cat (§5.7.2.24); xVal (§5.7.2.235)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pt (String Point)	§5.7.2.152
ptCount (Point Count)	§5.7.2.153

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrData">
   <sequence>
      <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
      <element name="pt" type="CT_StrVal" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.202 strRef (String Reference)

This element specifies a reference to data for a single data label or title with a cache of the last values used.

Parent Elements

Parent Elements
cat (§5.7.2.24); tx (§5.7.2.215); tx (§5.7.2.216); xVal (§5.7.2.235)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
f (Formula)	§5.7.2.65
strCache (String Cache)	§5.7.2.200

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrRef">
   <sequence>
      <element name="f" type="xsd:string" minOccurs="1" maxOccurs="1"/>
      <element name="strCache" type="CT_StrData" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.203 style (Style)

This element specifies the style that shall be applied to the chart.

Parent Elements
chartSpace (§5.7.2.29)

Attributes	Description
val (Style Type)	Specifies the chart style. The possible values for this attribute are defined by the ST_Style simple type (§5.7.3.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Style">
   <attribute name="val" type="ST_Style" use="required"/>
</complexType>
```

5.7.2.204 surface3DChart (3D Surface Charts)

This element contains the set of 3-D surface series.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
bandFmts (Band Formats)	§5.7.2.14
extLst (Chart Extensibility)	§5.7.2.64
ser (Surface Chart Series)	§5.7.2.171
wireframe (Wireframe)	§5.7.2.231

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Surface3DChart">
   <sequence>
      <group ref="EG_SurfaceChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="3" maxOccurs="3"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.205 surfaceChart (Surface Charts)

This element contains the set of 2-D contour charts.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
bandFmts (Band Formats)	§5.7.2.14
extLst (Chart Extensibility)	§5.7.2.64
ser (Surface Chart Series)	§5.7.2.171
wireframe (Wireframe)	§5.7.2.231

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SurfaceChart">
   <sequence>
      <group ref="EG_SurfaceChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="3"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.206 symbol (Symbol)

This element specifies the marker that shall be used for the data points.

Parent Elements

Parent Elements
marker (§5.7.2.106)

Attributes	Description
val (Marker Style Value)	Specifies the marker style. The possible values for this attribute are defined by the ST_MarkerStyle simple type (§5.7.3.27).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MarkerStyle">
   <attribute name="val" type="ST_MarkerStyle" use="required"/>
</complexType>
```

5.7.2.207 thickness (Thickness)

This element specifies the thickness of the walls or floor as a percentage of the largest dimension of the plot volume.

Parent Elements
backWall (§5.7.2.11); floor (§5.7.2.69); sideWall (§5.7.2.192)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.208 tickLblPos (Tick Label Position)

This element specifies the position of the tick labels on the axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Tick Label Position Value)	Specifies the tick label position. The possible values for this attribute are defined by the ST_TickLblPos simple type (§5.7.3.48).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TickLblPos">
   <attribute name="val" type="ST_TickLblPos" default="nextTo"/>
</complexType>
```

5.7.2.209 tickLblSkip (Tick Label Skip)

This element specifies how many tick labels to skip between label that is drawn.

Parent Elements
catAx (§5.7.2.25); serAx (§5.7.2.176)

Attributes	Description
val (Tick Skip Value)	Specifies the contents of this attribute will contain an integer greater than or equal to one. The possible values for this attribute are defined by the ST_Skip simple type (§5.7.3.44).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Skip">
   <attribute name="val" type="ST_Skip" use="required"/>
</complexType>
```

5.7.2.210 tickMarkSkip (Tick Mark Skip)

This element specifies how many tick marks shall be skipped before the next one shall be drawn.

Parent Elements
catAx (§5.7.2.25); serAx (§5.7.2.176)

Attributes	Description
val (Tick Skip Value)	Specifies the contents of this attribute will contain an integer greater than or equal to one. The possible values for this attribute are defined by the ST_Skip simple type (§5.7.3.44).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Skip">
   <attribute name="val" type="ST_Skip" use="required"/>
</complexType>
```

5.7.2.211 title (Title)

This element specifies a title.

Parent Elements
catAx (§5.7.2.25); chart (§5.7.2.27); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
layout (Layout)	§5.7.2.88
overlay (Overlay)	§5.7.2.133
spPr (Shape Properties)	§5.7.2.198
tx (Chart Text)	§5.7.2.215
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Title">
   <sequence>
      <element name="tx" type="CT_Tx" minOccurs="0" maxOccurs="1"/>
      <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
      <element name="overlay" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.212 trendline (Trendlines)

This element specifies a trendline.

Parent Elements
ser (§5.7.2.175); ser (§5.7.2.172); ser (§5.7.2.169); ser (§5.7.2.168); ser (§5.7.2.174)

Child Elements	Subclause
backward (Backward)	§5.7.2.12
dispEq (Display Equation)	§5.7.2.43
dispRSqr (Display R Squared Value)	§5.7.2.44

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
forward (Forward)	§5.7.2.73
intercept (Intercept)	§5.7.2.85
name (Trendline Name)	§5.7.2.117
order (Polynomial Trendline Order)	§5.7.2.130
period (Period)	§5.7.2.136
spPr (Shape Properties)	§5.7.2.198
trendlineLbl (Trendline Label)	§5.7.2.213
trendlineType (Trendline Type)	§5.7.2.214

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Trendline">
   <sequence>
      <element name="name" type="xsd:string" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="trendlineType" type="CT_TrendlineType" minOccurs="1" maxOccurs="1"/>
      <element name="order" type="CT_Order" minOccurs="0" maxOccurs="1"/>
      <element name="period" type="CT_Period" minOccurs="0" maxOccurs="1"/>
      <element name="forward" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="backward" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="intercept" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="dispRSqr" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="dispEq" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="trendlineLbl" type="CT_TrendlineLbl" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.213 trendlineLbl (Trendline Label)

This element specifies the label for the trendline.

Parent Elements
trendline (§5.7.2.212)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
layout (Layout)	§5.7.2.88
numFmt (Number Format)	§5.7.2.122
spPr (Shape Properties)	§5.7.2.198
tx (Chart Text)	§5.7.2.215

Child Elements	Subclause
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TrendlineLbl">
   <sequence>
      <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
      <element name="tx" type="CT_Tx" minOccurs="0" maxOccurs="1"/>
      <element name="numFmt" type="CT_NumFmt" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.214 trendlineType (Trendline Type)

This element specifies the type of the trendline.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Trendline Type Value)	Specifies the trendline type. The possible values for this attribute are defined by the ST_TrendlineType simple type (§5.7.3.51).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TrendlineType">
   <attribute name="val" type="ST_TrendlineType" default="linear"/>
</complexType>
```

5.7.2.215 tx (Chart Text)

This element specifies text to use on a chart, including rich text formatting.

Parent Elements
dispUnitsLbl (§5.7.2.46); dLbl (§5.7.2.47); title (§5.7.2.211); trendlineLbl (§5.7.2.213)

Child Elements	Subclause
rich (Rich Text)	§5.7.2.157
strRef (String Reference)	§5.7.2.202

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Tx">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="strRef" type="CT_StrRef" minOccurs="1" maxOccurs="1"/>
         <element name="rich" type="a:CT_TextBody" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
</complexType>
```

5.7.2.216 tx (Series Text)

This element specifies text for a series name, without rich text formatting.

Parent Elements
ser (§5.7.2.168); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.171); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175)

Child Elements	Subclause
strRef (String Reference)	§5.7.2.202
v (Text Value)	§5.7.2.223

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SerTx">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="strRef" type="CT_StrRef" minOccurs="1" maxOccurs="1"/>
         <element name="v" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
</complexType>
```

5.7.2.217 txPr (Text Properties)

This element specifies text formatting. The lstStyle element is not supported.

Parent Elements
catAx (§5.7.2.25); chartSpace (§5.7.2.29); dateAx (§5.7.2.39); dispUnitsLbl (§5.7.2.46); dLbl (§5.7.2.47); dLbls (§5.7.2.49); dTable (§5.7.2.54); legend (§5.7.2.94); legendEntry (§5.7.2.95); pivotFmt (§5.7.2.143); serAx (§5.7.2.176); title (§5.7.2.211); trendlineLbl (§5.7.2.213); valAx (§5.7.2.227)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
   <sequence>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.7.2.218 upBars (Up Bars)

This element specifies the up bars on the chart.

Parent Elements
upDownBars (§5.7.2.219)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UpDownBar">
   <sequence>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.219 upDownBars (Up/Down Bars)

This element specifies the up and down bars.

Parent Elements
lineChart (§5.7.2.98); stockChart (§5.7.2.199)

Child Elements	Subclause
downBars (Down Bars)	§5.7.2.51
extLst (Chart Extensibility)	§5.7.2.64
gapWidth (Gap Width)	§5.7.2.75
upBars (Up Bars)	§5.7.2.218

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UpDownBars">
   <sequence>
      <element name="gapWidth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
      <element name="upBars" type="CT_UpDownBar" minOccurs="0" maxOccurs="1"/>
      <element name="downBars" type="CT_UpDownBar" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.220 userInterface (User Interface)

This element specifies that the protection applies to the user interface only, and not to changes made through the object model.

Parent Elements
protection (§5.7.2.150)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.221 userShapes (User Shapes)

This element shall specify the shapes drawn on top of the chart.

Child Elements	Subclause
absSizeAnchor (Absolute Anchor Shape Size)	§5.8.2.1
relSizeAnchor (Relative Anchor Shape Size)	§5.8.2.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Drawing">
   <sequence>
      <group ref="EG_Anchor" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.7.2.222 userShapes (Reference to Chart Drawing Part)

This element specifies a relationship to a separate part which contains a drawing to be drawn on top of the chart.

Parent Elements
chartSpace (§5.7.2.29)

Attributes	Description
id (Relationship Reference) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the relationship for this Chart, Chart Drawing, or VML Drawing part. The type of relationship needed is specified by the parent element. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelId">
   <attribute ref="r:id" use="required"/>
</complexType>
```

5.7.2.223 v (Text Value)

This element specifies a text value for a category axis label or a series name.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
pt (§5.7.2.152); tx (§5.7.2.216)

5.7.2.224 v (Numeric Value)

This element specifies a numeric value.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
pt (§5.7.2.151)

5.7.2.225 val (Values)

This element specifies the data values which shall be used to define the location of data markers on a chart.

Parent Elements
ser (§5.7.2.174); ser (§5.7.2.171); ser (§5.7.2.175); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.173)

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumDataSource">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
         <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
</complexType>
```

5.7.2.226 val (Error Bar Value)

This element specifies a value which is used with the Error Bar Type to determine the length of the error bars.

Parent Elements
errBars (§5.7.2.55)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.227 valAx (Value Axis)

This element specifies a value axis.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
axPos (Axis Position)	§5.7.2.10
crossAx (Crossing Axis ID)	§5.7.2.31
crossBetween (Cross Between)	§5.7.2.32
crosses (Crosses)	§5.7.2.33
crossesAt (Crossing Value)	§5.7.2.34
delete (Delete)	§5.7.2.40
dispUnits (Display Units)	§5.7.2.45
extLst (Chart Extensibility)	§5.7.2.64
majorGridlines (Major Gridlines)	§5.7.2.101
majorTickMark (Major Tick Mark)	§5.7.2.102
majorUnit (Major Unit)	§5.7.2.104
minorGridlines (Minor Gridlines)	§5.7.2.110
minorTickMark (Minor Tick Mark)	§5.7.2.111
minorUnit (Minor Unit)	§5.7.2.113
numFmt (Number Format)	§5.7.2.122
scaling (Scaling)	§5.7.2.161
spPr (Shape Properties)	§5.7.2.198
tickLblPos (Tick Label Position)	§5.7.2.208
title (Title)	§5.7.2.211
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ValAx">
   <sequence>
      <group ref="EG_AxShared" minOccurs="1" maxOccurs="1"/>
      <element name="crossBetween" type="CT_CrossBetween" minOccurs="0" maxOccurs="1"/>
      <element name="majorUnit" type="CT_AxisUnit" minOccurs="0" maxOccurs="1"/>
      <element name="minorUnit" type="CT_AxisUnit" minOccurs="0" maxOccurs="1"/>
      <element name="dispUnits" type="CT_DispUnits" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.228 varyColors (Vary Colors by Point)

This element specifies that each data marker in the series shall have a different color.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); bar3DChart (§5.7.2.15); barChart (§5.7.2.16); bubbleChart (§5.7.2.20); doughnutChart (§5.7.2.50); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); ofPieChart (§5.7.2.127); pie3DChart (§5.7.2.141); pieChart (§5.7.2.142); radarChart (§5.7.2.154); scatterChart (§5.7.2.162)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.229 view3D (View In 3D)

This element specifies the 3-D view of the chart.

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause
depthPercent (Depth Percent)	§5.7.2.41
extLst (Chart Extensibility)	§5.7.2.64
hPercent (Height Percent)	§5.7.2.83
perspective (Perspective)	§5.7.2.137
rAngAx (Right Angle Axes)	§5.7.2.156
rotX (X Rotation)	§5.7.2.158
rotY (Y Rotation)	§5.7.2.159

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_View3D">
   <sequence>
      <element name="rotX" type="CT_RotX" minOccurs="0" maxOccurs="1"/>
      <element name="hPercent" type="CT_HPercent" minOccurs="0" maxOccurs="1"/>
      <element name="rotY" type="CT_RotY" minOccurs="0" maxOccurs="1"/>
      <element name="depthPercent" type="CT_DepthPercent" minOccurs="0" maxOccurs="1"/>
      <element name="rAngAx" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="perspective" type="CT_Perspective" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.230 w (Width)

This element specifies the width (if Width Mode is Factor) or right (if Width Mode is Edge) of the chart element as a fraction of the width of the chart.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.231 wireframe (Wireframe)

This element specifies the surface chart is drawn as a wireframe.

Parent Elements
surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for

Attributes	Description
	this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.232 wMode (Width Mode)

This element specifies how to interpret the Width element for this manual layout.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width. The possible values for this attribute are defined by the ST_LayoutMode simple type (§5.7.3.20).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutMode">
   <attribute name="val" type="ST_LayoutMode" default="factor"/>
</complexType>
```

5.7.2.233 x (Left)

This element specifies the x location (left) of the chart element as a fraction of the width of the chart. If Left Mode is Factor, then the position is relative to the default position for the chart element.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.234 xMode (Left Mode)

This element specifies how to interpret the Left element for this manual layout.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width. The possible values for this attribute are defined by the ST_LayoutMode simple type (§5.7.3.20).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutMode">
   <attribute name="val" type="ST_LayoutMode" default="factor"/>
</complexType>
```

5.7.2.235 xVal (X Values)

This element specifies the x values which shall be used to define the location of data markers on a chart.

Parent Elements
ser (§5.7.2.168); ser (§5.7.2.172)

Child Elements	Subclause
multiLvlStrRef (Multi Level String Reference)	§5.7.2.116
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124
strLit (String Literal)	§5.7.2.201
strRef (String Reference)	§5.7.2.202

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AxDataSource">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="multiLvlStrRef" type="CT_MultiLvlStrRef" minOccurs="1" maxOccurs="1"/>
         <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
         <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
         <element name="strRef" type="CT_StrRef" minOccurs="1" maxOccurs="1"/>
         <element name="strLit" type="CT_StrData" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
</complexType>
```

5.7.2.236 y (Top)

This element specifies the top of the chart element as a fraction of the height of the chart. If Top Mode is Factor, then the position is relative to the default position for the chart element.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.237 yMode (Top Mode)

This element specifies how to interpret the Top element for this manual layout.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width. The possible values for this attribute are defined by the ST_LayoutMode simple type

Attributes	Description
	(§5.7.3.20).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutMode">
   <attribute name="val" type="ST_LayoutMode" default="factor"/>
</complexType>
```

5.7.2.238 yVal (Y Values)

This element specifies the y values which shall be used to define the location of data markers on a chart.

Parent Elements
ser (§5.7.2.168); ser (§5.7.2.172)

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumDataSource">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
         <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
</complexType>
```

5.7.3 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/drawingml/2006/chart namespace.

5.7.3.1 ST_AxisUnit (Axis Unit)

This simple type specifies that its contents will contain a positive floating point number.

This simple type's contents are a restriction of the XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than 0.

Referenced By
majorUnit@val (§5.7.2.104); minorUnit@val (§5.7.2.113)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AxisUnit">
   <restriction base="xsd:double">
      <minExclusive value="0"/>
   </restriction>
</simpleType>
```

5.7.3.2 ST_AxPos (Axis Position)

This simple type specifies the possible positions for an axis.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies that the axis shall be displayed at the bottom of the plot area.
l (Left)	Specifies that the axis shall be displayed at the left of the plot area.
r (Right)	Specifies that the axis shall be displayed at the right of the plot area.
t (Top)	Specifies that the axis shall be displayed at the top of the plot area.

Referenced By
axPos@val (§5.7.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AxPos">
   <restriction base="xsd:string">
      <enumeration value="b"/>
      <enumeration value="l"/>
      <enumeration value="r"/>
      <enumeration value="t"/>
   </restriction>
</simpleType>
```

5.7.3.3 ST_BarDir (Bar Direction)

This simple type specifies the possible directions for a bar chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
bar (Bar)	Specifies that the chart is a bar chart - the data markers are horizontal rectangles.
col (Column)	Specifies that the chart is a column chart - the data markers are vertical rectangles.

Referenced By
barDir@val (§5.7.2.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BarDir">
   <restriction base="xsd:string">
      <enumeration value="bar"/>
      <enumeration value="col"/>
   </restriction>
</simpleType>
```

5.7.3.4 ST_BarGrouping (Bar Grouping)

This simple type specifies the possible groupings for a bar chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clustered (Clustered)	Specifies that the chart series are drawn next to each other along the category axis.
percentStacked (100% Stacked)	Specifies that the chart series are drawn next to each other along the value axis and scaled to total 100%.
stacked (Stacked)	Specifies that the chart series are drawn next to each other on the value axis.
standard (Standard)	Specifies that the chart series are drawn next to each other on the depth axis.

Referenced By
grouping@val (§5.7.2.77)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BarGrouping">
   <restriction base="xsd:string">
      <enumeration value="percentStacked"/>
      <enumeration value="clustered"/>
      <enumeration value="standard"/>
      <enumeration value="stacked"/>
   </restriction>
</simpleType>
```

5.7.3.5 ST_BubbleScale (Bubble Scale)

This simple type specifies that its contents will contain an integer between 0 and 300.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 300.

Referenced By
bubbleScale@val (§5.7.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BubbleScale">
   <restriction base="xsd:unsignedInt">
      <minInclusive value="0"/>
      <maxInclusive value="300"/>
   </restriction>
</simpleType>
```

5.7.3.6 ST_BuiltInUnit (Built-In Unit)

This simple type specifies the built in display units for an axis.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
billions (Billions)	Specifies the values on the chart shall be divided by 1,000,000,000.
hundredMillions (Hundred Millions)	Specifies the values on the chart shall be divided by 100,000,000.
hundreds (Hundreds)	Specifies the values on the chart shall be divided by 100.
hundredThousands (Hundred Thousands)	Specifies the values on the chart shall be divided by

Enumeration Value	Description
	100,000.
millions (Millions)	Specifies the values on the chart shall be divided by 1,000,000.
tenMillions (Ten Millions)	Specifies the values on the chart shall be divided by 10,000,000.
tenThousands (Ten Thousands)	Specifies the values on the chart shall be divided by 10,000.
thousands (Thousands)	Specifies the values on the chart shall be divided by 1,000.
trillions (Trillions)	Specifies the values on the chart shall be divided by 1,000,000,000.

Referenced By
builtInUnit@val (§5.7.2.23)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BuiltInUnit">
   <restriction base="xsd:string">
      <enumeration value="hundreds"/>
      <enumeration value="thousands"/>
      <enumeration value="tenThousands"/>
      <enumeration value="hundredThousands"/>
      <enumeration value="millions"/>
      <enumeration value="tenMillions"/>
      <enumeration value="hundredMillions"/>
      <enumeration value="billions"/>
      <enumeration value="trillions"/>
   </restriction>
</simpleType>
```

5.7.3.7 ST_CrossBetween (Cross Between)

This simple type specifies the possible crossing states of an axis.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
between (Between)	Specifies the value axis shall cross the category axis between data markers.
midCat (Midpoint of Category)	Specifies the value axis shall cross the category axis at the midpoint of a category.

Referenced By
crossBetween@val (§5.7.2.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CrossBetween">
   <restriction base="xsd:string">
      <enumeration value="between"/>
      <enumeration value="midCat"/>
   </restriction>
</simpleType>
```

5.7.3.8 ST_Crosses (Crosses)

This simple type specifies the possible crossing points for an axis.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autoZero (Axis Crosses at Zero)	The category axis crosses at the zero point of the value axis (if possible), or the minimum value (if the minimum is greater than zero) or the maximum (if the maximum is less than zero).
max (Maximum)	The axis crosses at the maximum value
min (Minimum)	Axis crosses at the minimum value of the chart.

Referenced By
crosses@val (§5.7.2.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Crosses">
   <restriction base="xsd:string">
      <enumeration value="autoZero"/>
      <enumeration value="max"/>
      <enumeration value="min"/>
   </restriction>
</simpleType>
```

5.7.3.9 ST_DepthPercent (Depth Percent)

This simple type specifies that its contents will contain a whole number between 20 and 2000, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 20.
- This simple type has a maximum value of less than or equal to 2000.

Referenced By
depthPercent@val (§5.7.2.41)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DepthPercent">
   <restriction base="xsd:unsignedShort">
      <minInclusive value="20"/>
      <maxInclusive value="2000"/>
   </restriction>
</simpleType>
```

5.7.3.10 ST_DispBlanksAs (Display Blanks As)

This simple type specifies the possible ways to display blanks.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
gap (Gap)	Specifies that blank values shall be left as a gap.
span (Span)	Specifies that blank values shall be spanned with a line.
zero (Zero)	Specifies that blank values shall be treated as zero.

Referenced By
dispBlanksAs@val (§5.7.2.42)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DispBlanksAs">
   <restriction base="xsd:string">
      <enumeration value="span"/>
      <enumeration value="gap"/>
      <enumeration value="zero"/>
   </restriction>
</simpleType>
```

5.7.3.11 ST_DLblPos (Data Label Position)

This simple type specifies the possible positions for a data label.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies that data labels shall be displayed below the data marker.
bestFit (Best Fit)	Specifies that data labels shall be displayed in the best position.
ctr (Center)	Specifies that data labels shall be displayed centered on the data marker.
inBase (Inside Base)	Specifies that data labels shall be displayed inside the base of the data marker.
inEnd (Inside End)	Specifies that data labels shall be displayed inside the end of the data marker.
l (Left)	Specifies that data labels shall be displayed to the left of the data marker.
outEnd (Outside End)	Specifies that data labels shall be displayed outside the end of the data marker.
r (Right)	Specifies that data labels shall be displayed to the right of the data marker.
t (Top)	Specifies that data labels shall be displayed above the data marker.

Referenced By
dLblPos@val (§5.7.2.48)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DLblPos">
   <restriction base="xsd:string">
      <enumeration value="bestFit"/>
      <enumeration value="b"/>
      <enumeration value="ctr"/>
      <enumeration value="inBase"/>
      <enumeration value="inEnd"/>
      <enumeration value="l"/>
      <enumeration value="outEnd"/>
      <enumeration value="r"/>
      <enumeration value="t"/>
   </restriction>
</simpleType>
```

5.7.3.12 ST_ErrBarType (Error Bar Type)

This simple type specifies the possible ways to draw an error bar.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
both (Both)	Specifies that error bars shall be shown in the positive and negative directions.
minus (Minus)	Specifies that error bars shall be shown in the negative direction only.
plus (Plus)	Specifies that error bars shall be shown in the positive direction only.

Referenced By
errBarType@val (§5.7.2.56)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ErrBarType">
   <restriction base="xsd:string">
      <enumeration value="both"/>
      <enumeration value="minus"/>
      <enumeration value="plus"/>
   </restriction>
</simpleType>
```

5.7.3.13 ST_ErrDir (Error Bar Direction)

This simple type specifies the possible directions for error bars.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
x (X)	Specifies that error bars shall be shown in the x direction.
y (Y)	Specifies that error bars shall be shown in the y direction.

Referenced By
errDir@val (§5.7.2.57)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ErrDir">
   <restriction base="xsd:string">
      <enumeration value="x"/>
      <enumeration value="y"/>
   </restriction>
</simpleType>
```

5.7.3.14 ST_ErrValType (Error Value Type)

This simple type specifies the possible ways to determine the length of the error bars

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cust (Custom Error Bars)	Specifies that the length of the error bars shall be determined by the Plus and Minus elements.
fixedVal (Fixed Value)	Specifies that the length of the error bars shall be the fixed value determined by Error Bar Value.
percentage (Percentage)	Specifies that the length of the error bars shall be Error Bar Value percent of the data.
stdDev (Standard Deviation)	Specifies that the length of the error bars shall be Error Bar Value standard deviations of the data.
stdErr (Standard Error)	Specifies that the length of the error bars shall be Error Bar Value standard errors of the data.

Referenced By
errValType@val (§5.7.2.58)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ErrValType">
   <restriction base="xsd:string">
      <enumeration value="cust"/>
      <enumeration value="fixedVal"/>
      <enumeration value="percentage"/>
      <enumeration value="stdDev"/>
      <enumeration value="stdErr"/>
   </restriction>
</simpleType>
```

5.7.3.15 ST_FirstSliceAng (First Slice Angle)

This simple type specifies that its contents will contain an integer between 0 and 360.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 360.

Referenced By
firstSliceAng@val (§5.7.2.68)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FirstSliceAng">
   <restriction base="xsd:unsignedShort">
      <minInclusive value="0"/>
      <maxInclusive value="360"/>
   </restriction>
</simpleType>
```

5.7.3.16 ST_GapAmount (Gap Amount)

This simple type specifies that its contents will contain an integer between 0 and 500, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 500.

Referenced By
gapDepth@val (§5.7.2.74); gapWidth@val (§5.7.2.75)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_GapAmount">
   <restriction base="xsd:unsignedShort">
      <minInclusive value="0"/>
      <maxInclusive value="500"/>
   </restriction>
</simpleType>
```

5.7.3.17 ST_Grouping (Grouping)

This simple type specifies the possible groupings for a bar chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
percentStacked (100% Stacked)	Specifies that the chart series are drawn next to each other along the value axis and scaled to total 100%.
stacked (Stacked)	Specifies that the chart series are drawn next to each other on the value axis.
standard (Standard)	Specifies that the chart series are drawn on the value axis.

Referenced By
grouping@val (§5.7.2.76)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Grouping">
   <restriction base="xsd:string">
      <enumeration value="percentStacked"/>
      <enumeration value="standard"/>
      <enumeration value="stacked"/>
   </restriction>
</simpleType>
```

5.7.3.18 ST_HoleSize (Hole Size)

This simple type specifies that its contents will contain an integer between 10 and 90, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 10.
- This simple type has a maximum value of less than or equal to 90.

Referenced By
holeSize@val (§5.7.2.82)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HoleSize">
   <restriction base="xsd:unsignedByte">
      <minInclusive value="10"/>
      <maxInclusive value="90"/>
   </restriction>
</simpleType>
```

5.7.3.19 ST_HPercent (Height Percent)

This simple type specifies that its contents will contain an integer between 5 and 500, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 5.
- This simple type has a maximum value of less than or equal to 500.

Referenced By
hPercent@val (§5.7.2.83)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HPercent">
   <restriction base="xsd:unsignedShort">
      <minInclusive value="5"/>
      <maxInclusive value="500"/>
   </restriction>
</simpleType>
```

5.7.3.20 ST_LayoutMode (Layout Mode)

This simple type specifies the possible ways to store a chart element's position.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
edge (Edge)	Specifies that the Width or Height shall be interpreted as the Right or Bottom of the chart element.
factor (Factor)	Specifies that the Width or Height shall be interpreted as the Width or Height of the chart element.

Referenced By
hMode@val (§5.7.2.81); wMode@val (§5.7.2.232); xMode@val (§5.7.2.234); yMode@val (§5.7.2.237)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LayoutMode">
   <restriction base="xsd:string">
      <enumeration value="edge"/>
      <enumeration value="factor"/>
   </restriction>
</simpleType>
```

5.7.3.21 ST_LayoutTarget (Layout Target)

This simple type specifies the possible ways to layout the plot area.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
inner (Inner)	Specifies that the plot area size shall determine the size of the plot area, not including the tick marks and axis labels.
outer (Outer)	Specifies that the plot area size shall determine the size of the plot area, the tick marks, and the axis labels.

Referenced By
layoutTarget@val (§5.7.2.89)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LayoutTarget">
   <restriction base="xsd:string">
      <enumeration value="inner"/>
      <enumeration value="outer"/>
   </restriction>
</simpleType>
```

5.7.3.22 ST_LblAlgn (Label Alignment)

This simple type specifies the possible ways to align the tick labels.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies that the text shall be centered.
l (Left)	Specifies that the text shall be left justified.
r (Right)	Specifies that the text shall be right justified.

Referenced By
lblAlgn@val (§5.7.2.90)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LblAlgn">
   <restriction base="xsd:string">
      <enumeration value="ctr"/>
      <enumeration value="l"/>
      <enumeration value="r"/>
   </restriction>
</simpleType>
```

5.7.3.23 ST_LblOffset (Label Offset)

This simple type specifies that its contents will contain an integer between 0 and 1000, whose contents are a percentage of the default value.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 1000.

Referenced By
lblOffset@val (§5.7.2.91)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LblOffset">
   <restriction base="xsd:unsignedShort">
      <minInclusive value="0"/>
      <maxInclusive value="1000"/>
   </restriction>
</simpleType>
```

5.7.3.24 ST_LegendPos (Legend Position)

This simple type specifies the possible positions for a legend.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies that the legend shall be drawn at the bottom of the chart.
l (Left)	Specifies that the legend shall be drawn at the left of the chart.
r (Right)	Specifies that the legend shall be drawn at the right of the chart.
t (Top)	Specifies that the legend shall be drawn at the top of

Enumeration Value	Description
	the chart.
tr (Top Right)	Specifies that the legend shall be drawn at the top right of the chart.

Referenced By
legendPos@val (§5.7.2.96)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LegendPos">
   <restriction base="xsd:string">
      <enumeration value="b"/>
      <enumeration value="tr"/>
      <enumeration value="l"/>
      <enumeration value="r"/>
      <enumeration value="t"/>
   </restriction>
</simpleType>
```

5.7.3.25 ST_LogBase (Logarithmic Base)

This simple type specifies that its contents will contain an floating point number greater than or equal to two.

This simple type's contents are a restriction of the XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2.
- This simple type has a maximum value of less than or equal to 1000.

Referenced By
logBase@val (§5.7.2.99)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LogBase">
   <restriction base="xsd:double">
      <minInclusive value="2"/>
      <maxInclusive value="1000"/>
   </restriction>
</simpleType>
```

5.7.3.26 ST_MarkerSize (Marker Size)

This simple type specifies that its contents will contain an integer between 2 and 72, whose contents are a size in points.

This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2.
- This simple type has a maximum value of less than or equal to 72.

Referenced By
size@val (§5.7.2.193)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MarkerSize">
   <restriction base="xsd:unsignedByte">
      <minInclusive value="2"/>
      <maxInclusive value="72"/>
   </restriction>
</simpleType>
```

5.7.3.27 ST_MarkerStyle (Marker Style)

This picture shows each of the marker styles. Black is used as the line color, while red is used as the fill color. The height of the dash and the dot are 1/5th of the height of the marker. The width of the dot is 1/2 the width of the marker. The dash and dot have fills as well, but the markers need to be made quite large before these are visible.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
circle (Circle)	Specifies a circle shall be drawn at each data point.
dash (Dash)	Specifies a dash shall be drawn at each data point.
diamond (Diamond)	Specifies a diamond shall be drawn at each data point.
dot (Dot)	Specifies a dot shall be drawn at each data point.
none (None)	Specifies nothing shall be drawn at each data point.

Enumeration Value	Description
picture (Picture)	Specifies a picture shall be drawn at each data point.
plus (Plus)	Specifies a plus shall be drawn at each data point.
square (Square)	Specifies a square shall be drawn at each data point.
star (Star)	Specifies a star shall be drawn at each data point.
triangle (Triangle)	Specifies a triangle shall be drawn at each data point.
x (X)	Specifies an X shall be drawn at each data point.

Referenced By
symbol@val (§5.7.2.206)

```
<simpleType name="ST_MarkerStyle">
   <restriction base="xsd:string">
      <enumeration value="circle"/>
      <enumeration value="dash"/>
      <enumeration value="diamond"/>
      <enumeration value="dot"/>
      <enumeration value="none"/>
      <enumeration value="picture"/>
      <enumeration value="plus"/>
      <enumeration value="square"/>
      <enumeration value="star"/>
      <enumeration value="triangle"/>
      <enumeration value="x"/>
   </restriction>
</simpleType>
```

5.7.3.28 ST_OfPieType (Pie of Pie or Bar of Pie Type)

This simple type specifies the possible types of Pie or Pie or Bar of Pie charts.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bar (Bar)	Specifies that the chart is a bar of pie chart, not a pie of pie chart.
pie (Pie)	Specifies that the chart is pie of pie chart, not a bar of pie chart.

Referenced By

Referenced By
ofPieType@val (§5.7.2.128)

   <restriction base="xsd:string">
      <enumeration value="pie"/>
      <enumeration value="bar"/>
   </restriction>
</simpleType>
```

5.7.3.29 ST_Order (Order)

This simple type specifies that its contents will contain an integer between 2 and 6, whose contents are the order of the trendline polynomial.

This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2.
- This simple type has a maximum value of less than or equal to 6.

Referenced By
order@val (§5.7.2.130)

The following XML Schema fragment defines the contents of this simple type:

      <minInclusive value="2"/>
      <maxInclusive value="6"/>
   </restriction>
</simpleType>
```

5.7.3.30 ST_Orientation (Orientation)

This simple type specifies the possible ways to place a picture on a data point, series, wall, or floor.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
maxMin (Maximum to Minimum)	Specifies that the values on the axis shall be reversed so they go from maximum to minimum.
minMax (Minimum to Maximum)	Specifies that the axis values shall be in the usual order, minimum to maximum.

Referenced By
orientation@val (§5.7.2.131)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Orientation">
   <restriction base="xsd:string">
      <enumeration value="maxMin"/>
      <enumeration value="minMax"/>
   </restriction>
</simpleType>
```

5.7.3.31 ST_Overlap (Overlap)

This simple type specifies that its contents will contain an integer between -100 and 100, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema byte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -100.
- This simple type has a maximum value of less than or equal to 100.

Referenced By
overlap@val (§5.7.2.132)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Overlap">
   <restriction base="xsd:byte">
      <minInclusive value="-100"/>
      <maxInclusive value="100"/>
   </restriction>
</simpleType>
```

5.7.3.32 ST_PageSetupOrientation (Printed Page Orientation)

This simple type specifies the page orientation of the printed page(s) on which this chart shall appear.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
default (Default Page Orientation)	Specifies that the page orientation shall be the default orientation of the system.
landscape (Landscape Page)	Specifies that the printed page shall have landscape orientation.

Enumeration Value	Description
portrait (Portrait Page)	Specifies that the printed page shall have portrait orientation.

Referenced By
pageSetup@orientation (§5.7.2.135)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PageSetupOrientation">
   <restriction base="xsd:string">
      <enumeration value="default"/>
      <enumeration value="portrait"/>
      <enumeration value="landscape"/>
   </restriction>
</simpleType>
```

5.7.3.33 ST_Period (Period)

This simple type specifies that its contents will contain an integer between 2 and 255.

This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2.
- This simple type has a maximum value of less than or equal to 255.

Referenced By
period@val (§5.7.2.136)

```
<simpleType name="ST_Period">
   <restriction base="xsd:unsignedByte">
      <minInclusive value="2"/>
      <maxInclusive value="255"/>
   </restriction>
</simpleType>
```

5.7.3.34 ST_Perspective (Perspective)

This simple type specifies that its contents will contain an integer between 0 and 100, whose contents are a percentage.

This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 240.

Referenced By
perspective@val (§5.7.2.137)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Perspective">
   <restriction base="xsd:unsignedByte">
      <minInclusive value="0"/>
      <maxInclusive value="240"/>
   </restriction>
</simpleType>
```

5.7.3.35 ST_PictureFormat (Picture Format)

This simple type specifies the possible ways to place a picture on a data point, series, wall, or floor.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
stack (Stack)	Specifies that the picture shall be stacked.
stackScale (Stack and Scale)	Specifies that the picture shall be stacked after being scaled so that it's height is one Picture Stack Unit. Does not apply to walls or floor.
stretch (Stretch)	Specifies that the picture shall be anisotropic stretched to fill the data point, series, wall or floor.

Referenced By
pictureFormat@val (§5.7.2.138)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PictureFormat">
   <restriction base="xsd:string">
      <enumeration value="stretch"/>
      <enumeration value="stack"/>
      <enumeration value="stackScale"/>
   </restriction>
</simpleType>
```

5.7.3.36 ST_PictureStackUnit (Picture Stack Unit)

This simple type specifies that its contents will contain an floating point number greater than zero.

This simple type's contents are a restriction of the XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than 0.

Referenced By
pictureStackUnit@val (§5.7.2.140)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PictureStackUnit">
   <restriction base="xsd:double">
      <minExclusive value="0"/>
   </restriction>
</simpleType>
```

5.7.3.37 ST_RadarStyle (Radar Style)

This simple type specifies the possible styles of radar chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
filled (Filled)	Specifies that the radar chart shall be filled and have lines but no markers.
marker (Marker)	Specifies that the radar chart shall have lines and markers but no fill.
standard (Standard)	Specifies that the radar chart shall have lines but no markers and no fill.

Referenced By
radarStyle@val (§5.7.2.155)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RadarStyle">
   <restriction base="xsd:string">
      <enumeration value="standard"/>
      <enumeration value="marker"/>
      <enumeration value="filled"/>
   </restriction>
</simpleType>
```

5.7.3.38 ST_RotX (X Rotation)

This simple type specifies that its contents will contain an integer between -90 and 90, whose contents are an angle in degrees.

This simple type's contents are a restriction of the XML Schema byte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -90.
- This simple type has a maximum value of less than or equal to 90.

Referenced By
rotX@val (§5.7.2.158)

```
<simpleType name="ST_RotX">
   <restriction base="xsd:byte">
      <minInclusive value="-90"/>
      <maxInclusive value="90"/>
   </restriction>
</simpleType>
```

5.7.3.39 ST_RotY (Y Rotation)

This simple type specifies that its contents will contain an integer between 0 and 360, whose contents are an angle in degrees.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 360.

Referenced By
rotY@val (§5.7.2.159)

<simpleType name="ST_RotY">
   <restriction base="xsd:unsignedShort">
      <minInclusive value="0"/>
      <maxInclusive value="360"/>
   </restriction>
</simpleType>
```

5.7.3.40 ST_ScatterStyle (Scatter Style)

This simple type specifies the possible styles of scatter chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
line (Line)	Specifies the points on the scatter chart shall be connected with straight lines but markers shall not be drawn.
lineMarker (Line with Markers)	Specifies the points on the scatter chart shall be connected with straight lines and markers shall be drawn.
marker (Marker)	Specifies the points on the scatter chart shall not be connected with lines and markers shall be drawn.
none (None)	Specifies the points on the scatter chart shall not be connected with straight lines and markers shall not be drawn.
smooth (Smooth)	Specifies the the points on the scatter chart shall be connected with smoothed lines and markers shall not be drawn.
smoothMarker (Smooth with Markers)	Specifies the the points on the scatter chart shall be connected with smoothed lines and markers shall be drawn.

Referenced By
scatterStyle@val (§5.7.2.163)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ScatterStyle">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="line"/>
      <enumeration value="lineMarker"/>
      <enumeration value="marker"/>
      <enumeration value="smooth"/>
      <enumeration value="smoothMarker"/>
   </restriction>
</simpleType>
```

5.7.3.41 ST_SecondPieSize (Second Pie Size)

This simple type specifies that its contents will contain an integer between 5 and 200, whose contents consist of a percentage.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 5.
- This simple type has a maximum value of less than or equal to 200.

Referenced By
secondPieSize@val (§5.7.2.165)

```
<simpleType name="ST_SecondPieSize">
   <restriction base="xsd:unsignedShort">
      <minInclusive value="5"/>
      <maxInclusive value="200"/>
   </restriction>
</simpleType>
```

5.7.3.42 ST_Shape (Shape)

This simple type specifies the possible shapes for a 3-D data marker.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
box (Box)	Specifies the chart shall be drawn with a box shape.
cone (Cone)	Specifies the chart shall be drawn as a cone, with the base of the cone on the floor and the point of the cone at the top of the data marker.
coneToMax (Cone to Max)	Specifies the chart shall be drawn with truncated cones such that the point of the cone would be the maximum data value.
cylinder (Cylinder)	Specifies the chart shall be drawn as a cylinder.
pyramid (Pyramid)	Specifies the chart shall be drawn as a rectangular pyramid, with the base of the pyramid on the floor and the point of the pyramid at the top of the data marker.
pyramidToMax (Pyramid to Maximum)	Specifies the chart shall be drawn with truncated cones such that the point of the cone would be the maximum data value.

Referenced By
shape@val (§5.7.2.178)

      <enumeration value="coneToMax"/>
      <enumeration value="box"/>
      <enumeration value="cylinder"/>
      <enumeration value="pyramid"/>
      <enumeration value="pyramidToMax"/>
   </restriction>
</simpleType>
```

5.7.3.43 ST_SizeRepresents (Size Represents)

This simple type specifies the possible ways to represent data as bubble chart sizes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
area (Bubble Size Represents Area)	Specifies the area of the bubbles shall be proportional to the bubble size value.
w (Bubble Size Represents Width)	Specifies the radius of the bubbles shall be proportional to the bubble size value.

Referenced By
sizeRepresents@val (§5.7.2.194)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SizeRepresents">
   <restriction base="xsd:string">
      <enumeration value="area"/>
      <enumeration value="w"/>
   </restriction>
</simpleType>
```

5.7.3.44 ST_Skip (Skip)

This simple type specifies that its contents will contain an integer greater than or equal to one.

This simple type's contents are a restriction of the XML Schema unsignedShort datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.

Referenced By

Referenced By
tickLblSkip@val (§5.7.2.209); tickMarkSkip@val (§5.7.2.210)

   <restriction base="xsd:unsignedShort">
      <minInclusive value="1"/>
   </restriction>
</simpleType>
```

5.7.3.45 ST_SplitType (Split Type)

This simple type specifies the possible ways to split a pie of pie or bar of pie chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Default Split)	Specifies the data points shall be split using the default mechanism for this chart type.
cust (Custom Split)	Specifies the data points shall be split between the pie and the second chart according to the Custom Split values.
percent (Split by Percentage)	Specifies the data points shall be split between the pie and the second chart by putting the points with percentage less than Split Position percent in the second chart.
pos (Split by Position)	Specifies the data points shall be split between the pie and the second chart by putting the last Split Position of the data points in the second chart
val (Split by Value)	Specifies the data points shall be split between the pie and the second chart by putting the data points with value less than Split Position in the second chart

Referenced By
splitType@val (§5.7.2.197)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SplitType">
   <restriction base="xsd:string">
      <enumeration value="auto"/>
      <enumeration value="cust"/>
      <enumeration value="percent"/>
      <enumeration value="pos"/>
      <enumeration value="val"/>
   </restriction>
</simpleType>
```

5.7.3.46 ST_Style (Style)

This simple type specifies that its contents will contain an integer between 1 and 48. The value determines the default formatting for all chart elements through the tables described below.

The default font is the minor font as defined by the document's theme. The default font size for each element is the font size of the chart, except for the title which is always 120% the font size of the chart. If the chart does not have a font size set, then the default font size is 10. Axis titles and chart titles are bold by default, while all other chart elements are normal. The default font color is the same as the Axis & Major Gridlines Line Color.

The default line style, fill style, and effect style are determined by the tables below. Each of the default includes a themed line, fill, or effect (None, Subtle, Moderate, or Intense) and a color to be used when applying that line, fill, or effect. In some cases, both the themed formatting and the color vary per style, in other cases they do not. The default line width is determined by the theme, except for lines for data points it is multipled by the line width value given in the table.

Table 1: Chart element defaults

This table lists whether the default is constant or whether it depends on the ST_Style using one of the later tables.

	Line		Fill		Effect	
Chart Element	Themed Line	Color	Themed Fill	Color	Themed Effect	Color
Axis	Subtle	Table 2	No Fill		No Effect	
Axis Title	No Line		No Fill		No Effect	
Chart Area	Table 2		Subtle	Table 3	No Effect	
Chart Title	No Line		No Fill		No Effect	
Data Labels	No Line		No Fill		No Effect	
Data Table	Subtle	Table 2	No Fill		No Effect	
Down Bars	Table 4		Table 4		Table 4	dk1
Fills for Data Points (2-D)	Subtle	Table 5	Table 5		Table 5	dk1
Fills for Data Points (3-D)	Subtle	Table 5	Table 5		Table 5	dk1
Floor	Table 2		Table 3		No Effect	

	Line		Fill		Effect	
Legend	No Line		No Fill		No Effect	
Lines for Data Points	Subtle	Table 5	N/A		No Effect	
Major Gridlines	Subtle	Table 2	N/A		No Effect	
Markers for Data Points	Subtle	Table 5	Table 5		Table 5	dk1
Minor Gridlines	Subtle	Table 2	N/A		No Effect	
Other Lines	Subtle	Table 2	N/A		No Effect	
Plot Area (2-D charts)	No Line		Subtle	Table 3	No Effect	
Plot Area (3-D charts)	No Line		No Fill		No Effect	
Trendline Labels	No Line		No Fill		No Effect	
Up Bars	Table 4		Table 4		Table 4	dk1
Walls	No Line		Table 3		No Effect	

Other Lines includes Drop Lines, Error Bars, High Low Lines, Leader Lines, Series Lines, and Trendlines.

Fills for Data Points (2-D) includes 2-D bar, filled radar, stock, bubble, pie, doughnut and area charts.

Fills for Data Points (3-D) includes all 3-D charts.

Lines for Data Points includes lines on 2-D line, scatter, bubble, and radar charts.

Markers for Data Points includes markers on 2-D line, scatter, and radar charts.

Table 2: Default line formatting per chart style

This table lists line formatting for several chart elements by style.

Style	Axis & Major Gridlines	Minor Gridlines	Chart Area, Data Table, & Floor	Other Lines	Floor & Chart Area
	Color	Color	Color	Color	Themed Line
1-32	tx1	50% tint of tx1	75% tint of tx1	tx1	Subtle
33-34	dk1	50% tint of tx1	75% tint of dk1	dk1	Subtle
35-40	dk1	50% tint of tx1	75% tint of dk1	25% shade of dk1	Subtle
41-48	dk1	90% tint of tx1	lt1	lt1	No Line

Table 3: Default fill formatting per chart style

This table lists fill formatting for several chart elements by style.

Style	Chart Area	Floor, Walls & Plot Area (2-D)	Floor & Walls
	Color	Color	Themed Fill
1-32	bg1	bg1	No Fill
33-34	lt1	20% tint of dk1	Subtle
35-40	lt1	accent1-6	Subtle
41-48	dk1	95% tint of dk1	Subtle

Table 4: Up and down bars default formatting per chart style

This table lists line, fill, and effect formatting for up and down bars by style. The color listed as accent1-6 means that the first style uses accent1, the next uses accent2, up to the sixth uses accent6.

	Up Bars	Down Bars	Up & Down Bars			
			Themed			
Style	Fill Color	Fill Color	Fill	Effect	Line	Line Color
1	25% tint of dk1	85% tint of dk1	Subtle	None	Subtle	tx1
2	5% tint of dk1	95% tint of dk1	Subtle	None	Subtle	tx1
3-8	25% tint of accent1-6	25% shade of accent1-6	Subtle	None	Subtle	tx1
9	25% tint of dk1	85% tint of dk1	Subtle	Subtle	Subtle	tx1
10	5% tint of dk1	95% tint of dk1	Subtle	Subtle	Subtle	tx1
11-16	25% tint of accent1-6	25% shade of accent1-6	Subtle	Subtle	Subtle	tx1
17	25% tint of dk1	85% tint of dk1	Intense	Moderate	No ne	None
18	5% tint of dk1	95% tint of dk1	Intense	Moderate	None	None
19-24	25% tint of accent1-6	25% shade of accent1-6	Intense	Moderate	None	None
25	25% tint of dk1	85% tint of dk1	Intense	Intense	None	None

	Up Bars	Down Bars	Up & Down Bars			
26	5% tint of dk1	95% tint of dk1	Intense	Intense	None	None
27-32	25% tint of accent1-6	25% shade of accent1-6	Intense	Intense	None	None
33	lt1	85% tint of dk1	Subtle	None	Subtle	dk1
34	lt1	95% tint of dk1	Subtle	None	Subtle	dk1
35-40	lt1	25% shade of accent1-6	Subtle	None	Subtle	25% shade of accent1-6
41	25% tint of dk1	85% tint of dk1	Intense	Intense	None	None
42	lt1	dk1	Intense	Intense	None	None
43-48	25% tint of accent1-6	25% shade of accent1-6	Intense	Intense	None	None

Table 5: Default data point formatting per chart style

This table lists line, fill, and effect formatting for data points by style. Some of the formatting is a repeating pattern described in the next table (denoted by "Pattern"). Other use a fade pattern in which the first series is a certain% shade of the color listed and the last series is an certain% tint of the color listed. The intermediate colors are linearly interpolated by shade and tint to the listed color. The starting shade% and ending tint% are determined by the spreadsheet application, where shades are always darker than tints.

Note: A suggested way to implement this percentage is by using the formula: shade/tint percent = -70 + 140 * (SeriesFormattingIndex / (HighestFormattingIndexOfAllSeriesOnAllGraphs + 1)). In this case the series formatting index is the `idx` attribute value for the series. Negative outputs are shades, and positive outputs are tints.

Note: The arrows across the top of the table indicate which columns apply for that row: i.e., for Fills, Lines, or Markers. So, for example, only the last two columns for Lines for Data Points apply.

Fills for Data Points (2-D)	↓	↓		↓	↓		
Fills for Data Points (3-D)		↓	↓	↓	↓		
Lines for Data Points						↓	↓
Markers for Data Points	↓	↓					↓
Effect	Fill	Fill	Fill	Line	Line	Line	Line

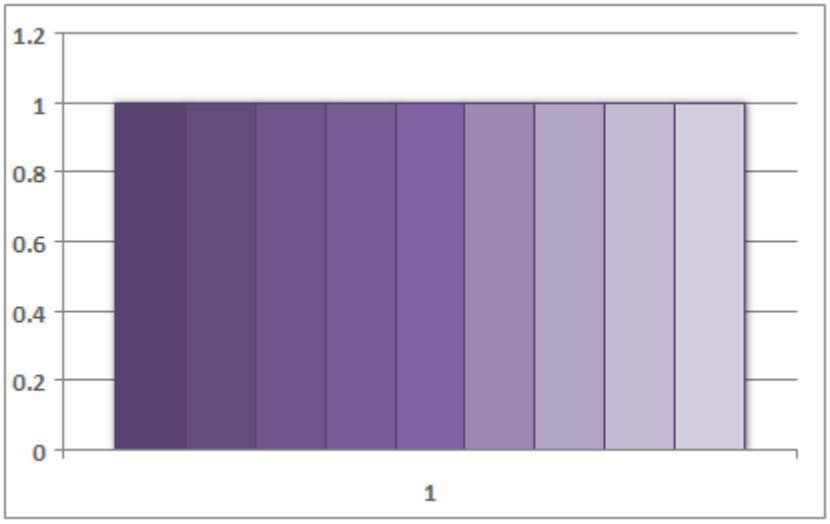
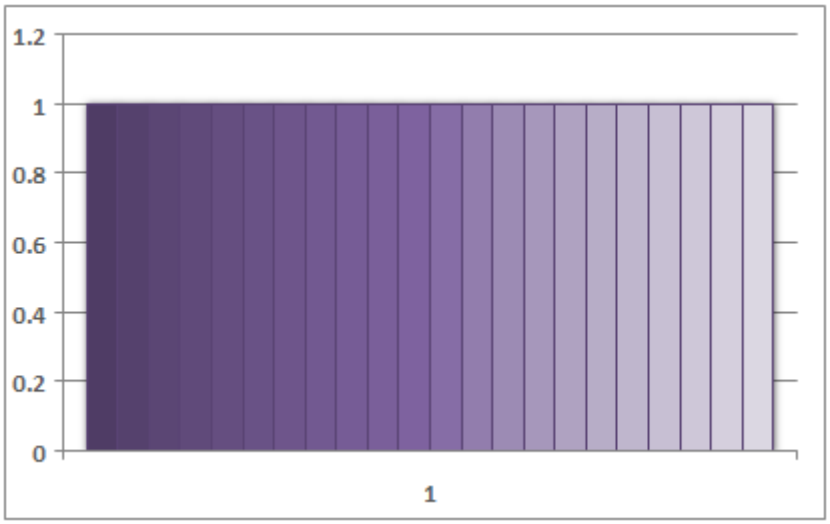
Table 6: Default data point formatting per data point

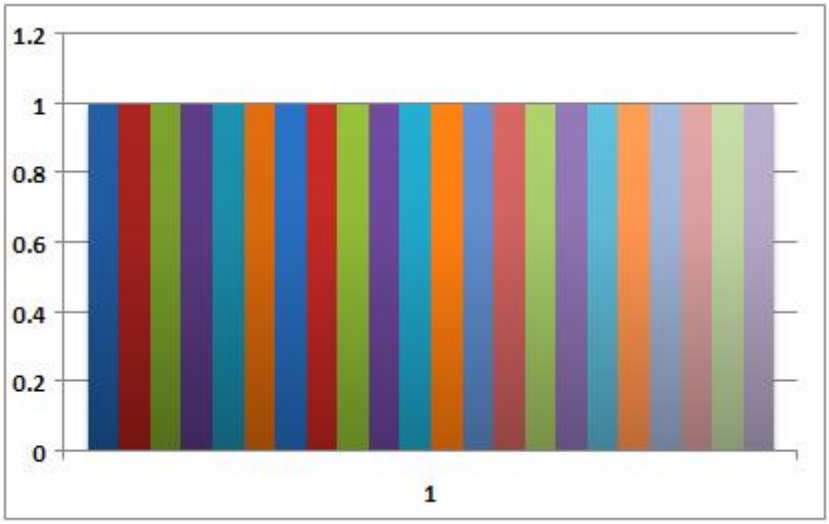
This table contains the formatting patterns used for each data point when there are is one series, or each series when there is just one series. The patterns in this table can repeat, see the pictures below the table for an illustration.

Pattern	Data Point 1	Data Point 2	Data Point 3	Data Point 4	Data Point 5	Data Point 6
1	88.5% tint of dk1	55% tint of dk1	78% tint of dk1	92.5% tint of dk1	70% tint of dk1	30% tint of dk1
2	accent1	accent2	accent3	accent4	Accent5	accent6
3	50% shade of accent1	50% shade of accent2	50% shade of accent3	50% shade of accent4	50% shade of accent5	50% shade of accent6
4	5% tint of dk1	55% tint of dk1	78% tint of dk1	15% tint of dk1	70% tint of dk1	30% tint of dk1





Above are two charts showing the same monochromatic pattern, just with a different number of series. Note that these charts just have tint and shade adjusted for each series beginning and ending at the same values.



Above is a pattern that has 6 distinct accent colors. The colors repeat every 6 data points, but the tint/shade is changed for each set.

This simple type's contents are a restriction of the XML Schema unsignedByte datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 48.

Referenced By
style@val (§5.7.2.203)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Style">
   <restriction base="xsd:unsignedByte">
      <minInclusive value="1"/>
      <maxInclusive value="48"/>
   </restriction>
</simpleType>
```

5.7.3.47 ST_TextLanguageID (Chart Language Tag)

This simple type specifies a language code value. *Language tags* are a standard mechanism defined by RFC 3066 to specify a language, and consist of a combination of:

- A two-letter ISO 639-1 language code
- A country code

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
lang@val (§5.7.2.87)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextLanguageID">
   <restriction base="xsd:string"/>
</simpleType>
```

5.7.3.48 ST_TickLblPos (Tick Label Position)

This simple type specifies the possible positions for tick labels.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
high (High)	Specifies the axis labels shall be at the high end of the perpendicular axis.
low (Low)	Specifies the axis labels shall be at the low end of the perpendicular axis.
nextTo (Next To)	Specifies the axis labels shall be next to the axis.
none (None)	Specifies the axis labels are not drawn.

Referenced By
tickLblPos@val (§5.7.2.208)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TickLblPos">
   <restriction base="xsd:string">
      <enumeration value="high"/>
      <enumeration value="low"/>
      <enumeration value="nextTo"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

5.7.3.49 ST_TickMark (Tick Mark)

This simple type specifies the possible positions for tick marks.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cross (Cross)	Specifies the tick marks shall cross the axis.
in (Inside)	Specifies the tick marks shall be inside the plot area.
none (None)	Specifies there shall be no tick marks.
out (Outside)	Specifies the tick marks shall be outside the plot area.

Referenced By
majorTickMark@val (§5.7.2.102); minorTickMark@val (§5.7.2.111)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TickMark">
   <restriction base="xsd:string">
      <enumeration value="cross"/>
      <enumeration value="in"/>
      <enumeration value="none"/>
      <enumeration value="out"/>
   </restriction>
</simpleType>
```

5.7.3.50 ST_TimeUnit (Time Unit)

This simple type specifies a unit of time.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
days (Days)	Specifies the chart data shall be shown in days.

Enumeration Value	Description
months (Months)	Specifies the chart data shall be shown in months.
years (Years)	Specifies the chart data shall be shown in years.

Referenced By
baseTimeUnit@val (§5.7.2.18); majorTimeUnit@val (§5.7.2.103); minorTimeUnit@val (§5.7.2.112)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TimeUnit">
   <restriction base="xsd:string">
      <enumeration value="days"/>
      <enumeration value="months"/>
      <enumeration value="years"/>
   </restriction>
</simpleType>
```

5.7.3.51 ST_TrendlineType (Trendline Type)

This simple type specifies all types of trendline which are available for series in a chart.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
exp (Exponential)	Specifies the trendline shall be an exponential curve in the form $y = ab^x$.
linear (Linear)	Specifies the trendline shall be a line in the form $y = mx + b$.
log (Logarithmic)	Specifies the trendline shall be a logarithmic curve in the form $y = a \log x + b$, where log is the natural logarithm.
movingAvg (Moving Average)	Specifies the trendline shall be a moving average of period Period.
poly (Polynomial)	Specifies the trendline shall be a polynomial curve of order Order in the form $y = ax^6 + bx^5 + cx^4 + dx^3 + ex^2 + fx + g$.
power (Power)	Specifies the trendline shall be a power curve in the form $y = ax^b$.

Referenced By
trendlineType@val (§5.7.2.214)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TrendlineType">
   <restriction base="xsd:string">
      <enumeration value="exp"/>
      <enumeration value="linear"/>
      <enumeration value="log"/>
      <enumeration value="movingAvg"/>
      <enumeration value="poly"/>
      <enumeration value="power"/>
   </restriction>
</simpleType>
```

5.7.3.52 ST_Xstring (String With Encoded Characters)

This simple type specifies that its contents will contain a string. Any character in the string may be encoded by use of a \ followed by the hexadecimal representation of the Unicode code points.

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
evenFooter (§5.7.2.59); evenHeader (§5.7.2.60); firstFooter (§5.7.2.66); firstHeader (§5.7.2.67); formatCode (§5.7.2.71); name (§5.7.2.118); numFmt@formatCode (§5.7.2.122); oddFooter (§5.7.2.125); oddHeader (§5.7.2.126); pt@formatCode (§5.7.2.151); v (§5.7.2.223); v (§5.7.2.224)

5.8 DrawingML - Chart Drawings

Within a chart, it is sometimes necessary to include DrawingML elements (shapes or pictures) which should be a child object within the parent chart. This relationship allows those elements to optionally be resized with the chart, automatically moved with the chart, etc.

The Chart Drawing namespace acts in this capacity, specifying all information necessary to anchor and display DrawingML objects within a chart.

5.8.1 Table of Contents

This subclause is informative.

End of informative text.

5.8.2 Elements

The following element define the contents of the ChartDrawing namespace:

5.8.2.1 absSizeAnchor (Absolute Anchor Shape Size)

This element specifies that the shape described here to reside within a chart should be sized based on relative anchor points. This is achieved via two elements. The from element specifies the top left corner of the shape bounding box in a RTL(right-to-left) implementation. The ext element then specifies the bottom right corner of the shape bounding box in a RTL(right-to-left) implementation and thus the size of the shape.

Parent Elements
userShapes (§5.7.2.221)

Child Elements	Subclause
cxnSp (Connection Shape)	§5.8.2.9
ext (Shape Extent)	§5.8.2.10
from (Starting Anchor Point)	§5.8.2.11
graphicFrame (Graphic Frame)	§5.8.2.12
grpSp (Group Shape)	§5.8.2.13

Child Elements	Subclause
pic (Picture)	§5.8.2.20
sp (Shape)	§5.8.2.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AbsSizeAnchor">
   <sequence>
      <element name="from" type="CT_Marker"/>
      <element name="ext" type="a:CT_PositiveSize2D"/>
      <group ref="EG_ObjectChoices"/>
   </sequence>
</complexType>
```

5.8.2.2 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example*: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<p:pic>
  ..
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  ..
</p:pic>
```

The above picture object is shown as an example of this fill type. End example]

[Example: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<p:pic>
  ..
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  <p:spPr>
    <a:gradFill>
      <a:gsLst>
        <a:gs pos="0">
          <a:schemeClr val="tx2">
            <a:shade val="50000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="39999">
          <a:schemeClr val="tx2">
            <a:tint val="20000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="70000">
          <a:srgbClr val="C4D6EB"/>
        </a:gs>
        <a:gs pos="100000">
          <a:schemeClr val="bg1"/>
        </a:gs>
      </a:gsLst>
    </a:gradFill>
  </p:spPr>
  ..
</p:pic>
```

The above picture object is shown as an example of this double fill type. *End example*]

Parent Elements
pic (§5.8.2.20)

Child Elements	Subclause
blip (Blip)	§5.1.10.13
srcRect (Source Rectangle)	§5.1.10.55
stretch (Stretch)	§5.1.10.56
tile (Tile)	§5.1.10.58

Attributes	Description
dpi (DPI Setting) Namespace: .../drawingml/2006/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [*Note*: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. *end note*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: .../drawingml/2006/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlipFillProperties">
   <sequence>
      <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
      <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
   <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
</complexType>
```

5.8.2.3 cNvCxnSpPr (Non-Visual Connection Shape Drawing Properties)

This element specifies the non-visual drawing properties for a connector shape. These non-visual properties are properties that the generating application would utilize when rendering the parent chart.

Parent Elements
nvCxnSpPr (§5.8.2.15)

Child Elements	Subclause
cxnSpLocks (Connection Shape Locks)	§5.1.2.1.11
endCxn (Connection End)	§5.1.2.1.13
extLst (Extension List)	§5.1.2.1.15
stCxn (Connection Start)	§5.1.2.1.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualConnectorProperties">
   <sequence>
      <element name="cxnSpLocks" type="CT_ConnectorLocking" minOccurs="0" maxOccurs="1"/>
      <element name="stCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
      <element name="endCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.8.2.4 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the chart.

Parent Elements
nvGraphicFramePr (§5.8.2.16)

Child Elements	Subclause

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGraphicFrameProperties">
   <sequence>
      <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
        maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.8.2.5 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the chart.

Parent Elements
nvGrpSpPr (§5.8.2.17)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
grpSpLocks (Group Shape Locks)	§5.1.2.1.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGroupDrawingShapeProps">
   <sequence>
      <element name="grpSpLocks" type="CT_GroupLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.8.2.6 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  ..
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
```

```
      </p:cNvPicPr>
      <p:nvPr/>
    </p:nvPicPr>
    ..
  </p:pic>
```

End example]

Parent Elements
nvPicPr (§5.8.2.18)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
picLocks (Picture Locks)	§5.1.2.1.31

Attributes	Description
preferRelativeResize (Relative Resize Preferred) Namespace: .../drawingml/2006/main	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be relative to the original picture size as opposed to the current picture size. [*Example*: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked. If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualPictureProperties">
   <sequence>
      <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.8.2.7 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following ChartDrawingML.

```
<cdr:pic>
  ..
  <cdr:nvPicPr>
    <cdr:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  </cdr:nvPicPr>
  ..
</cdr:pic>
```

End example]

Parent Elements
nvCxnSpPr (§5.8.2.15); nvGraphicFramePr (§5.8.2.16); nvGrpSpPr (§5.8.2.17); nvPicPr (§5.8.2.18); nvSpPr (§5.8.2.19)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

Attributes	Description
descr (Alternative Text for Object) Namespace: .../drawingml/2006/main	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which may be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hidden (Hidden) Namespace: .../drawingml/2006/main	Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [*Note*: An application may have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).

Attributes	Description
	[*Example*: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Unique Identifier) Namespace: …/drawingml/2006/main	Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant. [*Example*: Consider a DrawingML object defined as follows: `<… id="10" … >` The id attribute has a value of `10`, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
name (Name) Namespace: …/drawingml/2006/main	Specifies the name of the object. [*Note*: Typically, this will be used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: `< … name="foo.jpg" >` The name attribute has a value of `foo.jpg`, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingProps">
   <sequence>
      <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_DrawingElementId" use="required"/>
   <attribute name="name" type="xsd:string" use="required"/>
   <attribute name="descr" type="xsd:string" use="optional" default=""/>
   <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.8.2.8 cNvSpPr (Non-Visual Shape Drawing Properties)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with.

[Example: Consider the shape that has a shape lock applied to it.

```
<cdr:sp>
  <cdr:nvSpPr>
    <cdr:cNvPr id="2" name="Rectangle 1"/>
    <cdr:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </cdr:cNvSpPr>
   </cdr:nvSpPr>
   ..
</cdr:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. End example]

Parent Elements
nvSpPr (§5.8.2.19)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
spLocks (Shape Locks)	§5.1.2.1.34

Attributes	Description
txBox (Text Box) Namespace: .../drawingml/200	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.

Attributes	Description
6/main	[*Note*: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingShapeProps">
   <sequence>
      <element name="spLocks" type="CT_ShapeLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="txBox" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.8.2.9 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector will take. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[Example: Consider the following connector shape that connects two regular shapes.

```
<cp:grpSp>
  ..
  <cp:sp>
    <cp:nvSpPr>
      <cp:cNvPr id="1" name="Rectangle 1"/>
      <cp:cNvSpPr/>
      <cp:nvPr/>
    </cp:nvSpPr>
    ..
  </cp:sp>
  <cp:sp>
    <cp:nvSpPr>
      <cp:cNvPr id="2" name="Rectangle 2"/>
      <cp:cNvSpPr/>
      <cp:nvPr/>
    </cp:nvSpPr>
```

```
    ..
  </cp:sp>
  <cp:cxnSp>
    <cp:nvCxnSpPr>
      <cp:cNvPr id="3" name="Elbow Connector 3"/>
      <cp:cNvCxnSpPr>
        <a:stCxn id="1" idx="3"/>
        <a:endCxn id="2" idx="1"/>
      </cp:cNvCxnSpPr>
      <cp:nvPr/>
    </cp:nvCxnSpPr>
    …
  </cp:cxnSp>
</cp:grpSp>
```

End example]

Parent Elements
absSizeAnchor (§5.8.2.1); grpSp (§5.8.2.13); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
nvCxnSpPr (Connector Non Visual Properties)	§5.8.2.15
spPr (Shape Properties)	§5.8.2.23
style (Shape Style)	§5.8.2.24

Attributes	Description

fPublished (Publish to Server)	Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.
	
	[*Example*: Consider the following shape that will not be published with the worksheet when it is published back on the spreadsheet server.
	`<cdr:relSizeAnchor>`
	`..`
	`<cdr:sp fPublished="0">`
	`..`
	`</cdr:sp>`
	`..`
	`</cdr:relSizeAnchor>`
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

macro (Reference	This element specifies the custom function associated with the chart. [*Example*: A macro

Attributes	Description
to Custom Function)	script, add-in function, and so on. *end example*] The format of this string shall be application-defined, and should be ignored if not understood. [*Example*: `<cdr:... macro="DoWork()" >` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connector">
   <sequence>
      <element name="nvCxnSpPr" type="CT_ConnectorNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="macro" type="xsd:string" use="optional"/>
   <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.8.2.10 ext (Shape Extent)

This element describes the length and width properties for how far a drawing element should extend for.

Parent Elements
absSizeAnchor (§5.8.2.1)

Attributes	Description
cx (Extent Length) Namespace: .../drawingml/2006/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
cy (Extent Width)	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size

Attributes	Description
Namespace: .../drawingml/2006/main	of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveSize2D">
   <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
   <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

5.8.2.11 from (Starting Anchor Point)

This element specifies the first anchor point for the drawing element. This will be used to anchor the top and left sides of the shape within the chart. That is when the corresponding chart is adjusted, the shape will also be adjusted.

[Example: Consider the following Chart Drawing content:

```
<cdr:relSizeAnchor>
  <cdr:from>
    <cdr:x>0.04583</cdr:x>
    <cdr:y>0.53125</cdr:y>
  </cdr:from>
  <cdr:to>
    <cdr:x>0.24583</cdr:x>
    <cdr:y>0.86458</cdr:y>
  </cdr:to>
  <cdr:sp macro="" textlink="">
  ...
  </cdr:sp>
</cdr:relSizeAnchor>
```

The above example shows the first anchor point being specified via the from element. End example]

Parent Elements
absSizeAnchor (§5.8.2.1); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
x (Relative X Coordinate)	§5.8.2.27
y (Relative Y Coordinate)	§5.8.2.29

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
   <sequence>
      <element name="x" type="ST_MarkerCoordinate" minOccurs="1" maxOccurs="1"/>
      <element name="y" type="ST_MarkerCoordinate" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.8.2.12 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Parent Elements
absSizeAnchor (§5.8.2.1); grpSp (§5.8.2.13); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
graphic (Graphic Object)	§5.1.2.1.16
nvGraphicFramePr (Non-Visual Graphic Frame Properties)	§5.8.2.16
xfrm (Graphic Frame Transform)	§5.8.2.28

Attributes	Description

fPublished (Publish To Server)	Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server.
	
	[*Example*: Consider the following shape that will not be published with the worksheet when it is published back on the spreadsheet server.
	`<cdr:relSizeAnchor>`
	`..`
	`<cdr:sp fPublished="0">`
	`..`
	`</cdr:sp>`
	`..`
	`</cdr:relSizeAnchor>`
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

macro (Reference to Custom Function)	This element specifies the custom function associated with the chart. [*Example*: A macro script, add-in function, and so on. *end example*]

Attributes	Description
	The format of this string shall be application-defined, and should be ignored if not understood. [*Example*: `<cdr:... macro="DoWork()" >` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicFrame">
   <sequence>
      <element name="nvGraphicFramePr" type="CT_GraphicFrameNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="xfrm" type="a:CT_Transform2D" minOccurs="1" maxOccurs="1"/>
      <element ref="a:graphic" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="macro" type="xsd:string" use="optional"/>
   <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.8.2.13 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[Example: Consider the following group shape.

```
<cdr:grpSp>
  <cdr:nvGrpSpPr>
    <cdr:cNvPr id="10" name="Group 9"/>
    <cdr:cNvGrpSpPr/>
    <cdr:nvPr/>
  </cdr:nvGrpSpPr>
  <cdr:grpSpPr>
    <a:xfrm>
      <a:off x="838200" y="990600"/>
      <a:ext cx="2426208" cy="978408"/>
      <a:chOff x="838200" y="990600"/>
      <a:chExt cx="2426208" cy="978408"/>
   </a:xfrm>
```

```
    </cdr:grpSpPr>
    <cdr:sp>
    ..
    </cdr:sp>
    <cdr:sp>
    ..
    </cdr:sp>
    <cdr:sp>
    ..
    </cdr:sp>
  </cdr:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. end example]

Parent Elements
absSizeAnchor (§5.8.2.1); grpSp (§5.8.2.13); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
cxnSp (Connection Shape)	§5.8.2.9
graphicFrame (Graphic Frame)	§5.8.2.12
grpSp (Group Shape)	§5.8.2.13
grpSpPr (Group Shape Properties)	§5.8.2.14
nvGrpSpPr (Non-Visual Group Shape Properties)	§5.8.2.17
pic (Picture)	§5.8.2.20
sp (Shape)	§5.8.2.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShape">
   <sequence>
      <element name="nvGrpSpPr" type="CT_GroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="grpSpPr" type="a:CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
      <choice minOccurs="0" maxOccurs="unbounded">
         <element name="sp" type="CT_Shape"/>
         <element name="grpSp" type="CT_GroupShape"/>
         <element name="graphicFrame" type="CT_GraphicFrame"/>
         <element name="cxnSp" type="CT_Connector"/>
         <element name="pic" type="CT_Picture"/>
      </choice>
   </sequence>
</complexType>
```

5.8.2.14 grpSpPr (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Parent Elements
grpSp (§5.8.2.13)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26

scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
xfrm (2D Transform for Grouped Objects)	§5.1.9.5

Attributes	Description
bwMode (Black and White Mode) Namespace: .../drawingml/2006/main	Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes will use when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_GroupTransform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

5.8.2.15 nvCxnSpPr (Connector Non Visual Properties)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

Parent Elements
cxnSp (§5.8.2.9)

Child Elements	Subclause
cNvCxnSpPr (Non-Visual Connection Shape Drawing Properties)	§5.8.2.3
cNvPr (Non-Visual Drawing Properties)	§5.8.2.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConnectorNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvCxnSpPr" type="a:CT_NonVisualConnectorProperties" minOccurs="1"
        maxOccurs="1"/>
   </sequence>
</complexType>
```

5.8.2.16 nvGraphicFramePr (Non-Visual Graphic Frame Properties)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

Parent Elements
graphicFrame (§5.8.2.12)

Child Elements	Subclause
cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)	§5.8.2.4
cNvPr (Non-Visual Drawing Properties)	§5.8.2.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicFrameNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGraphicFramePr" type="a:CT_NonVisualGraphicFrameProperties" minOccurs="1"
        maxOccurs="1"/>
   </sequence>
</complexType>
```

5.8.2.17 nvGrpSpPr (Non-Visual Group Shape Properties)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

Parent Elements
grpSp (§5.8.2.13)

Child Elements	Subclause
cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)	§5.8.2.5
cNvPr (Non-Visual Drawing Properties)	§5.8.2.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGrpSpPr" type="a:CT_NonVisualGroupDrawingShapeProps" minOccurs="1"
        maxOccurs="1"/>
   </sequence>
</complexType>
```

5.8.2.18 nvPicPr (Non-Visual Picture Properties)

This element specifies the non visual properties for a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  ..
  <p:nvPicPr>
```

```
      ..
    </p:nvPicPr>
    ..
  </p:pic>
```

End example]

Parent Elements
pic (§5.8.2.20)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§5.8.2.6
cNvPr (Non-Visual Drawing Properties)	§5.8.2.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>

   <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.8.2.21 relSizeAnchor (Relative Anchor Shape Size)

This element specifies that the shape described here to reside within a chart should be sized based on relative anchor points. This is achieved via two elements. The from element specifies the top left corner of the shape bounding box in a RTL(right-to-left) implementation. The to element then specifies the bottom right corner of the shape bounding box in a RTL(right-to-left) implementation and thus the size of the shape.

Parent Elements
userShapes (§5.7.2.221)

Child Elements	Subclause

Child Elements	Subclause
cxnSp (Connection Shape)	§5.8.2.9
from (Starting Anchor Point)	§5.8.2.11

pic (Picture)	§5.8.2.20
sp (Shape)	§5.8.2.22
to (Ending Anchor Point)	§5.8.2.25

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelSizeAnchor">
   <sequence>
      <element name="from" type="CT_Marker"/>
      <element name="to" type="CT_Marker"/>
      <group ref="EG_ObjectChoices"/>
   </sequence>
</complexType>
```

5.8.2.22 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to geometry, each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

Parent Elements
absSizeAnchor (§5.8.2.1); grpSp (§5.8.2.13); relSizeAnchor (§5.8.2.21)

Child Elements	Subclause
nvSpPr (Non-Visual Shape Properties)	§5.8.2.19
spPr (Shape Properties)	§5.8.2.23
style (Shape Style)	§5.8.2.24
txBody (Shape Text Body)	§5.8.2.26

Attributes	Description
fLocksText (Lock Text)	Specifies whether to allow for the editing of text within this shape when the worksheet on which the shape resides has been protected as defined by SpreadsheetML. This allows for the specifying of locked or "protected" text on a per-shape basis within a spreadsheet document. If this attribute is not specified then a value of 0, or false will be assumed. [*Example*: Consider the following shape that does not have locked text on.

Attributes	Description
	<cdr:relSizeAnchor> .. <cdr:sp fLocksText="0"> .. </cdr:sp> .. </cdr:relSizeAnchor> *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
fPublished (Publish to Server)	Specifies whether the shape shall be published with the worksheet when sent to the spreadsheet server. This is for use when interfacing with a document server. [*Example*: Consider the following shape that will not be published with the worksheet when it is published back on the spreadsheet server. <cdr:relSizeAnchor> .. <cdr:sp fPublished="0"> .. </cdr:sp> .. </cdr:relSizeAnchor> *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
macro (Reference to Custom Function)	This element specifies the custom function associated with the chart. [*Example*: A macro script, add-in function, and so on. *end example*] The format of this string shall be application-defined, and should be ignored if not understood. [*Example*: <cdr:... macro="DoWork()" > *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
textlink (Text Link)	Specifies whether the text contained within this shape is linked to a cell within the spreadsheet. That is the text within the shape will have the value defined in the referenced spreadsheet cell. [*Example*: Consider the following shape with text linked to cell A1. <cdr:relSizeAnchor> .. <cdr:sp macro="" textlink="A1">

Attributes	Description
	.. </cdr:sp> .. </cdr:relSizeAnchor> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape">
   <sequence>
      <element name="nvSpPr" type="CT_ShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="txBody" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="macro" type="xsd:string" use="optional"/>
   <attribute name="textlink" type="xsd:string" use="optional"/>
   <attribute name="fLocksText" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.8.2.23 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a special shape such as a connector shape or picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe additional object-specific properties within a document. This allows for these shapes to have both the properties of a shape as well as specific properties that are unique to only them.

Parent Elements
cxnSp (§5.8.2.9); pic (§5.8.2.20); sp (§5.8.2.22)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44

Child Elements	Subclause
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

Attributes	Description
bwMode (Black and White Mode) Namespace: .../drawingml/2006/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

5.8.2.24 style (Shape Style)

The element specifies the style that will be applied to a shape and the corresponding references for each of the style components such as lines and fills.

Parent Elements
cxnSp (§5.8.2.9); pic (§5.8.2.20); sp (§5.8.2.22)

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeStyle">
   <sequence>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.8.2.25 to (Ending Anchor Point)

This element specifies the second anchor point for the drawing element. This will be used to anchor the bottom and right sides of the shape within the spreadsheet. That is when the corresponding chart is adjusted, the shape will also be adjusted.

[Example: Consider the following ChartDrawingML

```
<cdr:relSizeAnchor>
  <cdr:from>
    <cdr:x>0.04583</cdr:x>
    <cdr:y>0.53125</cdr:y>
  </cdr:from>
  <cdr:to>
    <cdr:x>0.24583</cdr:x>
    <cdr:y>0.86458</cdr:y>
  </cdr:to>
  <cdr:sp macro="" textlink="">
  ...
  </cdr:sp>
</cdr:relSizeAnchor>
```

The above example shows the second anchor point being specified via the to element. End example]

Parent Elements
relSizeAnchor (§5.8.2.21)

Child Elements	Subclause

Child Elements	Subclause
x (Relative X Coordinate)	§5.8.2.27
y (Relative Y Coordinate)	§5.8.2.29

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
   <sequence>
      <element name="x" type="ST_MarkerCoordinate" minOccurs="1" maxOccurs="1"/>
      <element name="y" type="ST_MarkerCoordinate" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.8.2.26 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

Parent Elements
sp (§5.8.2.22)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
   <sequence>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.8.2.27 x (Relative X Coordinate)

This element specifies the relative x coordinate that is used to define the percentage-based horizontal position for a shape within a chart drawing object. The coordinate boundaries are specified within the corresponding simple type listed below.

The possible values for this element are defined by the ST_MarkerCoordinate simple type (§5.8.3.1).

Parent Elements
from (§5.8.2.11); to (§5.8.2.25)

5.8.2.28 xfrm (Graphic Frame Transform)

This element specifies a 2-D transform to be applied to a Graphic Frame.

Parent Elements
graphicFrame (§5.8.2.12)

Child Elements	Subclause
ext (Extents)	§5.1.9.3
off (Offset)	§5.1.9.4

Attributes	Description
flipH (Horizontal Flip) Namespace: .../drawingml/2006/main	Specifies a horizontal flip. When true, this attribute defines that the shape will be flipped horizontally about the center of its bounding box. [*Example*: The following illustrates the effect of a horizontal flip.  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
flipV (Vertical Flip) Namespace: .../drawingml/2006/main	Specifies a vertical flip. When true, this attribute defines that the group will be flipped vertically about the center of its bounding box. [*Example*: The following illustrates the effect of a vertical flip.  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
rot (Rotation) Namespace: .../drawingml/2006/main	Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Transform2D">
   <sequence>
      <element name="off" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
      <element name="ext" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rot" type="ST_Angle" use="optional" default="0"/>
   <attribute name="flipH" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="flipV" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.8.2.29 y (Relative Y Coordinate)

This element specifies the relative y coordinate that is used to define the percentage-based vertical position for a shape within a chart drawing object. The coordinate boundaries are specified within the corresponding simple type listed below.

The possible values for this element are defined by the ST_MarkerCoordinate simple type (§5.8.3.1).

Parent Elements
from (§5.8.2.11); to (§5.8.2.25)

5.8.3 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/drawingml/2006/chartDrawing namespace.

5.8.3.1 ST_MarkerCoordinate (Chart Marker Coordinate Value)

This simple type specifies the chart marker coordinate value. It is to be represented as a fractional position between 0.0 and 1.0 of the chart width or height with 0.0 being the left or top edge.

This simple type's contents are a restriction of the XML Schema double datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.0.
- This simple type has a maximum value of less than or equal to 1.0.

Referenced By
x (§5.8.2.27); y (§5.8.2.29)

5.9 DrawingML - Diagrams

A DrawingML diagram allows the definition of diagrams using DrawingML objects and constructs. This namespace defines the contents of a DrawingML diagram.

5.9.1 Table of Contents

This subclause is informative.

End of informative text.

5.9.2 Diagram Definition

This section specifies the elements which define the layout and hierarchy of a diagram based on its constituent nodes and connections.

5.9.2.1 adj (Shape Adjust)

Shape adjust value. These can be used to modify the adjust handles supported on various auto shapes. It is only possible to set the initial value, not to modify it using constraints and rules.

[*Example*: Consider the following example of the adj element in a DrawingML diagram:

```
<adjLst>
    <adj idx="2" val=".35" />
</adjLst>
```

In this example we have a single adjust handle being modified by setting its value to `0.35`. *end example*]

Parent Elements
adjLst (§5.9.2.2)

Attributes	Description
idx (Adjust Handle Index)	Adjust value index. Different shapes support different adjust handles. The possible values for this attribute are defined by the ST_Index1 simple type (§5.9.7.38).
val (Value)	An absolute value. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Adj">
   <attribute name="idx" type="ST_Index1" use="required"/>
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.9.2.2 adjLst (Shape Adjust List)

This element is simply a list of shape adjusts.

[*Example*: Consider the following example of the adjLst element in a DrawingML diagram:

```
<adjLst>
   <adj idx="1" val="1.35" />
    <adj idx="2" val=".35" />
</adjLst>
```

In this example we have a two adjust handle being modified for the containing shape. *end example*]

Parent Elements
shape (§5.9.2.27)

Child Elements	Subclause
adj (Shape Adjust)	§5.9.2.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AdjLst">
   <sequence>
      <element name="adj" type="CT_Adj" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.2.3 alg (Algorithm)

The algorithm used by the containing layout node. The algorithm defines the behavior of the layout node along with the behavior and layout of the nested layout nodes.

[*Example*: Consider the following example of alg being used in a DrawingML diagram:

```
<layoutNode name="arrow">
    <varLst/>
    <alg type="tx" />
    <shape type="upArrow">
          <adjLst>
                <adj idx="2" val=".35" />
          </adjLst>
    </shape>
    <presOf axis="desOrSelf" ptType="node" />
    <ruleLst/>
</layoutNode>
```

In this example, the tx algorithm is being used to layout text within the containing layout node. *end example*]

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13
param (Parameter)	§5.9.2.20

Attributes	Description
rev (Revision Number)	The revision number of an algorithm. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Algorithm Type)	Specifies the algorithm type. The possible values for this attribute are defined by the ST_AlgorithmType simple type (§5.9.7.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Algorithm">
   <sequence>
      <element name="param" type="CT_Parameter" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="type" type="ST_AlgorithmType" use="required"/>
   <attribute name="rev" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

5.9.2.4 cat (Category)

This element specifies a category in the user interface where this layout definition will display to the user.

[*Example*: Consider the following example of a cat in a DrawingML diagram:

```
<catLst>
    <cat type="relationship" pri="19000" />
</catLst>
```

In this example we define a single category called `relationship` which has a priority of `19000`. *end example*]

Parent Elements
catLst (§5.9.2.5)

Attributes	Description
pri (Priority)	The priority within the category for this diagram determines the order in which it will display in the user interface. Lower numbers are displayed at the beginning of the list. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Category Type)	Specifies the category type associated with the element. The possible values for this attribute are defined by the XML Schema anyURI datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Category">
   <attribute name="type" type="xsd:anyURI" use="required"/>
   <attribute name="pri" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.9.2.5 catLst (Category List)

This element is simply a list of cat elements.

[*Example*: Consider the following example of a catLst element in a DrawingML diagram:

```
<catLst>
    <cat type="list" pri="18000" />
    <cat type="relationship" pri="19000" />
</catLst>
```

In this example we define two different categories which are to be displayed in the user interface. *end example*]

Parent Elements
layoutDef (§5.9.2.16); layoutDefHdr (§5.9.2.17)

Child Elements	Subclause
cat (Category)	§5.9.2.4

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Categories">
   <sequence>
      <element name="cat" type="CT_Category" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.2.6 choose (Choose Element)

The choose element wraps if/else blocks into a choose block.

[*Example*: Consider the following example of a choose element in a DrawingML diagram:

```
<choose name="Name1">
    <if name="Name2" func="var" arg="dir" op="equ" val="norm">
          <alg type="snake">
                <param type="grDir" val="tL"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </if>
    <else name="Name3">
          <alg type="snake">
                <param type="grDir" val="tR"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </else>
</choose>
```

In this example, a choose element is used to define two different sets of parameters associated with a snake algorithm depending upon the direction in which the user wants the algorithm to flow (RTL or LTR*). end example*]

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
else (Else)	§5.9.2.12
if (If)	§5.9.2.15

Attributes	Description

name (Name)	A unique name associated with the choose statement.
	
	[*Example*: Consider the following example of a choose element in a DrawingML diagram:
	
	`<choose name="Name1">`
	
	`...`

Attributes	Description
	</choose> In this example, the choose element is named Name1. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Choose">
   <sequence>
      <element name="if" type="CT_When" maxOccurs="unbounded"/>
      <element name="else" type="CT_Otherwise" minOccurs="0"/>
   </sequence>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
</complexType>
```

5.9.2.7 clrData (Color Transform Sample Data)

This element defines the sample data that is to be used in the user interface controls regarding displaying color transforms for a given diagram. This sample data predefines a data model to be combined with a layout definition in order to create a diagram which a color transform can be applied and displayed to the user as an example of the color transform.

[*Example*: Consider the following example of a clrData element in a DrawingML diagram:

```
<clrData>
    <dataModel>
          <ptLst>
                <pt modelId="0" type="doc"/>
                <pt modelId="1"/>
                <pt modelId="2"/>
                <pt modelId="3"/>
                <pt modelId="4"/>
                <pt modelId="5"/>
                <pt modelId="6"/>
          </ptLst>
          <cxnLst>
                <cxn modelId="7" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
                <cxn modelId="8" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
                <cxn modelId="9" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
                <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
                <cxn modelId="11" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
                <cxn modelId="12" srcId="0" destId="6" srcOrd="5" destOrd="0"/>
          </cxnLst>
          <bg/>
```

```
            <whole/>
        </dataModel>
    </clrData>
```

In this example we define 6 points which all connect back to a seventh document type point. *end example*]

Parent Elements
layoutDef (§5.9.2.16)

Child Elements	Subclause
dataModel (Data Model)	§5.9.2.10

Attributes	Description
useDef (Use Default)	If the value of this attribute is `true`, the data model defined in the clrData element is ignored and a default data model is used instead. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SampleData">
   <sequence>
      <element name="dataModel" type="CT_DataModel" minOccurs="0"/>
   </sequence>
   <attribute name="useDef" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.9.2.8 constr (Constraint)

This element is used to specify size, position of nodes, text values, and layout dependencies between nodes in a layout definition.

[*Example*: Consider the following example of a constraint list which contains some example constraints being defined and applied to layout nodes in the layout definition:

```
<constrLst>
    <constr type="w" for="ch" forName="node1" refType="w" refForName=""/>
    <constr type="h" for="ch" forName="node1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.6"/>
    <constr type="w" for="ch" forName="transition1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.1"/>
    <constr type="primFontSz" for="ch" forName="node1" refForName="" op="equ"
val="100"/>
</constrLst>
```

In this example we can see constraints being defined for the width and height along with the primary font size for a layout node referenced by node1. The width for a transition is also specified. *end example*]

Parent Elements
constrLst (§5.9.2.9)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13

Attributes	Description
fact (Factor)	Factor used in a reference constraint or a rule in order to modify a referenced value by the factor defined. [*Example*: Consider the following example of fact in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, the width for transition1 is being defined as one-tenth the width of node1. *end example*] The possible values for this attribute are defined by the XML Schema double datatype.
for (For)	Specifies the axis of layout nodes to apply a constraint or rule to. [*Example*: Consider the following example of for in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, the for attribute is specifying that node1 is a child node to the current layout node. *end example*] The possible values for this attribute are defined by the ST_ConstraintRelationship simple type (§5.9.7.20).
forName (For Name)	Specifies the name of the layout node to apply a constraint or rule to. [*Example*: Consider the following example of forName in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, forName is specifying the layout node named transition1 for its reference. *end example*]

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
op (Operator)	The operator constraint used to evaluate the condition. [*Example*: Consider the following example of op in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, op is specifying an equality defined between the two referencing values. *end example*] The possible values for this attribute are defined by the ST_BoolOperator simple type (§5.9.7.10).
ptType (Data Point Type)	Specifies the type of data point to select. The possible values for this attribute are defined by the ST_ElementType simple type (§5.9.7.25).
refFor (Reference For)	The for value of the referenced constraint. [*Example*: Consider the following example of refFor in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, refFor is specifying the reference constraint is a child of the current layout node. *end example*] The possible values for this attribute are defined by the ST_ConstraintRelationship simple type (§5.9.7.20).
refForName (Reference For Name)	The name of the layout node referenced by a reference constraint. [*Example*: Consider the following example of refForName in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, refForName is specifying the layout node named node1 for its reference. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
refPtType (Reference Point Type)	The point type used int he referenced constraint.

Attributes	Description
	The possible values for this attribute are defined by the ST_ElementType simple type (§5.9.7.25).
refType (Reference Type)	Specifies the type of a reference constraint. [*Example*: Consider the following example of refType in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, refType is specifying referencing the width attribute of `node1`. *end example*] The possible values for this attribute are defined by the ST_ConstraintType simple type (§5.9.7.21).
type (Constraint Type)	Specifies the constraint to apply to this layout node. [*Example*: Consider the following example of type in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/>` In this example, type is specifying the width attribute of `transition1`. *end example*] The possible values for this attribute are defined by the ST_ConstraintType simple type (§5.9.7.21).
val (Value)	Specifies an absolute value instead of reference another constraint. [*Example*: Consider the following example of forName in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" val="10"/>` In this example, val is specifying the absolute value of the width of `transition1`. *end example*] The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Constraint">
   <sequence>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_ConstraintAttributes"/>
   <attributeGroup ref="AG_ConstraintRefAttributes"/>
   <attribute name="op" type="ST_BoolOperator" use="optional" default="none"/>
   <attribute name="val" type="xsd:double" use="optional" default="0"/>
   <attribute name="fact" type="xsd:double" use="optional" default="1"/>
</complexType>
```

5.9.2.9 constrLst (Constraint List)

This element is simply a list of constraints.

[*Example*: Consider the following example of a constraint list which contains some example constraints which are being defined and applied to layout nodes in the layout definition:

```
<constrLst>
   <constr type="w" for="ch" forName="node1" refType="w" refForName=""/>
   <constr type="h" for="ch" forName="node1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.6"/>
   <constr type="w" for="ch" forName="transition1" refType="w" refFor="ch"
refForName="node1" op="equ" fact="0.1"/>
   <constr type="primFontSz" for="ch" forName="node1" refForName="" op="equ"
val="100"/>
</constrLst>
```

In this example we can see constraints being defined for the width and height along with the primary font size for a layout node referenced by `node1`. The width for a transition is also specified. *end example*]

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
constr (Constraint)	§5.9.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Constraints">
   <sequence>
      <element name="constr" type="CT_Constraint" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.2.10 dataModel (Data Model)

The data for this instance of the diagram. Either a sample data model, or the data the user has entered.

Parent Elements
Root element of DrawingML Diagram Data partclrData (§5.9.2.7); sampData (§5.9.2.26); styleData (§5.9.2.29)

Child Elements	Subclause
bg (Background Formatting)	§5.9.3.1
cxnLst (Connection List)	§5.9.3.3
extLst (Extension List)	§5.9.2.13
ptLst (Point List)	§5.9.3.6
whole (Whole E2O Formatting)	§5.9.3.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DataModel">
   <sequence>
      <element name="ptLst" type="CT_PtList"/>
      <element name="cxnLst" type="CT_CxnList" minOccurs="0" maxOccurs="1"/>
      <element name="bg" type="a:CT_BackgroundFormatting" minOccurs="0"/>
      <element name="whole" type="a:CT_WholeE2oFormatting" minOccurs="0"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.9.2.11 desc (Description)

This element holds a description for a layout definition. The description can be used to describe the qualities associated with a particular layout definition.

Parent Elements
layoutDef (§5.9.2.16); layoutDefHdr (§5.9.2.17)

Attributes	Description
lang (Language)	The natural language of the title or description of this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.
val (Value)	The string which is used as the description of the layout definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Description">
   <attribute name="lang" type="xsd:string" use="optional" default=""/>
   <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

5.9.2.12 else (Else)

This element is similar to an else statement in a programming language in that it wraps elements which are to be used when the if conditionals are not true.

[*Example*: Consider the following example of an else element in a DrawingML diagram within the context of a choose statement:

```
<choose name="Name1">
    <if name="Name2" func="var" arg="dir" op="equ" val="norm">
          <alg type="snake">
                <param type="grDir" val="tL"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </if>
    <else name="Name3">
          <alg type="snake">
                <param type="grDir" val="tR"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </else>
</choose>
```

In this example, a else element is used to define a set of parameters associated with the snake algorithm when the diagram is reversed. *end example*]

Parent Elements
choose (§5.9.2.6)

Child Elements	Subclause
alg (Algorithm)	§5.9.2.3
choose (Choose Element)	§5.9.2.6

Child Elements	Subclause
constrLst (Constraint List)	§5.9.2.9
extLst (Extension List)	§5.9.2.13
forEach (For Each)	§5.9.2.14
layoutNode (Layout Node)	§5.9.2.19
presOf (Presentation Of)	§5.9.2.21
ruleLst (Rule List)	§5.9.2.25
shape (Shape)	§5.9.2.27

Attributes	Description

name (Name)	A unique name associated with the choose statement.
	
	[*Example*: Consider the following example of a else element in a DrawingML diagram:
	
	`<else name="Name1">`
	
	`...`
	
	`</else>`
	
	In this example, the else element is named `Name1`. *end example*].
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Otherwise">
   <choice minOccurs="0" maxOccurs="unbounded">
      <element name="alg" type="CT_Algorithm" minOccurs="0" maxOccurs="1"/>
      <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
      <element name="presOf" type="CT_PresentationOf" minOccurs="0" maxOccurs="1"/>
      <element name="constrLst" type="CT_Constraints" minOccurs="0" maxOccurs="1"/>
      <element name="ruleLst" type="CT_Rules" minOccurs="0" maxOccurs="1"/>
      <element name="forEach" type="CT_ForEach"/>
      <element name="layoutNode" type="CT_LayoutNode"/>
      <element name="choose" type="CT_Choose"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </choice>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
</complexType>
```

5.9.2.13 extLst (Extension List)

This element specifies an extension list, within which all future extensions will be defined within ext elements.

The extension list along with corresponding future extensions is used to extend the storage capabilities of the DrawingML framework. This allows for various new types of data to be stored natively within the existing diagram syntax.

Parent Elements
alg (§5.9.2.3); colorsDef (§5.9.4.3); colorsDefHdr (§5.9.4.4); constr (§5.9.2.8); cxn (§5.9.3.2); dataModel (§5.9.2.10); else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutDef (§5.9.2.16); layoutDefHdr (§5.9.2.17); layoutNode (§5.9.2.19); presOf (§5.9.2.21); pt (§5.9.3.5); rule (§5.9.2.24); shape (§5.9.2.27); styleDef (§5.9.5.7); styleDefHdr (§5.9.5.8); styleLbl (§5.9.5.10); styleLbl (§5.9.4.10)

Child Elements	Subclause
ext (Extension)	§5.1.2.1.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OfficeArtExtensionList">
   <sequence>
      <group ref="EG_OfficeArtExtensionList" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.9.2.14 forEach (For Each)

A looping structure, similar to a `for` loop in a programming language, which defines what data model points will use this layout node.

[*Example*: Consider the following example of a forEach being used within a DrawingML diagram:

```
<forEach name="Name5" ref="" axis="ch" ptType="node">
    <layoutNode name="node1" styleLbl="" moveWith="">
          <alg type="sp"/>
          <shape
xmlns:r="http://schemas.openxmlformats.org/officeDocument/2006/relationships"
r:blip="">
                <adjLst/>
          </shape>
          <constrLst/>
    </layoutNode>
</forEach>
```

In this example, the forEach element will create a layout node, referenced by the name `node1`, for every associated data model point in the diagram. In this particular instance the forEach will create the layout node for every child of the current point node. *end example*]

Parent Elements

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
alg (Algorithm)	§5.9.2.3
choose (Choose Element)	§5.9.2.6
constrLst (Constraint List)	§5.9.2.9
extLst (Extension List)	§5.9.2.13
forEach (For Each)	§5.9.2.14
layoutNode (Layout Node)	§5.9.2.19
presOf (Presentation Of)	§5.9.2.21
ruleLst (Rule List)	§5.9.2.25
shape (Shape)	§5.9.2.27

Attributes	Description
axis (Axis)	Specifies the axis on which to select data from the data model. [*Example*: For example, `axis="ch"` will select children of the current point node and `axis="des"` will select all descendants. *end example*] The possible values for this attribute are defined by the ST_AxisTypes simple type (§5.9.7.7).

cnt (Count)	Specifies the count of items to use in a data set.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	`...`
	
	`</forEach>`
	
	In this example, up to two children will be obtained through this forEach. *end example*]
	
	The possible values for this attribute are defined by the ST_UnsignedInts simple type (§5.9.7.63).

hideLastTrans (Hide Last Transition)	In algorithms that support transitions, this attribute specifies that the last transition will not be rendered. This allows for diagrams that start and end with a node. The possible values for this attribute are defined by the ST_Booleans simple type

Attributes	Description
	(§5.9.7.9).
name (Name)	A unique identifier for the layout node. The possible values for this attribute are defined by the XML Schema string datatype.

ptType (Data Point Type)	Specifies the type of data point to select.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	`...`
	
	`</forEach>`
	
	In this example, the forEach will select all node type points in the set. *end example*]
	
	The possible values for this attribute are defined by the ST_ElementTypes simple type (§5.9.7.26).

ref (Reference)	When used on a for-each element, causes the specified for-each element to be used instead. The possible values for this attribute are defined by the XML Schema string datatype.
st (Start)	Specifies where to start in a data set. [*Example*: Consider the following example of a forEach in a DrawingML diagram: `<presOf axis="desOrSelf" ptType="node" st="2"/>` In this example, the second element in the set will be the first point returned. *end example*] The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).
step (Step)	Specifies the step to use in a data set. A step with a value of 2 will return every other item in the set. The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ForEach">
   <choice minOccurs="0" maxOccurs="unbounded">
      <element name="alg" type="CT_Algorithm" minOccurs="0" maxOccurs="1"/>
      <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
      <element name="presOf" type="CT_PresentationOf" minOccurs="0" maxOccurs="1"/>
      <element name="constrLst" type="CT_Constraints" minOccurs="0" maxOccurs="1"/>
      <element name="ruleLst" type="CT_Rules" minOccurs="0" maxOccurs="1"/>
      <element name="forEach" type="CT_ForEach"/>
      <element name="layoutNode" type="CT_LayoutNode"/>
      <element name="choose" type="CT_Choose"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </choice>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
   <attribute name="ref" type="xsd:string" use="optional" default=""/>
   <attributeGroup ref="AG_IteratorAttributes"/>
</complexType>
```

5.9.2.15 if (If)

Like an if statement in a programming language, wraps elements which are to be used under the conditions defined by its attributes.

[*Example*: Consider the following example of an if element in a DrawingML diagram within the context of a choose statement:

```
<choose name="Name1">
    <if name="Name2" func="var" arg="dir" op="equ" val="norm">
          <alg type="snake">
                <param type="grDir" val="tL"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </if>
    <else name="Name3">
          <alg type="snake">
                <param type="grDir" val="tR"/>
                <param type="flowDir" val="row"/>
                <param type="contDir" val="sameDir"/>
                <param type="off" val="ctr"/>
          </alg>
    </else>
</choose>
```

In this example, a if element is used to define a set of parameters associated with the snake algorithm when the diagram is in the normal direction. *end example*]

Parent Elements
choose (§5.9.2.6)

Child Elements	Subclause
alg (Algorithm)	§5.9.2.3
choose (Choose Element)	§5.9.2.6
constrLst (Constraint List)	§5.9.2.9
extLst (Extension List)	§5.9.2.13
forEach (For Each)	§5.9.2.14
layoutNode (Layout Node)	§5.9.2.19
presOf (Presentation Of)	§5.9.2.21
ruleLst (Rule List)	§5.9.2.25
shape (Shape)	§5.9.2.27

Attributes	Description
arg (Argument)	Specifies the variable to use as part of the test in an if element. Ignored unless the function attribute is set to "var". The possible values for this attribute are defined by the ST_FunctionArgument simple type (§5.9.7.29).
axis (Axis)	Specifies the axis on which to select data from the data model. [*Example*: For example, `axis="ch"` will select children of the current point node and `axis="des"` will select all descendants. *end example*] The possible values for this attribute are defined by the ST_AxisTypes simple type (§5.9.7.7).

cnt (Count)	Specifies the count of items to use in a data set.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	`...`
	
	`</forEach>`
	
	In this example, up to two children will be obtained through this forEach. *end example*]
	
	The possible values for this attribute are defined by the ST_UnsignedInts simple type

Attributes	Description
	(§5.9.7.63).

func (Function)	The function used to evaluate the if condition.
	
	[*Example*: Consider the following example of `func` being used in DrawingML:
	
	`<if name="Name2" func="var" arg="dir" op="equ" val="norm">`
	`...`
	`</if>`
	
	In this example, `func` is set to `var`. *end example*]
	
	The possible values for this attribute are defined by the ST_FunctionType simple type (§5.9.7.31).

hideLastTrans (Hide Last Transition)	In algorithms that support transitions, this attribute specifies that the last transition will not be rendered. This allows for diagrams that start and end with a node. The possible values for this attribute are defined by the ST_Booleans simple type (§5.9.7.9).

name (Name)	A unique identifier for the layout node.
	
	The function used to evaluate the if condition.
	
	[*Example*: Consider the following example of `name` being used in DrawingML:
	
	`<if name="Name2" func="var" arg="dir" op="equ" val="norm">`
	`...`
	`</if>`
	
	In this example, the `name` attribute is set to `Name2`. *end example*]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

op (Operator)	The operator used to evaluate the condition.
	
	[*Example*: Consider the following example of op being used in DrawingML:
	
	`<if name="Name2" func="var" arg="dir" op="equ" val="norm">`
	`...`
	`</if>`
	
	In this example, op is being used to test the equality of the argument and value. *end example*]
	
	The possible values for this attribute are defined by the ST_FunctionOperator simple type (§5.9.7.30).

ptType (Data Point	Specifies the type of data point to select.

Attributes	Description

Type)	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	`...`
	
	`</forEach>`
	
	In this example, the forEach will select all node type points in the set. *end example*]
	
	The possible values for this attribute are defined by the ST_ElementTypes simple type (§5.9.7.26).

st (Start)	Specifies where to start in a data set. [*Example*: Consider the following example of a forEach in a DrawingML diagram: `<presOf axis="desOrSelf" ptType="node" st="2"/>` In this example, the second element in the set will be the first point returned. *end example*] The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).
step (Step)	Specifies the step to use in a data set. A step with a value of 2 will return every other item in the set. The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).
val (Value)	An absolute value. The possible values for this attribute are defined by the ST_FunctionValue simple type (§5.9.7.32).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_When">
   <choice minOccurs="0" maxOccurs="unbounded">
      <element name="alg" type="CT_Algorithm" minOccurs="0" maxOccurs="1"/>
      <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
      <element name="presOf" type="CT_PresentationOf" minOccurs="0" maxOccurs="1"/>
      <element name="constrLst" type="CT_Constraints" minOccurs="0" maxOccurs="1"/>
      <element name="ruleLst" type="CT_Rules" minOccurs="0" maxOccurs="1"/>
      <element name="forEach" type="CT_ForEach"/>
      <element name="layoutNode" type="CT_LayoutNode"/>
      <element name="choose" type="CT_Choose"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </choice>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
   <attributeGroup ref="AG_IteratorAttributes"/>
   <attribute name="func" type="ST_FunctionType" use="required"/>
   <attribute name="arg" type="ST_FunctionArgument" use="optional" default="none"/>
   <attribute name="op" type="ST_FunctionOperator" use="required"/>
   <attribute name="val" type="ST_FunctionValue" use="required"/>
</complexType>
```

5.9.2.16 layoutDef (Layout Definition)

This element is the root element for defining a layout definition. The layout definition is defined through a set of nested layout nodes. The layout definition is responsible for defining the look of a diagram.

Parent Elements
Root element of DrawingML Diagram Layout Definition part

Child Elements	Subclause
catLst (Category List)	§5.9.2.5
clrData (Color Transform Sample Data)	§5.9.2.7
desc (Description)	§5.9.2.11
extLst (Extension List)	§5.9.2.13
layoutNode (Layout Node)	§5.9.2.19
sampData (Sample Data)	§5.9.2.26
styleData (Style Data)	§5.9.2.29
title (Title)	§5.9.2.30

Attributes	Description
defStyle (Default Style)	This attribute defines a reference to a default style which is to be applied to the diagram. The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description
minVer (Minimum Version)	Minimum product version that can support this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.
uniqueId (Unique Identifier)	The unique identifier for this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DiagramDefinition">
   <sequence>
      <element name="title" type="CT_Name" minOccurs="0" maxOccurs="unbounded"/>
      <element name="desc" type="CT_Description" minOccurs="0" maxOccurs="unbounded"/>
      <element name="catLst" type="CT_Categories" minOccurs="0"/>
      <element name="sampData" type="CT_SampleData" minOccurs="0"/>
      <element name="styleData" type="CT_SampleData" minOccurs="0"/>
      <element name="clrData" type="CT_SampleData" minOccurs="0"/>
      <element name="layoutNode" type="CT_LayoutNode"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="uniqueId" type="xsd:string" use="optional" default=""/>
   <attribute name="minVer" type="xsd:string" use="optional"
     default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
   <attribute name="defStyle" type="xsd:string" use="optional" default=""/>
</complexType>
```

5.9.2.17 layoutDefHdr (Layout Definition Header)

This element is the header information representing the minimum knowledge needed by an application to preload information about a layout definition. This preloading allows for the actual load of the layout definition to occur at a later time which will help with any performance concerns an application may have.

[*Example*: Consider the following example of a layoutDefHdr within a DrawingML diagram:

```
<layoutDefHdr uniqueId="urn:layout/default">
    <title val="Basic Block List" />
    <desc val="" />
    <catLst>
        <cat type="list" pri="1000" />
    </catLst>
</layoutDefHdr>
```

In this example we define a title along with a category and prioritization for the diagram referenced by the `uniqueId` of `urn:layout:default`. *end example*]

Parent Elements
layoutDefHdrLst (§5.9.2.18)

Child Elements	Subclause
catLst (Category List)	§5.9.2.5
desc (Description)	§5.9.2.11
extLst (Extension List)	§5.9.2.13
title (Title)	§5.9.2.30

Attributes	Description
defStyle (Default Style)	This attribute defines a reference to a default style which is to be applied to the diagram. The possible values for this attribute are defined by the XML Schema string datatype.
minVer (Minimum Version)	Minimum product version that can support this Diagram Layout. The possible values for this attribute are defined by the XML Schema string datatype.
resId (Resource Identifier)	Resource ID used internally. The possible values for this attribute are defined by the XML Schema int datatype.
uniqueId (Unique Identifier)	The unique identifier for this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DiagramDefinitionHeader">
   <sequence>
      <element name="title" type="CT_Name" minOccurs="1" maxOccurs="unbounded"/>
      <element name="desc" type="CT_Description" minOccurs="1" maxOccurs="unbounded"/>
      <element name="catLst" type="CT_Categories" minOccurs="0"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="uniqueId" type="xsd:string" use="required"/>
   <attribute name="minVer" type="xsd:string" use="optional"
     default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
   <attribute name="defStyle" type="xsd:string" use="optional" default=""/>
   <attribute name="resId" type="xsd:int" use="optional" default="0"/>
</complexType>
```

5.9.2.18 layoutDefHdrLst (Diagram Layout Header List)

This element is simply a list of layout definition headers. This list of headers is used internally as a way to group all of the layout definition headers together into a single structure.

Child Elements	Subclause
layoutDefHdr (Layout Definition Header)	§5.9.2.17

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DiagramDefinitionHeaderLst">
   <sequence>
      <element name="layoutDefHdr" type="CT_DiagramDefinitionHeader" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.2.19 layoutNode (Layout Node)

The layout node is the basic building block of diagrams. The layout node is responsible for defining how shapes are arranged in a diagram and how the data maps to a particular shape in a diagram.

[*Example*: Consider the following example of a basic layout node defined in a DrawingML diagram:

```
<layoutNode name="node">
    <varLst>
          <bulletEnabled val="1"/>
    </varLst>
    <presOf axis="desOrSelf" ptType="node"/>
    <alg type="tx"/>
    <shape type="rect"
xmlns:r="http://schemas.openxmlformats.org/officeDocument/2006/relationships"
r:blip="">
          <adjLst/>
    </shape>
    <constrLst/>
    <ruleLst>
          <rule type="primFontSz" forName="" val="2" fact="NaN" max="NaN"/>
    </ruleLst>
</layoutNode>
```

In this example we define a layout node which holds text and is a rectangle. *end example*]

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutDef (§5.9.2.16); layoutNode (§5.9.2.19)

Child Elements	Subclause
alg (Algorithm)	§5.9.2.3
choose (Choose Element)	§5.9.2.6
constrLst (Constraint List)	§5.9.2.9
extLst (Extension List)	§5.9.2.13
forEach (For Each)	§5.9.2.14

Child Elements	Subclause
layoutNode (Layout Node)	§5.9.2.19
presOf (Presentation Of)	§5.9.2.21
ruleLst (Rule List)	§5.9.2.25
shape (Shape)	§5.9.2.27
varLst (Variable List)	§5.9.2.31

Attributes	Description
chOrder (Child Order)	Specifes the ordering of the child layout nodes for a given layout node. The possible values for this attribute are defined by the ST_ChildOrderType simple type (§5.9.7.15).
moveWith (Move With)	Reference to another layout node that this layout node moves with. The possible values for this attribute are defined by the XML Schema string datatype.
name (Name)	A unique identifier for the layout node. The possible values for this attribute are defined by the XML Schema string datatype.
styleLbl (Style Label)	Specify which formatting option from a style or color variation should be applied to this layout node. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutNode">
   <choice minOccurs="0" maxOccurs="unbounded">
      <element name="alg" type="CT_Algorithm" minOccurs="0" maxOccurs="1"/>
      <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
      <element name="presOf" type="CT_PresentationOf" minOccurs="0" maxOccurs="1"/>
      <element name="constrLst" type="CT_Constraints" minOccurs="0" maxOccurs="1"/>
      <element name="ruleLst" type="CT_Rules" minOccurs="0" maxOccurs="1"/>
      <element name="varLst" type="CT_LayoutVariablePropertySet" minOccurs="0" maxOccurs="1"/>
      <element name="forEach" type="CT_ForEach"/>
      <element name="layoutNode" type="CT_LayoutNode"/>
      <element name="choose" type="CT_Choose"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </choice>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
   <attribute name="styleLbl" type="xsd:string" use="optional" default=""/>
   <attribute name="chOrder" type="ST_ChildOrderType" use="optional" default="b"/>
   <attribute name="moveWith" type="xsd:string" use="optional" default=""/>
</complexType>
```

5.9.2.20 param (Parameter)

The parameter element modifies the default behavior of an algorithm.

[*Example*: Consider the following example of a param being used in a DrawingML diagram:

```
<alg type="snake">
    <param type="grDir" val="tL"/>
    <param type="flowDir" val="row"/>
    <param type="contDir" val="sameDir"/>
    <param type="off" val="ctr"/>
</alg>
```

In this example we see the snake algorithm being utilized and four parameters being set which are associated with the snake algorithm and modify its behavior. *end example*]

Parent Elements
alg (§5.9.2.3)

Attributes	Description
type (Parameter Type)	Specifies the parameter which is being modified. The possible values for this attribute are defined by the ST_ParameterId simple type (§5.9.7.48).
val (Value)	Specifies the actual value to be given to the type defined. The possible values for this attribute are defined by the ST_ParameterVal simple type (§5.9.7.49).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Parameter">
   <attribute name="type" type="ST_ParameterId" use="required"/>
   <attribute name="val" type="ST_ParameterVal" use="required"/>
</complexType>
```

5.9.2.21 presOf (Presentation Of)

This element specifies a particular data model point which is to be mapped to the containing layout node. This attribute is responsible for defining the mapping of data to the layout nodes in a diagram.

[*Example*: Consider the following example of presOf in use within a DrawingML diagram:

```
<presOf axis="desOrSelf" ptType="node"/>
```

In this example the presOf element is mapping to a particular data model point. *end example*]

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13

Attributes	Description
axis (Axis)	Specifies the axis on which to select data from the data model. [*Example*: For example, `axis="ch"` will select children of the current point node and `axis="des"` will select all descendants. *end example*] The possible values for this attribute are defined by the ST_AxisTypes simple type (§5.9.7.7).

cnt (Count)	Specifies the count of items to use in a data set.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	`...`
	
	`</forEach>`
	
	In this example, up to two children will be obtained through this forEach. *end example*]
	
	The possible values for this attribute are defined by the ST_UnsignedInts simple type (§5.9.7.63).

hideLastTrans (Hide Last Transition)	In algorithms that support transitions, this attribute specifies that the last transition will not be rendered. This allows for diagrams that start and end with a node. The possible values for this attribute are defined by the ST_Booleans simple type (§5.9.7.9).

ptType (Data Point Type)	Specifies the type of data point to select.
	
	[*Example*: Consider the following example of a forEach in a DrawingML diagram:
	
	`<forEach name="Name5" ref="" axis="ch" ptType="node" cnt="2">`
	
	`...`
	
	`</forEach>`

Attributes	Description
	In this example, the forEach will select all node type points in the set. *end example*] The possible values for this attribute are defined by the ST_ElementTypes simple type (§5.9.7.26).
st (Start)	Specifies where to start in a data set. [*Example*: Consider the following example of a forEach in a DrawingML diagram: `<presOf axis="desOrSelf" ptType="node" st="2"/>` In this example, the second element in the set will be the first point returned. *end example*] The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).
step (Step)	Specifies the step to use in a data set. A step with a value of 2 will return every other item in the set. The possible values for this attribute are defined by the ST_Ints simple type (§5.9.7.39).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PresentationOf">
   <sequence>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_IteratorAttributes"/>
</complexType>
```

5.9.2.22 relIds (Explicit Relationships to Diagram Parts)

This element specifies the relationship IDs used to explicitly reference each of the four constituent parts of a DrawingML diagram:

- Diagram Colors (cs attribute)
- Diagram Data (dm attribute)
- Diagram Layout Definition (lo attribute)
- Diagram Style (qs attribute)

Attributes	Description
cs (Explicit Relationship to Diagram Colors Part) Namespace: .../officeDocument	Specifies the relationship ID for the explicit relationship to the Diagram Colors part used by this diagram. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramColors or the document shall be considered non-conformant.

Attributes	Description
/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
dm (Explicit Relationship to Diagram Data Part) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Data part used by this diagram. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramData or the document shall be considered non-conformant. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
lo (Explicit Relationship to Diagram Layout Definition Part) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Layout Definition part used by this diagram. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramLayout or the document shall be considered non-conformant. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
qs (Explicit Relationship to Style Definition Part) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the explicit relationship to the Diagram Style part used by this diagram. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/diagramQuickStyle or the document shall be considered non-conformant. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelIds">
   <attribute ref="r:dm" use="required"/>
   <attribute ref="r:lo" use="required"/>
   <attribute ref="r:qs" use="required"/>
   <attribute ref="r:cs" use="required"/>
</complexType>
```

5.9.2.23 resizeHandles (Shape Resize Style)

This element defines the behavior when resizing shapes within a diagram. Because the size of the shape plays a large role in the overall layout of other nodes within the diagram, there are two ways resize can occur on a node.

Parent Elements

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Shape Resize Style Type)	Specifies the behavior for a shape when resizing shapes within a diagram. If this attribute is not specified, the default value shall be `rel`. The possible values for this attribute are defined by the ST_ResizeHandlesStr simple type (§5.9.7.53).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ResizeHandles">
   <attribute name="val" type="ST_ResizeHandlesStr" default="rel" use="optional"/>
</complexType>
```

5.9.2.24 rule (Rule)

This element allows for a rule to be specified which changes the value of an existing constraint.

[*Example*: Consider the following example of a rule in a DrawingML diagram:

```
<ruleLst>
   <rule type="primFontSz" val="2" />
</ruleLst>
```

In this example a rule is being defined that will shrink the primary font size down to a lower limit of 2pt font when the text no longer fits correctly in the layout node. *end example*]

Parent Elements
ruleLst (§5.9.2.25)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13

Attributes	Description
fact (Factor)	Factor used in a reference constraint or a rule in order to modify a referenced value by the factor defined. [*Example*: Consider the following example of fact in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" refType="w"`

Attributes	Description
	refFor="ch" refForName="node1" op="equ" fact="0.1"/> In this example, the width for transition1 is being defined as one-tenth the width of node1. *end example*] The possible values for this attribute are defined by the XML Schema double datatype.
for (For)	Specifies the axis of layout nodes to apply a constraint or rule to. [*Example*: Consider the following example of for in use in a DrawingML diagram: <constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/> In this example, the for attribute is specifying that node1 is a child node to the current layout node. *end example*] The possible values for this attribute are defined by the ST_ConstraintRelationship simple type (§5.9.7.20).
forName (For Name)	Specifies the name of the layout node to apply a constraint or rule to. [*Example*: Consider the following example of forName in use in a DrawingML diagram: <constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/> In this example, forName is specifying the layout node named transition1 for its reference. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
max (Max Value)	Sets the maximum value for a constraint so rules can no longer increase the constraint beyond that value. The possible values for this attribute are defined by the XML Schema double datatype.
ptType (Data Point Type)	Specifies the type of data point to select. The possible values for this attribute are defined by the ST_ElementType simple type (§5.9.7.25).
type (Constraint Type)	Specifies the constraint to apply to this layout node. [*Example*: Consider the following example of type in use in a DrawingML diagram: <constr type="w" for="ch" forName="transition1" refType="w" refFor="ch" refForName="node1" op="equ" fact="0.1"/> In this example, type is specifying the width attribute of transition1. *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_ConstraintType simple type (§5.9.7.21).
val (Value)	Specifies an absolute value instead of reference another constraint. [*Example*: Consider the following example of forName in use in a DrawingML diagram: `<constr type="w" for="ch" forName="transition1" val="10"/>` In this example, val is specifying the absolute value of the width of `transition1`. *end example*] The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumericRule">
   <sequence>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_ConstraintAttributes"/>
   <attribute name="val" type="xsd:double" use="optional" default="NaN"/>
   <attribute name="fact" type="xsd:double" use="optional" default="NaN"/>
   <attribute name="max" type="xsd:double" use="optional" default="NaN"/>
</complexType>
```

5.9.2.25 ruleLst (Rule List)

This element is simply a list of rules.

This element allows for a rule to be specified which changes the value of an existing constraint.

[*Example*: Consider the following example of a ruleLst in a DrawingML diagram:

```
<ruleLst>
   <rule type="primFontSz" val="2" />
</ruleLst>
```

In this example a single rule is being defined in the ruleLst that will shrink the primary font size down to a lower limit of 2pt font when the text no longer fits correctly in the layout node. *end example*]

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
rule (Rule)	§5.9.2.24

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rules">
   <sequence>
      <element name="rule" type="CT_NumericRule" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.2.26 sampData (Sample Data)

This element defines the sample data model which is used to pre-populate a diagram with placeholder data in order for the diagram to display itself in the user interface which shows all of the available diagrams to a user.

[*Example*: Consider the following example of a sampData element within a DrawingML diagram:

```
<sampData>
    <dataModel>
          <ptLst>
                <pt modelId="0" type="doc"/>
                <pt modelId="1">
                      <prSet phldr="1"/>
                </pt>
                <pt modelId="2">
                      <prSet phldr="1"/>
                </pt>
                <pt modelId="3">
                      <prSet phldr="1"/>
                </pt>
                <pt modelId="4">
                      <prSet phldr="1"/>
                </pt>
                <pt modelId="5">
                      <prSet phldr="1"/>
                </pt>
          </ptLst>
          <cxnLst>
                <cxn modelId="6" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
                <cxn modelId="7" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
                <cxn modelId="8" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
                <cxn modelId="9" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
                <cxn modelId="10" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
          </cxnLst>
          <bg/>
          <whole/>
    </dataModel>
</sampData>
```

In this example we define the sample data to consist of five nodes all attached to a document point type node. When displayed, this diagram will show five shapes in the diagram. *end example*]

Parent Elements
layoutDef (§5.9.2.16)

Child Elements	Subclause
dataModel (Data Model)	§5.9.2.10

Attributes	Description
useDef (Use Default)	If the value of this attribute is `true`, the data model defined in the clrData element is ignored and a default data model is used instead. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SampleData">
   <sequence>
      <element name="dataModel" type="CT_DataModel" minOccurs="0"/>
   </sequence>
   <attribute name="useDef" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.9.2.27 shape (Shape)

The shape displayed by the containing layout node. Not all layout nodes display shapes.

Parent Elements
else (§5.9.2.12); forEach (§5.9.2.14); if (§5.9.2.15); layoutNode (§5.9.2.19)

Child Elements	Subclause
adjLst (Shape Adjust List)	§5.9.2.2
extLst (Extension List)	§5.9.2.13

Attributes	Description
blip (Relationship to Image Part) Namespace: .../officeDocument/2006/relationshi	Specifies the relationship ID of the explicit relationship to an image which shall be used as the image for the contents of this shape. This relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or

Attributes	Description
ps	the document shall be considered non-conformant. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
blipPhldr (Image Placeholder)	Specifies whether to use an image placeholder or not. The possible values for this attribute are defined by the XML Schema boolean datatype.
hideGeom (Hide Geometry)	When set to "true", hides the geometry of the shape. The text is still visible. The possible values for this attribute are defined by the XML Schema boolean datatype.
lkTxEntry (Prevent Text Editing)	Prevents text editing on this shape. The possible values for this attribute are defined by the XML Schema boolean datatype.
rot (Rotation)	Rotates the shape by the specified number of degrees. The possible values for this attribute are defined by the XML Schema double datatype.
type (Shape Type)	Specifies the type of shape. The possible values for this attribute are defined by the ST_LayoutShapeType simple type (§5.9.7.40).
zOrderOff (Z-Order Offset)	Offsets the shape from its default z-order stacking, which is based on the order the layout nodes appear in the XML. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape">
   <sequence>
      <element name="adjLst" type="CT_AdjLst" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rot" type="xsd:double" use="optional" default="0"/>
   <attribute name="type" type="ST_LayoutShapeType" use="optional" default="none"/>
   <attribute ref="r:blip" use="optional"/>
   <attribute name="zOrderOff" type="xsd:int" use="optional" default="0"/>
   <attribute name="hideGeom" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="lkTxEntry" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="blipPhldr" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.9.2.28 style (Shape Style)

This element specifies the style information for a shape, as defined by its DrawingML child elements.

Parent Elements

Parent Elements
prSet (§5.9.3.4); styleLbl (§5.9.5.10)

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeStyle">
   <sequence>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.9.2.29 styleData (Style Data)

This element defines the style data model which is used to pre-populate a diagram with placeholder data in order for the diagram to display itself in the user interface which shows a quick style applied to the diagram.

[*Example*: Consider the following example of a styleData being used within a DrawingML diagram:

```
<styleData>
    <dataModel>
          <ptLst>
                <pt modelId="0" type="doc"/>
                <pt modelId="1"/>
                <pt modelId="2"/>
          </ptLst>
          <cxnLst>
                <cxn modelId="3" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
                <cxn modelId="4" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
          </cxnLst>
          <bg/>
          <whole/>
    </dataModel>
</styleData>
```

In this example we define a data model which has only two nodes which will be shown in the user interface when a layout definition is combined with this data model. *end example*]

Parent Elements
layoutDef (§5.9.2.16)

Child Elements	Subclause
dataModel (Data Model)	§5.9.2.10

Attributes	Description
useDef (Use Default)	If the value of this attribute is `true`, the data model defined in the clrData element is ignored and a default data model is used instead. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SampleData">
   <sequence>
      <element name="dataModel" type="CT_DataModel" minOccurs="0"/>
   </sequence>
   <attribute name="useDef" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.9.2.30 title (Title)

Title of the Diagram Layout.

Parent Elements
layoutDef (§5.9.2.16); layoutDefHdr (§5.9.2.17)

Attributes	Description
lang (Language)	Specifies the language of the title or description of this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.
val (Value)	Specifies the title or description of this layout definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Name">
   <attribute name="lang" type="xsd:string" use="optional" default=""/>
   <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

5.9.2.31 varLst (Variable List)

This element consists of a list of variables which interact with user interface components.

[*Example*: Consider the following example of a varLst in a DrawingML diagram:

```
<varLst>
    <chMax val="2" />
    <dir val="norm" />
    <resizeHandles val="exact" />
</varLst>
```

In this example we see different variables being defined which modify the behavior of user interface components directly. *end example*]

Parent Elements
layoutNode (§5.9.2.19)

Child Elements	Subclause
animLvl (Level Animation)	§5.9.6.1
animOne (One by One Animation String)	§5.9.6.2
bulletEnabled (Show Insert Bullet)	§5.9.6.3
chMax (Maximum Children)	§5.9.6.4
chPref (Preferred Number of Children)	§5.9.6.5
dir (Diagram Direction)	§5.9.6.6
hierBranch (Organization Chart Branch Style)	§5.9.6.7
orgChart (Show Organization Chart User Interface)	§5.9.6.8
resizeHandles (Shape Resize Style)	§5.9.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutVariablePropertySet">
   <sequence>
      <element name="orgChart" type="CT_OrgChart" minOccurs="0" maxOccurs="1"/>
      <element name="chMax" type="CT_ChildMax" minOccurs="0" maxOccurs="1"/>
      <element name="chPref" type="CT_ChildPref" minOccurs="0" maxOccurs="1"/>
      <element name="bulletEnabled" type="CT_BulletEnabled" minOccurs="0" maxOccurs="1"/>
      <element name="dir" type="CT_Direction" minOccurs="0" maxOccurs="1"/>
      <element name="hierBranch" type="CT_HierBranchStyle" minOccurs="0" maxOccurs="1"/>
      <element name="animOne" type="CT_AnimOne" minOccurs="0" maxOccurs="1"/>
      <element name="animLvl" type="CT_AnimLvl" minOccurs="0" maxOccurs="1"/>
      <element name="resizeHandles" type="CT_ResizeHandles" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.9.3 Data

This section specifies the data that is to be contained within a diagram.

5.9.3.1 bg (Background Formatting)

This element defines formatting that can be applied to the background shape of the entire diagram. The background shape can hold formatting options just as a normal shape can hold within DrawingML.

[*Example*: Consider the following example of a bg in DiagramML:

```
<bg>
     <solidFill>
          <schemeClr val="tx1"/>
     </solidFill>
     <effectLst>
          <glow rad="152400">
               <schemeClr val="accent1">
                    <alpha val="75000"/>
               </schemeClr>
          </glow>
     </effectLst>
</bg>
```

In this example we see a solid fill applied to the background of the diagram along with a glow. *end example*]

Parent Elements
dataModel (§5.9.2.10)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BackgroundFormatting">
   <sequence>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.9.3.2 cxn (Connection)

This element defines a connection between two points. A connection defines a relationship between two points in a diagram.

[*Example*: Consider the following example of a cxn in DiagramML:

```
<cxnLst>
    <cxn modelId="7" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
    <cxn modelId="8" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
    <cxn modelId="9" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
    <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
    <cxn modelId="11" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
    <cxn modelId="12" srcId="0" destId="6" srcOrd="5" destOrd="0"/>
</cxnLst>
```

In this example we see 6 cxn elements defined within a cxnLst element (§5.9.3.3). In this example, a relationship is being defined between point 0 and every other point in the diagram. *end example*]

Parent Elements
cxnLst (§5.9.3.3)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13

Attributes	Description
destId (Destination Identifier)	The model identifier of the destination point for a connection. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>` In this example we see the destination identifier referencing a point who's model identifier is 4. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type

Attributes	Description
	(§5.9.7.42).
destOrd (Destination Position)	The relative position of the destination point among it's siblings. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>` In this example we see the destination position is 0. This means that it is ranked first among its siblings if there are sibling points present. *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
modelId (Model Identifier)	The unique identifier associated with this cxn. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>` In this example we see the model identifier is 10. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).
parTransId (Parent Transition Identifier)	The model identifier of the point representing the parent transition. An example of a parent transition can be thought of as the shape connecting two points, such as an arrow in the diagram. The unique identifier associated with this cxn. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0" parTransId="9" sibTransId="5"/>` In this example we see the parent transition identifier is referencing a point who's model identifier is 9. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).
presId (Presentation Identifier)	The unique identifier of the layout associated to the cxn (only the active presentation (layout) is saved so all the presId's in the file should be the same). [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" type="presParOf" srcId="0" destId="4" srcOrd="3" destOrd="0" presId="urn:sampleLayouts/layout1"/>`

Attributes	Description
	In this example we see the presentation identifier is `urn:sampleLayouts/layout1`. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
sibTransId (Sibling Transition Identifier)	The model identifier of the point representing the sibling transition. An example of a sibling transition can be thought of as the shape connecting two points, such as an arrow in the diagram. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0" parTransId="9" sibTransId="5"/>` In this example we see the sibling transition identifier is referencing a point who's model identifier is 5. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).
srcId (Source Identifier)	The model identifier of the source point for a connection. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>` In this example we see the souce identifier referencing a point who's model identifier is 0. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).
srcOrd (Source Position)	The relative position of the source point among it's siblings. [*Example*: Consider the following example cxn within DiagramML: `<cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>` In this example we see the source position is 3. This means that it is ranked third among its siblings. *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Point Type)	The type of point, which will correspond to a connection in this case. [*Example*: Consider the following example cxn within DiagramML:

Attributes	Description
	<cxn modelId="10" type="presParOf" srcId="0" destId="4" srcOrd="3" destOrd="0" presId="urn:sampleLayouts/layout1"/> In this example we see the point type is defined as presParOf. *end example*] The possible values for this attribute are defined by the ST_CxnType simple type (§5.9.7.23).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cxn">
   <sequence>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="modelId" type="ST_ModelId" use="required"/>
   <attribute name="type" type="ST_CxnType" use="optional" default="parOf"/>
   <attribute name="srcId" type="ST_ModelId" use="required"/>
   <attribute name="destId" type="ST_ModelId" use="required"/>
   <attribute name="srcOrd" type="xsd:unsignedInt" use="required"/>
   <attribute name="destOrd" type="xsd:unsignedInt" use="required"/>
   <attribute name="parTransId" type="ST_ModelId" use="optional" default="0"/>
   <attribute name="sibTransId" type="ST_ModelId" use="optional" default="0"/>
   <attribute name="presId" type="xsd:string" use="optional" default=""/>
</complexType>
```

5.9.3.3 cxnLst (Connection List)

This element defines a group of connections. There can be a connection list defined for any data model which holds all of the connections between points defined in the diagram.

[*Example*: Consider the following example of a cxnLst in DiagramML:

```
<cxnLst>
   <cxn modelId="7" srcId="0" destId="1" srcOrd="0" destOrd="0"/>
   <cxn modelId="8" srcId="0" destId="2" srcOrd="1" destOrd="0"/>
   <cxn modelId="9" srcId="0" destId="3" srcOrd="2" destOrd="0"/>
   <cxn modelId="10" srcId="0" destId="4" srcOrd="3" destOrd="0"/>
   <cxn modelId="11" srcId="0" destId="5" srcOrd="4" destOrd="0"/>
   <cxn modelId="12" srcId="0" destId="6" srcOrd="5" destOrd="0"/>
</cxnLst>
```

In this example we see 6 cxn elements (§5.9.3.2) defined within a cxnLst element. In this example, a relationship is being defined between point 0 and every other point in the diagram. *end example*]

Parent Elements
dataModel (§5.9.2.10)

Child Elements	Subclause
cxn (Connection)	§5.9.3.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CxnList">
   <sequence>
      <element name="cxn" type="CT_Cxn" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.3.4 prSet (Property Set)

This element holds properties and customizations which are used throughout certain elements in DiagramML. The properties can be grouped into the following general categories:

- Presentation Properties - presLayoutVars, style, presAssocId, presName, presStyleLbl, presStyleIdx, presStyleCnt
- Document Properties - loTypeId, loCatId, qsTypeId, qaCatId, csTypeId, coherent3DOff
- Semantic Element Properties - phldrT, phldr
- Customization Properties - custAng, custFlipVert, custFlipHor, custSzX, custSzY, custScaleX, custScaleY, custT, custLinFactX, custLinFactY, custLinFactNeighborX, custLinFactNeighborY, custRadScaleRad, custRadScaleInc

[*Example*: Consider the basic example of prSet in use in DrawingML on a document point type:

```
<prSet loTypeId="urn:microsoft.com/office/officeart/2005/8/layout/default"
loCatId="list"
qsTypeId="urn:microsoft.com/office/officeart/2005/8/quickstyle/3d1" qsCatId="3D"
csTypeId="urn:microsoft.com/office/officeart/2005/8/colors/colorful2"
csCatId="colorful" phldr="1"/>
```

In this example we define the layout identifier, the category of the layout, the quick style identifier, the quick style category, along with the color style and color style category. *end example*]

Parent Elements
pt (§5.9.3.5)

Child Elements	Subclause
presLayoutVars (Presentation Layout Variables)	§5.9.5.4
style (Shape Style)	§5.9.2.28

Attributes	Description

Attributes	Description
coherent3DOff (Coherent 3D Behavior)	Enables or disables the Coherent 3D behavior for styles that specify this property. The possible values for this attribute are defined by the XML Schema boolean datatype.
csCatId (Color Transform Category)	This attribute specifies the identifier of the current color transform category. The possible values for this attribute are defined by the XML Schema string datatype.
csTypeId (Color Transform Type Identifier)	This attribute specifies the identifier of the currently applied color transform. The possible values for this attribute are defined by the XML Schema string datatype.
custAng (Custom Rotation)	Specifies the amount that rotation is customized by. The possible values for this attribute are defined by the XML Schema int datatype.
custFlipHor (Custom Horizontal Flip)	Specifies if there is a custom horizontal flip applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
custFlipVert (Custom Vertical Flip)	Specifies if there is a custom vertical flip applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
custLinFactNeighborX (Neighbor Offset Width)	Specifies the percentage of the neighbor's width used for offsetting shape. The possible values for this attribute are defined by the XML Schema int datatype.
custLinFactNeighborY (Neighbor Offset Height)	Specifies the percentage of the neighbor's height used for offsetting shape. The possible values for this attribute are defined by the XML Schema int datatype.
custLinFactX (Custom Factor Width)	Specifies the percentage of the current shape width used for offsetting the shape. The possible values for this attribute are defined by the XML Schema int datatype.
custLinFactY (Custom Factor Height)	Specifies the percentage of the current shape height used for offsetting the shape. The possible values for this attribute are defined by the XML Schema int datatype.
custRadScaleInc (Include Angle Scale)	Specifies the amount that the include angle has been scaled by. The possible values for this attribute are defined by the XML Schema int datatype.
custRadScaleRad (Radius Scale)	Specifies how much the radius has been scaled. The possible values for this attribute are defined by the XML Schema int datatype.
custScaleX (Width Scale)	Specifies the amount that the width has been scaled by. The possible values for this attribute are defined by the XML Schema int datatype.
custScaleY (Height Scale)	Specifies the amount that the height has been scaled by.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema int datatype.
custSzX (Fixed Width Override)	Specifies a fixed width override for a shape. The possible values for this attribute are defined by the XML Schema int datatype.
custSzY (Fixed Height Override)	Specifies a fixed height override for a shape. The possible values for this attribute are defined by the XML Schema int datatype.
custT (Text Changed)	Specifies if the text has been customized which allows layout to ignore automatic formatting options available to the text. The possible values for this attribute are defined by the XML Schema boolean datatype.
loCatId (Current Diagram Category)	Specifies the current identifier of the layout category applied to the diagram. The possible values for this attribute are defined by the XML Schema string datatype.
loTypeId (Current Diagram Type)	Specifies the identifier for the layout currently applied to the diagram. The possible values for this attribute are defined by the XML Schema string datatype.
phldr (Placeholder)	Indicates that the point is a placeholder or sample item. The possible values for this attribute are defined by the XML Schema boolean datatype.
phldrT (Placeholder Text)	The text used for display in the element if the placeholder flag is set to `true`. If this property is not set than default placeholder text will be used. The possible values for this attribute are defined by the XML Schema string datatype.
presAssocID (Presentation Element Identifier)	The point associated with this presentation element. This identifier is used together with presName to create a unique key for presentation element indexing. The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).
presName (Presentation Name)	The layout node name of this presentation element. This name is used together with presAssocID to create a unique key for presentation element indexing. The possible values for this attribute are defined by the XML Schema string datatype.
presStyleCnt (Presentation Style Count)	Specifies the layout node style count of this presentation element. The possible values for this attribute are defined by the XML Schema int datatype.
presStyleIdx (Presentation Style Index)	Specifies the layout node style index of this presentation element. The possible values for this attribute are defined by the XML Schema int datatype.
presStyleLbl (Presentation Style Label)	Specifies the layout node style label of this presentation element. The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description
qsCatId (Current Style Category)	Specifies the identifier of the category of the currently applied quick style. The possible values for this attribute are defined by the XML Schema string datatype.
qsTypeId (Current Style Type)	Specifies the identifier of the currently applied quick style. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ElemPropSet">
   <sequence>
      <element name="presLayoutVars" type="CT_LayoutVariablePropertySet" minOccurs="0"
        maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="presAssocID" type="ST_ModelId" use="optional"/>
   <attribute name="presName" type="xsd:string" use="optional"/>
   <attribute name="presStyleLbl" type="xsd:string" use="optional"/>
   <attribute name="presStyleIdx" type="xsd:int" use="optional"/>
   <attribute name="presStyleCnt" type="xsd:int" use="optional"/>
   <attribute name="loTypeId" type="xsd:string" use="optional"/>
   <attribute name="loCatId" type="xsd:string" use="optional"/>
   <attribute name="qsTypeId" type="xsd:string" use="optional"/>
   <attribute name="qsCatId" type="xsd:string" use="optional"/>
   <attribute name="csTypeId" type="xsd:string" use="optional"/>
   <attribute name="csCatId" type="xsd:string" use="optional"/>
   <attribute name="coherent3DOff" type="xsd:boolean" use="optional"/>
   <attribute name="phldrT" type="xsd:string" use="optional"/>
   <attribute name="phldr" type="xsd:boolean" use="optional"/>
   <attribute name="custAng" type="xsd:int" use="optional"/>
   <attribute name="custFlipVert" type="xsd:boolean" use="optional"/>
   <attribute name="custFlipHor" type="xsd:boolean" use="optional"/>
   <attribute name="custSzX" type="xsd:int" use="optional"/>
   <attribute name="custSzY" type="xsd:int" use="optional"/>
   <attribute name="custScaleX" type="xsd:int" use="optional"/>
   <attribute name="custScaleY" type="xsd:int" use="optional"/>
   <attribute name="custT" type="xsd:boolean" use="optional"/>
   <attribute name="custLinFactX" type="xsd:int" use="optional"/>
   <attribute name="custLinFactY" type="xsd:int" use="optional"/>
   <attribute name="custLinFactNeighborX" type="xsd:int" use="optional"/>
   <attribute name="custLinFactNeighborY" type="xsd:int" use="optional"/>
   <attribute name="custRadScaleRad" type="xsd:int" use="optional"/>
   <attribute name="custRadScaleInc" type="xsd:int" use="optional"/>
</complexType>
```

5.9.3.5 pt (Point)

This element defines a point in DiagramML. A point in DiagramML is defined to hold data associated with a particular point or node in a diagram. Transitions between nodes in a diagram along with the nodes themselves are defined as different types of points. A point is not only responsible for holding the data associated with a

node in a diagram, but also for holding customization properties made to the text and shape associated with the particular node.

[*Example*: Consider the following example of a pt in DiagramML:

```
<pt modelId="{C6A8900D-3F1B-4F1D-A514-4E8BDD964568}">
    <prSet phldrT="[Text]"/>
    <spPr/>
    <t>
          <bodyPr/>
          <lstStyle/>
          <p>
                <r>
                      <rPr lang="en-US" smtClean="0"/>
                      <t>Text 2</t>
                </r>
                <endParaRPr lang="en-US" dirty="0"/>
          </p>
    </t>
</pt>
```

In this example we define a point which holds the data associated with a node in a diagram. The actual text in the diagram is defined in the text body, t, tag and consists of the string "Text 2". There are no overrides made to the shape properties and placeholder text defined for this node when there is no text body present. *end example*]

Parent Elements
ptLst (§5.9.3.6)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13
prSet (Property Set)	§5.9.3.4
spPr (Shape Properties)	§5.9.3.7
t (Text Body)	§5.9.3.8

Attributes	Description
cxnId (Connection Identifier)	The model identifier of the connection that represents the transition node. [*Example*: Consider the following example of a cxnId: `<dgm:pt modelId="5" type="parTrans" cxnId="9">`

Attributes	Description
	<dgm:prSet/> <dgm:spPr/> </dgm:pt> In this example we define the connection related to this point to reference connection 9. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).
modelId (Model Identifier)	The unique identifier of the element within the data model. This identifier should be unique only relative to the containing data model. [*Example*: Consider the following example of a cxnId: <dgm:pt modelId="5" type="parTrans" cxnId="9"> <dgm:prSet/> <dgm:spPr/> </dgm:pt> In this example we define the point type is to be 5. *end example*] The possible values for this attribute are defined by the ST_ModelId simple type (§5.9.7.42).
type (Point Type)	The type of point that this is. [*Example*: Consider the following example of a cxnId: <dgm:pt modelId="5" type="parTrans" cxnId="9"> <dgm:prSet/> <dgm:spPr/> </dgm:pt> In this example the point type is defined as a parTrans point type. *end example*] The possible values for this attribute are defined by the ST_PtType simple type (§5.9.7.50).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Pt">
   <sequence>
      <element name="prSet" type="CT_ElemPropSet" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="t" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="modelId" type="ST_ModelId" use="required"/>
   <attribute name="type" type="ST_PtType" use="optional" default="node"/>
   <attribute name="cxnId" type="ST_ModelId" use="optional" default="0"/>
</complexType>
```

5.9.3.6 ptLst (Point List)

This element simply holds a list of points within the data model.

[*Example*: Consider the following example of a very simple point list in DiagramML:

```
<dgm:ptLst>
    <dgm:pt modelId="0" type="doc"/>
    <dgm:pt modelId="1"/>
    <dgm:pt modelId="2"/>
    <dgm:pt modelId="3"/>
    <dgm:pt modelId="4"/>
    <dgm:pt modelId="5"/>
    <dgm:pt modelId="6"/>
</dgm:ptLst>
```

In this example we define a single document type point and five node type points. *end example*]

Parent Elements
dataModel (§5.9.2.10)

Child Elements	Subclause
pt (Point)	§5.9.3.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PtList">
   <sequence>
      <element name="pt" type="CT_Pt" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.3.7 spPr (Shape Properties)

This element specifies the properties for a single shape in a diagram's data, as defined using DrawingML child elements.

Parent Elements
pt (§5.9.3.5)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26

sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

Attributes	Description
bwMode (Black and White Mode) Namespace: .../drawingml/2006/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

5.9.3.8 t (Text Body)

Text body containing the default body, paragraph and character properties. There should be a signle paragraph and no text runs. Any runs in the first paragraph and paragraphs in addition to the first are ignored.

Parent Elements
pt (§5.9.3.5)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
   <sequence>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.3.9 whole (Whole E2O Formatting)

Formatting that applies to the entire diagram object, and not just the background, includes line and effect properties.

Parent Elements
dataModel (§5.9.2.10)

Child Elements	Subclause
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
ln (Outline)	§5.1.2.1.24

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WholeE2oFormatting">
   <sequence>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.9.4 Color Information

This section defines the coloring information that is to be associated with a diagram.

5.9.4.1 cat (Color Transform Category)

This element specifies the category in the user interface that a color transform is to be displayed within.

[*Example*: Consider the following example of a cat in DiagramML:

```
<dgm:cat type="mainScheme" pri="10300"/>
```

In this example we see a cat defined with a type and priority. *end example*]

Parent Elements
catLst (§5.9.4.2)

Attributes	Description
pri (Priority)	The priority within the category for this color variation determines the order in which it will display in the user interface. The lower numbers are to be displayed at the beginning of the list. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Category Type)	The category type used to organize the color transforms in the user interface. The possible values for this attribute are defined by the XML Schema anyURI datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CTCategory">
   <attribute name="type" type="xsd:anyURI" use="required"/>
   <attribute name="pri" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.9.4.2 catLst (Color Transform Category List)

This element defines a list of color transform categories. This list can be used to populate user interface components which could separate color transforms into categories.

[*Example*: Consider the following example of a catLst in DiagramML:

```
<dgm:catLst>
     <dgm:cat type="mainScheme" pri="10300"/>
</dgm:catLst>
```

In this example we see a catLst defined which holds a single *color transform category* (§5.9.4.1). *end example*]

Parent Elements
colorsDef (§5.9.4.3); colorsDefHdr (§5.9.4.4)

Child Elements	Subclause
cat (Color Transform Category)	§5.9.4.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CTCategories">
   <sequence minOccurs="0" maxOccurs="unbounded">
      <element name="cat" type="CT_CTCategory" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.4.3 colorsDef (Color Transform Definitions)

This element is the root element for color transforms. Held within this element are all of the available color transforms themselves along with other elements and attributes associated with defining the general color transform properties and attributes.

[*Example*: Consider the following example of a colorsDef in DiagramML:

```
<dgm:colorsDef
xmlns:dgm="http://schemas.openxmlformats.org/drawingml/2006/3/diagram"
xmlns:a="http://schemas.openxmlformats.org/drawingml/2006/3/main"
uniqueId="urn:microsoft.com/office/officeart/2005/8/colors/accent0_3"
minVer="12.0">
    <dgm:title lang="" val=""/>
    <dgm:desc lang="" val=""/>
    <dgm:catLst>
          <dgm:cat type="mainScheme" pri="10300"/>
    </dgm:catLst>
    <dgm:styleLbl name="node0">
          ...
```

```
    </dgm:styleLbl>
    ...
</dgm:colorsDef>
```

In this example we see a sampling of a colorsDef being defined with a number of styleLbl elements held within the colorsDef. *end example*]

Parent Elements
Root element of DrawingML Diagram Colors part

Child Elements	Subclause
catLst (Color Transform Category List)	§5.9.4.2
desc (Description)	§5.9.4.6
extLst (Extension List)	§5.9.2.13
styleLbl (Style Label)	§5.9.4.10
title (Title)	§5.9.4.11

Attributes	Description

minVer (Minimum Version)	The minimum product version that can support this color transform.
	
	[*Example*: Consider the following example:
	
	`<colorsDef uniqueId="urn:colors/accent0_3" minVer="12.0">`
	`...`
	`</colorsDef>`
	
	In this example we see the minVer set to `12.0`. *end example*]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

uniqueId (Unique ID)	A unique id associated with the color transform definition.
	
	[*Example*: Consider the following example:
	
	`<colorsDef uniqueId="urn:colors/accent0_3" minVer="12.0">`
	`...`
	`</colorsDef>`
	
	In this example we see the uniqueId set to `urn:colors/accent0_3`. *end example*]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorTransform">
   <sequence>
      <element name="title" type="CT_CTName" minOccurs="0" maxOccurs="unbounded"/>
      <element name="desc" type="CT_CTDescription" minOccurs="0" maxOccurs="unbounded"/>
      <element name="catLst" type="CT_CTCategories" minOccurs="0"/>
      <element name="styleLbl" type="CT_CTStyleLabel" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="uniqueId" type="xsd:string" use="optional" default=""/>
   <attribute name="minVer" type="xsd:string" use="optional"
     default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
</complexType>
```

5.9.4.4 colorsDefHdr (Color Transform Definition Header)

This element specifies header information associated with a color transform definition. The header information is used by an application to preprocess required data in order to help with possible performance concerns associated with an initial full load of a color transform definition.

[*Example*: Consider the following example of a colorsDefHdr within DiagramML:

```
<colorsDefHdr uniqueId="urn:colors/accent0_1">
    <title val="Main 1" />
    <desc val="" />
    <catLst>
        <cat type="mainScheme" pri="10100" />
    </catLst>
</colorsDefHdr>
```

In this example we see a color transform definition header which defines a title and category for a set of color transforms. *end example*]

Parent Elements
colorsDefHdrLst (§5.9.4.5)

Child Elements	Subclause
catLst (Color Transform Category List)	§5.9.4.2
desc (Description)	§5.9.4.6
extLst (Extension List)	§5.9.2.13
title (Title)	§5.9.4.11

Attributes	Description
minVer (Minimum	The minimum product version that can support the associated color transform definition.

Attributes	Description
Version)	The possible values for this attribute are defined by the XML Schema string datatype.
resId (Resource ID)	This attribute is the id which associates this header to the actual color transform definition. The possible values for this attribute are defined by the XML Schema int datatype.
uniqueId (Unique ID)	This attribute defines a unique identifier for the associated color transform definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorTransformHeader">
   <sequence>
      <element name="title" type="CT_CTName" minOccurs="1" maxOccurs="unbounded"/>
      <element name="desc" type="CT_CTDescription" minOccurs="1" maxOccurs="unbounded"/>
      <element name="catLst" type="CT_CTCategories" minOccurs="0"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="uniqueId" type="xsd:string" use="required"/>
   <attribute name="minVer" type="xsd:string" use="optional"
     default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
   <attribute name="resId" type="xsd:int" use="optional" default="0"/>
</complexType>
```

5.9.4.5 colorsDefHdrLst (Color Transform Header List)

This element is simply a list of color transform definition headers and is used to consolidate multiple headers in a group.

Child Elements	Subclause
colorsDefHdr (Color Transform Definition Header)	§5.9.4.4

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorTransformHeaderLst">
   <sequence>
      <element name="colorsDefHdr" type="CT_ColorTransformHeader" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.4.6 desc (Description)

This element holds a description for a color definition. The description can be used to describe the qualities associated with a particular color transform definition.

Parent Elements

Parent Elements
colorsDef (§5.9.4.3); colorsDefHdr (§5.9.4.4)

Attributes	Description
lang (Language)	The natural language of the color transform definition. The possible values for this attribute are defined by the XML Schema string datatype.
val (Description Value)	The string which is used as the description of the color transform definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CTDescription">
   <attribute name="lang" type="xsd:string" use="optional" default=""/>
   <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

5.9.4.7 effectClrLst (Effect Color List)

This element defines a list of colors applied to effects within a color transform.

[*Example*: Consider the following example of an effectClrLst in DiagramML:

```
<dgm:effectClrLst meth="repeat">
    <a:schemeClr val="dk2">
          <a:tint val="60000"/>
    </a:schemeClr>
</dgm:effectClrLst>
```

In this example we see a single color defined in the effectClrLst, more specifically we see a scheme color being utilized with a tint applied to the color. *end example*]

Parent Elements
styleLbl (§5.9.4.10)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) will occur.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*]
	
	The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).

meth (Color Application Method Type)	The type of method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example and lnClrLst is defined using the `repeat` color application method. *end example*]
	
	The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Colors">
   <sequence>
      <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
   <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
</complexType>
```

5.9.4.8 fillClrLst (Fill Color List)

This element defines a list of colors which are used as fill colors in the color transform. The fill colors define the color of the nodes in a diagram.

[*Example*: Consider the following example of a fillClrLst in DiagramML:

```
<dgm:fillClrLst meth="repeat">
     <a:schemeClr val="dk2"/>
</dgm:fillClrLst>
```

In this example the fillClrList contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Parent Elements
styleLbl (§5.9.4.10)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) will occur.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*]
	
	The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).

meth (Color Application Method Type)	The type of method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`

Attributes	Description
	<a:tint val="60000"/> </a:schemeClr> </dgm:lnClrLst> In this example and lnClrLst is defined using the repeat color application method. *end example*] The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Colors">
   <sequence>
      <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
   <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
</complexType>
```

5.9.4.9 linClrLst (Line Color List)

This element defines a list of colors which are used as line colors in the color transform. The line colors define the color of the lines used on a given node in a diagram

[*Example*: Consider the following example of a lnClrLst in DiagramML:

```
<dgm:lnClrLst meth="repeat">
     <a:schemeClr val="dk2"/>
</dgm:lnClrLst>
```

In this example the lnClrList contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Parent Elements
styleLbl (§5.9.4.10)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) will occur.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*]
	
	The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).

meth (Color Application Method Type)	The type of method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example and lnClrLst is defined using the `repeat` color application method. *end example*]
	
	The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Colors">
   <sequence>
      <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
   <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
</complexType>
```

5.9.4.10 styleLbl (Style Label)

This element defines a style label. The style label is used to define a color transform that is applied to a given node in a diagram.

[*Example*: Consider the following example of a styleLbl in DiagramML:

```
<dgm:styleLbl name="exampleStyleLabel">
    <dgm:fillClrLst>
          <a:schemeClr val="accent2"/>
          <a:schemeClr val="accent3"/>
    </dgm:fillClrLst>
    <dgm:linClrLst meth="repeat">
          <a:schemeClr val="lt1"/>
    </dgm:linClrLst>
    <dgm:effectClrLst/>
    <dgm:txLinClrLst/>
    <dgm:txFillClrLst/>
    <dgm:txEffectClrLst/>
</dgm:styleLbl>
```

In this example we see a style label defined in its entirety. This style label can be used on a layout node in order to define the color transform that is to be applied to the node. *end example*]

Parent Elements
colorsDef (§5.9.4.3)

Child Elements	Subclause
effectClrLst (Effect Color List)	§5.9.4.7
extLst (Extension List)	§5.9.2.13
fillClrLst (Fill Color List)	§5.9.4.8
linClrLst (Line Color List)	§5.9.4.9
txEffectClrLst (Text Effect Color List)	§5.9.4.12
txFillClrLst (Text Fill Color List)	§5.9.4.13
txLinClrLst (Text Line Color List)	§5.9.4.14

Attributes	Description

name (Name)	A name given to the style label. This name can be referenced by layout nodes in order to apply the style label to the layout node.
	
	[*Example*: Consider the following example of a styleLbl in DiagramML:
	`<dgm:styleLbl name="exampleStyleLabel">`
	`...`
	`</dgm:styleLbl>`
	
	In this example we see a style label defined with the name `exampleStyleLabel`

Attributes	Description
	defined. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CTStyleLabel">
   <sequence>
      <element name="fillClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
      <element name="linClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
      <element name="effectClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
      <element name="txLinClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
      <element name="txFillClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
      <element name="txEffectClrLst" type="CT_Colors" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="xsd:string" use="required"/>
</complexType>
```

5.9.4.11 title (Title)

The name or title given to the color definition header.

Parent Elements
colorsDef (§5.9.4.3); colorsDefHdr (§5.9.4.4)

Attributes	Description
lang (Language)	The natural language of the title or description of a color transform definition. The possible values for this attribute are defined by the XML Schema string datatype.
val (Description Value)	A string used for a description of a color transform definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CTName">
   <attribute name="lang" type="xsd:string" use="optional" default=""/>
   <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

5.9.4.12 txEffectClrLst (Text Effect Color List)

This element defines a list of colors which are used as text effect colors in the color transform. The text effect colors define the color of the text effects used on a given node in a diagram

[*Example*: Consider the following example of a txEffectClrLst in DiagramML:

```
<dgm:txEffectClrLst meth="repeat">
     <a:schemeClr val="dk2"/>
</dgm:txEffectClrLst>
```

In this example the txEffectClrLst contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Parent Elements
styleLbl (§5.9.4.10)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) will occur.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*]
	
	The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).

meth (Color Application Method Type)	The type of method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`

Attributes	Description
	</dgm:lnClrLst> In this example and lnClrLst is defined using the repeat color application method. *end example*] The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Colors">
   <sequence>
      <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
   <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
</complexType>
```

5.9.4.13 txFillClrLst (Text Fill Color List)

This element defines a list of colors which are used as text colors in the color transform. The text colors define the color of the text used in a given node in a diagram

[*Example*: Consider the following example of a txFillClrLst in DiagramML:

```
<dgm:txFillClrLst meth="repeat">
     <a:schemeClr val="dk2"/>
</dgm:txFillClrLst>
```

In this example the txFillClrLst contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Parent Elements
styleLbl (§5.9.4.10)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) will occur.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*]
	
	The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).

meth (Color Application Method Type)	The type of method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example and lnClrLst is defined using the `repeat` color application method. *end example*]
	
	The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Colors">
   <sequence>
      <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
   <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
</complexType>
```

5.9.4.14 txLinClrLst (Text Line Color List)

This element defines a list of colors which are used as text line colors in the color transform. The text line colors define the color of the line on text used in a given node in a diagram

[*Example*: Consider the following example of a txLinClrLst in DiagramML:

```
<dgm:txLinClrLst meth="repeat">
     <a:schemeClr val="dk2"/>
</dgm:txLinClrLst>
```

In this example the txLinClrLst contains a single scheme color and is utilizing the repeat method for color application. *end example*]

Parent Elements
styleLbl (§5.9.4.10)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description

hueDir (Hue Direction)	The direction around the color wheel the hue shift (if defined) will occur.
	
	[*Example*: Consider the following example of a hueDir in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`
	`</dgm:lnClrLst>`
	
	In this example an lnClrLst is defined with a hue direction defined as clockwise. *end example*]
	
	The possible values for this attribute are defined by the ST_HueDir simple type (§5.9.7.37).

meth (Color Application Method Type)	The type of method used to apply the color transform.
	
	[*Example*: Consider the following example of a meth in use:
	
	`<dgm:lnClrLst hueDir="cw" meth="repeat">`
	`  <a:schemeClr val="dk2">`
	`  <a:tint val="60000"/>`
	`  </a:schemeClr>`

Attributes	Description
	</dgm:lnClrLst> In this example and lnClrLst is defined using the repeat color application method. *end example*] The possible values for this attribute are defined by the ST_ClrAppMethod simple type (§5.9.7.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Colors">
   <sequence>
      <group ref="a:EG_ColorChoice" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="meth" type="ST_ClrAppMethod" use="optional" default="span"/>
   <attribute name="hueDir" type="ST_HueDir" use="optional" default="cw"/>
</complexType>
```

5.9.5 Style Definitions

This section describes the styling information to be associated with a diagram.

5.9.5.1 cat (Category)

The category in the user interface where this quick style will display in the user interface.

[*Example*: Consider the following example of a cat in use in DiagramML:

```
<catLst>
    <cat type="3D" pri="11100"/>
</catLst>
```

In this example we see a 3D category type being defined with a priority of 11100. *end example*]

Parent Elements
catLst (§5.9.5.2)

Attributes	Description
pri (Priority)	The priority within the category for this style determines the order in which it will display in the user interface. Lower numbers are displayed at the beginning of the list. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Category Type)	Category type. This is used to organize the quick style in the user interface. The possible values for this attribute are defined by the XML Schema anyURI datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SDCategory">
   <attribute name="type" type="xsd:anyURI" use="required"/>
   <attribute name="pri" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.9.5.2 catLst (Category List)

This element is simply a list of categories.

[*Example*: Consider the following example of a catLst in use in DiagramML:

```
<catLst>
    <cat type="Simple" pri="10000"/>
    <cat type="3D" pri="11100"/>
</catLst>
```

In this example two categories defined in the category list. *end example*]

Parent Elements
styleDef (§5.9.5.7); styleDefHdr (§5.9.5.8)

Child Elements	Subclause
cat (Category)	§5.9.5.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SDCategories">
   <sequence minOccurs="0" maxOccurs="unbounded">
      <element name="cat" type="CT_SDCategory" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.5.3 desc (Style Label Description)

This element defines a description for a style label definition. The description is simply a string describing the characteristics of the style label definition.

[*Example*: Consider the following example of the desc element in DiagramML:

```
<desc lang="" val="3-D Style 1"/>
```

In this example we define the description to be `3-D Style 1`. *end example*]

Parent Elements
styleDef (§5.9.5.7); styleDefHdr (§5.9.5.8)

Attributes	Description
lang (Natural Language)	The natural language of the title or description of this quick style. The possible values for this attribute are defined by the XML Schema string datatype.
val (Description Value)	The string used for the description. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SDDescription">
   <attribute name="lang" type="xsd:string" use="optional" default=""/>
   <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

5.9.5.4 presLayoutVars (Presentation Layout Variables)

This element specified the layout property set. This set of properties determine different aspects concerning the layout of a diagram. All of the elements associated with enabling or disabling aspects of the user interface are also defined here.

Parent Elements
prSet (§5.9.3.4)

Child Elements	Subclause
animLvl (Level Animation)	§5.9.6.1
animOne (One by One Animation String)	§5.9.6.2
bulletEnabled (Show Insert Bullet)	§5.9.6.3
chMax (Maximum Children)	§5.9.6.4
chPref (Preferred Number of Children)	§5.9.6.5
dir (Diagram Direction)	§5.9.6.6
hierBranch (Organization Chart Branch Style)	§5.9.6.7
orgChart (Show Organization Chart User Interface)	§5.9.6.8
resizeHandles (Shape Resize Style)	§5.9.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutVariablePropertySet">
   <sequence>
      <element name="orgChart" type="CT_OrgChart" minOccurs="0" maxOccurs="1"/>
      <element name="chMax" type="CT_ChildMax" minOccurs="0" maxOccurs="1"/>
      <element name="chPref" type="CT_ChildPref" minOccurs="0" maxOccurs="1"/>
      <element name="bulletEnabled" type="CT_BulletEnabled" minOccurs="0" maxOccurs="1"/>
      <element name="dir" type="CT_Direction" minOccurs="0" maxOccurs="1"/>
      <element name="hierBranch" type="CT_HierBranchStyle" minOccurs="0" maxOccurs="1"/>
      <element name="animOne" type="CT_AnimOne" minOccurs="0" maxOccurs="1"/>
      <element name="animLvl" type="CT_AnimLvl" minOccurs="0" maxOccurs="1"/>
      <element name="resizeHandles" type="CT_ResizeHandles" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.9.5.5 scene3d (3-D Scene)

The 3-D scene which consists of a camera, a light rig, and an optional backdrop to catch shadows.

Parent Elements
styleDef (§5.9.5.7); styleLbl (§5.9.5.10)

Child Elements	Subclause
backdrop (Backdrop Plane)	§5.1.7.2
camera (Camera)	§5.1.7.5
extLst (Extension List)	§5.1.2.1.15
lightRig (Light Rig)	§5.1.7.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Scene3D">
   <sequence>
      <element name="camera" type="CT_Camera" minOccurs="1" maxOccurs="1"/>
      <element name="lightRig" type="CT_LightRig" minOccurs="1" maxOccurs="1"/>
      <element name="backdrop" type="CT_Backdrop" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.9.5.6 sp3d (3-D Shape Properties)

A set of 3-D properties which a shape can contain.

Parent Elements
styleLbl (§5.9.5.10)

Child Elements	Subclause
bevelB (Bottom Bevel)	§5.1.7.3
bevelT (Top Bevel)	§5.1.7.4
contourClr (Contour Color)	§5.1.7.6
extLst (Extension List)	§5.1.2.1.15
extrusionClr (Extrusion Color)	§5.1.7.7

Attributes	Description
contourW (Contour Width) Namespace: .../drawingml/2006/main	Defines the width of the contour on the shape. [*Example*: Consider the following example of a contourW in use within the sp3d element: `<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> >/a:sp3d>` In this example, we see a countourW defined as `50800`. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
extrusionH (Extrusion Height) Namespace: .../drawingml/2006/main	Defines the height of the extrusion applied to the shape. [*Example*: Consider the following example of an extrusionH in use within the sp3d element: `<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> < <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr>`

Attributes	Description
	</a:sp3d> In this example, we see a extrusionH defined as 165100. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
prstMaterial (Preset Material Type) Namespace: .../drawingml/2006/main	Defines the preset material which is combined with the lighting properties to give the final look and feel of a shape. [*Example*: Consider the following example of a prstMaterial in use within the sp3d element: <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </a:sp3d> In this example, we see a prstMaterial defined as plastic. *end example*] The possible values for this attribute are defined by the ST_PresetMaterialType simple type (§5.1.12.50).
z (Shape Depth) Namespace: .../drawingml/2006/main	Defines the z coordinate for the 3D shape. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape3D">
   <sequence>
      <element name="bevelT" type="CT_Bevel" minOccurs="0" maxOccurs="1"/>
      <element name="bevelB" type="CT_Bevel" minOccurs="0" maxOccurs="1"/>
      <element name="extrusionClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="contourClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="z" type="ST_Coordinate" use="optional" default="0"/>
   <attribute name="extrusionH" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="contourW" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="prstMaterial" type="ST_PresetMaterialType" use="optional" default="warmMatte"/>
</complexType>
```

5.9.5.7 styleDef (Style Definition)

This element is the root tag for a style definition.

[*Example*: Consider the following example of a styleDef in DiagramML:

```
<dgm:styleDef
xmlns:dgm="http://schemas.openxmlformats.org/drawingml/2006/3/diagram"
xmlns:a="http://schemas.openxmlformats.org/drawingml/2006/3/main"
uniqueId="urn:microsoft.com/office/officeart/2005/8/quickstyle/3d1"
minVer="12.0">
    <dgm:title lang="" val="3-D Style 1"/>
    <dgm:desc lang="" val="3-D Style 1"/>
    <dgm:catLst>
          <dgm:cat type="3D" pri="11100"/>
    </dgm:catLst>
    <dgm:scene3d>
          <a:camera prst="orthographicFront"/>
          <a:lightRig rig="threePt" dir="t"/>
    </dgm:scene3d>
    <dgm:style>
                    ...
    </dgm:style>
    <dgm:styleLbl name="node0">
          <dgm:scene3d>
                <a:camera prst="orthographicFront"/>
                <a:lightRig rig="flat" dir="t"/>
          </dgm:scene3d>
          <dgm:sp3d prstMaterial="flat">
                <a:bevelT w="120900" h="88900"/>
                <a:bevelB w="88900" h="31750" prst="angle"/>
          </dgm:sp3d>
```

```
            <dgm:txPr/>
            <dgm:style>
                  <a:lnRef idx="0">
                        <a:scrgbClr r="0" g="0" b="0"/>
                  </a:lnRef>
                  <a:fillRef idx="3">
                        <a:scrgbClr r="0" g="0" b="0"/>
                  </a:fillRef>
                  <a:effectRef idx="2">
                        <a:scrgbClr r="0" g="0" b="0"/>
                  </a:effectRef>
                  <a:fontRef idx="minor">
                        <a:schemeClr val="lt1"/>
                  </a:fontRef>
            </dgm:style>
      </dgm:styleLbl>
...
</styleDef>
```

In this example we see a styleDef being defined along with many properties. *end example*]

Parent Elements
Root element of DrawingML Diagram Style part

Child Elements	Subclause
catLst (Category List)	§5.9.5.2
desc (Style Label Description)	§5.9.5.3
extLst (Extension List)	§5.9.2.13
scene3d (3-D Scene)	§5.9.5.5
styleLbl (Style Label)	§5.9.5.10
title (Title)	§5.9.5.11

Attributes	Description

minVer (Minimum Version)	The minimum product version that can support this quick style.
	
	[*Example*: Consider the following example of a styleDef in DiagramML:
	
	`<styleDef uniqueId="urn:quickstyle/3d1" minVer="12.0">`
	
	`...`

Attributes	Description
	</styleDef> In this example we see the minVer defined to be 12.0. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
uniqueId (Unique Style ID)	Unique ID that identifies a style. [*Example*: Consider the following example of a styleDef in DiagramML: <styleDef uniqueId="urn:quickstyle/3d1" minVer="12.0"> ... </styleDef> In this example we see the uniqueId defined to be urn:quickstyle/3d1. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleDefinition">
   <sequence>
      <element name="title" type="CT_SDName" minOccurs="0" maxOccurs="unbounded"/>
      <element name="desc" type="CT_SDDescription" minOccurs="0" maxOccurs="unbounded"/>
      <element name="catLst" type="CT_SDCategories" minOccurs="0"/>
      <element name="scene3d" type="a:CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="styleLbl" type="CT_StyleLabel" minOccurs="1" maxOccurs="unbounded"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="uniqueId" type="xsd:string" use="optional" default=""/>
   <attribute name="minVer" type="xsd:string" use="optional"
     default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
</complexType>
```

5.9.5.8 styleDefHdr (Style Definition Header)

This element specifies header information associated with a style definition. The header information is used by an application to preprocess required data in order to help with possible performance concerns associated with an initial full load of a color transform definition.

[*Example*: Consider the following example of a styleDefHdr element within DiagramML:

```
<styleDefHdr uniqueId="urn:quicktyle/3d1">
    <title val="3D" />
```

```
      <desc val="" />
      <catLst>
          <cat type="3D" pri="10100" />
      </catLst>
  </ styleDefHdr >
```

In this example we see a style definition header which defines a title and category for a set of style definitions. *end example*]

Parent Elements
styleDefHdrLst (§5.9.5.9)

Child Elements	Subclause
catLst (Category List)	§5.9.5.2
desc (Style Label Description)	§5.9.5.3
extLst (Extension List)	§5.9.2.13
title (Title)	§5.9.5.11

Attributes	Description
minVer (Minimum Version)	The minimum product version that can support this quick style. The possible values for this attribute are defined by the XML Schema string datatype.
resId (Resource ID)	This attribute is the id which associates this header to the actual style definition part. The possible values for this attribute are defined by the XML Schema int datatype.
uniqueId (Unique Style ID)	This attribute defines a unique identifier for the associated style definition. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleDefinitionHeader">
   <sequence>
      <element name="title" type="CT_SDName" minOccurs="1" maxOccurs="unbounded"/>
      <element name="desc" type="CT_SDDescription" minOccurs="1" maxOccurs="unbounded"/>
      <element name="catLst" type="CT_SDCategories" minOccurs="0"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="uniqueId" type="xsd:string" use="required"/>
   <attribute name="minVer" type="xsd:string" use="optional"
     default="http://schemas.openxmlformats.org/drawingml/2006/diagram"/>
   <attribute name="resId" type="xsd:int" use="optional" default="0"/>
</complexType>
```

5.9.5.9 styleDefHdrLst (List of Style Definition Headers)

This element is simply a list of style definition headers and is used to consolidate multiple headers into one group.

Child Elements	Subclause
styleDefHdr (Style Definition Header)	§5.9.5.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleDefinitionHeaderLst">
   <sequence>
      <element name="styleDefHdr" type="CT_StyleDefinitionHeader" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.9.5.10 styleLbl (Style Label)

This element defines the actual style which is applied to a node in a diagram The style is referenced from within layout node. The style label contains formatting (without defining color) such as the 3D properties and text properties associated with a shape.

[*Example*: Consider the following example of a styleLbl in DiagramML:

```
<styleLbl name="node0">
   <scene3d>
         <camera prst="orthographicFront"/>
         <lightRig rig="flat" dir="t"/>
   </scene3d>
   <sp3d prstMaterial="flat">
         <bevelT w="120900" h="88900"/>
         <bevelB w="88900" h="31750" prst="angle"/>
   </sp3d>
   <txPr/>
   <style>
         <lnRef idx="0">
               <scrgbClr r="0" g="0" b="0"/>
         </lnRef>
         <fillRef idx="3">
               <scrgbClr r="0" g="0" b="0"/>
         </fillRef>
         <effectRef idx="2">
               <scrgbClr r="0" g="0" b="0"/>
         </effectRef>
         <fontRef idx="minor">
               <schemeClr val="lt1"/>
```

```
            </fontRef>
        </style>
    </styleLbl>
```

In this example we see a styleLbl defined which sets 3D properties for the scene, shape 3D properties, line, fill, effect and font properties. *end example*]

Parent Elements
styleDef (§5.9.5.7)

Child Elements	Subclause
extLst (Extension List)	§5.9.2.13
scene3d (3-D Scene)	§5.9.5.5
sp3d (3-D Shape Properties)	§5.9.5.6
style (Shape Style)	§5.9.2.28
txPr (Text Properties)	§5.9.5.12

Attributes	Description
name (Style Name)	The name of the style. This apears as the tooltip in the user interface. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleLabel">
   <sequence>
      <element name="scene3d" type="a:CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="sp3d" type="a:CT_Shape3D" minOccurs="0" maxOccurs="1"/>
      <element name="txPr" type="CT_TextProps" minOccurs="0" maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="a:CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="xsd:string" use="required"/>
</complexType>
```

5.9.5.11 title (Title)

This element defines the title given to a style definition header. The title is simply a name for the style definition.

[*Example*: Consider the following example of title being used in DiagramML:

```
<styleDefHdr uniqueId="urn:quickstyle/3d1" minVer="12.0">
     <title val="My Title"/>
```

```
        <desc val="My Description"/>

        ...

    </styleDefHdr>
```

In this example we see the title being set to `My Title`. *end example*]

Parent Elements
styleDef (§5.9.5.7); styleDefHdr (§5.9.5.8)

Attributes	Description
lang (Natural Language)	The natural language of the title or description of this quick style. The possible values for this attribute are defined by the XML Schema string datatype.
val (Description Value)	The string used for the description. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SDName">
   <attribute name="lang" type="xsd:string" use="optional" default=""/>
   <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

5.9.5.12 txPr (Text Properties)

This element defines special text formatting that can be applied to text through a style label.

Parent Elements
styleLbl (§5.9.5.10)

Child Elements	Subclause
flatTx (No text in 3D scene)	§5.1.7.8
sp3d (Apply 3D shape properties)	§5.1.7.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextProps">
   <sequence>
      <group ref="a:EG_Text3D" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.9.6 Layout Definition

This section specifies the node layout information to be associated with a diagram.

5.9.6.1 animLvl (Level Animation)

This variable is used to indicate the animate by level string which is displayed to a user in the user interface.

[*Example*: Consider the following example of animLvl in use in DiagramML:

```
<varLst>
     <chMax val="1" />
     <dir val="norm" />
     <animLvl val="ctr" />
     <resizeHandles val="exact" />
</varLst>
```

In this example we see that the animLvl is set to `ctr`. This is being defined in a radial type diagram which will allow the user to specify that animation is to start at the center of the diagram. *end example*]

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Level Animation Value)	This attribute indicates the string to use for level animation in the user interface. The possible values for this attribute are defined by the ST_AnimLvlStr simple type (§5.9.7.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimLvl">
   <attribute name="val" type="ST_AnimLvlStr" default="none" use="optional"/>
</complexType>
```

5.9.6.2 animOne (One by One Animation String)

This variable is used to indicate the string to use for one-by-one animation in the user interface. This is used primarily when defining hierarchical diagrams to specify different ways animations applies to different levels of the diagram.

[*Example*: Consider the following example of animOne used in a hierarchical type diagram:

```
<varLst>
     <chPref val="1" />
     <dir val="norm" />
     <animOne val="branch" />
```

```
        <animLvl val="lvl" />
        <resizeHandles val="exact" />
    </varLst>
```

In this example we see that the animOne element is defined to animate the diagram per branch. *end example*]

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (One By One Animation Value)	Specifies the type of one-by-one animation to use for a diagram. The possible values for this attribute are defined by the ST_AnimOneStr simple type (§5.9.7.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimOne">
   <attribute name="val" type="ST_AnimOneStr" default="one" use="optional"/>
</complexType>
```

5.9.6.3 bulletEnabled (Show Insert Bullet)

This element is used to indicate when to enable the 'Insert Bullet' button in the user interface.

[*Example*: Consider the following example of bulletEnabled in DiagramML:

```
<varLst>
    <bulletEnabled val="true" />
</varLst>
```

In this example we see that the insert button in the user interface is to be enabled when the focus is within the containing layout node. *end example*]

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Show Insert Bullet Value)	This attribute is used to indicate when to enable the 'Insert Bullet' button. A value of `true` will enable the insert bullet button. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BulletEnabled">
   <attribute name="val" type="xsd:boolean" default="false" use="optional"/>
</complexType>
```

5.9.6.4 chMax (Maximum Children)

This element is used to indicate when to enable and disable the user interface components associated with adding a new shape to a diagram. This element defines a max number of nodes a diagram can support through the user interface directly.

[*Example*: Consider the following example of chMax usage in DiagramML:

```
<varLst>
    <chMax val="5"/>
    <dir val="norm"/>
    <resizeHandles val="exact" />
</varLst>
```

In this example we define the user interface to only be enabled to insert five nodes. *end example*]

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Maximum Children Value)	This attribute indicates the maximum number of children the node can have before the user interface should be disabled. A value of -1 indicates an infinite number of children. Default value is -1. The possible values for this attribute are defined by the ST_NodeCount simple type (§5.9.7.43).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChildMax">
   <attribute name="val" type="ST_NodeCount" default="-1" use="optional"/>
</complexType>
```

5.9.6.5 chPref (Preferred Number of Children)

This variable indicates the number of children that the current node prefers to have. This determines what the next action of the 'Add Shape' button should be in the user interface.

[*Example*: Consider the following example of chPref being used in DiagramML:

```
<varLst>
    <chMax val="3" />
```

```
      <chPref val="1" />
      <dir val="norm" />
      <animLvl val="lvl" />
      <resizeHandles val="rel" />
   </varLst>
```

In this example, chPref is set to a single node and the user interface will disable after a single node has been inserted. *end example*]

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Preferred Number of CHildren Value)	This attribute indicates the number of children that the current node prefers to have. This determines what the next action of the 'Add Shape' button should be. A value of -1 indicates an infinite number of children. Default value is -1. The possible values for this attribute are defined by the ST_NodeCount simple type (§5.9.7.43).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChildPref">
   <attribute name="val" type="ST_NodeCount" default="-1" use="optional"/>
</complexType>
```

5.9.6.6 dir (Diagram Direction)

This element indicates whether the diagram should switch direction. This element provides the ability to define different behavior for diagrams considering LTR or RTL directions.

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Diagram Direction Value)	This variable indicates whether the diagram should switch direction. The possible values for this attribute are defined by the ST_Direction simple type (§5.9.7.24).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Direction">
   <attribute name="val" type="ST_Direction" default="norm" use="optional"/>
</complexType>
```

5.9.6.7 hierBranch (Organization Chart Branch Style)

This element defines the layout style of a branch in an organizational chart.

[*Example*: Consider the following example of hierBranch being used in DiagramML:

```
<varLst>
    <hierBranch val="init" />
</varLst>
```

In this example the value of hierBranch is defined as `init` which will be a kind of not set state, or initial state. *end example*]

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Organization Chart Branch Style Value)	The value of this attribute indicates the layout style of a branch in an organization chart. The default value is `std`. The possible values for this attribute are defined by the ST_HierBranchStyle simple type (§5.9.7.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HierBranchStyle">
   <attribute name="val" type="ST_HierBranchStyle" default="std" use="optional"/>
</complexType>
```

5.9.6.8 orgChart (Show Organization Chart User Interface)

This element is used to indicate when to show user interface controls specifically associated with organizational charts such as being able to add an assistant to a selected node.

[*Example*: Consider the following example of orgChart used in DiagramML:

```
<varLst>
    <orgChart val="true" />
    <chPref val="1" />
    <dir val="norm" />
    <animOne val="branch" />
    <animLvl val="lvl" />
    <resizeHandles val="rel" />
</varLst>
```

In this example we set the orgChart value to `true` indicating that the organizational chart specific user interface controls are to be enabled when the containing diagram is used. *end example*]

Parent Elements
presLayoutVars (§5.9.5.4); varLst (§5.9.2.31)

Attributes	Description
val (Show Organization Chart User Interface Value)	This attribute value specifies when to show the 'Insert Assistant' user interface control and the 'Change Layout' user interface for this diagram. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OrgChart">
   <attribute name="val" type="xsd:boolean" default="false" use="optional"/>
</complexType>
```

5.9.7 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/drawingml/2006/diagram namespace.

5.9.7.1 ST_AlgorithmType (Algorithm Types)

Types of available algorithms.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
composite (Composite)	The composite algorithm specifies the size and position for all child layout nodes. You can use it to create graphics with a predetermined layout or in combination with other algorithms to create more complex shapes.
conn (Connector Algorithm)	The connector algorithm lays out and routes connecting lines, arrows, and shapes between layout nodes.
cycle (Cycle Algorithm)	The cycle algorithm lays out child layout nodes around a circle or portion of a circle using equal angle spacing.
hierChild (Hierarchy Child Algorithm)	The hierarchy child algorithm works with the hierRoot algorithm to create hierarchical tree layouts. This algorithm aligns and positions its child layout nodes in a linear path under the hierRoot layout node.
hierRoot (Hierarchy Root Algorithm)	The hierarchy root algorithm works with the hierChild algorithm to create hierarchical tree layouts. The hierRoot algorithm aligns and positions the hierRoot

Enumeration Value	Description
	layout node in relation to the hierChild layout nodes.
lin (Linear Algorithm)	The linear algorithm lays out child layout nodes along a linear path.
pyra (Pyramid Algorithm)	The pyramid algorithm lays out child layout nodes along a vertical path and works with the trapezoid shape to create a pyramid.
snake (Snake Algorithm)	The snake algorithm lays out child layout nodes along a linear path in two dimensions, allowing the linear flow to continue across multiple rows or columns.
sp (Space Algorithm)	The space algorithm is used to specify a minimum space between other layout nodes or as an indication to do nothing with the layout node's size and position.
tx (Text Algorithm)	The text algorithm sizes text to fit inside a shape and controls its margins and alignment.

Referenced By
alg@type (§5.9.2.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AlgorithmType" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="composite"/>
      <enumeration value="conn"/>
      <enumeration value="cycle"/>
      <enumeration value="hierChild"/>
      <enumeration value="hierRoot"/>
      <enumeration value="pyra"/>
      <enumeration value="lin"/>
      <enumeration value="sp"/>
      <enumeration value="tx"/>
      <enumeration value="snake"/>
   </restriction>
</simpleType>
```

5.9.7.2 ST_AnimLvlStr (Animation Level String Definition)

This simple type specifies the possible values for the string that should be displayed by a consumer for level animation of this diagram.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
ctr (From Center Animation)	This value specifies that the consumer shall allow "From Center At Once" or "From Center One by One" animation styles for this diagram.
lvl (By Level Animation)	This value specifies that the consumer shall display "By Level" animation types for this diagram.
none (Disable Level At Once)	This value specifies that the consumer shall disable level at once animation.

Referenced By
animLvl@val (§5.9.6.1); ST_FunctionValue (§5.9.7.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimLvlStr" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="lvl"/>
      <enumeration value="ctr"/>
   </restriction>
</simpleType>
```

5.9.7.3 ST_AnimOneStr (One by One Animation Value Definition)

This simple type defines the possible values for the string to use for one by one animation in the UI. Default value is one.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
branch (By Branch One By One)	This value specifies that the one by one animation string in the user interface should read "By Branch One By One".
none (Disable One-by-One)	This value specifies that the consumer should disable one by one animation.
one (One By One)	This value specifies that the one by one animation string in the user interface should read "One By One".

Referenced By
animOne@val (§5.9.6.2); ST_FunctionValue (§5.9.7.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimOneStr" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="one"/>
      <enumeration value="branch"/>
   </restriction>
</simpleType>
```

5.9.7.4 ST_ArrowheadStyle (Arrowhead Styles)

This simple type defines different arrowhead style types for connectors.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
arr (Arrowhead Present)	Specifies that an arrowhead is to be used on the connector.
auto (Auto)	Specifies that the algorithm defines if an arrowhead is to be used on a connector.
noArr (No Arrowhead)	Specifies no arrowhead is to be used on the connector.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ArrowheadStyle" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="auto"/>
      <enumeration value="arr"/>
      <enumeration value="noArr"/>
   </restriction>
</simpleType>
```

5.9.7.5 ST_AutoTextRotation (Auto Text Rotation)

This simple type defines how text rotates within a shape when the shape is rotated by an algorithm during layout.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
grav (Gravity)	Specifies that when the angle of the text hits the

Enumeration Value	Description
	threshold of 90 degrees and 180 degrees, the text rotates by 180 degrees.
none (None)	Specifies that text always rotates with the shape.
upr (Upright)	Specifies that when the text angle hits 45, 135, 225, or 315 degree thresholds, then it rotates by negative 90 degrees.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AutoTextRotation" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="upr"/>
      <enumeration value="grav"/>
   </restriction>
</simpleType>
```

5.9.7.6 ST_AxisType (Axis Type)

This simple type defines different node sets in relation to the current context node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ancst (Ancestor)	Specifies a set of nodes between the current context node and the root node, including the root node. [*Example*: Consider the following example 
Enumeration Value	Description
	end example]
ancstOrSelf (Ancestor or Self)	Specifies a set of nodes between the current context node and the root node, including the root node and the context node. [*Example*: Consider the following example  *end example*]
ch (Child)	Specifies a set of children of the current context node. [*Example*: Consider the following example  *end example*]
des (Descendant)	Specifies a set of all nodes beneath the current context node. [*Example*: Consider the following example

Enumeration Value	Description
	 *end example*]
desOrSelf (Descendant or Self)	Specifies a set of all nodes beneath the current context node, including the context node. [*Example*: Consider the following example  *end example*]
follow (Follow)	Specifies the set of nodes which are peers after the context node and all descendants of the peers. [*Example*: Consider the following example

Enumeration Value	Description
	 *end example*]
followSib (Follow Sibling)	Specifies the set of nodes which are peers after the context node. [*Example*: Consider the following example  *end example*]
none (None)	Specifies no node.
par (Parent)	Specifies the parent node. [*Example*: Consider the following example

Enumeration Value	Description
	 *end example*]
preced (Preceding)	Specifies the set of nodes which are peers before the context node and all the descendants of the peers. [*Example*: Consider the following example  *end example*]
precedSib (Preceding Sibling)	Specifies the set of nodes which are peers before the context node. [*Example*: Consider the following example

Enumeration Value	Description
	 *end example*]
root (Root)	Specifies the top-most node of the diagram. [*Example*: Consider the following example  *end example*]
self (Self)	Specifies the calling context node. [*Example*: Consider the following example  *end example*]

Referenced By
ST_AxisType (§5.9.7.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AxisType" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="self"/>
      <enumeration value="ch"/>
      <enumeration value="des"/>
      <enumeration value="desOrSelf"/>
      <enumeration value="par"/>
      <enumeration value="ancst"/>
      <enumeration value="ancstOrSelf"/>
      <enumeration value="followSib"/>
      <enumeration value="precedSib"/>
      <enumeration value="follow"/>
      <enumeration value="preced"/>
      <enumeration value="root"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

5.9.7.7 ST_AxisTypes (Axis Type List)

This simple type represents a list of axis types.

This simple type allows a list of items of the ST_AxisType simple type (§5.9.7.6).

Referenced By
forEach@axis (§5.9.2.14); if@axis (§5.9.2.15); presOf@axis (§5.9.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AxisTypes">
   <list itemType="ST_AxisType"/>
</simpleType>
```

5.9.7.8 ST_BendPoint (Bend Point)

This simple type defines where a bend is to occur within a connection between two nodes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
beg (Beginning)	The bend is to occur at the beginning of the connection.

Enumeration Value	Description
def (Default)	The default bend is used. By default connections will bend in the center.
end (End)	The bend is to occur at the end of the connection.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BendPoint" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="beg"/>
      <enumeration value="def"/>
      <enumeration value="end"/>
   </restriction>
</simpleType>
```

5.9.7.9 ST_Booleans (Boolean List.)

A list of booleans.

This simple type allows a list of items of the XML Schema boolean datatype.

Referenced By
forEach@hideLastTrans (§5.9.2.14); if@hideLastTrans (§5.9.2.15); presOf@hideLastTrans (§5.9.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Booleans">
   <list itemType="xsd:boolean"/>
</simpleType>
```

5.9.7.10 ST_BoolOperator (Boolean Constraint)

This simple type specified Boolean operations which can be applied to compare constraints.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
equ (Equal)	Equal operator.
gte (Greater Than or Equal to)	Specifies the greater than or equal to Boolean operator.
lte (Less Than or Equal to)	Specifies the less than or equal to Boolean operator.
none (None)	Specifies a none Boolean operator

Referenced By
constr@op (§5.9.2.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BoolOperator" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="equ"/>
      <enumeration value="gte"/>
      <enumeration value="lte"/>
   </restriction>
</simpleType>
```

5.9.7.11 ST_Breakpoint (Breakpoint)

This simple type defines at what point the wrapping of nodes occurs for the snake algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bal (Balanced)	Specifies that the number of nodes in every row and every column should be equal.
endCnv (End of Canvas)	Specifies that nodes are added to the next column or row after filling the current column or row's space.
fixed (Fixed)	Specifies to use a user defined number of nodes in a column or row.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Breakpoint" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="endCnv"/>
      <enumeration value="bal"/>
      <enumeration value="fixed"/>
   </restriction>
</simpleType>
```

5.9.7.12 ST_CenterShapeMapping (Center Shape Mapping)

This simple type defines the behavior of the cycle algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fNode (First Node)	Specifies a node which is always in the center of a cycle diagram.
none (None)	Specifies the normal layout of a cycle diagram.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CenterShapeMapping" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="fNode"/>
   </restriction>
</simpleType>
```

5.9.7.13 ST_ChildAlignment (Child Alignment)

This simple type defines how to align a node in its allocated space.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies to align the node to the bottom.
l (Left)	Specifies to align the node to the left.
r (Right)	Specifies to align the node to the right.
t (Top)	Specifies to align the node to the top.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ChildAlignment" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="t"/>
      <enumeration value="b"/>
      <enumeration value="l"/>
      <enumeration value="r"/>
   </restriction>
</simpleType>
```

5.9.7.14 ST_ChildDirection (Child Direction)

This simple type defines the layout direction of child nodes related to a specific parent node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
horz (Horizontal)	Specifies that the child nodes are to be laid out horizontally.
vert (Vertical)	Specifies that the child nodes are to be laid out vertically.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ChildDirection" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="horz"/>
      <enumeration value="vert"/>
   </restriction>
</simpleType>
```

5.9.7.15 ST_ChildOrderType (Child Order)

This simple type specifies the child order for a given layout node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Child order along the bottom.
t (Top)	Top child order.

Referenced By
layoutNode@chOrder (§5.9.2.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ChildOrderType" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="b"/>
      <enumeration value="t"/>
   </restriction>
</simpleType>
```

5.9.7.16 ST_ClrAppMethod (Color Application Method Type)

This type defines the way a given set of colors is applied to a set of nodes or items across a diagram.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cycle (Cycle)	The colors will apply from A to B to A if A and B were the colors present. [*Example*: Consider the following image as an example of cycle applied to a diagram:  In this example, the color A is applied to node 1 and node 10. Color B is considered the node color between A and A across the diagram. Colors interpolate across the diagram from A to B back to A. *end example*]
repeat (Repeat)	The colors will apply from A through B to A through B if A through B were the colors present.

Enumeration Value	Description
	[*Example*: Consider the following image as an example of repeat applied to a diagram:  In this example, the color A is applied to node 1, the next color to node 2, and so on through color B, then this coloring is repeated until there are no more nodes to color. *end example*]
span (Span)	The colors will interpolate from A to B across the entire diagram if A and B were the colors present. [*Example*: Consider the following image as an example of span applied to a diagram:  In this example, the color A is applied to node 1, the color B is applied to node 10 and the colors applied to nodes 2 through 9 are interpolated between colors A and B. *end example*]

Referenced By
effectClrLst@meth (§5.9.4.7); fillClrLst@meth (§5.9.4.8); linClrLst@meth (§5.9.4.9); txEffectClrLst@meth

Referenced By
(§5.9.4.12); txFillClrLst@meth (§5.9.4.13); txLinClrLst@meth (§5.9.4.14)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ClrAppMethod">
   <restriction base="xsd:token">
      <enumeration value="span"/>
      <enumeration value="cycle"/>
      <enumeration value="repeat"/>
   </restriction>
</simpleType>
```

5.9.7.17 ST_ConnectorDimension (Connector Dimension)

This simple type defines the dimensionality of the connection between two nodes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1D (1 Dimension)	Specifies a one dimensional connection, or rather a line.
2D (2 Dimensions)	Specifies a two dimensional connection which has both width and height.
cust (Custom)	Specifies a custom connection type.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConnectorDimension" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="1D"/>
      <enumeration value="2D"/>
      <enumeration value="cust"/>
   </restriction>
</simpleType>
```

5.9.7.18 ST_ConnectorPoint (Connector Point)

This simple type defines different connection sites available on a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Auto)	Specifies that the algorithm will determine the best connection site to use.
bCtr (Bottom Center)	Specifies that the bottom, center connection site is to be used.
bL (Bottom Left)	Specifies that the bottom, left connection site is to be used.
bR (Bottom Right)	Specifies that the bottom right connection site is to be used.
ctr (Center)	Specifies that the center connection site is to be used.
midL (Middle Left)	Specifies that the middle left connection site is to be used.
midR (Middle Right)	Specifies that the middle right connection site is to be used.
radial (Radial)	Specifies connections along a radial path to support the use of connections in cycle diagrams.
tCtr (Top Center)	Specifies that the top center connection site is to be used.
tL (Top Left)	Specifies that the top left connection site is to be used.
tR (Top Right)	Specifies that the top right connection site is to be used.

      <enumeration value="bL"/>
      <enumeration value="bR"/>
      <enumeration value="tL"/>
      <enumeration value="tR"/>
      <enumeration value="radial"/>
   </restriction>
</simpleType>
```

5.9.7.19 ST_ConnectorRouting (Connector Routing)

This simple type defines how the routing of a connection between two nodes is supposed to progress from node 1 to node 2.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bend (Bending)	Specifies a bending connection which bends at a right angle.
curve (Curve)	Specifies a connection which is curved.
longCurve (Long Curve)	Specifies a connection that is curved that has a greater radius than a simple curved connection.
stra (Straight)	Specifies a straight connection.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConnectorRouting" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="stra"/>
      <enumeration value="bend"/>
      <enumeration value="curve"/>
      <enumeration value="longCurve"/>
   </restriction>
</simpleType>
```

5.9.7.20 ST_ConstraintRelationship (Constraint Relationship)

This simple type specifies the types of constraint relationships which are present and can be used.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ch (Child)	The constraint should reference a child node.
des (Descendant)	The layout node can map to the descendants of the data point.
self (Self)	The layout node maps to the current data point.

Referenced By
constr@for (§5.9.2.8); constr@refFor (§5.9.2.8); rule@for (§5.9.2.24)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConstraintRelationship" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="self"/>
      <enumeration value="ch"/>
      <enumeration value="des"/>
   </restriction>
</simpleType>
```

5.9.7.21 ST_ConstraintType (Constraint Type)

This simple type defines the list of possible constraints available for use.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
alignOff (Alignment Offset)	This value defines the alignment offset for a node.
b (Bottom)	The bottom of the node.
begMarg (Beginning Margin)	Specifies the beginning margin.
begPad (Beginning Padding)	Specifies the beginning padding.
bendDist (Bending Distance)	Specifies the distance from the start of a connector to a bend in the connector.
bMarg (Bottom Margin)	Specifies the bottom margin.
bOff (Bottom Offset)	Specifies the bottom offset.
connDist (Connection Distance)	Specifies the connection distance.
ctrX (Center Height)	Specifies the center of the height.
ctrXOff (Center X Offset)	Specifies the center x coordinate offset.
ctrY (Center Width)	Specifies the center of the width.
ctrYOff (Center Y Offset)	Specifies the center y coordinate offset.
diam (Diameter)	Specifies the diameter.
endMarg (End Margin)	Specifies the ending margin.
endPad (End Padding)	Specifies the end padding.
h (Height)	Specifies the height.
hArH (Arrowhead Height)	Specifies the height of the arrowhead portion of the connector.
hOff (Height Offset)	Specifies the amount to offset the height.

Enumeration Value	Description
l (Left)	Specifies the left constraint.
lMarg (Left Margin)	Specifies the left margin.
lOff (Left Offset)	Specifies the left offset.
none (Unknown)	Unknown constraint.
primFontSz (Primary Font Size)	The primary font size.
pyraAcctRatio (Pyramid Accent Ratio)	Specifies the fraction of the width of the diagram that is reserved for the fly outs at their shortest distance.
r (Right)	Specifies the right constraint.
rMarg (Right Margin)	Specifies the right margin constraint.
rOff (Right Offset)	Specifies the right offset constraint.
secFontSz (Secondary Font Size)	The secondary font size.
secSibSp (Secondary Sibling Spacing)	The secondary sibling spacing.
sibSp (Sibling Spacing)	Specifies the minimum distance between sibling shapes.
sp (Spacing)	Specifies the spacing defined.
stemThick (Stem Thickness)	Specifies the thickness of the arrow's shaft.
t (Top)	Specifies the top constraint.
tMarg (Top Margin)	Top margin constraint.
tOff (Top Offset)	Top offset constraint.
userA (User Defined A)	User defined information.
userB (User Defined B)	User defined information.
userC (User Defined C)	User defined information.
userD (User Defined D)	User defined information.
userE (User Defined E)	User defined information.
userF (User Defined F)	User defined information.
userG (User Defined G)	User defined information.
userH (User Defined H)	User defined information.
userI (User Defined I)	User defined information.
userJ (User Defined J)	User defined information.
userK (User Defined K)	User defined information.
userL (User Defined L)	User defined information.
userM (User Defined M)	User defined information.
userN (User Defined N)	User defined information.
userO (User Defined O)	User defined information.
userP (User Defined P)	User defined information.

Enumeration Value	Description
userQ (User Defined Q)	User defined information.
userR (User Defined R)	User defined information.
userS (User Defined S)	User defined information.
userT (User Defined T)	User defined information.
userU (User Defined U)	User defined information.
userV (User Defined V)	User defined information.
userW (User Defined W)	User defined information.
userX (User Defined X)	User defined information.
userY (User Defined Y)	User defined information.
userZ (User Defined Z)	User defined information.
w (Width)	The width parameter.
wArH (Arrowhead Width)	Specifies the width of the arrowhead portion of the connector.
wOff (Width Offset)	Offsets the width by the specified amount.

```

5.9.7.22 ST_ContinueDirection (Continue Direction)

This simple type specifies the behavior of the direction that additional nodes are added to new rows or columns in the snake algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
revDir (Reverse Direction)	Specifies that the direction is to be revered on a subsequent row or column. [*Example*: Consider the following diagram as an example of reverse direction  *end example*]
sameDir (Same Direction)	Specifies that the direction is to be maintained on a subsequent row or column.

Enumeration Value	Description
	[*Example*: Consider the following diagram as an example of same direction  *end example*]

Referenced By
ST_ParameterVal (§5.9.7.49)

```
<simpleType name="ST_ContinueDirection" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="revDir"/>
      <enumeration value="sameDir"/>
   </restriction>
</simpleType>
```

5.9.7.23 ST_CxnType (Connection Type)

This simple type defines the different types of relationships that can be defined between two nodes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
parOf (Parent Of)	This defines a parent-child relationship in the sense that node X is a parent of node Y.
presOf (Presentation Of)	A presentation type relationship. This type of relationship exists to actually present data.
presParOf (Presentation Parent Of)	A relationship defining a parent of a presentation node.
unknownRelationship (Unknown Relationship)	The type of relationship is unknown.

Referenced By
cxn@type (§5.9.3.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CxnType">
    <restriction base="xsd:token">
        <enumeration value="parOf"/>
        <enumeration value="presOf"/>
        <enumeration value="presParOf"/>
        <enumeration value="unknownRelationship"/>
    </restriction>
</simpleType>
```

5.9.7.24 ST_Direction (Diagram Direction Definition)

This simple type defines the possible values for a diagram's direction when displayed in an application.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
norm (Normal Direction)	This value specifies that the direction of the diagram should not be switched.
rev (Reversed Direction)	This value specifies that the direction of the diagram should be switched.

Referenced By
dir@val (§5.9.6.6); ST_FunctionValue (§5.9.7.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Direction" final="restriction">

        <enumeration value="norm"/>
        <enumeration value="rev"/>
    </restriction>
</simpleType>
```

5.9.7.25 ST_ElementType (Element Type)

This simple type defines the different types of data points which are supported.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Defined as utilizing all of the nodes.
asst (Assistant)	The assistant nodes.
doc (Document)	Specifies the a node on the document level.
node (Node)	Data nodes that are children of other data nodes.
nonAsst (Non Assistant)	Selects all of the non-assistant nodes.
nonNorm (Non Normal)	Selects the non-normal elements.
norm (Normal)	Selects a normal elements.
parTrans (Parent Transition)	The transition associated with the parent node.
pres (Presentation)	This refers to a presentation node.
sibTrans (Sibling Transition)	Use only sibling transitions between data nodes. These transitions represent sibling relationships between nodes, and are frequently mapped to arrows between shapes in the drawing. A sibTrans value is sometimes used to create white space between nodes.

5.9.7.27 ST_FallbackDimension (Fallback Dimension)

Specifies the dimensionality by which nodes can grow or shrink automatically.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1D (1 Dimension)	Specifies that the node can grow or shrink by its height or its width, but not both.
2D (2 Dimensions)	Specifies that the node can grow or shrink by both height and width.

Referenced By
ST_ParameterVal (§5.9.7.49)

      <enumeration value="2D"/>
   </restriction>
</simpleType>
```

5.9.7.28 ST_FlowDirection (Flow Direction)

This simple type defines how the progression of new nodes are to be entered into the diagram.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
col (Column)	Specifies that the layout occurs in a column-based fashion. This would mean laying out the nodes from top to bottom, before moving left to right.
row (Row)	Specifies that the layout occurs in a row-based fashion.

Enumeration Value	Description
	This would mean laying out the nodes from left to right before moving from top to bottom.

   <union memberTypes="ST_VariableType"/>
</simpleType>
```

5.9.7.30 ST_FunctionOperator (Function Operator)

This simple type defines the condition expression functions which can be used to perform operations.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
equ (Equal)	Equal function operator.
gt (Greater Than)	Specifies the grater than function operator.
gte (Greater Than or Equal to)	Specifies the greater than or equal to function operator.
lt (Less Than)	Specifies the less than function operator.

Enumeration Value	Description
lte (Less Than or Equal to)	Specifies the less than or equal to function operator.
neq (Not Equal To)	Specifies the not equal to function operator.

Referenced By
if@op (§5.9.2.15)

      <enumeration value="gte"/>
      <enumeration value="lte"/>
   </restriction>
</simpleType>
```

5.9.7.31 ST_FunctionType (Function Type)

This simple type defines the set of available conditional expression function types present for use.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cnt (Count)	Specifies a count.
depth (Depth)	Specifies the depth.
maxDepth (Max Depth)	Defines the maximum depth.
pos (Position)	Retrieves the position of the node in the specified set of nodes.
posEven (Position Even)	Returns 1 if the specified node is at an even numbered position in the data model.
posOdd (Position Odd)	Returns 1 if the specified node is in an odd position in the data model.
revPos (Reverse Position)	Reverse position function.
var (Variable)	Used to reference a variable.

Referenced By
if@func (§5.9.2.15)

      <enumeration value="pos"/>
      <enumeration value="revPos"/>
      <enumeration value="posEven"/>
      <enumeration value="posOdd"/>
      <enumeration value="var"/>
      <enumeration value="depth"/>
      <enumeration value="maxDepth"/>
   </restriction>
</simpleType>
```

5.9.7.32 ST_FunctionValue (Function Value)

Conditional expression function value.

This simple type is defined as a union of the following types:

- TheXML Schema int datatype.
- TheXML Schema boolean datatype.
- TheST_Direction simple type (§5.9.7.24).
- TheST_HierBranchStyle simple type (§5.9.7.35).
- TheST_AnimOneStr simple type (§5.9.7.3).
- TheST_AnimLvlStr simple type (§5.9.7.2).
- TheST_ResizeHandlesStr simple type (§5.9.7.53).

Referenced By

     ST_AnimLvlStr ST_ResizeHandlesStr"/>
</simpleType>
```

5.9.7.33 ST_GrowDirection (Grow Direction)

This simple type defines different starting locations for nodes within the snake algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bL (Bottom Left)	Specifies the placement of nodes is to start in the bottom left corner.

Enumeration Value	Description
bR (Bottom Right)	Specifies the placement of nodes is to start in the bottom right corner.
tL (Top Left)	Specifies the placement of nodes is to start in the top left corner.
tR (Top Right)	Specifies the placement of nodes is to stat in the top right corner.

Referenced By
ST_ParameterVal (§5.9.7.49)

      <enumeration value="tR"/>
      <enumeration value="bL"/>
      <enumeration value="bR"/>
   </restriction>
</simpleType>
```

5.9.7.34 ST_HierarchyAlignment (Hierarchy Alignment)

This simple type defines different relative locations of child nodes and their descendants to a parent node within a hierarchy diagram.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bCtrCh (Bottom Center Child)	Specifies the child nodes are placed below the parent node and that they are center aligned to the parent node.
bCtrDes (Bottom Center Descendant)	Specifies the descendant nodes are placed below the parent node and that they are center aligned to the parent node.
bL (Bottom Left)	Specifies the child and descendant nodes are placed below the parent node and that the set is left aligned.
bR (Bottom Right)	Specifies the child and descendant nodes are placed below the parent node and the set is right aligned.
lB (Left Bottom)	Specifies the child and descendant nodes are placed to the left of the parent node and that the set is bottom aligned.

Enumeration Value	Description
lCtrCh (Left Center Child)	Specifies the child nodes are placed to the left of the parent node and that the set is center aligned.
lCtrDes (Left Center Descendant)	Specifies the descendant nodes are placed to the left of the parent node and that the set is center aligned.
lT (Left Top)	Specifies the child and descendant nodes are placed to the left of the parent node and that the set is top aligned.
rB (Right Bottom)	Specifies the child and descendant nodes are placed to the right of the parent node and that the set is bottom aligned.
rCtrCh (Right Center Children)	Specifies the child nodes are placed to the right of the parent node and that the set is center aligned.
rCtrDes (Right Center Descendants)	Specifies the descendant nodes are placed to the right of the parent node and that the set is center aligned.
rT (Right Top)	Specifies the child and descendant nodes are placed to the right of the parent node and that the set is top aligned.
tCtrCh (Top Center Children)	Specifies the child nodes are placed above the parent node and that the set is center aligned.
tCtrDes (Top Center Descendants)	Specifies the descendant nodes are placed above the parent node and that the set is center aligned.
tL (Top Left)	Specifies the child and descendant nodes are placed above the parent node and that the set is left aligned.
tR (Top Right)	Specifies the child and descendant nodes are placed above the parent node and that the set is right aligned.

Referenced By

      <enumeration value="rT"/>
      <enumeration value="rB"/>
      <enumeration value="rCtrCh"/>
      <enumeration value="rCtrDes"/>
   </restriction>
</simpleType>
```

5.9.7.35 ST_HierBranchStyle (Hierarchy Branch Style Definition)

This simple type specifies the possible values for the branch style of a hierarchy diagram.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hang (Hanging)	The branch style is hanging from the parent. [*Example*: Consider the following image as an example of a hanging branch style:  *end example*]
init (Initial)	This means that the value has not been set.
l (Left)	The branch style falls off the left. [*Example*: Consider the following image as an example

Enumeration Value	Description
	of a left hanging branch style:  *end example*]
r (Right)	The branch style falls off the right. [*Example*: Consider the following image as an example of a right hanging branch style:  *end example*]
std (Standard)	The standard branch style is to be used. [*Example*: Consider the following image as an example of a standard hanging branch style:  *end example*]

Referenced By
hierBranch@val (§5.9.6.7); ST_FunctionValue (§5.9.7.32)

      <enumeration value="std"/>
      <enumeration value="init"/>
   </restriction>
</simpleType>
```

5.9.7.36 ST_HorizontalAlignment (Horizontal Alignment)

This simple type defines the horizontal alignment.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies center alignment.
l (Left)	Specifies left alignment.
none (None)	Specifies no alignment defined.
r (Right)	Specifies right alignment.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HorizontalAlignment" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="l"/>
      <enumeration value="ctr"/>
      <enumeration value="r"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

5.9.7.37 ST_HueDir (Hue Direction)

When given two colors to interpolate between, one can go in one of two directions around the color wheel to perform the interpolation. This type defines that direction.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ccw (Counterclockwise Hue Direction)	A hue interpolation in the counterclockwise direction.
cw (Clockwise Hue Direction)	A hue interpolation in the clockwise direction.

Referenced By
effectClrLst@hueDir (§5.9.4.7); fillClrLst@hueDir (§5.9.4.8); linClrLst@hueDir (§5.9.4.9); txEffectClrLst@hueDir (§5.9.4.12); txFillClrLst@hueDir (§5.9.4.13); txLinClrLst@hueDir (§5.9.4.14)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HueDir">
   <restriction base="xsd:token">
      <enumeration value="cw"/>
      <enumeration value="ccw"/>
   </restriction>
</simpleType>
```

5.9.7.38 ST_Index1 (1-Based Index)

A 1-based index.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.

Referenced By
adj@idx (§5.9.2.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Index1">
   <restriction base="xsd:unsignedInt">
      <minInclusive value="1"/>
   </restriction>
</simpleType>
```

5.9.7.39 ST_Ints (Integer List)

A list of integers.

This simple type allows a list of items of the XML Schema int datatype.

Referenced By

Referenced By
forEach@st (§5.9.2.14); forEach@step (§5.9.2.14); if@st (§5.9.2.15); if@step (§5.9.2.15); presOf@st (§5.9.2.21); presOf@step (§5.9.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Ints">
   <list itemType="xsd:int"/>
</simpleType>
```

5.9.7.40 ST_LayoutShapeType (Layout Shape Type)

All of the available shape types.

This simple type is defined as a union of the following types:

- TheST_ShapeType simple type (§5.1.12.56).
- TheST_OutputShapeType simple type (§5.9.7.47).

Referenced By
shape@type (§5.9.2.27)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LayoutShapeType" final="restriction">
   <union memberTypes="a:ST_ShapeType ST_OutputShapeType"/>
</simpleType>
```

5.9.7.41 ST_LinearDirection (Linear Direction)

This simple type defines the direction of growth of new nodes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fromB (From Bottom)	Specifies growth to start from the bottom.
fromL (From Left)	Specifies growth to start from the left.
fromR (From Right)	Specifies growth to start from the right.
fromT (From Top)	Specifies growth to start from the Top

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LinearDirection" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="fromL"/>
      <enumeration value="fromR"/>
      <enumeration value="fromT"/>
      <enumeration value="fromB"/>
   </restriction>
</simpleType>
```

5.9.7.42 ST_ModelId (Model Identifier)

The unique ID of the element within the data model. Model Identifiers can be either longs or guids.

This simple type is defined as a union of the following types:

- TheXML Schema int datatype.
- TheST_Guid simple type (§5.1.12.27).

Referenced By
cxn@destId (§5.9.3.2); cxn@modelId (§5.9.3.2); cxn@parTransId (§5.9.3.2); cxn@sibTransId (§5.9.3.2); cxn@srcId (§5.9.3.2); prSet@presAssocID (§5.9.3.4); pt@cxnId (§5.9.3.5); pt@modelId (§5.9.3.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ModelId">
   <union memberTypes="xsd:int a:ST_Guid"/>
</simpleType>
```

5.9.7.43 ST_NodeCount (Number of Nodes Definition)

This simple type defines a count of the number of nodes for a property in a diagram. A value of -1 shall mean that the value is unbounded.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -1.

Referenced By
chMax@val (§5.9.6.4); chPref@val (§5.9.6.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_NodeCount">
   <restriction base="xsd:int">
      <minInclusive value="-1"/>
   </restriction>
</simpleType>
```

5.9.7.44 ST_NodeHorizontalAlignment (Node Horizontal Alignment)

This simple type defines the horizontal alignment of a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies center alignment.
l (Left)	Specifies left alignment.
r (Right)	Specifies right alignment.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_NodeHorizontalAlignment" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="l"/>
      <enumeration value="ctr"/>
      <enumeration value="r"/>
   </restriction>
</simpleType>
```

5.9.7.45 ST_NodeVerticalAlignment (Node Vertical Alignment)

This simple type defines the vertical alignment of a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies bottom alignment.
mid (Middle)	Specifies middle alignment.
t (Top)	Specifies top alignment.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_NodeVerticalAlignment" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="t"/>
      <enumeration value="mid"/>
      <enumeration value="b"/>
   </restriction>
</simpleType>
```

5.9.7.46 ST_Offset (Offset)

This simple type defines whether or not subsequent rows or columns in the snake algorithm are offset from the preceding row or column.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies no offset.
off (Offset)	Specifies that the nodes will be shifted by some amount relative to the preceding row or column.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Offset" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="ctr"/>
      <enumeration value="off"/>
   </restriction>
</simpleType>
```

5.9.7.47 ST_OutputShapeType (Output Shape Type)

Shapes which are special specifically for a DrawingML diagram.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
conn (Connection)	Connection shape type.
none (None)	None.

Referenced By
ST_LayoutShapeType (§5.9.7.40)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OutputShapeType" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="conn"/>
   </restriction>
</simpleType>
```

5.9.7.48 ST_ParameterId (Parameter Identifier)

This simple type defines algorithm parameters which can be modified in order to adjust the behavior of algorithms for use in layout nodes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
alignTx (Text Alignment)	This value defines how the text is aligned in a node.
ar (Aspect Ratio)	Specifies the aspect ratio (width to height) of the composite node to use when determining child constraints. A value of 0 means leave the width and height constraints as is. The algorithm may temporarily shrink one dimension to achieve that ratio. For example, if a composite node has a width constraint of 20 and height constraint of 10, and if ar=1.5, composite uses a width value of 15 to calculate the composite node's child constraints. However, the algorithm does not propagate this value to other nodes.
autoTxRot (Auto Text Rotation)	Auto text rotation.
begPts (Beginning Points)	Beginning Points
begSty (Beginning Arrowhead Style)	Beginning Arrowhead Style
bendPt (Bend Point)	The bend point.
bkpt (Breakpoint)	Specifies the point at which the diagram starts to snake. The value bal specifies that snaking begin at an even number of rows and columns. The value fixed specifies that snaking begin at a fixed point, for example, in a row that contains three nodes. The value endCnv specifies that snaking begin when there is no more room for a shape in the row.
bkPtFixedVal (Breakpoint Fixed Value)	Specifies where the snake should break, if bkpt=fixed.

Enumeration Value	Description
chAlign (Child Alignment)	Specifies the alignment of the children.
chDir (Child Direction)	The child direction.
connRout (Connection Route)	The route of the connection.
contDir (Continue Direction)	Specifies the direction of the subsequent row or column. For example, if the algorithm initially places the nodes from left to right, revDir places the nodes in the next row from right to left. However if the algorithm uses contDir, the nodes on the next row are arranged from left to right.
ctrShpMap (Center Shape Mapping)	Specifies where to place nodes in relation to the center circle.
dim (Connector Dimension)	Specifies the connector dimension.
dstNode (Destination Node)	Specifies the name of the layout node from which to end the connection from.
endPts (End Points)	Specifies the end points.
endSty (End Style)	Specifies the end style.
fallback (Fallback Scale)	1D specifies fallback. It only scales in one dimension. 2D specifies fallback. It scales in both dimensions equally.
flowDir (Flow Direction)	Specifies whether nodes are arranged in rows or columns.
grDir (Grow Direction)	Specifies from which corner the snake grows. For example, if the algorithm uses a top left value, the snake grows from the top left.
hierAlign (Hierarchy Alignment)	The alignment of the hierarchy.
horzAlign (Horizontal Alignment)	Aligns all the child nodes within the space reserved for the parent and adjusts child positions in the x direction.
linDir (Linear Direction)	Specifies the linear direction.
lnSpAfChP (Line Spacing After Children Paragraph)	Line spacing after children.
lnSpAfParP (Line Spacing After Parent Paragraph)	Line spacing after the parent.
lnSpCh (Line Spacing Children)	Line spacing of the children
lnSpPar (Line Spacing Parent)	Line spacing of the parent.
nodeHorzAlign (Node Horizontal Alignment)	Specifies how child nodes are aligned within the extents of the canvas. For example, you can align the tops of all the child nodes, but center all of them within the canvas.
nodeVertAlign (Node Vertical Alignment)	Specifies how child nodes are aligned within the extents of the canvas. Same as nodeHorzAlign, but in

Enumeration Value	Description
	the y direction.
off (Offset)	Specifies the offset.
parTxLTRAlign (Parent Text Left-to-Right Alignment)	Specifies the paragraph alignment of parent text when the shape has only parent text. This parameter applies when the text direction is left to right.
parTxRTLAlign (Parent Text Right-to-Left Alignment)	Specifies the paragraph alignment of parent text when the shape has only parent text. This parameter applies when the text direction is right to left.
pyraAcctBkgdNode (Pyramid Accent Background Node)	If pyramid has a composite child node, specifies the name of the node that is a child of the composite that makes up the child flyout shape. If the node specifies a shape of the nonIsoscelesTrapezoid autoshape, it modifies the adjust handles in order to fit the flyout flush against the side of the pyramid.
pyraAcctPos (Pyramid Accent Position)	Specifies the placement of the flyout grandchildren.
pyraAcctTxMar (Pyramid Accent Text Margin)	Specifies the placement of one edge of the child text (grandchild node). If the value is step, the text is against the edge of the pyramid. If the value is stack, the text aligns.
pyraAcctTxNode (Pyramid Accent Text Node)	If pyramid has a composite child node, specifies the child node that should hold the child text.
pyraLvlNode (Pyramid Level Node)	If pyramid has a composite child node, specifies the name of the node that is a child of the composite that makes up the pyramid itself. If the node specifies a trapezoid shape, it modifies the adjustment handles to construct a pyramid.
rotPath (Rotation Path)	The rotation path specified.
rtShortDist (Route Shortest Distance)	If true, the connector is routed through the shortest distance between the points.
secChAlign (Secondary Child Alignment)	The secondary child alignment.
secLinDir (Secondary Linear Direction)	The secondary linear direction.
shpTxLTRAlignCh (Shape Text Left-to-Right Alignment)	Specifies the paragraph alignment of all text within the shape when the shape contains both parent and child text. This parameter applies when the text direction is left to right.
shpTxRTLAlignCh (Shape Text Right-to-Left Alignment)	Specifies the paragraph alignment of all text within the shape when the shape contains both parent and child text. This parameter applies when the text direction is right to left.
spanAng (Span Angle)	Specifies the angle the cycle spans. Final shapealign text is placed at stAng+spanAng, unless spanAng=360.

Enumeration Value	Description
	In that case, the algorithm places the text so that shapes do not overlap.
srcNode (Source Node)	Specifies the name of the layout node from which to start the connection.
stAng (Start Angle)	Specifies the angle at which the first shape is placed. Angles are in degrees, measured clockwise from a line pointing straight upward from the center of the cycle.
stBulletLvl (Start Bullets At Level)	Specifies whether bullets start at the top level (1) or with children (2).
stElem (Start Element)	Specifies the point type of the layout node to use as the first shape in the cycle.
txAnchorHorz (Text Anchor Horizontal)	Specifies the y-axis position of the text area within a shape.
txAnchorHorzCh (Text Anchor Horizontal With Children)	Specifies that the definition can allow a different text anchoring on the x-axis, if child nodes exist in the shape.
txAnchorVert (Text Anchor Vertical)	Specifies the x-axis position of the text area within a shape.
txAnchorVertCh (Text Anchor Vertical With Children)	Specifies that the definition can allow a different text anchoring on the y-axis, if child nodes exist in the shape.
txBlDir (Text Block Direction)	Specifies whether the text block is vertical or horizontal.
txDir (Text Direction)	Specifies where the text of the first node starts.
vertAlign (Vertical Alignment)	Aligns all the child nodes within the space reserved for the parent and adjusts child positions in the y direction.

5.9.7.49 ST_ParameterVal (Parameter Values)

Specifies the list of parameter types that can be used by a diagram.

This simple type is defined as a union of the following types:

- TheST_HorizontalAlignment simple type (§5.9.7.36).
- TheST_VerticalAlignment simple type (§5.9.7.65).
- TheST_ChildDirection simple type (§5.9.7.14).
- TheST_ChildAlignment simple type (§5.9.7.13).
- TheST_SecondaryChildAlignment simple type (§5.9.7.55).
- TheST_LinearDirection simple type (§5.9.7.41).
- TheST_SecondaryLinearDirection simple type (§5.9.7.56).
- TheST_StartingElement simple type (§5.9.7.57).
- TheST_BendPoint simple type (§5.9.7.8).
- TheST_ConnectorRouting simple type (§5.9.7.19).
- TheST_ArrowheadStyle simple type (§5.9.7.4).
- TheST_ConnectorDimension simple type (§5.9.7.17).
- TheST_RotationPath simple type (§5.9.7.54).
- TheST_CenterShapeMapping simple type (§5.9.7.12).
- TheST_NodeHorizontalAlignment simple type (§5.9.7.44).
- TheST_NodeVerticalAlignment simple type (§5.9.7.45).
- TheST_FallbackDimension simple type (§5.9.7.27).
- TheST_TextDirection simple type (§5.9.7.62).
- TheST_PyramidAccentPosition simple type (§5.9.7.51).
- TheST_PyramidAccentTextMargin simple type (§5.9.7.52).
- TheST_TextBlockDirection simple type (§5.9.7.61).
- TheST_TextAnchorHorizontal simple type (§5.9.7.59).
- TheST_TextAnchorVertical simple type (§5.9.7.60).
- TheST_TextAlignment simple type (§5.9.7.58).
- TheST_AutoTextRotation simple type (§5.9.7.5).
- TheST_GrowDirection simple type (§5.9.7.33).
- TheST_FlowDirection simple type (§5.9.7.28).
- TheST_ContinueDirection simple type (§5.9.7.22).
- TheST_Breakpoint simple type (§5.9.7.11).
- TheST_Offset simple type (§5.9.7.46).

- TheST_HierarchyAlignment simple type (§5.9.7.34).
- TheXML Schema int datatype.
- TheXML Schema double datatype.
- TheXML Schema boolean datatype.
- TheXML Schema string datatype.
- TheST_ConnectorPoint simple type (§5.9.7.18).

     ST_Offset ST_HierarchyAlignment xsd:int xsd:double xsd:boolean xsd:string ST_ConnectorPoint"/>
</simpleType>
```

5.9.7.50 ST_PtType (Point Type)

This simple type defines the different point types which can be utilized to create diagrams in DiagramML.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
asst (Assistant Element)	This point type is used in a hierarchy diagram to represent an assistant element.
doc (Document)	This point type specifies a document type point. This point type can be thought of as the root node associated with the document itself.
node (Node)	The node point type specifies a basic point type.
parTrans (Parent Transition)	This point type specifies a parent transition element.
pres (Presentation)	Specifies a presentation point type.
sibTrans (Sibling Transition)	This point type specifies a sibling transition element.

Referenced By
pt@type (§5.9.3.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PtType">
   <restriction base="xsd:token">
      <enumeration value="node"/>
      <enumeration value="asst"/>
      <enumeration value="doc"/>
      <enumeration value="pres"/>
      <enumeration value="parTrans"/>
      <enumeration value="sibTrans"/>
   </restriction>
</simpleType>
```

5.9.7.51 ST_PyramidAccentPosition (Pyramid Accent Position)

This simple type defines different positioning for the accent shapes which can be associated with a pyramid algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
aft (Pyramid Accent After)	Specifies that the accent shapes are to be placed to the right of the pyramid.
bef (Before)	Specifies that the accent shapes are to be placed to the left of the pyramid.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PyramidAccentPosition" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="bef"/>
      <enumeration value="aft"/>
   </restriction>
</simpleType>
```

5.9.7.52 ST_PyramidAccentTextMargin (Pyramid Accent Text Margin)

This simple type defines different ways to lay out text in the accent shape for a pyramid algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
stack (Stack)	Specifies that all accent shape text is to be left aligned. [*Example*: Consider the following example of a pyramid diagram  *end example*]
step (Step)	Specifies that all accent shape text is to be relative to the pyramid. [*Example*: Consider the following example of a pyramid diagram  *end example*]

Referenced By
ST_ParameterVal (§5.9.7.49)

```
<simpleType name="ST_PyramidAccentTextMargin" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="step"/>
      <enumeration value="stack"/>
   </restriction>
</simpleType>
```

5.9.7.53 ST_ResizeHandlesStr (Resize Handle)

This simple type defines the possible behaviors when resizing shapes within a diagram. Because the size of the shape plays a large role in the overall layout of other nodes within the diagram, there are two ways resize can occur on a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
exact (Exact)	This value specifies that the resize of the shape occurs and sizes exactly to the size the user defines, which causes all other shapes in the diagram to shrink or grow accordingly.
rel (Relative)	This value specifies that resize operations happen relatively. This means that the relative size difference between nodes is maintained before and after the resize operation.

Referenced By
resizeHandles@val (§5.9.2.23); ST_FunctionValue (§5.9.7.32)

The following XML Schema fragment defines the contents of this simple type:

   <restriction base="xsd:token">
      <enumeration value="exact"/>
      <enumeration value="rel"/>
   </restriction>
</simpleType>
```

5.9.7.54 ST_RotationPath (Rotation Path)

This simple type defines rotation properties for nodes within the cycle algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
alongPath (Along Path)	Specifies that the nodes should rotate in relation to their placement along the cycle.
none (None)	Specifies that the nodes should not rotate.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RotationPath" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="alongPath"/>
   </restriction>
</simpleType>
```

5.9.7.55 ST_SecondaryChildAlignment (Secondary Child Alignment)

This simple type defines different alignment properties of the both hanging layout type of the hierarchy algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies that the children nodes should be bottom aligned.
l (Left)	Specifies that the children nodes should be left aligned.
none (None)	Specifies no alignment.
r (Right)	Specifies that the children nodes should be right aligned.
t (Top)	Specifies that the children nodes should be top aligned.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SecondaryChildAlignment" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="t"/>
      <enumeration value="b"/>
      <enumeration value="l"/>
      <enumeration value="r"/>
   </restriction>
</simpleType>
```

5.9.7.56 ST_SecondaryLinearDirection (Secondary Linear Direction)

This simple type defines different directions for the nodes in a both hanging layout in the hierarchy algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fromB (From Bottom)	Specifies that the nodes begin from the bottom and move upward.
fromL (From Left)	Specifies that the nodes begin from the left and move right.
fromR (From Right)	Specifies that the nodes begin from the right and move left.
fromT (From Top)	Specifies that the nodes begin from the top and move downward.
none (None)	Specifies no direction.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SecondaryLinearDirection" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="fromL"/>
      <enumeration value="fromR"/>
      <enumeration value="fromT"/>
      <enumeration value="fromB"/>
   </restriction>
</simpleType>
```

5.9.7.57 ST_StartingElement (Starting Element)

This simple type defines behavior for the first node in a cycle algorithm.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
node (Node)	Specifies that a node should be placed first.
trans (Transition)	Specifies that a transition should be placed first.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StartingElement" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="node"/>
      <enumeration value="trans"/>
   </restriction>
</simpleType>
```

5.9.7.58 ST_TextAlignment (Text Alignment)

This simple type defines alignment types for text within a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies center aligned text.
l (Left)	Specifies left aligned text.
r (Right)	Specifies right aligned text.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextAlignment" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="l"/>
      <enumeration value="ctr"/>
      <enumeration value="r"/>
   </restriction>
</simpleType>
```

5.9.7.59 ST_TextAnchorHorizontal (Text Anchor Horizontal)

This simple type defines horizontal anchor points for text.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center)	Specifies text to be anchored to the center.
none (None)	Specifies no horizontal text anchor.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextAnchorHorizontal" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="ctr"/>
   </restriction>
</simpleType>
```

5.9.7.60 ST_TextAnchorVertical (Text Anchor Vertical)

This simple type defines vertical anchor points for text.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies text to be anchored to the bottom.
mid (Middle)	Specifies text to be anchored to the middle.
t (Top)	Specifies text to be anchored to the top.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextAnchorVertical" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="t"/>
      <enumeration value="mid"/>
      <enumeration value="b"/>
   </restriction>
</simpleType>
```

5.9.7.61 ST_TextBlockDirection (Text Block Direction)

This simple type defines different layout options for text within a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
horz (Horizontal)	Specifies that the text is to be horizontal.
vert (Vertical Direction)	Specifies that the text is to be vertical.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextBlockDirection" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="horz"/>
      <enumeration value="vert"/>
   </restriction>
</simpleType>
```

5.9.7.62 ST_TextDirection (Text Direction)

This simple type defines different way the growth of additional text can occur within a node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fromB (From Bottom)	Specifies additional text grows from the bottom.
fromT (From Top)	Specifies additional text grows from the top.

Referenced By

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextDirection" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="fromT"/>
      <enumeration value="fromB"/>
   </restriction>
</simpleType>
```

5.9.7.63 ST_UnsignedInts (Unsigned Integer List)

A list of unsigned integers.

This simple type allows a list of items of the XML Schema unsignedInt datatype.

Referenced By
forEach@cnt (§5.9.2.14); if@cnt (§5.9.2.15); presOf@cnt (§5.9.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UnsignedInts">
   <list itemType="xsd:unsignedInt"/>
</simpleType>
```

5.9.7.64 ST_VariableType (Variable Type)

Conditional expression variable type.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
animLvl (Animation Level)	Specifies the animation level
animOne (Animate One)	Specifies animate as one.
bulEnabled (Bullets Enabled)	Specifies bullets enabled.
chMax (Child Max)	The maximum number of children.
chPref (Child Preference)	The preferred number of children.
dir (Direction)	Specifies the direction of the diagram.
hierBranch (Hierarchy Branch)	The hierarchy branch.
none (Unknown)	Unknown variable type.
orgChart (Organizational Chart Algorithm)	Algorithm that lays out an org chart.
resizeHandles (Resize Handles)	Specifies the resize handles.

Referenced By
ST_FunctionArgument (§5.9.7.29)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VariableType" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="orgChart"/>
      <enumeration value="chMax"/>
      <enumeration value="chPref"/>
      <enumeration value="bulEnabled"/>
      <enumeration value="dir"/>
      <enumeration value="hierBranch"/>
      <enumeration value="animOne"/>
      <enumeration value="animLvl"/>
      <enumeration value="resizeHandles"/>
   </restriction>
</simpleType>
```

5.9.7.65 ST_VerticalAlignment (Vertical Alignment)

This simple type defines different vertical alignment parameters.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	Specifies bottom aligned.
mid (Middle)	Specifies middle aligned.
none (None)	Specifies no vertical alignment.
t (Top)	Specifies top aligned.

Referenced By
ST_ParameterVal (§5.9.7.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VerticalAlignment" final="restriction">
   <restriction base="xsd:token">
      <enumeration value="t"/>
      <enumeration value="mid"/>
      <enumeration value="b"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

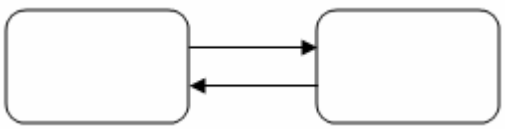
6. VML Reference Material

6.1 VML

VML is a language for defining graphical objects in cases where DrawingML does not apply, such as text boxes and shapes in WordprocessingML documents and comments and controls in SpreadsheetML documents. This namespace provides the base elements and attributes for defining shape primitives. Other VML namespaces define elements that layer on information beyond the baseline graphical definition. To maintain backward compatibility, all VML namespaces defined in this specification maintain the legacy namespace structure already used by millions of documents.

[*Note*: The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a deprecated format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML .*end note*]

[*Example*: Assume the following shapes exist in a WordprocessingML document:



The drawing consists of four shapes. The arrows are specified by extending the shape type base definition in the shapetype element. Each shape representing an arrow references the shapetype it is extending via its type attribute.

```
<v:shapetype id="_x0000_t32" coordsize="21600,21600" o:spt="32" o:oned="t"
  path="m,l21600,21600e" filled="f">
  <v:path arrowok="t" fillok="f" o:connecttype="none"/>
  <o:lock v:ext="edit" shapetype="t"/>
</v:shapetype>

<v:shape id="_x0000_s1030" type="#_x0000_t32" style="position:absolute;left:0;
  text-align:left;margin-left:105pt;margin-top:36pt;width:48pt;height:0;flip:x;
  z-index:251661312" o:connectortype="straight">
  <v:stroke endarrow="block"/>
</v:shape>

<v:shape id="_x0000_s1029" type="#_x0000_t32" style="position:absolute;left:0;
  text-align:left;margin-left:105pt;margin-top:21.75pt;width:48pt;height:0;
```

```
    z-index:251660288" o:connectortype="straight">
    <v:stroke endarrow="block"/>
  </v:shape>
```

The rounded rectangles use the VML roundrect element.

```
  <v:roundrect id="_x0000_s1028" style="position:absolute;left:0;
    text-align:left;margin-left:153pt;margin-top:8.25pt;width:68.25pt;height:42pt;
    z-index:251659264" arcsize="10923f"/>

  <v:roundrect id="_x0000_s1027" style="position:absolute;left:0;
    text-align:left;margin-left:36.75pt;margin-top:8.25pt;width:68.25pt;
    height:42pt;z-index:251658240" arcsize="10923f"/>
```

end example]

Note that, throughout VML, numeric values that are allowed to take units may be specified in: cm (centimeters), mm (millimeters), in (inches), pt (points), pc (picas), px (pixels).

6.1.1 Table of Contents

This subclause is informative.

End of informative text.

6.1.2 Elements

The following elements comprise the contents of the urn:schemas-microsoft-com:vml namespace:

[*Note*: As the VML format is a format provided for backward compatibility, many VML elements are defined in the same urn:schemas-microsoft-com:vml namespace that is already used by millions of documents already using VML. *end note*]

6.1.2.1 arc (Arc Segment)

This element specifies an arc defined as a segment of an oval. The CSS2 style content width and height define the width and height of that oval. The arc is defined by the intersection of the oval with the start and end radius vectors given by the angles. The angles are calculated on the basis of a circle (width equal to height) which is then scaled anisotropically to the desired width and height.

[*Example:* The following specifies a simple half-circle arc open at the top:

```
<v:arc
  style="position:relative;top:120;left:20;width:200;height:200"
  startangle="90" endangle="270">
</v:arc>
```

The shape looks like this:

end example]

textpath (Text Layout Path)	§6.1.2.23
wrap (Text Wrapping)	§6.3.2.6

Attributes	Description
allowincell (Allow in Table Cell) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can be placed in a table. Default is `false`. [*Example:* `<v:shape ... o:allowincell="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
allowoverlap (Allow Shape Overlap) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute. [*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red" alt="Red rectangle"></v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset"></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderbottomcolor (Bottom Border Color)	Specifies the bottom border color of an inline shape. Default is no value. [*Example:*

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<v:shape ... o:borderbottomcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the left border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:borderleftcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:borderrightcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:bordertopcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* <v:shape ... o:bullet="true" ... > </v:shape> *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* `<v:shape ... o:button="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is `auto`, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment: `<v:shape ... o:bwmode="grayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for normal black-and-white output devices. Default is `auto`. [*Example:* This shape renders in a pale grayscale in a normal black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwpure (Pure	Specifies the black-and-white mode for pure black-and-white output devices. Default is

Attributes	Description
Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value. [*Example:* `<v:image ... chromakey="white" ...> </v:image>` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value. [*Example:* The snippets below are equivalent: `... .narrowstyle {width:50;height:100} ... <v:shape ... class="narrowstyle" style="top:1;left:1"> </v:shape>` `<v:shape ... style="top:1;left:1; width:50;height:100"> </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
clip (Clipping Toggle)	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.

Attributes	Description

Namespace: urn:schemas-microsoft-com:office:office	[*Example:*
	
	`<v:shape ... o:clip="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

cliptowrap (Clip to Wrapping Polygon)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:cliptowrap="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

connectortype (Shape Connector Type)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the type of connector used for joining shapes. Default is `straight`.
	
	[*Example:*
	
	`<v:shape ... o:connectortype="elbow" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box. This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space. [*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100).

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>coordsize
(Coordinate Space Size)</td><td>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".

The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.

[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>dgmlayout
(Diagram Node Layout Identifier)

Namespace: urn:schemas-microsoft-</td><td>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.</td></tr></table></td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>com:office:office</td><td>
<table>
<tr><td></td><td>  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>
[Example:
<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]
The possible values for this attribute are defined by the XML Schema integer datatype.
</td></tr>
<tr><td>dgmlayoutmru (Diagram Node Recent Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>
Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description

	<table><tr><td></td><td>  </td></tr><tr><td>3</td><td>Hanging, left side layout.  </td></tr></table>
	[*Example:*
	
	`<v:shape ... dgmlayout="1">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

dgmnodekind (Diagram Node Identifier)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.
	
	[*Example:*
	
	`<v:shape ... dgmnodekind="1">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

doubleclicknotify (Double-click Notification Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that an event message is sent when a shape is double-clicked. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:doubleclicknotify="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

endAngle (Ending Angle)	Specifies the angle that defines the endpoint of the arc. The angle is measured in degrees clockwise from the vertical. Default is `90`. [*Example:* This arc ends at the bottom center of the shape's region:

Attributes	Description
	<v:arc ... endangle="180" ... > </v:arc> *end example*] The possible values for this attribute are defined by the XML Schema decimal datatype.
fillcolor (Fill Color)	Specifies the color to use for the fill. Default is white. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description. [*Example:* This shape is red if its fill is visible: <v:shape ... fillcolor="red" ... > </v:shape> This is equivalent to: <v:shape ... fillcolor="#ff0000" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
filled (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is true. This attribute is overridden by the fill on attribute. [*Example:* <v:shape ... filled="f" fillcolor="red" ...> </v:shape>  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
forcedash (Force Dashed Outline)	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is false.

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape. [*Example:* `<v:shape ... o:forcedash="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hr (Horizontal Rule Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that a shape is a horizontal rule. Default is `false`. [*Example:* `<v:shape ... o:hr="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hralign (Horizontal Rule Alignment) Namespace: urn:schemas-microsoft-com:office:office	Specifies the alignment of a horizontal rule. Default is `left`. [*Example:* `<v:shape ... o:hralign="center" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:* `<v:shape ... href="http://www.openxmlformats.org" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* `<v:shape ... o:hrnoshade="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	Specifies the length of a horizontal rule as a percentage of page width. Default is 0. [*Example:* `<v:shape ... o:hrpct="85" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is `true`. Default is `false`. [*Example:* `<v:shape ... o:hrstd="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* `<v:shape ... id="myShape" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is `custom`. This attribute is only meaningful for text boxes. [*Example:* `<v:shape ... o:insetmode="auto" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* `<v:shape ... insetpen="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
ole (Embedded Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is `false`. [*Example:* `<v:shape ... o:ole="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:* `<v:shape ... o:oleicon="true" ... ></v:shape>` *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* `<v:shape ... o:oned="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:* The red color is 25% opaque:
	
	`<v:fill type="gradient" color="red" color2="blue" opacity=".25"></v:fill>`
	
	  `opacity="1"`
	 `opacity=".25"`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

preferrelative (Relative Resize Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the original size of an object is saved after reformatting. Default is `false`. If `true`, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%. [*Example:* `<v:shape ... o:preferrelative="true" ... ></v:shape>` *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`. [*Example:* `<v:shape ... print="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID) Namespace: urn:schemas-microsoft-com:office:office	Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically. [*Example:* The shape was part of a group identified by the ID 040754: `<v:shape ... o:regroupid="040754" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.
startAngle (Starting Angle)	Specifies an angle that defines the starting point of the arc. The angle is measured in degrees clockwise from the vertical. Default is `0`. [*Example:* This arc begins in the upper-right quadrant:

Attributes	Description
	<v:arc ... startangle="45" ... > </v:arc> *end example*] The possible values for this attribute are defined by the XML Schema decimal datatype.
strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description. [*Example:* <v:shape ... strokecolor="red" ...> </v:shape>  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
stroked (Shape Stroke Toggle)	Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true. [*Example:* <v:shape ... fillcolor="red" stroked="false" strokecolor="blue"...> </v:shape>  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
strokeweight (Shape Stroke	Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>Weight)</td><td>(§6.1.2.21) overrides this attribute.

[Example:

<pre><v:shape ... strokeweight="3pt" ... >
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
<tr><td>height</td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• auto - Default position of an element in the flow of the page.
• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the parent object's height.</td></tr>
<tr><td>left</td><td>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</td></tr>
</table>
</td></tr>
</table>

Attributes	Description	
		• auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-bottom	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	margin-left	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.

Attributes	Description	
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
	mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside

Attributes	Description	
	mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
	mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
	position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:

Attributes	Description	
		• `static` - The element is positioned according to the normal flow of the page. The `top` and `left` properties are ignored. If the object is anchored inline, this value is used. • `absolute` - The element is positioned relative to the parent, using the `top` and `left` properties. • `relative` - The element is positioned according to the normal flow of the page, but the `top` and `left` properties are used. The overlap of overlapping elements is governed by the `z-index` property.
	`rotation`	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	`top`	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	`visibility`	Specifies whether a shape is displayed. Only `inherit` and `hidden` are used; any other values are mapped to `inherit`. Default is `inherit`. Allowed values are: • `hidden` - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • `inherit` - The visibility state is inherited from the parent of the shape.
	`width`	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.

Attributes	Description
	<table><tr><td></td><td>• <percentage>- Value expressed as a percentage of the parent object's width.</td></tr><tr><td>z-index</td><td>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Uses the order that the shapes appear in the page, bottom to top. • <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</td></tr></table> The following properties are only used by the textbox element (§6.1.2.22): <table><tr><th>Property</th><th>Description</th></tr><tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are: • ltr - Test is displayed left-to-right. • rtl - Test is displayed right-to-left.</td></tr><tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are: • horizontal - Text is displayed horizontally. • vertical - Text is displayed vertically. • vertical-ideographic - Ideographic text is displayed vertically. • horizontal-ideographic - Ideographic text is displayed horizontally.</td></tr><tr><td>mso-direction-alt</td><td>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</td></tr><tr><td>mso-fit-shape-to-text</td><td>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</td></tr><tr><td>mso-fit-text-to-shape</td><td>Specifies whether the text stretches to fit the textbox. Default is false.</td></tr><tr><td>mso-layout-</td><td>Specifies the alternate layout flow for text in textboxes. This</td></tr></table>

Attributes	Description
	flow-alt: property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
	mso-next-textbox: Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
	mso-rotate: Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
	mso-text-scale: Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
	v-text-anchor: Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline

The following properties are only used by the textpath element (§6.1.2.23):

Property	Description
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.
font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr>
<tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are:
normal
italic
oblique - Treated the same as italic.</td></tr>
<tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:
normal
small-caps</td></tr>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200
300
400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold
bolder
500
600
700
800
900</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
<tr><td>mso-text-</td><td>Specifies whether a shadow is applied to the text on a text path.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	shadow: Default is false.
	text-decoration: Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are: • none • underline • overline • line-through • blink
	v-rotate-letters: Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
	v-same-letter-heights: Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align: Specifies the alignment of text. Default is left. Allowed values are: • left • right • center • justify • letter-justify - Distributes the extra space between the letters. • stretch-justify - Stretches the letters to fill in the space.
	v-text-kern: Specifies whether kerning is turned on. Default is false.
	v-text-reverse: Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
	v-text-spacing-mode: Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are: • tightening • tracking
	v-text-spacing: Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:

• top
• left
• width
• height

The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:

• flip
• height
• left
• margin-left
• margin-top
• position
• rotation
• top
• visibility

<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description

	[*Example:*
	
	`<v:shape ...`
	`  href="http://www.openxmlformats.org"`
	`  target="_self" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

title (Shape Title)	Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.
	
	[*Example:*
	
	`<v:shape ... title="tooltip" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

userdrawn (Exists In Master Slide)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether the user has added the shape to a master slide. Default is `false`. Used by PresentationML.
	
	[*Example:*
	
	`<v:shape ... o:userdrawn="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

userhidden (Hide Script Anchors)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.
	
	[*Example:*
	
	`<v:shape ... o:userhidden="true" ... >`
	`</v:shape>`
	
	end example]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to tight or through.
	
	[*Example:*
	
	`<v:shape ...`
	`  wrapcoords="0,0 0,200, 200,200, 200,0" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Arc">
   <sequence>
      <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
   <attribute name="startAngle" type="xsd:decimal" use="optional"/>
   <attribute name="endAngle" type="xsd:decimal" use="optional"/>
</complexType>
```

6.1.2.2 background (Document Background)

This element describes the fill of the background of a page using vector graphics fills. Fills consist of simple colors, more advanced effects defined through the fill element (§6.1.2.5), or images.

[*Example:* The following shades the page background a pale red:

```
<v:background fillcolor="#c0504d">
</v:background>
```

This uses the fill element (§6.1.2.5) to create a gradient background fill:

```
<v:background>
 <v:fill type="gradient" color="#c0504d" color2="#f0504d" angle="45"/>
</v:background>
```

end example]

Parent Elements

Parent Elements
background (§2.2.1); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23)

Child Elements	Subclause
fill (Shape Fill Properties)	§6.1.2.5

Attributes	Description

bwmode (Black-and-White Mode)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering
	
	[*Example:* This shape renders in grayscale in a black-and-white environment:
	
	`<v:shape ... o:bwmode="grayscale" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).

bwnormal (Normal Black-and-White Mode)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the black-and-white mode for normal black-and-white output devices. Default is auto.
	
	[*Example:* This shape renders in a pale grayscale in a normal black-and-white environment:
	
	`<v:shape ...`
	`  o:bwmode="lightgrayscale" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).

bwpure (Pure Black-and-White Mode)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto.
	
	[*Example:* This shape renders in high contrast when in a pure black-and-white environment:
	
	`<v:shape ... o:bwmode="highcontrast" ... >`
	`</v:shape>`

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).

fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.
	
	[*Example:* This shape is red if its fill is visible:
	
	`<v:shape ... fillcolor="red" ... ></v:shape>`
	
	This is equivalent to:
	
	`<v:shape ... fillcolor="#ff0000" ... ></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

filled (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is `true`. This attribute is overridden by the fill on attribute. [*Example:* `<v:shape ... filled="f" fillcolor="red" ...></v:shape>`  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value.

Attributes	Description
	[*Example:* `<v:shape ... id="myShape" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
targetscreensize (Target Screen Size) Namespace: urn:schemas-microsoft-com:office:office	Specifies the target resolution used for WordprocessingML documents with a gradient or picture filled background. Default is no value. Allowed values are: • 544,376 • 640,480 • 720,512 • 800,600 • 1024,768 • 1152,862 The possible values for this attribute are defined by the ST_ScreenSize simple type (§6.2.3.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Background">
   <sequence>
      <element ref="fill" minOccurs="0"/>
   </sequence>
   <attributeGroup ref="AG_Id"/>
   <attributeGroup ref="AG_Fill"/>
   <attribute ref="o:bwmode"/>
   <attribute ref="o:bwpure"/>
   <attribute ref="o:bwnormal"/>
   <attribute ref="o:targetscreensize"/>
</complexType>
```

6.1.2.3 curve (Bezier Curve)

This element is used to draw a cubic bézier curve.

The following properties of the style attribute are ignored:

- top
- margin-top
- center-y
- left
- margin-left
- center-x

- width
- height

[*Example:* The following specifies a simple curve that opens upward:

```
<v:curve id="mycurve"
from="10pt,10pt" to="100pt,10pt"
control1="40pt,30pt" control2="85pt,30pt">
</v:curve>
```

This shape is created:

end example]

Parent Elements
background (§2.2.1); group (§6.1.2.7); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23)

Child Elements	Subclause
anchorlock (Anchor Location Is Locked)	§6.3.2.1
borderbottom (Bottom Border)	§6.3.2.2
borderleft (Left Border)	§6.3.2.3
borderright (Right Border)	§6.3.2.4
bordertop (Top Border)	§6.3.2.5
callout (Callout)	§6.2.2.2
ClientData (Attached Object Data)	§6.4.2.12
clippath (Shape Clipping Path)	§6.2.2.3
extrusion (3D Extrusion)	§6.2.2.10
fill (Shape Fill Properties)	§6.1.2.5
formulas (Set of Formulas)	§6.1.2.6
handles (Set of Handles)	§6.1.2.9
imagedata (Image Data)	§6.1.2.11
lock (Shape Protections)	§6.2.2.17
path (Shape Path)	§6.1.2.14
shadow (Shadow Effect)	§6.1.2.18
signatureline (Digital Signature Line)	§6.2.2.29
skew (Skew Transform)	§6.2.2.30
stroke (Line Stroke Settings)	§6.1.2.21

Child Elements	Subclause
textbox (Text Box)	§6.1.2.22
textdata (VML Diagram Text)	§6.5.2.2
textpath (Text Layout Path)	§6.1.2.23
wrap (Text Wrapping)	§6.3.2.6

Attributes	Description
allowincell (Allow in Table Cell) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can be placed in a table. Default is `false`. [*Example:* `<v:shape ... o:allowincell="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
allowoverlap (Allow Shape Overlap) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute. [*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red" alt="Red rectangle"></v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset"></v:shape>`

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.
borderbottomcolor (Bottom Border Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the bottom border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderbottomcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the left border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderleftcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderrightcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:bordertopcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical	Specifies whether the shape is a graphical bullet. Default is `false`.

Attributes	Description
Bullet) Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:bullet="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* `<v:shape ... o:button="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is `auto`, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment: `<v:shape ... o:bwmode="grayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White Mode) Namespace: urn:schemas-	Specifies the black-and-white mode for normal black-and-white output devices. Default is `auto`. [*Example:* This shape renders in a pale grayscale in a normal black-and-white environment:

Attributes	Description
microsoft-com:office:office	<v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwpure (Pure Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: <v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value. [*Example:* <v:image ... chromakey="white" ...> </v:image> *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value. [*Example:* The snippets below are equivalent: ... .narrowstyle {width:50;height:100} ... <v:shape ... class="narrowstyle" style="top:1;left:1"> </v:shape> <v:shape ... style="top:1;left:1; width:50;height:100">

Attributes	Description
	</v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
clip (Clipping Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region. [*Example:* <v:shape ... o:clip="true"> </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
cliptowrap (Clip to Wrapping Polygon) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`. [*Example:* <v:shape ... o:cliptowrap="true"> </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
connectortype (Shape Connector Type) Namespace: urn:schemas-microsoft-com:office:office	Specifies the type of connector used for joining shapes. Default is `straight`. [*Example:* <v:shape ... o:connectortype="elbow" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).
control1 (First Curve Control Point)	Specifies the first control point for the curve, given in the coordinate space of the parent element. Default is "10,10". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.

Attributes	Description
	[*Example:* `<v:curve ... control1="20,30" ... ></v:curve>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
control2 (Second Curve Control Point)	Specifies the second control point for the curve, given in the coordinate space of the parent element. Default is "20,0". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px. [*Example:* `<v:curve ... control2="50,20" ... ></v:curve>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box. This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space. [*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space: `<v:shape ... coordsize="200,200" coordorigin="-100,-100" path="m 0,0 l 0,50, 50,50, 50,0 x e"></v:shape>`  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>coordsize
(Coordinate Space Size)</td><td>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".

The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.

[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>dgmlayout
(Diagram Node Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>  </td></tr>
</table>

[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]

The possible values for this attribute are defined by the XML Schema integer datatype.
</td></tr>
<tr><td>dgmlayoutmru (Diagram Node Recent Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]</td></tr>
</table>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema integer datatype.

dgmnodekind (Diagram Node Identifier)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.
	
	[*Example:*
	
	`<v:shape ... dgmnodekind="1">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

doubleclicknotify (Double-click Notification Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that an event message is sent when a shape is double-clicked. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:doubleclicknotify="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.
	
	[*Example:* This shape is red if its fill is visible:
	
	`<v:shape ... fillcolor="red" ... >`
	`</v:shape>`
	
	This is equivalent to:
	
	`<v:shape ... fillcolor="#ff0000" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

filled (Shape Fill	Specifies whether the closed path will be filled. Default is `true`. This attribute is

Attributes	Description

Toggle)	overridden by the fill on attribute.
	
	[*Example:*
	
	`<v:shape ... filled="f"`
	`  fillcolor="red" ...>`
	`</v:shape>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

forcedash (Force Dashed Outline)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`.
	
	Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.
	
	[*Example:*
	
	`<v:shape ... o:forcedash="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

from (Curve Starting Point)	Specifies the starting point of the line in the coordinate space of the parent element. Default is "0,0". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.
	
	[*Example:*
	
	`<v:curve ... from="10,10" ... >`
	`</v:curve>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

hr (Horizontal Rule Toggle)	Specifies that a shape is a horizontal rule. Default is `false`.

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:hr="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hralign (Horizontal Rule Alignment) Namespace: urn:schemas-microsoft-com:office:office	Specifies the alignment of a horizontal rule. Default is `left`. [*Example:* `<v:shape ... o:hralign="center" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:* `<v:shape ... href="http://www.openxmlformats.org" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* `<v:shape ... o:hrnoshade="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal Rule Length Percentage)	Specifies the length of a horizontal rule as a percentage of page width. Default is 0. [*Example:*

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<v:shape ... o:hrpct="85" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is true. Default is false. [*Example:* <v:shape ... o:hrstd="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* <v:shape ... id="myShape" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes. [*Example:* <v:shape ... o:insetmode="auto" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.

Attributes	Description
	[*Example:* `<v:shape ... insetpen="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
ole (Embedded Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is `false`. [*Example:* `<v:shape ... o:ole="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:* `<v:shape ... o:oleicon="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* `<v:shape ... o:oned="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

Attributes	Description

opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:* The red color is 25% opaque:
	
	`<v:fill type="gradient" color="red"`
	`  color2="blue" opacity=".25">`
	`</v:fill>`
	
	  `opacity="1"`
	  `opacity=".25"`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

preferrelative (Relative Resize Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether the original size of an object is saved after reformatting. Default is `false`. If `true`, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.
	
	[*Example:*
	
	`<v:shape ... o:preferrelative="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`.
	
	[*Example:*
	
	`<v:shape ... print="false" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

regroupid (Regroup	Specifies a previous group for a shape. An ID number is used to identify groups of shapes

Attributes	Description
ID) Namespace: urn:schemas-microsoft-com:office:office	that are no longer grouped. This allows shapes to be regrouped programmatically. [*Example:* The shape was part of a group identified by the ID 040754: `<v:shape ... o:regroupid="040754" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.
strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is `black`. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. [*Example:* `<v:shape ... strokecolor="red" ...> </v:shape>`  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
stroked (Shape Stroke Toggle)	Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>overrides this attribute. Default is <code>true</code>.

[Example:

<pre><v:shape ... fillcolor="red"
  stroked="false" strokecolor="blue"...>
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</td></tr>
<tr><td>strokeweight (Shape Stroke Weight)</td><td>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.

[Example:

<pre><v:shape ... strokeweight="3pt" ... >
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td><code>flip</code></td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	• yx - Flip along both the x- and y-axis.
height	Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
left	Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
margin-bottom	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
margin-left	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page.

Attributes	Description
	<table><tr><td></td><td> <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. <percentage>- Value expressed as a percentage of the parent object's width. </td></tr><tr><td>margin-right</td><td>Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: - auto - Default position of an element in the flow of the page. <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. <percentage>- Value expressed as a percentage of the parent object's width. </td></tr><tr><td>margin-top</td><td>Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: - auto - Default position of an element in the flow of the page. <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. <percentage>- Value expressed as a percentage of the parent object's height. </td></tr><tr><td>mso-position-horizontal</td><td>Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: - absolute - left - center - right - inside - outside </td></tr><tr><td>mso-position-horizontal-relative</td><td>Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are:</td></tr></table>

Attributes	Description
	• margin • page • text • char
mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside
mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin

Attributes	Description
	of the shape to include the margin areas. This property does not change the origin.
mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is

Attributes	Description
	`inherit`. Allowed values are: • `hidden` - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • `inherit` - The visibility state is inherited from the parent of the shape.
	`width` — Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	`z-index` — Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Uses the order that the shapes appear in the page, bottom to top. • <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.

The following properties are only used by the textbox element (§6.1.2.22):

Property	Description
`direction`	Specifies the direction of the text in the textbox. Default is `ltr`. This property is superceded by the `mso-direction-alt` property if that is specified. Allowed values are: • `ltr` - Test is displayed left-to-right. • `rtl` - Test is displayed right-to-left.
`layout-flow`	Determines the flow of the text layout in a textbox. Default is `horizontal`. Allowed values are: • `horizontal` - Text is displayed horizontally.

Attributes	Description
	• `vertical` - Text is displayed vertically. • `vertical-ideographic` - Ideographic text is displayed vertically. • `horizontal-ideographic` - Ideographic text is displayed horizontally.
`mso-direction-alt`	Specifies an alternate direction for text in textboxes. Overrides the `direction` property. The only allowed value is `context`.
`mso-fit-shape-to-text`	Specifies whether the shape stretches to fit the text in the textbox. Default is `false`.
`mso-fit-text-to-shape`	Specifies whether the text stretches to fit the textbox. Default is `false`.
`mso-layout-flow-alt`	Specifies the alternate layout flow for text in textboxes. This property is used instead of `layout-flow` when the layout flow is from bottom to top for non-ideographic languages. Its only value is `bottom-to-top`.
`mso-next-textbox`	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
`mso-rotate`	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
`mso-text-scale`	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if `mso-fit-text-to-shape` is `true`.
`v-text-anchor`	Specifies the vertical anchoring of text in a textbox. Default is `top`. The alignment of a text anchor only becomes evident if `mso-fit-text-to-shape` is `false`. This property is different from the `vertical-align` CSS property, which is used for ideographic languages. Allowed values are: • `top` • `middle` • `bottom` • `top-center` • `middle-center` • `bottom-center`

<tr><td>mso-text-shadow</td><td>Specifies whether a shadow is applied to the text on a text path. Default is false.</td></tr>
<tr><td>text-decoration</td><td>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:

• none
• underline
• overline
• line-through
• blink</td></tr>
<tr><td>v-rotate-letters</td><td>Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.</td></tr>
<tr><td>v-same-letter-heights</td><td>Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.</td></tr>
<tr><td>v-text-align</td><td>Specifies the alignment of text. Default is left. Allowed values are:

• left
• right
• center
• justify
• letter-justify - Distributes the extra space between the letters.
• stretch-justify - Stretches the letters to fill in the space.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>v-text-kern</td><td>Specifies whether kerning is turned on. Default is false.</td></tr>
<tr><td>v-text-reverse</td><td>Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.</td></tr>
<tr><td>v-text-spacing-mode</td><td>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:

• tightening
• tracking</td></tr>
<tr><td>v-text-spacing</td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr>
</table>

The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:

• top
• left
• width
• height

The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:

• flip
• height
• left
• margin-left
• margin-top
• position
• rotation
• top
• visibility
• width
• z-index

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>target (Hyperlink Display Target)</td><td>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:

<table>
<tr><th>Value</th><th>Description</th></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td><targetname></td><td>String containing the name of the frame or window in which to load the document.</td></tr>
<tr><td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr>
<tr><td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr>
<tr><td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr>
<tr><td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr>
<tr><td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr>
<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>
[Example:
<pre>
  <v:shape ...
    href="http://www.openxmlformats.org"
    target="_self" ... >
  </v:shape>
</pre>
end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>title (Shape Title)</td><td>
Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.
[Example:
<pre>
  <v:shape ... title="tooltip" ... >
  </v:shape>
</pre>
end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>to (Curve Ending Point)</td><td>
Specifies the ending point of the line in the coordinate space of the parent element. Default is "30,20". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.
[Example:
<pre>
  <v:curve ... to="40,40" ... >
</pre>
</td></tr>
</table>

Attributes	Description
	</v:curve> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
userdrawn (Exists In Master Slide) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the user has added the shape to a master slide. Default is `false`. Used by PresentationML. [*Example:* <v:shape ... o:userdrawn="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
userhidden (Hide Script Anchors) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application. [*Example:* <v:shape ... o:userhidden="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to `tight` or `through`. [*Example:* <v:shape ... wrapcoords="0,0 0,200, 200,200, 200,0" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Curve">
   <sequence>
      <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
   <attribute name="from" type="xsd:string" use="optional"/>
   <attribute name="control1" type="xsd:string" use="optional"/>
   <attribute name="control2" type="xsd:string" use="optional"/>
   <attribute name="to" type="xsd:string" use="optional"/>
</complexType>
```

6.1.2.4 f (Single Formula)

This element defines a single value as the result of the evaluation of an expression. The expression is defined by the eqn attribute and has the general form of an operation followed by up to three arguments, which consist of adjustment values (see the adj attribute of the shape element (§6.1.2.19)), the results of earlier formulas, fixed numbers or pre-defined values. Each f value is referenced using "@" followed by a number corresponding to the zero-based index for that value in the list of f elements. For example, the value of the second f element is referenced as "@2".

[*Example:* The following defines a blue arrow pointing to the right:

```
<v:shape coordsize="21600,21600" adj="18000,5400,10800"
  path="m @0,0 l @0,@1 0,@1 0,@3 @0,@3 @0,21600 21600,10800 x e"
  style='left:50pt;top:50pt;width:90pt;height:30pt'
  fillcolor="#4f81bd" strokecolor="#4f81bd" strokeweight="2pt">
  <v:formulas>
   <v:f eqn="val #0"/>
   <v:f eqn="val #1"/>
   <v:f eqn="val #2"/>
   <v:f eqn="sum height 0 #1"/>
   <v:f eqn="sum #2 0 #1"/>
   <v:f eqn="sum width 0 #0"/>
   <v:f eqn="prod @5 @4 #2"/>
   <v:f eqn="sum width 0 @6"/>
  </v:formulas>
</v:shape>
```

The shape looks like this:

end example]

Parent Elements
formulas (§6.1.2.6)

Attributes	Description
eqn (Equation)	Specifies a single formula, which consists of a named operation followed by up to three parameters, typically described as v, P1 and P2. Up to 128 formulas may be specified. These operations are defined (calculation accuracy is discussed below):

Operation	Description
`val`	v Returns the supplied value. Exact.
`sum`	$\mathrm{v} + \mathrm{P1} - \mathrm{P2}$ Addition and subtraction. Exact.
`product`	$\mathrm{v} \times \mathrm{P1}/\mathrm{P2}$ Multiplication and division. Rounds up.
`mid`	$(\mathrm{v} + \mathrm{P1})/2$ Simple average. Rounds toward zero.
`abs`	$\lvert\mathrm{v}\rvert$ Absolute value. Exact.
`min`	$\min(\mathrm{v}, \mathrm{P1})$ The lesser of two values. Exact.
`max`	$\max(\mathrm{v}, \mathrm{P1})$ The greater of two values. Exact.
`if`	$\mathrm{v} > 0\ ?\ P1 : P2$ Conditional selection. Exact.
`mod`	$\sqrt{\mathrm{v}^2 + \mathrm{P1}^2 + \mathrm{P1}^2}$ Modulus. Inexact.
`atan2`	$\mathrm{atan2}(\mathrm{P1}, \mathrm{v})$ Trigonometric arc tangent of a quotient. Result is in "fd" units or fractional degrees - degrees $\times\ 2^{16}$. Inexact.
`sin`	$\mathrm{v} \times \sin(\mathrm{P1})$ Sine. Argument is in "fd" units or fractional degrees - degrees $\times\ 2^{16}$. Inexact.
`cos`	$\mathrm{v} \times \cos(\mathrm{P1})$ Cosine. Argument is in "fd" units or fractional degrees - degrees $\times\ 2^{16}$. Inexact.
`cosatan2`	$\mathrm{v} \times \cos\big(\mathrm{atan2}(\mathrm{P2}, \mathrm{P1})\big)$ Preserves full accuracy in the intermediate calculation. Inexact.

Attributes	Description

sinatan2	$v \times \sin(\text{atan2}(P2, P1))$ Preserves full accuracy in the intermediate calculation. Inexact.
sqrt	$\sqrt{v}$ Square root. Result is positive and rounds down. Inexact.
sumangle	$v + P1 \times 2^{16} - P2 \times 2^{16}$ Adds an existing angle in fd units (v) to two other angles specified in degrees. P1 and P2 are scaled by 2^{16}. Exact.
ellipse	$P2\sqrt{1 - \left(\frac{v}{P1}\right)^2}$ The eccentricity formula for an ellipse, where v is length of the semiminor axis and P1 is the length of the semimajor axis. Inexact.
tan	$v \times \tan(P1)$ Tangent. Argument is in "fd" units or fractional degrees - degrees $\times 2^{16}$. Inexact.

Formulas are evaluated to full precision, but the result is always a 32-bit integer. Formula authors should avoid formulas which are discontinuous - not only are many of the trigonometric operations inexact, the transformations within the coordinate spaces are also inexact. This can mean that a set of formulas which is discontinuous evaluates to give very different path values with the same input on two different systems.

When an operation is marked as exact then a conforming implementation must always generate the correct arithmetic answer (unless the calculations overflow internally). The product operation is required to round to the nearest integer. If the result is exactly 0.5 then it must be rounded up to the next numerically greater integer. The mid operation is required to round towards 0.

All other operations are inexact, but the implementation must round non-integral values down (towards -infinity) and should perform internal calculations with this form of rounding.

The arguments used in the evaluation of a formula are normally either fixed numbers, the result of the evaluation of a previous formula or an adjust value - the value of the corresponding entry in the shape adj attribute. Fixed numbers must be positive integral values in the range 0 to 65535 (unsigned 16-bit numbers). The following named values are defined:

Value	Description
@n	The value of formula n, where n is the zero-

Attributes	Description
	based index of the formula in the list of formulas. n must be less than the current formula index.
#n	Adjustment (adj) value n. n must be in the range 0 to 7.
width	The width defined by the coordsize attribute.
height	The height defined by the coordsize attribute.
xcenter	The x ordinate of the center of the coordinate space defined by coordorigin and coordsize.
ycenter	The y ordinate of the center of the coordinate space defined by coordorigin and coordsize.
xlimo	The x value of the limo attribute (see also the path element (§6.1.2.14)).
ylimo	The y value of the limo attribute (see also the path element (§6.1.2.14)).
hasstroke	1 if the shape has a stroke operation, 0 if it does not, as determined by the on attribute of the stroke element (§6.1.2.21).
hasfill	1 if the shape has a fill operation, 0 if it does not, as determined by the on attribute of the fill element (§6.1.2.5).
pixellinewidth	The line width in output device pixels. This is used to outset lines from the edge of a rectangle on the assumption that the implementation draws to lower right pixel in preference to the upper left pixel when a line is on a pixel boundary.
pixelwidth	The width of the shape in device pixels (i.e., the coordsize width transformed into device space).
pixelheight	The height of the coordsize in device pixels.
emuwidth	The width of the coordsize in EMUs.
emuheight	The height of the coordsize in EMUs.
emuwidth2	Half the width of the coordsize in EMUs.

Attributes	Description
	emuheight2 — Half the height of the coordsize in EMUs. The EMU, or English Metric Unit, is the smallest unit of measure in VML and corresponds to 914400 EMU per inch or 12700 EMU per point. See above for an example. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_F">
   <attribute name="eqn" type="xsd:string"/>
</complexType>
```

6.1.2.5 fill (Shape Fill Properties)

This element specifies how the path should be filled if something beyond a solid color fill is desired. The attributes of the fill element can be used to describe a powerful set of image- or gradient-based fill patterns. Extensions to the VML fill definition are encoded as sub-elements of fill.

Parent Elements
arc (§6.1.2.1); background (§2.2.1); background (§6.1.2.2); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapetype (§6.1.2.20)

Child Elements	Subclause
fill (Shape Fill Extended Properties)	§6.2.2.12

Attributes	Description
alignshape (Align Image With Shape)	Specifies whether an image will align with the shape. Default is `true`. [*Example:* The image displayed in the shape is not rotated even though the shape is rotated 30 degrees: `<v:shape coordorigin="0,0" coordsize="200,200" style="top:1;left:1;width:50; height:50;rotation:30" path="m 1,1 l 1,200, 200,200, 200,1 x e"> <v:fill alignshape="false" type="frame" src="myimage.gif">`

Attributes	Description
	</v:fill> </v:shape> Applied to a simple square the fill looks like this:  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
althref (Alternate Image Reference Location) Namespace: urn:schemas-microsoft-com:office:office	Defines an alternate reference for an image in Macintosh PICT format. [*Example:* <v:fill ... althref="myimage.pcz" ... > </v:fill> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
angle (Gradient Angle)	Specifies the direction of a gradient. The vector of a gradient is perpendicular to the vector of the blend direction from one color to another. The default value is zero degrees, which is a horizontal vector from left to right. Positive angles rotate the gradient in a counter-clockwise direction. [*Example:* The fill is composed of a 45-degree gradient of two colors. Blue is in the top left corner and red is in the bottom right corner. <v:fill type="gradient" color="red" color2="blue" angle="45"> </v:fill>  *end example*] The possible values for this attribute are defined by the XML Schema decimal datatype.
aspect (Image Aspect Ratio)	Specifies how the fill image aspect ratio will be preserved. Default is ignore. Allowed values are:

Attributes	Description

	• `ignore` - Ignore aspect ratio.
	• `atleast` - At least as large as defined by the size attribute.
	• `atmost` - No larger than that defined by the size attribute.
	
	In each case, the size attribute will be adjusted to preserve the aspect ratio of the image.
	
	[*Example:* The image that makes up the fill is no larger than 20 points by 20 points, limiting the size of the tiles inside the shape.
	
	`<v:fill type="tile" aspect="atmost"`
	`  size="20pt,20pt" src="myimage.gif">`
	`</v:fill>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).

color (Primary Color)	Specifies the main fill color; functions the same as the fillcolor attribute of the shape element (§6.1.2.19). This attribute overrides the shape's fillcolor. Default is `white`. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.
	
	[*Example:* The shape is blue:
	
	`<v:shape ... fillcolor="red" ... >`
	`  <v:fill color="blue"/>`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

color2 (Secondary Color)	Specifies the secondary fill color, used when a fill type is a pattern or a gradient. Default is `white`. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. [*Example:* The shape is filled with a horizontal gradient with red at the bottom and blue on top: `<v:fill type="gradient"`

Attributes	Description
	color="red" color2="blue"> </v:fill> *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
colors (Intermediate Colors)	Specifies an array of comma-separated percentage-color pairs that define intermediate colors and their positions in a gradient fill. The primary color, specified either by the fillcolor attribute of the shape element (§6.1.2.19) or the color attribute of the fill element (§6.1.2.5), is used at the 0% endpoint. The secondary color, specified by the color2 attribute of the fill element (§6.1.2.5), is used at the 100% endpoint. The numeric values may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* The shape is filled with a horizontal gradient colored, from bottom to top, red, yellow, green, blue: <v:fill type="gradient" color="red" color2="blue" colors="30% yellow,70% green"> </v:fill>  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
detectmouseclick (Detect Mouse Click) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a mouse click is detected on the fill of a shape. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
focus (Gradient Center)	Specifies the center starting position of a gradient. Values range from 100% to -100%. Default is 0. A value of 100% or -100% reverses the direction of the gradient (in effect swapping color and color2). A value of 50% changes the gradient so that color is at both ends and color2 is in the middle. A value of -50% changes the gradient so that color2 is at both ends and color is in the middle.

Attributes	Description

	[*Example:* The shape is filled with a horizontal gradient with red at both ends and blue in the middle:
	
	`<v:fill type="gradient"`
	`  color="red" color2="blue"`
	`  focus="50%">`
	`</v:fill>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

focusposition (Radial Gradient Center)	Specifies the position of the center rectangle of a radial gradient. The vector is a fraction of the width and height of the shape. The first is a percentage of the fill to the left edge; the second is a percentage of the fill to the top. Default is 0,0. To position a radial fill at the center of a shape, use a value of 50%,50%.
	
	[*Example:* The shape is filled with a rectangular gradient positioned in the top-left quadrant of the shape. The interior of the gradient is blue and the exterior is red:
	
	`<v:fill type="gradientradial"`
	`  color="red" color2="blue"`
	`  focusposition="25%,25%">`
	`</v:fill>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

focussize (Radial Gradient Size)	Specifies the size of the center rectangle of a radial gradient. The vector is a fraction of the width and height of the shape. The first is a percentage of the fill to the right edge; the second is a percentage of the fill to the bottom. Default is 0,0. A focussize value of 100%,100% and a focusposition of 0,0 makes color2 dominate the gradient completely. Small values of around 10%,10% are recommended for balanced gradients. [*Example:* The shape is filled with a rectangular gradient positioned in the top-left quadrant of the shape. The interior of the gradient is blue and the exterior is red. The

Attributes	Description

	red portion is wider on the bottom and right sides of the blue region. The pure blue region is 25% the width and 25% the height of the shape:
	
	`<v:fill type="gradientradial"`
	`color="red" color2="blue"`
	`focussize="25%,25%"`
	`focusposition="25%,25%">`
	`</v:fill>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

href (Hyperlink Target)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.
	
	[*Example:*
	
	`<v:fill ... o:href="myimage.gif" ... >`
	`</v:fill>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object.
	
	Default is no value.
	
	[*Example:*
	
	`<v:shape ... id="myShape" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

id (Relationship to Part) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID of the relationship to the image used for this fill. The specified relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or the document shall be considered non-conformant. [*Example*: The markup specifies the associated relationship part with relationship ID

Attributes	Description
	`rId10` contains the corresponding relationship information for the fill: `< ... r:id="rId10" />` *end example*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

method (Gradient Fill Method)	Specifies the method used to generate the transition from color to color2 in a gradient fill. Default is `sigma`.
	
	[*Example:*
	
	`<v:fill type="gradient"`
	`  color="red" color2="blue" method="any">`
	`</v:fill>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_FillMethod simple type (§6.1.3.4).

on (Fill Toggle)	Specifies whether to fill the shape. Default is `true`. This attribute overrides the shape's fill attribute.
	
	[*Example:* The shape has a transparent fill:
	
	`<v:shape ... fill="true" ... >`
	`  <v:fill color="red" on="false">`
	`  </v:fill>`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

opacity (Primary Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* The red color is 25% opaque:

Attributes	Description
	<v:fill type="gradient" color="red" color2="blue" opacity=".25"> </v:fill>  opacity="1"  opacity=".25" *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
opacity2 (Secondary Color Opacity) Namespace: urn:schemas-microsoft-com:office:office	Specifies the opacity of the secondary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* The blue color is 25% opaque: <v:fill type="gradient" color="red" color2="blue" o:opacity2=".25"> </v:fill>  opacity2="1"  opacity2=".25" *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
origin (Fill Image Origin)	Specifies the position of the origin of a fill image as a point relative to the top left corner of the image. The vector is a fraction of the width and height of the image. Default is the center of the image. These numeric values may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* The origin of the image is 25% to the right and 25% above the image's top left corner: <v:fill type="tile" src="myimage.gif" origin="0.25,-0.25"> </v:fill>

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

position (Fill Image Position)	Specifies the position of the origin of a fill image as a point within its containing shape. The vector is a fraction of the width and height of the shape. These numeric values may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:* The origin of the image is positioned 25% to the right of the left edge of the shape and 25% down from the shape's top:
	
	`<v:fill type="tile" src="myimage.gif"`
	`  position="0.25,0.25">`
	`</v:fill>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

recolor (Recolor Fill as Picture)	Specifies that the fill uses an image. Default is `false`.
	
	[*Example:*
	
	`<v:fill r:id="rId4" o:title="MyPic" recolor="true"`
	`  type="frame">`
	`</v:fill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

relid (Relationship to Part) Namespace: urn:schemas-microsoft-com:office:office	Specifies the relationship ID of the relationship to the image. The specified relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or the document shall be considered non-conformant. [*Example*: The markup specifies the associated relationship part with relationship ID

Attributes	Description

	`rId10` contains the corresponding relationship information:
	
	`<v:fill ... o:relid="rId10" ...>`
	`</v:fill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_RelationshipId simple type (§6.2.3.20).

rotate (Rotate Fill with Shape)	Specifies whether the fill is rotated with the shape. Default is `false`.
	
	[*Example:* The gradient is rotated with the shape:
	
	`<v:fill color2="white" focus="100%" rotate="true"`
	`type="gradient">`
	`</v:fill>`
	
	 
	`rotate="true"`
	 
	`rotate="false"`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

size (Fill Image Size)	Specifies the size of the fill image. Default is the native image pixel size.
	
	[*Example:* The image is reduced in size disproportionately:
	
	`<v:fill type="tile" src="myimage.gif"`
	`size="25pt,15pt">`
	`</v:fill>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description
src (Fill Image Source)	Specifies the URL specifying the fill image to use. [*Example:* `<v:fill ... src="myimage.gif" ... ></v:fill>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
title (Title) Namespace: urn:schemas-microsoft-com:office:office	Specifies the title of an embedded fill image. This is typically set to the comment property of the image, which is often blank. [*Example:* `<v:fill ... o:title="alt text" ... ></v:fill>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
type (Fill Type)	Specifies the type of fill. Default is `solid`. Allowed values are: • `solid` • `gradient` • `gradientradial` • `tile` • `pattern` • `frame` [*Example:* Applied to a simple square using the following fill element, the three gradient types look like this: `<v:fill color="red" color2="blue" type="solid"></v:fill>`  `type="solid"`  `type="gradient"`

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>

type="gradientradial"

Applied to a simple square using the following fill elements, the three image types look like this:

<table>
<tr><td>  </td><td><v:fill src="myimage.gif"
type="tile" size="50%,50%">
</v:fill></td></tr>
<tr><td>  </td><td><v:fill src="myimage.gif"
type="frame" size="50%,50%">
</v:fill></td></tr>
<tr><td>  </td><td><v:fill src="myimage.gif"
color="red" color2="blue"
type="pattern">
</v:fill></td></tr>
</table>

end example]

The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).
</td></tr>
</table>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Fill">
   <sequence>
      <element ref="o:fill" minOccurs="0"/>
   </sequence>
   <attributeGroup ref="AG_Id"/>
   <attribute name="type" type="ST_FillType" use="optional"/>
   <attribute name="on" type="ST_TrueFalse" use="optional"/>
   <attribute name="color" type="ST_ColorType" use="optional"/>
   <attribute name="opacity" type="xsd:string" use="optional"/>
   <attribute name="color2" type="ST_ColorType" use="optional"/>
   <attribute name="src" type="xsd:string" use="optional"/>
   <attribute ref="o:href"/>

   <attribute ref="r:id" use="optional"/>
   <attribute ref="o:relid" use="optional"/>
</complexType>
```

6.1.2.6 formulas (Set of Formulas)

This element defines a set of formulas whose calculated values are referenced by other attributes. Each formula is contained in a child f element (§6.1.2.4).

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Child Elements	Subclause
f (Single Formula)	§6.1.2.4

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Formulas">
   <sequence>
      <element name="f" type="CT_F" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

6.1.2.7 group (Shape Group)

This element is used to collect shapes and groups so they can be positioned and transformed as a single unit. A group contains group, shapetype, shape, pre-defined shape - arc, curve, image, line, oval, polyline, rect, roundrect - and lock elements.

[*Example:* The following example defines a few basic parts of a flying saucer graphic. The group consists of five shapes. Each shape's position is determined within the coordinate space of the group, which is defined by the group's attributes.

```
<v:group id="saucer"
  style='position:relative;left:200;top:200;width:50;height:50'
  coordorigin="0,0" coordsize="6000,6000">
  <v:shape id="body"
    style='position:relative;left:234.75pt;top:208.875pt;
    width:235.25pt;height:128.875pt' coordsize="3765,2060"
    path="m1285,251l1126,469,580,1009,,1285,25,1412,93,1547,194,1673,
    1017,2026,2312,2060,3209,1756,3765,1388,3278,680,3059,319,2976,,
    1285,251,1285,251xe"
    fillcolor="#bcbcd6" stroked="f">
    <v:path arrowok="t"/>
  </v:shape>
  <v:shape id="canopy"
    style='position:relative;left:314.625pt;top:140.5pt;
    width:104pt;height:102pt' coordsize="1663,1633"
    path="m0,1355l177,1498,353,1582,840,1633,1378,1498,1663,1295,
    1545,456,1260,10,1025,,656,260,253,874,,1355,,1355xe"
    fillcolor="#99ebff" stroked="f">
    <v:path arrowok="t"/>
  </v:shape>
  <v:shape id="light1"
    style='position:relative;left:408.625pt;top:268.75pt;
    width:24.25pt;height:27.375pt' coordsize="388,437"
    path="m209,0l34,101,,302,125,437,329,327,388,152,209,,209,0xe"
    fillcolor="#fff27f" stroked="f">
    <v:path arrowok="t"/>
  </v:shape>
  <v:shape id="light2"
```

```
      style='position:relative;left:356.625pt;top:279.25pt;
      width:28.875pt;height:30pt' coordsize="462,479"
      path="m135,0l0,186,59,422,344,479,462,228,135,,135,0xe"
      fillcolor="#fff27f" stroked="f">
      <v:path arrowok="t"/>
    </v:shape>
    <v:shape id="light3"
      style='position:relative;left:302.625pt;top:274pt;
      width:23pt;height:23.625pt' coordsize="369,378"
      path="m0,591226,,369,186,243,378,32,363,,59,,59xe"
      fillcolor="#fff27f" stroked="f">
      <v:path arrowok="t"/>
    </v:shape>
  </v:group>
```

end example]

Parent Elements
background (§2.2.1); group (§6.1.2.7); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23)

wrap (Text Wrapping)	§6.3.2.6

Attributes	Description
allowincell (Allow in Table Cell) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can be placed in a table. Default is `false`. [*Example:* `<v:shape ... o:allowincell="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
allowoverlap (Allow Shape Overlap)	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red" alt="Red rectangle"></v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset"></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderbottomcolor (Bottom Border Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the bottom border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderbottomcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the left border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderleftcolor="red" ... ></v:shape>` *end example*]

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderrightcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:bordertopcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* `<v:shape ... o:bullet="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* `<v:shape ... o:button="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
class (CSS	Specifies a reference to the definition of a CSS style. Default is no value.

Attributes	Description

Reference)	[*Example:* The snippets below are equivalent:
	
	`...`
	`.narrowstyle {width:50;height:100}`
	`...`
	`<v:shape ... class="narrowstyle"`
	`  style="top:1;left:1">`
	`</v:shape>`
	
	`<v:shape ... style="top:1;left:1;`
	`  width:50;height:100">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.
	
	This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.
	
	[*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`  coordorigin="-100,-100"`
	`  path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

coordsize (Coordinate Space	Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>Size)</td><td>The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.

[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>dgmlayout
(Diagram Node Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>
[Example:
<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]
The possible values for this attribute are defined by the XML Schema integer datatype.
</td></tr>
<tr><td>dgmlayoutmru
(Diagram Node Recent Layout Identifier)

Namespace:
urn:schemas-microsoft-com:office:office</td><td>
Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>
[Example:
<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
</td></tr>
</table>

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema integer datatype.

dgmnodekind (Diagram Node Identifier)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.
	
	[*Example:*
	
	`<v:shape ... dgmnodekind="1">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

doubleclicknotify (Double-click Notification Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that an event message is sent when a shape is double-clicked. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:doubleclicknotify="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

editas (Group Diagram Type)	Specifies which diagram type the contained shapes represent. This is used in conjunction with the diagram element (§6.2.2.8). A value of `canvas` indicates that the group is a regular group of shapes and does not represent a diagram. Other values indicate that the diagram element and its children contain semantic information relevant to that type of diagram, which is represented by the shapes in the group.
	
	[Example:
	
	`<v:group ... editas="orgchart">`
	`</v:group>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_EditAs simple type (§6.1.3.2).

fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.

Attributes	Description

	[*Example:* This shape is red if its fill is visible:
	
	`<v:shape ... fillcolor="red" ... ></v:shape>`
	
	This is equivalent to:
	
	`<v:shape ... fillcolor="#ff0000" ... ></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

filled (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is `true`. This attribute is overridden by the fill on attribute. [*Example:* `<v:shape ... filled="f" fillcolor="red" ...></v:shape>`  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
hr (Horizontal Rule Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that a shape is a horizontal rule. Default is `false`. [*Example:* `<v:shape ... o:hr="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hralign (Horizontal Rule Alignment)	Specifies the alignment of a horizontal rule. Default is `left`. [*Example:*

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<v:shape ... o:hralign="center" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:* <v:shape ... href="http://www.openxmlformats.org" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* <v:shape ... o:hrnoshade="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	Specifies the length of a horizontal rule as a percentage of page width. Default is 0. [*Example:* <v:shape ... o:hrpct="85" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace: urn:schemas-	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is `true`. Default is `false`. [*Example:* <v:shape ... o:hrstd="true" ... >

Attributes	Description
microsoft-com:office:office	</v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* <v:shape ... id="myShape" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is `custom`. This attribute is only meaningful for text boxes. [*Example:* <v:shape ... o:insetmode="auto" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* <v:shape ... o:oned="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>[Example:

<pre><v:shape ... print="false" ... >
</v:shape></pre>
end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</td></tr>
<tr><td>regroupid (Regroup ID)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.

[Example: The shape was part of a group identified by the ID 040754:

<pre><v:shape ... o:regroupid="040754" ... >
</v:shape></pre>
end example]

The possible values for this attribute are defined by the XML Schema integer datatype.</td></tr>
<tr><td>spid (Optional String)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies an optional string that an application may use to Identify the particular shape. Default is no value.

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
<tr><td>height</td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	• auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
left	Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
margin-bottom	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
margin-left	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the

Attributes	Description
	parent object's width.
margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text

Attributes	Description
	• char
mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside
mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this

Attributes	Description	
	edited	property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
	position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are: • hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not

Attributes	Description
	processed. • `inherit` - The visibility state is inherited from the parent of the shape.
`width`	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
`z-index`	Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Uses the order that the shapes appear in the page, bottom to top. • <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.

The following properties are only used by the textbox element (§6.1.2.22):

Property	Description
`direction`	Specifies the direction of the text in the textbox. Default is `ltr`. This property is superceded by the `mso-direction-alt` property if that is specified. Allowed values are: • `ltr` - Test is displayed left-to-right. • `rtl` - Test is displayed right-to-left.
`layout-flow`	Determines the flow of the text layout in a textbox. Default is `horizontal`. Allowed values are: • `horizontal` - Text is displayed horizontally. • `vertical` - Text is displayed vertically. • `vertical-ideographic` - Ideographic text is displayed vertically. • `horizontal-ideographic` - Ideographic text is displayed

Attributes	Description
	horizontally.
mso-direction-alt	Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.
mso-fit-shape-to-text	Specifies whether the shape stretches to fit the text in the textbox. Default is false.
mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.
mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
v-text-anchor	Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
The following properties are only used by the textpath element (§6.1.2.23):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr>
<tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr>
<tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr>
<tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are:
normal
italic
oblique - Treated the same as italic.</td></tr>
<tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:
normal
small-caps</td></tr>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200
300
400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	<table><tr><td>bolder 500 600 700 800 900</td><td></td></tr></table>
	mso-text-shadow: Specifies whether a shadow is applied to the text on a text path. Default is false.
	text-decoration: Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are: • none • underline • overline • line-through • blink
	v-rotate-letters: Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
	v-same-letter-heights: Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align: Specifies the alignment of text. Default is left. Allowed values are: • left • right • center • justify • letter-justify - Distributes the extra space between the letters. • stretch-justify - Stretches the letters to fill in the space.
	v-text-kern: Specifies whether kerning is turned on. Default is false.
	v-text-reverse: Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>v-text-spacing-mode</td><td>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:

• tightening
• tracking</td></tr>
<tr><td>v-text-spacing</td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr>
</table>

The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:

• top
• left
• width
• height

The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:

• flip
• height
• left
• margin-left
• margin-top
• position
• rotation
• top
• visibility
• width
• z-index

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>tablelimits (Table Row Height Limits)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies a list of minimum height values for each row in a table. Default is no value.

Used by PresentationML for native tables. This attribute is only useful when the table is made up of shapes that are grouped. When text is added to table cells, the row height may increase. The tablelimits attribute stores the original row height so that if text is deleted, the row height will not fall below the original value.

[Example:</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>

```
<v:shape ... o:tablelimits="30pt 20pt" ... >
</v:shape>
```

end example]

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>tableproperties (Table Properties)

Namespace: urn:schemas-microsoft-com:office:office</td><td>

Specifies a bitmask, represented as an integer, that determines table properties. Only the first three bits of this integer are used. Default is 0.

Used by PresentationML for native tables. This attribute is only useful when the table is made up of shapes that are grouped. Allowed values are:

<table>
<tr><th>Bit</th><th>Description</th></tr>
<tr><td>1</td><td>Set if the group of shapes is a table.</td></tr>
<tr><td>2</td><td>Set if the shape is a placeholder.</td></tr>
<tr><td>3</td><td>Set if the table text is bi-directional.</td></tr>
</table>

[*Example:* Decimal 3 means that bits 1 and 2 are set.

```
<v:shape ... o:tableproperties="3" ... >
</v:shape>
```

end example]

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>target (Hyperlink Display Target)</td><td>

Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td><targetname></td><td>String containing the name of the frame or window in which to load the document.</td></tr>
<tr><td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr>
<tr><td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr>
<tr><td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr>
<tr><td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr>
<tr><td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>

[Example:

<pre>
<v:shape ...
  href="http://www.openxmlformats.org"
  target="_self" ... >
</v:shape>
</pre>

end example]

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>title (Shape Title)</td><td>Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.

[Example:

<pre>
<v:shape ... title="tooltip" ... >
</v:shape>
</pre>

end example]

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>userdrawn (Exists In Master Slide)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies whether the user has added the shape to a master slide. Default is <code>false</code>. Used by PresentationML.

[Example:

<pre>
<v:shape ... o:userdrawn="true" ... >
</v:shape>
</pre>

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
</td></tr>
<tr><td>userhidden (Hide Script Anchors)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies whether a script anchor is hidden. Default is <code>false</code>. If <code>true</code>, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application.

[Example:

<pre>
<v:shape ... o:userhidden="true" ... >
</v:shape>
</pre>
</td></tr>
</table>

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to `tight` or `through`.
	
	[*Example:*
	
	`<v:shape ...`
	`  wrapcoords="0,0 0,200, 200,200, 200,0" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Group">
   <choice maxOccurs="unbounded">
      <group ref="EG_ShapeElements"/>
      <element ref="group"/>
      <element ref="shape"/>
      <element ref="shapetype"/>
      <element ref="arc"/>

   <attribute ref="o:tableproperties"/>
   <attribute ref="o:tablelimits"/>
</complexType>
```

6.1.2.8 h (Shape Handle)

This element defines a single handle, which is a user interface element tied to one or two adj values. Moving the handle changes its linked adj values, which in turn changes formulas and attributes that depend on them.

The handle is optionally constrained vertically or horizontally. The linked adj values store the position of the handle in the shape's coordinate space.

[*Example:* The example below defines a simple kite shape with a resizable width:

```
<v:shape coordsize="200,200" coordorigin="-100,-100" adj="100"
style="width:50;height:50;position:relative"
 path="m @1,-50 l 0,-200 @0,-50 0,200 x e">
 <v:formulas>
  <v:f eqn="val #0"/>
  <v:f eqn="sum 0 0 @0"/>
 </v:formulas>
 <v:handles>
  <v:h position="#0,0"/>
 </v:handles>
</v:shape>
```

end example]

Parent Elements
handles (§6.1.2.9)

Attributes	Description

invx (Invert Handle's X Position)	Specifies whether the x position of the handle should be inverted according to: $x_{new} = coordorigin_x + coordsize_x - x_{old}$
	
	Default is `false`.
	
	[*Example:*
	
	`<v:handles>`
	`  <v:h ... invx="true" ... />`
	`</v:handles>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

invy (Invert Handle's Y Position)	Specifies whether the y position of the handle should be inverted according to: $y_{new} = coordorigin_y + coordsize_y - y_{old}$ Default is `false`. [*Example:*

Attributes	Description
	<v:handles> <v:h ... invy="true" ... /> </v:handles> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
map (Handle Coordinate Mapping)	Specifies how the x and y positions of the handle are mapped from the coordsize range into the specified range. Default is "0,1000". [*Example:* <v:handles> <v:h ... map="-1000,1000" ... /> </v:handles> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
polar (Handle Polar Center)	Specifies the center position of a handle that uses polar coordinates. If specified, the position attribute is assumed to contain radius and angle values. If omitted, the position attribute is assumed to contain x and y positions. Default is no value. [*Example:* <v:handles> <v:h ... polar="0,0" ... /> </v:handles> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
position (Handle Position)	Specifies the x and y position of the handle. If the polar attribute is present, defines the handle position using radius and angle values. Default is "0,0". Each value in the vector is one of the following: • constant • formula (e.g., @2) • adj value (e.g., #2) • center • topleft • bottomright

Attributes	Description

	Each of the above except for an adj value reference fixes the handle position for that dimension. Specifying an adj value allows the handle to move in that dimension and the handle position for that dimension is stored in the adj value.
	
	[*Example:* The handle's x position is fixed but it is free to move in the y dimension:
	
	`<v:handles>`
	`  <v:h ... position="topleft,#2" ... />`
	`</v:handles>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

radiusrange (Handle Polar Radius Range)	Specifies a range of minimum and maximum values that constrain the radius of a handle using polar coordinates. Default is "0,0". Each value is either a constant or a formula reference. Omitting a value leaves that bound unconstrained.
	
	[*Example:* The polar handle may only be moved within a radius range of 25 to 50.
	
	`<v:handles>`
	`  <v:h ... radiusrange="25,50" ... />`
	`</v:handles>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

switch (Handle Inversion Toggle)	Specifies whether the x and y dimensions of the handle are switched when the shape is taller than it is wide. Default is `false`. This is useful for shapes with limo stretch behavior.
	
	[*Example:*
	
	`<v:handles>`
	`  <v:h ... switch="true" ... />`
	`</v:handles>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.1.3.15).

xrange (Handle X Position Range)	Specifies a range of minimum and maximum values that constrain the x position of a handle. Default is "0,0". Each value is either a constant or a formula reference. Omitting a value leaves that bound unconstrained.

Attributes	Description

	[*Example:* The handle's x position has a maximum bound of 500 and no minimum bound:
	
	`<v:handles>`
	`  <v:h ... xrange=",500" ... />`
	`</v:handles>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

yrange (Handle Y Position Range)	Specifies a range of minimum and maximum values that constrain the y position of a handle. Default is "0,0". Each value is either a constant or a formula reference. Omitting a value leaves that bound unconstrained.
	
	[*Example:* The handle's y position has a minimum bound of -500 and no maximum bound:
	
	`<v:handles>`
	`  <v:h ... yrange="-500," ... />`
	`</v:handles>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_H">
   <attribute name="position" type="xsd:string"/>
   <attribute name="polar" type="xsd:string"/>
   <attribute name="map" type="xsd:string"/>
   <attribute name="invx" type="ST_TrueFalse"/>
   <attribute name="invy" type="ST_TrueFalse"/>
   <attribute name="switch" type="ST_TrueFalseBlank"/>
   <attribute name="xrange" type="xsd:string"/>
   <attribute name="yrange" type="xsd:string"/>
   <attribute name="radiusrange" type="xsd:string"/>
</complexType>
```

6.1.2.9 handles (Set of Handles)

This element defines a set of user interface elements which can vary a shape's adj values. All dependent formulas and attributes are recalculated. Each handle is defined by a child h element.

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Child Elements	Subclause
h (Shape Handle)	§6.1.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Handles">
   <sequence>
      <element name="h" type="CT_H" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

6.1.2.10 image (Image File)

This element is used to draw an image that has been loaded from an external source. There is an implied rectangle that is the same size as the image. Any stroke or fill is applied to this implied rectangle. The stroke is drawn on top of the image. The fill is behind the image and therefore only visible through transparent areas of the image. Image transparency is either encoded in the file or defined via a color value using the chromakey attribute. Unlike the imagedata element (§6.1.2.11), the image element does not have a parent element.

[*Example:*

```
<v:image src="myimage.gif"
  style="position:relative;top:1;left:1;width:50;height:45"
  cropbottom="10%" gamma="0.5" gain="2">
</v:image>
```

textpath (Text Layout Path)	§6.1.2.23
wrap (Text Wrapping)	§6.3.2.6

Attributes	Description
allowincell (Allow in Table Cell) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can be placed in a table. Default is `false`. [*Example:* `<v:shape ... o:allowincell="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
allowoverlap (Allow Shape Overlap) Namespace: urn:schemas-microsoft-	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute. [*Example:* `<v:shape ... o:allowoverlap="false" ... >`

Attributes	Description
com:office:office	</v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value. [*Example:* The alt text describes the basic shape: <v:shape ... fillcolor="red" alt="Red rectangle"> </v:shape> The alt text describes the contents of a shape displaying an image: <v:shape ... alt="Picture of a sunset"> </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bilevel (Image Bilevel Toggle)	Specifies that all colors in the picture shall be converted to either 0 or full intensity component values. This converts a color bitmap to 8 colors and a grayscale bitmap to black and white. Default is false. [*Example:* <v:image ... bilevel="true" ...> </v:image>  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
blacklevel (Image Brightness)	Specifies the image brightness. Default is 0. [*Example:* <v:image ... blacklevel="0.1" ...> </v:image>

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderbottomcolor (Bottom Border Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the bottom border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderbottomcolor="red" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the left border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderleftcolor="red" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderrightcolor="red" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:bordertopcolor="red" ... > </v:shape>`

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* `<v:shape ... o:bullet="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* `<v:shape ... o:button="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is `auto`, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment: `<v:shape ... o:bwmode="grayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White	Specifies the black-and-white mode for normal black-and-white output devices. Default is `auto`.

Attributes	Description
Mode) Namespace: urn:schemas-microsoft-com:office:office	[*Example:* This shape renders in a pale grayscale in a normal black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwpure (Pure Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value. [*Example:* `<v:image ... chromakey="white" ...></v:image>` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value.
	
	[*Example:* The snippets below are equivalent:
	
	`...`
	`.narrowstyle {width:50;height:100}`
	`...`
	`<v:shape ... class="narrowstyle"`
	`style="top:1;left:1">`

Attributes	Description
	</v:shape> <v:shape ... style="top:1;left:1; width:50;height:100"> </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
clip (Clipping Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region. [*Example:* <v:shape ... o:clip="true"> </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
cliptowrap (Clip to Wrapping Polygon) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`. [*Example:* <v:shape ... o:cliptowrap="true"> </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
connectortype (Shape Connector Type) Namespace: urn:schemas-microsoft-com:office:office	Specifies the type of connector used for joining shapes. Default is `straight`. [*Example:* <v:shape ... o:connectortype="elbow" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_ConnectorType simple type

Attributes	Description
	(§6.2.3.6).

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.
	
	This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.
	
	[*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`  coordorigin="-100,-100"`
	`  path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

coordsize (Coordinate Space Size)	Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".
	
	The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.
	
	[*Example:* The path is 50 units wide and tall, which is 25% of the size of the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`  coordorigin="-100,-100"`
	`  path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

cropbottom (Image Bottom Crop)	Specifies the how much to crop the image from the bottom up as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:*
	
	`<v:image ... cropbottom="10%" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

cropleft (Image Left Crop)	Specifies how much to crop the image from the left in as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:*
	
	`<v:image ... cropleft="10%" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

cropright (Image Right Crop)	Specifies how much to crop the image from the right in as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* `<v:image ... cropright="10%" ...>`

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>

</td></tr>
</table>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema integer datatype.

dgmnodekind (Diagram Node Identifier)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.
	
	[*Example:*
	
	`<v:shape ... dgmnodekind="1">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

doubleclicknotify (Double-click Notification Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that an event message is sent when a shape is double-clicked. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:doubleclicknotify="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.
	
	[*Example:* This shape is red if its fill is visible:
	
	`<v:shape ... fillcolor="red" ... >`
	`</v:shape>`
	
	This is equivalent to:
	
	`<v:shape ... fillcolor="#ff0000" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

filled (Shape Fill	Specifies whether the closed path will be filled. Default is `true`. This attribute is

Attributes	Description
Toggle)	overridden by the fill on attribute. [*Example:* `<v:shape ... filled="f" fillcolor="red" ...> </v:shape>`  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
forcedash (Force Dashed Outline) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`. Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape. [*Example:* `<v:shape ... o:forcedash="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
gain (Image Intensity)	Specifies an adjustment for the intensity of all colors. Essentially sets how bright white will be. Default is 1. [*Example:* `<v:image ... gain="0.5" ...> </v:image>`  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description

gamma (Image Gamma Correction)	Specifies the gamma correction. Default is 1.
	
	Gamma correction is a factor by which the intended target display gamma differs from the sRGB profile. It can be used to correct for images not prepared for sRGB displays and to adjust overall image contrast. Decreasing it below 1 gives a higher contrast image.
	
	[*Example:*
	
	`<v:image ... gamma="0.5" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

grayscale (Image Grayscale Toggle)	Specifies to display the image in grayscale. Default is `false`.
	
	[*Example:*
	
	`<v:image ... gamma="0.5" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

hr (Horizontal Rule Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that a shape is a horizontal rule. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:hr="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

hralign (Horizontal Rule Alignment)	Specifies the alignment of a horizontal rule. Default is `left`.

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:hralign="center" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:* `<v:shape ... href="http://www.openxmlformats.org" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* `<v:shape ... o:hrnoshade="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	Specifies the length of a horizontal rule as a percentage of page width. Default is 0. [*Example:* `<v:shape ... o:hrpct="85" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace:	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is `true`. Default is `false`. [*Example:*

Attributes	Description
urn:schemas-microsoft-com:office:office	<v:shape ... o:hrstd="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* <v:shape ... id="myShape" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is `custom`. This attribute is only meaningful for text boxes. [*Example:* <v:shape ... o:insetmode="auto" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* <v:shape ... insetpen="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
ole (Embedded	Specifies whether the shape is an embedded object. Default is `false`.

Attributes	Description
Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:ole="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:* `<v:shape ... o:oleicon="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* `<v:shape ... o:oned="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* The red color is 25% opaque: `<v:fill type="gradient" color="red" color2="blue" opacity=".25"></v:fill>`

Attributes	Description
	 opacity="1"  opacity=".25" *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
preferrelative (Relative Resize Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the original size of an object is saved after reformatting. Default is `false`. If `true`, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%. [*Example:* `<v:shape ... o:preferrelative="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`. [*Example:* `<v:shape ... print="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID) Namespace: urn:schemas-microsoft-com:office:office	Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically. [*Example:* The shape was part of a group identified by the ID 040754: `<v:shape ... o:regroupid="040754" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.

Attributes	Description
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.

src (Image Source)	Specifies the URL of the image to use.
	
	[*Example:*
	
	`<v:image ... src="myimage.gif" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is `black`. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.
	
	[*Example:*
	
	`<v:shape ... strokecolor="red" ...>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>(§6.1.3.1).</td></tr>
<tr><td>stroked (Shape Stroke Toggle)</td><td>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.

[Example:

<pre><v:shape ... fillcolor="red"
  stroked="false" strokecolor="blue"...>
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</td></tr>
<tr><td>strokeweight (Shape Stroke Weight)</td><td>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.

[Example:

<pre><v:shape ... strokeweight="3pt" ... >
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	• x - Flip along the y-axis, reversing the x-coordinates. • y - Flip along the x-axis, reversing the y-coordinates. • xy - Flip along both the y- and x-axis. • yx - Flip along both the x- and y-axis.
`height`	Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
`left`	Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
`margin-bottom`	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
`margin-left`	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

Attributes	Description	
		• auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
	mso-position-	Specifies relative horizontal position data for objects in

Attributes	Description	
	horizontal-relative	WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside
	mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
	mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.

Attributes	Description	
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
	position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.

Attributes	Description	
	top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are: • hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • inherit - The visibility state is inherited from the parent of the shape.
	width	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	z-index	Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Uses the order that the shapes appear in the page, bottom to top. • <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
The following properties are only used by the textbox element (§6.1.2.22):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:
ltr - Test is displayed left-to-right.
rtl - Test is displayed right-to-left.</td></tr>
<tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:
horizontal - Text is displayed horizontally.
vertical - Text is displayed vertically.
vertical-ideographic - Ideographic text is displayed vertically.
horizontal-ideographic - Ideographic text is displayed horizontally.</td></tr>
<tr><td>mso-direction-alt</td><td>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</td></tr>
<tr><td>mso-fit-shape-to-text</td><td>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</td></tr>
<tr><td>mso-fit-text-to-shape</td><td>Specifies whether the text stretches to fit the textbox. Default is false.</td></tr>
<tr><td>mso-layout-flow-alt</td><td>Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.</td></tr>
<tr><td>mso-next-textbox</td><td>Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.</td></tr>
<tr><td>mso-rotate</td><td>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:
0
90
180</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	<table><tr><td></td><td>• -90</td></tr><tr><td>mso-text-scale</td><td>Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.</td></tr><tr><td>v-text-anchor</td><td>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline</td></tr></table> The following properties are only used by the textpath element (§6.1.2.23): <table><tr><th>Property</th><th>Description</th></tr><tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr><tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr><tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr><tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are: • normal • italic • oblique - Treated the same as italic.</td></tr><tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:</td></tr></table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>

normal
small-caps

</td></tr>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200
300
400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold
bolder
500
600
700
800
900</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
<tr><td>mso-text-shadow</td><td>Specifies whether a shadow is applied to the text on a text path. Default is false.</td></tr>
<tr><td>text-decoration</td><td>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:

none
underline
overline
line-through
blink

</td></tr>
<tr><td>v-rotate-</td><td>Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.</td></tr>
</table>
</td></tr>
</table>

<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>letters</td><td></td></tr>
<tr><td>v-same-letter-heights</td><td>Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.</td></tr>
<tr><td>v-text-align</td><td>Specifies the alignment of text. Default is left. Allowed values are:
left
right
center
justify
letter-justify - Distributes the extra space between the letters.
stretch-justify - Stretches the letters to fill in the space.</td></tr>
<tr><td>v-text-kern</td><td>Specifies whether kerning is turned on. Default is false.</td></tr>
<tr><td>v-text-reverse</td><td>Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.</td></tr>
<tr><td>v-text-spacing-mode</td><td>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:
tightening
tracking</td></tr>
<tr><td>v-text-spacing</td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr>
</table>
The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:
top
left
width
height
The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:
flip
</td></tr>

<tr><td>title (Shape Title)</td><td>Specifies the text displayed when the mouse pointer moves over the shape. Default is no</td></tr>
</table>

Attributes	Description
	value. [*Example:* `<v:shape ... title="tooltip" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
userdrawn (Exists In Master Slide) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the user has added the shape to a master slide. Default is `false`. Used by PresentationML. [*Example:* `<v:shape ... o:userdrawn="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
userhidden (Hide Script Anchors) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application. [*Example:* `<v:shape ... o:userhidden="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to `tight` or `through`. [*Example:* `<v:shape ... wrapcoords="0,0 0,200, 200,200, 200,0" ... ></v:shape>`

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Image">
   <sequence>
      <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
   <attributeGroup ref="AG_ImageAttributes"/>
</complexType>
```

6.1.2.11 imagedata (Image Data)

This element is used to draw an image that has been loaded from an external source. There is an implied rectangle that is the same size as the image. Any stroke or fill is applied to this implied rectangle. The stroke is drawn on top of the image. The fill is behind the image and therefore only visible through transparent areas of the image. Image transparency is either encoded in the file or defined via a color value using the chromakey attribute. Unlike the image element (§6.1.2.10), the imagedata element must have a parent element.

[*Example:*

```
<v:shape style="position:relative;top:1;left:1;width:50;height:50"
  path="m 0,0 l 1000,0 1000,1000 0,1000 x e" fillcolor="blue">
  <v:imagedata src="myimage.gif"/>
</v:shape>
```

end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description
althref (Alternate Image Reference)	Defines an alternate reference for an image in Macintosh PICT format. [*Example:*

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<v:imagedata ... althref="myimage.pcz" ... > </v:imagedata> *end example* The possible values for this attribute are defined by the XML Schema string datatype.
bilevel (Image Bilevel Toggle)	Specifies that all colors in the picture shall be converted to either 0 or full intensity component values. This converts a color bitmap to 8 colors and a grayscale bitmap to black and white. Default is `false`. [*Example:* <v:image ... bilevel="true" ...> </v:image>  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
blacklevel (Image Brightness)	Specifies the image brightness. Default is 0. [*Example:* <v:image ... blacklevel="0.1" ...> </v:image>  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value. [*Example:* <v:image ... chromakey="white" ...> </v:image>

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

cropbottom (Image Bottom Crop)	Specifies the how much to crop the image from the bottom up as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:*
	
	`<v:image ... cropbottom="10%" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

cropleft (Image Left Crop)	Specifies how much to crop the image from the left in as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:*
	
	`<v:image ... cropleft="10%" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

cropright (Image Right Crop)	Specifies how much to crop the image from the right in as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:*
	
	`<v:image ... cropright="10%" ...>`
	`</v:image>`

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

croptop (Image Top Crop)	Specifies how much to crop the image from the top down as a fraction of picture size. Default is 0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:*
	
	`<v:image ... croptop="10%" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

detectmouseclick (Detect Mouse Click) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a mouse click is detected on the fill of a shape. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
embosscolor (Embossed Color)	Specifies the color to use to create an embossed effect in the image. Default is no value. This can be set to a percentage of the shadow color to create an embossed picture effect. The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

gain (Image Intensity)	Specifies an adjustment for the intensity of all colors. Essentially sets how bright white will be. Default is 1.
	
	[*Example:*
	
	`<v:image ... gain="0.5" ...>`
	`</v:image>`

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

gamma (Image Gamma Correction)	Specifies the gamma correction. Default is 1.
	
	Gamma correction is a factor by which the intended target display gamma differs from the sRGB profile. It can be used to correct for images not prepared for sRGB displays and to adjust overall image contrast. Decreasing it below 1 gives a higher contrast image.
	
	[*Example:*
	
	`<v:image ... gamma="0.5" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

grayscale (Image Grayscale Toggle)	Specifies to display the image in grayscale. Default is `false`.
	
	[*Example:*
	
	`<v:image ... gamma="0.5" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

href (Explicit Relationship to Hyperlink Target) Namespace: …/officeDocument	Specifies the relationship ID of the relationship to the hyperlink used for this VML object. The specified relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or the document shall be considered non-conformant. [*Example*: The markup specifies the associated relationship part with relationship ID

Attributes	Description
/2006/relationships	`rId10` contains the corresponding relationship information for the image data: `< ... r:href="rId5" />` *end example*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

href (Original Image Reference)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.
	
	[*Example:*
	
	`<v:fill ... o:href="myimage.gif" ... >`
	`</v:fill>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object.
	
	Default is no value.
	
	[*Example:*
	
	`<v:shape ... id="myShape" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

id (Explicit Relationship to Image Data) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID of the relationship to the image used for this VML object. The specified relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or the document shall be considered non-conformant. [*Example*: The markup specifies the associated relationship part with relationship ID `rId10` contains the corresponding relationship information for the image data: `< ... r:id="rId10" />` *end example*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

Attributes	Description

movie (Movie Reference)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies a pointer to a movie image. This is a data block that contains a pointer to a pointer to movie data.
	
	[*Example:*
	
	`<v:imagedata ... o:movie="1434" ...>`
	`</v:imagedata>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema float datatype.

oleid (Image Embedded Object ID) Namespace: urn:schemas-microsoft-com:office:office	Specifies the embedded object ID of an image. The possible values for this attribute are defined by the XML Schema float datatype.
pict (Explicit Relationship to Alternate Image Data) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID of the relationship to an alternate format image used for this VML object. The specified relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or the document shall be considered non-conformant. If this attribute is specified, the application should attempt to display the image defined by the relationship. If the application cannot display the format of that image, the r:id attribute is used. [*Example*: The markup specifies the associated relationship part with relationship ID `rId7` contains the corresponding relationship information for the image data. The relationship part with relationship ID `rId10` is used if the application cannot display the image referenced by `rId7`.: `< ... r:id="rId10" r:pict="rId7"/>` *end example*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

recolortarget (Black Recoloring Color)	Specifies the color to which black should be recolored.
	
	[*Example:*
	
	`<v:imagedata r:id="rId4" recolortarget="red">`
	`</v:imagedata>`

Attributes	Description
	 `no recolor`  `recolortarget="red"` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

relid (Relationship to Part)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the relationship ID of the relationship to the image. The specified relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or the document shall be considered non-conformant.
	
	[*Example*: The markup specifies the associated relationship part with relationship ID `rId10` contains the corresponding relationship information:
	
	`<v:imagedata ... o:relid="rId10" ...>`
	`</v:imagedata>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_RelationshipId simple type (§6.2.3.20).

src (Image Source)	Specifies the URL of the image to use.
	
	[*Example:*
	
	`<v:image ... src="myimage.gif" ...>`
	`</v:image>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

title (Image Data Title) Namespace:	Specifies the title of an embedded image. This is typically set to the comment property of the image, which is often blank. [*Example:*

Attributes	Description
urn:schemas-microsoft-com:office:office	<v:fill ... o:title="alt text" ... > </v:fill> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ImageData">
   <attributeGroup ref="AG_Id"/>
   <attributeGroup ref="AG_ImageAttributes"/>
   <attributeGroup ref="AG_Chromakey"/>
   <attribute name="embosscolor" type="ST_ColorType" use="optional"/>
   <attribute name="recolortarget" type="ST_ColorType"/>
   <attribute ref="o:href"/>
   <attribute ref="o:althref"/>
   <attribute ref="o:title"/>
   <attribute ref="o:oleid"/>
   <attribute ref="o:detectmouseclick"/>
   <attribute ref="o:movie"/>
   <attribute ref="o:relid"/>
   <attribute ref="r:id"/>
   <attribute ref="r:pict"/>
   <attribute ref="r:href"/>
</complexType>
```

6.1.2.12 line (Line)

This element draws a straight line.

[*Example:*

```
<v:line from="10pt,10pt" to="75pt,35pt"
  strokecolor="blue" strokeweight="3pt">
</v:line>
```

end example]

wrap (Text Wrapping)	§6.3.2.6

Attributes	Description
allowincell (Allow in Table Cell) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can be placed in a table. Default is `false`. [*Example:* `<v:shape ... o:allowincell="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

Attributes	Description
allowoverlap (Allow Shape Overlap) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute. [*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red" alt="Red rectangle"></v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset"></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderbottomcolor (Bottom Border Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the bottom border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderbottomcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-	Specifies the left border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderleftcolor="red" ... >`

Attributes	Description
microsoft-com:office:office	</v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:borderrightcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:bordertopcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* <v:shape ... o:bullet="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* <v:shape ... o:button="true" ... > </v:shape> *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment: `<v:shape ... o:bwmode="grayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for normal black-and-white output devices. Default is auto. [*Example:* This shape renders in a pale grayscale in a normal black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwpure (Pure Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type

Attributes	Description
	(§6.2.3.2).

chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value.
	
	[*Example:*
	
	`<v:image ... chromakey="white" ...>`
	`</v:image>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value.
	
	[*Example:* The snippets below are equivalent:
	
	`...`
	`.narrowstyle {width:50;height:100}`
	`...`
	`<v:shape ... class="narrowstyle"`
	`style="top:1;left:1">`
	`</v:shape>`
	
	`<v:shape ... style="top:1;left:1;`
	`width:50;height:100">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

clip (Clipping Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.
	
	[*Example:*
	
	`<v:shape ... o:clip="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

cliptowrap (Clip to	Specifies that the clipping region for the shape aligns with the wrapping polygon that

Attributes	Description

Wrapping Polygon)
 	
Namespace: urn:schemas-microsoft-com:office:office
	tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:cliptowrap="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

connectortype (Shape Connector Type)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the type of connector used for joining shapes. Default is `straight`.
	
	[*Example:*
	
	`<v:shape ... o:connectortype="elbow" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.
	
	This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.
	
	[*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`coordorigin="-100,-100"`
	`path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`
	
	 

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>coordsize
(Coordinate Space Size)</td><td>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".

The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.

[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>dgmlayout
(Diagram Node Layout Identifier)

Namespace:
urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]

The possible values for this attribute are defined by the XML Schema integer datatype.</td></tr>
<tr><td>dgmlayoutmru (Diagram Node Recent Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:</td></tr>
</table>

Attributes	Description
	<v:shape ... dgmlayout="1"> </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
dgmnodekind (Diagram Node Identifier) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram. [*Example:* <v:shape ... dgmnodekind="1"> </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
doubleclicknotify (Double-click Notification Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that an event message is sent when a shape is double-clicked. Default is `false`. [*Example:* <v:shape ... o:doubleclicknotify="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. [*Example:* This shape is red if its fill is visible: <v:shape ... fillcolor="red" ... > </v:shape> This is equivalent to: <v:shape ... fillcolor="#ff0000" ... > </v:shape>

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

filled (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is `true`. This attribute is overridden by the fill on attribute.
	
	[*Example:*
	
	`<v:shape ... filled="f"`
	`  fillcolor="red" ...>`
	`</v:shape>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

forcedash (Force Dashed Outline)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`.
	
	Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.
	
	[*Example:*
	
	`<v:shape ... o:forcedash="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

from (Line Start)	Specifies the starting point of the line in the coordinate space of the parent element. Default is "0,0". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px.
	
	[*Example:*
	
	`<v:line from="10pt,10pt" to="50pt,50pt">`
	`</v:line>`

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hr (Horizontal Rule Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that a shape is a horizontal rule. Default is `false`. [*Example:* `<v:shape ... o:hr="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hralign (Horizontal Rule Alignment) Namespace: urn:schemas-microsoft-com:office:office	Specifies the alignment of a horizontal rule. Default is `left`. [*Example:* `<v:shape ... o:hralign="center" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:* `<v:shape ... href="http://www.openxmlformats.org" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* `<v:shape ... o:hrnoshade="true" ... ></v:shape>`

Attributes	Description
microsoft-com:office:office	*end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	Specifies the length of a horizontal rule as a percentage of page width. Default is 0. [*Example:* `<v:shape ... o:hrpct="85" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is `true`. Default is `false`. [*Example:* `<v:shape ... o:hrstd="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* `<v:shape ... id="myShape" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is `custom`. This attribute is only meaningful for text boxes. [*Example:* `<v:shape ... o:insetmode="auto" ... >`

Attributes	Description
com:office:office	</v:shape> *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* <v:shape ... insetpen="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
ole (Embedded Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is `false`. [*Example:* <v:shape ... o:ole="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:* <v:shape ... o:oleicon="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace:	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`.

Attributes	Description
urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:oned="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:* The red color is 25% opaque:
	
	`<v:fill type="gradient" color="red"`
	`color2="blue" opacity=".25">`
	`</v:fill>`
	
	  `opacity="1"`
	
	 `opacity=".25"`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

preferrelative (Relative Resize Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the original size of an object is saved after reformatting. Default is `false`. If `true`, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%. [*Example:* `<v:shape ... o:preferrelative="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`. [*Example:*

Attributes	Description
	<v:shape ... print="false" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID) Namespace: urn:schemas-microsoft-com:office:office	Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically. [*Example:* The shape was part of a group identified by the ID 040754: <v:shape ... o:regroupid="040754" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.
strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is black. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as #00FF30. Full details are specified in the simple type description. [*Example:* <v:shape ... strokecolor="red" ...> </v:shape>

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

stroked (Shape Stroke Toggle)	Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is `true`.
	
	[*Example:*
	
	`<v:shape ... fillcolor="red"`
	`  stroked="false" strokecolor="blue"...>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

strokeweight (Shape Stroke Weight)	Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.
	
	[*Example:*
	
	`<v:shape ... strokeweight="3pt" ... >`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

style (Shape Styling Properties)	Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here:

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
<tr><td>height</td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• auto - Default position of an element in the flow of the page.
• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the parent object's height.</td></tr>
<tr><td>left</td><td>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:

• auto - Default position of an element in the flow of the page.
• <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the parent object's width.</td></tr>
<tr><td>margin-bottom</td><td>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• auto - Default position of an element in the flow of the page.
• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or</td></tr>
</table>
</td></tr>
</table>

Attributes	Description	
		ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	margin-left	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute

Attributes	Description
	• left • center • right • inside • outside
mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside
mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin

Attributes	Description
	of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:

Attributes	Description
	<table><tr><td></td><td> - auto - Default position of an element in the flow of the page. <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. <percentage>- Value expressed as a percentage of the parent object's height. </td></tr><tr><td>visibility</td><td>Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are: - hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. - inherit - The visibility state is inherited from the parent of the shape. </td></tr><tr><td>width</td><td>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: - auto - Default position of an element in the flow of the page. <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. <percentage>- Value expressed as a percentage of the parent object's width. </td></tr><tr><td>z-index</td><td>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: - auto - Uses the order that the shapes appear in the page, bottom to top. <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed. </td></tr></table> The following properties are only used by the textbox element (§6.1.2.22): <table><tr><th>Property</th><th>Description</th></tr></table>

Attributes	Description	
	direction	Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are: • ltr - Test is displayed left-to-right. • rtl - Test is displayed right-to-left.
	layout-flow	Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are: • horizontal - Text is displayed horizontally. • vertical - Text is displayed vertically. • vertical-ideographic - Ideographic text is displayed vertically. • horizontal-ideographic - Ideographic text is displayed horizontally.
	mso-direction-alt	Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.
	mso-fit-shape-to-text	Specifies whether the shape stretches to fit the text in the textbox. Default is false.
	mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.
	mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
	mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
	mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
	mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>v-text-anchor</td><td>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are:
top
middle
bottom
top-center
middle-center
bottom-center
top-baseline
bottom-baseline
top-center-baseline
bottom-center-baseline</td></tr>
</table>
The following properties are only used by the textpath element (§6.1.2.23):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr>
<tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr>
<tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr>
<tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are:
normal
italic
oblique - Treated the same as italic.</td></tr>
<tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:
normal
small-caps</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200
300
400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold
bolder
500
600
700
800
900</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
<tr><td>mso-text-shadow</td><td>Specifies whether a shadow is applied to the text on a text path. Default is false.</td></tr>
<tr><td>text-decoration</td><td>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:
none
underline
overline
line-through
blink</td></tr>
<tr><td>v-rotate-letters</td><td>Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.</td></tr>
<tr><td>v-same-letter-heights</td><td>Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>height of the uppercase letters. Default is <code>false</code>.</td></tr>
<tr><td><code>v-text-align</code></td><td>Specifies the alignment of text. Default is <code>left</code>. Allowed values are:
<code>left</code>
<code>right</code>
<code>center</code>
<code>justify</code>
<code>letter-justify</code> - Distributes the extra space between the letters.
<code>stretch-justify</code> - Stretches the letters to fill in the space.</td></tr>
<tr><td><code>v-text-kern</code></td><td>Specifies whether kerning is turned on. Default is <code>false</code>.</td></tr>
<tr><td><code>v-text-reverse</code></td><td>Specifies whether the layout order of rows is reversed. Default is <code>false</code>. This is used for vertical text layout.</td></tr>
<tr><td><code>v-text-spacing-mode</code></td><td>Specifies the mode for letter spacing. Default is <code>tightening</code>. This property determines whether space will be removed between each letter (<code>tightening</code>) or added between each letter (<code>tracking</code>). The amount of letter spacing change is defined by the <code>v-text-spacing</code> property. Allowed values are:
<code>tightening</code>
<code>tracking</code></td></tr>
<tr><td><code>v-text-spacing</code></td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr>
</table>
The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:
<code>top</code>
<code>left</code>
<code>width</code>
<code>height</code>
The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:
<code>flip</code>
<code>height</code>
<code>left</code>
<code>margin-left</code>
<code>margin-top</code>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>

position
rotation
top
visibility
width
z-index

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>target (Hyperlink Display Target)</td><td>
Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td><targetname></td><td>String containing the name of the frame or window in which to load the document.</td></tr>
<tr><td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr>
<tr><td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr>
<tr><td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr>
<tr><td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr>
<tr><td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr>
<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>
[Example:
<pre>
  <v:shape ...
    href="http://www.openxmlformats.org"
    target="_self" ... >
  </v:shape>
</pre>
end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>title (Shape Title)</td><td>
Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.
[Example:
</td></tr>
</table>

Attributes	Description
	<v:shape ... title="tooltip" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
to (Line End Point)	Specifies the ending point of the line in the coordinate space of the parent element. Default is "10,10". If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px. [*Example:* <v:line from="10pt,10pt" to="50pt,50pt"> </v:line>  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
userdrawn (Exists In Master Slide) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the user has added the shape to a master slide. Default is `false`. Used by PresentationML. [*Example:* <v:shape ... o:userdrawn="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
userhidden (Hide Script Anchors) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application. [*Example:* <v:shape ... o:userhidden="true" ... > </v:shape> *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to tight or through.
	
	[*Example:*
	
	`<v:shape ...`
	`  wrapcoords="0,0 0,200, 200,200, 200,0" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Line">
   <sequence>
      <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
   <attribute name="from" type="xsd:string" use="optional"/>
   <attribute name="to" type="xsd:string" use="optional"/>
</complexType>
```

6.1.2.13 oval (Oval)

This element draws an oval sized according to the CSS2 style content width and height.

[*Example:*

```
<v:oval fillcolor="blue"
  style="position:relative;top:1;left:1;width:150;height:50">
</v:oval>
```

end example]

signatureline (Digital Signature Line)	§6.2.2.29
skew (Skew Transform)	§6.2.2.30
stroke (Line Stroke Settings)	§6.1.2.21
textbox (Text Box)	§6.1.2.22
textdata (VML Diagram Text)	§6.5.2.2
textpath (Text Layout Path)	§6.1.2.23
wrap (Text Wrapping)	§6.3.2.6

Attributes	Description
allowincell (Allow in Table Cell) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can be placed in a table. Default is `false`. [*Example:* `<v:shape ... o:allowincell="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

Attributes	Description
allowoverlap (Allow Shape Overlap) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute. [*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red" alt="Red rectangle"></v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset"></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderbottomcolor (Bottom Border Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the bottom border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderbottomcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-	Specifies the left border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderleftcolor="red" ... >`

Attributes	Description
microsoft-com:office:office	</v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:borderrightcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:bordertopcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* <v:shape ... o:bullet="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* <v:shape ... o:button="true" ... > </v:shape> *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment: `<v:shape ... o:bwmode="grayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for normal black-and-white output devices. Default is auto. [*Example:* This shape renders in a pale grayscale in a normal black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwpure (Pure Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type

Attributes	Description
	(§6.2.3.2).

chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value.
	
	[*Example:*
	
	`<v:image ... chromakey="white" ...>`
	`</v:image>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value.
	
	[*Example:* The snippets below are equivalent:
	
	`...`
	`.narrowstyle {width:50;height:100}`
	`...`
	`<v:shape ... class="narrowstyle"`
	`style="top:1;left:1">`
	`</v:shape>`
	
	`<v:shape ... style="top:1;left:1;`
	`width:50;height:100">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

clip (Clipping Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.
	
	[*Example:*
	
	`<v:shape ... o:clip="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

cliptowrap (Clip to	Specifies that the clipping region for the shape aligns with the wrapping polygon that

Attributes	Description

Wrapping Polygon)
 	
Namespace: urn:schemas-microsoft-com:office:office
	tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:cliptowrap="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

connectortype (Shape Connector Type)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the type of connector used for joining shapes. Default is `straight`.
	
	[*Example:*
	
	`<v:shape ... o:connectortype="elbow" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.
	
	This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.
	
	[*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`coordorigin="-100,-100"`
	`path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`
	
	 

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>coordsize
(Coordinate Space Size)</td><td>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".

The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.

[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>dgmlayout
(Diagram Node Layout Identifier)

Namespace:
urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]

The possible values for this attribute are defined by the XML Schema integer datatype.</td></tr>
<tr><td>dgmlayoutmru (Diagram Node Recent Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:</td></tr>
</table>

Attributes	Description
	<v:shape ... dgmlayout="1"> </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
dgmnodekind (Diagram Node Identifier) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram. [*Example:* <v:shape ... dgmnodekind="1"> </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
doubleclicknotify (Double-click Notification Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that an event message is sent when a shape is double-clicked. Default is `false`. [*Example:* <v:shape ... o:doubleclicknotify="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. [*Example:* This shape is red if its fill is visible: <v:shape ... fillcolor="red" ... > </v:shape> This is equivalent to: <v:shape ... fillcolor="#ff0000" ... > </v:shape>

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
filled (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is `true`. This attribute is overridden by the fill on attribute. [*Example:* `<v:shape ... filled="f" fillcolor="red" ...> </v:shape>`  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
forcedash (Force Dashed Outline) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`. Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape. [*Example:* `<v:shape ... o:forcedash="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hr (Horizontal Rule Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that a shape is a horizontal rule. Default is `false`. [*Example:* `<v:shape ... o:hr="true" ... > </v:shape>` *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hralign (Horizontal Rule Alignment) Namespace: urn:schemas-microsoft-com:office:office	Specifies the alignment of a horizontal rule. Default is `left`. [*Example:* `<v:shape ... o:hralign="center" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:* `<v:shape ... href="http://www.openxmlformats.org" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* `<v:shape ... o:hrnoshade="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	Specifies the length of a horizontal rule as a percentage of page width. Default is 0. [*Example:* `<v:shape ... o:hrpct="85" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is

Attributes	Description
Rule Standard Display Toggle) Namespace: urn:schemas-microsoft-com:office:office	`true`. Default is `false`. [*Example:* `<v:shape ... o:hrstd="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* `<v:shape ... id="myShape" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is `custom`. This attribute is only meaningful for text boxes. [*Example:* `<v:shape ... o:insetmode="auto" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* `<v:shape ... insetpen="true" ... ></v:shape>` *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
ole (Embedded Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is `false`. [*Example:* `<v:shape ... o:ole="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:* `<v:shape ... o:oleicon="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* `<v:shape ... o:oned="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* The red color is 25% opaque: `<v:fill type="gradient" color="red"`

Attributes	Description
	color2="blue" opacity=".25"> </v:fill>  opacity="1"  opacity=".25" *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
preferrelative (Relative Resize Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the original size of an object is saved after reformatting. Default is `false`. If `true`, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%. [*Example:* <v:shape ... o:preferrelative="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`. [*Example:* <v:shape ... print="false" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID) Namespace: urn:schemas-microsoft-com:office:office	Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically. [*Example:* The shape was part of a group identified by the ID 040754: <v:shape ... o:regroupid="040754" ... > </v:shape>

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema integer datatype.
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.

strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is `black`. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.
	
	[*Example:*
	
	`<v:shape ... strokecolor="red" ...>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

stroked (Shape Stroke Toggle)	Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is `true`.
	
	[*Example:*
	
	`<v:shape ... fillcolor="red"`
	`  stroked="false" strokecolor="blue"...>`
	`</v:shape>`

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td> 

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</td></tr>
<tr><td>strokeweight (Shape Stroke Weight)</td><td>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.

[*Example:*

<pre><v:shape ... strokeweight="3pt" ... >
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
<tr><td>height</td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• auto - Default position of an element in the flow of the</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	`left` — Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	`margin-bottom` — Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	`margin-left` — Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.

Attributes	Description	
	margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
	mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char

Attributes	Description	
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside
	mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
	mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user.

Attributes	Description
	Default is `false`.
`mso-wrap-style`	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is `square`. Allowed values are: • `square` - Wraps text inside the shape in a square. • `none` - Text does not wrap.
`position`	Specifies the type of positioning used to place an element. Default is `static`. When the element is contained inside a group, this property must be `absolute`. Allowed values are: • `static` - The element is positioned according to the normal flow of the page. The `top` and `left` properties are ignored. If the object is anchored inline, this value is used. • `absolute` - The element is positioned relative to the parent, using the `top` and `left` properties. • `relative` - The element is positioned according to the normal flow of the page, but the `top` and `left` properties are used. The overlap of overlapping elements is governed by the `z-index` property.
`rotation`	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
`top`	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
`visibility`	Specifies whether a shape is displayed. Only `inherit` and `hidden` are used; any other values are mapped to `inherit`. Default is `inherit`. Allowed values are: • `hidden` - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>• inherit - The visibility state is inherited from the parent of the shape.</td></tr>
<tr><td>width</td><td>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• auto - Default position of an element in the flow of the page.
• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the parent object's width.</td></tr>
<tr><td>z-index</td><td>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:

• auto - Uses the order that the shapes appear in the page, bottom to top.
• <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</td></tr>
</table>

The following properties are only used by the textbox element (§6.1.2.22):

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:

• ltr - Test is displayed left-to-right.
• rtl - Test is displayed right-to-left.</td></tr>
<tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:

• horizontal - Text is displayed horizontally.
• vertical - Text is displayed vertically.
• vertical-ideographic - Ideographic text is displayed vertically.
• horizontal-ideographic - Ideographic text is displayed horizontally.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
mso-direction-alt	Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.
mso-fit-shape-to-text	Specifies whether the shape stretches to fit the text in the textbox. Default is false.
mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.
mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
v-text-anchor	Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>The following properties are only used by the textpath element (§6.1.2.23):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr>
<tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr>
<tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr>
<tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are:

• normal
• italic
• oblique - Treated the same as italic.</td></tr>
<tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:

• normal
• small-caps</td></tr>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal

lighter

100

200

300

400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold</td><td>Treated as bold.</td></tr>
</table></td></tr>
</table></td></tr>
</table>

Attributes	Description
	bolder 500 600 700 800 900
mso-text-shadow	Specifies whether a shadow is applied to the text on a text path. Default is false.
text-decoration	Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are: • none • underline • overline • line-through • blink
v-rotate-letters	Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
v-same-letter-heights	Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
v-text-align	Specifies the alignment of text. Default is left. Allowed values are: • left • right • center • justify • letter-justify - Distributes the extra space between the letters. • stretch-justify - Stretches the letters to fill in the space.
v-text-kern	Specifies whether kerning is turned on. Default is false.
v-text-reverse	Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>v-text-spacing-mode</td><td>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:

• tightening
• tracking</td></tr>
<tr><td>v-text-spacing</td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr>
</table>

The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:

• top
• left
• width
• height

The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:

• flip
• height
• left
• margin-left
• margin-top
• position
• rotation
• top
• visibility
• width
• z-index

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>target (Hyperlink Display Target)</td><td>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td><targetname></td><td>String containing the name of the frame or window in which to load the document.</td></tr>
<tr><td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr>
<tr><td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr>
<tr><td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr>
<tr><td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr>
<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>
[Example:
<pre>
<v:shape ...
  href="http://www.openxmlformats.org"
  target="_self" ... >
</v:shape>
</pre>
end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>title (Shape Title)</td><td>
Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.
[Example:
<pre>
<v:shape ... title="tooltip" ... >
</v:shape>
</pre>
end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>userdrawn (Exists In Master Slide)

Namespace: urn:schemas-microsoft-com:office:office</td><td>
Specifies whether the user has added the shape to a master slide. Default is false. Used by PresentationML.
[Example:
<pre>
<v:shape ... o:userdrawn="true" ... >
</v:shape>
</pre>
end example]
The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
</td></tr>
</table>

Attributes	Description
userhidden (Hide Script Anchors) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application. [*Example:* `<v:shape ... o:userhidden="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to `tight` or `through`. [*Example:* `<v:shape ... wrapcoords="0,0 0,200, 200,200, 200,0" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Oval">
   <choice maxOccurs="unbounded">
      <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
   </choice>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
</complexType>
```

6.1.2.14 path (Shape Path)

This element defines the path that makes up the shape. This is done through a string that contains a rich set of pen movement commands. This element also describes the limo-stretch point, inscribed textbox rectangle locations and connection site locations. The limo-stretch definition and the formulas element (§6.1.2.6) allow greater designer control of how the path scales. They allow, for example, definition of a true rounded corner rectangle where the corners remain circular even though the rectangle is scaled anisotropically.

Parent Elements

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description

arrowok (Arrowhead Display Toggle)	Specifies whether arrowheads are allowed to be displayed. This attribute overrides all other arrowhead attributes in the parent or the stroke element (§6.1.2.21). Default is `false`.
	
	[*Example:*
	
	`<v:shape style="width:50;height:50">`
	`  <v:stroke endarrow="block"/>`
	`  <v:path arrowok="true"`
	`  v="m 0,0 l 1000,0 1000,1000 e"/>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

connectangles (Connection Point Connect Angles)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the angle at which curves connect to a shape's connection points. The connection angles are defined by a string consisting of angle values delimited by commas. Default is no value.
	
	[*Example:* Connections are made along the horizontal and vertical axes:
	
	`<v:path ... o:connectangles="0,90,180,270" ... >`
	`</v:path>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

connectlocs (Connection Points) Namespace: urn:schemas-microsoft-com:office:office	Specifies the location of connection points on a path. The connection points are defined by a string consisting of pairs of x and y values, delimited by commas. This is used if connecttype is `custom`. Default is no value. [*Example:* Connection points exist at the midpoints of the sides of the square: `<v:path ... v="m 0,0 l 100,0 100,100 0,100 x e"`

Attributes	Description
	o:connectlocs="50,0;100,50;50,100;0,50" ... > </v:path> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
connecttype (Connection Point Type) Namespace: urn:schemas-microsoft-com:office:office	Specifies the type of connection points used for attaching shapes to other shapes. Default is none. If set to custom, connectlocs is used. Allowed values are: [*Example:* <v:path ... o:connecttype="custom" o:connectlocs="50,0;100,50;50,100;0,50" ... > </v:path> *end example*] The possible values for this attribute are defined by the ST_ConnectType simple type (§6.2.3.7).
extrusionok (Extrusion Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an extrusion is allowed to be displayed. This attribute overrides all other extrusion attributes in the parent or the extrusion element (§6.2.2.10). Default is true. [*Example:* <v:rect fillcolor="lime" style="width:50;height:50"> <v:extrusion on="true"/> <v:path o:extrusionok="false"/> </v:rect>  <v:path o:extrusionok="false"/>  <v:path o:extrusionok="true"/> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
fillok (Shape Fill Toggle)	Specifies whether a fill is allowed to be displayed. This attribute overrides all other fill attributes in the parent or fill element (§6.1.2.5). Default is true.

Attributes	Description

	[*Example:*
	
	`<v:shape style="width:50;height:50"`
	`  fillcolor="red">`
	`  <v:path fillok="false"`
	`  v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e"/>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

gradientshapeok (Gradient Shape Toggle)	Specifies whether a gradient path will be made up of repeated concentric paths. Default is `false`.
	
	If `true`, a gradient fill can be produced by repeated drawing of scaled versions of the path - this must only be set if it is possible to scale the path in such a way that a fill is always contained in the original path. This controls the interpretation of the type="gradientradial" attribute of the fill element (§6.1.2.5).
	
	[*Example:* In the first case, the radial gradient is aligned irrespective of the shape's path:
	
	`<v:shape style="width:50;height:50;rotation:45"`
	`  path="m 0,0 l 0,1000, 1000,1000, 1000,0 x e">`
	`  <v:path gradientshapeok="false"/>`
	`  <v:fill type="gradientradial"`
	`  color="red" color2="blue"/>`
	`</v:shape>`
	
	 	`gradientshapeok="false"`
	 	`gradientshapeok="true"`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type

Attributes	Description
	(§6.1.3.14).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* `<v:shape ... id="myShape" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetpenok (Inset Stroke From Path Flag)	Specifies whether the stroke may be inset from the path. If this is `false`, it overrides the insetpen attribute and prevents the stroke from being inset. [*Example:* The stroke is not inset: `<v:shape ... insetpen="true"> <v:path ... insetpenok="false"/> </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
limo (Limo Stretch Point)	Specifies a stretch point on the shape's edge that defines where and how a shape is allowed to be stretched by a user in a graphical editor. Default is "0,0". [*Example:* `<v:line from="20pt,20pt" to="100pt,20pt"> <v:path limo="60pt,20pt"/> </v:line>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
shadowok (Shadow Toggle)	Specifies whether a shadow is allowed to be displayed. This attribute overrides all other shadow attributes in the parent or the shadow element (§6.1.2.18). Default is `true`. [*Example:* The shape has no shadow: `<v:shape style="width:50;height:50"> <v:path v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e"`

Attributes	Description
	shadowok="false"/> <v:shadow on="true"/> </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
strokeok (Stroke Toggle)	Specifies whether a stroke will be displayed. This attribute overrides all other stroke attributes in the parent or the stroke element (§6.1.2.21). Default is true. [*Example:* The shape's red stroke is not shown: <v:shape style="width:50;height:50" fillcolor="blue" strokecolor="red"> <v:path v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e" strokeok="false"/> </v:shape>  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
textboxrect (Text Box Bounding Box)	Specifies one or more text boxes inside a shape. Default is the same as the geometry's bounding box. A textbox is defined by one or more sets of numbers specifying (in order) the left, top, right, and bottom points of the rectangle. Multiple sets are delimited by a semicolon. The default value is the same dimension value as the containing rectangle. If more than one textbox is defined, the comma-delimited quadruple sets that define each textbox are separated by semicolons. Normally textboxes come in sets of 1, 2, 3, or 6 rectangles on a shape. The textboxrect dimensions clip any text that extends beyond its region. [*Example:* The textbox is 25% down from the top and the exclamation point is clipped: <v:shape style="width:60;height:50"> <v:path v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e" textboxrect="0,250,850,1000"/> <v:textbox>VML!</v:textbox> </v:shape>

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
textpathok (Text Path Toggle)	Specifies whether a text path will be displayed. Default is `false`. If `true`, this indicates that the path is an appropriate warping path for the textpath element (§6.1.2.23). Otherwise, the textpath element must be ignored. [*Example:* The defined textpath is ignored: `<v:curve from="50,100" to="400,100" control1="200,200" control2="300,200"><v:path textpathok="false"/><v:textpath on="false" style="font:normal normal normal 36pt Arial" string="textpath"/></v:curve>`  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
v (Path Definition)	Specifies a string containing the commands that define the shape's path. This value consists of commands followed by zero or more parameters. Default is no value. The following rules apply to path strings: • Commas or spaces delimit parameters for each command. Both "m 0,0" and "m0 0" are acceptable. • A parameter that is omitted using commas is treated as having a value of zero. Thus, "c 10,10,0,0,25,13" and "c 10,10,,,25,13" are equivalent. • Parameterized paths are also allowed. In this case, the shape must also have a formulas element (§6.1.2.6) with a list of formulas that are substituted into the path using the @ symbol followed by the number of the formula. The adj property of the shape contains the input parameters for these formulas. For example, "moveto @1@4". The evaluations of the formulas are substituted into the appropriate positions. Note that @ also serves as a delimiter.

Attributes	Description

The allowed commands are given below. An asterisk (*) indicates that the command is allowed to be repeated. For the qb command, the controlpoint parameter is also allowed to be repeated.

Command	Name	Parameters	Description
m	moveto	2	Start a new sub-path at the given (x,y) coordinate.
l	lineto	2*	Draw a line from the current point to the given (x,y) coordinate which becomes the new current point. Specifying a number of coordinate pairs forms a polyline.
c	curveto	6*	Draw a cubic bézier curve from the current point to the coordinate given by the final two parameters. The control points are given by the first four parameters.
x	close	0	Close the current sub-path by drawing a straight line from the current point to the original moveto point.
e	end	0	End the current set of sub-paths. A given set of sub-paths (as delimited by end) is filled. Subsequent sets of sub-paths are filled independently and superimposed on existing ones.
t	rmoveto	2*	Start a new sub-path at a coordinate relative to the current point, cp (cpx+x, cpy+y).
r	rlineto	2*	Draw a line from the current point to the given relative coordinate (cpx+x, cpy+y).
v	rcurveto	6*	Cubic bézier curve using the given coordinate relative to the current point.
nf	nofill	0	The current set of sub-paths (delimited by e) will not be filled.
ns	nostroke	0	The current set of sub-paths (delimited by e) will not be stroked.

Attributes	Description			
	ae	angleellipseto	6*	Draws a segment of an ellipse as described using these parameters. A straight line is drawn from the current point to the start point of the segment. The parameters are: center (x,y), size(w,h), start angle, end angle.
	al	angleellipse	6*	Same as angleellipseto except that there is an implied moveto the starting point of the segment.
	at	arcto	8*	A segment of the ellipse is drawn which starts at the angle defined by the start radius vector and ends at the angle defined by the end vector. A straight line is drawn from the current point to the start of the arc. The arc is always drawn in a counterclockwise direction. The parameters are: left, top, right, bottom, start(x,y), end(x,y). The first four values define the bounding box of an ellipse. The last four define two radial vectors.
	ar	arc	8*	Same as arcto except there is an implied moveto the start point of the arc.
	wa	clockwisearcto	8*	Same as arcto but the arc is drawn in a clockwise direction.
	wr	clockwisearc	8*	Same as arc but the arc is drawn in a clockwise direction
	qx	ellipticalqaudrantx	2*	A quarter ellipse is drawn from the current point to the given end point. The elliptical segment is initially tangential to a line parallel to the x-axis. (i.e. the segment starts out horizontal). The parameters are: end(x,y).
	qy	ellipticalquadranty	2*	Same as ellipticalquadrantx except that the elliptical segment is initially tangential to a line parallel to the y-axis (i.e. the segment starts out vertical).

Attributes	Description
	qb | quadraticbezier | 2+2* | Defines one or more quadratic bézier curves by means of control points and an end point. Intermediate (on-curve) points are obtained by interpolation between successive control points as in the OpenType font specification. The sub-path need not be started in which case the sub-path will be closed. In this case the last point of the sub-path defines the start point of the quadratic bézier. The parameters are: controlpoint(x,y)*, end(x,y). The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path">
   <attributeGroup ref="AG_Id"/>
   <attribute name="v" type="xsd:string" use="optional"/>
   <attribute name="limo" type="xsd:string" use="optional"/>

Attributes	Description
allowincell (Allow in Table Cell) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can be placed in a table. Default is `false`. [*Example:* `<v:shape ... o:allowincell="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
allowoverlap (Allow Shape Overlap) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute. [*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red" alt="Red rectangle"></v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset"></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderbottomcolor (Bottom Border	Specifies the bottom border color of an inline shape. Default is no value.

Attributes	Description
Color) Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:borderbottomcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the left border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderleftcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderrightcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:bordertopcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* `<v:shape ... o:bullet="true" ... ></v:shape>`

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* `<v:shape ... o:button="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is `auto`, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment: `<v:shape ... o:bwmode="grayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for normal black-and-white output devices. Default is `auto`. [*Example:* This shape renders in a pale grayscale in a normal black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type

Attributes	Description
	(§6.2.3.2).
bwpure (Pure Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value. [*Example:* `<v:image ... chromakey="white" ...> </v:image>` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value. [*Example:* The snippets below are equivalent: `... .narrowstyle {width:50;height:100} ... <v:shape ... class="narrowstyle" style="top:1;left:1"> </v:shape>` `<v:shape ... style="top:1;left:1; width:50;height:100"> </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description

clip (Clipping Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.
	
	[*Example:*
	
	`<v:shape ... o:clip="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

cliptowrap (Clip to Wrapping Polygon)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:cliptowrap="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

connectortype (Shape Connector Type)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the type of connector used for joining shapes. Default is `straight`.
	
	[*Example:*
	
	`<v:shape ... o:connectortype="elbow" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box. This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.

Attributes	Description

	[*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`  coordorigin="-100,-100"`
	`  path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

coordsize (Coordinate Space Size)	Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".
	
	The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.
	
	[*Example:* The path is 50 units wide and tall, which is 25% of the size of the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`  coordorigin="-100,-100"`
	`  path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

dgmlayout (Diagram Node Layout Identifier) Namespace:	Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are: **Value** | **Description**

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>urn:schemas-microsoft-com:office:office</td><td>
<table>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]

The possible values for this attribute are defined by the XML Schema integer datatype.</td></tr>
<tr><td>dgmlayoutmru (Diagram Node Recent Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description

	<table><tr><td></td><td>  </td></tr><tr><td>3</td><td>Hanging, left side layout.  </td></tr></table>
	[*Example:*
	
	`<v:shape ... dgmlayout="1">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

dgmnodekind (Diagram Node Identifier)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.
	
	[*Example:*
	
	`<v:shape ... dgmnodekind="1">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

doubleclicknotify (Double-click Notification Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that an event message is sent when a shape is double-clicked. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:doubleclicknotify="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.

Attributes	Description

	[*Example:* This shape is red if its fill is visible:
	
	`<v:shape ... fillcolor="red" ... ></v:shape>`
	
	This is equivalent to:
	
	`<v:shape ... fillcolor="#ff0000" ... ></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

filled (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is `true`. This attribute is overridden by the fill on attribute. [*Example:* `<v:shape ... filled="f" fillcolor="red" ...></v:shape>`  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
forcedash (Force Dashed Outline) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`. Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape. [*Example:* `<v:shape ... o:forcedash="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type

Attributes	Description
	(§6.2.3.23).
hr (Horizontal Rule Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that a shape is a horizontal rule. Default is `false`. [*Example:* `<v:shape ... o:hr="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hralign (Horizontal Rule Alignment) Namespace: urn:schemas-microsoft-com:office:office	Specifies the alignment of a horizontal rule. Default is `left`. [*Example:* `<v:shape ... o:hralign="center" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:* `<v:shape ... href="http://www.openxmlformats.org" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* `<v:shape ... o:hrnoshade="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal	Specifies the length of a horizontal rule as a percentage of page width. Default is 0.

Attributes	Description
Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:hrpct="85" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is `true`. Default is `false`. [*Example:* `<v:shape ... o:hrstd="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* `<v:shape ... id="myShape" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is `custom`. This attribute is only meaningful for text boxes. [*Example:* `<v:shape ... o:insetmode="auto" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).

Attributes	Description
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* `<v:shape ... insetpen="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
ole (Embedded Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is `false`. [*Example:* `<v:shape ... o:ole="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:* `<v:shape ... o:oleicon="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* `<v:shape ... o:oned="true" ... ></v:shape>` *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:* The red color is 25% opaque:
	
	`<v:fill type="gradient" color="red"`
	`  color2="blue" opacity=".25">`
	`</v:fill>`
	
	  `opacity="1"`
	  `opacity=".25"`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

points (Points for Compound Line)	Specifies a set of straight line segments that are composed of a series of pairs of points. Default is "0,0 10,10". Points are specified in the coordinate system of the parent element. If the parent is not a VML element, the default unit is a pixel. Allowed units are in, cm, mm, pt, pc and px. While commas are not required, they should be used for easier readability. See above for an example. The possible values for this attribute are defined by the XML Schema string datatype.

preferrelative (Relative Resize Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether the original size of an object is saved after reformatting. Default is `false`. If `true`, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.
	
	[*Example:*
	
	`<v:shape ... o:preferrelative="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type

Attributes	Description
	(§6.2.3.23).
print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`. [*Example:* `<v:shape ... print="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID) Namespace: urn:schemas-microsoft-com:office:office	Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically. [*Example:* The shape was part of a group identified by the ID 040754: `<v:shape ... o:regroupid="040754" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.
strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is `black`. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. [*Example:*

Attributes	Description
	<v:shape ... strokecolor="red" ...> </v:shape>  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
stroked (Shape Stroke Toggle)	Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true. [*Example:* <v:shape ... fillcolor="red" stroked="false" strokecolor="blue"...> </v:shape>  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
strokeweight (Shape Stroke Weight)	Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute. [*Example:* <v:shape ... strokeweight="3pt" ... > </v:shape>  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
style (Shape Styling	Specifies the CSS2 styling properties of the shape. This uses the syntax described in the

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>Properties)</td><td>"Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:
x - Flip along the y-axis, reversing the x-coordinates.
y - Flip along the x-axis, reversing the y-coordinates.
xy - Flip along both the y- and x-axis.
yx - Flip along both the x- and y-axis.</td></tr>
<tr><td>height</td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:
auto - Default position of an element in the flow of the page.
<units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
<percentage>- Value expressed as a percentage of the parent object's height.</td></tr>
<tr><td>left</td><td>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:
auto - Default position of an element in the flow of the page.
<units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
<percentage>- Value expressed as a percentage of the parent object's width.</td></tr>
<tr><td>margin-bottom</td><td>Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:
auto - Default position of an element in the flow of the page.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description	
		• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	margin-left	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are:

Attributes	Description	
		• absolute • left • center • right • inside • outside
	mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside
	mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
	mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-	Specifies the distance from the left side of the shape to the text

Attributes	Description	
	distance-left	that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
	position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group,

Attributes	Description
	in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are: • hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • inherit - The visibility state is inherited from the parent of the shape.
width	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
z-index	Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Uses the order that the shapes appear in the page, bottom to top. • <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.
The following properties are only used by the textbox element (§6.1.2.22):	

Attributes	Description

Property	Description
direction	Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are: • ltr - Test is displayed left-to-right. • rtl - Test is displayed right-to-left.
layout-flow	Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are: • horizontal - Text is displayed horizontally. • vertical - Text is displayed vertically. • vertical-ideographic - Ideographic text is displayed vertically. • horizontal-ideographic - Ideographic text is displayed horizontally.
mso-direction-alt	Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.
mso-fit-shape-to-text	Specifies whether the shape stretches to fit the text in the textbox. Default is false.
mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.
mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>v-text-anchor</td><td>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are:
top
middle
bottom
top-center
middle-center
bottom-center
top-baseline
bottom-baseline
top-center-baseline
bottom-center-baseline</td></tr>
</table>
The following properties are only used by the textpath element (§6.1.2.23):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr>
<tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr>
<tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr>
<tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are:
normal
italic
oblique - Treated the same as italic.</td></tr>
<tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:
normal
small-caps</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200
300
400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold
bolder
500
600
700
800
900</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
<tr><td>mso-text-shadow</td><td>Specifies whether a shadow is applied to the text on a text path. Default is false.</td></tr>
<tr><td>text-decoration</td><td>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:

none
underline
overline
line-through
blink

</td></tr>
<tr><td>v-rotate-letters</td><td>Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.</td></tr>
<tr><td>v-same-letter-heights</td><td>Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>height of the uppercase letters. Default is <code>false</code>.</td></tr>
<tr><td><code>v-text-align</code></td><td>Specifies the alignment of text. Default is <code>left</code>. Allowed values are:
<code>left</code>
<code>right</code>
<code>center</code>
<code>justify</code>
<code>letter-justify</code> - Distributes the extra space between the letters.
<code>stretch-justify</code> - Stretches the letters to fill in the space.</td></tr>
<tr><td><code>v-text-kern</code></td><td>Specifies whether kerning is turned on. Default is <code>false</code>.</td></tr>
<tr><td><code>v-text-reverse</code></td><td>Specifies whether the layout order of rows is reversed. Default is <code>false</code>. This is used for vertical text layout.</td></tr>
<tr><td><code>v-text-spacing-mode</code></td><td>Specifies the mode for letter spacing. Default is <code>tightening</code>. This property determines whether space will be removed between each letter (<code>tightening</code>) or added between each letter (<code>tracking</code>). The amount of letter spacing change is defined by the <code>v-text-spacing</code> property. Allowed values are:
<code>tightening</code>
<code>tracking</code></td></tr>
<tr><td><code>v-text-spacing</code></td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr>
</table>
The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:
<code>top</code>
<code>left</code>
<code>width</code>
<code>height</code>
The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:
<code>flip</code>
<code>height</code>
<code>left</code>
<code>margin-left</code>
<code>margin-top</code>
</td></tr>
</table>

position
rotation
top
visibility
width
z-index

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>target (Hyperlink Display Target)</td><td>
Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td><targetname></td><td>String containing the name of the frame or window in which to load the document.</td></tr>
<tr><td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr>
<tr><td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr>
<tr><td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr>
<tr><td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr>
<tr><td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr>
<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>
[Example:
<pre>
  <v:shape ...
    href="http://www.openxmlformats.org"
    target="_self" ... >
  </v:shape>
</pre>
end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>title (Shape Title)</td><td>
Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.
[Example:
</td></tr>
</table>

Attributes	Description
	<v:shape ... title="tooltip" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
userdrawn (Exists In Master Slide) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the user has added the shape to a master slide. Default is `false`. Used by PresentationML. [*Example:* <v:shape ... o:userdrawn="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
userhidden (Hide Script Anchors) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application. [*Example:* <v:shape ... o:userhidden="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to `tight` or `through`. [*Example:* <v:shape ... wrapcoords="0,0 0,200, 200,200, 200,0" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

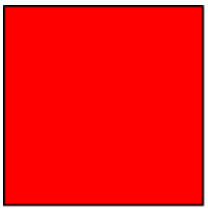
```
<complexType name="CT_PolyLine">
   <choice minOccurs="0" maxOccurs="unbounded">
      <group ref="EG_ShapeElements"/>
      <element ref="o:ink"/>
   </choice>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
   <attribute name="points" type="xsd:string" use="optional"/>
</complexType>
```

6.1.2.16 rect (Rectangle)

This element is used to draw a simple rectangle. The CSS2 style content width and height define the width and height of the rectangle.

[*Example:*

```
<v:rect fillcolor="red"
  style="position:relative;top:0;left:0;width:100;height:100">
</v:rect>
```



end example]

wrap (Text Wrapping)	§6.3.2.6

Attributes	Description
allowincell (Allow in Table Cell) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can be placed in a table. Default is `false`. [*Example:* `<v:shape ... o:allowincell="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
allowoverlap (Allow Shape Overlap) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute. [*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

Attributes	Description

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red"`
	`  alt="Red rectangle">`
	`</v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderbottomcolor (Bottom Border Color)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the bottom border color of an inline shape. Default is no value.
	
	[*Example:*
	
	`<v:shape ... o:borderbottomcolor="red" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderleftcolor (Border Left Color)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the left border color of an inline shape. Default is no value.
	
	[*Example:*
	
	`<v:shape ... o:borderleftcolor="red" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderrightcolor (Border Right Color)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the right border color of an inline shape. Default is no value.
	
	[*Example:*
	
	`<v:shape ... o:borderrightcolor="red" ... >`
	`</v:shape>`
	
	end example]

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:bordertopcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* `<v:shape ... o:bullet="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* `<v:shape ... o:button="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is `auto`, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment:

Attributes	Description
	<v:shape ... o:bwmode="grayscale" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for normal black-and-white output devices. Default is auto. [*Example:* This shape renders in a pale grayscale in a normal black-and-white environment: <v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwpure (Pure Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: <v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value. [*Example:* <v:image ... chromakey="white" ...> </v:image> *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

Attributes	Description

class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value.
	
	[*Example:* The snippets below are equivalent:
	
	`...`
	`.narrowstyle {width:50;height:100}`
	`...`
	`<v:shape ... class="narrowstyle"`
	`  style="top:1;left:1">`
	`</v:shape>`
	
	`<v:shape ... style="top:1;left:1;`
	`  width:50;height:100">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

clip (Clipping Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.
	
	[*Example:*
	
	`<v:shape ... o:clip="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

cliptowrap (Clip to Wrapping Polygon)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:cliptowrap="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

connectortype (Shape Connector	Specifies the type of connector used for joining shapes. Default is `straight`.

Attributes	Description
Type) Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:connectortype="elbow" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.
	
	This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.
	
	[*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`coordorigin="-100,-100"`
	`path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

coordsize (Coordinate Space Size)	Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000". The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically. [*Example:* The path is 50 units wide and tall, which is 25% of the size of the coordinate

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>dgmlayout
(Diagram Node Layout Identifier)

Namespace:
urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.

<tr><td>dgmlayoutmru
(Diagram Node Recent Layout Identifier)

Namespace:
urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]

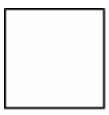
The possible values for this attribute are defined by the XML Schema integer datatype.</td></tr>
<tr><td>dgmnodekind
(Diagram Node Identifier)

Namespace:
urn:schemas-microsoft-com:office:office</td><td>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.

[Example:

<pre><v:shape ... dgmnodekind="1">
</v:shape></pre>
end example]</td></tr>
</table>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema integer datatype.
doubleclicknotify (Double-click Notification Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that an event message is sent when a shape is double-clicked. Default is `false`. [*Example:* `<v:shape ... o:doubleclicknotify="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. [*Example:* This shape is red if its fill is visible: `<v:shape ... fillcolor="red" ... > </v:shape>` This is equivalent to: `<v:shape ... fillcolor="#ff0000" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

filled (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is `true`. This attribute is overridden by the fill on attribute.
	
	[*Example:*
	
	`<v:shape ... filled="f"`
	`  fillcolor="red" ...>`
	`</v:shape>`
	
	 


Attributes	Description
	end example] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
forcedash (Force Dashed Outline) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`. Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape. [*Example:* `<v:shape ... o:forcedash="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hr (Horizontal Rule Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that a shape is a horizontal rule. Default is `false`. [*Example:* `<v:shape ... o:hr="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hralign (Horizontal Rule Alignment) Namespace: urn:schemas-microsoft-com:office:office	Specifies the alignment of a horizontal rule. Default is `left`. [*Example:* `<v:shape ... o:hralign="center" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:*

Attributes	Description
	<v:shape ... href="http://www.openxmlformats.org" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* <v:shape ... o:hrnoshade="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	Specifies the length of a horizontal rule as a percentage of page width. Default is 0. [*Example:* <v:shape ... o:hrpct="85" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is `true`. Default is `false`. [*Example:* <v:shape ... o:hrstd="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:*

Attributes	Description
	<v:shape ... id="myShape" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is `custom`. This attribute is only meaningful for text boxes. [*Example:* <v:shape ... o:insetmode="auto" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* <v:shape ... insetpen="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
ole (Embedded Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is `false`. [*Example:* <v:shape ... o:ole="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle)	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:*

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<v:shape ... o:oleicon="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* <v:shape ... o:oned="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* The red color is 25% opaque: <v:fill type="gradient" color="red" color2="blue" opacity=".25"> </v:fill>  opacity="1" opacity=".25" *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
preferrelative (Relative Resize Toggle)	Specifies whether the original size of an object is saved after reformatting. Default is `false`. If `true`, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:preferrelative="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`. [*Example:* `<v:shape ... print="false" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID) Namespace: urn:schemas-microsoft-com:office:office	Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically. [*Example:* The shape was part of a group identified by the ID 040754: `<v:shape ... o:regroupid="040754" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.

Attributes	Description

strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is `black`. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.
	
	[*Example:*
	
	`<v:shape ... strokecolor="red" ...>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

stroked (Shape Stroke Toggle)	Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is `true`.
	
	[*Example:*
	
	`<v:shape ... fillcolor="red"`
	`  stroked="false" strokecolor="blue"...>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

strokeweight (Shape Stroke Weight)	Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.
	
	[*Example:*
	
	`<v:shape ... strokeweight="3pt" ... >`
	`</v:shape>`

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td> 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
<tr><td>height</td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• auto - Default position of an element in the flow of the page.
• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the parent object's height.</td></tr>
<tr><td>left</td><td>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:

• auto - Default position of an element in the flow of the page.
• <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	parent object's width.
margin-bottom	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
margin-left	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page.

Attributes	Description	
		• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
	mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside
	mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page

Attributes	Description
	• text • line
mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the

Attributes	Description	
		normal flow of the page, but the `top` and `left` properties are used. The overlap of overlapping elements is governed by the `z-index` property.
	`rotation`	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	`top`	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	`visibility`	Specifies whether a shape is displayed. Only `inherit` and `hidden` are used; any other values are mapped to `inherit`. Default is `inherit`. Allowed values are: • `hidden` - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • `inherit` - The visibility state is inherited from the parent of the shape.
	`width`	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	`z-index`	Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Uses the order that the shapes appear in the page,

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>bottom to top.
• <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</td></tr>
</table>
The following properties are only used by the textbox element (§6.1.2.22):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:
• ltr - Test is displayed left-to-right.
• rtl - Test is displayed right-to-left.</td></tr>
<tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:
• horizontal - Text is displayed horizontally.
• vertical - Text is displayed vertically.
• vertical-ideographic - Ideographic text is displayed vertically.
• horizontal-ideographic - Ideographic text is displayed horizontally.</td></tr>
<tr><td>mso-direction-alt</td><td>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</td></tr>
<tr><td>mso-fit-shape-to-text</td><td>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</td></tr>
<tr><td>mso-fit-text-to-shape</td><td>Specifies whether the text stretches to fit the textbox. Default is false.</td></tr>
<tr><td>mso-layout-flow-alt</td><td>Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.</td></tr>
<tr><td>mso-next-textbox</td><td>Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	mso-rotate: Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
	mso-text-scale: Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
	v-text-anchor: Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline

The following properties are only used by the textpath element (§6.1.2.23):

Property	Description
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.
font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.
font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.
font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are:

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>

normal
italic
oblique - Treated the same as italic.

</td></tr>
<tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:

normal
small-caps

</td></tr>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200
300
400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold
bolder
500
600
700
800
900</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
<tr><td>mso-text-shadow</td><td>Specifies whether a shadow is applied to the text on a text path. Default is false.</td></tr>
<tr><td>text-decoration</td><td>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:

none

</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	<table><tr><td></td><td> - underline - overline - line-through - blink </td></tr><tr><td>v-rotate-letters</td><td>Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.</td></tr><tr><td>v-same-letter-heights</td><td>Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.</td></tr><tr><td>v-text-align</td><td>Specifies the alignment of text. Default is left. Allowed values are: - left - right - center - justify - letter-justify - Distributes the extra space between the letters. - stretch-justify - Stretches the letters to fill in the space. </td></tr><tr><td>v-text-kern</td><td>Specifies whether kerning is turned on. Default is false.</td></tr><tr><td>v-text-reverse</td><td>Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.</td></tr><tr><td>v-text-spacing-mode</td><td>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are: - tightening - tracking </td></tr><tr><td>v-text-spacing</td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr></table> The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties: - top - left - width - height

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:

• flip
• height
• left
• margin-left
• margin-top
• position
• rotation
• top
• visibility
• width
• z-index

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>target (Hyperlink Display Target)</td><td>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td><targetname></td><td>String containing the name of the frame or window in which to load the document.</td></tr>
<tr><td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr>
<tr><td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr>
<tr><td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr>
<tr><td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr>
<tr><td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr>
<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>

[Example:

<pre><v:shape ...
  href="http://www.openxmlformats.org"
  target="_self" ... >
</v:shape></pre></td></tr>
</table>

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.
title (Shape Title)	Specifies the text displayed when the mouse pointer moves over the shape. Default is no value. [*Example:* `<v:shape ... title="tooltip" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
userdrawn (Exists In Master Slide) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the user has added the shape to a master slide. Default is `false`. Used by PresentationML. [*Example:* `<v:shape ... o:userdrawn="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
userhidden (Hide Script Anchors) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application. [*Example:* `<v:shape ... o:userhidden="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to `tight` or `through`.

Attributes	Description

	[*Example:*
	
	`<v:shape ...`
	`  wrapcoords="0,0 0,200, 200,200, 200,0" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

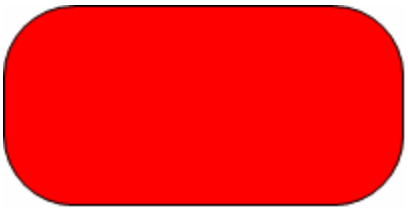
```
<complexType name="CT_Rect">
   <choice maxOccurs="unbounded">
      <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
   </choice>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
</complexType>
```

6.1.2.17 roundrect (Rounded Rectangle)

This element is used to draw a rectangle with rounded corners. The CSS2 style content width and height define the width and height of the rectangle.

[*Example:*

```
<v:roundrect fillcolor="red" arcsize="35%"
  style="position:relative;top:0;left:0;width:200;height:100">
</v:roundrect>
```



end example]

Attributes	Description
allowincell (Allow in Table Cell) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can be placed in a table. Default is `false`. [*Example:* `<v:shape ... o:allowincell="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
allowoverlap (Allow Shape Overlap)	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute.

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red" alt="Red rectangle"></v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset"></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

arcsize (Rounded Corner Arc Size)	Specifies the amount of roundness for a rounded rectangle as a percentage of half the smaller dimension of the length and width of the rectangle. Default is 20%. An arc size of 0% yields square corners and 100% forms circular corners. A square with an arc size value of 100% is a circle. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* `<v:roundrect ... arcsize="35%"></v:roundrect>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderbottomcolor (Bottom Border Color)	Specifies the bottom border color of an inline shape. Default is no value. [*Example:*

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<v:shape ... o:borderbottomcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the left border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:borderleftcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:borderrightcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:bordertopcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* <v:shape ... o:bullet="true" ... > </v:shape> *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* `<v:shape ... o:button="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is `auto`, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment: `<v:shape ... o:bwmode="grayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for normal black-and-white output devices. Default is `auto`. [*Example:* This shape renders in a pale grayscale in a normal black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwpure (Pure	Specifies the black-and-white mode for pure black-and-white output devices. Default is

Attributes	Description
Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value. [*Example:* `<v:image ... chromakey="white" ...> </v:image>` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value. [*Example:* The snippets below are equivalent: `... .narrowstyle {width:50;height:100} ... <v:shape ... class="narrowstyle" style="top:1;left:1"> </v:shape>` `<v:shape ... style="top:1;left:1; width:50;height:100"> </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
clip (Clipping Toggle)	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.

Attributes	Description

Namespace: urn:schemas-microsoft-com:office:office	[*Example:*
	
	`<v:shape ... o:clip="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

cliptowrap (Clip to Wrapping Polygon)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:cliptowrap="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

connectortype (Shape Connector Type)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the type of connector used for joining shapes. Default is `straight`.
	
	[*Example:*
	
	`<v:shape ... o:connectortype="elbow" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box. This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space. [*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100).

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>coordsize
(Coordinate Space Size)</td><td>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".

The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.

[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>dgmlayout
(Diagram Node Layout Identifier)

Namespace: urn:schemas-microsoft-</td><td>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table><tr><th>Value</th><th>Description</th></tr><tr><td>0</td><td>Top-down, centered layout.</td></tr></table></td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>com:office:office</td><td>
<table>
<tr><td></td><td>  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>
[Example:
<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]
The possible values for this attribute are defined by the XML Schema integer datatype.
</td></tr>
<tr><td>dgmlayoutmru (Diagram Node Recent Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>
Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]

The possible values for this attribute are defined by the XML Schema integer datatype.</td></tr>
<tr><td>dgmnodekind (Diagram Node Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.

[Example:

<pre><v:shape ... dgmnodekind="1">
</v:shape></pre>
end example]

The possible values for this attribute are defined by the XML Schema integer datatype.</td></tr>
<tr><td>doubleclicknotify (Double-click Notification Toggle)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies that an event message is sent when a shape is double-clicked. Default is <code>false</code>.

[Example:

<pre><v:shape ... o:doubleclicknotify="true" ... >
</v:shape></pre>
end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</td></tr>
<tr><td>fillcolor (Fill Color)</td><td>Specifies the color to use for the fill. Default is <code>white</code>. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as <code>red</code>, or six hexadecimal digits representing the red, green and blue values of the color, such as <code>#00FF30</code>. Full details are specified in the simple type description.</td></tr>
</table>

Attributes	Description

	[*Example:* This shape is red if its fill is visible:
	
	`<v:shape ... fillcolor="red" ... ></v:shape>`
	
	This is equivalent to:
	
	`<v:shape ... fillcolor="#ff0000" ... ></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

filled (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is `true`. This attribute is overridden by the fill on attribute. [*Example:* `<v:shape ... filled="f" fillcolor="red" ...></v:shape>`  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
forcedash (Force Dashed Outline) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`. Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape. [*Example:* `<v:shape ... o:forcedash="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type

Attributes	Description
	(§6.2.3.23).
hr (Horizontal Rule Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that a shape is a horizontal rule. Default is `false`. [*Example:* `<v:shape ... o:hr="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hralign (Horizontal Rule Alignment) Namespace: urn:schemas-microsoft-com:office:office	Specifies the alignment of a horizontal rule. Default is `left`. [*Example:* `<v:shape ... o:hralign="center" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:* `<v:shape ... href="http://www.openxmlformats.org" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* `<v:shape ... o:hrnoshade="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal	Specifies the length of a horizontal rule as a percentage of page width. Default is 0.

Attributes	Description
Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:hrpct="85" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is `true`. Default is `false`. [*Example:* `<v:shape ... o:hrstd="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* `<v:shape ... id="myShape" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is `custom`. This attribute is only meaningful for text boxes. [*Example:* `<v:shape ... o:insetmode="auto" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).

Attributes	Description
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* `<v:shape ... insetpen="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
ole (Embedded Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is `false`. [*Example:* `<v:shape ... o:ole="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:* `<v:shape ... o:oleicon="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* `<v:shape ... o:oned="true" ... ></v:shape>` *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	[*Example:* The red color is 25% opaque:
	
	`<v:fill type="gradient" color="red"`
	`  color2="blue" opacity=".25">`
	`</v:fill>`
	
	  `opacity="1"`
	  `opacity=".25"`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

preferrelative (Relative Resize Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether the original size of an object is saved after reformatting. Default is `false`. If `true`, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%.
	
	[*Example:*
	
	`<v:shape ... o:preferrelative="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`.
	
	[*Example:*
	
	`<v:shape ... print="false" ... >`
	`</v:shape>`
	
	end example]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID) Namespace: urn:schemas-microsoft-com:office:office	Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically. [*Example:* The shape was part of a group identified by the ID 040754: `<v:shape ... o:regroupid="040754" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.
strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is `black`. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. [*Example:* `<v:shape ... strokecolor="red" ...> </v:shape>`  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>(§6.1.3.1).</td></tr>
<tr><td>stroked (Shape Stroke Toggle)</td><td>Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is true.

[Example:

<pre><v:shape ... fillcolor="red"
  stroked="false" strokecolor="blue"...>
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</td></tr>
<tr><td>strokeweight (Shape Stroke Weight)</td><td>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.

[Example:

<pre><v:shape ... strokeweight="3pt" ... >
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	• x - Flip along the y-axis, reversing the x-coordinates. • y - Flip along the x-axis, reversing the y-coordinates. • xy - Flip along both the y- and x-axis. • yx - Flip along both the x- and y-axis.
`height`	Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
`left`	Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
`margin-bottom`	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
`margin-left`	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

Attributes	Description	
		• auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
	mso-position-	Specifies relative horizontal position data for objects in

Attributes	Description	
	horizontal-relative	WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside
	mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
	mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.

Attributes	Description	
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
	position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.

Attributes	Description	
	top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are: • hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • inherit - The visibility state is inherited from the parent of the shape.
	width	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	z-index	Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Uses the order that the shapes appear in the page, bottom to top. • <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
The following properties are only used by the textbox element (§6.1.2.22):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:
ltr - Test is displayed left-to-right.
rtl - Test is displayed right-to-left.</td></tr>
<tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:
horizontal - Text is displayed horizontally.
vertical - Text is displayed vertically.
vertical-ideographic - Ideographic text is displayed vertically.
horizontal-ideographic - Ideographic text is displayed horizontally.</td></tr>
<tr><td>mso-direction-alt</td><td>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</td></tr>
<tr><td>mso-fit-shape-to-text</td><td>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</td></tr>
<tr><td>mso-fit-text-to-shape</td><td>Specifies whether the text stretches to fit the textbox. Default is false.</td></tr>
<tr><td>mso-layout-flow-alt</td><td>Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.</td></tr>
<tr><td>mso-next-textbox</td><td>Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.</td></tr>
<tr><td>mso-rotate</td><td>Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are:
0
90
180</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	<table><tr><td></td><td>• -90</td></tr><tr><td>mso-text-scale</td><td>Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.</td></tr><tr><td>v-text-anchor</td><td>Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline</td></tr></table> The following properties are only used by the textpath element (§6.1.2.23): <table><tr><th>Property</th><th>Description</th></tr><tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr><tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr><tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr><tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are: • normal • italic • oblique - Treated the same as italic.</td></tr><tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:</td></tr></table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>

normal
small-caps

</td></tr>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200
300
400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold
bolder
500
600
700
800
900</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
<tr><td>mso-text-shadow</td><td>Specifies whether a shadow is applied to the text on a text path. Default is false.</td></tr>
<tr><td>text-decoration</td><td>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:

none
underline
overline
line-through
blink

</td></tr>
<tr><td>v-rotate-</td><td>Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>letters</td><td></td></tr>
<tr><td>v-same-letter-heights</td><td>Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.</td></tr>
<tr><td>v-text-align</td><td>Specifies the alignment of text. Default is left. Allowed values are:
left
right
center
justify
letter-justify - Distributes the extra space between the letters.
stretch-justify - Stretches the letters to fill in the space.</td></tr>
<tr><td>v-text-kern</td><td>Specifies whether kerning is turned on. Default is false.</td></tr>
<tr><td>v-text-reverse</td><td>Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.</td></tr>
<tr><td>v-text-spacing-mode</td><td>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:
tightening
tracking</td></tr>
<tr><td>v-text-spacing</td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr>
</table>
The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:
top
left
width
height
The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:
flip

z-index

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>target (Hyperlink Display Target)</td><td>
Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td><targetname></td><td>String containing the name of the frame or window in which to load the document.</td></tr>
<tr><td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr>
<tr><td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr>
<tr><td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr>
<tr><td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr>
<tr><td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr>
<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>
[Example:
<pre>
  <v:shape ...
    href="http://www.openxmlformats.org"
    target="_self" ... >
  </v:shape>
</pre>
end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>title (Shape Title)</td><td>Specifies the text displayed when the mouse pointer moves over the shape. Default is no</td></tr>
</table>

Attributes	Description
	value. [*Example:* `<v:shape ... title="tooltip" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
userdrawn (Exists In Master Slide) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the user has added the shape to a master slide. Default is `false`. Used by PresentationML. [*Example:* `<v:shape ... o:userdrawn="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
userhidden (Hide Script Anchors) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application. [*Example:* `<v:shape ... o:userhidden="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to `tight` or `through`. [*Example:* `<v:shape ... wrapcoords="0,0 0,200, 200,200, 200,0" ... ></v:shape>`

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RoundRect">
   <choice maxOccurs="unbounded">
      <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
   </choice>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
   <attribute name="arcsize" type="xsd:string" use="optional"/>
</complexType>
```

6.1.2.18 shadow (Shadow Effect)

This element adds shadow effects to a shape. The on attribute must be `true` for the shadow to be displayed.

[*Example:*

```
<v:shadow on="true" type="perspective"
  matrix="1.25,-2,,1.5,,.000001"
  offset="38pt,-6pt">
</v:shadow>
```

end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapetype (§6.1.2.20)

Attributes	Description
color (Shadow Primary Color)	Specifies the color of the primary shadow. Default is gray (RGB 128,128,128). [*Example:* `<v:shadow on="true" color="green">`

Attributes	Description
	</v:shadow> Applied to a simple square the shadow looks like this:  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
color2 (Shadow Secondary Color)	Specifies the color of the second shadow, or highlight in an embossed or engraved shadow. Default is light gray (RGB 203,203,203). [*Example:* <v:shadow on="true" type="double" color="green" color2="blue"> </v:shadow>  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* <v:shape ... id="myShape" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
matrix (Shadow Perspective Matrix)	Specifies a perspective transform for a shadow. Default is no value. The matrix is given in the form "s_{xx}, s_{xy}, s_{yx}, s_{yy}, p_x, p_y" where s = scale and p = perspective. If the offset attribute is in absolute units then p_x, p_y are in 1/EMU units;

Attributes	Description
	otherwise they are an inverse fraction of the shape size. [*Example:* The following snippets explain the matrix parameters. The shadow is applied to a simple square with no fill and a red stroke color (note there is a default shadow offset):  `matrix=",,,,,"` s_{xx}, s_{yy} specify scaling factors for the x and y dimensions:  `matrix="2,,,,,"`  `matrix=",,,2,,"` s_{xy}, s_{yx} specify skews in the x and y dimensions:  `matrix=",2,,,,"`  `matrix=",,-2,,,"` p_x, p_y effectively set the perspective trapezoid skews along the x and y dimensions:  `matrix=",,,,.000001,"`

Attributes	Description

	 `matrix=",,,,,-.000002"`
	
	end example]
	
	[*Example:*
	
	`<v:shadow on="true" type="perspective"`
	`matrix="1.25,-2,,1.5,,.000001"`
	`offset="38pt,-6pt">`
	`</v:shadow>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

obscured (Shadow Transparency)	Specifies whether a shadow is transparent. Default is `false`. If `true`, the shadow is transparent if there is no fill on the shape.
	
	[*Example:*
	
	`<v:background fillcolor="yellow"/>`
	`<v:shape style="width:50;height:50"`
	`filled="false" fillcolor="red"`
	`path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`<v:shadow on="true" offset="50%,25%"`
	`obscured="true">`
	`</v:shadow>`
	`</v:shape>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

Attributes	Description

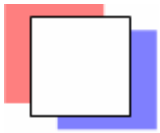
offset (Shadow Primary Offset)	Specifies the primary shadow's x,y offset from the shape's location. Default is "2pt,2pt".
	
	Values are either an absolute measurement or a fractional value of the shape dimensions, from –50% to 50%.
	
	[*Example:*
	
	`<v:shadow on="true" offset="50%,25%">`
	`</v:shadow>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

offset2 (Shadow Secondary Offset)	Specifies the secondary shadow's x,y offset from the shape's location. Default is "-2pt,-2pt".
	
	[*Example:*
	
	`<v:shadow type="double" on="true"`
	`color="blue" offset="10pt,5pt"`
	`color2="red" offset2="-10pt,-5pt">`
	`</v:shadow>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

on (Shadow Toggle)	Specifies whether to show a shadow. Default is `true`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
opacity (Shadow Opacity)	Specifies the opacity of the shadow. Default is 1. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:*

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>

```
<v:shadow type="double" on="true" opacity=".5"
  color="blue" offset="10pt,5pt"
  color2="red" offset2="-10pt,-5pt">
</v:shadow>
```



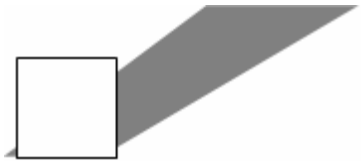
end example]

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>origin (Shadow Origin)</td><td>

Specifies the center of the shadow relative to the shape's origin. Specified as a pair of fractional values of the shape dimensions, ranging from 50% to -50%. Default is "0,0".

[*Example:* This example is unchanged from above except for the addition of the origin attribute:

```
<v:shadow on="true" type="perspective"
  matrix="1.25,-2,,1.5,,.000001"
  offset="38pt,-6pt" origin="10%,-10%">
</v:shadow>
```



end example]

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>type (Shadow Type)</td><td>

Specifies the type of shadow. Default is `single`. Allowed values are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td><code>single</code></td><td>Single shadow.</td></tr>
<tr><td><code>double</code></td><td>Double shadow. color2 and offset2 are used for the second shadow's color and offset.</td></tr>
<tr><td><code>perspective</code></td><td>Perspective shadow.</td></tr>
<tr><td><code>shaperelative</code></td><td>The shadow is created relative to the shape.</td></tr>
<tr><td><code>drawingrelative</code></td><td>The shadow is created relative to the drawing.</td></tr>
</table>

</td></tr>
</table>

Attributes	Description
	emboss — The shadow has an embossed look. The possible values for this attribute are defined by the ST_ShadowType simple type (§6.1.3.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shadow">
   <attributeGroup ref="AG_Id"/>
   <attribute name="on" type="ST_TrueFalse" use="optional"/>
   <attribute name="type" type="ST_ShadowType" use="optional"/>
   <attribute name="obscured" type="ST_TrueFalse" use="optional"/>
   <attribute name="color" type="ST_ColorType" use="optional"/>
   <attribute name="opacity" type="xsd:string" use="optional"/>
   <attribute name="offset" type="xsd:string" use="optional"/>
   <attribute name="color2" type="ST_ColorType" use="optional"/>
   <attribute name="offset2" type="xsd:string" use="optional"/>
   <attribute name="origin" type="xsd:string" use="optional"/>
   <attribute name="matrix" type="xsd:string" use="optional"/>
</complexType>
```

6.1.2.19 shape (Shape Definition)

This element is used to describe a shape, the core object in VML. This element may appear by itself or within a group element (§6.1.2.7). If a shapetype element (§6.1.2.20) is referenced using the type attribute, any attributes specified in the shape will override those found in the shapetype.

[*Example:*

```
<v:shape style="position:absolute;top:50;left:20;width:50;height:50"
  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">
  <v:shadow on="true" type="perspective"
    matrix="1.25,-2,,1.5,,.000001" offset="38pt,-6pt"/>
</v:shape>

<v:shape style="position:absolute;top:50;left:20;width:50;height:50"
  fillcolor="yellow" path="m 0,0 l 0,1000 1000,1000 1000,0 x e">
  <v:extrusion on="true" lightposition="0,-2000,10000"/>
</v:shape>
```

end example]

Attributes	Description
adj (Adjustment Parameters)	Specifies a comma-delimited list of parameters, or adjustment values, used to define values for a parameterized formula. Values may be omitted. There can be up to 8 adjust

Attributes	Description

	values. Each value is referenced using # followed by a number corresponding to the zero-based index for that value in the list of adjustment values. For example, #2 references the second value in the adj list.
	
	[*Example:* The following shape uses formulas to define a simple rectangle. The adj values are referenced by the eqn attribute of the f element (§6.1.2.4) and in turn referenced by the path element (§6.1.2.14).
	
	`<v:shape`
	`coordorigin="0 0" coordsize="200 200"`
	`style="position:relative;top:30;left:30;width:20;height:20"`
	`adj="1, 1, 1, 200, 200, 200, 200, 1">`
	`<v:path v="m @0,@1 l @2,@3, @4,@5, @6,@7 x e"/>`
	`<v:formulas>`
	`<v:f eqn="val #0"/>`
	`<v:f eqn="val #1"/>`
	`<v:f eqn="val #2"/>`
	`<v:f eqn="val #3"/>`
	`<v:f eqn="val #4"/>`
	`<v:f eqn="val #5"/>`
	`<v:f eqn="val #6"/>`
	`<v:f eqn="val #7"/>`
	`</v:formulas>`
	`</v:shape>`
	
	This is the equivalent of:
	
	`<v:shape`
	`coordorigin="0 0" coordsize="200 200"`
	`style="position:relative;top:30;left:30;width:20;height:20"`
	`path="m 1,1 l 1,200, 200,200, 200,1 x e">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

allowincell (Allow in Table Cell)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether a shape can be placed in a table. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:allowincell="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

Attributes	Description
allowoverlap (Allow Shape Overlap) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of the HTML float attribute. [*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red" alt="Red rectangle"></v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset"></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderbottomcolor (Bottom Border Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the bottom border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderbottomcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-	Specifies the left border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderleftcolor="red" ... >`

Attributes	Description
microsoft-com:office:office	</v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:borderrightcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* <v:shape ... o:bordertopcolor="red" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* <v:shape ... o:bullet="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* <v:shape ... o:button="true" ... > </v:shape> *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment: `<v:shape ... o:bwmode="grayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for normal black-and-white output devices. Default is auto. [*Example:* This shape renders in a pale grayscale in a normal black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwpure (Pure Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type

Attributes	Description
	(§6.2.3.2).

chromakey (Image Transparency Color)	Specifies a color value that will be transparent and show anything behind the shape. Default is no value.
	
	[*Example:*
	
	`<v:image ... chromakey="white" ...>`
	`</v:image>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value.
	
	[*Example:* The snippets below are equivalent:
	
	`...`
	`.narrowstyle {width:50;height:100}`
	`...`
	`<v:shape ... class="narrowstyle"`
	`style="top:1;left:1">`
	`</v:shape>`
	
	`<v:shape ... style="top:1;left:1;`
	`width:50;height:100">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

clip (Clipping Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.
	
	[*Example:*
	
	`<v:shape ... o:clip="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

cliptowrap (Clip to	Specifies that the clipping region for the shape aligns with the wrapping polygon that

Attributes	Description

Wrapping Polygon)
 	
Namespace: urn:schemas-microsoft-com:office:office
	tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:cliptowrap="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

connectortype (Shape Connector Type)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the type of connector used for joining shapes. Default is `straight`.
	
	[*Example:*
	
	`<v:shape ... o:connectortype="elbow" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.
	
	This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.
	
	[*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`coordorigin="-100,-100"`
	`path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`
	
	 

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>coordsize
(Coordinate Space Size)</td><td>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".

The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.

[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>dgmlayout
(Diagram Node Layout Identifier)

Namespace:
urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]

The possible values for this attribute are defined by the XML Schema integer datatype.</td></tr>
<tr><td>dgmlayoutmru (Diagram Node Recent Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>

[Example:</td></tr>
</table>

Attributes	Description
	<v:shape ... dgmlayout="1"> </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
dgmnodekind (Diagram Node Identifier) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram. [*Example:* <v:shape ... dgmnodekind="1"> </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
doubleclicknotify (Double-click Notification Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that an event message is sent when a shape is double-clicked. Default is `false`. [*Example:* <v:shape ... o:doubleclicknotify="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
equationxml (Storage for Alternate Math Content)	Specifies alternate XML markup which may be used to rehydrate an equation using the Office Open XML Math syntax. The actual format of the contents of this attribute are application-defined, but shall contain Office Open XML Math as well as any application-specific content. The XML markup stored in this attribute shall be escaped as needed to contain only those characters legal in an attribute value. The possible values for this attribute are defined by the XML Schema string datatype.
fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. [*Example:* This shape is red if its fill is visible:

Attributes	Description
	<v:shape ... fillcolor="red" ... > </v:shape> This is equivalent to: <v:shape ... fillcolor="#ff0000" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
filled (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is `true`. This attribute is overridden by the fill on attribute. [*Example:* <v:shape ... filled="f" fillcolor="red" ...> </v:shape>  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
forcedash (Force Dashed Outline) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`. Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape. [*Example:* <v:shape ... o:forcedash="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

Attributes	Description

gfxdata (Encoded Package)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies a base-64 encoded package as deifined in Part 2 of this Standard that contains DrawingML content. The contents of this package are application-defined, but the contents of the package shall use the Parts defined by this Standard whenever possible. [*Rationale:* This attribute allows an application to use VML to represent graphical content while still persisting DrawingML for consuming applications that support DrawingML. For example, a diagram stored within this attribute would have the four parts defined for a DrawingML diagram, as well as any number of application-defined parts and relationships. *end ationale*]
	
	[*Example:* A DrawingML object is encoded in the gfxdata attribute, leaving VML to handle the visual display:
	
	`<v:shape id="Diagram 1" o:spid="_x0000_i1025"`
	`type="#_x0000_t75" style="width:446.25pt;height:252pt;`
	`visibility:visible" o:gfxdata="UEsDBBQABgAIAAAAIQDIu8KcTQE…">`
	`<v:imagedata r:id="rId4" o:title=""/>`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema base64Binary datatype.

hr (Horizontal Rule Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that a shape is a horizontal rule. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:hr="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

hralign (Horizontal Rule Alignment)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the alignment of a horizontal rule. Default is `left`.
	
	[*Example:*
	
	`<v:shape ... o:hralign="center" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).

href (Hyperlink	Specifies a hyperlink URL target for the shape. Default is no value.

Attributes	Description
Target)	[*Example:* `<v:shape ... href="http://www.openxmlformats.org" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* `<v:shape ... o:hrnoshade="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	Specifies the length of a horizontal rule as a percentage of page width. Default is 0. [*Example:* `<v:shape ... o:hrpct="85" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is `true`. Default is `false`. [*Example:* `<v:shape ... o:hrstd="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value.

Attributes	Description
	[*Example:* `<v:shape ... id="myShape" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is `custom`. This attribute is only meaningful for text boxes. [*Example:* `<v:shape ... o:insetmode="auto" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* `<v:shape ... insetpen="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
ole (Embedded Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is `false`. [*Example:* `<v:shape ... o:ole="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).

Attributes	Description
oleicon (Embedded Object Icon Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:* `<v:shape ... o:oleicon="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* `<v:shape ... o:oned="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* The red color is 25% opaque: `<v:fill type="gradient" color="red" color2="blue" opacity=".25"></v:fill>`  `opacity="1"`  `opacity=".25"` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
path (Edge Path)	Specifies the line that makes up the edges of a shape. See the v attribute of the path

Attributes	Description
	element (§6.1.2.14) for a full description. The possible values for this attribute are defined by the XML Schema string datatype.
preferrelative (Relative Resize Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the original size of an object is saved after reformatting. Default is `false`. If `true`, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%. [*Example:* `<v:shape ... o:preferrelative="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
print (Print Toggle)	Specifies whether the shape will be printed. Default is `true`. [*Example:* `<v:shape ... print="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID) Namespace: urn:schemas-microsoft-com:office:office	Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically. [*Example:* The shape was part of a group identified by the ID 040754: `<v:shape ... o:regroupid="040754" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.

strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is `black`. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.
	
	[*Example:*
	
	`<v:shape ... strokecolor="red" ...>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

stroked (Shape Stroke Toggle)	Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is `true`.
	
	[*Example:*
	
	`<v:shape ... fillcolor="red"`
	`  stroked="false" strokecolor="blue"...>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

strokeweight (Shape Stroke	Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>Weight)</td><td>(§6.1.2.21) overrides this attribute.

[Example:

<pre><v:shape ... strokeweight="3pt" ... >
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
<tr><td>height</td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• auto - Default position of an element in the flow of the page.
• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the parent object's height.</td></tr>
<tr><td>left</td><td>Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are:</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	• auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
margin-bottom	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
margin-left	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.

Attributes	Description	
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
	mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside

Attributes	Description	
	mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
	mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
	mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
	mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
	position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:

Attributes	Description	
		• `static` - The element is positioned according to the normal flow of the page. The `top` and `left` properties are ignored. If the object is anchored inline, this value is used. • `absolute` - The element is positioned relative to the parent, using the `top` and `left` properties. • `relative` - The element is positioned according to the normal flow of the page, but the `top` and `left` properties are used. The overlap of overlapping elements is governed by the `z-index` property.
	`rotation`	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	`top`	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	`visibility`	Specifies whether a shape is displayed. Only `inherit` and `hidden` are used; any other values are mapped to `inherit`. Default is `inherit`. Allowed values are: • `hidden` - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • `inherit` - The visibility state is inherited from the parent of the shape.
	`width`	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.

Attributes	Description
	<table><tr><td></td><td>• <percentage>- Value expressed as a percentage of the parent object's width.</td></tr><tr><td>z-index</td><td>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Uses the order that the shapes appear in the page, bottom to top. • <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</td></tr></table> The following properties are only used by the textbox element (§6.1.2.22): <table><tr><th>Property</th><th>Description</th></tr><tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are: • ltr - Test is displayed left-to-right. • rtl - Test is displayed right-to-left.</td></tr><tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are: • horizontal - Text is displayed horizontally. • vertical - Text is displayed vertically. • vertical-ideographic - Ideographic text is displayed vertically. • horizontal-ideographic - Ideographic text is displayed horizontally.</td></tr><tr><td>mso-direction-alt</td><td>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</td></tr><tr><td>mso-fit-shape-to-text</td><td>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</td></tr><tr><td>mso-fit-text-to-shape</td><td>Specifies whether the text stretches to fit the textbox. Default is false.</td></tr><tr><td>mso-layout-</td><td>Specifies the alternate layout flow for text in textboxes. This</td></tr></table>

Attributes	Description
	flow-alt: property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
	mso-next-textbox: Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
	mso-rotate: Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
	mso-text-scale: Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
	v-text-anchor: Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline

The following properties are only used by the textpath element (§6.1.2.23):

Property	Description
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.
font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.

<tr><td></td><td>
<table>
<tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr>
<tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are:
normal
italic
oblique - Treated the same as italic.</td></tr>
<tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:
normal
small-caps</td></tr>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200
300
400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold
bolder
500
600
700
800
900</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
<tr><td>mso-text-</td><td>Specifies whether a shadow is applied to the text on a text path.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	shadow: Default is false.
	text-decoration: Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are: • none • underline • overline • line-through • blink
	v-rotate-letters: Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
	v-same-letter-heights: Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align: Specifies the alignment of text. Default is left. Allowed values are: • left • right • center • justify • letter-justify - Distributes the extra space between the letters. • stretch-justify - Stretches the letters to fill in the space.
	v-text-kern: Specifies whether kerning is turned on. Default is false.
	v-text-reverse: Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
	v-text-spacing-mode: Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are: • tightening • tracking
	v-text-spacing: Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:

• top
• left
• width
• height

The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:

• flip
• height
• left
• margin-left
• margin-top
• position
• rotation
• top
• visibility

<tr><td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr>
<tr><td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr>
<tr><td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr>
<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description

	[*Example:*
	
	`<v:shape ...`
	`  href="http://www.openxmlformats.org"`
	`  target="_self" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

title (Shape Title)	Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.
	
	[*Example:*
	
	`<v:shape ... title="tooltip" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

type (Shape Type Reference)	Specifies a reference to a shapetype ID that describes the standard path, fill and stroke properties of a shape. Properties specified in the shape override the shapetype properties. Default is no value.
	
	[*Example:* The following example defines a shapetype that is a simple rectangle and an actual shape instance that uses it and overrides the fill color.
	
	`<v:shapetype id="mytype"`
	`fillcolor="red" strokecolor="blue"`
	`coordorigin="0 0" coordsize="200 200"`
	`path="m 0,0 l 0,200, 200,200, 200,0 x e"/>`
	`</v:shapetype>`
	
	`<v:shape id="shape02" type="#mytype"`
	`fillcolor="green"`
	`style="position:relative;top:1;left:1;width:20;height:20">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

userdrawn (Exists In Master Slide)	Specifies whether the user has added the shape to a master slide. Default is `false`. Used by PresentationML.

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	[*Example:* `<v:shape ... o:userdrawn="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
userhidden (Hide Script Anchors) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application. [*Example:* `<v:shape ... o:userhidden="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to `tight` or `through`. [*Example:* `<v:shape ... wrapcoords="0,0 0,200, 200,200, 200,0" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape">
   <choice maxOccurs="unbounded">
      <group ref="EG_ShapeElements"/>
      <element ref="o:ink"/>
      <element ref="p:iscomment"/>
   </choice>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
   <attributeGroup ref="AG_Type"/>
   <attributeGroup ref="AG_Adj"/>
   <attributeGroup ref="AG_Path"/>
   <attribute ref="o:gfxdata"/>
   <attribute name="equationxml" type="xsd:string" use="optional"/>
</complexType>
```

6.1.2.20 shapetype (Shape Template)

This element defines a shape template that can be used to create other shapes. Shapetype is identical to the shape element (§6.1.2.19) except it cannot reference another shapetype element. The type attribute may not be used with shapetype. Attributes defined in the shape override any that appear in the shapetype. CSS positioning attributes (such as `top`, `width`, `z-index`, `rotation`, `flip`) are not passed to a shape from a shapetype. To use this element, create a shapetype with a specific id attribute. Then create a shape and reference the shapetype's id using the type attribute.

[*Example:*

```
<v:shapetype id="mytype" fillcolor="silver" strokecolor="blue">
  <v:path v="m 0,0 l 0,1000, 1000,1000, 1000,0 x e"/>
  <v:fill on="true" type="gradient" color2="navy" angle="-45"/>
</v:shapetype>
<v:shape type="#mytype"
  style="position:absolute;top:10;left:10;width:50;height:50"/>
<v:shape type="#mytype" fillcolor="teal"
  style="position:absolute;top:10;left:75;width:75;height:50"/>
<v:shape type="#mytype"
  style="position:absolute;top:10;left:165;width:50;height:50">
  <v:fill type="solid"/>
</v:shape>
<v:shape type="#mytype" path="m 500,0 l 1000,1000 0,1000 x e"
style="position:absolute;top:10;left:230;width:50;height:50"/>
```

end example]

Attributes	Description
adj (Adjustment Parameters)	Specifies a comma-delimited list of parameters, or adjustment values, used to define values for a parameterized formula. Values may be omitted. There can be up to 8 adjust values. Each value is referenced using # followed by a number corresponding to the zero-based index for that value in the list of adjustment values. For example, #2 references the second value in the adj list.

Attributes	Description

	[*Example:* The following shape uses formulas to define a simple rectangle. The adj values are referenced by the eqn attribute of the f element (§6.1.2.4) and in turn referenced by the path element (§6.1.2.14).
	
	`<v:shape`
	`coordorigin="0 0" coordsize="200 200"`
	`style="position:relative;top:30;left:30;width:20;height:20"`
	`adj="1, 1, 1, 200, 200, 200, 200, 1">`
	`<v:path v="m @0,@1 l @2,@3, @4,@5, @6,@7 x e"/>`
	`<v:formulas>`
	`<v:f eqn="val #0"/>`
	`<v:f eqn="val #1"/>`
	`<v:f eqn="val #2"/>`
	`<v:f eqn="val #3"/>`
	`<v:f eqn="val #4"/>`
	`<v:f eqn="val #5"/>`
	`<v:f eqn="val #6"/>`
	`<v:f eqn="val #7"/>`
	`</v:formulas>`
	`</v:shape>`
	
	This is the equivalent of:
	
	`<v:shape`
	`coordorigin="0 0" coordsize="200 200"`
	`style="position:relative;top:30;left:30;width:20;height:20"`
	`path="m 1,1 l 1,200, 200,200, 200,1 x e">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

allowincell (Allow in Table Cell)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether a shape can be placed in a table. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:allowincell="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

allowoverlap (Allow Shape	Specifies whether a shape can overlap another shape. Default is `true`. If `false`, the shape will shift left or right so as not to overlap another shape, similar to the behavior of

Attributes	Description
Overlap) Namespace: urn:schemas-microsoft-com:office:office	the HTML float attribute. [*Example:* `<v:shape ... o:allowoverlap="false" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

alt (Alternate Text)	Specifies alternative text describing the graphical object. This text should provide a brief description of the shape for use by accessibility tools. Default is no value.
	
	[*Example:* The alt text describes the basic shape:
	
	`<v:shape ... fillcolor="red" alt="Red rectangle"></v:shape>`
	
	The alt text describes the contents of a shape displaying an image:
	
	`<v:shape ... alt="Picture of a sunset"></v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

borderbottomcolor (Bottom Border Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the bottom border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderbottomcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
borderleftcolor (Border Left Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the left border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderleftcolor="red" ... ></v:shape>`

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.
borderrightcolor (Border Right Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the right border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:borderrightcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bordertopcolor (Border Top Color) Namespace: urn:schemas-microsoft-com:office:office	Specifies the top border color of an inline shape. Default is no value. [*Example:* `<v:shape ... o:bordertopcolor="red" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
bullet (Graphical Bullet) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is a graphical bullet. Default is `false`. [*Example:* `<v:shape ... o:bullet="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
button (Button Behavior Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a shape will exhibit button press behavior on click. Default is `false`. [*Example:* `<v:shape ... o:button="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

Attributes	Description
bwmode (Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies how a shape will render for black-and-white output devices. When a shape is printed on a black-and-white printer or displayed in a black-and-white view in an application, several options are possible. Default is auto, which will use o:bwnormal for normal black-and-white rendering and o:bwpure for pure black-and-white rendering. bwnormal and bwpure are subordinate to bwmode. If bwmode is "auto" then the value for bwnormal or bwpure is used depending on what the output format is. An application may define for itself what, if any, difference there is between normal B&W and pure B&W. For example, normal B&W might allow greyscale and pure B&W might not. [*Example:* This shape renders in grayscale in a black-and-white environment: `<v:shape ... o:bwmode="grayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwnormal (Normal Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for normal black-and-white output devices. Default is auto. [*Example:* This shape renders in a pale grayscale in a normal black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwnormal="lightgrayscale" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
bwpure (Pure Black-and-White Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies the black-and-white mode for pure black-and-white output devices. Default is auto. [*Example:* This shape renders in high contrast when in a pure black-and-white environment: `<v:shape ... o:bwmode="auto" o:bwpure="highcontrast" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_BWMode simple type (§6.2.3.2).
chromakey (Image	Specifies a color value that will be transparent and show anything behind the shape.

Attributes	Description

Transparency Color)	Default is no value.
	
	[*Example:*
	
	`<v:image ... chromakey="white" ...>`
	`</v:image>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

class (CSS Reference)	Specifies a reference to the definition of a CSS style. Default is no value.
	
	[*Example:* The snippets below are equivalent:
	
	`...`
	`.narrowstyle {width:50;height:100}`
	`...`
	`<v:shape ... class="narrowstyle"`
	`style="top:1;left:1">`
	`</v:shape>`
	
	`<v:shape ... style="top:1;left:1;`
	`width:50;height:100">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

clip (Clipping Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that the clipping region is active. This is used in conjunction with the clippath (§6.2.2.3) element to create a clipping region.
	
	[*Example:*
	
	`<v:shape ... o:clip="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

cliptowrap (Clip to Wrapping Polygon)	Specifies that the clipping region for the shape aligns with the wrapping polygon that tightly surrounds the entire shape (essentially, that the shape shall not be drawn beyond its wrapping polygon's extents – if it does, the shape shall be clipped). Default is `false`.

Attributes	Description

Namespace: urn:schemas-microsoft-com:office:office	[*Example:*
	
	`<v:shape ... o:cliptowrap="true">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

connectortype (Shape Connector Type)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the type of connector used for joining shapes. Default is `straight`.
	
	[*Example:*
	
	`<v:shape ... o:connectortype="elbow" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ConnectorType simple type (§6.2.3.6).

coordorigin (Coordinate Space Origin)	Specifies the coordinate of the top left corner of the shape's coordinate space. This determines the position of the (0,0) coordinate space origin within the shape's bounding box. Default is "0,0", which places the (0,0) origin at the top left corner of the bounding box.
	
	This affects shape properties that specify coordinate positions, such as the path attribute. Thus a path can be defined against a generic (0,0) origin and the coordorigin value translates the entire path within the shape's bounding space.
	
	[*Example:* The horizontal and vertical coordinate space ranges from -100 to +100 because the coordinate space (coordsize) is 200 by 200 and the top left coordinate is (-100,-100). The (0,0) origin lies at the center of the shape's bounding box, as evidenced by the position of the shape's path within the coordinate space:
	
	`<v:shape ... coordsize="200,200"`
	`coordorigin="-100,-100"`
	`path="m 0,0 l 0,50, 50,50, 50,0 x e">`
	`</v:shape>`
	
	 
	
	end example]

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>coordsize
(Coordinate Space Size)</td><td>Specifies the size of the shape's coordinate space in coordinate units. Default is "1000,1000".

The physical size of a coordinate unit length is determined by both the size of the coordinate space (coordsize) and the size of the shape (style width and height). The coordsize attribute defines the number of horizontal and vertical subdivisions into which the shape's bounding box is divided. The combination of coordsize and style width/height effective scales the shape anisotropically.

[Example: The path is 50 units wide and tall, which is 25% of the size of the coordinate space:

<pre><v:shape ... coordsize="200,200"
  coordorigin="-100,-100"
  path="m 0,0 l 0,50, 50,50, 50,0 x e">
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>dgmlayout
(Diagram Node Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies the type of automatic layout to apply to the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>  </td></tr>
</table>

[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]

The possible values for this attribute are defined by the XML Schema integer datatype.
</td></tr>
<tr><td>dgmlayoutmru (Diagram Node Recent Layout Identifier)

Namespace: urn:schemas-microsoft-com:office:office</td><td>
Specifies the type of automatic layout most recently used on the child elements of the diagram node. This is only meaningful for organization charts. Valid values for organization charts are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>0</td><td>Top-down, centered layout.
  </td></tr>
<tr><td>1</td><td>Hanging, both sides layout.
  </td></tr>
<tr><td>2</td><td>Hanging, right side layout.
  </td></tr>
<tr><td>3</td><td>Hanging, left side layout.
  </td></tr>
</table>
[Example:

<pre><v:shape ... dgmlayout="1">
</v:shape></pre>
end example]
</td></tr>
</table>

Attributes	Description
	The possible values for this attribute are defined by the XML Schema integer datatype.

dgmnodekind (Diagram Node Identifier)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies an optional, application-specific parameter that is intended to be used by the application to tag different types of nodes in a diagram.
	
	[*Example:*
	
	`<v:shape ... dgmnodekind="1">`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

doubleclicknotify (Double-click Notification Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that an event message is sent when a shape is double-clicked. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:doubleclicknotify="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

fillcolor (Fill Color)	Specifies the color to use for the fill. Default is `white`. If the fill element (§6.1.2.5) is present, its color attribute takes precedence. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description.
	
	[*Example:* This shape is red if its fill is visible:
	
	`<v:shape ... fillcolor="red" ... >`
	`</v:shape>`
	
	This is equivalent to:
	
	`<v:shape ... fillcolor="#ff0000" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).

filled (Shape Fill	Specifies whether the closed path will be filled. Default is `true`. This attribute is

Attributes	Description

Toggle)	overridden by the fill on attribute.
	
	[*Example:*
	
	`<v:shape ... filled="f"`
	`  fillcolor="red" ...>`
	`</v:shape>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

forcedash (Force Dashed Outline)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`.
	
	Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.
	
	[*Example:*
	
	`<v:shape ... o:forcedash="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

hr (Horizontal Rule Toggle)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies that a shape is a horizontal rule. Default is `false`.
	
	[*Example:*
	
	`<v:shape ... o:hr="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

hralign (Horizontal Rule Alignment)	Specifies the alignment of a horizontal rule. Default is `left`. [*Example:*

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	<v:shape ... o:hralign="center" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_HrAlign simple type (§6.2.3.14).
href (Hyperlink Target)	Specifies a hyperlink URL target for the shape. Default is no value. [*Example:* <v:shape ... href="http://www.openxmlformats.org" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hrnoshade (Horizontal Rule 3D Shading Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies that the horizontal rule does not have 3-D shading. Default is `false`. [*Example:* <v:shape ... o:hrnoshade="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
hrpct (Horizontal Rule Length Percentage) Namespace: urn:schemas-microsoft-com:office:office	Specifies the length of a horizontal rule as a percentage of page width. Default is 0. [*Example:* <v:shape ... o:hrpct="85" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema float datatype.
hrstd (Horizontal Rule Standard Display Toggle) Namespace: urn:schemas-	Specifies whether a shape is displayed as a standard horizontal rule. Only applies if hr is `true`. Default is `false`. [*Example:* <v:shape ... o:hrstd="true" ... >

Attributes	Description
microsoft-com:office:office	</v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* <v:shape ... id="myShape" ... > </v:shape> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetmode (Text Inset Mode) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is custom. This attribute is only meaningful for text boxes. [*Example:* <v:shape ... o:insetmode="auto" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* <v:shape ... insetpen="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
master (Master Element Toggle)	Specifies whether the shapetype is a master element. If true, it is rendered by the rendering engine. Default is false.

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	The possible values for this attribute are defined by the XML Schema string datatype.
ole (Embedded Object Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the shape is an embedded object. Default is `false`. [*Example:* `<v:shape ... o:ole="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
oleicon (Embedded Object Icon Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether an embedded object will be displayed as an icon. Default is `false`. [*Example:* `<v:shape ... o:oleicon="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
oned (Shape Handle Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the extra handles of a shape are hidden. If `true`, hides all shape handles except the top left and bottom right; that is, the same handles that are used for a straight line segment. Default is `false`. [*Example:* `<v:shape ... o:oned="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
opacity (Fill Color Opacity)	Specifies the opacity of the primary fill color. Default is 1.0. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied. For example, a value of "52429f" represents 52429/65536 or 0.8. [*Example:* The red color is 25% opaque:

Attributes	Description
	<v:fill type="gradient" color="red" color2="blue" opacity=".25"> </v:fill>  opacity="1"  opacity=".25" *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
path (Edge Path)	Specifies the line that makes up the edges of a shape. See the v attribute of the path element (§6.1.2.14) for a full description. The possible values for this attribute are defined by the XML Schema string datatype.
preferrelative (Relative Resize Toggle) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether the original size of an object is saved after reformatting. Default is false. If true, the original size of the object is stored and all resizing is based on a percentage of that original size. Otherwise, each resizing will reset the scale to 100%. [*Example:* <v:shape ... o:preferrelative="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
print (Print Toggle)	Specifies whether the shape will be printed. Default is true. [*Example:* <v:shape ... print="false" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
regroupid (Regroup ID)	Specifies a previous group for a shape. An ID number is used to identify groups of shapes that are no longer grouped. This allows shapes to be regrouped programmatically.

Attributes	Description
Namespace: urn:schemas-microsoft-com:office:office	[*Example:* The shape was part of a group identified by the ID 040754: `<v:shape ... o:regroupid="040754" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
spid (Optional String) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional string that an application may use to Identify the particular shape. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
spt (Optional Number) Namespace: urn:schemas-microsoft-com:office:office	Specifies an optional number that an application may use to associate the particular shape with a defined shape type. Default is 0. The possible values for this attribute are defined by the XML Schema float datatype.
strokecolor (Shape Stroke Color)	Specifies the primary color of the brush to use to stroke the path of the shape. Default is `black`. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. [*Example:* `<v:shape ... strokecolor="red" ...> </v:shape>`  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
stroked (Shape Stroke Toggle)	Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is `true`.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>[Example:

<pre><v:shape ... fillcolor="red"
  stroked="false" strokecolor="blue"...>
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</td></tr>
<tr><td>strokeweight (Shape Stroke Weight)</td><td>Specifies the width of the brush to use to stroke the path. Default is 1 point. If a number is given without units, the emu is used. The weight attribute of the stroke element (§6.1.2.21) overrides this attribute.

[Example:

<pre><v:shape ... strokeweight="3pt" ... >
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description	
	height	Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	left	Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-bottom	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	margin-left	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm,

Attributes	Description
	mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	`margin-right` Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	`margin-top` Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	`mso-position-horizontal` Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is `absolute`. Allowed values are: • `absolute` • `left` • `center` • `right` • `inside` • `outside`
	`mso-position-horizontal-relative` Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the `mso-position-horizontal` property. Default is `text`. Allowed values are:

Attributes	Description
	• margin • page • text • char
mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside • outside
mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not

Attributes	Description
	change the origin.
mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.
position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are:

Attributes	Description
	<table><tr><td></td><td> - hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. - inherit - The visibility state is inherited from the parent of the shape. </td></tr><tr><td>width</td><td>Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: - auto - Default position of an element in the flow of the page. <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. <percentage>- Value expressed as a percentage of the parent object's width. </td></tr><tr><td>z-index</td><td>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are: - auto - Uses the order that the shapes appear in the page, bottom to top. <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed. </td></tr></table> The following properties are only used by the textbox element (§6.1.2.22): <table><tr><th>Property</th><th>Description</th></tr><tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are: - ltr - Test is displayed left-to-right. - rtl - Test is displayed right-to-left. </td></tr><tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are: - horizontal - Text is displayed horizontally. - vertical - Text is displayed vertically. </td></tr></table>

Attributes	Description

	• `vertical-ideographic` - Ideographic text is displayed vertically. • `horizontal-ideographic` - Ideographic text is displayed horizontally.
`mso-direction-alt`	Specifies an alternate direction for text in textboxes. Overrides the `direction` property. The only allowed value is `context`.
`mso-fit-shape-to-text`	Specifies whether the shape stretches to fit the text in the textbox. Default is `false`.
`mso-fit-text-to-shape`	Specifies whether the text stretches to fit the textbox. Default is `false`.
`mso-layout-flow-alt`	Specifies the alternate layout flow for text in textboxes. This property is used instead of `layout-flow` when the layout flow is from bottom to top for non-ideographic languages. Its only value is `bottom-to-top`.
`mso-next-textbox`	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
`mso-rotate`	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
`mso-text-scale`	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if `mso-fit-text-to-shape` is `true`.
`v-text-anchor`	Specifies the vertical anchoring of text in a textbox. Default is `top`. The alignment of a text anchor only becomes evident if `mso-fit-text-to-shape` is `false`. This property is different from the `vertical-align` CSS property, which is used for ideographic languages. Allowed values are: • `top` • `middle` • `bottom` • `top-center` • `middle-center` • `bottom-center` • `top-baseline`

<table>

<table>
<tr><td></td><td>

bottom-baseline
top-center-baseline
bottom-center-baseline

</td></tr>
</table>
The following properties are only used by the textpath element (§6.1.2.23):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>font</td><td>Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.</td></tr>
<tr><td>font-family</td><td>Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.</td></tr>
<tr><td>font-size</td><td>Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.</td></tr>
<tr><td>font-style</td><td>Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property. Allowed values are:
normal
italic
oblique - Treated the same as italic.</td></tr>
<tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:
normal
small-caps</td></tr>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:
<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200</td><td>Treated as non-bold.</td></tr>
</table>
</td></tr>
</table>
</td></tr>

800

900</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
<tr><td>mso-text-shadow</td><td>Specifies whether a shadow is applied to the text on a text path. Default is false.</td></tr>
<tr><td>text-decoration</td><td>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:

• none
• underline
• overline
• line-through
• blink</td></tr>
<tr><td>v-rotate-letters</td><td>Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.</td></tr>
<tr><td>v-same-letter-heights</td><td>Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.</td></tr>
<tr><td>v-text-align</td><td>Specifies the alignment of text. Default is left. Allowed values are:

• left
• right
• center
• justify
• letter-justify - Distributes the extra space between the letters.
• stretch-justify - Stretches the letters to fill in the space.</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>v-text-kern</td><td>Specifies whether kerning is turned on. Default is false.</td></tr>
<tr><td>v-text-reverse</td><td>Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.</td></tr>
<tr><td>v-text-spacing-mode</td><td>Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:

• tightening
• tracking</td></tr>
<tr><td>v-text-spacing</td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr>
</table>

The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:

• top
• left
• width
• height

The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:

• flip
• height
• left
• margin-left
• margin-top
• position
• rotation
• top
• visibility
• width
• z-index

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>target (Hyperlink Display Target)</td><td>Specifies a frame or window that a URL is displayed in. Default is no value. Allowed values are:

<table>
<tr><th>Value</th><th>Description</th></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td><targetname></td><td>String containing the name of the frame or window in which to load the document.</td></tr>
<tr><td>_blank</td><td>Specifies that the linked document is loaded into a new blank window. This window is not named.</td></tr>
<tr><td>_media</td><td>Specifies that the linked document is loaded into the Media Bar. Available in Microsoft® Internet Explorer 6 or later.</td></tr>
<tr><td>_parent</td><td>Specifies that the linked document is loaded into the immediate parent of the document containing the link.</td></tr>
<tr><td>_search</td><td>Specifies that the linked document is loaded into the browser's search pane. Available in Microsoft Internet Explorer 5 or greater.</td></tr>
<tr><td>_self</td><td>Specifies that the linked document is loaded into the window in which the link was clicked (the active window).</td></tr>
<tr><td>_top</td><td>Specifies that the linked document is loaded into the topmost window.</td></tr>
</table>
[Example:
<pre>
  <v:shape ...
    href="http://www.openxmlformats.org"
    target="_self" ... >
  </v:shape>
</pre>
end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>title (Shape Title)</td><td>
Specifies the text displayed when the mouse pointer moves over the shape. Default is no value.
[Example:
<pre>
  <v:shape ... title="tooltip" ... >
  </v:shape>
</pre>
end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>userdrawn (Exists In Master Slide)

Namespace: urn:schemas-microsoft-com:office:office</td><td>
Specifies whether the user has added the shape to a master slide. Default is <code>false</code>. Used by PresentationML.
[Example:
<pre>
  <v:shape ... o:userdrawn="true" ... >
  </v:shape>
</pre>
</td></tr>
</table>

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
userhidden (Hide Script Anchors) Namespace: urn:schemas-microsoft-com:office:office	Specifies whether a script anchor is hidden. Default is `false`. If `true`, script anchors stay hidden even if the shape is otherwise visible. A script anchor is the visual representation of a script that when displayed in an application. [*Example:* `<v:shape ... o:userhidden="true" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

wrapcoords (Shape Bounding Polygon)	Specifies the bounding polygon that surrounds a shape. This is specified using a comma-delimited list of x and y coordinates: "x1,y1,x2,y2,x3,y3,..." This is used when text is tightly wrapped around a shape. Default is no value until the mso-wrap-mode style attribute is set to `tight` or `through`.
	
	[*Example:*
	
	`<v:shape ...`
	`wrapcoords="0,0 0,200, 200,200, 200,0" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shapetype">
   <sequence>
      <group ref="EG_ShapeElements" minOccurs="0" maxOccurs="unbounded"/>
      <element ref="o:complex" minOccurs="0"/>
   </sequence>
   <attributeGroup ref="AG_AllCoreAttributes"/>
   <attributeGroup ref="AG_AllShapeAttributes"/>
   <attributeGroup ref="AG_Adj"/>
   <attributeGroup ref="AG_Path"/>
   <attribute ref="o:master"/>
</complexType>
```

6.1.2.21 stroke (Line Stroke Settings)

This element describes how to draw the path if something beyond solid line with a solid color is desired. The attributes of the stroke element can be used to describe a powerful set of stroke properties. Extensions to the VML stroke definition are encoded as sub-elements of stroke.

[*Example:*

```
<v:polyline points="0pt,0pt,50pt,0pt,50pt,35pt,15pt,35pt,
  15pt,15pt,75pt,15pt">
  <v:stroke startarrow="classic" endarrow="classic"
    startarrowwidth="wide" endarrowwidth="wide" dashstyle="dashdot"
    weight="2pt" color="teal" linestyle="thinThin"/>
</v:polyline>
```

end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapetype (§6.1.2.20)

Child Elements	Subclause
bottom (Text Box Bottom Stroke)	§6.2.2.1
column (Text Box Interior Stroke)	§6.2.2.6
left (Text Box Left Stroke)	§6.2.2.15
right (Text Box Right Stroke)	§6.2.2.25
top (Text Box Top Stroke)	§6.2.2.31

Attributes	Description
althref (Alternate Image Reference) Namespace: urn:schemas-microsoft-com:office:office	Specifies an alternate reference for an image in Macintosh PICT format. [*Example:* `<v:stroke ... althref="myimage.pcz" ... ></v:stroke>` *end example*]

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
color (Stroke Color)	Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is `black`. See the fillcolor attribute for a list of supported named colors. [*Example:* The shape stroke is blue: `<v:shape ... strokecolor="red" ... >   <v:stroke color="blue"/> </v:shape>` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
color2 (Stroke Alternate Pattern Color)	Specifies a second color for strokes, used when filltype is `pattern`. Default is no value. When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image. [*Example:* This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape. `<v:background fillcolor="yellow"/> <v:shape style="width:60;height:50"   strokecolor="red" fillcolor="lime"   path="m 0,0 l 0,1000 1000,1000 1000,0 x e">   <v:stroke filltype="pattern" weight="10pt"   src="myimage.gif" color2="blue"/> </v:shape>`  , where myimage.gif is:  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.1.3.1).
dashstyle (Stroke Dash Pattern)	Specifies the dot and dash pattern for a stroke. Default is `solid`. Pre-defined values are:

Attributes	Description

	• solid
	• shortdash
	• shortdot
	• shortdashdot
	• shortdashdotdot
	• dot
	• dash
	• longdash
	• dashdot
	• longdashdot
	• longdashdotdot
	
	A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).
	
	[*Example:*
	
	`<v:stroke dashstyle="0 2" weight="3pt" endcap="round"></v:stroke>`
	
	 
	
	`<v:stroke dashstyle="longdashdotdot" weight="2pt"></v:stroke>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

endarrow (Line End Arrowhead)	Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are:

Attributes	Description
	• none • block • classic • diamond • oval • open [*Example:* `<v:stroke endarrow="classic"/>`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
endarrowlength (Line End Arrowhead Length)	Specifies the length of the arrowhead at the end of a line. Default is `medium`. Allowed values are: • short • medium • long [*Example:* `<v:stroke ... endarrowlength="long" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
endarrowwidth (Line End Arrowhead Width)	Specifies the width of the arrowhead at the end of a line. Default is `medium`. Allowed values are: • narrow

Attributes	Description
	• medium • wide [*Example:* `<v:stroke ... endarrowwidth="wide" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
endcap (Line End Cap)	Specifies the cap style for the end of a stroke. Default is `flat`. Allowed values are: • flat • square • round [*Example:* `<v:stroke ... endcap="round" weight="10pt" ... />`  endcap="flat" endcap="square" endcap="round" *end example*] The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).
filltype (Stroke Image Style)	Specifies the type of fill used for the background of a stroke. Default is `solid`. Allowed values are:

Attributes	Description

	• `solid` - The fill pattern is solid.
	• `tile` - The fill image is tiled.
	• `pattern` - The fill image is stretched to form a pattern.
	• `frame` - The fill image becomes a border for the shape.
	
	[*Example:*
	
	`<v:shape style="width:50;height:50"`
	`  strokecolor="red"`
	`  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`  <v:stroke filltype="frame" weight="10pt"`
	`  src="border.gif"/>`
	`</v:shape>`
	
	  , where border.gif is: 
	
	end example]
	
	The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).

forcedash (Force Dashed Outline)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`.
	
	Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.
	
	[*Example:*
	
	`<v:shape ... o:forcedash="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

href (Original Image Reference)
 	
Namespace: urn:schemas-microsoft-com:office:office
	Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.
	
	[*Example:*
	
	`<v:fill ... o:href="myimage.gif" ... >`
	`</v:fill>`

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* `<v:shape ... id="myShape" ... > </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
id (Relationship) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID of the relationship to the image used for the stroke. The specified relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or the document shall be considered non-conformant. [*Example*: The markup specifies the associated relationship part with relationship ID `rId10` contains the corresponding relationship information: `< ... r:id="rId10" />` *end example*] The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

imagealignshape (Stoke Image Alignment)	Specifies the alignment of the stroke image. If `true`, the image is aligned with the shape. Otherwise, it is aligned with the containing scope. Default is `true`.
	
	[*Example:* The top position offset shifts the image alignment relative to the containing window:
	
	`<v:shape fillcolor="silver"`
	`style="top:20;width:50;height:50"`
	`path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`<v:stroke imagealignshape="false" weight="20pt"`
	`filltype="tile" src="myimage.gif"/>`
	`</v:shape>`

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
 imagealignshape="false"

 imagealignshape="false"

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
</td></tr>
<tr><td>imageaspect (Stroke Image Aspect Ratio)</td><td>
Specifies how the stroke image aspect ratio is preserved. Default is ignore. Allowed values are:

<table>
<tr><td>Value</td><td>Description</td></tr>
<tr><td>ignore</td><td>Ignore aspect issues.</td></tr>
<tr><td>atleast</td><td>Image is at least as big as imagesize.</td></tr>
<tr><td>atmost</td><td>Image is no bigger than imagesize.</td></tr>
</table>

[Example:

<pre>
<v:stroke filltype="frame" weight="10pt"
  src="border.gif" imagealignshape="true"
  imageaspect="atleast">
</v:stroke>
</pre>
 imagealignshape="ignore"

 imagealignshape="atleast"

 imagealignshape="atmost"

end example]
</td></tr>
</table>

Attributes	Description
	The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).
imagesize (Stroke Image Size)	Specifies the size of the image for the stroke. Default is the size of the image. [*Example:* `<v:stroke ... imagesize="10pt,10pt" ... />` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.
	
	[*Example:*
	
	`<v:shape ... insetpen="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

joinstyle (Line End Join Style)	Specifies the join style for line ends. Default is round.
	
	• round
	• bevel
	• miter
	
	[*Example:*
	
	`<v:polyline strokeweight="10pt" strokecolor="navy"`
	`points="10pt,10pt,50pt,50pt,90pt,10pt">`
	`<v:stroke joinstyle="bevel"/>`
	`</v:polyline>`
	
	 
	joinstyle="round"

Attributes	Description
	 `joinstyle="bevel"`  `joinstyle="miter"` *end example*] The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).

linestyle (Stroke Line Style)	Specifies the line style of the stroke. Default is `single`.
	
	• `single`
	• `thinThin`
	• `thinThick`
	• `thickThin`
	• `thickBetweenThin`
	
	[*Example:*
	
	`<v:stroke linestyle="thickThin" weight="5pt">`
	`</v:stroke>`
	 
	end example]
	
	The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).

miterlimit (Miter Joint Limit)	Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8.
	
	[*Example:*
	
	`<v:stroke joinstyle="miter" weight="10pt"`
	`miterlimit="2">`
	`</v:stroke>`

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema decimal datatype.

on (Stroke Toggle)	Specifies whether the stroke is displayed. Default is `true`. This attribute overrides the shape's stroke attribute.
	
	[*Example:*
	
	`<v:rect style="width:50;height:50" stroked="true"`
	`  fillcolor="lime" strokecolor="red">`
	`  <v:stroke on="false" weight="5pt"/>`
	`</v:rect>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

opacity (Stroke Opacity)	Specifies the amount of transparency of a stroke. Default is 1.0.
	
	[*Example:*
	
	`<v:rect style="width:50;height:50"`
	`  fillcolor="lime" strokecolor="red">`
	`  <v:stroke weight="5pt" opacity="50%"/>`
	`</v:rect>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

relid (Relationship to Part) Namespace: urn:schemas-	Specifies the relationship ID of the relationship to the image. The specified relationship shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/image or the document shall be considered non-conformant.

Attributes	Description

microsoft-com:office:office	[*Example*: The markup specifies the associated relationship part with relationship ID `rId10` contains the corresponding relationship information:
	
	`<v:stroke ... o:relid="rId10" ...>`
	`</v:stroke>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_RelationshipId simple type (§6.2.3.20).

src (Stroke Image Location)	Specifies the source image to load for a stroke fill. Default is no value.
	
	[*Example:*
	
	`<v:stroke ... src="myimage.gif" ... >`
	`</v:stroke>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

startarrow (Line Start Arrowhead)	Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • `none` • `block` • `classic` • `diamond` • `oval` • `open` [*Example:* `<v:stroke startarrow="classic"/>`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
startarrowlength (Line Start	Specifies the length of the arrowhead at the start of a line. Default is `medium`. Allowed values are:

Attributes	Description
Arrowhead Length)	• short • medium • long [*Example:* `<v:stroke ... startarrowlength="long" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
startarrowwidth (Line Start Arrowhead Width)	Specifies the width of the arrowhead at the start of a line. Default is `medium`. Allowed values are: • narrow • medium • wide [*Example:* `<v:stroke ... startarrowwidth="wide" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
title (Stroke Title) Namespace: urn:schemas-microsoft-com:office:office	Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank. [*Example:* `<v:fill ... o:title="alt text" ... ></v:fill>`

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.
weight (Stroke Weight)	Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Stroke">
   <sequence>
      <element ref="o:left" minOccurs="0"/>
      <element ref="o:top" minOccurs="0"/>
      <element ref="o:right" minOccurs="0"/>
      <element ref="o:bottom" minOccurs="0"/>
      <element ref="o:column" minOccurs="0"/>
   </sequence>
   <attributeGroup ref="AG_Id"/>
   <attributeGroup ref="AG_StrokeAttributes"/>
</complexType>
```

6.1.2.22 textbox (Text Box)

This element is used to define text that appears inside the shape. This text may contain rich formatting and is rendered to fit inside the textboxrect defined by the path element (§6.1.2.14).

[*Example:*

```
<v:shape style="width=200;height=200" coordsize="400,400"
  fillcolor="yellow" strokecolor="maroon"
  path="m 119,0 l 148,86 238,86 166,140 192,226 119,175 46,226
  72,140 0,86 90,86 x e">
  <v:textbox inset="32pt,35pt,,">VML</v:textbox>
</v:shape>
```

end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12);

Parent Elements
object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapetype (§6.1.2.20)

Child Elements	Subclause
Any element from the empty namespace	n/a
Any element from the empty namespace	n/a
txbxContent (Rich Text Box Content Container)	§2.17.1.1

Attributes	Description
id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object. Default is no value. [*Example:* `<v:shape ... id="myShape" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
inset (Text Box Inset)	Specifies inner margin values for textbox text. Default is "0.1in, 0.05in, 0.1in, 0.05in". Missing values are set to the default. This is used if insetmode is `custom`. The internal text margin value is specified as a string containing four values, each separated by commas or spaces. The values measure inset from the left, top, right, and bottom edges of the box specified by the textboxrect attribute of the path element (§6.1.2.14). [*Example:* The text is set toward the lower right of a small square: `<v:textbox inset="20pt,30pt,10pt,10pt">VML</v:textbox>`  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>insetmode (Text Inset Mode)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies whether the application calculates the internal text margin instead of using the inset attribute. Default is <code>custom</code>.

[Example:

<pre><v:textbox ... o:insetmode="auto" ... >
</v:textbox></pre>
end example]

The possible values for this attribute are defined by the ST_InsetMode simple type (§6.2.3.15).</td></tr>
<tr><td>singleclick (Text Box Single-Click Selection Toggle)

Namespace: urn:schemas-microsoft-com:office:office</td><td>Specifies whether text is selectable with a single click. Default is <code>false</code>.

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td><code>flip</code></td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
<tr><td><code>height</code></td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• <code>auto</code> - Default position of an element in the flow of the page.
• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	parent object's height.
left	Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
margin-bottom	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
margin-left	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
margin-right	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the

Attributes	Description	
		page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
	mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute

Attributes	Description
	• top • center • bottom • inside • outside
mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are:

Attributes	Description	
		• square - Wraps text inside the shape in a square. • none - Text does not wrap.
	position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
	rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are: • hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • inherit - The visibility state is inherited from the parent of the shape.
	width	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>

auto - Default position of an element in the flow of the page.
<units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
<percentage>- Value expressed as a percentage of the parent object's width.

</td></tr>
<tr><td>z-index</td><td>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:
auto - Uses the order that the shapes appear in the page, bottom to top.
<order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.
</td></tr>
</table>
The following properties are only used by the textbox element (§6.1.2.22):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:
ltr - Test is displayed left-to-right.
rtl - Test is displayed right-to-left.
</td></tr>
<tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:
horizontal - Text is displayed horizontally.
vertical - Text is displayed vertically.
vertical-ideographic - Ideographic text is displayed vertically.
horizontal-ideographic - Ideographic text is displayed horizontally.
</td></tr>
<tr><td>mso-direction-alt</td><td>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</td></tr>
<tr><td>mso-fit-shape-</td><td>Specifies whether the shape stretches to fit the text in the</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	to-text: textbox. Default is false. mso-fit-text-to-shape: Specifies whether the text stretches to fit the textbox. Default is false. mso-layout-flow-alt: Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top. mso-next-textbox: Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value. mso-rotate: Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90 mso-text-scale: Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true. v-text-anchor: Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline The following properties are only used by the textpath element (§6.1.2.23): font: Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The

<table>

</table>

Attributes	Description
	700 800 900
	mso-text-shadow: Specifies whether a shadow is applied to the text on a text path. Default is false.
	text-decoration: Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are: • none • underline • overline • line-through • blink
	v-rotate-letters: Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.
	v-same-letter-heights: Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the height of the uppercase letters. Default is false.
	v-text-align: Specifies the alignment of text. Default is left. Allowed values are: • left • right • center • justify • letter-justify - Distributes the extra space between the letters. • stretch-justify - Stretches the letters to fill in the space.
	v-text-kern: Specifies whether kerning is turned on. Default is false.
	v-text-reverse: Specifies whether the layout order of rows is reversed. Default is false. This is used for vertical text layout.
	v-text-spacing-mode: Specifies the mode for letter spacing. Default is tightening. This property determines whether space will be removed between each letter (tightening) or added between each letter (tracking). The amount of letter spacing change is defined by the v-text-spacing property. Allowed values are:

Attributes	Description
	<table><tr><td></td><td> - tightening - tracking </td></tr><tr><td>v-text-spacing</td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr></table> The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties: - top - left - width - height The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute: - flip - height - left - margin-left - margin-top - position - rotation - top - visibility - width - z-index The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Textbox">
   <choice>
      <element ref="w:txbxContent" minOccurs="0"/>
      <any namespace="##local" processContents="skip"/>
   </choice>
   <attributeGroup ref="AG_Id"/>
   <attributeGroup ref="AG_Style"/>
   <attribute name="inset" type="xsd:string" use="optional"/>
   <attribute ref="o:singleclick"/>
   <attribute ref="o:insetmode"/>
</complexType>
```

6.1.2.23 textpath (Text Layout Path)

This element is used to define a vector path based on the text data, font and font styles supplied. The path which results is then mapped into the region defined by the v attribute of the shape's path (§6.1.2.14).

[*Example:*

```
<v:curve from="50,100" to="400,100"
  control1="200,200" control2="300,200">
  <v:stroke color="blue"/>
  <v:fill color="yellow" color2="green" type="gradient"/>
  <v:path textpathok="true"/>
  <v:textpath on="true" style="font:normal normal normal 36pt Arial"
    fitpath="true" string="Hello, VML!"/>
</v:curve>
```

end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description

fitpath (Path Fit Toggle)	Specifies whether the text fits the path of a shape. If `true`, sizes the text to fill the path it lies out on. Default is `false`.
	
	[*Example:*
	
	`<v:textpath on="true" fitpath="true"`
	`  string="VML">`
	`</v:textpath>`
	
	 
	
	end example]

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

fitshape (Shape Fit Toggle)	Specifies whether the text fits the bounding box of a shape. If `true`, the text is stretched out to the edges of the box that defines the entire shape. Default is `false`.
	
	[*Example:* When fitshape is `false`, the text is drawn along the first part of the path. When `true`, the text is stretched to fit the entire enclosed area of the shape.
	
	`<v:shape style="width:100;height:100"`
	`path="m 0,500 c 250,0 750,0 1000,500 e`
	`m 0,600 c 250,900 750,900 1000,600 e"`
	`fillcolor="yellow" strokecolor="maroon">`
	`<v:path textpathok="t"/>`
	`<v:textpath on="t" fitshape="t" string="VML"/>`
	`</v:shape>`
	
	 
	
	The raw path stroke is:
	 	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

id (Unique Identifier)	Specifies a unique identifier that can be used to reference a VML object.
	
	Default is no value.
	
	[*Example:*
	
	`<v:shape ... id="myShape" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

on (Text Path	Specifies whether the text is displayed on the textpath. Default is `false`. The

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>Toggle)</td><td>textpathok attribute of the path element (§6.1.2.14) overrides this.

[Example:

<pre><v:line from="50,100" to="100,100">
  <v:path textpathok="false"/>
  <v:textpath on="true" string="VML"/>
</v:line></pre>
———

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).</td></tr>
<tr><td>string (Text Path Text)</td><td>Specifies the text of the text path. Default is no value.

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>flip</td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
<tr><td>height</td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• auto - Default position of an element in the flow of the page.
• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the parent object's height.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description	
	`left`	Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	`margin-bottom`	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	`margin-left`	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	`margin-right`	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page.

Attributes	Description	
		• <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
	mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top

Attributes	Description
	• center • bottom • inside • outside
mso-position-vertical-relative	Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line
mso-wrap-distance-bottom	Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-left	Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-right	Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-distance-top	Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.
mso-wrap-edited	Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.
mso-wrap-style	Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square.

Attributes	Description
	• none - Text does not wrap.
position	Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are: • static - The element is positioned according to the normal flow of the page. The top and left properties are ignored. If the object is anchored inline, this value is used. • absolute - The element is positioned relative to the parent, using the top and left properties. • relative - The element is positioned according to the normal flow of the page, but the top and left properties are used. The overlap of overlapping elements is governed by the z-index property.
rotation	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
top	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
visibility	Specifies whether a shape is displayed. Only inherit and hidden are used; any other values are mapped to inherit. Default is inherit. Allowed values are: • hidden - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • inherit - The visibility state is inherited from the parent of the shape.
width	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>

auto - Default position of an element in the flow of the page.
<units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
<percentage>- Value expressed as a percentage of the parent object's width.

</td></tr>
<tr><td>z-index</td><td>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:

auto - Uses the order that the shapes appear in the page, bottom to top.
<order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.

</td></tr>
</table>
The following properties are only used by the textbox element (§6.1.2.22):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:

ltr - Test is displayed left-to-right.
rtl - Test is displayed right-to-left.

</td></tr>
<tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:

horizontal - Text is displayed horizontally.
vertical - Text is displayed vertically.
vertical-ideographic - Ideographic text is displayed vertically.
horizontal-ideographic - Ideographic text is displayed horizontally.

</td></tr>
<tr><td>mso-direction-alt</td><td>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</td></tr>
<tr><td>mso-fit-shape-</td><td>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description

to-text	
mso-fit-text-to-shape	Specifies whether the text stretches to fit the textbox. Default is false.
mso-layout-flow-alt	Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value is bottom-to-top.
mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
v-text-anchor	Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline

The following properties are only used by the textpath element (§6.1.2.23):

Property	Description
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The

width
height

The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:

flip
height
left
margin-left
margin-top
position
rotation
top
visibility
width
z-index

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>trim (Text Path Trim Toggle)</td><td>
Specifies whether extra space is removed above and below the text. If true, space reserved for ascenders and descenders is removed. Default is false.
[Example: The shape path is duplicated as a second shape and overlaid on the textpath for illustrative purposes:
<pre>
<v:shape style=" width:100;height:100"
  path="m 0,500 c 250,0 750,0 1000,500 e
  m 0,600 c 250,900 750,900 1000,600 e"
  fillcolor="yellow" strokecolor="maroon">
  <v:path textpathok="true"/>
  <v:textpath on="true" fitshape="true"
    string="vml" trim="true"/>
</v:shape>
</pre>
</td></tr>
</table>

Attributes	Description
	 `trim="true"`  `trim="false"` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).
xscale (Text X-Scaling)	Specifies whether a straight text path will be used instead of the shape path. If `true`, the text runs along a path from left to right along the x value of the lower boundary of the shape. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.1.3.14).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextPath">
   <attributeGroup ref="AG_Id"/>
   <attributeGroup ref="AG_Style"/>
   <attribute name="on" type="ST_TrueFalse" use="optional"/>
   <attribute name="fitshape" type="ST_TrueFalse" use="optional"/>
   <attribute name="fitpath" type="ST_TrueFalse" use="optional"/>
   <attribute name="trim" type="ST_TrueFalse" use="optional"/>
   <attribute name="xscale" type="ST_TrueFalse" use="optional"/>
   <attribute name="string" type="xsd:string" use="optional"/>
</complexType>
```

6.1.3 Simple Types

This is the complete list of simple types in the urn:schemas-microsoft-com:vml namespace.

6.1.3.1 ST_ColorType (Color Type)

This simple type specifies a color. Colors are specified in one of three ways - named color, hexadecimal RGB or color palette entry. An optional index may be stored in square brackets following the color and a space. [*Rationale:* An application might store the color's index in a system color palette using this means. *end rationale*]

A named color is specified using the name of the color. The following named colors are supported:

- `Black (#000000)` ■
- `Silver (#C0C0C0)` ■

- Gray (#808080)
- White (#FFFFFF)
- Maroon (#800000)
- Red (#FF0000)
- Purple (#800080)
- Fuchsia (#FF00FF)
- Green (#008000)
- Lime (#00FF00)
- Olive (#808000)
- Yellow (#FFFF00)
- Navy (#000080)
- Blue (#0000FF)
- Teal (#008080)
- Aqua (#00FFFF)

[*Example:*

```
<... color="red" ... >
```

end example]

Hexadecimal RGB is specified using a hash symbol (#) followed by six hexadecimal characters, where each pair represents the red, green and blue component of the color.

[*Example:*

```
< ... color="#5f2726" ... >
```

end example]

A color palette entry is specified using the name of the color in the palette.

[*Example:*

```
<... color="buttonFace [67]" ... >
```

end example]

This simple type's contents are a restriction of the XML Schema string datatype.

```
<simpleType name="ST_ColorType">
   <restriction base="xsd:string"/>
</simpleType>
```

6.1.3.2 ST_EditAs (Shape Grouping Types)

This simple type specifies the different meanings of a group of shapes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bullseye (Bullseye Diagram)	Specifies that the group represents a bulls-eye diagram.
canvas (Shape Canvas)	Specifies that the group is a regular group and does not represent a diagram.
cycle (Cycle Diagram)	Specifies that the group represents a cycle diagram.
orgchart (Organization Chart Diagram)	Specifies that the group represents an organization chart.
radial (Radial Diagram)	Specifies that the group represents a radial diagram.
stacked (Pyramid Diagram)	Specifies that the group represents a pyramid diagram.
venn (Venn Diagram)	Specifies that the group represents a Venn diagram.

Referenced By
group@editas (§6.1.2.7)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_EditAs">
   <restriction base="xsd:string">
      <enumeration value="canvas"/>
      <enumeration value="orgchart"/>
      <enumeration value="radial"/>
      <enumeration value="cycle"/>
      <enumeration value="stacked"/>
      <enumeration value="venn"/>
      <enumeration value="bullseye"/>
   </restriction>
</simpleType>
```

6.1.3.3 ST_Ext (VML Extension Handling Behaviors)

This simple type specifies VML extension handling behaviors.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
backwardCompatible (Renderable)	Specifies that the VML entity may be rendered by ignoring the extension information. If edited, the extension information must be discarded.
edit (Editable)	Specifies that the VML entity may be safely rendered and edited without invalidating the extension information.
view (Not renderable)	Specifies that the VML entity is not be renderable without understanding the extension information. If the extension information cannot be understood, the downlevel image should be used to render the object.

Referenced By
bottom@ext (§6.2.2.1); callout@ext (§6.2.2.2); colormenu@ext (§6.2.2.4); colormru@ext (§6.2.2.5); column@ext (§6.2.2.6); complex@ext (§6.2.2.7); diagram@ext (§6.2.2.8); extrusion@ext (§6.2.2.10); fill@ext (§6.2.2.12); idmap@ext (§6.2.2.13); left@ext (§6.2.2.15); lock@ext (§6.2.2.17); regrouptable@ext (§6.2.2.22); rel@ext (§6.2.2.23); relationtable@ext (§6.2.2.24); right@ext (§6.2.2.25); rules@ext (§6.2.2.26); shapedefaults@ext (§6.2.2.27); shapelayout@ext (§6.2.2.28); signatureline@ext (§6.2.2.29); skew@ext (§6.2.2.30); top@ext (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Ext">
   <restriction base="xsd:string">
      <enumeration value="view"/>
      <enumeration value="edit"/>
      <enumeration value="backwardCompatible"/>
   </restriction>
</simpleType>
```

6.1.3.4 ST_FillMethod (Gradient Fill Computation Type)

This simple type specifies ways in which a gradient fill is computed.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
any (Application Default Fill)	Default blend 
linear (Linear Fill)	Linear blend 
linear sigma (Linear Sigma Fill)	Linear sigma blend none (No Gradient Fill)	No blend 
sigma (Sigma Fill)	Sigma blend 
Referenced By
fill@method (§6.1.2.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FillMethod">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="linear"/>
      <enumeration value="sigma"/>
      <enumeration value="any"/>
      <enumeration value="linear sigma"/>
   </restriction>
</simpleType>
```

6.1.3.5 ST_FillType (Shape Fill Type)

This simple type specifies the types for fills applied to a shape.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
frame (Stretch Image to Fit)	The image is stretched to fill the shape. 
gradient (Linear Gradient)	The fill colors blend together in a linear gradient from bottom to top. 
gradientRadial (Radial Gradient)	The fill colors blend together in a radial gradient. 
pattern (Image Pattern)	The image is used to create a pattern using the fill colors. 
solid (Solid Fill)	The fill pattern is a solid color. 
tile (Tiled Image)	The fill image is tiled. 

Referenced By
bottom@filltype (§6.2.2.1); column@filltype (§6.2.2.6); fill@type (§6.1.2.5); left@filltype (§6.2.2.15); right@filltype (§6.2.2.25); stroke@filltype (§6.1.2.21); top@filltype (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FillType">
   <restriction base="xsd:string">
      <enumeration value="solid"/>
      <enumeration value="gradient"/>
      <enumeration value="gradientRadial"/>
      <enumeration value="tile"/>
      <enumeration value="pattern"/>
      <enumeration value="frame"/>
   </restriction>
</simpleType>
```

6.1.3.6 ST_ImageAspect (Image Scaling Behavior)

This simple type specifies the scaling behaviors for an image applied to a stroke.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
atLeast (At Least)	Image is at least as big as imagesize. 
atMost (At Most)	Image is no bigger than imagesize. 
ignore (Ignore Aspect Ratio)	Ignore aspect issues. 

Referenced By
bottom@imageaspect (§6.2.2.1); column@imageaspect (§6.2.2.6); fill@aspect (§6.1.2.5); left@imageaspect (§6.2.2.15); right@imageaspect (§6.2.2.25); stroke@imageaspect (§6.1.2.21); top@imageaspect (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ImageAspect">
   <restriction base="xsd:string">
      <enumeration value="ignore"/>
      <enumeration value="atMost"/>
      <enumeration value="atLeast"/>
   </restriction>
</simpleType>
```

6.1.3.7 ST_ShadowType (Shadow Type)

This simple type specifies the types of shadows applied to a shape.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
double (Double Shadow)	Double shadow. color2 and offset2 are used for the second shadow's color and offset.
emboss (Embossed Shadow)	The shadow has an embossed look. Similar to double.
perspective (Perspective Shadow)	Perspective shadow.
single (Single Shadow)	Single shadow.

Referenced By
shadow@type (§6.1.2.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ShadowType">
   <restriction base="xsd:string">
      <enumeration value="single"/>
      <enumeration value="double"/>
      <enumeration value="emboss"/>
      <enumeration value="perspective"/>
   </restriction>
</simpleType>
```

6.1.3.8 ST_StrokeArrowLength (Stroke Arrowhead Length)

This simple type specifies the lengths of a stroke arrowhead.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
long (Long Arrowhead)	Long length 
medium (Medium Arrowhead)	Medium length 
short (Short Arrowhead)	Short length 

Referenced By
bottom@endarrowlength (§6.2.2.1); bottom@startarrowlength (§6.2.2.1); column@endarrowlength (§6.2.2.6); column@startarrowlength (§6.2.2.6); left@endarrowlength (§6.2.2.15); left@startarrowlength (§6.2.2.15); right@endarrowlength (§6.2.2.25); right@startarrowlength (§6.2.2.25); stroke@endarrowlength (§6.1.2.21); stroke@startarrowlength (§6.1.2.21); top@endarrowlength (§6.2.2.31); top@startarrowlength (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StrokeArrowLength">
   <restriction base="xsd:string">
      <enumeration value="short"/>
      <enumeration value="medium"/>
      <enumeration value="long"/>
   </restriction>
</simpleType>
```

6.1.3.9 ST_StrokeArrowType (Stroke Arrowhead Type)

This simple type specifies the types of arrowhead for a stroke.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
block (Block Arrowhead)	Block arrowhead 
classic (Classic Arrowhead)	Classic curved arrowhead 
diamond (Diamond Arrowhead)	Diamond arrowhead 
none (No Arrowhead)	No arrowhead 
open (Open Arrowhead)	Open arrowhead 
oval (Oval Arrowhead)	Round arrowhead

Enumeration Value	Description
	

Referenced By
bottom@endarrow (§6.2.2.1); bottom@startarrow (§6.2.2.1); column@endarrow (§6.2.2.6); column@startarrow (§6.2.2.6); left@endarrow (§6.2.2.15); left@startarrow (§6.2.2.15); right@endarrow (§6.2.2.25); right@startarrow (§6.2.2.25); stroke@endarrow (§6.1.2.21); stroke@startarrow (§6.1.2.21); top@endarrow (§6.2.2.31); top@startarrow (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StrokeArrowType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="block"/>
      <enumeration value="classic"/>
      <enumeration value="oval"/>
      <enumeration value="diamond"/>
      <enumeration value="open"/>
   </restriction>
</simpleType>
```

6.1.3.10 ST_StrokeArrowWidth (Stroke Arrowhead Width)

This simple type specifies the widths of a stroke arrowhead.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
medium (Medium Arrowhead)	Medium width 
narrow (Narrow Arrowhead)	Narrow width 
wide (Wide Arrowhead)	Wide width 

Referenced By
bottom@endarrowwidth (§6.2.2.1); bottom@startarrowwidth (§6.2.2.1); column@endarrowwidth (§6.2.2.6); column@startarrowwidth (§6.2.2.6); left@endarrowwidth (§6.2.2.15); left@startarrowwidth (§6.2.2.15); right@endarrowwidth (§6.2.2.25); right@startarrowwidth (§6.2.2.25); stroke@endarrowwidth (§6.1.2.21); stroke@startarrowwidth (§6.1.2.21); top@endarrowwidth (§6.2.2.31); top@startarrowwidth (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StrokeArrowWidth">
   <restriction base="xsd:string">
      <enumeration value="narrow"/>
      <enumeration value="medium"/>
      <enumeration value="wide"/>
   </restriction>
</simpleType>
```

6.1.3.11 ST_StrokeEndCap (Stroke End Cap Type)

This simple type specifies the styles for the end of a stroke.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
flat (Flat End)	Flat end 
round (Round End)	Round end 
square (Square End)	Square end 

Referenced By
bottom@endcap (§6.2.2.1); column@endcap (§6.2.2.6); left@endcap (§6.2.2.15); right@endcap (§6.2.2.25); stroke@endcap (§6.1.2.21); top@endcap (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StrokeEndCap">
   <restriction base="xsd:string">
      <enumeration value="flat"/>
      <enumeration value="square"/>
      <enumeration value="round"/>
   </restriction>
</simpleType>
```

6.1.3.12 ST_StrokeJoinStyle (Line Join Type)

This simple type specifies the join styles for a polyline (§6.1.2.15).

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bevel (Bevel Joint)	Bevel joint 
miter (Miter Joint)	Miter joint 
round (Round Joint)	Round joint 

Referenced By
bottom@joinstyle (§6.2.2.1); column@joinstyle (§6.2.2.6); left@joinstyle (§6.2.2.15); right@joinstyle (§6.2.2.25); stroke@joinstyle (§6.1.2.21); top@joinstyle (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StrokeJoinStyle">
   <restriction base="xsd:string">
      <enumeration value="round"/>
      <enumeration value="bevel"/>
      <enumeration value="miter"/>
   </restriction>
</simpleType>
```

6.1.3.13 ST_StrokeLineStyle (Stroke Line Style)

This simple type specifies the line styles for a stroke.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
single (Single Line)	Single line 
thickBetweenThin (Thck Line Between Thin Lines)	Thick line between thin lines 
thickThin (Thick Line Outside Thin Line)	Thick line outside thin line 
thinThick (Thin Line Outside Thick Line)	Thin line outside thick line 
thinThin (Two Thin Lines)	Two thin lines 

Referenced By
bottom@linestyle (§6.2.2.1); column@linestyle (§6.2.2.6); left@linestyle (§6.2.2.15); right@linestyle (§6.2.2.25); stroke@linestyle (§6.1.2.21); top@linestyle (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StrokeLineStyle">
   <restriction base="xsd:string">
      <enumeration value="single"/>
      <enumeration value="thinThin"/>
      <enumeration value="thinThick"/>
      <enumeration value="thickThin"/>
      <enumeration value="thickBetweenThin"/>
   </restriction>
</simpleType>
```

6.1.3.14 ST_TrueFalse (Boolean Value)

This type specifies logical true and false.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
f (False)	Logical false.

Enumeration Value	Description
false (False)	Logical false.
t (True)	Logical true.
true (True)	Logical true.

Referenced By
arc@filled (§6.1.2.1); arc@insetpen (§6.1.2.1); arc@print (§6.1.2.1); arc@stroked (§6.1.2.1); background@filled (§6.1.2.2); curve@filled (§6.1.2.3); curve@insetpen (§6.1.2.3); curve@print (§6.1.2.3); curve@stroked (§6.1.2.3); fill@alignshape (§6.1.2.5); fill@on (§6.1.2.5); fill@recolor (§6.1.2.5); fill@rotate (§6.1.2.5); group@filled (§6.1.2.7); group@print (§6.1.2.7); h@invx (§6.1.2.8); h@invy (§6.1.2.8); image@bilevel (§6.1.2.10); image@filled (§6.1.2.10); image@grayscale (§6.1.2.10); image@insetpen (§6.1.2.10); image@print (§6.1.2.10); image@stroked (§6.1.2.10); imagedata@bilevel (§6.1.2.11); imagedata@grayscale (§6.1.2.11); line@filled (§6.1.2.12); line@insetpen (§6.1.2.12); line@print (§6.1.2.12); line@stroked (§6.1.2.12); oval@filled (§6.1.2.13); oval@insetpen (§6.1.2.13); oval@print (§6.1.2.13); oval@stroked (§6.1.2.13); path@arrowok (§6.1.2.14); path@fillok (§6.1.2.14); path@gradientshapeok (§6.1.2.14); path@insetpenok (§6.1.2.14); path@shadowok (§6.1.2.14); path@strokeok (§6.1.2.14); path@textpathok (§6.1.2.14); polyline@filled (§6.1.2.15); polyline@insetpen (§6.1.2.15); polyline@print (§6.1.2.15); polyline@stroked (§6.1.2.15); rect@filled (§6.1.2.16); rect@insetpen (§6.1.2.16); rect@print (§6.1.2.16); rect@stroked (§6.1.2.16); roundrect@filled (§6.1.2.17); roundrect@insetpen (§6.1.2.17); roundrect@print (§6.1.2.17); roundrect@stroked (§6.1.2.17); shadow@obscured (§6.1.2.18); shadow@on (§6.1.2.18); shape@filled (§6.1.2.19); shape@insetpen (§6.1.2.19); shape@print (§6.1.2.19); shape@stroked (§6.1.2.19); shapetype@filled (§6.1.2.20); shapetype@insetpen (§6.1.2.20); shapetype@print (§6.1.2.20); shapetype@stroked (§6.1.2.20); stroke@imagealignshape (§6.1.2.21); stroke@insetpen (§6.1.2.21); stroke@on (§6.1.2.21); textpath@fitpath (§6.1.2.23); textpath@fitshape (§6.1.2.23); textpath@on (§6.1.2.23); textpath@trim (§6.1.2.23); textpath@xscale (§6.1.2.23)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TrueFalse">
   <restriction base="xsd:string">
      <enumeration value="t"/>
      <enumeration value="f"/>
      <enumeration value="true"/>
      <enumeration value="false"/>
   </restriction>
</simpleType>
```

6.1.3.15 ST_TrueFalseBlank (Boolean Value with Blank [False] State)

This simple type specifies a boolean value with a third state, using a blank attribute, which specifies that the value be `false`.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
(Blank – Logical False)	Logical false.
f (Logical False)	Logical false.
false (Logical False)	Logical false.
t (Logical True)	Logical true.
true (Logical True)	Logical true.

Referenced By
h@switch (§6.1.2.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TrueFalseBlank">
   <restriction base="xsd:string">
      <enumeration value="t"/>
      <enumeration value="f"/>
      <enumeration value="true"/>
      <enumeration value="false"/>
      <enumeration value=""/>
   </restriction>
</simpleType>
```

6.2 VML - Office Drawing

It is possible to include graphical VML objects in Office Open XML documents. The elements describing the core graphical objects are defined in the VML namespace. Additional elements that describe certain advanced shape effects, metadata and relationships are defined in this namespace.

[*Note*: The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a deprecated format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML .*end note*]

[*Example:* Assume the following shape exists in a document:

The basic speech bubble shape is defined using VML. The 3-D effect is defined using the extrusion element in this namespace. The specularity attribute defines the subtle sharp reflection on the edge of the shape. The

color attribute sets the extrusion to a different color than the face of the shape. The rotationangle attribute sets the shape's rotation about the X- and Y-axes. The lightposition and lightposition2 attributes set the positions of the light sources that illuminate the shape.

```
<o:extrusion v:ext="view" specularity="80000f" color="#c4bc96 [2414]" on="t"
rotationangle="-5,15" lightposition="0,-50000" lightposition2="0,50000"
type="perspective"/>
```

This element is a child of the primary shape definition:

```
<v:shape id="_x0000_s1030" type="#_x0000_t62"
  style="position:absolute;left:0;text-align:left;margin-left:35.25pt;
  margin-top:60pt;width:69pt;height:57pt;z-index:251658240" adj="1675,27171"
  fillcolor="#ddd8c2 [2894]">
  <o:extrusion ... />
</v:shape>
```

end example]

Note that, throughout VML, numeric values that are allowed to take units may be specified in: cm (centimeters), mm (millimeters), in (inches), pt (points), pc (picas), px (pixels).

6.2.1 Table of Contents

This subclause is informative.

End of informative text.

6.2.2 Elements

The following elements comprise the contents of the urn:schemas-microsoft-com:office:office namespace:

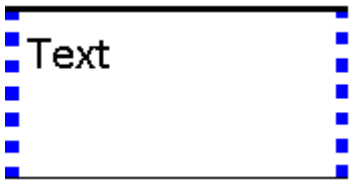
[*Note*: As the VML format is a format provided for backward compatibility, those VML elements defined in the same urn:schemas-microsoft-com:office:office namespace will remain in that namespace is it is already used by millions of documents already using VML. *end note*]

6.2.2.1 bottom (Text Box Bottom Stroke)

This element specifies the stroke properties for the bottom border of a text box. It entirely supercedes its parent stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a value specified in the parent. If the on attribute is `false` or not specified, the border is not shown.

[*Example:* The text box borders are set independently. Note that the bottom border does not inherit the weight from the parent stroke element.

```
<v:stroke weight="2.25pt">
  <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
  <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:bottom v:ext="view" color="black" on="t"/>
  <o:column v:ext="view" color="#f60" on="t"/>
</v:stroke>
```



end example]

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); stroke (§6.1.2.21)

Attributes	Description
althref (Alternate Image Reference)	Specifies an alternate reference for an image in Macintosh PICT format. [*Example:* `<v:stroke ... althref="myimage.pcz" ... ></v:stroke>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
color (Stroke Color)	Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is `black`. See the fillcolor attribute for a list of supported named colors. [*Example:* The shape stroke is blue:

Attributes	Description
	<v:shape ... strokecolor="red" ... > <v:stroke color="blue"/> </v:shape> *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
color2 (Stroke Alternate Pattern Color)	Specifies a second color for strokes, used when filltype is `pattern`. Default is no value. When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image. [*Example:* This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape. <v:background fillcolor="yellow"/> <v:shape style="width:60;height:50" strokecolor="red" fillcolor="lime" path="m 0,0 l 0,1000 1000,1000 1000,0 x e"> <v:stroke filltype="pattern" weight="10pt" src="myimage.gif" color2="blue"/> </v:shape>  , where myimage.gif is:  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
dashstyle (Stroke Dash Pattern)	Specifies the dot and dash pattern for a stroke. Default is `solid`. Pre-defined values are: • `solid` • `shortdash` • `shortdot` • `shortdashdot` • `shortdashdotdot` • `dot`

Attributes	Description

	• dash
	• longdash
	• dashdot
	• longdashdot
	• longdashdotdot
	
	A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).
	
	[*Example:*
	
	`<v:stroke dashstyle="0 2" weight="3pt" endcap="round"></v:stroke>`
	
	 
	
	`<v:stroke dashstyle="longdashdotdot" weight="2pt"></v:stroke>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

endarrow (Line End Arrowhead)	Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open [*Example:*

Attributes	Description
	<v:stroke endarrow="classic"/>  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
endarrowlength (Line End Arrowhead Length)	Specifies the length of the arrowhead at the end of a line. Default is `medium`. Allowed values are: • `short` • `medium` • `long` [*Example:* <v:stroke ... endarrowlength="long" ... />  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
endarrowwidth (Line End Arrowhead Width)	Specifies the width of the arrowhead at the end of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* <v:stroke ... endarrowwidth="wide" ... /> 
Attributes	Description
	end example] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).

endcap (Line End Cap)	Specifies the cap style for the end of a stroke. Default is `flat`. Allowed values are:
	
	• `flat`
	• `square`
	• `round`
	
	[*Example:*
	
	`<v:stroke ... endcap="round" weight="10pt" ... />`
	
	 
	`endcap="flat"`
	`endcap="square"`
	`endcap="round"`
	
	end example]
	
	The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).

ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
filltype (Stroke Image Style)	Specifies the type of fill used for the background of a stroke. Default is `solid`. Allowed values are: • `solid` - The fill pattern is solid. • `tile` - The fill image is tiled. • `pattern` - The fill image is stretched to form a pattern. • `frame` - The fill image becomes a border for the shape.

Attributes	Description

	[*Example:*
	
	`<v:shape style="width:50;height:50"`
	`  strokecolor="red"`
	`  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`  <v:stroke filltype="frame" weight="10pt"`
	`  src="border.gif"/>`
	`</v:shape>`
	
	  , where border.gif is: 
	
	end example]
	
	The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).

forcedash (Force Dashed Outline)	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`.
	
	Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.
	
	[*Example:*
	
	`<v:shape ... o:forcedash="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

href (Original Image Reference)	Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.
	
	[*Example:*
	
	`<v:fill ... o:href="myimage.gif" ... >`
	`</v:fill>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

imagealignshape	Specifies the alignment of the stroke image. If `true`, the image is aligned with the shape.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>(Stoke Image Alignment)</td><td>Otherwise, it is aligned with the containing scope. Default is <code>true</code>.

[Example: The top position offset shifts the image alignment relative to the containing window:

<pre><v:shape fillcolor="silver"
  style="top:20;width:50;height:50"
  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">
  <v:stroke imagealignshape="false" weight="20pt"
    filltype="tile" src="myimage.gif"/>
</v:shape></pre>
  imagealignshape="false"

  imagealignshape="false"

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</td></tr>
<tr><td>imageaspect (Stroke Image Aspect Ratio)</td><td>Specifies how the stroke image aspect ratio is preserved. Default is <code>ignore</code>. Allowed values are:

<table>
<tr><td>Value</td><td>Description</td></tr>
<tr><td><code>ignore</code></td><td>Ignore aspect issues.</td></tr>
<tr><td><code>atleast</code></td><td>Image is at least as big as imagesize.</td></tr>
<tr><td><code>atmost</code></td><td>Image is no bigger than imagesize.</td></tr>
</table>

[Example:

<pre><v:stroke filltype="frame" weight="10pt"
  src="border.gif" imagealignshape="true"
  imageaspect="atleast">
</v:stroke></pre>
  imagealignshape="ignore"</td></tr>
</table>

Attributes	Description
	 imagealignshape="atleast" imagealignshape="atmost" *end example*] The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).
imagesize (Stroke Image Size)	Specifies the size of the image for the stroke. Default is the size of the image. [*Example:* `<v:stroke ... imagesize="10pt,10pt" ... />` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* `<v:shape ... insetpen="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
joinstyle (Line End Join Style))	Specifies the join style for line ends. Default is round. • round • bevel • miter [*Example:* `<v:polyline strokeweight="10pt" strokecolor="navy" points="10pt,10pt,50pt,50pt,90pt,10pt"><v:stroke joinstyle="bevel"/>`

Attributes	Description
	</v:polyline>  joinstyle="round" joinstyle="bevel" joinstyle="miter" *end example*] The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).
linestyle (Stroke Line Style)	Specifies the line style of the stroke. Default is single. • single • thinThin • thinThick • thickThin • thickBetweenThin [*Example:* <v:stroke linestyle="thickThin" weight="5pt"> </v:stroke>  *end example*] The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).
miterlimit (Miter Joint Limit)	Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8. [*Example:* <v:stroke joinstyle="miter" weight="10pt"

Attributes	Description
	<pre> miterlimit="2">
</v:stroke></pre>  *end example*] The possible values for this attribute are defined by the XML Schema decimal datatype.

on (Stroke Toggle)	Specifies whether the stroke is displayed. Default is `true`. This attribute overrides the shape's stroke attribute.
	
	[*Example:*
	
	<pre><v:rect style="width:50;height:50" stroked="true"
	  fillcolor="lime" strokecolor="red">
	  <v:stroke on="false" weight="5pt"/>
	</v:rect></pre> 	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

opacity (Stroke Opacity)	Specifies the amount of transparency of a stroke. Default is 1.0.
	
	[*Example:*
	
	<pre><v:rect style="width:50;height:50"
	  fillcolor="lime" strokecolor="red">
	  <v:stroke weight="5pt" opacity="50%"/>
	</v:rect></pre> 	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

src (Stroke Image Location)	Specifies the source image to load for a stroke fill. Default is no value.

Attributes	Description
	[*Example:* `<v:stroke ... src="myimage.gif" ... ></v:stroke>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
startarrow (Line Start Arrowhead)	Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open [*Example:* `<v:stroke startarrow="classic"/>`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
startarrowlength (Line Start Arrowhead Length)	Specifies the length of the arrowhead at the start of a line. Default is medium. Allowed values are: • short • medium • long [*Example:* `<v:stroke ... startarrowlength="long" ... />`  *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
startarrowwidth (Line Start Arrowhead Width)	Specifies the width of the arrowhead at the start of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* `<v:stroke ... startarrowwidth="wide" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
title (Stroke Title)	Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank. [*Example:* `<v:fill ... o:title="alt text" ... ></v:fill>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
weight (Stroke Weight)	Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrokeChild">
    <attributeGroup ref="v:AG_Ext"/>
    <attribute name="on" type="ST_TrueFalse" use="optional"/>
    <attribute name="weight" type="xsd:string" use="optional"/>

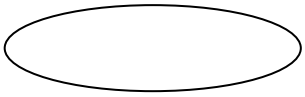
```

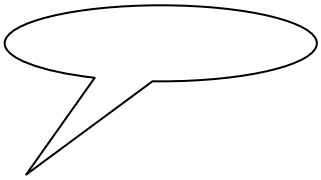
6.2.2.2 callout (Callout)

This element specifies the automatic behavior and layout parameters of callout shapes. Callout shapes are standard VML shapes that behave as callouts, providing an additional callout object which can be used to point at another location:

[*Example*: Consider the following VML shape:



If this shape is made a callout shape by adding the callout element to its shape definition, then the shape will have a callout object, for example:



end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
accentbar (Callout accent bar toggle)	Specifies whether an accent bar will be used with the callout. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
angle (Callout angle)	Specifies the angle that the callout makes with respect to the bounding box of the shape. Default is no value. The possible values for this attribute are defined by the ST_Angle simple type (§6.2.3.1).
distance (Callout drop distance)	Specifies the drop distance of a callout. The drop distance of a callout is measured from the edge of the shape where the pointer line starts and continues the absolute length of the distance value. If specified with no units, EMUs are assumed. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
drop (Callout drop position)	Specifies where the drop of a callout will be placed. The possible values for this attribute are defined by the ST_CalloutDrop simple type (§6.2.3.3).
dropauto (Callout automatic drop toggle)	Specifies whether the callout has an automatic drop. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
gap (Callout gap)	Specifies the distance of the callout line from the bounding rectangle of the callout. Default value is one-twelfth of an inch, in EMUs (76200). The possible values for this attribute are defined by the XML Schema string datatype.
length (Callout	Specifies the length of the first part of a multi-segmented callout line. If specified with no

Attributes	Description
length)	units, EMUs are assumed. Default is 0. The possible values for this attribute are defined by the XML Schema string datatype.
lengthspecified (Callout length toggle)	Specifies whether the length attribute will be used for the callout. Default is `false`. If `true`, the length attribute is used. If `false`, a best fit is used. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
minusx (Callout flip x)	Specifies whether the callout flips to the other side of the drop tip along the x-axis when moved or resized. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
minusy (Callout flip y)	Specifies whether the callout flips to the other side of the drop tip along the y-axis when moved or resized. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
on (Callout toggle)	Specifies whether a shape is a callout. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
textborder (Callout text border toggle)	Specifies whether a callout has a text border. Default is `true`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
type (Callout type)	Specifies the type of callout. Default is `rectangle`. Allowed values are: • `rectangle` • `roundedrectangle` • `oval` • `cloud` The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Callout">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="on" type="ST_TrueFalse" use="optional"/>
   <attribute name="type" type="xsd:string" use="optional"/>
   <attribute name="gap" type="xsd:string" use="optional"/>
   <attribute name="angle" type="ST_Angle" use="optional"/>
   <attribute name="dropauto" type="ST_TrueFalse" use="optional"/>
   <attribute name="drop" type="ST_CalloutDrop" use="optional"/>
   <attribute name="distance" type="xsd:string" use="optional"/>
   <attribute name="lengthspecified" type="ST_TrueFalse" default="f" use="optional"/>
   <attribute name="length" type="xsd:string" use="optional"/>
   <attribute name="accentbar" type="ST_TrueFalse" use="optional"/>
   <attribute name="textborder" type="ST_TrueFalse" use="optional"/>
   <attribute name="minusx" type="ST_TrueFalse" use="optional"/>
   <attribute name="minusy" type="ST_TrueFalse" use="optional"/>
</complexType>
```

6.2.2.3 clippath (Shape Clipping Path)

This element specifies the path of the clipping polygon for the shape.

[*Example:*

```
<v:rect ... wrapcoords="-207 -433 -207 21925 21807 21925 21807 -433 -207 -433"
o:clip="t" o:cliptowrap="t">
  <o:clippath o:v="m-207,-433r,22358l21807,21925r,-22358l-207,-433xe"/>
</v:rect>
```

end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
v (Path Definition)	Specifies a string containing the commands that define the shape's path. This value consists of commands followed by zero or more parameters. Default is no value. The following rules apply to path strings: • Commas or spaces delimit parameters for each command. Both "m 0,0" and "m0 0" are acceptable. • A parameter that is omitted using commas is treated as having a value of zero. Thus, "c 10,10,0,0,25,13" and "c 10,10,,,25,13" are equivalent. • Parameterized paths are also allowed. In this case, the shape must also have a

Attributes	Description

formulas element (§6.1.2.6) with a list of formulas that are substituted into the path using the @ symbol followed by the number of the formula. The adj property of the shape contains the input parameters for these formulas. For example, "moveto @1@4". The evaluations of the formulas are substituted into the appropriate positions. Note that @ also serves as a delimiter.

The allowed commands are given below. An asterisk (*) indicates that the command is allowed to be repeated. For the qb command, the controlpoint parameter is also allowed to be repeated.

Command	Name	Parameters	Description
m	moveto	2	Start a new sub-path at the given (x,y) coordinate.
l	lineto	2*	Draw a line from the current point to the given (x,y) coordinate which becomes the new current point. Specifying a number of coordinate pairs forms a polyline.
c	curveto	6*	Draw a cubic bézier curve from the current point to the coordinate given by the final two parameters. The control points are given by the first four parameters.
x	close	0	Close the current sub-path by drawing a straight line from the current point to the original moveto point.
e	end	0	End the current set of sub-paths. A given set of sub-paths (as delimited by end) is filled. Subsequent sets of sub-paths are filled independently and superimposed on existing ones.
t	rmoveto	2*	Start a new sub-path at a coordinate relative to the current point, cp (cpx+x, cpy+y).
r	rlineto	2*	Draw a line from the current point to the given relative coordinate (cpx+x, cpy+y).
v	rcurveto	6*	Cubic bézier curve using the given coordinate relative to the current point.
nf	nofill	0	The current set of sub-paths (delimited by e) will not be filled.

Attributes	Description			
	ns	nostroke	0	The current set of sub-paths (delimited by e) will not be stroked.
	ae	angleellipseto	6*	Draws a segment of an ellipse as described using these parameters. A straight line is drawn from the current point to the start point of the segment. The parameters are: center (x,y), size(w,h), start angle, end angle.
	al	angleellipse	6*	Same as angleellipseto except that there is an implied moveto the starting point of the segment.
	at	arcto	8*	A segment of the ellipse is drawn which starts at the angle defined by the start radius vector and ends at the angle defined by the end vector. A straight line is drawn from the current point to the start of the arc. The arc is always drawn in a counterclockwise direction. The parameters are: left, top, right, bottom, start(x,y), end(x,y). The first four values define the bounding box of an ellipse. The last four define two radial vectors.
	ar	arc	8*	Same as arcto except there is an implied moveto the start point of the arc.
	wa	clockwisearcto	8*	Same as arcto but the arc is drawn in a clockwise direction.
	wr	clockwisearc	8*	Same as arc but the arc is drawn in a clockwise direction
	qx	ellipticalqaudrantx	2*	A quarter ellipse is drawn from the current point to the given end point. The elliptical segment is initially tangential to a line parallel to the x-axis. (i.e. the segment starts out horizontal). The parameters are: end(x,y).
	qy	ellipticalquadranty	2*	Same as ellipticalquadrantx except that the elliptical segment is initially tangential to a line parallel to the y-axis (i.e. the segment starts out vertical).

Attributes	Description
	qb | quadraticbezier | 2+2* | Defines one or more quadratic bézier curves by means of control points and an end point. Intermediate (on-curve) points are obtained by interpolation between successive control points as in the OpenType font specification. The sub-path need not be started in which case the sub-path will be closed. In this case the last point of the sub-path defines the start point of the quadratic bézier. The parameters are: controlpoint(x,y)*, end(x,y). The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ClipPath">
   <attribute name="v" type="xsd:string" use="required" form="qualified"/>
</complexType>
```

6.2.2.4 colormenu (UI Default Colors)

This element determines the default colors for different types of colors that can be applied to VML shapes. [*Rationale:* An application may choose to retain default colors or the last color choices a user made and present those in parts of its user interface. *end rationale*]

[*Example:*

```
<o:shapedefaults ... >
  <o:colormenu v:ext="edit" fillcolor="none" extrusioncolor="#36f"/>
</o:shapedefaults>
```

end example]

Parent Elements
shapedefaults (§6.2.2.27)

Attributes	Description
ext (VML Extension Handling Behavior) Namespace: urn:schemas-	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end*

Attributes	Description
microsoft-com:vml	*rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
extrusioncolor (Default extrusion color)	The default color associated with the 3D extrusion of a VML shape. Default is "#000000". The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
fillcolor (Default fill color)	The default color associated with the fill of a VML shape. Default is "#0000FF". The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
shadowcolor (Default shadow color)	The default color associated with the shadow of a VML shape. Default is "#80800C". The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
strokecolor (Default stroke color)	The default color associated with the stroke of a VML shape. Default is "#FFFF00". The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMenu">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="strokecolor" type="ST_ColorType"/>
   <attribute name="fillcolor" type="ST_ColorType"/>
   <attribute name="shadowcolor" type="ST_ColorType"/>
   <attribute name="extrusioncolor" type="ST_ColorType"/>
</complexType>
```

6.2.2.5 colormru (Most Recently Used Colors)

This element defines a list of up to eight colors which represent the colors most recently used by the user. [*Rationale:* An application may choose to retain the last color choices a user made, regardless of where on VML shapes they are used, and present those in parts of its user interface. *end rationale*]

[*Example:*

```
<o:shapedefaults ... >
  <o:colormru v:ext="edit" colors="#a01aae,#456b69,#06f,#a1ae24,#d57811"/>
</o:shapedefaults>
```

end example]

Parent Elements
shapedefaults (§6.2.2.27)

Attributes	Description
colors (Recent colors)	A comma-separated list of up to eight most recently used colors. Default is no value. Colors should be defined using hexadecimal notation - see the ST_ColorType simple type (§6.2.3.5) for a full description. [*Example:* `<o:colormru v:ext="edit" colors="#a01aae,#456b69,#06f,#a1ae24,#d57811"/>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

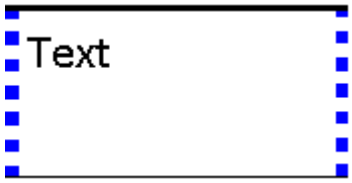
```
<complexType name="CT_ColorMru">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="colors" type="xsd:string"/>
</complexType>
```

6.2.2.6 column (Text Box Interior Stroke)

This element specifies the stroke properties for the interior border of a text box. It entirely supercedes its parent stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a value specified in the parent. If the on attribute is `false` or not specified, the border is not shown. [*Note:* This element is ignored if an implementation does not support multi-column text boxes. *end note*]

[*Example:* The text box borders are set independently. Note that the bottom border does not inherit the weight from the parent stroke element.

```
<v:stroke weight="2.25pt">
  <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
  <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:bottom v:ext="view" color="black" on="t"/>
  <o:column v:ext="view" color="#f60" on="t"/>
</v:stroke>
```



end example]

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); stroke (§6.1.2.21)

Attributes	Description
althref (Alternate Image Reference)	Specifies an alternate reference for an image in Macintosh PICT format. [*Example:* `<v:stroke ... althref="myimage.pcz" ... ></v:stroke>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
color (Stroke Color)	Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is `black`. See the fillcolor attribute for a list of supported named colors. [*Example:* The shape stroke is blue: `<v:shape ... strokecolor="red" ... ><v:stroke color="blue"/></v:shape>` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
color2 (Stroke Alternate Pattern Color)	Specifies a second color for strokes, used when filltype is `pattern`. Default is no value. When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image. [*Example:* This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight

Attributes	Description

	shows more of the image. The green shape fill shows how the stroke is overlaid on the shape.
	
	`<v:background fillcolor="yellow"/>`
	`<v:shape style="width:60;height:50"`
	`  strokecolor="red" fillcolor="lime"`
	`  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`  <v:stroke filltype="pattern" weight="10pt"`
	`  src="myimage.gif" color2="blue"/>`
	`</v:shape>`
	
	  , where myimage.gif is: 
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).

dashstyle (Stroke Dash Pattern)	Specifies the dot and dash pattern for a stroke. Default is `solid`. Pre-defined values are: • `solid` • `shortdash` • `shortdot` • `shortdashdot` • `shortdashdotdot` • `dot` • `dash` • `longdash` • `dashdot` • `longdashdot` • `longdashdotdot` A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle). [*Example:* `<v:stroke dashstyle="0 2" weight="3pt"`

Attributes	Description
	endcap="round"> </v:stroke>  <v:stroke dashstyle="longdashdotdot" weight="2pt"> </v:stroke>  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
endarrow (Line End Arrowhead)	Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open [*Example:* <v:stroke endarrow="classic"/>  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
endarrowlength (Line End Arrowhead Length)	Specifies the length of the arrowhead at the end of a line. Default is medium. Allowed values are: • short • medium • long

Attributes	Description
	[*Example:* `<v:stroke ... endarrowlength="long" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
endarrowwidth (Line End Arrowhead Width)	Specifies the width of the arrowhead at the end of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* `<v:stroke ... endarrowwidth="wide" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
endcap (Line End Cap)	Specifies the cap style for the end of a stroke. Default is `flat`. Allowed values are: • `flat` • `square` • `round` [*Example:* `<v:stroke ... endcap="round" weight="10pt" ... />`  `endcap="flat"`

Attributes	Description
	 endcap="square" endcap="round" *end example*] The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

filltype (Stroke Image Style)	Specifies the type of fill used for the background of a stroke. Default is `solid`. Allowed values are:
	
	• `solid` - The fill pattern is solid.
	• `tile` - The fill image is tiled.
	• `pattern` - The fill image is stretched to form a pattern.
	• `frame` - The fill image becomes a border for the shape.
	
	[*Example:*
	
	`<v:shape style="width:50;height:50"`
	`  strokecolor="red"`
	`  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`  <v:stroke filltype="frame" weight="10pt"`
	`  src="border.gif"/>`
	`</v:shape>`
	
	  , where border.gif is: 	
	end example]
	
	The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).

Attributes	Description
forcedash (Force Dashed Outline)	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`. Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape. [*Example:* `<v:shape ... o:forcedash="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
href (Original Image Reference)	Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value. [*Example:* `<v:fill ... o:href="myimage.gif" ... ></v:fill>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
imagealignshape (Stoke Image Alignment)	Specifies the alignment of the stroke image. If `true`, the image is aligned with the shape. Otherwise, it is aligned with the containing scope. Default is `true`. [*Example:* The top position offset shifts the image alignment relative to the containing window: `<v:shape fillcolor="silver" style="top:20;width:50;height:50" path="m 0,0 l 0,1000 1000,1000 1000,0 x e"><v:stroke imagealignshape="false" weight="20pt" filltype="tile" src="myimage.gif"/></v:shape>`  `imagealignshape="false"`

Attributes	Description
	 imagealignshape="false" *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
imageaspect (Stroke Image Aspect Ratio)	Specifies how the stroke image aspect ratio is preserved. Default is ignore. Allowed values are: Value / Description ignore — Ignore aspect issues. atleast — Image is at least as big as imagesize. atmost — Image is no bigger than imagesize. [*Example:* `<v:stroke filltype="frame" weight="10pt" src="border.gif" imagealignshape="true" imageaspect="atleast"> </v:stroke>`  imagealignshape="ignore"  imagealignshape="atleast"  imagealignshape="atmost" *end example*] The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).
imagesize (Stroke Image Size)	Specifies the size of the image for the stroke. Default is the size of the image. [*Example:* `<v:stroke ... imagesize="10pt,10pt" ... />`

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* `<v:shape ... insetpen="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
joinstyle (Line End Join Style))	Specifies the join style for line ends. Default is round. • round • bevel • miter [*Example:* `<v:polyline strokeweight="10pt" strokecolor="navy" points="10pt,10pt,50pt,50pt,90pt,10pt"><v:stroke joinstyle="bevel"/></v:polyline>`  joinstyle="round" joinstyle="bevel" joinstyle="miter" *end example*] The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type

Attributes	Description
	(§6.1.3.12).

linestyle (Stroke Line Style)	Specifies the line style of the stroke. Default is `single`.
	
	• `single`
	• `thinThin`
	• `thinThick`
	• `thickThin`
	• `thickBetweenThin`
	
	[*Example:*
	
	`<v:stroke linestyle="thickThin" weight="5pt">`
	`</v:stroke>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).

miterlimit (Miter Joint Limit)	Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8.
	
	[*Example:*
	
	`<v:stroke joinstyle="miter" weight="10pt"`
	`miterlimit="2">`
	`</v:stroke>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema decimal datatype.

on (Stroke Toggle)	Specifies whether the stroke is displayed. Default is `true`. This attribute overrides the shape's stroke attribute.
	
	[*Example:*
	
	`<v:rect style="width:50;height:50" stroked="true"`
	`fillcolor="lime" strokecolor="red">`

Attributes	Description
	<v:stroke on="false" weight="5pt"/> </v:rect>  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
opacity (Stroke Opacity)	Specifies the amount of transparency of a stroke. Default is 1.0. [*Example:* <v:rect style="width:50;height:50" fillcolor="lime" strokecolor="red"> <v:stroke weight="5pt" opacity="50%"/> </v:rect>  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
src (Stroke Image Location)	Specifies the source image to load for a stroke fill. Default is no value. [*Example:* <v:stroke ... src="myimage.gif" ... > </v:stroke> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
startarrow (Line Start Arrowhead)	Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open

Attributes	Description
	[*Example:* `<v:stroke startarrow="classic"/>`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
startarrowlength (Line Start Arrowhead Length)	Specifies the length of the arrowhead at the start of a line. Default is `medium`. Allowed values are: • `short` • `medium` • `long` [*Example:* `<v:stroke ... startarrowlength="long" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
startarrowwidth (Line Start Arrowhead Width)	Specifies the width of the arrowhead at the start of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* `<v:stroke ... startarrowwidth="wide" ... />` 
Attributes	Description
	end example] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
title (Stroke Title)	Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank. [*Example:* `<v:fill ... o:title="alt text" ... ></v:fill>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
weight (Stroke Weight)	Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrokeChild">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="on" type="ST_TrueFalse" use="optional"/>

</complexType>
```

6.2.2.7 complex (Complex)

This element specifies that a shapetype contains fragments.

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Complex">
   <attributeGroup ref="v:AG_Ext"/>
</complexType>
```

6.2.2.8 diagram (VML Diagram)

This element specifies semantic information for a limited set of structured diagrams that have VML representations. Note that diagrams should be defined using DrawingML; this representation is included for compatibility with applications that rely on VML. The following diagram types have VML representations:

Diagram Type	Example (non-normative)
Organization chart	Radial	Cycle	Pyramid	Venn	
Bulls-eye	
Each of these types of diagrams contains shapes that are positioned relative to one another. Each shape also has optional associated text.

Parent Elements
background (§2.2.1); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79)

Child Elements	Subclause
relationtable (Diagram Relationship Table)	§6.2.2.24

Attributes	Description

autoformat (Diagram Automatic Format)	Specifies whether the diagram is formatted automatically by the application and user overrides are locked. Default is `false`.
	
	[*Example:*
	
	`<o:diagram ... autoformat="true">`
	`</o:diagram>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

autolayout (Diagram Automatic Layout)	Specifies whether the diagram elements are laid out automatically by the application and user overrides are locked. Default is `true`.
	
	[*Example:*
	
	`<o:diagram ... autolayout="false">`
	`</o:diagram>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

constrainbounds (Diagram Layout Extents)	Specifies an optional, application-specific parameter related to the diagram's extents intended to be used by the application to assist laying out the diagram.
	
	[*Example:*
	
	`<o:diagram ... constrainbounds="2910,2696,9773,9558">`
	`</o:diagram>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

dgmbasetextscale (Diagram Base Font Size)	Specifies the diagram's original font size. This is used in subsequent font size recalculations. If the most recent diagram font size is used to calculate the font size after a rescale, the font size would be wrong after non-isometric diagram rescalings.

Attributes	Description

	[*Example:*
	
	`<o:diagram ... dgmbasetextscale="12">`
	`</o:diagram>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

dgmfontsize (Diagram Font Size)	Specifies the font size for attached text when a new diagram node is added.
	
	[*Example:*
	
	`<o:diagram ... dgmfontsize="12">`
	`</o:diagram>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

dgmscalex (Diagram Layout X Scale)	Specifies an optional, application-specific parameter related to the horizontal scaling of the diagram that is intended to be used by the application to assist laying out the diagram.
	
	[*Example:*
	
	`<o:diagram ... dgmscalex="50000">`
	`</o:diagram>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

dgmscaley (Diagram Layout Y Scale)	Specifies an optional, application-specific parameter related to the vertical scaling of the diagram that is intended to be used by the application to assist laying out the diagram.
	
	[*Example:*
	
	`<o:diagram ... dgmscaley="75000">`
	`</o:diagram>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema integer datatype.

dgmstyle (Diagram Style Options)	Specifies an optional, application-specific parameter related to the styling of the diagram that is intended to be used by the application to assist in formatting the diagram. [*Example:*

Attributes	Description
	<o:diagram ... dgmstyle="1"> </o:diagram> *end example*] The possible values for this attribute are defined by the XML Schema integer datatype.
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
reverse (Diagram Reverse Direction)	Specifies whether the order of the diagram nodes is reversed. This is only relevant to diagrams that have linear ordering. [*Example:* <o:diagram ... reverse="true"> </o:diagram>  reverse="false" reverse="true" *end example* The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Diagram">
   <sequence>
      <element name="relationtable" type="CT_RelationTable" minOccurs="0"/>
   </sequence>
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="dgmstyle" type="xsd:integer" use="optional"/>
   <attribute name="autoformat" type="ST_TrueFalse" use="optional"/>
   <attribute name="reverse" type="ST_TrueFalse" use="optional"/>
   <attribute name="autolayout" type="ST_TrueFalse" use="optional"/>
   <attribute name="dgmscalex" type="xsd:integer" use="optional"/>
   <attribute name="dgmscaley" type="xsd:integer" use="optional"/>
   <attribute name="dgmfontsize" type="xsd:integer" use="optional"/>
   <attribute name="constrainbounds" type="xsd:string" use="optional"/>
   <attribute name="dgmbasetextscale" type="xsd:integer" use="optional"/>
</complexType>
```

6.2.2.9 entry (Regroup Entry)

This element specifies a single entry in a regrouptable (§6.2.2.22). Each entry is a pair mapping a current regroupid value to an old one. This is used to restore regrouping information on the regrouped object. A value of zero indicates no previous group.

[*Example:* The zero value of the old attribute indicates that if the shapes with regroupid 1 are regrouped, the restored group was not previously grouped with any other shapes:

```
<o:regrouptable v:ext="edit">
  <o:entry new="1" old="0"/>
</o:regrouptable>
```

end example]

Parent Elements
regrouptable (§6.2.2.22)

Attributes	Description
new (New Group ID)	Specifies the ID of the new group. Default is 0. The possible values for this attribute are defined by the XML Schema int datatype.
old (Old Group ID)	Specifies the ID of the old group. Default is 0. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Entry">
   <attribute name="new" type="xsd:int" use="optional"/>
   <attribute name="old" type="xsd:int" use="optional"/>
</complexType>
```

6.2.2.10 extrusion (3D Extrusion)

This element specifies a parallel or perspective extrusion of a 2-D shape, creating the appearance of a 3-D shape. Lighting is controlled via two independent point light sources. Extrusions are defined as either perspective or parallel.

[*Example:*

```
<v:polyline points="0pt,75pt 20pt,45pt 10pt,50pt 30pt,10pt
  50pt,50pt 40pt,45pt 60pt,75pt 0pt,75pt" fillcolor="#00a000">
  <o:extrusion on="t" backdepth="20pt"
    lightposition="30000,10000,10000"/>
</v:polyline>
```

end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
autorotationcenter (Center of Rotation Toggle)	Specifies whether the center of rotation is the geometric center of the extrusion. Default is `false`. If `true`, the geometric center of an extruded shape is (0,0,0). If `false`, the center of rotation is determined by the rotationcenter attribute. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
backdepth (Backward Extrusion Depth)	Specifies the amount of backward extrusion. Default is 36 pt, default units are points. [*Example:*

Attributes	Description
	<o:extrusion on="true" backdepth="15pt"> </o:extrusion>  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
brightness (Brightness)	Specifies the overall brightness of a scene. Default is 0.3. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8. This quantity is not specified using units. The numeric values range from 0 to 1 (0f to 65536f), where 0 implies darkness and 1 implies light saturation. [*Example:* <o:extrusion on="true" brightness="0.4"> </o:extrusion>  brightness="0" brightness="25000f" brightness="0.4" brightness="0.75" *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
color (Extrusion Color)	Specifies the color of the extrusion faces. This attribute is only used when colormode is custom. Colors are typically specified as either a named color, such as red, or six hexadecimal digits representing the red, green and blue values of the color, such as

Attributes	Description

	#00FF30. Full details are specified in the simple type description.
	
	[*Example:*
	
	`<o:extrusion on="true" color="lime"`
	`  colormode="custom">`
	`</o:extrusion>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).

colormode (Extrusion Color Mode)	Specifies whether the extrusion color is defined by the color attribute or is the same as the shape's fill color. Default is auto.
	
	[*Example:*
	
	`<o:extrusion on="true" color="lime"`
	`  colormode="auto">`
	`</o:extrusion>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_ColorMode simple type (§6.2.3.4).

diffusity (Diffuse Reflection)	Specifies the amount of diffusion of reflected light from an extruded shape, defined as the ratio of incident light to diffused reflected light. Default is 1. Normal values range from 0 to 1. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8. This quantity is not specified using units. The numeric values range from 0 to 1 (0f to 65536f), where 0 implies all reflected light is diffuse and 1 implies no reflected light is diffuse. Note that specularity and diffusity should be considered together as it is possible, though

Attributes	Description

	physically incorrect, to define more reflected light than incident light. This is the case if the amount of specularly reflected light and diffusely reflected light add up to more than the amount of incident light.
	
	[*Example:*
	
	`<o:extrusion on="true" diffusity=".75">`
	`</o:extrusion>`
	
	  `diffusity="0"`
	  `diffusity="0.5"`
	  `diffusity="0.75"`
	  `diffusity="1"`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

edge (Simulated Bevel)	Specifies the apparent bevel of the extrusion edges. Default is 1 point.
	
	[*Example:*
	
	`<o:extrusion on="true" edge="2pt">`
	`</o:extrusion>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

ext (VML Extension	Specifies an optional value that indicates how applications that implement VML should

Attributes	Description
Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

facet (Faceting Quality)	Specifies the quality with which the application approximates curved surfaces of an extrusion. A higher facet value produces shapes with smoother curves. A lower value reduces smoothing, resulting in curves with sharper, jagged edges. Default is 30000.
	
	Valid values range from 1 to 65536, where 1 implies extremely low quality curve approximation and 65536 implies extremely high quality.
	
	[*Example:*
	
	`<o:extrusion on="true" facet="65536">`
	`</o:extrusion>`
	
	 	`facet="65536"`
	
	`facet="100"`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

foredepth (Forward Extrusion)	Specifies the amount of forward extrusion. Default is 0 pt, default units are points.
	
	[*Example:*
	
	`<o:extrusion on="true" foredepth="25pt">`
	`</o:extrusion>`
	
	 
	
	end example]

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.

lightface (Shape Face Lighting Toggle)	Specifies whether the front face of the extrusion responds to changes in the lighting. If `false`, the front face does not respond when a lighting value changes. Default is `true`.
	
	[*Example:* The front face is colored as if the shape were not extruded and lit by a 3-D light source:
	
	`<o:extrusion on="true" lightface="false">`
	`</o:extrusion>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

lightharsh (Primary Light Harshness Toggle)	Specifies whether the primary light source is harsh. If `false`, shadow boundaries are diffused. Default is `true`.
	
	[*Example:* The secondary light source is turned off so only the primary has an effect:
	
	`<o:extrusion on="true" lightharsh="false"`
	`lightlevel2="0">`
	`</o:extrusion>`
	
	 
	`lightharsh="false"`
	
	`lightharsh="true"`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

lightharsh2 (Secondary Light Harshness Toggle)	Specifies whether the secondary light source is harsh. If `false`, shadow boundaries defined by the secondary light source are diffused. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type

Attributes	Description
	(§6.2.3.23).

lightlevel (Primary Light Intensity)	Specifies the intensity of the primary light source for the scene. Default is 0.6. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8.
	
	This quantity is not specified using units. The numeric values range from 0 to 1 (0f to 65536f), where 0 implies no direct light and 1 implies saturated direct light.
	
	[*Example:* The secondary light source is turned off so only the primary has an effect:
	
	`<o:extrusion on="true" lightlevel=".5"`
	`  lightlevel2="0">`
	`</o:extrusion>`
	
	  `lightlevel="1"`
	  `lightlevel="0.5"`
	  `lightlevel="0"`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

lightlevel2 (Secondary Light Intensity)	Specifies the intensity of the secondary light source for the scene. Default is 0.6. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8. This quantity is not specified using units. The numeric values range from 0 to 1 (0f to 65536f), where 0 implies no direct light and 1 implies saturated direct light. The possible values for this attribute are defined by the XML Schema string datatype.
lightposition (Primary Light Position)	Specifies the normalized X,Y,Z position of the primary light in a scene in 1/65536-ths. Default is "50000,0,10000". The use of a normalized vector from the shape origin effectively establishes the direction of the light relative to the shape. The distance of the light from the shape is irrelevant as the light source is treated as a directional light.

Attributes	Description

	The position "0,0,0" is at the center of the shape. Positive numbers move the light to the right, down and toward the viewer, respectively.
	
	[*Example:* The secondary light source is turned off so only the primary has an effect:
	
	`<o:extrusion on="true" lightlevel2="0"`
	`  lightposition="7000,-13000,20000">`
	`</o:extrusion>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

lightposition2 (Secondary Light Position)	Specifies the X,Y,Z position of the secondary light in a scene in 1/65536-ths. Default is "-50000,0,10000". The use of a normalized vector from the shape origin effectively establishes the direction of the light relative to the shape. The distance of the light from the shape is irrelevant as the light source is treated as a directional light. The position "0,0,0" is at the center of the shape. Positive numbers move the light to the right, down and toward the viewer, respectively. The possible values for this attribute are defined by the XML Schema string datatype.

lockrotationcenter (Rotation Toggle)	Specifies whether the rotation of the extruded object is specified by the rotationangle attribute. If `false`, the rotation is specified by the orientation attribute. Default is `true`.
	
	[*Example:* The following snippets are equivalent:
	
	`<o:extrusion lockrotationcenter="false"`
	`  orientationangle="45" orientation="0,1,0">`
	`</o:extrusion>`
	
	`<o:extrusion lockrotationcenter=true`
	`  rotationangle="45"/>`
	`</o:extrusion>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

metal (Metallic Surface Toggle)	Specifies whether the surface of the extruded shape resembles metal. Default is `false`.

Attributes	Description

	If `true`, this attribute causes the specularly reflected light to be the material color instead of the light source color, making the object seem more metallic. To further approximate a metallic material requires that specularity be relatively high (about 1.2) and diffusity be relatively low (about 0.6).
	
	[*Example:*
	
	`<o:extrusion on="true" metal="true"`
	`lightposition="10000,-10000,10000"`
	`lightlevel2="0" specularity="1.2"`
	`diffusity="0.6">`
	`</o:extrusion>`
	
	  `metal="true"`
	  `metal="false"`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

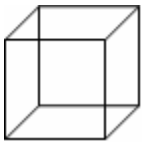
on (Extrusion Toggle)	Specifies whether an extrusion is displayed. Default is `false`.
	
	[*Example:*
	
	`<v:rect style="width=50;height=50">`
	`<o:extrusion />`
	`</v:rect>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

orientation (Rotation Axis)	Specifies a vector in 3D space around which the shape is rotated, as given by the orientationangle attribute. Default is "100,0,0". The position "0,0,0" is at the center of the shape. Positive numbers are to the right,

Attributes	Description
	down and toward the viewer, respectively. [*Example:* `<o:extrusion ... orientation="200,0,0"> </o:extrusion>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
orientationangle (Rotation Around Axis)	Specifies the angle, in degrees, that an extrusion rotates around the orientation. Default is 0. [*Example:* `<o:extrusion ... orientationangle="30"> </o:extrusion>` *end example*] The possible values for this attribute are defined by the XML Schema float datatype.

plane (Extrusion Direction)	Specifies the plane that is at right angles to the extrusion. Default is `xy`. Allowed values are:
	
	• `xy`
	• `zx`
	• `yz`
	
	[*Example:*
	
	`<o:extrusion on="true" plane="yz"`
	`backdepth="100pt">`
	`</o:extrusion>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_ExtrusionPlane simple type (§6.2.3.8).

render (Extrusion	Specifies the rendering mode of the extrusion. Default is `solid`. Allowed values are:

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>Render Mode)</td><td>
<table>
<tr><td>Value</td><td>Description</td></tr>
<tr><td><code>solid</code></td><td>Rendering displays a solid shape.</td></tr>
<tr><td><code>wireframe</code></td><td>Rendering displays a wireframe shape.</td></tr>
<tr><td><code>boundingcube</code></td><td>Rendering displays the bounding cube that contains the shape.</td></tr>
</table>
[Example:
<pre>
<o:extrusion on="true" render="wireframe">
</o:extrusion>
</pre>


end example]
The possible values for this attribute are defined by the ST_ExtrusionRender simple type (§6.2.3.9).
</td></tr>
<tr><td>rotationangle (X-Y Rotation Angle)</td><td>
Specifies the rotation of the object about the x- and y-axes, in degrees. Default is "0,0". Positive angles are measured clockwise around the axis (as if viewing from the positive axis).
The rotation of the object is defined by a rotation angle about the y-axis followed by the rotation angle about the x-axis. The z-axis angle is controlled by the value of the CSS style attribute's <code>rotation</code> property.
[Example:
<pre>
<o:extrusion on="t" lockrotationcenter="true"
  rotationangle="10,20">
</o:extrusion>
</pre>

end example]
The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
</table>

Attributes	Description
rotationcenter (Rotation Center)	Specifies the center of rotation for a shape if autorotationcenter is `false`. The offset of the rotation is specified in terms of fractions of the shape's size. Default is "0,0,0". The position "0,0,0" is at the center of the shape. Positive numbers are to the right, down and toward the viewer, respectively. The possible values for this attribute are defined by the XML Schema string datatype.
shininess (Shininess)	Specifies the concentration of the reflected light on an extrusion surface. Default is 5. The range of values should be constrained to 0-10. Reflection intensity typically grows exponentially with the shininess value. High values (8-10) approximate the shininess of a mirror and low values (2-3) approximate a speckled effect. Reflections do not mirror other objects; only pinpoint light sources are reflected. The possible values for this attribute are defined by the XML Schema float datatype.

skewamt (Extrusion Skew)	Specifies the amount of skew, or length, of a parallel extrusion. Default is 50%. Applies only if the extrusion type is `parallel`. Note that this attribute and backdepth interact to create the actual extrusion length. Valid values range from 0 (0%) to 1 (100%).
	
	[*Example:*
	
	`<o:extrusion on="true" skewamt="100%">`
	`</o:extrusion>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

skewangle (Extrusion Skew Angle)	Specifies the angle of the skew of a parallel extrusion. Default is 225 degrees. Angles are measured in degrees, counterclockwise from the negative x-axis. Applies only if the extrusion type is `parallel`.
	
	[*Example:*
	
	`<o:extrusion on="true" skewangle="25">`
	`</o:extrusion>`

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td> 

end example]

The possible values for this attribute are defined by the XML Schema float datatype.</td></tr>
<tr><td>specularity (Specularity)</td><td>Specifies the specularity of an extruded shape, defined as the ratio of incident light to specularly reflected light. Default is 0. Normal values range from 0 to 1. This numeric value may also be specified in 1/65536-ths if a trailing "f" is supplied (as "f" indicates the value is a fraction). For example, a value of "52429f" represents 52429/65536 or 0.8.

Note that specularity and diffusity should be considered together as it is possible, though physically incorrect, to define more reflected light than incident light. This is the case if the amount of specularly reflected light and diffusely reflected light add up to more than the amount of incident light.

[Example: The secondary light source is turned off so only the primary has an effect. Although the effect is subtle, the first cylinder has a sharper specular reflection on its edge:

<pre><o:extrusion on="true" specularity="1"
  lightposition="10000,-10000,10000"
  lightlevel2="0">
</o:extrusion></pre>
 
<pre>specularity="1"</pre>
 
<pre>specularity="0"</pre>
end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>type (Extrusion Type)</td><td>Specifies the way that the shape is extruded. Default is <code>parallel</code>. Allowed values are:

<table><tr><th>Value</th><th>Description</th></tr><tr><td><code>parallel</code></td><td>Extrusion is rendered so that the center of projection is infinitely far away; that is, the extrusion lines do not converge (unlike</td></tr></table></td></tr>
</table>

Attributes	Description

	<table><tr><td></td><td>perspective projections).</td></tr><tr><td>perspective</td><td>Extrusion is rendered to a center of projection, which is the same as the vanishing point for unrotated objects.</td></tr></table>
	[*Example:*
	
	`<o:extrusion on="true" type="parallel"`
	`  backdepth="100pt">`
	`</o:extrusion>`
	
	  `type="parallel"`
	  `type="perspective"`
	
	end example]
	
	The possible values for this attribute are defined by the ST_ExtrusionType simple type (§6.2.3.10).

viewpoint (Extrusion Viewpoint)	Specifies the viewpoint of the observer in EMUs. This is effectively the end of a vector extending from the viewpointorigin.
	
	The position "0,0,0" is at the center of the shape. Positive numbers are to the right, down and toward the viewer, respectively.
	
	[*Example:*
	
	`<o:extrusion on="true" type="perspective"`
	`  viewpoint="500000,-100000,100000">`
	`</o:extrusion>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

Attributes	Description

viewpointorigin (Extrusion Viewpoint Origin)	Specifies the origin of the viewpoint vector for perspective extrusions. This is the origin of the vector whose opposite end is given by the viewpoint attribute. This origin is always within the bounding box of the shape. Default is "0.5,-0.5".
	
	The viewpoint is specified in terms of the x and y values of the original shape. The x and y values range from 0.5 to -0.5 (50% to -50% of the shape's coordinate origin). Larger numbers move the viewpoint outside the bounding box.
	
	[*Example:*
	
	`<o:extrusion on="true" type="perspective"`
	`viewpoint="500000,-100000,100000"`
	`viewpointorigin="0,1">`
	`</o:extrusion>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Extrusion">
    <attributeGroup ref="v:AG_Ext"/>
    <attribute name="on" type="ST_TrueFalse" use="optional"/>
    <attribute name="type" type="ST_ExtrusionType" default="parallel" use="optional"/>
    <attribute name="render" type="ST_ExtrusionRender" default="solid" use="optional"/>

    <attribute name="lightharsh2" type="ST_TrueFalse" use="optional"/>
</complexType>
```

6.2.2.11 FieldCodes (WordprocessingML Field Switches)

This element specifies the WordprocessingML field switches which shall be stored with an embedded object, using the set of field switches defined by the LINK field, as specified in §2.16. This element shall only be used within a WordprocessingML document, and shall specify the exact field switches for the field which represents the object..

[*Rationale*: Legacy word processors used fields to represent embedded objects – this element stores the field switches not explicitly defined using individual Office VML Drawing elements for embeddings so as not to use the fidelity of their contents. *end rationale*]

[*Example*: The following example inserts an embedded object and specifies additional properties as defined by the LINK field.

```
<o:OLEObject …>
  <o:FieldCodes>\f 0</o:FieldCodes>
</o:OLEObject>
```

This embedded object specifies additional LINK field code values of `\f 0`, which specifies that the embedded object shall retain its source formatting (as defined in §2.16).

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
OLEObject (§6.2.2.19)

6.2.2.12 fill (Shape Fill Extended Properties)

This element specifies additional properties for fills. It is used to identify additional types of gradient fills beyond those specified in the fill element (§6.1.2.5).

Parent Elements
background (§2.2.1); fill (§6.1.2.5); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79)

Attributes	Description
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

type (Fill Type)	Specifies the type of fill. If specified, this overrides the value of the type attribute in the parent fill element.
	
	[*Example:* The `gradientCenter` value overrides `gradientRadial`:
	
	`<v:fill color2="black" focus="100%" type="gradientRadial">`
	`  <o:fill v:ext="view" type="gradientCenter"/>`
	`</v:fill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_FillType simple type (§6.2.3.11).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Fill">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="type" type="ST_FillType"/>
</complexType>
```

6.2.2.13 idmap (Shape ID Map)

This element specifies how shape IDs in the document have been generated. This is an optional element included to allow applications a mechanism for storing information they need to persist related to generating shape IDs.

Parent Elements
shapelayout (§6.2.2.28)

Attributes	Description

data (Shape IDs)	Specifies the data the application uses to generate shape IDs.
	
	[*Example:* An application might choose to reserve blocks of shape ID numbers for each part in the package. Each block of 1024 shape IDs could be referred to by index and this index stored in the data attribute. The data value for a given part might then be:
	
	`<o:idmap v:ext="edit" data="1"/>`
	
	indicating that all the IDs in block 1 are reserved by this part (meaning shape IDs from 1 to 1024 cannot be used). The application's internal constraint would be that each part reserve a different set of IDs. Another part, that contains more shapes, might use:
	
	`<o:idmap v:ext="edit" data="2,3"/>`
	
	In this case, shape IDs from 1025 to 3072 [3 x 1024] cannot be used).
	
	Another implementation might choose to store more verbose information in this attribute. Yet another implementation might ignore this element completely.
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IdMap">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="data" type="xsd:string" use="optional"/>
</complexType>
```

6.2.2.14 ink (Ink)

This element specifies the presence of an ink object. An ink object is a VML object which allows applications to store data for ink annotations in an application-defined format.

[*Example:*

```
<v:shape ... >
  <o:ink i="AMgFHQSWC+YFASAAaAwAAAAAAMA..." annotation="t"/>
</v:shape>
```

end example]

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); shape (§6.1.2.19); shapeDefaults (§2.15.1.79)

Attributes	Description

annotation (Annotation Flag)	Specifies whether the ink object was created as an annotation rather than through pen input. Default is `false`. [*Rationale* This allows an application to treat annotation ink objects as any other annotation. For example, if annotations are hidden, the application can hide the ink object. An ink object that represents primary user input through a pen can be left visible. *end rationale*]
	
	[*Example:*
	
	`<o:ink ... annotation="true">`
	`</o:ink>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

i (Ink Data)	Specifies additional ink object information which shall be associated with the parent VML shape. The VML shape specifies the information necessary to render the ink, and this attribute may be used to store additional application-specific data about the VML shape(s) representing ink. This attribute's contents are optional and may be ignored if not recognized. [*Example:*

Attributes	Description
	<o:ink ... i="AMgFHQSWC+YFASAAaAwAAAAAAMA..."> </o:ink> *end example*] The possible values for this attribute are defined by the XML Schema base64Binary datatype.

The following XML Schema fragment defines the contents of this element:

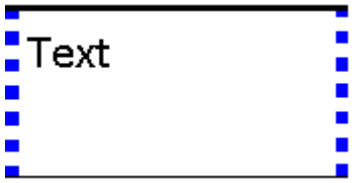
```
<complexType name="CT_Ink">
   <sequence/>
   <attribute name="i" type="xsd:base64Binary"/>
   <attribute name="annotation" type="ST_TrueFalse"/>
</complexType>
```

6.2.2.15 left (Text Box Left Stroke)

This element specifies the stroke properties for the left border of a text box. It entirely supercedes its parent stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a value specified in the parent. If the on attribute is `false` or not specified, the border is not shown.

[*Example:* The text box borders are set independently. Note that the bottom border does not inherit the weight from the parent stroke element.

```
<v:stroke weight="2.25pt">
  <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
  <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:bottom v:ext="view" color="black" on="t"/>
  <o:column v:ext="view" color="#f60" on="t"/>
</v:stroke>
```



end example]

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); stroke (§6.1.2.21)

Attributes	Description
althref (Alternate Image Reference)	Specifies an alternate reference for an image in Macintosh PICT format. [*Example:* `<v:stroke ... althref="myimage.pcz" ... ></v:stroke>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
color (Stroke Color)	Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is `black`. See the fillcolor attribute for a list of supported named colors. [*Example:* The shape stroke is blue: `<v:shape ... strokecolor="red" ... ><v:stroke color="blue"/></v:shape>` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).

color2 (Stroke Alternate Pattern Color)	Specifies a second color for strokes, used when filltype is `pattern`. Default is no value.
	
	When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image.
	
	[*Example:* This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape.
	
	`<v:background fillcolor="yellow"/>`
	`<v:shape style="width:60;height:50"`
	`strokecolor="red" fillcolor="lime"`
	`path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`<v:stroke filltype="pattern" weight="10pt"`
	`src="myimage.gif" color2="blue"/>`
	`</v:shape>`

Attributes	Description
	 , where myimage.gif is:  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).

dashstyle (Stroke Dash Pattern)	Specifies the dot and dash pattern for a stroke. Default is `solid`. Pre-defined values are:
	
	• `solid`
	• `shortdash`
	• `shortdot`
	• `shortdashdot`
	• `shortdashdotdot`
	• `dot`
	• `dash`
	• `longdash`
	• `dashdot`
	• `longdashdot`
	• `longdashdotdot`
	
	A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).
	
	[*Example:*
	
	`<v:stroke dashstyle="0 2" weight="3pt" endcap="round"></v:stroke>`
	
	 
	
	`<v:stroke dashstyle="longdashdotdot" weight="2pt"></v:stroke>`

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
endarrow (Line End Arrowhead)	Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open [*Example:* `<v:stroke endarrow="classic"/>`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
endarrowlength (Line End Arrowhead Length)	Specifies the length of the arrowhead at the end of a line. Default is medium. Allowed values are: • short • medium • long [*Example:* `<v:stroke ... endarrowlength="long" ... />`  *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
endarrowwidth (Line End Arrowhead Width)	Specifies the width of the arrowhead at the end of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* `<v:stroke ... endarrowwidth="wide" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).

endcap (Line End Cap)	Specifies the cap style for the end of a stroke. Default is `flat`. Allowed values are:
	• `flat`
	• `square`
	• `round`
	[*Example:*
	`<v:stroke ... endcap="round" weight="10pt" ... />`
	 
	`endcap="flat"`
	`endcap="square"`
	`endcap="round"`
	end example]

Attributes	Description
	The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

filltype (Stroke Image Style)	Specifies the type of fill used for the background of a stroke. Default is `solid`. Allowed values are:
	
	• `solid` - The fill pattern is solid.
	• `tile` - The fill image is tiled.
	• `pattern` - The fill image is stretched to form a pattern.
	• `frame` - The fill image becomes a border for the shape.
	
	[*Example:*
	
	`<v:shape style="width:50;height:50"`
	`  strokecolor="red"`
	`  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`  <v:stroke filltype="frame" weight="10pt"`
	`  src="border.gif"/>`
	`</v:shape>`
	
	  , where border.gif is: 
	
	end example]
	
	The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).

forcedash (Force Dashed Outline)	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`.
	
	Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.
	
	[*Example:*
	
	`<v:shape ... o:forcedash="true" ... >`
	`</v:shape>`

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
href (Original Image Reference)	Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value. [*Example:* `<v:fill ... o:href="myimage.gif" ... ></v:fill>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
imagealignshape (Stoke Image Alignment)	Specifies the alignment of the stroke image. If `true`, the image is aligned with the shape. Otherwise, it is aligned with the containing scope. Default is `true`. [*Example:* The top position offset shifts the image alignment relative to the containing window: `<v:shape fillcolor="silver" style="top:20;width:50;height:50" path="m 0,0 l 0,1000 1000,1000 1000,0 x e"><v:stroke imagealignshape="false" weight="20pt" filltype="tile" src="myimage.gif"/></v:shape>`  `imagealignshape="false"`  `imagealignshape="false"` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
imageaspect	Specifies how the stroke image aspect ratio is preserved. Default is `ignore`. Allowed

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>(Stroke Image Aspect Ratio)</td><td>values are:

<table>
<tr><td>Value</td><td>Description</td></tr>
<tr><td><code>ignore</code></td><td>Ignore aspect issues.</td></tr>
<tr><td><code>atleast</code></td><td>Image is at least as big as imagesize.</td></tr>
<tr><td><code>atmost</code></td><td>Image is no bigger than imagesize.</td></tr>
</table>

[Example:

<pre>
<v:stroke filltype="frame" weight="10pt"
  src="border.gif" imagealignshape="true"
  imageaspect="atleast">
</v:stroke>
</pre>

<code>imagealignshape="ignore"</code>

<code>imagealignshape="atleast"</code>

<code>imagealignshape="atmost"</code>

end example]

The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).</td></tr>
<tr><td>imagesize (Stroke Image Size)</td><td>Specifies the size of the image for the stroke. Default is the size of the image.

[Example:

<pre>
<v:stroke ... imagesize="10pt,10pt" ... />
</pre>
end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>insetpen (Inset Border From Path)</td><td>Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.

[Example:</td></tr>
</table>

Attributes	Description
	<v:shape ... insetpen="true" ... > </v:shape> *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
joinstyle (Line End Join Style))	Specifies the join style for line ends. Default is round. • round • bevel • miter [*Example:* <v:polyline strokeweight="10pt" strokecolor="navy" points="10pt,10pt,50pt,50pt,90pt,10pt"> <v:stroke joinstyle="bevel"/> </v:polyline>  joinstyle="round" joinstyle="bevel" joinstyle="miter" *end example*] The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).
linestyle (Stroke Line Style)	Specifies the line style of the stroke. Default is single. • single • thinThin • thinThick • thickThin • thickBetweenThin [*Example:*

Attributes	Description
	<v:stroke linestyle="thickThin" weight="5pt"> </v:stroke>  *end example*] The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).
miterlimit (Miter Joint Limit)	Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8. [*Example:* <v:stroke joinstyle="miter" weight="10pt" miterlimit="2"> </v:stroke>  *end example*] The possible values for this attribute are defined by the XML Schema decimal datatype.
on (Stroke Toggle)	Specifies whether the stroke is displayed. Default is true. This attribute overrides the shape's stroke attribute. [*Example:* <v:rect style="width:50;height:50" stroked="true" fillcolor="lime" strokecolor="red"> <v:stroke on="false" weight="5pt"/> </v:rect>  *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

Attributes	Description

opacity (Stroke Opacity)	Specifies the amount of transparency of a stroke. Default is 1.0.
	
	[*Example:*
	
	`<v:rect style="width:50;height:50"`
	`  fillcolor="lime" strokecolor="red">`
	`  <v:stroke weight="5pt" opacity="50%"/>`
	`</v:rect>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

src (Stroke Image Location)	Specifies the source image to load for a stroke fill. Default is no value.
	
	[*Example:*
	
	`<v:stroke ... src="myimage.gif" ... >`
	`</v:stroke>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

startarrow (Line Start Arrowhead)	Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open [*Example:* `<v:stroke startarrow="classic"/>`  *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
startarrowlength (Line Start Arrowhead Length)	Specifies the length of the arrowhead at the start of a line. Default is `medium`. Allowed values are: • `short` • `medium` • `long` [*Example:* `<v:stroke ... startarrowlength="long" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
startarrowwidth (Line Start Arrowhead Width)	Specifies the width of the arrowhead at the start of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* `<v:stroke ... startarrowwidth="wide" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
title (Stroke Title)	Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank. [*Example:* `<v:fill ... o:title="alt text" ... >`

Attributes	Description
	</v:fill> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
weight (Stroke Weight)	Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrokeChild">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="on" type="ST_TrueFalse" use="optional"/>
   <attribute name="weight" type="xsd:string" use="optional"/>
   <attribute name="color" type="ST_ColorType" use="optional"/>
   <attribute name="color2" type="ST_ColorType" use="optional"/>
   <attribute name="opacity" type="xsd:string" use="optional"/>

   <attribute ref="title"/>
   <attribute ref="forcedash"/>
</complexType>
```

6.2.2.16 LinkType (Embedded Object Alternate Image Request)

This element specifies the type of image which shall be requested from an embedded object's host application when the contents of a linked image are updated within a document. When linked images are stored in documents, the only items stored in the document are an image representation and a link to the source. This element specifies the type of image which shall be requested from the source on update.

[*Note*: The formats available may vary based on the type of embedded object - this information is typically queried from the embedded object's application before it is stored. This setting may be omitted, and is usually stored for performance reasons, so it is not queried on each update of the linked object. *end note*]

The possible values for this element are defined by the ST_OLELinkType simple type (§6.2.3.17).

Parent Elements
OLEObject (§6.2.2.19)

6.2.2.17 lock (Shape Protections)

This element specifies locks against actions that can be effected in the UI of an authoring application or programmatically through an object model.

[*Example:* The following snippet locks the shape's aspect ratio and text from user edits.

```
<v:shape ... >
  <o:lock v:ext="edit" aspectratio="t" text="t"/>
</v:shape>
```

end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
adjusthandles (Handles Lock)	Specifies whether the handles of a shape are locked from being edited. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
aspectratio (Aspect Ratio Lock)	Specifies whether the aspect ratio of a shape is locked from being edited. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
cropping (Cropping Lock)	Specifies whether cropping of a shape is locked from being edited. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
ext (VML Extension Handling Behavior)	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML.

Attributes	Description
Namespace: urn:schemas-microsoft-com:vml	[*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
grouping (Grouping Lock)	Specifies whether a shape is locked from being grouped. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
position (Position Lock)	Specifies whether the position of a shape is locked from being edited. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
rotation (Rotation Lock)	Specifies whether the rotation of a shape is locked from being edited. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
selection (Selection Lock)	Specifies whether the shape is locked from being selectable in an editor. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
shapetype (AutoShape Type Lock)	Specifies whether the AutoShape type is locked from being edited. Default is `false`. If `true`, the type of an AutoShape cannot be changed in a graphical editor. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
text (Text Lock)	Specifies whether the text attached to a shape is locked from being edited. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
ungrouping (Ungrouping Lock)	Specifies whether a grouped shape is locked from being ungrouped. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
verticies (Vertices Lock)	Specifies whether the vertices of a path are locked from being edited. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Lock">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="position" type="ST_TrueFalse" use="optional"/>
   <attribute name="selection" type="ST_TrueFalse" use="optional"/>
   <attribute name="grouping" type="ST_TrueFalse" use="optional"/>
   <attribute name="ungrouping" type="ST_TrueFalse" use="optional"/>
   <attribute name="rotation" type="ST_TrueFalse" use="optional"/>
   <attribute name="cropping" type="ST_TrueFalse" use="optional"/>
   <attribute name="verticies" type="ST_TrueFalse" use="optional"/>
   <attribute name="adjusthandles" type="ST_TrueFalse" use="optional"/>
   <attribute name="text" type="ST_TrueFalse" use="optional"/>
   <attribute name="aspectratio" type="ST_TrueFalse" use="optional"/>
   <attribute name="shapetype" type="ST_TrueFalse" use="optional"/>
</complexType>
```

6.2.2.18 LockedField (Embedded Object Cannot Be Refreshed)

This element specifies that the embedded object's appearance is locked - that is, that the object's current representation shall be locked to prevent any user interaction or automatic application behavior from modifying its contents.

This element shall contain no content - its presence indicates that the embedded object is locked, and its omission allows the field to be updated.

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).

Parent Elements
OLEObject (§6.2.2.19)

6.2.2.19 OLEObject (Embedded OLE Object)

This element specifies an OLE object.

[*Example:* The following demonstrates a video file embedded in a WordprocessingML document:

```
<w:object ... >
  <v:shape id="_x0000_i1025" type="#_x0000_t75"
  style="width:1in;height:24pt" o:ole="">
  <v:imagedata r:id="rId4" o:title=""/>
  </v:shape>
  <o:OLEObject Type="Embed" ProgID="AVIFile" ShapeID="_x0000_i1025"
  DrawAspect="Content" ObjectID="_1219561732" r:id="rId5"/>
</w:object>
```

end example]

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23);

Parent Elements
shapeDefaults (§2.15.1.79)

Child Elements	Subclause
FieldCodes (WordprocessingML Field Switches)	§6.2.2.11
LinkType (Embedded Object Alternate Image Request)	§6.2.2.16
LockedField (Embedded Object Cannot Be Refreshed)	§6.2.2.18

Attributes	Description

DrawAspect (OLE Object Representation)	Specifies how the object is represented visually in the application.
	
	[*Example:*
	
	`<o:OLEObject ... DrawAspect="Content">`
	`</o:OLEObject>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_OLEDrawAspect simple type (§6.2.3.16).

id (Relationship)
 	
Namespace: .../officeDocument/2006/relationships
	Specifies the actual OLE object using a standard part relationship lookup.
	
	[*Example:*
	
	`<o:OLEObject ... r:id="rId5">`
	`</o:OLEObject>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

ObjectID (OLE Object Unique ID)	Specifies a unique ID identifying the OLE object.
	
	[*Example:*
	
	`<o:OLEObject ... ObjectID="_1219561732">`
	`</o:OLEObject>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

ProgID (OLE Object	Specifies the OLE server application associated with the OLE object.

Attributes	Description

Application)	[*Example:*
	
	`<o:OLEObject ... ProgID="AVIFile">`
	`</o:OLEObject>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

ShapeID (OLE Object Shape)	Specifies the shape with which the OLE object is associated. A VML shape provides the visual placeholder for an OLE object and this attribute is set to the id of the placeholder shape.
	
	[*Example:*
	
	`<o:OLEObject ... ShapeID="_x0000_i1025">`
	`</o:OLEObject>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

Type (OLE Object Type)	Specifies the type of the OLE connection.
	
	[*Example:*
	
	`<o:OLEObject ... Type="Embed">`
	`</o:OLEObject>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_OLEType simple type (§6.2.3.18).

UpdateMode (OLE Update Mode)	Specifies how the object is updated with new data if the Type is `Link` - automatically or on-demand by the user.
	
	[*Example:*
	
	`<o:OLEObject ... UpdateMode="Always">`
	`</o:OLEObject>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_OLEUpdateMode simple type (§6.2.3.19).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OLEObject">
   <sequence>
      <element name="LinkType" type="ST_OLELinkType" minOccurs="0"/>
      <element name="LockedField" type="ST_TrueFalseBlank" minOccurs="0"/>
      <element name="FieldCodes" type="xsd:string" minOccurs="0"/>
   </sequence>
   <attribute name="Type" type="ST_OLEType" use="optional"/>
   <attribute name="ProgID" type="xsd:string" use="optional"/>
   <attribute name="ShapeID" type="xsd:string" use="optional"/>
   <attribute name="DrawAspect" type="ST_OLEDrawAspect" use="optional"/>
   <attribute name="ObjectID" type="xsd:string" use="optional"/>
   <attribute ref="r:id" use="optional"/>
   <attribute name="UpdateMode" type="ST_OLEUpdateMode" use="optional"/>
</complexType>
```

6.2.2.20 proxy (Shape Reference)

This element specifies an entry in a r element rule that contains a reference to one or more shapes that are participating in the rule.

[*Example:* The following rule defines a connection between two shapes. The shape with id _s1036 connects shape _s1033 to _s1032:

```
<o:shapelayout v:ext="edit">
  <o:rules v:ext="edit">
    <o:r id="V:Rule1" type="connector" idref="#_s1036">
      <o:proxy start="" idref="#_s1033" connectloc="0"/>
      <o:proxy end="" idref="#_s1032" connectloc="2"/>
    </o:r>
  </o:rules>
</o:shapelayout>
```

end example]

Parent Elements
r (§6.2.2.21)

Attributes	Description
connectloc (Connection Location)	Specifies the location on the shape where the connector is attached. The value is an index into the list of connection points defined in the shape - see the connectlocs attribute. Default is 0. Only used in a connector rule. The possible values for this attribute are defined by the XML Schema int datatype.
end (End Point Connection Flag)	Specifies whether the connector's end point is connected to the shape. Default is `false`. Only used in a connector rule.

Attributes	Description
	The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).
idref (Proxy Shape Reference)	Specifies a reference to a shape in the current document. Default is no value. A shape name is used as the reference mechanism; this is not a relationship ID. This attribute indicates that the referenced shape is part of this rule. Two or more proxy elements are used for an alignment rule. A connector rule uses one or two, indicating which shapes the connector is attached to. The possible values for this attribute are defined by the XML Schema string datatype.
start (Start Point Connection Flag)	Specifies whether the connector's start point is connected to the shape. Default is `false`. Only used in a connector rule. If both start and end are specified the later one takes precedence. The possible values for this attribute are defined by the ST_TrueFalseBlank simple type (§6.2.3.24).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Proxy">
   <attribute name="start" type="ST_TrueFalseBlank" use="optional" default="false"/>
   <attribute name="end" type="ST_TrueFalseBlank" use="optional" default="false"/>
   <attribute name="idref" type="xsd:string" use="optional"/>
   <attribute name="connectloc" type="xsd:int" use="optional"/>
</complexType>
```

6.2.2.21 r (Rule)

This element specifies a rule entry in a rules element rule set that describes how a certain shape or set of shapes behaves during editing.

[*Example:* The following rule defines a connection between two shapes. The shape with id _s1036 connects shape _s1033 to _s1032:

```
<o:shapelayout v:ext="edit">
  <o:rules v:ext="edit">
    <o:r id="V:Rule1" type="connector" idref="#_s1036">
      <o:proxy start="" idref="#_s1033" connectloc="0"/>
      <o:proxy end="" idref="#_s1032" connectloc="2"/>
    </o:r>
  </o:rules>
</o:shapelayout>
```

end example]

Parent Elements
rules (§6.2.2.26)

Child Elements	Subclause
proxy (Shape Reference)	§6.2.2.20

Attributes	Description
how (Alignment Rule Type)	Specifies the type of alignment for an alignment rule. Default is no value. Allowed values are: • top • middle • bottom • left • center • right The possible values for this attribute are defined by the ST_How simple type (§6.2.3.13).
id (Rule ID)	Specifies an identifier for the rule. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
idref (Rule Shape Reference)	Specifies a reference to a shape in the current document that is the primary shape in the rule. For example, for a connector rule, the connector. Default is no value. A shape name is used as the reference mechanism; this is not a relationship ID. The possible values for this attribute are defined by the XML Schema string datatype.
type (Rule Type)	Specifies the type of the rule. Default is no value. Allowed values are: • arc • callout • connector • align The possible values for this attribute are defined by the ST_RType simple type (§6.2.3.21).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_R">
   <sequence>
      <element name="proxy" type="CT_Proxy" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="id" type="xsd:string" use="required"/>
   <attribute name="type" type="ST_RType" use="optional"/>
   <attribute name="how" type="ST_How" use="optional"/>
   <attribute name="idref" type="xsd:string" use="optional"/>
</complexType>
```

6.2.2.22 regrouptable (Shape Grouping History)

This element specifies a list of entries which describe how shapes were previously grouped so they can be regrouped. The regroupid attribute of shapes indicates which shapes belong together when a regroup is performed. The regrouptable tracks the previous regroupid that should be assigned to all shapes with the given current regroupid.

[*Example:* Consider a document containing two rectangles and a circle. The rectangles are grouped together, then that group is grouped with the circle. This new group is then ungrouped, leaving the circle and grouped rectangles. The document might contain the following snippets:

```
<v:oval ... o:regroupid="1"/>
<v:group ... o:regroupid="1"/>
  <v:rect ... />
  <v:rect ... />
</v:group>

<o:regrouptable v:ext="edit">
  <o:entry new="1" old="0"/>
</o:regrouptable>
```

The regroupid attribute indicates that the shapes with regroupid 1 were previously grouped together. The entry indicates that if those shapes are regrouped, the new group formed should not have a regroupid value as it was not previously ungrouped.

If the two rectangles are ungrouped, the document reflects that the rectangles were previously grouped and that their old group was previously grouped:

```
<v:oval ... o:regroupid="1"/>
<v:rect ... o:regroupid="2"/>
<v:rect ... o:regroupid="2"/>

<o:regrouptable v:ext="edit">
  <o:entry new="1" old="0"/>
  <o:entry new="2" old="1"/>
</o:regrouptable>
```

end example]

Parent Elements
shapelayout (§6.2.2.28)

Child Elements	Subclause
entry (Regroup Entry)	§6.2.2.9

Attributes	Description
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RegroupTable">
   <sequence>
      <element name="entry" type="CT_Entry" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attributeGroup ref="v:AG_Ext"/>
</complexType>
```

6.2.2.23 rel (Diagram Relationship)

This element specifies a relationship between two diagram nodes. An optional third node that exists between the primary two may also be included. The relationship has an implicit order since it describes the source and destination nodes.

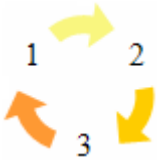
[*Example:* In the cycle diagram below, shape 1036 (the shape that is the text box for the text "2") is the first node. A relationship exists between shape 1036 and shape 1044 (the text box containing "1"). In between those shapes is shape 1038 (the yellow arrow).

```
<o:relationtable v:ext="edit">
  <o:rel v:ext="edit" idsrc="#_s1036" iddest="#_s1036"/>
  <o:rel v:ext="edit" idsrc="#_s1042" iddest="#_s1036" idcntr="#_s1043"/>
  <o:rel v:ext="edit" idsrc="#_s1044" iddest="#_s1042" idcntr="#_s1045"/>
  <o:rel v:ext="edit" idsrc="#_s1036" iddest="#_s1044" idcntr="#_s1038"/>
</o:relationtable>
```

```
<v:rect id="_s1036" ... >
  <v:textbox ... ><...>2</...></v:textbox>
</v:rect>

<v:rect id="_s1044" ... >
  <v:textbox ... ><...>1</...></v:textbox>
</v:rect>

<v:shape id="_s1038" ... />
```



end example]

Parent Elements
relationtable (§6.2.2.24)

Attributes	Description
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

idcntr (Diagram Relationship Center Shape)	Specifies the optional identifier of the shape that exists between the source and destination shapes. This is omitted if the relationship does not have a shape between the source and destination shapes.
	
	[*Example:*
	
	`<o:rel ... idcntr="#s_1038">`
	`</o:rel>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

iddest (Diagram Relationship	Specifies the identifier of the shape at the destination of the relationship.

Attributes	Description

Destination Shape)	[*Example:*
	
	`<o:rel ... iddest="#s_1044">`
	`</o:rel>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

idsrc (Diagram Relationship Source Shape)	Specifies the identifier of the shape at the source of the relationship.
	
	[*Example:*
	
	`<o:rel ... idsrc="#s_1036">`
	`</o:rel>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Relation">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="idsrc" type="xsd:string" use="optional"/>
   <attribute name="iddest" type="xsd:string" use="optional"/>
   <attribute name="idcntr" type="xsd:string" use="optional"/>
</complexType>
```

6.2.2.24 relationtable (Diagram Relationship Table)

This element specifies a list that describes the relationships among diagram nodes.

[*Example:* The following table describes the parent-child relationships for shapes in an organization chart. The first entry describes the top-level shape in the diagram. The next two rows describe that the shapes are subordinates to the first shape. Shape 1029 is a subordinate of shape 1028. Shape 1032, a connector in this case, is in between the two.

```
<o:relationtable v:ext="edit">
  <o:rel v:ext="edit" idsrc="#_s1028" iddest="#_s1028"/>
  <o:rel v:ext="edit" idsrc="#_s1029" iddest="#_s1028" idcntr="#_s1032"/>
  <o:rel v:ext="edit" idsrc="#_s1030" iddest="#_s1028" idcntr="#_s1033"/>
</o:relationtable>
```

end example]

Parent Elements
diagram (§6.2.2.8)

Child Elements	Subclause
rel (Diagram Relationship)	§6.2.2.23

Attributes	Description
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

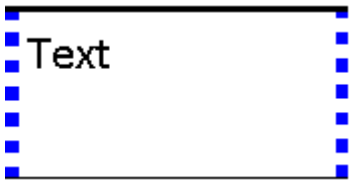
```
<complexType name="CT_RelationTable">
   <sequence>
      <element name="rel" type="CT_Relation" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attributeGroup ref="v:AG_Ext"/>
</complexType>
```

6.2.2.25 right (Text Box Right Stroke)

This element specifies the stroke properties for the right border of a text box. It entirely supercedes its parent stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a value specified in the parent. If the on attribute is `false` or not specified, the border is not shown.

[*Example:* The text box borders are set independently. Note that the bottom border does not inherit the weight from the parent stroke element.

```
<v:stroke weight="2.25pt">
  <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
  <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:bottom v:ext="view" color="black" on="t"/>
  <o:column v:ext="view" color="#f60" on="t"/>
</v:stroke>
```



end example]

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); stroke (§6.1.2.21)

Attributes	Description
althref (Alternate Image Reference)	Specifies an alternate reference for an image in Macintosh PICT format. [*Example:* `<v:stroke ... althref="myimage.pcz" ... ></v:stroke>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
color (Stroke Color)	Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is `black`. See the fillcolor attribute for a list of supported named colors. [*Example:* The shape stroke is blue: `<v:shape ... strokecolor="red" ... ><v:stroke color="blue"/></v:shape>` *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).

color2 (Stroke Alternate Pattern Color)	Specifies a second color for strokes, used when filltype is `pattern`. Default is no value.
	
	When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image.
	
	[*Example:* This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape.
	
	`<v:background fillcolor="yellow"/>`
	`<v:shape style="width:60;height:50"`
	`strokecolor="red" fillcolor="lime"`

Attributes	Description
	path="m 0,0 l 0,1000 1000,1000 1000,0 x e"> <v:stroke filltype="pattern" weight="10pt" src="myimage.gif" color2="blue"/> </v:shape>  , where myimage.gif is:  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
dashstyle (Stroke Dash Pattern)	Specifies the dot and dash pattern for a stroke. Default is `solid`. Pre-defined values are: • `solid` • `shortdash` • `shortdot` • `shortdashdot` • `shortdashdotdot` • `dot` • `dash` • `longdash` • `dashdot` • `longdashdot` • `longdashdotdot` A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle). [*Example:* <v:stroke dashstyle="0 2" weight="3pt" endcap="round"> </v:stroke> 

Attributes	Description
	<v:stroke dashstyle="longdashdotdot" weight="2pt"> </v:stroke>  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
endarrow (Line End Arrowhead)	Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open [*Example:* <v:stroke endarrow="classic"/>  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
endarrowlength (Line End Arrowhead Length)	Specifies the length of the arrowhead at the end of a line. Default is medium. Allowed values are: • short • medium • long [*Example:* <v:stroke ... endarrowlength="long" ... />

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
endarrowwidth (Line End Arrowhead Width)	Specifies the width of the arrowhead at the end of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* `<v:stroke ... endarrowwidth="wide" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
endcap (Line End Cap)	Specifies the cap style for the end of a stroke. Default is `flat`. Allowed values are: • `flat` • `square` • `round` [*Example:* `<v:stroke ... endcap="round" weight="10pt" ... />`  `endcap="flat"`  `endcap="square"`

Attributes	Description
	 `endcap="round"` *end example*] The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

filltype (Stroke Image Style)	Specifies the type of fill used for the background of a stroke. Default is `solid`. Allowed values are:
	
	• `solid` - The fill pattern is solid.
	• `tile` - The fill image is tiled.
	• `pattern` - The fill image is stretched to form a pattern.
	• `frame` - The fill image becomes a border for the shape.
	
	[*Example:*
	
	`<v:shape style="width:50;height:50"`
	`  strokecolor="red"`
	`  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`  <v:stroke filltype="frame" weight="10pt"`
	`  src="border.gif"/>`
	`</v:shape>`
	
	  , where border.gif is: 
	
	end example]
	
	The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).

forcedash (Force Dashed Outline)	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`.

Attributes	Description
	Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape. [*Example:* `<v:shape ... o:forcedash="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
href (Original Image Reference)	Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value. [*Example:* `<v:fill ... o:href="myimage.gif" ... ></v:fill>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
imagealignshape (Stoke Image Alignment)	Specifies the alignment of the stroke image. If `true`, the image is aligned with the shape. Otherwise, it is aligned with the containing scope. Default is `true`. [*Example:* The top position offset shifts the image alignment relative to the containing window: `<v:shape fillcolor="silver" style="top:20;width:50;height:50" path="m 0,0 l 0,1000 1000,1000 1000,0 x e"> <v:stroke imagealignshape="false" weight="20pt" filltype="tile" src="myimage.gif"/> </v:shape>`  `imagealignshape="false"`  `imagealignshape="false"`

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</td></tr>
<tr><td>imageaspect (Stroke Image Aspect Ratio)</td><td>Specifies how the stroke image aspect ratio is preserved. Default is <code>ignore</code>. Allowed values are:

<table>
<tr><td>Value</td><td>Description</td></tr>
<tr><td><code>ignore</code></td><td>Ignore aspect issues.</td></tr>
<tr><td><code>atleast</code></td><td>Image is at least as big as imagesize.</td></tr>
<tr><td><code>atmost</code></td><td>Image is no bigger than imagesize.</td></tr>
</table>

[Example:

<pre><v:stroke filltype="frame" weight="10pt"
  src="border.gif" imagealignshape="true"
  imageaspect="atleast">
</v:stroke></pre>
  <code>imagealignshape="ignore"</code>
  <code>imagealignshape="atleast"</code>
  <code>imagealignshape="atmost"</code>

end example]

The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).</td></tr>
<tr><td>imagesize (Stroke Image Size)</td><td>Specifies the size of the image for the stroke. Default is the size of the image.

[Example:

<pre><v:stroke ... imagesize="10pt,10pt" ... /></pre>
end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
</table>

Attributes	Description
insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image. [*Example:* `<v:shape ... insetpen="true" ... ></v:shape>` *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

joinstyle (Line End Join Style))	Specifies the join style for line ends. Default is `round`.
	
	• `round`
	• `bevel`
	• `miter`
	
	[*Example:*
	
	`<v:polyline strokeweight="10pt" strokecolor="navy" points="10pt,10pt,50pt,50pt,90pt,10pt"><v:stroke joinstyle="bevel"/></v:polyline>`
	
	 
	`joinstyle="round"`
	`joinstyle="bevel"`
	`joinstyle="miter"`
	
	end example]
	
	The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).

linestyle (Stroke Line Style)	Specifies the line style of the stroke. Default is `single`. • `single`

Attributes	Description

	• thinThin
	• thinThick
	• thickThin
	• thickBetweenThin
	
	[*Example:*
	
	`<v:stroke linestyle="thickThin" weight="5pt">`
	`</v:stroke>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).

miterlimit (Miter Joint Limit)	Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8.
	
	[*Example:*
	
	`<v:stroke joinstyle="miter" weight="10pt"`
	`  miterlimit="2">`
	`</v:stroke>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema decimal datatype.

on (Stroke Toggle)	Specifies whether the stroke is displayed. Default is `true`. This attribute overrides the shape's stroke attribute.
	
	[*Example:*
	
	`<v:rect style="width:50;height:50" stroked="true"`
	`  fillcolor="lime" strokecolor="red">`
	`  <v:stroke on="false" weight="5pt"/>`
	`</v:rect>`

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
opacity (Stroke Opacity)	Specifies the amount of transparency of a stroke. Default is 1.0. [*Example:* `<v:rect style="width:50;height:50" fillcolor="lime" strokecolor="red"> <v:stroke weight="5pt" opacity="50%"/> </v:rect>`  *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
src (Stroke Image Location)	Specifies the source image to load for a stroke fill. Default is no value. [*Example:* `<v:stroke ... src="myimage.gif" ... > </v:stroke>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
startarrow (Line Start Arrowhead)	Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open [*Example:*

Attributes	Description
	<v:stroke startarrow="classic"/>  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
startarrowlength (Line Start Arrowhead Length)	Specifies the length of the arrowhead at the start of a line. Default is `medium`. Allowed values are: • `short` • `medium` • `long` [*Example:* <v:stroke ... startarrowlength="long" ... />  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
startarrowwidth (Line Start Arrowhead Width)	Specifies the width of the arrowhead at the start of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* <v:stroke ... startarrowwidth="wide" ... />  *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
title (Stroke Title)	Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank. [*Example:* `<v:fill ... o:title="alt text" ... ></v:fill>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
weight (Stroke Weight)	Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrokeChild">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="on" type="ST_TrueFalse" use="optional"/>
   <attribute name="weight" type="xsd:string" use="optional"/>
   <attribute name="color" type="ST_ColorType" use="optional"/>
   <attribute name="color2" type="ST_ColorType" use="optional"/>
   <attribute name="opacity" type="xsd:string" use="optional"/>
   <attribute name="linestyle" type="v:ST_StrokeLineStyle" use="optional"/>
   <attribute name="miterlimit" type="xsd:decimal" use="optional"/>
   <attribute name="joinstyle" type="v:ST_StrokeJoinStyle" use="optional"/>
   <attribute name="endcap" type="v:ST_StrokeEndCap" use="optional"/>
   <attribute name="dashstyle" type="xsd:string" use="optional"/>
   <attribute name="insetpen" type="ST_TrueFalse" use="optional"/>
   <attribute name="filltype" type="v:ST_FillType" use="optional"/>
   <attribute name="src" type="xsd:string" use="optional"/>
   <attribute name="imageaspect" type="v:ST_ImageAspect" use="optional"/>
   <attribute name="imagesize" type="xsd:string" use="optional"/>
   <attribute name="imagealignshape" type="ST_TrueFalse" use="optional"/>
   <attribute name="startarrow" type="v:ST_StrokeArrowType" use="optional"/>
   <attribute name="startarrowwidth" type="v:ST_StrokeArrowWidth" use="optional"/>
   <attribute name="startarrowlength" type="v:ST_StrokeArrowLength" use="optional"/>
   <attribute name="endarrow" type="v:ST_StrokeArrowType" use="optional"/>
   <attribute name="endarrowwidth" type="v:ST_StrokeArrowWidth" use="optional"/>
   <attribute name="endarrowlength" type="v:ST_StrokeArrowLength" use="optional"/>
   <attribute ref="href"/>
   <attribute ref="althref"/>
   <attribute ref="title"/>
   <attribute ref="forcedash"/>
</complexType>
```

6.2.2.26 rules (Rule Set)

This element specifies a list of rule entries which describe how a certain shape or sets of shapes should behave during editing.

[*Example:* The following rule defines a connection between two shapes. The shape with id _s1036 connects shape _s1033 to _s1032:

```
<o:shapelayout v:ext="edit">
  <o:rules v:ext="edit">
    <o:r id="V:Rule1" type="connector" idref="#_s1036">
      <o:proxy start="" idref="#_s1033" connectloc="0"/>
      <o:proxy end="" idref="#_s1032" connectloc="2"/>
    </o:r>
  </o:rules>
</o:shapelayout>
```

end example]

Parent Elements
shapelayout (§6.2.2.28)

Child Elements	Subclause
r (Rule)	§6.2.2.21

Attributes	Description
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rules">
   <sequence>
      <element name="r" type="CT_R" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attributeGroup ref="v:AG_Ext"/>
</complexType>
```

6.2.2.27 shapedefaults (New Shape Defaults)

This element specifies the defaults that are used when creating new shapes. These defaults are stored once per document.

[*Example:* Consider a case in which an application chooses to store the highest shape ID it has used in the document thus far. This could be used to support the generation of new shape IDs:

```
<o:shapedefaults v:ext="edit" spidmax="1029"/>
```

end example]

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79)

Child Elements	Subclause
callout (Callout)	§6.2.2.2
colormenu (UI Default Colors)	§6.2.2.4
colormru (Most Recently Used Colors)	§6.2.2.5
extrusion (3D Extrusion)	§6.2.2.10
fill (Shape Fill Properties)	§6.1.2.5
lock (Shape Protections)	§6.2.2.17
shadow (Shadow Effect)	§6.1.2.18
skew (Skew Transform)	§6.2.2.30
stroke (Line Stroke Settings)	§6.1.2.21
textbox (Text Box)	§6.1.2.22

Attributes	Description
allowincell (Allow in Table Cell)	Specifies whether the shape is allowed to be placed in a table cell. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

Attributes	Description

fill (Shape Fill Toggle)	Specifies whether the closed path will be filled. Default is `true`. This attribute is overridden by the fill on attribute.
	
	[*Example:*
	
	`<v:shape ... fill="f" fillcolor="red" ...>`
	`</v:shape>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

fillcolor (Default Fill Color)	Specifies the default shape fill color. Default is no value. Colors are typically specified as either a named color, such as `red`, or six hexadecimal digits representing the red, green and blue values of the color, such as `#00FF30`. Full details are specified in the simple type description. The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
spidmax (Shape ID Optional Storage)	Specifies an optional value that allows applications a mechanism for storing information they need to persist related to shape IDs. Default is 0. The possible values for this attribute are defined by the XML Schema integer datatype.

stroke (Shape Stroke Toggle)	Specifies whether the path defining the shape is stroked with a solid line. The stroke element (§6.1.2.21) defines other strokes. The on attribute of the stroke element overrides this attribute. Default is `true`.
	
	[*Example:*
	
	`<v:shape ... fillcolor="red"`
	`  stroke="false" strokecolor="blue"...>`
	`</v:shape>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>strokecolor (Shape Stroke Color)</td><td>Specifies the primary color of the brush to use to stroke the path of the shape. Default is <code>black</code>. The color attribute of the stroke element (§6.1.2.21) overrides this. Colors are typically specified as either a named color, such as <code>red</code>, or six hexadecimal digits representing the red, green and blue values of the color, such as <code>#00FF30</code>. Full details are specified in the simple type description.

[Example:

<pre><v:shape ... strokecolor="red" ...>
</v:shape></pre>
 

end example]

The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).</td></tr>
<tr><td>style (Shape Styling Properties)</td><td>Specifies the CSS2 styling properties of the shape. This uses the syntax described in the "Visual formatting model" of the Cascading Style Sheets, Level 2 specification, a Recommendation of the World Wide Web Consortium available here: http://www.w3.org/TR/REC-CSS2. Full descriptions of each property are not repeated here, but the VML treatment of each property is defined. Allowed properties include:

<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td><code>flip</code></td><td>Specifies that the orientation of a shape is flipped. Default is no value. Allowed values are:

• x - Flip along the y-axis, reversing the x-coordinates.
• y - Flip along the x-axis, reversing the y-coordinates.
• xy - Flip along both the y- and x-axis.
• yx - Flip along both the x- and y-axis.</td></tr>
<tr><td><code>height</code></td><td>Specifies the height of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are:

• <code>auto</code> - Default position of an element in the flow of the page.
• <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.
• <percentage>- Value expressed as a percentage of the parent object's height.</td></tr>
</table>
</td></tr>
</table>

Attributes	Description	
	`left`	Specifies the position of the left of the containing block of the shape relative to the element left of it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	`margin-bottom`	Specifies the position of the bottom of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	`margin-left`	Specifies the position of the left of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	`margin-right`	Specifies the position of the right of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page.

Attributes	Description	
		• <units> - A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's width.
	margin-top	Specifies the position of the top of the containing block of the shape relative to the shape anchor. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • auto - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	mso-position-horizontal	Specifies the horizontal positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • left • center • right • inside • outside
	mso-position-horizontal-relative	Specifies relative horizontal position data for objects in WordprocessingML documents. This modifies the mso-position-horizontal property. Default is text. Allowed values are: • margin • page • text • char
	mso-position-vertical	Specifies the vertical positioning data for objects in WordprocessingML documents. Default is absolute. Allowed values are: • absolute • top • center • bottom • inside

Attributes	Description
	<table><tr><td></td><td>• outside</td></tr><tr><td>mso-position-vertical-relative</td><td>Specifies relative vertical position data for objects in WordprocessingML documents. This modifies the mso-position-vertical property. Default is text. Allowed values are: • margin • page • text • line</td></tr><tr><td>mso-wrap-distance-bottom</td><td>Specifies the distance from the bottom of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</td></tr><tr><td>mso-wrap-distance-left</td><td>Specifies the distance from the left side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</td></tr><tr><td>mso-wrap-distance-right</td><td>Specifies the distance from the right side of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</td></tr><tr><td>mso-wrap-distance-top</td><td>Specifies the distance from the top of the shape to the text that wraps around it. Default is 0 pt. Note that this property is different from the CSS margin property, which changes the origin of the shape to include the margin areas. This property does not change the origin.</td></tr><tr><td>mso-wrap-edited</td><td>Specifies whether the wrap coordinates were customized by the user. If the wrap coordinates are generated by an editor, this property is true; otherwise they were customized by a user. Default is false.</td></tr><tr><td>mso-wrap-style</td><td>Specifies the wrapping mode for text in shapes in WordprocessingML documents. Default is square. Allowed values are: • square - Wraps text inside the shape in a square. • none - Text does not wrap.</td></tr><tr><td>position</td><td>Specifies the type of positioning used to place an element. Default is static. When the element is contained inside a group, this property must be absolute. Allowed values are:</td></tr></table>

Attributes	Description	
		• `static` - The element is positioned according to the normal flow of the page. The `top` and `left` properties are ignored. If the object is anchored inline, this value is used. • `absolute` - The element is positioned relative to the parent, using the `top` and `left` properties. • `relative` - The element is positioned according to the normal flow of the page, but the `top` and `left` properties are used. The overlap of overlapping elements is governed by the `z-index` property.
	`rotation`	Specifies the angle that a shape is rotated, in degrees. Default is 0. Positive angles are clockwise.
	`top`	Specifies the position of the top of the containing block of the shape relative to the element above it in the flow of the page. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. This property shall not be used for shapes anchored inline. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed. • <percentage>- Value expressed as a percentage of the parent object's height.
	`visibility`	Specifies whether a shape is displayed. Only `inherit` and `hidden` are used; any other values are mapped to `inherit`. Default is `inherit`. Allowed values are: • `hidden` - The shape is not visible, but is still part of the flow of the objects in the browser. Mouse events are not processed. • `inherit` - The visibility state is inherited from the parent of the shape.
	`width`	Specifies the width of the containing block of the shape. Default is 0. It is specified in CSS units or, for elements in a group, in the coordinate system of the parent element. Allowed values are: • `auto` - Default position of an element in the flow of the page. • <units>- A number with an absolute units designator (cm, mm, in, pt, pc, or px) or a relative units designator (em or ex). If no units are given, pixels (px) is assumed.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>• <percentage>- Value expressed as a percentage of the parent object's width.</td></tr>
<tr><td>z-index</td><td>Specifies the display order of overlapping shapes. Default is 0. This property shall not be used for shapes anchored inline. Allowed values are:

• auto - Uses the order that the shapes appear in the page, bottom to top.
• <order>- A number that represents the stacking precedence. Shapes with higher numbers are placed on top of those with lower numbers. Negative numbers are allowed.</td></tr>
</table>
The following properties are only used by the textbox element (§6.1.2.22):
<table>
<tr><th>Property</th><th>Description</th></tr>
<tr><td>direction</td><td>Specifies the direction of the text in the textbox. Default is ltr. This property is superceded by the mso-direction-alt property if that is specified. Allowed values are:

• ltr - Test is displayed left-to-right.
• rtl - Test is displayed right-to-left.</td></tr>
<tr><td>layout-flow</td><td>Determines the flow of the text layout in a textbox. Default is horizontal. Allowed values are:

• horizontal - Text is displayed horizontally.
• vertical - Text is displayed vertically.
• vertical-ideographic - Ideographic text is displayed vertically.
• horizontal-ideographic - Ideographic text is displayed horizontally.</td></tr>
<tr><td>mso-direction-alt</td><td>Specifies an alternate direction for text in textboxes. Overrides the direction property. The only allowed value is context.</td></tr>
<tr><td>mso-fit-shape-to-text</td><td>Specifies whether the shape stretches to fit the text in the textbox. Default is false.</td></tr>
<tr><td>mso-fit-text-to-shape</td><td>Specifies whether the text stretches to fit the textbox. Default is false.</td></tr>
<tr><td>mso-layout-flow-alt</td><td>Specifies the alternate layout flow for text in textboxes. This property is used instead of layout-flow when the layout flow is from bottom to top for non-ideographic languages. Its only value</td></tr>
</table>
</td></tr>
</table>

Attributes	Description

	is bottom-to-top.
mso-next-textbox	Specifies the ID of the next textbox in a series. Used to keep track of a set of linked textboxes. Default is no value.
mso-rotate	Specifies a specific rotation value for text in a textbox. Default is 0. Allowed values are: • 0 • 90 • 180 • -90
mso-text-scale	Specifies the scaling factor for fitting text to shapes. Default is 0. This property is only used if mso-fit-text-to-shape is true.
v-text-anchor	Specifies the vertical anchoring of text in a textbox. Default is top. The alignment of a text anchor only becomes evident if mso-fit-text-to-shape is false. This property is different from the vertical-align CSS property, which is used for ideographic languages. Allowed values are: • top • middle • bottom • top-center • middle-center • bottom-center • top-baseline • bottom-baseline • top-center-baseline • bottom-center-baseline

The following properties are only used by the textpath element (§6.1.2.23):

Property	Description
font	Specifies a compound value of font settings. Default is no value. The values are the same as those of the CSS font property. The order of definitions in the string is: font-style, font-variant, font-weight, font-size, line-height, font-family.
font-family	Specifies the family of the font. Default is no value. The values are the same as those of the CSS font-family property.
font-size	Specifies the size of the font. Default is no value. The font size is defined in points. The values are the same as those of the CSS font-size property.
font-style	Specifies the amount of slant for a font. Default is normal. The values are the same as those of the CSS font-style property.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>Allowed values are:

• normal
• italic
• oblique - Treated the same as italic.</td></tr>
<tr><td>font-variant</td><td>Specifies the variant style of a font. Default is normal. The values are the same as those of the CSS font-variant property. Allowed values are:

• normal
• small-caps</td></tr>
<tr><td>font-weight</td><td>Specifies the thickness of the letters of the font. Default is normal. The values are the same as those of the CSS font-weight property. Allowed values are:

<table>
<tr><th>Value</th><th>Description</th></tr>
<tr><td>normal
lighter
100
200
300
400</td><td>Treated as non-bold.</td></tr>
<tr><td>bold
bolder
500
600
700
800
900</td><td>Treated as bold.</td></tr>
</table>
</td></tr>
<tr><td>mso-text-shadow</td><td>Specifies whether a shadow is applied to the text on a text path. Default is false.</td></tr>
<tr><td>text-decoration</td><td>Specifies the style of text decoration. Default is none. The values are the same as those of the CSS text-decoration property. Allowed values are:

• none
• underline
• overline
• line-through
• blink</td></tr>
<tr><td>v-rotate-letters</td><td>Specifies whether the letters of the text are rotated counterclockwise by 90 degrees. Default is false.</td></tr>
<tr><td>v-same-letter-heights</td><td>Specifies whether all letters will be the same height regardless of initial case. If true, the lowercase letters are stretched to the</td></tr>
</table>
</td></tr>
</table>

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td></td><td>height of the uppercase letters. Default is <code>false</code>.</td></tr>
<tr><td><code>v-text-align</code></td><td>Specifies the alignment of text. Default is <code>left</code>. Allowed values are:
<code>left</code>
<code>right</code>
<code>center</code>
<code>justify</code>
<code>letter-justify</code> - Distributes the extra space between the letters.
<code>stretch-justify</code> - Stretches the letters to fill in the space.</td></tr>
<tr><td><code>v-text-kern</code></td><td>Specifies whether kerning is turned on. Default is <code>false</code>.</td></tr>
<tr><td><code>v-text-reverse</code></td><td>Specifies whether the layout order of rows is reversed. Default is <code>false</code>. This is used for vertical text layout.</td></tr>
<tr><td><code>v-text-spacing-mode</code></td><td>Specifies the mode for letter spacing. Default is <code>tightening</code>. This property determines whether space will be removed between each letter (<code>tightening</code>) or added between each letter (<code>tracking</code>). The amount of letter spacing change is defined by the <code>v-text-spacing</code> property. Allowed values are:
<code>tightening</code>
<code>tracking</code></td></tr>
<tr><td><code>v-text-spacing</code></td><td>Specifies the amount of spacing for text in 100ths of single line spacing. Default is 100.</td></tr>
</table>
The line (§6.1.2.12), polyline (§6.1.2.15) and curve (§6.1.2.3) elements ignore the following properties:
<code>top</code>
<code>left</code>
<code>width</code>
<code>height</code>
The following properties are not inherited by an element that references a shapetype element (§6.1.2.20) via the id attribute:
<code>flip</code>
<code>height</code>
<code>left</code>
<code>margin-left</code>
<code>margin-top</code>
<code>position</code>
<code>rotation</code>
<code>top</code>
</td></tr>
</table>

Attributes	Description
	• visibility • width • z-index The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeDefaults">
   <all minOccurs="0">
      <element ref="v:fill" minOccurs="0"/>
      <element ref="v:stroke" minOccurs="0"/>

   <attribute name="stroke" type="ST_TrueFalse" use="optional"/>
   <attribute name="strokecolor" type="ST_ColorType"/>
   <attribute name="allowincell" form="qualified" type="ST_TrueFalse"/>
</complexType>
```

6.2.2.28 shapelayout (Shape Layout Properties)

This element contains child elements that store information used in the editing and layout of shapes.

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79)

Child Elements	Subclause
idmap (Shape ID Map)	§6.2.2.13
regrouptable (Shape Grouping History)	§6.2.2.22
rules (Rule Set)	§6.2.2.26

Attributes	Description

Attributes	Description
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeLayout">
   <all>
      <element name="idmap" type="CT_IdMap" minOccurs="0"/>
      <element name="regrouptable" type="CT_RegroupTable" minOccurs="0"/>
      <element name="rules" type="CT_Rules" minOccurs="0"/>
   </all>
   <attributeGroup ref="v:AG_Ext"/>
</complexType>
```

6.2.2.29 signatureline (Digital Signature Line)

This element specifies a signature line in a document. A signature line provides a visual representation of a signature in a document that is digitally signed. The signature line element indicates that the VML shape in which it appears acts as that visual representation. Typically, the VML shape is an image.

[*Example:*

```
<v:shape ... >
  <v:imagedata ... />
  <o:signatureline v:ext="edit" id="{11979195-DE54-414B-ABD6-5F63607C648B}"
  provid="{00000000-0000-0000-0000-000000000000}" o:suggestedsigner="John Doe"
  o:suggestedsigner2="Manager" o:suggestedsigneremail=johndoe@example.com
  allowcomments="t" issignatureline="t"/>
</v:shape>
```

The signature line in the document might look like this:

end example]

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description

addlxml (Additional Signature Information)	Specifies an optional string that is used to store additional information about the digital signature. Default is no value. [*Rationale*: Some digital signature software stores, for example, server and region information with the signature. *end rationale*]
	
	[Example:
	
	`<o:signatureline ... o:addlxml="...">`
	`</o:signatureline>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

allowcomments (User-specified Comments Flag)	Specifies whether the user can attach comments to the signature line at signing time. Default is `false`.
	
	[Example:
	
	`<o:signatureline ... allowcomments="true">`
	`</o:signatureline>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).

id (Unique ID)	Specifies a unique ID for the signature line. Default is no value.
	
	[Example:
	
	`<o:signatureline ...`
	`id="{11979195-DE54-414B-ABD6-5F63607C648B}">`

Attributes	Description
	</o:signatureline> end example] The possible values for this attribute are defined by the ST_Guid simple type (§6.2.3.12).
issignatureline (Signature Line Flag)	Specifies whether the image is a signature line. Default is true. [Example: <o:signatureline ... issignatureline="true"> </o:signatureline> end example] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
provid (Signature Provider ID)	Specifies a unique ID identifying which signature provider created the signature line. Default is no value. [*Guidance* The GUID is typically the CLSID of the provider COM add-in. *end guidance*] [Example: <o:signatureline ... provid="{00000000-0000-0000-0000-000000000000}"> </o:signatureline> end example] The possible values for this attribute are defined by the ST_Guid simple type (§6.2.3.12).
showsigndate (Show Signed Date Flag)	Specifies whether the signed signature line image generated should include the date of signing. Default is true. [Example: <o:signatureline ... showsigndate="false"> </o:signatureline> end example] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
signinginstructions (Instructions for Signing)	Specifies text shown to the user at signing time. Default is no value. [Example:

Attributes	Description
	<o:signatureline ... o:signinginstructions="Sign here"> </o:signatureline> end example] The possible values for this attribute are defined by the XML Schema string datatype.
signinginstructionsset (Use Signing Instructions Flag)	Specifies whether there is data set in the signinginstructions attribute. Default is false. [Example: <o:signatureline ... signinginstructionsset="true"> </o:signatureline> end example] The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
sigprovurl (Signature Provider Download URL)	Specifies the URL for downloading the signature provider. Default is no value. [Example: <o:signatureline ... o:sigprovurl="http://www.example.com"> </o:signatureline> end example] The possible values for this attribute are defined by the XML Schema string datatype.
suggestedsigner (Suggested Signer Line 1)	Specifies the first line of information of who should sign the signature line. Default is no value. [Example: <o:signatureline ... o:suggestedsigner="John Doe"> </o:signatureline> end example] The possible values for this attribute are defined by the XML Schema string datatype.
suggestedsigner2 (Suggested Signer Line 2)	Specifies the second line of information of who should sign the signature line. Default is no value. [Example: <o:signatureline ... o:suggestedsigner2="Title"> </o:signatureline>

Attributes	Description
	end example] The possible values for this attribute are defined by the XML Schema string datatype.
suggestedsigneremail (Suggested Signer E-mail Address)	Specifies the e-mail address of who should sign the signature line. Default is no value. [Example: `<o:signatureline ... o:suggestedsigneremail="johndoe@example.com"></o:signatureline>` end example] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SignatureLine">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="issignatureline" type="ST_TrueFalse"/>
   <attribute name="id" type="ST_Guid"/>
   <attribute name="provid" type="ST_Guid"/>
   <attribute name="signinginstructionsset" type="ST_TrueFalse"/>
   <attribute name="allowcomments" type="ST_TrueFalse"/>
   <attribute name="showsigndate" type="ST_TrueFalse"/>
   <attribute name="suggestedsigner" type="xsd:string" form="qualified"/>
   <attribute name="suggestedsigner2" type="xsd:string" form="qualified"/>
   <attribute name="suggestedsigneremail" type="xsd:string" form="qualified"/>
   <attribute name="signinginstructions" type="xsd:string"/>
   <attribute name="addlxml" type="xsd:string"/>
   <attribute name="sigprovurl" type="xsd:string"/>
</complexType>
```

6.2.2.30 skew (Skew Transform)

This element specifies a perspective skew effect on a shape. The skew is applied to vector graphics, not image data on the shape in picture fills or image elements. The on attribute must be true and a valid value assigned to the matrix attribute.

Parent Elements
arc (§6.1.2.1); background (§2.2.1); curve (§6.1.2.3); group (§6.1.2.7); hdrShapeDefaults (§2.15.1.50); image (§6.1.2.10); line (§6.1.2.12); object (§2.3.3.19); oval (§6.1.2.13); pict (§2.3.3.21); pict (§2.9.23); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapedefaults (§6.2.2.27); shapeDefaults (§2.15.1.79); shapetype (§6.1.2.20)

Attributes	Description
ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
id (Skew ID)	Specifies a name that provides a unique identifier for a skew. Default is no value. The possible values for this attribute are defined by the XML Schema string datatype.
matrix (Skew Perspective Matrix)	Specifies a perspective transform of a skew. Default is "1,0,0,1,0,0". The matrix is given in the form "s_{xx}, s_{xy}, s_{yx}, s_{yy}, p_x, p_y" where s = scale and p = perspective. If the offset attribute is in absolute units then p_x, p_y are in 1/EMU units; otherwise they are an inverse fraction of the shape size. The possible values for this attribute are defined by the XML Schema string datatype.
offset (Skew Offset)	Specifies the amount of x,y offset from the shape's location. Default is "2pt,2pt". Positive values are measured from the upper left of the face of the shape. Values are specified as either an absolute measurement or a fractional value of the shape's dimensions (–0.5 to +0.5). The possible values for this attribute are defined by the XML Schema string datatype.
on (Skew Toggle)	Specifies whether a skew is displayed. Default is `false`. The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).
origin (Skew Origin)	Specifies the origin of the skew. Default is "0,0". Values are typically a percentage of the shape's size and range from -0.5 to +0.5. Larger values are allowed that give offsets as multiples of the shape's size. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

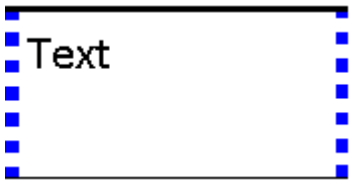
```
<complexType name="CT_Skew">
   <attributeGroup ref="v:AG_Ext"/>
   <attribute name="id" type="xsd:string" use="optional"/>
   <attribute name="on" type="ST_TrueFalse" use="optional"/>
   <attribute name="offset" type="xsd:string" use="optional"/>
   <attribute name="origin" type="xsd:string" use="optional"/>
   <attribute name="matrix" type="xsd:string" use="optional"/>
</complexType>
```

6.2.2.31 top (Text Box Top Stroke)

This element specifies the stroke properties for the top border of a text box. It entirely supercedes its parent stroke element if its on attribute is true. Thus the default value of an unspecified attribute overrides a value specified in the parent. If the on attribute is `false` or not specified, the border is not shown.

[*Example:* The text box borders are set independently. Note that the bottom border does not inherit the weight from the parent stroke element.

```
<v:stroke weight="2.25pt">
  <o:left v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:top v:ext="view" color="black" weight="2.25pt" on="t"/>
  <o:right v:ext="view" dashstyle="1 1" color="blue" weight="5pt" on="t"/>
  <o:bottom v:ext="view" color="black" on="t"/>
  <o:column v:ext="view" color="#f60" on="t"/>
</v:stroke>
```



end example]

Parent Elements
background (§2.2.1); hdrShapeDefaults (§2.15.1.50); object (§2.3.3.19); pict (§2.3.3.21); pict (§2.9.23); shapeDefaults (§2.15.1.79); stroke (§6.1.2.21)

Attributes	Description
althref (Alternate Image Reference)	Specifies an alternate reference for an image in Macintosh PICT format. [*Example:* `<v:stroke ... althref="myimage.pcz" ... ></v:stroke>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
color (Stroke Color)	Specifies the stroke color. Overrides the strokecolor attribute of a shape. Default is `black`. See the fillcolor attribute for a list of supported named colors. [*Example:* The shape stroke is blue:

Attributes	Description
	<v:shape ... strokecolor="red" ... > <v:stroke color="blue"/> </v:shape> *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
color2 (Stroke Alternate Pattern Color)	Specifies a second color for strokes, used when filltype is `pattern`. Default is no value. When a pattern fill is used for the stroke, the stroke color is used in colored parts of the source image. The color2 defines an alternate color to use in place of black in the source image. [*Example:* This unusual example is intended to demonstrate how the image and colors interact to create a patterned stroke. The yellow background shows transparency. The non-square shape and square image create an effective offset. The heavy stroke weight shows more of the image. The green shape fill shows how the stroke is overlaid on the shape. <v:background fillcolor="yellow"/> <v:shape style="width:60;height:50" strokecolor="red" fillcolor="lime" path="m 0,0 l 0,1000 1000,1000 1000,0 x e"> <v:stroke filltype="pattern" weight="10pt" src="myimage.gif" color2="blue"/> </v:shape>  , where myimage.gif is:  *end example*] The possible values for this attribute are defined by the ST_ColorType simple type (§6.2.3.5).
dashstyle (Stroke Dash Pattern)	Specifies the dot and dash pattern for a stroke. Default is `solid`. Pre-defined values are: • `solid` • `shortdash` • `shortdot` • `shortdashdot` • `shortdashdotdot` • `dot`

Attributes	Description

	• dash
	• longdash
	• dashdot
	• longdashdot
	• longdashdotdot
	
	A custom-defined dash pattern may also be specified using a series of numbers. These define the length of the dash (the drawn part of the stroke) and the length of the space between the dashes. The lengths are relative to the line width: a length of 1 is equal to the line width. The endcap style is applied to each dash but the arrow style is not. The string defines the length of the dash then the length of the space. This may be repeated to form complex dash styles. The string should always contain a pair of numbers; if it contains an odd number of numbers the last is disregarded. 0 implies a dot that is fourfold symmetrical (with round end caps, this is a circle).
	
	[*Example:*
	
	`<v:stroke dashstyle="0 2" weight="3pt" endcap="round"></v:stroke>`
	
	 
	
	`<v:stroke dashstyle="longdashdotdot" weight="2pt"></v:stroke>`
	
	 
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

endarrow (Line End Arrowhead)	Specifies an arrowhead for the end of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open [*Example:*

Attributes	Description
	<v:stroke endarrow="classic"/>  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
endarrowlength (Line End Arrowhead Length)	Specifies the length of the arrowhead at the end of a line. Default is `medium`. Allowed values are: • `short` • `medium` • `long` [*Example:* <v:stroke ... endarrowlength="long" ... />  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
endarrowwidth (Line End Arrowhead Width)	Specifies the width of the arrowhead at the end of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* <v:stroke ... endarrowwidth="wide" ... /> 
Attributes	Description
	end example] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).

endcap (Line End Cap)	Specifies the cap style for the end of a stroke. Default is `flat`. Allowed values are:
	
	• `flat`
	• `square`
	• `round`
	
	[*Example:*
	
	`<v:stroke ... endcap="round" weight="10pt" ... />`
	
	 
	`endcap="flat"`
	`endcap="square"`
	`endcap="round"`
	
	end example]
	
	The possible values for this attribute are defined by the ST_StrokeEndCap simple type (§6.1.3.11).

ext (VML Extension Handling Behavior) Namespace: urn:schemas-microsoft-com:vml	Specifies an optional value that indicates how applications that implement VML should interpret extensions not defined as part of the original specification of core VML. [*Rationale*: This part of the original VML specification is included to assist applications that leverage existing VML support in implementing the Office Open XML Format. *end rationale*] The possible values for this attribute are defined by the ST_Ext simple type (§6.1.3.3).
filltype (Stroke Image Style)	Specifies the type of fill used for the background of a stroke. Default is `solid`. Allowed values are: • `solid` - The fill pattern is solid. • `tile` - The fill image is tiled. • `pattern` - The fill image is stretched to form a pattern. • `frame` - The fill image becomes a border for the shape.

Attributes	Description

	[*Example:*
	
	`<v:shape style="width:50;height:50"`
	`  strokecolor="red"`
	`  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">`
	`  <v:stroke filltype="frame" weight="10pt"`
	`  src="border.gif"/>`
	`</v:shape>`
	
	  , where border.gif is: 
	
	end example]
	
	The possible values for this attribute are defined by the ST_FillType simple type (§6.1.3.5).

forcedash (Force Dashed Outline)	Specifies whether a dashed outline is used to draw a shape when a shape has no line or fill. Default is `false`.
	
	Used by PresentationML placeholders to draw a dashed outline when there is no line and no fill for a shape.
	
	[*Example:*
	
	`<v:shape ... o:forcedash="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

href (Original Image Reference)	Specifies the URL to the original image file. Used only if the picture has been linked and embedded. Default is no value.
	
	[*Example:*
	
	`<v:fill ... o:href="myimage.gif" ... >`
	`</v:fill>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

imagealignshape	Specifies the alignment of the stroke image. If `true`, the image is aligned with the shape.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>(Stoke Image Alignment)</td><td>Otherwise, it is aligned with the containing scope. Default is <code>true</code>.

[Example: The top position offset shifts the image alignment relative to the containing window:

<pre>
<v:shape fillcolor="silver"
  style="top:20;width:50;height:50"
  path="m 0,0 l 0,1000 1000,1000 1000,0 x e">
  <v:stroke imagealignshape="false" weight="20pt"
    filltype="tile" src="myimage.gif"/>
</v:shape>
</pre>
 imagealignshape="false"

 imagealignshape="false"

end example]

The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).</td></tr>
<tr><td>imageaspect (Stroke Image Aspect Ratio)</td><td>Specifies how the stroke image aspect ratio is preserved. Default is <code>ignore</code>. Allowed values are:

<table>
<tr><td>Value</td><td>Description</td></tr>
<tr><td><code>ignore</code></td><td>Ignore aspect issues.</td></tr>
<tr><td><code>atleast</code></td><td>Image is at least as big as imagesize.</td></tr>
<tr><td><code>atmost</code></td><td>Image is no bigger than imagesize.</td></tr>
</table>

[Example:

<pre>
<v:stroke filltype="frame" weight="10pt"
  src="border.gif" imagealignshape="true"
  imageaspect="atleast">
</v:stroke>
</pre>
 imagealignshape="ignore"</td></tr>
</table>

Attributes	Description
	 `imagealignshape="atleast"` `imagealignshape="atmost"` *end example*] The possible values for this attribute are defined by the ST_ImageAspect simple type (§6.1.3.6).
imagesize (Stroke Image Size)	Specifies the size of the image for the stroke. Default is the size of the image. [*Example:* `<v:stroke ... imagesize="10pt,10pt" ... />` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

insetpen (Inset Border From Path)	Specifies that the border shall be displayed inside of the path defining the shape, rather than along the path (the default border placement), or outside of the path as might be done with an image.
	
	[*Example:*
	
	`<v:shape ... insetpen="true" ... >`
	`</v:shape>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

joinstyle (Line End Join Style))	Specifies the join style for line ends. Default is round.
	
	• round
	• bevel
	• miter
	
	[*Example:*
	
	`<v:polyline strokeweight="10pt" strokecolor="navy"`
	`points="10pt,10pt,50pt,50pt,90pt,10pt">`
	`<v:stroke joinstyle="bevel"/>`

Attributes	Description
	</v:polyline>  joinstyle="round" joinstyle="bevel" joinstyle="miter" *end example*] The possible values for this attribute are defined by the ST_StrokeJoinStyle simple type (§6.1.3.12).
linestyle (Stroke Line Style)	Specifies the line style of the stroke. Default is single. • single • thinThin • thinThick • thickThin • thickBetweenThin [*Example:* <v:stroke linestyle="thickThin" weight="5pt"> </v:stroke>  *end example*] The possible values for this attribute are defined by the ST_StrokeLineStyle simple type (§6.1.3.13).
miterlimit (Miter Joint Limit)	Specifies the smoothness of the miter joint, or the maximum distance between the inner point and outer point of a joint. This number is a multiple of the thickness of the line. Default is 8. [*Example:* <v:stroke joinstyle="miter" weight="10pt"

Attributes	Description
	<pre> miterlimit="2">
</v:stroke></pre>    *end example*] The possible values for this attribute are defined by the XML Schema decimal datatype.

on (Stroke Toggle)	Specifies whether the stroke is displayed. Default is `true`. This attribute overrides the shape's stroke attribute.
	
	[*Example:*
	
	<pre><v:rect style="width:50;height:50" stroked="true"
	  fillcolor="lime" strokecolor="red">
	  <v:stroke on="false" weight="5pt"/>
	</v:rect></pre>
	 	
	end example]
	
	The possible values for this attribute are defined by the ST_TrueFalse simple type (§6.2.3.23).

opacity (Stroke Opacity)	Specifies the amount of transparency of a stroke. Default is 1.0.
	
	[*Example:*
	
	<pre><v:rect style="width:50;height:50"
	  fillcolor="lime" strokecolor="red">
	  <v:stroke weight="5pt" opacity="50%"/>
	</v:rect></pre>
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

src (Stroke Image Location)	Specifies the source image to load for a stroke fill. Default is no value.

Attributes	Description
	[*Example:* `<v:stroke ... src="myimage.gif" ... ></v:stroke>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
startarrow (Line Start Arrowhead)	Specifies an arrowhead for the start of a line. Default is none. Note that the path must not be closed with the x command for the arrowhead to show. Allowed values are: • none • block • classic • diamond • oval • open [*Example:* `<v:stroke startarrow="classic"/>`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowType simple type (§6.1.3.9).
startarrowlength (Line Start Arrowhead Length)	Specifies the length of the arrowhead at the start of a line. Default is medium. Allowed values are: • short • medium • long [*Example:* `<v:stroke ... startarrowlength="long" ... />`  *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_StrokeArrowLength simple type (§6.1.3.8).
startarrowwidth (Line Start Arrowhead Width)	Specifies the width of the arrowhead at the start of a line. Default is `medium`. Allowed values are: • `narrow` • `medium` • `wide` [*Example:* `<v:stroke ... startarrowwidth="wide" ... />`  *end example*] The possible values for this attribute are defined by the ST_StrokeArrowWidth simple type (§6.1.3.10).
title (Stroke Title)	Specifies the title of an embedded stroke image. This is typically set to the comment property of the image, which is often blank. [*Example:* `<v:fill ... o:title="alt text" ... ></v:fill>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
weight (Stroke Weight)	Specifies the thickness of a stroke. Default is 1. This attribute overrides the shape's strokeweight attribute. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrokeChild">
    <attributeGroup ref="v:AG_Ext"/>
    <attribute name="on" type="ST_TrueFalse" use="optional"/>
    <attribute name="weight" type="xsd:string" use="optional"/>
    <attribute name="color" type="ST_ColorType" use="optional"/>
    <attribute name="color2" type="ST_ColorType" use="optional"/>
    <attribute name="opacity" type="xsd:string" use="optional"/>
    <attribute name="linestyle" type="v:ST_StrokeLineStyle" use="optional"/>
    <attribute name="miterlimit" type="xsd:decimal" use="optional"/>
    <attribute name="joinstyle" type="v:ST_StrokeJoinStyle" use="optional"/>
    <attribute name="endcap" type="v:ST_StrokeEndCap" use="optional"/>
    <attribute name="dashstyle" type="xsd:string" use="optional"/>
    <attribute name="insetpen" type="ST_TrueFalse" use="optional"/>
    <attribute name="filltype" type="v:ST_FillType" use="optional"/>
    <attribute name="src" type="xsd:string" use="optional"/>
    <attribute name="imageaspect" type="v:ST_ImageAspect" use="optional"/>
    <attribute name="imagesize" type="xsd:string" use="optional"/>
    <attribute name="imagealignshape" type="ST_TrueFalse" use="optional"/>
    <attribute name="startarrow" type="v:ST_StrokeArrowType" use="optional"/>
    <attribute name="startarrowwidth" type="v:ST_StrokeArrowWidth" use="optional"/>
    <attribute name="startarrowlength" type="v:ST_StrokeArrowLength" use="optional"/>
    <attribute name="endarrow" type="v:ST_StrokeArrowType" use="optional"/>
    <attribute name="endarrowwidth" type="v:ST_StrokeArrowWidth" use="optional"/>
    <attribute name="endarrowlength" type="v:ST_StrokeArrowLength" use="optional"/>
    <attribute ref="href"/>
    <attribute ref="althref"/>
    <attribute ref="title"/>
    <attribute ref="forcedash"/>
</complexType>
```

6.2.3 Simple Types

This is the complete list of simple types in the urn:schemas-microsoft-com:office:office namespace.

6.2.3.1 ST_Angle (Callout Angles)

This simple type specifies values for the angle attribute of the callout element (§6.2.2.2).

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
30 (30 degrees)	30 degrees.
45 (45 degrees)	45 degrees.
60 (60 degrees)	60 degrees.
90 (90 degrees)	90 degrees.
any (Any Angle)	Unconstrained angle.

Enumeration Value	Description
auto (Automatic Angle)	The application chooses an appropriate angle.

Referenced By
callout@angle (§6.2.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Angle">
   <restriction base="xsd:string">
      <enumeration value="any"/>
      <enumeration value="30"/>
      <enumeration value="45"/>
      <enumeration value="60"/>
      <enumeration value="90"/>
      <enumeration value="auto"/>
   </restriction>
</simpleType>
```

6.2.3.2 ST_BWMode (Black And White Modes)

This simple type specifies the ways in which a shape renders in a black and white context.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatic)	Use the bwpure or bwnormal attributes based on the type of output being generated.
black (Black)	Use black only.
blackTextAndLines (Black Text And Lines)	Use shades of gray, except for text and lines, which are black.
color (Color)	Do not use grayscale or black and white.
grayOutline (Gray Outlines)	Use gray and white only.
grayScale (Grayscale)	Use shades of gray only.
hide (Hide Object When Displayed in Black and White)	Do not display the object when rendering in only black and white.
highContrast (Black And White)	Use black and white only, no grays.
inverseGray (Inverse Grayscale)	Use shades of gray only, but invert light and dark grays.
lightGrayscale (Light grayscale)	Use light shades of gray only.
undrawn (Do Not Show)	Do not show the object.

Enumeration Value	Description
white (White)	Use white only.

Referenced By
arc@bwmode (§6.1.2.1); arc@bwnormal (§6.1.2.1); arc@bwpure (§6.1.2.1); background@bwmode (§6.1.2.2); background@bwnormal (§6.1.2.2); background@bwpure (§6.1.2.2); curve@bwmode (§6.1.2.3); curve@bwnormal (§6.1.2.3); curve@bwpure (§6.1.2.3); image@bwmode (§6.1.2.10); image@bwnormal (§6.1.2.10); image@bwpure (§6.1.2.10); line@bwmode (§6.1.2.12); line@bwnormal (§6.1.2.12); line@bwpure (§6.1.2.12); oval@bwmode (§6.1.2.13); oval@bwnormal (§6.1.2.13); oval@bwpure (§6.1.2.13); polyline@bwmode (§6.1.2.15); polyline@bwnormal (§6.1.2.15); polyline@bwpure (§6.1.2.15); rect@bwmode (§6.1.2.16); rect@bwnormal (§6.1.2.16); rect@bwpure (§6.1.2.16); roundrect@bwmode (§6.1.2.17); roundrect@bwnormal (§6.1.2.17); roundrect@bwpure (§6.1.2.17); shape@bwmode (§6.1.2.19); shape@bwnormal (§6.1.2.19); shape@bwpure (§6.1.2.19); shapetype@bwmode (§6.1.2.20); shapetype@bwnormal (§6.1.2.20); shapetype@bwpure (§6.1.2.20)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BWMode">
   <restriction base="xsd:string">
      <enumeration value="color"/>
      <enumeration value="auto"/>
      <enumeration value="grayScale"/>
      <enumeration value="lightGrayscale"/>
      <enumeration value="inverseGray"/>
      <enumeration value="grayOutline"/>
      <enumeration value="highContrast"/>
      <enumeration value="black"/>
      <enumeration value="white"/>
      <enumeration value="hide"/>
      <enumeration value="undrawn"/>
      <enumeration value="blackTextAndLines"/>
   </restriction>
</simpleType>
```

6.2.3.3 ST_CalloutDrop (Callout Drop Location)

This simple type specifies location values for the drop attribute of the callout element (§6.2.2.2).

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
callout@drop (§6.2.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CalloutDrop">
   <restriction base="xsd:string"/>
</simpleType>
```

6.2.3.4 ST_ColorMode (Extrusion Color Types)

This simple type specifies ways that the extrusion color is defined.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Use Shape Fill Color)	Specifies that the color of the extrusion is the same as the fill color of the shape.
custom (Use Custom Color)	Specifies that the extrusion is the color of the color attribute.

Referenced By
extrusion@colormode (§6.2.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ColorMode">
    <restriction base="xsd:string">
        <enumeration value="auto"/>
        <enumeration value="custom"/>
    </restriction>
</simpleType>
```

6.2.3.5 ST_ColorType (Color Type)

This simple type specifies a color. Colors are specified in one of three ways - named color, hexadecimal RGB or color palette entry. One of two optional descriptors may follow the color and a space: a number in square brackets or a recoloring instruction. [*Rationale:* An application might store the color's index in a system color palette using the numeric storage. An application might choose to make one color dependent on another using a recoloring instruction. *end rationale*] In cases where it is appropriate for an application to indicate that no color exists, the value none may be used.

A named color is specified using the name of the color. The following named colors are supported:

- Black (#000000)
- Silver (#C0C0C0)
- Gray (#808080)
- White (#FFFFFF)
- Maroon (#800000)
- Red (#FF0000)
- Purple (#800080)
- Fuchsia (#FF00FF)
- Green (#008000)
- Lime (#00FF00)

- Olive (#808000)
- Yellow (#FFFF00)
- Navy (#000080)
- Blue (#0000FF)
- Teal (#008080)
- Aqua (#00FFFF)

[*Example:*

```
<... color="red" ... >
```

end example]

Hexadecimal RGB is specified using a hash symbol (#) followed by six hexadecimal characters, where each pair represents the red, green and blue component of the color.

[*Example:*

```
<... color="#5f2726" ... >
```

end example]

Hexadecimal RGB is also optionally be specified using a hash symbol followed by three hexadecimal characters, where each character stands in for two characters in each of the red, green and blue components. For clarity, applications should use the full six character representation rather than this short form.

[*Example:* The following two representations are equivalent:

```
<... color="ff4400" ... >
<... color="f40" ... >
```

end example]

A color palette entry is specified using the name of the color in the palette.

[*Example:* This example also demonstrates the optional numeric storage:

```
<... color="buttonFace [67]" ... >
```

end example]

Recoloring instructions indicate that the given color is to be modified a particular amount. The instruction consists of a named instruction followed by the amount, a number in the range 0-255, in parenthesis. There are no required implementations for these recoloring instructions - applications are free to implement their own versions of each. A particular implementation should achieve the result implied by the instruction name. The instructions are:

- darken

- lighten
- add
- subtract
- reverseSubtract
- blackWhite
- invert
- invert128
- grayScale

[Example: The color is darker than the fill color by 50 units:

```
<... color="fill darken(50)">
```

end example]

This simple type's contents are a restriction of the XML Schema string datatype.

bottom@color (§6.2.2.1); bottom@color2 (§6.2.2.1); colormenu@extrusioncolor (§6.2.2.4); colormenu@fillcolor (§6.2.2.4); colormenu@shadowcolor (§6.2.2.4); colormenu@strokecolor (§6.2.2.4); column@color (§6.2.2.6); column@color2 (§6.2.2.6); extrusion@color (§6.2.2.10); left@color (§6.2.2.15); left@color2 (§6.2.2.15); right@color (§6.2.2.25); right@color2 (§6.2.2.25); shapedefaults@fillcolor (§6.2.2.27); shapedefaults@strokecolor (§6.2.2.27); top@color (§6.2.2.31); top@color2 (§6.2.2.31)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ColorType">
   <restriction base="xsd:string"/>
</simpleType>
```

6.2.3.6 ST_ConnectorType (Connector Type)

This simple type specifies types of connectors.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
curved (Curved Connector)	A curved connector.
elbow (Elbow Connector)	An elbow-shaped connector.
none (No Connector)	No connector.
straight (Straight Connector)	A straight connector.

Referenced By
arc@connectortype (§6.1.2.1); curve@connectortype (§6.1.2.3); image@connectortype (§6.1.2.10);

Referenced By
line@connectortype (§6.1.2.12); oval@connectortype (§6.1.2.13); polyline@connectortype (§6.1.2.15); rect@connectortype (§6.1.2.16); roundrect@connectortype (§6.1.2.17); shape@connectortype (§6.1.2.19); shapetype@connectortype (§6.1.2.20)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConnectorType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="straight"/>
      <enumeration value="elbow"/>
      <enumeration value="curved"/>
   </restriction>
</simpleType>
```

6.2.3.7 ST_ConnectType (Connection Locations Type)

This simple type specifies types of connection locations.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
custom (Custom Connections)	A custom array of connection locations.
none (No)	No connection locations.
rect (Four Connections)	Standard four connection points at midpoints of top, bottom, left, and right sides.
segments (Edit Point Connections)	The edit points of the shape are used. Edit points are the black dots in a graphical editor that are used to select parts of a shape.

Referenced By
path@connecttype (§6.1.2.14)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConnectType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="rect"/>
      <enumeration value="segments"/>
      <enumeration value="custom"/>
   </restriction>
</simpleType>
```

6.2.3.8 ST_ExtrusionPlane (Extrusion Planes)

This simple type specifies three axis-aligned planes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
XY (XY Plane)	The xy plane.
YZ (YZ Plane)	The yz plane.
ZX (ZX Plane)	The zx plane.

Referenced By
extrusion@plane (§6.2.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ExtrusionPlane">
   <restriction base="xsd:string">
      <enumeration value="XY"/>
      <enumeration value="ZX"/>
      <enumeration value="YZ"/>
   </restriction>
</simpleType>
```

6.2.3.9 ST_ExtrusionRender (Extrusion Rendering Types)

This simple type specifies different rendering modes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
boundingCube (Bounding Cube)	Rendering displays the bounding cube that contains the shape.
solid (Solid)	Rendering displays a solid shape.
wireFrame (Wireframe)	Rendering displays a wireframe shape.

Referenced By
extrusion@render (§6.2.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ExtrusionRender">
   <restriction base="xsd:string">
      <enumeration value="solid"/>
      <enumeration value="wireFrame"/>
      <enumeration value="boundingCube"/>
   </restriction>
</simpleType>
```

6.2.3.10 ST_ExtrusionType (Extrusion Type)

This simple type specifies types of extrusions.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
parallel (Parallel Projection)	Extrusion is rendered so that the center of projection is infinitely far away; the extrusion lines do not converge.
perspective (Perspective Projection)	Extrusion is rendered to a center of projection, which is the same as the vanishing point for unrotated objects.

Referenced By
extrusion@type (§6.2.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ExtrusionType">
   <restriction base="xsd:string">
      <enumeration value="perspective"/>
      <enumeration value="parallel"/>
   </restriction>
</simpleType>
```

6.2.3.11 ST_FillType (Shape Fill Type)

This simple type specifies the types for fills applied to a shape.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
background (Use Background Fill)	Use the fill properties of the background of the object on which the shape exists, such as the page.

Enumeration Value	Description
frame (Stretch Image to Fit)	The image is stretched to fill the shape. 
gradient (Linear Gradient)	The fill colors blend together in a linear gradient from bottom to top. 
gradientCenter (Centered Radial Gradient)	This indicates that the gradient runs across the center of the shape for a gradient that is defined as `gradientRadial` in the parent fill element (§6.1.2.5) that is defined in the VML namespace.
gradientRadial (Radial Gradient)	The fill colors blend together in a radial gradient. 
gradientUnscaled (Unscaled Gradient)	The gradient angle is not scaled relative to the aspect ratio of the shape. For example, the shapes below are twice as wide as they are tall. The first shape uses an unscaled gradient and the second uses a regular scaled gradient: pattern (Image Pattern)	The image is used to create a pattern using the fill colors. 
solid (Solid Fill)	The fill pattern is a solid color. 
tile (Tiled Image)	The fill image is tiled. 

Referenced By
fill@type (§6.2.2.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FillType">
   <restriction base="xsd:string">
      <enumeration value="gradientCenter"/>
      <enumeration value="solid"/>
      <enumeration value="pattern"/>
      <enumeration value="tile"/>
      <enumeration value="frame"/>
      <enumeration value="gradientUnscaled"/>
      <enumeration value="gradientRadial"/>
      <enumeration value="gradient"/>
      <enumeration value="background"/>
   </restriction>
</simpleType>
```

6.2.3.12 ST_Guid (128-Bit GUID)

This simple type specifies a 128 bit GUID.

This simple type's contents are a restriction of the XML Schema token datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: \{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}.

Referenced By
signatureline@id (§6.2.2.29); signatureline@provid (§6.2.2.29)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Guid">
   <restriction base="xsd:token">
      <pattern value="\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}"/>
   </restriction>
</simpleType>
```

6.2.3.13 ST_How (Alignment Type)

This simple type specifies types of alignment.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bottom (Bottom Alignment)	Bottom vertical alignment.

Enumeration Value	Description
center (Center Alignment)	Center horizontal alignment.
left (Left Alignment)	Left horizontal alignment.
middle (Middle Alignment)	Middle vertical alignment.
right (Right Alignment)	Right horizontal alignment.
top (Top Alignment)	Top vertical alignment.

Referenced By
r@how (§6.2.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_How">
   <restriction base="xsd:string">
      <enumeration value="top"/>
      <enumeration value="middle"/>
      <enumeration value="bottom"/>
      <enumeration value="left"/>
      <enumeration value="center"/>
      <enumeration value="right"/>
   </restriction>
</simpleType>
```

6.2.3.14 ST_HrAlign (Alignment Type)

This simple type specifies alignments for horiztonal rules.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center Alignment)	Center aligned.
left (Left Alignment)	Left aligned.
right (Right Alignment)	Right aligned.

Referenced By
arc@hralign (§6.1.2.1); curve@hralign (§6.1.2.3); group@hralign (§6.1.2.7); image@hralign (§6.1.2.10); line@hralign (§6.1.2.12); oval@hralign (§6.1.2.13); polyline@hralign (§6.1.2.15); rect@hralign (§6.1.2.16); roundrect@hralign (§6.1.2.17); shape@hralign (§6.1.2.19); shapetype@hralign (§6.1.2.20)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HrAlign">
   <restriction base="xsd:string">
      <enumeration value="left"/>
      <enumeration value="right"/>
      <enumeration value="center"/>
   </restriction>
</simpleType>
```

6.2.3.15 ST_InsetMode (Inset Margin Type)

This simple type specifies how inner text margins are obtained.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatic Margins)	Inner text margins are calculated by the application.
custom (Custom Margins)	Inner text margins are specified by the shape.

Referenced By
arc@insetmode (§6.1.2.1); curve@insetmode (§6.1.2.3); group@insetmode (§6.1.2.7); image@insetmode (§6.1.2.10); line@insetmode (§6.1.2.12); oval@insetmode (§6.1.2.13); polyline@insetmode (§6.1.2.15); rect@insetmode (§6.1.2.16); roundrect@insetmode (§6.1.2.17); shape@insetmode (§6.1.2.19); shapetype@insetmode (§6.1.2.20); textbox@insetmode (§6.1.2.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_InsetMode">
   <restriction base="xsd:string">
      <enumeration value="auto"/>
      <enumeration value="custom"/>
   </restriction>
</simpleType>
```

6.2.3.16 ST_OLEDrawAspect (OLE Object Representations)

This simple type specifies the ways in which OLE objects are displayed in the application.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
Content (Snapshot)	The object's presentation is a picture of the contained document (provided by the OLE server application).
Icon (Icon)	The object's presentation is an icon.

Referenced By
OLEObject@DrawAspect (§6.2.2.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OLEDrawAspect">
   <restriction base="xsd:string">
      <enumeration value="Content"/>
      <enumeration value="Icon"/>
   </restriction>
</simpleType>
```

6.2.3.17 ST_OLELinkType (Embedded Object Alternate Image Request Types)

This simple type specifies the type of image that shall be requested from the application which hosts embedded object data for a linked object.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
Bitmap (Bitmap Image)	Specifies that a bitmap shall be requested.
EnhancedMetaFile (Enhanced Metafile Image)	Specifies that an enhanced metafile shall be requested.
Picture (Other Image)	Specifies that any image format may be requested.

Referenced By
LinkType (§6.2.2.16)

6.2.3.18 ST_OLEType (OLE Connection Type)

This simple type specifies whether an OLE object is included in the package (that is, embedded) or is stored outside the package (that is, linked).

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
Embed (Embedded Object)	Embedded object.
Link (Linked Object)	Linked object.

Referenced By
OLEObject@Type (§6.2.2.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OLEType">
   <restriction base="xsd:string">
      <enumeration value="Embed"/>
      <enumeration value="Link"/>
   </restriction>
</simpleType>
```

6.2.3.19 ST_OLEUpdateMode (OLE Update Method Type)

This simple type specifies how an OLE object is updated.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
Always (Server Application Update)	The object is updated whenever the OLE server application indicates there is new data available.
OnCall (User Update)	The object is updated when the user chooses to update it.

Referenced By
OLEObject@UpdateMode (§6.2.2.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OLEUpdateMode">
   <restriction base="xsd:string">
      <enumeration value="Always"/>
      <enumeration value="OnCall"/>
   </restriction>
</simpleType>
```

6.2.3.20 ST_RelationshipId (Explicit Relationship ID)

This simple type specifies the relationship ID in a part's relationship item which is the target of an explicit relationship from the parent XML element. This simple type is an exact analog of ST_RelationshipId defined in the http://schemas.openxmlformats.org/officeDocument/2006/relationships namespace

The type of relationship which shall be the target of the relationship specified shall be determined based on the context of the parent XML element.

[*Example*: Consider the following markup in an Office Open XML document:

```
<… o:relid="rId5" />
```

The relid attribute is of type ST_RelationshipID, and therefore the relationship with ID `rId5` shall be the target of an explicit relationship from the source part, based on the context of the parent XML element. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
fill@relid (§6.1.2.5); imagedata@relid (§6.1.2.11); stroke@relid (§6.1.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RelationshipId">
   <restriction base="xsd:string"/>
</simpleType>
```

6.2.3.21 ST_RType (Rule Type)

This simple type specifies types of rules.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
align (Alignment Rule)	Alignment rule.
arc (Arc Rule)	Arc rule.
callout (Callout Rule)	Callout rule.
connector (Connector Rule)	Connector rule.

Referenced By
r@type (§6.2.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RType">
   <restriction base="xsd:string">
      <enumeration value="arc"/>
      <enumeration value="callout"/>
      <enumeration value="connector"/>
      <enumeration value="align"/>
   </restriction>
</simpleType>
```

6.2.3.22 ST_ScreenSize (Screen Sizes Type)

This simple type specifies screen sizes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1024,768 (1024x768 pixels)	1024x768 pixels.
1152,862 (1152x862 pixels)	1152x862 pixels.
544,376 (544x376 pixels)	544x376 pixels.
640,480 (640x480 pixels)	640x480 pixels.
720,512 (720x512 pixels)	720x512 pixels.
800,600 (800x600 pixels)	800x600 pixels.

Referenced By
background@targetscreensize (§6.1.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ScreenSize">
   <restriction base="xsd:string">
      <enumeration value="544,376"/>
      <enumeration value="640,480"/>
      <enumeration value="720,512"/>
      <enumeration value="800,600"/>
      <enumeration value="1024,768"/>
      <enumeration value="1152,862"/>
   </restriction>
</simpleType>
```

6.2.3.23 ST_TrueFalse (Boolean Value)

This simple type specifies logical true and false.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
f (False)	Logical false.
false (False)	Logical false.
t (True)	Logical true.
true (True)	Logical true.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TrueFalse">
   <restriction base="xsd:string">
      <enumeration value="t"/>
      <enumeration value="f"/>
      <enumeration value="true"/>
      <enumeration value="false"/>
   </restriction>
</simpleType>
```

6.2.3.24 ST_TrueFalseBlank (Boolean Value with Blank [False] State)

This simple type specifies a boolean value with a third state, using a blank attribute, which specifies that the value be `false`.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
(Blank – Logical False)	Logical false.

Enumeration Value	Description
f (Logical False)	Logical false.
false (Logical False)	Logical false.
t (Logical True)	Logical true.
true (Logical True)	Logical true.

6.3 VML - WordprocessingML Drawing

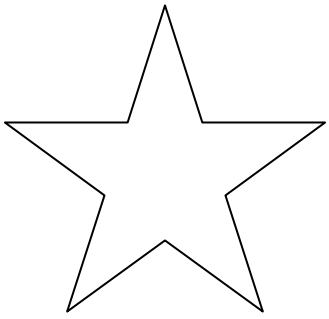
Within a WordprocessingML document, it is possible to include graphical VML objects. When these objects are present in a word processing document, it is necessary to include information about the object which is specific to their presence in a word processing document.

[*Note*: The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a deprecated format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML .*end note*]

The VML WordprocessingML Drawing namespace acts in this capacity, specifying all information necessary to anchor and display VML objects within a word processing document.

All elements defined in this subclause shall only appear in a WordprocessingML document.

[*Example*: Consider a 5-point star added to a WordprocessingML document, for example:



This object allows surrounding text to wrap around its top and bottom, but not to either side, so this interaction with the surrounding document text (which is specific to a word processing document) is stored in the WordprocessingML Drawing namespace as follows:

```
<v:shape … >
  …
  <wd:wrap wd:type="topAndBottom" />
</v:shape>
```

The wrap element specifies how surrounding WordprocessingML document content shall wrap around the floating VML object - in this case, by wrapping to its top and bottom extents via the type attribute value of `topAndBottom`. *end example*]

6.3.1 Table of Contents

This subclause is informative.

End of informative text.

6.3.2 Elements

The following elements comprise the contents of the urn:schemas-microsoft-com:office:word namespace:

[*Note*: As the VML format is a format provided for backward compatibility, those VML elements defined in the same urn:schemas-microsoft-com:office:word namespace will remain in that namespace is it is already used by millions of documents already using VML. *end note*]

6.3.2.1 anchorlock (Anchor Location Is Locked)

This element specifies that the anchor location for this object shall not be modified at runtime when an application edits the contents of this document. [*Guidance*: An application might have automatic behaviors which reposition the anchor for a VML object based on user interaction - for example, moving it from one page to another as needed. This element shall tell applications not to perform any such behaviors. *end guidance*]

If this element is omitted, then the anchor shall not be locked for the parent VML object.

[*Example*: Consider a floating VML object which shall have its anchor locked at the current location. This setting would be specified as follows:

```
<wd:anchorLock/>
```

The anchorLock element's presence specifies that the VML object's current anchor location shall not be changed by applications editing this content. *end example*].

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnchorLock"/>
```

6.3.2.2 borderbottom (Bottom Border)

This element specifies the properties for the bottom border of a VML object.

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description
shadow (Border shadow)	Specifies whether this border should be modified to create the appearance of a shadow. For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the left and top borders, this is accomplished by moving the border down and to the right of its original location. If this attribute is omitted, then the border is not given the shadow effect. [*Example*: Consider a top border which shall appear with a shadow effect, resulting in the following content: `<wd:bordertop wd:shadow="true" ... />` This element's shadow attribute is `true`, indicating that the shadow effect shall be applied to the border. *end example*] The possible values for this attribute are defined by the ST_BorderShadow simple type (§6.3.3.1).
type (Border Style)	Specifies the style of border used on this object. See the simple type definition for a description of each border style.

Attributes	Description
	[*Example*: Consider a left border resulting in the following WordprocessingML: `<wd:borderleft wd:type="single" …/>` This border's type is `single`, indicating that the border style is a single line. *end example*] The possible values for this attribute are defined by the ST_BorderType simple type (§6.3.3.2).

width (Border Width)	Specifies the width of the current border.
	
	The width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.
	
	[*Example*: Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:
	
	`<wd:bordertop wd:type="dashed" wd:width="24" …/>`
	`<wd:borderleft wd:type="dashed" wd:width="24" …/>`
	`<wd:borderbottom wd:type="dashed" wd:width="24" …/>`
	`<wd:borderright wd:type="dashed" wd:width="24" …/>`
	
	The width attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). *end example*]
	
	The possible values for this attribute are defined by the XML Schema positiveInteger datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
   <attribute name="type" type="ST_BorderType" use="optional"/>
   <attribute name="width" type="xsd:positiveInteger" use="optional"/>
   <attribute name="shadow" type="ST_BorderShadow" use="optional"/>
</complexType>
```

6.3.2.3 borderleft (Left Border)

This element represents the properties for the left border of a VML object.

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description

Attributes	Description
shadow (Border shadow)	Specifies whether this border should be modified to create the appearance of a shadow. For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the left and top borders, this is accomplished by moving the border down and to the right of its original location. If this attribute is omitted, then the border is not given the shadow effect. [*Example*: Consider a top border which shall appear with a shadow effect, resulting in the following content: `<wd:bordertop wd:shadow="true" ... />` This element's shadow attribute is `true`, indicating that the shadow effect shall be applied to the border. *end example*] The possible values for this attribute are defined by the ST_BorderShadow simple type (§6.3.3.1).
type (Border Style)	Specifies the style of border used on this object. See the simple type definition for a description of each border style. [*Example*: Consider a left border resulting in the following WordprocessingML: `<wd:borderleft wd:type="single" …/>` This border's type is `single`, indicating that the border style is a single line. *end example*] The possible values for this attribute are defined by the ST_BorderType simple type (§6.3.3.2).

width (Border Width)	Specifies the width of the current border.
	
	The width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.
	
	[*Example*: Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:
	
	`<wd:bordertop wd:type="dashed" wd:width="24" …/>`
	`<wd:borderleft wd:type="dashed" wd:width="24" …/>`
	`<wd:borderbottom wd:type="dashed" wd:width="24" …/>`
	`<wd:borderright wd:type="dashed" wd:width="24" …/>`
	
	The width attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). *end example*]

Attributes	Description
	The possible values for this attribute are defined by the XML Schema positiveInteger datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
   <attribute name="type" type="ST_BorderType" use="optional"/>
   <attribute name="width" type="xsd:positiveInteger" use="optional"/>
   <attribute name="shadow" type="ST_BorderShadow" use="optional"/>
</complexType>
```

6.3.2.4 borderright (Right Border)

This element specifies the properties for the right border of a VML object.

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description
shadow (Border shadow)	Specifies whether this border should be modified to create the appearance of a shadow. For the right and bottom borders, this is accomplished by duplicating the border below and right of the normal border location. For the left and top borders, this is accomplished by moving the border down and to the right of its original location. If this attribute is omitted, then the border is not given the shadow effect. [*Example*: Consider a top border which shall appear with a shadow effect, resulting in the following content: `<wd:bordertop wd:shadow="true" ... />` This element's shadow attribute is `true`, indicating that the shadow effect shall be applied to the border. *end example*] The possible values for this attribute are defined by the ST_BorderShadow simple type (§6.3.3.1).
type (Border Style)	Specifies the style of border used on this object. See the simple type definition for a description of each border style. [*Example*: Consider a left border resulting in the following WordprocessingML:

Attributes	Description
	<wd:borderleft wd:type="single" …/> This border's type is single, indicating that the border style is a single line. *end example*] The possible values for this attribute are defined by the ST_BorderType simple type (§6.3.3.2).
width (Border Width)	Specifies the width of the current border. The width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value. [*Example*: Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup: <wd:bordertop wd:type="dashed" wd:width="24" …/> <wd:borderleft wd:type="dashed" wd:width="24" …/> <wd:borderbottom wd:type="dashed" wd:width="24" …/> <wd:borderright wd:type="dashed" wd:width="24" …/> The width attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). *end example*] The possible values for this attribute are defined by the XML Schema positiveInteger datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
   <attribute name="type" type="ST_BorderType" use="optional"/>
   <attribute name="width" type="xsd:positiveInteger" use="optional"/>
   <attribute name="shadow" type="ST_BorderShadow" use="optional"/>
</complexType>
```

6.3.2.5 bordertop (Top Border)

This element specifies the properties for the top border of a VML object.

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description
shadow (Border shadow)	Specifies whether this border should be modified to create the appearance of a shadow. For the right and bottom borders, this is accomplished by duplicating the border below

Attributes	Description
	and right of the normal border location. For the left and top borders, this is accomplished by moving the border down and to the right of its original location. If this attribute is omitted, then the border is not given the shadow effect. [*Example*: Consider a top border which shall appear with a shadow effect, resulting in the following content: `<wd:bordertop wd:shadow="true" ... />` This element's shadow attribute is `true`, indicating that the shadow effect shall be applied to the border. *end example*] The possible values for this attribute are defined by the ST_BorderShadow simple type (§6.3.3.1).
type (Border Style)	Specifies the style of border used on this object. See the simple type definition for a description of each border style. [*Example*: Consider a left border resulting in the following WordprocessingML: `<wd:borderleft wd:type="single" …/>` This border's type is `single`, indicating that the border style is a single line. *end example*] The possible values for this attribute are defined by the ST_BorderType simple type (§6.3.3.2).

width (Border Width)	Specifies the width of the current border.
	
	The width of this border is specified in measurements of eighths of a point, with a minimum value of two (one-fourth of a point) and a maximum value of 96 (twelve points). Any values outside this range may be reassigned to a more appropriate value.
	
	[*Example*: Consider a document with a three point wide dashed line border on all sides, resulting in the following WordprocessingML markup:
	
	`<wd:bordertop wd:type="dashed" wd:width="24" …/>`
	`<wd:borderleft wd:type="dashed" wd:width="24" …/>`
	`<wd:borderbottom wd:type="dashed" wd:width="24" …/>`
	`<wd:borderright wd:type="dashed" wd:width="24" …/>`
	
	The width attribute specifies the size in eighths of a point (24 eighths of a point = 3 points). *end example*]
	
	The possible values for this attribute are defined by the XML Schema positiveInteger datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Border">
   <attribute name="type" type="ST_BorderType" use="optional"/>
   <attribute name="width" type="xsd:positiveInteger" use="optional"/>
   <attribute name="shadow" type="ST_BorderShadow" use="optional"/>
</complexType>
```

6.3.2.6 wrap (Text Wrapping)

This element specifies the type of text wrapping which should be allowed around the contents of this VML object.

If this element is omitted, then no text wrapping shall be performed (i.e. the object shall be presented in line with text).

[*Example*: Consider the following VML object:

```
<v:shape … >
  …
  <wd:wrap wd:type="square" />
```

The wrap element specifies how surrounding WordprocessingML document content shall wrap around the floating VML object - in this case, by wrapping around its extents in a square via the type attribute value of `square`. *end example*].

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description
anchorx (Horizontal Positioning Base)	Specifies the base object from which the horizontal positioning of the object should be calculated. A VML object may be horizontally positioned relative to: • The vertical edge of the page before any runs of text (the left edge for left-to-right paragraphs, the right edge for right-to-left paragraphs) • The vertical edge of the text margin before any runs of text (the left edge for left-to-right paragraphs, the right edge for right-to-left paragraphs) • The vertical edge of the text in the paragraph containing the VML object • The position of anchor for the floating VML object in the text. If this attribute is omitted, then its value shall be assumed to be page. [*Example*: Consider a VML object which should be positioned relative to the page edges, which would be specified as follows:

Attributes	Description
	<wd:wrap wd:anchorx="page" wd:anchory="page" /> The anchorx attribute specifies that horizontal anchoring is relative to the edge of the page. *end example*] The possible values for this attribute are defined by the ST_HorizontalAnchor simple type (§6.3.3.3).
anchory (Vertical Positioning Base)	Specifies the base object from which the vertical positioning of the object should be calculated. A VML object may be vertically positioned relative to: • The horizontal top edge of the page • The horizontal edge of the top text margin before any runs of text • The horizontal top edge of line containing the VML object • The horizontal top edge of the paragraph containing the text. If this attribute is omitted, then its value shall be assumed to be page. [*Example*: Consider a VML object which should be positioned relative to the page edges, which would be specified as follows: <wd:wrap wd:anchorx="page" wd:anchory="page" /> The anchory attribute specifies that horizontal anchoring is relative to the edge of the page. *end example*] The possible values for this attribute are defined by the ST_VerticalAnchor simple type (§6.3.3.4).
side (Wrapping side)	Specifies how text shall wrap around the object's left and right sides. [*Example*: Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows: <wd:wrap side="left" … /> The side attribute value of `left` specifies that text shall only wrap around the left side of the object. *end example*] The possible values for this attribute are defined by the ST_WrapSide simple type (§6.3.3.5).
type (Wrapping type)	Specifies the type of wrapping - see the simple type definition for a description of each type. [*Example*: Consider the following VML object:

Attributes	Description
	<v:shape … > … <wd:wrap wd:type="topAndBottom" /> The wrap element specifies how surrounding WordprocessingML document content shall wrap around the floating VML object - in this case, by wrapping around its top and bottom extents via the type attribute value of topAndBottom. *end example*] The possible values for this attribute are defined by the ST_WrapType simple type (§6.3.3.6).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Wrap">
   <attribute name="type" type="ST_WrapType" use="optional"/>
   <attribute name="side" type="ST_WrapSide" use="optional"/>
   <attribute name="anchorx" type="ST_HorizontalAnchor" use="optional"/>
   <attribute name="anchory" type="ST_VerticalAnchor" use="optional"/>
</complexType>
```

6.3.3 Simple Types

This is the complete list of simple types in the urn:schemas-microsoft-com:office:word namespace.

6.3.3.1 ST_BorderShadow (Border Shadow Type)

This simple type specifies logical true and false values.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
f (False)	Logical false.
false (False)	Logical false.
t (True)	Logical true.
true (True)	Logical true.

Referenced By
borderbottom@shadow (§6.3.2.2); borderleft@shadow (§6.3.2.3); borderright@shadow (§6.3.2.4); bordertop@shadow (§6.3.2.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BorderShadow">
   <restriction base="xsd:string">
      <enumeration value="t"/>
      <enumeration value="true"/>
      <enumeration value="f"/>
      <enumeration value="false"/>
   </restriction>
</simpleType>
```

6.3.3.2 ST_BorderType (Border Type)

This type defines which types of borders are supported.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dash (pecifies a line border consisting of a dashed line around the parent object.)	Specifies a line border consisting of a dashed line around the parent object.
dashDotDot (Dash Dot Dot Border)	Specifies a line border consisting of a alternating dotted, dotted, dashed line around the parent object.
dashDotStroked (Stroked Dash Dot Border)	Specifies a line border consisting of a line with a series of alternating thin and thick strokes around the parent object.
dashedSmall (Small Dash Border)	Specifies a line border consisting of a dashed line with small gaps around the parent object.
dot (Dotted Border)	Specifies a line border consisting of a dotted line around the parent object.
dotDash (Dot Dash Border)	Specifies a line border consisting of a alternating dotted and dashed line around the parent object.
double (Double Line Border)	Specifies a line border consisting of a double line around the parent object.
doubleWave (Double Wavy Lines Border)	Specifies a line border consisting of a double wavy line around the parent object.
hairline (Hairline Border)	Specifies a line border consisting of a very thin line.
HTMLInset (Inset Border)	Specifies a line border consisting of an inset set of lines around the parent object. [*Example*: *end example*]

Enumeration Value	Description
HTMLOutset (Outset Border)	Specifies a line border consisting of an outset set of lines around the parent object. [*Example*: *end example*]
none (No Border)	Specifies that no border shall be applied to the current item.
single (Single Line Border)	Specifies a line border consisting of a single line around the parent object.
thick (Thick Line Border)	Specifies a line border consisting of a single line around the parent object.
thickBetweenThin (Thin-thick-thin Border)	Specifies a line border consisting of a thick line contained within a thin line with a medium sized intermediate gap around the parent object.
thickBetweenThinLarge (Large thin-thick-thin Border)	Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a medium sized intermediate gap around the parent object.
thickBetweenThinSmall (Small thin-thick-thin Lines Border)	Specifies a line border consisting of a thin line contained within a thick line, contained within a thin line with a small intermediate gap around the parent object.
thickThin (Thick Thin Line Border)	Specifies a line border consisting of a thick line contained within a thin line with a medium sized intermediate gap around the parent object.
thickThinLarge (Thick Thin Large Gap Border)	Specifies a line border consisting of a thick line contained within a thin line with a large sized intermediate gap around the parent object.
thickThinSmall (Small thick-thin lines border)	Specifies a line border consisting of a thick line contained within a thin line with a small intermediate gap around the parent object.
thinThick (Thin Thick Line Border)	Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a medium sized intermediate gap between each around the parent object.
thinThickLarge (Thin Thick Large Gap Border)	Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a large sized intermediate gap between each around the parent object.

Enumeration Value	Description
thinThickSmall (Thin Thick Small Gap Border)	Specifies a line border consisting of a thin line contained within a thick line contained within a thick thin with a small intermediate gap between each around the parent object.
threeDEmboss (3D Embossed Border)	Specifies a line border consisting of three staged gradient lines around the parent object, getting darker towards the object. [*Example*:  *end example*]
threeDEngrave (3D Engraved Border)	Specifies a line border consisting of three staged gradient lines around the parent object, getting darker away from the object. [*Example*:  *end example*]
triple (Triple Line Border)	Specifies a line border consisting of a triple line around the parent object.
wave (Wavy Border)	Specifies a line border consisting of a wavy line around the parent object. [*Example*: *end example*]

Referenced By
borderbottom@type (§6.3.2.2); borderleft@type (§6.3.2.3); borderright@type (§6.3.2.4); bordertop@type (§6.3.2.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BorderType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="single"/>
      <enumeration value="thick"/>
      <enumeration value="double"/>
      <enumeration value="hairline"/>
      <enumeration value="dot"/>
      <enumeration value="dash"/>
      <enumeration value="dotDash"/>
      <enumeration value="dashDotDot"/>
      <enumeration value="triple"/>
      <enumeration value="thinThickSmall"/>
      <enumeration value="thickThinSmall"/>
      <enumeration value="thickBetweenThinSmall"/>
      <enumeration value="thinThick"/>
      <enumeration value="thickThin"/>
      <enumeration value="thickBetweenThin"/>
      <enumeration value="thinThickLarge"/>
      <enumeration value="thickThinLarge"/>
      <enumeration value="thickBetweenThinLarge"/>
      <enumeration value="wave"/>
      <enumeration value="doubleWave"/>
      <enumeration value="dashedSmall"/>
      <enumeration value="dashDotStroked"/>
      <enumeration value="threeDEmboss"/>
      <enumeration value="threeDEngrave"/>
      <enumeration value="HTMLOutset"/>
      <enumeration value="HTMLInset"/>
   </restriction>
</simpleType>
```

6.3.3.3 ST_HorizontalAnchor (Horizontal Anchor Type)

This simple type specifies the horizontal position to which the parent object has been anchored in the document. This anchor position shall be used as the base location to determine the final horizontal position of the object in the document.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
char (Character)	Specifies that the parent object shall be horizontally anchored based on the position of the anchor within the text flow.
margin (Margin)	Specifies that the parent object shall be horizontally anchored to the text margins.

Enumeration Value	Description
	This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the text margin.
page (Page)	Specifies that the parent object shall be horizontally anchored to the page edge. This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the page.
text (Text)	Specifies that the parent object shall be horizontally anchored to the text extents. This shall be used to specify that any horizontal positioning values shall be calculated with respect to the location of the edge of the text in the anchor paragraph (including text indentations on that paragraph within the text margins).

Referenced By
wrap@anchorx (§6.3.2.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HorizontalAnchor">
   <restriction base="xsd:string">
      <enumeration value="margin"/>
      <enumeration value="page"/>
      <enumeration value="text"/>
      <enumeration value="char"/>
   </restriction>
</simpleType>
```

6.3.3.4 ST_VerticalAnchor (Vertical Anchor Type)

This simple type specifies the vertical position to which the parent object has been anchored in the document. This anchor position shall be used as the base location to determine the final vertical position of the object in the document.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
line (Line)	Specifies that the parent object shall be vertically anchored to the line on which its anchor appears.

Enumeration Value	Description
	This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the top edge of the anchor's line in the anchor paragraph.
margin (Margin)	Specifies that the parent object shall be vertically anchored to the text margins. This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the text margin.
page (Page)	Specifies that the parent object shall be vertically anchored to the page edge. This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the edge of the page.
text (Text)	Specifies that the parent object shall be vertically anchored to the text extents. This shall be used to specify that any vertical positioning values shall be calculated with respect to the location of the top edge of the text in the anchor paragraph.

Referenced By
wrap@anchory (§6.3.2.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VerticalAnchor">
   <restriction base="xsd:string">
      <enumeration value="margin"/>
      <enumeration value="page"/>
      <enumeration value="text"/>
      <enumeration value="line"/>
   </restriction>
</simpleType>
```

6.3.3.5 ST_WrapSide (Text Wrapping Side)

This type defines which sides text can wrap around a VML object.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
both (Both sides)	Wrap text on both sides.
largest (Largest side)	Wrap text on largest side.
left (Left side)	Wrap text on left side.
right (Right side)	Wrap text on right side.

Referenced By
wrap@side (§6.3.2.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WrapSide">
   <restriction base="xsd:string">
      <enumeration value="both"/>
      <enumeration value="left"/>
      <enumeration value="right"/>
      <enumeration value="largest"/>
   </restriction>
</simpleType>
```

6.3.3.6 ST_WrapType (Text Wrapping Type)

This simple type specifies the type of text wrapping which shall be allowed around a VML object within a document.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
none (No wrapping)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around this VML object.
square (Square wrapping)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document using a rectangle touching each of the object's furthest edges.
through (Through wrapping)	Specifies that text shall be allowed to wrap around the remaining space on each line around this text frame in the document, including any holes in the object.
tight (Tight wrapping)	Specifies that text shall be allowed to tightly wrap around the remaining space on each line around this text frame in the document.
topAndBottom (Top and bottom wrapping)	Specifies that text shall not be allowed to wrap around the remaining space on each lines around the VML

Enumeration Value	Description
	object. Any text content shall therefore be placed on the next line following the object which does not intersect with the object's extents.

Referenced By
wrap@type (§6.3.2.6)

The following XML Schema fragment defines the contents of this simple type:

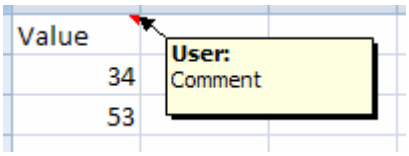
```
<simpleType name="ST_WrapType">
   <restriction base="xsd:string">
      <enumeration value="topAndBottom"/>
      <enumeration value="square"/>
      <enumeration value="none"/>
      <enumeration value="tight"/>
      <enumeration value="through"/>
   </restriction>
</simpleType>
```

6.4 VML - SpreadsheetML Drawing

It is possible to attach user interface controls, such as comments, combo boxes (dropdowns) and embedded controls, to a SpreadsheetML document. VML is used to define certain aspects of the control, such as size and visual appearance. Additional information describing the control must also be included. The VML SpreadsheetML Drawing namespace provides the additional information necessary to define the type, settings and behavior of the control.

[*Note*: The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a deprecated format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML .*end note*]

[*Example:* Assume the comment below exists on a spreadsheet:



The following defines the additional information necessary to describe the comment. The ObjectType attribute describes the object as a comment. The Anchor element defines that its edges are anchored to the first and

fourth rows and the second and fourth columns. The Row and Column elements indicate that it points to the cell in the first row, first column.

```
<x:ClientData ObjectType="Note">
  <x:MoveWithCells/>
  <x:SizeWithCells/>
  <x:Anchor>1, 13, 0, 12, 2, 52, 2, 10</x:Anchor>
  <x:AutoFill>False</x:AutoFill>
  <x:Row>0</x:Row>
  <x:Column>0</x:Column>
  <x:Visible/>
</x:ClientData>
```

This additional comment data exists inside the VML shape that defines the comment object:

```
<v:shape id="_x0000_s1025" type="#_x0000_t202" style='position:absolute;margin
  left:57.75pt;margin-top:9pt;width:77.25pt;height:28.5pt;z-index:1;mso-wrap-
  style:tight' fillcolor="#ffffe1" o:insetmode="auto">
  <v:fill color2="#ffffe1"/>
  <v:shadow on="t" color="black" obscured="t"/>
  <v:path o:connecttype="none"/>
  <v:textbox style='mso-direction-alt:auto'>
    <div style='text-align:left'></div>
  </v:textbox>
  <x:ClientData ObjectType="Note"> … </x:ClientData>
</v:shape>
```

end example]

6.4.1 Table of Contents

This subclause is informative.

End of informative text.

6.4.2 Elements

The following elements comprise the contents of the urn:schemas-microsoft-com:office:excel namespace:

[*Note*: As the VML format is a format provided for backward compatibility, those VML elements defined in the same urn:schemas-microsoft-com:office:excel namespace will remain in that namespace is it is already used by millions of documents already using VML. *end note*]

6.4.2.1 Accel (Primary Keyboard Accelerator)

This element specifies the primary keyboard accelerator for an object. The value is the ASCII decimal number corresponding to the accelerator key. This element is used for buttons, checkboxes, radio buttons and group boxes.

[*Example:* The primary accelerator key is 'A' (65 is the ASCII decimal value for 'A'):

```
<x:ClientData … >
  <x:Accel>65</x:Accel>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.2 Accel2 (Secondary Keyboard Accelerator)

This element specifies the secondary keyboard accelerator for an object. The value is the ASCII decimal number corresponding to the accelerator key. This element is used for buttons, checkboxes, radio buttons and group boxes.

[*Example:* The secondary accelerator key is 'A' (65 is the ASCII decimal value for 'A'):

```
<x:ClientData … >
  <x:Accel2>65</x:Accel2>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.3 Anchor (Anchor)

This element specifies the anchor location for the object. This is a general-use element.

The value is a comma-separated list of data written out as: LeftColumn, LeftOffset, TopRow, TopOffset, RightColumn, RightOffset, BottomRow, BottomOffset.

Value	Description
LeftColumn	The left anchor column of the object (left-most column is 0). [*Example*: An object whose left anchor was off of the third column would have a LeftColumn value of 2. *end example*]
LeftOffset	The offset of the object's left edge from the left edge of the left anchor column. This value is measured in pixels.
TopRow	The top anchor row of the object (top-most column is 0). [*Example*: An object whose top anchor was off of the fifth row would have a TopRow value of 4. *end example*]
TopOffset	The offset of the object's top edge from the top edge of the top anchor row. This value is measured in pixels.
RightColumn	The right anchor column of the object (left-most column is 0). [*Example*: An object whose right anchor was off of the tenth column would have a RightColumn value of 9. *end example*]
RightOffset	The offset of the object's right edge from the left edge of the right anchor column. This value is measured in pixels.
BottomRow	The bottom anchor row of the object (top-most column is 0). [*Example*: An object whose bottom anchor was off of the tenth row would have a BottomRow value of 9. *end example*]
BottomOffset	The offset of the object's bottom edge from the bottom edge of the bottom anchor row. This value is measured in pixels.

[*Example:* The left side of the object is 15 pixels to the right of the left edge of the second column. The top edge is 2 pixels below the upper edge of the first row. The right side is 15 pixels to the right of the left edge of the fourth column. The bottom edge is 16 pixels below the top of the fourth row.

```
<x:ClientData … >
  <x:Anchor>1, 15, 0, 2, 3, 15, 3, 16</x:Anchor>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.4 AutoFill (AutoFill)

This element specifies that the object is an AutoFill object. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:AutoFill>False</x:AutoFill>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.5 AutoLine (AutoLine)

This element specifies that the object is an AutoLine object. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:AutoLine>False</x:AutoLine>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.6 AutoPict (Automatically Size)

This element specifies whether the object's size is formatted automatically by the application. If this element is specified without a value, it is assumed to be `true`. This is a general-use element for objects that use an image representation, such as OLE objects, Embedded controls, cameras and signature lines.

[*Example:*

```
<x:ClientData … > …
  <x:AutoPict>True</x:AutoPict>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.7 AutoScale (Font AutoScale)

This element specifies whether the object's font is automatically scaled by the application when the object is resized. If this element is specified without a value, it is assumed to be `true`. This element is used for attached text.

[*Example:*

```
<x:ClientData … > …
  <x:AutoScale>True</x:AutoScale>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.8 Camera (Camera Tool)

This element specifies that the object is a camera object. A camera object shows a live view of another part of the spreadsheet. If this element is specified without a value, it is assumed to be `true`. This element is used for cameras.

[*Example:*

```
<x:ClientData … > …
  <x:Camera>True</x:Camera>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.9 Cancel (Cancel Button)

This element specifies that the object is a cancel button. If this element is specified without a value, it is assumed to be `true`. This element is used for buttons.

[*Example:*

```
<x:ClientData … > …
  <x:Cancel/>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.10 CF (Clipboard Format)

This element specifies the clipboard format used to render the object. This is a general-use element for objects that use an image representation, such as OLE objects, embedded controls, cameras and signature lines.

[*Example:*

```
<x:ClientData … > …
  <x:CF>Pict</x:CF>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_CF simple type (§6.4.3.1).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.11 Checked (Checked)

This element specifies that the checkbox is checked or the radio button is selected. This element is used for checkboxes and radio buttons. Valid values are:

Value	Description
0	Unchecked / unselected
1	Checked / selected
2	Mixed selection

[*Example:*

```
<x:ClientData … > …
  <x:Checked>2</x:Checked>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.12 ClientData (Attached Object Data)

This element specifies data associated with objects attached to a spreadsheet. While this element may contain any of the child elements below, only certain combinations are meaningful. The ObjectType attribute determines the type of object the element represents and which subset of child elements is appropriate. Relevant groups are identified for each child element.

[*Example:* The following defines additional information for a comment. Its edges are anchored to the first and fourth rows and the second and fourth columns. It points to the cell in the first row, first column.

```
<x:ClientData ObjectType="Note">
  <x:MoveWithCells/>
  <x:SizeWithCells/>
  <x:Anchor>1, 15, 0, 2, 3, 15, 3, 16</x:Anchor>
  <x:AutoFill>False</x:AutoFill>
  <x:Row>0</x:Row>
  <x:Column>0</x:Column>
  <x:Visible/>
</x:ClientData>
```

end example]

[*Example:* The following defines additional information for a radio button. It is the first in a series of radio buttons and selected by default. The accelerator key is 'A' (65 is the ASCII decimal value for 'A') and it is linked to the cell at column A, row 1 of the first sheet.

```
<x:ClientData ObjectType=3D"Radio">
  <x:SizeWithCells/>
  <x:AutoFill>False</x:AutoFill>
  <x:AutoLine>False</x:AutoLine>
  <x:TextVAlign>Center</x:TextVAlign>
  <x:Checked>1</x:Checked>
  <x:Accel>65</x:Accel>
  <x:FmlaLink>Sheet1!$A$1</x:FmlaLink>
  <x:FirstButton/>
</x:ClientData>
```

end example]

Parent Elements

Colored (Dropdown Color Toggle)	§6.4.2.14
Column (Comment Column Target)	§6.4.2.15
DDE (Dynamic Data Exchange)	§6.4.2.16
Default (Default Button)	§6.4.2.17
DefaultSize (Default Size Toggle)	§6.4.2.18

Child Elements	Subclause
Disabled (Macro Disable Toggle)	§6.4.2.19
Dismiss (Dismiss Button)	§6.4.2.20
DropLines (Dropdown Maximum Lines)	§6.4.2.21
DropStyle (Dropdown Style)	§6.4.2.22
Dx (Scroll Bar Width)	§6.4.2.23
FirstButton (First Radio Button)	§6.4.2.24
FmlaGroup (Linked Formula - Group Box)	§6.4.2.25
FmlaLink (Linked Formula)	§6.4.2.26
FmlaMacro (Reference to Custom Function)	§6.4.2.27
FmlaPict (Camera Source Range)	§6.4.2.28
FmlaRange (List Items Source Range)	§6.4.2.29
FmlaTxbx (Text Formula)	§6.4.2.30
Help (Help Button)	§6.4.2.31
Horiz (Scroll Bar Orientation)	§6.4.2.32
Inc (Scroll Bar Increment)	§6.4.2.33
JustLastX (Far East Alignment Toggle)	§6.4.2.34
LCT (Callback Type)	§6.4.2.35
ListItem (Non-linked List Item)	§6.4.2.36
Locked (Lock Toggle)	§6.4.2.37
LockText (Text Lock)	§6.4.2.38
MapOCX (Embedded Control)	§6.4.2.39
Max (Scroll Bar Maximum)	§6.4.2.40
Min (Scroll Bar Minimum)	§6.4.2.41
MoveWithCells (Move with Cells)	§6.4.2.42
MultiLine (Multi-line)	§6.4.2.43
MultiSel (Multiple Selections)	§6.4.2.44
NoThreeD (Disable 3D)	§6.4.2.45
NoThreeD2 (Disable 3D)	§6.4.2.46
Page (Scroll Bar Page Increment)	§6.4.2.47
PrintObject (Print Toggle)	§6.4.2.48
RecalcAlways (Recalculation Toggle)	§6.4.2.49
Row (Comment Row Target)	§6.4.2.50
RowHidden (Comment's Row is Hidden)	§6.4.2.51
ScriptExtended (HTML Script Attributes)	§6.4.2.52

Child Elements	Subclause
ScriptLanguage (HTML Script Language)	§6.4.2.53
ScriptLocation (HTML Script Location)	§6.4.2.54
ScriptText (HTML Script Text)	§6.4.2.55
SecretEdit (Password Edit)	§6.4.2.56
Sel (Selected Entry)	§6.4.2.57
SelType (Selection Type)	§6.4.2.58
SizeWithCells (Resize with Cells)	§6.4.2.59
TextHAlign (Horizontal Text Alignment)	§6.4.2.60
TextVAlign (Vertical Text Alignment)	§6.4.2.61
UIObj (UI Object Toggle)	§6.4.2.62
Val (Scroll bar position)	§6.4.2.63
ValidIds (Valid ID)	§6.4.2.64
Visible (Comment Visibility Toggle)	§6.4.2.65
VScroll (Vertical Scroll)	§6.4.2.66
VTEdit (Validation Type)	§6.4.2.67
WidthMin (Minimum Width)	§6.4.2.68

Attributes	Description
ObjectType (Object type)	Specifies the type of the object. Different sets of child elements are appropriate for different types of objects. The possible values for this attribute are defined by the ST_ObjectType simple type (§6.4.3.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ClientData">
   <choice minOccurs="0" maxOccurs="unbounded">
      <element name="MoveWithCells" type="ST_TrueFalseBlank"/>
      <element name="SizeWithCells" type="ST_TrueFalseBlank"/>
      <element name="Anchor" type="xsd:string"/>
      <element name="Locked" type="ST_TrueFalseBlank"/>
      <element name="DefaultSize" type="ST_TrueFalseBlank"/>
      <element name="PrintObject" type="ST_TrueFalseBlank"/>
      <element name="Disabled" type="ST_TrueFalseBlank"/>
      <element name="AutoFill" type="ST_TrueFalseBlank"/>
      <element name="AutoLine" type="ST_TrueFalseBlank"/>
      <element name="AutoPict" type="ST_TrueFalseBlank"/>
      <element name="FmlaMacro" type="xsd:string"/>
      <element name="TextHAlign" type="xsd:string"/>
      <element name="TextVAlign" type="xsd:string"/>
      <element name="LockText" type="ST_TrueFalseBlank"/>
      <element name="JustLastX" type="ST_TrueFalseBlank"/>
      <element name="SecretEdit" type="ST_TrueFalseBlank"/>
      <element name="Default" type="ST_TrueFalseBlank"/>
      <element name="Help" type="ST_TrueFalseBlank"/>
      <element name="Cancel" type="ST_TrueFalseBlank"/>
      <element name="Dismiss" type="ST_TrueFalseBlank"/>
      <element name="Accel" type="xsd:integer"/>
      <element name="Accel2" type="xsd:integer"/>
      <element name="Row" type="xsd:integer"/>
      <element name="Column" type="xsd:integer"/>
      <element name="Visible" type="ST_TrueFalseBlank"/>
      <element name="RowHidden" type="ST_TrueFalseBlank"/>
      <element name="ColHidden" type="ST_TrueFalseBlank"/>
      <element name="VTEdit" type="xsd:integer"/>
      <element name="MultiLine" type="ST_TrueFalseBlank"/>
      <element name="VScroll" type="ST_TrueFalseBlank"/>
      <element name="ValidIds" type="ST_TrueFalseBlank"/>
      <element name="FmlaRange" type="xsd:string"/>
      <element name="WidthMin" type="xsd:integer"/>

      <element name="Val" type="xsd:integer"/>
      <element name="Min" type="xsd:integer"/>
```

```
        <element name="Max" type="xsd:integer"/>
        <element name="Inc" type="xsd:integer"/>
        <element name="Page" type="xsd:integer"/>
        <element name="Horiz" type="ST_TrueFalseBlank"/>
        <element name="Dx" type="xsd:integer"/>
        <element name="MapOCX" type="ST_TrueFalseBlank"/>
        <element name="CF" type="ST_CF"/>
        <element name="Camera" type="ST_TrueFalseBlank"/>
        <element name="RecalcAlways" type="ST_TrueFalseBlank"/>
        <element name="AutoScale" type="ST_TrueFalseBlank"/>
        <element name="DDE" type="ST_TrueFalseBlank"/>
        <element name="UIObj" type="ST_TrueFalseBlank"/>
        <element name="ScriptText" type="xsd:string"/>
        <element name="ScriptExtended" type="xsd:string"/>
        <element name="ScriptLanguage" type="xsd:nonNegativeInteger"/>
        <element name="ScriptLocation" type="xsd:nonNegativeInteger"/>
        <element name="FmlaTxbx" type="xsd:string"/>
    </choice>
    <attribute name="ObjectType" type="ST_ObjectType" use="required"/>
</complexType>
```

6.4.2.13 ColHidden (Comment's Column is Hidden)

This element specifies that the column of the cell to which this comment points is hidden. If this element is specified without a value, it is assumed to be `true`. This element is used for comments.

[*Example:*

```
<x:ClientData … > …
  <x:ColHidden>True</x:ColHidden>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.14 Colored (Dropdown Color Toggle)

This element specifies that the dropdown is colored. If this element is specified without a value, it is assumed to be `true`. This element is used for dropdowns.

[*Example:*

```
<x:ClientData … > …
  <x:Colored>True</x:Colored>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.15 Column (Comment Column Target)

This element specifies the column a comment points to. The column index is 0-based. This element is used for comments.

[*Example:*

```
<x:ClientData … > …
  <x:Column>0</x:Column>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.16 DDE (Dynamic Data Exchange)

This element specifies that the object is a DDE (Dynamic Data Exchange) link. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:DDE>True</x:DDE>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.17 Default (Default Button)

This element specifies that the object is a default (OK) button . If this element is specified without a value, it is assumed to be `true`. This element is used for buttons.

[*Example:*

```
<x:ClientData … > …
  <x:Default>True</x:Default>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.18 DefaultSize (Default Size Toggle)

This element specifies that the object is at its default size. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:DefaultSize>True</x:DefaultSize>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.19 Disabled (Macro Disable Toggle)

This element specifies that the object cannot run an attached macro. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:Disabled>True</x:Disabled>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.20 Dismiss (Dismiss Button)

This element specifies that the object is a dismiss button. If this element is specified without a value, it is assumed to be `true`. This element is used for buttons.

[*Example:*

```
<x:ClientData … > …
  <x:Dismiss>True</x:Dismiss>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.21 DropLines (Dropdown Maximum Lines)

This element specifies the maximum number of lines in the dropdown before scrollbars are added. This element is used for dropdowns.

If this element is omitted, one line is shown.

[*Example:*

```
<x:ClientData … > …
  <x:DropLines>8</x:DropLines>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.22 DropStyle (Dropdown Style)

This element specifies the style of the dropdown. Allowed values are:

Value	Description
`Combo`	Standard combo box
`ComboEdit`	Editable combo box
`Simple`	Standard combo box with only the dropdown button visible when the box is not expanded

This element is used for dropdowns.

[*Example:*

```
<x:ClientData … > …
  <x:DropStyle>Combo</x:DropStyle>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.23 Dx (Scroll Bar Width)

This element specifies the width of the scroll bar in screen pixels. This element is used for scroll bars and spinners. [*Note*: It is possible for other controls, such as combo boxes and list boxes, to use scroll bars and this element is valid for those controls. *end note*]

[*Example:*

```
<x:ClientData … > …
  <x:Dx>16</x:Dx>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.24 FirstButton (First Radio Button)

This element specifies that the object is the first radio button in a set of radio buttons. If this element is specified without a value, it is assumed to be `true`. This element is used for radio buttons.

[*Example:*

```
<x:ClientData … > …
  <x:FirstButton>True</x:FirstButton>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.25 FmlaGroup (Linked Formula - Group Box)

This element specifies the cell the object is linked to, using standard cell reference syntax. This element is used for group boxes. This overrides the FmlaLink for any radio buttons enclosed in the group box. The value in the linked cell and the index of the selected radio button are linked together. The formula syntax is described in §3.17 of the SpreadsheetML reference.

[*Example:*

```
<x:ClientData … > …
  <x:FmlaGroup>$A$1</x:FmlaGroup>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.26 FmlaLink (Linked Formula)

This element specifies the cell the object is linked to, using standard cell reference syntax. This element is used for checkboxes, radio buttons, scroll bars, spinners, dropdowns and list boxes. The value in the linked cell and the index of the selected item in the object are linked together. This link is ignored if the control allows multiple selections. The formula syntax is described in §3.17 of the SpreadsheetML reference.

[*Example:*

```
<x:ClientData … > …
  <x:FmlaLink>$A$4</x:FmlaLink>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.27 FmlaMacro (Reference to Custom Function)

This element specifies the custom function associated with the object. [*Example*: A macro script, add-in function, and so on. *end example*]

The format of this string shall be application-defined, and should be ignored if not understood.

[*Example*:

```
<x:ClientData … > …
  <x:FmlaMacro>Button1_Click()</x:FmlaMacro>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.28 FmlaPict (Camera Source Range)

This element specifies the range of source data cells visible in the camera. This element is used for cameras. The formula syntax is described in §3.17 of the SpreadsheetML reference.

[*Example:*

```
<x:ClientData … > …
  <x:FmlaPict>$A$2:$B$4</x:FmlaPict>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.29 FmlaRange (List Items Source Range)

This element specifies the range of source data cells used to populate the list box, using standard cell reference syntax. This element is used for list boxes. The formula syntax is described in §3.17 of the SpreadsheetML reference.

[*Example:*

```
<x:ClientData … > …
  <x:FmlaRange>$A$1:$A$15</x:FmlaRange>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.30 FmlaTxbx (Text Formula)

This element defines the formula associated with the object's text. This element is used for attached text.

[*Example:*

```
<x:ClientData … > …
  <x:FmlaTxbx>$D$9</x:FmlaTxbx>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.31 Help (Help Button)

This element specifies that the object is a help button. If this element is specified without a value, it is assumed to be `true`. This element is used for buttons.

[*Example:*

```
<x:ClientData … > …
  <x:Help>True</x:Help>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.32 Horiz (Scroll Bar Orientation)

This element specifies that the scroll bar is horizontal. If omitted, the scroll bar is vertical. If this element is specified without a value, it is assumed to be `true`. This element is used for scroll bars and spinners.

[*Example:*

```
<x:ClientData … > …
  <x:Horiz>True</x:Horiz>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.33 Inc (Scroll Bar Increment)

This element specifies the number of lines to move the scroll bar on an increment click. If omitted, the increment is 0. This element is used for scroll bars and spinners.

[*Example:*

```
<x:ClientData … > …
  <x:Inc>1</x:Inc>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.34 JustLastX (Far East Alignment Toggle)

This element specifies that Far East alignment is set for the last line in the text. Typically, justified text in Far East environments leaves the last line unjustified. Specifying this element also justifies the last line. If this element is specified without a value, it is assumed to be `true`. This element is used for attached text.

[*Example:*

```
<x:ClientData … > …
  <x:JustLastX>True</x:JustLastX>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.35 LCT (Callback Type)

This element specifies the list box callback type. The application should use the callback to determine how to handle user actions on the list box. The only allowed value is `Normal`. This element is used for list boxes.

[*Example:*

```
<x:ClientData … > …
  <x:LCT>Normal</x:LCT>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.36 ListItem (Non-linked List Item)

This element specifies a non-linked list item that must be persisted with the list. This element is used for list boxes. [*Rationale*: This is a place for applications to store optional information associated with the list box. For example, an item to be shown in the list box that is not linked from another set of data. *end rationale*]

[*Example:*

```
<x:ClientData … > …
  <x:ListItem>TheItem</x:ListItem>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.37 Locked (Lock Toggle)

This element specifies that the object is locked when the sheet is protected. If omitted, the object is assumed to be locked. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:Locked>False</x:Locked>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.38 LockText (Text Lock)

This element specifies that the object's text is locked. If omitted, the object's text is assumed to be locked. If this element is specified without a value, it is assumed to be `true`. This element is used for attached text.

[*Example:*

```
<x:ClientData … > …
  <x:LockText>False</x:LockText>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.39 MapOCX (Embedded Control)

This element specifies that the object is an embedded control. If this element is specified without a value, it is assumed to be `true`. This element is used for all embedded controls.

[*Example:*

```
<x:ClientData … >…
  <x:MapOCX>True</x:MapOCX>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.40 Max (Scroll Bar Maximum)

This element specifies the maximum scroll bar position as the index of the list item just above the item at the top of the view when the control is scrolled all the way down. The list indexes are 1-based. If omitted, the value is assumed to be that which allows the last item to be viewed when the control is scrolled all the way down. This element is used for scroll bars and spinners.

[*Example:* Item 21 is the first item visible in the list when the object is scrolled all the way down.

```
<x:ClientData … > …
  <x:Max>20</x:Max>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.41 Min (Scroll Bar Minimum)

This element specifies the minimum scroll bar position as the index of the list item just above the item at the top of the view when the control is scrolled all the way up, typically 0. The list indexes are 1-based. If omitted, the value is assumed to be 0. This element is used for scroll bars and spinners.

[*Example:* The first item in the list is visible when the object is scrolled all the way up:

```
<x:ClientData … > …
  <x:Min>0</x:Min>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.42 MoveWithCells (Move with Cells)

This element specifies that the object moves with its underlying cells. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:MoveWithCells>True</x:MoveWithCells>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements

Parent Elements
ClientData (§6.4.2.12)

6.4.2.43 MultiLine (Multi-line)

This element specifies that the control is multiline. If this element is specified without a value, it is assumed to be `true`. This element is used for edit controls.

[*Example:*

```
<x:ClientData … > …
  <x:Multiline>True</x:Multiline>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.44 MultiSel (Multiple Selections)

This element specifies a comma-delimited list of selected items. This element overrides the Sel element (§6.4.2.57). This element is used for list boxes that allow multiple selections. See also the SelType element (§6.4.2.58).

[*Example:*

```
<x:ClientData … > …
  <x:MultiSel>3, 5, 6</x:MultiSel>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.45 NoThreeD (Disable 3D)

This element specifies that 3D effects are disabled. If this element is specified without a value, it is assumed to be `true`. This element is used for checkboxes, radio buttons, group boxes and scroll bars.

[*Example:*

```
<x:ClientData … > …
  <x:NoThreeD>True</x:NoThreeD>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.46 NoThreeD2 (Disable 3D)

This element specifies that 3D effects are disabled. If this element is specified without a value, it is assumed to be `true`. This element is used for dropdowns and list boxes.

[*Example:*

```
<x:ClientData … > …
  <x:NoThreeD2>True</x:NoThreeD2>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.47 Page (Scroll Bar Page Increment)

This element specifies the number of lines to move the scroll bar on a page click. This element is used for scroll bars and spinners.

[*Example:*

```
<x:ClientData … > …
  <x:Page>9</x:Page>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.48 PrintObject (Print Toggle)

This element specifies that the object is printed when the document is printed. If omitted, it is assumed the object will print when the document is printed. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:PrintObject>False</x:PrintObject>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.49 RecalcAlways (Recalculation Toggle)

This element defines whether the object is always included in recalculation. If this element is specified without a value, it is assumed to be `true`. This is used by controls that reference cells in the spreadsheet to update themselves when the spreadsheet changes.

[*Example:*

```
<x:ClientData … > …
  <x:RecalcAlways>True</x:RecalcAlways>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.50 Row (Comment Row Target)

This element specifies the row a comment points to. The row index is 0-based. This element is used for comments.

[*Example:*

```
<x:ClientData … > …
  <x:Row>0</x:Row>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.51 RowHidden (Comment's Row is Hidden)

This element specifies that the row of the cell to which this comment points is hidden. If this element is specified without a value, it is assumed to be `true`. This element is used for comments.

[*Example:*

```
<x:ClientData … > …
  <x:RowHidden>True</x:RowHidden>
</x:ClientData>
```

end example

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.52 ScriptExtended (HTML Script Attributes)

This element specifies custom extended attributes associated with the HTML script tag. The language and id are not included in the extended attributes. If the document contains no HTML script, this element should be ignored.

[*Example:* The extended script attribute is " src="file.js"":

```
<x:ClientData … > …
  <x:ScriptExtended>src=&amp;quot;file.js&amp;quot;</x:ScriptExtended>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.53 ScriptLanguage (HTML Script Language)

This element specifies the language of the custom function. If the document contains no HTML script, this element should be ignored. Allowed values are:

Value	Description
1	Java
2	Visual Basic
3	ASP
4	Other

[*Example:*

```
<x:ClientData … > …
  <x:ScriptLanguage>1</x:ScriptLanguage>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema nonNegativeInteger datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.54 ScriptLocation (HTML Script Location)

This element specifies the location of the custom function. If the document contains no HTML script, this element should be ignored. Allowed values are:

Value	Description
1	Head
2	Body

[*Example:*

```
<x:ClientData … > …
  <x:ScriptLocation>2</x:ScriptLocation>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema nonNegativeInteger datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.55 ScriptText (HTML Script Text)

This element specifies the script text (comment) associated with a block of HTML script in the document. If the document contains no HTML script, this element should be ignored.

[*Example:* The script text reads: "<!-- Comment -->":

```
<x:ClientData … > …
  <x:ScriptText>&lt;!&#45;- Comment &#45;-&gt;</x:ScriptText>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.56 SecretEdit (Password Edit)

This element specifies that the object represents a password edit field. If this element is specified without a value, it is assumed to be `true`. This element is used for attached text.

[*Example:*

```
<x:ClientData … > …
  <x:SecretEdit>True</x:SecretEdit>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.57 Sel (Selected Entry)

This element specifies the index of the selected item. The list indexes are 1-based. If omitted or set to a value of 0, no items are selected. This element is used for list boxes.

[*Example:*

```
<x:ClientData … >…
  <x:Sel>1</x:Sel>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.58 SelType (Selection Type)

This element specifies the selection type for the list box. If omitted, the control is assumed to be `Single`. Allowed values are:

Value	Description
`Single`	The listbox may only have one selected item.
`Multi`	The listbox may have multiple items selected by clicking on each item.
`Extend`	The listbox may have multiple items selected by holding a control key and clicking on each item.

This element is used for list boxes.

[*Example:*

```
<x:ClientData … > …
  <x:SelType>Single</x:SelType>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.59 SizeWithCells (Resize with Cells)

This element specifies that the object resizes with its underlying cells. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:SizeWithCells>True</x:SizeWithCells>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.60 TextHAlign (Horizontal Text Alignment)

This element specifies the horizontal text alignment for the object. Valid values are Left, Justify, Center, Right and Distributed. If omitted, the alignment is assumed to be `Left`. This element is used for attached text.

[*Example:*

```
<x:ClientData … > …
  <x:TextHAlign>Right</x:TextHAlign>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.61 TextVAlign (Vertical Text Alignment)

This element specifies the horizontal text alignment for the object. Valid values are Top, Justify, Center, Bottom and Distributed. If omitted, the alignment is assumed to be `Top`. This element is used for attached text.

[*Example:*

```
<x:ClientData … > …
  <x:TextVAlign>Center</x:TextVAlign>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.62 UIObj (UI Object Toggle)

This element defines whether the object is a UI object. If this element is specified without a value, it is assumed to be `true`. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:UIObj>True</x:UIObj>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.63 Val (Scroll bar position)

This element specifies the scroll bar position as the index of the list item just above the item at the top of the view, given the current scroll position. The list indexes are 1-based. If omitted, the value is assumed to be 0. This element is used for scroll bars and spinners.

[*Example:* The first list item (item 1) is just off the top of the view. The second list item is at the top of the view.

```
<x:ClientData … > …
  <x:Val>1</x:Val>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.64 ValidIds (Valid ID)

This element specifies that the ID of a linked object is valid. This is a general-use element.

[*Example:*

```
<x:ClientData … > …
  <x:ValidIds>True</x:ValidIds>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.65 Visible (Comment Visibility Toggle)

This element specifies that a comment is visible. If omitted, the comment is assumed to be invisible. If this element is specified without a value, it is assumed to be `true`. This element is used for comments.

[*Example:*

```
<x:ClientData … > …
  <x:Visible>True</x:Visible>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.66 VScroll (Vertical Scroll)

This element specifies that the object has a vertical scroll. If omitted, a vertical scroll is not used. If this element is specified without a value, it is assumed to be `true`. This element is used for edit controls.

[*Example:*

```
<x:ClientData … > …
  <x:VScroll>True</x:VScroll>
</x:ClientData>
```

end example]

The possible values for this element are defined by the ST_TrueFalseBlank simple type (§6.4.3.3).

Parent Elements
ClientData (§6.4.2.12)

6.4.2.67 VTEdit (Validation Type)

This element specifies the type of validation to use for data input to the control. If omitted, the value is assumed to be `Text`. Valid values are:

Value	Description
0	Text
1	Integer
2	Number
3	Reference
4	Formula

This element is used for edit controls.

[*Example:*

```
<x:ClientData … > …
  <x:VTEdit>True</x:VTEdit>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.2.68 WidthMin (Minimum Width)

This element specifies the smallest width allowed for the dropdown window in screen pixels. This element is used for list boxes and dropdowns.

[*Example:*

```
<x:ClientData … > …
  <x:WidthMin>78</x:WidthMin>
</x:ClientData>
```

end example]

The possible values for this element are defined by the XML Schema integer datatype.

Parent Elements
ClientData (§6.4.2.12)

6.4.3 Simple Types

This is the complete list of simple types in the urn:schemas-microsoft-com:office:excel namespace.

6.4.3.1 ST_CF (Clipboard Format Type)

This simple type specifies the allowed clipboard formats.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
Bitmap (Bitmap)	Bitmap.
Pict (EMF)	Enhanced metafile.
PictOld (WMF)	Windows metafile.
PictPrint (Printer Picture)	An image rendered using the default printer's settings. This is typically of higher resolution and scaled

Enumeration Value	Description
	differently compared to a picture created for on-screen rendering.
PictScreen (Screen Picture EMF)	An image rendered using screen settings. This is typically lower resolution than an image created for printing.

Referenced By
CF (§6.4.2.10)

6.4.3.2 ST_ObjectType (Object Type)

This simple type specifies the types of objects that a ClientData element can represent.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
Button (Pushbutton)	A pushbutton control.
Checkbox (Checkbox)	A checkbox control.
Dialog (Dialog)	A dialog.
Drop (Dropdown Box)	A dropdown (combo box) control.
Edit (Editable Text Field)	An editable text field control.
GBox (Group Box)	A group box control.
Group (Group)	A group of objects, such as a group of checkboxes.
Label (Label)	A label control.
LineA (Auditing Line)	A formula auditing arrow.
List (List Box)	A list control.
Movie (Movie)	A movie object in Mac format.
Note (Comment)	A comment.
Pict (Image)	A placeholder image.
Radio (Radio Button)	A radio button control.
Rect (Plain Rectangle)	A rectangle shape that is not a control.
RectA (Auditing Rectangle)	A formula auditing rectangle.
Scroll (Scroll Bar)	A scroll bar.
Shape (Plain Shape)	A general shape that is not a control.
Spin (Spin Button)	A spin button (spinner) control.

Referenced By
ClientData@ObjectType (§6.4.2.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ObjectType">
   <restriction base="xsd:string">
      <enumeration value="Button"/>
      <enumeration value="Checkbox"/>
      <enumeration value="Dialog"/>
      <enumeration value="Drop"/>
      <enumeration value="Edit"/>
      <enumeration value="GBox"/>
      <enumeration value="Label"/>
      <enumeration value="LineA"/>
      <enumeration value="List"/>
      <enumeration value="Movie"/>
      <enumeration value="Note"/>
      <enumeration value="Pict"/>
      <enumeration value="Radio"/>
      <enumeration value="RectA"/>
      <enumeration value="Scroll"/>
      <enumeration value="Spin"/>
      <enumeration value="Shape"/>
      <enumeration value="Group"/>
      <enumeration value="Rect"/>
   </restriction>
</simpleType>
```

6.4.3.3 ST_TrueFalseBlank (Boolean Value with Blank State)

This element specifies logical true and false. Any string that does not evaluate to true is considered false.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
(Blank - Default Value)	Use the default true or false value as defined by the element. If an element does not define a specific value for this state, it is assumed to be `true`.
f (Logical False)	Logical false.
False (Logical False)	Logical false.
t (Logical True)	Logical true.
True (Logical True)	Logical true.

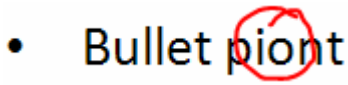
6.5 VML - PresentationML Drawing

This section describes additional information attached to VML shapes that is specific to usage with PresentationML.

[*Note*: The VML format is a legacy format originally introduced with Office 2000 and is included and fully defined in this Standard for backwards compatibility reasons. The DrawingML format is a newer and richer format created with the goal of eventually replacing any uses of VML in the Office Open XML formats. VML should be considered a deprecated format included in Office Open XML for legacy reasons only and new applications that need a file format for drawings are strongly encouraged to use preferentially DrawingML .*end note*]

[*Example:* Assume the following annotation was drawn on a slide during a presentation and saved into the presentation:



The red circle annotation is stored as a VML shape that is an ink annotation. For brevity, the specific path and ink data are omitted.

```
<v:shape id="_x0000_s1029" style='position:absolute;left:126pt;
  top:327.375pt;width:27.625pt;height:24.75pt' coordorigin="4445,11549"
  coordsize="973,874" path="..." filled="f" strokecolor="red"
  strokeweight="1.5pt">
  <v:stroke endcap="round"/>
  <v:path shadowok="f" o:extrusionok="f" fillok="f" insetpenok="f"/>
  <o:lock v:ext="edit" rotation="t" aspectratio="t" verticies="t" text="t"
    shapetype="t"/>
  <o:ink i="..." annotation="t"/>
  <p:iscomment/>
 </v:shape>
```

end example]

6.5.1 Table of Contents

This subclause is informative.

End of informative text.

6.5.2 Elements

The following elements comprise the contents of the urn:schemas-microsoft-com:office:powerpoint namespace:

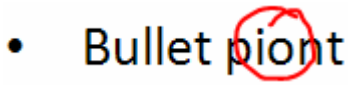
[*Note*: As the VML format is a format provided for backward compatibility, those VML elements defined in the same urn:schemas-microsoft-com:office:powerpoint namespace will remain in that namespace is it is already used by millions of documents already using VML. *end note*]

6.5.2.1 iscomment (Ink Annotation Flag)

Specifies that the object was created as an ink annotation. Default is `false`. If this element is specified without a value, it is assumed to be `true`. This element is only used with PresentationML. [*Rationale* This allows an application to treat annotation ink objects as any other annotation. For example, if annotations are hidden, the application can hide the ink object. *end rationale*]

[*Example:*

```
<v:shape ... >
  <o:ink ... annotation="true"/>
  <p:iscomment/>
</v:shape>
```



end example]

Parent Elements
shape (§6.1.2.19)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

6.5.2.2 textdata (VML Diagram Text)

This element specifies optional supplementary text information associated with a legacy VML shape that is a node in a VML diagram when it cannot otherwise be stored within the DrawingML framework.

[*Note:* An application could use this to preserve a specific diagram format for backward compatibility, but it is strongly recommended to upgrade all VML shapes to DrawingML shapes. *end note*]

Parent Elements
arc (§6.1.2.1); curve (§6.1.2.3); group (§6.1.2.7); image (§6.1.2.10); line (§6.1.2.12); oval (§6.1.2.13); polyline (§6.1.2.15); rect (§6.1.2.16); roundrect (§6.1.2.17); shape (§6.1.2.19); shapetype (§6.1.2.20)

Attributes	Description
id (Text Reference)	Specifies the identifier that is used in conjunction with a corresponding relationship file to resolve the location of the diagram shape text. [*Example:* `<v:shape ... o:dgmnodekind="0" > <v:textbox inset="0,0,0,0"/> <p:textdata id="rId1"/> </v:shape>` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rel">
   <attribute name="id" type="xsd:string"/>
</complexType>
```

7. Shared MLs Reference Material

7.1 Math

The following documentation describes the XML representation of equations. The outermost element is oMathPara, a paragraph of one or more equations. Each equation inside the math paragraph is represented as a single oMath. Inside each oMath is a combination of runs (r) and objects or functions (such as accents, acc, or fractions, (f).

7.1.1 Table of Contents

This subclause is informative.

End of informative text.

7.1.2 Elements

The following elements describe contents of equations.

7.1.2.1 acc (Accent)

This element specifies the accent function, consisting of a base and a combining diacritical mark. [*Example*: Example accent functions are $\dot{a}$, $\acute{a}$, and $\tilde{a}$.

```
<m:acc>
  <m:accPr>
    <m:chr m:val="&#771;"/>
    <m:ctrlPr/>
  </m:accPr>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
</m:acc>
```

end example]

Parent Elements

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
accPr (Accent Properties)	§7.1.2.2
e (Base (Argument))	§7.1.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Acc">
   <sequence>
      <element name="accPr" type="CT_AccPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.2 accPr (Accent Properties)

This element specifies the properties of the Accent function. [*Example*:

```
<m:accPr>
  <m:chr m:val="&#771;"/>
  <m:ctrlPr/>
</m:accPr>
```

end example]

Parent Elements
acc (§7.1.2.1)

Child Elements	Subclause
chr (Accent Character)	§7.1.2.20
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AccPr">
   <sequence>
      <element name="chr" type="CT_Char" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.3 aln (Alignment)

This element specifies the alignment property on the box function. It is utilized only when the box is designated as an operator emulator. When true, this operator emulator serves as an alignment point; that is, designated alignment points in other equations can be aligned with it. [*Example*: For example, the following equation uses the operator emulator as an alignment point. $a == b$.

Its XML representation is as follows:

```
<m:oMath>
  <m:r>
    <m:t>a</m:t>
  </m:r>
  <m:box>
    <m:boxPr>
      <m:opEmu m:val="on"/>
      <m:aln m:val="on"/>
      <m:ctrlPr/>
    </m:boxPr>
    <m:e>
      <m:r>
        <m:t>==</m:t>
      </m:r>
    </m:e>
  </m:box>
  <m:r>
    <m:t>b</m:t>
  </m:r>
</m:oMath>
```

end example]

Parent Elements
boxPr (§7.1.2.14); rPr (§7.1.2.91)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present.

Attributes	Description
	The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.4 alnScr (Align Scripts)

This element specifies the alignment of scripts in the subscript/superscript function. When on, subscripts and superscripts are aligned to each other. When off, they are kerned to the shape of the base. If this element is omitted, scripts are not aligned. [*Example*: Example (OFF): f_2^3; Example (ON): f_2^3.

The XML representation of the second example above is:

```
<m:sSubSup>
  <m:sSubSupPr>
    <m:alnScr   m:val="on"/>
  </m:sSubSupPr>
  <m:e>
    <m:r>
      <m:t>f</m:t>
    </m:r>
  </m:e>
  <m:sub>
    <m:r>
      <m:rPr>
        <m:scr m:val="roman"/>
        <m:sty m:val="p"/>
      </m:rPr>
      <m:t>2</m:t>
    </m:r>
  </m:sub>
  <m:sup>
    <m:r>
      <m:rPr>
        <m:scr m:val="roman"/>
        <m:sty m:val="p"/>
      </m:rPr>
      <m:t>3</m:t>
    </m:r>
  </m:sup>
</m:sSubSup>
```

end example]

Parent Elements
sSubSupPr (§7.1.2.104)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.5 argPr (Argument Properties)

This element specifies any properties of the math argument. [*Example*: The XML below represents the argSz attribute on the base element e of a box:

```
<m:box>
  <m:boxPr>
    <m:noBreak m:val="off"/>
    <m:ctrlPr/>
  </m:boxPr>
  <m:e>
    <m:argPr>
      <m:argSz m:val="-1"/>
    </m:argPr>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:box>
```

end example]

Parent Elements

Parent Elements
deg (§7.1.2.26); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); lim (§7.1.2.52); num (§7.1.2.75); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
argSz (Argument Size)	§7.1.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArgPr">
   <sequence>
      <element name="argSz" type="CT_Integer2" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.6 argSz (Argument Size)

This element specifies the size, or script level, of an argument. If the element is omitted, the default argument size is 0. [*Example*: The following example contains three runs: regular text in the equation, a box object with the base at script size (val=-1) and a box object with the base at script-script size (val=-2).

$$abc^{abc}\ _{abc}$$

The XML below shows argSize used in the middle box.

```
<m:box>
  <m:boxPr>
    <m:noBreak m:val="off"/>
  </m:boxPr>
  <m:e>
    <m:argPr>
      <m:argSz m:val="-1"/>
    </m:argPr>
    <m:r>
      <m:t>abc</m:t>
    </m:t>
  </m:e>
</m:box>
```

end example]

Parent Elements
argPr (§7.1.2.5)

Attributes	Description

Attributes	Description
val (Value)	Specifies a value between -2 and 2 for the property defined by the parent XML element. The positive or negative sign specifies in which direction to change argument size; the absolute value specifies by how much. The table below represents two cases in which argument size can be changed: superscripts and boxes. In the superscript object a^{b^c}, by default the term c has script-script size. Should the user wish for the c to be shown at script size, `val` should be set to +1 (that is, one size larger). Should the user wish for c to be shown at text size, `val` should be set to +2 (that is, two sizes larger). **`val` of c in a^{b^c}** / **Display** Default / a^{b^c} +1 / a^{b^c} +2 / $a^{b^{\mathbf{c}}}$ **`val` of abc** / **Display** Default / abc -1 / abc -2 / abc The possible values for this attribute are defined by the ST_Integer2 simple type (§7.1.3.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Integer2">
   <attribute name="val" type="ST_Integer2" use="required"/>
</complexType>
```

7.1.2.7 bar (Bar)

This element specifies the bar function, consisting of a base argument and an overbar or underbar, as in $\overline{a}$and $\underline{a}$.

[*Example*: The XML below demonstrates the overbar in use.

```
<m:bar>
  <m:barPr>
   <m:pos   m:val="top"/>
  </m:barPr>
```

```
    <m:e>
      <m:r>
        <m:t>a</m:t>
      </m:r>
    </m:e>
  </m:bar>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
barPr (Bar Properties)	§7.1.2.8
e (Base (Argument))	§7.1.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Bar">
   <sequence>
      <element name="barPr" type="CT_BarPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.8 barPr (Bar Properties)

This element specifies properties of the bar function. If this element is omitted, the bar assumes its default location of top (the mathematical overbar).

Parent Elements
bar (§7.1.2.7)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
pos (Position (Bar))	§7.1.2.84

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BarPr">
   <sequence>
      <element name="pos" type="CT_TopBot" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.9 baseJc (Matrix Base Justification)

This element specifies the justification of the matrix. Text outside of the matrix can be aligned with the bottom, top, or center of a matrix function. If this element is omitted, the matrix assumes center justification.

[*Example*: This matrix has center baseJc: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$

This matrix has top baseJc: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$

This matrix has bottom baseJc: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$

The XML below represents the matrix with top baseJC:

```
<m:d>
  <m:dPr>
    <m:shp  m:val="match"/>
  </m:dPr>
  <m:e>
    <m:m>
      <m:mPr>
        <m:baseJc m:val="top"/>
        <m:mcs>
          <m:mc>
            <m:mcPr>
              <m:mcJc  m:val="center"/>
              <m:count m:val="2"/>
            </m:mcPr>
          </m:mc>
        </m:mcs>
      </m:mPr>
```

```
<m:mr>
  <m:e>
    <m:r>
      <m:rPr>
        <m:scr  m:val="roman"/>
        <m:sty m:val="p"/>
      </m:rPr>
      <m:t>1</m:t>
    </m:r>
  </m:e>
  <m:e>
    <m:r>
      <m:rPr>
        <m:scr  m:val="roman"/>
        <m:sty  m:val="p"/>
      </m:rPr>
      <m:t>2</m:t>
    </m:r>
  </m:e>
</m:mr>
<m:mr>
  <m:e>
    <m:r>
      <m:rPr>
        <m:scr  m:val="roman"/>
        <m:sty  m:val="p"/>
      </m:rPr>
      <m:t>3</m:t>
    </m:r>
  </m:e>
  <m:e>
    <m:r>
      <m:rPr>
        <m:scr  m:val="roman"/>
        <m:sty  m:val="p"/>
      </m:rPr>
      <m:t>4</m:t>
    </m:r>
  </m:e>
```

```
          <m:e>
            <m:r>
              <m:rPr>
                <m:scr  m:val="roman"/>
                <m:sty  m:val="p"/>
              </m:rPr>
              <m:t>5</m:t>
            </m:r>
          </m:e>
          <m:e>
            <m:r>
              <m:rPr>
                <m:scr  m:val="roman"/>
                <m:sty  m:val="p"/>
              </m:rPr>
              <m:t>6</m:t>
            </m:r>
          </m:e>
        </m:mr>
      </m:m>
    </m:e>
  </m:d>
```

end example]

Parent Elements
eqArrPr (§7.1.2.35); mPr (§7.1.2.68)

Attributes	Description
val (Value)	Specifies the vertical justification parent element respect to surrounding text. Possible values are `top`, `bot`, and `center`. [*Example*: The following examples illustrate baseJc on the matrix object m. This matrix has `center` baseJc: $\begin{pmatrix}1 & 2\\3 & 4\\5 & 6\end{pmatrix}$ This matrix has `top` baseJc: $\begin{pmatrix}1 & 2\\3 & 4\\5 & 6\end{pmatrix}$ This matrix has `bot` baseJc: $\begin{pmatrix}1 & 2\\3 & 4\\5 & 6\end{pmatrix}$ The possible values for this attribute are defined by the ST_YAlign simple type (§7.1.3.19).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_YAlign">
   <attribute name="val" type="ST_YAlign" use="required"/>
</complexType>
```

7.1.2.10 begChr (Delimiter Beginning Character)

This element specifies the beginning, or opening, delimiter character. Mathematical delimiters are enclosing characters such as parentheses, brackets, and braces. If this element is omitted, the default begChr is '('. [*Example*: In the following example, $\{a\}$ uses { and } as its enclosing characters:

```
<m:dPr>
  <m:begChr  m:val="{"/>
  <m:endChr m:val="}"/>
</m:dPr>
```

end example]

Parent Elements
dPr (§7.1.2.31)

Attributes	Description

val (value)	Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default. [*Example*: delimiter object {a}:
	`<m:dPr>`
	`<m:begChr m:val="{"/>`
	`<m:endChr m:val="}"/>`
	`</m:dPr>`
	
	The possible values for this attribute are defined by the ST_Char simple type (§7.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Char">
   <attribute name="val" type="ST_Char" use="required"/>
</complexType>
```

7.1.2.11 borderBox (Border-Box Function)

This element specifies the Border Box function, consisting of a border drawn around an equation, as in $\boxed{a^2 + b^2 = c^2}$.

[*Example*: The following example shows the XML representation of the following Border Box: $\boxed{abc}$

```
<m:borderBox>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
borderBoxPr (Border Box Properties)	§7.1.2.12
e (Base (Argument))	§7.1.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderBox">
   <sequence>
      <element name="borderBoxPr" type="CT_BorderBoxPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.12 borderBoxPr (Border Box Properties)

This element specifies the properties of the Border Box function, which dictate the types of lines that can be drawn as part of the border. [*Example*: $\boxed{\cancel{a^2 + b^2 = c^2}}$ (Diagonal Strikethrough from Top Left) and $\underline{\overline{a^2 + b^2 = c^2}}$ (no left or right edges).

Parent Elements
borderBox (§7.1.2.11)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
hideBot (Hide Bottom Edge)	§7.1.2.44
hideLeft (Hide Left Edge)	§7.1.2.45
hideRight (Hide Right Edge)	§7.1.2.46

Child Elements	Subclause
hideTop (Hide Top Edge)	§7.1.2.47
strikeBLTR (Border Box Strikethrough Bottom-Left to Top-Right)	§7.1.2.107
strikeH (Border Box Strikethrough Horizontal)	§7.1.2.108
strikeTLBR (Border Box Strikethrough Top-Left to Bottom-Right)	§7.1.2.109
strikeV (Border Box Strikethrough Vertical)	§7.1.2.110

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BorderBoxPr">
   <sequence>
      <element name="hideTop" type="CT_OnOff" minOccurs="0"/>
      <element name="hideBot" type="CT_OnOff" minOccurs="0"/>
      <element name="hideLeft" type="CT_OnOff" minOccurs="0"/>
      <element name="hideRight" type="CT_OnOff" minOccurs="0"/>
      <element name="strikeH" type="CT_OnOff" minOccurs="0"/>
      <element name="strikeV" type="CT_OnOff" minOccurs="0"/>
      <element name="strikeBLTR" type="CT_OnOff" minOccurs="0"/>
      <element name="strikeTLBR" type="CT_OnOff" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.13 box (Box Function)

This element specifies the box function, which is used to group components of an equation. A boxed object can (for example) serve as an operator emulator with or without an alignment point, serve as a line break point, have associated argSz, or be grouped such as not to allow line breaks within.

The equation $a == b$ uses a box around the double equal sign.

[*Example*: Its XML representation is as follows:

```
<m:r>
  <m:t>a</m:t>
</m:r>
<m:box>
  <m:boxPr>
    <m:opEmu    m:val="on"/>
    <m:aln/>
  </m:boxPr>
  <m:e>
      <m:r>
        <m:t>==</m:t>
      </m:r>
  </m:e>
</m:box>
```

```
<m:r>
  <m:t>b</m:t>
</m:r>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
boxPr (Box Properties)	§7.1.2.14
e (Base (Argument))	§7.1.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Box">
   <sequence>
      <element name="boxPr" type="CT_BoxPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.14 boxPr (Box Properties)

This element specifies properties of the Box function, for example, whether the Box serves as operator emulator with or without an alignment point, serves as a line break point, or receives the correct spacing for the mathematical differential.

Parent Elements
box (§7.1.2.13)

Child Elements	Subclause
aln (Alignment)	§7.1.2.3
brk (Break)	§7.1.2.15
ctrlPr (Control Properties)	§7.1.2.23
diff (Differential)	§7.1.2.29
noBreak (No Break)	§7.1.2.73
opEmu (Operator Emulator)	§7.1.2.80

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BoxPr">
   <sequence>
      <element name="opEmu" type="CT_OnOff" minOccurs="0"/>
      <element name="noBreak" type="CT_OnOff" minOccurs="0"/>
      <element name="diff" type="CT_OnOff" minOccurs="0"/>
      <element name="brk" type="CT_ManualBreak" minOccurs="0"/>
      <element name="aln" type="CT_OnOff" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.15 brk (Break)

This element specifies whether there is a line break at the start of a run, or at the start of the Box function, such that the line wraps at the start of the run or function. If this element is omitted, a manual break is not inserted. The line may happen to wrap at this point if the equation exceeds the column width. [*Example*:The following example includes a manual line break at the operator emulator:

$$a \\ == b$$

```
<m:r>
  <m:t>a</m:t>
</m:r>
<m:box>
  <m:boxPr>
    <m:opEmu    m:val="on"/>
    <m:brk/>
  </m:boxPr>
  <m:e>
    <m:r>
      <m:t>==</m:t>
    </m:r>
  </m:e>
</m:box>
<m:r>
  <m:t>b</m:t>
</m:r>
```

end example]

Parent Elements
boxPr (§7.1.2.14); rPr (§7.1.2.91)

Attributes	Description
alnAt (Index of Operator to Align To)	Specifies the index of the operator on the previous line which shall be used as the alignment point for the current line. A line can be aligned to any operator on the previous line in the equation; this attribute specifies exactly which operator shall be the target of that alignment in cases where there are multiple operators. [*Example*: For example, consider the break in this equation: $$a + b + c + d + e \\ + f + g$$ The second line could theoretically be aligned to any of the four operators in the previous line. Specifying an alnAt value of 3 for the second line resolves this ambiguity; the second line is aligned to the third operator in the previous line. *end example*] The possible values for this attribute are defined by the ST_Integer255 simple type (§7.1.3.6).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ManualBreak">
   <attribute name="alnAt" type="ST_Integer255"/>
</complexType>
```

7.1.2.16 brkBin (Break on Binary Operators)

This element specifies how binary operators are treated when they coincide with a line break. If this element is omitted, the line break occurs before the binary operator. That is, the binary operator is the first element on the wrapped line. [*Example*: For example:

$f(x) = a_{11} + a_{12} + \cdots \\ + a_{nn}$

Before

$f(x) = a_{11} + a_{12} + \cdots + \\ a_{nn}$

After

$f(x) = a_{11} + a_{12} + \cdots + \\ + a_{nn}$

Duplicate

The XML below demonstrates brkBin in use under mathPr:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
```

```
    <m:lMargin m:val="0"/>
    <m:rMargin m:val="0"/>
    <m:defJc m:val="centerGroup"/>
    <m:wrapIndent m:val="1440"/>
    <m:intLim m:val="subSup"/>
    <m:naryLim m:val="undOvr"/>
  </m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies where to break on binary operators. Possible values are `before`, `after`, and `repeat`. The possible values for this attribute are defined by the ST_BreakBin simple type (§7.1.3.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BreakBin">
   <attribute name="val" type="ST_BreakBin"/>
</complexType>
```

7.1.2.17 brkBinSub (Break on Binary Subtraction)

This element specifies how the subtraction operator is treated when it coincides with a line break, when brkBin is set to repeat. If this element is omitted, the subtraction operator is repeated before and after the break.

[*Example*: The XML below demonstrates brkBinSub in use under mathPr:

```
  <m:mathPr>
    <m:mathFont m:val="Cambria Math"/>
    <m:brkBin m:val="before"/>
    <m:brkBinSub m:val="--"/>
    <m:smallFrac m:val="off"/>
    <m:dispDef/>
    <m:lMargin m:val="0"/>
    <m:rMargin m:val="0"/>
    <m:defJc m:val="centerGroup"/>
    <m:wrapIndent m:val="1440"/>
    <m:intLim m:val="subSup"/>
    <m:naryLim m:val="undOvr"/>
  </m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies how the subtraction operator is treated when it coincides with a line break, when `brkBin` is set to `repeat`. Possible values are `--`, `-+`, and `+-`. The possible values for this attribute are defined by the ST_BreakBinSub simple type (§7.1.3.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BreakBinSub">
   <attribute name="val" type="ST_BreakBinSub"/>
</complexType>
```

7.1.2.18 cGp (Matrix Column Gap)

The additional (custom) column gap spacing information; the default is'0'. [*Example*: This matrix: $\begin{matrix} 1 & 2 \\ 3 & 4 \end{matrix}$ has .5 ems of additional spacing between columns. The matrix properties that demonstrate this element in use are:

```
<m:mPr>
  <m:cGpRule  m:val="4"/>
  <m:cGp  m:val="6"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:mcJc m:val="center"/>
        <m:count m:val="2"/>
      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

Parent Elements
mPr (§7.1.2.68)

Attributes	Description

Attributes	Description
val (Value)	Specifies the amount of space between the parent element. The manner in which this value is determined depends on the setting of the rule of the parent element. If the rule is set to 3 (or "Exactly"), then the unit is interpreted as points. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as lines. The possible values for this attribute are defined by the ST_UnSignedInteger simple type (§7.1.3.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnSignedInteger">
   <attribute name="val" type="ST_UnSignedInteger" use="required"/>
</complexType>
```

7.1.2.19 cGpRule (Matrix Column Gap Rule)

This element specifies the type of horizontal spacing between columns in a matrix. Type of gap (horizontal spacing) between columns of a Matrix; the default is '0'. [*Example*: The following matrix has double spacing between columns:

$$\begin{matrix} 1 & 2 \\ 3 & 4 \end{matrix}$$

The XML that represents this property in use is:

```
<m:mPr>
  <m:cGpRule  m:val="2"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:mcJc  m:val="center"/>
        <m:count  m:val="2"/>
      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

Parent Elements
mPr (§7.1.2.68)

Attributes	Description
val (Value)	Specifies the type of spacing between rows and/or columns. Possible values are 0, 1, 2, 3, or 4, whose definitions are contained in the following table:

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><th>Value</th><th>Column/Row Gap</th><th>Example</th></tr>
<tr><td>0</td><td>Single spacing gap</td><td>1 2</td></tr>
<tr><td>1</td><td>1.5 spacing gap</td><td>1 2</td></tr>
<tr><td>2</td><td>2 spacing gap</td><td>1 2</td></tr>
<tr><td>3</td><td>Exactly
(for columns, rely on value of cGp, measured in points)
(for rows, rely on value of rSp, measured in points)</td><td>1 2</td></tr>
<tr><td>4</td><td>Multiple
(for columns, rely on value of cGp, measured in lines)
(for rows, rely on value of rSp, measured in lines)</td><td>1 2</td></tr>
</table>

The possible values for this attribute are defined by the ST_SpacingRule simple type (§7.1.3.12).
</td></tr>
</table>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SpacingRule">
   <attribute name="val" type="ST_SpacingRule" use="required"/>
</complexType>
```

7.1.2.20 chr (Accent Character)

This element specifies the type of combining diacritical mark attached to the base of the accent function. If this property is omitted, the default accent character is U+0302. [*Example*: Examples of accent characters are the dot, hat, and arrow in the following cases: $\dot{a}$ $\hat{a}$ $\vec{a}$.

For example, the following XML represents the acc $\tilde{a}$.

```
<m:acc>
  <m:accPr>
    <m:chr m:val="&#771;"/>
  </m:accPr>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
</m:acc>
```

end example]

Parent Elements
accPr (§7.1.2.2); groupChrPr (§7.1.2.42); naryPr (§7.1.2.72)

Attributes	Description

val (value)	Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default. [*Example*: delimiter object {a}:
	`<m:dPr>`
	`<m:begChr m:val="{"/>`
	`<m:endChr m:val="}"/>`
	`</m:dPr>`
	
	The possible values for this attribute are defined by the ST_Char simple type (§7.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Char">
   <attribute name="val" type="ST_Char" use="required"/>
</complexType>
```

7.1.2.21 count (Matrix Column Count)

This element specifies the number of columns to which a property applies. [*Example*: The example below represents that two of the columns in the matrix described by the XML have the `center` property.

```
<m:mPr>
  <m:cSp  m:val="120"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:mcJc m:val="center"/>
        <m:count  m:val="2"/>
      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

Parent Elements
mcPr (§7.1.2.66)

Attributes	Description

Attributes	Description
val (Value)	Specifies the number of columns to which a column attribute applies. [Example: A count attribute value of 3 specifies that the property applies to the first three columns of the matrix. end example] The possible values for this attribute are defined by the ST_Integer255 simple type (§7.1.3.6).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Integer255">
   <attribute name="val" type="ST_Integer255" use="required"/>
</complexType>
```

7.1.2.22 cSp (Matrix Column Spacing)

This element specifies the minimum spacing between the edge of one column and the corresponding edge of the adjacent column. Additional spacing can be added to enhance appearance. If this element is omitted, the default is column spacing is '0'. [*Example*: The following matrix specifies that there should never be fewer than 6 pts. between adjacent column edges:

$$\begin{matrix} 1 & 2 \\ 3 & 4 \end{matrix}$$

```
<m:mPr>
  <m:cSp  m:val="120"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:mcJc m:val="center"/>
        <m:count  m:val="2"/>
      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

Parent Elements
mPr (§7.1.2.68)

Attributes	Description
val (Value)	Specifies the amount of space between the parent element. The manner in which this value is determined depends on the setting of the rule of the parent element. If the rule is set to 3 (or "Exactly"), then the unit is interpreted as points. If the rule is set to 4 (or

Attributes	Description
	"Multiple"), then the unit is interpreted as lines. The possible values for this attribute are defined by the ST_UnSignedInteger simple type (§7.1.3.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnSignedInteger">
   <attribute name="val" type="ST_UnSignedInteger" use="required"/>
</complexType>
```

7.1.2.23 ctrlPr (Control Properties)

This element specifies properties on control characters; that is, object characters that cannot be selected. Examples of control characters are n-ary operators (excluding their limits and bases), fraction bars (excluding the numerator and denominator), and grouping characters (excluding the base). ctrlPr allows formatting properties to be stored on these control characters. The control character inherits its formatting from the paragraph formatting; ctrlPr contains the formatting differences between the control character and the paragraph formatting.

[*Example*: The example below shows that the control character is of font Cambria Math. All other formatting, such as text size and color, are the same as the paragraph.

```
<m:ctrlPr>
  <w:rPr>
    <w:rFonts w:ascii="Cambria Math" w:hAnsi="Cambria Math"/>
  </w:rPr>
</m:ctrlPr>
```

end example]

CtrlPr is also used to save properties on characters used in the Linear representation of an equation, that are not displayed in the Professional form. For example, the linear string ∫_0^1 might have color on the _ or ^. Though these characters are not displayed in Professional form, their formatting is stored.

Parent Elements
accPr (§7.1.2.2); barPr (§7.1.2.8); borderBoxPr (§7.1.2.12); boxPr (§7.1.2.14); deg (§7.1.2.26); den (§7.1.2.28); dPr (§7.1.2.31); e (§7.1.2.32); eqArrPr (§7.1.2.35); fName (§7.1.2.37); fPr (§7.1.2.38); funcPr (§7.1.2.40); groupChrPr (§7.1.2.42); lim (§7.1.2.52); limLowPr (§7.1.2.55); limUppPr (§7.1.2.57); mPr (§7.1.2.68); naryPr (§7.1.2.72); num (§7.1.2.75); phantPr (§7.1.2.82); radPr (§7.1.2.89); sPrePr (§7.1.2.100); sSubPr (§7.1.2.102); sSubSupPr (§7.1.2.104); sSupPr (§7.1.2.106); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
del (Deleted Math Control Character)	§2.13.5.15

Child Elements	Subclause
ins (Inserted Math Control Character)	§2.13.5.17
rPr (Run Properties)	§2.3.2.25

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CtrlPr">
   <sequence>
      <group ref="w:EG_RPrMath" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.24 d (Delimiter Function)

This element specifies the delimiter function, consisting of opening and closing delimiters (such as parentheses, braces, brackets, and vertical bars), and an element contained inside. The delimiter may have more than one element, with a designated separator character between each element. [*Example*:

Delimiter with one base: (x^2)

Delimiter with more than one base and separators, whose XML is shown below: $(x^2|y^2)$

```
<m:d>
  <m:e>
    <m:sSup>
      <m:e>
        <m:r>
          <m:t>x</m:t>
        </m:r>
      </m:e>
      <m:sup>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>2</m:t>
        </m:r>
      </m:sup>
    </m:sSup>
  </m:e>
```

```
    <m:e>
      <m:sSup>
        <m:e>
          <m:r>
            <m:t>y</m:t>
          </m:r>
        </m:e>
        <m:sup>
          <m:r>
            <m:rPr>
              <m:scr m:val="roman"/>
              <m:sty  m:val="p"/>
            </m:rPr>
            <m:t>2</m:t>
          </m:r>
        </m:sup>
      </m:sSup>
    </m:e>
  </m:d>
```

end example]

Parent Elements

Child Elements	Subclause
dPr (Delimiter Properties)	§7.1.2.31
e (Base (Argument))	§7.1.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_D">
   <sequence>
      <element name="dPr" type="CT_DPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

7.1.2.25 defJc (Default Justification)

This element specifies the default justification of display math, at the document level. Individual equations can overrule the default setting.

Display math can be left justified, right justified, centered, or centered as a group. When display math is centered as a group, the equations are left aligned within a block, and the entire block is centered with respect to column margins. If this element is omitted, the equations are centered as a group. [*Example*: The XML below demonstrates defJc in use:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the default justification of equations in the document. Possible values are `center`, `centerGroup`, `left`, and `right`. The possible values for this attribute are defined by the ST_Jc simple type (§7.1.3.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathJc">
   <attribute name="val" type="ST_Jc"/>
</complexType>
```

7.1.2.26 deg (Degree)

This element specifies the degree in the mathematical radical, for example the 3 in $\sqrt[3]{x}$ (XML representation is below). This element is optional. When omitted, the square root function, as in $\sqrt{x}$, is assumed. [*Example*:

```
<m:rad>
  <m:deg>
     <m:r>
        <m:rPr>
          <m:scr   m:val="roman"/>
          <m:sty   m:val="p"/>
        </m:rPr>
        <m:t>3</m:t>
      </m:r>
  </m:deg>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
  </m:e>
</m:rad>
```

end example]

sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
   <sequence>
      <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
      <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.27 degHide (Hide Degree)

This element specifies the per-object option to hide the degree of a radical. Every rad has a deg, but the deg can appear or not appear. When degHide is set to 'on,' the degree is not shown, as in $\sqrt{x}$ (XML shown below). When degHide is omitted, the default is 'off'; that is, the degree is not hidden. [*Example*:

```
<m:rad>
  <m:radPr>
    <m:degHide  m:val="on"/>
  </m:radPr>
  <m:deg>
  </m:deg>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
  </m:e>
</m:rad>
```

end example]

Parent Elements
radPr (§7.1.2.89)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.28 den (Denominator)

This element specifies the denominator of a fraction. [*Example*: For example, the b in $^{a}/_{b}$:

```
<m:f>
  <m:fPr>
    <m:type  m:val="skw"/>
  </m:fPr>
  <m:num>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:num>
  <m:den>
    <m:r>
      <m:t>b</m:t>
    </m:r>
  </m:den>
</m:f>
```

sSub (Subscript Function)	§7.1.2.101
sSubSup (Sub-Superscript Function)	§7.1.2.103
sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
   <sequence>
      <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
      <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.29 diff (Differential)

The element specifies the differential property on box. When 'on,' the box acts as a differential (e.g., dx in an integrand), and receives the appropriate horizontal spacing for the mathematical differential. When this property is omitted, the box is not treated as a differential. [*Example*: The following example demonstrates a box set as differential in use, both in its proper form and in XML:

$$\int_0^1 x\,dx$$

```
<m:nary>
  <m:naryPr>
    <m:chr m:val="&#8747;"/>
  </m:naryPr>
  <m:sub>
      <m:r>
        <m:rPr>
          <m:scr m:val="roman"/>
          <m:sty m:val="p"/>
        </m:rPr>
        <m:t>0</m:t>
      </m:r>
  </m:sub>
```

```
<m:sup>
    <m:r>
      <m:rPr>
        <m:scr  m:val="roman"/>
        <m:sty  m:val="p"/>
      </m:rPr>
      <m:t>1</m:t>
    </m:r>
</m:sup>
<m:e>
  <m:r>
    <m:t>x</m:t>
  </m:r>
  <m:box>
    <m:boxPr>
      <m:diff  m:val="on"/>
    </m:boxPr>
    <m:e>
      <m:r>
        <m:t>dx</m:t>
      </m:r>
    </m:e>
  </m:box>
</m:e>
</m:nary>
```

end example]

Parent Elements
boxPr (§7.1.2.14)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.30 dispDef (Use Display Math Defaults)

This element specifies the document-level property to overwrite paragraph settings for equations. When omitted, this element is set to 'on' and special math settings are applied.

[*Example*: The XML below demonstrates dispDef in use:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.31 dPr (Delimiter Properties)

This element specifies the properties of d, including the enclosing and separating characters, and the properties that affect the shape of the delimiters.

Parent Elements
d (§7.1.2.24)

Child Elements	Subclause
begChr (Delimiter Beginning Character)	§7.1.2.10
ctrlPr (Control Properties)	§7.1.2.23
endChr (Delimiter Ending Character)	§7.1.2.33
grow (n-ary Grow)	§7.1.2.43
sepChr (Delimiter Separator Character)	§7.1.2.95
shp (Shape (Delimiters))	§7.1.2.97

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DPr">
   <sequence>
      <element name="begChr" type="CT_Char" minOccurs="0"/>
      <element name="sepChr" type="CT_Char" minOccurs="0"/>
      <element name="endChr" type="CT_Char" minOccurs="0"/>
      <element name="grow" type="CT_OnOff" minOccurs="0"/>
      <element name="shp" type="CT_Shp" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.32 e (Base (Argument))

This element specifies the base argument of a mathematical function.

[*Example*: For example, the func $\lim_{n\to\infty} x_n$ has fName $\lim_{n\to\infty}$ and e x_n:

```
<m:func>
  <m:fName>
    <m:limLow>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>lim</m:t>
        </m:r>
      </m:e>
      <m:lim>
        <m:r>
          <m:t>n&#8594;&#8734;</m:t>
        </m:r>
      </m:lim>
    </m:limLow>
  </m:fName>
  <m:e>
    <m:sSub>
      <m:e>
        <m:r>
          <m:t>x</m:t>
        </m:r>
      </m:e>
      <m:sub>
        <m:r>
          <m:t>n</m:t>
        </m:r>
      </m:sub>
    </m:sSub>
  </m:e>
</m:func>
```

end example]

sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
   <sequence>
      <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
      <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.33 endChr (Delimiter Ending Character)

This element specifies the ending, or closing, delimiter character. Mathematical delimiters are enclosing characters such as parentheses, brackets, and braces. If this element is omitted, the default endChr is ')'.

[*Example*: In the following example, $\{a\}$ uses { and } as its enclosing characters:

```
<m:dPr>
  <m:begChr  m:val="{"/>
  <m:endChr m:val="}"/>
</m:dPr>
```

end example]

Parent Elements
dPr (§7.1.2.31)

Attributes	Description

Attributes	Description

val (value)	Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default. [*Example*: delimiter object {a}:
	`<m:dPr>`
	`<m:begChr m:val="{"/>`
	`<m:endChr m:val="}"/>`
	`</m:dPr>`
	
	The possible values for this attribute are defined by the ST_Char simple type (§7.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Char">
   <attribute name="val" type="ST_Char" use="required"/>
</complexType>
```

7.1.2.34 eqArr (Equation-Array Function)

This element specifies the Equation-Array function, an object consisting of one or more equations that can be vertically justified as a unit respect to surrounding text on the line. Alignment of multiple points within each equation can occur within the equation array. [*Example*: An example of an equation array with alignment points is:

$$\begin{aligned} x- \quad y+ \quad z= \quad 10 \\ 3x+ \quad y+2z= \quad 34 \\ -5x+2y- \quad z=-14 \end{aligned}$$

Notice that the variables, operators, and tens digits of the sums line up properly.

The XML of a simple eqArr $\begin{matrix} a=b+c \\ d+e=f \end{matrix}$ is:

```
<m:eqArr>
  <m:e>
    <m:r>
      <m:t>a=b+c</m:t>
    </m:r>
  </m:e>
  <m:e>
    <m:r>
      <m:t>d+e=f</m:t>
    </m:r>
  </m:e>
</m:eqArr>
```

end example]

Parent Elements

Parent Elements

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
eqArrPr (Equation Array Properties)	§7.1.2.35

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EqArr">
   <sequence>
      <element name="eqArrPr" type="CT_EqArrPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

7.1.2.35 eqArrPr (Equation Array Properties)

This element specifies the properties of the equation array object, including the vertical justification of the object and layout inside the object.

Parent Elements
eqArr (§7.1.2.34)

Child Elements	Subclause
baseJc (Matrix Base Justification)	§7.1.2.9
ctrlPr (Control Properties)	§7.1.2.23
maxDist (Maximum Distribution)	§7.1.2.63
objDist (Object Distribution)	§7.1.2.76
rSp (Row Spacing (Equation Array))	§7.1.2.92
rSpRule (Row Spacing Rule)	§7.1.2.93

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EqArrPr">
   <sequence>
      <element name="baseJc" type="CT_YAlign" minOccurs="0"/>
      <element name="maxDist" type="CT_OnOff" minOccurs="0"/>
      <element name="objDist" type="CT_OnOff" minOccurs="0"/>
      <element name="rSpRule" type="CT_SpacingRule" minOccurs="0"/>
      <element name="rSp" type="CT_UnSignedInteger" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.36 f (Fraction Function)

This element specifies the fraction object, consisting of a numerator and denominator separated by a fraction bar. The fraction bar can be horizontal or diagonal, depending on the fraction properties. The fraction object is also used to represent the stack function, which places one element above another, with no fraction bar. [*Example*: Examples of fractions are:

Stacked Fraction: $\frac{a}{b}$

Skewed Fraction: a/b

Linear Fraction: a/b

Stack Object (No-Bar Fraction): $\begin{matrix} n \\ k \end{matrix}$

The fraction a/b is represented as:

```
<m:f>
  <m:fPr>
    <m:type  m:val="skw"/>
  </m:fPr>
  <m:num>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:num>
  <m:den>
    <m:r>
      <m:t>b</m:t>
    </m:r>
  </m:den>
</m:f>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
den (Denominator)	§7.1.2.28
fPr (Fraction Properties)	§7.1.2.38
num (Numerator)	§7.1.2.75

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_F">
   <sequence>
      <element name="fPr" type="CT_FPr" minOccurs="0"/>
      <element name="num" type="CT_OMathArg"/>
      <element name="den" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.37 fName (Function Name)

This element specifies the name of the function in the Function-Apply object func. For example, function names are sin and cos.

[*Example*: As an example, the func $\lim_{n\to\infty} x_n$ has fName $\lim_{n\to\infty}$ and e x_n:

```
<m:func>
  <m:fName>
    <m:limLow>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>lim</m:t>
        </m:r>
      </m:e>
```

```
        <m:lim>
          <m:r>
            <m:t>n&#8594;&#8734;</m:t>
          </m:r>
        </m:lim>
      </m:limLow>
    </m:fName>
    <m:e>
      <m:sSub>
        <m:e>
          <m:r>
            <m:t>x</m:t>
          </m:r>
        </m:e>
        <m:sub>
          <m:r>
            <m:t>n</m:t>
          </m:r>
        </m:sub>
      </m:sSub>
    </m:e>
  </m:func>
```

end example]

sSubSup (Sub-Superscript Function)	§7.1.2.103
sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
    <sequence>
        <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
        <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
        <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
    </sequence>
</complexType>
```

7.1.2.38 fPr (Fraction Properties)

This element specifies the properties of the fraction function f. Properties of the Fraction function include the type or style of the fraction. The fraction bar can be horizontal or diagonal, depending on the fraction properties. The fraction object is also used to represent the stack function, which places one element above another, with no fraction bar. [*Example*: Examples of fractions are:

Stacked Fraction: $\frac{a}{b}$

Skewed Fraction: a/b

Linear Fraction: a/b

Stack Object (No-Bar Fraction): $\binom{n}{k}$

end example]

Parent Elements
f (§7.1.2.36)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
type (Fraction type)	§7.1.2.118

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FPr">
    <sequence>
        <element name="type" type="CT_FType" minOccurs="0"/>
        <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
    </sequence>
</complexType>
```

7.1.2.39 func (Function Apply Function)

This element specifies the Function-Apply function, which consists of a function name and an argument acted upon. [*Example*: Examples of Function-Apply objects include: $\sin x$, $\tan^{-1} x^2$, and $\max_{0\le x\le 1} xe^{-x^2}$.

As an example, the func $\lim_{n\to\infty} x_n$ has fName $\lim_{n\to\infty}$ and e x_n:

```
<m:func>
  <m:fName>
    <m:limLow>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>lim</m:t>
        </m:r>
      </m:e>
      <m:lim>
        <m:r>
          <m:t>n&#8594;&#8734;</m:t>
        </m:r>
      </m:lim>
    </m:limLow>
  </m:fName>
  <m:e>
    <m:sSub>
      <m:e>
        <m:r>
          <m:t>x</m:t>
        </m:r>
      </m:e>
      <m:sub>
        <m:r>
          <m:t>n</m:t>
        </m:r>
      </m:sub>
    </m:sSub>
  </m:e>
</m:func>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32

<complexType name="CT_GroupChr">
   <sequence>
      <element name="groupChrPr" type="CT_GroupChrPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.42 groupChrPr (Group-Character Properties)

This element specifies the properties of the Group-Character function groupChr. These properties can be used to specify the character placed above or below the argument, and the position of the character. When omitted, U+23DF is used as the chr and its pos is set to bot.

Parent Elements
groupChr (§7.1.2.41)

Child Elements	Subclause
chr (Accent Character)	§7.1.2.20

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
pos (Position (Bar))	§7.1.2.84
vertJc (Vertical Justification)	§7.1.2.119

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupChrPr">
   <sequence>
      <element name="chr" type="CT_Char" minOccurs="0"/>
      <element name="pos" type="CT_TopBot" minOccurs="0"/>
      <element name="vertJc" type="CT_TopBot" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.43 grow (n-ary Grow)

This element specifies the growth property of n-ary operators at the document level. When off, n-ary operators such as integrals and summations do not grow to match the size of their operand height. When on, the n-ary operator grows vertically to match its operand height. If this property is omitted, grow is set to off. [*Example*: The two integrals below demonstrate the difference between grow = off and grow = on.

$$\int_0^1 \frac{x^2}{x+y}dx \int_0^1 \frac{y^2}{x+y}dy$$

The XML that defines nary growth is:

```
<m:naryPr>
  <m:chr  m:val="&#8747;"/>
  <m:grow m:val="on"/>
</m:naryPr>
```

end example]

Parent Elements
dPr (§7.1.2.31); naryPr (§7.1.2.72)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

Attributes	Description
	A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.44 hideBot (Hide Bottom Edge)

This element specifies the hidden or shown state of the bottom edge of borderBox. When this element is omitted, the bottom edge is shown. When on, the bottom border is hidden, as in $\overline{abc}$. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideBot/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Parent Elements
borderBoxPr (§7.1.2.12)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.45 hideLeft (Hide Left Edge)

This element specifies the hidden or shown state of the left edge of borderBox. When this element is omitted, the edge is shown. When on, the left border is hidden, as in $\boxed{abc}$. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideLeft/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Parent Elements
borderBoxPr (§7.1.2.12)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.46 hideRight (Hide Right Edge)

This element specifies the hidden or shown state of the right edge of borderBox. When this element is omitted, the edge is shown. When on, the right border is hidden, as in $\boxed{abc}$. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideRight/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Parent Elements
borderBoxPr (§7.1.2.12)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.47 hideTop (Hide Top Edge)

This element specifies the hidden or shown state of the top edge of borderBox. When this element is omitted, the edge is shown.

When on, the top border is hidden, as in $\underline{abc}$. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideTop/>
  </m:borderBoxPr>
```

```
    <m:e>
      <m:r>
        <m:t>abc</m:t>
      </m:r>
    </m:e>
  </m:borderBox>
```

end example]

Parent Elements
borderBoxPr (§7.1.2.12)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.48 interSp (Inter-Equation Spacing)

This element specifies spacing between equations within a display math paragraph, in twips.

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
   <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

7.1.2.49 intLim (Integral Limit Locations)

This element specifies the document setting for the default placement of integral limits, when converted from a linear format to a two-dimensional output. Limits can be either centered above and below the integral, or positioned just to the right of the operator, as in:

$$\int_a^b x\,dx \quad \int_a^b x\,dx$$

When this integral object is written linearly, as $\int \_a\^b$, the placement of limits is ambiguous. intLim is a document-level property that specifies the default positioning. When this element is omitted, the default placement of integral limits is subSup (that is, the location of subscripts and superscripts, or just to the right of the base or operator).

[*Example*: The XML that specifies this property in use is:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the default location of limits on an integral. Possible values are subSup and undOvr.

Attributes	Description
	The possible values for this attribute are defined by the ST_LimLoc simple type (§7.1.3.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimLoc">
   <attribute name="val" type="ST_LimLoc" use="required"/>
</complexType>
```

7.1.2.50 intraSp (Intra-Equation Spacing)

This element specifies the spacing between adjacent display math paragraphs, in twips.

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
   <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

7.1.2.51 jc (Justification)

This element specifies justification of the math paragraph (a series of adjacent equations within the same paragraph). A math paragraph can be Left Justified, Right Justified, Centered, or Centered as Group. If this element is omitted, the math paragraph is Centered as Group. This means that the equations can be aligned with respect to each other, but the entire group of equations is centered as a whole. [*Example*: An example of Centered as Group is the following example, in which each equation is left-aligned, but the series is centered:

$$x = x_1 + x_2 + x_3 + \cdots$$
$$y = y_1 + y_2 + y_3 + y_4 + \cdots$$
$$z = z_1 + z_2 + z_3 + z_4 + z_5 + \cdots$$

The XML that demonstrates jc in use is:

```
<m:oMathParaPr>
  <m:jc m:val="right"/>
</m:oMathParaPr>
```

end example]

Parent Elements
oMathParaPr (§7.1.2.79)

Attributes	Description
val (Value)	Specifies the default justification of equations in the document. Possible values are `center`, `centerGroup`, `left`, and `right`. The possible values for this attribute are defined by the ST_Jc simple type (§7.1.3.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathJc">
   <attribute name="val" type="ST_Jc"/>
</complexType>
```

7.1.2.52 lim (Limit (Lower))

This element specifies the lower limit of the limLow function. [*Example*: For example, the limit of the limLow $\lim_{n\to\infty}$ is $n \to \infty$. The XML that specifies this function is:

```
<m:limLow>
  <m:e>
    <m:r>
      <m:rPr>
        <m:scr m:val="roman"/>
        <m:sty  m:val="p"/>
      </m:rPr>
      <m:t>lim</m:t>
    </m:r>
  </m:e>
  <m:lim>
    <m:r>
      <m:t>n&#8594;&#8734;</m:t>
    </m:r>
  </m:lim>
</m:limLow>
```

end example]

Parent Elements
limLow (§7.1.2.54); limUpp (§7.1.2.56)

sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
   <sequence>
      <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
      <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.53 limLoc (n-ary Limit Location)

This element specifies the location of limits in n-ary operators. Limits can be either centered above and below the n-ary operator, or positioned just to the right of the operator, as in:

$$\sum_{i=0}^{n} x_n \sum_{i=0}^{n} x_n$$

When this element is omitted, the default location is undOvr. [*Example*: The XML representing this property in use is:

```
<m:naryPr>
  <m:chr  m:val="&#8721;"/>
  <m:limLoc m:val="subSup"/>
  <m:grow m:val="on"/>
</m:naryPr>
```

end example]

Parent Elements
naryPr (§7.1.2.72)

Attributes	Description
val (Value)	Specifies the default location of limits on an integral. Possible values are subSup and undOvr. The possible values for this attribute are defined by the ST_LimLoc simple type (§7.1.3.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimLoc">
   <attribute name="val" type="ST_LimLoc" use="required"/>
</complexType>
```

7.1.2.54 limLow (Lower-Limit Function)

This element specifies the Lower-Limit function, consisting of text on the baseline and reduced-size text immediately below it. Examples of limLow include $\lim_{n \to \infty}$ and $\max_{0 \leq x \leq 1}$. [*Example*: The XML that represents $\lim_{n \to \infty}$ is:

```
<m:limLow>
  <m:e>
    <m:r>
      <m:rPr>
        <m:scr m:val="roman"/>
        <m:sty  m:val="p"/>
      </m:rPr>
      <m:t>lim</m:t>
    </m:r>
  </m:e>
  <m:lim>
    <m:r>
      <m:t>n&#8594;&#8734;</m:t>
    </m:r>
  </m:lim>
</m:limLow>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
lim (Limit (Lower))	§7.1.2.52
limLowPr (Lower Limit Properties)	§7.1.2.55

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimLow">
   <sequence>
      <element name="limLowPr" type="CT_LimLowPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
      <element name="lim" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.55 limLowPr (Lower Limit Properties)

This element specifies control properties (ctrlPr) that can be stored on the Lower Limit (limLow).

Parent Elements
limLow (§7.1.2.54)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimLowPr">
   <sequence>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.56 limUpp (Upper-Limit Function)

This element specifies the Upper-Limit function, consisting of text on the baseline and reduced-size text immediately above it. [*Example*: Examples of limUpp include $\overbrace{x+x+x}^{k \text{ times}}$ and $\overset{\text{def}}{=}$.

The XML that specifies the $\text{limUpp}\overset{\text{def}}{=}$ is:

```
<m:limUpp>
  <m:e>
    <m:r>
      <m:t>=</m:t>
    </m:r>
  </m:e>
```

```
    <m:lim>
      <m:r>
        <m:rPr>
          <m:nor/>
        </m:rPr>
        <m:t>def</m:t>
      </m:r>
    </m:lim>
  </m:limUpp>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
lim (Limit (Lower))	§7.1.2.52
limUppPr (Upper Limit Properties)	§7.1.2.57

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimUpp">
   <sequence>
      <element name="limUppPr" type="CT_LimUppPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
      <element name="lim" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.57 limUppPr (Upper Limit Properties)

This element specifies control properties (ctrlPr) that can be stored on the Upper Limit (limUpp).

Parent Elements
limUpp (§7.1.2.56)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimUppPr">
   <sequence>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.58 lit (Literal)

This element specifies that the characters in the run are literal; that is, they are to be interpreted literally and not take on any special mathematical meaning such as operators or characters that trigger conversion to a 2-dimensional format. [*Example*: In the following XML, the + operator is treated literally and does not receive proper binary spacing:

```
<m:r>a</m:r>
<m:r>
  <m:rPr>
    <m:lit/>
  </m:rPr>
  <m:t>+</m:t>
</m:r>
<m:r>
  <m:t>b</m:t>
</m:r>
```

end example]

Parent Elements
rPr (§7.1.2.91)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.59 lMargin (Left Margin)

This element specifies the left margin for math, in twips. Math margins are added to the paragraph settings for margins. [*Example*: The following XML demonstrates an lmargin setting of 1".

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
  <m:lMargin m:val="1440"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
   <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

7.1.2.60 m (Matrix Function)

This element specifies the Matrix function, consisting of one or more elements laid out in one or more rows and one or more columns. [*Example*: Examples of matrices are: $\begin{pmatrix} 1 & 2 \\ 3 & 4 \\ 5 & 6 \end{pmatrix}$ and $\begin{bmatrix} 1 & \\ & 1 \end{bmatrix}$. Below is a 2x2 matrix, in its proper form an in XML.

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
<m:m>
  <m:mPr>
    <m:mcs>
      <m:mc>
        <m:mcPr>
          <m:mcJc  m:val="center"/>
          <m:count m:val="2"/>
        </m:mcPr>
      </m:mc>
    </m:mcs>
  </m:mPr>
  <m:mr>

  <m:mr>
    <m:e>
      <m:r>
        <m:rPr>
          <m:scr  m:val="roman"/>
          <m:sty  m:val="p"/>
        </m:rPr>
        <m:t>3</m:t>
      </m:r >
    </m:e>
```

```
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>4</m:t>
        </m:r >
      </m:e>
    </m:mr>
  </m:m>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
mPr (Matrix Properties)	§7.1.2.68
mr (Matrix Row)	§7.1.2.69

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_M">
   <sequence>
      <element name="mPr" type="CT_MPr" minOccurs="0"/>
      <element name="mr" type="CT_MR" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

7.1.2.61 mathFont (Math Font)

This element specifies the default math font to be used in the document. [*Example*: The XML containing this property is:

```
  <m:mathPr>
    <m:mathFont m:val="Cambria Math"/>
    <m:brkBin m:val="before"/>
    <m:brkBinSub m:val="--"/>
    <m:smallFrac m:val="off"/>
    <m:dispDef/>
```

```
    <m:lMargin m:val="1440"/>
    <m:rMargin m:val="0"/>
    <m:defJc m:val="centerGroup"/>
    <m:wrapIndent m:val="1440"/>
    <m:intLim m:val="subSup"/>
    <m:naryLim m:val="undOvr"/>
  </m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (value)	Specifies the default math font to be used in the document. The possible values for this attribute are defined by the ST_String simple type (§7.1.3.13).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_String">
   <attribute name="val" type="ST_String"/>
</complexType>
```

7.1.2.62 mathPr (Math Properties)

This element specifies the document-level properties for all math in the document.

Parent Elements
settings (§2.15.1.78)

Child Elements	Subclause
brkBin (Break on Binary Operators)	§7.1.2.16
brkBinSub (Break on Binary Subtraction)	§7.1.2.17

      <element name="interSp" type="CT_TwipsMeasure" minOccurs="0"/>
      <element name="intraSp" type="CT_TwipsMeasure" minOccurs="0"/>
      <choice minOccurs="0">
         <element name="wrapIndent" type="CT_TwipsMeasure"/>
         <element name="wrapRight" type="CT_OnOff"/>
      </choice>
      <element name="intLim" type="CT_LimLoc" minOccurs="0"/>
      <element name="naryLim" type="CT_LimLoc" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.63 maxDist (Maximum Distribution)

This element specifies Equation Array Maximum Distribution. When on, the equation array is spaced to the maximum width of the containing element (page, column, cell, etc.). When this element is omitted, Equation Array Maximum Distribution is off.

Parent Elements
eqArrPr (§7.1.2.35)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element.

Attributes	Description
	A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.64 mc (Matrix Column)

This element specifies a single column in a matrix m. [*Example*: An example of this element in use is:

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
<m:m>
  <m:mPr>
    <m:mcs>
      <m:mc>
        <m:mcPr>
          <m:mcJc  m:val="center"/>
          <m:count m:val="2"/>
        </m:mcPr>
      </m:mc>
    </m:mcs>
  </m:mPr>
  <m:mr>
    <m:e>
      <m:r>
        <m:rPr>
          <m:scr  m:val="roman"/>
          <m:sty  m:val="p"/>
        </m:rPr>
        <m:t>1</m:t>
      </m:r >
    </m:e>
```

```
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>2</m:t>
        </m:r >
      </m:e>
    </m:mr>
    <m:mr>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>3</m:t>
        </m:r >
      </m:e>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>4</m:t>
        </m:r >
      </m:e>
    </m:mr>
  </m:m>
```

end example]

Parent Elements
mcs (§7.1.2.67)

Child Elements	Subclause
mcPr (Matrix Column Properties)	§7.1.2.66

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MC">
   <sequence>
      <element name="mcPr" type="CT_MCPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.65 mcJc (Matrix Column Justification)

This element specifies the justification of a matrix column (or group of matrix columns) mc. When this element is omitted, the column is centered. The matrix below has three columns. The leftmost column is left-justified, the rightmost column is right-justified, and the center column is centered: $\begin{pmatrix} 1 & 1 & 1 \\ 23 & 23 & 23 \\ 456 & 456 & 456 \end{pmatrix}$

[*Example*: A simple example of this property in use is a 2x2 matrix with both columns centered:

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
<m:m>
  <m:mPr>
    <m:mcs>
      <m:mc>
        <m:mcPr>
          <m:mcJc  m:val="center"/>
          <m:count m:val="2"/>
        </m:mcPr>
      </m:mc>
    </m:mcs>
  </m:mPr>
  <m:mr>
    <m:e>
      <m:r>
        <m:rPr>
          <m:scr  m:val="roman"/>
          <m:sty  m:val="p"/>
        </m:rPr>
        <m:t>1</m:t>
      </m:r >
    </m:e>
```

```
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>2</m:t>
        </m:r >
      </m:e>
    </m:mr>
    <m:mr>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>3</m:t>
        </m:r >
      </m:e>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>4</m:t>
        </m:r >
      </m:e>
    </m:mr>
  </m:m>
```

end example]

Parent Elements
mcPr (§7.1.2.66)

Attributes	Description

val (Value)	Specifies the horizontal alignment of the parent element. Possible values are `left`, `right`, and `center`. [*Example*:
	`<m:mcPr>`
	`<m:mcJc  m:val="center"/>`
	`<m:count m:val="2"/>`

Attributes	Description
	</m:mcPr> The possible values for this attribute are defined by the ST_XAlign simple type (§7.1.3.18).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_XAlign">
   <attribute name="val" type="ST_XAlign" use="required"/>
</complexType>
```

7.1.2.66 mcPr (Matrix Column Properties)

This element specifies the properties of the matrix column mn, including the number of columns and the type of justification. [*Example*: As an extreme example, the following matrix has two columns that are left justified (count is 2) and three columns that are right justified (count is 3). $\begin{pmatrix} 1 & 1 & 1 & 1 & 1 \\ 23 & 23 & 23 & 23 & 23 \\ 456 & 456 & 456 & 456 & 456 \end{pmatrix}$ *end example*]

Parent Elements
mc (§7.1.2.64)

Child Elements	Subclause
count (Matrix Column Count)	§7.1.2.21
mcJc (Matrix Column Justification)	§7.1.2.65

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MCPr">
   <sequence>
      <element name="count" type="CT_Integer255" minOccurs="0"/>
      <element name="mcJc" type="CT_XAlign" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.67 mcs (Matrix Columns)

This element specifies the collection of columns of the matrix m. [*Example*: An example of this element in use is:

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
<m:m>
  <m:mPr>
    <m:mcs>
      <m:mc>
        <m:mcPr>
          <m:mcJc  m:val="center"/>
          <m:count m:val="2"/>
        </m:mcPr>

        </m:r >
      </m:e>
    </m:mr>
  </m:m>
```

end example]

Parent Elements
mPr (§7.1.2.68)

Child Elements	Subclause
mc (Matrix Column)	§7.1.2.64

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MCS">
   <sequence>
      <element name="mc" type="CT_MC" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

7.1.2.68 mPr (Matrix Properties)

This element specifies properties of the matrix m, including the justification of the matrix and the layout of elements within the matrix.

Parent Elements
m (§7.1.2.60)

Child Elements	Subclause
baseJc (Matrix Base Justification)	§7.1.2.9
cGp (Matrix Column Gap)	§7.1.2.18
cGpRule (Matrix Column Gap Rule)	§7.1.2.19
cSp (Matrix Column Spacing)	§7.1.2.22
ctrlPr (Control Properties)	§7.1.2.23

Child Elements	Subclause
mcs (Matrix Columns)	§7.1.2.67
plcHide (Hide Placeholders (Matrix))	§7.1.2.83
rSp (Row Spacing (Equation Array))	§7.1.2.92
rSpRule (Row Spacing Rule)	§7.1.2.93

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MPr">
   <sequence>
      <element name="baseJc" type="CT_YAlign" minOccurs="0"/>
      <element name="plcHide" type="CT_OnOff" minOccurs="0"/>
      <element name="rSpRule" type="CT_SpacingRule" minOccurs="0"/>
      <element name="cGpRule" type="CT_SpacingRule" minOccurs="0"/>
      <element name="rSp" type="CT_UnSignedInteger" minOccurs="0"/>
      <element name="cSp" type="CT_UnSignedInteger" minOccurs="0"/>
      <element name="cGp" type="CT_UnSignedInteger" minOccurs="0"/>
      <element name="mcs" type="CT_MCS" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.69 mr (Matrix Row)

This element specifies a single row of the matrix m. [*Example*: An example of this element in use is the following example, a 2x2 matrix. There are two rows; the first contains the elements 1 and 2; the second contains 3 and 4.

$$\begin{pmatrix} 1 & 2 \\ 3 & 4 \end{pmatrix}$$

```
<m:m>
  <m:mPr>
    <m:mcs>
      <m:mc>
        <m:mcPr>
          <m:mcJc  m:val="center"/>
          <m:count m:val="2"/>
        </m:mcPr>
      </m:mc>
    </m:mcs>
  </m:mPr>
```

```
    <m:mr>
      <m:e>
        <m:r>
          <m:rPr>

          </m:rPr>
          <m:t>1</m:t>
        </m:r >
      </m:e>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>2</m:t>
        </m:r >
      </m:e>
    </m:mr>
    <m:mr>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>3</m:t>
        </m:r >
      </m:e>
      <m:e>
        <m:r>
          <m:rPr>
            <m:scr  m:val="roman"/>
            <m:sty  m:val="p"/>
          </m:rPr>
          <m:t>4</m:t>
        </m:r >
      </m:e>
    </m:mr>
  </m:m>
```

end example]

Parent Elements
m (§7.1.2.60)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MR">
   <sequence>
      <element name="e" type="CT_OMathArg" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

7.1.2.70 nary (n-ary Operator Function)

This element specifies an n-ary object, consisting of an n-ary object, a base (or operand), and optional upper and lower limits. Examples of n-ary objects are: $\int_0^1 x\,dx$, $\sum_k \binom{n}{k}$, $\prod_{k=1}^{n} A_k$, and $\cup_{=1}^{m}(X_n \cap Y_n)$. [*Example*: The example below demonstrates an n-ary object in its proper form and XML representation:

$$\int_0^1 x\,dx$$

```
<m:nary>
  <m:naryPr>
    <m:chr m:val="&#8747;"/>
  </m:naryPr>
  <m:sub>
      <m:r>
        <m:rPr>
          <m:scr m:val="roman"/>
          <m:sty m:val="p"/>
        </m:rPr>
        <m:t>0</m:t>
      </m:r>
  </m:sub>
  <m:sup>
      <m:r>
        <m:rPr>
          <m:scr  m:val="roman"/>
          <m:sty  m:val="p"/>
        </m:rPr>
        <m:t>1</m:t>
      </m:r>
  </m:sup>
```

```
    <m:e>
      <m:r>
        <m:t>x</m:t>
      </m:r>
      <m:box>
        <m:boxPr>
          <m:diff  m:val="on"/>
        </m:boxPr>
        <m:e>
          <m:r>
            <m:t>dx</m:t>
          </m:r>
        </m:e>
      </m:box>
    </m:e>
  </m:nary>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
naryPr (n-ary Properties)	§7.1.2.72
sub (Subscript (Pre-Sub-Superscript))	§7.1.2.112
sup (Superscript (Superscript function))	§7.1.2.114

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Nary">
   <sequence>
      <element name="naryPr" type="CT_NaryPr" minOccurs="0"/>
      <element name="sub" type="CT_OMathArg"/>
      <element name="sup" type="CT_OMathArg"/>
      <element name="e" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.71 naryLim (n-ary Limit Location)

This element specifies the document setting for the default placement of n-ary limits other than integrals (since integrals are most often written as subSup and other n-ary operators are most often written as undOvr), when

converted from a linear format to a two-dimensional output. Limits can be either centered above and below the n-ary operator, or positioned just to the right of the operator, as in:

$$\sum_{i=0}^{n} x_i \quad \sum_{i=0}^{n} x_i$$

When this integral object is written linearly, as $\sum_(i = 0)^n$, the placement of limits is ambiguous. naryLim specifies this positioning. When this element is omitted, the default placement of n-ary limits is undOvr (that is, the location of lower and upper limits). [*Example*: An example XML of this element in use is:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the default location of limits on an integral. Possible values are subSup and undOvr. The possible values for this attribute are defined by the ST_LimLoc simple type (§7.1.3.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LimLoc">
   <attribute name="val" type="ST_LimLoc" use="required"/>
</complexType>
```

7.1.2.72 naryPr (n-ary Properties)

This element specifies the properties of the n-ary object, including the type of n-ary operator that is used, the shape and height of the operator, the location of limits, and whether limits are shown or hidden.

Parent Elements
nary (§7.1.2.70)

Child Elements	Subclause
chr (Accent Character)	§7.1.2.20
ctrlPr (Control Properties)	§7.1.2.23
grow (n-ary Grow)	§7.1.2.43
limLoc (n-ary Limit Location)	§7.1.2.53
subHide (Hide Subscript (n-ary))	§7.1.2.113
supHide (Hide Superscript (n-ary))	§7.1.2.115

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NaryPr">
   <sequence>
      <element name="chr" type="CT_Char" minOccurs="0"/>
      <element name="limLoc" type="CT_LimLoc" minOccurs="0"/>
      <element name="grow" type="CT_OnOff" minOccurs="0"/>
      <element name="subHide" type="CT_OnOff" minOccurs="0"/>
      <element name="supHide" type="CT_OnOff" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.73 noBreak (No Break)

This property specifies the "unbreakable" property on the Box function box. When on, no line breaks can occur within the box. This can be important for operator emulators that consist of more than one binary operator. When this element is not specified, breaks can occur inside box. [*Example*: Sample XML containing this element is below. In this box, breaks are allowed.

```
<m:boxPr>
  <m:noBreak m:val="off"/>
</m:boxPr>
```

end example]

Parent Elements
boxPr (§7.1.2.14)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element.

Attributes	Description
	A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.74 nor (Normal Text)

This element specifies that the run is normal text, i.e., math italics and math spacing are not applied. In a normal text run, no characters will trigger reformatting of a linear expression into a two-dimensional expression. [*Example*: The example below illustrates three runs of normal text, along with the XML representation of the equation:

$$\text{rate} = \frac{\text{distance}}{\text{time}}$$

```
<m:r>
  <m:rPr>
    <m:nor/>
  </m:rPr>
  <m:t>rate</m:t>
</m:r>
<m:r>
  <m:t>=</m:t>
</m:r>
<m:f>
  <m:num>
    <m:r>
      <m:rPr>
        <m:nor/>
      </m:rPr>
      <m:t>distance</m:t>
    </m:r>
  </m:num>
```

```
    <m:den>
      <m:r>
        <m:rPr>
          <m:nor/>
        </m:rPr>
        <m:t>time</m:t>
      </m:r>
    </m:den>
  </m:f>
```

end example]

Parent Elements
rPr (§7.1.2.91)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.75 num (Numerator)

This element specifies the numerator of the Fraction function f. [*Example*: The a in $^{a}/_{b}$:

```
  <m:f>
    <m:fPr>
      <m:type  m:val="skw"/>
    </m:fPr>
    <m:num>
      <m:r>
        <m:t>a</m:t>
      </m:r>
    </m:num>
```

```
      <m:den>
        <m:r>
          <m:t>b</m:t>
        </m:r>
      </m:den>
    </m:f>
```

end example]

Parent Elements

sSub (Subscript Function)	§7.1.2.101
sSubSup (Sub-Superscript Function)	§7.1.2.103
sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
   <sequence>
      <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
      <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.76 objDist (Object Distribution)

This element specifies Equation Array Object Distribution. When on, the contents of the equation array are spaced to the maximum width of the equation array object. When this element is omitted, the equation array does not receive object distribution.

Parent Elements
eqArrPr (§7.1.2.35)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
    <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.77 oMath (Office Math)

This element specifies an equation or mathematical expression. All equations are surrounded by oMath tags.

Parent Elements
body (§2.2.2); comment (§2.13.4.2); customXml (§2.5.1.3); customXml (§2.5.1.4); customXml (§2.5.1.5); customXml (§2.5.1.6); deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); docPartBody (§2.12.6); e (§7.1.2.32); endnote (§2.11.2); fldSimple (§2.16.21); fName (§7.1.2.37); footnote (§2.11.10); ftr (§2.10.3); hdr (§2.10.4); hyperlink (§2.16.24); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); oMathPara (§7.1.2.78); p (§2.3.1.22); rt (§2.3.3.23); rubyBase (§2.3.3.26); sdtContent (§2.5.2.32); sdtContent (§2.5.2.33); sdtContent (§2.5.2.34); sdtContent (§2.5.2.35); smartTag (§2.5.1.9); sub (§7.1.2.112); sup (§7.1.2.114); tbl (§2.4.36); tc (§2.4.62); tr (§2.4.75); txbxContent (§2.17.1.1)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMath">
    <sequence>
        <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
</complexType>
```

7.1.2.78 oMathPara (Math Paragraph)

This element specifies a math paragraph, one or more display equations within a single paragraph.

Parent Elements
body (§2.2.2); comment (§2.13.4.2); customXml (§2.5.1.3); customXml (§2.5.1.4); customXml (§2.5.1.5); customXml (§2.5.1.6); deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); docPartBody (§2.12.6); e (§7.1.2.32); endnote (§2.11.2); fldSimple (§2.16.21); fName (§7.1.2.37); footnote (§2.11.10); ftr (§2.10.3); hdr (§2.10.4); hyperlink (§2.16.24); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); p (§2.3.1.22); rt (§2.3.3.23); rubyBase (§2.3.3.26); sdtContent (§2.5.2.32); sdtContent (§2.5.2.33); sdtContent (§2.5.2.34); sdtContent (§2.5.2.35); smartTag (§2.5.1.9); sub (§7.1.2.112); sup (§7.1.2.114); tbl (§2.4.36); tc (§2.4.62); tr (§2.4.75); txbxContent (§2.17.1.1)

Child Elements	Subclause
oMath (Office Math)	§7.1.2.77
oMathParaPr (Office Math Paragraph Properties)	§7.1.2.79

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathPara">
    <sequence>
        <element name="oMathParaPr" type="CT_OMathParaPr" minOccurs="0" maxOccurs="1"/>
        <element name="oMath" type="CT_OMath" minOccurs="1" maxOccurs="unbounded">
            <unique name="uniqueContentAnchorIdsInsideMath">
                <selector xpath="m:annotation/m:content"/>
                <field xpath="@id"/>
            </unique>
            <unique name="uniqueContextAnchorIdsInsideMath">
                <selector xpath="m:annotation/m:context"/>
                <field xpath="@id"/>
            </unique>
        </element>
    </sequence>
</complexType>
```

7.1.2.79 oMathParaPr (Office Math Paragraph Properties)

This property specifies properties of the math paragraph oMathPara, including justification jc.

Parent Elements
oMathPara (§7.1.2.78)

Child Elements	Subclause
jc (Justification)	§7.1.2.51

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathParaPr">
   <sequence>
      <element name="jc" type="CT_OMathJc" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.1.2.80 opEmu (Operator Emulator)

This element specifies the Operator Emulator property on box. When on, the box and its contents behave as a single operator and inherit the properties of an operator. This means, for example, that the character can serve as a point for a line break and can be aligned to other operators. Operator Emulators are often used when one or more glyphs combine to form an operator, such as ==. The following equation uses an Operator Emulator:

$$a == b$$

[*Example*: Its XML representation is as follows:

```
<m:r>
  <m:t>a</m:t>
</m:r>
<m:box>
  <m:boxPr>
    <m:opEmu    m:val="on"/>
    <m:aln/>
  </m:boxPr>
  <m:e>
    <m:r>
      <m:t>==</m:t>
    </m:r>
  </m:e>
</m:box>
<m:r>
  <m:t>b</m:t>
</m:r>
```

end example]

Parent Elements
boxPr (§7.1.2.14)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.81 phant (Phantom Function)

This element specifies the phantom function. phant has two primary uses: adding the spacing of the phantom base e without displaying that base; and suppressing part of the glyph from spacing considerations.

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
phantPr (Phantom Properties)	§7.1.2.82

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Phant">
   <sequence>
      <element name="phantPr" type="CT_PhantPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.82 phantPr (Phantom Properties)

This element specifies properties of the Phantom function, including whether the phantom is hidden or visible, and the amount of space that is taken into account when laying out text and objects around phantoms.

Parent Elements
phant (§7.1.2.81)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
show (Phantom Show)	§7.1.2.96
transp (Transparent (Phantom))	§7.1.2.117
zeroAsc (Phantom Zero Ascent)	§7.1.2.122
zeroDesc (Phantom Zero Descent)	§7.1.2.123
zeroWid (Phantom Zero Width)	§7.1.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PhantPr">
   <sequence>
      <element name="show" type="CT_OnOff" minOccurs="0"/>
      <element name="zeroWid" type="CT_OnOff" minOccurs="0"/>
      <element name="zeroAsc" type="CT_OnOff" minOccurs="0"/>
      <element name="zeroDesc" type="CT_OnOff" minOccurs="0"/>
      <element name="transp" type="CT_OnOff" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.83 plcHide (Hide Placeholders (Matrix))

This element specifies the Hide Placeholders property on a matrix m. When this property is on, placeholders do not appear in the matrix. If this element is omitted, placeholders do appear such that the locations where text can be inserted are made visible. [*Example*: The following two examples of matrices show the hidden and visible states of placeholders:

$$\begin{pmatrix} 1 & & \\ & 1 & \\ & & 1 \end{pmatrix}\begin{pmatrix} 1 & & \\ & 1 & \\ & & 1 \end{pmatrix}$$

In the matrix described by the XML below, placeholders will be hidden:

```
<m:mPr>
  <m:plcHide  m:val="on"/>
  <m:mcs>
    <m:mc>
      <m:mcPr>
        <m:mcJc m:val="center"/>
        <m:count  m:val="3"/>
      </m:mcPr>
    </m:mc>
  </m:mcs>
</m:mPr>
```

end example]

Parent Elements
mPr (§7.1.2.68)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.84 pos (Position (Bar))

This element specifies the position of the bar in the bar object; the default is 'top,' signifying the mathematical overbar. [*Example*: The XML representation for the mathematical overbar is:

```
<m:bar>
  <m:barPr>
    <m:pos   m:val="top"/>
  </m:barPr>
  <m:e>
    <m:r>
      <m:t>a</m:t>
    </m:r>
  </m:e>
</m:bar>
```

end example]

Parent Elements
barPr (§7.1.2.8); groupChrPr (§7.1.2.42)

Attributes	Description

val (Value)	Specifies the position of the parent element. Possible values are `top` and `bot`.
	
	[*Example*:
	`<m:barPr>`
	`  <m:pos   m:val="top"/>`
	`</m:barPr>`
	
	The possible values for this attribute are defined by the ST_TopBot simple type (§7.1.3.15).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TopBot">
   <attribute name="val" type="ST_TopBot" use="required"/>
</complexType>
```

7.1.2.85 postSp (Post-Equation Spacing)

This element specifies the spacing after math paragraph, in twips

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type

Attributes	Description
	(§7.1.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
   <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

7.1.2.86 preSp (Pre-Equation Spacing)

This element specifies the spacing before a math paragraph, in twips

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
   <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

7.1.2.87 r (Run)

This element specifies a run of math text.

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
annotationRef (Comment Information Block)	§2.13.4.1
br (Break)	§2.3.3.1
commentReference (Comment Content Reference Mark)	§2.13.4.5
continuationSeparator (Continuation Separator Mark)	§2.11.1
cr (Carriage Return)	§2.3.3.4
dayLong (Date Block - Long Day Format)	§2.3.3.5

Child Elements	Subclause
dayShort (Date Block - Short Day Format)	§2.3.3.6
delInstrText (Deleted Field Code)	§2.16.13
delText (Deleted Text)	§2.3.3.7
drawing (DrawingML Object)	§2.3.3.9
endnoteRef (Endnote Reference Mark)	§2.11.6
endnoteReference (Endnote Reference)	§2.11.7
fldChar (Complex Field Character)	§2.16.18
footnoteRef (Footnote Reference Mark)	§2.11.13
footnoteReference (Footnote Reference)	§2.11.14
instrText (Field Code)	§2.16.25
lastRenderedPageBreak (Position of Last Calculated Page Break)	§2.3.3.13
monthLong (Date Block - Long Month Format)	§2.3.3.15
monthShort (Date Block - Short Month Format)	§2.3.3.16
noBreakHyphen (Non Breaking Hyphen Character)	§2.3.3.18
object (Inline Embedded Object)	§2.3.3.19
pgNum (Page Number Block)	§2.3.3.20
pict (VML Object)	§2.3.3.21
ptab (Absolute Position Tab Character)	§2.3.3.22
rPr (Run Properties)	§7.1.2.91
rPr (Run Properties)	§2.3.2.25
ruby (Phonetic Guide)	§2.3.3.24
separator (Footnote/Endnote Separator Mark)	§2.11.23
softHyphen (Optional Hyphen Character)	§2.3.3.28

t (Text)	§7.1.2.116
t (Text)	§2.3.3.30
tab (Tab Character)	§2.3.3.31
yearLong (Date Block - Long Year Format)	§2.3.3.32
yearShort (Date Block - Short Year Format)	§2.3.3.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_R">
   <sequence>
      <element name="rPr" type="CT_RPR" minOccurs="0"/>
      <group ref="w:EG_RPr" minOccurs="0"/>
      <choice minOccurs="0" maxOccurs="unbounded">
         <group ref="w:EG_RunInnerContent"/>
         <element name="t" type="CT_Text" minOccurs="0"/>
      </choice>
   </sequence>
</complexType>
```

7.1.2.88 rad (Radical Function)

This element specifies the radical function, consisting of a radical, a base e, and an optional degree deg.

[*Example*: Examples of rad are $\sqrt[3]{x}$ (XML shown below) and $\sqrt{x}$.

```
<m:rad>
  <m:deg>
     <m:r>
        <m:rPr>
          <m:scr   m:val="roman"/>
          <m:sty   m:val="p"/>
        </m:rPr>
        <m:t>3</m:t>
     </m:r>
  </m:deg>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
  </m:e>
</m:rad>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
deg (Degree)	§7.1.2.26
e (Base (Argument))	§7.1.2.32
radPr (Radical Properties)	§7.1.2.89

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Rad">
   <sequence>
      <element name="radPr" type="CT_RadPr" minOccurs="0"/>
      <element name="deg" type="CT_OMathArg"/>
      <element name="e" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.89 radPr (Radical Properties)

This element specifies properties of the Radical function rad, including the hidden or shown state of the degree deg.

Parent Elements
rad (§7.1.2.88)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23
degHide (Hide Degree)	§7.1.2.27

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RadPr">
   <sequence>
      <element name="degHide" type="CT_OnOff" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.90 rMargin (Right Margin)

This element specifies the right margin for math, in twips. Math margins are added to the paragraph settings for margins. [*Example*: The following XML demonstrates an rmargin setting of 1".

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
```

```
    <m:lMargin m:val="0"/>
    <m:rMargin m:val="1440"/>
    <m:defJc m:val="centerGroup"/>
    <m:wrapIndent m:val="1440"/>
    <m:intLim m:val="subSup"/>
    <m:naryLim m:val="undOvr"/>
  </m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
   <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

7.1.2.91 rPr (Run Properties)

This element specifies the properties of the math run r.

Parent Elements
r (§7.1.2.87)

Child Elements	Subclause
aln (Alignment)	§7.1.2.3
brk (Break)	§7.1.2.15
lit (Literal)	§7.1.2.58
nor (Normal Text)	§7.1.2.74
scr (Script)	§7.1.2.94
sty (style)	§7.1.2.111

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RPR">
   <sequence>
      <element name="lit" minOccurs="0" type="CT_OnOff"/>
      <choice>
         <element name="nor" minOccurs="0" type="CT_OnOff"/>
         <sequence>
            <group ref="EG_ScriptStyle"/>
         </sequence>
      </choice>
      <element name="brk" minOccurs="0" type="CT_ManualBreak"/>
      <element name="aln" minOccurs="0" type="CT_OnOff"/>
   </sequence>
</complexType>
```

7.1.2.92 rSp (Row Spacing (Equation Array))

This element specifies spacing between rows of an equation array eqArr; it is used only when rSpRule is set to 3 (exactly; in which case the unit of measure is points) or 4 (Multiple; in which case the unit of measure is lines). If this element is omitted, single line spacing is used in the equation array, and no additional spacing is used in the layout of rows.

[*Example*: Below are three examples of the same equation array, with single line spacing, 1.5 line spacing, and double line spacing:

$$\begin{pmatrix} x- & y+ & z= & 10 \\ 3x+ & y+2z= & 34 \\ -5x+2y- & z= & -14 \end{pmatrix} \begin{pmatrix} x- & y+ & z= & 10 \\ 3x+ & y+2z= & 34 \\ -5x+2y- & z= & -14 \end{pmatrix} \begin{pmatrix} x- & y+ & z= & 10 \\ 3x+ & y+2z= & 34 \\ -5x+2y- & z= & -14 \end{pmatrix}$$

The following eqArr $\begin{matrix} a=b+c \\ d+e=f \end{matrix}$ has rSp of 1.6:

```
<m:eqArr>
  <m:eqArrPr>
    <m:rSpRule  m:val="4"/>
    <m:rSp m:val="3"/>
  </m:eqArrPr>
  <m:e>
    <m:r>
      <m:t>a=b+c</m:t>
    </m:r>
  </m:e>
```

```
    <m:e>
      <m:r>
        <m:t>d+e=f</m:t>
      </m:r>
    </m:e>
  </m:eqArr>
```

end example]

Parent Elements
eqArrPr (§7.1.2.35); mPr (§7.1.2.68)

Attributes	Description
val (Value)	Specifies the amount of space between the parent element. The manner in which this value is determined depends on the setting of the rule of the parent element. If the rule is set to 3 (or "Exactly"), then the unit is interpreted as points. If the rule is set to 4 (or "Multiple"), then the unit is interpreted as lines. The possible values for this attribute are defined by the ST_UnSignedInteger simple type (§7.1.3.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnSignedInteger">
   <attribute name="val" type="ST_UnSignedInteger" use="required"/>
</complexType>
```

7.1.2.93 rSpRule (Row Spacing Rule)

This element specifies the type of vertical spacing between columns in a matrix. The following table demonstrates possible values of rSpRule along with their definitions and examples.

Value	Line spacing between rows	Example (non-normative)
0	Single line gap	1 2 3 4
1	1.5 line gap	1 2 3 4
2	2 line gap	1 2 3 4
3	Exactly (rely on value of rGp, measured in points)	1 2 3 4
4	Multiple (rely on value of rGp, measured in lines)	1 2 3 4

Parent Elements
eqArrPr (§7.1.2.35); mPr (§7.1.2.68)

Attributes	Description
val (Value)	Specifies the type of spacing between rows and/or columns. Possible values are 0, 1, 2, 3, or 4, whose definitions are contained in the following table: **Value** / **Column/Row Gap** / **Example** 0 / Single spacing gap / 1 2 1 / 1.5 spacing gap / 1 2 2 / 2 spacing gap / 1 2 3 / Exactly (for columns, rely on value of cGp, measured in points) (for rows, rely on value of rSp, measured in points) / 1 2 4 / Multiple (for columns, rely on value of cGp, measured in lines) (for rows, rely on value of rSp, measured in lines) / 1 2 The possible values for this attribute are defined by the ST_SpacingRule simple type (§7.1.3.12).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SpacingRule">
   <attribute name="val" type="ST_SpacingRule" use="required"/>
</complexType>
```

7.1.2.94 scr (Script)

This element describes the script applied to the characters in the run. The XML includes the ASCII value of the character along with the script of the character. The application maps the ASCII value and script type to the appropriate Unicode range. [*Example*: Example: 𝔞𝔞

```
<m:r>
  <m:rPr>
    <m:scr m:val="fraktur"/>
    <m:sty m:val="p"/>
  </m:rPr>
  <m:t>a</m:t>
</m:r>
<m:r>
  <m:rPr>
    <m:scr m:val=“double-struck"/>
    <m:sty m:val="p"/>
  </m:rPr>
  <m:t>a</m:t>
</m:r>
```

end example]

Parent Elements
rPr (§7.1.2.91)

Attributes	Description
val (Value)	Specifies the script type of the parent element. Possible values are: `double-struck`, `fraktur`, `monospace`, `roman`, `sans-serif`, and `script`. The possible values for this attribute are defined by the ST_Script simple type (§7.1.3.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Script">
   <attribute name="val" type="ST_Script"/>
</complexType>
```

7.1.2.95 sepChr (Delimiter Separator Character)

This element specifies the character that separates base arguments e in the delimiter object d. If this element is omitted, the default sepChr is '|'. [*Example*: Examples of d, each with a different sepChr, are: $(a_1|a_2)(a_1:a_2)(a_1;a_2)$. The following example describes a separator character if :.

```
<m:dPr>
  <m:sepChr val=&#0058/>
</m:dPr>
```

end example]

Parent Elements

Parent Elements
dPr (§7.1.2.31)

Attributes	Description

val (value)	Specifies the character used by the parent element. When it is omitted, the parent uses its assigned default. [*Example*: delimiter object {a}:
	`<m:dPr>`
	`<m:begChr m:val="{"/>`
	`<m:endChr m:val="}"/>`
	`</m:dPr>`
	
	The possible values for this attribute are defined by the ST_Char simple type (§7.1.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Char">
   <attribute name="val" type="ST_Char" use="required"/>
</complexType>
```

7.1.2.96 show (Phantom Show)

This element specifies the show property of the phantom phant. When off, the phant base e is hidden. If this element is omitted, the base e is shown. [*Example*: In the following example, there is a phantom of the fraction a/b in the second radical such that only the height is preserved. The fraction does not show.

$$\sqrt{\frac{a}{b}} = \sqrt{x}$$

```
<m:phantPr>
  <m:show  m:val="off"/>
  <m:zeroDesc m:val="on"/>
</m:phantPr>
```

end example]

Parent Elements
phantPr (§7.1.2.82)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `on` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `off` specifies that the property shall be explicitly turned off. This is implied

Attributes	Description
	when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.97 shp (Shape (Delimiters))

This element specifies the shape of delimiters in the delimiter object d. Delimiters can be centered around the entire height of their contents, or their height can be altered to exactly match their contents' height. When this element is omitted, delimiters are 'centered'. [*Example*: In the example below, delimiters will be matched to the height of their contents:

```
<m:dPr>
  <m:shp  m:val="match"/>
</m:dPr>
```

end example]

Parent Elements
dPr (§7.1.2.31)

Attributes	Description
val (Value)	Specifies the shape of the parent element. Possible values are `match` and `centered`. The possible values for this attribute are defined by the ST_Shp simple type (§7.1.3.11).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shp">
   <attribute name="val" type="ST_Shp" use="required"/>
</complexType>
```

7.1.2.98 smallFrac (Small Fraction)

This element specifies a reduced fraction size display math, such that the numerator and denominator are written in script size instead of at the size of regular text. [*Example*: The XML containing this element in use is:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.99 sPre (Pre-Sub-Superscript Function)

This element specifies the Pre-Sub-Superscript function, which consists of a base e and a subscript and superscript placed to the left of the base, as in ${}_{1}^{2}A$. [*Example*: The XML that specifies this function is:

```
<m:sPre>
  <m:sub>
    <m:r>
      <m:t>1</m:t>
    </m:r>
  </m:sub>
  <m:sup>
    <m:r>
      <m:t>2</m:t>
    </m:r>
  </m:sup>
  <m:e>
    <m:r>
      <m:t>A</m:t>
    </m:r>
  </m:e>
</m:sPre>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
sPrePr (Pre-Sub-Superscript Properties)	§7.1.2.100
sub (Subscript (Pre-Sub-Superscript))	§7.1.2.112
sup (Superscript (Superscript function))	§7.1.2.114

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SPre">
   <sequence>
      <element name="sPrePr" type="CT_SPrePr" minOccurs="0"/>
      <element name="sub" type="CT_OMathArg"/>
      <element name="sup" type="CT_OMathArg"/>
      <element name="e" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.100 sPrePr (Pre-Sub-Superscript Properties)

This element specifies properties such as ctrlPr that can be stored on the Pre-Sub-Superscript object sPre.

Parent Elements
sPre (§7.1.2.99)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SPrePr">
   <sequence>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.101 sSub (Subscript Function)

This element specifies the subscript function sSub, which consists of a base e and a reduced-size scr placed below and to the right, as in x_n. [*Example*: The XML that specifies this function is:

```
<m:sSub>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </r>
  </m:e>
  <m:sub>
    <m:r>
      <m:t>n</m:t>
    </r>
  </m:sub>
</m:sSub>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
sSubPr (Subscript Properties)	§7.1.2.102
sub (Subscript (Pre-Sub-Superscript))	§7.1.2.112

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSub">
   <sequence>
      <element name="sSubPr" type="CT_SSubPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
      <element name="sub" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.102 sSubPr (Subscript Properties)

This element specifies properties such as ctrlPr that can be stored on the Subscript function sSub.

Parent Elements
sSub (§7.1.2.101)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSubPr">
   <sequence>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.103 sSubSup (Sub-Superscript Function)

This element specifies the sub-superscript function, which consists of a base e, a reduced-size scr placed below and to the right, and a reduced-size scr placed above and to the right, as in x_m^n.

[*Example*: The XML that specifies this function is:

```
<m:sSubSup>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </r>
  </m:e>
  <m:sub>
    <m:r>
      <m:t>m</m:t>
    </r>
  </m:sub>
```

```
    <m:sup>
      <m:r>
        <m:t>n</m:t>
      </r>
    </m:sup>
  </m:sSubSup>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
sSubSupPr (Sub-Superscript Properties)	§7.1.2.104
sub (Subscript (Pre-Sub-Superscript))	§7.1.2.112
sup (Superscript (Superscript function))	§7.1.2.114

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSubSup">
   <sequence>
      <element name="sSubSupPr" type="CT_SSubSupPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
      <element name="sub" type="CT_OMathArg"/>
      <element name="sup" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.104 sSubSupPr (Sub-Superscript Properties)

This element specifies properties of the Sub-Superscript function, including the alignment of scripts.

Parent Elements
sSubSup (§7.1.2.103)

Child Elements	Subclause
alnScr (Align Scripts)	§7.1.2.4
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSubSupPr">
   <sequence>
      <element name="alnScr" type="CT_OnOff" minOccurs="0"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.105 sSup (Superscript Function)

This element specifies the subscript function sSub, which consists of a base e and a reduced-size scr placed below and to the right, as in x^n. [*Example*: The XML that specifies this function is:

```
<m:sSup>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </r>
  </m:e>
  <m:sup>
    <m:r>
      <m:t>n</m:t>
    </r>
  </m:sup>
</m:sSup>
```

end example]

Parent Elements
deg (§7.1.2.26); del (§2.13.5.12); den (§7.1.2.28); e (§7.1.2.32); fName (§7.1.2.37); ins (§2.13.5.20); lim (§7.1.2.52); moveFrom (§2.13.5.21); moveTo (§2.13.5.26); num (§7.1.2.75); oMath (§7.1.2.77); sub (§7.1.2.112); sup (§7.1.2.114)

Child Elements	Subclause
e (Base (Argument))	§7.1.2.32
sSupPr (Superscript Properties)	§7.1.2.106
sup (Superscript (Superscript function))	§7.1.2.114

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSup">
   <sequence>
      <element name="sSupPr" type="CT_SSupPr" minOccurs="0"/>
      <element name="e" type="CT_OMathArg"/>
      <element name="sup" type="CT_OMathArg"/>
   </sequence>
</complexType>
```

7.1.2.106 sSupPr (Superscript Properties)

This element specifies properties such as ctrlPr that can be stored on the Superscript function sSup.

Parent Elements
sSup (§7.1.2.105)

Child Elements	Subclause
ctrlPr (Control Properties)	§7.1.2.23

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SSupPr">
   <sequence>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.107 strikeBLTR (Border Box Strikethrough Bottom-Left to Top-Right)

This element specifies the hidden or shown state of a strikethrough diagonal line from the bottom-left corner to the top-right corner of borderBox. When this element is omitted, the strikethrough is not drawn. When on, a strikethrough is drawn, as in ~~abc~~. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideTop  m:val="on"/>
    <m:hideBot  m:val="on"/>
    <m:hideLeft  m:val="on"/>
    <m:hideRight  m:val="on"/>
    <m:strikeBLTR m:val="on"/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Parent Elements
borderBoxPr (§7.1.2.12)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.108 strikeH (Border Box Strikethrough Horizontal)

This element specifies the hidden or shown state of a strikethrough horizontal line in borderBox. When this element is omitted, the strikethrough is not drawn. When on, a horizontal strikethrough is drawn, as in ~~*abc*~~. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideTop  m:val="on"/>
    <m:hideBot  m:val="on"/>
    <m:hideLeft  m:val="on"/>
    <m:hideRight  m:val="on"/>
    <m:strikeH m:val="on"/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Parent Elements

Parent Elements
borderBoxPr (§7.1.2.12)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.109 strikeTLBR (Border Box Strikethrough Top-Left to Bottom-Right)

This element specifies the hidden or shown state of a strikethrough diagonal line from the top-left corner to the bottom-right corner of borderBox. When this element is omitted, the strikethrough is not drawn. When on, a strikethrough is drawn, as in ~~abc~~. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:hideTop  m:val="on"/>
    <m:hideBot  m:val="on"/>
    <m:hideLeft  m:val="on"/>
    <m:hideRight  m:val="on"/>
    <m:strikeTLBR m:val="on"/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Parent Elements
borderBoxPr (§7.1.2.12)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.110 strikeV (Border Box Strikethrough Vertical)

This element specifies the hidden or shown state of a strikethrough vertical line in borderBox. When this element is omitted, the strikethrough is not drawn. When on, a strikethrough is drawn, as in $\boxed{a}$. [*Example*:

```
<m:borderBox>
  <m:borderBoxPr>
    <m:strikeV m:val="on"/>
  </m:borderBoxPr>
  <m:e>
    <m:r>
      <m:t>abc</m:t>
    </m:r>
  </m:e>
</m:borderBox>
```

end example]

Parent Elements
borderBoxPr (§7.1.2.12)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present.

Attributes	Description
	A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.111 sty (style)

This element describes the script applied to the characters in the run. The XML includes the ASCII value of the character along with the style of the character. The application maps the ASCII value and style to the appropriate Unicode range. [*Example*: Example: $\mathbf{a}\boldsymbol{bc}$

```
<m:oMath>
  <m:r>
    <m:rPr>
      <m:scr  m:val="roman"/>
      <m:sty m:val="b"/>
    </m:rPr>
    <m:t>abc</m:t>
  </m:r>
</m:oMath>
```

end example]

Parent Elements
rPr (§7.1.2.91)

Attributes	Description
val (Value)	Specifies the style of the parent element. Possible values are b (bold), i (italic), bi (bold-italic), and p (plain). The possible values for this attribute are defined by the ST_Style simple type (§7.1.3.14).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Style">
   <attribute name="val" type="ST_Style"/>
</complexType>
```

7.1.2.112 sub (Subscript (Pre-Sub-Superscript))

This element specifies the subscript of the Pre-Sub-Superscript function sPre. [*Example*: For example, the sub in the object ${}_{1}^{2}A$ is 1. An example of this element in use is:

```
<m:sPre>
   <m:sub>
    <m:r>
      <m:t>1</m:t>
    </m:r>
  </m:sub>
  <m:sup>
    <m:r>
      <m:t>2</m:t>
    </m:r>
  </m:sup>
  <m:e>
    <m:r>
      <m:t>A</m:t>
    </m:r>
  </m:e>
</m:sPre>
```

end example]

Parent Elements
nary (§7.1.2.70); sPre (§7.1.2.99); sSub (§7.1.2.101); sSubSup (§7.1.2.103)

sSub (Subscript Function)	§7.1.2.101

Child Elements	Subclause
sSubSup (Sub-Superscript Function)	§7.1.2.103
sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
   <sequence>
      <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
      <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.113 subHide (Hide Subscript (n-ary))

This element specifies the n-ary Hide Subscript property. When on, the lower limit does not appear, as in $\int^{\infty} \frac{x}{x+1} dx$. If this element is omitted, the lower limit appears. [*Example*: An example of this element in use is:

```
<m:naryPr>
  <m:chr  m:val="&#8747;"/>
  <m:subHide m:val="on"/>
</m:naryPr>
```

end example]

Parent Elements
naryPr (§7.1.2.72)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.114 sup (Superscript (Superscript function))

This element specifies the superscript of the superscript function sSup. For example, the sup in the superscript object x^n is n. [*Example*: An example of this element in use is:

```
<m:sSup>
  <m:e>
    <m:r>
      <m:t>x</m:t>
    </m:r>
  </m:e>
  <m:sup>
    <m:r>
      <m:t>n</m:t>
    </m:r>
  </m:sup>
</m:sSup>
```

end example]

oMathPara (Math Paragraph)	§7.1.2.78
permEnd (Range Permission End)	§2.13.7.1
permStart (Range Permission Start)	§2.13.7.2
phant (Phantom Function)	§7.1.2.81
proofErr (Proofing Error Anchor)	§2.13.8.1
r (Run)	§7.1.2.87
rad (Radical Function)	§7.1.2.88
sPre (Pre-Sub-Superscript Function)	§7.1.2.99
sSub (Subscript Function)	§7.1.2.101
sSubSup (Sub-Superscript Function)	§7.1.2.103
sSup (Superscript Function)	§7.1.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OMathArg">
   <sequence>
      <element name="argPr" type="CT_OMathArgPr" minOccurs="0"/>
      <group ref="EG_OMathElements" minOccurs="0" maxOccurs="unbounded"/>
      <element name="ctrlPr" type="CT_CtrlPr" minOccurs="0"/>
   </sequence>
</complexType>
```

7.1.2.115 supHide (Hide Superscript (n-ary))

This element specifies the n-ary Hide Superscript property. When on, the upper limit does not appear, as in $\int_0 \frac{x}{x+1} dx$. If this element is omitted, the lower limit appears. [*Example*: An example of this element in use is:

```
<m:naryPr>
  <m:chr  m:val="&#8747;"/>
  <m:supHide m:val="on"/>
</m:naryPr>
```

end example]

Parent Elements
naryPr (§7.1.2.72)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.116 t (Text)

This element specifies the text in a math run r.

Parent Elements
r (§7.1.2.87)

Attributes	Description

space (Content Contains Significant Whitespace)
 	
Namespace: http://www.w3.org/XML/1998/namespace
	Specifies how white space should be handled for the contents of this element using the W3C space preservation rules. [*Example*: Consider the following run contained within a WordprocessingML document:
	
	`<w:r>`
	`  <w:t>significant whitespace  </w:t>`
	`</w:r>`
	
	Although there are three spaces on each side of the text content in the run, that whitespace has not been specifically marked as significant, therefore it is removed when this run is added to the document. *end example*]
	
	The possible values for this attribute are defined by the type in the namespace.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Text">
   <simpleContent>
      <extension base="ST_String">
         <attribute ref="xml:space" use="optional"/>
      </extension>
   </simpleContent>
</complexType>
```

7.1.2.117 transp (Transparent (Phantom))

This element specifies that the phantom is transparent for spacing. This means that if the contents of the phantom are belonging to a special spacing class (such as binary operators, relational operators, differentials, etc.), the contents of that phantom are taken into consideration when laying out text. If transparency is off, then the contents of the phantom are ignored during layout. When this element is omitted, transparency is 'off'. In the following example, transparency is off on the phantom around the differential term. $\int xdx$. The spacing is incorrect. In the following integral, the only difference is that transparency is on: $\int x\,dx$. Now the spacing is correct.

[*Example*: An example of this element in XML is:

```
<m:phantPr>
  <m:zeroAsc  m:val="on"/>
  <m:zeroDesc  m:val="on"/>
  <m:transp  m:val="on"/>
</m:phantPr>
```

end example]

Parent Elements
phantPr (§7.1.2.82)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of `on` specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of `off` specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.118 type (Fraction type)

This element specifies the type of fraction f; the default is 'bar'. Fractions types are:

Stacked Fraction: $\frac{a}{b}$

Skewed Fraction: a/b

Linear Fraction: a/b

Stack Object (No-Bar Fraction): $\binom{n}{k}$

Parent Elements
fPr (§7.1.2.38)

Attributes	Description
val (Value)	Specifies the type of fraction. Possible values are `bar` (Bar Fraction), `lin` (Linear Fraction), `noBar` (No-Bar Fraction (Stack)), and `skw` (Skewed). The possible values for this attribute are defined by the ST_FType simple type (§7.1.3.4).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FType">
   <attribute name="val" type="ST_FType" use="required"/>
</complexType>
```

7.1.2.119 vertJc (Vertical Justification)

This element, combined with pos of groupChrPr, specifies the vertical layout of the groupChr object. Where pos specifies the position of the grouping character, vertJc specifies the alignment of the object with respect to the baseline. For example, when the group character is above the object, vertJc of top signifies that the top of the object falls on the baseline; when vertJc is set to bot, the bottom of the object is on the baseline. The table below demonstrates the four possible combinations of groupChr layout:

Pos	vertJc	Layout
top	top	$a \underset{bcd}{\longleftarrow} e$
top	bot	$a \overbrace{bcd} e$
bot	top	$a \underbrace{bcd} e$
bot	bot	$a \overset{yields}{\longrightarrow} b$

Parent Elements
groupChrPr (§7.1.2.42)

Attributes	Description

val (Value)	Specifies the position of the parent element. Possible values are top and bot.
	
	[*Example*:
	`<m:barPr>`
	`  <m:pos  m:val="top"/>`
	`</m:barPr>`
	
	The possible values for this attribute are defined by the ST_TopBot simple type (§7.1.3.15).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TopBot">
   <attribute name="val" type="ST_TopBot" use="required"/>
</complexType>
```

7.1.2.120 wrapIndent (Wrap Indent)

This element specifies the indent of the wrapped line of an equation. The line or lines of a wrapped equation after the line break can either be indented by a specified amount from the left margin, or right aligned. The default indent is 1".

[*Example*: The XML below demonstrates wrapIndent in use:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
  <m:lMargin m:val="0"/>
  <m:rMargin m:val="0"/>
  <m:defJc m:val="centerGroup"/>
  <m:wrapIndent m:val="1440"/>
  <m:intLim m:val="subSup"/>
  <m:naryLim m:val="undOvr"/>
</m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (Value)	Specifies the value, in twips, of the parent element. The possible values for this attribute are defined by the ST_TwipsMeasure simple type (§7.1.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwipsMeasure">
   <attribute name="val" type="ST_TwipsMeasure" use="required"/>
</complexType>
```

7.1.2.121 wrapRight (Wrap Right)

This element specifies the right justification of the wrapped line of an equation. The line or lines of a wrapped equation after the line break can either be indented by a specified amount from the left margin, or right aligned. If this element is present, the continuation is right aligned. [*Example*: An example of this element in use is:

```
<m:mathPr>
  <m:mathFont m:val="Cambria Math"/>
  <m:brkBin m:val="before"/>
  <m:brkBinSub m:val="--"/>
  <m:smallFrac m:val="off"/>
  <m:dispDef/>
```

```
    <m:lMargin m:val="0"/>
    <m:rMargin m:val="0"/>
    <m:defJc m:val="centerGroup"/>
    <m:wrapRight/>
    <m:intLim m:val="subSup"/>
    <m:naryLim m:val="undOvr"/>
  </m:mathPr>
```

end example]

Parent Elements
mathPr (§7.1.2.62)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
    <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.122 zeroAsc (Phantom Zero Ascent)

This element specifies that the phantom has zero ascent. The ascent of the contents of the phantom is not taken into account during layout. When this property is omitted, the phantom does have ascent (zero ascent is off). In the following example, the differential term is contained in a phantom that zero ascent. As a result, spacing is reduced between the tip of the "d" and the radical bar: $\sqrt{xdx}$. [*Example*:

```
  <m:phantPr>
    <m:zeroAsc  m:val="on"/>
  </m:phantPr>
```

end example]

Parent Elements
phantPr (§7.1.2.82)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.123 zeroDesc (Phantom Zero Descent)

This element specifies that the phantom has zero descent. The descent of the contents of the phantom is not taken into account during layout. When this property is omitted, the phantom does have descent (zero descent is off). [*Example*: In the following two examples, only the second has zero descent around the "y". Note that the radical is smaller than in the first case. $\sqrt{y}\sqrt{y}$

```
<m:phantPr>
  <m:zeroDesc  m:val="on"/>
</m:phantPr>
```

end example]

Parent Elements
phantPr (§7.1.2.82)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.2.124 zeroWid (Phantom Zero Width)

This element specifies that the phantom has zero width. The width of the contents of the phantom is not taken into account during layout. When this property is omitted, the phantom does have width (zero width is off). [*Example*: In the folowing example, the second radical contains a phantom of the fraction a/b. The phantom has zero width, such that only the height grows to accommodate the hidden fraction: $\sqrt{\frac{a}{b}} = \sqrt{x}$

```
<m:phantPr>
  <m:show  m:val="off"/>
  <m:zeroDesc  m:val="on"/>
</m:phantPr>
```

end example]

Parent Elements
phantPr (§7.1.2.82)

Attributes	Description
val (value)	Specifies a binary value for the property defined by the parent XML element. A value of on specifies that the property shall be explicitly applied. This is the default value for this attribute, and is implied when the parent element is present. A value of off specifies that the property shall be explicitly turned off. This is implied when the parent element is not present. The possible values for this attribute are defined by the ST_OnOff simple type (§7.1.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OnOff">
   <attribute name="val" type="ST_OnOff"/>
</complexType>
```

7.1.3 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/officeDocument/2006/math namespace.

7.1.3.1 ST_BreakBin (Break Binary Operators)

This defines how to represent binary operators with respect to a line-wrapping break. The line can wrap before the operator or after the operator; alternately, the operator can appear both at the end of the first line and the beginning of the second.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
after (After)	When line-wrapping breaks occur on binary operators, the binary operator appears after the break (at the start of the next line).
before (Before)	When line-wrapping breaks occur on binary operators, the binary operator appears before the break (at the end of the first line).
repeat (Repeat)	When line-wrapping breaks occur on binary operators, the binary operator appears on both sides of the break (at the end of the first line and the start of the next line).

Referenced By
brkBin@val (§7.1.2.16)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BreakBin">
   <restriction base="xsd:string">
      <enumeration value="before"/>
      <enumeration value="after"/>
      <enumeration value="repeat"/>
   </restriction>
</simpleType>
```

7.1.3.2 ST_BreakBinSub (Break on Binary Subtraction)

This simple type specifies how to represent subtraction on both sides of a line-wrapping break, when the Break Binary Operators option is set to repeat. The first character represents the sign at the end of the line with the break; the second represents the sign at the start of the wrapped line. Options are --, -+, and +-.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
-- (Minus Minus)	Repetition of subtraction sign after a line-wrapping

Enumeration Value	Description
	break is minus on the first and second lines.
-+ (Minus Plus)	Repetition of subtraction sign after a line-wrapping break is minus on the first line and plus on the second line.
+- (Plus Minus)	Repetition of subtraction sign after a line-wrapping break is plus on the first line and minus on the second line.

Referenced By
brkBinSub@val (§7.1.2.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BreakBinSub">
   <restriction base="xsd:string">
      <enumeration value="--"/>
      <enumeration value="-+"/>
      <enumeration value="+-"/>
   </restriction>
</simpleType>
```

7.1.3.3 ST_Char (Character)

This Simple Type specifies the single character used by the parent element.

[*Example*: In the following example, $\{a\}$ uses { and } as its enclosing characters, instead of the default (and).

```
<m:dPr>
  <m:begChr  m:val="{"/>
  <m:endChr m:val="}"/>
</m:dPr>
```

end example]

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a maximum length of 1 characters.

Referenced By
begChr@val (§7.1.2.10); chr@val (§7.1.2.20); endChr@val (§7.1.2.33); sepChr@val (§7.1.2.95)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Char">
   <restriction base="xsd:string">
      <maxLength value="1"/>
   </restriction>
</simpleType>
```

7.1.3.4 ST_FType (Fraction Type)

Fractions can be of type bar (horizontal fraction bar), skewed ("skw" - diagonal fraction bar with kerned and vertically adjusted numerator and denominator), linear ("lin" - diagonal fraction bar, takes up exactly one line of space), and the "stack" object ("noBar").

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bar (Bar Fraction)	Fraction with a horizontal fraction bar.
lin (Linear Fraction)	Fraction with slanted fraction bar, that takes up no additional vertical space.
noBar (No-Bar Fraction (Stack))	Stack object, which looks like a fraction with no fraction bar.
skw (Skewed)	Fraction with diagonal fraction bar.

Referenced By
type@val (§7.1.2.118)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FType">
   <restriction base="xsd:string">
      <enumeration value="bar"/>
      <enumeration value="skw"/>
      <enumeration value="lin"/>
      <enumeration value="noBar"/>
   </restriction>
</simpleType>
```

7.1.3.5 ST_Integer2 (Integer value (-2 to 2))

This simple type contains a value from (-2,+2) which specifies the size of the argument. The effects of each value are described by the referencing element.

This simple type's contents are a restriction of the XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -2.
- This simple type has a maximum value of less than or equal to 2.

Referenced By
argSz@val (§7.1.2.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Integer2">
   <restriction base="xsd:integer">
      <minInclusive value="-2"/>
      <maxInclusive value="2"/>
   </restriction>
</simpleType>
```

7.1.3.6 ST_Integer255 (Integer value (1 to 255))

This simple type specifies an integer value. The semantics of each value are discussed by the referencing element.

This simple type's contents are a restriction of the XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 255.

Referenced By
brk@alnAt (§7.1.2.15); count@val (§7.1.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Integer255">
   <restriction base="xsd:integer">
      <minInclusive value="1"/>
      <maxInclusive value="255"/>
   </restriction>
</simpleType>
```

7.1.3.7 ST_Jc (Justification)

This Simple Type specifies the justification of Math Paragraphs. Justification of the Math Paragraph can be Left, Right, Centered, or Centered as Group.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center (Equation))	Centers each equation individually with respect to

Enumeration Value	Description
	margins.
centerGroup (Centered as Group (Equations))	Justifies equations with respect to each other, and centers the group of equations (the Math Paragraph) with respect to the page.
left (Left Justification)	Left justification of Math Paragraph
right (Right)	Right Justification of Math Paragraph

Referenced By
defJc@val (§7.1.2.25); jc@val (§7.1.2.51)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Jc">
   <restriction base="xsd:string">
      <enumeration value="left"/>
      <enumeration value="right"/>
      <enumeration value="center"/>
      <enumeration value="centerGroup"/>
   </restriction>
</simpleType>
```

7.1.3.8 ST_LimLoc (Limit Location)

Limits can be in one of two positions: Under-Over (undOvr - above and below the base), and Subscript-Superscript (subSup - positioned to the side of the base, in the position of subscripts and superscripts).

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
subSup (Subscript-Superscript location)	Limits placed to the side of the base, as opposed to directly over and under.
undOvr (Under-Over location)	Limits placed to the directly above and below the base, as opposed to on the side.

Referenced By
intLim@val (§7.1.2.49); limLoc@val (§7.1.2.53); naryLim@val (§7.1.2.71)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LimLoc">
   <restriction base="xsd:string">
      <enumeration value="undOvr"/>
      <enumeration value="subSup"/>
   </restriction>
</simpleType>
```

7.1.3.9 ST_OnOff (On Off)

The boolean value of either on or off.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
off (Off)	Off
on (On)	On

Referenced By
aln@val (§7.1.2.3); alnScr@val (§7.1.2.4); degHide@val (§7.1.2.27); diff@val (§7.1.2.29); dispDef@val (§7.1.2.30); grow@val (§7.1.2.43); hideBot@val (§7.1.2.44); hideLeft@val (§7.1.2.45); hideRight@val (§7.1.2.46); hideTop@val (§7.1.2.47); lit@val (§7.1.2.58); maxDist@val (§7.1.2.63); noBreak@val (§7.1.2.73); nor@val (§7.1.2.74); objDist@val (§7.1.2.76); opEmu@val (§7.1.2.80); plcHide@val (§7.1.2.83); show@val (§7.1.2.96); smallFrac@val (§7.1.2.98); strikeBLTR@val (§7.1.2.107); strikeH@val (§7.1.2.108); strikeTLBR@val (§7.1.2.109); strikeV@val (§7.1.2.110); subHide@val (§7.1.2.113); supHide@val (§7.1.2.115); transp@val (§7.1.2.117); wrapRight@val (§7.1.2.121); zeroAsc@val (§7.1.2.122); zeroDesc@val (§7.1.2.123); zeroWid@val (§7.1.2.124)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OnOff">
   <restriction base="xsd:string">
      <enumeration value="on"/>
      <enumeration value="off"/>
   </restriction>
</simpleType>
```

7.1.3.10 ST_Script (Script)

Script can be of type Roman, Script, Fraktur, Double-Struck, Sans-Serif, or Monospace.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
double-struck (double-struck)	Double-Struck Script Type
fraktur (Fraktur)	Fraktur Script Type
monospace (Monospace)	Monospace Script Type
roman (Roman)	Roman Script Type
sans-serif (Sans-Serif)	Sans-Serif Script Type
script (Script)	Script Type

Referenced By
scr@val (§7.1.2.94)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Script">
   <restriction base="xsd:string">
      <enumeration value="roman"/>
      <enumeration value="script"/>
      <enumeration value="fraktur"/>
      <enumeration value="double-struck"/>
      <enumeration value="sans-serif"/>
      <enumeration value="monospace"/>
   </restriction>
</simpleType>
```

7.1.3.11 ST_Shp (Shape (Delimiters))

Delimiters shape can be centered around the argument, or matched to the shape of the argument.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
centered (Centered (Delimiters))	Delimiters are centered around their argument.
match (Match)	Match shape of contents of delimiters.

Referenced By
shp@val (§7.1.2.97)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Shp">
   <restriction base="xsd:string">
      <enumeration value="centered"/>
      <enumeration value="match"/>
   </restriction>
</simpleType>
```

7.1.3.12 ST_SpacingRule (Spacing Rule)

Integer value (0 to 4), representing the type of spacing between rows.

This simple type's contents are a restriction of the XML Schema integer datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 4.

Referenced By
cGpRule@val (§7.1.2.19); rSpRule@val (§7.1.2.93)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SpacingRule">
   <restriction base="xsd:integer">
      <minInclusive value="0"/>
      <maxInclusive value="4"/>
   </restriction>
</simpleType>
```

7.1.3.13 ST_String (String)

String

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
mathFont@val (§7.1.2.61)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_String">
   <restriction base="xsd:string"/>
</simpleType>
```

7.1.3.14 ST_Style (Style)

Style of math can be plain, bold, italic, or bold-italic (p, bi, i, or bi).

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bold)	Bold
bi (Bold-Italic)	Bold-Italic
i (Italic)	Italic
p (Plain)	Plain

Referenced By
sty@val (§7.1.2.111)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Style">
   <restriction base="xsd:string">
      <enumeration value="p"/>
      <enumeration value="b"/>
      <enumeration value="i"/>
      <enumeration value="bi"/>
   </restriction>
</simpleType>
```

7.1.3.15 ST_TopBot (Top-Bottom)

Possible values are `top` and `bot`.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bot (Bottom Alignment)	Aligns the bottom of the function to the baseline of the surrounding text.
top (Top)	Aligns the top row of the function to the baseline of the surrounding text.

Referenced By
pos@val (§7.1.2.84); vertJc@val (§7.1.2.119)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TopBot">
   <restriction base="xsd:string">
      <enumeration value="top"/>
      <enumeration value="bot"/>
   </restriction>
</simpleType>
```

7.1.3.16 ST_TwipsMeasure (Twips measurement)

Positive measurement in twips (twentieths of a point, 1/1440 of an inch).

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
interSp@val (§7.1.2.48); intraSp@val (§7.1.2.50); lMargin@val (§7.1.2.59); postSp@val (§7.1.2.85); preSp@val (§7.1.2.86); rMargin@val (§7.1.2.90); wrapIndent@val (§7.1.2.120)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TwipsMeasure">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

7.1.3.17 ST_UnSignedInteger (Unsigned integer.)

Unsigned Integer

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
cGp@val (§7.1.2.18); cSp@val (§7.1.2.22); rSp@val (§7.1.2.92)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UnSignedInteger">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

7.1.3.18 ST_XAlign (Horizontal Alignment)

Possible values are `left`, `center`, and `right`.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center)	Centers the argument in the containing function.
left (Left Justification)	Aligns the argument to the left of the containing

Enumeration Value	Description
	function.
right (Right)	Aligns the argument to the right of the containing function.

Referenced By
mcJc@val (§7.1.2.65)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_XAlign">
   <restriction base="xsd:string">
      <enumeration value="left"/>
      <enumeration value="center"/>
      <enumeration value="right"/>
   </restriction>
</simpleType>
```

7.1.3.19 ST_YAlign (Vertical Alignment)

Possible values are `bot`, `center`, and `top`.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bot (Bottom Alignment)	Aligns the bottom of the function to the baseline of the surrounding text.
center (Center (Function))	Centers the argument in the containing function.
top (Top)	Aligns the top row of the function to the baseline of the surrounding text.

Referenced By
baseJc@val (§7.1.2.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_YAlign">
   <restriction base="xsd:string">
      <enumeration value="top"/>
      <enumeration value="center"/>
      <enumeration value="bot"/>
   </restriction>
</simpleType>
```

7.2 Extended Properties

Extended properties are a predefined set of metadata properties that are applicable to Office Open XML documents. These properties extend the set of core properties defined in Part 2: "Open Packaging Conventions" which are common to all packages.

Extended properties are stored within an Extended File Properties part with:

- Source Relationship: http://schemas.openxmlformats.org/officeDocument/2006/relationships/extended-properties
- Content Type: application/vnd.openxmlformats-officedocument.extended-properties+xml

Each extended property is represented as an element in the extended properties part. Extended properties elements are non-repeatable and may be empty or omitted. If all extended property elements are omitted then the extended properties part may be excluded from a document.

[*Example*: A sample extended file properties part:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<Properties xmlns="http://…/extended-properties"
  xmlns:vt="http://…/docPropsVTypes">
..<Template>Sales Report.dotm</Template>
..<TotalTime>0</TotalTime>
..<Pages>1</Pages>
..<Words>166</Words>
..<Characters>948</Characters>
..<Application>Microsoft Office Word</Application>
..<DocSecurity>0</DocSecurity>
..<Lines>7</Lines>
..<Paragraphs>2</Paragraphs>
..<ScaleCrop>false</ScaleCrop>
..<Company>Northwind Traders</Company>
..<LinksUpToDate>false</LinksUpToDate>
..<CharactersWithSpaces>1112</CharactersWithSpaces>
..<SharedDoc>false</SharedDoc>
..<HyperlinksChanged>false</HyperlinksChanged>
..<AppVersion>12.0000</AppVersion>
</Properties>
```

end example]

7.2.1 Table of Contents

This subclause is informative.

End of informative text.

7.2.2 Elements

The following elements specify the contents of this namespace:

7.2.2.1 Application (Application Name)

This element specifies the name of the application that created this document.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.2 AppVersion (Application Version)

This element specifies the version of the application which produced this document.

The content of this element shall be of the form XX.YYYY where X and Y represent numerical values, or the document shall be considered non-conformant.

[*Note*: The contents of this element do not represent absolute values, but rather qualify the contents of the Application element to differentiate between different versions of the same producer. Applications should use this information in an informative manner only (as document metadata). *end note*]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.3 Characters (Total Number of Characters)

This element specifies the total number of characters in a document.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.4 CharactersWithSpaces (Number of Characters (With Spaces))

This element specifies the last count of the number of characters (including spaces) in this document.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.5 Company (Name of Company)

This element specifies the name of a company associated with the document.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.6 DigSig (Digital Signature)

This element contains the signature of a digitally signed document.

[*Note*: This property is a mechanism used by legacy documents to store the digital signature of its binary representation, and should be considered deprecated in favor of the well-defined mechanism defined in Part 2. Any use of this property should be for legacy compatibility only, and is application-defined. *end note*]

Parent Elements

Parent Elements
Properties (§7.2.2.21)

Child Elements	Subclause
blob (Binary Blob)	§7.4.2.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DigSigBlob">
   <sequence minOccurs="1" maxOccurs="1">
      <element ref="vt:blob"/>
   </sequence>
</complexType>
```

7.2.2.7 DocSecurity (Document Security)

This metadata element specifies the security level of a document as a numeric value. Document security is defined as:

DocSecurity	Security Level
1	Document is password protected.
2	Document is recommended to be opened as read-only.
4	Document is enforced to be opened as read-only.
8	Document is locked for annotation.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.8 HeadingPairs (Heading Pairs)

Heading pairs indicates the grouping of document parts and the number of parts in each group. These parts are not document parts but conceptual representations of document sections.

[*Example*: A presentation composing of three slides with an applied theme may have the following HeadingPairs representation:

```
<HeadingPairs>
  <vt:vector size="4" baseType="variant">
    <vt:variant>
      <vt:lpstr>Theme</vt:lpstr>
    </vt:variant>
```

```
      <vt:variant>
        <vt:i4>1</vt:i4>
      </vt:variant>
      <vt:variant>
        <vt:lpstr>Slide Titles</vt:lpstr>
      </vt:variant>
      <vt:variant>
        <vt:i4>3</vt:i4>
      </vt:variant>
    </vt:vector>
  </HeadingPairs>
```

end example]

Parent Elements
Properties (§7.2.2.21)

Child Elements	Subclause
vector (Vector)	§7.4.2.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VectorVariant">
   <sequence minOccurs="1" maxOccurs="1">
      <element ref="vt:vector"/>
   </sequence>
</complexType>
```

7.2.2.9 HiddenSlides (Number of Hidden Slides)

This element specifies the number of hidden slides in a presentation document.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.10 HLinks (Hyperlink List)

This element specifies the set of hyperlinks that were in this document when last saved.

Parent Elements
Properties (§7.2.2.21)

Child Elements	Subclause

Child Elements	Subclause
vector (Vector)	§7.4.2.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VectorVariant">
   <sequence minOccurs="1" maxOccurs="1">
      <element ref="vt:vector"/>
   </sequence>
</complexType>
```

7.2.2.11 HyperlinkBase (Relative Hyperlink Base)

This element specifies the base string used for evaluating relative hyperlinks in this document.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.12 HyperlinksChanged (Hyperlinks Changed)

This element specifies that one or more hyperlinks in this part were updated exclusively in this part by a producer. The next producer to open this document shall update the hyperlink relationships with the new hyperlinks specified in this part.

The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.13 Lines (Number of Lines)

This element specifies the total number of lines in a document when last saved by a conforming producer if applicable.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.14 LinksUpToDate (Links Up-to-Date)

This element indicates whether hyperlinks in a document are up-to-date. Set this element to TRUE to indicate that hyperlinks are updated. Set this element to FALSE to indicate that hyperlinks are outdated.

The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements

Parent Elements
Properties (§7.2.2.21)

7.2.2.15 Manager (Name of Manager)

This element specifies the name of a supervisor associated with the document.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.16 MMClips (Total Number of Multimedia Clips)

This element specifies the total number of sound or video clips that are present in the document.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.17 Notes (Number of Slides Containing Notes)

This element specifies the number of slides in a presentation containing notes.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.18 Pages (Total Number of Pages)

This element specifies the total number of pages of a document if applicable.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.19 Paragraphs (Total Number of Paragraphs)

This element specifies the total number of paragraphs found in a document if applicable.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.20 PresentationFormat (Intended Format of Presentation)

This element specifies the intended format for a presentation document. For example, a presentation intended to be shown on video will have PresentationFormat "Video".

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.21 Properties (Application Specific File Properties)

This element specifies the application properties of a document. For properties of type string, NCR escape format (_xHHHH_) is used for any invalid XML characters.

Parent Elements
Root element of Shared Extended File Properties part

Child Elements	Subclause
Application (Application Name)	§7.2.2.1
AppVersion (Application Version)	§7.2.2.2
Characters (Total Number of Characters)	§7.2.2.3
CharactersWithSpaces (Number of Characters (With Spaces))	§7.2.2.4
Company (Name of Company)	§7.2.2.5
DigSig (Digital Signature)	§7.2.2.6
DocSecurity (Document Security)	§7.2.2.7
HeadingPairs (Heading Pairs)	§7.2.2.8
HiddenSlides (Number of Hidden Slides)	§7.2.2.9
HLinks (Hyperlink List)	§7.2.2.10
HyperlinkBase (Relative Hyperlink Base)	§7.2.2.11
HyperlinksChanged (Hyperlinks Changed)	§7.2.2.12
Lines (Number of Lines)	§7.2.2.13
LinksUpToDate (Links Up-to-Date)	§7.2.2.14
Manager (Name of Manager)	§7.2.2.15
MMClips (Total Number of Multimedia Clips)	§7.2.2.16
Notes (Number of Slides Containing Notes)	§7.2.2.17
Pages (Total Number of Pages)	§7.2.2.18
Paragraphs (Total Number of Paragraphs)	§7.2.2.19
PresentationFormat (Intended Format of Presentation)	§7.2.2.20

Child Elements	Subclause
ScaleCrop (Thumbnail Display Mode)	§7.2.2.22
SharedDoc (Shared Document)	§7.2.2.23
Slides (Slides Metadata Element)	§7.2.2.24
Template (Name of Document Template)	§7.2.2.25
TitlesOfParts (Part Titles)	§7.2.2.26
TotalTime (Total Edit Time Metadata Element)	§7.2.2.27
Words (Word Count)	§7.2.2.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Properties">
   <all>
      <element name="Template" minOccurs="0" maxOccurs="1" type="xsd:string"/>
      <element name="Manager" minOccurs="0" maxOccurs="1" type="xsd:string"/>
      <element name="Company" minOccurs="0" maxOccurs="1" type="xsd:string"/>
      <element name="Pages" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="Words" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="Characters" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="PresentationFormat" minOccurs="0" maxOccurs="1" type="xsd:string"/>
      <element name="Lines" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="Paragraphs" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="Slides" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="Notes" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="TotalTime" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="HiddenSlides" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="MMClips" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="ScaleCrop" minOccurs="0" maxOccurs="1" type="xsd:boolean"/>
      <element name="HeadingPairs" minOccurs="0" maxOccurs="1" type="CT_VectorVariant"/>
      <element name="TitlesOfParts" minOccurs="0" maxOccurs="1" type="CT_VectorLpstr"/>
      <element name="LinksUpToDate" minOccurs="0" maxOccurs="1" type="xsd:boolean"/>
      <element name="CharactersWithSpaces" minOccurs="0" maxOccurs="1" type="xsd:int"/>
      <element name="SharedDoc" minOccurs="0" maxOccurs="1" type="xsd:boolean"/>
      <element name="HyperlinkBase" minOccurs="0" maxOccurs="1" type="xsd:string"/>
      <element name="HLinks" minOccurs="0" maxOccurs="1" type="CT_VectorVariant"/>
      <element name="HyperlinksChanged" minOccurs="0" maxOccurs="1" type="xsd:boolean"/>
      <element name="DigSig" minOccurs="0" maxOccurs="1" type="CT_DigSigBlob"/>
      <element name="Application" minOccurs="0" maxOccurs="1" type="xsd:string"/>
      <element name="AppVersion" minOccurs="0" maxOccurs="1" type="xsd:string"/>
      <element name="DocSecurity" minOccurs="0" maxOccurs="1" type="xsd:int"/>
   </all>
</complexType>
```

7.2.2.22 ScaleCrop (Thumbnail Display Mode)

This element indicates the display mode of the document thumbnail. Set this element to TRUE to enable scaling of the document thumbnail to the display. Set this element to FALSE to enable cropping of the document thumbnail to show only sections that will fit the display.

The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.23 SharedDoc (Shared Document)

This element indicates if this document is currently shared between multiple producers. If this element is set to TRUE, producers should take care when updating the document.

The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.24 Slides (Slides Metadata Element)

This element specifies the total number of slides in a presentation document.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.25 Template (Name of Document Template)

This element specifies the name of an external document template containing format and style information used to create the current document.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.26 TitlesOfParts (Part Titles)

This element specifies the title of each document. These parts are not document parts but conceptual representations of document sections.

[*Example*: A presentation composing of three slides with an applied theme "Currency" may have the following TitlesofParts representation:

```
<TitlesofParts>
  <vt:vector size="4" baseType="lpstr">
    <vt:lpstr>Currency</vt:lpstr>
    <vt:lpstr>Slide 1</vt:lpstr>
    <vt:lpstr>Slide 2</vt:lpstr>
    <vt:lpstr>Slide 3</vt:lpstr>
  </vt:vector>
</TitlesofParts>
```

end example]

Parent Elements
Properties (§7.2.2.21)

Child Elements	Subclause
vector (Vector)	§7.4.2.34

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VectorLpstr">
   <sequence minOccurs="1" maxOccurs="1">
      <element ref="vt:vector"/>
   </sequence>
</complexType>
```

7.2.2.27 TotalTime (Total Edit Time Metadata Element)

Total time that a document has been edited. The default time unit is minutes.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.2.2.28 Words (Word Count)

This element specifies the total number of words contained in a document when last saved.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
Properties (§7.2.2.21)

7.3 Custom Properties

Custom properties enable users to define custom metadata properties through a set of well-defined data types.

Custom properties are represented by property elements (§7.3.2.2) stored in the Custom File Properties part with:

- Source Relationship: http://schemas.openxmlformats.org/officeDocument/2006/relationships/custom-properties
- Content Type: application/vnd.openxmlformats-officedocument.custom-properties+xml

Custom property elements are non-repeatable and may be empty or omitted. If all custom property elements are omitted then the custom properties part may be excluded from a document.

The type and value of custom properties are specified by child XML elements in the File Properties Variant Types namespace (discussed in detail in §7.4). User defined properties are uniquely identified through the name attribute of the property element. Custom properties can be associated with OLE document properties through the fmtid and pid attributes.

[*Example*: A custom OLE `Editor` property of type `string` can be defined as follows:

```
<property fmtid="{D5CDD505-2E9C-101B-9397-08002B2CF9AE}" pid="2"
  name="Editor">
  <vt:lpwstr>John Smith</vt:lpwstr>
</property>
```

end example]

7.3.1 Table of Contents

This subclause is informative.

End of informative text.

7.3.2 Elements

This subclause specifies the set of elements that define this namespace:

7.3.2.1 Properties (Custom File Properties)

Parent element for the custom file properties part.

Parent Elements
Root element of Shared Custom File Properties part

Child Elements	Subclause

Child Elements	Subclause
property (Custom File Property)	§7.3.2.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Properties">
   <sequence>
      <element name="property" minOccurs="0" maxOccurs="unbounded" type="CT_Property"/>
   </sequence>
</complexType>
```

7.3.2.2 property (Custom File Property)

This element specifies a single custom file property. Custom file property type is defined through child elements in the File Properties Variant Type namespace. Custom file property value can be set by setting the appropriate Variant Type child element value.

Parent Elements
Properties (§7.3.2.1)

Child Elements	Subclause
array (Array)	§7.4.2.1
blob (Binary Blob)	§7.4.2.2
bool (Boolean)	§7.4.2.3
bstr (Basic String)	§7.4.2.4
cf (Clipboard Data)	§7.4.2.5
clsid (Class ID)	§7.4.2.6
cy (Currency)	§7.4.2.7
date (Date and Time)	§7.4.2.8
decimal (Decimal)	§7.4.2.9
empty (Empty)	§7.4.2.10
error (Error Status Code)	§7.4.2.11
filetime (File Time)	§7.4.2.12
i1 (1-Byte Signed Integer)	§7.4.2.13
i2 (2-Byte Signed Integer)	§7.4.2.14
i4 (4-Byte Signed Integer)	§7.4.2.15
i8 (8-Byte Signed Integer)	§7.4.2.16
int (Integer)	§7.4.2.17
lpstr (LPSTR)	§7.4.2.18
lpwstr (LPWSTR)	§7.4.2.19

Child Elements	Subclause
null (Null)	§7.4.2.20
oblob (Binary Blob Object)	§7.4.2.21
ostorage (Binary Storage Object)	§7.4.2.22
ostream (Binary Stream Object)	§7.4.2.23
r4 (4-Byte Real Number)	§7.4.2.24
r8 (8-Byte Real Number)	§7.4.2.25
storage (Binary Storage)	§7.4.2.26
stream (Binary Stream)	§7.4.2.27
ui1 (1-Byte Unsigned Integer)	§7.4.2.28
ui2 (2-Byte Unsigned Integer)	§7.4.2.29
ui4 (4-Byte Unsigned Integer)	§7.4.2.30
ui8 (8-Byte Unsigned Integer)	§7.4.2.31
uint (Unsigned Integer)	§7.4.2.32
vector (Vector)	§7.4.2.34
vstream (Binary Versioned Stream)	§7.4.2.35

Attributes	Description
fmtid (Format ID)	Uniquely relates a custom property with an OLE property. The value of this attribute is a Globally Unique Identifier in the form of {HHHHHHHH-HHHH-HHHH-HHHH-HHHHHHHH} where each H is a hexidecimal. The possible values for this attribute are defined by the ST_Clsid simple type (§7.4.3.2).
linkTarget (Bookmark Link Target)	Specifies the name of a bookmark in the current document (for WordprocessingML), or a table or named cell (for SpreadsheetML) from which the value of this custom document property should be extracted. If this attribute is present, then any value under this element shall be considered a cache and replaced with the value of this bookmark (if present) on save. If the bookmark is not present, then this link shall be considered broken and the cached value shall be retained. The possible values for this attribute are defined by the XML Schema string datatype.
name (Custom File Property Name)	Specifies the name of this custom file property. The possible values for this attribute are defined by the XML Schema string datatype.
pid (Property ID)	Uniquely relates a custom property with an OLE property. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Property">
   <choice minOccurs="1" maxOccurs="1">
      <element ref="vt:vector"/>
      <element ref="vt:array"/>
      <element ref="vt:blob"/>
      <element ref="vt:oblob"/>
      <element ref="vt:empty"/>
      <element ref="vt:null"/>
      <element ref="vt:i1"/>
      <element ref="vt:i2"/>
      <element ref="vt:i4"/>
      <element ref="vt:i8"/>
      <element ref="vt:int"/>
      <element ref="vt:ui1"/>
      <element ref="vt:ui2"/>
      <element ref="vt:ui4"/>
      <element ref="vt:ui8"/>
      <element ref="vt:uint"/>
      <element ref="vt:r4"/>
      <element ref="vt:r8"/>
      <element ref="vt:decimal"/>
      <element ref="vt:lpstr"/>
      <element ref="vt:lpwstr"/>
      <element ref="vt:bstr"/>
      <element ref="vt:date"/>
      <element ref="vt:filetime"/>
      <element ref="vt:bool"/>
      <element ref="vt:cy"/>
      <element ref="vt:error"/>
      <element ref="vt:stream"/>
      <element ref="vt:ostream"/>
      <element ref="vt:storage"/>
      <element ref="vt:ostorage"/>
      <element ref="vt:vstream"/>
      <element ref="vt:clsid"/>
      <element ref="vt:cf"/>
   </choice>
   <attribute name="fmtid" use="required" type="vt:ST_Clsid"/>
   <attribute name="pid" use="required" type="xsd:int"/>
   <attribute name="name" use="optional" type="xsd:string"/>
   <attribute name="linkTarget" use="optional" type="xsd:string"/>
</complexType>
```

7.4 Variant Types

This subclause specifies the set of data types which may be included within file properties that accept variant type structures.

7.4.1 Table of Contents

This subclause is informative.

End of informative text.

7.4.2 Elements

The following elements define the contents of this namespace:

7.4.2.1 array (Array)

The array element defines the array variant type. Array contents must be of uniform type as specified by the baseType attribute. The contents of an array are defined using repeated child elements of the appropriate variant type.

Multi-dimensional arrays can be defined by specifying the length of each dimension in the lBound and uBound attributes through the use of the "," delimiter. Child elements of multi-dimensional arrays are indexed along each dimension in the order the dimensions are declared.

In other words, the array shall be filled as follows:

- The first index shall be incremented to its maximum value [*Example*: [0,0,0] to [max,0,0] *end example*]
- The second index shall be incremented to its maximum value [*Example*: [0,1,0] to [0,max,0] *end example*]
- Subsequent indices shall be filled until all provided values have been added
- All other values shall have null values within the array (i.e. no default value shall be assumed).

[*Example*: A 2x3 variant type array of type "i4" is specified as follows:

```
<vt:array lBounds="0,0" uBounds="1,2" baseType="i4">
  <vt:i4>0</vt:i4>
  <vt:i4>1</vt:i4>
  <vt:i4>2</vt:i4>
  <vt:i4>3</vt:i4>
  <vt:i4>4</vt:i4>
</vt:array>
```

The resulting array: [0,0] = 0, [1,0] = 1, [0,1] = 2, [1,1] = 3, [0,2] = 4. *end example*]

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

Child Elements	Subclause
bool (Boolean)	§7.4.2.3
bstr (Basic String)	§7.4.2.4
cy (Currency)	§7.4.2.7
date (Date and Time)	§7.4.2.8
decimal (Decimal)	§7.4.2.9

Child Elements	Subclause
error (Error Status Code)	§7.4.2.11
i1 (1-Byte Signed Integer)	§7.4.2.13
i2 (2-Byte Signed Integer)	§7.4.2.14
i4 (4-Byte Signed Integer)	§7.4.2.15
int (Integer)	§7.4.2.17
r4 (4-Byte Real Number)	§7.4.2.24
r8 (8-Byte Real Number)	§7.4.2.25
ui1 (1-Byte Unsigned Integer)	§7.4.2.28
ui2 (2-Byte Unsigned Integer)	§7.4.2.29
ui4 (4-Byte Unsigned Integer)	§7.4.2.30
uint (Unsigned Integer)	§7.4.2.32
variant (Variant)	§7.4.2.33

Attributes	Description
baseType (Array Base Type)	The baseType attribute specifies the base variant type of an array. The allowed values are: variant, i1, i2, i4, int, ui1, ui2, ui4, uint, r4, r8, decimal, bstr, date, bool, cy, and error. The possible values for this attribute are defined by the ST_ArrayBaseType simple type (§7.4.3.1).
lBounds (Array Lower Bounds Attribute)	The lBounds attribute specifies the lower bound of an array in the format: #, #, # ... # where each # represents an integer. The possible values for this attribute are defined by the XML Schema int datatype.
uBounds (Array Upper Bounds Attribute)	The uBounds attribute specifies the upper bound of an array in the format: #, #, # ... # where each # represents an integer. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Array">
   <choice minOccurs="1" maxOccurs="unbounded">
      <element ref="variant"/>
      <element ref="i1"/>
      <element ref="i2"/>
      <element ref="i4"/>
      <element ref="int"/>
      <element ref="ui1"/>
      <element ref="ui2"/>
      <element ref="ui4"/>
      <element ref="uint"/>
      <element ref="r4"/>
      <element ref="r8"/>
      <element ref="decimal"/>
      <element ref="bstr"/>
      <element ref="date"/>
      <element ref="bool"/>
      <element ref="error"/>
      <element ref="cy"/>
   </choice>
   <attribute name="lBounds" type="xsd:int" use="required"/>
   <attribute name="uBounds" type="xsd:int" use="required"/>
   <attribute name="baseType" type="ST_ArrayBaseType" use="required"/>
</complexType>
```

7.4.2.2 blob (Binary Blob)

This element specifies a base64 binary blob variant type.

This type is defined as follows: a DWORD count of bytes, followed by that many bytes of data. The byte count does not include the four bytes for the length of the count itself; an empty blob member would have a count of zero, followed by zero bytes.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
DigSig (§7.2.2.6); property (§7.3.2.2); variant (§7.4.2.33)

7.4.2.3 bool (Boolean)

This element specifies a Boolean variant type.

The possible values for this element are defined by the XML Schema boolean datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.4 bstr (Basic String)

This element defines a binary basic string variant type. For all characters that cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format _xHHHH_, where H represents a hexadecimal character in the character's value. [*Example*: The Unicode character 8 is not permitted in an XML 1.0 document, so it shall be escaped as _x0008_. *end example*]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.5 cf (Clipboard Data)

This element specifies base64-encoded binary clipboard data.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>format (Format Attribute)</td><td>Specifies the format of the clipboard data and must be: -3, -2, -1, 0, or any positive integer.

<table>
<tr><th>Format Value</th><th>Clipboard Data</th></tr>
<tr><td>0</td><td>No data.</td></tr>
<tr><td>-1</td><td>A long that contains a built-in Windows clipboard format value.</td></tr>
<tr><td>-2</td><td>A long that contains a Macintosh clipboard format value.</td></tr>
<tr><td>-3</td><td>A GUID that contains a format identifier (FMTID).</td></tr>
<tr><td>any positive value</td><td>A null-terminated string that contains a clipboard format name to be registered. The Format value indicates the string length, including the null byte at the end.</td></tr>
</table>

The possible values for this attribute are defined by the ST_Format simple type (§7.4.3.5).</td></tr>
</table>

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cf">
    <simpleContent>
        <extension base="xsd:base64Binary">
            <attribute name="format" type="ST_Format"/>
        </extension>
    </simpleContent>
</complexType>
```

7.4.2.6 clsid (Class ID)

This element specifies a class ID variant type. The value must be a Globally Unique Identifier with format: {HHHHHHHH-HHHH-HHHH-HHHH-HHHHHHHH}.

The possible values for this element are defined by the ST_Clsid simple type (§7.4.3.2).

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.7 cy (Currency)

This element specifies a currency variant type with exactly four digits after the decimal point.

The possible values for this element are defined by the ST_Cy simple type (§7.4.3.3).

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.8 date (Date and Time)

This element specifies a date variant type of type date-time as defined in RFC 3339.

The possible values for this element are defined by the XML Schema dateTime datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.9 decimal (Decimal)

This element specifies a decimal variant type.

The possible values for this element are defined by the XML Schema decimal datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33)

7.4.2.10 empty (Empty)

This element specifies an empty variant type. No values or child elements are allowed.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

7.4.2.11 error (Error Status Code)

The error element specifies a 32-bit error status code variant type of the form 0xHHHHHHHH. Each H represents a hexadecimal digit.

The possible values for this element are defined by the ST_Error simple type (§7.4.3.4).

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.12 filetime (File Time)

This element specifies a file-time variant type of type date-time as defined in RFC 3339.

The possible values for this element are defined by the XML Schema dateTime datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.13 i1 (1-Byte Signed Integer)

This element specifies a 1-byte signed integer variant type.

The possible values for this element are defined by the XML Schema byte datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.14 i2 (2-Byte Signed Integer)

This element specifies a 2-byte signed integer variant type.

The possible values for this element are defined by the XML Schema short datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.15 i4 (4-Byte Signed Integer)

This element specifies a 4-byte signed integer variant type.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.16 i8 (8-Byte Signed Integer)

This element specifies a 8-byte signed integer variant type.

The possible values for this element are defined by the XML Schema long datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.17 int (Integer)

This element specifies an integer variant type.

The possible values for this element are defined by the XML Schema int datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33)

7.4.2.18 lpstr (LPSTR)

This element specifies a string variant type. For all characters that cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format _xHHHH_, where H represents a hexadecimal character in the character's value. [*Example*: The Unicode character 8 is not permitted in an XML 1.0 document, so it shall be escaped as _x0008_. *end example*]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.19 lpwstr (LPWSTR)

This element specifies a string variant type. For all characters that cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format _xHHHH_, where H represents a hexadecimal character in the character's value. [*Example*: The Unicode character 8 is not permitted in an XML 1.0 document, so it shall be escaped as _x0008_. *end example*]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.20 null (Null)

This element specifies a null variant type.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Null"/>
```

7.4.2.21 oblob (Binary Blob Object)

This element specifies a base64 binary blob object variant type.

This type is defined as follows: A blob member that contains a serialized object in the same representation that would appear in the ostream element. That is, a DWORD byte count (where the byte count does not include the size of itself) which is in the format of a class identifier followed by initialization data for that class.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

7.4.2.22 ostorage (Binary Storage Object)

This element specifies a base64 binary storage object variant type.

This type is defined as follows: Identical to the storage element, but indicates that the designated storage shall contain a loadable object.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

7.4.2.23 ostream (Binary Stream Object)

This element specifies a binary stream object variant type.

This type is defined as follows: Identical to the definition of the stream element, but indicates that the stream contains a serialized object, which is a CLSID – see the ST_Clsid simple type (§7.4.3.2) – followed by initialization data for the specified class.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

7.4.2.24 r4 (4-Byte Real Number)

This element specifies a 4-byte real number variant type.

The possible values for this element are defined by the XML Schema float datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.25 r8 (8-Byte Real Number)

This element specifies a 8-byte real number variant type.

The possible values for this element are defined by the XML Schema double datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.26 storage (Binary Storage)

This element specifies a binary storage variant type.

This type is defined as follows: Contains the base64-encoded data for a structured storage.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

7.4.2.27 stream (Binary Stream)

This element specifies a binary stream variant type.

This type is defined as follows: Contains the base64-encoded data for a structured storage stream.

The possible values for this element are defined by the XML Schema base64Binary datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

7.4.2.28 ui1 (1-Byte Unsigned Integer)

This element specifies a 1-byte unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedByte datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.29 ui2 (2-Byte Unsigned Integer)

This element specifies a 2-byte unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedShort datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.30 ui4 (4-Byte Unsigned Integer)

This element specifies a 4-byte unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedInt datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.31 ui8 (8-Byte Unsigned Integer)

This element specifies a 8-byte unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedLong datatype.

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33); vector (§7.4.2.34)

7.4.2.32 uint (Unsigned Integer)

This element specifies an unsigned integer variant type.

The possible values for this element are defined by the XML Schema unsignedInt datatype.

Parent Elements
array (§7.4.2.1); property (§7.3.2.2); variant (§7.4.2.33)

7.4.2.33 variant (Variant)

This element can contain exactly 1 child element of any variant type. This element is only valid as a child element of a vector or array variant type.

[*Example*: A vector of variant types:

```
<vt:vector baseType="variant">
  <vt:variant>
    <vt:i4>12</vt:i4>
  </vt:variant>
  <vt:variant>
    <vt:lpstr>WorkSheets</vt:lpstr>
```

```
  </vt:variant>
</vt:vector>
```

end example]

Parent Elements
array (§7.4.2.1); variant (§7.4.2.33); vector (§7.4.2.34)

Child Elements	Subclause
array (Array)	§7.4.2.1

      <element ref="lpwstr"/>
      <element ref="bstr"/>
      <element ref="date"/>
      <element ref="filetime"/>
      <element ref="bool"/>
      <element ref="cy"/>
      <element ref="error"/>
      <element ref="stream"/>
      <element ref="ostream"/>
      <element ref="storage"/>
      <element ref="ostorage"/>
      <element ref="vstream"/>
      <element ref="clsid"/>
      <element ref="cf"/>
   </choice>
</complexType>
```

7.4.2.34 vector (Vector)

This element defines the vector variant type. Vector contents must be of uniform type as specified by the baseType attribute. The contents of a vector are defined using repeated child elements of the appropriate variant type.

[*Example*: A vector of lpstr variant types:

```
<vt:vector baseType="lpstr">
  <vt:lpstr>One</vt:lpstr>
  <vt:lpstr>Two</vt:lpstr>
  <vt:lpstr>Three</vt:lpstr>
</vt:vector>
```

end example]

Parent Elements
HeadingPairs (§7.2.2.8); HLinks (§7.2.2.10); property (§7.3.2.2); TitlesOfParts (§7.2.2.26); variant (§7.4.2.33)

Child Elements	Subclause
bool (Boolean)	§7.4.2.3
bstr (Basic String)	§7.4.2.4
cf (Clipboard Data)	§7.4.2.5

ui2 (2-Byte Unsigned Integer)	§7.4.2.29
ui4 (4-Byte Unsigned Integer)	§7.4.2.30
ui8 (8-Byte Unsigned Integer)	§7.4.2.31
variant (Variant)	§7.4.2.33

Attributes	Description
baseType (Vector	The baseType attribute specifies the base variant type of a vector.

Attributes	Description
Base Type)	The allowed values are: variant, i1, i2, i4, i8, ui1, ui2, ui4, ui8, r4, r8, lpstr, lpwstr, bstr, date, filetime, bool, cy, error, clsid, and cf. The possible values for this attribute are defined by the ST_VectorBaseType simple type (§7.4.3.6).
size (Vector Size)	Specifies the number of elements in the vector. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Vector">
   <choice minOccurs="1" maxOccurs="unbounded">
      <element ref="variant"/>
      <element ref="i1"/>
      <element ref="i2"/>
      <element ref="i4"/>
      <element ref="i8"/>
      <element ref="ui1"/>
      <element ref="ui2"/>
      <element ref="ui4"/>
      <element ref="ui8"/>
      <element ref="r4"/>
      <element ref="r8"/>
      <element ref="lpstr"/>
      <element ref="lpwstr"/>
      <element ref="bstr"/>
      <element ref="date"/>
      <element ref="filetime"/>
      <element ref="bool"/>
      <element ref="cy"/>
      <element ref="error"/>
      <element ref="clsid"/>
      <element ref="cf"/>
   </choice>
   <attribute name="baseType" type="ST_VectorBaseType" use="required"/>
   <attribute name="size" type="xsd:unsignedInt" use="required"/>
</complexType>
```

7.4.2.35 vstream (Binary Versioned Stream)

This element specifies a binary versioned stream variant type.

This type is defined as follows: A stream element's content with a GUID version (the version attribute).

Parent Elements
property (§7.3.2.2); variant (§7.4.2.33)

Attributes	Description
version (VSTREAM Version Attribute)	The version attribute of the vstream element specifies the version as a Globally Unique Identifiers with format: {HHHHHHHH-HHHH-HHHH-HHHH-HHHHHHHH}. The possible values for this attribute are defined by the ST_Clsid simple type (§7.4.3.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Vstream">
   <simpleContent>
      <extension base="xsd:base64Binary">
         <attribute name="version" type="ST_Clsid"/>
      </extension>
   </simpleContent>
</complexType>
```

7.4.3 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/officeDocument/2006/docPropsVTypes namespace.

7.4.3.1 ST_ArrayBaseType (Array Base Type Simple Type)

The ST_ArrayBaseType simple type defines the allowed values for an array's baseType attribute as: variant, i1, i2, i4, int, ui1,ui2, ui4, uint, r4, r8, decimal, bstr, date, bool, cy, and error.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bool (Boolean Base Type)	Specifies that the variant type for the contents of a array shall be `bool`.
bstr (Basic String Base Type)	Specifies that the variant type for the contents of a array shall be `bstr`.
cy (Curency Base Type)	Specifies that the variant type for the contents of a array shall be `cy`.
date (Date and Time Base Type)	Specifies that the variant type for the contents of a array shall be `date`.
decimal (Decimal Base Type)	Specifies that the variant type for the contents of a array shall be `decimal`.
error (Error Status Code Base Type)	Specifies that the variant type for the contents of a array shall be `error`.
i1 (1-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a array shall be `i1`.

Enumeration Value	Description
i2 (2-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a array shall be `i2`.
i4 (4-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a array shall be `i4`.
int (Integer Base Type)	Specifies that the variant type for the contents of a array shall be `int`.
r4 (4-Byte Real Number Base Type)	Specifies that the variant type for the contents of a array shall be `r4`.
r8 (8-Byte Real Number Base Type)	Specifies that the variant type for the contents of a array shall be `r8`.
ui1 (1-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be `ui1`.
ui2 (2-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be `ui2`.
ui4 (4-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be `ui4`.
uint (Unsigned Integer Base Type)	Specifies that the variant type for the contents of a array shall be `uint`.
variant (Variant Base Type)	Specifies that the variant type for the contents of a array shall be `variant`.

Referenced By
array@baseType (§7.4.2.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ArrayBaseType">
   <restriction base="xsd:string">
      <enumeration value="variant"/>
      <enumeration value="i1"/>
      <enumeration value="i2"/>
      <enumeration value="i4"/>
      <enumeration value="int"/>
      <enumeration value="ui1"/>
      <enumeration value="ui2"/>
      <enumeration value="ui4"/>
      <enumeration value="uint"/>
      <enumeration value="r4"/>
      <enumeration value="r8"/>
      <enumeration value="decimal"/>
      <enumeration value="bstr"/>
      <enumeration value="date"/>
      <enumeration value="bool"/>
      <enumeration value="cy"/>
      <enumeration value="error"/>
   </restriction>
</simpleType>
```

7.4.3.2 ST_Clsid (Class ID Simple Type)

The ST_Clsid simple type specifies the type for the clsid element. The allowed values must be Globally Unique Identifiers with format: {HHHHHHHH-HHHH-HHHH-HHHH-HHHHHHHH}.

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: \s*\{[a-fA-F0-9]{8}-[a-fA-F0-9]{4}-[a-fA-F0-9]{4}-[a-fA-F0-9]{4}-[a-fA-F0-9]{12}\}\s*.

Referenced By
clsid (§7.4.2.6); property@fmtid (§7.3.2.2)

7.4.3.3 ST_Cy (Currency Simple Type)

The ST_Cy simple type defines the cy element as a currency variant type with exactly four digits after the decimal point.

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: \s*[0-9]*\.[0-9]{4}\s*.

Referenced By

Referenced By
cy (§7.4.2.7)

7.4.3.4 ST_Error (Error Status Code Simple Type)

The ST_Error simple type defines a 32-bit error status code variant type of the form 0xHHHHHHHH. Each H represents a hexadecimal.

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: \s*0x[0-9A-Za-z]{8}\s*.

Referenced By
error (§7.4.2.11)

7.4.3.5 ST_Format (Format Simple Type)

The ST_Format simple type defines the format attribute of the cf element. The format attribute can be the following values: -3, -2, 1, 0, and any positive integer.

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: \-1.
- This simple type's contents must match the following regular expression pattern: \-2.
- This simple type's contents must match the following regular expression pattern: \-3.
- This simple type's contents must match the following regular expression pattern: [1-9]+.
- This simple type's contents must match the following regular expression pattern: 0.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Format">
    <restriction base="xsd:string">
        <pattern value="\-1"/>
        <pattern value="\-2"/>
        <pattern value="\-3"/>
        <pattern value="[1-9]+"/>
        <pattern value="0"/>
    </restriction>
</simpleType>
```

7.4.3.6 ST_VectorBaseType (Vector Base Type Simple Type)

The ST_VectorBaseType simple type defines the allowed values for a vector's baseType attribute as: variant, i1, i2, i4, i8, ui1, ui2, ui4, ui8, r4, r8, lpstr, lpwstr, bstr, date, filetime, bool, cy, error, clsid, and cf.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bool (Boolean Base Type)	Specifies that the variant type for the contents of a vector shall be `bool`.
bstr (Basic String Base Type)	Specifies that the variant type for the contents of a vector shall be `bstr`.
cf (Clipboard Data Base Type)	Specifies that the variant type for the contents of a vector shall be `cf`.
clsid (Class ID Base Type)	Specifies that the variant type for the contents of a vector shall be `clsid`.
cy (Currency Base Type)	Specifies that the variant type for the contents of a vector shall be `cy`.
date (Date and Time Base Type)	Specifies that the variant type for the contents of a vector shall be `date`.
error (Error Status Code Base Type)	Specifies that the variant type for the contents of a vector shall be `error`.
filetime (File Time Base Type)	Specifies that the variant type for the contents of a vector shall be `filetime`.
i1 (Vector Base Type Enumeration Value)	Specifies that the variant type for the contents of a vector shall be `i1`.
i2 (2-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `i2`.
i4 (4-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `i4`.
i8 (8-Byte Signed Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `i8`.
lpstr (LPSTR Base Type)	Specifies that the variant type for the contents of a vector shall be `lpstr`.
lpwstr (LPWSTR Base Type)	Specifies that the variant type for the contents of a vector shall be `lpwstr`.
r4 (4-Byte Real Number Base Type)	Specifies that the variant type for the contents of a vector shall be `r4`.
r8 (8-Byte Real Number Base Type)	Specifies that the variant type for the contents of a vector shall be `r8`.
ui1 (1-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `ui1`.
ui2 (2-Byte Unisigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `ui2`.
ui4 (4-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `ui4`.

Enumeration Value	Description
ui8 (8-Byte Unsigned Integer Base Type)	Specifies that the variant type for the contents of a vector shall be `ui8`.
variant (Variant Base Type)	Specifies that the variant type for the contents of a vector shall be `variant`.

Referenced By
vector@baseType (§7.4.2.34)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VectorBaseType">
   <restriction base="xsd:string">
      <enumeration value="variant"/>
      <enumeration value="i1"/>
      <enumeration value="i2"/>
      <enumeration value="i4"/>
      <enumeration value="i8"/>
      <enumeration value="ui1"/>
      <enumeration value="ui2"/>
      <enumeration value="ui4"/>
      <enumeration value="ui8"/>
      <enumeration value="r4"/>
      <enumeration value="r8"/>
      <enumeration value="lpstr"/>
      <enumeration value="lpwstr"/>
      <enumeration value="bstr"/>
      <enumeration value="date"/>
      <enumeration value="filetime"/>
      <enumeration value="bool"/>
      <enumeration value="cy"/>
      <enumeration value="error"/>
      <enumeration value="clsid"/>
      <enumeration value="cf"/>
   </restriction>
</simpleType>
```

7.5 Custom XML Data Properties

This namespace defines the set of properties that may be associated with one or more custom XML parts within an Office Open XML document. A *custom XML part* is a part within an Office Open XML document, that contains arbitrary custom XML markup not necessarily defined by this Office Open XML Standard, and which is kept independent from the presentation-specific markup within the package.

[*Rationale*: It is often necessary to include custom XML semantics with an Office Open XML document, to store a complex set of properties (e.g., a document management system's metadata) along with the file. This mechanism allows this custom XML to be stored in the document in a way that is independent of the type of

document and separate from the presentation markup—only the custom XML is stored in this part. *end rationale*]

The properties that can be applied to a custom XML part are:

- A part ID
- (optionally) One or more associated custom XML schemas

7.5.1 Table of Contents

This subclause is informative.

End of informative text.

7.5.2 Elements

The following information describes the elements in this namespace:

7.5.2.1 datastoreItem (Custom XML Data Properties)

This element specifies the properties for a single custom XML part inside of an Office Open XML document. The set of properties specified within this element are attached to the custom XML part that specifies a relationship to this part.

[*Example*: Consider the following content for a custom XML part properties part:

```
<w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
  <w:schemaRefs>
    <w:schemaRef w:uri="http://www.contoso.com/exampleSchema" />
  </w:schemaRefs>
</w:datastoreItem>
```

The datastoreItem element contains the properties for the custom XML part that referenced it; specifically, a part ID of `A67AC88A-A164-4ADE-8889-8826CE44DE6E`, and a single XML Schema reference to a schema with a target namespace of `http://www.contoso.com/exampleSchema`. *end example*]

Parent Elements
Root element of Shared Custom XML Data Storage Properties part

Child Elements	Subclause
schemaRefs (Set of Associated XML Schemas)	§7.5.2.3

Attributes	Description

itemID (Custom XML Data ID)	Specifies a globally unique identifier (GUID) that uniquely identifies a single custom XML part within an Office Open XML document.
	
	Each itemID value shall be unique among all custom XML data parts in this document. If a document contains duplicate itemID values, then the first value should be persisted, and subsequent values should be reassigned.
	
	[*Example*: Consider the following content for a custom XML part properties part:
	
	`<w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">`
	`…`
	`</w:datastoreItem>`
	
	The itemID attribute specifies that the ID associated with the parent custom XML part is `A67AC88A-A164-4ADE-8889-8826CE44DE6E`. *end example*]
	
	The possible values for this attribute are defined by the ST_Guid simple type (§7.5.3.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DatastoreItem">
    <sequence>
        <element name="schemaRefs" type="CT_DatastoreSchemaRefs" minOccurs="0"/>
    </sequence>
    <attribute name="itemID" type="ST_Guid" use="required"/>
</complexType>
```

7.5.2.2 schemaRef (Associated XML Schema)

This element specifies a single XML schema that is associated with the custom XML data part. This XML schema is identified using its target namespace, and may be located via any means available to an application processing the contents of this file.

If the custom XML part cannot be validated using the specified XML schema when it is opened, then this reference may be omitted when the file is subsequently saved.

[*Example*: Consider the following content for a custom XML part properties part:

```
<w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
  <w:schemaRefs>
    <w:schemaRef w:uri="http://www.contoso.com/exampleSchema" />
  </w:schemaRefs>
</w:datastoreItem>
```

The schemaRef element contains a single XML Schema reference to a schema with a target namespace of `http://www.contoso.com/exampleSchema`. Applications may then locate and utilize a schema for this namespace using any means available. *end example*]

Parent Elements
schemaRefs (§7.5.2.3)

Attributes	Description
uri (Target Namespace of Associated XML Schema)	Specifies the target namespace for the XML Schema associated with this schema reference. [*Example*: Consider the following content for a custom XML part properties part: … <w:schemaRef w:uri="http://www.contoso.com/schema1" /> <w:schemaRef w:uri="http://www.contoso.com/schema2" /> … The uri attribute specifies the target namespace of each XML schema reference: • http://www.contoso.com/schema1 • http://www.contoso.com/schema2 Applications may then locate and utilize a schema for these namespaces using any means available. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DatastoreSchemaRef">
   <attribute name="uri" type="xsd:string" use="required"/>
</complexType>
```

7.5.2.3 schemaRefs (Set of Associated XML Schemas)

This element specifies the set of XML schemas that are associated with the parent custom XML part. Any number of XML schemas may be referenced, and this collection of schemas shall then be used to validate the contents of the corresponding custom XML part. If this element is present, then the set of XML schemas provided within should be used to validate the contents of the corresponding custom XML part (including the

explicit presence of no child elements to specify that no custom XML schemas should be used even if one is present).

If this element is omitted, then applications may determine the set of XML schemas to be used to validate the contents of this part using any desired means.

[*Example*: Consider the following content for a custom XML part properties part:

```
<w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
  <w:schemaRefs>
    <w:schemaRef w:uri="http://www.contoso.com/exampleSchema" />
  </w:schemaRefs>
</w:datastoreItem>
```

The schemaRefs element contains the set of XML Schema references that may be used to validate the contents of this part. *end example*]

Parent Elements
datastoreItem (§7.5.2.1)

Child Elements	Subclause
schemaRef (Associated XML Schema)	§7.5.2.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DatastoreSchemaRefs">
   <sequence>
      <element name="schemaRef" type="CT_DatastoreSchemaRef" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

7.5.3 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/officeDocument/2006/customXml namespace.

7.5.3.1 ST_Guid (128-Bit GUID Value)

This simple type specifies that its values shall be a 128-bit globally unique identifier (GUID) value.

[*Example*: Consider the following content for a custom XML part properties part:

```
<w:datastoreItem w:itemID="{A67AC88A-A164-4ADE-8889-8826CE44DE6E}">
  …
</w:datastoreItem>
```

The itemID attribute specifies that the ID associated with the parent custom XML part is A67AC88A-A164-4ADE-8889-8826CE44DE6E. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: \{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}.

Referenced By
datastoreItem@itemID (§7.5.2.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Guid">
   <restriction base="xsd:token">
      <pattern value="\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}"/>
   </restriction>
</simpleType>
```

7.6 Bibliography

Within an Office Open XML document, it is possible to store an arbitrary amount of bibliographic data, the use of which can be determined by the application reading the content. This subclause defines the format and structure of that bibliographic data.

The outermost element of bibliographic data is Sources, which represents the collection of individual reference materials (Source) in the document.

7.6.1 Table of Contents

This subclause is informative.

End of informative text.

7.6.2 Elements

The following elements define the contents of the Bibliography schema:

7.6.2.1 AbbreviatedCaseNumber (Abbreviated Case Number)

This element describes the abbreviated form of a case number. Typically, this field is used in the Case source type.

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.2 AlbumTitle (Album Title)

This element specifies the title of an album. Typically, this field is used in the Sound recording source type. [*Example*:

```
<b:Source>
  <b:Tag>Bon96</b:Tag>
  <b:SourceType>SoundRecording</b:SourceType>
  <b:Author>
    <b:Performer>
      <b:NameList>
        <b:Person>
          <b:Last>Villaron</b:Last>
          <b:First>Shawn</b:First>
          <b:Middle>Alan</b:Middle>
        </b:Person>
      </b:NameList>
    </b:Performer>
  </b:Author>
  <b:Title>Title</b:Title>
  <b:Year>2004</b:Year>
  <b:City>London</b:City>
  <b:AlbumTitle>Album Title</b:AlbumTitle>
  <b:RefOrder>15</b:RefOrder>
  <b:Guid>{17722923-790D-47E7-BB5D-C5DC67FA83D6}</b:Guid>
  <b:LCID>0</b:LCID>
  <b:Comments>Comments</b:Comments>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.3 Artist (Artist)

This element specifies the artist of the source. Typically, this field is used in the Art and Sound Recording source types. [*Example*:

```
<b:Author>
  <b:Artist>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Artist>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.4 Author (Author)

This element specifies the author of the source. [*Example*:

```
<b:Author>
  <b:Author>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Author>
</b:Author>
```

end example]

Parent Elements

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
Corporate (Corporate Author)	§7.6.2.18
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameOrCorporateType">
   <sequence>
      <choice minOccurs="0" maxOccurs="1">
         <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
         <element name="Corporate" minOccurs="1" maxOccurs="1" type="ST_String255"/>
      </choice>
   </sequence>
</complexType>
```

7.6.2.5 Author (Contributors List)

This element specifies the contributors to the source. [*Example*:

```
<b:Author>
  <b:Author>
    <b:NameList>
      <b:Person>
        <b:Last>Rothschiller</b:Last>
        <b:First>Chad</b:First>
      </b:Person>
    </b:NameList>
  </b:Author>
  <b:Editor>
    <b:NameList>
      <b:Person>
        <b:Last>Jaeschke</b:Last>
        <b:First>Rex</b:First>
      </b:Person>
    </b:NameList>
  </b:Editor>
```

```
    <b:Translator>
      <b:NameList>
        <b:Person>
          <b:Last>Davis</b:Last>
          <b:First>Tristan</b:First>
        </b:Person>
      </b:NameList>
    </b:Translator>
  </b:Author>
```

end example]

Parent Elements
Source (§7.6.2.59)

Child Elements	Subclause
Artist (Artist)	§7.6.2.3
Author (Author)	§7.6.2.4
BookAuthor (Book Author)	§7.6.2.6
Compiler (Compiler)	§7.6.2.14
Composer (Composer)	§7.6.2.15
Conductor (Conductor)	§7.6.2.16
Counsel (Counsel)	§7.6.2.19
Director (Director)	§7.6.2.25
Editor (Editor)	§7.6.2.28
Interviewee (Interviewee)	§7.6.2.33

Inventor (Inventor)	§7.6.2.35
Performer (Performer)	§7.6.2.48
ProducerName (Producer Name)	§7.6.2.51
Translator (Translator)	§7.6.2.69
Writer (Writer)	§7.6.2.74

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AuthorType">
   <sequence>
      <choice minOccurs="0" maxOccurs="unbounded">
         <element name="Artist" type="CT_NameType"/>
         <element name="Author" type="CT_NameOrCorporateType"/>
         <element name="BookAuthor" type="CT_NameType"/>
         <element name="Compiler" type="CT_NameType"/>
         <element name="Composer" type="CT_NameType"/>
         <element name="Conductor" type="CT_NameType"/>
         <element name="Counsel" type="CT_NameType"/>
         <element name="Director" type="CT_NameType"/>
         <element name="Editor" type="CT_NameType"/>
         <element name="Interviewee" type="CT_NameType"/>
         <element name="Interviewer" type="CT_NameType"/>
         <element name="Inventor" type="CT_NameType"/>
         <element name="Performer" type="CT_NameOrCorporateType"/>
         <element name="ProducerName" type="CT_NameType"/>
         <element name="Translator" type="CT_NameType"/>
         <element name="Writer" type="CT_NameType"/>
      </choice>
   </sequence>
</complexType>
```

7.6.2.6 BookAuthor (Book Author)

This element specifies the author of a book, when the primary author has authored the book section. For example, if person X writes a chapter in a book by person Y, person X is the Author and person Y is the BookAuthor. [*Example*:

```
<b:Author>
  <b:BookAuthor>
    <b:NameList>
      <b:Person>
        <b:Last>Rothschiller</b:Last>
        <b:First>Chad</b:First>
      </b:Person>
    </b:NameList>
  </b:BookAuthor>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.7 BookTitle (Book Title)

This element specifies the title of a book, when the source is a book section. In this case, the title of the book section is the primary title. For example, if X is the title of a chapter in a book entitled , X is the Title and Y is the BookTitle. [*Example*:

```
    …
    <b:Year>1992</b:Year>
    <b:City>Paris</b:City>
    <b:Publisher>Publisher</b:Publisher>
    <b:Pages>51-84</b:Pages>
    <b:Comments>Comments</b:Comments>
    <b:BookTitle>Book Title</b:BookTitle>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.8 Broadcaster (Broadcaster)

This element specifies the broadcaster of a source. Typically, this field is used in the Interview source type. [*Example*:

```
    …
    <b:ProgramTitle>Program Title</b:ProgramTitle>
    <b:Broadcaster>Broadcaster</b:Broadcaster>
    <b:Station>Station</b:Station>
    <b:RefOrder>1</b:RefOrder>
    <b:Title>Title (Interview)</b:Title>
    <b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
    <b:StateProvince>State or Province</b:StateProvince>
    <b:CountryRegion>Country or Region</b:CountryRegion>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.9 BroadcastTitle (Broadcast Title)

This element specifies the broadcast title of a source. Typically, this field is used in the Interview source type. [*Example*:

```
    …
    <b:ProgramTitle>Program Title</b:ProgramTitle>
    <b:Broadcaster>Broadcaster</b:Broadcaster>
    <b:Station>Station</b:Station>
    <b:RefOrder>1</b:RefOrder>
    <b:Title>Title (Interview)</b:Title>
    <b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
    <b:StateProvince>State/Province</b:StateProvince>
    <b:CountryRegion>Country/Region</b:CountryRegion>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.10 CaseNumber (Case Number)

This element specifies the case number of a source. Typically, this field is used in the Case source type. [*Example*:

```
…
<b:Title>Title (Case)</b:Title>
<b:Year>Year</b:Year>
<b:City>Place Published</b:City>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:CaseNumber>Case Number</b:CaseNumber>
<b:Court>Court</b:Court>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.11 ChapterNumber (Chapter Number)

This element specifies the number or index of the chapter being referenced. [*Example*:

```
…
<b:BookTitle>Title</b:BookTitle>
<b:Pages>23-65</b:Pages>
<b:Comments>Comments</b:Comments>
<b:ChapterNumber>6</b:ChapterNumber>
<b:RefOrder>1</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.12 City (City)

This element specifies the city in which the source was published, printed, or manufactured. [*Example*:

```
…
<b:Title>Title</b:Title>
<b:Year>1997</b:Year>
<b:City>London</b:City>
<b:Publisher>Publihser</b:Publisher>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.13 Comments (Comments)

This element specifies any additional comments about the source. The documentation style determines whether the comments appear in the bibliography. [*Example*:

```
…
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Comments>Comments</b:Comments>
<b:RefOrder>2</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.14 Compiler (Compiler)

This element specifies the person who compiled the information in a source. [*Example*:

```
<b:Author>
  <b:Compiler>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Compiler>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.15 Composer (Composer)

This element specifies the composer of a sound recording. [*Example*:

```
<b:Author>
  <b:Composer>
    <b:NameList>
      <b:Person>
        <b:Last>Davis</b:Last>
        <b:First>Tristan</b:First>
      </b:Person>
    </b:NameList>
  </b:Composer>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.16 Conductor (Conductor)

This element specifies the conductor of a source. Typically, this field is used in the sound recording source type. [*Example*:

```
<b:Author>
  <b:Conductor>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Conductor>
</b:Author>
```

end example]

Parent Elements

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.17 ConferenceName (Conference or Proceedings Name)

This element specifies the title of the proceedings from a conference. [*Example*:

```
…
<b:Comments>Comments</b:Comments>
<b:ConferenceName>Conference Name</b:ConferenceName>
<b:RefOrder>9</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.18 Corporate (Corporate Author)

This element specifies the corporate author, performer, or any field that can be a name. The element is used when an organization, rather than a person, is used. [*Example*:

```
<b:Author>
  <b:Author>
    <b:Corporate>Corporate Author</b:Corporate>
  </b:Author>
</b:Author>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements

Parent Elements
Author (§7.6.2.4); Performer (§7.6.2.48)

7.6.2.19 Counsel (Counsel)

This element specifies the counsel, attorney, or attorneys in a case.

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.20 CountryRegion (Country or Region)

This element specifies the country or region of a source. [*Example*:

```
…
  <b:ProgramTitle>Program Title</b:ProgramTitle>
  <b:Broadcaster>Broadcaster</b:Broadcaster>
  <b:Station>Station</b:Station>
  <b:RefOrder>1</b:RefOrder>
  <b:Title>Title (Interview)</b:Title>
  <b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
  <b:StateProvince>State or Province</b:StateProvince>
  <b:CountryRegion>Country or Region</b:CountryRegion>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.21 Court (Court)

This element specifies the court in which the case was presented. [*Example*:

```
…
<b:Year>1972</b:Year>
<b:CaseNumber>339 1018</b:CaseNumber>
<b:Court>Supreme Court</b:Court>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.22 Day (Day)

This element specifies the day on which a source was created or published. [*Example*:

```
…
<b:PeriodicalTitle>Periodical Title</b:PeriodicalTitle>
<b:Month>November</b:Month>
<b:Day>10</b:Day>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.23 DayAccessed (Day Accessed)

This element specifies the day of the month a source was accessed. [*Example*:

```
<b:MonthAccessed>October</b:MonthAccessed>
<b:DayAccessed>5</b:DayAccessed>
<b:YearAccessed>2000</b:YearAccessed>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.24 Department (Department)

This element specifies the department in which a source originated, or to which a source was submitted. Typically, this field is used in the Report source type, which includes theses and dissertations. [*Example*:

```
…
<b:Institution>Harvard University</b:Institution>
<b:ThesisType>Doctoral Dissertation</b:ThesisType>
<b:Department>Department of Mathematics</b:Department>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.25 Director (Director)

This element specifies the director of a source. Typically, this field is used in the Film source type. [*Example*:

```
<b:Author>
  <b:Director>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Director>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
    <sequence>
        <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
    </sequence>
</complexType>
```

7.6.2.26 Distributor (Distributor)

This element specifies the distributor of a source. Typically, this field is used in the Performance and Film source types. [*Example*:

```
…
<b:Distributor>Distributor</b:Distributor>
<b:Country>United States</b:Country>
<b:RefOrder>19</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.27 Edition (Editor)

This element specifies the edition of a source. [*Example*:

```
…
<b:Pages>1-34</b:Pages>
<b:Edition>Edition</b:Edition>
<b:Issue>Issue</b:Issue>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.28 Editor (Editor)

This element specifies the editor of a source. [*Example*:

```
<b:Author>
      <b:Editor>
        <b:NameList>
          <b:Person>
            <b:Last>Jaeschke</b:Last>
            <b:First>Rex</b:First>
          </b:Person>
        </b:NameList>
      </b:Editor>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.29 First (Person's First, or Given, Name)

This element specifies a person's first name. [*Example*:

```
<b:Author>
  <b:Editor>
    <b:NameList>
      <b:Person>
        <b:Last>Jaeschke</b:Last>
        <b:First>Rex</b:First>
      </b:Person>
    </b:NameList>
  </b:Editor>
</b:Author>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Person (§7.6.2.50)

7.6.2.30 Guid (GUID)

This element specifies the GUID of a source. [*Example*:

```
…
  <b:RefOrder>2</b:RefOrder>
  <b:Guid>{EE06CBFE-1989-4533-A274-D81DFA436D79}</b:Guid>
  <b:LCID>0</b:LCID>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.31 Institution (Institution)

This element specifies the institution of the source. Typically, this field is used in the Report source type, where it signifies the university or institute, and in the Art source type, where it signifies the museum or institution where the art is housed. [*Example*:

```
…
  <b:Institution>Harvard University</b:Institution>
  <b:ThesisType>Dissertation</b:ThesisType>
  <b:RefOrder>12</b:RefOrder>
  <b:Guid>{6CB80970-81D3-476D-90D5-5C9D64E77FAF}</b:Guid>
  <b:LCID>0</b:LCID>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.32 InternetSiteTitle (Internet Site Title)

This element specifies the title of an internet site. Typically, this field is used in the Internet Site and Document from Internet Site source types. [*Example*:

```
…
<b:Title>Title</b:Title>
<b:InternetSiteTitle>Internet Site Title</b:InternetSiteTitle>
<b:Month>July</b:Month>
<b:Day>1</b:Day>
<b:Year>2001</b:Year>
<b:MonthAccessed>Sept.</b:MonthAccessed>
<b:DayAccessed>22</b:DayAccessed>
<b:YearAccessed>1999</b:YearAccessed>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.33 Interviewee (Interviewee)

This element specifies the person being interviewed. Typically, this field is used in the Interview source type.

[*Example*:

```
<b:Interviewee>
  <b:NameList>
    <b:Person>
      <b:Last>Rothschiller</b:Last>
      <b:First>Chad</b:First>
    </b:Person>
  </b:NameList>
</b:Interviewee>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.34 Interviewer (Interviewer)

This element specifies the person conducting an interview. Typically, this field is used in the Interview source type. [*Example*:

```
<b:Interviewer>
  <b:NameList>
    <b:Person>
      <b:Last>Davis</b:Last>
      <b:First>Tristan</b:First>
     </b:Person>
  </b:NameList>
</b:Interviewer>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.35 Inventor (Inventor)

This element specifies the inventor of a source. Typically, this field is used in the Patent source type. [*Example*:

```
<b:Author>
  <b:Inventor>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Inventor>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.36 Issue (Issue)

This element specifies the issue of a source. Typically, this field is used in the Journal Article and Article in Periodical source types. [*Example*:

```
…
  <b:Edition>Edition</b:Edition>
  <b:Issue>Issue</b:Issue>
  <b:RefOrder>28</b:RefOrder>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.37 JournalName (Journal Name)

This element specifies the name of the journal. Typically, this field is used in the Journal Article source type. [*Example*:

```
…
<b:Title>Article Title</b:Title>
<b:Year>2000</b:Year>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>100</b:Volume>
<b:Comments>Comments</b:Comments>
<b:JournalName>Journal Name</b:JournalName>
<b:Pages>91-160</b:Pages>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.38 Last (Person's Last, or Family, Name)

This element specifies a person's last name. [*Example*:

```
<b:Author>
  <b:Editor>
    <b:NameList>
      <b:Person>
        <b:Last>Jaeschke</b:Last>
        <b:First>Tristan</b:First>
      </b:Person>
    </b:NameList>
  </b:Editor>
</b:Author>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Person (§7.6.2.50)

7.6.2.39 LCID (Locale ID)

This element specifies the locale ID of a source, representing the source's language. The set of locale IDs shall be as specified in §2.18.52. [*Example*:

```
    …
    <b:RefOrder>2</b:RefOrder>
    <b:Guid>{EE06CBFE-1989-4533-A274-D81DFA436D79}</b:Guid>
    <b:LCID>0</b:LCID>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.40 Medium (Medium)

This element specifies the medium on or in which a source was created. Typically, this field is used in the Electronic source, sound recording, and film source types. [*Example*:

```
  <b:Source>
    …
    <b:LCID>0</b:LCID>
    <b:Medium>DVD</b:Medium>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.41 Middle (Person's Middle, or Other, Name)

This element specifies a person's middle name. [*Example*:

```
<b:Author>
  <b:Editor>
    <b:NameList>
      <b:Person>
        <b:Last>Villaron</b:Last>
        <b:First>Shawn</b:First>
        <b:Middle>Alan</b:Middle>
      </b:Person>
    </b:NameList>
  </b:Editor>
</b:Author>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Person (§7.6.2.50)

7.6.2.42 Month (Month)

This element specifies the month in which a source was created or published. [*Example*:

```
…
<b:PeriodicalTitle>Time</b:PeriodicalTitle>
<b:Month>November</b:Month>
<b:Day>10</b:Day>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.43 MonthAccessed (Month Accessed)

This element specifies the month during which the source was accessed. [*Example*:

```
…
<b:MonthAccessed>October</b:MonthAccessed>
<b:DayAccessed>5</b:DayAccessed>
<b:YearAccessed>2000</b:YearAccessed>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.44 NameList (Name List)

This element specifies a list containing one or more names of a type of contributor to a source, such as a list of authors, editors, or translators. [*Example*:

```
<b:Author>
  <b:Author>
    <b:NameList>
      <b:Person>
        <b:Last>Davis</b:Last>
        <b:First>Tristan</b:First>
      </b:Person>
    </b:NameList>
  </b:Author>
</b:Author>
```

end example]

Parent Elements
Artist (§7.6.2.3); Author (§7.6.2.4); BookAuthor (§7.6.2.6); Compiler (§7.6.2.14); Composer (§7.6.2.15); Conductor (§7.6.2.16); Counsel (§7.6.2.19); Director (§7.6.2.25); Editor (§7.6.2.28); Interviewee (§7.6.2.33); Interviewer (§7.6.2.34); Inventor (§7.6.2.35); Performer (§7.6.2.48); ProducerName (§7.6.2.51); Translator (§7.6.2.69); Writer (§7.6.2.74)

Child Elements	Subclause
Person (Person)	§7.6.2.50

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameListType">
   <sequence>
      <element name="Person" type="CT_PersonType" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

7.6.2.45 NumberVolumes (Number of Volumes)

This element specifies the number of volumes a source contains. [*Example*:

```
…
  <b:NumberVolumes>10</b:NumberVolumes>
  <b:Comments>Comments</b:Comments>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.46 Pages (Pages)

This element specifies the page range being cited in a source. [*Example*:

```
…
<b:Title>Article Title</b:Title>
<b:Year>2000</b:Year>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>100</b:Volume>
<b:Comments>Comments</b:Comments>
<b:JournalName>Journal Name</b:JournalName>
<b:Pages>91-160</b:Pages>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.47 PatentNumber (Patent Number)

This element specifies the patent number of a source. Typically, this field is used in the Patent source type. [*Example*:

```
<b:Source>
  …
  <b:PatentNumber>1,000,000</b:PatentNumber>
  <b:RefOrder>26</b:RefOrder>
  <b:Guid>{8295ABC5-2DFD-4FA7-A2A7-A748917C1755}</b:Guid>
  <b:LCID>0</b:LCID>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.48 Performer (Performer)

This element specifies the performer. Typically, this field is used in the sound recording, performance, and film source types. [*Example*:

```
<b:Performer>
  <b:NameList>
    <b:Person>
      <b:Last>Rothschiller</b:Last>
      <b:First>Chad</b:First>
    </b:Person>
  </b:NameList>
</b:Performer>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
Corporate (Corporate Author)	§7.6.2.18
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameOrCorporateType">
   <sequence>
      <choice minOccurs="0" maxOccurs="1">
         <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
         <element name="Corporate" minOccurs="1" maxOccurs="1" type="ST_String255"/>
      </choice>
   </sequence>
</complexType>
```

7.6.2.49 PeriodicalTitle (Periodical Title)

This element specifies the title of a periodical. [*Example*:

```
…
<b:PeriodicalTitle>Periodical Title</b:PeriodicalTitle>
<b:Month>July</b:Month>
<b:Day>1</b:Day>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.50 Person (Person)

This element specifies a person who contributed to a source. [*Example*:

```
<b:Author>
  <b:NameList>
    <b:Person>
      <b:Last>Villaron</b:Last>
      <b:First>Shawn</b:First>
      <b:Middle>Alan</b:Middle>
    </b:Person>
  </b:NameList>
</b:Author>
```

end example]

Parent Elements
NameList (§7.6.2.44)

Child Elements	Subclause
First (Person's First, or Given, Name)	§7.6.2.29
Last (Person's Last, or Family, Name)	§7.6.2.38
Middle (Person's Middle, or Other, Name)	§7.6.2.41

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PersonType">
   <sequence>
      <element name="Last" type="ST_String255" minOccurs="0" maxOccurs="unbounded"/>
      <element name="First" type="ST_String255" minOccurs="0" maxOccurs="unbounded"/>
      <element name="Middle" type="ST_String255" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

7.6.2.51 ProducerName (Producer Name)

This element specifies the person who produced a source. Typically, this field is used in the Internet site, Doc from internet site, Electronic source, Sound recording, Performance, and Film source types. [*Example*:

```
<b:ProducerName>
  <b:NameList>
    <b:Person>
      <b:Last>Rothschiller</b:Last>
      <b:First>Chad</b:First>
    </b:Person>
  </b:NameList>
</b:ProducerName>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.52 ProductionCompany (Production Company)

This element specifies the company that produced a source. Typically, this field is used in the Internet site, Document from internet site, Electronic source, Sound recording, Performance, and Film source types. [*Example*:

```
…
  <b:City>Chicago</b:City>
  <b:ProductionCompany>Production Company</b:ProductionCompany>
  <b:Medium>CD</b:Medium>
  <b:RefOrder>16</b:RefOrder>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements

Parent Elements
Source (§7.6.2.59)

7.6.2.53 PublicationTitle (Publication Title)

This element specifies the title of the publication that contains the source. Typically, this field is used in the Electronic Source source type. [*Example*:

```
…
<b:Volume>Volume</b:Volume>
<b:PublicationTitle>Publication Title</b:PublicationTitle>
<b:Month>June</b:Month>
<b:Day>2</b:Day>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.54 Publisher (Publisher)

This element specifies the publisher of a source.

```
…
<b:City>London</b:City>
<b:Publisher>Publisher</b:Publisher>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>Volume</b:Volume>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.55 RecordingNumber (Recording Number)

This element specifies the recording number of a source. Typically, this field is used in the sound recording source type.

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements

Parent Elements
Source (§7.6.2.59)

7.6.2.56 RefOrder (Reference Order)

This element specifies the reference order of a source. [*Example*:

```
…
  <b:City>Chicago</b:City>
  <b:ProductionCompany>Production Company</b:ProductionCompany>
  <b:Medium>CD</b:Medium>
  <b:RefOrder>16</b:RefOrder>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.57 Reporter (Reporter)

This element specifies the reporter of a source. Typically, this field is used in the Case source type. [*Example*:

```
…
  <b:Reporter>Reporter</b:Reporter>
  <b:RefOrder>27</b:RefOrder>
  <b:Guid>{CE314AB7-E824-4D10-B295-044C68EBED27}</b:Guid>
  <b:LCID>0</b:LCID>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.58 ShortTitle (Short Title)

This element specifies the short title of a source. [*Example*:

```
…
<b:City>London</b:City>
<b:Publisher>Publisher</b:Publisher>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>Volume</b:Volume>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.59 Source (Source)

This element specifies the bibliography entry for a source or reference work. [*Example*:

```
…
  <b:NumberVolumes>10</b:NumberVolumes>
  <b:Comments>Comments</b:Comments>
</b:Source>
```

end example]

7.6.2.60 Sources (Sources)

This element specifies the sources in a collection.

Parent Elements
Root element of Shared Bibliography part

Child Elements	Subclause
Source (Source)	§7.6.2.59

Attributes	Description
SelectedStyle (Selected Style)	Specifies the filename of a file which may be used to format the bibliographies and citations within this document. If this file is of an unknown form or cannot be located, then the other attributes on this element may be used to determine the format to use. [*Example*: `<b:Sources SelectedStyle="\APA.XSL" StyleName="APA" URI="http://schemas.openxmlformats.org/bibliographicStyle/APA">` *end example*] The possible values for this attribute are defined by the ST_String255 simple type (§7.6.3.2).
StyleName (Documentation Style Name)	Specifies the name of the documentation style in which the bibliography and citations are formatted. The following values shall be well-defined: **Value** / **Reference** APA — American Psychological Association. http://www.apa.org/. Publication Manual of the American Psychological Association, Fifth Edition. Chicago — Chicago Manual of Style, 15th Edition GB7714: GB7714-1987, Standardization Administration of China,

</table>

Attributes	Description
	The possible values for this attribute are defined by the ST_String255 simple type (§7.6.3.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Sources">
   <sequence>
      <element name="Source" type="CT_SourceType" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="SelectedStyle" type="ST_String255"/>
   <attribute name="StyleName" type="ST_String255"/>
   <attribute name="URI" type="ST_String255"/>
</complexType>
```

7.6.2.61 SourceType (Source Type)

This element specifies the type of source being cited.

The possible values for this element are defined by the ST_SourceType simple type (§7.6.3.1).

Parent Elements
Source (§7.6.2.59)

7.6.2.62 StandardNumber (Standard Number)

This element specifies the standard number, such as ISBN or ISSN, of a source. [*Example*:

```
…
  <b:NumberVolumes>10</b:NumberVolumes>
  <b:StandardNumber>ISBN or ISSN</b:StandardNumber>
  <b:Comments>Comments</b:Comments>
</b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.63 StateProvince (State or Province)

This element specifies the state or province in which a source was created or published. [*Example*:

```
…
  <b:ProgramTitle>Program Title</b:ProgramTitle>
  <b:Broadcaster>Broadcaster</b:Broadcaster>
  <b:Station>Station</b:Station>
  <b:RefOrder>1</b:RefOrder>
```

```
    <b:Title>Title (Interview)</b:Title>
    <b:BroadcastTitle>Broadcast Title</b:BroadcastTitle>
    <b:StateProvince>State/Province</b:StateProvince>
    <b:CountryRegion>Country/Region</b:CountryRegion>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.64 Station (Station)

This element specifies the station on which an interview was broadcasted. Typically, this field is used in the Interview source type. [*Example*:

```
  …
  <b:Month>November</b:Month>
  <b:Day>18</b:Day>
  <b:Broadcaster>ABC</b:Broadcaster>
  <b:Station>WABC</b:Station>
  …
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.65 Tag (Tag)

This element specifies the tag name of a source. [*Example*:

```
  <b:Source>
    <b:Tag>New01</b:Tag>
    …
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.66 Theater (Theater)

This element specifies the theater in which a source was performed or viewed. Typically, this field is used in the Performer source type. [*Example*:

```
…
<b:Theater>Theater Name</b:Theater>
<b:Month>October</b:Month>
<b:Day>25</b:Day>
<b:RefOrder>19</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.67 ThesisType (Thesis Type)

This element specifies the type of report being cited, such as Thesis, Dissertation, or Book Report. Typically, this field is used in the Report source type. [*Example*:

```
…
<b:Institution>Harvard University</b:Institution>
<b:ThesisType>Doctoral Dissertation</b:ThesisType>
<b:Department>Department of Mathematics</b:Department>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.68 Title (Title)

This element specifies the title of a source. [*Example*:

```
…
</b:Author>
<b:Title>Title</b:Title>
<b:Year>2005</b:Year>
<b:City>Seattle</b:City>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.69 Translator (Translator)

This element specifies the translator of a source. [*Example*:

```
<b:Author>
  <b:Translator>
    <b:NameList>
      <b:Person>
        <b:Last>Davis</b:Last>
        <b:First>Tristan</b:First>
      </b:Person>
    </b:NameList>
  </b:Translator>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.70 Type (Type)

This element specifies the type of patent. Typically, this field is used in the Patent source type.

[*Example*:

```
    <b:Type>Patent Type</b:Type>
    <b:Guid>{8295ABC5-2DFD-4FA7-A2A7-A748917C1755}</b:Guid>
    <b:LCID>0</b:LCID>
  </Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.71 URL (URL)

This element specifies the URL of the source. Typically, this field is used in the Internet Site and Document from Internet Site source types. [*Example*:

```
…
<b:MonthAccessed>September</b:MonthAccessed>
<b:DayAccessed>1</b:DayAccessed>
<b:YearAccessed>1998</b:YearAccessed>
<b:URL>URL</b:URL>
<b:RefOrder>29</b:RefOrder>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.72 Version (Version)

This element specifies the version of the source. Typically, this field is used in the Internet Site and Document from Internet Site source types. [*Example*:

```
…
    <b:Version>3.0</b:Version>
    <b:RefOrder>31</b:RefOrder>
    <b:Guid>{F06D8D48-7FD7-4515-88E9-EC70AB9BE792}</b:Guid>
    <b:LCID>0</b:LCID>
  </b:Source>
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.73 Volume (Volume)

This element specifies the volume of the source. [*Example*:

```
…
<b:Title>Article Title</b:Title>
<b:Year>2000</b:Year>
<b:ShortTitle>Short Title</b:ShortTitle>
<b:Volume>100</b:Volume>
<b:Comments>Comments</b:Comments>
<b:JournalName>Journal Name</b:JournalName>
<b:Pages>91-160</b:Pages>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.74 Writer (Writer)

This element specifies the writer of the source. Typically, this field is used in the Performance and Film source types. [*Example*:

```
<b:Author>
  <b:Writer>
    <b:NameList>
      <b:Person>
        <b:Last>Jones</b:Last>
        <b:First>Brian</b:First>
      </b:Person>
    </b:NameList>
  </b:Writer>
</b:Author>
```

end example]

Parent Elements
Author (§7.6.2.5)

Child Elements	Subclause
NameList (Name List)	§7.6.2.44

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NameType">
   <sequence>
      <element name="NameList" type="CT_NameListType" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

7.6.2.75 Year (Year)

This element specifies the year in which a source was created or published.

[*Example*:

```
…
<b:Title>Title</b:Title>
<b:InternetSiteTitle>Internet Site Title</b:InternetSiteTitle>
<b:Month>July</b:Month>
<b:Day>1</b:Day>
<b:Year>2001</b:Year>
<b:MonthAccessed>Sept.</b:MonthAccessed>
<b:DayAccessed>22</b:DayAccessed>
<b:YearAccessed>1999</b:YearAccessed>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.2.76 YearAccessed (Year Accessed)

This element specifies the month during which the source was accessed. [*Example*:

```
…
<b:Title>Title</b:Title>
<b:InternetSiteTitle>Internet Site Title</b:InternetSiteTitle>
<b:Month>July</b:Month>
<b:Day>1</b:Day>
<b:Year>2001</b:Year>
<b:MonthAccessed>Sept.</b:MonthAccessed>
<b:DayAccessed>22</b:DayAccessed>
<b:YearAccessed>1999</b:YearAccessed>
…
```

end example]

The possible values for this element are defined by the ST_String255 simple type (§7.6.3.2).

Parent Elements
Source (§7.6.2.59)

7.6.3 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/officeDocument/2006/bibliography namespace.

7.6.3.1 ST_SourceType (Bibliographic Data Source Types)

This simple type specifies the possible types of sources that may be used within bibliographic data in an Office Open XML document.

[*Note:* The Office Open XML formats support a collection of predefined source types based on the categories most commonly used in various citation and bibliography style guidelines . The set of predefined source types can be extended as needed. The recommended approach for extending this set is to use the `Misc` type, and then leverage the methods described in Part 5 of this standard for extending the format with new attributes or elements. *end note.*]

This simple type's contents are a restriction of the ST_String255 simple type (§7.6.3.2).

The following are possible enumeration values for this type:

Enumeration Value	Description
Art (Art)	Art
ArticleInAPeriodical (Article in a Periodical)	Article in a Periodical
Book (Book)	Book
BookSection (Book Section)	Book Section
Case (Case)	Case
ConferenceProceedings (Conference Proceedings)	Conference Proceedings

Enumeration Value	Description
DocumentFromInternetSite (Document from Internet Site)	Document from Internet Site
ElectronicSource (Electronic Source)	Electronic Source
Film (Film)	Film
InternetSite (Internet Site)	Internet Site
Interview (Interview)	Interview
JournalArticle (Journal Article)	Journal Article
Misc (Miscellaneous)	Miscellaneous
Patent (Patent)	Patent
Performance (Performance)	Performance
Report (Reporter)	Report
SoundRecording (Sound Recording)	Sound Recording

Referenced By
SourceType (§7.6.2.61)

7.6.3.2 ST_String255 (String Value)

String whose maximum length is 255 characters.

This simple type's contents are a restriction of the XML Schema string datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a minimum length of 0 characters.
- This simple type's contents have a maximum length of 255 characters.

Referenced By
AbbreviatedCaseNumber (§7.6.2.1); AlbumTitle (§7.6.2.2); BookTitle (§7.6.2.7); Broadcaster (§7.6.2.8); BroadcastTitle (§7.6.2.9); CaseNumber (§7.6.2.10); ChapterNumber (§7.6.2.11); City (§7.6.2.12); Comments (§7.6.2.13); ConferenceName (§7.6.2.17); Corporate (§7.6.2.18); CountryRegion (§7.6.2.20); Court (§7.6.2.21); Day (§7.6.2.22); DayAccessed (§7.6.2.23); Department (§7.6.2.24); Distributor (§7.6.2.26); Edition (§7.6.2.27); First (§7.6.2.29); Guid (§7.6.2.30); Institution (§7.6.2.31); InternetSiteTitle (§7.6.2.32); Issue (§7.6.2.36); JournalName (§7.6.2.37); Last (§7.6.2.38); LCID (§7.6.2.39); Medium (§7.6.2.40); Middle (§7.6.2.41); Month (§7.6.2.42); MonthAccessed (§7.6.2.43); NumberVolumes (§7.6.2.45); Pages (§7.6.2.46); PatentNumber (§7.6.2.47); PeriodicalTitle (§7.6.2.49); ProductionCompany (§7.6.2.52); PublicationTitle (§7.6.2.53); Publisher (§7.6.2.54); RecordingNumber (§7.6.2.55); RefOrder (§7.6.2.56); Reporter (§7.6.2.57); ShortTitle (§7.6.2.58); Sources@SelectedStyle (§7.6.2.60); Sources@StyleName (§7.6.2.60); Sources@URI (§7.6.2.60); ST_SourceType (§7.6.3.1); StandardNumber (§7.6.2.62); StateProvince (§7.6.2.63); Station (§7.6.2.64); Tag (§7.6.2.65); Theater (§7.6.2.66); ThesisType (§7.6.2.67); Title (§7.6.2.68); Type (§7.6.2.70); URL (§7.6.2.71); Version (§7.6.2.72); Volume (§7.6.2.73); Year (§7.6.2.75); YearAccessed (§7.6.2.76)

7.7 Additional Characteristics

In order to allow producers of Office Open XML to describe specific contextual conditions under which the document was created, additional characteristics can be provided within the Additional Characteristics part using the syntax defined below.

The set of additional characteristics is designed to be an extensible list, and can provide a consumer with more information on how to interpret the file. This Standard defines one set of characteristics; however, additional grammars can be created and associated with a unique URI via the vocabulary attribute.

7.7.1 Table of Contents

This subclause is informative.

End of informative text.

7.7.2 Elements

The following elements define the contents of the Additional Characteristics schema:

7.7.2.1 additionalCharacteristics (Set of Additional Characteristics)

This element is the root element of the Additional Characteristics part and contains the list of additional characteristics for an Office Open XML document.

[*Example:* The following content in an Additional Characteristics part would specify that the producing spreadsheet application supports from 0 to 10,000 columns, and that column ranges should be interpreted accordingly:

```
<additionalCharacteristics>
  <characteristic name="numColumns" relation="le" val="10000"/>
  <characteristic name="numColumns" relation="ge" val="0"/>
</additionalCharacteristics>
```

end example]

Parent Elements
Root element of Shared Additional Characteristics part

Child Elements	Subclause
characteristic (Single Characteristic)	§7.7.2.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AdditionalCharacteristics">
   <sequence>
      <element name="characteristic" type="CT_Characteristic" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

7.7.2.2 characteristic (Single Characteristic)

This element specifies a single characteristic. The type of characteristic is defined by the name attribute.

[*Example:* A producer can inform the consumer that the computations used to calculate the stored numbers in the formulas belong to a value space expressed by ranges of the binary mantissa and exponent. A consumer can optionally check those characteristics to determine whether, for example, the values should be recalculated. The XML for this would be:

```
<additionalCharacteristics>
  <characteristic name='precisionMantissa' relation='gt'
     val='-9007199254740992'/>
  <characteristic name='precisionMantissa' relation='lt'
     val='9007199254740992'/>
  <characteristic name='precisionExponent' relation='ge' val='-1075'/>
  <characteristic name='precisionExponent' relation='le' val='970'/>
</additionalCharacteristics>
```

end example]

Parent Elements
additionalCharacteristics (§7.7.2.1)

Attributes	Description
name (Name of Characteristic)	Specifies the name of the characteristic. There are no constraints on the value of the name attribute, but each name shall be associated with a specific vocabulary via the vocabulary attribute. The values defined by this Standard shall be associated with a null vocabulary value, and are as follows: **Name Value** / **Property Specified** numColumns / Number of Columns supported by the spreadsheet producer.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>
<table>
<tr><td>numRows</td><td>Number of Rows supported by the spreadsheet producer.</td></tr>
<tr><td>functionVersion</td><td>Version of the function specification used</td></tr>
<tr><td>precisionMantissa</td><td>Allowed values of the mantissa of numbers within spreadsheet cells/formulas when expressed in base 2.</td></tr>
<tr><td>precisionExponent</td><td>Allowed values of the exponent of numbers within spreadsheet cells/formulas when expressed in base 2.</td></tr>
<tr><td>numWorkbookColors</td><td>Number of Workbook colors</td></tr>
<tr><td>numConditionalFormatConditions</td><td>Number of condition format conditions on a workbook cell</td></tr>
<tr><td>nummaxSortLevels</td><td>Number of level of sorting on a range or table</td></tr>
<tr><td>numAutoFilterItems</td><td>Number of items shown in the Auto-filter dropdown</td></tr>
<tr><td>numDisplayCellChars</td><td>Number of characters that can display in a cell</td></tr>
<tr><td>numPrintCellChars</td><td>Number of characters per cell that Excel can print</td></tr>
<tr><td>numUnqiueCellStyles</td><td>Number of unique cell styles in a workbook (combinations of all cell formatting)</td></tr>
<tr><td>numFormulaLengthChars</td><td>Length of formulas in characters</td></tr>
<tr><td>numFormulaNestingLevel</td><td>Number of levels of formula nesting</td></tr>
<tr><td>numFunctionArguments</td><td>Number of arguments to a function</td></tr>
<tr><td>numPivotTableRows</td><td>Number of rows in a pivot table</td></tr>
<tr><td>numPivotTableColumns</td><td>Number of columns in a pivot table</td></tr>
<tr><td>numUniquePivotFieldItems</td><td>Number of unique items in a pivot field</td></tr>
<tr><td>numPivotTableMDXNameChars</td><td>Number of characters in a MDX name for a pivot table item</td></tr>
<tr><td>numPivotTableRelationChars</td><td>String length for a relationship pivot table</td></tr>
<tr><td>numPivotTableFieldLabelChars</td><td>Length of field labels in PivotTable including caption length limitations</td></tr>
<tr><td>numPivotTableFields</td><td>Number of fields in a pivot table</td></tr>
<tr><td>numSheetXRefArrayFormulas</td><td>The number of array formulas in a worksheet that can refer to another (given) worksheet</td></tr>
</table>

The possible values for this attribute are defined by the XML Schema string datatype.
</td></tr>
<tr><td>relation (Relationship of Value to Name)</td><td>Specifies how the contents of the value attribute should be interpreted in the context of this characteristic.</td></tr>
</table>

Attributes	Description

	[*Example:* The following would specify that the application supports from 0 to 10,000 columns, and that column ranges should be interpreted accordingly:
	
	`<additionalCharacteristics>`
	`  <characteristic name="numColumns" relation="le" val="10000"/>`
	`  <characteristic name="numColumns" relation="ge" val="0"/>`
	`</additionalCharacteristics>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Relation simple type (§7.7.3.1).

val (Characteristic Value)	Specifies the value of the characteristic. The possible values for this attribute are defined by the XML Schema string datatype.
vocabulary (Characteristic Grammar)	Specifies a URI defining the characteristic grammar with which the name attribute value shall be interpreted. If this attribute is omitted, then the default grammar (as defined above) shall be used. The possible values for this attribute are defined by the XML Schema anyURI datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Characteristic">
   <attribute name="name" type="xsd:string" use="required"/>
   <attribute name="relation" type="ST_Relation" use="required"/>
   <attribute name="val" type="xsd:string" use="required"/>
   <attribute name="vocabulary" type="xsd:anyURI" use="optional"/>
</complexType>
```

7.7.3 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/officeDocument/2006/characteristics namespace.

7.7.3.1 ST_Relation (Characteristic Relationship Types)

This simple type specifies the possible relationships between a characteristic's name and value attributes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
eq (Equal To)	Equal to.
ge (Greater Than or Equal to)	Greater than or equal to.

Enumeration Value	Description
gt (Greater Than)	Greater than.
le (Less Than or Equal To)	Less than or equal to.
lt (Less Than)	Less than.

Referenced By
characteristic@relation (§7.7.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Relation">
   <restriction base="xsd:string">
      <enumeration value="ge"/>
      <enumeration value="le"/>
      <enumeration value="gt"/>
      <enumeration value="lt"/>
      <enumeration value="eq"/>
   </restriction>
</simpleType>
```

7.8 Office Document Relationships

Within an Office Open XML document, it is necessary to be able to explicitly reference one part within the package from another [*Example*: A PresentationML Slide needs to be able to explicitly reference each picture within it to know where each one is anchored. *end example*]

In order to ensure that all such explicit relationship references are easily identifiable within a document, all such relationships are included within attributes in this namespace. This namespace therefore only serves to define attributes used throughout Office Open XML to create explicit relationships, and a single simple type for such attributes.

7.8.1 Table of Contents

This subclause is informative.

End of informative text.

7.8.2 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/officeDocument/2006/relationships namespace.

7.8.2.1 ST_RelationshipId (Explicit Relationship ID)

This simple type specifies the relationship ID in a part's relationship item which is the target of an explicit relationship from the parent XML element.

The type of relationship which shall be the target of the relationship specified shall be determined based on the context of the parent XML element.

[*Example*: Consider the following markup in an Office Open XML document:

```
<… r:id="rId5" />
```

The id attribute is of type ST_RelationshipID, and therefore the relationship with ID `rId5` shall be the target of an explicit relationship from the source part, based on the context of the parent XML element. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
altChunk@id (§2.17.3.1); attachedTemplate@id (§2.15.1.6); audioFile@link (§5.1.3.2); blip@embed (§5.1.10.13); blip@link (§5.1.10.13); bold@id (§4.3.1.1); boldItalic@id (§4.3.1.2); chart@id (§5.7.2.26); control@id (§2.3.3.2); control@id (§2.3.3.3); control@id (§4.4.2.1); control@id (§3.3.1.18); custData@id (§4.2.1); customPr@id (§3.3.1.20); dataRef@id (§3.3.1.28); dataSource@id (§2.14.9); drawing@id (§3.3.1.34); embedBold@id (§2.8.2.3); embedBoldItalic@id (§2.8.2.4); embedItalic@id (§2.8.2.5); embedRegular@id (§2.8.2.6); externalBook@id (§3.14.7); externalData@id (§5.7.2.63); externalReference@id (§3.2.8); fill@id (§6.1.2.5); footerReference@id (§2.10.2); handoutMasterId@id (§4.3.1.11); header@id (§3.11.1.1); headerReference@id (§2.10.5); headerSource@id (§2.14.16); hlinkClick@id (§5.1.5.3.5); hlinkHover@id (§5.1.2.1.23); hlinkMouseOver@id (§5.1.5.3.6); htmlPubPr@id (§4.3.1.13); hyperlink@id (§2.16.24); hyperlink@id (§3.3.1.44); imagedata@href (§6.1.2.11); imagedata@id (§6.1.2.11); imagedata@pict (§6.1.2.11); italic@id (§4.3.1.14); legacyDrawing@id (§3.3.1.51); legacyDrawingHF@id (§3.3.1.52); legacyDrawingHF@id (§5.7.2.93); movie@id (§2.3.3.17); notesMasterId@id (§4.3.1.18); oleLink@id (§3.14.11); oleObj@id (§4.4.2.4); oleObject@id (§3.3.1.57); OLEObject@id (§6.2.2.19); pageSetup@id (§3.3.1.62); pageSetup@id (§3.3.1.61); picture@id (§3.3.1.65); pivotCache@id (§3.2.17); pivotCacheDefinition@id (§3.10.1.67); pivotSelection@id (§3.3.1.67); printerSettings@id (§2.6.14); quickTimeFile@link (§5.1.3.4); rangeSet@id (§3.10.1.79); recipientData@id (§2.14.27); regular@id (§4.3.1.27); relIds@cs (§5.9.2.22); relIds@dm (§5.9.2.22); relIds@lo (§5.9.2.22); relIds@qs (§5.9.2.22); saveThroughXslt@id (§2.15.1.76); shape@blip (§5.9.2.27); sheet@id (§3.2.19); sld@id (§4.2.6); sld@id (§4.3.2.14); sldId@id (§4.3.1.29); sldLayoutId@id (§4.4.1.37); sldMasterId@id (§4.3.1.32); smartTags@id (§4.3.1.35); snd@embed (§4.6.68); snd@embed (§5.1.2.1.32); sndTgt@embed (§4.6.70); sourceFileName@id (§2.15.2.38); src@id (§2.14.30); stroke@id (§6.1.2.21); subDoc@id (§2.17.2.1); tablePart@id (§3.3.1.91); tags@id (§4.2.9); userShapes@id (§5.7.2.222); videoFile@link (§5.1.3.6); wavAudioFile@embed (§5.1.3.7); worksheetSource@id (§3.10.1.95)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RelationshipId">
   <restriction base="xsd:string"/>
</simpleType>
```

8. Custom XML Schema References

This namespace defines the set of properties which define the location and properties associated with one or more custom XML schemas which have been stored within the contents of a Office Open XML document. Collectively, the set of schemas associated with a document's custom XML markup are referred to as that document's *schema library*. The schema library then stores the set of unique XML namespaces used within the document's custom XML markup, and allows applications to 'tag' these namespaces with appropriate metadata.

8.1 Table of Contents

This subclause is informative.

End of informative text.

8.2 Elements

The following information describes the elements in this namespace:

8.2.1 schema (Custom XML Schema Reference)

This element specifies the properties associated with a single XML namespace, for which all known XML schemas shall be loaded in order to validate the custom XML markup stored within this document. These properties may be used appropriately to locate custom XML schema(s) for use with the document.

[*Example*: Consider a WordprocessingML document which contains custom XML markup in the http://www.contoso.com namespace. The following content would be displayed in the document's schema library data:

```
<w:schemaLibrary>
  <w:schema w:uri="http://www.contoso.com" w:schemaLocation="c:\contoso.xsd" />
</w:schemaLibrary>
```

The schema element contains the properties for this one XML namespace: in this case, a namespace URI of `http://www.contoso.com` and a file location of `c:\contoso.xsd`. *end example*]

Parent Elements
schemaLibrary (§8.2.2)

Attributes	Description

manifestLocation (Resource File Location)	Specifies the location of a resource file which should be downloaded and parsed when this document is loaded. The format and contents of this resource file are application-defined.
	
	[*Example*: Consider a WordprocessingML document which contains custom XML markup in the http://www.contoso.com namespace, which is associated with a resource file located at `http://www.contoso.com/resource.xml`. The following content would be displayed in the document's schema library data:
	
	`<w:schemaLibrary>`
	`  <w:schema w:uri="http://www.contoso.com" w:manifestLocation=`
	`"http://www.contoso.com/resource.xml" />`
	`</w:schemaLibrary>`
	
	The manifestLocation attribute contains `http://www.contoso.com/manifest.xml` which is the location of a resource file that may be downloaded for use when this namespace is used. *end example*]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

schemaLocation (Custom XML Schema Location)	Specifies the location of the XML schema file which should be downloaded and parsed when this document is loaded.
	
	[*Example*: Consider a WordprocessingML document which contains custom XML markup in the http://www.contoso.com namespace, which is defined by an XML schema located at `c:\contoso.xsd`. The following content would be displayed in the document's schema library data:
	
	`<w:schemaLibrary>`
	`  <w:schema w:uri="http://www.contoso.com" w:schemaLocation=`
	`"c:\contoso.xsd" />`
	`</w:schemaLibrary>`
	
	The schemaLocation attribute contains `c:\contoso.xsd` which is the location of the XML schema file used when this namespace is used. *end example*]
	
	The possible values for this attribute are defined by the XML Schema string datatype.

uri (Custom XML Schema Namespace)	Specifies the target namespace for the XML Schema associated with this schema reference.
	
	[*Example*: Consider the following content for custom XML namespace data:
	
	…
	`<w:schema w:uri="http://www.contoso.com/schema1" />`
	`<w:schema w:uri="http://www.contoso.com/schema2" />`
	…

Attributes	Description
	The uri attribute specifies the target namespace of each XML schema reference: • http://www.contoso.com/schema1 • http://www.contoso.com/schema2 Applications may then locate and utilize a schema for these namespaces using any means available. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Schema">
   <attribute name="uri" type="xsd:string" default=""/>
   <attribute name="manifestLocation" type="xsd:string"/>
   <attribute name="schemaLocation" type="xsd:string"/>
</complexType>
```

8.2.2 schemaLibrary (Embedded Custom XML Schema Supplementary Data)

This element specifies the set of XML namespaces which have been associated with the contents of the custom XML markup within the current Office Open XML document. Each unique namespace which is referenced within the document may be referenced within this element by a single schema element, regardless of the number of constituent XML schemas which comprise that namespace.

[*Example*: Consider a WordprocessingML document which contains custom XML markup in two distinct namespaces: the http://www.contoso.com namespace and the http://www.woodgroveBank.com namespace. If the first namespace is defined by a single XML schema, and the second is defined by five XML schemas (which are cross-referenced using the appropriate XML Schema syntax), the following content would be displayed in the document's schema library XML:

```
<w:schemaLibrary>
  <w:schema … />
  <w:schema … />
</w:schemaLibrary>
```

The schemaLibrary element contains only two schema elements even though there are six XML schemas in use, as there are only two distinct namespaces for which data is stored. *end example*]

Parent Elements
settings (§2.15.1.78)

Child Elements	Subclause
schema (Custom XML Schema Reference)	§8.2.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SchemaLibrary">
    <sequence>
        <element name="schema" type="CT_Schema" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
</complexType>
```

Annex A. Office Schemas – XML Schema

This Office Open XML specification includes a family of schemas defined using the XML Schema 1.0 syntax. The normative definitions of these schemas reside in an accompanying file named OfficeOpenXML-XMLSchema.zip, which is distributed in electronic form only.

If discrepancies exist between the electronic version of a schema and its corresponding representation as published in this part, Part 4, the electronic version is the definitive version.

Annex B. Schemas – RELAX NG

This clause is informative.

This Office Open XML specification includes a family of schemas defined using the RELAX NG syntax. The definitions of these schemas reside in an accompanying file named OfficeOpenXML-RELAXNG.zip, which is distributed in electronic form only.

If discrepancies exist between the RELAX NG version of a schema and its corresponding XML Schema, the XML Schema is the definitive version.

End of informative text.

Annex C. Additional Syntax Constraints

This clause is informative.

Although the set of XML Schemas included in Annex A specifies a majority of the requirements needed to ensure document conformance, there also exists a set of constraints that cannot easily be expressed in the XML Schema syntax (otherwise referred to as *additional syntax constraints*). These additional constraints can be deduced from the normative content of this Part, and are included in the requirements for document conformance.

The following is a sample of such constraints specified in this Part:

Subclause	Constraint
WordprocessingML Paragraphs	The caps element shall not be present with the smallCaps element on the same run, since they are mutually exclusive in terms of appearance.
WordprocessingML Headers and Footers	If the relationship type of the relationship specified by this element shall be present, have a TargetMode attribute value of `Internal`, and a Type attribute value of http://schemas.openxmlformats.org/officeDocument/2006/header.
WordprocessingML Annotations	Each "cross-structure" annotation shall have a start element whose id attribute value matches the id attribute value of the corresponding end element.
SpreadsheetML Formulas	The syntax of the value of a formula shall conform to the structure of a formula as defined in the Formulas subclause.
SpreadsheetML Styles	The xfId attribute on the cellStyles element shall specify an xf record which is present in the cellStyleXfs collection.
PresentationML Slides	Each sldId attribute in a sldLst shall have a unique value for its id attribute (within the scope of the collection).
PresentationML Slides	A customShow element specifies a range of slides (a start and end slide) in PresentationML to define the set of slides that define a slide show. There shall be slides in the presentation that have slide IDs referenced in these attributes and the start slide shall be before the end slide.
DrawingML Main	The id attribute on the stCxn and endCxn elements specifies the start and end shapes to be connected. Shapes with matching id attribute values shall exist elsewhere in the spTree.

End of informative text.

Annex D. Predefined SpreadsheetML Style Definitions

This Office Open XML specification includes the definitions of all predefined SpreadsheetML styles that are referenced by the following elements:

- cellStyle (§3.8.7)
- tableStyle (§3.8.40)

The normative SpreadsheetML markup defining these styles resides in an accompanying file named OfficeOpenXML-SpreadsheetMLStyles.zip, which is distributed in electronic form only.

Annex E. Example Predefined DrawingML Shape and Text Geometries

This clause is informative.

This Office Open XML specification includes an example definition for all predefined DrawingML shape geometries that are referenced by the following elements:

- prstGeom@prst (§5.1.11.18)
- prstTxWarp@prst (§5.1.11.19)

The informative sample DrawingML markup defining these shape and text geometries resides in an accompanying file named OfficeOpenXML-DrawingMLGeometries.zip, which is distributed in electronic form only.

End of informative text.

Annex F. Root Element Locations

This clause is informative.

This clause provides the location of each part's root element (as identified in §1) within the set of normative XML Schema files provided in Annex A, based on both its part name and its XML Schema:

F.1 Grouped by Part Name

Part	Schema	Element Name
DrawingML Chart	dml-chart.xsd	chartSpace
DrawingML Chart Drawing	dml-chart.xsd	userShapes

Office Open XML

Part 5: Markup Compatibility and Extensibility

December 2006

Table of Contents

Foreword

This multi-part Standard deals with Office Open XML Format-related technology, and consists of the following parts:

- Part 1: "Fundamentals"
- Part 2: "Open Packaging Conventions"
- Part 3: "Primer"
- Part 4: "Markup Language Reference"
- **Part 5: "Markup Compatibility and Extensibility" (this document)**

1. Scope

This Part (the *Markup Compatibility and Extensibility specification*) describes a set of conventions that are used by Office Open XML documents that facilitate future enhancement and extension of Office Open XML documents, while providing a baseline for interoperability.

In all subsequent uses within this document, the term "this specification" shall refer to the content of this Part.

2. Normative References

The following normative documents contain provisions, which, through reference in this text, constitute provisions of this specification. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this specification are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

ISO/IEC 2382.1:1993, *Information technology — Vocabulary — Part 1: Fundamental terms*.

ISO/IEC 10646:2003 (all parts), *Information technology — Universal Multiple-Octet Coded Character Set (UCS)*.

3. Definitions

For the purposes of this specification, the following definitions apply. Other terms are defined where they appear in *italics* type. Terms explicitly defined in this specification are not to be presumed to refer implicitly to similar terms defined elsewhere. [*Note*: This part uses OPC-related terms, which are defined in Part 2: "Open Packaging Conventions". *end note*]

Throughout this specification, the terms *namespace declaration*, *namespace name*, *qualified name*, *expanded name*, *prefixed name*, *unprefixed name*, and *local name* shall have the meanings as defined in the W3C Recommendation, “Namespaces in XML 1.0 (Second Edition).”

alternate content — A set of markup alternatives, of which no more than one shall be processed by a markup consumer. A markup consumer chooses from among the alternatives based upon its set of understood namespaces.

compatibility-rule attribute — An XML attribute described in this specification that expresses rules governing markup consumers’ behavior when encountering XML elements and attributes from non-understood namespaces.

ignore — To disregard the presence of an element or attribute, processing the markup as if that element or attribute did not exist.

markup consumer — A tool that can read and parse a markup document and further conforms to the requirements of a markup specification.

markup document — An XML document that conforms to the requirements of a markup specification.

markup editor — A tool that acts as a markup consumer in reading a markup document, makes changes to that markup, and acts as the producer of the modified markup.

markup preprocessor — A software module, designed for use in the implementation of markup consumers, that follows the rules of this Markup Compatibility and Extensibility specification to remove or replace all elements and attributes from the Markup Compatibility namespace, all elements and attributes from ignorable non-understood namespaces, and all elements and attributes from subsumed namespaces..

markup producer — A tool that can generate a markup document, and conforms to a markup specification.

markup specification — An XML-based markup format specification that incorporates all of the requirement of this Part.

namespace, ignorable — A namespace, identified in markup, whose elements and attributes shall be ignored by a markup consumer that does not understand that namespace.

namespace, understood — An XML namespace containing any recognized XML elements or attributes.

preserve —To retain an ignored element or attribute during the course of editing.

recognize — To have knowledge of the correct interpretation of an XML element, XML attribute, or attribute-value, as defined in a markup specification.

4. Notational Conventions

The following typographical conventions are used in this Standard:

1. The first occurrence of a new term is written in italics. [*Example*: … is considered *normative*. *end example*]
2. A term defined as a basic definition is written in bold. [*Example*: **behavior** — External … *end example*]
3. The name of an XML element is written using an Element style. [*Example*: The root element is document. *end example*]
4. The name of an XML element attribute is written using an Attribute style. [*Example*: … an id attribute. *end example*]
5. An XML element attribute value is written using a constant-width style. [*Example*: … value of `CommentReference`. *end example*]
6. An XML element type name is written using a Type style. [*Example*: … as values of the xsd:anyURI data type. *end example*]

5. Acronyms and Abbreviations

This clause is informative

The following acronyms and abbreviations are used throughout this specification

IEC — the International Electrotechnical Commission

ISO — the International Organization for Standardization

W3C — World Wide Web Consortium

End of informative text

6. General Description

This specification is intended for use by implementers, academics, and application programmers. As such, it contains a considerable amount of explanatory material that, strictly speaking, is not necessary in a formal specification.

This specification is divided into the following subdivisions:

1. Front matter (clauses 1–7);
2. Overview and introductory material (clause 8);
3. Main body (clauses 9–13);
4. Annexes

Examples are provided to illustrate possible forms of the constructions described. References are used to refer to related clauses. Notes are provided to give advice or guidance to implementers or programmers.

The following clauses form the normative pieces of this specification:

- Clauses 1–4, 6, and 8–11

The following clauses form the informative pieces of this specification:

- Introduction
- Clause 5, 7, and 12
- All annexes
- All notes and examples

Whole clauses that are informative are identified as such. Informative text that is contained within normative text is identified as either an example or note, as specified in §4.

7. Overview

This clause is informative

This Part describes a set of XML elements and attributes that collectively enable producers to explicitly guide consumers in their handling of any XML elements and attributes not understood by the consumer.

These elements and attributes enable the creation of future versions of and extensions to this Standard, while enabling desirable compatibility characteristics:

- A markup producer can produce markup documents that exploit new features defined by versions and extensions, yet remain interoperable with markup consumers thats are unaware of those versions and extensions.
- For any such markup document, a markup consumer whose implementation is aware of the exploited versions and extensions will deliver functionality that is enhanced by the markup document's use of those versions and extensions.
- For any such markup document, the markup producer can enable and precisely control graceful degradation that will occur when the markup document is processed by a markup consumer that is unaware of the exploited versions and extensions.

End of informative text

8. Markup Compatibility Fundamentals

8.1 Terminology

Any XML-based document specification can use the markup language described in this Part as the basis of its compatibility with previous and future specification revisions and to enable the creation of independent extensions of its specification. In this specification, the term *markup specification* is used to refer to a specification that relies on this Office Open XML Markup Compatibility and Extensibility Part and defines a set of XML namespaces, the elements and attributes within those namespaces, and any processing requirements for those namespaces, elements, and attributes. *Markup document* refers to an XML document that conforms to a markup specification. A *markup producer* is a software application or component that generates a markup document. A *markup consumer* is a software application or component that can process a markup document according to the processing requirements of the markup specification.

This specification is dependent on XML namespace names, expressed as URIs. A markup specification defines a set of elements and attributes within one or more namespaces. A characteristic of a markup consumer is that it can *recognize* or process the elements and attributes within *understood namespaces*, including those containing elements and attributes defined in the markup specification. Markup consumers shall process all recognized elements and attributes of any understood namespace according to the requirements of the markup specifications defining those elements or attributes. A markup specification might require that the presence of unrecognized elements or attributes in an understood namespace be treated as an error condition; however, markup consumers shall always treat the presence of an unrecognized element or attribute from the Markup Compatibility namespace as an error condition. If a markup consumer encounters an element or attribute from a non-understood namespace, the markup consumer shall treat the presence of that element or attribute as an error condition, unless the markup producer has embedded in the markup document explicit Markup Compatibility elements or attributes that override that behavior.

Within a markup document, a markup producer might use Markup Compatibility attributes to identify *ignorable namespaces*. Markup consumers shall *ignore* elements and attributes from namespaces that are both non-understood and ignorable, and shall not treat their presence as errors. A markup producer can indicate to the markup consumer whether the content of an ignored element shall be disregarded together with the ignored element, or if the content should be processed as if it were the content of the ignored element's parent.

Within a markup docume

nt, a markup producer might also use Markup Compatibility attributes to suggest to a markup editor that the editor attempt to *preserve* some ignored elements or attributes. The markup editor can attempt to persist these ignored elements and attributes when a saving markup document, despite the editor's inability to recognize the purpose of these ignored elements and attributes.

A markup producer, aware of the existence of markup consumers with overlapping but different sets of understood namespaces, might choose to include in a markup document *alternate content* regions, each holding a set of markup alternatives for use by different markup consumers. A markup consumer shall use rules embedded in the markup document by the markup producer to select no more than one of these alternatives for normal processing, and shall disregard all other alternatives.

Future versions of markup specifications shall specify new namespaces for any markup that is enhanced or modified by the new version, which a markup consumer of that version of the markup specification would include as an understood namespace. Some of the namespaces introduced in the new markup specification might each subsume one of the previous version's understood namespaces. A new understood namespace *subsumes* a previously-understood namespace if it includes all of the elements, attributes, and attribute values of the previously-understood namespace. Regardless of whether a new namespace subsumes a previously defined namespace, markup consumers based on a new version of a markup specification shall support all understood namespaces of the previous version unless the new version makes an explicit statement to the contrary.

This specification can be implemented using a pipelined, preprocessing architecture in the form of a software module called a *markup preprocessor*. A markup preprocessor can use the Markup Compatibility elements and attributes to produce output that is free of all ignorable non-understood content, all Markup Compatibility elements and attributes, and all elements and attributes in subsumed namespaces.

Markup consumers should report errors when processing non-conforming documents.

8.2 Markup Compatibility Namespace

The following is the Markup Compatibility namespace:

```
http://schemas.openxmlformats.org/markup-compatibility/2006
```

The namespace includes XML elements and attributes that markup producers can use to express to markup consumers how they shall respond to markup in non-understood namespaces. The elements and attributes described in this specification are contained in the Markup Compatibility namespace.

9. Markup Compatibility Attributes and Elements

This specification defines attributes to express compatibility rules and elements to specify alternate content.

[*Note*: Whitespace characters that can appear in attribute values, as defined in the XML specification, are described in the following table:

Table 9–1. Whitespace characters in attribute values

Character	Syntax
space	#x20
tab	#x9
line feed	#xA
carriage return	#xD

end note]

Whitespace characters that appear in values of attributes defined in this specification shall be normalized by markup consumers before processing as follows:

1. Replace each tab, line feed, and carriage return with a space.
2. Collapse contiguous sequences of spaces into a single space.
3. Remove leading and trailing spaces.

[*Note*: The following table, and Table 9–3, summarize the Markup Compatibility attributes and elements, respectively, and are further described in the sub-clauses that follow.

Table 9–2. Compatibility-rule attributes

Name	Description
Ignorable	A whitespace-delimited list of namespace prefixes that identify a set of namespaces whose elements and attributes should be silently ignored by markup consumers that do not understand the namespace of the element or attribute in question.
ProcessContent	A whitespace-delimited list of element-qualified names identifying the expanded names of elements whose content shall be processed, even if the elements themselves are ignored. In any qualified name in the list, the wildcard character “*” can replace the local name to indicate that the content of all elements in the namespace shall be processed.

Name	Description
PreserveElements	A whitespace-delimited list of element qualified names identifying the expanded names of elements that a markup producer suggests for preservation by markup editors, even if the elements themselves are ignored. In any qualified name in the list, the wildcard character "*" can replace the local name to indicate that all elements in the namespace should be preserved.
PreserveAttributes	A whitespace-delimited list of attribute qualified names identifying the expanded names of attributes that a markup producer suggests for preservation by markup editors. In any qualified name in the list, the wildcard character "*" can replace the local name to indicate that all attributes in the namespace should be preserved.
MustUnderstand	A whitespace-delimited list of namespace prefixes identifying a set of namespace names. Markup consumers that do not understand these namespaces shall not continue to process the markup document and shall generate an error.

Table 9–3. Alternate-content elements

Name	Description
AlternateContent	Associates a set of possible markup alternatives that a markup consumer might choose based on that markup consumer's understood namespaces. The markup consumer chooses the first alternative, in markup order, requiring only namespaces it understands.
Choice	This child of AlternateContent contains a single markup alternative and identifies the namespaces that the markup consumer needs to understand in order to choose and process that alternative. At least one Choice element is required.
Fallback	This child of AlternateContent specifies the fallback markup alternative a markup consumer chooses if the markup consumer cannot choose any Choice alternative. An AlternateContent element shall hold no more than one Fallback element, which if present, shall follow all Choice elements.

end note]

9.1 Compatibility-Rule Attributes

This specification describes the manner by which compatibility rules can be associated with any XML element, including Markup Compatibility elements. Compatibility rules are associated with an element by means of compatibility-rule attributes. These attributes control how markup consumers, including markup editors, shall react to elements or attributes from non-understood namespaces.

The principal compatibility-rule attribute is the Ignorable attribute. By default, markup consumers should treat the presence of any element or attribute from a non-understood namespace as an error condition. However, elements and attributes from a non-understood namespace identified in an Ignorable attribute shall be ignored without error.

Compatibility-rule attributes shall affect the element to which they are attached, including the element's other attributes and contents. The order in which compatibility-rule attributes occur on an element shall not affect the application of those rules to that element, its attributes, or its contents.

9.1.1 Ignorable Attribute

The Ignorable attribute value contains a whitespace-delimited list of namespace prefixes, where each namespace prefix identifies an ignorable namespace. During processing, if a markup consumer encounters an element or attribute in a non-understood and ignorable namespace, the markup consumer shall treat that element or attribute as if it did not exist and shall not generate an error.

Markup consumers should treat elements and attributes from non-ignorable and non-understood namespaces as errors.

[*Note*: By default, an ignored element is ignored in its entirety, including its attributes and its content. The processing of an ignored element's contents is enabled through the use of the ProcessContents attribute. The PreserveAttributes and PreserveElements attributes can be used to assist markup editors in preserving ignored elements and ignored attributes. *end note*]

If an Ignorable attribute references an understood namespace, its presence shall not affect the processing of elements and attributes from the understood namespace, regardless of whether or not those elements and attributes are recognized by the markup consumer.

The presence of an Ignorable attribute shall reset a markup consumer's content-processing and preservation behavior for all elements and attributes in the namespaces referenced by the Ignorable attribute value. Once reset, by default the markup consumer shall ignore all content contained by the ignored element and markup editors shall not preserve ignored attributes and elements. This default behavior shall be overridden by the presence of any ProcessContent, PreserveAttributes, and PreserveElements attributes on the element with the Ignorable attribute.

The value of the Ignorable attribute can be an empty or blank string. When a markup consumer encounters such a value, it shall proceed as if the Ignorable attribute was not present.

[*Example*: Example 9–1. Processing Ignorable and PreserveAttributes attributes

The example namespace with the name `http://schemas.openxmlformats.org/Circles/v1` defines a Version 1 element, Circle, in its initial version. The subsequent Version 2 of the markup specification introduces the Opacity attribute in a new Version 2 namespace. The subsequent Version 3 of the markup specification introduces the Luminance attribute in a Version 3 namespace. The markup is loadable by markup consumers conforming to any one of these markup specification versions. The PreserveAttributes attribute specifies that the v3:Luminance attribute should be preserved during editing, even when the markup editor does not understand the v3:Luminance attribute.

For a Version 1 markup consumer, Opacity and Luminance are ignored attributes.

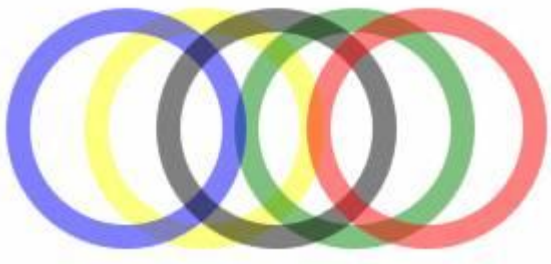
For a Version 2 markup consumer, only Luminance is an ignored attribute.

For a Version 3 markup consumer and beyond, none of the attributes are ignored.

```
<Circles xmlns="http://schemas.openxmlformats.org/Circles/v1"
  xmlns:mc="http://schemas.openxmlformats.org/markup-
  compatibility/2006"
  xmlns:v2="http://schemas.openxmlformats.org/Circles/v2"
  xmlns:v3="http://schemas.openxmlformats.org/Circles/v3"
  mc:Ignorable="v2 v3"
  mc:PreserveAttributes="v3:Luminance">
  <Circle Center="0,0" Radius="20" Color="Blue"
    v2:Opacity="0.5" v3:Luminance="13" />
  <Circle Center="25,0" Radius="20" Color="Black"
    v2:Opacity="0.5" v3:Luminance="13" />
  <Circle Center="50,0" Radius="20" Color="Red"
    v2:Opacity="0.5" v3:Luminance="13" />
  <Circle Center="13,0" Radius="20" Color="Yellow"
    v2:Opacity="0.5" v3:Luminance="13" />
  <Circle Center="38,0" Radius="20" Color="Green"
    v2:Opacity="0.5" v3:Luminance="13" />
</Circles>
```

The following figure shows an example possible rendering of the markup above.

Figure 9–1. Rings



end example]

[*Example*: Example 9–2. Processing Ignorable content using namespaces

A markup consumer that does not understand the namespace with the name `http://schemas.openxmlformats.org/MyExtension/v1` shall ignore both the a:IgnoreMe and b:IgnoreMeToo elements. Although the two elements use different namespace prefixes, they draw from the same ignorable namespace.

```
<Circles
  xmlns="http://schemas.openxmlformats.org/Circles/v1"
  xmlns:mc="http://schemas.openxmlformats.org/markup-
  compatibility/2006"
  xmlns:a="http://schemas.openxmlformats.org/MyExtension/v1"
  xmlns:b="http://schemas.openxmlformats.org/MyExtension/v1"
  mc:Ignorable="a">
  <a:IgnoreMe />
  <b:IgnoreMeToo />
</Circles>
```

end example]

9.1.2 ProcessContent Attribute

The ProcessContent attribute value contains a whitespace-delimited list of element-qualified names identifying the expanded names of elements whose content shall be processed, even if the elements themselves are ignored. In any qualified name in the list, the wildcard character "*" can replace the local name to indicate that the content all elements in the namespace shall be processed.

A markup consumer that encounters an ignored element whose expanded name matches the expanded name of an element identified in the ProcessContent attribute value, the markup consumer shall consider that element to be a processed element, regardless of whether or not the element's qualified name matches the qualified name specified in the ProcessContent attribute value.

A markup consumer that encounters a processed element shall process the contents of that element as if the contents were directly embedded within the parent element of the ignored element.

The ProcessContent attribute value shall not reference any element name that does not belong to a namespace that is identified by the Ignorable attribute of the same element.

The value of the ProcessContent attribute can be an empty or blank string. When a markup consumer encounters such a value, it shall proceed as if the ProcessContent attribute was not provided.

Markup producers shall not generate an element that has an xml:lang or xml:space attribute if that element is identified by a ProcessContent attribute value. Markup consumers that ignore an element that has an xml:lang or xml:space attribute and is also identified by a ProcessContent attribute value shall generate an error. Markup consumers that encounter a non-ignored element that has an xml:lang or xml:space attribute and is also identified by a ProcessContent attribute value might generate an error.

[*Example*: Example 9–3. Processing Ignorable and ProcessContent attributes

A Version 1 markup consumer ignores the blue, black, and red circles, but does render the yellow and green circles.

```
<Circles
  xmlns="http://schemas.openxmlformats.org/Circles/v1"
  xmlns:mc="http://schemas.openxmlformats.org/markup-
  compatibility/2006"
  xmlns:v2="http://schemas.openxmlformats.org/Circles/v2"
  mc:Ignorable="v2"
  mc:ProcessContent="v2:Blink" >
  <v2:Watermark Opacity="v0.1">
    <Circle Center="0,0" Radius="20" Color="Blue" />
    <Circle Center="25,0" Radius="20" Color="Black" />
    <Circle Center="50,0" Radius="20" Color="Red" />
  </v2:Watermark>
  <v2:Blink>
    <Circle Center="13,0" Radius="20" Color="Yellow" />
    <Circle Center="38,0" Radius="20" Color="Green" />
  </v2:Blink>
</Circles>
```

The Version 1 markup consumer, unaware of Version 2 markup, renders the above markup as if it had processed the following markup:

```
<Circles
  xmlns="http://schemas.openxmlformats.org/Circles/v1" >
  <Circle Center="13,0" Radius="20" Color="Yellow" />
  <Circle Center="38,0" Radius="20" Color="Green" />
</Circles>
```

end example]

9.1.3 PreserveElements and PreserveAttributes Attributes

The Ignorable attribute presents a challenge unique to markup editors in deciding when and how to *preserve* ignored markup in the face of modification and when to discard ignored markup. In the absence of explicit knowledge of the specification governing the unrecognized ignored markup, it is difficult for a markup editor to preserve ignored markup while simultaneously maintaining document conformance with whatever specification governs that markup. Similarly, it is difficult for the markup editor to avoid undesired change to the edited document's semantics as they would be interpreted by a markup consumer whose implementation is based on the specification governing the preserved markup.

A markup editor might use the presence of PreserveElements and PreserveAttributes attributes as hints for deciding what ignored elements and attributes to preserve when markup is modified. The markup editor's specific interpretation of those hints shall be governed by the markup specification or specifications that formed the basis for the markup editor's implementation.

Markup specifications should specify conditions under which markup editors should preserve ignored markup. Markup specifications should define the widest possible set ofconditions under which markup editors should preserve ignored markup. [*Note*: If preservation conditions are too widely defined, future versions and extensions will be over constrained in what new semantics they can introduce. *end note*]

If a markup specification lacks such guidance, markup editors for markup documents governed by that markup specification should be conservative in their preservation behavior Before preserving any ignored markup, markup editors should attempt to establish confidence that the preserved markup will be acceptable to, and interpretable with acceptable semantics by, all imaginable markup consumers that understand future versions of extensions. [*Note*: Such confidence could be established by deep understanding of the base specification. *end note*]

Even in the presence of explicit preservation guidance in a markup specification, any markup editor might choose to discard together all ignored markup without regard to the presence of any PreserveElements or PreserveAttributes attribute. [*Note:* The explicit presence of the Ignorable attribute indicates that discarding such markup before editing produces a document that conforms to relevant specifications and is self-sufficient in its semantic interpretation. *end note*]

A markup specification might define conditions calling for the preservation of some ignored elements or attributes without requiring the presence of any PreserveElements or PreserveAttributes attribute.

A markup specification might restrict preservation of elements identified by the PreserveElements attribute to those elements that are descendants of particular elements. Likewise, a markup specification might restrict the set of elements whose ignored attributes can be preserved, as identified by the PreserveAttributes element, to those that are descendants of particular elements. Regardless of any such restrictions, markup consumers shall always accept, but possibly disregard, PreserveElements and PreserveAttributes attributes on any element.

9.1.3.1 PreserveElements Attribute

The PreserveElements attribute value contains a whitespace-delimited list of element qualified names identifying the expanded names of elements that a markup producer suggests for preservation by markup editors, even if the elements themselves are ignored. In any qualified name in the list, the wildcard character “*” can replace the local name to suggest that all elements in the namespace can be preserved.

If a markup consumer encounters an ignored element whose expanded name matches the expanded name of an element identified in the PreserveElements attribute value, the markup consumer shall consider that element to be a candidate for preservation, regardless of whether or not the element’s qualified name matches the qualified name specified in the PreserveElements attribute value.

When an element is ignored and preserved, all of its unprefixed attributes shall also be preserved along with any preserved attributes identified in a PreserveAttributes attribute value.

The PreserveElements attribute value shall not reference any element name that does not belong to a namespace that is identified by the Ignorable attribute of the same element.

The value of the PreserveElements attribute can be an empty or blank string. When a markup consumer encounters such a value, it shall proceed as if the PreserveElements attribute was not provided.

9.1.3.2 PreserveAttributes Attributes

The PreserveAttributes attribute value contains a whitespace-delimited list of attribute qualified names identifying the expanded names of attributes that a markup producer suggests for preservation by markup editors. [*Note*: An attribute cannot be preserved if it appears on a non-preserved ignored element. *end note*] In any qualified name in the list, the wildcard character "*" can replace the local name to indicate that all attributes in the namespace should be preserved. [*Note*: An unprefixed local attribute cannot be identified by a PreserveAttributes attribute value. *end note*]

If a markup consumer encounters an ignored attribute whose expanded name matches the expanded name of an attribute identified in the PreserveAttributes attribute value, the markup consumer shall consider that attribute to be a candidate for preservation, regardless of whether or not the attribute's qualified name matches the qualified name specified in the PreserveAttributes attribute value.

The ProcessAttributes attribute value shall not reference any attribute name that does not belong to a namespace that is identified by the Ignorable attribute of the same element.

The value of the PreserveAttributes attribute can be an empty or blank string. When a markup consumer encounters such a value, it shall proceed as if the PreserveAttributes attribute was not provided.

9.1.4 MustUnderstand Attribute

The MustUnderstand attribute value containsa whitespace-delimited list of namespace prefixes identifying a set of namespace names. A markup consumer that does not understand these identified namespaces shall not continue to process the markup document, regardless of whether the non-understood namespace was identified as an ignorable namespace on an ancestor element. Markup consumers shall generate an error condition if one or more of these identified namespaces is not understood.

The value of the MustUnderstand attribute can be an empty or blank string. When a markup consumer encounters such a value, it shall proceed as if the MustUnderstand attribute was not declared.

[*Note*: §9.2 clarifies the rules for processing the MustUnderstand attribute when it is applied to a Choice or Fallback element, or when it is applied to a descendant element of one of those elements. *end note*]

[*Example*: Example 9–4. Processing an attribute's prefixed qualified name

The declaration of a Version 2 attribute causes a Version 1 markup consumer to trigger an error when processing the last Circle element.

```
<Circles
  xmlns="http://schemas.openxmlformats.org/Circles/v1"
  xmlns:mc="http://schemas.openxmlformats.org/markup-
  compatibility/2006"
  xmlns:v2="http://schemas.openxmlformats.org/Circles/v2">
```

```
    <Circle Center="0,0" Radius="20" Color="Blue" />
    <Circle Center="25,0" Radius="20" Color="Black" />
    <Circle Center="50,0" Radius="20" Color="Red" />
    <Circle Center="13,0" Radius="20" Color="Yellow" />
    <Circle Center="38,0" Radius="20" Color="Green"
      v2:Opacity="0.5" />
  </Circles>
```

Example 10–5. Processing a MustUnderstand attribute

The value of the MustUnderstand attribute causes a Version 1 markup consumer to trigger an error when processing the root Circles element.

```
  <Circles
    xmlns="http://schemas.openxmlformats.org/Circles/v1"
    xmlns:mc=http://schemas.openxmlformats.org/markup-
    compatibility/2006
    xmlns:v2="http://schemas.openxmlformats.org/Circles/v2"
    mc:MustUnderstand="v2">
    <Circle Center="0,0" Radius="20" Color="Blue" />
    <Circle Center="25,0" Radius="20" Color="Black" />
    <Circle Center="50,0" Radius="20" Color="Red" />
    <Circle Center="13,0" Radius="20" Color="Yellow" />
    <Circle Center="38,0" Radius="20" Color="Green"
      v2:Opacity="0.5" />
  </Circles>
```

end example]

9.2 Alternate-Content Elements

[*Note*: Markup producers can generate a markup document that includes multiple markup alternatives, each labeled with the namespaces that needs to be understood by any markup consumer choosing that alternative. A markup consumer shall choose only a single alternative. A particular markup alternative can exploit features introduced in subsequent revisions of the markup specification or in extensions to the markup specification.

In some cases, the Ignorable attribute could provide flexibility sufficient for a markup producer to create an acceptable experience to users of a markup consumer that is unaware of any revisions or extensions. In other cases, it could be desirable or necessary for markup producers to provide different markup alternatives, with one alternative processed by markup consumers implemented according to particular revisions or extensions of the markup specification, and others processed by markup consumers implemented according to different revisions or extensions of the markup specification. *end note*]

9.2.1 AlternateContent Element

The AlternateContent element contains the full set of all possible markup alternatives. Each possible alternative is contained within either a Choice or Fallback child element of the AlternateContent element.

An AlternateContent element shall contain one or more Choice child elements, optionally followed by a Fallback child element. If present, there shall be only one Fallback element, and it shall follow all Choice elements. An AlternateContent element shall not be the child of an AlternateContent element.

More than one Choice child element might be specified, each identifying the namespaces that a markup consumer needs to understand in order to choose the markup alternative contained within the Choice element. Markup consumers shall rely solely on the namespaces identified by the Choice element rather than the alternate content markup itself in order to decide which content to use.

AlternateContent elements might include the attributes Ignorable, MustUnderstand, ProcessContent, PreserveElements, and PreserveAttributes described in this specification. These attributes' qualified names shall be prefixed when associated with an AlternateContent element. A markup consumer shall generate an error if it encounters an unprefixed attribute name associated with an AlternateContent element. [*Note*: A namespace declaration is not considered to be an unprefixed attribute name. *end note*]

AlternateContent elements might have ignored attributes or contain ignored child elements. Markup consumers shall not generate an error when encountering such attributes or child elements. However, markup consumers shall generate an error when encountering an attribute or child element of the AlternateContent element that belongs to a namespace that is neither understood nor ignorable. [*Note*: In addition to Choice and Fallback elements, an ignored element can occur as a child of AlternateContent. *end note*]

When a markup consumer processes an AlternateContent element, each successive Choice or Fallback element is considered in markup order for selection based on its attributes. If a Choice or Fallback element is not selected for processing, all of the child and descendant elements of that Choice or Fallback element shall be treated as if they did not exist. A markup consumer shall not generate an error based on any MustUnderstand attribute applied to an element contained within the content of the unselected Choice or Fallback element. A markup consumer shall not generate an error based on any markup that is contained within an unselected Choice or Fallback element, even if that markup is not conformant to this specification.

In processing an AlternateContent element, the attributes of every child Choice or Fallback element shall be processed and checked for conformance to this specification, regardless of whether the Choice or Fallback element precedes or follows the selected alternative in markup order. If the AlternateContent element's child Choice or Fallback elements include an attribute from a namespace that is not understood and is not ignorable, the markup consumer shall generate an error. Likewise, a markup consumer shall generate an error if it encounters a MustUnderstand attribute included on a Choice or Fallback element that identifies a namespace that it does not understand.

The content of the selected Choice or Fallback element is processed as though it replaces the entire AlternateContent element. All namespace declarations and compatibility-rule attributes present on the AlternateContent element or selected Choice or Fallback element shall be processed as though they appeared

on every child element of the selected Choice or Fallback element. This logical removal of the parent AlternateContent, Choice, and Fallback elements shall not change the expanded name of any element or attribute contained within the selected Choice of Fallback element. Additionally, this logical removal shall not change the set of ignorable namespaces, or their corresponding preservation and content-processing behavior, when processing the contents of the selected Choice or Fallback element.

[*Note*: The AlternateContent element can appear as the root element of a markup document. *end note*]

Markup producers shall not generate AlternateContent elements that have the xml:lang or xml:space attributes. Markup consumers shall generate an error if they encounter the xml:lang or xml:space attributes on an AlternateContent element.

9.2.2 Choice Element

All Choice elements shall have a Requires attribute whose value contains a whitespace-delimited list of namespace prefixes that identify the namespaces that a markup consumer needs to understand to select that Choice and process the content. If the markup consumer does not understand all of the namespaces identified, it shall not select that Choice element. Markup consumers shall select the first Choice element, in markup order, in which all namespaces identified by the Requires attribute are understood.

Choice elements can include the attributes Ignorable, MustUnderstand, ProcessContent, PreserveElements, and PreserveAttributes described in this specification. These attributes shall be prefixed when on a Choice element. A markup consumer shall generate an error if it encounters a Choice element having any unprefixed attribute name, with the single exception of the Requires attribute, which shall be unprefixed. [*Note*: A namespace declaration is not considered to be an unprefixed attribute name. *end note*] A markup consumer that encounters a prefixed Requires attribute, when the prefix is associated with the Markup Compatibility namespace, shall generate an error.

Choice elements might have ignored attributes. Markup consumers shall not generate an error when encountering such attributes. However, markup consumers shall generate an error when encountering an attribute of the Choice element that belongs to a namespace that is neither understood nor ignorable.

Markup producers shall not generate Choice elements that have the xml:lang or xml:space attributes. Markup consumers shall generate an error if they encounter the xml:lang or xml:space attributes on a Choice element, regardless of whether the element is preceded by a selected Choice element.

9.2.3 Fallback Element

If no Choice element can be selected, markup consumers shall use the content provided in a Fallback element, if present. If no Choice element can be selected and no Fallback element is provided, the document content is processed as if the AlternateContent element were absent.

Fallback elements can include the attributes Ignorable, MustUnderstand, ProcessContent, PreserveElements, and PreserveAttributes described in this specification. These attributes shall be prefixed when on a Fallback element. A markup consumer shall generate an error if it encounters a Fallback element

having any unprefixed attribute name. [*Note*: A namespace declaration is not considered to be an unprefixed attribute name. *end note*]

Fallback elements might have ignored attributes. Markup consumers shall not generate an error when encountering such attributes. However, markup consumers shall generate an error when encountering an attribute of the Fallback element that belongs to a namespace that is neither understood nor ignorable.

Markup producers shall not generate Fallback element s that have the xml:lang or xml:space attributes. Markup consumers shall generate an error if they encounter the xml:lang or xml:space attributes on a Fallback element, regardless of whether the element is preceded by a selected Choice element.

9.2.4 Alternate-Content Examples

The following examples illustrate the usage of alternate-content elements.

[*Example*: Example 9–6. Processing AlternateContent markup

In this example, luminance is expressed as an attribute of a Circle element for markup consumers supporting the Version 3 namespace, identified by the v3 namespace prefix, and as an attribute of a LuminanceFilter element for other markup consumers.

```
<Circles
  xmlns="http://schemas.openxmlformats.org/Circles/v1"
  xmlns:mc=http://schemas.openxmlformats.org/markup-
  compatibility/2006
  xmlns:v2=http://schemas.openxmlformats.org/Circles/v2
  xmlns:v3=http://schemas.openxmlformats.org/Circles/v3
  mc:Ignorable="v2 v3">
  <mc:AlternateContent>
    <mc:Choice Requires="v3">
      <v3:Circle Center="0,0" Radius="20" Color="Blue"
        Opacity="0.5" Luminance="13" />
      <v3:Circle Center="25,0" Radius="20" Color="Black"
        Opacity="0.5" Luminance="13" />
      <v3:Circle Center="50,0" Radius="20" Color="Red"
        Opacity="0.5" Luminance="13" />
      <v3:Circle Center="13,0" Radius="20" Color="Yellow"
        Opacity="0.5" Luminance="13" />
      <v3:Circle Center="38,0" Radius="20" Color="Green"
         Opacity="0.5" Luminance="13" />
    </mc:Choice>
    <mc:Fallback>
      <LuminanceFilter Luminance="13">
         <Circle Center="0,0" Radius="20" Color="Blue"
           v2:Opacity="0.5" />
```

```
            <Circle Center="25,0" Radius="20" Color="Black"
              v2:Opacity="0.5" />
            <Circle Center="50,0" Radius="20" Color="Red"
              v2:Opacity="0.5" />
            <Circle Center="13,0" Radius="20" Color="Yellow"
              v2:Opacity="0.5" />
            <Circle Center="38,0" Radius="20" Color="Green"
              v2:Opacity="0.5" />
          </LuminanceFilter>
        </mc:Fallback>
      </mc:AlternateContent>
    </Circles>
```

end example]

[*Example*: Example 9–7. Processing AlternateContent markup using namespaces

In this example, if the markup consumer understands the metallic-finishes namespace, the contents of the mc:Choice block are used. If it does not, the contents of mc:Fallback are used instead.

```
    <Circles
      xmlns="http://schemas.openxmlformats.org/Circles/v1"
      xmlns:mc="http://schemas.openxmlformats.org/markup-
      compatibility/2006" >
      <mc:AlternateContent
        xmlns:m="http://schemas.openxmlformats.org/metallic-
        finishes/v1">
        <mc:Choice Requires="m">
          <Circle m:Finish="GoldLeaf" Center="100,100" Radius="50"
            />
        </mc:Choice>
        <mc:Fallback>
          <Circle Fill="Gold" Center="100,100" Radius="50" />
        </mc:Fallback>
      </mc:AlternateContent>
    </Circles>
```

end example]

10. Namespace Subsumption

10.1 The Subsumption Process

A namespace *subsumes* another namespace if it includes all of the elements, attributes, and attribute values of the subsumed namespace.

A markup specification that defines a subsuming namespace shall require that any instance of the following constructs that would be recognized in the subsumed namespace shall also be recognized and interpreted identically in the subsuming namespace.

- Element local names
- Unprefixed attribute names of elements
- Prefixed attribute names of elements
- Attribute values
- Element contents

Subsumption is the process by which a markup consumer recognizes and interprets elements, attributes, and attribute values in a subsumed namespace as if they occurred in the subsuming namespace.

When performing subsumption, markup consumers might confirm that the markup using the old namespace is compatible with the specification of the old namespace

Any markup specification that relies on the Markup Compatibility namespace should define a namespace naming convention for use by future versions of that specification when those future versions introduce new namespaces that subsume older namespaces.

When markup consumers encounter a non-understood namespace name, they might examine it for a naming convention that suggests that an understood namespace is being subsumed. The suggestion of a subsumption relationship shall not suppress error processing triggered by the non-understood namespace name. If error processing is triggered, markup consumers might use the suggested subsumption relationship to choose the most appropriate error message or error code. [*Example*: One error message might encourage upgrading to a newer application version, while another might merely highlight the non-understood namespace name. *end example*]

10.2 Special Considerations for Attributes

§6.3 of the W3C Recommendation “Namespaces in XML 1.0 (Second Edition)” makes a distinction between prefixed attributes and unprefixed attributes sharing the same local name. Given an element whose expanded name refers to namespace *N*, an unprefixed attribute with local name *L* is distinct from a prefixed attribute with local name *L* and namespace *N*. The existence of this distinction is important in defining correct subsumption behavior for markup consumers.

A subsuming namespace might extend a pre-existing element local name with a new unprefixed attribute. Similarly, a subsuming namespace might create a new attribute designed for prefixed use.

[*Note*: The statements above introduce a potential ambiguity in defining the correct behavior of a markup consumer performing subsumption.

Assume that the namespace associated with prefix v2 subsumes the namespace associated with v1. Suppose a markup consumer that understands the v2 namespace encounters markup of the following form:

```
<v1:OldElement mc:Ignorable=”v2” v2:NewAttribute=”value” />
```

How should that markup consumer interpret that markup? Should it be considered equivalent to the following markup?

```
<v2:OldElement NewAttribute=”value” />
```

Or should it be considered equivalent to the following markup?

```
<v2:OldElement v2:NewAttribute=”value” />
```

According to “Namespaces in XML 1.0 (Second Edition)”, these two potential pieces of markup are not equivalent. Additionally, the XML Schema specification allows for the construction of different XSD schemas that validate one, the other, or both of these constructs. *end note*]

When processing an element from an older namespace that carries a prefixed attribute from a newer, subsuming namespace, a markup consumer shall decide whether to treat the new attribute as if its expanded name refers to the new namespace or as if its expanded name refers to no namespace. If a subsuming namespace adds a new attribute or permissible attribute value to an element that was present in the subsumed namespace, the markup specification that defines the subsuming namespace shall state which of the two subsumption behaviors shall be used by markup consumers and assumed by markup producers.

[*Note*: Example 13-1 illustrates how a markup preprocessor handles each of the two possible behaviors. *end note*]

In order to support a preprocessing model for Markup Compatibility elements and attributes, specifications should restrict the use of any combination of prefixed and unprefixed attributes with the same local name.

A namespace should not be subsumed by a newer namespace if the older namespace includes both a prefixed attribute and an unprefixed attribute sharing its local name but having a different type or different semantics.

A subsuming namespace should not include both a prefixed attribute and an unprefixed attribute sharing its local name but having a different type or different semantics.

11. Application-Defined Extension Elements

A markup specification using Markup Compatibility elements and attributes might define one or more specific extension elements in the namespaces it defines. *Extension elements* suspend Markup Compatibility processing within their content. Except as noted below, within the content of an extension element, markup consumers shall not treat elements and attributes from non-understood namespaces as Markup Compatibility errors. Similarly, under the same conditions, markup consumers shall disregard elements and attributes from the Markup Compatibility namespace.

A specification for an element nested somewhere within an extension-element might require a markup consumer to re-establish Markup Compatibility processing. Within the scope of such a nested element and its content, a markup consumer shall disregard all Markup Compatibility attributes that were encountered on elements outside of the element that re-establishes Markup Compatibility processing. Within the scope of such a nested element, a markup consumer might understand a set of namespaces that is different from the set of namespaces understood at the point in the markup where the extension element was encountered.

The following examples illustrate two uses of application-defined extension elements:

[*Example*: Example 11–1. An application-defined XML island

An extension element can be used to introduce an “island” of unprocessed XML whose markup is otherwise unconstrained by the application's specification. The specification of the island element can further require preservation of the contents of the island by markup processors, without requiring the use of the PreserveElements and PreserveAttributes Markup Compatibility attributes. *end example*]

[*Example*: Example 11–2. An application-defined add-in element

Some markup specifications and markup consumers can use an extension element to implement an add-in model. In an add-in model, the specification for the contents of the extension element is separate from the specification for the extension element itself.

The specification for some particular nested content can include support for Markup Compatibility elements and attributes, while the specification for other nested content could omit such support. If the specification for the nested content does include support for Markup Compatibility elements and attributes, the Markup Compatibility processing state is reset temporarily for processing of the nested content. Any Ignorable attribute-value associated with an extension element or any of its ancestor elements is “forgotten” during the processing of content nested within that extension element. In an add-in model the set of namespaces assumed to be understood when processing descendant elements of an extension element is completely unrelated to the set of understood namespaces when that extension element itself is processed.

In this example, the "Circles" specification includes an extension AddIn element, allowing for nested markup to be handled by a markup consumer that does not process Circle markup. The specification for the nested "TextFlow" markup does not provide for the processing of Markup Compatibility elements and attributes.

```
<Circles
  xmlns="http://schemas.openxmlformats.org/Circles/v1"
  xmlns:mc=http://schemas.openxmlformats.org/markup-
  compatibility/2006
  xmlns:v2="http://schemas.openxmlformats.org/Circles/v2"
  mc:Ignorable="v2 ">
  <Circle Center="0,0" Radius="20" Color="Blue"
    v2:Opacity="0.5" />
  <Circle Center="25,0" Radius="20" Color="Black"
    v2:Opacity="0.5" />
  <Circle Center="50,0" Radius="20" Color="Red"
    v2:Opacity="0.5" />
  <Circle Center="13,0" Radius="20" Color="Yellow"
    v2:Opacity="0.5" />
  <Circle Center="38,0" Radius="20" Color="Green"
    v2:Opacity="0.5" />
  <AddIn Center="25,10" Radius="10" CodeBase=
    "http://www.openxmlformats.org/code/TextFlowAddin.jar">
    <TextFlow
      xmlns="http://schemas.openxmlformats.org/TextFlow/v1">
      <!--
        Because the TextFlow specification does not make use
        of Markup Compatibility elements and attributes,
        the TextFlow processor would consider the presence
        of an mc:Ignorable attribute to be an error condition.
        Because the TextFlow specification is completely
        unaware of all versions of the Circles specification,
        the TextFlow processor would also consider the
        presence of a Circle or v2:Ellipse element to be an
        error condition.
      -->
      <Paragraph>How are <Bold>you</Bold>?</Paragraph>
    </TextFlow>
  </AddIn>
</Circles>
```

end example]

12. Preprocessing Model for Markup Consumption

This clause is informative.

Markup consumers might rely on a preprocessing model to support Markup Compatibility. Such a model can simplify the markup consumer's implementation and allow it to rely on XML schema validation for the preprocessed markup document. Furthermore, a single preprocessing implementation can be shared by markup consumers that target various markup specifications.

A markup preprocessor accepts as input XML markup containing a variety of elements and attributes from the following namespace categories:

- The Markup Compatibility namespace.
- *Current namespaces*: Understood namespaces that have not been subsumed by newer namespaces.
- *Obsolete namespaces*: Understood namespaces known to have been subsumed by newer namespaces).
- Non-understood namespaces.

The markup preprocessor transforms its input markup into output markup that contains elements and attributes drawn only from current and non-understood namespaces. This transformation is disabled for input markup nested within an application-defined extension element. The markup preprocessor accomplishes its transformation using the following rules:

The markup preprocessor checks for the correct usage of all elements and attributes in the Markup Compatibility namespace, and triggers error processing if an element or attribute in that namespace violates the requirements of this Markup Compatibility Part.

The markup preprocessor interprets occurrences of the MustUnderstand attribute, and triggers error processing when appropriate.

The markup preprocessor removes all elements and attributes in the Markup Compatibility namespace, removing the contents of unselected Choice and Fallback elements.

The markup preprocessor removes all elements and attributes in obsolete namespaces, and replaces them with identically named elements and attributes in current namespaces.

Guided by the Ignorable attribute, the markup preprocessor removes some elements and attributes in non-understood namespaces, leaving others undisturbed.

Guided by the ProcessContent attribute, the markup preprocessor removes all nested content within some removed elements from non-understood namespaces.

In addition to producing such transformed output, the markup preprocessor might also implement mechanisms to optionally provide to a markup editor the additional information necessary to preserve some ignored content.

[*Note*: The output of the markup preprocessor can be validated against a schema written entirely in terms of current namespaces. Where a schema does not allow for an open attribute or content model, occurrences of elements and attributes from non-understood namespaces in the markup preprocessor's output will trigger validation failures. Where a schema does allow for an open attribute or content model, occurrences of elements and attributes from non-understood namespaces will validate successfully.

If a markup preprocessor is used in conjunction with XSD schema validation, the schema should set the value of the elementFormDefault attribute of the root schema element to the value `qualified`. *end note*]

[*Example*: Example 12–1. Preprocessing using Markup Compatibility elements and attributes

Given the following input document:

```
<Circles
  xmlns="http://schemas.openxmlformats.org/Circles/v1"
  xmlns:mc="http://schemas.openxmlformats.org/markup-
  compatibility/2006"
  xmlns:v2="http://schemas.openxmlformats.org/Circles/v2"
  xmlns:v3="http://schemas.openxmlformats.org/Circles/v3"
  mc:Ignorable="v3"
  mc:ProcessContent="v3:Blink">
  <mc:AlternateContent>
    <mc:Choice Requires="v3">
      <v3:Circle Center="0,0" Radius="20" Color="Blue"
        Opacity="0.5" Luminance="13" />
      <v3:Circle Center="25,0" Radius="20" Color="Black"
        Opacity="0.5" Luminance="13" />
      <v3:Circle Center="50,0" Radius="20" Color="Red"
        Opacity="0.5" Luminance="13" />
      <v3:Circle Center="13,0" Radius="20" Color="Yellow"
        Opacity="0.5" Luminance="13" />
      <v3:Circle Center="38,0" Radius="20" Color="Green"
        Opacity="0.5" Luminance="13" />
    </mc:Choice>
    <mc:Fallback>
      <LuminanceFilter Luminance="13">
        <Circle Center="0,0" Radius="20" Color="Blue"
          v2:Opacity="0.5" />
```

```
            <Circle Center="25,0" Radius="20" Color="Black"
              v2:Opacity="0.5" />
            <Circle Center="50,0" Radius="20" Color="Red"
              v2:Opacity="0.5" />
            <Circle Center="13,0" Radius="20" Color="Yellow"
              v2:Opacity="0.5" />
            <Circle Center="38,0" Radius="20" Color="Green"
              v2:Opacity="0.5" />
          </LuminanceFilter>
        </mc:Fallback>
      </mc:AlternateContent>
      <v3:Blink>
        <Circle Center="13,0" Radius="20" Color="Yellow" />
        <Circle Center="38,0" Radius="20" Color="Green" />
      </v3:Blink>
      <v3:Watermark>
        <Circle Center="50,0" Radius="20" Color="Red" />
      </v3:Watermark>
    </Circles>
```

According to §10.2, this markup document's markup specification, when it defines the namespace name `http://schemas.openxmlformats.org/Circles/v2`, shall state the intended subsumption behavior when processing a Version 2 Opacity attribute that is applied to a Circle element from an earlier version. Depending on that statement, a Version 2 markup consumer renders the above markup as if it had processed one of the following pieces of preprocessed markup:

```
    <v2:Circles
      v2:xmlns="http://schemas.openxmlformats.org/Circles/v2">
      <v2:LuminanceFilter Luminance="13">
        <v2:Circle Center="0,0" Radius="20" Color="Blue"
          Opacity="0.5" />
        <v2:Circle Center="25,0" Radius="20" Color="Black"
          Opacity="0.5" />
        <v2:Circle Center="50,0" Radius="20" Color="Red"
          Opacity="0.5" />
        <v2:Circle Center="13,0" Radius="20" Color="Yellow"
          Opacity="0.5" />
        <v2:Circle Center="38,0" Radius="20" Color="Green"
          Opacity="0.5" />
      </v2:LuminanceFilter>
      <v2:Circle Center="13,0" Radius="20" Color="Yellow" />
      <v2:Circle Center="38,0" Radius="20" Color="Green" />
    </v2:Circles>
```

Or:

```
  <v2:Circles
    v2:xmlns="http://schemas.openxmlformats.org/Circles/v2">
    <v2:LuminanceFilter Luminance="13">
      <v2:Circle Center="0,0" Radius="20" Color="Blue"
        v2:Opacity="0.5" />
      <v2:Circle Center="25,0" Radius="20" Color="Black"
        v2:Opacity="0.5" />
      <v2:Circle Center="50,0" Radius="20" Color="Red"
        v2:Opacity="0.5" />
      <v2:Circle Center="13,0" Radius="20" Color="Yellow"
        v2:Opacity="0.5" />
      <v2:Circle Center="38,0" Radius="20" Color="Green"
        v2:Opacity="0.5" />
    </v2:LuminanceFilter>
    <v2:Circle Center="13,0" Radius="20" Color="Yellow" />
    <v2:Circle Center="38,0" Radius="20" Color="Green" />
  </v2:Circles>
```

end example]

End of informative text.

Annex A. Validation Using NVDL

This annex is informative.

Namespace-based Validation Dispatching Language (NVDL) allows documents to be decomposed into validation candidates, each of which may be validated independently.

NVDL may be used for validation against the normative requirements of this Part. It may also be used for validation against the combination of Office Open XML documents (including the elements and attributes defined in this Part) and any extensions.

A.1 Validation Against Requirements of this Part

A markup document may satisfy requirements of this Annex without being an Office Open XML document. The following NVDL script examines whether a given document correctly uses the attributes and elements as defined by this Part.

This NVDL script first extracts elements and attributes in the Markup Compatibility namespace, and then validates them against the appropriate RELAX NG schemas.

Note that AlternateContent, Choice and Fallback elements are allowed to have foreign elements and attributes.

```
<?xml version="1.0" encoding="UTF-8"?>
<rules xmlns="http://purl.oclc.org/dsdl/nvdl/ns/structure/1.0">
  <namespace match="attributes" ns="http://schemas.openxmlformats.org/markup-
    compatibility/2006">
    <validate schemaType="application/relax-ng-compact-syntax">
      <schema>
        namespace mc="http://schemas.openxmlformats.org/markup-
         compatibility/2006"
        nsList = list { xsd:NCName* }
        qnameList = list { (xsd:QName | xsd:string {pattern = "\i\c*:\*" })*}
        start = element * {
          attribute mc:Ignorable { nsList }?,
          attribute mc:ProcessContent { qnameList }?,
          attribute mc:PreserveElements { qnameList }?,
          attribute mc:PreserveAttributes { qnameList }?,
          attribute mc:MustUnderstand { nsList }?
        }
      </schema>
    </validate>
```

```
    </namespace>
    <namespace match="elements" ns="http://schemas.openxmlformats.org/markup-
    compatibility/2006">
      <validate schemaType="application/relax-ng-compact-syntax">
        <schema>
          default namespace ="http://schemas.openxmlformats.org/markup-
            compatibility/2006"
          nsList = list { xsd:NCName* }
          qnameList = list { (xsd:QName | xsd:string {pattern = "\i\c*:\*" })*}
          start = element AlternateContent {choice+,fallback?}
          choice = element Choice {attribute Requires { nsList }, text}
          fallback = element Fallback {text}
        </schema>
      </validate>
    </namespace>
    <namespace ns="" match="attributes">
      <attach/>
    </namespace>
    <anyNamespace match="elements attributes">
      <allow/>
    </anyNamespace>
  </rules>
```

The two RELAX NG schemas embedded in the above NVDL script may be rewritten in the analogous XML Schema form.

A.2 Validation Against the Combination of Office Open XML and Extensions

An extension of Office Open XML specified using the mechanisms defined in this Part may be captured by an NVDL script that invokes the Office Open XML schema and schemas for the extension.

The following schema allows two extensions. They have the namespaces http://www.example.com/myExtensionWithFallback and http://www.example.com/myExtensionWithoutFallback. The first extension is accompanied with a parent AlternateContent element and a sibling Fallback element, while the second one may appear anywhere in the document without AlternateContent or Fallback elements.

```
  <?xml version="1.0" encoding="UTF-8"?>
  <rules xmlns="http://purl.oclc.org/dsdl/nvdl/ns/structure/1.0" startMode="top">
      <mode name="top">
          <namespace
            ns="http://schemas.openxmlformats.org/wordprocessingml/2006/main">
              <validate schema="wml.xsd" useMode="nested"/>
          </namespace>
      </mode>
```

```
        <mode name="nested">
            <namespace match="attributes elements"
                ns="http://schemas.openxmlformats.org/drawingml/2006/*">
                <attach/>
            </namespace>
            <namespace match="attributes elements"
                ns="http://schemas.openxmlformats.org/officeDocument/2006/*">
                <attach/>
            </namespace>
            <namespace match="attributes elements"
              ns="http://schemas.openxmlformats.org/package/2006/*">
                <attach/>
            </namespace>
            <namespace match="attributes elements"
                ns="http://schemas.openxmlformats.org/presentationml/2006/main">
                <attach/>
