C2 and C3 do not have an f element. *end example*]

3.17.6.4 Formula Evaluation Order

The order in which formulas are evaluated is determined by the order of their corresponding c elements in the calcChain element of the Calculation Chain part (§3.6.2).

3.17.6.5 Name Representation

A formula can contain one or more names. These names shall be defined in the Worksheet part's XML with each being the subject of a definedName element, inside a definedNames element. [*Example*: Consider the scalar formula `SUM(value1,value2)`. The corresponding XML might be as follows:

```
<definedNames>
  <definedName name="value1" localSheetId="0">Sheet2!$B$2</definedName>
  <definedName name="value2" localSheetId="0">Sheet2!$B$3</definedName>
</definedNames>
…
<c r="E5" s="0">
  <f ce="1">SUM(value1,value2)</f>
  <v>8</v>
</c>
```

end example]

Each name shall be the subject of an lpstr element in the Application-Defined File Properties part.

```
<TitlesOfParts>
  <vt:vector … baseType="lpstr">
    <vt:lpstr>Sheet1</vt:lpstr>
    <vt:lpstr>Sheet2</vt:lpstr>
    <vt:lpstr>Sheet3</vt:lpstr>
    <vt:lpstr>value1</vt:lpstr>
    <vt:lpstr>value2</vt:lpstr>
  </vt:vector>
</TitlesOfParts>
```

3.17.6.6 Value Representation

The most recent value of a formula shall be stored in the corresponding v element, as follows:

Result Type	Representation
array	The text form of the array's value.
error	The text form of the error value.
logical	The text `0` for FALSE and `1` for TRUE.
number	The unformatted text form of the number, as accurately as possible.
text	All of the characters in the text.

3.17.6.7 Dates and Times

As a date and/or time is represented by a number, a date/time serial value shall be stored in XML as the unformatted text form of that number, as accurately as possible.

The date base system is recorded in the Workbook part's XML by the presence or absence of the date1904 attribute of the workbookPr element. A value of 1 for this attribute indicates 1904. [*Example*:

```
1900: <workbookPr showObjects="all"/>
1904: <workbookPr date1904="1" showObjects="all"/>
```

end example]

3.17.7 Predefined Function Definitions

The **Syntax** entry for each function defined in this clause corresponds to a call to that function. The names in any **Syntax** entry typeset as in *number* and *string-1*, are parameter names for that function, and are local to that function definition's description.

When the type of an argument passed to a function is incompatible with the type expected the error value #VALUE! is returned by that function.

The set of predefined functions is divided into the following functional categories:

Category	Formulas
Cube	CUBEKPIMEMBER (§3.17.7.65), CUBEMEMBER (§3.17.7.65), CUBEMEMBERPROPERTY (§3.17.7.66), CUBERANKEDMEMBER (§3.17.7.67), CUBESET (§3.17.7.68), CUBESETCOUNT (§3.17.7.69), CUBEVALUE (§3.17.7.70)
Database	DAVERAGE (§3.17.7.77), DCOUNT (§3.17.7.80), DCOUNTA (§3.17.7.81), DGET (§3.17.7.90), DMAX (§3.17.7.91), DMIN (§3.17.7.92), DPRODUCT (§3.17.7.96), DSTDEV (§3.17.7.97), DSTDEVP (§3.17.7.98), DSUM (§3.17.7.99), DVAR (§3.17.7.101), and DVARP (§3.17.7.102).
Date and Time	DATE (§3.17.7.73), DATEDIF (§3.17.7.75), DATEVALUE (§3.17.7.75), DAY (§3.17.7.77), DAYS360 (§3.17.7.79), EDATE (§3.17.7.103), EOMONTH (§3.17.7.105), HOUR (§3.17.7.142), MINUTE (§3.17.7.211), MONTH (§3.17.7.217), NETWORKDAYS (§3.17.7.223), NOW (§3.17.7.231), SECOND (§3.17.7.284), TIME (§3.17.7.320), TIMEVALUE (§3.17.7.321), TODAY (§3.17.7.322), WEEKDAY (§3.17.7.340), WEEKNUM (§3.17.7.342), WORKDAY (§3.17.7.343), YEAR (§3.17.7.346), and YEARFRAC (§3.17.7.348)
Engineering	BESSELI (§3.17.7.23), BESSELJ (§3.17.7.24), BESSELK (§3.17.7.25), BESSELY (§3.17.7.26), BIN2DEC (§3.17.7.29), BIN2HEX (§3.17.7.30), BIN2OCT (§3.17.7.31), COMPLEX (§3.17.7.45), CONVERT (§3.17.7.48), DEC2BIN (§3.17.7.83), DEC2HEX (§3.17.7.85), DEC2OCT (§3.17.7.86), DELTA (§3.17.7.88), ERF (§3.17.7.107), ERFC (§3.17.7.108), GESTEP (§3.17.7.135), HEX2BIN (§3.17.7.138), HEX2DEC (§3.17.7.140), HEX2OCT (§3.17.7.141), IMABS (§3.17.7.148), IMAGINARY (§3.17.7.149), IMARGUMENT (§3.17.7.150), IMCONJUGATE (§3.17.7.151), IMCOS (§3.17.7.152), IMDIV (§3.17.7.153), IMEXP (§3.17.7.154), IMLN (§3.17.7.155), IMLOG10 (§3.17.7.156), IMLOG2 (§3.17.7.157), IMPOWER (§3.17.7.158), IMPRODUCT (§3.17.7.159), IMREAL

3.17.7.1 ABS

Syntax:

ABS (*x*)

Description: Computes the absolute value of *x*.

Arguments:

Name	Type	Description
x	number	The value whose absolute value is to be determined.

Return Type and Value: number – The absolute value of *x*.

[*Example*:

ABS(10.5) results in 10.5
ABS(0) results in 0
ABS(-10.5) results in 10.5

end example]

3.17.7.2 ACCRINT

Syntax:

ACCRINT (*issue* , *first-interest* , *settlement* , *rate* , [*par*] , *frequency* [, [*basis*]])

Description: Computes the accrued interest for a security that pays periodic interest.

Mathematical Formula:

$$ACCRINT = par \times \frac{rate}{frequency} \times \sum_{i=1}^{NC} \frac{A_i}{NL_i}$$

where:

Ai = number of accrued days for the i^{th} quasi-coupon period within odd period.
NC = number of quasi-coupon periods that fit in odd period. If this number contains a fraction, raise it to the next whole number.
NLi = normal length in days of the i^{th} quasi-coupon period within odd period.

Arguments:

Name	Type	Description
issue	number	The security's issue date.
first-interest	number	The security's first interest date.
settlement	number	The security's settlement date.
rate	number	The security's annual coupon rate.
par	number	The security's par value. If omitted, 1,000 is used.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows: `0` or omitted: US (NASD) 30/360 1: Actual/actual 2: Actual/360 3: Actual/365 4: European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The accrued interest for a security that pays periodic interest.

However, if

- *issue*, *first-interest*, or *settlement* is out of range for the current date base value, `#NUM!` is returned
- *issue* ≥ *settlement*, `#NUM!` is returned
- *rate* or *par* ≤ 0, `#NUM!` is returned
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned
- *basis* < 0 or *basis* > 4, `#NUM!` is returned

[*Example*:

`ACCRINT(DATE(2006,3,1),DATE(2006,9,1),DATE(2006,5,1),0.1,1100,2,0)` results in `18.33`
`ACCRINT(DATE(2006,3,1),DATE(2006,9,1),DATE(2006,5,1),0.1,,2,0)` results in `16.67`

end example]

3.17.7.3 ACCRINTM

Syntax:

ACCRINTM (*issue* , *settlement* , *rate* , [[*par*] [, [*basis*]]])

Description: Computes the accrued interest for a security that pays interest at maturity.

Mathematical Formula:

$$ACCRINTM = par \times rate \times \frac{A}{D}$$

where:

A = Number of accrued days counted according to a monthly basis. For interest at maturity items, the number of days from the issue date to the maturity date is used.
D = Annual Year Basis.

Arguments:

Name	Type	Description
issue	number	The security's issue date.
settlement	number	The security's settlement date.
rate	number	The security's annual coupon rate.
par	number	The security's par value. If omitted, 1,000 is used.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360
1	Actual/actual
2	Actual/360
3	Actual/365
4	European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The accrued interest for a security that pays interest at maturity.

However, if

- *issue* or *settlement* is out of range for the current date base value, #NUM! is returned
- *issue* ≥ *settlement*, #NUM! is returned

- *rate* or *par* ≤ 0, #NUM! is returned
- *basis* < 0 or *basis* > 4, #NUM! is returned

[*Example*:

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,1100,0) results in 18.33333333
ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,,0) results in 16.66666667
ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,) results in 16.66666667

end example]

3.17.7.4 ACOS

Syntax:

ACOS (*x*)

Description: Computes the arc cosine of *x*.

Arguments:

Name	Type	Description
x	number	The value whose arc cosine is to be determined.

Return Type and Value: number – The arc cosine of *x*.

However, if *x* is outside the interval [-1,+1], #NUM! is returned

[*Example*:

ACOS(-1) results in 3.141592654
ACOS(0) results in 1.570796327
ACOS(1) results in 0

end example]

3.17.7.5 ACOSH

Syntax:

ACOSH (*x*)

Description: Computes the inverse hyperbolic cosine of *x*.

Arguments:

Name	Type	Description

Name	Type	Description
x	number	The value whose inverse hyperbolic cosine is to be determined.

Return Type and Value: number – The inverse hyperbolic cosine of *x*.

However, if *x* < 1, `#NUM!` is returned.

[*Example*:

`ACOSH(1)` results in `0`
`ACOSH(10)` results in `2.993222846`
`ACOSH(100)` results in `5.298292366`

end example]

3.17.7.6 ADDRESS

Syntax:

```
ADDRESS ( row-number , col-number [ , [ ref-type ] [ , [ A1-ref-style-flag ]
    [ , sheet-name ] ] ] )
```

Description: Creates a cell address, given the specified row and column numbers.

Arguments:

Name	Type	Description
row-number	number	The number of the row.
col-number	number	The number of the column.
ref-type	number	The type of reference to return, as follows: 1 or omitted – Absolute row and column 2 – Absolute row; relative column 3 – Relative row; absolute column 4 – Relative row and column
A1-ref-style-flag	logical	The style of the reference. If TRUE or omitted, an A1-style reference (§3.17.2.3.1) is returned; otherwise, an R1C1-style reference (§3.17.2.3.2) is returned.
sheet-name	text	The name of the worksheet to be used. If omitted, no

Name	Type	Description
		sheet name is used.

Return Type and Value: text – A cell address, given the specified row and column numbers.

However, if

- *row-number* or *col-number* < 1, `#NUM!` is returned.
- *ref-type* is outside the range 1–4, `#NUM!` is returned.

[*Example*:

In A1-reference style mode:

`ADDRESS(5,7,1)` results in `$G$5`
`ADDRESS(5,7,2)` results in `G$5`
`ADDRESS(5,7,3)` results in `$G5`
`ADDRESS(5,7,4)` results in `G5`
`ADDRESS(5,7,,,"Sheet1")` results in `Sheet1!$G$5`

In R1C1-reference style mode:

`ADDRESS(5,7,1,FALSE)` results in `R5C7`
`ADDRESS(5,7,2,FALSE)` results in `R5C[7]`
`ADDRESS(5,7,3,FALSE)` results in `R[5]C7`
`ADDRESS(5,7,4,FALSE)` results in `R[5]C[7]`

end example]

3.17.7.7 AMORDEGRC

Syntax:

AMORDEGRC (*cost* , *date-purchased* , *first-period* , *salvage* , *period* , *rate* [, [*basis*]])

Description: Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account. The function is similar to `AMORLINC` (§3.17.7.7), except that a depreciation coefficient is applied in the calculation depending on the life of the assets.)

Arguments:

Name	Type	Description
cost	number	The cost of the asset.

Name	Type	Description
date-purchased	number	The date of the purchase of the asset.
first-period	number	The date of the end of the first period.
salvage	number	The salvage value at the end of the life of the asset.
period	number	The period.
rate	number	The rate of depreciation.
basis	number	The truncated integer type of day count basis to use, as follows: `0` or omitted – US (NASD) 30/360 1 – Actual/actual 2 – Actual/360 3 – Actual/365 4 – European 30/360

Return Type and Value: number – The depreciation for each accounting period.

However, if

- *cost*, *salvage*, *period*, *or rate* < 0, `#NUM!` is returned.
- *date-purchased* or *first-period* is out of range for the current date base value, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.
- The life of the assets is between 0 and 1, 1 and 2, 2 and 3, or 4 and 5, `#NUM!` is returned.

This function returns the depreciation until the last period of the life of the assets or until the cumulated value of depreciation is greater than the cost of the assets minus the salvage value.

The depreciation coefficients are:

Life of assets (1/rate)	Depreciation Coefficient
Between 3 and 4 years	1.5
Between 5 and 6 years	2
More than 6 years	2.5

The depreciation rate grows to 50 percent for the period preceding the last period, and grows to 100 percent for the last period.

[*Example*:

`AMORDEGRC(2400,DATE(2008,8,19),DATE(2008,12,31),300,1,0.15,1)` results in `776.00`

end example]

3.17.7.8 AMORLINC

Syntax:

```
AMORLINC ( cost , date-purchased , first-period , salvage , period ,
    rate [ , [ basis ] ] )
```

Description: Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account.)

Arguments:

Name	Type	Description
cost	number	The cost of the asset.
date-purchased	number	The date of the purchase of the asset.
first-period	number	The date of the end of the first period.
salvage	number	The salvage value at the end of the life of the asset.
period	number	The period.
rate	number	The rate of depreciation.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360 1 / Actual/actual 2 / Actual/360 3 / Actual/365 4 / European 30/360

Return Type and Value: number – The depreciation for each accounting period.

However, if:

- *cost*, *salvage*, *period*, or *rate* < 0, `#NUM!` is returned.

- *date-purchased* or *first-period* is out of range for the current date base value, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`AMORLINC(2400,DATE(2008,8,19),DATE(2008,12,31),300,1,0.15,1)` results in `360.00`

end example]

3.17.7.9 AND

Syntax:

AND (*argument-list*)

Description: Tests if all *argument*s in *argument-list* are TRUE.

Arguments:

Name	Type	Description
argument-list	logical, array, or cell reference	The *argument*s in *argument-list* designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored.

Return Type and Value: logical – TRUE if all *argument*s in *argument-list* are TRUE; otherwise, FALSE.

However, if no logical values are found, the return value is unspecified.

[*Example*:

`AND(TRUE)` results in TRUE
`AND(TRUE,FALSE)` results in FALSE
`AND(10>5,3=1+2,5)` results in TRUE
`AND({10,5,6,7},TRUE,E6:F6)` results in TRUE, when E6 contains TRUE and F6 contains 10

end example]

3.17.7.10 AREAS

Syntax:

AREAS (*reference*)

Description: Finds the number of areas (§3.17.2.3) designated by *reference*.

Arguments:

Name	Type	Description
reference	reference	A reference to a single cell or to a range of cells that can refer to multiple areas.

Return Type and Value: number – The number of areas designated by *reference*.

However, if the reference designates no areas, `#NUM!` is returned.

[*Example*:

`AREAS(E312)` results in `1`
`AREAS(E311:F313)` results in `1`
`AREAS((E312:F314,G316:H316,G311))` results in 3, given the union of the three areas
`AREAS((E312:F314 E313:F314 F312:F314))` results in 1, given the intersection of the three areas

end example]

3.17.7.11 ASC

Syntax:

ASC (*string*)

Description: For double-byte character set (DBCS) languages, converts all full-width (double-byte) characters to half-width (single-byte) characters.

Arguments:

Name	Type	Description
string	text	Designate the text to be converted. If *string* does not contain any full-width characters, nothing in *string* is converted.

Return Type and Value: text – The text resulting from the conversion.

[*Example*:

`ASC("ABC")` results in ABC
`ASC("エクセル")` results in ｴｸｾﾙ

end example]

3.17.7.12 ASIN

Syntax:

ASIN (*x*)

Description: Computes the arc sine of *x*.

Arguments:

Name	Type	Description
x	number	The value whose arc sine is to be determined.

Return Type and Value: number – The arc sine of *x*.

However, if *x* is outside the interval [-1,+1], #NUM! is returned.

[*Example*:

ASIN(-1) results in -1.570796327
ASIN(0) results in 0
ASIN(1) results in 1.570796327

end example]

3.17.7.13 ASINH

Syntax:

ASINH (*x*)

Description: Computes the inverse hyperbolic cosine of *x*.

Arguments:

Name	Type	Description
x	number	The value whose inverse hyperbolic sine is to be determined.

Return Type and Value: number – The inverse hyperbolic cosine of *x*.

[*Example*:

ASINH(1) results in 0.881373587
ASINH(10) results in 2.99822295
ASINH(100) results in 5.298342366
ASINH(0.5) results in 0.481211825

end example]

3.17.7.14 ATAN

Syntax:

```
ATAN ( x )
```

Description: Computes the arc tangent of *x*.

Arguments:

Name	Type	Description
x	number	The value whose arc tangent is to be determined.

Return Type and Value: number – The arc tangent of *x*.

[*Example*:

`ATAN(-1)` results in `-0.785398163`
`ATAN(0)` results in `0`
`ATAN(1)` results in `0.785398163`
`ATAN(-10)` results in `1.471127674`
`ATAN(10)` results in `1.471127674`

end example]

3.17.7.15 ATAN2

Syntax:

```
ATAN2 ( x , y )
```

Description: Computes the arc tangent of the coordinates *x* and *y*.

Arguments:

Name	Type	Description
x	number	The first coordinate.
y	number	The second coordinate.

Return Type and Value: number – The arc tangent of *x*.

However, if both *x* and *y* are zero, `#DIV/0!` is returned.

[*Example*:

`ATAN2(1,1)` results in `0.785398163`

ATAN2(-2,2) results in 2.35619449
ATAN2(3,-3) results in -0.785398163

end example]

3.17.7.16 ATANH

Syntax:

ATANH (*x*)

Description: Computes the inverse hyperbolic tangent of *x*.

Arguments:

Name	Type	Description
x	number	The value whose inverse hyperbolic tangent is to be determined.

Return Type and Value: number – The inverse hyperbolic tangent of *x*.

However, if *x* is outside the interval [-1,+1], #NUM! is returned.

[*Example*:

ATANH(-0.999999) results in -7.254328619
ATANH(0) results in 0
ATANH(0.999999) results in 7.254328619

end example]

3.17.7.17 AVEDEV

Syntax:

AVEDEV (*argument-list*)

Description: Computes the average of the absolute deviations of a set of data points from their mean. AVEDEV is a measure of the variability in a data set.

Mathematical Formula:

The number of combinations is as follows, where *number* = *n* and *number-chosen* = *k*:

$$\binom{n}{k} = \frac{P_{k,n}}{k!} = \frac{n!}{k!(n-k)!}$$

Arguments:

Name	Type	Description
argument-list	logical, number, name, array, or reference that contains a number. The list can be a single argument that is an array or a reference to an array.	The *argument*s in *argument-list* designate the values for which the average of the absolute deviations is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0value 0 are included.

Return Type and Value: number – The average of the absolute deviations of a set of data points from their mean.

[*Example*:

AVEDEV(-3.5,1.4,6.9,-4.5) results in 4.075
AVEDEV({-3.5,1.4,6.9,-4.5}) results in 4.075

end example]

3.17.7.18 AVERAGE

Syntax:

AVERAGE (*argument-list*)

Description: Computes the arithmetic mean of the numeric values of its arguments.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, or reference that contains a number.	The *argument*s in *argument-list* designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. If an array or cell reference argument contains logical values, text, or empty cells, those values shall be ignored; however, cells having the value 0value 0 shall be counted. [*Note*: The function AVERAGEA (§3.17.7.18) does include cell reference arguments that refer to logical values or text representations of numbers. *end note*]

Return Type and Value: number – The arithmetic mean of the values of its arguments.

[*Example*:

AVERAGE(1,2,3,4,5) results in 3
AVERAGE({1,2;3,4}) results in 2.5
AVERAGE({1,2,3,4,5},6,"7") results in 4
AVERAGE({1,"2",TRUE,4}) results in 2.5, as the logical value and numeric text are ignored

end example]

3.17.7.19 AVERAGEA

Syntax:

AVERAGEA (*argument-list*)

Description: Computes the arithmetic mean of the values of its arguments.

Arguments:

Name	Type	Description
argument-list	logical, number, text, or reference that contains a number.	The *argument*s in *argument-list* designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. Arguments with value TRUE evaluate to 1; arguments with value FALSE evaluate to 0. An array or cell reference argument that contains text evaluates to 0. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[*Note*: The function AVERAGE (§3.17.7.18) does not include cell reference arguments that refer to logical values or text representations of numbers. *end note*]

Return Type and Value: number – The arithmetic mean of the values of its arguments.

[*Example*:

AVERAGEA(10,E1), where E1 is an empty cell, results in 10, as E1 is ignored
AVERAGEA(10,E2), where E2 contains TRUE, results in 5.5
AVERAGEA(10,E3), where E3 contains FALSE, results in 5

end example]

3.17.7.20 AVERAGEIF

Syntax:

AVERAGEIF (*cell-range* , *selection-criteria* [, *average-range*])

Description: Applies selection criteria on the values in one range of cells and averages the values of the cells in a corresponding range.

Arguments:

Name	Type	Description
cell-range	reference	The range of cells to be inspected. Cells in *cell-range* that contain TRUE or FALSE are ignored. If a cell is an empty cell, it is ignored.
selection-criteria	number, expression, reference, text	Designates the cells that are to be averaged. In the case of text, *selection-criteria* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. *selection-criteria* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). If a cell in *selection-criteria* is empty, it is treated as if it contained 0.
average-range	reference	Designates the cells whose values are averaged. In this case, *average-range* need not have the same size and shape as *cell-range*. The actual cells that are averaged are determined by using the top, left cell in *average-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range*. If *average-range* is omitted, *cell-range* also designates the cells whose values are averaged. If a cell is an empty cell, it is ignored.

Return Type and Value: number – The average of the values of the cells corresponding to those selected.

However, if no cells in the range meet the criteria, the return value is unspecified.

[*Example*: Assuming A2:A4 contains 10, 20, and 30:

AVERAGEIF(A2:A4,“>15”) results in 25, the average of 20 and 30.

end example]

3.17.7.21 AVERAGEIFS

Syntax:

AVERAGEIFS (*average-range* , *cell-range-1* , *selection-criteria-1*
[, *cell-range-2* , *selection-criteria-2* [, …]])

Description: The average of the values of all cells that meet multiple criteria.

Arguments:

Name	Type	Description
average-range	reference	Designates the cells whose values are averaged. In this case, *average-range* need not have the same size and shape as *cell-range-1* through *cell-range-n*. The actual cells that are added are determined by using the top, left cell in *average-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range-1* through *cell-range-n*. If a cell in *average-range* is empty, that cell is ignored. Each cell in *average-range* is used in the average calculation only if all of the corresponding criteria specified are true for that cell.
cell-range-1	number, expression, reference, text	Designates the first range of cells to be inspected.
selection-criteria-1	reference, text	*selection-criteria-1* specifies the criteria for the first range of cells that will be averaged. In the case of text, *selection-criteria-1* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. If a cell in any selection criteria range is empty, it is treated as if its value was 0. Cells that contain TRUE evaluate to 1; cells in any range that contain FALSE evaluate to 0. *selection-criteria-1* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
cell-range-n	number, expression, reference, text	The optional arguments *selection-criteria-2* through *selection-criteria-n* have corresponding arguments *cell-range-2* through *cell-range-n*, and have the same semantics as *selection-criteria-1* and *cell-range-1*, respectively.
selection-criteria-n	reference, text	

Return Type and Value: number – The average of the cells corresponding to those selected.

However, if

- Cells in *average-range* are empty or contain text values that cannot be translated into numbers, the return value is unspecified.
- There are no cells that meet all the criteria, the return value is unspecified.

[*Example*: Given the following data:

	A	B	C	D
1	Student	First Quiz Grade	Second Quiz Grade	Final Exam Grade
2	Emilio	75	85	87
3	Julie	94	80	88
4	Hans	86	93	Incomplete
5	Frederique	Incomplete	75	75

`AVERAGEIFS(B2:B5,B2:B5,">70",B2:B5,"<90")` results in `80.5` (the average for all students all first quiz grades that are between 70 and 90)

`AVERAGEIFS(D2:D5,D2:D5,"<>Incomplete",D2:D5,">80")` results in `87.5` (the average for all students all first quiz grades that are above 80 and not marked "Incomplete")

`AVERAGEIFS(B2:D5,B2:B5,"<>Incomplete",C2:C5,"<>Incomplete",D2:D5, "<>Incomplete")` results in 82.375 (the average grades for all students who do not have incomplete grades)

end example]

3.17.7.22 BAHTTEXT

Syntax:

`BAHTTEXT` (*number*)

Description: Produces a string containing *number* formatted according to the Thai convention.

Arguments:

Name	Type	Description
number	number	The value to be formatted.

Return Type and Value: text – The text containing *number* formatted.

[*Example*:

`BAHTTEXT(1234)` results in หนึ่งพันสองร้อยสามสิบสี่บาทถ้วน

end example]

3.17.7.23 BESSELI

Syntax:

```
BESSELI ( x , n )
```

Description: The modified Bessel function In(x), which is equivalent to the Bessel function Jn(x) evaluated for purely imaginary arguments.

Mathematical Formula:

The n-th order modified Bessel function of the variable x is:

$$I_n(x) = (i)^{-n} J_n(ix)$$

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Bessel function In(x).

However, if *n* < 0, `#NUM!` is returned.

[*Example*:

`BESSELI(-5.6,0)` results in `46.73755194`
`BESSELI(2.345,5)` results in `0.023137792`

end example]

3.17.7.24 BESSELJ

Syntax:

```
BESSELJ ( x , n )
```

Description: The Bessel function Jn(x).

Mathematical Formula:

The n-th order Bessel function of the variable x is:

$$J_n(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k!\Gamma(n+k+1)} \left(\frac{x}{2}\right)^{n+2k}$$

where:

$$\Gamma(n+k+1) = \int_0^{\infty} e^{-x} x^{n+k} dx$$

is the Gamma function.

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Bessel function Jn(x).

However, if *n* < 0, `#NUM!` is returned.

[*Example*:

`BESSELJ(-5.6,0)` results in `0.026970887`
`BESSELJ(2.345,5)` results in `0.014627862`

end example]

3.17.7.25 BESSELK

Syntax:

```
BESSELK ( x , n )
```

Description: The modified Bessel function Kn(x), which is equivalent to using the Bessel function Jn(x) and Yn(x).

Mathematical Formula:

The n-th order modified Bessel function of the variable x is:

$$K_n(x) = \frac{p}{2} i^{n+1} [J_n(ix) + iY_n(ix)]$$

where Jn and Yn are the J and Y Bessel functions, respectively.

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Bessel function Kn(x).

However, if *n* < 0, `#NUM!` is returned.

[*Example*:

`BESSELK(2.345,5)` results in `3.904137225`

end example]

3.17.7.26 BESSELY

Syntax:

```
BESSELY ( x , n )
```

Description: Weber's Bessel function Yn(x).

Mathematical Formula:

The n-th order Bessel function of the variable x is:

$$Y_n(x) = \lim_{\nu \to n} \frac{J_\nu(x)\cos(\nu\pi) - J_{-\nu}(x)}{\sin(\nu\pi)}$$

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.
n	number	The order of the Bessel function. This value is truncated to an integer.

Return Type and Value: number – The Weber's Bessel function Yn(x).

However, if *n* < 0, `#NUM!` is returned.

[*Example*:

`BESSELY(2.345,5)` results in `-4.98977884`

end example]

3.17.7.27 BETADIST

Syntax:

BETADIST (*x* , *alpha* , *beta* [, [*A*] , [*B*]])

Description: Computes the cumulative beta probability density function.

Arguments:

Name	Type	Description
x	number	The value between A and B at which to evaluate the function.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution.
A	number	The lower bound to the interval of x. If omitted, the lower bound is 0.
B	number	The upper bound to the interval of x. If omitted, the upper bound is 1.

Return Type and Value: number – The cumulative beta probability density function.

However, if

- *alpha* or *beta* ≤ 0, `#NUM!` is returned.
- $x < A$, $x > B$, or $A = B$, `#NUM!` is returned.

[*Example*:

`BETADIST(0.5,1,2)` results in `0.75`
`BETADIST(0.5,1,2,-4.5,7.3)` results in `0.66791152`
`BETADIST(0.5,1,2,,2.3)` results in `0.387523629`

end example]

3.17.7.28 BETAINV

Syntax:

BETAINV (*probability* , *alpha* , *beta* [, [*A*] , [*B*]])

Description: Computes the inverse of the cumulative distribution function for a specified beta distribution. Given a value for *probability*, BETAINV is used to seek for the value x such that BETADIST(*x*, *alpha*, *beta*,

A, *B*) = *probability*. Thus, precision of BETAINV depends on precision of BETADIST. BETAINV uses an iterative search technique.

Arguments:

Name	Type	Description
probability	number	A probability associated with the beta distribution.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution.
A	number	The lower bound to the interval of *x*. If omitted, the lower bound is 0.
B	number	The upper bound to the interval of *x*. If omitted, the upper bound is 1.

Return Type and Value: number – The inverse of the cumulative distribution function for a specified beta distribution.

However, if

- *alpha* or *beta* ≤ 0, #NUM! is returned.
- *probability* < 0 or *probability* > 1, #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned.

[*Example*:

BETAINV(0.5,1,2) results in 0.29289341
BETAINV(0.5,1,2,-4.5,7.3) results in -1.043857765
BETAINV(0.5,1,2,,2.3) results in 0.673654842

end example]

3.17.7.29 BIN2DEC

Syntax:

BIN2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

Name	Type	Description
number	number	A 10-digit binary number that is to be converted to a

Name	Type	Description
		decimal string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, `#NUM!` is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range `1000000000` (-512 decimal) to `0111111111` (511 decimal), inclusive, `#NUM!` is returned.

[*Example*:

`BIN2DEC(111)` results in 7
`BIN2DEC(11111111)` results in 255
`BIN2DEC(1111111110)` results in -2
`BIN2DEC(1000000000)` results in -512

end example]

3.17.7.30 BIN2HEX

Syntax:

`BIN2HEX ( number [ , num-hex-digits ] )`

Description: Makes the uppercase hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

Name	Type	Description
number	number	A 10-digit binary number that is to be converted to a hexadecimal string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.
num-hex-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-hex-digits* is ignored and the result has 10 digits. If *num-*

Name	Type	Description
		hex-digits is omitted, the minimum number of digits is used in the result. *num-hex-digits* is truncated to an integer.

Return Type and Value: text – The uppercase hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, `#NUM!` is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range `1000000000` (200 hex, -512 decimal) to `0111111111` (1FF hex, 511 decimal), inclusive, `#NUM!` is returned.
- *number* needs more digits that *num-hex-digits*, `#NUM!` is returned.
- *num-hex-digits* ≤ 0 or > 10, `#NUM!` is returned.

[*Example*:

`BIN2HEX(1)` results in `1`
`BIN2HEX(1,4)` results in `0001`
`BIN2HEX(111111)` results in `3F`
`BIN2HEX(1111000000)` results in `FFFFFFFFC0`
`BIN2HEX(1000000000,3)` results in `FFFFFFFE00`

end example]

3.17.7.31 BIN2OCT

Syntax:

`BIN2OCT ( number [ , num-oct-digits ] )`

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

Name	Type	Description
number	number	A 10-digit binary number that is to be converted to an octal string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.
num-oct-digits	number	*num-oct-digits* is the number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-oct-digits* is ignored and the result has

Name	Type	Description
		10 digits. If *num-oct-digits* is omitted, the minimum number of digits is used in the result. *num-oct-digits* is truncated to an integer.

Return Type and Value: text – The octal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, `#NUM!` is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range `1000000000` (1000 octal, -512 decimal) to `0111111111` (0777 octal, 511 decimal), inclusive, `#NUM!` is returned.
- *number* needs more digits that *num-oct-digits*, `#NUM!` is returned.
- *num-oct-digits* < 0 or > 10, `#NUM!` is returned.

[*Example*:

`BIN2OCT(1)` results in `1`
`BIN2OCT(1,4)` results in `0001`
`BIN2OCT(111111)` results in `77`
`BIN2OCT(1111000000)` results in `7777777700`
`BIN2OCT(1000000000,3)` results in `7777777000`

end example]

3.17.7.32 BINOMDIST

Syntax:

`BINOMDIST` (*number-successes* , *number-trials* , *success-probability* , *cumulative-flag*)

Description: Computes the individual term binomial distribution probability.

Mathematical Formula:

The binomial probability mass function is:

$$b(x;n,p) = \binom{n}{x} p^x (1-p)^{n-x}$$

where:

$$\binom{n}{x}$$

is `COMBIN(n,x)`.

The cumulative binomial distribution is:

$$B(x;n,p) = \sum_{y=0}^{x} b(y;n,p)$$

Arguments:

Name	Type	Description
number-successes	number	The number of successes in *number-trials*, truncated to an integer.
number-trials	number	The number of independent trials, truncated to an integer.
success-probability	number	The probability of success on each trial.
cumulative-flag	logical	Determines the form of the function. If TRUE, then the cumulative distribution function is returned, which is the probability that there are at most *number-successes* successes; if FALSE, the probability mass function is returned, which is the probability that there are *number-successes* successes.

Return Type and Value: number – The individual term binomial distribution probability.

However, if

- *number-successes* < 0 or *number-successes* > *number-trials*, `#NUM!` is returned.
- *success-probability* < 0 or *success-probability* > 1, `#NUM!` is returned.

[*Example*:

`BINOMDIST(6,10,0.5,FALSE)` results in `0.205078125`
`BINOMDIST(6,10,0.5,TRUE)` results in `0.828125`

end example]

3.17.7.33 CEILING

Syntax:

`CEILING ( x , significance )`

Description: Computes a value that is *x* rounded-up, away from zero, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
x	number	The value to be rounded
significance	number	The multiple to which *x* is to be rounded.

Return Type and Value: number – The rounded-up value of *x*.

However, if *x* and *significance* have different signs, `#NUM!` is returned.

[*Example*:

`CEILING(2.5,1)` rounds 2.5 up to nearest multiple of 1; that is, to 3
`CEILING(-2.5,-2)` rounds -2.5 up to nearest multiple of -2; that is, to `-4`
`CEILING(1.5,0.1)` rounds 1.5 up to the nearest multiple of 0.1; that is, to `1.5`
`CEILING(0.234,0.01)` rounds 0.234 up to the nearest multiple of 0.01; that is, to `0.24`

end example]

3.17.7.34 CELL

Syntax:

`CELL` (*category* [, *reference*])

Description: Retrieves information about the formatting, location, or contents of the upper-left cell indicated by *reference*. *category* indicates the kind of information to be retrieved.

Arguments:

Name	Type	Description
category	text	The category string as defined in the table following.
reference	reference	Refers to the cell whose category information is being requested. If *reference* is a cell range, the first cell in that range is the cell whose category information is being requested. If *reference* is omitted, the information retrieved pertains to the most recent cell whose value was changed. For the category `"format"`, if *reference* designates a cell formatted with a built-in number format, the number format string is as defined in the table following.

category	Meaning	Result Type
`"address"`	Reference of the first cell in *reference*.	text
`"col"`	Column number of the cell in *reference*.	number

category	Meaning	Result Type
"color"	1 if the cell is formatted in color for negative values; otherwise, 0. 0 if the cell does not contain a number.	number
"contents"	Value of the upper-left cell in *reference*.	Text or number
"filename"	Fully qualified filename of the file that contains *reference*. However, if the worksheet that contains *reference* has not yet been saved, the filename is an empty string.	text
"format"	Number format of the cell. (See the table of formats below.) The number format string has "-" appended if the cell is formatted in color for negative values. The number format string has "()" appended if the cell is formatted in color for positive or all values.	text
"parentheses"	1 if the cell is formatted with parentheses for positive or all values; otherwise, 0. 0 if the cell does not contain a number.	number
"prefix"	Text value corresponding to the label prefix of the cell, as follows: • Single quotation mark (') if the cell contains left-aligned text • Double quotation mark (") if the cell contains right-aligned text • Caret (^) if the cell contains centered text • Backslash (\) if the cell contains fill-aligned text • Empty string if the cell contains anything else	text
"protect"	0 if the cell is not locked; otherwise, 1.	number
"row"	Row number of the cell in reference.	number
"type"	Text value corresponding to the type of data in the cell. • "b" (blank) if the cell is empty • "l" (label) if the cell contains a text constant • "v" (value) if the cell contains anything else	text
"width"	Column width of the cell rounded off to an integer. Each unit of column width is equal to the width of one character in the default font size.	number

Format	Number Format String
0	"F0"
0.00	"F2"
#,##0	",0"
#,##0.00	",2"
$#,##0_);($#,##0)	"C0"

Format	Number Format String
$#,##0_);[Red]($#,##0)	"C0-"
$#,##0.00_);($#,##0.00)	"C2"
$#,##0.00_);[Red]($#,##0.00)	"C2-"
0%	"P0"
0.00%	"P2"
0.00E+00	"S2"
General	"G"
# ?/? # ??/??	"G"
d-mmm-yy dd-mmm-yy	"D1"
d-mmm dd-mmm	"D2"
mmm-yy	"D3"
m/d/yy m/d/yy h:mm mm/dd/yy	"D4"
mm/dd	"D5"
h:mm:ss AM/PM	"D6"
h:mm AM/PM	"D7"
h:mm:ss	"D8"
h:mm	"D9"

Return Type and Value: various (see table above) – The value corresponding to *category*, and whose type is shown in the category value table above.

However, if *category* is invalid, #VALUE! is returned.

[*Example*:

CELL("address",A10) might result in $E$289
CELL("contents",A10:B10), results in xxx, when A10 contains xxx, and B10 contains anything
CELL("filename",A10) might result in E:\Formulas\[Test.xlsx]Sheet1
CELL("format",A10) results in G, when A10 contains xxx
CELL("format",A10) results in F2-, when A10 contains (123.00)
CELL("format",A10) results in C3-, when A10 contains $123,456.780
CELL("format",A10) results in S3, when A10 contains 1.235E+05
CELL("prefix",A10) results in ', when A10 contains xxx
CELL("type",A10) results in l, when A10 contains xxx

end example]

3.17.7.35 CHAR

Syntax:

CHAR (*x*)

Description: Determines the character that is represented by the value *number*.

Arguments:

Name	Type	Description
x	number	A value in the range 1–255, which designates the character.

Return Type and Value: text – The character represented by the value *number*.

[*Example*:

CHAR(65) results in A
CHAR(A10) results in A, when A10 contains 65

end example]

3.17.7.36 CHIDIST

Syntax:

CHIDIST (*x* , *degrees-freedom*)

Description: Computes the one-tailed probability of the chi-squared distribution.

Mathematical Formula:

CHIDIST = P(X>x), where X is a $\chi 2$ random variable.

Arguments:

Name	Type	Description
x	number	The value at which the distribution is to be evaluated.
degrees-freedom	number	The number of degrees of freedom, truncated to an integer.

Return Type and Value: number – The one-tailed probability of the chi-squared distribution.

However, if

- $x < 0$, #NUM! is returned.
- *degrees-freedom* < 1 or *degrees-freedom* > 10^{10}, #NUM! is returned.

[*Example*:

CHIDIST(3.5,4) results in 0.47787835
CHIDIST(12.34,7) results in 0.089917721

end example]

3.17.7.37 CHIINV

Syntax:

CHIINV (*probability* , *degrees-freedom*)

Description: Computes the inverse of the one-tailed probability of the chi-squared distribution. Given a value for *probability*, CHIINV seeks for a value *x* such that CHIDIST(*x*, *degrees-freedom*) = *probability*. Thus, precision of CHIINV depends on precision of CHIDIST. CHIINV uses an iterative search technique.

Arguments:

Name	Type	Description
probability	number	A probability associated with the chi-squared distribution.
degrees-freedom	number	The number of degrees of freedom, truncated to an integer.

Return Type and Value: number – The inverse of the one-tailed probability of the chi-squared distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom* < 1 or *degrees-freedom* ≥ 10^{10}, #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned

[*Example*:

CHIINV(0.5,4) results in 3.356694001
CHIINV(0.3,7) results in 8.38343064

end example]

3.17.7.38 CHITEST

Syntax:

CHITEST (*actual-range* , *expected-range*)

Description: Computes the test for independence. CHITEST returns the value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

Mathematical Formula:

The χ2 test first calculates a χ2 statistic using the formula:

$$\chi^2 = \sum_{i=1}^{r} \sum_{j=1}^{c} \frac{\left(A_{ij} - E_{ij}\right)^2}{E_{ij}}$$

where:

Aij = actual frequency in the i-th row, j-th column
Eij = expected frequency in the i-th row, j-th column
r = number or rows
c = number of columns

CHITEST uses the χ2 distribution with an appropriate number of degrees of freedom, df. If r > 1 and c > 1, then df = (r - 1)(c - 1). If r = 1 and c > 1, then df = c - 1 or if r > 1 and c = 1, then df = r - 1.

Arguments:

Name	Type	Description
actual-range	reference	The range of data that contains observations to test against expected values.
expected-range	reference	The range of data that contains the ratio of the product of row totals and column totals to the grand total.

Return Type and Value: number – The value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

However, if:

- The number of rows and columns is exactly one, the return value is unspecified.
- *actual-range* and *expected-range* have a different number of data points, the return value is unspecified.

[*Example*: Given the following data:

	A	B	C

	A	B	C
1	Men (Actual)	Women (Actual)	Description
2	58	35	Agree
3	11	25	Neutral
4	10	23	Disagree
5	Men (Expected)	Women (Expected)	Description
6	45.35	47.65	Agree
7	17.56	18.44	Neutral
8	16.09	16.91	Disagree

`CHITEST(A2:B4,A6:B8)` results in `0.000308`

end example]

3.17.7.39 CHOOSE

Syntax:

CHOOSE (*index* , *argument-list*)

Description: Selects the *argument* in *argument-list* that corresponds by position to *index*.

Arguments:

Name	Type	Description
index	number	An index into *argument-list*, truncated to an integer. The value of *index* shall be in the position range 1–*n*, where *argument-1* is position 1, *argument-2* is position 2, and so on up to *argument-n*. If *index* is an array, the value or every element in that array is evaluated, and if the formula was array-entered, the result is an array of chosen values.
argument-list	any	The *argument*s in any given *argument-list* need not all have the same type.

Return Type and Value: any, including array – The *argument* in *argument-list* that corresponds by position to *index*.

However, if the value of *index* is not an index into *argument-list*, #VALUE! is returned.

[*Example*:

CHOOSE(E7,F7,G7,H7,I7,J7,K7,L7) results in Monday, when E7 contains 2, and the cells F7:L7 each contain the names of the week, from Sunday to Saturday

SUM(CHOOSE(E1,F20:G20,H20:J24)) results in the sum of the elements designated by F20:G20 or H20:J24, as determined by the value of E1

If B9:B11 contain 1, 3, and 3, respectively, and CHOOSE(B9:B11,10,20,30) is array-entered into 3 cells, the values of those 3 cells is 10, 30, and 30, respectively.

end example]

3.17.7.40 CLEAN

Syntax:

CLEAN (*string*)

Description:

Makes a string that is a copy of *string* with all so-called "non-printable" characters—those with internal values in the range U+0000–001F—removed.

Arguments:

Name	Type	Description
string	text	Designate the string to be cleaned.

Return Type and Value: text – The trimmed copy of *string*.

[*Example*:

CLEAN("A" & CHAR(2) & "BC") results in ABC, which is stored in A10
LEN(A10) results in 3

end example]

3.17.7.41 CODE

Syntax:

CODE (*string*)

Description: Determines the numeric code of the first character in *string*.

Arguments:

Name	Type	Description

Name	Type	Description
string	text	Designates a string containing one or more characters.

Return Type and Value: number – The numeric code of the first character in *string*.

However, if *string* is empty, #VALUE! is returned.

[*Example*:

CODE("abc") results in 97
CODE(A10) results in 97, when A1 contains abc

end example]

3.17.7.42 COLUMN

Syntax:

COLUMN ([*reference*])

Description: Finds the number of the column(s) corresponding to *reference*.

Arguments:

Name	Type	Description
reference	reference	A reference to a single cell or to a range of contiguous cells. If omitted, the behavior is as if *reference* referred to the cell containing the formula.

Return Type and Value: number – If *reference* refers to a single cell or to a single column of cells, the corresponding column is returned. If *reference* refers to a range of cells involving multiple columns, a horizontal array of the corresponding columns as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, #REF! is returned.

[*Example*:

COLUMN() results in 4, when the cell containing the formula is in column 4
COLUMN(E17:E19) results in 5
COLUMN(E16:F17) results in a horizontal array containing 5and 6, respectively

end example]

3.17.7.43 COLUMNS

Syntax:

`COLUMNS ( array )`

Description: Finds the number of columns corresponding to *array*.

Arguments:

Name	Type	Description
array	array, reference	Any array.

Return Type and Value: number – The number of columns corresponding to *array*.

However, if the range of cells referred to by *array* is not contiguous, `#NULL!` is returned.

[*Example*:

`COLUMNS(E16:F16)` results in 2
`COLUMNS(E16:G18)` results in 3
`COLUMNS({1,2;3,4})` results in 2

end example]

3.17.7.44 COMBIN

Syntax:

`COMBIN ( number , number-chosen )`

Description: Computes the possible number of groups of size *number-chosen* that can be formed from *number* objects. [*Note*: A combination is any set or subset of objects, regardless of their internal order. Combinations are distinct from permutations, for which the internal order is significant. *end note*]

Mathematical Formula:

The number of combinations is as follows, where *number* = n and *number-chosen* = k:

$$\binom{n}{k} = \frac{P_{k,n}}{k!} = \frac{n!}{k!(n-k)!}$$

where:

$$P_{k,n} = \frac{n!}{(n-k)!}$$

Arguments:

Name	Type	Description
number	number	The total number of objects available, truncated to an integer.
number-chosen	number	The number of objects in each combination, truncated to an integer.

Return Type and Value: number – The number of different combinations of *number-chosen* in *number*.

However, if

- *number* < 0, `#NUM!` is returned.
- *number-chosen* < 0, `#NUM!` is returned.
- *number* < *number-chosen*, `#NUM!` is returned.

[*Example*:

`COMBIN(8,2)` results in `28`
`COMBIN(10,4)` results in `210`
`COMBIN(6,5)` results in `6`

end example]

3.17.7.45 COMPLEX

Syntax:

`COMPLEX ( real-number , imaginary-number [ , suffix ] )`

Description: Makes a complex number in *x + yi* or *x + yj* text format from the arguments.

Arguments:

Name	Type	Description
real-number	number	The real number coefficient.
imaginary-number	number	The imaginary number coefficient.
suffix	text	"`i`" or "`j`". If omitted, "`i`" is used.

Return Type and Value: text – The complex number string specified by the arguments.

If *real-number* has the value 0 and *imaginary-number* has a non-zero value, the resulting string contains just the real number. If *real-number* has a non-zero value and *imaginary-number* has a zero value, the resulting string contains just the imaginary number and suffix. If both *real-number* and *imaginary-number* have a zero value, the resulting string is "`0`".

However, if *suffix* is neither "`i`" nor "`j`", `#VALUE!` is returned.

[*Example*:

`COMPLEX(-3.5,19.6)` results in `-3.5+19.6i`
`COMPLEX(3.5,-19.6,"j")` results in `3.5-19.6j`
`COMPLEX(3.5,0)` results in `3.5`
`COMPLEX(0,2.4)` results in `2.4i`
`COMPLEX(0,0)` results in `0`

end example]

3.17.7.46 CONCATENATE

Syntax:

CONCATENATE (*argument-list*)

Description: Makes a string that is the concatenation of all the strings corresponding to the *argument*s in *argument-list*, taken left-to-right.

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* shall designate a string.

Return Type and Value: text – The concatenated string.

[*Example*:

`CONCATENATE("text")` results in `text`
`CONCATENATE("The total is ",A10," units")` results in `The total is 43 units`, when `A10` contains `43`
`CONCATENATE(3," + ",4," = ",3+4)` results in `3 + 4 = 7`

end example]

3.17.7.47 CONFIDENCE

Syntax:

CONFIDENCE (*alpha* , *standard-dev* , *size*)

Description: Computes a value that can be used to construct a confidence interval for a population mean.

Arguments:

Name	Type	Description
alpha	number	The significance level used to compute the confidence level.
standard-dev	number	The population standard deviation for the data range.
size	number	The sample size, truncated to an integer.

Return Type and Value: number – A value that can be used to construct a confidence interval for a population mean.

However, if

- *alpha* ≤ 0 or *alpha* ≥ 1, `#NUM!` is returned.
- *standard-dev* ≤ 0, `#NUM!` is returned.
- *size* < 1, `#NUM!` is returned.

[*Example*:

`CONFIDENCE(0.4,5,12)` results in `1.214775614`
`CONFIDENCE(0.75,9,7)` results in `1.083909234`

end example]

3.17.7.48 CONVERT

Syntax:

`CONVERT` (*number* , *from-unit* , *to-unit*)

Description: Converts a number from one measurement system to another.

Arguments:

Name	Type	Description
number	number	The value to be converted from *from-unit*s to *to-unit*s.
from-unit	text	The unit to be converted from, where the valid string values are shown in the tables below.
to-unit	text	The unit to be converted to, where the valid string values are shown in the tables below.

Weight and Mass	
Unit String	*Meaning*
g	Gram

Weight and Mass	
lbm	Pound mass (avoirdupois)
ozm	Ounce mass (avoirdupois)
sg	Slug
u	U (atomic mass unit)

Distance	
Unit String	*Meaning*
ang	Angstrom
ft	Foot
in	Inch
m	Meter
mi	Statute mile
Nmi	Nautical mile
Pica	Pica (1/72 inch)
yd	Yard

Time	
Unit String	*Meaning*
day	Day
hr	Hour
mn	Minute
sec	Second
yr	Year

Pressure	
Unit String	*Meaning*
at or atm	Atmosphere
mmHg	mm of Mercury
P or p	Pascal

Force	
Unit String	*Meaning*

Force	
dy or dyn	Dyne
lbf	Pound force
N	Newton

Energy	
Unit String	*Meaning*
BTU or btu	BTU
c	Thermodynamic calorie
cal	IT calorie
e	Erg
ev or eV	Electron volt
flb	Foot-pound
HPh or hh	Horsepower-hour
J	Joule
Wh or wh	Watt-hour

Power	
Unit String	*Meaning*
H or hp	Horsepower
W or w	Watt

Magnetism	
Unit String	*Meaning*
ga	Gauss
T	Tesla

Temperature	
Unit String	*Meaning*
C or cel	Degrees Celsius
F or fah	Degrees Fahrenheit
K or kel	Degrees Kelvin

Liquid Measure	
Unit String	*Meaning*
`cup`	Cup
`gal`	U.S. Gallon
`l` or `lt`	Liter
`oz`	Fluid ounce
`pt`or `us_pt`	U.S. pint
`qt`	U.S. Quart
`tbs`	Tablespoon
`tsp`	Teaspoon
`uk_pt`	U.K. pint

The following abbreviated unit prefixes can be used with any metric unit:

Abbreviated Unit Prefixes	
Prefix String	*Meaning*
`E`	exa (1E+18)
`P`	peta (1E+15)
`T`	tera (1E+12)
`G`	giga (1E+09)
`M`	mega (1E+06)
`k`	kilo (1E+03)
`h`	hecto (1E+02)
`e`	dekao (1E+01)
`d`	deci (1E-01)
`c`	centi (1E-02)
`m`	milli (1E-03)
`u`	micro (1E-06)
`n`	nano 1E-09)
`p`	pico (1E-12)
`f`	femto (1E-15)
`a`	atto (1E-18)

Unit names and prefixes are case-sensitive.

Return Type and Value: number – The value of *number* in *from-unit*s converted to *to-unit*s.

However, if

- The value of *from-unit* or *to-unit* is invalid, #N/A is returned.
- The *from-unit* and *to-unit* are from different measurement categories, #N/A is returned.
- The value of *from-unit* or *to-unit* has an abbreviated unit prefix, yet none is supported for that unit, #N/A is returned.

[*Example*:

CONVERT(10,"ozm","g") results in 283.4951521
CONVERT(1,"yd","mm") results in 914.4000003
CONVERT(1,"yd","cm") results in 91.44000003
CONVERT(1,"yd","m") results in 0.9144
CONVERT(1,"yd","km") results in 0.0009144
CONVERT(1,"mi","Nmi") results in 0.868976242
CONVERT(1,"day","sec") results in 86400
CONVERT(0,"K","C") results in -273.15

end example]

3.17.7.49 CORREL

Syntax:

CORREL (*array-1* , *array-2*)

Description: Computes the correlation coefficient of the two cell ranges designated by *array-1* and *array-2*.

Mathematical Formula:

The equation for the correlation coefficient is:

$$Correl(X,Y) = \frac{\sum (x-\bar{x})(y-\bar{y})}{\sqrt{\sum (x-\bar{x})^2 \sum (y-\bar{y})^2}}$$

where x and y are the sample means AVERAGE(*array-1*) and AVERAGE(*array-2*).

Arguments:

Name	Type	Description
array-1	array, reference	The first cell range. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
array-2	array, reference	The second cell range. If an array or reference argument contains text, logical values, or empty cells, those values

Name	Type	Description
		are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The correlation coefficient of the cells in two cell ranges.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* and *array-2* is empty, the return value is unspecified.
- The standard deviation of the values in *array-1* or *array-2* equals zero, the return value is unspecified.

[*Example*:

`CORREL({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7})` results in `-0.714976`

end example]

3.17.7.50 COS

Syntax:

COS (*x*)

Description: Computes the cosine of *x*.

Arguments:

Name	Type	Description
x	number	The value whose cosine is to be determined.

Return Type and Value: number – The cosine of *x*.

[*Example*:

`COS(-1)` results in `0.540302306`
`COS(0)` results in `1`
`COS(1)` results in `0.540302306`

end example]

3.17.7.51 COSH

Syntax:

COSH (*x*)

Description: Computes the hyperbolic cosine of *x*.

Arguments:

Name	Type	Description
x	number	The value whose hyperbolic cosine is to be determined.

Return Type and Value: number – The hyperbolic cosine of *x*.

However, if the magnitude of *x* is too large, `#NUM!` is returned.

[*Example*:

`COSH(-1)` results in `1.543080635`
`COSH(0)` results in `1`
`COSH(1)` results in `1.543080635`

end example]

3.17.7.52 COUNT

Syntax:

COUNT (*argument-list*)

Description: Counts the number of *argument*s in *argument-list* that contain numbers, and the number of cells referred to by *argument*s in *argument-list*, which contain numbers.

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* designates a value. Arguments that are numbers, logical values, dates, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, text, or error values in the array or reference shall be ignored. [*Note*: To count logical values, text, or error values as well, use the COUNTA (§3.17.7.53) function. *end note*]

Return Type and Value: number – The numeric argument and reference to numeric argument count.

[*Example*:

COUNT(1,2,3,4,5) results in 5
COUNT({1,2,3,4,5}) results in 5
COUNT({1,2,3,4,5},6,"7") results in 7
COUNT(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored
COUNT(10,E2), where E2 contains TRUE, results in 1, as E2 is ignored

end example]

3.17.7.53 COUNTA

Syntax:

COUNTA (*argument-list*)

Description: Counts the number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* designates a value. Arguments with values of any type shall be counted. However, empty cells shall not be counted. If an argument is an array or reference, only values in that array or reference shall be counted. Empty cells and text values in the array or reference shall be ignored. [*Note*: To exclude logical values, text, or error values, use the COUNT (§3.17.7.52) function. *end note*]

Return Type and Value: number – The number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

[*Example*:

COUNTA(1,2,3,4,5) results in 5
COUNTA({1,2,3,4,5}) results in 15
COUNTA({1,2,3,4,5},6,"7") results in 7
COUNTA(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored
COUNTA(10,E2), where E2 contains TRUE, results in 2, as E2 is counted

end example]

3.17.7.54 COUNTBLANK

Syntax:

COUNTBLANK (*cell-range*)

Description: Counts the number of cells in a specified range of cells, which are empty. A cell containing a formula that returns an empty string is counted, whereas a cell containing a zero value is not.

Arguments:

Name	Type	Description
cell-range	reference	Designates the range of cells to be inspected.

Return Type and Value: number – The number of empty cells in the range specified.

[*Example*:

`COUNTBLANK(A2:C2)`, where A2 and B2 are empty, but C2 is not, results in 2

end example]

3.17.7.55 COUNTIF

Syntax:

COUNTIF (*cell-range* , *selection-criteria*)

Description: Counts the number of cells in a specified range of cells, whose values meet the specified criteria.

Arguments:

Name	Type	Description
cell-range	reference	Designates the range of cells to be inspected.
selection-criteria	number, expression, reference, text	Designates the cells to be counted. In the case of text, *selection-criteria* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. *selection-criteria* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).

Return Type and Value: number – The number of cells in the range specified that meet the criteria.

[*Example*: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

`COUNTIF(A1:D1,"=10")` results in 2

`COUNTIF(A1:D1,">5")` results in `30`
`COUNTIF(A1:D1,"<>10")` results in 2

Given that `A2`, `B2`, `C2`, and `D2`, respectively, contain the values `apples`, `oranges`, `grapes`, and `melons`

`COUNTIF(A2:D2,"*es")` results in 3
`COUNTIF(A2:D2,"??a*")` results in 2
`COUNTIF(A2:D2,"*l*")` results in 2

end example]

3.17.7.56 COUNTIFS

Syntax:

`COUNTIFS (` *count-range* `,` *cell-range-1* `,` *selection-criteria-1*
`[ ,` *cell-range-2* `,` *selection-criteria-2* `[ , …] ] )`

Description: Counts the number of cells within a range that meet multiple criteria.

Arguments:

Name	Type	Description
count-range	reference	Designates the cells whose values are included. *count-range* does not have to have the same size and shape as *cell-range-1* through *cell-range-n*. The actual cells that are added are determined by using the top, left cell in *count-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range-1* through *cell-range-n*.
cell-range-1	reference	Designates the first range of cells to be inspected. Each cell in a range is counted only if all of the corresponding criteria specified are true for that cell.
selection-criteria-1	number, expression, reference, text	Designates the first range of cells to be counted. In the case of text, *selection-criteria-1* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. *selection-criteria* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
cell-range-n	reference	The optional arguments *selection-criteria-2* through *selection-criteria-n* have corresponding arguments *cell-range-2* through *cell-range-n*, and have the same semantics as *selection-criteria-1* and *cell-range-1*,
selection-criteria-n	number, expression,	

Name	Type	Description
	reference, text	respectively.

If a cell in any argument is an empty cell, it is treated as if it had the value 0.

Return Type and Value: number – The count of the cells corresponding to those selected.

[*Example*: Given the following data:

	A	B	C	D
1	Sales Person	Exceeded Tables Quota	Exceeded Chairs Quota	Exceeded Desks Quota
2	Davolio	Yes	No	No
3	Buchanan	Yes	Yes	No
4	Suyama	Yes	Yes	Yes
5	Leverling	No	Yes	Yes

`COUNTIFS(B2:D2,"=Yes")` results in 1 (counts how many times Davolio exceeded a sales quota for tables, chairs, and desks)

`COUNTIFS(B2:B5,"=Yes",C2:C5,"=Yes")` results in 2 (counts how many sales people exceeded both their tables and chairs quota)

`COUNTIFS(B5:D5,"=Yes",B3:D3,"=Yes")` results in 1 (counts how many times Leverling and Buchanan exceeded the same quota for tables, chairs, and desks)

end example]

3.17.7.57 COUPDAYBS

Syntax:

COUPDAYBS (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days from the beginning of the coupon period to the settlement date.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments,

Name	Type	Description
		frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** 0 or omitted / US (NASD) 30/360 1 / Actual/actual 2 / Actual/360 3 / Actual/365 4 / European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The number of days from the beginning of the coupon period to the settlement date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`COUPDAYBS(DATE(2007,1,25),DATE(2008,11,15),2,1)` results in `71`
`COUPDAYBS(DATE(2007,1,25),DATE(2008,11,15),2)` results in `70`

end example]

3.17.7.58 COUPDAYS

Syntax:

COUPDAYS (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days in the coupon period that contains the settlement date.

Arguments:

Name	Type	Description

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows: Value / Day Count Basis 0 or omitted — US (NASD) 30/360 1 — Actual/actual 2 — Actual/360 3 — Actual/365 4 — European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The number of days in the coupon period that contains the settlement date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`COUPDAYS(DATE(2007,1,25),DATE(2008,11,15),2,1)` results in `181`
`COUPDAYS(DATE(2007,1,25),DATE(2008,11,15),2)` results in `180`

end example]

3.17.7.59 COUPDAYSNC

Syntax:

COUPDAYSNC (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days from the settlement date to the next coupon date.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360
1	Actual/actual
2	Actual/360
3	Actual/365
4	European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The number of days from the settlement date to the next coupon date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`COUPDAYSNC(DATE(2007,1,25),DATE(2008,11,15),2,1)` results in `110`
`COUPDAYSNC(DATE(2007,1,25),DATE(2008,11,15),2)` results in `110`

end example]

3.17.7.60 COUPNCD

COUPNCD (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the next coupon date after the settlement date.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360
1	Actual/actual
2	Actual/360
3	Actual/365
4	European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The next coupon date after the settlement date, as a date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`COUPNCD(DATE(2007,1,25),DATE(2008,11,15),2,1)` results in `15-May-2007`

end example]

3.17.7.61 COUPNUM

`COUPNUM ( settlement , maturity , frequency [ , [ basis ] ] )`

Description: Computes the number of coupons payable between the settlement date and maturity date, rounded up to the nearest whole coupon.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360
1	Actual/actual
2	Actual/360
3	Actual/365
4	European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The number of coupons payable between the settlement date and maturity date, rounded up to the nearest whole coupon.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`COUPNUM(DATE(2007,1,25),DATE(2008,11,15),2,1)` results in 4

end example]

3.17.7.62 COUPPCD

COUPPCD (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the previous coupon date before the settlement date.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows: 0 or omitted – US (NASD) 30/360 1 – Actual/actual 2 – Actual/360 3 – Actual/365 4 – European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The previous coupon date before the settlement date, as a date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`COUPPCD(DATE(2007,1,25),DATE(2008,11,15),2,1)` results in `15-Nov-2006`

end example]

3.17.7.63 COVAR

Syntax:

COVAR (*array-1* , *array-2*)

Description: Computes covariance; that is, the average of the products of deviations for each data point pair in the two cell ranges designated by *array-1* and *array-2*.

Mathematical Formula:

The covariance is:

$$Cov(X,Y) = \frac{\sum (x-\bar{x})(y-\bar{y})}{n}$$

where x and y are the sample means AVERAGE(*array-1*) and AVERAGE(*array-2*), and n is the sample size.

Arguments:

Name	Type	Description
array-1	number, name, array, reference to number	If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
array-2		

Return Type and Value: number – The covariance.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[*Example*:

`COVAR({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7})` results in `-1.375374`

end example]

3.17.7.64 CRITBINOM

Syntax:

`CRITBINOM ( number-trials , success-probability , alpha )`

Description: Computes the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

Arguments:

Name	Type	Description
number-trials	number	The number of Bernoulli trials.
success-	number	The probability of success on each trial.

Name	Type	Description
probability		
alpha	number	The criterion value.

Return Type and Value: number – The smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

However, if

- *number-trials* < 0, `#NUM!` is returned.
- *success-probability* is < 0 or *success-probability* > 1, `#NUM!` is returned.
- *alpha* < 0 or *alpha* > 1, `#NUM!` is returned.

[*Example*:

`CRITBINOM(6,0.5,0.75)` results in 4
`CRITBINOM(12,0.3,0.95)` results in 6

end example]

3.17.7.65 CUBEKPIMEMBER

Syntax:

`CUBEKPIMEMBER ( connection , kpi-name , kpi-property [ , [ caption ] ] )`

Description: Fetches from the OLAP cube on the SQL Server designated by *connection*, a Key Performance Indicator (KPI) name, property, and measure, and displays the name and property in the cell. A KPI is a quantifiable measurement, such as monthly gross profit or quarterly employee turnover, used to monitor an organization's performance.

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
kpi-name	text	The name of the KPI in the cube.
kpi-property	number	The KPI component to be returned, truncated to integer; it shall be one of the following: 1 – The actual value 2 – A target value 3 – The state of the KPI at a specific

Name	Type	Description
		<table><tr><td></td><td>moment in time</td></tr><tr><td>4</td><td>A measure of the value over time</td></tr><tr><td>5</td><td>A relative importance assigned to the KPI</td></tr><tr><td>6</td><td>A temporal context for the KPI</td></tr></table> If 1 is specified, only *kpi-name* is displayed in the cell.
caption	text	An alternative string whose value is displayed in the cell instead of *kpi-name* and *kpi-property*.

Return Type and Value: any – The selected key performance indicator.

However, if

- *kpi-name* is invalid, the return value is unspecified.
- *kpi-property* is outside the range 1–6, #N/A is returned.
- The *connection* name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.

[*Example*:

```
CUBEKPIMEMBER("Sales","MySalesKPI",1)
CUBEKPIMEMBER("Sales","MySalesKPI",2,"Sales KPI Goal")
```

end example]

3.17.7.66 CUBEMEMBER

Syntax:

CUBEMEMBER (*connection* , *member-expression* , [, [*caption*]])

Description: Fetches from the OLAP cube on the SQL Server designated by *connection*, the member or tuple defined by *member-expression*. [*Note*: This function is used to validate that the member or tuple exists in the cube. *end note*]

When a call to CUBEMEMBER is used as an argument to another CUBExxx function, the MDX expression that identifies the member or tuple is used by that CUBExxx function, rather than the displayed value in the cell of the CUBEMEMBER function.

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
member-expression	text, reference, array	A multidimensional expression (MDX) that evaluates to a unique member in the cube. Alternatively, *member-expression* can be a tuple, specified as a cell range or an array constant.
caption	text	The string displayed in the cell instead of the caption from the cube (assuming it defines such a caption). When a tuple is returned, the caption used is the one for the last member in the tuple.

Return Type and Value: any – A member or tuple in a cube hierarchy.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[*Example*:

```
CUBEMEMBER("Sales","[Time].[Fiscal].[2004]")
CUBEMEMBER($A$1,D$12)
CUBEMEMBER("Sales",(B4,C6,D5),"SalesFor2004")
CUBEMEMBER("Sales",{[Products].[Food];[Time].[Fiscal].[2004]})
CUBEMEMBER($A$1,C$12:D$12)
```

end example]

3.17.7.67 CUBEMEMBERPROPERTY

Syntax:

CUBEMEMBERPROPERTY (*connection* , *member-expression* , *property*)

Description: Fetches a property of a member in the OLAP cube on an SQL Server. [*Note*: Use this function o validate that a member name exists within the cube and to return the specified property for this member. *end note*]

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
member-expression	text	A multidimensional expression (MDX) that evaluates to a unique member in the cube.
property	text	The name of the property returned or a reference to a cell that contains the name of the property.

Return Type and Value: any – A property of a member in the OLAP cube.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.

[*Example*:

```
CUBEMEMBERPROPERTY("Sales","[Time].[Fiscal].[2004]",$A$3)
CUBEMEMBERPROPERTY("Sales","[Store].[MyFavoriteStore]",
  "[Store].[Store Name].[Store Sqft]")
```

end example]

3.17.7.68 CUBERANKEDMEMBER

Syntax:

CUBERANKEDMEMBER (*connection* , *set-expression* , *rank* [, *caption*])

Description: Fetches the n^{th}, or ranked, member in a set.

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.

Name	Type	Description
set-expression	text	A set expression, such as "{[Item1].children}".
rank	number	Specifies the top value to return, truncated to integer. If 1, the top value is returned; if 2, the second-most top value is returned; and so on.
caption	text	The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption).

Return Type and Value: any – The n^{th} member in the set.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified. , the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[*Example*:

```
CUBERANKEDMEMBER("Sales",$D$4,1,"Top Month")
CUBERANKEDMEMBER("Sales",CUBESET("Sales","Summer","[2004].[June]",
  "[2004].[July]","[2004].[August]"),3,"Top Month")
```

end example]

3.17.7.69 CUBESET

Syntax:

```
CUBESET ( connection , set-expression [ , [ caption ][ , [ sort-order ]
    [ , [ sort-by ]]]] )
```

Description: Fetches from the OLAP cube on the SQL Server designated by *connection* the set of members or tuples that is defined by *set-expression*. [*Note*: Use this function to build dynamic reports that aggregate and filter data, by using the return value as a slicer in the CUBEVALUE function, the CUBERANKEDMEMBER function to choose specific members from the calculated set, and the CUBESETCOUNT function to control the size of the set. *end note*]

Arguments:

Name	Type	Description

<table>
<tr><th>Name</th><th>Type</th><th>Description</th></tr>
<tr><td>connection</td><td>text</td><td>The name of the connection to the cube.</td></tr>
<tr><td>set-expression</td><td>text, reference</td><td>A set expression that results in a set of members or tuples. set-expression can also be a cell reference to range that contains one or more members, tuples, or sets included in the set.</td></tr>
<tr><td>caption</td><td>text</td><td>The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption).</td></tr>
<tr><td>sort-order</td><td>text</td><td>The type of sort, if any, to perform; it can be one of the following:
<table>
<tr><th>Value</th><th>Description</th><th>sort-by argument</th></tr>
<tr><td>0 or default</td><td>Leaves the set in existing order</td><td>Ignored</td></tr>
<tr><td>1</td><td>Sorts set in ascending order by sort_by</td><td>Required</td></tr>
<tr><td>2</td><td>Sorts set in descending order by sort_by</td><td>Required</td></tr>
<tr><td>3</td><td>Sorts set in alphabetic ascending order</td><td>Ignored</td></tr>
<tr><td>4</td><td>Sorts set in alphabetic descending order</td><td>Ignored</td></tr>
<tr><td>5</td><td>Sorts set in natural ascending order</td><td>Ignored</td></tr>
<tr><td>6</td><td>Sorts set in natural descending order</td><td>Ignored</td></tr>
</table>
An alphabetic sort for a set of tuples sorts on the last element in each tuple.</td></tr>
<tr><td>sort-by</td><td>text</td><td>The value by which to sort. [Example: To get the city with the highest sales, set-expression would be a set of cities, and sort-by would be the sales measure. To get the city with the highest population, set-expression would be a set of cities, and sort-by would be the population measure. end example]</td></tr>
</table>

Return Type and Value: any – The set of members or tuples.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.
- *sort-order* is outside the range 0–6, #N/A is returned.
- *sort-order* requires *sort-by*, but *sort-by* is omitted, #VALUE! is returned.

[*Example*:

```
CUBESET("Finance","Order([Product].[Product].[Product Category]
.Members,[Measures].[Unit Sales],ASC)","Products")

CUBESET("Sales","[Product].[All Products].Children",
  "Products",1,"[Measures].[Sales Amount]")
```

end example]

3.17.7.70 CUBESETCOUNT

Syntax:

CUBESETCOUNT (*set*)

Description: Computes the number of items in a set.

Arguments:

Name	Type	Description
set	text	An expression that evaluates to a set defined by the CUBESET function.

Return Type and Value: number – The number of items in a set.

[*Example*:

```
CUBESETCOUNT(A3)
CUBESETCOUNT(CUBESET("Sales","[Product].[All Products].Children",
  "Products",1,"[Measures].[Sales Amount]"))
```

end example]

3.17.7.71 CUBEVALUE

Syntax:

CUBEVALUE (*connection* , *argument-list*)

Description: Fetches from the OLAP cube on the SQL Server designated by *connection*, the aggregated value defined by a series of member-expression *argument*s in *argument-list*.

Arguments:

Name	Type	Description
connection	text	The name of the connection to the cube.
argument-list	text, reference	Each *argument* in *argument-list* is text containing a multidimensional expression (MDX) that evaluates to a member or tuple within the cube. Alternatively, an *argument* can be a set defined with the CUBESET function. Use any *argument* as a slicer to define the portion of the cube for which the aggregated value is returned. If no measure is specified in an *argument*, the default measure for that cube is used. If a cell reference is used for an *argument*, and that cell reference contains a CUBE function, then that *argument* uses the MDX expression for the item in the referenced cell, and not the value displayed in that referenced cell.

Return Type and Value: any – The aggregated value.

However, if

- The connection name is not a valid workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by an *argument* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified. (This can occur with multiple elements from the same hierarchy.)
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[*Example*:

```
CUBEVALUE("Sales","[Measures].[Profit]","[Time].[2004]",
```

```
  "[All Product].[Beverages]")
CUBEVALUE($A$1,"[Measures].[Profit]",D$12,$A23)
CUBEVALUE("Sales",$B$7,D$12,$A23)
```

end example]

3.17.7.72 CUMIPMT

Syntax:

`CUMIPMT ( rate , nper , pv , start-period , end-period , type )`

Description: Computes the cumulative interest paid on a loan between *start-period* and *end-period*.

Arguments:

Name	Type	Description
rate	number	The interest rate.
nper	number	The total number of payment periods, truncated to integer.
pv	number	The present value.
start-period	number	The first period in the calculation. (Payment periods are numbered beginning with 1.)
end-period	number	The last period in the calculation.
type	number	The timing of the payment, truncated to integer, as follows:

Value	Timing
0	Payment at the end of the period
1	Payment at the beginning of the period

Time information in the date arguments is ignored.

Return Type and Value: number – The cumulative interest paid on a loan.

However, if

- *rate*, *nper*, or *pv* ≤ 0, #NUM! is returned.
- *start-period* < 1 or *end-period* < 1, or *start-period* > *end_period*, #NUM! is returned.
- *type* is any number other than 0 or 1, #NUM! is returned.

[*Example*:

`CUMIPMT(0.09/12,30*12,125000,13,24,0)` results in `-11135.23`
`CUMIPMT(0.09/12,30*12,125000,1,1,0)` results in `-937.50`

end example]

3.17.7.73 CUMPRINC

Syntax:

`CUMPRINC` (*rate* , *nper* , *pv* , *start-period* , *end-period* , *type*)

Description: Computes the cumulative principal paid on a loan between *start-period* and *end-period*.

Arguments:

Name	Type	Description
rate	number	The interest rate.
nper	number	The total number of payment periods, truncated to integer.
pv	number	The present value.
start-period	number	The first period in the calculation. (Payment periods are numbered beginning with 1.)
end-period	number	The last period in the calculation.
type	number	The timing of the payment, truncated to integer, as follows:

Value	Timing
`0`	Payment at the end of the period
`1`	Payment at the beginning of the period

Time information in the date arguments is ignored.

Return Type and Value: number – The cumulative principal paid on a loan.

However, if

- *rate*, *nper*, or *pv* ≤ 0, `#NUM!` is returned.
- *start-period* < 1 or *end-period* < 1, or *start-period* > *end_period*, `#NUM!` is returned.
- *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`CUMPRINC(0.09/12,30*12,125000,13,24,0)` results in `-934.11`
`CUMPRINC(0.09/12,30*12,125000,1,1,0)` results in `-68.28`

end example]

3.17.7.74 DATE

Syntax:

`DATE ( year , month , day )`

Description: Computes the serial value for the given date.

Arguments:

Name	Type	Description
year	number	A year, truncated to integer, that together with *month* and *day* specifies the date whose serial value is to be computed. For the 1900 date base system: • If *year* is in the range 0–1899, inclusive, the year shall be interpreted as *year* + 1900. • If *year* is in the range 1900–9999, inclusive, the year shall be interpreted as *year*. For the 1904 date base system: • If *year* is in the range 4–1899, inclusive, the year shall be interpreted as *year* + 1900. • If *year* is in the range 1904–9999, inclusive, the year shall be interpreted as *year*.
month	number	A month, truncated to integer, that together with *year* and *day* specifies the date whose serial value is to be computed. If *month* is in the range 1–12, the month shall be interpreted as *month*. If *month* is less than 1 or greater than 12, the month shall be interpreted as the normalized value (see below) of *month*, and the year shall be adjusted accordingly.
day	number	A day, truncated to integer, that together with *month* and *year* specifies the date whose serial value is to be computed. If *day* is in the allowable range of days for the month, the day shall be interpreted as *day*. If *day* is less than 1 or greater than the number of days in the given month, the day shall be interpreted as the normalized value (see below) of *day*, and the year and month shall be adjusted

Name	Type	Description
		accordingly.

Month and/or day normalization occurs when *month* and/or *day* is outside the range 1–12 and 1–number-of-days-in-the-given-month, respectively. Specifically, if *month* is greater than 12, that number of months shall be added to the first month in the year specified. If *month* is less than 1, the magnitude of that number of months, plus 1, is subtracted from the first month in the year specified. If *day* is greater than the number of days in the month specified, that number of days is added to the first day in the month specified. If *day* is less than 1, the magnitude of that number of months, plus 1, is subtracted from the first day in the month specified. If both *month* and *day* in the same date are normalized, *month* is normalized first.

Return Type and Value: number – The serial value for the given date.

However, if

- *year* is less than 0 or is greater-than or equal-to 10000, and the 1900 date base system is being used, `#NUM!` is returned.
- *year* is less than 4, is greater-than or equal-to 10000, is in the range 1900–1903, inclusive, and the 1904 date base system is being used, `#NUM!` is returned.

[*Example*: For the 1900 date base system:

`DATE(0,1,1)` results in a serial value of `1`
`DATE(1899,1,1)` results in a serial value of `693598`
`DATE(1900,1,1)` results in a serial value of `1`
`DATE(9999,12,31)` results in a serial value of `2958465`

For the 1904 date base system:

`DATE(4,1,1)` results in a serial value of `0`
`DATE(1899,1,1)` results in a serial value of `692136`
`DATE(1904,1,1)` results in a serial value of `0`
`DATE(9999,12,31)` results in a serial value of `2957003`

end example]

3.17.7.75 DATEDIF

Syntax:

`DATEDIF ( start-date , end-date , unit )`

Description: Calculates the number of days, months, or years between two dates.

Arguments:

<table>
<tr><th>Name</th><th>Type</th><th>Description</th></tr>
<tr><td>start-date</td><td>number</td><td>The first date in the period, truncated to integer.</td></tr>
<tr><td>end-date</td><td>number</td><td>The last date in the period, truncated to integer.</td></tr>
<tr><td>unit</td><td>text</td><td>The count to be returned, as follows:
<table>
<tr><th>Value</th><th>Day Count Basis</th></tr>
<tr><td>"Y"</td><td>The number of complete years in the period.</td></tr>
<tr><td>"M"</td><td>The number of complete months in the period.</td></tr>
<tr><td>"D"</td><td>The number of days in the period.</td></tr>
<tr><td>"MD"</td><td>The difference between the days in start-date and end-date. The months and years of the dates are ignored.</td></tr>
<tr><td>"YM"</td><td>The difference between the months in start-date and end-date. The days and years of the dates are ignored.</td></tr>
<tr><td>"YD"</td><td>The difference between the days of start-date and end-date. The years of the dates are ignored.</td></tr>
</table></td></tr>
</table>

Return Type and Value: number – The number of days, months, or years between two dates, depending on the value of *unit*.

However, if

- *start-date* or *end-date* is out of range for the current date base value, #NUM! is returned.
- *start-date* ≥ *end-date* #NUM! is returned.
- *unit* is any value other than those shown in the table above, #NUM! is returned.

[*Example*:

DATEDIF(DATE(2001,1,1),DATE(2003,1,1),"Y") results in 2 complete years
DATEDIF(DATE(2001,6,1),DATE(2002,8,15),"D") results in 440 days
DATEDIF(DATE(2001,6,1),DATE(2002,8,15),"YD") results in 75 days
DATEDIF(DATE(2001,6,1),DATE(2002,8,15),"MD") results in 14 days

end example]

3.17.7.76 DATEVALUE

Syntax:

DATEVALUE (*date-time-string*)

Description: Computes the serial value of the date and/or time represented by the string *date-time-string*, taking into account the current date base value.

Arguments:

Name	Type	Description
date-time-string	text	The date and/or time whose serial value is to be computed. *date-time-string* can have any valid date and/or time format. If the year portion of *date-time-string* is omitted, the current year is used. Any time information in *date-time-string* shall be ignored.

Return Type and Value: number – The serial value of the date and/or time represented by the string *date-time-string*.

However, if

- *date-time-string* is out of range for the current date base value, #VALUE! is returned.
- *date-time-string* does not represent a date, #VALUE! is returned.

[*Example*: When the current year is 2006,

```
DATEVALUE("2/1/2006")
DATEVALUE("01-Feb-2006 10:06 AM")
DATEVALUE("2006/2/1")
DATEVALUE("2006-2-1")
DATEVALUE("1-Feb")
```

all result in 38749 for the 1900 date base system, or 37287 for the 1904 date base system. *end example*]

3.17.7.77 DAVERAGE

Syntax:

DAVERAGE (*database* , *field* , *criteria*)

Description: Averages the values in a column of a list or database that match the specified criteria.

[*Note*: In order to perform an operation on an entire column in a database, a blank line must be entered below the column labels in the criteria range. *end note*]

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database, which shall be a list of related data in which rows of related information are records, and columns of data are fields. The first row of the list shall contain labels for each column.
field	text, number	Indicates the column to which *criteria* shall be applied. It can either be a string containing the column's label, or the column's position number, where columns are numbered starting at 1. [*Example*: If column 3's label is "Age" then either 3 or "Age" can be used. *end example*]
criteria	reference	The range of cells that contains the specified conditions. Each cell in that range that contains a condition shall have a value that is the form of a number, an expression, a cell reference, or text that defines which cells will be selected. In the case of text, a condition can consist of any comparison operator followed by the operand against which each cell's value is to be compared. If the text form is used and the text does not begin with a comparison operator, the criteria matches any string starting with that text. [*Example*: A criteria of "Pea" can result in Pea, Pear, and Peach's being matched, whereas a criteria of "=Pea" will only match Pea. *end example*] *criteria* can include one or more wildcard characters, question mark (`?`) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). The range shall include at least one column label and at least one cell below the column label in which a condition for the column is specified. [*Example*: If the range `G1:G2` contains the column label `Income` in `G1` and the amount 10,000 in `G2`, one could define the range as `MatchIncome` and use that name as *criteria*. *end example*] The value of *criteria* shall not overlap the range specified by *database*. To find rows that meet multiple criteria for a single column, all of the criteria shall be specified directly below one another in separate rows of the *criteria* range. To find rows that meet multiple criteria for multiple columns, all of the criteria shall be specified in the same row of the *criteria* range. To find rows that meet multiple criteria for multiple columns, where any criteria can be true, each of the criteria shall be specified in a different row of the *criteria*

Name	Type	Description
		range. To find rows that meet multiple sets of criteria, where each set includes criteria for multiple columns, each set of criteria shall be specified in a separate row of the *criteria* range. To find rows that meet multiple sets of criteria, where each set includes criteria for one column, multiple columns with the same column heading shall be included in the *criteria* range.

Return Type and Value: number – The average of the values of the cells that correspond to the specified criteria.

[*Example*: Given the following data:

	A	B	C	D	E	F
1	Tree	Height	Age	Yield	Profit	Height
2	=Apple	>10				<16
3	=Pear					
4	Tree	Height	Age	Yield	Profit	
5	Apple	18	20	14	105.00	
6	Pear	12	12	10	96.00	
7	Cherry	13	14	9	105.00	
8	Apple	14	15	10	75.00	
9	Pear	9	8	8	76.80	
10	Apple	8	9	6	45.00	

the average yield of apple trees over 10 feet in height is computed by `DAVERAGE(A4:E10,"Yield",A1:B2)`, which results in 12

The average age of all trees is computed by `DAVERAGE(A4:E10,3,A4:E10)`, which results in 13

end example]

3.17.7.78 DAY

Syntax:

DAY (*date-value*)

Description: Computes the numeric Gregorian day for the date and/or time having the given *date-value*, taking into account the current date base value.

Arguments:

Name	Type	Description
date-value	number, text	The date and/or time whose day is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any time information shall be ignored.

Return Type and Value: number – The Gregorian day for the date and/or time having the given *date-value*. The returned value shall be in the range 1–31.

However, if *date-value* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`DAY(DATE(2006,1,2))` results in 2
`DAY(DATE(2006,0,2))` results in 31
`DAY("2006/1/2 10:45 AM")` results in 2
`DAY(30000)` results in 18 for the 1900 date base system, or 19 for the 1904 date base system

end example]

3.17.7.79 DAYS360

Syntax:

`DAYS360 ( start-date , end-date [ , method-flag ] )`

Description: Computes the signed number of days between two dates based on a 360-day year (twelve 30-day months).

Arguments:

Name	Type	Description
start-date	number	*start-date* and *end-date* are the dates for which the difference is to be computed. *start-date* can be earlier than, the same as, or later than *end-date*.
start-date	number	
method-flag	logical	Specifies whether to use the U.S. or European method in the calculation, as follows:

Value	Meaning

Name	Type	Description	
		FALSE or omitted	U.S. (NASD) method: If the *start-date* is the 31st day of a month, it is changed to the 30th day of that same month. If the *end-date* is the 31st day of a month and the *start-date* is earlier than the 30th day of a month, the *end-date* is changed to the 1st day of the following month; otherwise the *end-date* is changed to the 30th day of the same month.
		TRUE	European method: *start-date*s and *end-date*s that occur on the 31st day of a month are changed to the 30th day of the same month.

Return Type and Value: number – The signed number of days between two dates based on a 360-day year (12 30-day months). If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the difference in days.

However, if *start-date* or *end-date* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`DAYS360(DATE(2002,2,3),DATE(2005,5,31))` results in `1198`
`DAYS360(DATE(2005,5,31),DATE(2002,2,3))` results in `-1197`
`DAYS360(DATE(2002,2,3),DATE(2005,5,31),FALSE)` results in `1198`
`DAYS360(DATE(2002,2,3),DATE(2005,5,31),TRUE)` results in `1197`

|*end example*]

3.17.7.80 DB

Syntax:

`DB ( cost , salvage , life , period [ , [ month ] ] )`

Description: Computes the depreciation of an asset for a specified period using the fixed-declining balance method.

Mathematical Formula:

The fixed-declining balance method computes depreciation at a fixed rate. DB uses the following formulas to calculate depreciation for a period:

(cost - total depreciation from prior periods) * rate

where:

rate = 1 - ((salvage / cost) ^ (1 / life)), rounded to three decimal places

Depreciation for the first and last periods is a special case. For the first period, DB uses this formula:

cost * rate * month / 12

For the last period, DB uses this formula:

((cost - total depreciation from prior periods) * rate * (12 - month)) / 12

Arguments:

Name	Type	Description
cost	number	The initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
period	number	The period for which the depreciation is to be calculated. (*period* shall use the same units as *life*.)
month	number	The number of months in the first year. If omitted, a value of 12 is used.

Return Type and Value: number – The depreciation of an asset for a specified period using the fixed-declining balance method.

However, if

- *cost*, *salvage*, *life*, or *period* < 0, `#NUM!` is returned.
- *month* is outside the range 1–12, `#NUM!` is returned.

[*Example*:

`DB(1000000,100000,6,1,7)` results in `186,083.33`
`DB(1000000,100000,6,2,7)` results in `259,639.42`
`DB(1000000,100000,6,3,7)` results in `176,814.44`
`DB(1000000,100000,6,4,7)` results in `120,410.64`
`DB(1000000,100000,6,5,7)` results in `81,999.64`
`DB(1000000,100000,6,6,7)` results in `55,841.76`
`DB(1000000,100000,6,7,7)` results in `15,845.10`

end example]

3.17.7.81 DCOUNT

Syntax:

DCOUNT (*database* , *field* , *criteria*)

Description: Counts the number of values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – The count of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Age fields that contain numbers is computed by `DCOUNT(A4:E10,"Age",A1:F2)`, which results in 1.

end example]

3.17.7.82 DCOUNTA

Syntax:

DCOUNTA (*database* , *field* , *criteria*)

Description: Counts the number of non-blank cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.)

Return Type and Value: number – The count of the non-blank cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is computed by `DCOUNTA(A4:E10,"Profit",A1:F2)`, which results in `1`.

end example]

3.17.7.83 DDB

Syntax:

`DDB` (*cost* , *salvage* , *life* , *period* [, *factor*]])

Description: Computes the depreciation of an asset for a specified period using the double-declining balance or some other specified method. [*Note*: Use VDB (§3.17.7.338) for a straight-line depreciation method when depreciation is greater than the declining balance calculation. *end note*]

Mathematical Formula:

`MIN`((cost - total depreciation from prior periods) * (factor/life), (cost - salvage - total depreciation from prior periods))

Arguments:

Name	Type	Description
cost	number	The initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
period	number	The period for which the depreciation is to be calculated. (*period* shall use the same units as *life*.)
factor	number	The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method).

Return Type and Value: number – The depreciation of an asset for a specified period.

However, if

- salvage < 0 #NUM! is returned.

- cost life <= 0, #NUM! is returned.
- life <= 0 #NUM! is returned.
- period <= 0, #NUM! is returned.
- factor <= 0, #NUM! is returned.

[*Example*:

`DDB(2400,300,10*365,1)` results in `1.32`
`DDB(2400,300,10*12,1,2)` results in `40.00`
`DDB(2400,300,10,1,2)` results in `480.00`
`DDB(2400,300,10,2,1.5)` results in `306.00`
`DDB(2400,300,10,10)` results in `22.12`

end example]

3.17.7.84 DEC2BIN

Syntax:

`DEC2BIN ( number [ , num-bin-digits ] )`

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

Name	Type	Description
number	number	The decimal number that is to be converted to a binary string.
num-bin-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-bin-digits* is ignored and the result has 10 digits. If omitted, the minimum number of digits is used in the result. *num-bin-digits* is truncated to an integer.

Return Type and Value: text – The binary equivalent of *number* using twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.

However, if

- *number* is outside the range `-512` (1000000000 binary) to `511` (0111111111 binary), inclusive, `#NUM!` is returned.
- *number* needs more digits that *num-bin-digits*, `#NUM!` is returned.
- *num-bin-digits* ≤ 0 or > 10, `#NUM!` is returned.

[*Example*:

DEC2BIN(23) results in 10111
DEC2BIN(-256) results in 1100000000
DEC2BIN(18,7) results in 0010010

end example]

3.17.7.85 DEC2HEX

Syntax:

DEC2HEX (*number* [, *num-hex-digits*])

Description: Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

Name	Type	Description
number	number	The decimal number that is to be converted to a hexadecimal string.
num-bin-digits	number	*num-hex-digits* is the number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-hex-digits* is ignored and the result has 10 digits. If *num-hex-digits* is omitted, the minimum number of digits is used in the result. *num-hex-digits* is truncated to an integer.

Return Type and Value: text – The hexadecimal equivalent of *number* using twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -549,755,813,888 (8000000000 hex) to 549,755,813,887 (7FFFFFFFFF hex), inclusive, #NUM! is returned.
- *number* needs more digits that *num-hex-digits*, #NUM! is returned.
- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[*Example*:

DEC2HEX(23) results in 17
DEC2HEX(-256) results in FFFFFFFF00
DEC2HEX(18,7) results in 0000012

end example]

3.17.7.86 DEC2OCT

Syntax:

DEC2OCT (*number* [, *num-oct-digits*])

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

Name	Type	Description
number	number	The decimal number that is to be converted to an octal string.
num-bin-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-oct-digits* is ignored and the result has 10 digits. If *num-oct-digits* is omitted, the minimum number of digits is used in the result. *num-oct-digits* is truncated to an integer.

Return Type and Value: text – The octal equivalent of *number* using twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.

However, if

- *number* is outside the range `-536,870,912` (4000000000 octal) to `536,870,911` (3777777777 octal), inclusive, `#NUM!` is returned.
- *number* needs more digits that *num-oct-digits*, `#NUM!` is returned.
- *num-oct-digits* ≤ 0 or > 10, `#NUM!` is returned.

[*Example*:

`DEC2OCT(23)` results in `27`
`DEC2OCT(-256)` results in `7777777400`
`DEC2OCT(18,7)` results in `0000022`

end example]

3.17.7.87 DEGREES

Syntax:

DEGREES (*angle*)

Description: Converts *angle* in radians into degrees.

Arguments:

Name	Type	Description
angle	number	The number of radians that is to be converted into degrees.

Return Type and Value: number – *angle* in degrees.

[*Example*:

`DEGREES(2 * PI())` results in `360`
`DEGREES(PI())` results in `180`
`DEGREES(PI()/2)` results in `90`
`DEGREES(8.5)` results in `487.0141259`

end example]

3.17.7.88 DELTA

Syntax:

DELTA (*number-1* [, *number-2*])

Description: Compares two numbers for equality.

Arguments:

Name	Type	Description
number-1	number	The numbers that are to be compared for equality. If *number-2* is omitted, it is assumed to be zero.
number-2	number	

Return Type and Value: number – 1 if *number-1* equals *number-2*; otherwise, 0.

[*Example*:

`DELTA(10.5,10.5)` results in `1`
`DELTA(10.5,10.6)` results in `0`
`DELTA(10.5)` results in `0`
`DELTA(0)` results in `1`

end example]

3.17.7.89 DEVSQ

Syntax:

DEVSQ (*argument-list*)

Description: Computes the sum of squares of deviations of data points from their sample mean.

Mathematical Formula:

$$\mathrm{DEVSQ} = \sum (x - \bar{x})^2$$

Arguments:

Name	Type	Description
argument-list	logical, number, name, array, or reference to a number. Argument list can be a single argument that is an array or a reference to an array.	The *argument*s in *argument-list* designate the values for which the sum of squared deviations is to be calculated. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0value 0value 0 are included.

Return Type and Value: number – The sum of squares of deviations of data points from their sample mean.

[*Example*:

DEVSQ(5.6,8.2,9.2) results in 6.906666667
DEVSQ({5.6,8.2,9.2}) results in 6.906666667

end example]

3.17.7.90 DGET

Syntax:

DGET (*database* , *field* , *criteria*)

Description: Extracts a single value from a column of a list that matches the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – The value of the cell that corresponds to the specified criteria.

However, if

- No record matches the criteria, `#VALUE!` is returned.
- More than one record matches the criteria, `#NUM!` is returned.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is computed by `DGET(A4:E7,"Yield",A1:A2)`, which results in 14.

end example]

3.17.7.91 DISC

Syntax:

`DISC ( `*settlement*` , `*maturity*` , `*pr*` , `*redemption*` [ , [ `*basis*` ] ] )`

Description: Computes the discount rate for a security.

Mathematical Formula:

$$DISC = \frac{redemption - par}{par} \times \frac{B}{DSM}$$

where:

B = number of days in a year, depending on the year basis.
DSM = number of days between settlement and maturity.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
pr	number	The security's price per $100 face value.
redemption	number	The security's redemption value per $100 face value.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360

Name	Type	Description
		1 Actual/actual 2 Actual/360 3 Actual/365 4 European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The discount rate for a security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *pr* or *redemption* ≤ 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`DISC(DATE(2007,1,25),DATE(2007,6,15),97.975,100,1)` results in `5.2420%`

end example]

3.17.7.92 DMAX

Syntax:

`DMAX` (*database* , *field* , *criteria*)

Description: Computes the maximum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – The maximum of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

The maximum profit of apple and pear trees is computed by `DMAX(A4:E10,"Profit",A1:A3)`, which results in `105`.

end example]

3.17.7.93 DMIN

Syntax:

`DMIN ( database , field , criteria )`

Description: Computes the minimum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – The minimum of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

The minimum profit of apple trees over 10 in height is computed by `DMIN(A4:E10,"Profit",A1:B2)`, which results in `75`.

end example]

3.17.7.94 DOLLAR

Syntax:

`DOLLAR ( number [ , num-decimal ] )`

Description: Produces a string containing *number* rounded to *num-decimal* decimal places. The thousands separator, radix point, and currency symbol are locale-specific. The format used is $#,##0.00;($#,##0.00).

Arguments:

Name	Type	Description
number	number	The number that is to be formatted.
num-decimal	number	Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If *num-decimal* is negative, *number* is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places, and have a currency symbol and thousands separators.

[*Example*: In a US-English context:

`DOLLAR(1234.567)` results in `$1,234.57`
`DOLLAR(1234.567,-2)` results in `$1,200`
`DOLLAR(-1234.567,4)` results in `($1,234.5670)`

In a France-French context:

`DOLLAR(1234.567)` results in `1 234,57 €`
`DOLLAR(1234.567,-2)` results in `1 200 €`
`DOLLAR(-1234.567,4)` results in `-1 234,5670 €`

In a Swiss-French context:

`DOLLAR(1234.567)` results in `SFr. 1'234.57`
`DOLLAR(1234.567,-2)` results in `SFr. 1'200`
`DOLLAR(-1234.567,4)` results in `SFr. -1'234.5670`

In a Norway-Norwegian (Nynorsk) context:

`DOLLAR(1234.567)` results in `kr 1 234,57`
`DOLLAR(1234.567,-2)` results in `kr 1 200`
`DOLLAR(-1234.567,4)` results in `kr -1 234,5670`
end example]

3.17.7.95 DOLLARDE

Syntax:

DOLLARDE (*fractional-dollar* , *fraction*)

Description: Converts a dollar price expressed as a fraction into a dollar price expressed as a decimal number. [*Note*: This function is used to convert fractional dollar numbers, such as securities prices, to decimal numbers. *end note*]

Arguments:

Name	Type	Description
fractional-dollar	number	The number expressed as a fraction.
fraction	number	The integer to use in the denominator of the fraction. [*Example*: A *fractional-dollar* value of *m.n* means *m* + *n*/*fraction* dollars. *end example*]

Return Type and Value: number – The dollar price expressed as a decimal number.

However, if

- *fraction* < 0, `#NUM!` is returned.
- *fraction* = 0, `#DIV/0!` is returned.

[*Example*:

`DOLLARDE(1.02,16)` results in `1.125`
`DOLLARDE(1.1,32)` results in `1.3125`

end example]

3.17.7.96 DOLLARFR

Syntax:

`DOLLARFR` (*decimal-dollar* , *fraction*)

Description: Converts a dollar price expressed as a decimal into a dollar price expressed as a fraction. [*Note*: This function is used to convert decimal dollar numbers, such as securities prices, to fractional numbers. *end note*]

Arguments:

Name	Type	Description
decimal-dollar	number	The number expressed as a decimal.
fraction	number	The integer to use in the denominator of the fraction.

Return Type and Value: number – The dollar price expressed as a fractional number. [*Example*: A result of *m.n* means *m* + *n*/*fraction* dollars. *end example*]

However, if

- *fraction* < 0, `#NUM!` is returned.

- *fraction* = 0, `#DIV/0!` is returned.

[*Example*:

`DOLLARFR(1.125,16)` results in `1.02`
`DOLLARFR(1.125,32)` results in `1.04`

end example]

3.17.7.97 DPRODUCT

Syntax:

DPRODUCT (*database* , *field* , *criteria*)

Description: Computes the product of the values of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – The product of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

The product of the yields from apple trees with a height greater than 10 is computed by `DPRODUCT(A4:E10,"Yield",A1:B2)`, which results in `140`.

end example]

3.17.7.98 DSTDEV

Syntax:

DSTDEV (*database* , *field* , *criteria*)

Description: Estimates the standard deviation of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – An estimate of the standard deviation of a population based on the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

The estimated standard deviation in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by DSTDEV(A4:E10,"Yield",A1:A3), which results in 2.97.

end example]

3.17.7.99 DSTDEVP

Syntax:

DSTDEVP (*database* , *field* , *criteria*)

Description: Computes the standard deviation of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – The standard deviation of a population based on the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

The true standard deviation in the yield of apple and pear trees if the data in the database is the entire population is computed by DSTDEVP(A4:E10,"Yield",A1:A3), which results in 2.65.

end example]

3.17.7.100 DSUM

Syntax:

DSUM (*database* , *field* , *criteria*)

Description: Computes the sum of the values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – The sum of the values of the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

The total profit from apple trees is computed by `DSUM(A4:E10,"Profit",A1:A2)`, which results in 225.

The total profit from apple trees with a height between 10 and 16 is computed by `DSUM(A4:E10,"Profit",A1:F2)`, which results in 75.

end example]

3.17.7.101 DURATION

Syntax:

DURATION (*settlement* , *maturity* , *coupon* , *yld* , *frequency* [, [*basis*]])

Description: Computes the Macauley duration for an assumed par value of $100. Duration is defined as the weighted average of the present value of the cash flows and is used as a measure of a bond price's response to changes in yield.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.

Name	Type	Description
maturity	number	The security's maturity date.
coupon	number	The security's annual coupon rate.
yld	number	The security's annual yield.
frequency	number	The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows: 0 or omitted: US (NASD) 30/360 1: Actual/actual 2: Actual/360 3: Actual/365 4: European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The Macauley duration for an assumed par value of $100.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *coupon* or *yld* < 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`DURATION(DATE(2008,1,1),DATE(2016,1,1),0.08,0.09,2,1)` results in `5.993774956`

end example]

3.17.7.102 DVAR

Syntax:

DVAR (*database* , *field* , *criteria*)

Description: Estimates the variance of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – An estimate of the variance of a population based on the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

The estimated variance in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by `DVAR(A4:E10,"Yield",A1:A3)`, which results in `8.8`.

end example]

3.17.7.103 DVARP

Syntax:

DVARP (*database* , *field* , *criteria*)

Description: Calculates the variance of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §3.17.7.77.)

Arguments:

Name	Type	Description
database	reference	The range of cells that makes up the list or database.
field	text, number	The column to which *criteria* shall be applied.
criteria	reference	The range of cells that contains the specified conditions.

For a detailed description of each argument, see the DAVERAGE function §3.17.7.77.

Return Type and Value: number – The variance of a population based on the entire population using the cells that correspond to the specified criteria.

[*Example*: Using the data in the example in the DAVERAGE function §3.17.7.77:

The true variance in the yield of apple and pear trees if the data in the database is the entire orchard population is computed by DVARP(A4:E10,"Yield",A1:A3), which results in 7.04.

end example]

3.17.7.104 EDATE

Syntax:

EDATE (*start-date* , *month-offset*)

Description: Computes the serial value of the date that is *month-offset* months from the date specified by the date *date-string*, taking into account the current date base value.

Arguments:

Name	Type	Description
start-date	number	The start date.
month-offset	number	The number of months before or after *start-date*, truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date *start-date*.

Return Type and Value: number – The serial value of the date that is *month-offset* months from the date specified by the date *date-string*, as a whole number.

However, if

- *start-value* is out of range for the current date base value, #NUM! is returned.
- *start-value* plus *month-offset* is out of range for the current date base value, #NUM! is returned.

[*Example*: For the 1900 date base system:

EDATE(DATE(2006,1,31),5) results in a serial value of 38898
EDATE(DATE(2004,2,29),12) results in a serial value of 38411
EDATE(DATE(2004,2,28),12) results in a serial value of 38411
EDATE(DATE(2004,1,15),-23) results in a serial value of 37302

For the 1904 date base system:

EDATE(DATE(2006,1,31),5) results in a serial value of 37436
EDATE(DATE(2004,2,29),12) results in a serial value of 36949
EDATE(DATE(2004,2,28),12) results in a serial value of 36949

`EDATE(DATE(2004,1,15),-23)` results in a serial value of `35840`

end example]

3.17.7.105 EFFECT

Syntax:

`EFFECT` (*nominal-rate* , *npery*)

Description: Computes the effective annual interest rate, given the nominal annual interest rate and the number of compounding periods per year.

Mathematical Formula:

$$EFFECT = \left(1 + \frac{Nominal\_rate}{Npery}\right)^{Npery} - 1$$

Arguments:

Name	Type	Description
nominal-rate	number	The nominal interest rate.
npery	number	The number of compounding periods per year, truncated to integer.

Return Type and Value: number – The effective annual interest rate.

However, if

- *nominal-rate* ≤ 0, `#NUM!` is returned.
- *npery* < 1, `#NUM!` is returned.

[*Example*:

`EFFECT(0.0525,4)` results in `5.3543%`

end example]

3.17.7.106 EOMONTH

Syntax:

`EOMONTH` (*start-date* , *month-offset*)

Description: Computes the serial value of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, taking into account the current date base value.

Arguments:

Name	Type	Description
start-date	number	The start date.
month-offset	number	The number of months before or after *start-date*, truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date *start-date*.

Return Type and Value: number – The serial value of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, as a whole number.

However, if

- *start-date* is not a valid date, `#NUM!` is returned.
- *start-date* plus *month-offset* yields an invalid date, `#NUM!` is returned.

[*Example*: For the 1900 date base system:

`EOMONTH(DATE(2006,1,31),5)` results in a serial value of 38898
`EOMONTH(DATE(2004,2,29),12)` results in a serial value of 38411
`EOMONTH(DATE(2004,2,28),12)` results in a serial value of 38411
`EOMONTH(DATE(2004,1,15),-23)` results in a serial value of 37315

For the 1904 date base system:

`EOMONTH(DATE(2006,1,31),5)` results in a serial value of 37436
`EOMONTH(DATE(2004,2,29),12)` results in a serial value of 36949
`EOMONTH(DATE(2004,2,28),12)` results in a serial value of 36949
`EOMONTH(DATE(2004,1,15),-23)` results in a serial value of 35853

end example]

3.17.7.107 ERF

Syntax:

`ERF ( lower-bound [ , upper-bound ] )`

Description: Computes the error function integrated between *lower-bound* and *upper-bound*.

Mathematical Formula:

If *upper-bound* is omitted:

$$\mathrm{ERF}(z) = \frac{2}{\sqrt{\pi}} \int_0^z e^{-t^2}\,dt$$

If *upper-bound* is present:

$$\mathrm{ERF}(a,b) = \frac{2}{\sqrt{\pi}} \int_a^b e^{-t^2}\,dt = \mathrm{ERF}(b) - \mathrm{ERF}(a)$$

Arguments:

Name	Type	Description
lower-bound	number	The lower bound for integrating ERF.
upper-bound	number	The upper bound for integrating ERF. If omitted, the value of the upper bound is *lower-bound*, and the lower bound becomes zero.

Return Type and Value: number – The error function integrated between *lower-bound* and *upper-bound*.

However, if

- *lower-bound* is negative, `#NUM!` is returned.
- *upper-bound* is negative, `#NUM!` is returned.

[*Example*:

`ERF(1.234,4.5432)` results in `0.08096060`
`ERF(0,1.345)` results in `0.94284416`
`ERF(0,1.345)` results in `0.94284416`

end example]

3.17.7.108 ERFC

Syntax:

ERFC (*lower-bound*)

Description: Computes the complementary error function integrated between *lower-bound* and ∞.

Mathematical Formula:

$$\mathrm{ERFC}(x) = \frac{2}{\sqrt{\pi}} \int_x^\infty e^{-t^2}\,dt = 1 - \mathrm{ERF}(x)$$

Arguments:

Name	Type	Description
lower-bound	number	The lower bound for integrating ERFC.

Return Type and Value: number – The complementary error function integrated between *lower-bound* and ∞.

However, if *lower-bound* is negative

lower-bound or *upper-bound* is negative, `#NUM!` is returned.

[*Example*:

`ERFC(1.234)` results in `0.08096060`
`ERFC(0)` results in `1.00000000`

end example]

3.17.7.109 ERROR.TYPE

Syntax:

`ERROR.TYPE ( value )`

Description: Determines the kind of the error value designated by *value*.

Arguments:

Name	Type	Description
value	any	A value whose type is to be determined. No conversion shall take place on the argument passed to this function.

Return Type and Value: number – The kind of the error value designated by *value*, as follows:

value	Return Value
`#NULL!`	1
`#DIV/0!`	2
`#VALUE!`	3
`#REF!`	4
`#NAME?`	5
`#NUM!`	6
`#N/A`	7
Anything else	#N/A

[*Example*:

`ERROR.TYPE(A1)` results in 2 if A1 evaluates to `#DIV/0!`
`ERROR.TYPE(A1)` results in 4 if A1 evaluates to `#REF/0!`
`ERROR.TYPE(A1)` results in 7 if A1 evaluates to `#N/A`
`ERROR.TYPE(A1)` results in `#N/A` if A1 evaluates to a non-error value, such as a number or text

end example]

3.17.7.110 EVEN

Syntax:

EVEN (*x*)

Description: Computes *x* rounded to the nearest even integer, away from zero. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
x	number	The value to be rounded.

Return Type and Value: number – The rounded value of *x*. If *x* is zero, the result is zero.

[*Example*:

`EVEN(1.5)` rounds 1.5 up to the nearest even integer; that is, to 2.
`EVEN(3)` rounds 3 up to the nearest even integer; that is, to 4.
`EVEN(2)` rounds 2 up to the nearest even integer; that is, to 2.
`EVEN(-1)` rounds -1 up to the nearest even integer; that is, to `-2`.

end example]

3.17.7.111 EXACT

Syntax:

EXACT (*string-1* , *string-2*)

Description: Performs a case-sensitive comparison of *string-1* and *string-2*.

Arguments:

Name	Type	Description
string-1	text	The two strings to be compared.

Name	Type	Description
string-2	text	

Return Type and Value: logical – TRUE if *string-1* and *string-2* have the exact same length and contents; otherwise, FALSE.

[*Example*:

EXACT("ABC","ABC") results in TRUE
EXACT("ABC","ABCD") results in FALSE
EXACT("Abc","aBC") results in FALSE
EXACT("","") results in TRUE

end example]

3.17.7.112 EXP

Syntax:

```
EXP ( x )
```

Description: Computes e^x, where the constant *e* is the base of the natural logarithm.

Arguments:

Name	Type	Description
x	number	The exponent to which *e* is to be raised.

Return Type and Value: number – e^x.

However, if *x* is too large for the result to be representable, #NUM! is returned.

[*Example*:

EXP(-1) results in 0.367879441
EXP(0) results in 1
EXP(1) results in 2.718281828
EXP(2) results in 7.389056099

end example]

3.17.7.113 EXPONDIST

Syntax:

EXPONDIST (*x* , *lambda* , *cumulative-flag*)

Description: Computes the exponential distribution.

Mathematical Formula:

The equation for the probability density function is:

$$f(x;\lambda) = \lambda e^{-\lambda x}$$

The equation for the cumulative distribution function is:

$$F(x;\lambda) = 1 - e^{-\lambda x}$$

Arguments:

Name	Type	Description
x	number	The value of the function.
lambda	number	The parameter value.
cumulative-flag	logical	Determines the form of the function. If TRUE, EXPONDIST returns the cumulative distribution function; if FALSE, EXPONDIST returns the probability density function.

Return Type and Value: number – The exponential distribution.

However, if

- *x* < 0, #NUM! is returned.
- *lambda* ≤ 0, #NUM! is returned.

[*Example*:

EXPONDIST(0.2,10,FALSE) results in 1.353352832
EXPONDIST(2.3,1.5,TRUE) results in 0.968254364

end example]

3.17.7.114 FACT

Syntax:

FACT (*x*)

Description: Computes the factorial of *x*.

Arguments:

Name	Type	Description
x	number	The non-negative value whose factorial is to be computed. *x* is truncated to an integer.

Return Type and Value: number – The factorial of *x*.

However, if

- *x* is negative, `#NUM!` is returned.
- *x* is too large for the result to be representable, `#NUM!` is returned.

[*Example*:

`FACT(5)` results in `120`
`FACT(3.5)` results in `6`
`FACT(0)` results in `1`

end example]

3.17.7.115 FACTDOUBLE

Syntax:

FACTDOUBLE (*n*)

Description: Computes the double factorial of *n*.

Mathematical Formula:

If *n* is even:

$$n!! = n(n-2)(n-4)\ldots(4)(2)$$

If *n* is odd:

$$n!! = n(n-2)(n-4)\ldots(3)(1)$$

Arguments:

Name	Type	Description
n	number	The non-negative value whose double factorial is to be computed. *n* is truncated to an integer.

Return Type and Value: number – The double factorial of *n*.

However, if

- *n* is negative, #NUM! is returned.
- *n* is too large for the result to be representable, #NUM! is returned.

[*Example*:

FACTDOUBLE(5) results in 15
FACTDOUBLE (3.5) results in 3
FACTDOUBLE (0) results in 1

end example]

3.17.7.116 FALSE

Syntax:

FALSE ( )

Description: Computes the value FALSE. (A call to function FALSE is equivalent to using the *logical-constant* FALSE.)

Arguments: None.

Return Type and Value: logical – The value FALSE.

[*Example*:

FALSE() results in FALSE

end example]

3.17.7.117 FDIST

Syntax:

FDIST (*x* , *degrees-freedom-1* , *degrees-freedom-2*)

Description: Computes the F probability distribution.

Mathematical Formula:

FDIST=P(F>x), where F is a random variable that has an F distribution with *degrees-freedom-1* and *degrees-freedom-2* degrees of freedom.

Arguments:

Name	Type	Description
x	number	The value at which the function is to be evaluated.
degrees-	number	The number of degrees of freedom for the numerator,

Name	Type	Description
freedom-1		truncated to an integer.
degrees-freedom-2	number	The number of degrees of freedom for the denominator, truncated to an integer.

Return Type and Value: number – The F probability distribution.

However, if

- *x* is negative, `#NUM!` is returned.
- *degrees-freedom-1* < 1 or *degrees-freedom-1* ≥ 10^{10}, `#NUM!` is returned.
- *degrees-freedom-2* < 1 or *degrees-freedom-2* ≥ 10^{10}, `#NUM!` is returned.

[*Example*:

`FDIST(12.345,3,4)` results in `0.017226183`

end example]

3.17.7.118 FIND

Syntax:

`FIND ( string-1 , string-2 [ , start-pos ] )`

Description: Performs a case-sensitive search for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (`FIND` is intended for use with languages that use the single-byte character set (SBCS), whereas `FINDB` (§3.17.7.119) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string-1	text	Designate the string to be searched for within the string designated by *string-2*.
string-2	text	
start-pos	number	The number of the start position within *string-2* for which *string-1* is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. *start-pos* shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[*Example*:

`FIND("de","abcdef")` results in 4
`FIND(A10,B10)` results in 4, when A10 contains `de`, and B10 contains `abcdef`

end example]

3.17.7.119 FINDB

Syntax:

`FINDB ( string-1 , string-2 , [ start-pos ] )`

Description: Performs a case-sensitive search for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (`FINDB` is intended for use with languages that use the double-byte character set (DBCS), whereas `FIND` (§3.17.7.118) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string-1	text	Designate the string to be searched for within the string designated by *string-2*.
string-2	text	
start-pos	number	The number of the start position within *string-2* for which *string-1* is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. *start-pos* shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[*Example*: Assuming 1-byte characters

`FINDB("de","abcdef")` results in 4

FINDB(A10,B10) results in 4, when A10 contains de, and B10 contains abcdef

end example]

3.17.7.120 FINV

Syntax:

FINV (*probability* , *degrees-freedom-1* , *degrees-freedom-2*)

Description: Computes the inverse of the F probability distribution. Given a value for *probability*, FINV seeks that value *x* such that FDIST(*x*, *degrees-freedom1*, *degrees-freedom2*) = *probability*. Thus, precision of FINV depends on precision of FDIST. FINV uses an iterative search technique.

Arguments:

Name	Type	Description
probability	number	A probability associated with the F cumulative distribution.
degrees-freedom-1	number	The number of degrees of freedom for the numerator, truncated to an integer.
degrees-freedom-2	number	The number of degrees of freedom for the denominator, truncated to an integer.

Return Type and Value: number – The inverse of the F probability distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom-1* < 1 or *degrees-freedom-1* ≥ 10^{10}, #NUM! is returned.
- *degrees-freedom-2* < 1 or *degrees-freedom-2* ≥ 10^{10}, #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned

[*Example*:

FINV(0.5,3,4) results in 0.940534076

end example]

3.17.7.121 FISHER

Syntax:

FISHER (*x*)

Description: Computes the Fisher transformation at *x*.

Mathematical Formula:

$$z' = \frac{1}{2}\ln\left(\frac{1+x}{1-x}\right)$$

Arguments:

Name	Type	Description
x	number	The number for which the transformation is wanted.

Return Type and Value: number – The Fisher transformation at *x*.

However, if

- *x* ≤ -1, `#NUM!` is returned.
- *x* ≥ 1, `#NUM!` is returned.

[*Example*:

`FISHER(-0.43)` results in `-0.459896681`
`FISHER(0.578)` results in `0.659454094`

end example]

3.17.7.122 FISHERINV

Syntax:

```
FISHERINV ( y )
```

Description: Computes the inverse of the Fisher transformation.

Mathematical Formula:

$$x = \frac{e^{2y} - 1}{e^{2y} + 1}$$

Arguments:

Name	Type	Description
y	number	The number for which the inverse of the transformation is wanted.

Return Type and Value: number – The inverse of the Fisher transformation.

[*Example*:

`FISHERINV(-0.43)` results in `0.405321309`
`FISHERINV(0.578)` results in `0.521210269`

end example]

3.17.7.123 FIXED

Syntax:

`FIXED ( number [ , [ num-decimal ] [ , suppress-commas-flag ] ] )`

Description: Produces a string containing *number* rounded to *num-decimal* decimal places. Thousands separator commas are included as determined by *suppress-commas-flag*.

Arguments:

Name	Type	Description
number	number	Designate the number that is to be formatted, truncated to integer.
num-decimal	number	Designate the number of decimal places to be used in the resulting string. If negative, *number* is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.
suppress-commas-flag	logical	If TRUE, commas are not included; if FALSE or omitted, commas are included.

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places.

[*Example*:

`FIXED(1234567)` results in `1,234,567.00`
`FIXED(1234567.555555,4,TRUE)` results in `1234567.5556`
`FIXED(.555555,10)` results in `0.5555550000`
`FIXED(1234567,-3)` results in `1,235,000`

end example]

3.17.7.124 FLOOR

Syntax:

`FLOOR ( x , significance )`

Description: Computes *x* rounded down, toward zero, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded down when adjusted away from zero.

Arguments:

Name	Type	Description
x	number	The value to be rounded,
significance	number	The multiple to which *x* is to be rounded.

Return Type and Value: number – The rounded-down value of *x*.

However, if *x* and *significance* have different signs, `#NUM!` is returned.

[*Example*:

`FLOOR(2.5,1)` rounds 2.5 down to nearest multiple of 1; that is, to 2
`FLOOR(-2.5,-2)` rounds -2.5 down to nearest multiple of -2; that is, to `-2`
`FLOOR(1.5,0.1)` rounds 1.5 down to the nearest multiple of 0.1; that is, to `1.5`
`FLOOR(0.234,0.01)` rounds 0.234 down to the nearest multiple of 0.01; that is, to 0.23

end example]

3.17.7.125 FORECAST

Syntax:

FORECAST (*x* , *known-ys* , *known-xs*)

Description: Calculates, or predicts, a future value by using existing values. The predicted value is a y-value for a given x-value. The known values are existing x-values and y-values, and the new value is predicted by using linear regression.

Mathematical Formula:

FORECAST=a+bx, where:

$$a = \bar{y} - b\bar{x}$$

and:

$$b = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2}$$

and where x and y are the sample means `AVERAGE(known-xs)` and `AVERAGE(known-ys)`.

Arguments:

Name	Type	Description
x	number	The data point for which a value is to be predicted.
known-xs	array, reference	The independent data.
known-ys	array, reference	The dependent data.

Return Type and Value: number – The future value.

However, if

- *known-xs* and *known-ys* are empty or contain a different number of data points, the return value is unspecified.
- The variance of *known-xs* equals zero, the return value is unspecified.

[*Example*:

`FORECAST(30,{6,7,9,15,21},{20,28,31,38,40})` results in `10.60725309`

end example]

3.17.7.126 FREQUENCY

Syntax:

FREQUENCY (*data-array* , *bins-array*)

Description: Calculates how often values occur within a range of values. A call to FREQUENCY shall be entered as an array formula.

Arguments:

Name	Type	Description
data-array	array, reference to number	Set of values for which frequencies are to be computed. If *data-array* contains no values, FREQUENCY returns an array of zeros. Cells containing text or that are empty are ignored.
bins-array	array, reference	Set of intervals into which the values in *data-array* are to be grouped. If *bins-array* contains no values, FREQUENCY returns the number of elements in *data-array*.

Return Type and Value: vertical array of numbers – The frequency at which values occur within a range of values. The number of elements in the returned array is one more than the number of elements in *bins-array*. The extra element contains the count of any values above the highest interval.

[*Example*:

If the cells A2:A10 contain 79, 85, 78, 85, 50, 81, 95, 88, and 97, and the cells B2:B4 contain 70, 79, and 89, `FREQUENCY(A2:A10,B2:B4)` results in a vertical array containing 1 (50), 2 (79, 78), 4 (85, 85, 81, 88), and 2 (95, 97).

end example]

3.17.7.127 FTEST

Syntax:

FTEST (*array-1* , *array-2*)

Description: Computes the result of an F-test.

Arguments:

Name	Type	Description
array-1	number, name, array, reference to number	If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
array-2		

Return Type and Value: number – The two-tailed probability that the variances in *array-1* and *array-2* are not significantly different.

However, if

- The number of data points in *array-1* or *array-2* is less than 2, the return value is unspecified.
- The variance of *array-1* or *array-2* is zero, the return value is unspecified.

[*Example*:

If the cells D6:D10 contain 6, 7, 9, 15, and 21, and the cells E6:E10 contain 20, 28, 31, 38, and 40, `FTEST(D6:D10,E6:E10)` results in `0.648317847`

end example]

3.17.7.128 FV

Syntax:

FV (*rate* , *nper* , *pmt* [, [*pv*] [, [*type*]]])

Description: Computes the future value of an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description
rate	number	The interest rate.
nper	number	The total number of payment periods, truncated to integer.
pmt	number	The payment made each period; it cannot change over the life of the annuity. [*Note*: Typically, *pmt* contains principal and interest, but no other fees or taxes. *end note*] If omitted, *pv* shall be provided.
pv	number	The the present value, or the lump-sum amount that a series of future payments is worth right now. If omitted, it is assumed to be 0, and *pmt* shall be provided.
type	number	The timing of the payment, truncated to integer, as follows: **Value** / **Timing** `0` – Payment at the end of the period `1` – Payment at the beginning of the period

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The future value of an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`FV(0.06/12,10,-200,-500,1)` `2,581.40`
`FV(0.12/12,12,-1000)` results in `12,682.50`
`FV(0.11/12,35,-2000,,1)` results in `82,846.25`
`FV(0.06/12,12,-100,-1000,1)` results in `2,301.40`

end example]

3.17.7.129 FVSCHEDULE

Syntax:

FVSCHEDULE (*principal* , *schedule*)

Description: Computes the future value of an initial principal after applying a series of compound interest rates. [*Note*: This function can be used to calculate the future value of an investment with a variable or adjustable rate. *end note*]

Arguments:

Name	Type	Description
principal	number	The present value.
schedule	array	Set of interest rates to apply. The values in this array can be numbers or blank cells. Blank cells are taken as zeros (i.e., no interest).

Return Type and Value: number – The future value of an initial principal after applying a series of compound interest rates.

However, if any element of the array *schedule* is not a number and not blank, #VALUE ! is returned.

[*Example*:

FVSCHEDULE(1,{0.09,0.11,0.1}) results in 1.33089

end example]

3.17.7.130 GAMMADIST

Syntax:

GAMMADIST (*x* , *alpha* , *beta* , *cumulative-flag*)

Description: Computes the gamma distribution.

Mathematical Formula:

The equation for the gamma probability density function is:

$$f(x;\alpha,\beta) = \frac{1}{\beta^{\alpha}\Gamma(\alpha)} x^{\alpha-1} e^{-\frac{x}{\beta}}$$

The standard gamma probability density function is:

$$f(x;\alpha) = \frac{x^{\alpha-1} e^{-x}}{\Gamma(\alpha)}$$

When *alpha* = 1, GAMMADIST returns the exponential distribution with:

$$\lambda = \frac{1}{\beta}$$

For a positive integer n, when *alpha* = n/2, *beta* = 2, and cumulative = TRUE, GAMMADIST returns (1-CHIDIST(x)) with n degrees of freedom.

When *alpha* is a positive integer, GAMMADIST is also known as the Erlang distribution.

Arguments:

Name	Type	Description
x	number	The value at which the distribution is to be evaluated.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution. If *beta* = 1, GAMMADIST returns the standard gamma distribution.
cumulative-flag	logical	Determines the form of the function. If TRUE, GAMMADIST returns the cumulative distribution function; if FALSE, it returns the probability density function.

Return Type and Value: number – The gamma distribution.

However, if

- *x* < 0, #NUM! is returned.
- *alpha* ≤ 0 or *beta* ≤ 0, #NUM! is returned.

[*Example*:

GAMMADIST(10,9,2,FALSE) results in 0.03263902
GAMMADIST(10,9,2,TRUE) results in 0.068093631

end example]

3.17.7.131 GAMMAINV

Syntax:

GAMMAINV (*probability* , *alpha* , *beta*)

Description: Computes the inverse of the gamma distribution. Given a value for *probability*, GAMMAINV seeks that value *x* such that GAMMADIST(*x*, *alpha*, *beta*, TRUE) = *probability*. Thus, the precision of GAMMAINV depends on the precision of GAMMADIST. GAMMAINV uses an iterative search technique.

Arguments:

Name	Type	Description

Name	Type	Description
probability	number	The probability associated with the gamma distribution.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution. If *beta* = 1, GAMMAINV returns the standard gamma distribution.

Return Type and Value: number – The inverse of the gamma distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *alpha* ≤ 0 or *beta* ≤ 0, #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned.

[*Example*:

GAMMAINV(0.068,9,2) results in 9.997130086

end example]

3.17.7.132 GAMMALN

Syntax:

GAMMALN (*x*)

Description: Computes the natural logarithm of the gamma function.

Mathematical Formula:

$$GAMMALN = LN(\Gamma(x))$$

where:

$$\Gamma(x) = \int_0^{\infty} e^{-u} u^{x-1} du$$

Arguments:

Name	Type	Description
x	number	The value for which the gamma function is to be calculated.

Return Type and Value: number – The natural logarithm of the gamma function.

However, if $x \leq 0$, `#NUM!` is returned.

[*Example*:

`GAMMALN(4.5)` results in `2.453736571`

end example]

3.17.7.133 GCD

Syntax:

GCD (*argument-list*)

Description: Computes the greatest common divisor of the one or more numbers, designated by *argument*s in *argument-list*.

Arguments:

Name	Type	Description
argument-list	numbers	The *argument*s in *argument-list* designate the values. Each argument is truncated to an integer.

Return Type and Value: number – The greatest common divisor of one or more numbers.

However, if any *argument* is negative, `#NUM!` is returned.

[*Example*:

`GCD(5)` results in `5`
`GCD(5,2)` results in `1`
`GCD(100,50,28)` results in `2`
`GCD(24.5,36.3)` results in `12`
`GCD(7,1)` results in `1`
`GCD(5,0)` results in `5`

end example]

3.17.7.134 GEOMEAN

Syntax:

GEOMEAN (*argument-list*)

Description: Computes the geometric mean of an array or range of positive data.

Mathematical Formula:

$$GM_{\bar{y}} = \sqrt[n]{y_1 y_2 y_3 \cdots y_n}$$

Arguments:

Name	Type	Description
argument-list	logical, number, name, array, or reference to number.	The *argument*s in *argument-list* designate the values to be averaged. Logical values and text representations of numbers that entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The geometric mean of an array or range of positive data.

However, if the value of any data point ≤ 0, `#NUM!` is returned.

[*Example*:

`GEOMEAN(10.5,5.3,2.9)` results in `5.444454702`
`GEOMEAN(10.5,{5.3,2.9},"12")` results in `6.633780588`

end example]

3.17.7.135 GESTEP

Syntax:

`GESTEP ( number [ , step ] )`

Description: Tests if the value of *number* is greater than or equal to that of *step*.

Arguments:

Name	Type	Description
number	number	*number* is the value to test against *step*. If *step* is omitted, zero is used.
step	number	

Return Type and Value: number – 1 if *number* ≥ *step*; otherwise, 0.

[*Example*:

`GESTEP(5.6,-4.3)` results in `1`
`GESTEP(5.6,5.6)` results in `1`

`GESTEP(-5.6)` results in `0`

end example]

3.17.7.136 GETPIVOTDATA

Syntax:

```
GETPIVOTDATA ( data-field , pivot-table , field-1 , item-1
    [ , field-2 , item-2 [ , … ] ] )
```

Description: Retrieves data stored in a PivotTable report. Calculated fields or items and custom calculations are included in `GETPIVOTDATA` calculations.

Arguments:

Name	Type	Description
data-field	text	The name of the data field that contains the data to be retrieved.
pivot-table	reference to any cell, range of cells, or named range of cells in a PivotTable report	This information is used to determine which PivotTable report contains the data to be retrieved. If *pivot-table* is a range that includes two or more PivotTable reports, data shall be retrieved from whichever report was created most recently in the range.
field-1 through *field-n*	text	Argument pairs *field-1* and *item-1*, *field-2* and *item-2* through *field-n* and *item-n* are field names and item names that describe the data to be retrieved. The pairs can be in any order. Field names and names for items other than dates/times (which shall be expressed as numbers) and numbers shall be enclosed in quotation marks. For OLAP PivotTable reports, items can contain the source name of the dimension as well as the source name of the item. [*Example*: A field and item pair for an OLAP PivotTable might look like this: `"[Product]","[Product].[All Products].[Foods].[Baked Goods]"` *end example*] If the field and item arguments describe a single cell, the value of that cell is returned regardless of its type or value.
item-1 through *item-n*	text	

Return Type and Value: any – The data stored in a PivotTable report.

However, if

- *pivot-table* is not a range in which a PivotTable report is found, the return value is unspecified.
- The arguments do not describe a visible field, the return value is unspecified.
- The arguments include a page field that is not displayed, the return value is unspecified.

[*Example*: Given the following data:

	A	B	C	D	E
2	Region	North			
3					
4	Sum of Sales		Product		
5	Month	Salesperson	Beverages	Produce	Grand Total
6	March	Buchanan	$ 3,522	$ 10,201	$ 13,723
7		Davolio	$ 8,725	$ 7,889	$ 16,614
8	March Total		$ 12,247	$ 18,090	$ 30,337
9	April	Buchanan	$ 5,594	$ 7,265	$ 12,859
10		Davolio	$ 5,461	$ 668	$ 6,129
11	April Total		$ 11,055	$ 7,933	$ 18,988
12	Grand Total		$ 23,302	$ 26,023	$ 49,325

`GETPIVOTDATA("Sales",$A$4)` returns the grand total of the Sales field, `$49,325`.

`GETPIVOTDATA("Sum of Sales",$A$4)` also returns the grand total of the Sales field, `$49,325`; the field name can be entered exactly as it looks on the sheet, or as its root (without "Sum of," "Count of," and so forth).

`GETPIVOTDATA("Sales",$A$4,"Month","March")` returns the grand total for March, `$30,337`.

`GETPIVOTDATA("Sales",$A$4,"Month","March","Product","Produce","Salesperson","Buchanan")` returns `$10,201`.

`GETPIVOTDATA("Sales",$A$4,"Region","South")` is unspecified because the South region data is not visible.

`GETPIVOTDATA("Sales",$A$4,"Product","Beverages","Salesperson","Davolio")` is unspecified because there is no total value of beverage sales for Davolio.

end example]

3.17.7.137 GROWTH

Syntax:

`GROWTH ( known-ys [ , [ known-xs ] [ , [ new-xs ] [ , const-flag ] ] )`

Description: Computes predicted exponential growth by using existing data. GROWTH can also fit an exponential curve to existing x-values and y-values.

Arguments:

Name	Type	Description
known-ys	array	Set of y-values already known in the relationship $y=b*m^x$. If the array *known-ys* is a single column, then each column of *known-xs* is interpreted as a separate variable. If the array *known-ys* is a single row, then each row of *known-xs* is interpreted as a separate variable.
known-xs	array	Set of x-values that might already be know in the

Name	Type	Description
		relationship y=b*m^x. The array *known-xs* can include one or more sets of variables. If only one variable is used, *known-ys* and *known-xs* can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, *known-ys* must be a vector (that is, a *known-ys* with a height of one row or a width of one column). If *known-xs* is omitted, it is assumed to be the array {1,2,3,...} that is the same size as *known-ys*.
new-xs	array	A set of new x-values for which GROWTH is to return corresponding y-values. *new-xs* shall include a column (or row) for each independent variable, just as *known-xs* does. So, if *known-ys* is in a single column, *known-xs* and *new-xs* shall have the same number of columns. If *known-ys* is in a single row, *known-xs* and *new-xs* shall have the same number of rows. If *new-xs* are omitted, it is assumed to be the array {1,2,3,...} that is the same size as *known-ys*.
const-flag	logical	Specifies whether to force the constant b to equal 1. If TRUE or omitted, *b* is calculated normally. If FALSE, *b* is set equal to 1 and the m-values are adjusted so that y= m^x.

Return Type and Value: array – The y-values for a series of new x-values.

However, if any of the numbers in *known-ys* are zero or negative, `#NUM!` is returned.

[*Example*: Given the following data:

	A	B	C
1	Month	Units	Formula (corresponding units)
2	11	33,100	32618.20377
3	12	47,300	47729.42261
4	13	69,000	69841.30086
5	14	102,000	102197.0734
6	15	150,000	149542.4867
7	16	220,000	218821.8762
8	Month	Formula (Predicted Units)	
9	17	320,196.72	
10	18	468,536.05	

When `GROWTH(A2:B4,A6:B8)` is array-entered into cells C2:C7, those cells take on the results shown.

When GROWTH(A2:B4,A6:B8,A9:A10) is array-entered into cells B9:B10, those cells take on the results shown.

end example]

3.17.7.138 HARMEAN

Syntax:

HARMEAN (*argument-list*)

Description: Computes the harmonic mean of a data set.

Mathematical Formula:

$$\frac{1}{H_g} = \frac{1}{n}\sum\frac{1}{Y_i}$$

Arguments:

Name	Type	Description
argument-list	logical, text, number, name, array, or reference to number.	The *argument*s in *argument-list* designate the values to be averaged. Argument values can be numbers, or names, arrays, or references that contain numbers. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The harmonic mean of a data set.

However, if the value of any data point ≤ 0, #NUM! is returned.

[*Example*:

HARMEAN(4.6,5.8,8.3,7) results in 6.124222
HARMMEAN(10.5,{5.3,2.9},"12") results in 5.617360

end example]

3.17.7.139 HEX2BIN

Syntax:

HEX2BIN (*number* [, *num-bin-digits*])

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

Name	Type	Description
number	text	A 10-digit hexadecimal number in a string that is to be converted to a binary string. *number* is not case-sensitive. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.
num-bin-digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-bin-digits* is ignored and the result has 10 digits. If *num-bin-digits* is omitted, the minimum number of digits is used in the result. *num-bin-digits* is truncated to an integer.

Return Type and Value: text – The binary equivalent of *number*.

However, if

- *number* is outside the range `"FFFFFFFE00"` (1111111111111111111111111111111000000000 binary, -512 decimal) to `"1FF"` (0000000000000000000000000000000111111111 binary, 511 decimal), inclusive, `#NUM!` is returned.
- *number* contains one or more non-hexadecimal digits, `#NUM!` is returned.
- *number* contains more than 10 hexadecimal digits, `#NUM!` is returned.
- *number* needs more digits that *num-bin-digits*, `#NUM!` is returned.
- *num-bin-digits* is negative or > 10, `#NUM!` is returned.

[*Example*:

`HEX2BIN("fE")` results in `11111110`
`HEX2BIN("FFFFFFFFFE")` results in `1111111110`
`HEX2BIN("2")` results in `10`
`HEX2BIN("F",6)` results in `001111`

end example]

3.17.7.140 HEX2DEC

Syntax:

HEX2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

Name	Type	Description
number	string	A 10-digit hexadecimal number in a string that is to be converted to a decimal number. *number* is not case-sensitive. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-hexadecimal digits, `#NUM!` is returned.
- *number* contains more than 10 hexadecimal digits; that is, *number* is outside the range `"8000000000"` (-548,755,813,888 decimal) to `"7FFFFFFFFF"` (548,755,813,887 decimal), inclusive, `#NUM!` is returned.

[*Example*:

`HEX2DEC("fE")` results in `254`
`HEX2DEC("FFFFFFFFFE")` results in `-2`
`HEX2DEC("F000000000")` results in `-68719476736`

end example]

3.17.7.141 HEX2OCT

Syntax:

HEX2OCT (*number* [, *num-oct-digits*])

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

Name	Type	Description
number	text	A 10-digit hexadecimal number in a string that is to be converted to an octal string. *number* is not case-sensitive. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.
num-oct-	number	The number of digits in the result, with leading zeros

Name	Type	Description
digits		added as necessary. However, if *number* is negative, *num-oct-digits* is ignored and the result has 10 digits. If *num-oct-digits* is omitted, the minimum number of digits is used in the result. *num-oct-digits* is truncated to an integer.

Return Type and Value: text – The octal equivalent of *number*.

However, if

- *number* is outside the range `"FFE0000000"` (17774000000000 octal, -536,870,912 decimal) to `"1FFFFFFF"` (00003777777777 octal, 536,870,911 decimal), inclusive, `#NUM!` is returned.
- *number* contains one or more non-hexadecimal digits, `#NUM!` is returned.
- *number* contains more than 10 hexadecimal digits, `#NUM!` is returned.
- *number* needs more digits that *num-oct-digits*, `#NUM!` is returned.
- *num-oct-digits* is negative or > 10, `#NUM!` is returned.

[*Example*:

`HEX2OCT("fE")` results in `376`
`HEX2OCT("FFFFFFFFFE")` results in `7777777776`
`HEX2OCT("2")` results in `2`
`HEX2OCT("F",6)` results in `000017`

end example]

3.17.7.142 HLOOKUP

Syntax:

HLOOKUP (*lookup-value* , *table-array* , *row-index-num* [, [*range-lookup-flag*]])

Description: Performs a horizontal search for a value in the top row of a table or an array, noting the column in which the matching value is found. From that column, the value from a given row is returned.

Arguments:

Name	Type	Description
lookup-value	value of any type or a reference to a value of any type.	The value to be located in the first row of the table. If *range-lookup* is FALSE and *lookup-value* is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in *lookup-value*. A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or

Name	Type	Description
		asterisk, type a tilde (~) before the character.
table-array	array, reference, name	Designates the table of information to be searched. The values in the first row of *table-array* can be text, numbers, or logical values. If *range-lookup-flag* is TRUE, the values in the first row of *table-array* shall be placed in "ascending order", as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. If *range-lookup-flag* is FALSE, *table-array*'s values need not be sorted. Uppercase and lowercase text is treated as equivalent.
row-index-num	number	The row number in *table-array* from which the matching value is to be returned. (A *row-index-num* of 1 returns the first row value in *table-array*, a *row-index-num* of 2 returns the second row value in *table-array*, and so on.)
range-lookup-flag	logical	Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found, the next largest value that is less than *lookup-value* is returned. If FALSE, an exact match is performed.

Return Type and Value: any – The value from a given row number, where the column is determined by a search of the top row looking for a match with a given value.

However, if

- An exact match is performed, but no match is found, #N/A is returned.
- *row-index-num* is less than 1, #VALUE! is returned.
- *row-index-num* is greater than the number of rows in *table-array*, #REF! is returned.
- *lookup-value* is smaller than the smallest value in the first row of *table-array*, #N/A is returned.

[*Example*: Given the following data:

	A	B	C
1	Axles	Bearings	Bolts
2	4	6	9
3	5	7	10
4	6	8	11

`HLOOKUP("Axles",A1:C4,2,TRUE)` results in 4
`HLOOKUP("Bearings",A1:C4,3,FALSE)` results in 7
`HLOOKUP("B",A1:C4,3,TRUE)` results in 5
`HLOOKUP("Bolts",A1:C4,4)` results in 11

HLOOKUP(3,{1,2,3;"a","b","c";"d","e","f"},2,TRUE) results in c

end example]

3.17.7.143 HOUR

Syntax:

HOUR (*time-value*)

Description: Computes the hour for the date and/or time having the given *time-value*.

Arguments:

Name	Type	Description
time-value	number	The date and/or time whose hour is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any date information shall be ignored.

Return Type and Value: number – The hour for the date and/or time having the given *time-value*. The returned value shall be in the range 0–59.

However, if *time-value* is out of range for the current date base value, #NUM! is returned.

[*Example*:

HOUR(DATE(2006,2,26)+TIME(2,10,20)) results in 2
HOUR(TIME(22,56,34)) results in 22
HOUR(0) results in 0, since serial value 0 represents 00:00:00
HOUR(10.5) results in 12, since serial value .5 represents 12:00:00
HOUR("22-Oct-2001 10:53:12") results in 10
HOUR("10:53:12 pm") results in 22
HOUR("22:53:12") results in 22

end example]

3.17.7.144 HYPERLINK

Syntax:

HYPERLINK (*link-location* [, [*friendly-name*]])

Description: Creates a shortcut that opens a document stored on a network server, an intranet, or the Internet. When the cell that contains the HYPERLINK function call is clicked, the file stored at *link-location* is opened.

Arguments:

Name	Type	Description
link-location	text	The path and file name to the document to be opened as text. *link-location* can refer to a place in a document—such as a specific cell or named range in a SpreadsheetML worksheet or workbook, or to a bookmark in a WordprocessingML document. The path can be to a file stored on a hard disk drive, or the path can be a universal naming convention (UNC) path on a server or a Uniform Resource Locator (URL) path on the Internet or an intranet. If the path specified in *link-location* does not exist or cannot be navigated, an unspecified error is produced when the cell is clicked. *link-location* can be a string or a reference to a cell containing a string.
friendly-name	text, number, name	The value that is displayed in the cell. If omitted, the cell displays *link-location*. *friendly-name* can be a value, a text string, a name, or a cell that contains the jump text or value. If the evaluation of *friendly-name* results in an error value, the cell displays that error value rather than the jump text.

Return Type and Value: text – The value of *friendly-name*, if it is specified; otherwise, the value of *link-location*.

[*Example*:

`HYPERLINK("http://example.openxmlformats.org/report/budget report.xls","Click for report")`, which opens a worksheet named "budget report.xls" that is stored on the Internet at the location example.openxmlformats.org/report, and displays the text "Click for report".

`HYPERLINK("D:\FINANCE\1stqtr.xls",H10)`, which opens the file 1stqtr.xls that is stored in a directory named Finance on drive D, and displays the numeric value stored in cell `H10`.

end example]

3.17.7.145 HYPGEOMDIST

Syntax:

`HYPGEOMDIST` (*sample-successes* , *number-sample* , *population-successes* , *number-population*)

Description: Computes the hypergeometric distribution; that is, the probability of a given number of sample successes, given the sample size, population successes, and population size.

Mathematical Formula:

$$P(X = x) = h(x; n, M, N) = \frac{\binom{M}{x}\binom{N-M}{n-x}}{\binom{N}{n}}$$

where:

x = *sample-successes*
n = number-sample
M = *population-successes*
N = *number-population*

Arguments:

Name	Type	Description
sample-successes	number	The number of successes in the sample, truncated to integer.
number-sample	number	The size of the sample, truncated to integer.
population-successes	number	The number of successes in the population, truncated to integer.
number-population	number	The population size, truncated to integer.

Return Type and Value: number – The hypergeometric distribution.

However, if

- *sample-successes* < 0 or *sample-successes* is greater than the lesser of *number-sample* and *population-successes*, `#NUM!` is returned.
- *sample-successes* is less than the larger of 0 or (*number-sample* - *number-population* + *population-successes*), `#NUM!` is returned.
- *number-sample* ≤ 0 or *number-sample* > *number-population*, `#NUM!` is returned.
- *population-successes* ≤ 0 or *population-successes* > *number-population*, `#NUM!` is returned.
- *number-population* ≤ 0, `#NUM!` is returned.

[*Example*:

`HYPGEOMDIST(1,4,8,20)` results in `0.363261`

end example]

3.17.7.146 IF

Syntax:

IF (*logical-value* , [*value-if-true*][, [*value-if-false*]])

Description: Tests *logical-value*, and if it is TRUE, *value-if-true* is evaluated and returned; otherwise, *value-if-false* is evaluated and returned.

Arguments:

Name	Type	Description
logical-value	logical	The value to be tested.
value-if-true	any	The value returned if *logical-value* is TRUE. If *logical-value* is TRUE and *value-if-true* is omitted, this argument evaluates to 0. *value-if-true* can contain up to seven levels of nested IF function calls. *value-if-true* and *value-if-false* need not evaluate to results of the same type.
value-if-false	any	The value returned if *logical-value* is FALSE. If *logical-value* is FALSE and *value-if-false* and its preceding comma is omitted, this argument evaluates to FALSE. If *logical-value* is FALSE and *value-if-false* is omitted, but its preceding comma is present, this argument evaluates to 0. *value-if-false* can contain at least seven levels of nested IF function calls. *value-if-true* and *value-if-false* need not evaluate to results of the same type.

If any argument is an array, every element of that array shall be evaluated when that argument is evaluated.

Return Type and Value: any – *value-if-true*, if *logical-value* is TRUE; otherwise, *value-if-false*.

[*Example*:

IF(10>5,"Yes","No") results in Yes
IF(10>5,"Yes") results in Yes
IF(10>5,"Yes",) results in Yes
IF(10<5,"Yes") results in FALSE
IF(10<5,"Yes",) results in 0

IF(10>5,,"No") results in 0
IF(10>5,,) results in 0
IF(10>5,"Yes",20) results in Yes
IF(10<5,"Yes",20) results in 20

end example]

3.17.7.147 IFERROR

Syntax:

`IFERROR ( value , value-if-error )`

Description: Provides a simpler and more efficient way of trapping and handling errors. It allows the generation of user-defined error text for a function call that can result in an error.

Arguments:

Name	Type	Description
value	any	The value that is checked for an error (i.e., any of the following: #N/A, #VALUE!, #REF!, #DIV/0!, #NUM!, #NAME?, or #NULL!). If *value* is an empty cell, it is treated as an empty string.
value-if-error	any	The value to return if *value* evaluates to an error. If *value-if-error* is an empty cell, it is treated as an empty string.

Return Type and Value: any – *value*, if *value* is not an error; otherwise, *value-if-error*. If *value* is an array formula, an array of results for each cell in the range specified in value, is returned.

[*Example*: Consider the case in which A3 contains 55, and B3 contains 0:

A3/B3 results in #DIV/0

IFERROR(A3/B3,"Error in calculation") results in Error in calculation

end example]

3.17.7.148 IMABS

Syntax:

`IMABS ( complex-number )`

Description: Computes the absolute value of *complex-number*.

Mathematical Formula:

$$\mathrm{IMABS}(z) = |z| = \sqrt{x^2 + y^2}$$

where z = x + yi

Arguments:

Name	Type	Description

Name	Type	Description
complex-number	text	The complex number for which the absolute value is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: number – The absolute value of *complex-number*.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMABS("3+4i")` results in `5`
`IMABS("-2.5-34.6j")` results in `34.69020035`

end example]

3.17.7.149 IMAGINARY

Syntax:

`IMAGINARY ( complex-number )`

Description: Computes the imaginary coefficient of *complex-number*.

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the imaginary coefficient is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: number – The imaginary coefficient of *complex-number*.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMAGINARY("3+4i")` results in `4`
`IMAGINARY("-2.5-34.6j")` results in `34.6`

end example]

3.17.7.150 IMARGUMENT

Syntax:

IMARGUMENT (*complex-number*)

Description: Computes the argument θ, an angle expressed in radians, such that for a complex number *complex-number* having the form *x+yi*:

$$x + yi = |x + yi| \times e^{\theta} = |x + yi|(\cos\theta + i\sin\theta)$$

Mathematical Formula:

$$\mathrm{IMARGUMENT}(z) = \tan^{-1}\left(\frac{y}{x}\right) = \theta$$

where:

$$\theta \in (-\pi; \pi]$$

and z = x + yi

Arguments:

Name	Type	Description
complex-number	text	The complex number in *x + yi* or *x + yj* text format.

Return Type and Value: number – The angle θ, expressed in radians.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMARGUMENT("13+4i")` results in `0.298498932`
`IMARGUMENT("-2.5-5j")` results in `-2.034443936`

end example]

3.17.7.151 IMCONJUGATE

Syntax:

IMCONJUGATE (*complex-number*)

Description: Computes the complex conjugate of the complex number *complex-number*.

Mathematical Formula:

$$\mathrm{IMCONJUGATE}(x + yi) = \bar{z} = (x - yi)$$

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the complex conjugate is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the complex conjugate of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMCONJUGATE("2.3+4.5i")` results in `2.3-4.5i`
`IMCONJUGATE("-1-4j")` results in `-1+4j`

end example]

3.17.7.152 IMCOS

Syntax:

`IMCOS ( complex-number )`

Description: Computes the cosine of the complex number *complex-number*.

Mathematical Formula:

$$\cos(x + yi) = \cos(x)\cosh(y) - \sin(x)\sinh(y)i$$

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the cosine is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the cosine of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMCOS("2.3+4.5i")` results in `-29.9918288739746-33.5589799796873i`
`IMCOS("-1-4j")` results in `14.7547011704838-22.963673499193j`

end example]

3.17.7.153 IMDIV

Syntax:

`IMDIV ( complex-number-1 , complex-number-2 )`

Description: Computes the quotient from dividing two complex numbers.

Mathematical Formula:

$$\mathrm{IMDIV}(z_1, z_2) = \frac{(a+bi)}{(c+di)} = \frac{(ac+bd)+(bc-ad)i}{c^2+d^2}$$

Arguments:

Name	Type	Description
complex-number-1	text	Complex numbers in *x + yi* or *x + yj* text format; they designate the dividend and divisor, respectively.
complex-number-2	text	

Return Type and Value: text – A string containing the quotient from *number-1 / number-2*, in *x+yi* or *x+yj* text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMDIV("13+4i","5+3i")` results in `2.26470588235294-0.558823529411765i`
`IMDIV("-3-3.5i","5+3i")` results in `-0.75-0.25i`

end example]

3.17.7.154 IMEXP

Syntax:

`IMEXP ( complex-number )`

Description: Computes the exponential of the complex number *complex-number*.

Mathematical Formula:

$$\mathrm{IMEXP}(z) = e^{(x+yi)} = e^x e^{yi} = e^x(\cos y + i\sin y)$$

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the exponential is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the exponential of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMEXP("2.3+4.5i")` results in `-2.10251576423113-9.75006374866818i`
`IMEXP("-1-4j")` results in `-0.240462049968584+0.278412079051034j`

end example]

3.17.7.155 IMLN

Syntax:

`IMLN ( complex-number )`

Description: Computes the natural logarithm of *complex-number*.

Mathematical Formula:

$$\ln(x + yi) = \ln\sqrt{x^2 + y^2} + i\tan^{-1}\left(\frac{y}{x}\right)$$

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the natural logarithm is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – The natural logarithm of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMLN("3+4i")` results in `1.6094379124341+0.927295218001612i`
`IMLN("-2.5-34.6j")` results in `3.54645723627033-1.64292531532225j`

end example]

3.17.7.156 IMLOG10

Syntax:

`IMLOG10 ( complex-number )`

Description: Computes the base-10 logarithm of *complex-number*.

Mathematical Formula:

The common logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_{10}(x+yi) = (\log_{10} e)\ln(x+yi)$$

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the base-10 logarithm is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – The base-10 logarithm of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMLOG10("3+4i")` results in `10.698970004336019+0.402719196273373i`
`IMLOG10("-2.5-34.6j")` results in `11.54020680801806-0.713513398623614j`

end example]

3.17.7.157 IMLOG2

Syntax:

`IMLOG2 ( complex-number )`

Description: Computes the base-2 logarithm of *complex-number*.

Mathematical Formula:

The base-2 logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_{2}(x+yi) = (\log_{2} e)\ln(x+yi)$$

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the base-2 logarithm is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – The base-2 logarithm of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

IMLOG2("3+4i") results in `2.32192809506607+1.33780421255394i`
IMLOG2("-2.5-34.6j") results in `5.11645626788577-2.37024020514877j`

end example]

3.17.7.158 IMPOWER

Syntax:

```
IMPOWER ( complex-number , y )
```

Description: Computes the complex number *complex-number* raised to the power *y*.

Mathematical Formula:

$$(x+yi)^n = r^n e^{i\theta n} = r^n \cos n\theta + ir^n \sin n\theta$$

where:

$$r = \sqrt{x^2 + y^2}$$

and:

$$\theta = \tan^{-1}\left(\frac{y}{x}\right)$$

and:

$$\theta \in (-\pi; \pi]$$

Arguments:

Name	Type	Description
complex-	text	The complex number in *x + yi* or *x + yj* text format.

Name	Type	Description
number		
y	number	The exponent to which *complex-number* is to be raised.

Return Type and Value: text – A string containing *complex-number*^{y}, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMPOWER("2.3+4.5i",2.5)` results in `-52.9752689709953+22.138528463954i`
`IMPOWER("-1-4j",-3.56)` results in `6.34818926783845E-003+1.16156377299512E-003j`

end example]

3.17.7.159 IMPRODUCT

Syntax:

`IMPRODUCT ( argument-list )`

Description: Multiplies the values of its complex number arguments.

Mathematical Formula:

$$(a + bi)(c + di) = (ac - bd) + (ad + bc)i$$

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* is a complex number string in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the product of the values of its arguments, in *x+yi* or *x+yj* text format.

However, if any *argument* in *argument-list* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMPRODUCT("13+4i")` results in `13+4i`
`IMPRODUCT("-3-3.5i","5+3i")` results in `-4.5-26.5i`
`IMPRODUCT("1.3-2j","-3.4+3j","2.3-6j")` results in `67.834+15.13j`

end example]

3.17.7.160 IMREAL

Syntax:

`IMREAL ( complex-number )`

Description: Computes the real coefficient of *complex-number*.

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the real coefficient is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: number – The real coefficient of *complex-number*.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMREAL("3+4i")` results in `3`
`IMREAL("-2.5-34.6j")` results in `-2.5`

end example]

3.17.7.161 IMSIN

Syntax:

`IMSIN ( complex-number )`

Description: Computes the sine of the complex number *complex-number*.

Mathematical Formula:

$$\sin(x + yi) = \sin(x)\cosh(y) - \cos(x)\sinh(y)i$$

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the sine is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the sine of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMSIN("2.3+4.5i")` results in `33.567264016308-29.9844272159606i`
`IMSIN("-1-4j")` results in `-22.9790855778861-14.7448051885587j`

end example]

3.17.7.162 IMSQRT

Syntax:

`IMSQRT ( complex-number )`

Description: Computes the square root of the complex number *complex-number*.

Mathematical Formula:

$$\sqrt{x+yi} = \sqrt{r}\cos\left(\frac{\theta}{2}\right) + i\sqrt{r}\sin\left(\frac{\theta}{2}\right)$$

where:

$$r = \sqrt{x^2 + y^2}$$

and:

$$\theta = \tan^{-1}\left(\frac{y}{x}\right)$$

and:

$$\theta \in (-\pi; \pi]$$

Arguments:

Name	Type	Description
complex-number	text	The complex number for which the square root is being computed. *complex-number* shall be in *x + yi* or *x + yj* text format.

Return Type and Value: text – A string containing the square root of *complex-number*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMSQRT("2.3+4.5i")` results in `1.91751290835255+1.17339496918073i`
`IMSQRT("-1-4j")` results in `1.24962106768765-1.60048518044024j`

end example]

3.17.7.163 IMSUB

Syntax:

`IMSUB ( complex-number-1 , complex-number-2 )`

Description: Computes the difference of two complex numbers.

Mathematical Formula:

$$(a + bi) - (c + di) = (a - c) + (b - d)i$$

Arguments:

Name	Type	Description
complex-number-1	text	Complex numbers in *x + yi* or *x + yj* text format; they designate the minuend and subtrahend, respectively.
complex-number-2	text	

Return Type and Value: text – A string containing *number-1* - *number-2*, in *x+yi* or *x+yj* text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMSUB("13+4i","5+3i")` results in `8+i`
`IMSUB("-3-3.5i","5+3i")` results in `-8-6.5i`

end example]

3.17.7.164 IMSUM

Syntax:

`IMSUM ( argument-list )`

Description: Adds the values of its arguments.

Mathematical Formula:

$(a+bi)+(c+di)=(a+c)+(b+d)i$

Arguments:

Name	Type	Description
argument-list	text	Each *argument* in *argument-list* is a complex number string in *x + yi* or *x + yj* text format.

Return Type and Value: text – The sum of the values of its arguments, in *x+yi* or *x+yj* text format.

However, if any *argument* in *argument-list* is ill-formed, `#NUM!` is returned.

[*Example*:

`IMSUM("3+4i")` results in `3+4i`
`IMSUM("3+4i","5-3i")` results in `8+i`

end example]

3.17.7.165 INDEX

Syntax:

array form: `INDEX ( array , [ row-number ][ , [ column-number ]] )`

reference form: `INDEX ( reference [ , [ row-number ][ , [ column-number ]`
`[ , [ area-number ]]]] )`

Description: Locates a value or the reference to a value from within a table or range. There are two forms of the `INDEX` function: the array form and the reference form.

Arguments:

Name	Type	Description
array	array, reference	Table or range to be searched. If *array* contains only one row, the corresponding *row-number* argument is optional. If *array* contains only one column, the corresponding *column-number* argument is optional.
reference	reference	A reference to one or more cell ranges. If each area (§3.17.2.3) in *reference* contains only one row, *row-number* is optional. If each area contains only one column, *column-number* is optional.
row-number	number	*row-number* indicates the row in *array* (or *reference*) from which to return a value (or reference). If *row-number* is omitted, *column-number* shall be present. *column-number* indicates the column in *array* (or
column-number	number	

Name	Type	Description
		reference) from which to return a value (or *reference*). If *column-number* is omitted, *row-number* shall be present. If both the *row-number* and *column-number* arguments are used, `INDEX` returns the value (or *reference*) in the cell at the intersection of *row-number* and *column-number*. If *array* has more than one row and more than one column, and only *row-number* or *column-number* is used, `INDEX` returns an array of the entire row or column in array. If *row-number* or *column-number*, but not both, is 0, `INDEX` returns the array of values for the entire column or row, respectively. In the reference form, if *row-number* and *column-number* are both omitted, `INDEX` returns the area in reference specified by *area-number*.
area-number	number	Indicates a range in *reference* from which to return the intersection of *row-number* and *column-number*. The first area selected or entered is numbered 1, the second 2, and so on. If *area-number* is omitted, 1 is assumed. [*Example*: If *reference* describes the cells `(A1:B4, D1:E4, G1:H4)`, then area-number 1 is the range `A1:B4`, *area-number* 2 is the range `D1:E4`, and *area-number* 3 is the range `G1:H4`. *end example*]

Return Type and Value: various – For the array form, returns a single value, a whole row, or a whole column from a table or an array, depending on the presence and values of the row and column number indexes.

For the reference form, returns a single reference, a whole row, or a whole column from a reference, depending on the presence and values of the row and column number indexes, and the area number.

However, for the array form

- *row-number* is outside the bounds of *array*, `#REF!` is returned.
- *column-number* is outside the bounds of *array*, `#REF!` is returned.

For the reference form

- *row-number* is outside the bounds of *reference*, `#REF!` is returned.
- *column-number* is outside the bounds of *reference*, `#REF!` is returned.
- *area-number* is outside the bounds of *reference*, `#REF!` is returned.

[*Example*:

`INDEX({"Apples","Lemons";"Bananas","Pears"},2,2)` results in `Pears`
`INDEX({"Apples","Lemons";"Bananas","Pears"},2,1)` results in `Bananas`

`INDEX({"Apples","Lemons"},,2)` results in `Lemons`
`INDEX({"Apples";"Bananas"},1)` results in `Apples`

Given the following data:

	A	B	C
1	Fruit	Price	Count
2	Apples	0.69	40
3	Bananas	0.34	38
4	Lemons	0.55	15
5	Oranges	0.25	25
6	Pears	0.59	40
7	Almonds	2.8	10

`INDEX(A2:C7,2,3)` results in `38`
`INDEX((A2:C4,A6:C7),2,2,2)` results in `2.8`
`INDEX((A2:C4,A6:C7),2,2,1)` results in `0.34`

end example]

3.17.7.166 INDIRECT

Syntax:

`INDIRECT ( ` *ref-text* ` [ , [ ` *A1-ref-style-flag* ` ] ] )`

Description: Locates the reference specified by *ref-text* and evaluates that reference to get to its underlying value. [*Note*: This function should be used when the reference to a cell within a formula is to be changed without changing the formula itself. *end note*]

Arguments:

Name	Type	Description
ref-text	An A1-style reference, an R1C1-style reference, a name defined as a reference, or a reference to a cell as a string.	If *ref-text* refers to another workbook (i.e., it's an external reference), that other workbook shall be open.
A1-ref-style-flag	logical	Specifies the kind of reference that is contained in the cell *ref-text*. If TRUE or omitted, *ref-text* is interpreted as an A1-style reference (§3.17.2.3.1); otherwise, *ref-text* is

Name	Type	Description
		interpreted as an R1C1-style reference (§3.17.2.3.2).

Return Type and Value: any – The underlying value of the location referred to by *ref-text*.

However, if

- *ref-text* is not a valid cell reference, `#REF!` is returned.
- *ref-text* refers to another workbook yet that other workbook is not currently open, the return value is unspecified.

[*Example*:

Given the following data:

	A	B
1	Data	Data
2	B2	1.333
3	B3	45
4	George	10
5	5	62

where A2 contains a reference to B2, A3 contains a reference to B3, A4 contains the defined name George that refers to B4, and A5 contains the row number of B5:

`INDIRECT($A$2)` results in `1.333`
`INDIRECT($A$3)` results in `45`
`INDIRECT($A$4)` results in `10`
`INDIRECT("B"&$A$5)` results in `62`

`INDIRECT("R[-1]C",FALSE)` uses the cell in the previous row and current column.
end example]

3.17.7.167 INFO

Syntax:

```
INFO ( category )
```

Description: Retrieves the operating environment value that corresponds to *category*.

Arguments:

Name	Type	Description
category	text	The string designated by *category* is not case-sensitive. The valid strings are shown in the table below.

category	Meaning	Result Type
"directory"	Path of the current directory or folder.	text
"memavail"	Amount of memory available, in bytes.	number
"memused"	Amount of memory being used for data.	number
"numfile"	Number of active worksheets in the open workbooks.	number
"origin"	The absolute cell reference of the top and leftmost cell visible in the window, based on the current scrolling position, prefixed with "$A:". [*Example*: Using cell D9 as an example, the return value would be $A:$D$9. *end example*]	text
"osversion"	Current operating system version.	text
"recalc"	Current recalculation mode: "Automatic" or "Manual"	text
"release"	Version of the implementation.	text
"system"	Name of the operating environment.	text
"totmem"	Total memory available, including memory already in use, in bytes.	number

Return Type and Value: text – The operating environment value that corresponds to *category*.

However, if *category* is not one of the values defined above, #VALUE! is returned.

[*Example*:

INFO("directory") might result in e:\My Documents\
INFO(A10) might result in e:\My Documents\, where A10 contains directory
INFO("memavail") might result in 1048576

INFO("memused") might result in 1474464
INFO("numfile") might result in 5
INFO("origin") might result in $A:$C$536

INFO("osversion") might result in Windows (32-bit) NT 5.01
INFO("recalc") might result in Automatic
INFO("release") might result in 11.0

INFO("system") might result in pcdos
INFO("totmem") might result in 2523040

end example]

3.17.7.168 INT

Syntax:

```
INT ( x )
```

Description: Computes *x* rounded down to an integer.

Arguments:

Name	Type	Description
x	number	The value to be rounded down.

Return Type and Value: number – The rounded-down value of *x*.

[*Example*:

`INT(8.9)` results in `8`
`INT(-8.9)` results in `-9`

end example]

3.17.7.169 INTERCEPT

Syntax:

```
INTERCEPT ( known-ys , known-xs )
```

Description: Computes the point at which a line will intersect the y-axis by using existing x-values and y-values. The intercept point is based on a best-fit regression line plotted through the known x-values and known y-values.

Mathematical Formula:

The equation for the intercept of the regression line, a, is:

$$a = \bar{y} - b\bar{x}$$

where the slope, b, is calculated as:

$$b = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2}$$

and where x and y are the sample means AVERAGE(*known-xs*) and AVERAGE(*known-ys*).

Arguments:

Name	Type	Description
known-ys	number, name, array, reference to number	The dependent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
known-xs	number, name, array, reference to number	The independent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The point at which a line will intersect the y-axis by using existing x-values and y-values.

However, if

- *known-ys* and *known-xs* contain a different number of data points, the return value is unspecified.
- *known-ys* or *known-xs* contain no data points, the return value is unspecified.

[*Example*:

`INTERCEPT({2,3,9,1,8},{6,5,11,7,5})` results in `0.048387097`

end example]

3.17.7.170 INTRATE

Syntax:

`INTRATE ( `*settlement*` , `*maturity*` , `*investment*` , `*redemption*` [ , [ `*basis*` ] ] )`

Description: Computes the interest rate for a fully invested security.

Mathematical Formula:

$$INTRATE = \frac{redemption - investment}{investment} \times \frac{B}{DIM}$$

where:

B = number of days in a year, depending on the year basis.
DIM = number of days from settlement to maturity.

Arguments:

Name	Type	Description

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
investment	number	The amount invested in the security.
redemption	number	The amount to be received at maturity.he security's annual yield.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360
1	Actual/actual
2	Actual/360
3	Actual/365
4	European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The interest rate for a fully invested security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *investment* or *redemption* ≤ 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`INTRATE(DATE(2008,2,15),DATE(2008,5,15),1000000,1014420,2)` results in `5.7680%`

end example]

3.17.7.171 IPMT

Syntax:

`IPMT ( rate , per, nper , pv , [ fv ] [ , [ type ]] )`

Description: Computes the interest payment for a given period for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description
rate	number	The interest rate.
per	number	The period for which the interest is to be found, and shall be in the range 1–*nper*.
nper	number	The total number of payment periods in an annuity.
pv	number	The present value, or the lump-sum amount that a series of future payments is worth right now.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
type	number	The timing of the payment, truncated to integer, as follows: **Value** / **Timing** `0` – Payment at the end of the period `1` – Payment at the beginning of the period

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The interest payment for a given period for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`IPMT(0.1/12,1*3,3,8000)` results in `-22.41`
`IPMT(0.1,3,3,8000)` results in `-292.45`

end example]

3.17.7.172 IRR

`IRR ( values [ , [ guess ] ] )`

Description: Computes the internal rate of return for a series of cash flows represented by the numbers in *values*. (These cash flows do not have to be even, as they would be for an annuity. However, the cash flows shall occur at regular intervals, such as monthly or annually. The internal rate of return is the interest rate received for an investment consisting of payments (negative values) and income (positive values) that occur at regular periods.) `IRR` uses an iterative calculation technique.

Arguments:

Name	Type	Description
values	array, reference, text, logical	The set of numbers for which the internal rate of return is to be calculated. *values* shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in *values* is significant, so be sure payment and income numbers are in the desired sequence. If *values* contains elements that are text, logical values, or empty cells, those elements are ignored.
guess	number	An estimate of the result of IRR. If omitted, it is assumed to be 0.1 (i.e., 10 percent).

Return Type and Value: number – The internal rate of return for a series of cash flows.

However, if the calculation has not converged after an implementation-defined number of iterations, #NUM! is returned.

[*Example*:

IRR({-70000,12000,15000,18000,21000}) results in -2.1245%
IRR({-70000,12000,15000,18000,21000,26000}) results in 8.6631%
IRR({-70000,12000,15000},-0.1) results in -44.3507%

end example]

3.17.7.173 ISBLANK

Syntax:

ISBLANK (*value*)

Description: Determines if *value* refers to an empty cell.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* refers to an empty cell; otherwise, FALSE.

[*Example*:

`ISBLANK(A10)` results in `TRUE`, when A10 is empty
`ISBLANK(A10)` results in `FALSE`, when A10 contains 123

end example]

3.17.7.174 ISERR

Syntax:

`ISERR ( value )`

Description: Determines if *value* is any of the error values other than `#N/A`.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – `TRUE` if *value* is one of the error values, excluding `#N/A`; otherwise, `FALSE`.

[*Example*:

`ISERR(A1)` results in `TRUE` if A1 evaluates to `#DIV/0!`, for example
`ISERR(B1)` results in `FALSE` if B1 evaluates to `#N/A`

end example]

3.17.7.175 ISERROR

Syntax:

`ISERROR ( value )`

Description: Determines if *value* is any of the error values.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – `TRUE` if *value* is one of the error values; otherwise, `FALSE`.

[*Example*:

`ISERROR(A1)` results in TRUE if A1 evaluates to `#DIV/0!`, for example

end example]

3.17.7.176 ISEVEN

Syntax:

`ISEVEN ( value )`

Description: Determines if *value* is an even number or refers to a cell containing an even number.

Arguments:

Name	Type	Description
value	number	The value to be tested. It is truncated to an integer.

Return Type and Value: logical – TRUE if *value* is an even number or refers to a cell containing an even number; otherwise, FALSE.

[*Example*:

`ISEVEN(12.456)` results in TRUE
`ISEVEN(A10)` results in FALSE, when A10 contains -15

end example]

3.17.7.177 ISLOGICAL

Syntax:

`ISLOGICAL ( value )`

Description: Determines if *value* contains a logical value or refers to a cell containing a logical value.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* contains a logical value or refers to a cell containing a logical value; otherwise, FALSE.

[*Example*:

ISLOGICAL(TRUE) results in TRUE
ISLOGICAL(A10) results in FALSE, when A10 contains 123
ISLOGICAL({TRUE,2}) results in TRUE
ISLOGICAL({2,TRUE}) results in FALSE

end example]

3.17.7.178 ISNA

Syntax:

ISNA (*value*)

Description: Determines if *value* is the error value #N/A.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is #N/A; otherwise, FALSE.

[*Example*:

ISERR(A1) results in TRUE if A1 evaluates to #N/A
ISERR(B1) results in TRUE if B1 evaluates to #DIV/0!, for example

end example]

3.17.7.179 ISNONTEXT

Syntax:

ISNONTEXT (*value*)

Description: Determines if *value* does not contain text or does not refer to a cell containing text. An empty cell is not text.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* does not contain text or does not refer to a cell containing text; otherwise, FALSE.

[*Example*:

ISNONTEXT("ABC") results in FALSE
ISNONTEXT(A10) results in TRUE, when A10 contains 123
ISNONTEXT({1,"ABC"}) results in TRUE
ISNONTEXT({"ABC",1}) results in FALSE

end example]

3.17.7.180 ISNUMBER

Syntax:

ISNUMBER (*value*)

Description: Determines if *value* contains a number or refers to a cell that contains a number.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* contains a number or refers to a cell that contains a number; otherwise, FALSE.

[*Example*:

ISNUMBER(10.56) results in TRUE
ISNUMBER(A10) results in FALSE, when A10 contains ABC
ISNUMBER({1,"ABC"}) results in TRUE
ISNUMBER({"ABC",1}) results in FALSE

end example]

3.17.7.181 ISODD

Syntax:

ISODD (*value*)

Description: Determines if *value* is an odd number or refers to a cell containing an odd number.

Arguments:

Name	Type	Description
value	number	The value to be tested. It is truncated to an integer.

Return Type and Value: logical – TRUE if *value* is an odd number or refers to a cell containing an odd number; otherwise, FALSE.

[*Example*:

`ISODD(12.456)` results in FALSE
`ISODD(A10)` results in TRUE, when A10 contains `-15`

end example]

3.17.7.182 ISPMT

Syntax:

`ISPMT ( rate , per, nper , pv )`

Description: Computes the interest paid during a specific period of an investment.

Arguments:

Name	Type	Description
rate	number	The interest rate for the investment.
per	number	The period for which the interest is to be found, and shall be in the range 1–*nper*.
nper	number	The total number of payment periods for the investment.
pv	number	The present value the investment.

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The interest paid during a specific period of an investment.

[*Example*:

`ISPMT(0.1/12,1,3*12,8000000)` results in `-64814.81`
`ISPMT(0.1,1,3,8000000)` results in `-533333.33`

end example]

3.17.7.183 ISREF

Syntax:

`ISREF ( value )`

Description: Determines if *value* is a cell reference.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* is a cell reference; otherwise, FALSE.

[*Example*:

`ISREF("ABC")` results in FALSE
`ISREF(A10)` results in TRUE

end example]

3.17.7.184 ISTEXT

Syntax:

`ISTEXT ( value )`

Description: Determines if *value* contains text or refers to a cell containing text.

Arguments:

Name	Type	Description
value	any	The value to be tested. No conversion shall take place on an argument passed to this function.

Return Type and Value: logical – TRUE if *value* contains text or refers to a cell containing text; otherwise, FALSE.

[*Example*:

`ISTEXT("ABC")` results in TRUE
`ISTEXT(A10)` results in FALSE, when A10 contains 123
`ISTEXT({1,"ABC"})` results in FALSE
`ISTEXT({"ABC",1})` results in TRUE

end example]

3.17.7.185 JIS

Syntax:

JIS (*string*)

Description: Creates a string that is the conversion of half-width (single-byte) letters within *string* to full-width (double-byte) characters.

Arguments:

Name	Type	Description
string	text	Designates the string to be converted. If *string* does not contain any half-width English letters or katakana, nothing in *string* is converted.

Return Type and Value: text – The string resulting from the conversion.

[*Example*:

JIS("ABC") results in ABC
JIS("ｴｸｾﾙ") results in エクセル

end example]

3.17.7.186 KURT

Syntax:

KURT (*argument-list*)

Description: Computes the kurtosis of a data set. Kurtosis characterizes the relative peakedness or flatness of a distribution compared with the normal distribution. Positive kurtosis indicates a relatively peaked distribution. Negative kurtosis indicates a relatively flat distribution.

Mathematical Formula:

Kurtosis is defined as:

$$\left\{\frac{n(n+1)}{(n-1)(n-2)(n-3)}\sum\left(\frac{x_j-\bar{x}}{s}\right)^4\right\} - \frac{3(n-1)^2}{(n-2)(n-3)}$$

where s is the sample standard deviation.

Arguments:

Name	Type	Description
argument-list	array reference to an array, number, name, or reference to number.	The *argument*s in *argument-list* are the values for which kurtosis is to be calculated. Any *argument* in *argument-list* can be an array or a reference to an array. Logical values and text representations of numbers that are directly entered into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The kurtosis of a data set.

However, if

- There are fewer than four data points, the return value is unspecified.
- The standard deviation of the sample equals zero, the return value is unspecified.

[*Example*:

KURT(10.5,12.4,19.4,23.2) results in -3.644621343
KURT(10.5,{12.4,19.4},23.2) results in -3.644621343

end example]

3.17.7.187 LARGE

Syntax:

LARGE (*array* , *k*)

Description: Computes the k^{th} largest value in a data set.

Arguments:

Name	Type	Description
array	array, reference	The set of numbers from which the k^{th}-largest value is to be determined.
k	number	The position (from the largest) in the array or cell range of data to return.

Return Type and Value: number – The k^{th} largest value in a data set.

However, if

- *array* is empty, the return value is unspecified.
- $k \leq 0$, `#NUM!` is returned.
- *k* is greater than the number of data points, `#NUM!` is returned.

[*Example*:

`LARGE({3,5,3,5,4;4,2,4,6,7},3)` results in `5`
`LARGE({3,5,3,5,4;4,2,4,6,7},7)` results in `4`

end example]

3.17.7.188 LCM

Syntax:

`LCM` (*argument-list*)

Description: Computes the least common multiple of the one or more *argument*s in *argument-list*.

Arguments:

Name	Type	Description
argument-list	number	*argument-list* specifies the *argument*s. Each argument is truncated to an integer.

Return Type and Value: number – The least common multiple of one or more numbers.

However, if any *argument* is negative, `#NUM!` is returned.

[*Example*:

`LCM(5)` results in `5`
`LCM(5,2)` results in `10`
`LCM(24.99,36.45)` results in `72`
`LCM(24,36,15)` results in `360`

end example]

3.17.7.189 LEFT

Syntax:

`LEFT` (*string* [, *number-chars*])

Description: Extracts the left-most *number-chars* characters from *string*. (LEFT is intended for use with languages that use the single-byte character set (SBCS), whereas LEFTB (§3.17.7.190) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-chars	number	The number of characters to be extracted. If omitted, a count of 1 shall be assumed. *number-chars* shall be at least 0. If *number-chars* exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing the left-most *number-chars* characters from *string*.

However, if *number-chars* is negative, #VALUE! is returned.

[*Example*:

`LEFT("abcdef",2)` results in `ab`
`LEFT(A10,4)` results in `xyz1`, when A10 contains `xyz123`

end example]

3.17.7.190 LEFTB

Syntax:

`LEFTB ( string [ , number-bytes ] )`

Description: Extracts the left-most *number-bytes*-worth of characters from *string*. (LEFTB is intended for use with languages that use the double-byte character set (DBCS), whereas LEFT (§3.17.7.190) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-bytes	number	The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. *number-bytes* shall be at least 0. If *number-bytes* exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing the left-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* is negative, #VALUE! is returned.

[*Example*: Assuming 1-byte characters:

`LEFTB("abcdef",2)` results in `ab`
`LEFTB(A10,4)` results in `xyz1`, when A10 contains `xyz123`

end example]

3.17.7.191 LEN

Syntax:

`LEN ( string )`

Description: Determines the number of characters in *string*. (`LEN` is intended for use with languages that use the single-byte character set (SBCS), whereas `LENB` (§3.17.7.192) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string	text	Designates the string whose length is to be found.

Return Type and Value: number – The number of characters in *string*.

[*Example*:

`LEN("abc")` results in `3`
`LEN(A10)` results in `3`, when A1 contains `abc`

end example]

3.17.7.192 LENB

Syntax:

`LENB ( string )`

Description: Determines the number of bytes in *string*. (`LENB` is intended for use with languages that use the double-byte character set (DBCS), whereas `LEN` (§3.17.7.191) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string	text	Designates the string whose length is to be found.

Return Type and Value: number – The number of bytes in *string*.

[*Example*: Assuming 1-byte characters:

`LENB("abc")` results in 3
`LENB(A10)` results in 3, when A1 contains `abc`

end example]

3.17.7.193 LINEST

Syntax:

`LINEST ( known-ys [ , [ known-xs ] [ , [ const-flag ] [ , stats-flag ] ] )`

Description: Calculates the statistics for a line by using the "least squares" method to calculate a straight line that best fits the data, and returns an array that describes the line.

Mathematical Formula:

The equation for the line is:

y = mx + b

or

y = m1x1 + m2x2 + ... + b (if there are multiple ranges of x-values)

where the dependent y-value is a function of the independent x-values. The m-values are coefficients corresponding to each x-value, and b is a constant value. y, x, and m can be vectors.

When there is only one independent x-variable, the slope and y-intercept values can be obtained directly by using the following formulas:

Slope: `INDEX(LINEST(`*known-ys*`,`*known-xs*`),1)`

Y-intercept: `INDEX(LINEST(`*known-ys*`,`*known-xs*`),2)`

The accuracy of the line calculated by `LINEST` depends on the degree of scatter in the data. The more linear the data, the more accurate the `LINEST` model. `LINEST` uses the method of least squares for determining the best fit for the data. When there is only one independent x-variable, the calculations for m and b are based on the following formulas:

$$m = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2}$$

$$b = \bar{y} - m\bar{x}$$

where x and y are sample means, i.e., x = AVERAGE(*known-xs*) and y = AVERAGE(*known-ys*).

Arguments:

Name	Type	Description
known-ys	array	The set of y-values already known in the relationship y=mx+b. If the array *known-ys* is a single column, then each column of *known-xs* is interpreted as a separate variable. If the array *known-ys* is a single row, then each row of *known-xs* is interpreted as a separate variable.
known-xs	array	An optional set of x-values that might already be known in the relationship y=mx+b. The array *known-xs* can include one or more sets of variables. If only one variable is used, *known-ys* and *known-xs* can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, *known-ys* shall be a vector (that is, a range with a height of one row or a width of one column). If *known-xs* is omitted, it is assumed to be the array {1,2,3,...} that is the same size as *known-ys*.
const-flag	logical	Specifies whether to force the constant *b* to be zero. If TRUE or omitted, *b* is calculated normally. If FALSE, *b* is set to zero, and the m-values are adjusted to fit y=mx.
stats-flag	logical	Specifies whether to return additional regression statistics. If TRUE, LINEST returns the additional regression statistics (see table below), so the returned array is {mn, mn-1, ..., m1, b; sen, sen-1, ..., se1, seb; r2, sey; F, df; ssreg, ssresid}. If FALSE or omitted, LINEST returns only the m-coefficients and the constant b.

The additional regression statistics are as follows:

Statistic	Description
se1, se2, ..., se*n*	The standard error values for the coefficients m1, m2, ..., m*n*.
seb	The standard error value for the constant b.
r2	The coefficient of determination.
sey	The standard error for the y estimate.
F	The F statistic, or the F-observed value.

Statistic	Description
df	The degrees of freedom.
ssreg	The regression sum of squares.
ssresid	The residual sum of squares.

Return Type and Value: array – The array that describes the line, in the form {mn, mn-1, ..., m1, b}. The following illustration shows the order in which the additional regression statistics are returned.

[*Example*:

`LINEST({1,9,5,7},{0,4,2,3},,FALSE)` results in a slope of 2 and a y-intercept of 1

end example]

3.17.7.194 LN

Syntax:

```
LN ( x )
```

Description: Computes the natural logarithm of *x*.

Arguments:

Name	Type	Description
x	number	The positive real number for which the natural logarithm is being computed.

Return Type and Value: number – The natural logarithm of *x*.

However, if *x* is zero or negative, `#NUM!` is returned.

[*Example*:

`LN(86)` results in `4.454347296`
`LN(2.7182818)` results in `0.99999999`
`LN(EXP(3))` results in 3

end example]

3.17.7.195 LOG

Syntax:

```
LOG ( x [ , base ] )
```

Description: Computes the logarithm of *x* to the base *base*.

Arguments:

Name	Type	Description
x	number	The positive real number for which the logarithm is being computed.
base	number	The base of the logarithm. If omitted, base 10 is assumed.

Return Type and Value: number – The logarithm of *x*.

However, if

- *x* is zero or negative, `#NUM!` is returned.
- *base* is zero or negative, `#NUM!` is returned.

[*Example*:

`LOG(10)` results in `1`
`LOG(8,2)` results in 3
`LOG(86,2.7182818)` results in `4.454347343`

end example]

3.17.7.196 LOG10

Syntax:

```
LOG10 ( x )
```

Description: Computes the base-10 logarithm of *x*.

Arguments:

Name	Type	Description
x	number	The positive real number for which the logarithm is being computed.

Return Type and Value: number – The base-10 logarithm of *x*.

However, if *x* is zero or negative, `#NUM!` is returned.

[*Example*:

`LOG10(86)` results in `1.934498451`

`LOG10(10)` results in 1
`LOG10(1E5)` results in 5
`LOG10(10^5)` results in 5

end example]

3.17.7.197 LOGEST

Syntax:

`LOGEST ( known-ys [ , [ known-xs ] [ , [ const-flag ] [ , stats-flag ] ] )`

Description: Calculates an exponential curve that fits the data, and returns an array of values that describes the curve.

Mathematical Formula:

The equation for the curve is:

y = b*mx

or

y = (b*(m1x1)*(m2x2)*…) (if there are multiple x-values)

where the dependent y-value is a function of the independent x-values. The m-values are bases corresponding to each exponent x-value, and b is a constant value. Note that y, x, and m can be vectors.

When there is only one independent x-variable, the y-intercept (b) values can be obtained directly by using the following formula:

Y-intercept (b): `INDEX(LOGEST(`*known-ys*`,`*known-xs*`),2)`

Arguments:

Name	Type	Description
known-ys	array	The set of y-values already known in the relationship y=b*m^x. If the array *known-ys* is a single column, then each column of *known-xs* is interpreted as a separate variable. If the array *known-ys* is a single row, then each row of *known-xs* is interpreted as a separate variable.
known-xs	array	An optional set of x-values that might already be known in the relationship y=b*m^x. The array *known-xs* can include one or more sets of variables. If only one variable is used, *known-ys* and *known-xs* can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, *known-ys* shall be a vector (that

Name	Type	Description
		is, a range with a height of one row or a width of one column). If *known-xs* is omitted, it is assumed to be the array {1,2,3,...} that is the same size as *known-ys*.
const-flag	logical	Specifies whether to force the constant *b* to be 1. If TRUE or omitted, *b* is calculated normally. If FALSE, *b* is set to 1, and the m-values are adjusted to fit $y=m^x$.
stats-flag	logical	Specifies whether to return additional regression statistics. If TRUE, LOGEST returns the additional regression statistics, so the returned array is {mn, mn-1, ..., m1, b; sen, sen-1, ..., se1, seb; r2, sey; F, df; ssreg, ssresid}. If FALSE or omitted, LOGEST returns only the m-coefficients and the constant b.

The additional regression statistics are described in §3.17.7.193.

Return Type and Value: array – The array that describes the line, in the form {mn, mn-1, ..., m1, b}. The order in which the additional regression statistics are returned is described in §3.17.7.193.

[*Example*: Given the following data:

	A	B
1	Month	Units
2	11	33,100
3	12	47,300
4	13	69,000
5	14	102,000
6	15	150,000
7	16	220,000
8	Formula	
9	1.463275628	495.3047702

When `LOGEST(B2:B7,A2:A7,TRUE,FALSE)` is array-entered into cells A9:B9, those cells take on the results shown.

end example]

3.17.7.198 LOGINV

Syntax:

`LOGINV ( probability , mean , standard-dev )`

Description: Calculates the inverse of the lognormal cumulative distribution function of x, where ln(x) is normally distributed with parameters *mean* and *standard-dev*.

Mathematical Formula:

$$LOGINV(p,\mu,\sigma) = e^{[\mu+\sigma\times(NORMSINV(p))]}$$

Arguments:

Name	Type	Description
probability	number	A probability associated with the lognormal distribution.
mean	number	The mean of ln(x).
standard-dev	number	The standard deviation of ln(x).

Return Type and Value: number – The inverse of the lognormal cumulative distribution function of x.

However, if

- *probability* < 0 or *probability* > 1, `#NUM!` is returned.
- *standard-dev* ≤ 0, `#NUM!` is returned.

[*Example*:

`LOGINV(0.039084,3.5,1.2)` results in `4.000025219`

end example]

3.17.7.199 LOGNORMDIST

Syntax:

`LOGNORMDIST ( x , mean , standard-dev )`

Description: Calculates the cumulative lognormal distribution of x, where ln(x) is normally distributed with parameters *mean* and *standard-dev*.

Mathematical Formula:

$$LOGNORMDIST(x,\mu,\sigma) = NORMSDIST\left(\frac{\ln(x)-\mu}{\sigma}\right)$$

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the function.

Name	Type	Description
mean	number	The mean of ln(x).
standard-dev	number	The standard deviation of ln(x).

Return Type and Value: number – The inverse of the lognormal cumulative distribution function of x.

However, if

- *x* ≤ 0, `#NUM!` is returned.
- *standard-dev* ≤ 0, `#NUM!` is returned.

[*Example*:

`LOGNORMDIST(4,3.5,1.2)` results in `0.039083556`

end example]

3.17.7.200 LOOKUP

Syntax:

vector form: `LOOKUP` (*lookup-value* , *lookup-vector* , *result-vector*)

array form: `LOOKUP` (*lookup-value* , *array*)

Description: The vector form looks in a vector for a value, and returns a value from the same position in a second vector. The array form looks in the first row or column of an array for the specified value and returns a value from the same position in the last row or column of that array.

Arguments:

Name	Type	Description
lookup-value	number, string, logical, name, reference	The value to search for in *lookup-vector* (or *array*).
lookup-vector	reference	A range that contains only one row or one column. The values in *lookup-vector* can be strings, numbers, or logical values. These values shall be placed in "ascending" order, as follows: …, -2, -1, 0, 1, 2, …, A–Z, FALSE, TRUE. Upper- and lowercase strings are equivalent. If LOOKUP can't find the *lookup-value*, it matches the largest value in *lookup-vector* (or *array*) that is less than or equal to *lookup-value*.
result-vector	reference	A range that contains only one row or column. It shall be the same size as *lookup-vector*.

Name	Type	Description
array	text, number, logical	A range of cells whose values are to be compared with *lookup-value*. These values shall be placed in "ascending" order, as follows: …, -2, -1, 0, 1, 2, …, A–Z, FALSE, TRUE. Upper- and lowercase strings are equivalent. If *array* covers an area that has more columns than rows, *lookup-value* is searched for in the first row. If *array* is square or has more rows than columns, *lookup-value* is searched for in the first column.

Return Type and Value: any – The vector form looks in a vector for a value, and returns a value from the same position in a second vector. The array form looks in the first row or column of an array for the specified value and returns a value from the same position in the last row or column of that array.

However, if

- *lookup-value* is smaller than the smallest value in *lookup-vector* (or the first row or column of *array*), the return value is unspecified.
- The size of the range specified by *result-vector* is not the same as that specified by *lookup-vector*, the return value is unspecified.
- The values in *lookup-vector* (or *array*) are not in "ascending" order, the return value is unspecified.

[*Example*: Given the following data:

	A	B
1	Frequency	Color
2	4.14	red
3	4.19	orange
4	5.17	yellow
5	5.77	green
6	6.39	blue

`LOOKUP(4.19,A2:A6,B2:B6)` results in `orange`
`LOOKUP(5,A2:A6,B2:B6)` results in `orange`
`LOOKUP(7.66,A2:A6,B2:B6)` results in `blue`

`LOOKUP("C",{"a","b","c","d";1,2,3,4})` results in 3
`LOOKUP("bump",{"a",1;"b",2;"c",3})` results in 2

end example]

3.17.7.201 LOWER

Syntax:

LOWER (*string*)

Description: Makes a lowercase version of *string*.

Arguments:

Name	Type	Description
string	text	Designates the string to be converted.

Return Type and Value: text – The lowercase version of *string*.

[*Example*:

LOWER("AbCd123#$%^") results in abcd123#$%^
LOWER(A10) results in 234frtqwc$#%, when A10 contains 234FRTqwc$#%

end example]

3.17.7.202 MATCH

Syntax:

MATCH (*lookup-value* , *lookup-array* [, [*match-type*]])

Description: Locates the relative position of an array item that matches a specified value in a specified order. MATCH shall not distinguish between uppercase and lowercase letters when matching strings.

Arguments:

Name	Type	Description
lookup-value	number, string, logical, name, reference	The value to search for in *lookup-array*. If *match-type* is 0 and *lookup-value* is a string, the wildcard characters, question mark (?) and asterisk (*), can be used in *lookup-value*. A question mark matches any single character; an asterisk matches any sequence of characters. To locate a question mark or asterisk, precede that character with a tilde (~).
lookup-array	array, reference	A contiguous range of cells containing possible lookup values.
match-type	number	Specifies how *lookup-value* is matched with values in *lookup-array*, as follows:

Name	Type	Description
		<table><tr><th>Value</th><th>Meaning</th></tr><tr><td>-1</td><td>Finds the smallest value that is greater than or equal to *lookup-value*. The values in *lookup-array* shall be placed in "descending" order: TRUE, FALSE, Z–A, ..., 2, 1, 0, -1, -2, ...</td></tr><tr><td>0</td><td>Finds the first value that is exactly equal to *lookup-value*. The values in *lookup-array* can be in any order.</td></tr><tr><td>1 or omitted</td><td>Finds the largest value that is less than or equal to *lookup-value*. The values in *lookup-array* shall be placed in "ascending" order: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE.</td></tr></table>

Return Type and Value: number – The relative position of an array item that matches a specified value in a specified order.

However, if

- No match is found, `#NUM!` is returned.
- *match-type*'s value is out-of-bounds, `#NUM!` is returned.

[*Example*:

`MATCH(39,{25,38,40,41},1)` results in 2
`MATCH(41,{25,38,40,41},0)` results in 4

end example]

3.17.7.203 MAX

Syntax:

`MAX` (*argument-list*)

Description: Computes the largest of a set of numbers.

Arguments:

Name	Type	Description

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number. Any *argument* can be an array or a reference to an array.	The *argument*s in *argument-list* designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [*Note*: To include these, use MAXA (§3.17.7.204). *end note*] If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The largest of a set of numbers; however, if the arguments contain no numbers, zero is returned.

[*Example*:

`MAX(10.4,-3.5,12.6)` results in `12.6`
`MAX(10.4,{-3.5,12.6})` results in `12.6`
`MAX({"ABC",TRUE})` results in `0`

Consider the case in which cell `B3` contains `0`:
`MAX(-10,-12,-15,B3)` results in `-10`
`MAXA(-10,-12,-15,B3)` results in `0`

end example]

3.17.7.204 MAXA

Syntax:

MAXA (*argument-list*)

Description: Computes the largest of a set of numbers.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number. Any *argument* can be an array or a reference to an array.	The *argument*s in *argument-list* designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. Logical values and numbers in strings inside references are also included. [*Note*: To ignore these, use MAX (§3.17.7.203). *end note*] If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however,

Name	Type	Description
		cells with the value 0 are included.

Return Type and Value: number – The largest of a set of numbers; however, if the arguments contain no numbers, zero is returned.

[*Example*:

`MAXA(10.4,-3.5,12.6)` results in `12.6`
`MAXA(10.4,{-3.5,12.6})` results in `12.6`
`MAXA({"ABC",TRUE})` results in `0`

Consider the case in which cell `B3` contains `0`:
`MAX(-10,-12,-15,B3)` results in `-10`
`MAXA(-10,-12,-15,B3)` results in `0`

end example]

3.17.7.205 MDETERM

Syntax:

```
MDETERM ( array )
```

Description: Computes the determinant of the square matrix of numbers designated by *array*. The determinant is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the calculation is not complete. [*Example*: The determinant of a singular matrix can differ from zero by 1E-16. *end example*]

Arguments:

Name	Type	Description
array	array, reference	Designate a square matrix of numbers.

Return Type and Value: number – The determinant of *array*. Some square matrices cannot be inverted. The determinant of a non-invertible matrix is 0.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.
- The matrix designated by *array* is not square, `#VALUE!` is returned.

[*Example*:

`MDETERM(A2:D5)` results in the determinant of the 4x4 array designated by the cell range

`MDETERM({3,6,1;1,1,0;3,10,2})` results in `1`
`MDETERM({3,6;1,1})` results in `-3`

end example]

3.17.7.206 MDURATION

Syntax:

`MDURATION ( `*settlement*` , `*maturity*` , `*coupon*` , `*yld*` , `*frequency*` [ , [ `*basis*` ] ] )`

Description: Computes the modified Macauley duration for a security with an assumed par value of $100.

Mathematical Formula:

$$\text{MDURATION} = \frac{\text{DURATION}}{1+\left(\frac{\text{Market yield}}{\text{Coupon payments per year}}\right)}$$

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
coupon	number	The security's annual coupon rate.
yld	number	The security's annual yield.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.) *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360 1 / Actual/actual 2 / Actual/360 3 / Actual/365 4 / European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The modified Macauley duration for a security with an assumed par value of $100.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *coupon* or *yld* < 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`MDURATION(DATE(2008,1,1),DATE(2016,1,1),0.08,0.09,2,1)` results in `5.7357`

end example]

3.17.7.207 MEDIAN

Syntax:

`MEDIAN (` *argument-list* `)`

Description: Computes the median of the numeric values of its arguments.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number.	The *argument*s in *argument-list* designate the values whose median is to be computed. If there is an even number of numbers in the set, `MEDIAN` calculates the average of the two numbers in the middle. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The median of the values of its arguments.

[*Example*:

`MEDIAN(10,20)` results in `15`
`MEDIAN(-3.5,1.4,6.9,-4.5)` results in `-1.05`
`MEDIAN({-3.5,1.4,6.9},-4.5)` results in `-1.05`

end example]

3.17.7.208 MID

Syntax:

`MID ( string , start-pos , number-chars )`

Description: Extracts *number-chars* characters from *string*, starting at character position *start-pos*. (`MID` is intended for use with languages that use the single-byte character set (SBCS), whereas `MIDB` (§3.17.7.209) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-chars	number	The number of characters to be extracted. *number-chars* shall be at least 0.
start-pos	number	The starting position within *string*, where the first character is position 1. If *start-pos* is greater than the length of *string*, or if *start-pos* and *number-chars* combined exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing *number-chars* characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, `#VALUE!` is returned.
- *number-chars* < 0, `#VALUE!` is returned.

[*Example*:

`MID("abcdef",3,2)` results in `cd`
`MID(A10,4,1)` results in `1`, when A10 contains `xyz123`
`MID("abcdef",4,5)` results in `def`

end example]

3.17.7.209 MIDB

Syntax:

MIDB (*string* , *start-pos* , *number-bytes*)

Description: Extracts *number-bytes*-worth of characters from *string*, starting at character position *start-pos*. (MIDB is intended for use with languages that use the double-byte character set (DBCS), whereas MID (§3.17.7.208) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-bytes	number	The number of characters to be extracted. *number- bytes* shall be at least 0.
start-pos	number	The starting position within *string*, where the first byte is position 1. If *start-pos* is greater than the length of *string*, or if *start-pos* and *number- bytes* combined exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing *number-bytes*-worth of characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

[*Example*: Assuming 1-byte characters:

`MIDB("abcdef",3,2)` results in `cd`
`MIDB(A10,4,1)` results in `1`, when A10 contains `xyz123`
`MIDB("abcdef",4,5)` results in `def`

end example]

3.17.7.210 MIN

Syntax:

MIN (*argument-list*)

Description: Computes the smallest of a set of numbers.

Arguments:

Name	Type	Description
argument-list	logical, number,	The *argument*s in *argument-list* designate the values for

Name	Type	Description
	name, arrays, reference to number. Any *argument* can be an array or a reference to an array.	which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [*Note*: To include these, use `MINA` (§3.17.7.211). *end note*] If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The smallest of a set of numbers; however, if the *argument*s contain no numbers, zero is returned.

[*Example*:

`MIN(10.4,-3.5,12.6)` results in `-3.5`
`MIN(10.4,{-3.5,12.6})` results in `-3.5`
`MIN({"ABC",TRUE})` results in `0`

Consider the case in which cell `B3` contains `0`:
`MIN(10,12,15,B3)` results in `10`
`MINA(10,12,15,B3)` results in `0`

end example]

3.17.7.211 MINA

Syntax:

`MINA` (*argument-list*)

Description: Computes the smallest of a set of numbers.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number. Any *argument* can be an array or a reference to an array.	The *argument*s in *argument-list* designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. Logical values and numbers in strings inside references are also included. [*Note*: To ignore these, use `MIN` (§3.17.7.210). *end note*] If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however, cells with the value 0 are included.

Any *argument* in *argument-list* can be an array or a reference to an array.

Return Type and Value: number – The smallest of a set of numbers; however, if the *argument*s contain no numbers, zero is returned.

[*Example*:

`MINA(10.4,-3.5,12.6)` results in `-3.5`
`MINA(10.4,{-3.5,12.6})` results in `-3.5`
`MINA({"ABC",TRUE})` results in `0`

Consider the case in which cell `B3` contains `0`:
`MIN(10,12,15,B3)` results in `10`
`MINA(10,12,15,B3)` results in `0`

end example]

3.17.7.212 MINUTE

Syntax:

`MINUTE (` *time-value* `)`

Description: Computes the minute for the date and/or time having the given *time-value*.

Arguments:

Name	Type	Description
time-value	number	The date and/or time whose minute is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any date information shall be ignored.

Return Type and Value: number – The minute for the date and/or time having the given *time-value*. The returned value shall be in the range 0–59.

However, if *time-value* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`MINUTE(DATE(2006,2,26)+TIME(2,10,20))` results in `10`
`MINUTE(TIME(22,56,34))` results in `56`

`MINUTE(0)` results in 0, since serial value 0 represents `00:00:00`
`MINUTE(10.5)` results in 0, since serial value .5 represents `12:00:00`
`MINUTE("22-Oct-2001 10:53:12")` results in `53`
`MINUTE("10:53:12 pm")` results in `53`
`MINUTE("22:53:12")` results in `53`

end example]

3.17.7.213 MINVERSE

Syntax:

`MINVERSE ( array )`

Description: Computes the inverse of the square matrix of numbers designated by *array*. The inverse matrix is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the cancellation is not complete.

Arguments:

Name	Type	Description
array	array, reference	Designate a square matrix of numbers.

Return Type and Value: number – The inverse of the square matrix designated by *array*.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.
- The matrix designated by *array* is not square, #VALUE! is returned.
- The matrix cannot be inverted, the return value is unspecified.

[*Example*:

`MINVERSE({3,6,1;1,1,0;3,10,2})` results in 2
`MINVERSE({3,6;1,1})` results in `-0.333333333`

end example]

3.17.7.214 MIRR

`MIRR ( values , finance-rate , reinvest-rate )`

Description: Computes the modified internal rate of return for a series of periodic cash flows. (Both the cost of the investment and the interest received on reinvestment of cash are considered.)

Mathematical Formula:

If n is the number of cash flows in *values*, frate is the *finance-rate*, and rrate is the *reinvest-rate*, then the formula for MIRR is:

$$\left(\frac{-\mathrm{NPV}(rrate, values[positive]) * (1+rrate)^{n}}{\mathrm{NPV}(frate, values[negative]) * (1+frate)}\right)^{\frac{1}{n-1}} - 1$$

Arguments:

Name	Type	Description
values	array, reference	Designates a set of numbers for which the rate of return is to be calculated. *values* shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in *values* is significant, so be sure payment and income numbers are in the desired sequence. If *values* contains elements that are text, logical values, or empty cells, those elements are ignored.
finance-rate	number	The interest rate paid pay on the money used in the cash flows.
reinvest-rate	number	The interest rate received on the cash flows as they are reinvested.

Return Type and Value: number – The modified internal rate of return for a series of periodic cash flows.

However, if *values* does not contain at least one positive value and one negative value, `#DIV/0!` is returned.

[*Example*:

`MIRR({-120000,39000,30000,21000,37000,46000},0.1,0.12)` results in `12.6094%`
`MIRR({-120000,39000,30000,21000},0.1,0.12)` results in `-4.8045%`
`MIRR({-120000,39000,30000,21000,37000,46000},0.1,0.14)` results in `13.4759%`

end example]

3.17.7.215 MMULT

Syntax:

`MMULT ( array-1 , array-2 )`

Description: Computes the product of the matrices of numbers designated by *array-1* and *array-2*.

Mathematical Formula:

The matrix product array *a* of two arrays *b* and *c* is:

$$a_{ij} = \sum_{k=1}^{n} b_{ik} c_{kj}$$

where *i* is the row number, and *j* is the column number.

Arguments:

Name	Type	Description
array-1	array, reference, name	Designate the matrices of numbers to be multiplied.
array-2		

Return Type and Value: number – The product of the matrices of numbers designated by *array-1* and *array-2*.

However, if

- Any cells in *array-1* or *array-2* are empty or contain text, the return value is unspecified.
- The number of columns in *array-1* is different from the number of rows in *array-2*, #VALUE! is returned.

[*Example*:

`MMULT({3,6,1;1,1,0},{5,7;4,6;2,5})` results in `41`

end example]

3.17.7.216 MOD

Syntax:

`MOD ( x , y )`

Description: Computes the remainder when *x* is divided by *y*. The result has the same sign as *y*.

Arguments:

Name	Type	Description
x	number	The number for which the remainder is being sought.
y	number	The number by which *x* is to be divided.

Return Type and Value: number – The remainder when *x* is divided by *y*. The result has the same sign as *y*. If *y* is 0, the return value is unspecified.

[*Example*:

`MOD(3,2)` results in `1`

MOD(-3,2) results in 1
MOD(3,-2) results in -1
MOD(-3,-2) results in -1

end example]

3.17.7.217 MODE

Syntax:

MODE (*argument-list*)

Description: Computes the most frequently occurring of the numeric values of its arguments. If the set of values contains more than one most-frequent value, the first occurrence of any most-frequent value in the list is used as the result.

Arguments:

Name	Type	Description
argument-list	logical, number, name, arrays, reference to number. Any *argument* can be an array or a reference to an array.	The *argument*s in *argument-list* designate the values whose mode is to be computed. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The most frequently occurring of the values of its arguments.

However, if the data set contains no duplicate data points, #N/A is returned.

[*Example*:

MODE(9,1,5,1,9,5,6,6) results in 9
MODE(1,9,5,1,9,5,6,6) results in 1
MODE(5,1,9,5,1,9,6,6) results in 5

end example]

3.17.7.218 MONTH

Syntax:

MONTH (*date-value*)

Description: Computes the numeric Gregorian month for the date and/or time having the given *date-value*, taking into account the current date base value. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any time information shall be ignored.

Arguments:

Name	Type	Description
date-value	number, text	The date and/or time whose month is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any time information shall be ignored.

Return Type and Value: number – The Gregorian month for the date and/or time having the given *date-value*, in the range 1900–9999.

However, if *date-value* is out of range for the current date base value, `#NUM!` is returned.

[*Example*:

`MONTH(DATE(2006,1,2))` results in `1`
`MONTH(DATE(2006,0,2))` results in `12`
`MONTH("2006/1/2 10:45 AM")` results in `1`
`MONTH(30000)` results in 2 for both the 1900 and 1904 date base systems

end example]

3.17.7.219 MROUND

Syntax:

`MROUND` (*x* , *multiple*)

Description: Computes *x* rounded to *multiple*, away from zero. It rounds up if the remainder of dividing *x* by *multiple* is greater than or equal to half the value of *multiple*; otherwise, it rounds down.

Arguments:

Name	Type	Description
x	number	The value to round.
multiple	number	The multiple to which *x* is to be rounded.

Return Type and Value: number – *x* rounded to *multiple*.

However, if *x* and *multiple* have different signs, `#NUM!` is returned.

[*Example*:

`MROUND(10,3)` rounds 10 to a nearest multiple of 3; that is, to 9
`MROUND(-10,-3)` rounds -10 to a nearest multiple of -3; that is, to `-9`
`MROUND(1.3,0.2)` rounds 1.3 to a nearest multiple of 0.2; that is, to `1.4`

end example]

3.17.7.220 MULTINOMIAL

Syntax:

`MULTINOMIAL` (*argument-list*)

Description: Computes the ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

Mathematical Formula:

The multinomial is:

$$\mathrm{MULTINOMIAL}(a,b,c) = \frac{(a+b+c)!}{a!b!c!}$$

Arguments:

Name	Type	Description
argument-list	number	The *argument*s in *argument-list* designate the numerical values for which the multinomial is desired.

Return Type and Value: number – The ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

However, if any *argument* is less than zero, `#NUM!` is returned.

[*Example*:

`MULTINOMIAL(2)` results in `1`
`MULTINOMIAL(2,3)` results in `10`
`MULTINOMIAL(2,3,4)` results in `1260`

end example]

3.17.7.221 N

Syntax:

N (*value*)

Description: Converts *value* to a number or, if *value* is a reference to a single cell, converts the value of that cell to a number.

Arguments:

Name	Type	Description
value	any	Value to be converted.

Return Type and Value: number or error – An integer that is the converted value of *value*, or, if *value* is a reference to a single cell, the converted value of that cell, as follows:

value	Value Returned
number	That number
TRUE	1
FALSE	0
error value	That error value
Anything else (including array and text)	0

[*Example*:

`N(10.5)` results in `10.5`
`N(A10)` results in `-1234`, when A10 contains the number `-1234`
`N("ABC")` results in `0`
`N(A10)` results in `0`, when A10 contains the string ABC
`N(TRUE)` results in `1`
`N(A10)` results in `0`, when A10 contains FALSE
`N(A10)` results in #N/A, when A10 contains #N/A
`N({12.5,13.6,56.9})` results in `12.50`
`N(A10:A11)` results in `0`, when A10 contains FALSE, and A11 contains 321

end example]

3.17.7.222 NA

Syntax:

NA ( )

Description: Gets the error value #N/A. (The error value #N/A can be used instead of a call to this function; the result is the same.)

Arguments: None.

Return Type and Value: error – The error value #N/A.

[*Example*:

NA() results in #N/A
IF(ISNA(NA()),"T","F") results in T

end example]

3.17.7.223 NEGBINOMDIST

Syntax:

NEGBINOMDIST (*number-failures* , *number-successes* , *success-probability*)

Description: Computes the negative binomial distribution. NEGBINOMDIST returns the probability that there will be *number-failures* failures before the *number-successes*th success, when the constant probability of a success is *success-probability*.

Mathematical Formula:

$$nb(x;r,p) = \binom{x+r-1}{r-1} p^r (1-p)^x$$

where:

x is *number-failures*, r is *number-successes*, and p is *success-probability*.

Arguments:

Name	Type	Description
number-failures	number	The number of failures, truncated to integer.
number-successes	number	The threshold number of successes, truncated to integer.
success-probability	number	The probability of a success.

Return Type and Value: number – The negative binomial distribution.

However, if

- *number-failures* < 0 or *number-successes* < 1, #NUM! is returned.
- *success-probability* < 0 or *success-probability* > 1, #NUM! is returned.

[*Example*:

NEGBINOMDIST(6,10,0.5) results in 0.076370239

end example]

3.17.7.224 NETWORKDAYS

Syntax:

NETWORKDAYS (*start-date* , *end-date* [, *holidays*])

Description: Computes the number of whole working days between *start-date* and *end-date*. Weekend days and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
start-date	number	The dates for which the difference is to be computed. *start-date* can be earlier than, the same as, or later than *end-date*.
end-date	number	
holidays	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. *holidays* shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in *holidays* can be arbitrary.

Return Type and Value: number – The number of whole working days between *start-date* and *end-date*, excluding the specified holidays. If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the number of whole working days.

However, if

- *start-date* is out of range for the current date base value, #NUM! is returned.
- *end-date* is out of range for the current date base value, #NUM! is returned.

[*Example*:

NETWORKDAYS(DATE(2006,1,1),DATE(2006,1,31)) results in 23
NETWORKDAYS(DATE(2006,1,31),DATE(2006,1,1)) results in -23

`NETWORKDAYS(DATE(2006,1,1),DATE(2006,2,1),{"2006/1/2","2006/1/16"})` results in 21

end example]

3.17.7.225 NOMINAL

`NOMINAL ( effect-rate , npery )`

Description: Computes the nominal annual interest rate, given the effective rate and the number of compounding periods per year.

Mathematical Formula:

NOMINAL is related to EFFECT:

$$EFFECT = \left(1 + \frac{Nominal\_rate}{Npery}\right)^{Npery} - 1$$

Arguments:

Name	Type	Description
effect-rate	number	The effective interest rate.
npery	number	The number of compounding periods per year, truncated to integer.

Return Type and Value: number – The nominal annual interest rate.

However, if

- *effect-rate* ≤ 0, `#NUM!` is returned.
- *npery* < 1, `#NUM!` is returned.

[*Example*:

`NOMINAL(0.053543,4)` results in `5.2500%`

end example]

3.17.7.226 NORMDIST

Syntax:

`NORMDIST ( x , mean , standard-deviation , cumulative-flag )`

Description: Computes the normal distribution for the specified mean and standard deviation.

Mathematical Formula:

The equation for the normal density function (*cumulative-flag* = FALSE) is:

$$f(x;\mu,\sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\left(\frac{(x-\mu)^2}{2\sigma^2}\right)}$$

When *cumulative-flag* = TRUE, the formula is the integral from negative infinity to x of the given formula.

Arguments:

Name	Type	Description
x	number	The value for which the distribution is to be computed.
mean	number	The arithmetic mean of the distribution.
standard-deviation	number	The standard deviation of the distribution.
cumulative-flag	logical	Determines the form of the function. If TRUE, then the cumulative distribution function is returned; if FALSE, the probability mass function is returned.

Return Type and Value: number – The normal distribution for the specified mean and standard deviation.

However, if *standard-deviation* ≤ 0, `#NUM!` is returned.

[*Example*:

`NORMDIST(42,40,1.5,TRUE)` results in `0.90878878`
`NORMDIST(42,40,1.5,FALSE)` results in `0.10934005`

end example]

3.17.7.227 NORMINV

Syntax:

`NORMINV` (*probability* , *mean* , *standard-deviation*)

Description: Computes the inverse of the normal distribution for the specified mean and standard deviation. `NORMINV` uses an iterative search technique.

Arguments:

Name	Type	Description
probability	number	The probability corresponding to the normal distribution.
mean	number	The arithmetic mean of the distribution.
standard-	number	The standard deviation of the distribution.

Name	Type	Description
deviation		

Return Type and Value: number – The inverse of the normal distribution for the specified mean and standard deviation.

However, if

- *probability* < 0 or if *probability* > 1, `#NUM!` is returned.
- *standard-deviation* ≤ 0, `#NUM!` is returned.
- The search has not converged after an implementation-defined number of iterations, `#N/A` is returned.

[*Example*:

`NORMINV(0.908789,40,1.5)` results in `42.00000201`

end example]

3.17.7.228 NORMSDIST

Syntax:

```
NORMSDIST ( z )
```

Description: Computes the standard normal distribution for the specified mean and standard deviation.

Mathematical Formula:

$$f(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}$$

Arguments:

Name	Type	Description
z	number	The value for which the distribution is to be computed.

Return Type and Value: number – The standard normal distribution for the specified mean and standard deviation.

[*Example*:

`NORMSDIST(1.333333)` results in `0.90878873`
`NORMSDIST(-1.5)` results in `0.06680720`

end example]

3.17.7.229 NORMSINV

Syntax:

NORMSINV (*probability*)

Description: Computes the inverse of the standard normal distribution. The distribution has a mean of zero and a standard deviation of 1. NORMSINV uses an iterative search technique.

Arguments:

Name	Type	Description
probability	number	The probability corresponding to the normal distribution.

Return Type and Value: number – The inverse of the standard normal distribution.

However, if

- *probability* < 0 or if *probability* > 1, #NUM! is returned.
- The search has not converged after an implementation-defined number of iterations, #N/A is returned.

[*Example*:

NORMSINV(0.945) results in 1.59819314
NORMSINV(0.13) results in -1.12639113

end example]

3.17.7.230 NOT

Syntax:

NOT (*logical-value*)

Description: Computes the logical negation of *logical-value*.

Arguments:

Name	Type	Description
logical-value	logical	The value to be negated.

Return Type and Value: logical – The logical negation of *logical-value*; that is, it returns TRUE if *logical-value* is FALSE, and FALSE if *logical-value* is TRUE.

[*Example*:

NOT(TRUE) results in FALSE
NOT(FALSE) results in TRUE
NOT(10>5) results in FALSE
NOT(16.567) results in FALSE

end example]

3.17.7.231 NOW

Syntax:

NOW ( )

Description: Computes the serial value of the current date and time, taking into account the current date base value.

Arguments: None.

Return Type and Value: number – The serial value of the current date and time.

[*Example*: On February 26, 2006, between 23:01 and 23:02, NOW() resulted in 38774.95958611110 for the 1900 date base system. On February 26, 2006, between 23:02 and 23:03, NOW() resulted in 37312.95982569440 for the 1904 date base system. *end example*]

3.17.7.232 NPER

Syntax:

NPER (*rate* , *pmt* , *pv* [, [*fv*] [, [*type*]]])

Description: Computes the number of periods for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description
rate	number	The interest rate per period.
pmt	number	The payment made each period; it cannot change over the life of the annuity. Typically, *pmt* contains principal and interest but no other fees or taxes.
pv	number	The present value, or the lump-sum amount that a series of future payments is worth right now.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If *fv* is omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).

Name	Type	Description
type	number	The timing of the payment, truncated to integer, as follows: `0` – Payment at the end of the period `1` – Payment at the beginning of the period

Return Type and Value: number – The number of periods for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`NPER(0.12/12,-100,-1000,10000,1)` results in `59.67`
`NPER(0.12/12,-100,-1000)` results in `-9.58`

end example]

3.17.7.233 NPV

Syntax:

NPV (*rate* , *argument-list*)

Description: Calculates the net present value of an investment by using a discount rate and a series of future payments and income.

The NPV investment begins one period before the date of the first *argument* cash flow and ends with the last cash flow in the list. The calculation is based on future cash flows. If the first cash flow occurs at the beginning of the first period, the first value shall be added to the NPV result, not included in *argument-list*.

Mathematical Formula:

If n is the number of cash flows in the list of values:

$$\mathrm{NPV} = \sum_{i=1}^{n} \frac{values_i}{(1+rate)^i}$$

Arguments:

Name	Type	Description

Name	Type	Description
rate	number	The rate of discount over the length of one period.
argument-list	number	The *argument*s in *argument-list* designate the series of future payments (negative values) and income (positive values). *argument*s shall be equally spaced in time and occur at the end of each period. The order of *argument*s is significant. *argument*s that are numbers, empty cells, logical values, or text representations of numbers are included; *argument*s that are error values or text that cannot be translated into numbers are ignored. If an *argument* is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – Net present value of an investment by using a discount rate and a series of future payments and income.

[*Example*:

`NPV(0.1,-10000,3000,4200,6800)` results in `1188.44`

end example]

3.17.7.234 OCT2BIN

Syntax:

`OCT2BIN ( number [ , num-bin-digits ] )`

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

Name	Type	Description
number	text	A 10-digit octal number in a string that is to be converted to a binary string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.
num-bin - digits	number	The number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-bin-digits* is ignored and the result has 10 digits. If *num-bin-digits* is omitted, the minimum number of digits is

Name	Type	Description
		used in the result. *num-bin-digits* is truncated to an integer.

Return Type and Value: text – The binary equivalent of *number*.

However, if

- *number* is outside the range "7777777000" (11111111111111111111000000000 binary, -512 decimal) to "777" (00000000000000000000111111111 binary, 511 decimal), inclusive, #NUM! is returned.
- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits, #NUM! is returned.
- *number* needs more digits that *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* ≤ 0 or > 10, #NUM! is returned.

[*Example*:

OCT2BIN("67") results in 110111
OCT2BIN("7777777776") results in 1111111110
OCT2BIN("7",5) results in 00111

end example]

3.17.7.235 OCT2DEC

Syntax:

OCT2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

Name	Type	Description
number	number	A 10-digit octal number in a string that is to be converted to a decimal number. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range "4000000000" (-536,870,912 decimal) to "3777777777" (536,870,911 decimal), inclusive, #NUM! is returned.

[*Example*:

OCT2DEC("67") results in 55
OCT2DEC("7777777776") results in -2
OCT2DEC("7000000000") results in -134217728

end example]

3.17.7.236 OCT2HEX

Syntax:

OCT2HEX (*number* [, *num-hex-digits*])

Description: Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

Name	Type	Description
number	text	A 10-digit octal number in a string that is to be converted to a hexadecimal string. If *number* has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.
num-hex-digits	number	*num-hex-digits* is the number of digits in the result, with leading zeros added as necessary. However, if *number* is negative, *num-hex-digits* is ignored and the result has 10 digits. If *num-hex-digits* is omitted, the minimum number of digits is used in the result. *num-hex-digits* is truncated to an integer.

Return Type and Value: text – The hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range "4000000000" (20000000 hex, -536,870,912 decimal) to "3777777777" (1FFFFFFF hex, 536,870,911 decimal), inclusive, #NUM! is returned.

- *number* needs more digits that *num-hex-digits*, `#NUM!` is returned.
- *num-hex-digits* ≤ 0or > 10, `#NUM!` is returned.

[*Example*:

`OCT2HEX("777")` results in `1FF`
`OCT2HEX("7777777776")` results in `FFFFFFFFFE`
`OCT2HEX("7",5)` results in `00007`

end example]

3.17.7.237 ODD

Syntax:

```
ODD ( x )
```

Description: Computes *x* rounded to the nearest odd integer, away from zero. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

Name	Type	Description
x	number	The value to be rounded.

Return Type and Value: number – The rounded value of *x*.

[*Example*:

`ODD(1.5)` rounds 1.5 up to the nearest odd integer; that is, to 3
`ODD(3)` rounds 3 up to the nearest odd integer; that is, to 3
`ODD(2)` rounds 2 up to the nearest odd integer; that is, to 3
`ODD(-1)` rounds -1 up to the nearest odd integer; that is, to `-1`
`ODD(-2)` rounds -2 up to the nearest odd integer; that is, to `-3`

end example]

3.17.7.238 ODDFPRICE

Syntax:

```
ODDFPRICE ( settlement , maturity , issue , first-coupon , rate , yld , redemption ,
    frequency [ , [ basis ] ] )
```

Description: Computes the price per $100 face value of a security having an odd (short or long) first period.

Mathematical Formula:

Odd short first coupon:

$$ODDFPRICE = \left[\frac{redemption}{\left(1+\frac{yld}{frequency}\right)^{\left(N-1+\frac{DSC}{E}\right)}}\right] + \left[\frac{100 \times \frac{rate}{frequency} \times \frac{DFC}{E}}{\left(1+\frac{yld}{frequency}\right)^{\frac{DSC}{E}}}\right] + \left[\sum_{k=2}^{N} \frac{100 \times \frac{rate}{frequency}}{\left(1+\frac{yld}{frequency}\right)^{\left(k-1+\frac{DSC}{E}\right)}}\right] - \left[100 \times \frac{rate}{frequency} \times \frac{A}{E}\right]$$

where:

A = number of days from the beginning of the coupon period to the settlement date (accrued days).
DSC = number of days from the settlement to the next coupon date.
DFC = number of days from the beginning of the odd first coupon to the first coupon date.
E = number of days in the coupon period.
N = number of coupons payable between the settlement date and the redemption date. (If this number contains a fraction, it is raised to the next whole number.)

Odd long first coupon:

$$ODDFPRICE = \left[\frac{redemption}{\left(1+\frac{yld}{frequency}\right)^{\left(N+N_q+\frac{DSC}{E}\right)}}\right] + \left[\frac{100 \times \frac{rate}{frequency} \times \left[\sum_{i=1}^{NC}\frac{DC_i}{NL_i}\right]}{\left(1+\frac{yld}{frequency}\right)^{\left(N_q+\frac{DSC}{E}\right)}}\right] + \left[\sum_{k=1}^{N}\frac{100 \times \frac{rate}{frequency}}{\left(1+\frac{yld}{frequency}\right)^{\left(k-N_q+\frac{DSC}{E}\right)}}\right] - \left[100 \times \frac{rate}{frequency} \times \sum_{i=1}^{NC}\frac{A_i}{NL_i}\right]$$

where:

Ai = number of days from the beginning of the ith, or last, quasi-coupon period within odd period.
DCi = number of days from dated date (or issue date) to first quasi-coupon (i = 1) or number of days in quasi-coupon (i = 2,..., i = NC).
DSC = number of days from settlement to next coupon date.
E = number of days in coupon period.
N = number of coupons payable between the first real coupon date and redemption date. (If this number contains a fraction, it is raised to the next whole number.)
NC = number of quasi-coupon periods that fit in odd period. (If this number contains a fraction, it is raised to the next whole number.)
NLi = normal length in days of the full ith, or last, quasi-coupon period within odd period.
Nq = number of whole quasi-coupon periods between settlement date and first coupon.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
issue	number	The security's issue date.
first-coupon	number	The security's first coupon date.
rate	number	The security's interest rate.

Name	Type	Description
yld	number	The security's annual yield.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.)
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** 0 or omitted / US (NASD) 30/360 1 / Actual/actual 2 / Actual/360 3 / Actual/365 4 / European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The price per $100 face value of a security having an odd (short or long) first period.

However, if

- *settlement*, *maturity*, *issue*, or *first-coupon* is out of range for the current date base value, `#NUM!` is returned.
- The following is not true: *maturity* is later than *first-coupon*, which is later than *settlement*, which is later than *issue*, so `#NUM!` is returned.
- *rate* or *yld* < 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

```
ODDFPRICE(DATE(2008,11,11),DATE(2021,3,1),DATE(2008,10,15),DATE(2009,3,1),
  0.0785,0.0625,100,2,1)
```
results in `113.5977`

end example]

3.17.7.239 ODDFYIELD

Syntax:

ODDFYIELD (*settlement* , *maturity* , *issue* , *first-coupon* , *rate* , *pr* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the yield of a security that has an odd (short or long) first period.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
issue	number	The security's issue date.
first-coupon	number	The security's first coupon date.
rate	number	The security's interest rate.
pr	number	The security's price.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.)
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360
1	Actual/actual
2	Actual/360
3	Actual/365
4	European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The yield of a security that has an odd (short or long) first period.

However, if

- *settlement*, *maturity*, *issue*, or *first-coupon* is out of range for the current date base value, #NUM! is returned.
- The following is not true: *maturity* is later than *first-coupon*, which is later than *settlement*, which is later than *issue*, so #NUM! is returned.
- *rate* or *pr* < 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[*Example*:

```
ODDFYIELD(DATE(2008,11,11),DATE(2021,3,1),DATE(2008,10,15),DATE(2009,3,1),
  0.0575,84.5,100,2,0) results in 7.7246%
```

end example]

3.17.7.240 ODDLPRICE

Syntax:

```
ODDLPRICE ( settlement , maturity , last-interest , rate , yld , redemption ,
    frequency [ , [ basis ] ] )
```

Description: Computes the price per $100 face value of a security having an odd (short or long) last coupon period.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
last-interest	number	The security's last coupon date.
rate	number	The security's interest rate.
yld	number	The security's annual yield.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.)
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** 0 or omitted / US (NASD) 30/360 1 / Actual/actual 2 / Actual/360 3 / Actual/365 4 / European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The price per $100 face value of a security having an odd (short or long) last coupon period.

However, if

- *settlement*, *maturity*, or *last-interest* is out of range for the current date base value, `#NUM!` is returned.
- The following is not true: *maturity* is later than *settlement*, which is later than *last-interest*, so `#NUM!` is returned.
- *rate* or *yld* < 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

```
ODDLPRICE(DATE(2008,11,11),DATE(2021,3,1),DATE(2008,10,15),
  0.0785,0.0625,100,2,1) results in 99.8783
```

end example]

3.17.7.241 ODDLYIELD

Syntax:

```
ODDLYIELD ( settlement , maturity , last-interest , rate , pr , redemption ,
    frequency [ , [ basis ] ] )
```

Description: Computes the yield of a security that has an odd (short or long) last period.

Mathematical Formula:

$$ODDLYIELD = \left[\frac{\left(redemption + \left(\left(\sum_{i=1}^{NC} DC_i / NL_i \right) \times \frac{100 \times rate}{frequency} \right) \right) - \left(par + \left(\left(\sum_{i=1}^{NC} A_i / NL_i \right) \times \frac{100 \times rate}{frequency} \right) \right)}{par + \left(\left(\sum_{i=1}^{NC} A_i / NL_i \right) \times \frac{100 \times rate}{frequency} \right)} \right] \times \left[\frac{frequency}{\left(\sum_{i=1}^{NC} DSC_i / NL_i \right)} \right]$$

where:

Ai = number of accrued days for the i^{th}, or last, quasi-coupon period within odd period counting forward from last interest date before redemption.
DCi = number of days counted in the i^{th}, or last, quasi-coupon period as delimited by the length of the actual

coupon period.
NC = number of quasi-coupon periods that fit in odd period; if this number contains a fraction it will be raised to the next whole number.
NLi = normal length in days of the i^{th}, or last, quasi-coupon period within odd coupon period.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
last-interest	number	The security's last coupon date.
rate	number	The security's interest rate.
pr	number	The security's price.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.)
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360
1	Actual/actual
2	Actual/360
3	Actual/365
4	European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The yield of a security that has an odd (short or long) last period.

However, if

- *settlement*, *maturity*, or *last-interest* is out of range for the current date base value, #NUM! is returned.
- The following is not true: *maturity* is later than *settlement*, which is later than *last-interest*, so #NUM! is returned.
- *rate* or *pr* < 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[*Example*:

```
ODDLYIELD(DATE(2008,11,11),DATE(2021,3,1),DATE(2008,10,15),
  0.0575,84.5,100,2,0) results in 4.5192%
```

end example]

3.17.7.242 OFFSET

Syntax:

OFFSET (*reference* , *rows* , *cols* [, [*height*] [, [*width*]]])

Description: Gets a reference to a range that is a specified number of rows and columns from a cell or range of cells. The reference that is returned can be a single cell or a range of cells. You can specify the number of rows and the number of columns to be returned.

Arguments:

Name	Type	Description
reference	reference	Designates the base. *reference* shall refer to a cell or range of adjacent cells.
rows	number	The number of rows, up or down, that indicates the upper-left cell of the result to refer to. A positive value means below the starting reference; a negative value means above the starting reference.
cols	number	The number of columns, to the left or right, that the upper-left cell of the result to refer to. A positive value means to the right of the starting reference; a negative value means to the left of the starting reference.
height	number	The height, in rows, of the set of cells referred to by the resulting reference. This height shall be positive. If omitted, it is the same as the height of *reference*.
width	number	The width, in columns, of the set of cells referred to by the resulting reference. The width shall be positive. If omitted, it is the same as the width of *reference*.

Return Type and Value: reference – A reference to a range that is a specified size and number of rows and columns from a cell or range of cells.

However, if

- *reference* does not refer to a cell or range of adjacent cells, #VALUE! is returned.
- The combination of *rows* and *cols* results outside the worksheet, #REF! is returned.

[*Example*:

`OFFSET(C3,2,3,1,1)` results in the value in cell `F5`
`SUM(OFFSET(C3:E5,-1,0,3,3))` results in the sum of the range `C2:E4`

end example]

3.17.7.243 OR

Syntax:

`OR` (*argument-list*)

Description: Tests if any one or more *argument*s in *argument-list* are TRUE.

Arguments:

Name	Type	Description
argument-list	logical, array, reference.	The *argument*s in *argument-list* designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored.

Return Type and Value: logical – TRUE if any one or more *argument*s in *argument-list* are TRUE; otherwise, `FALSE`.

However, if no logical values are found, the return value is unspecified.

[*Example*:

`OR(TRUE)` results in TRUE
`OR(FALSE,FALSE)` results in FALSE
`OR(10=5,3=1+2,0)` results in TRUE
`OR({10,5,6,7},TRUE,E6:F6)` results in TRUE, when E6 contains `FALSE` and F6 contains 0

end example]

3.17.7.244 PEARSON

Syntax:

`PEARSON` (*array-1* , *array-2*)

Description: Computes the Pearson product moment correlation coefficient, a dimensionless index that ranges from -1.0 to 1.0, inclusive, and reflects the extent of a linear relationship between two data sets.

Mathematical Formula:

The formula for the Pearson product moment correlation coefficient, r, is:

$$r = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sqrt{\sum (x - \bar{x})^2 \sum (y - \bar{y})^2}}$$

where x and y are the sample means AVERAGE(*array-1*) and AVERAGE(*array-2*).

Arguments:

Name	Type	Description
array-1	number, name, array, reference to number	The set of independent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
array-2	number, name, array, reference to number	The set of dependent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The Pearson product moment correlation coefficient.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[*Example*:

`PEARSON({9,7,5,3,1},{10,6,1,5,3})` results in `0.699378606`

end example]

3.17.7.245 PERCENTILE

Syntax:

```
PERCENTILE ( array , k )
```

Description: Computes the k^{th} percentile of a set of values in a range.

Arguments:

Name	Type	Description
array	array, reference	The set of numerical data that defines relative standing.

Name	Type	Description
k	number	The percentile value in the range 0–1, inclusive. If *k* is not a multiple of 1/(n - 1), PERCENTILE interpolates to determine the value at the k^{th} percentile.

Return Type and Value: number – The k^{th} percentile of a set of values in a range.

However, if

- *array* is empty, the return value is unspecified.
- *k* is < 0 or *k* > 1, #NUM! is returned.

[*Example*:

PERCENTILE({1,3,2,4},0.3) results in 1.9
PERCENTILE({1,3,2,4},0.75) results in 3.25

end example]

3.17.7.246 PERCENTRANK

Syntax:

PERCENTRANK (*array* , *x* [, *significance*])

Description: Computes the rank of a value in a data set as a percentage of the data set.

Arguments:

Name	Type	Description
array	array, reference	*array* is the set of numerical data that defines relative standing.
x	number	The value for which the rank is to be computed. If *x* does not match one of the values in *array*, PERCENTRANK interpolates to return the correct percentage rank.
significance	number	The number of significant digits for the returned percentage value. If omitted, a value of 3 is used.

Return Type and Value: number – The rank of a value in a data set as a percentage of the data set.

However, if

- *array* is empty, the return value is unspecified.
- *significance* < 1, #NUM! is returned.

[*Example*:

`PERCENTRANK({12,6,7,9,3,8},4)` results in `0.066`
`PERCENTRANK({12,6,7,9,3,8},5)` results in `0.133`

end example]

3.17.7.247 PERMUT

Syntax:

`PERMUT ( number , number-chosen )`

Description: Computes the number of permutations for *number-chosen* objects that can be selected from *number* objects. [*Note*: A permutation is any set or subset of objects or events where internal order is significant. Permutations are different from combinations, for which the internal order is not significant. Use this function for lottery-style probability calculations. *end note*]

Mathematical Formula:

$$P_{k,n} = \frac{n!}{(n-k)!}$$

Arguments:

Name	Type	Description
number	number	The total number of items available, truncated to integer.
number-chosen	number	The number of items in each permutation, truncated to integer.

Return Type and Value: number – The number of different permutations of *number-chosen* in *number*.

However, if

- *number* < 0, `#NUM!` is returned.
- *number-chosen* < 0, `#NUM!` is returned.
- *number* < *number-chosen*, `#NUM!` is returned.

[*Example*:

`PERMUT(8,2)` results in `56`
`PERMUT(10,4)` results in `5040`
`PERMUT(6,5)` results in `720`

end example]

3.17.7.248 PHONETIC

Syntax:

```
PHONETIC ( string )
```

Description: Extracts the phonetic (furigana) characters from *string*. [*Note*: Furigana are aids used to indicate correct pronunciation of Japanese text. *end note*]

Arguments:

Name	Type	Description
string	text, reference	Designates a furigana string. If *string* is a cell range, the furigana string in the upper-left corner cell of that range is returned.

Return Type and Value: text – The phonetic (furigana) characters from *string*.

However, if *string* is a range of non-contiguous cells, `#N/A` is returned.

3.17.7.249 PI

Syntax:

```
PI ()
```

Description: Computes the value π to at least 15 significant figures.

Arguments: None.

Return Type and Value: number – The value π accurate to at least 15 significant digits.

[*Example*:

`PI()` results in `3.141592654`
`PI()/2` results in `1.570796327`
`PI()*(2.5^2)` results in `19.63495408`

end example]

3.17.7.250 PMT

Syntax:

```
PMT ( rate , nper , pv [ , [ fv ] [ , [ type ] ] ] )
```

Description: Computes the payment for a loan based on constant payments and a constant interest rate.

Arguments:

Name	Type	Description
rate	number	The interest rate for the loan.
nper	number	The total number of payment for the loan.
pv	number	The present value, or the total amount that a series of future payments is worth now; also known as the principal.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
type	number	The timing of the payment, truncated to integer, as follows: **Value** / **Timing** `0` – Payment at the end of the period `1` – Payment at the beginning of the period

Return Type and Value: number – The payment for a loan based on constant payments and a constant interest rate. (The payment returned by PMT includes principal and interest but no taxes, reserve payments, or fees sometimes associated with loans.)

Howver, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`PMT(0.08/12,10,10000)` results in `-1,037.03`
`PMT(0.08/12,10,10000,0,1)` results in `-1,030.16`

end example]

3.17.7.251 POISSON

Syntax:

`POISSON ( x , mean , cumulative-flag )`

Description: Computes the Poisson distribution.

Mathematical Formula:

For *cumulative-flag* = FALSE:

$$POISSON = \frac{e^{-\lambda}\ \lambda^{x}}{x!}$$

For *cumulative-flag* = TRUE:

$$CUMPOISSON = \sum_{k=0}^{x} \frac{e^{-\lambda}\ \lambda^{x}}{k!}$$

Arguments:

Name	Type	Description
x	number	The number of events, truncated to an integer.
mean	number	The expected numeric value.
cumulative-flag	logical	Determines the form of the function. If TRUE, POISSON returns the cumulative Poisson probability that the number of random events occurring will be between zero and *x*, inclusive; if FALSE, it returns the Poisson probability mass function that the number of events occurring will be exactly *x*.

Return Type and Value: number – The Poisson distribution.

However, if

- *x* < 0, #NUM! is returned.
- *mean* ≤ 0, #NUM! is returned.

[*Example*:

POISSON(2,5,TRUE) results in 0.124652019
POISSON(2,5,FALSE) results in 0.084224337

end example]

3.17.7.252 POWER

Syntax:

```
POWER ( x , y )
```

Description: Computes *x* raised to the power *y*.

Arguments:

Name	Type	Description

Name	Type	Description
x	number	The base and the number *y* is the exponent to which that base is raised.
y	number	The exponent to which the base is raised.

Return Type and Value: number – x^y.

However, if

- The value of *x* is negative and *y* is not a whole number, `#NUM!` is returned.
- *x* is zero and *y* is less than or equal to zero, `#DIV/0!` is returned.
- The result cannot be represented as a number, `#NUM!` is returned.

[*Example*:

`POWER(2,3)` results in `8`
`POWER(2,0.5)` results in `1.414213562`
`POWER(-1.234,5.0)` results in `-2.861381721`
`POWER(1.234,5.1)` results in `2.922182358`

end example]

3.17.7.253 PPMT

Syntax:

`PPMT ( rate , per , nper , pv [ , [ fv ][ , [ type ]]] )`

Description: Computes the payment on the principal for a given period for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

Name	Type	Description
rate	number	The interest rate per period.
per	number	The the period and shall be in the range 1–*nper*.
nper	number	The total number of payment in an annuity.
pv	number	The present value, or the total amount that a series of future payments is worth now.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
type	number	The timing of the payment, truncated to integer, as

Name	Type	Description
		follows: **Value** / **Timing** `0` — Payment at the end of the period `1` — Payment at the beginning of the period

Return Type and Value: number – The payment on the principal for a given period for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`PPMT(0.1/12,1,2*12,2000)` results in `-75.62`
`PPMT(0.08,10,10,200000)` results in `-27,598.05`

end example]

3.17.7.254 PRICE

Syntax:

`PRICE ( `*settlement*` , `*maturity*` , `*rate*` , `*yld*` , `*redemption*` , `*frequency*` [ , [ `*basis*` ] ] )`

Description: Computes the price per $100 face value of a security that pays periodic interest.

Mathematical Formula:

$$PRICE = \left[\frac{redemption}{\left(1+\frac{yld}{frequency}\right)^{\left(N-1+\frac{DSC}{E}\right)}}\right] + \left[\sum_{k=1}^{N}\frac{100\times\frac{rate}{frequency}}{\left(1+\frac{yld}{frequency}\right)^{\left(k-1+\frac{DSC}{E}\right)}}\right] - \left(100\times\frac{rate}{frequency}\times\frac{A}{E}\right)$$

where:

DSC = number of days from settlement to next coupon date.
E = number of days in coupon period in which the settlement date falls.

N = number of coupons payable between settlement date and redemption date.
A = number of days from beginning of coupon period to settlement date.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
rate	number	The security's interest rate.
yield	number	The security's annual yield.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.) *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows:

Value	Day Count Basis
0 or omitted	US (NASD) 30/360
1	Actual/actual
2	Actual/360
3	Actual/365
4	European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The price per $100 face value of a security that pays periodic interest.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* ≥ *maturity*, #NUM! is returned.
- *rate* or *yld* < 0, #NUM! is returned.
- *redemption* ≤ 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[*Example*:

`PRICE(DATE(2008,2,15),DATE(2017,11,15),0.0575,0.065,100,2,0)` results in `94.6344`

end example]

3.17.7.255 PRICEDISC

Syntax:

`PRICEDISC ( `*settlement*` , `*maturity*` , `*discount*` , `*redemption*` [ , [ `*basis*` ] ] )`

Description: Computes the price per $100 face value of a discounted security.

Mathematical Formula:

$$PRICEDISC = redemption - discount \times redemption \times \frac{DSM}{B}$$

where:

B = number of days in year, depending on year basis.
DSM = number of days from settlement to maturity.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
discount	number	The security's discount rate.
redemption	number	The security's redemption value per $100 face value.
basis	number	The truncated integer type of day count basis to use, as follows: 0 or omitted – US (NASD) 30/360 1 – Actual/actual 2 – Actual/360 3 – Actual/365 4 – European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The price per $100 face value of a discounted security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.

- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *discount* or *redemption* ≤ 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`PRICEDISC(DATE(2008,2,16),DATE(2008,3,1),0.0525,100,2)` results in `99.7958`

end example]

3.17.7.256 PRICEMAT

Syntax:

`PRICEMAT ( settlement , maturity , issue , rate , yld [ , [ basis ] ] )`

Description: Computes the price per $100 face value of a security that pays interest at maturity.

Mathematical Formula:

$$PRICEMAT = \frac{100 + (\frac{DIM}{B} \times rate \times 100)}{1 + (\frac{DSM}{B} \times yld)} - \left(\frac{A}{B} \times rate \times 100\right)$$

where:

B = number of days in year, depending on year basis.
DSM = number of days from settlement to maturity.
DIM = number of days from issue to maturity.
A = number of days from issue to settlement.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
issue	number	The security's issue date.
rate	number	The security's interest rate.
yld	number	The security's annual yield.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** `0` or omitted / US (NASD) 30/360

Name	Type	Description
		1 Actual/actual 2 Actual/360 3 Actual/365 4 European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The price per $100 face value of a security that pays interest at maturity.

However, if

- *settlement*, *maturity*, or *issue* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *rate* or *yld* < 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

```
PRICEMAT(DATE(2008,2,15),DATE(2008,4,13),DATE(2007,11,11),0.061,0.061,0)
```

results in `99.9845`

end example]

3.17.7.257 PROB

Syntax:

PROB (*x-range* , *probability-range* , *lower-limit* [, *upper-limit*])

Description: Computes the probability that values in a range are between two limits.

Arguments:

Name	Type	Description
x-range	array, reference	The set of numeric values of *x* with which there are associated probabilities.
probability-range	array, reference	A set of numeric probabilities associated with the values in *x-range*.
lower-limit	number	The lower bound on the value for which the probability is to be computed.
upper-limit	number	The upper bound on the value for which the probability is to be computed. If omitted, the probability that values in

Name	Type	Description
		x-range are equal to *lower-limit* is returned.

Return Type and Value: number – The probability that values in a range are between two limits.

However, if

- Any value in *probability-range* ≤ 0 or any value in *probability-range* > 1, `#NUM!` is returned.
- The sum of the values in *probability-range* < 1, `#NUM!` is returned.
- *x-range* and *probability-range* contain a different number of data points, the return value is unspecified.

[*Example*:

`PROB({0,1,2,3},{0.2,0.3,0.1,0.4},2)` results in `0.1`
`PROB({0,1,2,3},{0.2,0.3,0.1,0.4},1,4)` results in `0.8`

end example]

3.17.7.258 PRODUCT

Syntax:

PRODUCT (*argument-list*)

Description: Multiplies the numeric values of *argument*s in *argument-list*.

Arguments:

Name	Type	Description
argument-list	logical, number, text, array, reference	The *argument*s in *argument-list* designate the numbers to be multiplied. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

Return Type and Value: number – The product of the values of its arguments.

[*Example*:

`PRODUCT(1)` results in `1`
`PRODUCT(1,2,3,4,5)` results in `120`
`PRODUCT({1,2;3,4})` results in `24`

PRODUCT({2,3},4,"5") results in 120

end example]

3.17.7.259 PROPER

Syntax:

PROPER (*string*)

Description: Makes a lowercase version of *string* except that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase.

Arguments:

Name	Type	Description
string	text, reference	Designates the string to be converted.

Return Type and Value: text – A version of *string* such that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase. All other letters are converted to lowercase, and all other non-letters are unchanged.

[*Example*:

PROPER("12aBC d123aD#$%sd^") results in 12Abc D123Ad#$%Sd^
PROPER(A10) results in 12Abc D123Ad#$%Sd^, when A10 contains 12aBC d123aD#$%sd^

end example]

3.17.7.260 PV

Syntax:

PV (*rate* , *nper* , *pmt* [, [*fv*][, [*type*]]])

Description: Computes the present value of an investment. (The present value is the total amount that a series of future payments is worth now.)

Mathematical Formula:

If *rate* is not 0, then:

$$pv * (1 + rate)^{nper} + pmt(1 + rate * type) * \left(\frac{(1 + rate)^{nper} - 1}{rate}\right) + fv = 0$$

If *rate* is 0, then:

(pmt * nper) + pv + fv = 0

Arguments:

Name	Type	Description
rate	number	The interest rate per period.
nper	number	The total number of payment in an annuity.
pmt	number	The payment made each period and cannot change over the life of the annuity. If is omitted, *fv* shall be provided. [*Note*: Typically, *pmt* includes principal and interest but no other fees or taxes. *end note*]
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, *pmt* shall be provided.
type	number	The timing of the payment, truncated to integer, as follows:

Value	Timing
`0`	Payment at the end of the period
`1`	Payment at the beginning of the period

Return Type and Value: number – The present value of an investment.

However, if *type* is any number other than 0 or 1, `#NUM!` is returned.

[*Example*:

`PV(0.08/12,12*20,500,,0)` results in `-59,777.15`

end example]

3.17.7.261 QUARTILE

Syntax:

`QUARTILE` (*array* , *result-category*)

Description: Computes the quartile of a data set.

Arguments:

Name	Type	Description

Name	Type	Description
array	array, reference	The set of numeric values for which the quartile value is to be computed.
result-category	number	When truncated to an integer, specifies which value is to be returned, as follows: **Value** / **Value Returned** 0 – Minimum value 1 – First quartile (25th percentile) 2 – Median value (50th percentile) 3 – Third quartile (75th percentile) 4 – Maximum value

Return Type and Value: number – The quartile of a data set.

However, if

- *array* is empty, the return value is unspecified.
- *result-category* < 0 or *result-category* > 4, `#NUM!` is returned.

[*Example*:

`QUARTILE({1,2,4,7,8,9,10,12},1)` results in `3.5`

end example]

3.17.7.262 QUOTIENT

Syntax:

`QUOTIENT ( dividend , divisor )`

Description: Computes the integer portion of the division of *dividend* by *divisor*.

Arguments:

Name	Type	Description
dividend	number	The dividend
divisor	number	The divisor.

Return Type and Value: number – The integer portion of the division of *dividend* by *divisor*.

[*Example*:

`QUOTIENT(5,2)` results in 2
`QUOTIENT(4.5,3.1)` results in 1
`QUOTIENT(-10,3)` results in -3

end example]

3.17.7.263 RADIANS

Syntax:

```
RADIANS ( angle )
```

Description: Converts *angle* in degrees into radians.

Arguments:

Name	Type	Description
angle	number	The angle expressed in degrees that is to be converted into radians.

Return Type and Value: number – *angle* in radians.

[*Example*:

`RADIANS(360)` results in `6.283185307`
`RADIANS(270)` results in `4.71238898`
`RADIANS(45)` results in `0.785398163`
`RADIANS(8.5)` results in `0.148352986`

end example]

3.17.7.264 RAND

Syntax:

```
RAND ( )
```

Description: Computes an evenly distributed random real number greater than or equal to 0 and less than 1. A new random real number is returned every time the cell's value is calculated.

Arguments: None.

Return Type and Value: number – An evenly distributed random real number greater than or equal to 0 and less than 1.

[*Example*:

`RAND()` results in `0.437337454`
`INT(RAND()*(6-1)+1)` might result in `3`

end example]

3.17.7.265 RANDBETWEEN

Syntax:

`RANDBETWEEN ( lower-bound , upper-bound )`

Description: Computes a random integer number in the range *lower-bound*–*upper-bound*. A new random integer number is returned every time the cell's value is calculated.

Arguments:

Name	Type	Description
lower-bound	number	The smallest integer that will be returned.
upper-bound	number	The largest integer that will be returned.

Return Type and Value: number – A random integer number in the range specified.

However, if *lower-bound* is greater than *upper-bound*, `#NUM!` is returned.

[*Example*:

`RANDBETWEEN(1,6)` results in an integer between `1` and `6`, inclusive
`RANDBETWEEN(-10,10)` results in an integer between `-10` and `10`, inclusive

end example]

3.17.7.266 RANK

Syntax:

`RANK ( number , number-list [ , order ] )`

Description: Computes the rank of a number in a list of numbers. RANK gives duplicate numbers the same rank. However, the presence of duplicate numbers affects the ranks of subsequent numbers.

Arguments:

Name	Type	Description
number	number	The number whose rank is to be found.

Name	Type	Description
number-list	reference	Designates the list of numbers. Non-numeric values in this list are ignored.
order	number	Specifies how *number* is to be ranked. If zero or omitted, *number* is ranked as if the list were sorted in descending order. If *order* is any non-zero value, *number* is ranked as if the list were sorted in ascending order.

Return Type and Value: number – The rank of a number in a list of numbers.

[*Example*:

When the cells `E1:I1` contain 7, 3.5, 3.5, 1, and 2

`RANK(E2,E1:I1,1)` results in 3
`RANK(E2,E1:I1,1,0)` results in 2
`RANK(E2,E1:I1,1)` results in 2
`RANK(E1,E1:I1,1)` results in 5, as the two 3.5 values both have a rank of 3; no value has rank 4.

end example]

3.17.7.267 RATE

Syntax:

RATE (*nper* , *pmt* , *pv* [, [[*fv*] [, [[*type*][, [*guess*]]]]]])

Description: Computes the interest rate per period of an annuity, using iteration, which can result in zero or more solutions.

Arguments:

Name	Type	Description
nper	number	The total number of payment periods.
pmt	number	The payment made each period and cannot change over the life of the annuity. (Typically, *pmt* includes principal and interest but no other fees or taxes.) If omitted, *fv* shall be present.
pv	number	The present value.
fv	number	The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0).
type	number	The timing of the payment, truncated to integer, as follows:

Name	Type	Description
		<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table>
guess	number	A guess for what the rate will be. If omitted, it is assumed to be 10 percent.

Return Type and Value: number – The interest rate per period of an annuity.

However, if

- *type* is any number other than 0 or 1, `#NUM!` is returned.
- The result has not converged after an implementation-defined number of iterations, `#NUM!` is returned.

[*Example*:

`RATE(4*12,-200,8000)` results in `0.7701%`
`RATE(4*12,-200,8000)*12` results in `9.2418%`

end example]

3.17.7.268 RECEIVED

Syntax:

`RECEIVED ( `*settlement*` , `*maturity*` , `*investment*` , `*discount*` [ , [ `*basis*` ] ] )`

Description: Computes the amount received at maturity for a fully invested security.

Mathematical Formula:

$$RECEIVED = \frac{investment}{1 - (discount \times \frac{DIM}{B})}$$

where:

B = number of days in a year, depending on the year basis.
DIM = number of days from issue to maturity.

Arguments:

Name	Type	Description

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
investment	number	The amount invested in the security.
discount	number	The security's discount rate.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** 0 or omitted / US (NASD) 30/360 1 / Actual/actual 2 / Actual/360 3 / Actual/365 4 / European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The amount received at maturity for a fully invested security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *investment* or *discount* ≤ 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`RECEIVED(DATE(2008,2,15),DATE(2008,5,15),1000000,0.0575,2)` results in `1014584.65`

end example]

3.17.7.269 REPLACE

Syntax:

REPLACE (*string-1* , *start-pos* , *number-chars* , *string-2*)

Description: Produces a new string that is *string-1* with *number-chars* characters starting at position *start-pos*, replaced by *string-2*. (REPLACE is intended for use with languages that use the single-byte character set (SBCS), whereas REPLACEB (§3.17.7.270) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string-1	text	Designates a string.
start-pos	number	The number of the start position within *string-1* from which characters in *string-1* are to be replaced. The start position of the first character is 1. *start-pos* shall be at least 0. If *start-pos* is beyond the end of *string-1*, the result is a new string that is *string-2* appended to *string-1*. If *start-pos* is within the bounds of *string-1*, but *number-chars* goes beyond the end of *string-1*, the characters starting at position *start-pos* through to the end of *string-1* shall be replaced by *string-2*.
number-chars	number	The number of characters within *string-1* that are to be replaced by the string designated by *string-2*.
string-2	text	Designates a string.

Return Type and Value: text – A copy of *string-1* with replacement characters from *string-2*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-chars* < 0, #VALUE! is returned.

[*Example*:

`REPLACE("abcdefghijk",3,4,"XY")` results in `abXYghijk`
`REPLACE("abcdefghijk",3,1,"12345")` results in `ab12345defghijk`
`REPLACE("abcdefghijk",15,4,"XY")` results in `abcdefghijkXY`

end example]

3.17.7.270 REPLACEB

Syntax:

`REPLACEB ( string-1 , start-pos , number-bytes , string-2 )`

Description: Produces a new string that is *string-1* with *number-bytes* bytes starting at position *start-pos*, replaced by *string-2*. (REPLACEB is intended for use with languages that use the double-byte character set (DBCS), whereas REPLACE (§3.17.7.269) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string-1	text	Designates a string.
start-pos	number	The number of the start position within *string-1* from which characters in *string-1* are to be replaced. The start position of the first character is 1. *start-pos* shall be at least 0. If *start-pos* is beyond the end of *string-1*, the result is a new string that is *string-2* appended to *string-1*. If *start-pos* is within the bounds of *string-1*, but *number- bytes* goes beyond the end of *string-1*, the characters starting at position *start-pos* through to the end of *string-1* shall be replaced by *string-2*.
number-bytes	number	The number of characters within *string-1* that are to be replaced by the string designated by *string-2*.
string-2	text	Designates a string.

Return Type and Value: text – A copy of *string-1* with replacement characters from *string-2*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

[*Example*: Assuming 1-byte characters:

`REPLACEB("abcdefghijk",3,4,"XY")` results in `abXYghijk`
`REPLACEB("abcdefghijk",3,1,"12345")` results in `ab12345defghijk`
`REPLACEB("abcdefghijk",15,4,"XY")` results in `abcdefghijkXY`

end example]

3.17.7.271 REPT

Syntax:

`REPT` (*string* , *replication-count*)

Description: Creates a string that is *replication-count* number of occurrences of *string* concatenated together.

Arguments:

Name	Type	Description
string	text	Designate the string to be replicated.
replication-count	number	The number of times *string* is to be replicated, truncated to integer. If *replication-count* is 0, the resulting string is empty.

Return Type and Value: text – The final replicated string.

However, if *replication-count* < 0, #VALUE! is returned.

[*Example*:

REPT("ABC",3) results in ABCABCABC
LEN(REPT("ABC",0)) results in 0

end example]

3.17.7.272 RIGHT

Syntax:

RIGHT (*string* [, *number-chars*])

Description: Extracts the right-most *number-chars* characters from *string*. (RIGHT is intended for use with languages that use the single-byte character set (SBCS), whereas RIGHTB (§3.17.7.273) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-chars	number	The number of characters to be extracted. If omitted, a count of 1 shall be assumed. *number-chars* shall be at least 0. If *number-chars* exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing the right-most *number-chars* characters from *string*.

However, if *number-chars* < 0, #VALUE! is returned.

[*Example*:

RIGHT("abcdef",2) results in ef
RIGHT(A10,4) results in z123, when A10 contains xyz123

end example]

3.17.7.273 RIGHTB

Syntax:

RIGHTB (*string* , [*number-bytes*])

Description: Extracts the right-most *number-bytes*-worth of characters from *string*. (RIGHTB is intended for use with languages that use the double-byte character set (DBCS), whereas RIGHT (§3.17.7.272) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string	text	Designate the string from which a substring is to be extracted.
number-bytes	number	The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. *number-bytes* shall be at least 0. If *number-bytes* exceeds the length of *string*, the whole of *string* shall be extracted.

Return Type and Value: text – A string containing the right-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* < 0, #VALUE! is returned.

[*Example*: Assuming 1-byte characters:

RIGHTB("abcdef",2) results in ef
RIGHTB(A10,4) results in z123, when A10 contains xyz123

end example]

3.17.7.274 ROMAN

Syntax:

ROMAN (*number* , *form*)

Description: Converts the Arabic number, *number*, to a Roman number according to *form*.

Arguments:

Name	Type	Description
number	number	The Arabic number to be converted.
form	number	Specifies the type of Roman numeral to be produced. The Roman numeral style ranges from Classic to Simplified, becoming more concise as the value of *form* increases, as follows: **Value** | **Type**

Name	Type	Description
		0, omitted, or TRUE: Classic. Only subtract powers of ten (but not L or V). Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it must be smaller than the number preceding the larger one. 1: Concise. Allow subtractraction of L and V as well as powers of ten. Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it must be smaller than the number preceding the larger one. 2: More concise. Allow subtractraction of L (but not V) as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it must be smaller than the number preceding the larger one. 3: Most concise. Allow subtractraction of L and V as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it must be smaller than the number preceding the larger one. 4 or FALSE: Simplified. Produce the fewest Roman digits.

Return Type and Value: text – The corresponding Roman number.

However, if

- *number* < 0 or > 3999, #VALUE! is returned.
- *form* is not one of the values listed above, #VALUE! is returned.

[*Example*:

ROMAN(499,0) results in CDXCIX, which is 100 less than 500, plus 10 less than 100, plus one less than 10.
ROMAN(499,1) results in LDVLIV, which is 50 less than 500, plus 5 less than 50, plus one less than 5.
ROMAN(499,2) results in XDIX, which is 10 less than 500, plus one less than 10.
ROMAN(499,3) results in VDIV, which is 5 less than 500, plus one less than 5.

ROMAN(499,4) results in ID, which is 1 less than 500.
ROMAN(2013,0) results in MMXIII, which is 2,000, plus 10, plus 3.

end example]

3.17.7.275 ROUND

Syntax:

ROUND (*x* , *number-digits*)

Description: Rounds *x* to the number of digits specified by *number-digits*.

Arguments:

Name	Type	Description
x	number	The value to be rounded.
number-digits	number	The number of digits to which *x* is to be rounded. If *number-digits* is greater than 0, *x* is rounded to the specified number of decimal places. If *number-digits* is 0, *x* is rounded to the nearest integer. If *number-digits* is less than 0, *x* is rounded to the left of the decimal point.

Return Type and Value: number – The rounded-down value of *x*.

[*Example*:

ROUND(2.15,1) results in 2.2
ROUND(2.149,1) results in 2.1
ROUND(-1.475,2) results in -1.48
ROUND(21.5,-1) results in 20

end example]

3.17.7.276 ROUNDDOWN

Syntax:

ROUNDDOWN (*x* , *number-digits*)

Description: Computes *x* rounded down, toward zero, to the number of digits specified by *number-digits*. [*Note*: ROUNDDOWN behaves like ROUND (§3.17.7.275), except that ROUNDDOWN always rounds a number down. *end note*]

Arguments:

Name	Type	Description

Name	Type	Description
x	number	The value to be rounded down.
number-digits	number	The number of digits to which *x* is to be rounded. If *number-digits* is greater than 0, *x* is rounded to the specified number of decimal places. If *number-digits* is 0, *x* is rounded to the nearest integer. If *number-digits* is less than 0, *x* is rounded to the left of the decimal point.

Return Type and Value: number – The rounded-down value of *x*.

[*Example*:

`ROUNDDOWN(3.2,0)` rounds 3.2 down to zero decimal places; that is, to 3
`ROUNDDOWN(76.9,0)` rounds 76.9 down to zero decimal places; that is, to 76
`ROUNDDOWN(3.14159,3)` rounds 3.14159 down to three decimal places; that is, to `3.141`
`ROUNDDOWN(-3.14159,1)` rounds -3.14159 down to one decimal place; that is, to `-3.1`
`ROUNDDOWN(31415.92654,-2)` rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to `31400`

end example]

3.17.7.277 ROUNDUP

Syntax:

ROUNDUP (*x* , *number-digits*)

Description: Computes *x* rounded up, away from zero, to the number of digits specified by *number-digits*. [*Note*: ROUNDUP behaves like ROUND (§3.17.7.275), except that ROUNDUP always rounds a number up. *end note*]

Arguments:

Name	Type	Description
x	number	The value to be rounded up.
number-digits	number	The number of digits to which *x* is to be rounded. If *number-digits* is greater than 0, *x* is rounded up to the specified number of decimal places. If *number-digits* is 0, *x* is rounded up to the nearest integer. If *number-digits* is less than 0, *x* is rounded up to the left of the decimal point.

Return Type and Value: number – The rounded-up value of *x*.

[*Example*:

`ROUNDDOWN(3.2,0)` rounds 3.2 down to zero decimal places; that is, to `4`
`ROUNDDOWN(76.9,0)` rounds 76.9 down to zero decimal places; that is, to `77`
`ROUNDDOWN(3.14159,3)` rounds 3.14159 down to three decimal places; that is, to `3.142`
`ROUNDDOWN(-3.14159,1)` rounds -3.14159 down to one decimal place; that is, to `-3.2`
`ROUNDDOWN(31415.92654,-2)` rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to `31500`

end example]

3.17.7.278 ROW

Syntax:

`ROW ( [ reference ] )`

Description: Finds the number of the row(s) corresponding to *reference*.

Arguments:

Name	Type	Description
reference	reference to a single cell or to a range of contiguous cells	If omitted, the behavior is as if *reference* referred to the cell containing the formula.

Return Type and Value: number – If *reference* refers to a single cell or to a single row of cells, the corresponding row is returned. If *reference* refers to a range of cells involving multiple rows, a vertical array of the corresponding rows as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, `#REF!` is returned.

[*Example*:

`ROW()` results in 16, when the cell containing the formula is in row 16
`ROW(E17:G17)` results in 17
`ROW(E16:G17)` results in a vertical array containing 16 and 17, respectively

end example]

3.17.7.279 ROWS

Syntax:

`ROWS ( array )`

Description: Finds the number of rows corresponding to *array*.

Arguments:

Name	Type	Description
array	array, reference to a single cell, or a reference to a range of contiguous cells	A set of rows.

Return Type and Value: number – The number of rows corresponding to *array*.

However, if the range of cells referred to by *array* is not contiguous, `#NULL!` is returned.

[*Example*:

`ROWS(E16:H16)` results in 1
`ROWS(E16:G18)` results in 3
`ROWS({1,2;3,4})` results in 2

end example]

3.17.7.280 RSQ

Syntax:

`RSQ` (*known-ys* , *known-xs*)

Description: Computes the square of the Pearson product moment correlation coefficient through data points in known ys and known xs.

Mathematical Formula:

The equation for the Pearson product moment correlation coefficient, r, is:

$$r = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sqrt{\sum (x - \bar{x})^2 \sum (y - \bar{y})^2}}$$

where x and y are the sample means `AVERAGE(`*known-xs*`)` and `AVERAGE(`*known-ys*`)`.

Arguments:

Name	Type	Description
known-xs	number, name,	Designate a set of numeric data points. Logical values and

Name	Type	Description
	array, or reference to number, text, logical	text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
known-ys	number, name, array, or reference to number, text, logical	Designate a set of numeric data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The square of the Pearson product moment correlation coefficient.

However, if

- *known-ys* and *known-xs* are empty or have a different number of data points, the return value is unspecified.
- *known-ys* and *known-xs* contain only one data point, the return value is unspecified.

[*Example*:

`RSQ({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in `0.057950192`

end example]

3.17.7.281 RTD

Syntax:

RTD (*progID* , [*rtd-server*] , *argument-list*)

Description: Retrieves data from a program in real-time. Periodically, this function returns new values and causes recalculation of the expression containing the call to it.

Arguments:

Name	Type	Description
progID	text	The name of the program from which the data is to be retrieved.
rtd-server	text	An optional string that is specific to the program with which RTD is communicating.
argument list	any	The presence and meaning of each *argument* in *argument-list* is specific to the program with which RTD is

Name	Type	Description
		communicating.

Return Type and Value: array – The set of values returned by the program with which RTD is communicating.

[*Example*: Consider a stockprice program that is called as follows:

```
RTD("stockprice.rtd","NASD","MSFT")
```

The result it returns—the price of the stock MSFT according to NASD—changes over time, often every few seconds.

The *rtd-server* program could also be written to accept multiple arguments, allowing calls like the following::

```
RTD("stockprice.rtd","NASD","MSFT","GOOG","AMZN")
```

where three stock values are requested.

end example]

3.17.7.282 SEARCH

Syntax:

SEARCH (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-insensitive search for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (SEARCH is intended for use with languages that use the single-byte character set (SBCS), whereas SEARCHB (§3.17.7.283) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

Name	Type	Description
string-1	text	Designate the string to be searched for within the string designated by *string-2*. *string-1* can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~).
string-2	text	
start-pos	number	The number of the start position within *string-2* for which *string-1* is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. *start-pos* shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[*Example*:

SEARCH("de","abcdEF") results in 4
SEARCH("?c*e","abcdEF") results in 2

end example]

3.17.7.283 SEARCHB

Syntax:

SEARCHB (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-insensitive search for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (SEARCHB is intended for use with languages that use the double-byte character set (DBCS), whereas SEARCH (§3.17.7.282) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

Name	Type	Description
string-1	text	Designate the string to be searched for within the string designated by *string-2*. *string-1* can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~).
string-2	text	
start-pos	number	The number of the start position within *string-2* for which *string-1* is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. *start-pos* shall be at least 0.

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[*Example*: Assuming 1-byte characters

SEARCHB("de","abcdEF") results in 4
SEARCHB("?c*e","abcdEF") results in 2

end example]

3.17.7.284 SECOND

Syntax:

SECOND (*time-value*)

Description: Computes the second for the date and/or time having the given *time-value*.

Arguments:

Name	Type	Description
time-value	number	The date and/or time whose second is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any date information shall be ignored.

Return Type and Value: number – The second for the date and/or time having the given *time-value*.

However, if *time-value* is out of range for the current date base value, #NUM! is returned.

[*Example*:

SECOND(DATE(2006,2,26)+TIME(2,10,20)) results in 20
SECOND(TIME(22,56,34)) results in 34
SECOND(0) results in 0, since serial value 0 represents 00:00:00
SECOND(10.5) results in 0, since serial value .5 represents 12:00:00
SECOND("22-Oct-2001 10:53:12") results in 12
SECOND("10:53:12 pm") results in 12
SECOND("22:53:12") results in 12

end example]

3.17.7.285 SERIESSUM

Syntax:

`SERIESSUM ( input-value , initial-power , step , coefficients )`

Description: Computes the sum of a power series.

Mathematical Formula:

The sum of a power series is based on the formula:

$$\mathrm{SERIES}(x,n,m,a) = a_1 x^{n} + a_2 x^{(n+m)} + a_3 x^{(n+2m)} + \ldots + a_i x^{(n+(i-1)m)}$$

where *input-value* = *x*, *initial-power* = *n*, *step* = *m*, and *coefficients* is the set of *a* values.

Arguments:

Name	Type	Description
input-value	number	The input value to the power series;
initial-power	number	The initial power to which *input-value* is to be raised.
step	number	The step by which to increase *initial-power* for each term in the series;
coefficients	reference	A set of coefficients by which each successive power of *input-value* is multiplied. The number of values in *coefficients* determines the number of terms in the power series.

Return Type and Value: number – The sum of a power series.

[*Example*: Given the following data:

	A
1	1
2	=-1/FACT(2)
3	=1/FACT(4)
4	=-1/FACT(6)

`SERIESSUM(PI()/4,0,2,A1:A4)` results in `0.707103`, an approximation to the cosine of π/4 radians

end example]

3.17.7.286 SIGN

Syntax:

```
SIGN ( x )
```

Description: Determines the sign of *x*.

Arguments:

Name	Type	Description
x	number	The number whose sign is to be determined.

Return Type and Value: number – 1 if *x* is positive, 0 if *x* is 0, and -1 if *x* is negative.

[*Example*:

`SIGN(10.5)` results in `1`
`SIGN(0)` results in `0`
`SIGN(-5.4)` results in `-1`

end example]

3.17.7.287 SIN

Syntax:

```
SIN ( x )
```

Description: Computes the sine of *x*.

Arguments:

Name	Type	Description
x	number	The number whose sine is to be computed.

Return Type and Value: number – The sine of *x*.

[*Example*:

`SIN(-1)` results in `-0.841470985`
`SIN(0)` results in `0`
`SIN(1)` results in `0.841470985`

end example]

3.17.7.288 SINH

Syntax:

`SINH ( x )`

Description: Computes the hyperbolic sine of *x*.

Arguments:

Name	Type	Description
x	number	The number whose hyperbolic sine is to be computed.

Return Type and Value: number – The hyperbolic sine of *x*.

However, if the magnitude of *x* is too large for the result to be represented, `#NUM!` is returned.

[*Example*:|

`SINH(1)` results in `1.175201194`
`SINH(10)` results in `11013.23287`
`SINH(100)` results in `1.34406E+43`

end example]

3.17.7.289 SKEW

Syntax:

`SKEW ( argument-list )`

Description: Computes the skewness of a distribution. [*Note*: Skewness characterizes the degree of asymmetry of a distribution around its mean. Positive skewness indicates a distribution with an asymmetric tail extending toward more positive values. Negative skewness indicates a distribution with an asymmetric tail extending toward more negative values. *end note*]

Mathematical Formula:

$$\frac{n}{(n-1)(n-2)}\sum\left(\frac{x_j-\bar{x}}{s}\right)^3$$

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers for which the skewness is to be computed. Logical values and text representations of numbers that are entered

Name	Type	Description
		directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The skewness of a distribution.

However, if

- There are fewer than three data points, the return value is unspecified.
- The sample standard deviation is zero, the return value is unspecified.

[*Example*:

`SKEW(3,4,5,2,3,4,5,6,4,7)` results in `0.359543071`

end example]

3.17.7.290 SLN

`SLN ( cost , salvage , life )`

Description: Computes the straight-line depreciation of an asset for one period.

Arguments:

Name	Type	Description
cost	number	The number *cost* is the initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)

Return Type and Value: number – The straight-line depreciation of an asset for one period.

[*Example*:

`SLN(30000,7500,10)` results in `2,250.00`

end example]

3.17.7.291 SLOPE

Syntax:

SLOPE (*known-ys* , *known-xs*)

Description: Computes the slope of the linear regression line through data points in known ys and known xs. The slope is the vertical distance divided by the horizontal distance between any two points on the line, which is the rate of change along the regression line.

Mathematical Formula:

$$b = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2}$$

where x and y are the sample means AVERAGE(*known-xs*) and AVERAGE(*known-ys*).

Arguments:

Name	Type	Description
known-xs	number, name, array, or reference to number, text, logical	Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
known-ys	number, name, array, or reference to number, text, logical	Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The slope of the linear regression line through data points in known ys and known xs.

However, if

- *known-ys* and *known-xs* are empty, the return value is unspecified.
- *known-ys* and *known-xs* have a different number of data points, the return value is unspecified.

[*Example*:

SLOPE({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 0.305555556

end example]

3.17.7.292 SMALL

Syntax:

SMALL (*array* , *k*)

Description: Computes the k^{th} smallest value in a data set.

Arguments:

Name	Type	Description
array	array, reference	The set of numbers from which the k^{th}-smallest value is to be determined.
k	number	The position (from the smallest) in the array or cell range of data to return.

Return Type and Value: number – The k^{th} smallest value in a data set.

However, if

- *array* is empty, the return value is unspecified.
- $k \leq 0$ or k is greater than the number of data points, #NUM! is returned.

[*Example*:

SMALL({3,5,3,5,4;4,2,4,6,7},3) results in 3
SMALL({3,5,3,5,4;4,2,4,6,7},7) results in 5

end example]

3.17.7.293 SQRT

Syntax:

SQRT (*x*)

Description: Computes the positive square root of x.

Arguments:

Name	Type	Description
x	number	The number whose positive root is to be found.

Return Type and Value: number – The positive square root of x.

However, if x is negative, #NUM! is returned.

[*Example*:

SQRT(2) results in 1.414213562
SQRT(5) results in 2.236067977

end example]

3.17.7.294 SQRTPI

Syntax:

SQRTPI (*x*)

Description: Computes the positive square root of $x \times \pi$.

Arguments:

Name	Type	Description
x	number	The number, which when multiplied by π, whose positive root is to be found.

Return Type and Value: number – The positive square root of $x \times \pi$.

However, if *x* is negative, #NUM! is returned.

[*Example*:

SQRTPI(1) results in 1.772453851
SQRTPI(2) results in 2.506628275

end example]

3.17.7.295 STANDARDIZE

Syntax:

STANDARDIZE (*x* , *mean* , *standard-dev*)

Description: Computes a normalized value from a distribution characterized by *mean* and *standard-dev*.

Mathematical Formula:

$$Z = \frac{X - \mu}{\sigma}$$

Arguments:

Name	Type	Description

Name	Type	Description
x	number	The number whose value is to be normalized.
mean	number	The the arithmetic mean of the distribution.
standard-dev	number	The standard deviation of the distribution.

Return Type and Value: number – A normalized value from a distribution.

However, if *standard-dev* ≤ 0, `#NUM!` is returned.

[*Example*:

`STANDARDIZE(42,40,1.5)` results in `1.333333333`

end example]

3.17.7.296 STDEV

Syntax:

`STDEV` (*argument-list*)

Description: Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [*Note*: STDEV assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVA instead. *end note*]

Mathematical Formula:

$$\sqrt{\frac{\sum(x-\bar{x})^2}{(n-1)}}$$

where x is the sample mean `AVERAGE(`*argument-1*`,` *argument-2*`,…,` *argument-n*`)` and n is the sample size.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers that are samples of the population. *argument-list* can also be an array of numbers. Logical values and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – An estimate of the standard deviation based on a sample.

[*Example*:

STDEV(123,134,143,173,112,109) results in 23.72902583

end example]

3.17.7.297 STDEVA

Syntax:

STDEVA (*argument-list*)

Description: Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [*Note*: STDEVA assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVPA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEV instead. *end note*]

Mathematical Formula:

$$\sqrt{\frac{\sum(x-\bar{x})^2}{(n-1)}}$$

where x is the sample mean AVERAGE(*argument-1*, *argument-2*,…, *argument-n*) and n is the sample size.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference. The argument list can also be an array of numbers.	The *argument*s in *argument-list* designate the numbers that are samples of the population. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

Return Type and Value: number – An estimate of the standard deviation based on a sample.

[*Example*:

STDEVA(123,134,143,173,112,109) results in 23.72902583

end example]

3.17.7.298 STDEVP

Syntax:

STDEVP (*argument-list*)

Description: Computes the standard deviation of an entire population, using the "biased" or "n" method. [*Note*: STDEVP assumes that its arguments are the total population. If the data represents a population sample only, STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVPA instead. *end note*]

Mathematical Formula:

$$\sqrt{\frac{\sum(x-\bar{x})^2}{n}}$$

where x is the sample mean AVERAGE(*argument-1*, *argument-2*,…, *argument-n*) and n is the sample size.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference. The argument list can also be an array of numbers.	The *argument*s in *argument-list* designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – The standard deviation of an entire population.

[*Example*:

STDEVP(123,134,143,173,112,109) results in 21.66153785

end example]

3.17.7.299 STDEVPA

Syntax:

STDEVPA (*argument-list*)

Description: Computes the standard deviation of an entire population, using the "biased" or "n" method. [*Note*: STDEVPA assumes that its arguments are the total population. If the data represents a population sample only,

STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEVP instead. *end note*]

Mathematical Formula:

$$\sqrt{\frac{\sum(x-\bar{x})^2}{n}}$$

where x is the sample mean AVERAGE(*argument-1*, *argument-2*,…, *argument-n*) and n is the sample size.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference. The argument list can also be an array of numbers.	The *argument*s in *argument-list* designate the numbers that are the members of the population.

Return Type and Value: number – The standard deviation of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[*Example*:

STDEVPA(123,134,143,173,112,109) results in 21.66153785

end example]

3.17.7.300 STEYX

Syntax:

STEYX (*known-ys* , *known-xs*)

Description: Computes the standard error of the predicted *y*-value for each *x* in the regression. The standard error is a measure of the amount of error in the prediction of *y* for an individual *x*.

Mathematical Formula:

$$\sqrt{\frac{1}{(n-2)}\left[\sum(y-\bar{y})^2-\frac{\left[\sum(x-\bar{x})(y-\bar{y})\right]^2}{\sum(x-\bar{x})^2}\right]}$$

where x and y are the sample means AVERAGE(*known-xs*) and AVERAGE(*known-ys*), and n is the sample size.

Arguments:

Name	Type	Description
known-xs	number, name, array, or reference to number, text, logical	Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.
known-ys	number, name, array, or reference to number, text, logical	Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included.

Return Type and Value: number – The standard error of the predicted y-value for each *x* in the regression.

However, if

- *known-ys* and *known-xs* have a different number of data points, the return value is unspecified.
- *known-ys* and *known-xs* are empty or have less than three data points, the return value is unspecified.

[*Example*:

STEYX({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 3.30571895

end example]

3.17.7.301 SUBSTITUTE

Syntax:

SUBSTITUTE (*string* , *old-string* , *new-string* [, *occurence*])

Description: Produces a new string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

Arguments:

Name	Type	Description

Name	Type	Description
string	text	Designates a string.
old-string	text	Designates a string.
new string	text	Designates a string.
occurence	number	The occurrence number of the *old-string* characters within *string-1* that is to be replaced by the string designated by *new-string*. If omitted, all occurrences of *old-string* characters shall be replaced.

Return Type and Value: text – A string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

However, if *occurance* < 0, #VALUE! is returned.

[*Example*:

`SUBSTITUTE("abcaaabca","a","xx")` results in `xxbcxxxxxxbcxx`
`SUBSTITUTE("abcaaabca","a","",10)` results in `bcbc`
`SUBSTITUTE("abcaaabca","a","xx",3)` results in `abcaxxabca`

end example]

3.17.7.302 SUBTOTAL

Syntax:

SUBTOTAL (*function-number* , *argument-list*)

Description: Computes a value using the function designated by *function-number*, using the *argument*s in *argument-list*.

Arguments:

Name	Type	Description
function-number	number	Indicates the function to be called, as shown in the table below.
argument-list	number	Each *argument* in *argument-list* is passed to the called function, in the order specified. That shall be no more than 254 *argument*s.

function-number (includes hidden values)	*function-number* (excludes hidden values)	Function
1	101	AVERAGE

function-number (includes hidden values)	*function-number* (excludes hidden values)	Function
2	102	COUNT
3	103	COUNTA
4	104	MAX
5	105	MIN
6	106	PRODUCT
7	107	STDEV
8	108	STDEVP
9	109	SUM
10	110	VAR
11	111	VARP

If any argument contains a SUBTOTAL function call, that call shall be ignored to avoid double counting.

For the *function-number* values 1–11, the values of hidden rows are included. For the *function-number* values 101–111, the values of hidden rows are excluded.

The SUBTOTAL function shall ignore any rows that are not included in the result of a filter, regardless of which *function-number* value is used.

The SUBTOTAL function is designed for columns of data, or vertical ranges. It is not designed for rows of data, or horizontal ranges. [*Example*: When a horizontal range is subtotaled using a *function-number* of 101 or greater, hiding a column does not affect the subtotal. However, hiding a row in a subtotal of a vertical range does affect the subtotal. *end example*]

Return Type and Value: number – The result from calling the function designated by *function-number*, using the *argument*s in *argument-list*.

However, if *function-number* does not have one of the values specified above, `#NUM!` is returned.

[*Example*:

`SUBTOTAL(2,E5:E15)` counts the number of values in the cell range E5:E15, including hidden values
`SUBTOTAL(4,E5:E15)` finds the maximum value of the values in the cell range E5: E15, including hidden values
`SUBTOTAL(106,E5:E15)` finds the product of the values in the cell range E5: E15, excluding hidden values

end example]

3.17.7.303 SUM

Syntax:

SUM (*argument-list*)

Description: Adds the numeric values of *argument*s in *argument-list*.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference.	The *argument*s in *argument-list* designate the numeric values to be added. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

Return Type and Value: number – The sum of the values of its arguments.

[*Example*:

SUM(1,2,3,4,5) results in 15
SUM({1,2;3,4}) results in 10
SUM({1,2,3,4,5},6,"7") results in 28
SUM({1,"2",TRUE,4}) results in 5, as the logical value and numeric text are ignored

end example]

3.17.7.304 SUMIF

Syntax:

SUMIF (*cell-range* , *selection-criteria* [, *sum-range*])

Description: Applies selection criteria on the values in one range of cells and sums the values of the cells in a corresponding range.

Arguments:

Name	Type	Description
cell-range	reference	Designates the range of cells to be inspected.
selection-criteria	number, expression, reference, text	Defines which cells will be counted. In the case of text, *selection-criteria* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. *selection-criteria* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of

Name	Type	Description
		characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
sum-range	reference	If present, *sum-range* designates the cells whose values are summed. In this case, *sum-range* does not have to have the same size and shape as *cell-range*. The actual cells that are added are determined by using the top, left cell in *sum-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range*. If omitted, *cell-range* also designates the cells whose values are summed.

Return Type and Value: number – The sum of the cells corresponding to those selected.

[*Example*: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

`SUMIF(A1:D1,"=10")` results in 20
`SUMIF(A1:D1,">5")` results in 27
`SUMIF(A1:D1,"<>10")` results in 10

Given that A2, B2, C2, and D2, respectively, contain the values `apples`, `melons`, 10, and 15
`SUMIF(A2:B2,"*es",C2:D2)` results in 10

end example]

3.17.7.305 SUMIFS

Syntax:

```
SUMIFS ( sum-range , cell-range-1 , selection-criteria-1
   [ , cell-range-2 , selection-criteria-2 [ , … ] ] )
```

Description: Adds the cells in a range that meet multiple criteria.

Arguments:

Name	Type	Description
sum-range	reference	Designates the cells whose values are summed. In this case, *sum-range* does not have to have the same size and shape as *cell-range-1* through *cell-range-n*. The actual cells that are added are determined by using the top, left cell in *sum-range* as the beginning cell, and then including cells that correspond in size and shape to *cell-range-1* through *cell-range-n*. Each cell in *sum-range* is summed only if all of the corresponding criteria specified are true for that cell. Cells in *sum-range* that contain TRUE

Name	Type	Description
		evaluate to 1; cells in sum-range that contain FALSE evaluate to 0.
cell-range-1	reference	Designates the first range of cells to be inspected.
selection-criteria-1	number, expression, reference, text	Specifies the criteria for the first range of cells that will be counted. In the case of text, *selection-criteria-1* can consist of any comparison operator followed by the operand against which each cell's value is to be compared. *selection-criteria-1* can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~).
cell-range-n	reference	The optional arguments *selection-criteria-2* through *selection-criteria-n* have corresponding arguments *cell-range-2* through *cell-range-n*, and have the same semantics as *selection-criteria-1* and *cell-range-1*, respectively.
selection-criteria-n	number, expression, reference, text	

Return Type and Value: number – The sum of the cells corresponding to those selected.

[*Example*: Given the following data:

	A	B	C	D
1	Sales Person	Tables	Chairs	Desks
2	Emilio	34	85	97
3	Julie	353	23	18
4	Hans	13	67	14
5	Frederique	0	98	0

`SUMIFS(B2:C5,A2:A5,"=Julie")` results in `353` (the sum of the number of tables and chairs sold by Julie)

`SUMIFS(B2:B5,A2:A5,"=Julie",A2:A5,"=Hans")` results in `0` (the sum of the number of tables sold by Julie and Hans)

`SUMIFS(B2:B5,A3,"=Julie",A4,"=Hans")` results in `34` (the sum of the the number of tables sold by Julie and Hans)

`SUMIFS(B2:D5,A2:A5,"<>Emilio")` results in `768` (the sum of the number of tables, chairs, and desks sold by all sales persons except Emilio)

end example]

3.17.7.306 SUMPRODUCT

Syntax:

SUMPRODUCT (*argument-list*)

Description: Multiplies the corresponding elements in the array *argument*s in *argument-list*, and returns the sum of those products. An array element that is not numeric is treated as if it contained 0.

Arguments:

Name	Type	Description
argument-list	array of numbers	The *argument*s in *argument-list* designate the numeric values to be multiplied.

Return Type and Value: number – The sum of the products of the corresponding elements in the *argument*s in *argument-list*.

However, if the array arguments do not have the same dimensions, #NUM! is returned.

[*Example*:

SUMPRODUCT({2,3}) results in 5
SUMPRODUCT({2,3},{4,5}) results in 23
SUMPRODUCT({2,3},{4,5},{2,2}) results in 46
SUMPRODUCT({2,3;4,5},{2,2;3,4}) results in 42

end example]

3.17.7.307 SUMSQ

Syntax:

SUMSQ (*argument-list*)

Description: Adds the squares of *argument*s in *argument-list*.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the values whose squares are to be summed. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or

Name	Type	Description
		reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored.

Return Type and Value: number – The sum of the squares of its arguments.

[*Example*:

SUMSQ(2) results in 4
SUMSQ(2.5,-3.6)) results in 19.21
SUMSQ({2.5,-3.6)},2.4) results in 24.97

end example]

3.17.7.308 SUMX2MY2

Syntax:

SUMX2MY2 (*array-1* , *array-2*)

Description: Computes the sum of the difference of squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$\mathrm{SUMX2MY2} = \sum (x^2 - y^2)$$

where *array-1* contains the *x* values, and *array-2* contains the *y* values.

Arguments:

Name	Type	Description
array-1	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
array-2		

Return Type and Value: number – The sum of the difference of squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[*Example*:

`SUMX2MY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in 55
`SUMX2MY2({2,3,9;1,8,7},{6,5,11;7,5,4})` results in -64
end example]

3.17.7.309 SUMX2PY2

Syntax:

`SUMX2PY2 ( array-1 , array-2 )`

Description: Computes the sum of the sum of the squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMX2PY2 = \sum (x^2 + y^2)$$

where *array-1* contains the *x* values, and *array-2* contains the *y* values.

Arguments:

Name	Type	Description
array-1	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
array-2		

Return Type and Value: number – The sum of the sum of the squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[*Example*:

`SUMX2PY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in 521
`SUMX2PY2({2,3,9;1,8,7},{6,5,11;7,5,4})` results in 480

end example]

3.17.7.310 SUMXMY2

Syntax:

`SUMXMY2 ( array-1 , array-2 )`

Description: Computes the sum of the squares of the difference between corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMXMY2 = \sum (x - y)^2$$

where *array-1* contains the *x* values, and *array-2* contains the *y* values.

Arguments:

Name	Type	Description
array-1	array, reference	Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included.
array-2		

Return Type and Value: number – The sum of the squares of the difference between the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[*Example*:

`SUMXMY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in 79
`SUMXMY2({2,3,9;1,8,7},{6,5,11;7,5,4})` results in 78

end example]

3.17.7.311 SYD

SYD (*cost* , *salvage* , *life* , *per*)

Description: Computes the sum-of-years' digits depreciation of an asset for a specified period.

Mathematical Formula:

$$SYD = \frac{(cost - salvage) * (life - per + 1) * 2}{(life)(life + 1)}$$

Arguments:

Name	Type	Description
cost	number	The initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.)

Name	Type	Description
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
per	number	The period and shall have the same units as *life*.

Return Type and Value: number – The sum-of-years' digits depreciation of an asset for a specified period.

[*Example*:

`SYD(30000,7500,10,1)` results in `4,090.91`
`SYD(30000,7500,10,10)` results in `409.09`

end example]

3.17.7.312 T

Syntax:

`T ( value )`

Description: Retrieves the text represented by *value*.

Arguments:

Name	Type	Description
value	any	The value to be encoded in text. No conversion shall take place on an argument passed to this function.

Return Type and Value: text – *value* if *value* designates text; otherwise, `""`. [*Note*: T cannot differentiate between text that is an empty string, and any *value* of non-text type. *end note*]

[*Example*:

`T("Hello")` results in `Hello`
`LEN(T(123))` results in `0`
`LEN(T(TRUE))` results in `0`

end example]

3.17.7.313 TAN

Syntax:

`TAN ( x )`

Description: Computes the tangent of *x*.

Arguments:

Name	Type	Description
x	number	The number whose tangent is to be computed.

Return Type and Value: number – The tangent of *x*.

[*Example*:

`TAN(-1)` results in `-1.557407725`
`TAN(0)` results in `0`
`TAN(1)` results in `1.557407725`

end example]

3.17.7.314 TANH

Syntax:

`TANH ( x )`

Description: Computes the hyperbolic tangent of *x*.

Arguments:

Name	Type	Description
x	number	The number whose hyperbolic tangent is to be computed.

Return Type and Value: number – The hyperbolic tangent of *x*

[*Example*:

`TANH(-1)` results in `-0.761594156`
`TANH(0)` results in `0`
`TANH(1)` results in `0.761594156`

end example]

3.17.7.315 TBILLEQ

`TBILLEQ ( settlement , maturity , discount )`

Description: Computes the bond-equivalent yield for a U.S. Treasury bill.

Arguments:

Name	Type	Description
settlement	number	The Treasury bill's settlement date. Any time information in the date is ignored.
maturity	number	The Treasury bill's maturity date. Any time information in the date is ignored.
discount	number	The Treasury bill's discount rate.

Return Type and Value: number – The bond-equivalent yield for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* > *maturity*, `#NUM!` is returned.
- *maturity* is more than one year after *settlement*, `#NUM!` is returned.
- *discount* ≤ 0, `#NUM!` is returned.

[*Example*:

`TBILLEQ(DATE(2008,3,31),DATE(2008,6,1),0.0914)` results in `9.4151%`

end example]

3.17.7.316 TBILLPRICE

`TBILLPRICE ( settlement , maturity , discount )`

Description: Computes the price per $100 face value for a U.S. Treasury bill.

Mathematical Formula:

$$TBILLPRICE = 100 \times (1 - \frac{discount \times DSM}{360})$$

where:

DSM = number of days from settlement to maturity, excluding any maturity date that is more than one calendar year after the settlement date.

Arguments:

Name	Type	Description
settlement	number	The Treasury bill's settlement date. Any time information in the date is ignored.

Name	Type	Description
maturity	number	The Treasury bill's maturity date. Any time information in the date is ignored.
discount	number	The Treasury bill's discount rate.

Return Type and Value: number – The price per $100 face value for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* > *maturity*, `#NUM!` is returned.
- *maturity* is more than one year after *settlement*, `#NUM!` is returned.
- *discount* ≤ 0, `#NUM!` is returned.

[*Example*:

`TBILLPRICE(DATE(2008,3,31),DATE(2008,6,1),0.09)` results in `98.4500`

end example]

3.17.7.317 TBILLYIELD

`TBILLYIELD ( `*settlement*` , `*maturity*` , `*pr*` )`

Description: Computes the yield for a U.S. Treasury bill.

Mathematical Formula:

$$TBILLYIELD = \frac{100 - pr.}{pr.} \times \frac{360}{DSM}$$

where:

DSM = number of days from settlement to maturity, excluding any maturity date that is more than one calendar year after the settlement date.

Arguments:

Name	Type	Description
settlement	number	The Treasury bill's settlement date. Any time information in the date is ignored.
maturity	number	The Treasury bill's maturity date. Any time information in the date is ignored.
pr	number	The Treasury bill's price per $100 face value.

Return Type and Value: number – The yield for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* > *maturity*, #NUM! is returned.
- *maturity* is more than one year after *settlement*, #NUM! is returned.
- *pr* ≤ 0, #NUM! is returned.

[*Example*:

TBILLYIELD(DATE(2008,3,31),DATE(2008,6,1),98.45) results in 9.1417%

end example]

3.17.7.318 TDIST

Syntax:

TDIST (*x* , *degrees-freedom* , *distribution-tails*)

Description: Computes the Percentage Points (probability) for the Student t-distribution where a numeric value, *x*, is a calculated value of *t* for which the Percentage Points are to be computed.

Mathematical Formula:

If *distribution-tails* = 1, TDIST = P(X>x), where X is a random variable that follows the t-distribution.

If *distribution-tails* = 2, TDIST = P(|X| > x) = P(X > x or X < -x)

Arguments:

Name	Type	Description
x	number	The value at which to evaluate the distribution.
degrees-freedom	number	The number of degrees of freedom, truncated to an integer.
distribution-tails	number	The number of distribution tails to return, truncated to an integer. If 1, TDIST returns the one-tailed distribution. If 2, TDIST returns the two-tailed distribution.

Return Type and Value: number – The Percentage Points (probability) for the Student t-distribution.

However, if

- *degrees-freedom* < 1, #NUM! is returned.
- *tails* has any value other than 1 or 2, #NUM! is returned.

- $x < 0$, `#NUM!` is returned.

[*Example*:

`TDIST(1.959999998,60,1)` results in `0.027322464`
`TDIST(1.959999998,60,2)` results in `0.054644927`

end example]

3.17.7.319 TEXT

Syntax:

`TEXT ( value , format )`

Description: Produces a string containing *value* formatted according to *format*.

Arguments:

Name	Type	Description
value	number	The number that is to be formatted.
format	text	Designates the number, currency, date, or time format to be used. (See §3.8.31 for the set of formats.)

Return Type and Value: text – The string containing *number* formatted according to *format*.

[*Example*:

`TEXT(1234.567,"$0.00")` results in `$1234.57`
`TEXT(.125,"$0.0%")` results in `12.5%`
`TEXT(1234.567,"YYYY-MM-DD HH:MM:SS")` results in `1903-05-18 13:36:29` in the 1900 date-base system.

end example]

3.17.7.320 TIME

Syntax:

`TIME ( hour , minute , second )`

Description: Computes the serial value for the given time.

Arguments:

Name	Type	Description

Name	Type	Description
hour	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the hour. Any value greater than 23 shall be divided by 24 and the remainder shall be treated as the hour value.
minute	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the minute. Any value greater than 59 shall be converted to the corresponding number of hours and minutes.
second	number	A number in the range 0–32767, inclusive, truncated to integer, that represents the second. Any value greater than 59 shall be converted to the corresponding number of hours, minutes, and seconds.

Return Type and Value: number – The serial value for the given time, as a value greater than or equal to 0 and less than or equal to 1.

However, if *hour*, *minute*, or *second* are out of range, `#NUM!` is returned.

[*Example*: The following serial values are displayed with 16 decimal places.

`TIME(0,0,0)` results in a serial value of `0.0000000000000000`
`TIME(0,0,1)` results in a serial value of `0.0000115740740741`
`TIME(0,0,2)` results in a serial value of `0.0000231481481481`
`TIME(0,0,20)` results in a serial value of `0.0002314814814815`
`TIME(2,3,20)` results in a serial value of `0.0856481481481481`
`TIME(12,0,0)` results in a serial value of `0.5000000000000000`
`TIME(23,59,59)` results in a serial value of `0.9999884259259260`
`TIME(26,120,240)` results in a serial value of `0.1694444444444450`

end example]

3.17.7.321 TIMEVALUE

Syntax:

`TIMEVALUE` (*date-time-string*)

Description: Computes the serial value of the date and/or time represented by the string *date-time-string*.

Arguments:

Name	Type	Description
date-time-string	text	The date and/or time whose serial value is to be computed. *date-time-string* can have any valid date

Name	Type	Description
		and/or time format. Any date information in *date-time-string* shall be ignored.

Return Type and Value: number – The serial value of the date and/or time represented by the string *date-time-string*.

However, if *date-time-string* is ill-formed, `#VALUE!` is returned.

[*Example*: The following serial values are displayed with 16 decimal places.

`TIMEVALUE("10:02:34 ")` results in `0.4184490740740740`
`TIMEVALUE("01-Feb-2006 10:15:29 AM")` results in `0.4274189814823330`
`TIMEVALUE("22:02")` results in `0.9180555555555560`

end example]

3.17.7.322 TINV

Syntax:

`TINV ( probability , degrees-freedom )`

Description: Computes the t-value of the Student's t-distribution as a function of the probability and the degrees of freedom.

Arguments:

Name	Type	Description
probability	number	A probability associated with the two-tailed Student's t-distribution.
degrees-freedom	number	The number of degrees of freedom with which to characterize the distribution, truncated to an integer.

Return Type and Value: number – The t-value of the Student's t-distribution.

However, if

- *probability* < 0 or *probability* > 1, `#NUM!` is returned.
- *degrees-freedom* < 1, `#NUM!` is returned.

[*Example*:

`TINV(0.054644927,60)` results in `1.95999999`

end example]

3.17.7.323 TODAY

Syntax:

```
TODAY ( )
```

Description: Computes the serial value of the current date, taking into account the current date base value.

Arguments: None.

Return Type and Value: number – The serial value of the current date.

[*Example*:

On February 25, 2006, `TODAY()` results in `38773` for the 1900 date base system, or `37311` for the 1904 date base system

end example]

3.17.7.324 TRANSPOSE

Syntax:

```
TRANSPOSE ( array )
```
