Description: Creates a new array that is the transpose of an existing array, by copying the first row of the existing array to the first column of the new array, the second row of the existing array as the second column of the new array, and so on. The formula containing the call to TRANSPOSE shall be an array formula in a range that has the same number of rows and columns, respectively, as *array* has columns and rows.

Arguments:

Name	Type	Description
array	array, reference	The set of values to be transposed.

Return Type and Value: array – The new array.

[*Example*:

`TRANSPOSE({10,20,30})` results in the array `{10;20;30}`

end example]

3.17.7.325 TREND

Syntax:

TREND (*known-ys* [, [*known-xs*] [, [*new-xs*] [, *const-flag*]])

Description: Computes values along a linear trend. Fits a straight line (using the method of least squares) to the arrays *known-ys* and *known-xs*. The y-values along that line for the array of *new-xs* specified.

Arguments:

Name	Type	Description
known-ys	array	The set of y-values already known in the relationship *y=mx+b*. If that array is in a single column, each column of *known-xs* is interpreted as a separate variable. If that array is in a single row, each row of *known-xs* is interpreted as a separate variable.
known-xs	array	An optional set of x-values that might already be known in the relationship *y=mx+b*. The array *known-xs* can include one or more sets of variables. If only one variable is used, *known-ys* and *known-xs* can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, *known-ys* shall be a vector. If *known-xs* is omitted, it is assumed to be the array {1,2,3,...} that is the same size as *known-ys*.
new-xs	array	New x-values for which TREND is to return corresponding y-values. *new-xs* shall include a column (or row) for each independent variable, just as *known-xs* does. So, if *known-ys* is in a single column, *known-xs* and *new-xs* shall have the same number of columns. If *known-ys* is in a single row, *known-xs* and *new-xs* shall have the same number of rows. If *new-xs* is omitted, it is assumed to be the same as *known-xs*. If both *known-xs* and *new-xs* are omitted, they are assumed to be the array {1,2,3,...} that is the same size as *known-ys*.
const-flag	logical	Specifies whether to force the constant b to equal 0. If TRUE or omitted, *b* is calculated normally. If FALSE, *b* is set equal to 0 and the m-values are adjusted so that *y=mx*.

Return Type and Value: array – The values along a linear trend, as an array of numbers.

3.17.7.326 TRIM

Syntax:

TRIM (*string*)

Description: Makes a string that is a copy of *string* with the leading and trailing space characters removed, and each sequence of embedded spaces reduced to a single space. The space character referred to here is character U+0020.

Arguments:

Name	Type	Description
string	text	Designates the string to be trimmed.

Return Type and Value: text – The trimmed copy of *string*.

[*Example*:

`TRIM("  abc  def  ")` results in `abc def`

end example]

3.17.7.327 TRIMMEAN

Syntax:

`TRIMMEAN ( array , percent )`

Description: Computes the mean of the interior of a data set by excluding a percentage of data points from the top and bottom tails of a data set. `TRIMMEAN` rounds the number of excluded data points down to the nearest multiple of 2. For symmetry, `TRIMMEAN` excludes a single value from the top and bottom of the data set.

Arguments:

Name	Type	Description
array	array, reference	The numeric values to trim and average.
percent	number	The fractional number of data points to exclude from the calculation. [*Example*: If *percent* = 0.2, 4 points are trimmed from a data set of 20 points (20x0.2): 2 from the top and 2 rom the bottom of the set. *end example*]

Return Type and Value: number – The mean of the interior of a data set.

However, if *percen* < 0 or *percen* > 1, `#NUM!` is returned.

[*Example*:

`TRIMMEAN({4,6,2,5,7,8,9},0.2)` results in `5.857142857`

end example]

3.17.7.328 TRUE

Syntax:

```
TRUE ( )
```

Description: Computes the value TRUE. (A call to function TRUE is equivalent to using the *logical-constant* TRUE.)

Arguments: None.

Return Type and Value: logical – The value TRUE.

[*Example*:

TRUE() results in TRUE

end example]

3.17.7.329 TRUNC

Syntax:

```
TRUNC ( x [ , number-digits ] )
```

Description: Truncates *x* to the number of fractional digits by *number-digits*.

Arguments:

Name	Type	Description
x	array, reference	The value to be rounded down.
number-digits	number	The number of fractional digits to which *x* is to be truncated. The default value for *number-digits* is 0.

Return Type and Value: number – The truncated value of *x*.

[*Example*:

TRUNC(PI()) results in 3
TRUNC(PI(),1) results in 3.1
TRUNC(PI(),3) results in 3.141
TRUNC(PI(),5) results in 3.14159

end example]

3.17.7.330 TTEST

Syntax:

TTEST (*array-1* , *array-2* , *distribution-tails* , *test-type*)

Description: Computes the probability associated with a Student's t-Test.

Arguments:

Name	Type	Description
array-1	array, reference	The first numerical data set.
array-1	array, reference	The first numerical data set.
distribution-tails	number	Specifies the number of distribution tails, truncated to an integer. If 1, TTEST uses the one-tailed distribution. If 2, TTEST uses the two-tailed distribution.
test-type	number	The truncated-to-integer kind of t-Test to perform, as follows:

Value	Test Performed
1	Paired
2	Two-sample equal variance (homoscedastic)
3	Two-sample unequal variance (heteroscedastic)

Return Type and Value: number – The probability associated with a Student's t-Test.

However, if

- *array-1* and *array-2* have a different number of data points, and *test-type* is 1, the return value is unspecified.
- *distribution-tails* is any value other than 1 or 2, #NUM! is returned.

[*Example*: Given the following data:

	A	B
1	Data 1	Data 2
2	3	6
3	4	19
4	5	3
5	8	2
6	9	14

	A	B
7	1	4
8	2	5
9	4	17
10	5	1

`TTEST(A2:A10,B2:B10,2,1)` results in `0.196016`

end example]

3.17.7.331 TYPE

Syntax:

TYPE (*value*)

Description: Computes the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell.

Arguments:

Name	Type	Description
value	any	The value whose type is to be determined. No conversion shall take place on an argument passed to this function.

Return Type and Value: number – An integer that indicates the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell, as follows:

Type of *value*	Value Returned
number	1
text	2
logical	4
error value	16
array of any kind	64

[*Example*:

`TYPE(10.5)` results in `1`
`TYPE(A10)` results in `1`, when A10 contains a number
`TYPE("ABC")` results in 2
`TYPE(A10)` results in 2, when A10 contains a string

TYPE(TRUE) results in 4
TYPE(A10) results in 4, when A10 contains a logical value

TYPE(5/0) results in 16
TYPE(A10) results in 16, when A10 contains any error value
TYPE({1,2,3}) results in 64
TYPE({TRUE,2.5,#N/A}) results in 64
TYPE(IF(10>5,"Yes",20)) results in 2
TYPE(IF(10<5,"Yes",20)) results in 1

end example]

3.17.7.332 UPPER

Syntax:

UPPER (*string*)

Description: Makes an uppercase version of *string*.

Arguments:

Name	Type	Description
string	text	Designates the string to be converted.

Return Type and Value: text – The uppercase version of *string*.

[*Example*:

UPPER("AbCd123#$%^") results in ABCD123#$%^
UPPER(A10) results in 234FRTQWC$#%, when A10 contains 234FRTqwc$#%

end example]

3.17.7.333 USDOLLAR

Syntax:

USDOLLAR (*number* [, *num-decimal*])

Description: Produces a string containing *number* rounded to *num-decimal* decimal places. The thousands separator is the comma, the radix point is the period, and the currency symbol is "$". The format used is $#,##0.00;($#,##0.00).

Arguments:

Name	Type	Description

Name	Type	Description
number	number	The number that is to be formatted.
num-decimal	number	Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If *num-decimal* is negative, *number* is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed.

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places, and have a currency symbol and thousands separators.

[*Example*:

`USDOLLAR(1234.567)` results in `$1,234.57`
`USDOLLAR(1234.567,-2)` results in `$1,200`
`USDOLLAR(-1234.567,4)` results in `($1,234.5670)`

end example]

3.17.7.334 VALUE

Syntax:

```
VALUE ( string )
```

Description: Converts *string* to a number.

Arguments:

Name	Type	Description
string	text	Designates a string that contains a number formatted using any number, currency, date, or time format. (See §3.8.31 for the set of formats.) Date and time strings are converted to their equivalent serial value.

Return Type and Value: number – The number represented by *string*.

[*Example*:

`VALUE("123.456")` results in `123.456`
`VALUE("$1,000")` results in `1000`
`VALUE("23-Mar-2002")` results in the corresponding serial value
`VALUE("16:48:00")-VALUE("12:17:12")` results in `0.188056`

end example]

3.17.7.335 VAR

Syntax:

VAR (*argument-list*)

Description: Makes an estimate of the variance based on a sample. [*Note*: VAR assumes that its arguments are a sample of the population. If the data represents the entire population, VARP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use VARA instead. *end note*]

Mathematical Formula:

$$\frac{\sum(x-\bar{x})^2}{(n-1)}$$

where x is the sample mean AVERAGE(*argument-1*, *argument-1*,…, *argument-n*) and n is the sample size.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers that are samples of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – An estimate of the variance based on a sample.

[*Example*:

VAR(1202,1220,1323,1254,1302) results in 2683.2

end example]

3.17.7.336 VARA

Syntax:

VARA (*argument-list*)

Description: Makes an estimate of the variance based on a sample. [*Note*: VARA assumes that its arguments are a sample of the population. If the data represents the entire population, VARPA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VAR instead. *end note*]

Mathematical Formula:

$$\frac{\sum(x-\bar{x})^2}{(n-1)}$$

where x is the sample mean AVERAGE(*argument-1*, *argument-1*,…, *argument-n*) and n is the sample size.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers that are samples of the population. Logical values and text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

Return Type and Value: number – An estimate of the variance based on a sample.

[*Example*:

VARA(1202,1220,1323,1254,1302) results in 2683.2

end example]

3.17.7.337 VARP

Syntax:

VARP (*argument-list*)

Description: Computes the variance of an entire population. [*Note*: VARP assumes that its arguments are the total population. If the data represents a population sample only, VAR should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use VARPA instead. *end note*]

Mathematical Formula:

$$\frac{\sum(x-\bar{x})^2}{n}$$

where x is the sample mean AVERAGE(*argument-1*, *argument-1*,…, *argument-n*) and n is the sample size.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored.

Return Type and Value: number – The variance of an entire population.

[*Example*:

VARP(1202,1220,1323,1254,1302) results in 2146.56

end example]

3.17.7.338 VARPA

Syntax:

VARPA (*argument-list*)

Description: Makes the variance of an entire population. [*Note*: VARPA assumes that its arguments are the total population. If the data represents a population sample only, VARA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VARP instead. *end note*]

Mathematical Formula:

$$\frac{\sum (x-\bar{x})^2}{n}$$

where x is the sample mean AVERAGE(*argument-1*, *argument-1*,…, *argument-n*) and n is the sample size.

Arguments:

Name	Type	Description
argument-list	logical, number, name, text, array, reference	The *argument*s in *argument-list* designate the numbers that are the members of the population.

Return Type and Value: number – The variance of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[*Example*:

`VARPA(1202,1220,1323,1254,1302)` results in `2146.56`

end example]

3.17.7.339 VDB

VDB (*cost* , *salvage* , *life* , *start-period* , *end-period* [, [[*factor*] [, [*no-switch-flag*]]]])

Description: Computes the depreciation of an asset for the period specified, including partial periods, using the double-declining balance or some other specified method.

Arguments:

Name	Type	Description
cost	number	The number *cost* is the initial cost of the asset.
salvage	number	The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.) This value can be 0.
life	number	The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.)
start-period	number	The starting period for which the depreciation is to be calculated. (*start-period* shall use the same units as *life*.)
end-period	number	The ending period for which the depreciation is to be calculated. (*end-period* shall use the same units as *life*.)
factor	number	The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method).
no-switch-flag	logical	Specifies whether to switch to straight-line depreciation when depreciation is greater than the declining balance calculation. If TRUE, straight-line depreciation is not used even when the depreciation is greater than the declining balance calculation. If FALSE or omitted, the straight-line depreciation is used when depreciation is greater than the declining balance calculation.

Return Type and Value: number – The depreciation of an asset for the period specified.

However, if any numerical argument value is non-positive, `#NUM!` is returned.

[*Example*:

`VDB(2400,300,10*365,0,1)` results in `1.32`
`VDB(2400,300,10*12,0,1)` results in `40.00`
`VDB(2400,300,10*12,6,18)` results in `396.31`

end example]

3.17.7.340 VLOOKUP

Syntax:

VLOOKUP (*lookup-value* , *table-array* , *col-index-num* [, [*range-lookup-flag*]])

Description: Performs a vertical search for a value in the left-most column of a table or an array, noting the row in which the matching value is found. From that row, the value from a given column is returned.

Arguments:

Name	Type	Description
lookup-value	value of any type or a reference to a value of any type.	The value to be located in the left-most column of the table. If *range-lookup* is FALSE and *lookup-value* is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in *lookup-value*. A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or asterisk, type a tilde (~) before the character.
table-array	array, reference, name	Designates the table of information to be searched. The values in the left-most column of *table-array* can be text, numbers, or logical values. The values in the left-most column of *table-array* shall be placed in "ascending order", as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. Uppercase and lowercase text is treated as equivalent.
col-index-num	number	The column number in *table-array* from which the matching value is to be returned. (A *col-index-num* of 1 returns the left-most column value in *table-array*, a *col-index-num* of 2 returns the next column in *table-array*, and so on.)
range-lookup-flag	logical	Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found,

Name	Type	Description
		the next largest value that is less than *lookup-value* is returned. If FALSE, an exact match is performed, in which case, the values in the left-most column of *table-array* need not be sorted. If there are two or more values in the left-most column of *table-array* that match *lookup-value*, the top-most value found is used.

Return Type and Value: any – The value from a given row number, where the column is determined by a search of the top row looking for a match with a given value.

However, if

- An exact match is performed, but no match is found, #N/A is returned.
- *col-index-num* is less than 1, #VALUE! is returned.
- *col-index-num* is greater than the number of columns in *table-array*, #REF! is returned.
- *lookup-value* is smaller than the smallest value in the left-most column of *table-array*, #N/A is returned.

[*Example*: Given the following data:

	A	B	C
1	Density	Bearings	Bolts
2	0.457	3.55	500
3	0.525	3.25	400
4	0.616	2.93	300
5	0.675	2.75	250
6	0.746	2.57	200
7	0.835	2.38	150
8	0.946	2.17	100
9	1.09	1.95	50
10	1.29	1.71	0

VLOOKUP(1,A2:C10,2) results in 2.17
VLOOKUP(1,A2:C10,3,TRUE) results in 100.00
VLOOKUP(2,A2:C10,2,TRUE) results in 1.71

end example]

3.17.7.341 WEEKDAY

Syntax:

WEEKDAY (*serial-value* [, *weekday-start-flag*])

Description: Computes the weekday number for the date having the given *serial-value*, taking into account the current date base value and *weekday-start-flag*, if present. See §3.17.4.1 for special handling of certain days in 1900.

Arguments:

Name	Type	Description
serial-value	number	The date whose weekday number is to be computed. The value of *serial-value* is truncated to an integer.
weekday-start-flag	number	When truncated to integer, indicates the weekday numbering convention to be used, as follows: **Value** / **Meaning** 1 or omitted — 1 (Sunday) through 7 (Saturday) 2 — 1 (Monday) through 7 (Sunday) 3 — 0 (Monday) through 6 (Sunday)

Return Type and Value: number – The weekday number for the date having the given serial value.

However, if

- *serial-value* is out of range for the current date base value, #NUM! is returned.
- *weekday-start-flag* is out of the range specified in the table above, #NUM! is returned.

[*Example*:

WEEKDAY(DATE(2006,2,1)) results in 4 (Wednesday)
WEEKDAY(DATE(2006,2,1),1) results in 4 (Wednesday)
WEEKDAY(DATE(2006,2,1),2) results in 3 (Wednesday)
WEEKDAY(DATE(2006,2,1),3) results in 2 (Wednesday)

end example]

3.17.7.342 WEEKNUM

Syntax:

WEEKNUM (*serial-value* [, *weekday-start-flag*])

Description: Computes the week number of the date corresponding to *serial-value*. The week containing January 1 is the first week of the year, and is numbered week 1.

Arguments:

Name	Type	Description
serial-value	number	The date whose week number is to be computed. The value of *serial-value* is truncated to an integer.
weekday-start-flag	number	When truncated to integer, indicates the weekday on which the week begins, as follows: *weekday-start-flag* / Meaning 1 or omitted / Week begins on Sunday. 2 / Week begins on Monday.

Return Type and Value: number – The week number of the date corresponding to *serial-value*.

However, if

- *serial-value* is out of range for the current date base value, `#NUM!` is returned.
- *weekday-start-flag* is out of the range specified in the table above, `#NUM!` is returned.

[*Example*:

`WEEKNUM(DATE(2006,1,1)` results in `1`
`WEEKNUM(DATE(2006,1,1),1)` results in `1`
`WEEKNUM(DATE(2006,2,1),1)` results in `5`
`WEEKNUM(DATE(2006,2,1),2)` results in `6`

end example]

3.17.7.343 WEIBULL

Syntax:

`WEIBULL ( x , alpha , beta , cumulative-flag )`

Description: Computes the Weibull distribution.

Mathematical Formula:

The equation for the Weibull cumulative distribution function is:

$$F(x;\alpha,\beta) = 1 - e^{-(x/\beta)^{\alpha}}$$

The equation for the Weibull probability density function is:

$$f(x;\alpha,\beta) = \frac{\alpha}{\beta^{\alpha}} x^{\alpha-1} e^{-(x/\beta)^{\alpha}}$$

When *alpha* = 1, `WEIBULL` returns the exponential distribution with:

$$\lambda = \frac{1}{\beta}$$

Arguments:

Name	Type	Description
x	number	The value at which the distribution is to be evaluated.
alpha	number	A parameter of the distribution.
beta	number	A parameter of the distribution.
cumulative-flag	logical	Determines the form of the function. If `TRUE`, `GAMMADIST` returns the cumulative distribution function; if `FALSE`, it returns the probability density function.

Return Type and Value: number – The Weibull distribution.

However, if

- *x* < 0, `#NUM!` is returned.
- *alpha* ≤ 0, `#NUM!` is returned.
- *beta* ≤ 0, `#NUM!` is returned.

[*Example*:

`WEIBULL(105,20,100,TRUE)` results in `0.92958139`
`WEIBULL(105,20,100,FALSE)` results in `0.035588864`

end example]

3.17.7.344 WORKDAY

Syntax:

`WORKDAY ( start-date , day-offset [ , holidays ] )`

Description: Computes the serial value of the date that is *day-offset* working days offset from *start-date*. Weekend days and any holidays specified by *holidays* are not considered as working days.

Arguments:

Name	Type	Description
start-date	number	The start date, truncated to integer.

Name	Type	Description
day-offset	number	The number of working days before or after *start-date*. A positive value yields a future date; a negative value yields a past date; a zero value yields the date *start-date*. *day-offset* is truncated to an integer.
holidays	reference, array	An optional set of one or more dates that are to be excluded from the working day calendar. *holidays* shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in *holidays* can be arbitrary.

Return Type and Value: number – The serial value of the date that is *day-offset* working days offset from *start-date*, excluding the specified holidays.

However, if

- *start-date* is out of range for the current date base value, `#NUM!` is returned.
- Any date in *holidays* is out of range for the current date base value, `#NUM!` is returned.
- *start-date* plus *day-offset* yields an invalid date, `#NUM!` is returned.

[*Example*:

`WORKDAY(DATE(2006,1,1),0)` results in a serial value corresponding to 1-Jan-2006
`WORKDAY(DATE(2006,1,1),10)` results in a serial value corresponding to 13-Jan-2006
`WORKDAY(DATE(2006,1,1),-10)` results in a serial value corresponding to 19-Dec-2005
`WORKDAY(DATE(2006,1,1),20,{"2006/1/2","2006/1/16"})` results in a serial value corresponding to 31-Jan-2006

end example]

3.17.7.345 XIRR

`XIRR ( values , dates [ , [ guess ] ] )`

Description: Computes the internal rate of return for a schedule of cash flows that is not necessarily periodic. `XIRR` uses an iterative calculation technique that cycles through the calculation until the result is accurate within 0.000001 percent.

Mathematical Formula:

Using a changing rate (starting with *guess*), `XIRR` cycles through the calculation until the result is accurate within 0.000001 percent. The rate is changed until:

$$0 = \sum_{i=1}^{M} \frac{P_i}{(1+rate)^{\frac{(d_i - d_1)}{365}}}$$

where:

di = the i^{th}, or last, payment date.
d1 = the 0^{th} payment date.
Pi = the i^{th}, or last, payment.

Arguments:

Name	Type	Description
values	array, reference	A series of cash flows that corresponds to a schedule of payment dates specified in *dates*. The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value.
dates	reference	A schedule of payment dates that corresponds to the cash flow payments in *values*. The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored.
guess	number	An estimate of the result of XIRR. If omitted, it is assumed to be 0.1 (i.e., 10 percent).

Return Type and Value: number – The internal rate of return for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date base value, #NUM! is returned.
- Any date in *dates* precedes the starting date, #NUM! is returned.
- *values* and *dates* contain different numbers of values, #NUM! is returned.
- The calculation has not converged after an implementation-defined number of tries, #NUM! is returned.

[*Example*: When the cells F2397:J2397contain the dates January 1, 2008; March 1,2008; October 30, 2008; February 15, 2009, and April 1, 2009:

XIRR({-10000,2750,4250,3250,2750},F2397:J2397,0.1) results in 37.34%

end example]

3.17.7.346 XNPV

XNPV (*rate* , *values* , *dates*)

Description: Computes the net present value for a schedule of cash flows that is not necessarily periodic.

Mathematical Formula:

$$XNPV = \sum_{i=1}^{N} \frac{P_i}{(1+rate)^{\frac{(d_i - d_1)}{365}}}$$

where:

di = the i^{th}, or last, payment date.
d1 = the 0^{th} payment date.
Pi = the i^{th}, or last, payment.

Arguments:

Name	Type	Description
rate	number	The discount rate to apply to the cash flows.
values	array, reference	A series of cash flows that corresponds to a schedule of payment dates specified in *dates*. The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value.
dates	reference	A schedule of payment dates that corresponds to the cash flow payments in *values*. The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored.

Return Type and Value: number – The net present value for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date base value, `#NUM!` is returned.
- Any date in *dates* precedes the starting date, `#NUM!` is returned.

- *values* and *dates* contain different numbers of values, #NUM! is returned.

[*Example*: When the cells F2397:J2397 contain the dates January 1, 2008; March 1,2008; October 30, 2008; February 15, 2009, and April 1, 2009:

XNPV(0.09,{-10000,2750,4250,3250,2750},F2397:J2397) results in 2086.65

end example]

3.17.7.347 YEAR

Syntax:

YEAR (*date-value*)

Description: Computes the numeric Gregorian year for the date and/or time having the given *date-value*, taking into account the current date base value. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any time information shall be ignored.

Arguments:

Name	Type	Description
date-value	number, text	The date and/or time whose year is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any valid date and/or time format, in which case, any time information shall be ignored.

Return Type and Value: number – The Gregorian year for the date and/or time having the given *date-value*. For the 1900 date base system, the returned value shall be in the range 1900–9999. For the 1904 date base system, the returned value shall be in the range 1904–9999.

However, if *date-value* is out of range for the current date base value, #NUM! is returned.

[*Example*:

YEAR(DATE(2006,1,2)) results in 2006
YEAR(DATE(2006,0,2)) results in 2005
YEAR("2006/1/2 10:45 AM") results in 2006
YEAR(30000) results in 1982 for the 1900 date base system, or 1986 for the 1904 date base system

end example]

3.17.7.348 YEARFRAC

Syntax:

YEARFRAC (*start-date* , *end-date* [, *basis*])

Description: Computes the fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date*., according to *basis*.

Arguments:

Name	Type	Description
start-date	number	The period's starting date. *start-date* can be earlier than, the same as, or later than *end-date*.
end-date	number	The period's ending date.
day-count-basis	number	The security's issue date.
basis	number	The truncated integer type of day count basis to use, as follows: **Value** / **Day Count Basis** 0 or omitted / US (NASD) 30/360 1 / Actual/actual 2 / Actual/360 3 / Actual/365 4 / European 30/360

All arguments are truncated to integers.

Return Type and Value: number – The fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date*., according to *basis*.

However, if the value of *basis* is out of range, #NUM! is returned.

[*Example*:

YEARFRAC(DATE(2006,1,1),DATE(2006,3,26)) results in 0.236111111
YEARFRAC(DATE(2006,3,26),DATE(2006,1,1)) results in 0.236111111
YEARFRAC(DATE(2006,1,1),DATE(2006,7,1)) results in 0.5
YEARFRAC(DATE(2006,1,1),DATE(2007,9,1)) results in 1.666666667
YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),0) results in 0.5
YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),1) results in 0.495890411
YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),2) results in 0.502777778

YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),3) results in 0.495890411
YEARFRAC(DATE(2006,1,1),DATE(2006,7,1),4) results in 0.5

end example]

3.17.7.349 YIELD

Syntax:

YIELD (*settlement* , *maturity* , *rate* , *pr* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the yield on a security that pays periodic interest.

Mathematical Formula:

If there is one coupon period or less until redemption, YIELD is calculated as follows:

$$YIELD = \frac{(\frac{redemption}{100} + \frac{rate}{frequency}) - (\frac{par}{100} + (\frac{A}{E} \times \frac{rate}{frequency}))}{\frac{par}{100} + (\frac{A}{E} \times \frac{rate}{frequency})} \times \frac{frequency \times E}{DSR}$$

where:

A = number of days from the beginning of the coupon period to the settlement date (accrued days).
DSR = number of days from the settlement date to the redemption date.
E = number of days in the coupon period.

If there is more than one coupon period until redemption, YIELD is calculated through some number of iterations. The resolution uses the Newton method, based on the formula used for the function PRICE. The yield is changed until the estimated price given the yield is close to price.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
rate	number	The security's interest rate.
pr	number	The security's price.
redemption	number	The security's redemption value per $100 face value.
frequency	number	the number of coupon payments per year. (For annual payments, *frequency* is 1; for semiannual payments, *frequency* is 2; for quarterly payments, *frequency* is 4.) *frequency* is truncated to an integer.
basis	number	The truncated integer type of day count basis to use, as follows:

Name	Type	Description
		<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360</td></tr><tr><td>1</td><td>Actual/actual</td></tr><tr><td>2</td><td>Actual/360</td></tr><tr><td></td><td>Actual/365</td></tr><tr><td>4</td><td>European 30/360</td></tr></table>

Time information in the date arguments is ignored.

Return Type and Value: number – The yield on a security that pays periodic interest.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *rate* < 0, `#NUM!` is returned.
- *pr* or *redemption* ≤ 0, `#NUM!` is returned.
- *frequency* is any number other than 1, 2, or 4, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`YIELD(DATE(2008,2,15),DATE(2016,11,15),0.0575,95.04287,100,2,0)` results in `6.5000%`

end example]

3.17.7.350 YIELDDISC

Syntax:

`YIELDDISC ( `*settlement*` , `*maturity*` , `*pr*` , `*redemption*` [ , [ `*basis*` ] ] )`

Description: Computes the annual yield for a discounted security.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
pr	number	The security's price.

Name	Type	Description
redemption	number	The security's redemption value per $100 face value.
basis	number	The truncated integer type of day count basis to use, as follows: 0 or omitted: US (NASD) 30/360 1: Actual/actual 2: Actual/360 3: Actual/365 4: European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The annual yield for a discounted security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *pr* or *redemption* ≤ 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

`YIELDDISC(DATE(2008,2,16),DATE(2008,3,1),99.795,100,2)` results in `5.2823%`

end example]

3.17.7.351 YIELDMAT

Syntax:

`YIELDMAT ( settlement , maturity , issue , rate , pr [ , [ basis ] ] )`

Description: Computes the annual yield of a security that pays interest at maturity.

Arguments:

Name	Type	Description
settlement	number	The security's settlement date.
maturity	number	The security's maturity date.
issue	number	The security's issue date.

Name	Type	Description
rate	number	The security's interest rate.
pr	number	The security's price.
basis	number	The truncated integer type of day count basis to use, as follows: 0 or omitted: US (NASD) 30/360 1: Actual/actual 2: Actual/360 3: Actual/365 4: European 30/360

Time information in the date arguments is ignored.

Return Type and Value: number – The annual yield of a security that pays interest at maturity.

However, if

- *settlement*, *maturity*, or *issue* is out of range for the current date base value, `#NUM!` is returned.
- *settlement* ≥ *maturity*, `#NUM!` is returned.
- *rate* or *pr* ≤ 0, `#NUM!` is returned.
- *basis* < 0 or *basis* > 4, `#NUM!` is returned.

[*Example*:

```
YIELDMAT(DATE(2008,3,15),DATE(2008,11,3),DATE(2007,11,8),0.0625,
  100.0123,0) results in 6.0954%
```

end example]

3.17.7.352 ZTEST

Syntax:

```
ZTEST ( array , test-value [ , sigma ] )
```

Description: Computes the one-tailed probability-value of a z-test. For a given hypothesized population mean, *test-value*, ZTEST returns the probability that the sample mean would be greater than the average of observations in the data set *array*; that is, the observed sample mean.

Mathematical Formula:

When *sigma* is present:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST((\bar{x} - \mu_0)/(sigma / \sqrt{n}))$$

When *sigma* is omitted:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST((\bar{x} - \mu_0)/(s / \sqrt{n}))$$

where x is the sample mean AVERAGE(*array*); s is the sample standard deviation STDEV(*array*); and n is the number of observations in the sample COUNT(*array*).

Arguments:

Name	Type	Description
array	array	The set of numerical data against which to test *test-value*.
test-value	number	The number to test.
sigma	number	The number is the population (known) standard deviation. If omitted, the sample standard deviation is used.

Return Type and Value: number – The one-tailed probability-value of a z-test.

However, if *array* is empty, the return value is unspecified.

[*Example*:

`ZTEST({3,6,7,8,6,5,4,2,1,9},4)` results in `0.090574197`
`ZTEST({3,6,7,8,6,5,4,2,1,9},6)` results in `0.863043389`

end example]

3.18 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/spreadsheetml/2006/main namespace.

3.18.1 ST_Axis (PivotTable Axis)

This simple type defines the axes for a PivotTable selection.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
axisCol (Column Axis)	Column axis
axisPage (Include Count Filter)	Page axis
axisRow (Row Axis)	Row axis
axisValues (Values Axis)	Values axis

Referenced By
pivotArea@axis (§3.3.1.66); pivotField@axis (§3.10.1.69); pivotSelection@axis (§3.3.1.67)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Axis">
   <restriction base="xsd:string">
      <enumeration value="axisRow"/>
      <enumeration value="axisCol"/>
      <enumeration value="axisPage"/>
      <enumeration value="axisValues"/>
   </restriction>
</simpleType>
```

3.18.2 ST_BorderId (Border Id)

Zero-based index of the border record used by this cell format.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
xf@borderId (§3.8.45)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BorderId">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

3.18.3 ST_BorderStyle (Border Line Styles)

The line style of a border in a cell.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dashDot (Dash Dot)	The line style of a border is dash-dot. [*Example*:

Enumeration Value	Description
	 *end example*]
dashDotDot (Dash Dot Dot)	The line style of a border is dash-dot-dot. [*Example*:  *end example*]
dashed (Dashed)	The line style of a border is dashed. [*Example*:  *end example*]
dotted (Dotted)	The line style of a border is dotted. [*Example*:  *end example*]
double (Double Line)	The line style of a border is double line. [*Example*:  *end example*]
hair (Hairline Border)	The line style of a border is hairline. [*Example*: 

Enumeration Value	Description
	end example]
medium (Medium Border)	The line style of a border is medium. [*Example*:  *end example*]
mediumDashDot (Medium Dash Dot)	The line style of a border is medium dash-dot. [*Example*:  *end example*]
mediumDashDotDot (Medium Dash Dot Dot)	The line style of a border is medium dash-dot-dot. [*Example*:  *end example*]
mediumDashed (Medium Dashed)	The line style of a border is medium dashed. [*Example*:  *end example*]
none (None)	The line style of a border is none (no border visible). [*Example*: *end example*]
slantDashDot (Slant Dash Dot)	The line style of a border is slant-dash-dot.

Enumeration Value	Description
	[*Example*:  *end example*]
thick (Thick Line Border)	The line style of a border is 'thick'. [*Example*:  *end example*]
thin (Thin Border)	The line style of a border is thin. [*Example*:  *end example*]

Referenced By
bottom@style (§3.8.6); diagonal@style (§3.8.13); horizontal@style (§3.8.24); left@style (§3.8.27); right@style (§3.8.35); top@style (§3.8.43); vertical@style (§3.8.44)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BorderStyle">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="thin"/>
      <enumeration value="medium"/>
      <enumeration value="dashed"/>
      <enumeration value="dotted"/>
      <enumeration value="thick"/>
      <enumeration value="double"/>
      <enumeration value="hair"/>
      <enumeration value="mediumDashed"/>
      <enumeration value="dashDot"/>
      <enumeration value="mediumDashDot"/>
      <enumeration value="dashDotDot"/>
      <enumeration value="mediumDashDotDot"/>
      <enumeration value="slantDashDot"/>
   </restriction>
</simpleType>
```

3.18.4 ST_CalcMode (Calculation Mode)

This simple type defines the supported modes for performing calculations on workbook data.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatic)	Indicates that calculations in the workbook will be performed automatically when cell values change. The application recalculates those cells that are dependent on other cells that contain changed values. This type of calculation helps to avoid unnecessary calculations.
autoNoTable (Automatic Calculation (No Tables))	Indicates tables be excluded during automatic calculation.
manual (Manual Calculation Mode)	Indicates that calculations in the workbook be triggered manually by the user. For example, the application might expose a command in the user interface.

Referenced By
calcPr@calcMode (§3.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CalcMode">
   <restriction base="xsd:string">
      <enumeration value="manual"/>
      <enumeration value="auto"/>
      <enumeration value="autoNoTable"/>
   </restriction>
</simpleType>
```

3.18.5 ST_CalendarType (Calendar Type)

Calendar type enumeration for date grouped items of a filter.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
gregorian (Gregorian)	Gregorian (localized) calendar
gregorianArabic (Gregorian Arabic Calendar)	Gregorian Arabic calendar
gregorianMeFrench (Gregorian Middle East French Calendar)	Gregorian Middle East French calendar
gregorianUs (Gregorian (U.S.) Calendar)	Gregorian (U.S.) calendar
gregorianXlitEnglish (Gregorian Transliterated English Calendar)	Gregorian Transliterated English calendar
gregorianXlitFrench (Gregorian Transliterated French Calendar)	Gregorian Transliterated French calendar
hebrew (Hebrew (Lunar) Calendar)	Hebrew (Lunar) calendar
hijri (Hijri (Arabic Lunar) Calendar)	Hijri (Arabic Lunar) calendar
japan (Japanese Emperor Era Calendar)	Japanese Emperor Era calendar
korea (Korean Tangun Era Calendar)	Korean Tangun Era calendar
none (No Calendar Type)	No calendar type specified
taiwan (Taiwan Era Calendar)	Taiwan Era calendar
thai (Thai Calendar)	Thai calendar

Referenced By
filters@calendarType (§3.3.2.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CalendarType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="gregorian"/>
      <enumeration value="gregorianUs"/>
      <enumeration value="japan"/>
      <enumeration value="taiwan"/>
      <enumeration value="korea"/>
      <enumeration value="hijri"/>
      <enumeration value="thai"/>
      <enumeration value="hebrew"/>
      <enumeration value="gregorianMeFrench"/>
      <enumeration value="gregorianArabic"/>
      <enumeration value="gregorianXlitEnglish"/>
      <enumeration value="gregorianXlitFrench"/>
   </restriction>
</simpleType>
```

3.18.6 ST_CellComments (Cell Comments)

These enumerations specify how cell comments shall be displayed for paper printing purposes.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
asDisplayed (Print Comments As Displayed)	Print cell comments as displayed.
atEnd (Print At End)	Print cell comments at end of document.
none (None)	Do not print cell comments.

Referenced By
pageSetup@cellComments (§3.3.1.61)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellComments">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="asDisplayed"/>
      <enumeration value="atEnd"/>
   </restriction>
</simpleType>
```

3.18.7 ST_CellFormulaType (Formula Type)

Indicates the type of formula in the cell.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
array (Array Entered)	Formula is an array entered formula.
dataTable (Table Formula)	Formula is a data table formula.
normal (Normal)	Formula is a regular cell formula.
shared (Shared Formula)	Formula is part of a shared formula.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellFormulaType">
    <restriction base="xsd:string">
        <enumeration value="normal"/>
        <enumeration value="array"/>
        <enumeration value="dataTable"/>
        <enumeration value="shared"/>
    </restriction>
</simpleType>
```

3.18.8 ST_CellRef (Cell Reference)

Represents a single cell reference in a SpreadsheetML document.

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
c@r (§3.6.1); c@r (§3.3.1.3); cell@r (§3.14.1); cellSmartTags@r (§3.3.1.6); cellWatch@r (§3.3.1.7); customSheetView@topLeftCell (§3.3.1.23); inputCells@r (§3.3.1.49); nc@r (§3.11.1.3); oc@r (§3.11.1.5); pane@topLeftCell (§3.3.1.64); rcmt@cell (§3.11.1.11); selection@activeCell (§3.3.1.75); sheetView@topLeftCell (§3.3.1.83); singleXmlCell@r (§3.5.2.1); tr@r (§3.15.4); undo@r (§3.11.1.25)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellRef">
    <restriction base="xsd:string"/>
</simpleType>
```

3.18.9 ST_CellSpan (Cell Span Type)

A single cell span item.

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
ST_CellSpan (§3.18.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellSpan">
   <restriction base="xsd:string"/>
</simpleType>
```

3.18.10 ST_CellSpans (Cell Spans)

List of the cell spans of the item.

This simple type allows a list of items of the ST_CellSpan simple type (§3.18.9).

Referenced By
row@spans (§3.3.1.71)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellSpans">
   <list itemType="ST_CellSpan"/>
</simpleType>
```

3.18.11 ST_CellStyleXfId (Cell Style Format Id)

Used by xf records and cellStyle records to reference xf records defined in the cellStyleXfs collection.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
cellStyle@xfId (§3.8.7); xf@xfId (§3.8.45)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellStyleXfId">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

3.18.12 ST_CellType (Cell Type)

Indicates the cell's data type.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Boolean)	Cell containing a boolean.
e (Error)	Cell containing an error.
inlineStr (Inline String)	Cell containing an (inline) rich string, i.e., one not in the shared string table. If this cell type is used, then the cell value is in the is element rather than the v

Enumeration Value	Description
	element in the cell (c element).
n (Number)	Cell containing a number.
s (Shared String)	Cell containing a shared string.
str (String)	Cell containing a formula string.

Referenced By
c@t (§3.3.1.3); cell@t (§3.14.1); nc@t (§3.11.1.3); oc@t (§3.11.1.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CellType">
   <restriction base="xsd:string">
      <enumeration value="b"/>
      <enumeration value="n"/>
      <enumeration value="e"/>
      <enumeration value="s"/>
      <enumeration value="str"/>
      <enumeration value="inlineStr"/>
   </restriction>
</simpleType>
```

3.18.13 ST_CfType (Conditional Format Type)

Conditional format rule type.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
aboveAverage (Above or Below Average)	This conditional formatting rule highlights cells that are above or below the average for all values in the range.
beginsWith (Begins With)	This conditional formatting rule highlights cells in the range that begin with the given text. Equivalent to using the LEFT() sheet function and comparing values.
cellIs (Cell Is)	This conditional formatting rule compares a cell value to a formula calculated result, using an operator.
colorScale (Color Scale)	This conditional formatting rule creates a gradated color scale on the cells.
containsBlanks (Contains Blanks)	This conditional formatting rule highlights cells that are completely blank. Equivalent of using LEN(TRIM()). This means that if the cell contains only characters that TRIM() would remove, then it is considered blank.

Enumeration Value	Description
	An empty cell is also considered blank.
containsErrors (Contains Errors)	This conditional formatting rule highlights cells with formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error.
containsText (Contains Text)	This conditional formatting rule highlights cells containing given text. Equivalent to using the SEARCH() sheet function to determine whether the cell contains the text.
dataBar (Data Bar)	This conditional formatting rule displays a gradated data bar in the range of cells.
duplicateValues (Duplicate Values)	This conditional formatting rule highlights duplicated values.
endsWith (Ends With)	This conditional formatting rule highlights cells ending with given text. Equivalent to using the RIGHT() sheet function and comparing values.
expression (Expression)	This conditional formatting rule contains a formula to evaluate. When the formula result is true, the cell is highlighted.
iconSet (Icon Set)	This conditional formatting rule applies icons to cells according to their values.
notContainsBlanks (Contains No Blanks)	This conditional formatting rule highlights cells that are not blank. Equivalent of using LEN(TRIM()). This means that if the cell contains only characters that TRIM() would remove, then it is considered blank. An empty cell is also considered blank.
notContainsErrors (Contains No Errors)	This conditional formatting rule highlights cells without formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error.
notContainsText (Does Not Contain Text)	This conditional formatting rule highlights cells that do not contain given text. Equivalent to using the SEARCH() sheet function.
timePeriod (Time Period)	This conditional formatting rule highlights cells containing dates in the specified time period. The underlying value of the cell is evaluated, therefore the cell does not need to be formatted as a date to be evaluated. For example, with a cell containing the value 38913 the conditional format shall be applied if the rule requires a value of 7/14/2006.
top10 (Top 10)	This conditional formatting rule highlights cells whose values fall in the top N or bottom N bracket, as specified.

Enumeration Value	Description
uniqueValues (Unique Values)	This conditional formatting rule highlights unique values in the range.

Referenced By
cfRule@type (§3.3.1.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CfType">
   <restriction base="xsd:string">
      <enumeration value="expression"/>
      <enumeration value="cellIs"/>
      <enumeration value="colorScale"/>
      <enumeration value="dataBar"/>
      <enumeration value="iconSet"/>
      <enumeration value="top10"/>
      <enumeration value="uniqueValues"/>
      <enumeration value="duplicateValues"/>
      <enumeration value="containsText"/>
      <enumeration value="notContainsText"/>
      <enumeration value="beginsWith"/>
      <enumeration value="endsWith"/>
      <enumeration value="containsBlanks"/>
      <enumeration value="notContainsBlanks"/>
      <enumeration value="containsErrors"/>
      <enumeration value="notContainsErrors"/>
      <enumeration value="timePeriod"/>
      <enumeration value="aboveAverage"/>
   </restriction>
</simpleType>
```

3.18.14 ST_CfvoType (Conditional Format Value Object Type)

This simple type expresses the type of the conditional formatting value object (cfvo). In general the cfvo specifies one value used in the gradated scale (max, min, midpoint, etc).

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
formula (Formula)	The minimum/ midpoint / maximum value for the gradient is determined by a formula.
max (Maximum)	Indicates that the maximum value in the range shall be used as the maximum value for the gradient.
min (Minimum)	Indicates that the minimum value in the range shall be used as the minimum value for the gradient.

Enumeration Value	Description
num (Number)	Indicates that the minimum / midpoint / maximum value for the gradient is specified by a constant numeric value.
percent (Percent)	Value indicates a percentage between the minimum and maximum values in the range shall be used as the minimum / midpoint / maximum value for the gradient.
percentile (Percentile)	Value indicates a percentile ranking in the range shall be used as the minimum / midpoint / maximum value for the gradient.

Referenced By
cfvo@type (§3.3.1.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CfvoType">
   <restriction base="xsd:string">
      <enumeration value="num"/>
      <enumeration value="percent"/>
      <enumeration value="max"/>
      <enumeration value="min"/>
      <enumeration value="formula"/>
      <enumeration value="percentile"/>
   </restriction>
</simpleType>
```

3.18.15 ST_Comments (Comment Display Types)

This simple type defines options for displaying comments in the user interface.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
commIndAndComment (Show Comment & Indicator)	Indicates that both the comment indicator and comment text be show in the user interface.
commIndicator (Show Comment Indicator)	Indicates that only the comment indicator be shown in the user interface.
commNone (No Comments)	Indicates that comments not be shown in the user interface.

Referenced By
customWorkbookView@showComments (§3.2.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Comments">
   <restriction base="xsd:string">
      <enumeration value="commNone"/>
      <enumeration value="commIndicator"/>
      <enumeration value="commIndAndComment"/>
   </restriction>
</simpleType>
```

3.18.16 ST_ConditionalFormattingOperator (Conditional Format Operators)

These conditional format operators are used for "Highlight Cells That Contain…" rules. For example, "highlight cells that begin with "M2" and contain "Mountain Gear"".

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
beginsWith (Begins With)	'Begins with' operator
between (Between)	'Between' operator
containsText (Contains)	'Contains' operator
endsWith (Ends With)	'Ends with' operator
equal (Equal)	'Equal to' operator
greaterThan (Greater Than)	'Greater than' operator
greaterThanOrEqual (Greater Than Or Equal)	'Greater than or equal to' operator
lessThan (Less Than)	'Less than' operator
lessThanOrEqual (Less Than Or Equal)	'Less than or equal to' operator
notBetween (Not Between)	'Not between' operator
notContains (Does Not Contain)	'Does not contain' operator
notEqual (Not Equal)	'Not equal to' operator

Referenced By
cfRule@operator (§3.3.1.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ConditionalFormattingOperator">
   <restriction base="xsd:string">
      <enumeration value="lessThan"/>
      <enumeration value="lessThanOrEqual"/>
      <enumeration value="equal"/>
      <enumeration value="notEqual"/>
      <enumeration value="greaterThanOrEqual"/>
      <enumeration value="greaterThan"/>
      <enumeration value="between"/>
      <enumeration value="notBetween"/>
      <enumeration value="containsText"/>
      <enumeration value="notContains"/>
      <enumeration value="beginsWith"/>
      <enumeration value="endsWith"/>
   </restriction>
</simpleType>
```

3.18.17 ST_CredMethod (Credentials Method)

Credentials method used for server access.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
integrated (Integrated Authentication)	Integrated authentication.
none (No Credentials)	Use no credentials at all.
prompt (Prompt Credentials)	Prompt for credentials.
stored (Stored Credentials)	Use stored credentials.

Referenced By
connection@credentials (§3.13.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CredMethod">
   <restriction base="xsd:string">
      <enumeration value="integrated"/>
      <enumeration value="none"/>
      <enumeration value="stored"/>
      <enumeration value="prompt"/>
   </restriction>
</simpleType>
```

3.18.18 ST_DataConsolidateFunction (Data Consolidation Functions)

Data consolidation functions specified by the user and used to consolidate ranges of data.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
average (Average)	The average of the values.
count (Count)	The number of data values. The Count consolidation function works the same as the COUNTA worksheet function.
countNums (CountNums)	The number of data values that are numbers. The Count Nums consolidation function works the same as the COUNT worksheet function.
max (Maximum)	The largest value.
min (Minimum)	The smallest value.
product (Product)	The product of the values.
stdDev (StdDev)	An estimate of the standard deviation of a population, where the sample is a subset of the entire population.
stdDevp (StdDevP)	The standard deviation of a population, where the population is all of the data to be summarized.
sum (Sum)	The sum of the values.
var (Variance)	An estimate of the variance of a population, where the sample is a subset of the entire population.
varp (VarP)	The variance of a population, where the population is all of the data to be summarized.

Referenced By
dataConsolidate@function (§3.3.1.27); dataField@subtotal (§3.10.1.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DataConsolidateFunction">
   <restriction base="xsd:string">
      <enumeration value="average"/>
      <enumeration value="count"/>
      <enumeration value="countNums"/>
      <enumeration value="max"/>
      <enumeration value="min"/>
      <enumeration value="product"/>
      <enumeration value="stdDev"/>
      <enumeration value="stdDevp"/>
      <enumeration value="sum"/>
      <enumeration value="var"/>
      <enumeration value="varp"/>
   </restriction>
</simpleType>
```

3.18.19 ST_DataValidationErrorStyle (Data Validation Error Styles)

The style of data validation error alert.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
information (Information Icon)	This data validation error style uses an information icon in the error alert. 
stop (Stop Icon)	This data validation error style uses a stop icon in the error alert. 
warning (Warning Icon)	This data validation error style uses a warning icon in the error alert. 

Referenced By
dataValidation@errorStyle (§3.3.1.30)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DataValidationErrorStyle">
   <restriction base="xsd:string">
      <enumeration value="stop"/>
      <enumeration value="warning"/>
      <enumeration value="information"/>
   </restriction>
</simpleType>
```

3.18.20 ST_DataValidationImeMode (Data Validation IME Mode)

These values specify that the IME (input method editor) mode is controlled by data validation.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
disabled (Disabled IME Mode)	IME mode is disabled. Forces the IME control to be disabled when this cell is selected.
fullAlpha (Full-Width Alpha-Numeric IME Mode)	Forces the IME control to be on and in full-width alph-numeric input mode when the cell is first selected.
fullHangul (Full Width Hangul)	Forces the IME control to be on and in full-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and a Korean IME control is selected.
fullKatakana (Full Katakana IME Mode)	Forces the IME control to be on and in full-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
halfAlpha (Half Alpha IME)	Forces the IME control to be on and in half-width alph-numeric input mode when the cell is first selected.
halfHangul (Half-Width Hangul IME Mode)	Forces the IME control to be on and in half-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and a Korean IME control is selected.
halfKatakana (Half-Width Katakana)	Forces the IME control to be on and in half-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected.
hiragana (Hiragana IME Mode)	Forces the IME control to be on and in Hiragana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected
noControl (IME Mode Not Controlled)	Data validation does not control the IME control's

Enumeration Value	Description
	mode.
off (IME Off)	Forces the IME control to be off when first selecting the cell (goes to direct cell input mode).
on (IME On)	Forces the IME control to be on when first selecting the cell.

Referenced By
dataValidation@imeMode (§3.3.1.30)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DataValidationImeMode">
   <restriction base="xsd:string">
      <enumeration value="noControl"/>
      <enumeration value="off"/>
      <enumeration value="on"/>
      <enumeration value="disabled"/>
      <enumeration value="hiragana"/>
      <enumeration value="fullKatakana"/>
      <enumeration value="halfKatakana"/>
      <enumeration value="fullAlpha"/>
      <enumeration value="halfAlpha"/>
      <enumeration value="fullHangul"/>
      <enumeration value="halfHangul"/>
   </restriction>
</simpleType>
```

3.18.21 ST_DataValidationOperator (Data Validation Operator)

The relational operator used in data validation.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
between (Between)	Data validation which checks if a value is between two other values.
equal (Equal)	Data validation which checks if a value is equal to a specified value.
greaterThan (Greater Than)	Data validation which checks if a value is greater than a specified value.
greaterThanOrEqual (Greater Than Or Equal)	Data validation which checks if a value is greater than or equal to a specified value.
lessThan (Less Than)	Data validation which checks if a value is less than a

Enumeration Value	Description
	specified value.
lessThanOrEqual (Less Than Or Equal)	Data validation which checks if a value is less than or equal to a specified value.
notBetween (Not Between)	Data validation which checks if a value is not between two other values.
notEqual (Not Equal)	Data validation which checks if a value is not equal to a specified value.

Referenced By
dataValidation@operator (§3.3.1.30)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DataValidationOperator">
   <restriction base="xsd:string">
      <enumeration value="between"/>
      <enumeration value="notBetween"/>
      <enumeration value="equal"/>
      <enumeration value="notEqual"/>
      <enumeration value="lessThan"/>
      <enumeration value="lessThanOrEqual"/>
      <enumeration value="greaterThan"/>
      <enumeration value="greaterThanOrEqual"/>
   </restriction>
</simpleType>
```

3.18.22 ST_DataValidationType (Data Validation Type)

Specifies the type of data validation used to validate user input.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
custom (Custom)	Data validation which uses a custom formula to check the cell value.
date (Date)	Data validation which checks for date values satisfying the given condition.
decimal (Decimal)	Data validation which checks for decimal values satisfying the given condition.
list (List)	Data validation which checks for a value matching one of list of values.
none (None)	No data validation.

Enumeration Value	Description
textLength (Text Length)	Data validation which checks for text values, whose length satisfies the given condition.
time (Time)	Data validation which checks for time values satisfying the given condition.
whole (Whole Number)	Data validation which checks for whole number values satisfying the given condition.

Referenced By
dataValidation@type (§3.3.1.30)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DataValidationType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="whole"/>
      <enumeration value="decimal"/>
      <enumeration value="list"/>
      <enumeration value="date"/>
      <enumeration value="time"/>
      <enumeration value="textLength"/>
      <enumeration value="custom"/>
   </restriction>
</simpleType>
```

3.18.23 ST_DateTimeGrouping (Date Time Grouping)

Specifies how to group dateTime values.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
day (Day)	Group by day
hour (Group by Hour)	Group by hour
minute (Group by Minute)	Group by minute
month (Month)	Group by month
second (Second)	Group by second
year (Group by Year)	Group by year

Referenced By

Referenced By
dateGroupItem@dateTimeGrouping (§3.3.2.4)

```
<simpleType name="ST_DateTimeGrouping">
   <restriction base="xsd:string">
      <enumeration value="year"/>
      <enumeration value="month"/>
      <enumeration value="day"/>
      <enumeration value="hour"/>
      <enumeration value="minute"/>
      <enumeration value="second"/>
   </restriction>
</simpleType>
```

3.18.24 ST_DdeValueType (DDE Value Types)

This simple type indicates the type of the DDE value.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Boolean)	Indicates that the value is a boolean.
e (Error)	Indicates that the value is an error.
n (Real Number)	Indicates that the value is a real number.
nil (Nil)	Indicates that the value is nil.
str (String)	Indicates that the value is a string.

Referenced By
value@t (§3.14.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DdeValueType">
   <restriction base="xsd:string">
      <enumeration value="nil"/>
      <enumeration value="b"/>
      <enumeration value="n"/>
      <enumeration value="e"/>
      <enumeration value="str"/>
   </restriction>
</simpleType>
```

3.18.25 ST_DvAspect (Data View Aspect Type)

Specifies the desired data or view aspect of the object when drawing or getting data.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
DVASPECT_CONTENT (Object Display Content)	Provides a representation of an object so it can be displayed as an embedded object inside of a container.
DVASPECT_ICON (Object Display Icon)	Provides an iconic representation of an object.

Referenced By
oleObject@dvAspect (§3.3.1.57)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DvAspect">
   <restriction base="xsd:string">
      <enumeration value="DVASPECT_CONTENT"/>
      <enumeration value="DVASPECT_ICON"/>
   </restriction>
</simpleType>
```

3.18.26 ST_DxfId (Format Id)

This simple type defines the identifier to CT_Dxfs in the styles part. This a zero-based index. See §3.8.30 in Style for more information on formats.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
cfRule@dxfId (§3.3.1.9); colorFilter@dxfId (§3.3.2.1); format@dxfId (§3.10.1.35); sortCondition@dxfId (§3.3.1.88); table@dataDxfId (§3.5.1.2); table@headerRowBorderDxfId (§3.5.1.2); table@headerRowDxfId (§3.5.1.2); table@tableBorderDxfId (§3.5.1.2); table@totalsRowBorderDxfId (§3.5.1.2); table@totalsRowDxfId (§3.5.1.2); tableColumn@dataDxfId (§3.5.1.3); tableColumn@headerRowDxfId (§3.5.1.3); tableColumn@totalsRowDxfId (§3.5.1.3); tableStyleElement@dxfId (§3.8.41)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DxfId">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

3.18.27 ST_DynamicFilterType (Dynamic Filter)

These are the dynamic filter types. A dynamic filter returns a result set which may vary due to a change in the data itself or a change in the date on which the filter is being applied. For example, for a set of data {1,1,2,3}, the

aboveAverage filter would return or highlight the last two values in the set. If the data is refreshed or changed to {1,1,1,2}, then only the last value would be highlighted. Similarly, the meaning of "lastQuarter" shall be the same for the dates in January, February, and March, but shall change meaning once the date advances from March to April.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
aboveAverage (Above Average)	Shows values that are above average.
belowAverage (Below Average)	Shows values that are below average.
lastMonth (Last Month)	Shows last month's dates.
lastQuarter (Last Quarter)	Shows last quarter's dates.
lastWeek (Last Week)	Shows last week's dates.
lastYear (Last Year)	Shows last year's dates.
M1 (1st Month)	Shows the dates that are in January, regardless of year.
M10 (10th Month)	Shows the dates that are in October, regardless of year.
M11 (11th Month)	Shows the dates that are in November, regardless of year.
M12 (12th Month)	Shows the dates that are in December, regardless of year.
M2 (2nd Month)	Shows the dates that are in Februray, regardless of year.
M3 (3rd Month)	Shows the dates that are in March, regardless of year.
M4 (4th Month)	Shows the dates that are in April, regardless of year.
M5 (5th Month)	Shows the dates that are in May, regardless of year.
M6 (6th Month)	Shows the dates that are in June, regardless of year.
M7 (7th Month)	Shows the dates that are in July, regardless of year.
M8 (8th Month)	Shows the dates that are in August, regardless of year.
M9 (9th Month)	Shows the dates that are in September, regardless of year.
nextMonth (Next Month)	Shows next month's dates.
nextQuarter (Next Quarter)	Shows next quarter's dates.
nextWeek (Next Week)	Shows next week's dates.
nextYear (Next Year)	Shows next year's dates.
null (Null)	Common filter type not available.

Enumeration Value	Description
Q1 (1st Quarter)	Shows the dates that are in the 1st quarter, regardless of year.
Q2 (2nd Quarter)	Shows the dates that are in the 2nd quarter, regardless of year.
Q3 (3rd Quarter)	Shows the dates that are in the 3rd quarter, regardless of year.
Q4 (4th Quarter)	Shows the dates that are in the 4th quarter, regardless of year.
thisMonth (This Month)	Shows this month's dates.
thisQuarter (This Quarter)	Shows this quarter's dates.
thisWeek (This Week)	Shows this week's dates.
thisYear (This Year)	Shows this year's dates.
today (Today)	Shows today's dates.
tomorrow (Tomorrow)	Shows tomorrow's dates.
yearToDate (Year To Date)	Shows the dates between the beginning of the year and today, inclusive.
yesterday (Yesterday)	Shows yesterday's dates.

Referenced By
dynamicFilter@type (§3.3.2.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DynamicFilterType">
   <restriction base="xsd:string">
      <enumeration value="null"/>
      <enumeration value="aboveAverage"/>
      <enumeration value="belowAverage"/>
      <enumeration value="tomorrow"/>
      <enumeration value="today"/>

      <enumeration value="M9"/>
      <enumeration value="M10"/>
      <enumeration value="M11"/>
      <enumeration value="M12"/>
   </restriction>
</simpleType>
```

3.18.28 ST_ExternalConnectionType (Text Field Datatype)

These are the possible data types to use when importing text into the SpreadsheetML document. Strings are converted to these data types in the worksheet.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
DMY (Day Month Year)	Field contains a date in the order: day, month, year.
DYM (Day Year Month)	Field contains a date in the order: day, year, month.
EMD (East Asian Year Month Day)	Field contains an East Asian date in the order: EA era year, month, day.
general (General)	The SpreadsheetML application decides the best fit data type based on the content.
MDY (Month Day Year)	Field contains a date in the order: month, day, year.
MYD (Month Day Year)	Field contains a date in the order: month, year, day.
skip (Skip Field)	Don't import this field at all.
text (Text)	Field contains text.
YDM (Year Day Month)	Field contains a date in the order: year, day, month.
YMD (Year Month Day)	Field contains a date in the order: year, month, day.

Referenced By
textField@type (§3.13.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ExternalConnectionType">
   <restriction base="xsd:string">
      <enumeration value="general"/>
      <enumeration value="text"/>
      <enumeration value="MDY"/>
      <enumeration value="DMY"/>
      <enumeration value="YMD"/>
      <enumeration value="MYD"/>
      <enumeration value="DYM"/>
      <enumeration value="YDM"/>
      <enumeration value="skip"/>
      <enumeration value="EMD"/>
   </restriction>
</simpleType>
```

3.18.29 ST_FieldSortType (Field Sort Type)

This simple type defines the sort orders that can be applied to fields in a PivotTable.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ascending (Ascending)	Indicates the field is sorted in ascending order.

Enumeration Value	Description
descending (Descending)	Indicates the field is sorted in descending order.
manual (Manual Sort)	Indicates the field is sorted manually.

Referenced By
pivotField@sortType (§3.10.1.69)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FieldSortType">
   <restriction base="xsd:string">
      <enumeration value="manual"/>
      <enumeration value="ascending"/>
      <enumeration value="descending"/>
   </restriction>
</simpleType>
```

3.18.30 ST_FileType (File Type)

The file type being used for text import.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dos (DOS)	DOS (PC-8).
mac (Macintosh)	Macintosh.
win (Windows (ANSI))	Windows (ANSI).

Referenced By
textPr@fileType (§3.13.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FileType">
   <restriction base="xsd:string">
      <enumeration value="mac"/>
      <enumeration value="win"/>
      <enumeration value="dos"/>
   </restriction>
</simpleType>
```

3.18.31 ST_FillId (Fill Id)

Zero-based index used to reference a fill record.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
xf@fillId (§3.8.45)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FillId">
    <restriction base="xsd:unsignedInt"/>
</simpleType>
```

3.18.32 ST_FilterOperator (Filter Operator)

Operator enumerations for filtering.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
equal (Equal)	Show results which are equal to criteria.
greaterThan (Greater Than)	Show results which are greater than criteria.
greaterThanOrEqual (Greater Than Or Equal)	Show results which are greater than or equal to criteria.
lessThan (Less Than)	Show results which are less than criteria.
lessThanOrEqual (Less Than Or Equal)	Show results which are less than or equal to criteria.
notEqual (Not Equal)	Show results which are not equal to criteria.

Referenced By
customFilter@operator (§3.3.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FilterOperator">
    <restriction base="xsd:string">
        <enumeration value="equal"/>
        <enumeration value="lessThan"/>
        <enumeration value="lessThanOrEqual"/>
        <enumeration value="notEqual"/>
        <enumeration value="greaterThanOrEqual"/>
        <enumeration value="greaterThan"/>
    </restriction>
</simpleType>
```

3.18.33 ST_FontId (Font Id)

An integer that represents a zero based index into the <fonts> collection in the style sheet.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
phoneticPr@fontId (§3.4.3); xf@fontId (§3.8.45)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FontId">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

3.18.34 ST_FontScheme (Font scheme Styles)

Defines the font scheme, if any, to which this font belongs.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
major (Major Font)	This font is the major font for this theme.
minor (Minor Font)	This font is the minor font for this theme.
none (None)	This font is not a theme font.

Referenced By
scheme@val (§3.8.36)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FontScheme">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="major"/>
      <enumeration value="minor"/>
   </restriction>
</simpleType>
```

3.18.35 ST_FormatAction (PivotTable Format Types)

This simple type defines the type of formats that can be applied to PivotTables.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
blank (Blank)	Indicates no format is applied to the PivotTable. This value is used when formatting is cleared from already

Enumeration Value	Description
	formatted cells in the PivotTable.
drill (Drill Type)	Indicates the PivotTable has drill-through format.
formatting (Formatting)	Indicates the PivotTable has formatting.
formula (Formula Type)	Indicates the PivotTable has formulas.

Referenced By
format@action (§3.10.1.35)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FormatAction">
   <restriction base="xsd:string">
      <enumeration value="blank"/>
      <enumeration value="formatting"/>
      <enumeration value="drill"/>
      <enumeration value="formula"/>
   </restriction>
</simpleType>
```

3.18.36 ST_Formula (Formula)

A formula

This simple type's contents are a restriction of the ST_Xstring simple type (§3.18.96).

Referenced By
formula (§3.3.1.40); formula1 (§3.3.1.41); formula2 (§3.3.1.42); oldFormula (§3.11.1.7)

3.18.37 ST_FormulaExpression (Formula Expression Type)

This simple type specifies an expression type that can comprise a formula.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
area (Area)	Reference to a range of cells.
areaError (Area Error)	Reference to a range of cells that now evaluates to an error.
computedArea (Computed Area)	Computed area reference.
ref (Reference)	Single cell reference.
refError (Reference Is Error)	Single cell reference that now evaluates to an error.

Referenced By
undo@exp (§3.11.1.25)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_FormulaExpression">
   <restriction base="xsd:string">
      <enumeration value="ref"/>
      <enumeration value="refError"/>
      <enumeration value="area"/>
      <enumeration value="areaError"/>
      <enumeration value="computedArea"/>
   </restriction>
</simpleType>
```

3.18.38 ST_GradientType (Gradient Type)

Type of gradient fill being used, either linear or path.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
linear (Linear Gradient)	This gradient fill is of linear gradient type. Linear gradient type means that the transition from one color to the next is along a line (e.g., horizontal, vertical, diagonal, etc.).
path (Path)	This gradient fill is of path gradient type. Path gradient type means the that the boundary of transition from one color to the next is a rectangle, defined by top, bottom, left, and right attributes on the gradientFill element.

Referenced By
gradientFill@type (§3.8.23)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_GradientType">
   <restriction base="xsd:string">
      <enumeration value="linear"/>
      <enumeration value="path"/>
   </restriction>
</simpleType>
```

3.18.39 ST_GroupBy (Values Group By)

This simple type defines types of data grouping that can be performed on a PivotTable.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
days (Days)	Indicates a grouping on "days" for date values.
hours (Hours)	Indicates a grouping on "hours" for date values.
minutes (Minutes)	Indicates a grouping on "minutes" for date values.
months (Months)	Indicates a grouping on "months" for date values.
quarters (Quarters)	Indicates a grouping on "quarters" for date values.
range (Group By Numeric Ranges)	Indicates a grouping by numeric ranges for numeric values.
seconds (Seconds)	Indicates a grouping on "seconds" for date values.
years (Years)	Indicates a grouping on "years" for date values.

Referenced By
rangePr@groupBy (§3.10.1.78)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_GroupBy">
   <restriction base="xsd:string">
      <enumeration value="range"/>
      <enumeration value="seconds"/>
      <enumeration value="minutes"/>
      <enumeration value="hours"/>
      <enumeration value="days"/>
      <enumeration value="months"/>
      <enumeration value="quarters"/>
      <enumeration value="years"/>
   </restriction>
</simpleType>
```

3.18.40 ST_GrowShrinkType (Grow Shrink Type)

This type enumerates behavior patterns for refreshing external data in a query table.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
insertClear (Insert & Clear On Refresh)	Insert entire rows for new data, clear unused cells.
insertDelete (Insert & Delete On Refresh)	Insert cells for new data, delete unused cells.

Enumeration Value	Description
overwriteClear (Overwrite & Clear On Refresh)	Overwrite existing cells with new data, clear unused cells.

Referenced By
queryTable@growShrinkType (§3.12.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_GrowShrinkType">
   <restriction base="xsd:string">
      <enumeration value="insertDelete"/>
      <enumeration value="insertClear"/>
      <enumeration value="overwriteClear"/>
   </restriction>
</simpleType>
```

3.18.41 ST_Guid (Globally Unique Identifier)

This simple type defines a 128 bit Globally Unique Identifier (GUID).

This simple type's contents are a restriction of the XML Schema token datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must match the following regular expression pattern: \{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}.

Referenced By
comment@guid (§3.7.3); customSheetView@guid (§3.3.1.22); customSheetView@guid (§3.3.1.23); customWorkbookView@guid (§3.2.3); fileVersion@codeName (§3.2.13); header@guid (§3.11.1.1); headers@guid (§3.11.1.2); headers@lastGuid (§3.11.1.2); rcmt@guid (§3.11.1.11); rcv@guid (§3.11.1.12); userInfo@guid (§3.11.2.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Guid">
   <restriction base="xsd:token">
      <pattern value="\{[0-9A-F]{8}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{4}-[0-9A-F]{12}\}"/>
   </restriction>
</simpleType>
```

3.18.42 ST_HorizontalAlignment (Horizontal Alignment Type)

The enumeration value indicating the portion of Cell Alignment in a cell format (XF) that is horizontal alignment, i.e., whether it is aligned general, left, right, horizontally centered, filled (replicated), justified, centered across multiple cells, or distributed.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Centered Horizontal Alignment)	The horizontal alignment is centered, meaning the text is centered across the cell.

centerContinuous (Center Continuous Horizontal Alignment)	The horizontal alignment is centered across multiple cells. The information about how many cells to span is expressed in the Sheet Part, in the row of the cell in question. For each cell that is spanned in the alignment, a cell element needs to be written out, with the same style Id which references the `centerContinuous` alignment.
	
	[*Example*:
	This shows the value of A1 centered across A1:C1:
	
	 	
	The XML from the Sheet Part:
	
	`<row r="1" spans="1:3">`
	`<c r="A1" s="1" t="s">`
	`<v>0</v>`
	`</c>`
	`<c r="B1" s="1"/>`
	`<c r="C1" s="1"/>`
	`</row>`
	The XML from the Styles Part:
	
	`<cellXfs count="2">`
	`<xf numFmtId="0" fontId="0" fillId="0" borderId="0" xfId="0"/>`
	`<xf numFmtId="0" fontId="0" fillId="0" borderId="0" xfId="0" applyAlignment="1">`
	`<alignment horizontal="centerContinuous"/>`
	`</xf>`
	`</cellXfs>`
	
	end example]

distributed (Distributed Horizontal Alignment)	I/ndicates that each 'word' in each line of text inside

Enumeration Value	Description
	the cell is evenly distributed across the width of the cell, with flush right and left margins. When there is also an indent value to apply, both the left and right side of the cell are padded by the indent value. A 'word' is a set of characters with no space character in them. Two lines inside a cell are separated by a carriage return. [*Example*: This shows three lines of text evenly distributed horizontally across the cell. The first line is "abc def ghi", the second line is blank, and the third line is "jkl mno".  This shows the same example, with an indent value of 2:  Note: there is no vertical component to the alignment being shown here. The row has been manually adjusted to display the text. *end example*]
fill (Fill)	Indicates that the value of the cell should be filled across the entire width of the cell. If blank cells to the right also have the fill alignment, they are also filled with the value, using a convention similar to `centerContinuous`.

Enumeration Value	Description
	Additional rules: • Only whole values can be appended, not partial values. • The column will not be widened to 'best fit' the filled value • If appending an additional occurrence of the value exceeds the boundary of the cell left/right edge, don't append the additional occurrence of the value. • The display value of the cell is filled, not the underlying raw number. [*Example*: This cell is filled with the value 1.2345 and has a width of 15 characters:  This cell is filled with the value abc and has width of 15 characters:  *end example*]
general (General Horizontal Alignment)	The horizontal alignment is general-aligned. Text data is left-aligned. Numbers, dates, and times are right-aligned. Boolean types are centered. Changing the alignment does not change the type of data. [*Example*: These cells are `general` aligned:  *end example*]

Enumeration Value	Description
justify (Justify)	The horizontal alignment is justified (flush left and right). For each line of text, aligns each line of the wrapped text in a cell to the right and left (except the last line). If no single line of text wraps in the cell, then the text is not justified. [*Example*: There are two lines of text in this cell, and the cell's horizontal alignment is `justify`:  *end example*]
left (Left Horizontal Alignment)	The horizontal alignment is left-aligned, even in Right-to-Left mode. Aligns contents at the left edge of the cell. If an indent amount is specified, the contents of the cell is indented from the left by the specified number of character spaces. The character spaces are based on the default font and font size for the workbook.
right (Right Horizontal Alignment)	The horizontal alignment is right-aligned, meaning that cell contents are aligned at the right edge of the cell, even in Right-to-Left mode.

Referenced By
alignment@horizontal (§3.8.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HorizontalAlignment">
   <restriction base="xsd:string">
      <enumeration value="general"/>
      <enumeration value="left"/>
      <enumeration value="center"/>
      <enumeration value="right"/>
      <enumeration value="fill"/>
      <enumeration value="justify"/>
      <enumeration value="centerContinuous"/>
      <enumeration value="distributed"/>
   </restriction>
</simpleType>
```

3.18.43 ST_HtmlFmt (HTML Formatting Handling)

How to handle formatting from the HTML source.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Transfer all HTML formatting into the worksheet along with data.
none (No Formatting)	Bring data in as unformatted text (setting data types still occurs).
rtf (Honor Rich Text)	Translate HTML formatting to rich text formatting on the data brought into the worksheet.

Referenced By
webPr@htmlFormat (§3.13.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HtmlFmt">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="rtf"/>
      <enumeration value="all"/>
   </restriction>
</simpleType>
```

3.18.44 ST_IconSetType (Icon Set Type)

Icon set type for conditional formatting. The threshold values for triggering the different icons within a set are configurable, and the icon order is reversible. See element iconSet for more information.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
3Arrows (3 Arrows)	3 arrows icon set. 
3ArrowsGray (3 Arrows (Gray))	3 gray arrows icon set. 
3Flags (3 Flags)	3 flags icon set. 
3Signs (3 Signs)	3 signs icon set. 
3Symbols (3 Symbols Circled)	3 symbols icon set. 
3Symbols2 (3 Symbols)	3 Symbols icon set. 
3TrafficLights1 (3 Traffic Lights)	3 traffic lights icon set (#1). 
3TrafficLights2 (3 Traffic Lights Black)	3 traffic lights icon set with thick black border. 

Enumeration Value	Description
4Arrows (4 Arrows)	4 arrows icon set. 
4ArrowsGray (4 Arrows (Gray))	4 gray arrows icon set. 
4Rating (4 Ratings)	4 ratings icon set. 
4RedToBlack (4 Red To Black)	4 'red to black' icon set. 
4TrafficLights (4 Traffic Lights)	4 traffic lights icon set. 
5Arrows (5 Arrows)	5 arrows icon set. 
5ArrowsGray (5 Arrows (Gray))	5 gray arrows icon set. 
5Quarters (5 Quarters)	5 quarters icon set. 
5Rating (5 Ratings Icon Set)	5 rating icon set.

Enumeration Value	Description
	

Referenced By
iconFilter@iconSet (§3.3.2.9); iconSet@iconSet (§3.3.1.46); sortCondition@iconSet (§3.3.1.88)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_IconSetType">
   <restriction base="xsd:string">
      <enumeration value="3Arrows"/>
      <enumeration value="3ArrowsGray"/>
      <enumeration value="3Flags"/>
      <enumeration value="3TrafficLights1"/>

      <enumeration value="5Arrows"/>
      <enumeration value="5ArrowsGray"/>
      <enumeration value="5Rating"/>
      <enumeration value="5Quarters"/>
   </restriction>
</simpleType>
```

3.18.45 ST_ItemType (PivotItem Type)

This simple type defines the type for a pivotItem.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
avg (Average)	Indicates the pivot item represents an "average" aggregate function.
blank (Blank Pivot Item)	Indicates the pivot item represents a blank line.
count (Count)	Indicates the pivot item represents custom the "count" aggregate."
countA (CountA)	Indicates the pivot item represents the "count

Enumeration Value	Description
	numbers" aggregate function.
data (Data)	Indicate the pivot item represents data.
default (Default)	Indicates the pivot item represents the default type for this PivotTable. The default pivot item type is the "total" aggregate function.
grand (Grand Total Item)	Indicates the pivot items represents the grand total line.
max (Max)	Indicates the pivot item represents the "maximum" aggregate function.
min (Min)	Indicates the pivot item represents the "minimum" aggregate function.
product (Product)	Indicates the pivot item represents the "product" function.
stdDev (stdDev)	Indicates the pivot item represents the "standard deviation" aggregate function.
stdDevP (StdDevP)	Indicates the pivot item represents the "standard deviation population" aggregate function.
sum (Sum)	Indicates the pivot item represents the "sum" aggregate value.
var (Var)	Indicates the pivot item represents the "variance" aggregate value.
varP (VarP)	Indicates the pivot item represents the "variance population" aggregate value.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ItemType">
   <restriction base="xsd:string">
      <enumeration value="data"/>
      <enumeration value="default"/>
      <enumeration value="sum"/>
      <enumeration value="countA"/>
      <enumeration value="avg"/>
      <enumeration value="max"/>
      <enumeration value="min"/>
      <enumeration value="product"/>
      <enumeration value="count"/>
      <enumeration value="stdDev"/>
      <enumeration value="stdDevP"/>
      <enumeration value="var"/>
      <enumeration value="varP"/>
      <enumeration value="grand"/>
      <enumeration value="blank"/>
   </restriction>
</simpleType>
```

3.18.46 ST_MdxFunctionType (MDX Function Type)

This simple type is an enumeration representing different MDX function types.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
c (Cube Set Count)	CUBESETCOUNT
k (Cube KPI Member)	CUBEKPIMEMBER
m (Cube Member)	CUBEMEMBER
p (Cube Member Property)	CUBEMEMBERPROPERTY
r (Cube Ranked Member)	CUBERANKEDMEMBER
s (Cube Set)	CUBESET
v (Cube Value)	CUBEVALUE

Referenced By
mdx@f (§3.9.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MdxFunctionType">
   <restriction base="xsd:string">
      <enumeration value="m"/>
      <enumeration value="v"/>
      <enumeration value="s"/>
      <enumeration value="c"/>
      <enumeration value="r"/>
      <enumeration value="p"/>
      <enumeration value="k"/>
   </restriction>
</simpleType>
```

3.18.47 ST_MdxKPIProperty (MDX KPI Property)

An enumeration representing the different types of KPI properties.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
g (Goal)	Goal.
m (Current Time Member)	Current time member.
s (Status)	Status.
t (Trend)	Trend.
v (Value)	Value.
w (Weight)	Weight.

Referenced By
k@p (§3.9.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MdxKPIProperty">
   <restriction base="xsd:string">
      <enumeration value="v"/>
      <enumeration value="g"/>
      <enumeration value="s"/>
      <enumeration value="t"/>
      <enumeration value="w"/>
      <enumeration value="m"/>
   </restriction>
</simpleType>
```

3.18.48 ST_MdxSetOrder (MDX Set Order)

This type represents an enumeration specifying an MDX set order.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
a (Ascending)	Sort ascending.
aa (Alpha Ascending Sort Order)	Sorted alphabetically in ascending order by the caption.
ad (Alpha Descending Sort Order)	Sort in descending order alphabetically by the caption.
d (Descending)	Sort descending.
na (Natural Ascending)	Sorted in ascending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this may be in order of account number.
nd (Natural Descending)	Sorted in descending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this may be in order of account number.
u (Unsorted)	Unsorted.

Referenced By
ms@o (§3.9.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_MdxSetOrder">
   <restriction base="xsd:string">
      <enumeration value="u"/>
      <enumeration value="a"/>
      <enumeration value="d"/>
      <enumeration value="aa"/>
      <enumeration value="ad"/>
      <enumeration value="na"/>
      <enumeration value="nd"/>
   </restriction>
</simpleType>
```

3.18.49 ST_NumFmtId (Number Format Id)

This simple type defines the identifier to a style sheet number format entry in CT_NumFmts. Number formats are written to the styles part. See §1.1.31 in Style for more information on number formats.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By

Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_NumFmtId">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

3.18.50 ST_Objects (Object Display Types)

This simple type defines how the application displays objects in this workbook. Objects might include charts, images, and other object data that the application supports.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Indicates that all objects be shown in the workbook.
none (None)	Indicates that all objects be hidden in the workbook.
placeholders (Show Placeholders)	Indicates that the application show placeholders for objects in the workbook.

Referenced By
customWorkbookView@showObjects (§3.2.3); workbookPr@showObjects (§3.2.28)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Objects">
   <restriction base="xsd:string">
      <enumeration value="all"/>
      <enumeration value="placeholders"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

3.18.51 ST_OleUpdate (OLE Update Types)

Indicates whether the linked object updates the cached data for the linked object automatically or only when the container calls IOleObject::Update or IOleLink::Update methods.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
OLEUPDATE_ALWAYS (Always Update OLE)	Update the link object whenever possible, this option corresponds to the 'automatic update' option in the Links dialog box.
OLEUPDATE_ONCALL (Update OLE On Call)	Update the link object only when IOleObject::Update or IOleLink::Update is called, this option coresponds to the Manual update option in the Links dialog box.

Referenced By
oleObject@oleUpdate (§3.3.1.57)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OleUpdate">
   <restriction base="xsd:string">
      <enumeration value="OLEUPDATE_ALWAYS"/>
      <enumeration value="OLEUPDATE_ONCALL"/>
   </restriction>
</simpleType>
```

3.18.52 ST_Orientation (Orientation)

Print orientation for this sheet.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
default (Default)	Orientation not specified, use the default.
landscape (Landscape)	Landscape orientation.
portrait (Portrait)	Portrait orientation.

Referenced By
pageSetup@orientation (§3.3.1.62); pageSetup@orientation (§3.3.1.61)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Orientation">
   <restriction base="xsd:string">
      <enumeration value="default"/>
      <enumeration value="portrait"/>
      <enumeration value="landscape"/>
   </restriction>
</simpleType>
```

3.18.53 ST_PageOrder (Page Order)

Specifies printed page order.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
downThenOver (Down Then Over)	Order pages vertically first, then move horizontally.
overThenDown (Over Then Down)	Order pages horizontally first, then move vertically

Referenced By
pageSetup@pageOrder (§3.3.1.61)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PageOrder">
   <restriction base="xsd:string">
      <enumeration value="downThenOver"/>
      <enumeration value="overThenDown"/>
   </restriction>
</simpleType>
```

3.18.54 ST_Pane (Pane Types)

Defines the names of the four possible panes into which the view of a workbook in the application can be split.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bottomLeft (Bottom Left Pane)	Bottom left pane, when both vertical and horizontal splits are applied. This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower regions. In that case, this value specifies the bottom pane.
bottomRight (Bottom Right Pane)	Bottom right pane, when both vertical and horizontal splits are applied.
topLeft (Top Left Pane)	Top left pane, when both vertical and horizontal splits are applied. This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower

Enumeration Value	Description
	regions. In that case, this value specifies the top pane. This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the left pane
topRight (Top Right Pane)	Top right pane, when both vertical and horizontal splits are applied. This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the right pane.

Referenced By
pane@activePane (§3.3.1.64); pivotSelection@pane (§3.3.1.67); selection@pane (§3.3.1.75)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Pane">
   <restriction base="xsd:string">
      <enumeration value="bottomRight"/>
      <enumeration value="topRight"/>
      <enumeration value="bottomLeft"/>
      <enumeration value="topLeft"/>
   </restriction>
</simpleType>
```

3.18.55 ST_PaneState (Pane State)

State of the sheet's pane.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
frozen (Frozen)	Panes are frozen, but were not split being frozen. In this state, when the panes are unfrozen again, a single pane results, with no split. In this state, the split bars are not adjustable.
frozenSplit (Frozen Split)	Panes are frozen and were split before being frozen. In this state, when the panes are unfrozen again, the split remains, but is adjustable.
split (Split)	Panes are split, but not frozen. In this state, the split

Enumeration Value	Description
	bars are adjustable by the user.

Referenced By
pane@state (§3.3.1.64)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PaneState">
   <restriction base="xsd:string">
      <enumeration value="split"/>
      <enumeration value="frozen"/>
      <enumeration value="frozenSplit"/>
   </restriction>
</simpleType>
```

3.18.56 ST_ParameterType (Parameter Type)

Parameter Type.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cell (Parameter From Cell)	Get the parameter value from a cell on each refresh.
prompt (Prompt on Refresh)	Prompt the user on each refresh for a parameter value.
value (Value)	Use a constant value on each refresh for the parameter value.

Referenced By
parameter@parameterType (§3.13.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ParameterType">
   <restriction base="xsd:string">
      <enumeration value="prompt"/>
      <enumeration value="value"/>
      <enumeration value="cell"/>
   </restriction>
</simpleType>
```

3.18.57 ST_PatternType (Pattern Type)

Indicates the style of fill pattern being used for a cell format.

The examples below use yellow background and black foreground colors.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
darkDown (Dark Down)	The fill style is 'dark down'. [*Example*:  *end example*]
darkGray (Dary Gray)	The fill style is 'dark gray'. [*Example*:  *end example*]
darkGrid (Dark Grid)	The fill style is 'dark grid'. [*Example*:  *end example*]
darkHorizontal (Dark Horizontal)	The fill style is dark horizontal. [*Example*:

Enumeration Value	Description
	 *end example*]
darkTrellis (Dark Trellis)	The fill style is 'dark trellis'. [*Example*:  *end example*]
darkUp (Dark Up)	The fill style is 'dark up'. [*Example*:  *end example*]
darkVertical (Dark Vertical)	The fill style is 'dark vertical'. [*Example*:  *end example*]
gray0625 (Gray 0.0625)	The fill style is grayscale of 0.0625 (1/16) value. [*Example*:

Enumeration Value	Description
	 *end example*]
gray125 (Gray 0.125)	The fill style is grayscale of 0.125 (1/8) value. [*Example*:  *end example*]
lightDown (Light Down)	The fill style is 'light down'. [*Example*:  *end example*]
lightGray (Light Gray)	The fill style is light gray. [*Example*:  *end example*]
lightGrid (Light Grid)	The fill style is 'light grid'. [*Example*:

Enumeration Value	Description
	 *end example*]
lightHorizontal (Light Horizontal)	The fill style is light horizontal. [*Example*:  *end example*]
lightTrellis (Light Trellis)	The fill style is 'light trellis'. [*Example*:  *end example*]
lightUp (Light Up)	The fill style is light up. [*Example*:  *end example*]
lightVertical (Light Vertical)	The fill style is light vertical.
mediumGray (Medium Gray)	The fill style is medium gray. [*Example*:

Enumeration Value	Description
	 *end example*]
none (None)	The fill style is none (no fill). When foreground and/or background colors are specified, a pattern of 'none' overrides and means the cell has no fill. [*Example*: *end example*]
solid (Solid)	The fill style is solid. When solid is specified, the foreground color (fgColor) is the only color rendered, even when a background color (bgColor) is also specified. [*Example*: *end example*]

Referenced By
patternFill@patternType (§3.8.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PatternType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="solid"/>
      <enumeration value="mediumGray"/>
      <enumeration value="darkGray"/>
      <enumeration value="lightGray"/>
      <enumeration value="darkHorizontal"/>
      <enumeration value="darkVertical"/>
      <enumeration value="darkDown"/>
      <enumeration value="darkUp"/>
      <enumeration value="darkGrid"/>
      <enumeration value="darkTrellis"/>
      <enumeration value="lightHorizontal"/>
      <enumeration value="lightVertical"/>
      <enumeration value="lightDown"/>
      <enumeration value="lightUp"/>
      <enumeration value="lightGrid"/>
      <enumeration value="lightTrellis"/>
      <enumeration value="gray125"/>
      <enumeration value="gray0625"/>
   </restriction>
</simpleType>
```

3.18.58 ST_PhoneticAlignment (Phonetic Alignment Types)

Phonetic alignment settings. These specify how to align the phonetic text, which represent the sounds, above the base text or base word.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center Alignment)	Center the phonetic characters over the base word, per word.
distributed (Distributed)	Each phonetic character is distributed above each base word character, per word.
left (Left Alignment)	Each phonetic character is left justified with respect to the base text., per word.
noControl (No Control)	Each phonetic character is left justified without respect to the base text (so it is not per word).

Referenced By
phoneticPr@alignment (§3.4.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PhoneticAlignment">
   <restriction base="xsd:string">
      <enumeration value="noControl"/>
      <enumeration value="left"/>
      <enumeration value="center"/>
      <enumeration value="distributed"/>
   </restriction>
</simpleType>
```

3.18.59 ST_PhoneticType (Phonetic Type)

Represents the different type of East Asian character sets that shall be used for displaying phonetic hints.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fullwidthKatakana (Full-Width Katakana)	Full-width Katakana is used
halfwidthKatakana (Half-Width Katakana)	Half-width Katakana is used, this is the same Katakana character set, just half as wide so it takes up less space.
Hiragana (Hiragana)	Hiragana is used
noConversion (No Conversion)	Any type of characters are allowed. In this case the spreadsheet application shall leave the text as entered.

Referenced By
phoneticPr@type (§3.4.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PhoneticType">
   <restriction base="xsd:string">
      <enumeration value="halfwidthKatakana"/>
      <enumeration value="fullwidthKatakana"/>
      <enumeration value="Hiragana"/>
      <enumeration value="noConversion"/>
   </restriction>
</simpleType>
```

3.18.60 ST_PivotAreaType (Rule Type)

Indicates the type of rule being used to describe an area or aspect of the PivotTable.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Refers to the whole PivotTable.
button (Field Button)	Refers to a field button.
data (Data)	Refers to something in the data area.
none (None)	Refers to no Pivot area.
normal (Normal)	Refers to a header or item.
origin (Origin)	Refers to the blank cells at the top-left of the PivotTable (top-right for RTL sheets).
topRight (Top Right)	Refers to the blank cells at the top-right of the PivotTable (top-left for RTL sheets).

Referenced By
pivotArea@type (§3.3.1.66)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PivotAreaType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="normal"/>
      <enumeration value="data"/>
      <enumeration value="all"/>
      <enumeration value="origin"/>
      <enumeration value="button"/>
      <enumeration value="topRight"/>
   </restriction>
</simpleType>
```

3.18.61 ST_PivotFilterType (Pivot Filter Types)

This simple type defines filters that can be applied to PivotTables.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
captionBeginsWith (Caption Begins With)	Indicates the "begins with" filter for field captions.
captionBetween (Caption Is Between)	Indicates the "is between" filter for field captions.
captionContains (Caption Contains)	Indicates the "contains" filter for field captions.
captionEndsWith (Caption Ends With)	Indicates the "ends with" filter for field captions.
captionEqual (Caption Equals)	Indicates the "equal" filter for field captions.

Enumeration Value	Description
captionGreaterThan (Caption Is Greater Than)	Indicates the "is greater than" filter for field captions.
captionGreaterThanOrEqual (Caption Is Greater Than Or Equal To)	Indicates the "is greater than or equal to" filter for field captions.
captionLessThan (Caption Is Less Than)	Indicates the "is less than" filter for field captions.
captionLessThanOrEqual (Caption Is Less Than Or Equal To)	Indicates the "is less than or equal to" filter for field captions.
captionNotBeginsWith (Caption Does Not Begin With)	Indicates the "does not begin with" filter for field captions.
captionNotBetween (Caption Is Not Between)	Indicates the "is not between" filter for field captions.
captionNotContains (Caption Does Not Contain)	Indicates the "does not contain" filter for field captions.
captionNotEndsWith (Caption Does Not End With)	Indicates the "does not end with" filter for field captions.
captionNotEqual (Caption Not Equal)	Indicates the "not equal" filter for field captions.
count (Count)	Indicates the "count" filter.
dateBetween (Date Between)	Indicates the "between" filter for date values.
dateEqual (Date Equals)	Indicates the "equals" filter for date values.
dateNewerThan (Date Newer Than)	Indicates the "newer than" filter for date values.
dateNewerThanOrEqual (Date Newer Than or Equal To)	Indicates the "newer than or equal to" filter for date values.
dateNotBetween (Date Not Between)	Indicates the "not between" filter for date values.
dateNotEqual (Date Does Not Equal)	Indicates the "does not equal" filter for date values.
dateOlderThan (Date Older Than)	Indicates the "older than" filter for date values.
dateOlderThanOrEqual (Date Older Than Or Equal)	Indicates the "older than or equal to" filter for date values.
lastMonth (Last Month)	Indicates the "last month" filter for date values.
lastQuarter (Last Quarter)	Indicates the "last quarter" filter for date values.
lastWeek (Last Week)	Indicates the "last week" filter for date values.
lastYear (Last Year)	Indicates the "last year" filter for date values.
M1 (January)	Indicates the "January" filter for date values.
M10 (Dates in October)	Indicates the "October" filter for date values.
M11 (Dates in November)	Indicates the "November" filter for date values.
M12 (Dates in December)	Indicates the "December" filter for date values.
M2 (Dates in February)	Indicates the "February" filter for date values.
M3 (Dates in March)	Indicates the "March" filter for date values.
M4 (Dates in April)	Indicates the "April" filter for date values.

Enumeration Value	Description
M5 (Dates in May)	Indicates the "May" filter for date values.
M6 (Dates in June)	Indicates the "June" filter for date values.
M7 (Dates in July)	Indicates the "July" filter for date values.
M8 (Dates in August)	Indicates the "August" filter for date values.
M9 (Dates in September)	Indicates the "September" filter for date values.
nextMonth (Next Month)	Indicates the "next month" filter for date values.
nextQuarter (Next Quarter)	Indicates the "next quarter" for date values.
nextWeek (Next Week)	Indicates the "next week" for date values.
nextYear (Next Year)	Indicates the "next year" filter for date values.
percent (Percent)	Indicates the "percent" filter for numeric values.
Q1 (First Quarter)	Indicates the "first quarter" filter for date values.
Q2 (Second Quarter)	Indicates the "second quarter" filter for date values.
Q3 (Third Quarter)	Indicates the "third quarter" filter for date values.
Q4 (Fourth Quarter)	Indicates the "fourth quarter" filter for date values.
sum (Sum)	Indicates the "sum" filter for numeric values.
thisMonth (This Month)	Indicates the "this month" filter for date values.
thisQuarter (This Quarter)	Indicates the "this quarter" filter for date values.
thisWeek (This Week)	Indicates the "this week" filter for date values.
thisYear (This Year)	Indicate the "this year" filter for date values.
today (Today)	Indicates the "today" filter for date values.
tomorrow (Tomorrow)	Indicates the "tomorrow" filter for date values.
unknown (Unknown)	Indicates the PivotTable filter is unknown to the application.
valueBetween (Value Between)	Indicates the "Value between" filter for text and numeric values.
valueEqual (Value Equal)	Indicates the "value equal" filter for text and numeric values.
valueGreaterThan (Value Greater Than)	Indicates the "value greater than" filter for text and numeric values.
valueGreaterThanOrEqual (Value Greater Than Or Equal To)	Indicates the "value greater than or equal to" filter for text and numeric values.
valueLessThan (Value Less Than)	Indicates the "value less than" filter for text and numeric values.
valueLessThanOrEqual (Value Less Than Or Equal To)	Indicates the "value less than or equal to" filter for text and numeric values
valueNotBetween (Value Not Between)	Indicates the "value not between" filter for text and

Enumeration Value	Description
	numeric values.
valueNotEqual (Value Not Equal)	Indicates the "value not equal" filter for text and numeric values.
yearToDate (Year-To-Date)	Indicates the "year-to-date" filter for date values.
yesterday (Yesterday)	Indicates the "yesterday" filter for date values.

Referenced By
filter@type (§3.10.1.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PivotFilterType">
   <restriction base="xsd:string">
      <enumeration value="unknown"/>
      <enumeration value="count"/>
      <enumeration value="percent"/>

        <enumeration value="M12"/>
    </restriction>
</simpleType>
```

3.18.62 ST_PrintError (Print Errors)

This enumeration specifies how to display cells with errors when printing the worksheet.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
blank (Show Cell Errors As Blank)	Display cell errors as blank.
dash (Dash Cell Errors)	Display cell errors as dashes.
displayed (Display Cell Errors)	Display cell errors as displayed on screen.
NA (NA)	Display cell errors as #N/A.

Referenced By
pageSetup@errors (§3.3.1.61)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PrintError">
    <restriction base="xsd:string">
        <enumeration value="displayed"/>
        <enumeration value="blank"/>
        <enumeration value="dash"/>
        <enumeration value="NA"/>
    </restriction>
</simpleType>
```

3.18.63 ST_Qualifier (Qualifier)

Qualifier to use to denote string data types in when text is imported from an external file.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
doubleQuote (Double Quote)	Quotation mark -- double quote (").
none (No Text Qualifier)	No text string qualifier used.
singleQuote (Single Quote)	Apostrophe mark -- single quote (').

Referenced By
textPr@qualifier (§3.13.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Qualifier">
   <restriction base="xsd:string">
      <enumeration value="doubleQuote"/>
      <enumeration value="singleQuote"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

3.18.64 ST_Ref (Cell References)

This simple type defines a reference to a range of cells within a sheet in the workbook. A reference identifies a cell or a range of cells on a worksheet and tells the application where to look for the values or data you want to use in a formula. With references, you can use data contained in different parts of a worksheet in one formula or use the value from one cell in several formulas. You can also refer to cells on other sheets in the same workbook, and to other workbooks. References to cells in other workbooks are called links.

SpreadsheetML defines two reference styles defined in the ST_RefMode simple type.

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
autoFilter@ref (§3.3.1.1); comment@ref (§3.7.3); dataRef@ref (§3.3.1.28); dimension@ref (§3.3.1.33); hyperlink@ref (§3.3.1.44); location@ref (§3.10.1.49); mergeCell@ref (§3.3.1.53); oleSize@ref (§3.2.16); pivotArea@offset (§3.3.1.66); raf@ref (§3.11.1.8); rangeSet@ref (§3.10.1.79); rm@destination (§3.11.1.19); rm@source (§3.11.1.19); rqt@ref (§3.11.1.20); rrc@ref (§3.11.1.21); sheetPr@syncRef (§3.3.1.79); sortCondition@ref (§3.3.1.88); sortState@ref (§3.3.1.89); ST_Ref (§3.18.64); table@ref (§3.5.1.2); webPublishItem@sourceRef (§3.3.1.94); worksheetSource@ref (§3.10.1.95)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Ref">
   <restriction base="xsd:string"/>
</simpleType>
```

3.18.65 ST_RefA (Single Cell Reference)

This simple type specifies a single cell reference that may be absolute.

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
undo@dr (§3.11.1.25)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RefA">
   <restriction base="xsd:string"/>
</simpleType>
```

3.18.66 ST_RefMode (Reference Mode)

This simple type defines the supported reference styles or modes for a workbook in SpreadsheetML.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
A1 (A1 Mode)	Indicates that the workbook uses A1 reference style. This is the default for SpreadsheetML. A1 reference style refers to columns with letters and refers to rows with numbers. For example, A1 refers to the cell at the intersection of column A and row 1.
R1C1 (R1C1 Reference Mode)	Indicates that the workbook uses the R1C1 reference style. R1C1 reference style refers to both the rows and the columns on the worksheet with numbers. The location of a cell is indicated with an "R" followed by a row number and a "C" followed by a column number. For example, R1C1 refers to the cell at the intersection of row R1 and column C1.

Referenced By
calcPr@refMode (§3.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RefMode">
   <restriction base="xsd:string">
      <enumeration value="A1"/>
      <enumeration value="R1C1"/>
   </restriction>
</simpleType>
```

3.18.67 ST_RevisionAction (Revision Action Types)

Identifies what kind of action the user performed. Applies to Comment and Custom View revision record.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
add (Add)	Add action.
delete (Delete)	Delete action.

Referenced By
rcmt@action (§3.11.1.11); rcv@action (§3.11.1.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RevisionAction">
   <restriction base="xsd:string">
      <enumeration value="add"/>
      <enumeration value="delete"/>
   </restriction>
</simpleType>
```

3.18.68 ST_rwColActionType (Row Column Action Type)

Identifies what kind of an action was applied to a row or column.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
deleteCol (Delete Column)	Column delete revision.
deleteRow (Delete Row)	Row delete revision.
insertCol (Column Insert)	Column insert revision.
insertRow (Insert Row)	Row insert revision.

Referenced By
rrc@action (§3.11.1.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_rwColActionType">
   <restriction base="xsd:string">
      <enumeration value="insertRow"/>
      <enumeration value="deleteRow"/>
      <enumeration value="insertCol"/>
      <enumeration value="deleteCol"/>
   </restriction>
</simpleType>
```

3.18.69 ST_Scope (Conditional Formatting Scope)

This simple type defines the scope of conditional formatting applied in the PivotTable.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
data (Data Fields)	Indicates that conditional formatting is applied to the selected data fields.
field (Field Intersections)	Indicates that conditional formatting is applied to the selected PivotTable field intersections.
selection (Selection)	Indicates that conditional formatting is applied to the selected cells.

Referenced By
conditionalFormat@scope (§3.10.1.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Scope">
   <restriction base="xsd:string">
      <enumeration value="selection"/>
      <enumeration value="data"/>
      <enumeration value="field"/>
   </restriction>
</simpleType>
```

3.18.70 ST_SheetState (Sheet Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hidden (Hidden)	Indicates the book window is hidden, but can be shown by the user via the user interface.
veryHidden (Very Hidden)	Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically.
visible (Visible)	Indicates the sheet is visible.

Referenced By
customSheetView@state (§3.3.1.22); customSheetView@state (§3.3.1.23); sheet@state (§3.2.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SheetState">
   <restriction base="xsd:string">
      <enumeration value="visible"/>
      <enumeration value="hidden"/>
      <enumeration value="veryHidden"/>
   </restriction>
</simpleType>
```

3.18.71 ST_SheetViewType (Sheet View Type)

Defines the view setting of the sheet.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
normal (Normal View)	Normal view
pageBreakPreview (Page Break Preview)	Page break preview
pageLayout (Page Layout View)	Page Layout View

Referenced By
customSheetView@view (§3.3.1.23); sheetView@view (§3.3.1.83)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SheetViewType">
   <restriction base="xsd:string">
      <enumeration value="normal"/>
      <enumeration value="pageBreakPreview"/>
      <enumeration value="pageLayout"/>
   </restriction>
</simpleType>
```

3.18.72 ST_ShowDataAs (Show Data As)

This simple type defines the data formats for a field in the PivotTable.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
difference (Difference)	Indicates the field is shown as the "difference from" a value.
index (Index)	Indicates the field is shown as the "index.
normal (Normal Data Type)	Indicates that the field is shown as its normal data type.
percent (Percentage Of)	Indicates the field is show as the "percentage of
percentDiff (Percentage Difference)	Indicates the field is shown as the "percentage difference from" a value.
percentOfCol (Percent of Column)	Indicates the field is shown as the percentage of column.
percentOfRow (Percentage of Row)	Indicates the field is shown as the percentage of row
percentOfTotal (Percentage of Total)	Indicates the field is shown as percentage of total.
runTotal (Running Total)	Indicates the field is shown as running total in the table.

Referenced By
dataField@showDataAs (§3.10.1.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ShowDataAs">
   <restriction base="xsd:string">
      <enumeration value="normal"/>
      <enumeration value="difference"/>
      <enumeration value="percent"/>
      <enumeration value="percentDiff"/>
      <enumeration value="runTotal"/>
      <enumeration value="percentOfRow"/>
      <enumeration value="percentOfCol"/>
      <enumeration value="percentOfTotal"/>
      <enumeration value="index"/>
   </restriction>
</simpleType>
```

3.18.73 ST_SmartTagShow (Smart Tag Display Types)

This simple type defines options for displaying smart tags in the user interface.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Indicates that smart tags are enabled and shown in the user interface.
noIndicator (No Smart Tag Indicator)	Indicates that the smart tags are enabled but the indicator not be shown in the user interface.
none (None)	Indicates that smart tags are disabled and not displayed in the user interface.

Referenced By
smartTagPr@show (§3.2.21)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SmartTagShow">
   <restriction base="xsd:string">
      <enumeration value="all"/>
      <enumeration value="none"/>
      <enumeration value="noIndicator"/>
   </restriction>
</simpleType>
```

3.18.74 ST_SortBy (Sort By)

Specifies what to sort by. In many cases a range of cells are sorted by their values. However, cells can also be sorted by their background color, font color, and type of icon in the cell.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
cellColor (Sort by Cell Color)	Sort by cell color
fontColor (Sort by Font Color)	Sort by font color
icon (Sort by Icon)	Sort by icon
value (Value)	Sort by value

Referenced By
sortCondition@sortBy (§3.3.1.88)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SortBy">
   <restriction base="xsd:string">
      <enumeration value="value"/>
      <enumeration value="cellColor"/>
      <enumeration value="fontColor"/>
      <enumeration value="icon"/>
   </restriction>
</simpleType>
```

3.18.75 ST_SortMethod (Sort Method)

Sort method. Chinese Simplified, Chinese Traditional, and Japanese support alternate sort methods (multiple sort options are available). All other languages support only 1 sort option. In that case, the value `pinYin` is used.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
none (None)	Not specified, use default sort method.
pinYin (PinYin Sort)	Default sort method. This is the only sort option for most languages. For Chinese Simplified, Chinese Traditional, and Japanese, `pinYin` means sort by phonetic value.
stroke (Sort by Stroke)	Sort by stroke count of the characters. Only applies to Chinese Simplified, Chinese Traditional, and Japanese.

Referenced By
sortState@sortMethod (§3.3.1.89)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SortMethod">
   <restriction base="xsd:string">
      <enumeration value="stroke"/>
      <enumeration value="pinYin"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

3.18.76 ST_SortType (Set Sort Order)

This simple type defines the possible sort order for the PivotTable.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ascending (Ascending)	Indicates that the PivotTable data is sorted in ascending order.
ascendingAlpha (Ascending Alpha)	Indicates that the PivotTable data is sorted in alphabetic order with ascending values.
ascendingNatural (Ascending Natural)	Indicates that the PivotTable data is sorted in natural order with ascending.
descending (Descending)	Indicates that the PivotTable data is sorted in descending.
descendingAlpha (Alphabetic Order Descending)	Indicates that the PivotTable data is sorted in alphabetic order with descending values.
descendingNatural (Natural Order Descending)	Indicates that the PivotTable data is sorted in natural order with descending values.
none (None)	Indicates that the PivotTable data is not sorted.

Referenced By
set@sortType (§3.10.1.88)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SortType">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="ascending"/>
      <enumeration value="descending"/>
      <enumeration value="ascendingAlpha"/>
      <enumeration value="descendingAlpha"/>
      <enumeration value="ascendingNatural"/>
      <enumeration value="descendingNatural"/>
   </restriction>
</simpleType>
```

3.18.77 ST_SourceType (PivotCache Type)

This simple type defines the cache types for PivotTables.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
consolidation (Consolidation Ranges)	Indicates that the cache contains data that consolidates ranges.
external (External)	Indicates that the cache contains data from an external data source.
scenario (Scenario Summary Report)	Indicates that the cache contains a scenario summary report
worksheet (Worksheet)	Indicates that the cache contains worksheet data.

Referenced By
cacheSource@type (§3.10.1.7)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SourceType">
   <restriction base="xsd:string">
      <enumeration value="worksheet"/>
      <enumeration value="external"/>
      <enumeration value="consolidation"/>
      <enumeration value="scenario"/>
   </restriction>
</simpleType>
```

3.18.78 ST_Sqref (Reference Sequence)

A sequence of cell references, space delimited.

This simple type allows a list of items of the ST_Ref simple type (§3.18.64).

Referenced By
conditionalFormatting@sqref (§3.3.1.17); dataValidation@sqref (§3.3.1.30); ignoredError@sqref (§3.3.1.47); protectedRange@sqref (§3.3.1.69); rfmt@sqref (§3.11.1.17); scenarios@sqref (§3.3.1.74); selection@sqref (§3.3.1.75)

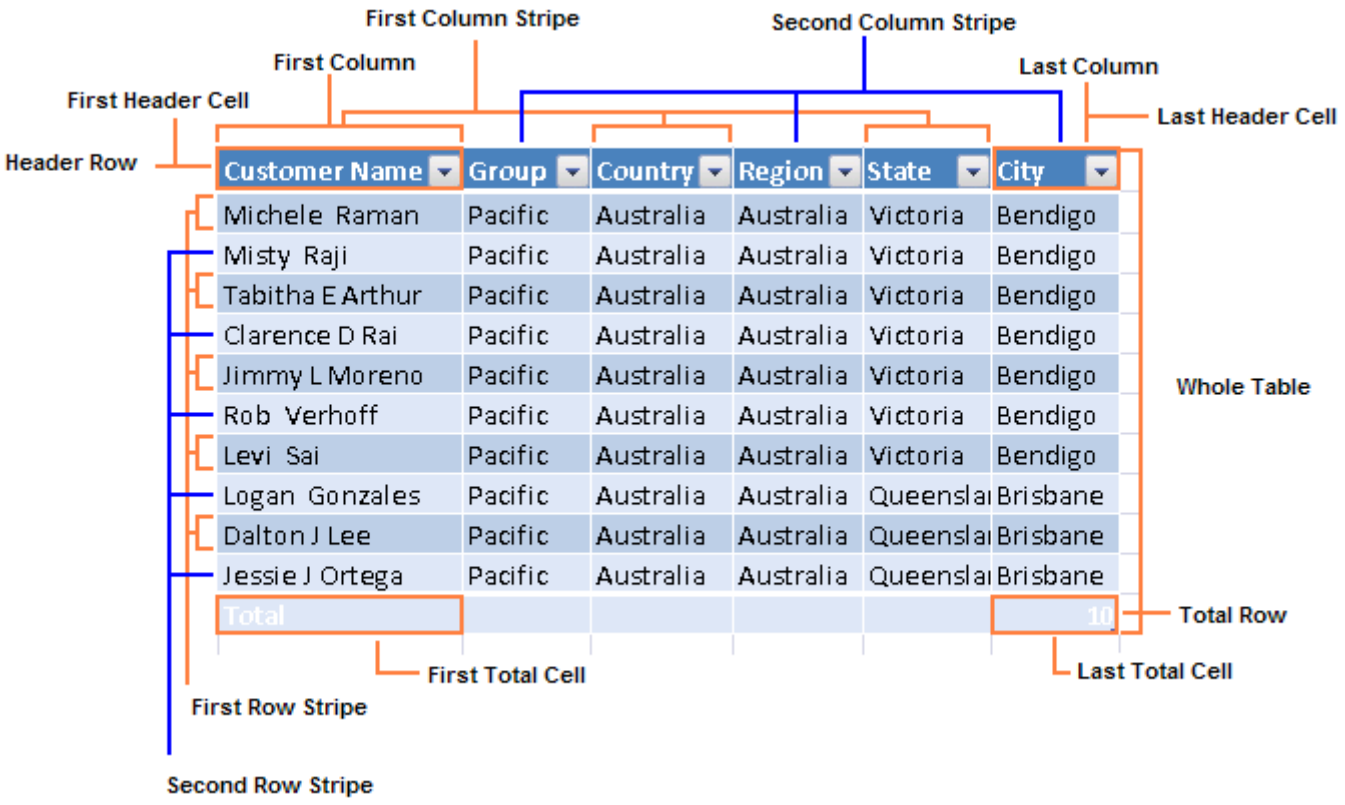
The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Sqref">
   <list itemType="ST_Ref"/>
</simpleType>
```

3.18.79 ST_TableStyleType (Table Style Type)

Enumeration of the different structured regions of a Table or PivotTable which can be formatted. Specifies which region is being formatted by this table style element.

Table Regions



PivotTable Regions

Blank Row

Only applies when "Insert blank row after each item" is ON.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
blankRow (Blank Row Style)	Table style element that applies to PivotTable's blank rows.
firstColumn (First Column Style)	Table style element that applies to table's first column.
firstColumnStripe (First Column Stripe Style)	Table style element that applies to table's first column stripes.
firstColumnSubheading (First Column Subheading Style)	Table style element that applies to PivotTable's first column subheading.
firstHeaderCell (First Header Row Style)	Table style element that applies to table's first header row cell.
firstRowStripe (First Row Stripe Style)	Table style element that applies to table's first row stripes.
firstRowSubheading (First Row Subheading Style)	Table style element that applies to PivotTable's first row subheading.
firstSubtotalColumn (First Subtotal Column Style)	Table style element that applies to PivotTable's first subtotal column.
firstSubtotalRow (First Subtotal Row Style)	Table style element that applies to pivot table's first subtotal row.
firstTotalCell (First Total Row Style)	Table style element that applies to table's first total

Enumeration Value	Description
	row cell.
headerRow (Header Row Style)	Table style element that applies to table's header row.
lastColumn (Last Column Style)	Table style element that applies to table's last column.
lastHeaderCell (Last Header Style)	Table style element that applies to table's last header row cell.
lastTotalCell (Last Total Row Style)	Table style element that applies to table's last total row cell.
pageFieldLabels (Page Field Labels Style)	Table style element that applies to pivot table's page field labels.
pageFieldValues (Page Field Values Style)	Table style element that applies to pivot table's page field values.
secondColumnStripe (Second Column Stipe Style)	Table style element that applies to table's second column stripes.
secondColumnSubheading (Second Column Subheading Style)	Table style element that applies to pivot table's second column subheading.
secondRowStripe (Second Row Stripe Style)	Table style element that applies to table's second row stripes.
secondRowSubheading (Second Row Subheading Style)	Table style element that applies to pivot table's second row subheading.
secondSubtotalColumn (Second Subtotal Column Style)	Table style element that applies to PivotTable's second subtotal column.
secondSubtotalRow (Second Subtotal Row Style)	Table style element that applies to PivotTable's second subtotal row.
thirdColumnSubheading (Third Column Subheading Style)	Table style element that applies to PivotTable's third column subheading.
thirdRowSubheading (Third Row Subheading Style)	Table style element that applies to PivotTable's third row subheading.
thirdSubtotalColumn (Third Subtotal Column Style)	Table style element that applies to pivot table's third subtotal column.
thirdSubtotalRow (Third Subtotal Row Style)	Table style element that applies to PivotTable's third subtotal row.
totalRow (Total Row Style)	Table style element that applies to table's total row.
wholeTable (Whole Table Style)	Table style element that applies to table's entire content.

3.18.80 ST_TableType (Table Type)

An enumeration that specifies what the table data is based on.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
queryTable (Query Table)	A table based on an external data query.
worksheet (Worksheet)	A table based on a worksheet data range.
xml (XML)	A table based on an XML mapping.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TableType">
   <restriction base="xsd:string">
      <enumeration value="worksheet"/>
      <enumeration value="xml"/>
      <enumeration value="queryTable"/>
   </restriction>
</simpleType>
```

3.18.81 ST_TargetScreenSize (Target Screen Size Types)

This simple type defines the collection of screen resolutions that are supported for this workbook.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1024x768 (1024 x 768 Resolution)	Sets the target screen resolution to 1024x768 pixels.
1152x882 (1152 x 882 Resolution)	Sets the target screen resolution to 1152x882 pixels.
1152x900 (1152 x 900 Resolution)	Sets the target screen resolution to 1152x900 pixels
1280x1024 (1280 x 1024 Resolution)	Sets the target screen resolution to 1280x1024 pixels.
1600x1200 (1600 x 1200 Resolution)	Sets the target screen resolution to 1600x1200 pixels.
1800x1440 (1800 x 1440 Resolution)	Sets the target screen resolution to 1800x1440 pixels.
1920x1200 (1920 x 1200 Resolution)	Sets the target screen resolution to 1920x1200 pixels.
544x376 (544 x 376 Resolution)	Sets the target screen resolution to 544x376 pixels.
640x480 (640 x 480 Resolution)	Sets the target screen resolution to 640x480 pixels.
720x512 (720 x 512 Resolution)	Sets the target screen resolution to 720x512 pixels.
800x600 (800 x 600 Resolution)	Sets the target screen resolution to 800x600 pixels.

      <enumeration value="1600x1200"/>
      <enumeration value="1800x1440"/>
      <enumeration value="1920x1200"/>
   </restriction>
</simpleType>
```

3.18.82 ST_TimePeriod (Time Period Types)

Used in a "contains dates" conditional formatting rule. These are dynamic time periods, which change based on the date the conditional formatting is refreshed / applied.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
last7Days (Last 7 Days)	A date in the last seven days.
lastMonth (Last Month)	A date occuring in the last calendar month.
lastWeek (Last Week)	A date occuring last week.
nextMonth (Next Month)	A date occuring in the next calendar month.
nextWeek (Next Week)	A date occuring next week.
thisMonth (This Month)	A date occuring in this calendar month.
thisWeek (This Week)	A date occuring this week.
today (Today)	Today's date.
tomorrow (Tomorrow)	Tomorrow's date.
yesterday (Yesterday)	Yesterday's date.

Referenced By
cfRule@timePeriod (§3.3.1.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TimePeriod">
   <restriction base="xsd:string">
      <enumeration value="today"/>
      <enumeration value="yesterday"/>
      <enumeration value="tomorrow"/>
      <enumeration value="last7Days"/>
      <enumeration value="thisMonth"/>
      <enumeration value="lastMonth"/>
      <enumeration value="nextMonth"/>
      <enumeration value="thisWeek"/>
      <enumeration value="lastWeek"/>
      <enumeration value="nextWeek"/>
   </restriction>
</simpleType>
```

3.18.83 ST_TotalsRowFunction (Totals Row Function Types)

An enumeration that specifies what function is used to aggregate the data in a column before it is displayed in the totals row.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
average (Average)	Represents the arithmetic mean.
count (Non Empty Cell Count)	Represents a count of the number of non-empty cells.
countNums (Count Numbers)	Represents the number of cells that contain numbers.
custom (Custom Formula)	Represents the formula provided in `totalsRowFormula`.
max (Maximum)	Represents the largest value.
min (Minimum)	Represents the smallest value.
none (None)	No total row.
stdDev (StdDev)	Represents the estimated standard deviation.
sum (Sum)	Represents the arithmetic sum.
var (Var)	Represents the estimated variance.

Referenced By
tableColumn@totalsRowFunction (§3.5.1.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TotalsRowFunction">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="sum"/>
      <enumeration value="min"/>
      <enumeration value="max"/>
      <enumeration value="average"/>
      <enumeration value="count"/>
      <enumeration value="countNums"/>
      <enumeration value="stdDev"/>
      <enumeration value="var"/>
      <enumeration value="custom"/>
   </restriction>
</simpleType>
```

3.18.84 ST_Type (Top N Evaluation Type)

This simple type defines the values for the Top N conditional formatting evaluation for the PivotTable. For more information on Top N conditional formatting, see the Sheet (§3.3.1) reference material.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (All)	Indicates that Top N conditional formatting is evaluated across the entire scope range.
column (Column Top N)	Indicates that Top N conditional formatting is evaluated for each column.
none (Top N None)	Indicates that Top N conditional formatting is not evaluated
row (Row Top N)	Indicates that Top N conditional formatting is evaluated for each row.

Referenced By
conditionalFormat@type (§3.10.1.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Type">
   <restriction base="xsd:string">
      <enumeration value="none"/>
      <enumeration value="all"/>
      <enumeration value="row"/>
      <enumeration value="column"/>
   </restriction>
</simpleType>
```

3.18.85 ST_UnderlineValues (Underline Types)

Represents the different types of possible underline formatting.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
double (Double Underline)	Double-line underlining under each character in the cell. underlines are drawn through the descenders of characters such as g and p. 
doubleAccounting (Accounting Double Underline)	Double-line accounting underlining under each character in the cell. The underlines are drawn under the descenders of characters such as g and p. none (None)	No underline.
single (Single Underline)	Single-line underlining under each character in the cell. The underline is drawn through the descenders of characters such as g and p. singleAccounting (Accounting Single Underline)	Single-line accounting underlining under each character in the cell. The underline is drawn under the descenders of characters such as g and p. 

Referenced By
u@val (§3.4.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UnderlineValues">
   <restriction base="xsd:string">
      <enumeration value="single"/>
      <enumeration value="double"/>
      <enumeration value="singleAccounting"/>
      <enumeration value="doubleAccounting"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

3.18.86 ST_UnsignedIntHex (Hex Unsigned Integer)

This simple type represents the Hex representation of an unsigned integer.

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 4 characters.

Referenced By
bgColor@rgb (§3.8.3); color@rgb (§3.3.1.14); e@bc (§3.10.1.27); e@fc (§3.10.1.27); fgColor@rgb (§3.8.18); m@bc (§3.10.1.50); m@fc (§3.10.1.50); n@bc (§3.10.1.60); n@fc (§3.10.1.60); rgbColor@rgb (§3.8.34); s@bc (§3.10.1.85); s@fc (§3.10.1.85); t@bc (§3.9.16); t@fc (§3.9.16); tabColor@rgb (§3.3.1.90)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UnsignedIntHex">
   <restriction base="xsd:hexBinary">
      <length value="4"/>
   </restriction>
</simpleType>
```

3.18.87 ST_UnsignedShortHex (Unsigned Short Hex)

This simple type defines the Hex representation of an unsigned short.

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 2 characters.

Referenced By
fileSharing@reservationPassword (§3.2.12); protectedRange@password (§3.3.1.69); sheetProtection@password (§3.3.1.81); sheetProtection@password (§3.3.1.82); workbookProtection@revisionsPassword (§3.2.29); workbookProtection@workbookPassword (§3.2.29)

```
<simpleType name="ST_UnsignedShortHex">
   <restriction base="xsd:hexBinary">
      <length value="2"/>
   </restriction>
</simpleType>
```

3.18.88 ST_UpdateLinks (Update Links Behavior Types)

This simple type defines when the application updates links to other workbooks when the workbook is opened.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
always (Always Update Links)	Indicates that links to other workbooks are always updated when the workbook is opened. The application will not display an alert in the user interface (UI).
never (Never Update Links)	Indicates that links to other workbooks are never updated when the workbook is opened. The application will not display an alert in the user interface.
userSet (User Set)	Indicates that the end-user specified whether they receive an alert to update links to other workbooks when the workbook is opened. For example, the application may expose this option in an application settings dialog.

Referenced By
workbookPr@updateLinks (§3.2.28)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_UpdateLinks">
   <restriction base="xsd:string">
      <enumeration value="userSet"/>
      <enumeration value="never"/>
      <enumeration value="always"/>
   </restriction>
</simpleType>
```

3.18.89 ST_VerticalAlignment (Vertical Alignment Types)

This enumeration value indicates the type of vertical alignment for a cell, i.e., whether it is aligned top, bottom, vertically centered, justified or distributed.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bottom (Aligned To Bottom)	The vertical alignment is aligned-to-bottom.
center (Centered Vertical Alignment)	The vertical alignment is centered across the height of the cell.
distributed (Distributed Vertical Alignment)	When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top

Enumeration Value	Description
	and bottom margins. When text direction is vertical: behaves exactly as distributed horizontal alignment. The first words in a line of text (appearing at the top of the cell) are flush with the top edge of the cell, and the last words of a line of text are flush with the bottom edge of the cell, and the line of text is distributed evenly from top to bottom. [*Example*: Horizontal text: this first example shows four lines of text (read horizontally from left to right) distributed vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl".  Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are: abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop The rendering looks like this:

Enumeration Value	Description
	 *end example*]
justify (Justified Vertically)	When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top and bottom margins. When text direction is vertical: similar behavior as horizontal justification. The alignment is justified (flush top and bottom in this case). For each line of text, each line of the wrapped text in a cell is aligned to the top and bottom (except the last line). If no single line of text wraps in the cell, then the text is not justified. [*Example*: Horizontal text: this first example shows four lines of text (read horizontally from left to right) justified vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl".

Enumeration Value	Description
	 Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are: abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop The rendering looks like this:  *end example*]
top (Align Top)	The vertical alignment is aligned-to-top.

Referenced By
alignment@vertical (§3.8.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VerticalAlignment">
   <restriction base="xsd:string">
      <enumeration value="top"/>
      <enumeration value="center"/>
      <enumeration value="bottom"/>
      <enumeration value="justify"/>
      <enumeration value="distributed"/>
   </restriction>
</simpleType>
```

3.18.90 ST_VerticalAlignRun (Vertical Alignment Run Types)

Defines the possible settings for vertical alignment of a run of text. This is used to get superscript or subscript text without altering the font size properties of the rest of the text run.

[*Example*:

```
<rPr>
  <vertAlign val="subscript"/>
</rPr>
```

end example]

The above example shows a run which shall be positioning as subscript when displaying its contents. The resulting run is positioned as `subscript`, therefore it is rendered in a smaller size below the default baseline location for the contents of the run.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
baseline (Baseline)	Returns the text in this run to the baseline, default, alignment, and returns it to the original font size.
subscript (Subscript)	Specifies that this text should be subscript. Lowers the text in this run below the baseline and changes it to a smaller size, if a smaller size is available.
superscript (Superscript)	Specifies that this text should be superscript. Raises the text in this run above the baseline and changes it to a smaller size, if a smaller size is available.

Referenced By
vertAlign@val (§3.4.14)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VerticalAlignRun">
   <restriction base="xsd:string">
      <enumeration value="baseline"/>
      <enumeration value="superscript"/>
      <enumeration value="subscript"/>
   </restriction>
</simpleType>
```

3.18.91 ST_Visibility (Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hidden (Hidden)	Indicates the book window is hidden, but can be shown by the user via the user interface.
veryHidden (Very Hidden)	Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically.
visible (Visible)	Indicates the workbook window is visible.

Referenced By
workbookView@visibility (§3.2.30)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Visibility">
   <restriction base="xsd:string">
      <enumeration value="visible"/>
      <enumeration value="hidden"/>
      <enumeration value="veryHidden"/>
   </restriction>
</simpleType>
```

3.18.92 ST_VolDepType (Volatile Dependency Types)

This simple type defines the dependency types available for this workbook.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
olapFunctions (OLAP Formulas)	Indicates that the type is Cube Functions.
realTimeData (Real Time Data)	Indicates that the type is Real Time Data (RTD).

Referenced By
volType@type (§3.15.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VolDepType">
   <restriction base="xsd:string">
      <enumeration value="realTimeData"/>
      <enumeration value="olapFunctions"/>
   </restriction>
</simpleType>
```

3.18.93 ST_VolValueType (Volatile Dependency Value Types)

This simple type defines the data type of the values in the dependency cache.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Boolean)	Indicates topic value is a boolean.
e (Error)	Indicates topic value is an error.
n (Real Number)	Indicates topic value is a real number.
s (String)	Indicates topic value is a string.

Referenced By
tp@t (§3.15.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_VolValueType">
   <restriction base="xsd:string">
      <enumeration value="b"/>
      <enumeration value="n"/>
      <enumeration value="e"/>
      <enumeration value="s"/>
   </restriction>
</simpleType>
```

3.18.94 ST_WebSourceType (Web Source Type)

This is an enumeration of types of objects which can be selected from the workbook to be published as HTML. For example, the entire sheet can be published, or a narrower set of objects on the sheet can be published, like a chart or a range.

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
autoFilter (AutoFilter)	Auto filter
chart (Chart)	Chart
label (Label)	Label
pivotTable (PivotTable)	PivotTable
printArea (Print Area)	Print area
query (QueryTable)	Query Table
range (Range)	Range of cells
sheet (All Sheet Content)	All content of a sheet

Referenced By
webPublishItem@sourceType (§3.3.1.94)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WebSourceType">
   <restriction base="xsd:string">
      <enumeration value="sheet"/>
      <enumeration value="printArea"/>
      <enumeration value="autoFilter"/>
      <enumeration value="range"/>
      <enumeration value="chart"/>
      <enumeration value="pivotTable"/>
      <enumeration value="query"/>
      <enumeration value="label"/>
   </restriction>
</simpleType>
```

3.18.95 ST_XmlDataType (XML Data Types)

Represents a W3C XML built-in datatype name (http://www.w3.org/TR/xmlschema-2/)

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
anyType (Any Type)	See http//www.w3.org/2001/XMLSchema
anyURI (Any URI)	See http//www.w3.org/2001/XMLSchema
base64Binary (Base 64 Encoded Binary)	See http//www.w3.org/2001/XMLSchema
boolean (Boolean)	See http//www.w3.org/2001/XMLSchema
byte (Byte)	See http//www.w3.org/2001/XMLSchema
date (Date)	See http//www.w3.org/2001/XMLSchema
dateTime (Date Time)	See http//www.w3.org/2001/XMLSchema
decimal (Decimal)	See http//www.w3.org/2001/XMLSchema
double (Double)	See http//www.w3.org/2001/XMLSchema
duration (Duration)	See http//www.w3.org/2001/XMLSchema
ENTITIES (ENTITIES)	See http//www.w3.org/2001/XMLSchema
ENTITY (ENTITY)	See http//www.w3.org/2001/XMLSchema
float (Float)	See http//www.w3.org/2001/XMLSchema
gDay (gDay)	See http//www.w3.org/2001/XMLSchema
gMonth (gMonth)	See http//www.w3.org/2001/XMLSchema
gMonthDay (gMonthDays)	See http//www.w3.org/2001/XMLSchema
gYear (gYear)	See http//www.w3.org/2001/XMLSchema

```

3.18.96 ST_Xstring (Escaped String)

String of characters with support for escaped invalid-XML characters.

For all characters which cannot be represented in XML as defined by the XML 1.0 specification, the characters are escaped using the Unicode numerical character representation escape character format _xHHHH_, where H represents a hexadecimal character in the character's value. [*Example*: The Unicode character 8 is invalid in an XML 1.0 document, so it shall be escaped as _x0008_. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Xstring">
    <restriction base="xsd:string"/>
</simpleType>
```

4. PresentationML Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising a PresentationML document, as defined by Part 1 of this Standard.

4.1 Table of Contents

This subclause is informative.

End of informative text.

4.2 Basics

The Basics portion of the PresentationML framework defines all commonly used elements for a PresentationML document. That is, those elements that do not fall into one of the following subclauses for PresentationML content as defined within this section.

4.2.1 custData (Customer Data)

This element specifies customer data which allows for the specifying and persistence of customer specific data within the presentation.

Parent Elements
custDataLst (§4.4.1.16)

Attributes	Description
id (Relationship ID)	This attribute specifies the relationship id for referencing other resources outside the scope of the current PresentationML file.

Attributes	Description
Namespace: .../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomerData">
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.2.2 custShow (Custom Show)

This element specifies a custom show which is an ordered list of a group of slides that are contained within the presentation. The custom show element allows for the specification of a presentation order that is different from the order in which the slides themselves are stored.

[Example: Consider the following custom show list that outlines a couple custom shows for a given set of slides.

```
<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId3"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
  <p:custShow name="Custom Show 2" id="1">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
</p:custShowLst>
```

In the above example there are two custom shows specified. The first specifies to present the slides in the order of 4, 3, 2 then 5 while the second specifies to play only slide 4 then 5. End example]

Parent Elements
htmlPubPr (§4.3.1.13); showPr (§4.3.1.28)

Attributes	Description
id (Custom Show Identifier)	This attribute specifies the custom show identification number. This is a number given that should be unique within the presentation document. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomShowId">
   <attribute name="id" type="xsd:unsignedInt" use="required"/>
</complexType>
```

4.2.3 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that will be used for later versions of generating applications.

Parent Elements
extLst (§4.2.4); extLst (§4.2.5)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	This attribute specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Extension">
   <sequence>
      <any processContents="lax"/>
   </sequence>
   <attribute name="uri" type="xsd:token"/>
</complexType>
```

4.2.4 extLst (Extension List with Modification Flag)

This element specifies the extension list with modification ability within which all future extensions of type ext will be defined. The extension list along with corresponding future extensions is used to extend the storage

capabilities of the PresentationML framework. This allows for various new types of data to be stored natively within the framework.

[*Note*: Using this extLst element allows the generating application to store whether this extension property has been modified. *end note*]

Parent Elements
cm (§4.5.1); cxnSp (§4.4.1.17); graphicFrame (§4.4.1.18); grpSp (§4.4.1.19); handoutMaster (§4.4.1.21); hf (§4.4.1.22); notes (§4.4.1.23); notesMaster (§4.4.1.24); ph (§4.4.1.33); pic (§4.4.1.34); sld (§4.4.1.35); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39); sp (§4.4.1.40); spTree (§4.4.1.42); timing (§4.4.1.44); transition (§4.4.1.46)

Child Elements	Subclause
ext (Extension)	§4.2.3

Attributes	Description
mod (Modify)	This attribute specifies whether the data contained within this element has been modified and should thus be processed again by the generating application. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExtensionListModify">
   <sequence>
      <group ref="EG_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="mod" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.2.5 extLst (Extension List)

This element specifies the extension list within which all future extensions of type ext will be defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the PresentationML framework. This allows for various new types of data to be stored natively within the framework.

Parent Elements
bgPr (§4.4.1.2); cmAuthor (§4.5.2); control (§4.4.2.1); cSld (§4.4.1.15); custShow (§4.3.1.5); embed (§4.4.2.2); handoutMasterId (§4.3.1.11); htmlPubPr (§4.3.1.13); link (§4.4.2.3); normalViewPr (§4.3.2.6); notesMasterId (§4.3.1.18); notesTextViewPr (§4.3.2.7); notesViewPr (§4.3.2.8); nvPr (§4.4.1.30); outlineViewPr (§4.3.2.10); photoAlbum (§4.3.1.22); presentation (§4.3.1.24); presentationPr (§4.3.1.25); prnPr (§4.3.1.26); showPr (§4.3.1.28); sldId (§4.3.1.29); sldLayoutId (§4.4.1.37); sldMasterId (§4.3.1.32); sldSyncPr (§4.7.1); slideViewPr (§4.3.2.16); sorterViewPr (§4.3.2.17); txStyles (§4.4.1.48); viewPr (§4.3.2.18); webPr (§4.3.1.36)

Child Elements	Subclause
ext (Extension)	§4.2.3

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExtensionList">
   <sequence>
      <group ref="EG_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.2.6 sld (Presentation Slide)

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

[Example: Consider the following custom show with an ordering of slides.

```
<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId3"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
</p:custShowLst>
```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. End example]

Parent Elements
sldLst (§4.3.1.31)

Attributes	Description
id (Relationship ID) Namespace: .../officeDocument/2006/relationships	This attribute specifies the relationship id that is used to reference to the actual slide XML file that contains all the information to the slide listed within the slide list. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideRelationshipListEntry">
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.2.7 sldAll (All Slides)

This attribute specifies all slides instead of a given range of slides for use within the html publishing properties as well as the show properties.

Parent Elements
htmlPubPr (§4.3.1.13); showPr (§4.3.1.28)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.2.8 sldRg (Slide Range)

This element specifies a slide range for use within the html publishing properties as well as the show properties.

[*Note*: The indexes used here correlate directly with the presentation slide numbers which they reference to. That is the slide range must be greater than or equal to 1 and also less than or equal to the number of slides in the presentation document. *end note*]

Parent Elements
htmlPubPr (§4.3.1.13); showPr (§4.3.1.28)

Attributes	Description
end (End)	This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).
st (Start)	This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IndexRange">
   <attribute name="st" type="ST_Index" use="required"/>
   <attribute name="end" type="ST_Index" use="required"/>
</complexType>
```

4.2.9 tags (Customer Data Tags)

This element specifies the existence of customer data in the form of tags. This allows for the storage of customer data within the PresenationML framework. While this is similar to the ext tag in that it can be used store

information, this tag mainly focuses on referencing to other parts of the presentation document. This is accomplished via the relationship identification attribute that is required for all specified tags.

Parent Elements
custDataLst (§4.4.1.16)

Attributes	Description
id (Relationship ID) Namespace: .../officeDocument/2006/relationships	This attribute specifies the relationship identifier for the customer data tag. This allows for a link to a resource that is external from the current XML document but still contained within the presentation document. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TagsData">
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3 Presentation

The Presentation portion of the PresentationML framework houses a set of elements that describe the storing of presentation-wide and view-specific properties. The presentation-wide properties are those that pertain to the entire presentation. The view-specific properties assist the generating application and viewing application by storing parameters that pertain to the final delivery of the presentation.

4.3.1 Presentation Properties

This section contains all presentation-level properties that pertain to a presentation document:

4.3.1.1 bold (Bold Embedded Font)

This element specifies a bold embedded font that is linked to a parent typeface. Once specified, this bold version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a bold version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:bold r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§4.3.1.8)

Attributes	Description
id (Relationship Identifier) Namespace: .../officeDocument/2006/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontDataId">
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.2 boldItalic (Bold Italic Embedded Font)

This element specifies a bold italic embedded font that is linked to a parent typeface. Once specified, this bold italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a bold italic version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:boldItalic r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§4.3.1.8)

Attributes	Description

Attributes	Description
id (Relationship Identifier) Namespace: .../officeDocument/2006/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontDataId">
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.3 browse (Browse Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a single window or browse mode, instead of full screen.

[*Example*: Consider the following presentation that is set to be viewed in a browse mode.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  <p:showPr>
    ..
    <p:browse showScrollbar="0"/>
    ..
  </p:showPr>
</p:presentationPr>
```

end example]

Parent Elements
showPr (§4.3.1.28)

Attributes	Description
showScrollbar (Show Scroll Bar in Window)	Specifies whether to show the scroll bar in the viewing window. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShowInfoBrowse">
   <attribute name="showScrollbar" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.3.1.4 clrMru (Color MRU)

This specifies the most recently used user-selected colors within the presentation. This list contains custom user-selected colors outside the presentation's theme colors, enabling the application to expose these additional color choices for easy reuse. The first item in the list is the most recently used color.

[*Example*: Consider the following presentation with two user-selected colors in the color MRU list.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  ..
  <p:clrMru>
    <a:srgbClr val="5361EB"/>
    <a:srgbClr val="CCECFF"/>
  </p:clrMru>
  ..
</p:presentationPr>
```

end example]

Parent Elements
presentationPr (§4.3.1.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMRU">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="10"/>
   </sequence>
</complexType>
```

4.3.1.5 custShow (Custom Show)

This element specifies a custom show that defines a specific slide sequence that the slides will be displayed in. This allows for many variants of the same set of slides to be presented.

[*Example*: Consider the following custom show using three slides.

```
<p:custShow name="Custom Show 1" id="0">
```

```
    <p:sldLst>
      <p:sld r:id="rId5"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId4"/>
    </p:sldLst>
  </p:custShow>
```

Notice here that the custom show specifies a show, or presentation, where slide 5 will be shown first, then slide 2 and finally slide 4. *end example*]

Parent Elements
custShowLst (§4.3.1.6)

Child Elements	Subclause
extLst (Extension List)	§4.2.5
sldLst (List of Presentation Slides)	§4.3.1.31

Attributes	Description
id (Custom Show ID)	Specifies the identification number for this custom show. This should be unique among all the custom shows within the corresponding presentation. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Custom Show Name)	Specifies a name for the custom show. The possible values for this attribute are defined by the ST_Name simple type (§4.8.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomShow">
   <sequence>
      <element name="sldLst" type="CT_SlideRelationshipList" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="ST_Name" use="required"/>
   <attribute name="id" type="xsd:unsignedInt" use="required"/>
</complexType>
```

4.3.1.6 custShowLst (List of Custom Shows)

This element specifies a list of all custom shows that are available within the corresponding presentation. A custom show is a defined slide sequence that allows for the displaying of the slides with the presentation in any arbitrary order.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
custShow (Custom Show)	§4.3.1.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomShowList">
   <sequence>
      <element name="custShow" type="CT_CustomShow" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.3.1.7 defaultTextStyle (Presentation Default Text Style)

This element specifies the default text styles that are to be used within the presentation. The text style defined here can be referenced when inserting a new slide if that slide is not associated with a master slide or if no styling information has been otherwise specified for the text within the presentation slide.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§5.1.5.2.2
extLst (Extension List)	§5.1.2.1.15
lvl1pPr (List Level 1 Text Style)	§5.1.5.4.13
lvl2pPr (List Level 2 Text Style)	§5.1.5.4.14
lvl3pPr (List Level 3 Text Style)	§5.1.5.4.15
lvl4pPr (List Level 4 Text Style)	§5.1.5.4.16
lvl5pPr (List Level 5 Text Style)	§5.1.5.4.17
lvl6pPr (List Level 6 Text Style)	§5.1.5.4.18
lvl7pPr (List Level 7 Text Style)	§5.1.5.4.19
lvl8pPr (List Level 8 Text Style)	§5.1.5.4.20
lvl9pPr (List Level 9 Text Style)	§5.1.5.4.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextListStyle">
   <sequence>
      <element name="defPPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl1pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl2pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl3pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl4pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl5pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl6pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl7pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl8pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl9pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.3.1.8 embeddedFont (Embedded Font)

This element specifies an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[*Example*: Consider the following embedded font.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFontLst (§4.3.1.9)

Child Elements	Subclause
bold (Bold Embedded Font)	§4.3.1.1
boldItalic (Bold Italic Embedded Font)	§4.3.1.2
font (Embedded Font Name)	§4.3.1.10
italic (Italic Embedded Font)	§4.3.1.14

Child Elements	Subclause
regular (Regular Embedded Font)	§4.3.1.27

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontListEntry">
   <sequence>
      <element name="font" type="a:CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="regular" type="CT_EmbeddedFontDataId" minOccurs="0" maxOccurs="1"/>
      <element name="bold" type="CT_EmbeddedFontDataId" minOccurs="0" maxOccurs="1"/>
      <element name="italic" type="CT_EmbeddedFontDataId" minOccurs="0" maxOccurs="1"/>
      <element name="boldItalic" type="CT_EmbeddedFontDataId" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.3.1.9 embeddedFontLst (Embedded Font List)

This element specifies a list of fonts that are embedded within the corresponding presentation. The font data for these fonts is stored alongside the other document parts within the document container. The actual font data is referenced within the embeddedFont element.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
embeddedFont (Embedded Font)	§4.3.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontList">
   <sequence>
      <element name="embeddedFont" type="CT_EmbeddedFontListEntry" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.3.1.10 font (Embedded Font Name)

This element specifies specific properties describing an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[*Example*: Consider the following embedded font.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
```

```
    <p:regular r:id="rId2"/>
  </p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§4.3.1.8)

Attributes	Description
charset (Similar Character Set) Namespace: .../drawingml/2006/main	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
panose (Panose Setting) Namespace: .../drawingml/2006/main	Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method. The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family) Namespace: .../drawingml/2006/main	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface) Namespace: .../drawingml/2006/main	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application. The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFont">
   <attribute name="typeface" type="ST_TextTypeface"/>
   <attribute name="panose" type="ST_Panose" use="optional"/>
   <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
   <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
</complexType>
```

4.3.1.11 handoutMasterId (Handout Master ID)

This element specifies a handout master that is available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

[*Example*: Consider the following specification of a handout master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  ..
  <p:handoutMasterIdLst>
    <p:handoutMasterId r:id="rId8"/>
  </p:handoutMasterIdLst>
  ..
</p:presentation>
```

end example]

Parent Elements
handoutMasterIdLst (§4.3.1.12)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (Relationship Identifier) Namespace: .../officeDocument/2006/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the handoutMaster element defining this handout master. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HandoutMasterIdListEntry">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.12 handoutMasterIdLst (List of Handout Master IDs)

This element specifies a list of identification information for the handout master slides that are available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
handoutMasterId (Handout Master ID)	§4.3.1.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HandoutMasterIdList">
    <sequence>
        <element name="handoutMasterId" type="CT_HandoutMasterIdListEntry" minOccurs="0"
          maxOccurs="1"/>
    </sequence>
</complexType>
```

4.3.1.13 htmlPubPr (HTML Publishing Properties)

This element specifies the publishing properties to be used when publishing this presentation document to the HTML file format.

Parent Elements
presentationPr (§4.3.1.25)

Child Elements	Subclause
custShow (Custom Show)	§4.2.2
extLst (Extension List)	§4.2.5
sldAll (All Slides)	§4.2.7
sldRg (Slide Range)	§4.2.8

Attributes	Description
id (Publish Path) Namespace: .../officeDocument/2006/relationships	Specifies the path that should be used when publishing. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
pubBrowser (Browser Support Target)	Specifies the web browser support that this publishing should be optimized for. The possible values for this attribute are defined by the ST_HtmlPublishWebBrowserSupport simple type (§4.8.6).
showSpeakerNotes (Show Speaker	Specifies whether to show speaker notes when publishing.

Attributes	Description
Notes)	The possible values for this attribute are defined by the XML Schema boolean datatype.
title (HTML Output Title)	Specifies a title for the HTML output file. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HtmlPublishProperties">
   <sequence>
      <group ref="EG_SlideListChoice" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="showSpeakerNotes" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="pubBrowser" type="ST_HtmlPublishWebBrowserSupport" use="optional"
     default="v3v4"/>
   <attribute name="title" type="xsd:string" use="optional" default=""/>
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.14 italic (Italic Embedded Font)

This element specifies an italic embedded font that is linked to a parent typeface. Once specified, this italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a italic version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:italic r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§4.3.1.8)

Attributes	Description
id (Relationship Identifier)	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation.

Attributes	Description
Namespace: .../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontDataId">
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.15 kinsoku (Kinsoku Settings)

This element specifies the presentation-wide kinsoku settings that define the line breaking behaviour of East Asian text within the corresponding presentation.

Parent Elements
presentation (§4.3.1.24)

Attributes	Description
invalEndChars (Invalid Kinsoku End Characters)	Specifies the characters that are not valid for ending a line of text with. The possible values for this attribute are defined by the XML Schema string datatype.
invalStChars (Invalid Kinsoku Start Characters)	Specifies the characters that are not valid for starting a line of text with. The possible values for this attribute are defined by the XML Schema string datatype.
lang (Language)	Specifies the corresponding East Asian language that these settings apply to. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Kinsoku">
   <attribute name="lang" type="xsd:string" use="optional"/>
   <attribute name="invalStChars" type="xsd:string" use="required"/>
   <attribute name="invalEndChars" type="xsd:string" use="required"/>
</complexType>
```

4.3.1.16 kiosk (Kiosk Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a full-screen kiosk mode. A presentation viewed in kiosk mode should have user input disabled and will restart after a specified interval.

[*Example*: Consider the following presentation that is set to be viewed in a looping kiosk mode.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  <p:showPr loop="1" showNarration="1">
```

```
      ..
      <p:kiosk/>
      ..
    </p:showPr>
  </p:presentationPr>
```

end example]

Parent Elements
showPr (§4.3.1.28)

Attributes	Description
restart (Restart Show)	Specifies the time length that the presentation should run until it is to be restarted. That is, the presentation should loop back to the first slide specified in the presentation or custom show. This value is specified in 1/1000ths of a second and measured from the most recent time the presentation started or restarted. [*Note*: The counter is reset when a presentation is restarted due to automatic looping at the end of a show, if specified by the loop attribute of showPr. *end note*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShowInfoKiosk">
   <attribute name="restart" type="xsd:unsignedInt" use="optional" default="300000"/>
</complexType>
```

4.3.1.17 modifyVerifier (Modification Verifier)

This element specifies the write protection settings which have been applied to a PresentationML document. *Write protection* refers to a mode in which the document's contents cannot be modified, and the document cannot be resaved using the same file name.

When present, the application shall require a password to enable modifications to the document. If the supplied password does not match the hash value in this attribute, then write protection shall be enabled. If this element is omitted, then no write protection shall be applied to the current document. Since this protection does not encrypt the document, malicious applications may circumvent its use.

The password supplied to the algorithm is to be a Unicode string; strings longer than 255 characters are truncated to 255 characters. The attributes of this element specify the algorithm to be used to verify the password provided by the user.

[*Example*: Consider a PresentationML document that can only be opened in a write protected state unless a password is provided, in which case the file would be opened in an editable state. This requirement would be specified using the following PresentationML:

```
<p:documentProtection …
  p:cryptAlgorithmClass="hash" p:cryptAlgorithmType="typeAny"
  p:cryptAlgorithmSid="1" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" ... />
```

In order for the hosting application to enable edits to the document, the hosting application would have to be provided with a password that the hosting application would then hash using the algorithm specified by the algorithm attributes and compare to the value of the hashData attribute (`9oN7nWkCAyEZib1RomSJTjmPpCY=`). If the two values matched, the file would be opened in an editable state. *end example]*

Parent Elements
presentation (§4.3.1.24)

Attributes	Description
algIdExt (Cryptographic Algorithm Extensibility)	Specifies that a cryptographic algorithm which was not defined by this Office Open XML Standard has been used to generate the hash value stored with this document. This value, when present, shall be interpreted based on the value of the algIdExtSource attribute in order to determine the algorithm used, which shall be application-defined. [*Rationale*: This extensibility affords the fact that with exponentially increasing computing power, documents created in the future will likely need to utilize as yet undefined hashing algorithms in order to remain secure. *end rationale*] If this value is present, the cryptAlgorithmClass, cryptAlgorithmType, and cryptAlgorithmSid attribute values shall be ignored in favor of the algorithm defined by this attribute. [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:algIdExt="0000000A" p:algIdExtSource="futureCryptography" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The algIdExt attribute value of `0000000A` specifies that the algorithm with hex code `A` shall be used as defined by the `futureCryptography` application. *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
algIdExtSource (Algorithm Extensibility Source)	Specifies the application which defined the algorithm value specified by the algIdExt attribute.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>[Example: Consider a PresentationML document with the following information stored in one its protection element:

<code><p:… p:algIdExt="0000000A"
p:algIdExtSource="futureCryptography"
p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></code>

The algIdExtSource attribute value of <code>futureCryptography</code> specifies that the algorithm used here was published by the <code>futureCryptography</code> application. end example]

The possible values for this attribute are defined by the XML Schema string datatype.</td></tr>
<tr><td>cryptAlgorithmClass (Cryptographic Algorithm Class)</td><td>Specifies the class of cryptographic algorithm used by this protection. [Note: The initial version of this Office Open XML Standard only supports a single version - <code>hash</code> - but future versions may expand this as necessary. end note]

[Example: Consider a PresentationML document with the following information stored in its protection element:

<code><p:… p:cryptAlgorithmClass="hash"
p:cryptAlgorithmType="typeAny"
p:cryptAlgorithmSid="1"
p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></code>

The cryptAlgorithmClass attribute value of <code>hash</code> specifies that the algorithm used for the password is a hashing algorithm. end example]

The possible values for this attribute are defined by the ST_AlgClass simple type (§4.8.1).</td></tr>
<tr><td>cryptAlgorithmSid (Cryptographic Hashing Algorithm)</td><td>Specifies the specific cryptographic hashing algorithm which shall be used along with the saltData attribute and user-supplied password in order to compute a hash value for comparison.

The possible values for this attribute shall be interpreted as follows:
<table>
<tr><th>Value</th><th>Algorithm</th></tr>
<tr><td>1</td><td>MD2</td></tr>
<tr><td>2</td><td>MD4</td></tr>
<tr><td>3</td><td>MD5</td></tr>
<tr><td>4</td><td>SHA-1</td></tr>
<tr><td>5</td><td>MAC</td></tr>
<tr><td>6</td><td>RIPEMD</td></tr>
<tr><td>7</td><td>RIPEMD-160</td></tr>
<tr><td>8</td><td>Undefined. Shall not be used.</td></tr>
<tr><td>9</td><td>HMAC</td></tr>
</table>
</td></tr>
</table>

Attributes	Description
	<table><tr><td>10</td><td>Undefined. Shall not be used.</td></tr><tr><td>11</td><td>Undefined. Shall not be used.</td></tr><tr><td>12</td><td>SHA-256</td></tr><tr><td>13</td><td>SHA-384</td></tr><tr><td>14</td><td>SHA-512</td></tr><tr><td>Any other value</td><td>Undefined. Shall not be used.</td></tr></table> [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:cryptAlgorithmClass="hash" p:cryptAlgorithmType="typeAny" p:cryptAlgorithmSid="1" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The cryptAlgorithmSid attribute value of 1 specifies that the SHA-1 hashing algorithm shall be used to generate a hash from the user-defined password. *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
cryptAlgorithmType (Cryptographic Algorithm Type)	Specifies the type of cryptographic algorithm used by this protection. [*Note*: The initial version of this Office Open XML Standard only supports a single type - typeAny - but future versions may expand this as necessary. *end note*] [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:cryptAlgorithmClass="hash" p:cryptAlgorithmType="typeAny" p:cryptAlgorithmSid="1" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The cryptAlgorithmType attribute value of typeAny specifies that any type of algorithm may have been used for the password. *end example*] The possible values for this attribute are defined by the ST_AlgType simple type (§4.8.2).
cryptProvider (Cryptographic Provider)	Specifies the cryptographic provider which was used to generate the hash value stored in this document. If the user provided a cryptographic provider which was not the system's built-in provider, then that provider shall be stored here so it can subsequently be used if available. If this attribute is omitted, then the built-in cryptographic provider on the system shall be

Attributes	Description
	used. [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:cryptProvider="Krista'sProvider" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The cryptProvider attribute value of `Krista'sProvider` specifies that the cryptographic provider with name "Krista's Provider" shall be used if available. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
cryptProviderType (Cryptographic Provider Type)	Specifies the type of cryptographic provider to be used. [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:cryptProviderType="rsaAES" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The cryptProviderType attribute value of `rsaAES` specifies that the cryptographic provider type shall be an Advanced Encryption Standard provider. *end example*] The possible values for this attribute are defined by the ST_CryptProv simple type (§4.8.4).
cryptProviderTypeExt (Cryptographic Provider Type Extensibility)	Specifies that a cryptographic provider type which was not defined by this Office Open XML Standard has been used to generate the hash value stored with this document. This value, when present, shall be interpreted based on the value of the cryptProviderTypeExtSource attribute in order to determine the provider type used, which shall be application-defined. [*Rationale*: This extensibility affords the fact that with exponentially increasing computing power, documents created in the future will likely need to utilize as yet undefined cryptographic provider types in order to remain secure. *end rationale*] If this value is present, the cryptProviderType attribute value shall be ignored in favor of the provider type defined by this attribute. [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:cryptProviderTypeExt="00A5691D" p:cryptProvideTypeExtSource="futureCryptography" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The cryptProviderTypeExt attribute value of `00A5691D` specifies that the provider type

Attributes	Description
	associated with hex code A5691D shall be used as defined by the futureCryptography application. *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
cryptProviderTypeExtSource (Provider Type Extensibility Source)	Specifies the application which defined the provider type value specified by the cryptProviderTypeExt attribute. [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:cryptProviderTypeExt="00A5691D" p:cryptProvideTypeExtSource="futureCryptography" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The cryptProvideTypeExtSource attribute value of futureCryptography specifies that the provider type used here was published by the futureCryptography application. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hashData (Password Hash)	Specifies the hash value for the password stored with this document. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced. If this value is omitted, then no password shall be associated with the protection, and it may be turned off without supplying any password. [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:cryptAlgorithmClass="hash" p:cryptAlgorithmType="typeAny" p:cryptAlgorithmSid="1" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The hashData attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password shall be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the cryptAlgorithmSid attribute value of 1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
saltData (Salt for	Specifies the salt which was prepended to the user-supplied password before it was

Attributes	Description
Password Verifier)	hashed using the hashing algorithm defined by the preceding attribute values to generate the hashData attribute, and which shall also be prepended to the user-supplied password before attempting to generate a hash value for comparison. A *salt* is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those precalculated values (often referred to as a "dictionary attack"). If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value. [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:saltData="ZUdHa+D8F/OAKP3I7ssUnQ==" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The saltData attribute value of `ZUdHa+D8F/OAKP3I7ssUnQ==` specifies that the user-supplied password shall have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
spinCount (Iterations to Run Hashing Algorithm)	Specifies the number of times the hashing function shall be iteratively run (using each iteration's result as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashData attribute. [*Rationale*: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). *end rationale*] [*Example*: Consider a PresentationML document with the following information stored in its protection element: `<p:… p:spinCount="100000" p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />` The spinCount attribute value of `100000` specifies that the hashing function shall be run one hundred thousand times to generate a hash value for comparison with the hash attribute. *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ModifyVerifier">
   <attribute name="cryptProviderType" type="ST_CryptProv" use="required"/>
   <attribute name="cryptAlgorithmClass" type="ST_AlgClass" use="required"/>
   <attribute name="cryptAlgorithmType" type="ST_AlgType" use="required"/>
   <attribute name="cryptAlgorithmSid" type="xsd:unsignedInt" use="required"/>
   <attribute name="spinCount" type="xsd:unsignedInt" use="required"/>
   <attribute name="saltData" type="xsd:string" use="required"/>
   <attribute name="hashData" type="xsd:string" use="required"/>
   <attribute name="cryptProvider" type="xsd:string" use="optional"/>
   <attribute name="algIdExt" type="xsd:unsignedInt" use="optional"/>
   <attribute name="algIdExtSource" type="xsd:string" use="optional"/>
   <attribute name="cryptProviderTypeExt" type="xsd:unsignedInt" use="optional"/>
   <attribute name="cryptProviderTypeExtSource" type="xsd:string" use="optional"/>
</complexType>
```

4.3.1.18 notesMasterId (Notes Master ID)

This element specifies a notes master that is available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

[*Example*: Consider the following specification of a notes master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  ..
  <p:notesMasterIdLst>
    <p:notesMasterId r:id="rId8"/>
  </p:notesMasterIdLst>
  ..
</p:presentation>
```

end example]

Parent Elements
notesMasterIdLst (§4.3.1.19)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (Relationship Identifier) Namespace: .../officeDocument	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the notesMaster element defining this notes master. The possible values for this attribute are defined by the ST_RelationshipId simple type

Attributes	Description
/2006/relationships	(§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesMasterIdListEntry">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.19 notesMasterIdLst (List of Notes Master IDs)

This element specifies a list of identification information for the notes master slides that are available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
notesMasterId (Notes Master ID)	§4.3.1.18

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesMasterIdList">
   <sequence>
      <element name="notesMasterId" type="CT_NotesMasterIdListEntry" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.3.1.20 notesSz (Notes Slide Size)

This element specifies the size of slide surface used for notes slides and handout slides. Objects within a notes slide can be specified outside these extents, but the notes slide will have a background surface of the specified size when presented or printed. This element is intended to specify the region to which content is fitted in any special type of printout the application may choose to generate, such as an outline handout.

[*Example*: Consider the following specifying of the size of a notes slide.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  ..
  <p:notesSz cx="9144000" cy="6858000"/>
  ..
</p:presentation>
```

end example]

Parent Elements
presentation (§4.3.1.24)

Attributes	Description
cx (Extent Length) Namespace: .../drawingml/2006/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
cy (Extent Width) Namespace: .../drawingml/2006/main	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveSize2D">
   <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
   <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

4.3.1.21 penClr (Pen Color for Slide Show)

This element specifies the pen color that should be used to make markings on the slides while in a presentation.

Parent Elements
showPr (§4.3.1.28)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

4.3.1.22 photoAlbum (Photo Album Information)

This element specifies that the corresponding presentation contains a photo album. A photo album specifies a list of images within the presentation that spread across one or more slides, all of which share a consistent layout. Each image in the album is formatted with a consistent style. This functionality enables the application to manage all of the images together and modify their ordering, layout, and formatting as a set.

This element does not enforce the specified properties on individual photo album images; rather, it specifies common settings that should be applied by default to all photo album images and their containing slides. Images that are part of the photo album are identified by the presence of the isPhoto element in the definition of the picture.

[*Example*: Consider the following presentation that has been specified as a photo album

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  ..
  <p:photoAlbum bw="1" layout="2pic"/>
  ..
</p:presentation>
```

end example]

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
bw (Black and White)	Specifies whether all pictures in the photo album are to be displayed as black and white. The possible values for this attribute are defined by the XML Schema boolean datatype.
frame (Frame Type)	Specifies the frame type that is to be used on all the pictures in the photo album. The possible values for this attribute are defined by the ST_PhotoAlbumFrameShape simple type (§4.8.11).
layout (Photo Album Layout)	Specifies the layout that is to be used to arrange the pictures in the photo album on individual slides. The possible values for this attribute are defined by the ST_PhotoAlbumLayout simple type (§4.8.12).
showCaptions (Show/Hide Captions)	Specifies whether to show captions for pictures in the photo album. Captions are text boxes grouped with each image, with the group set to not allow ungrouping. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PhotoAlbum">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bw" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showCaptions" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="layout" type="ST_PhotoAlbumLayout" use="optional" default="fitToSlide"/>
   <attribute name="frame" type="ST_PhotoAlbumFrameShape" use="optional" default="frameStyle1"/>
</complexType>
```

4.3.1.23 present (Presenter Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a full-screen presenter mode. In this mode, the presentation is displayed on one monitor while a different monitor displays notes and provides navigation controls intended to be viewed only by the presenter.

[*Example*: Consider the following presentation that is set to be viewed in a present mode.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  <p:showPr>
    ..
    <p:present/>
    ..
  </p:showPr>
</p:presentationPr>
```

end example]

Parent Elements
showPr (§4.3.1.28)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.3.1.24 presentation (Presentation)

This element specifies within it fundamental presentation-wide properties.

[*Example*: Consider the following presentation with a single slide master and two slides. In addition to these commonly used elements there can also be the specification of other properties such as slide size, notes size and default text styles.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="">
    <p:sldMasterIdLst>
        <p:sldMasterId id="2147483648" r:id="rId1"/>
    </p:sldMasterIdLst>
    <p:sldIdLst>
        <p:sldId id="256" r:id="rId3"/>
        <p:sldId id="257" r:id="rId4"/>
    </p:sldIdLst>
    <p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>
    <p:notesSz cx="6858000" cy="9144000"/>
    <p:defaultTextStyle>
      ...
    </p:defaultTextStyle>
</p:presentation>
```

end example]

Parent Elements
Root element of PresentationML Presentation part

Child Elements	Subclause
custDataLst (Customer Data List)	§4.4.1.16
custShowLst (List of Custom Shows)	§4.3.1.6
defaultTextStyle (Presentation Default Text Style)	§4.3.1.7
embeddedFontLst (Embedded Font List)	§4.3.1.9
extLst (Extension List)	§4.2.5
handoutMasterIdLst (List of Handout Master IDs)	§4.3.1.12
kinsoku (Kinsoku Settings)	§4.3.1.15

Child Elements	Subclause
modifyVerifier (Modification Verifier)	§4.3.1.17
notesMasterIdLst (List of Notes Master IDs)	§4.3.1.19
notesSz (Notes Slide Size)	§4.3.1.20
photoAlbum (Photo Album Information)	§4.3.1.22
sldIdLst (List of Slide IDs)	§4.3.1.30
sldMasterIdLst (List of Slide Master IDs)	§4.3.1.33
sldSz (Presentation Slide Size)	§4.3.1.34
smartTags (Smart Tags)	§4.3.1.35

Attributes	Description
autoCompressPictures (Automatically Compress Pictures)	Specifies whether the generating application should automatically compress all pictures for this presentation. The possible values for this attribute are defined by the XML Schema boolean datatype.
bookmarkIdSeed (Bookmark ID Seed)	Specifies a seed for generating bookmark IDs to ensure IDs remain unique across the document. This value specifies the number to be used as the ID for the next new bookmark created. The possible values for this attribute are defined by the ST_BookmarkIdSeed simple type (§4.8.3).
compatMode (Compatibility Mode)	Specifies whether the generating application is to be in a compatibility mode which serves to inform the user of any loss of content or functionality when working with older formats. The possible values for this attribute are defined by the XML Schema boolean datatype.
embedTrueTypeFonts (Embed True Type Fonts)	Specifies whether the generating application should automatically embed true type fonts or not. The possible values for this attribute are defined by the XML Schema boolean datatype.
firstSlideNum (First Slide Number)	Specifies the first slide number in the presentation. The possible values for this attribute are defined by the XML Schema int datatype.
removePersonalInfoOnSave (Remove Personal Information on Save)	Specifies whether to automatically remove personal information when the presentation document is saved. The possible values for this attribute are defined by the XML Schema boolean datatype.
rtl (Right-To-Left Views)	Specifies if the current view of the user interface is oriented right-to-left or left-to-right. The view is right-to-left is this value is set to true, and left-to-right otherwise.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
saveSubsetFonts (Save Subset Fonts)	Specifies to save only the subset of characters used in the presentation when a font is embedded. The possible values for this attribute are defined by the XML Schema boolean datatype.
serverZoom (Server Zoom)	Specifies the scaling to be used when the presentation is embedded in another document. The embedded slides are to be scaled by this percentage. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
showSpecialPlsOnTitleSld (Show Header and Footer Placeholders on Titles)	Specifies whether to show the header and footer placeholders on the title slides. The possible values for this attribute are defined by the XML Schema boolean datatype.
strictFirstAndLastChars (Strict First and Last Characters)	Specifies whether to use strict characters for starting and ending lines of Japanese text. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Presentation">
   <sequence>
      <element name="sldMasterIdLst" type="CT_SlideMasterIdList" minOccurs="0" maxOccurs="1"/>
      <element name="notesMasterIdLst" type="CT_NotesMasterIdList" minOccurs="0" maxOccurs="1"/>
      <element name="handoutMasterIdLst" type="CT_HandoutMasterIdList" minOccurs="0" maxOccurs="1"/>
      <element name="sldIdLst" type="CT_SlideIdList" minOccurs="0" maxOccurs="1"/>
      <element name="sldSz" type="CT_SlideSize" minOccurs="0" maxOccurs="1"/>

   <attribute name="autoCompressPictures" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="bookmarkIdSeed" type="ST_BookmarkIdSeed" use="optional" default="1"/>
</complexType>
```

4.3.1.25 presentationPr (Presentation-wide Properties)

This element functions as a parent element within which additional presentation-wide document properties are contained. All properties and their corresponding settings are defined within the child elements.

Parent Elements
Root element of PresentationML Presentation Properties part

Child Elements	Subclause
clrMru (Color MRU)	§4.3.1.4
extLst (Extension List)	§4.2.5
htmlPubPr (HTML Publishing Properties)	§4.3.1.13
prnPr (Printing Properties)	§4.3.1.26
showPr (Presentation-wide Show Properties)	§4.3.1.28
webPr (Web Properties)	§4.3.1.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PresentationProperties">
   <sequence>
      <element name="htmlPubPr" type="CT_HtmlPublishProperties" minOccurs="0" maxOccurs="1"/>
      <element name="webPr" type="CT_WebProperties" minOccurs="0" maxOccurs="1"/>
      <element name="prnPr" type="CT_PrintProperties" minOccurs="0" maxOccurs="1"/>
      <element name="showPr" type="CT_ShowProperties" minOccurs="0" maxOccurs="1"/>
      <element name="clrMru" type="a:CT_ColorMRU" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.3.1.26 prnPr (Printing Properties)

This element specifies the default printing properties associated with this presentation document.

Parent Elements
presentationPr (§4.3.1.25)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
clrMode (Print Color Mode)	Specifies the color mode to be used when printing. The possible values for this attribute are defined by the ST_PrintColorMode simple type (§4.8.15).
frameSlides (Frame slides when printing)	Specifies whether slides should be framed when printing. When framed, an outline border is printed for each slide. The possible values for this attribute are defined by the XML Schema boolean datatype.
hiddenSlides (Print Hidden Slides)	Specifies whether hidden slides should be printed. The possible values for this attribute are defined by the XML Schema boolean datatype.
prnWhat (Print Output)	Specifies what the default print output will be in terms of content layout. The possible values for this attribute are defined by the ST_PrintWhat simple type (§4.8.16).
scaleToFitPaper (Scale to Fit Paper when printing)	Specifies whether the print output should be scaled to fit the paper being used. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PrintProperties">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="prnWhat" type="ST_PrintWhat" use="optional" default="slides"/>
   <attribute name="clrMode" type="ST_PrintColorMode" use="optional" default="clr"/>
   <attribute name="hiddenSlides" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="scaleToFitPaper" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="frameSlides" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.3.1.27 regular (Regular Embedded Font)

This element specifies a regular embedded font that is linked to a parent typeface. Once specified, this regular version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a regular version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

Parent Elements
embeddedFont (§4.3.1.8)

Attributes	Description
id (Relationship Identifier) Namespace: .../officeDocument/2006/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedFontDataId">
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.28 showPr (Presentation-wide Show Properties)

This element functions as a parent element within which all presentation-wide show properties are contained. All properties and their corresponding settings are defined within the child elements.

Parent Elements
presentationPr (§4.3.1.25)

Child Elements	Subclause
browse (Browse Slide Show Mode)	§4.3.1.3
custShow (Custom Show)	§4.2.2
extLst (Extension List)	§4.2.5
kiosk (Kiosk Slide Show Mode)	§4.3.1.16
penClr (Pen Color for Slide Show)	§4.3.1.21
present (Presenter Slide Show Mode)	§4.3.1.23
sldAll (All Slides)	§4.2.7
sldRg (Slide Range)	§4.2.8

Attributes	Description
loop (Loop Slide Show)	Specifies whether the slide show should be set to loop at the end. The possible values for this attribute are defined by the XML Schema boolean datatype.
showAnimation (Show Animation in Slide Show)	Specifies whether slide show animation should be shown when presenting. The possible values for this attribute are defined by the XML Schema boolean datatype.
showNarration (Show Narration in Slide Show)	Specifies whether slide show narration should be played when presenting. The possible values for this attribute are defined by the XML Schema boolean datatype.
useTimings (Use Timings in Slide Show)	Specifies whether slide transition timings should be used to advance slides when presenting. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShowProperties">
   <sequence minOccurs="0" maxOccurs="1">
      <group ref="EG_ShowType" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_SlideListChoice" minOccurs="0" maxOccurs="1"/>
      <element name="penClr" type="a:CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="loop" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showNarration" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showAnimation" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="useTimings" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.3.1.29 sldId (Slide ID)

This element specifies a presentation slide that is available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

[*Example*: Consider the following specification of a slide master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  ..
  <p:sldIdLst>
    <p:sldId id="256" r:id="rId3"/>
    <p:sldId id="257" r:id="rId4"/>
    <p:sldId id="258" r:id="rId5"/>
    <p:sldId id="259" r:id="rId6"/>
    <p:sldId id="260" r:id="rId7"/>
  </p:sldIdLst>
  ..
</p:presentation>
```

end example]

Parent Elements
sldIdLst (§4.3.1.30)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (Relationship Identifier)	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sld element defining this slide.

Attributes	Description
Namespace: .../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
id (Slide Identifier)	Specifies the slide identifier that is to contain a value that is unique throughout the presentation. The possible values for this attribute are defined by the ST_SlideId simple type (§4.8.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideIdListEntry">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_SlideId" use="required"/>
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.30 sldIdLst (List of Slide IDs)

This element specifies a list of identification information for the slides that are available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
sldId (Slide ID)	§4.3.1.29

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideIdList">
   <sequence>
      <element name="sldId" type="CT_SlideIdListEntry" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.3.1.31 sldLst (List of Presentation Slides)

This element specifies a list of presentation slides. A presentation slide contains the information that is specific to a single slide such as slide-specific shape and text information.

Parent Elements
custShow (§4.3.1.5)

Child Elements	Subclause
sld (Presentation Slide)	§4.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideRelationshipList">
   <sequence>
      <element name="sld" type="CT_SlideRelationshipListEntry" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.3.1.32 sldMasterId (Slide Master ID)

This element specifies a slide master that is available within the corresponding presentation. A slide master is a slide that is specifically designed to be a template for all related child layout slides.

[*Example*: Consider the following specification of a slide master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  ..
  <p:sldMasterIdLst>
    <p:sldMasterId id="2147483648" r:id="rId1"/>
  </p:sldMasterIdLst>
  ..
</p:presentation>
```

end example]

Parent Elements
sldMasterIdLst (§4.3.1.33)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (Slide Master Identifier)	Specifies the slide master identifier that is to contain a value that is unique throughout the presentation. The possible values for this attribute are defined by the ST_SlideMasterId simple type (§4.8.20).
id (Relationship Identifier) Namespace:	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sldMaster element defining this slide master.

Attributes	Description
.../officeDocument/2006/relationships	The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideMasterIdListEntry">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_SlideMasterId" use="optional"/>
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.33 sldMasterIdLst (List of Slide Master IDs)

This element specifies a list of identification information for the slide master slides that are available within the corresponding presentation. A slide master is a slide that is specifically designed to be a template for all related child layout slides.

Parent Elements
presentation (§4.3.1.24)

Child Elements	Subclause
sldMasterId (Slide Master ID)	§4.3.1.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideMasterIdList">
   <sequence>
      <element name="sldMasterId" type="CT_SlideMasterIdListEntry" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.3.1.34 sldSz (Presentation Slide Size)

This element specifies the size of the presentation slide surface. Objects within a presentation slide can be specified outside these extents, but this is the size of background surface that will be shown when the slide is presented or printed..

[*Example*: Consider the following specifying of the size of a presentation slide.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  ..
  <p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>
  ..
```

```
</p:presentation>
```

end example]

Parent Elements
presentation (§4.3.1.24)

Attributes	Description
cx (Extent Length)	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§4.8.21).
cy (Extent Width)	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§4.8.21).
type (Type of Size)	Specifies the type of slide size that should be used. This identifies in particular the expected delivery platform for this presentation. The possible values for this attribute are defined by the ST_SlideSizeType simple type (§4.8.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideSize">
   <attribute name="cx" type="ST_SlideSizeCoordinate" use="required"/>
   <attribute name="cy" type="ST_SlideSizeCoordinate" use="required"/>
   <attribute name="type" type="ST_SlideSizeType" use="optional" default="custom"/>
</complexType>
```

4.3.1.35 smartTags (Smart Tags)

This element specifies the existence of smart tags within the corresponding presentation.

Parent Elements
presentation (§4.3.1.24)

Attributes	Description
id (Relationship Identifier) Namespace: .../officeDocument/2006/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this smart tag. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SmartTags">
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.3.1.36 webPr (Web Properties)

This element specifies all general output properties that pertain to generating a web format version of the presentation document.

Parent Elements
presentationPr (§4.3.1.25)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
allowPng (Allow PNG in HTML output)	Specifies whether to allow the output of PNG format pictures in the HTML document. The possible values for this attribute are defined by the XML Schema boolean datatype.
clr (Slide Navigation Colors for HTML output)	Specifies the color constraints that are to be used when generating HTML output. The possible values for this attribute are defined by the ST_WebColorType simple type (§4.8.60).
encoding (Encoding for HTML output)	Specifies the particular HTML character set encoding that should be used when generating output.

Attributes	Description
	The possible values for this attribute are defined by the ST_WebEncoding simple type (§4.8.61).
imgSz (Image size for HTML output)	Specifies the screen size for which the images in the HTML output should be optimized. The possible values for this attribute are defined by the ST_WebScreenSize simple type (§4.8.62).
organizeInFolders (Organize HTML output in folders)	Specifies whether the supporting output files should be automatically organized into a folder. The possible values for this attribute are defined by the XML Schema boolean datatype.
relyOnVml (Rely on VML for HTML output)	Specifies whether graphics should be output in VML within the HTML. The possible values for this attribute are defined by the XML Schema boolean datatype.
resizeGraphics (Resize graphics in HTML output)	Specifies whether to resize graphics to fit within the browser window when generating the HTML output. The possible values for this attribute are defined by the XML Schema boolean datatype.
showAnimation (Show animation in HTML output)	Specifies whether to show presentation animation in the HTML output file. The possible values for this attribute are defined by the XML Schema boolean datatype.
useLongFilenames (Use long file names in HTML output)	Specifies whether to allow the use of long file names when generating the HTML output. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WebProperties">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="showAnimation" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="resizeGraphics" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="allowPng" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="relyOnVml" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="organizeInFolders" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="useLongFilenames" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="imgSz" type="ST_WebScreenSize" use="optional" default="800x600"/>
   <attribute name="encoding" type="ST_WebEncoding" use="optional" default=""/>
   <attribute name="clr" type="ST_WebColorType" use="optional" default="whiteTextOnBlack"/>
</complexType>
```

4.3.2 View Properties

This section contains all properties that pertain to the viewing of the presentation.

4.3.2.1 cSldViewPr (Common Slide View Properties)

This element functions as a container for slide view properties that are common across multiple view property elements. The specific properties and associated values for these view properties reside within the child elements and attributes.

Parent Elements
notesViewPr (§4.3.2.8); slideViewPr (§4.3.2.16)

Child Elements	Subclause
cViewPr (Common View Properties)	§4.3.2.2
guideLst (List of Guides)	§4.3.2.5

Attributes	Description
showGuides (Show Guides in View)	Specifies whether to show guides when editing the presentation. The possible values for this attribute are defined by the XML Schema boolean datatype.
snapToGrid (Snap Objects to Grid)	Specifies whether objects should snap to underlying presentation grid when editing. The possible values for this attribute are defined by the XML Schema boolean datatype.
snapToObjects (Snap Objects to Objects)	Specifies whether objects should snap to other objects when editing the presentation. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommonSlideViewProperties">
   <sequence>
      <element name="cViewPr" type="CT_CommonViewProperties" minOccurs="1" maxOccurs="1"/>
      <element name="guideLst" type="CT_GuideList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="snapToGrid" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="snapToObjects" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="showGuides" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.3.2.2 cViewPr (Common View Properties)

This element specifies the view properties that are common across multiple view property elements.

Parent Elements
cSldViewPr (§4.3.2.1); notesTextViewPr (§4.3.2.7); outlineViewPr (§4.3.2.10); sorterViewPr (§4.3.2.17)

Child Elements	Subclause
origin (View Origin)	§4.3.2.9
scale (View Scale)	§4.3.2.13

Attributes	Description
varScale (Variable Scale)	Specifies that the view content should automatically scale to best fit the current window size. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommonViewProperties">
   <sequence>
      <element name="scale" type="a:CT_Scale2D" minOccurs="1" maxOccurs="1"/>
      <element name="origin" type="a:CT_Point2D" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="varScale" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.3.2.3 gridSpacing (Grid Spacing)

This element specifies the grid spacing that should be used for the grid underlying the presentation document. The grid may be used to align objects on the slide and to display visual positioning cues.

Parent Elements
viewPr (§4.3.2.18)

Attributes	Description
cx (Extent Length) Namespace: .../drawingml/2006/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: <… cx="1828800" cy="200000"/> The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
cy (Extent Width) Namespace:	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).

Attributes	Description
.../drawingml/2006/main	[*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of `200000` EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveSize2D">
   <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
   <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

4.3.2.4 guide (A Guide)

This element specifies a guide within the presentation. Guides are lines used for arranging layouts and content and never appear except as an aid in editing slides.

Parent Elements
guideLst (§4.3.2.5)

Attributes	Description
orient (Guide Orientation)	Specifies the orientation for a guide. The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).
pos (Guide Position)	Specifies the position information for a guide. The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Guide">
   <attribute name="orient" type="ST_Direction" use="optional" default="vert"/>
   <attribute name="pos" type="a:ST_Coordinate32" use="optional" default="0"/>
</complexType>
```

4.3.2.5 guideLst (List of Guides)

This element specifies a list of guides for a particular view of the presentation.

Parent Elements

Parent Elements
cSldViewPr (§4.3.2.1)

Child Elements	Subclause
guide (A Guide)	§4.3.2.4

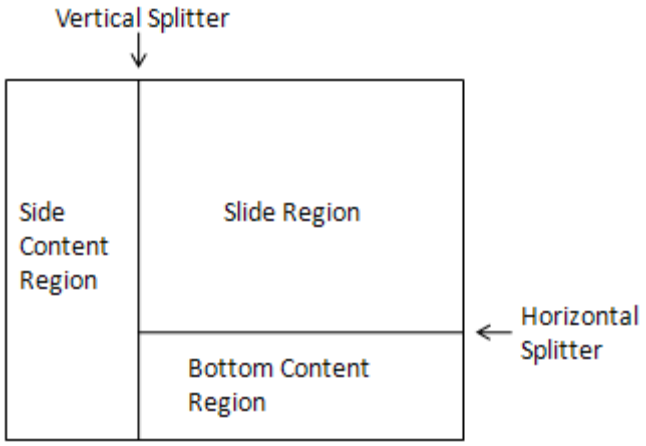
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GuideList">
   <sequence minOccurs="0" maxOccurs="1">
      <element name="guide" type="CT_Guide" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.3.2.6 normalViewPr (Normal View Properties)

This element specifies the view properties associated with the normal view mode. The normal view consists of three content regions: the slide itself, a side content region, and a bottom content region. The content of the side content region and bottom content region is determined by the generating application. Properties pertaining to the positioning of the different content regions are stored in this element. This information allows the application to save its view state to the file, so that when reopened the view is in the same state as when the presentation was last saved.

A vertical splitter bar separates the slide from the side content region. A horizontal splitter bar separates the slide from the content region below the slide. If the presentation is set to left-to-right, the side content region is to the left of the slide. If the presentation is set to right-to-left, the side content region is to the right of the slide.



Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
extLst (Extension List)	§4.2.5
restoredLeft (Normal View Restored Left Properties)	§4.3.2.11
restoredTop (Normal View Restored Top Properties)	§4.3.2.12

Attributes	Description
horzBarState (State of the Horizontal Splitter Bar)	Specifies the state that the horizontal splitter bar should be in when in normal view mode. The region to be maximized or minimized is the side content region. The possible values for this attribute are defined by the ST_SplitterBarState simple type (§4.8.23).
preferSingleView (Prefer Single View)	Specifies whether the user prefers to see a full-window single-content region over the standard normal view with three content regions. If enabled, the application may choose to display one of the content regions in the entire window. The possible values for this attribute are defined by the XML Schema boolean datatype.
showOutlineIcons (Show Outline Icons in Normal View)	Specifies whether the application should show icons if displaying outline content in any of the content regions of normal view mode. The possible values for this attribute are defined by the XML Schema boolean datatype.
snapVertSplitter (Snap Vertical Splitter)	Specifies whether the vertical splitter should snap to a minimized state when the side region is sufficiently small. The specific parameters of this behaviour are left to the generating application. The possible values for this attribute are defined by the XML Schema boolean datatype.
vertBarState (State of the Vertical Splitter Bar)	Specifies the state that the vertical splitter bar should be in when in normal view mode. The region to be maximized or minimized is the slide region. The possible values for this attribute are defined by the ST_SplitterBarState simple type (§4.8.23).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NormalViewProperties">
   <sequence>
      <element name="restoredLeft" type="CT_NormalViewPortion" minOccurs="1" maxOccurs="1"/>
      <element name="restoredTop" type="CT_NormalViewPortion" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="showOutlineIcons" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="snapVertSplitter" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="vertBarState" type="ST_SplitterBarState" use="optional" default="restored"/>
   <attribute name="horzBarState" type="ST_SplitterBarState" use="optional" default="restored"/>
   <attribute name="preferSingleView" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.3.2.7 notesTextViewPr (Notes Text View Properties)

This element functions as a parent element within which all properties associated with the notes text view are contained. All properties are defined within the child elements.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
cViewPr (Common View Properties)	§4.3.2.2
extLst (Extension List)	§4.2.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesTextViewProperties">
   <sequence minOccurs="1" maxOccurs="1">
      <element name="cViewPr" type="CT_CommonViewProperties" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.3.2.8 notesViewPr (Notes View Properties)

This element functions as a parent element within which all view properties associated with notes are contained. All properties are defined within the child elements.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
cSldViewPr (Common Slide View Properties)	§4.3.2.1
extLst (Extension List)	§4.2.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesViewProperties">
   <sequence>
      <element name="cSldViewPr" type="CT_CommonSlideViewProperties" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.3.2.9 origin (View Origin)

This element specifies the origin of the slide when it is being viewed with various scaling factors using the scale element.

Parent Elements
cViewPr (§4.3.2.2)

Attributes	Description
x (X-Axis Coordinate) Namespace: .../drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate) Namespace: .../drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
   <attribute name="x" type="ST_Coordinate" use="required"/>
   <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

4.3.2.10 outlineViewPr (Outline View Properties)

This element functions as a parent element within which all view properties associated with the outline view mode are contained. All properties are defined within the child elements.

Outline view displays only the textual content of a presentation. The presentation is formatted as an outline, with slide titles as the first level of the outline. Body text on slides is indented below the slide title.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
cViewPr (Common View Properties)	§4.3.2.2
extLst (Extension List)	§4.2.5
sldLst (List of Presentation Slides)	§4.3.2.15

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OutlineViewProperties">
   <sequence minOccurs="1" maxOccurs="1">
      <element name="cViewPr" type="CT_CommonViewProperties" minOccurs="1" maxOccurs="1"/>
      <element name="sldLst" type="CT_OutlineViewSlideList" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.3.2.11 restoredLeft (Normal View Restored Left Properties)

This element specifies the sizing of the side content region of the normal view, when the region is of a variable restored size (neither minimized nor maximized).

Parent Elements
normalViewPr (§4.3.2.6)

Attributes	Description
autoAdjust (Auto Adjust Normal View)	Specifies whether the size of the side content region should compensate for the new size when resizing the window containing the view within the application. The possible values for this attribute are defined by the XML Schema boolean datatype.
sz (Normal View Dimension Size)	Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft). The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NormalViewPortion">
   <attribute name="sz" type="a:ST_PositiveFixedPercentage" use="required"/>
   <attribute name="autoAdjust" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.3.2.12 restoredTop (Normal View Restored Top Properties)

This element specifies the sizing of the top slide region of the normal view, when the region is of a variable restored size (neither minimized nor maximized).

Parent Elements
normalViewPr (§4.3.2.6)

Attributes	Description
autoAdjust (Auto Adjust Normal View)	Specifies whether the size of the side content region should compensate for the new size when resizing the window containing the view within the application. The possible values for this attribute are defined by the XML Schema boolean datatype.
sz (Normal View Dimension Size)	Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft). The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NormalViewPortion">
   <attribute name="sz" type="a:ST_PositiveFixedPercentage" use="required"/>
   <attribute name="autoAdjust" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.3.2.13 scale (View Scale)

This element specifies the view scaling factors that the presentation was last viewed with.

Parent Elements
cViewPr (§4.3.2.2)

Child Elements	Subclause
sx (Horizontal Ratio)	§5.1.2.1.38
sy (Vertical Ratio)	§5.1.2.1.39

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Scale2D">
   <sequence>
      <element name="sx" type="CT_Ratio" minOccurs="1" maxOccurs="1"/>
      <element name="sy" type="CT_Ratio" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.3.2.14 sld (Presentation Slide)

This element specifies a presentation slide and properties specific to the slide's appearance in outline view.

[*Example*: Consider the following presentation slide that has been collapsed in outline view.

```
<p:viewPr xmlns:a="" xmlns:r="" xmlns:p="" lastView="outlineView">
  ..
  <p:outlineViewPr>
    ..
    <p:sldLst>
      <p:sld r:id="rId1" collapse="1"/>
    </p:sldLst>
    ..
  </p:outlineViewPr>
  ..
</p:viewPr>
```

end example]

Parent Elements
sldLst (§4.3.2.15)

Attributes	Description
collapse (Collapsed)	Specifies whether this presentation slide is to be shown as collapsed within outline view. That is, all text other than the slide title will not be shown to the user. The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Relationship Identifier) Namespace: .../officeDocument/2006/relationships	Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this presentation slide within a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OutlineViewSlideEntry">
   <attribute ref="r:id" use="required"/>
   <attribute name="collapse" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.3.2.15 sldLst (List of Presentation Slides)

This element specifies a list of presentation slides. A presentation slide contains the information that is specific to a single slide such as slide-specific shape and text information.

Parent Elements
outlineViewPr (§4.3.2.10)

Child Elements	Subclause
sld (Presentation Slide)	§4.3.2.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OutlineViewSlideList">
   <sequence>
      <element name="sld" type="CT_OutlineViewSlideEntry" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.3.2.16 slideViewPr (Slide View Properties)

This element functions as a parent element within which all view properties associated with the slide view mode are contained. All properties are defined within the child elements.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
cSldViewPr (Common Slide View Properties)	§4.3.2.1
extLst (Extension List)	§4.2.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideViewProperties">
   <sequence>
      <element name="cSldViewPr" type="CT_CommonSlideViewProperties" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.3.2.17 sorterViewPr (Slide Sorter View Properties)

This element functions as a parent element within which all view properties associated with the slide sorter view mode are contained. All properties are defined within the child elements.

The slide sorter view displays thumbnails of multiple slides at once; the number of slides and size of thumbnails depends on the scaling factor of the view.

Parent Elements
viewPr (§4.3.2.18)

Child Elements	Subclause
cViewPr (Common View Properties)	§4.3.2.2

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
showFormatting (Show Formatting)	Specifies whether to show associated slide formatting when in slide sorter view mode. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideSorterViewProperties">
   <sequence minOccurs="1" maxOccurs="1">
      <element name="cViewPr" type="CT_CommonViewProperties" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="showFormatting" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.3.2.18 viewPr (Presentation-wide View Properties)

This element functions as a parent element within which all presentation-wide view properties are contained. All properties and their corresponding settings are defined within the child elements.

Parent Elements
Root element of PresentationML View Properties part

Child Elements	Subclause
extLst (Extension List)	§4.2.5
gridSpacing (Grid Spacing)	§4.3.2.3
normalViewPr (Normal View Properties)	§4.3.2.6
notesTextViewPr (Notes Text View Properties)	§4.3.2.7
notesViewPr (Notes View Properties)	§4.3.2.8
outlineViewPr (Outline View Properties)	§4.3.2.10
slideViewPr (Slide View Properties)	§4.3.2.16
sorterViewPr (Slide Sorter View Properties)	§4.3.2.17

Attributes	Description
lastView (Last View)	Specifies the view mode that was used when the presentation document was last saved. The possible values for this attribute are defined by the ST_ViewType simple type (§4.8.59).

Attributes	Description
showComments (Show Comments)	Specifies whether the slide comments should be shown. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ViewProperties">
   <sequence minOccurs="0" maxOccurs="1">
      <element name="normalViewPr" type="CT_NormalViewProperties" minOccurs="0" maxOccurs="1"/>
      <element name="slideViewPr" type="CT_SlideViewProperties" minOccurs="0" maxOccurs="1"/>
      <element name="outlineViewPr" type="CT_OutlineViewProperties" minOccurs="0" maxOccurs="1"/>
      <element name="notesTextViewPr" type="CT_NotesTextViewProperties" minOccurs="0"
        maxOccurs="1"/>
      <element name="sorterViewPr" type="CT_SlideSorterViewProperties" minOccurs="0" maxOccurs="1"/>
      <element name="notesViewPr" type="CT_NotesViewProperties" minOccurs="0" maxOccurs="1"/>
      <element name="gridSpacing" type="a:CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="lastView" type="ST_ViewType" use="optional" default="sldView"/>
   <attribute name="showComments" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.4 Slides

The Slides portion of the PresentationML framework stores all information pertaining specifically to slides of various types. These slide types and corresponding parts can be broken down into three distinct parts, namely slides, embedded objects, and programmable tags.

4.4.1 Slides

Being the main segment of this section of PresentationML, the slides elements encompass all data that is to be contained within a slide. The best way to think of a slide is a container for all data that is to be on that slide. The specific shapes, images and relations within a slide will not come into play here. The elements here pertain to the six different types of slides that can be described within PresentationML, namely slide, slide layout, slide master, handout master, notes master and notes slide.

4.4.1.1 bg (Slide Background)

This element specifies the background appearance information for a slide. The slide background covers the entire slide and is visible where no objects exist and as the background for transparent objects.

Parent Elements
cSld (§4.4.1.15)

Child Elements	Subclause
bgPr (Background Properties)	§4.4.1.2

Child Elements	Subclause
bgRef (Background Style Reference)	§4.4.1.3

Attributes	Description
bwMode (Black and White Mode)	Specifies that the background should be rendered using only black and white coloring. That is, the coloring information for the background should be converted to either black or white when rendering the picture. [Note: No gray is to be used in rendering this background, only stark black and stark white. End note] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Background">
   <sequence>
      <group ref="EG_Background"/>
   </sequence>
   <attribute name="bwMode" type="a:ST_BlackWhiteMode" use="optional" default="white"/>
</complexType>
```

4.4.1.2 bgPr (Background Properties)

This element specifies visual effects used to render the slide background. This includes any fill, image, or effects that are to make up the background of the slide.

Parent Elements
bg (§4.4.1.1)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§4.2.5
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

Attributes	Description
shadeToTitle (Shade to Title)	Specifies whether the background of the slide is of a shade to title type. This type of gradient fill is on the slide background and changes based on the placement of the slide title placeholder. An example is shown below.  The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BackgroundProperties">
   <sequence>
      <group ref="a:EG_FillProperties" minOccurs="1" maxOccurs="1"/>
      <group ref="a:EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="shadeToTitle" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.1.3 bgRef (Background Style Reference)

This element specifies the slide background is to use a fill style defined in the style matrix. The idx attribute refers to the index of a background fill style or fill style within the presentation's style matrix, defined by the fmtScheme element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style within the fillStyleLst element, and values 1001 and above refer to the index of a background fill style within the bgFillStyleLst element. The value 1001 corresponds to the first background fill style, 1002 to the second background fill style, and so on.

[*Example*:

```
<p:bgRef idx="2">
  <a:schemeClr val="bg2"/>
</p:bgRef>
```

The above code indicates a slide background with the style's second fill style using the second background color of the color scheme.

end example]

[*Example*:

```
<p:bgRef idx="1001">
  <a:schemeClr val="bg2"/>
</p:bgRef>
```

The above code indicates a slide background with the style's first background fill style using the second background color of the color scheme.

end example]

Parent Elements
bg (§4.4.1.1)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
idx (Style Matrix Index) Namespace: .../drawingml/2006/main	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§5.1.12.57).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleMatrixReference">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="idx" type="ST_StyleMatrixColumnIndex" use="required"/>
</complexType>
```

4.4.1.4 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<p:pic>
  ..
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  ..
</p:pic>
```

The above picture object is shown as an example of this fill type. End example]

[Example: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<p:pic>
  ..
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
```

```
  <p:spPr>
    <a:gradFill>
      <a:gsLst>
        <a:gs pos="0">
          <a:schemeClr val="tx2">
            <a:shade val="50000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="39999">
          <a:schemeClr val="tx2">
            <a:tint val="20000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="70000">
          <a:srgbClr val="C4D6EB"/>
        </a:gs>
        <a:gs pos="100000">
          <a:schemeClr val="bg1"/>
        </a:gs>
      </a:gsLst>
    </a:gradFill>
  </p:spPr>
  ..
</p:pic>
```

The above picture object is shown as an example of this double fill type. End example]

Parent Elements
pic (§4.4.1.34)

Child Elements	Subclause
blip (Blip)	§5.1.10.13
srcRect (Source Rectangle)	§5.1.10.55
stretch (Stretch)	§5.1.10.56
tile (Tile)	§5.1.10.58

Attributes	Description
dpi (DPI Setting) Namespace: .../drawingml/2006/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [*Note*: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. *end note*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: .../drawingml/2006/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlipFillProperties">
   <sequence>
      <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
      <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
   <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
</complexType>
```

4.4.1.5 bodyStyle (Slide Master Body Text Style)

This element specifies the text formatting style for all body text within a master slide. This formatting will be used on all body text within presentation slides related to this master. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the bodyStyle element there may be many different types of styles defined as there are different types of text stored within the body of a slide.

Parent Elements

Parent Elements
txStyles (§4.4.1.48)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§5.1.5.2.2
extLst (Extension List)	§5.1.2.1.15
lvl1pPr (List Level 1 Text Style)	§5.1.5.4.13
lvl2pPr (List Level 2 Text Style)	§5.1.5.4.14
lvl3pPr (List Level 3 Text Style)	§5.1.5.4.15
lvl4pPr (List Level 4 Text Style)	§5.1.5.4.16
lvl5pPr (List Level 5 Text Style)	§5.1.5.4.17
lvl6pPr (List Level 6 Text Style)	§5.1.5.4.18
lvl7pPr (List Level 7 Text Style)	§5.1.5.4.19
lvl8pPr (List Level 8 Text Style)	§5.1.5.4.20
lvl9pPr (List Level 9 Text Style)	§5.1.5.4.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextListStyle">
   <sequence>
      <element name="defPPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl1pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl2pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl3pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl4pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl5pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl6pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl7pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl8pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl9pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.6 clrMap (Color Scheme Map)

This element specifies the mapping layer that transforms one color scheme definition to another. Each attribute represents a color name that may be referenced in this master, and the value is the corresponding color in the theme.

[*Example*: Consider the following mapping of colors that applies to a slide master:

```
<p:clrMap bg1="dk1" tx1="lt1" bg2="dk2" tx2="lt2" accent1="accent1"
accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

end example]

Parent Elements
handoutMaster (§4.4.1.21); notesMaster (§4.4.1.24); sldMaster (§4.4.1.39)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
accent1 (Accent 1) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent2 (Accent 2) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent3 (Accent 3) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent4 (Accent 4) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 4 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent5 (Accent 5) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent6 (Accent 6) Namespace: .../drawingml/200	Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

Attributes	Description
6/main	
bg1 (Background 1) Namespace: .../drawingml/2006/main	A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg2 (Background 2) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
folHlink (Followed Hyperlink) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
hlink (Hyperlink) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the color for a hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx1 (Text 1) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx2 (Text 2) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMapping">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bg1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="tx1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="bg2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="tx2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent3" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent4" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent5" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent6" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="hlink" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="folHlink" type="ST_ColorSchemeIndex" use="required"/>
</complexType>
```

4.4.1.7 clrMapOvr (Color Scheme Map Override)

This element provides a mechanism with which to override the color schemes listed within the ClrMap element. If the masterClrMapping element is present, the color scheme defined by the master is used. If the overrideClrMapping element is present, it defines a new color scheme specific to the parent notes slide, presentation slide, or slide layout.

Parent Elements
notes (§4.4.1.23); sld (§4.4.1.35); sldLayout (§4.4.1.36)

Child Elements	Subclause
masterClrMapping (Master Color Mapping)	§5.1.8.6
overrideClrMapping (Override Color Mapping)	§5.1.8.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMappingOverride">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="masterClrMapping" type="CT_EmptyElement"/>
         <element name="overrideClrMapping" type="CT_ColorMapping"/>
      </choice>
   </sequence>
</complexType>
```

4.4.1.8 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties specific to a connector shape. This includes information specifying the shapes to which the connector shape is connected.

Parent Elements
nvCxnSpPr (§4.4.1.26)

Child Elements	Subclause
cxnSpLocks (Connection Shape Locks)	§5.1.2.1.11
endCxn (Connection End)	§5.1.2.1.13
extLst (Extension List)	§5.1.2.1.15
stCxn (Connection Start)	§5.1.2.1.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualConnectorProperties">
   <sequence>
      <element name="cxnSpLocks" type="CT_ConnectorLocking" minOccurs="0" maxOccurs="1"/>
      <element name="stCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
      <element name="endCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.9 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGraphicFramePr (§4.4.1.27)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGraphicFrameProperties">
   <sequence>
      <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
        maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.10 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGrpSpPr (§4.4.1.28)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
grpSpLocks (Group Shape Locks)	§5.1.2.1.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGroupDrawingShapeProps">
   <sequence>
      <element name="grpSpLocks" type="CT_GroupLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.11 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  ..
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <p:nvPr/>
  </p:nvPicPr>
  ..
</p:pic>
```

end example]

Parent Elements
nvPicPr (§4.4.1.29)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
picLocks (Picture Locks)	§5.1.2.1.31

Attributes	Description
preferRelativeResize (Relative Resize Preferred) Namespace: .../drawingml/2006/main	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be relative to the original picture size as opposed to the current picture size. [*Example*: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked. If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualPictureProperties">
   <sequence>
      <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.4.1.12 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following DrawingML.

```
<p:pic>
  ..
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  </p:nvPicPr>
  ..
</p:pic>
```

End example]

Parent Elements
nvCxnSpPr (§4.4.1.26); nvGraphicFramePr (§4.4.1.27); nvGrpSpPr (§4.4.1.28); nvPicPr (§4.4.1.29); nvSpPr (§4.4.1.31)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

Attributes	Description
descr (Alternative Text for Object) Namespace: .../drawingml/2006/main	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which may be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hidden (Hidden) Namespace: .../drawingml/2006/main	Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [*Note*: An application may have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden). [*Example*: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Unique Identifier) Namespace: .../drawingml/2006/main	Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant. [*Example*: Consider a DrawingML object defined as follows:

Attributes	Description
	<… id="10" … > The id attribute has a value of 10, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
name (Name) Namespace: …/drawingml/2006/main	Specifies the name of the object. [*Note*: Typically, this will be used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: < … name="foo.jpg" > The name attribute has a value of foo.jpg, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingProps">
   <sequence>
      <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_DrawingElementId" use="required"/>
   <attribute name="name" type="xsd:string" use="required"/>
   <attribute name="descr" type="xsd:string" use="optional" default=""/>
   <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.1.13 cNvSpPr (Non-Visual Drawing Properties for a Shape)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with

[*Example*: Consider the shape that has a shape lock applied to it.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 1"/>
    <p:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </p:cNvSpPr>
  </p:nvSpPr>
```

```
    ..
</p:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *End example*]

Parent Elements
nvSpPr (§4.4.1.31)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
spLocks (Shape Locks)	§5.1.2.1.34

Attributes	Description
txBox (Text Box) Namespace: .../drawingml/2006/main	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box. [*Note*: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingShapeProps">
   <sequence>
      <element name="spLocks" type="CT_ShapeLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="txBox" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.1.14 controls (List of controls)

This element specifies a list of embedded controls for the corresponding slide. Custom embedded controls may be embedded on slides.

Parent Elements
cSld (§4.4.1.15)

Child Elements	Subclause
control (Embedded Control)	§4.4.2.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ControlList">
   <sequence>
      <element name="control" type="CT_Control" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.4.1.15 cSld (Common Slide Data)

This element specifies a container for the type of slide information that is relevant to all of the slide types. All slides share a common set of properties that is independent of the slide type; the description of these properties for any particular slide is stored within the slide's cSld container. Slide data specific to the slide type indicated by the parent element is stored elsewhere.

[*Note*: The actual data in cSld describe only the particular parent slide; it is only the type of information stored that is common across all slides. *end note*]

[*Example*: Consider the following PresentationML slide

```
<p:sld>
  <p:cSld>
    <p:spTree>
      ..
    </p:spTree>
  </p:cSld>
  ..
</p:sld>
```

As the above example shows, the shape tree of a slide (spTree) is a child element of cSld because all slide types may contain a shape tree. Other slide properties specific to the type of slide (such as transitions for sld slides) are specified elsewhere. *end example*]

Parent Elements
handoutMaster (§4.4.1.21); notes (§4.4.1.23); notesMaster (§4.4.1.24); sld (§4.4.1.35); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39)

Child Elements	Subclause
bg (Slide Background)	§4.4.1.1
controls (List of controls)	§4.4.1.14
custDataLst (Customer Data List)	§4.4.1.16
extLst (Extension List)	§4.2.5
spTree (Shape Tree)	§4.4.1.42

Attributes	Description
name (Name)	Specifies the slide name property that is used to further identify this unique configuration of common slide data. This might be used to aid in distinguishing different slide layouts or various other slide types. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommonSlideData">
   <sequence>
      <element name="bg" type="CT_Background" minOccurs="0" maxOccurs="1"/>
      <element name="spTree" type="CT_GroupShape" minOccurs="1" maxOccurs="1"/>
      <element name="custDataLst" type="CT_CustomerDataList" minOccurs="0" maxOccurs="1"/>
      <element name="controls" type="CT_ControlList" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
</complexType>
```

4.4.1.16 custDataLst (Customer Data List)

This element allows for the specifying of customer defined data within the PresentationML framework. References to custom data or tags may be defined within this list.

Parent Elements
cSld (§4.4.1.15); nvPr (§4.4.1.30); presentation (§4.3.1.24)

Child Elements	Subclause
custData (Customer Data)	§4.2.1
tags (Customer Data Tags)	§4.2.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomerDataList">
   <sequence minOccurs="0" maxOccurs="1">
      <element name="custData" type="CT_CustomerData" minOccurs="0" maxOccurs="unbounded"/>
      <element name="tags" type="CT_TagsData" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.17 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector will take. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[Example: Consider the following connector shape that connects two regular shapes.

```
<p:spTree>
  ..
  <p:sp>
    <p:nvSpPr>
      <p:cNvPr id="1" name="Rectangle 1"/>
      <p:cNvSpPr/>
      <p:nvPr/>
    </p:nvSpPr>
    ..
  </p:sp>
  <p:sp>
    <p:nvSpPr>
      <p:cNvPr id="2" name="Rectangle 2"/>
      <p:cNvSpPr/>
      <p:nvPr/>
    </p:nvSpPr>
    ..
  </p:sp>
  <p:cxnSp>
    <p:nvCxnSpPr>
      <p:cNvPr id="3" name="Elbow Connector 3"/>
      <p:cNvCxnSpPr>
        <a:stCxn id="1" idx="3"/>
        <a:endCxn id="2" idx="1"/>
      </p:cNvCxnSpPr>
      <p:nvPr/>
    </p:nvCxnSpPr>
    ..
  </p:cxnSp>
</p:spTree>
```

End example]

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4
nvCxnSpPr (Non-Visual Properties for a Connection Shape)	§4.4.1.26
spPr (Shape Properties)	§4.4.1.41
style (Shape Style)	§4.4.1.43

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connector">
   <sequence>
      <element name="nvCxnSpPr" type="CT_ConnectorNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.18 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4
graphic (Graphic Object)	§5.1.2.1.16
nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)	§4.4.1.27
xfrm (2D Transform for Graphic Frame)	§4.4.1.49

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectFrame">
   <sequence>
      <element name="nvGraphicFramePr" type="CT_GraphicalObjectFrameNonVisual" minOccurs="1"
        maxOccurs="1"/>
      <element name="xfrm" type="a:CT_Transform2D" minOccurs="1" maxOccurs="1"/>
      <element ref="a:graphic" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.19 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the

shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[Example: Consider the following group shape.

```
<p:grpSp>
  <p:nvGrpSpPr>
    <p:cNvPr id="10" name="Group 9"/>
    <p:cNvGrpSpPr/>
    <p:nvPr/>
  </p:nvGrpSpPr>
  <p:grpSpPr>
    <a:xfrm>
      <a:off x="838200" y="990600"/>
      <a:ext cx="2426208" cy="978408"/>
      <a:chOff x="838200" y="990600"/>
      <a:chExt cx="2426208" cy="978408"/>
   </a:xfrm>
  </p:grpSpPr>
  <p:sp>
  ..
  </p:sp>
  <p:sp>
  ..
  </p:sp>
  <p:sp>
  ..
  </p:sp>
</p:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. End example]

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
cxnSp (Connection Shape)	§4.4.1.17
extLst (Extension List with Modification Flag)	§4.2.4
graphicFrame (Graphic Frame)	§4.4.1.18

Child Elements	Subclause
grpSp (Group Shape)	§4.4.1.19
grpSpPr (Group Shape Properties)	§4.4.1.20
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§4.4.1.28
pic (Picture)	§4.4.1.34
sp (Shape)	§4.4.1.40

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShape">
   <sequence>
      <element name="nvGrpSpPr" type="CT_GroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="grpSpPr" type="a:CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
      <choice minOccurs="0" maxOccurs="unbounded">
         <element name="sp" type="CT_Shape"/>
         <element name="grpSp" type="CT_GroupShape"/>
         <element name="graphicFrame" type="CT_GraphicalObjectFrame"/>
         <element name="cxnSp" type="CT_Connector"/>
         <element name="pic" type="CT_Picture"/>
      </choice>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.20 grpSpPr (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
scene3d (3D Scene Properties)	§5.1.4.1.26

Child Elements	Subclause
solidFill (Solid Fill)	§5.1.10.54
xfrm (2D Transform for Grouped Objects)	§5.1.9.5

Attributes	Description
bwMode (Black and White Mode) Namespace: .../drawingml/2006/main	Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes will use when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_GroupTransform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

4.4.1.21 handoutMaster (Handout Master)

This element specifies an instance of a handout master slide. Within a handout master slide are contained all elements that describe the objects and their corresponding formatting for within a handout slide. Within a handout master slide the cSld element specifies the common slide elements such as shapes and their attached text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the intended purpose for a handoutMaster slide.

Parent Elements
Root element of PresentationML Handout Master part

Child Elements	Subclause
clrMap (Color Scheme Map)	§4.4.1.6

Child Elements	Subclause
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4
hf (Header/Footer information for a slide master)	§4.4.1.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HandoutMaster">
    <sequence>
        <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
        <group ref="EG_TopLevelSlide" minOccurs="1" maxOccurs="1"/>
        <element name="hf" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
        <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
    </sequence>
</complexType>
```

4.4.1.22 hf (Header/Footer information for a slide master)

This element specifies the header and footer information for a slide. Headers and footers consist of placeholders for text that should be consistent across all slides and slide types, such as a date and time, slide numbering, and custom header and footer text.

Parent Elements
handoutMaster (§4.4.1.21); notesMaster (§4.4.1.24); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4

Attributes	Description
dt (Date/Time Placeholder)	Specifies whether the Date/Time placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the XML Schema boolean datatype.
ftr (Footer Placeholder)	Specifies whether the Footer placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the XML Schema boolean datatype.
hdr (Header Placeholder)	Specifies whether the Header placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the XML Schema boolean datatype.
sldNum (Slide Number	Specifies whether the slide number placeholder is enabled. If this attribute is not specified, a value of true should be assumed by the generating application.

Attributes	Description
Placeholder)	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HeaderFooter">
   <sequence>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="sldNum" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="hdr" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="ftr" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="dt" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.4.1.23 notes (Notes Slide)

This element specifies the existence of a notes slide along with its corresponding data. Contained within a notes slide are all the common slide elements along with addition properties that are specific to the notes element.

[*Example*: Consider the following PresentationML notes slide

```
<p:notes>
  <p:cSld>
  ..
  </p:cSld>
  ..
</p:notes>
```

In the above example a notes element specifies the existence of a notes slide with all of its parts. Notice the cSld element, that specifies the common elements that can appear on any slide type and then any elements specify additional non-common properties for this notes slide. *end example*]

Parent Elements
Root element of PresentationML Notes Slide part

Child Elements	Subclause
clrMapOvr (Color Scheme Map Override)	§4.4.1.7
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4

Attributes	Description

Attributes	Description
showMasterPhAnim (Show Master Placeholder Animations)	Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesSlide">
   <sequence minOccurs="1" maxOccurs="1">
      <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
      <group ref="EG_ChildSlide" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_ChildSlide"/>
</complexType>
```

4.4.1.24 notesMaster (Notes Master)

This element specifies an instance of a handout master slide. Within a handout master slide are contained all elements that describe the objects and their corresponding formatting for within a handout slide. Within a handout master slide the cSld element specifies the common slide elements such as shapes and their attached text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the intended purpose for a handoutMaster slide.

Parent Elements
Root element of PresentationML Notes Master part

Child Elements	Subclause
clrMap (Color Scheme Map)	§4.4.1.6
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4
hf (Header/Footer information for a slide master)	§4.4.1.22
notesStyle (Notes Text Style)	§4.4.1.25

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NotesMaster">
   <sequence>
      <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
      <group ref="EG_TopLevelSlide" minOccurs="1" maxOccurs="1"/>
      <element name="hf" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
      <element name="notesStyle" type="a:CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.25 notesStyle (Notes Text Style)

This element specifies the text formatting style for the all other text within a notes slide. This formatting will be used on all text within the corresponding notes slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the notesStyle element there may be many different types of styles defined as there are different types of text stored within a notes slide.

Parent Elements

</complexType>
```

4.4.1.26 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

Parent Elements
cxnSp (§4.4.1.17)

Child Elements	Subclause
cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)	§4.4.1.8
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConnectorNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvCxnSpPr" type="a:CT_NonVisualConnectorProperties" minOccurs="1"
        maxOccurs="1"/>
      <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.27 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic

frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

Parent Elements
graphicFrame (§4.4.1.18)

Child Elements	Subclause
cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)	§4.4.1.9
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectFrameNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGraphicFramePr" type="a:CT_NonVisualGraphicFrameProperties" minOccurs="1"
        maxOccurs="1"/>
      <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.28 nvGrpSpPr (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)	§4.4.1.10
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGrpSpPr" type="a:CT_NonVisualGroupDrawingShapeProps" minOccurs="1"
        maxOccurs="1"/>
      <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.29 nvPicPr (Non-Visual Properties for a Picture)

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following PresentationML.

```
<p:pic>
  ..
  <p:nvPicPr>

  </p:nvPicPr>
  ..
</p:pic>
```

end example]

Parent Elements
pic (§4.4.1.34)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§4.4.1.11
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvPicPr" type="a:CT_NonVisualPictureProperties" minOccurs="1" maxOccurs="1"/>
      <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.30 nvPr (Non-Visual Properties)

This element specifies non-visual properties for objects. These properties include multimedia content associated with an object and properties indicating how the object is to be used or displayed in different contexts.

Parent Elements
nvCxnSpPr (§4.4.1.26); nvGraphicFramePr (§4.4.1.27); nvGrpSpPr (§4.4.1.28); nvPicPr (§4.4.1.29); nvSpPr (§4.4.1.31)

Child Elements	Subclause
audioCd (Audio from CD)	§5.1.3.1
audioFile (Audio from File)	§5.1.3.2
custDataLst (Customer Data List)	§4.4.1.16
extLst (Extension List)	§4.2.5
ph (Placeholder Shape)	§4.4.1.33
quickTimeFile (QuickTime from File)	§5.1.3.4
videoFile (Video from File)	§5.1.3.6
wavAudioFile (Audio from WAV File)	§5.1.3.7

Attributes	Description
isPhoto (Is a Photo Album)	Specifies whether the picture belongs to a photo album and should thus be included when editing a photo album within the generating application. The possible values for this attribute are defined by the XML Schema boolean datatype.
userDrawn (Is User Drawn)	Specifies if the corresponding object has been drawn by the user and should thus not be deleted. This allows for the flagging of slides that contain user drawn data. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ApplicationNonVisualDrawingProps">
   <sequence>
      <element name="ph" type="CT_Placeholder" minOccurs="0" maxOccurs="1"/>
      <group ref="a:EG_Media" minOccurs="0" maxOccurs="1"/>
      <element name="custDataLst" type="CT_CustomerDataList" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="isPhoto" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="userDrawn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.1.31 nvSpPr (Non-Visual Properties for a Shape)

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

Parent Elements
sp (§4.4.1.40)

Child Elements	Subclause
cNvPr (Non-Visual Drawing Properties)	§4.4.1.12
cNvSpPr (Non-Visual Drawing Properties for a Shape)	§4.4.1.13
nvPr (Non-Visual Properties)	§4.4.1.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvSpPr" type="a:CT_NonVisualDrawingShapeProps" minOccurs="1" maxOccurs="1"/>
      <element name="nvPr" type="CT_ApplicationNonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.32 otherStyle (Slide Master Other Text Style)

This element specifies the text formatting style for the all other text within a master slide. This formatting will be used on all text not covered by the titleStyle or bodyStyle elements within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the otherStyle element there may be many different types of styles defined as there are different types of text stored within a slide.

[*Note*: The otherStyle element is to be used for specifying the text formatting of text within a slide shape but not within a text box. Text box styling is handled from within the bodyStyle element. *end note*]

Parent Elements
txStyles (§4.4.1.48)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§5.1.5.2.2
extLst (Extension List)	§5.1.2.1.15
lvl1pPr (List Level 1 Text Style)	§5.1.5.4.13
lvl2pPr (List Level 2 Text Style)	§5.1.5.4.14

Child Elements	Subclause
lvl3pPr (List Level 3 Text Style)	§5.1.5.4.15
lvl4pPr (List Level 4 Text Style)	§5.1.5.4.16
lvl5pPr (List Level 5 Text Style)	§5.1.5.4.17

lvl7pPr (List Level 7 Text Style)	§5.1.5.4.19
lvl8pPr (List Level 8 Text Style)	§5.1.5.4.20
lvl9pPr (List Level 9 Text Style)	§5.1.5.4.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextListStyle">
   <sequence>
      <element name="defPPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl1pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl2pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl3pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl4pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl5pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl6pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl7pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl8pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl9pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.33 ph (Placeholder Shape)

This element specifies that the corresponding shape should be represented by the generating application as a placeholder. When a shape is considered a placeholder by the generating application it can have special properties to alert the user that they may enter content into the shape. Different types of placeholders are allowed and can be specified by using the placeholder type attribute for this element.

Parent Elements
nvPr (§4.4.1.30)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4

Attributes	Description
hasCustomPrompt (Placeholder has	Specifies whether the corresponding placeholder should have a custom prompt or not.

Attributes	Description
custom prompt)	The possible values for this attribute are defined by the XML Schema boolean datatype.
idx (Placeholder Index)	Specifies the placeholder index. This is used when applying templates or changing layouts to match a placeholder on one template/master to another. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
orient (Placeholder Orientation)	Specifies the orientation of a placeholder. The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).
sz (Placeholder Size)	Specifies the size of a placeholder. The possible values for this attribute are defined by the ST_PlaceholderSize simple type (§4.8.13).
type (Placeholder Type)	Specifies what type of content a placeholder is intended to contain. The possible values for this attribute are defined by the ST_PlaceholderType simple type (§4.8.14).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Placeholder">
   <sequence>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="type" type="ST_PlaceholderType" use="optional" default="obj"/>
   <attribute name="orient" type="ST_Direction" use="optional" default="horz"/>
   <attribute name="sz" type="ST_PlaceholderSize" use="optional" default="full"/>
   <attribute name="idx" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="hasCustomPrompt" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.1.34 pic (Picture)

This element specifies the existence of a picture object within the document.

[*Example*: Consider the following PresentationML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <p:nvPr/>
```

```
    </p:nvPicPr>
    <p:blipFill>
    ...
    </p:blipFill>
    <p:spPr>
    ...
    </p:spPr>
  </p:pic>
```

end example]

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
blipFill (Picture Fill)	§4.4.1.4
extLst (Extension List with Modification Flag)	§4.2.4
nvPicPr (Non-Visual Properties for a Picture)	§4.4.1.29
spPr (Shape Properties)	§4.4.1.41
style (Shape Style)	§4.4.1.43

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Picture">
   <sequence>
      <element name="nvPicPr" type="CT_PictureNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="blipFill" type="a:CT_BlipFillProperties" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.35 sld (Presentation Slide)

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

[*Example*: Consider the following custom show with an ordering of slides.

```
  <p:custShowLst>
    <p:custShow name="Custom Show 1" id="0">
      <p:sldLst>
        <p:sld r:id="rId4"/>
        <p:sld r:id="rId3"/>
        <p:sld r:id="rId2"/>
```

```
        <p:sld r:id="rId5"/>
      </p:sldLst>
    </p:custShow>
  </p:custShowLst>
```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. *end example*]

Parent Elements
Root element of PresentationML Slide part

Child Elements	Subclause
clrMapOvr (Color Scheme Map Override)	§4.4.1.7
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4
timing (Slide Timing Information for a Slide Layout)	§4.4.1.44
transition (Slide Transition for a Slide Layout)	§4.4.1.46

Attributes	Description
show (Show Slide in Slide Show)	Specifies that the current slide should be shown in slide show. If this attribute is omitted then a value of true is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterPhAnim (Show Master Placeholder Animations)	Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Slide">
   <sequence minOccurs="1" maxOccurs="1">
      <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
      <group ref="EG_ChildSlide" minOccurs="0" maxOccurs="1"/>
      <element name="transition" type="CT_SlideTransition" minOccurs="0" maxOccurs="1"/>
      <element name="timing" type="CT_SlideTiming" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_ChildSlide"/>
   <attribute name="show" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.4.1.36 sldLayout (Slide Layout)

This element specifies an instance of a slide layout. The slide layout contains in essence a template slide design that can be applied to any existing slide. When applied to an existing slide all corresponding content should be mapped to the new slide layout.

Parent Elements
Root element of PresentationML Slide Layout part

Child Elements	Subclause
clrMapOvr (Color Scheme Map Override)	§4.4.1.7
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4
hf (Header/Footer information for a slide master)	§4.4.1.22
timing (Slide Timing Information for a Slide Layout)	§4.4.1.44
transition (Slide Transition for a Slide Layout)	§4.4.1.46

Attributes	Description
matchingName (Matching Name)	Specifies a name to be used in place of the name attribute within the cSld element. This is used for layout matching in response to layout changes and template applications. The possible values for this attribute are defined by the XML Schema string datatype.
preserve (Preserve Slide Layout)	Specifies whether the corresponding slide layout will be deleted when all the slides that follow that layout are deleted. If this attribute is not specified then a value of false should be assumed by the generating application. This would mean that the slide would in fact be deleted if no slides within the presentation were related to it. The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterPhAnim (Show Master	Specifies whether or not to display animations on placeholders from the master slide.

Attributes	Description
Placeholder Animations)	The possible values for this attribute are defined by the XML Schema boolean datatype.
showMasterSp (Show Master Shapes)	Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the XML Schema boolean datatype.
type (Slide Layout Type)	Specifies the slide layout type that is used by this slide. The possible values for this attribute are defined by the ST_SlideLayoutType simple type (§4.8.19).
userDrawn (Is User Drawn)	Specifies if the corresponding object has been drawn by the user and should thus not be deleted. This allows for the flagging of slides that contain user drawn data. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideLayout">
   <sequence minOccurs="1" maxOccurs="1">
      <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
      <group ref="EG_ChildSlide" minOccurs="0" maxOccurs="1"/>
      <element name="transition" type="CT_SlideTransition" minOccurs="0" maxOccurs="1"/>
      <element name="timing" type="CT_SlideTiming" minOccurs="0" maxOccurs="1"/>
      <element name="hf" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_ChildSlide"/>
   <attribute name="matchingName" type="xsd:string" use="optional" default=""/>
   <attribute name="type" type="ST_SlideLayoutType" use="optional" default="cust"/>
   <attribute name="preserve" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="userDrawn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.1.37 sldLayoutId (Slide Layout Id)

This element specifies the relationship information for each slide layout that is used within the slide master. The slide master has relationship identifiers that it uses internally for determining the slide layouts that should be used. Then, to resolve what these slide layouts should be the sldLayoutId elements in the sldLayoutIdLst are utilized.

Parent Elements
sldLayoutIdLst (§4.4.1.38)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (ID Tag) Namespace: .../officeDocument/2006/relationships	Specifies the relationship id value that the generating application can use to resolve which slide layout will be used in the creation of the slide. This relationship id is used within the relationship file for the master slide to expose the location of the corresponding layout file within the presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
id (ID Tag)	Specifies the identification number that uniquely identifies this slide layout within the presentation file. The possible values for this attribute are defined by the ST_SlideLayoutId simple type (§4.8.18).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideLayoutIdListEntry">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_SlideLayoutId" use="optional"/>
   <attribute ref="r:id" use="required"/>
</complexType>
```

4.4.1.38 sldLayoutIdLst (List of Slide Layouts)

This element specifies the existence of the slide layout identification list. This list is contained within the slide master and is used to determine which layouts are being used within the slide master file. Each layout within the list of slide layouts has its own identification number and relationship identifier that uniquely identifies it within both the presentation document and the particular master slide within which it is used.

Parent Elements
sldMaster (§4.4.1.39)

Child Elements	Subclause
sldLayoutId (Slide Layout Id)	§4.4.1.37

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideLayoutIdList">
   <sequence>
      <element name="sldLayoutId" type="CT_SlideLayoutIdListEntry" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.4.1.39 sldMaster (Slide Master)

This element specifies an instance of a slide master slide. Within a slide master slide are contained all elements that describe the objects and their corresponding formatting for within a presentation slide. Within a slide master slide are two main elements. The cSld element specifies the common slide elements such as shapes and their attached text bodies. Then the txStyles element specifies the formatting for the text within each of these shapes. The other properties within a slide master slide specify other properties for within a presentation slide such as color information, headers and footers, as well as timing and transition information for all corresponding presentation slides.

Parent Elements
Root element of PresentationML Slide Master part

Child Elements	Subclause
clrMap (Color Scheme Map)	§4.4.1.6
cSld (Common Slide Data)	§4.4.1.15
extLst (Extension List with Modification Flag)	§4.2.4
hf (Header/Footer information for a slide master)	§4.4.1.22
sldLayoutIdLst (List of Slide Layouts)	§4.4.1.38
timing (Slide Timing Information for a Slide Layout)	§4.4.1.44
transition (Slide Transition for a Slide Layout)	§4.4.1.46
txStyles (Slide Master Text Styles)	§4.4.1.48

Attributes	Description
preserve (Preserve Slide Master)	Specifies whether the corresponding slide layout will be deleted when all the slides that follow that layout are deleted. If this attribute is not specified then a value of false should be assumed by the generating application. This would mean that the slide would in fact be deleted if no slides within the presentation were related to it. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideMaster">
   <sequence minOccurs="1" maxOccurs="1">
      <element name="cSld" type="CT_CommonSlideData" minOccurs="1" maxOccurs="1"/>
      <group ref="EG_TopLevelSlide" minOccurs="1" maxOccurs="1"/>
      <element name="sldLayoutIdLst" type="CT_SlideLayoutIdList" minOccurs="0" maxOccurs="1"/>
      <element name="transition" type="CT_SlideTransition" minOccurs="0" maxOccurs="1"/>
      <element name="timing" type="CT_SlideTiming" minOccurs="0" maxOccurs="1"/>
      <element name="hf" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
      <element name="txStyles" type="CT_SlideMasterTextStyles" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="preserve" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.1.40 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[Note: Shapes are the preferred mechanism for specifying text on a slide. End note]

Parent Elements
grpSp (§4.4.1.19); spTree (§4.4.1.42)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4
nvSpPr (Non-Visual Properties for a Shape)	§4.4.1.31
spPr (Shape Properties)	§4.4.1.41
style (Shape Style)	§4.4.1.43
txBody (Shape Text Body)	§4.4.1.47

Attributes	Description
useBgFill (Use Background Fill)	Specifies that the shape fill should be set to that of the slide background surface. [Note: This attribute does not set the fill of the shape to be transparent but instead sets it to be filled with the portion of the slide background that is directly behind it. End note] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape">
   <sequence>
      <element name="nvSpPr" type="CT_ShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="txBody" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="useBgFill" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.1.41 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a shape. These properties include the shape fill, outline, geometry, effects, and 3D orientation.

Parent Elements
cxnSp (§4.4.1.17); pic (§4.4.1.34); sp (§4.4.1.40)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

Attributes	Description
bwMode (Black and White Mode)	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white

Attributes	Description
Namespace: …/drawingml/2006/main	when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

4.4.1.42 spTree (Shape Tree)

This element specifies all shapes within a slide. Contained within here are all the shapes, either grouped or not, that can be referenced on a given slide. As most objects within a slide are shapes, this represents the majority of content within a slide. Text and effects are attached to shapes that are contained within the spTree element.

[*Example*: Consider the following PresentationML slide

```
<p:sld>
  <p:cSld>
    <p:spTree>
      <p:nvGrpSpPr>
      ..
      </p:nvGrpSpPr>
      <p:grpSpPr>
      ..
      </p:grpSpPr>
      <p:sp>
      ..
      </p:sp>
```

```
      </p:spTree>
    </p:cSld>
    ..
  </p:sld>
```

In the above example the shape tree specifies all the shape properties for this slide. *end example*]

Parent Elements
cSld (§4.4.1.15)

Child Elements	Subclause
cxnSp (Connection Shape)	§4.4.1.17
extLst (Extension List with Modification Flag)	§4.2.4
graphicFrame (Graphic Frame)	§4.4.1.18
grpSp (Group Shape)	§4.4.1.19
grpSpPr (Group Shape Properties)	§4.4.1.20
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§4.4.1.28
pic (Picture)	§4.4.1.34
sp (Shape)	§4.4.1.40

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShape">
   <sequence>
      <element name="nvGrpSpPr" type="CT_GroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="grpSpPr" type="a:CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
      <choice minOccurs="0" maxOccurs="unbounded">
         <element name="sp" type="CT_Shape"/>
         <element name="grpSp" type="CT_GroupShape"/>
         <element name="graphicFrame" type="CT_GraphicalObjectFrame"/>
         <element name="cxnSp" type="CT_Connector"/>
         <element name="pic" type="CT_Picture"/>
      </choice>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.43 style (Shape Style)

This element specifies the style information for a shape. This is used to define a shape's appearance in terms of the preset styles defined by the style matrix for the theme.

[*Example*:

```
  <p:style>
    <a:lnRef idx="3">
```

```
      <a:schemeClr val="lt1"/>
    </a:lnRef>
    <a:fillRef idx="1">
      <a:schemeClr val="accent3"/>
    </a:fillRef>
    <a:effectRef idx="1">
      <a:schemeClr val="accent3"/>
    </a:effectRef>
    <a:fontRef idx="minor">
      <a:schemeClr val="lt1"/>
    </a:fontRef>
  </p:style>
```

The parent shape of the above code is to have an outline that uses the third line style defined by the theme, use the first fill defined by the scheme, and be rendered with the first effect defined by the theme. Text inside the shape is to use the minor font defined by the theme.

end example]

Parent Elements
cxnSp (§4.4.1.17); pic (§4.4.1.34); sp (§4.4.1.40)

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeStyle">
   <sequence>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.44 timing (Slide Timing Information for a Slide Layout)

This element specifies the timing information for handling all animations and timed events within the corresponding slide. This information is tracked via time nodes within the timing element. More information on the specifics of these time nodes and how they are to be defined can be found within the Animation section of the PresentationML framework.

Parent Elements
sld (§4.4.1.35); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39)

Child Elements	Subclause
bldLst (Build List)	§4.6.14
extLst (Extension List with Modification Flag)	§4.2.4
tnLst (Time Node List)	§4.6.87

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideTiming">
    <sequence>
        <element name="tnLst" type="CT_TimeNodeList" minOccurs="0" maxOccurs="1"/>
        <element name="bldLst" type="CT_BuildList" minOccurs="0" maxOccurs="1"/>
        <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
    </sequence>
</complexType>
```

4.4.1.45 titleStyle (Slide Master Title Text Style)

This element specifies the text formatting style for the title text within a master slide. This formatting will be used on all title text within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within a title style there may be many different types of styles defined as there are different types of text stored within a slide title.

Parent Elements
txStyles (§4.4.1.48)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§5.1.5.2.2
extLst (Extension List)	§5.1.2.1.15
lvl1pPr (List Level 1 Text Style)	§5.1.5.4.13
lvl2pPr (List Level 2 Text Style)	§5.1.5.4.14
lvl3pPr (List Level 3 Text Style)	§5.1.5.4.15
lvl4pPr (List Level 4 Text Style)	§5.1.5.4.16
lvl5pPr (List Level 5 Text Style)	§5.1.5.4.17
lvl6pPr (List Level 6 Text Style)	§5.1.5.4.18
lvl7pPr (List Level 7 Text Style)	§5.1.5.4.19
lvl8pPr (List Level 8 Text Style)	§5.1.5.4.20
lvl9pPr (List Level 9 Text Style)	§5.1.5.4.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextListStyle">
   <sequence>
      <element name="defPPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl1pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl2pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl3pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl4pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl5pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl6pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl7pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl8pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl9pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.46 transition (Slide Transition for a Slide Layout)

This element specifies the type of slide transition that should be used to transition to the current slide from the previous slide. That is, the transition information is stored on the slide that will appear after the transition is complete.

Parent Elements
sld (§4.4.1.35); sldLayout (§4.4.1.36); sldMaster (§4.4.1.39)

Child Elements	Subclause
blinds (Blinds Slide Transition)	§4.6.18
checker (Checker Slide Transition)	§4.6.24
circle (Circle Slide Transition)	§4.6.26
comb (Comb Slide Transition)	§4.6.30
cover (Cover Slide Transition)	§4.6.32
cut (Cut Slide Transition)	§4.6.34
diamond (Diamond Slide Transition)	§4.6.35
dissolve (Dissolve Slide Transition)	§4.6.36
extLst (Extension List with Modification Flag)	§4.2.4
fade (Fade Slide Transition)	§4.6.41
newsflash (Newsflash Slide Transition)	§4.6.50
plus (Plus Slide Transition)	§4.6.54
pull (Pull Slide Transition)	§4.6.58
push (Push Slide Transition)	§4.6.59
random (Random Slide Transition)	§4.6.60

Child Elements	Subclause
randomBar (Random Bar Slide Transition)	§4.6.61
sndAc (Sound Action)	§4.6.69
split (Split Slide Transition)	§4.6.71
strips (Strips Slide Transition)	§4.6.74
wedge (Wedge Slide Transition)	§4.6.94
wheel (Wheel Slide Transition)	§4.6.95
wipe (Wipe Slide Transition)	§4.6.96
zoom (Zoom Slide Transition)	§4.6.97

Attributes	Description
advClick (Advance on Click)	Specifies whether a mouse click will advance the slide or not. If this attribute is not specified then a value of true is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
advTm (Advance after time)	Specifies the time, in milliseconds, after which the transition should start. This setting may be used in conjunction with the advClick attribute. If this attribute is not specified then it is assumed that no auto-advance will occur. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
spd (Transition Speed)	Specifies the transition speed that is to be used when transitioning from the current slide to the next. The possible values for this attribute are defined by the ST_TransitionSpeed simple type (§4.8.58).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideTransition">
   <sequence>
      <choice minOccurs="0" maxOccurs="1">
         <element name="blinds" type="CT_OrientationTransition"/>
         <element name="checker" type="CT_OrientationTransition"/>
         <element name="circle" type="CT_Empty"/>
         <element name="dissolve" type="CT_Empty"/>
         <element name="comb" type="CT_OrientationTransition"/>
         <element name="cover" type="CT_EightDirectionTransition"/>
         <element name="cut" type="CT_OptionalBlackTransition"/>
         <element name="diamond" type="CT_Empty"/>
         <element name="fade" type="CT_OptionalBlackTransition"/>
         <element name="newsflash" type="CT_Empty"/>
         <element name="plus" type="CT_Empty"/>
         <element name="pull" type="CT_EightDirectionTransition"/>
         <element name="push" type="CT_SideDirectionTransition"/>
         <element name="random" type="CT_Empty"/>
         <element name="randomBar" type="CT_OrientationTransition"/>
         <element name="split" type="CT_SplitTransition"/>
         <element name="strips" type="CT_CornerDirectionTransition"/>
         <element name="wedge" type="CT_Empty"/>
         <element name="wheel" type="CT_WheelTransition"/>
         <element name="wipe" type="CT_SideDirectionTransition"/>
         <element name="zoom" type="CT_InOutTransition"/>
      </choice>
      <element name="sndAc" minOccurs="0" maxOccurs="1" type="CT_TransitionSoundAction"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="spd" type="ST_TransitionSpeed" use="optional" default="fast"/>
   <attribute name="advClick" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="advTm" type="xsd:unsignedInt" use="optional"/>
</complexType>
```

4.4.1.47 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

Parent Elements
sp (§4.4.1.40)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
   <sequence>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.4.1.48 txStyles (Slide Master Text Styles)

This element specifies the text styles within a slide master. Within this element is the styling information for title text, the body text and other slide text as well. This element is only for use within the Slide Master and thus sets the text styles for the corresponding presentation slides.

[*Example*: Consider the case where we would like to specify the title text for a master slide.

```
<p:txStyles>
  <p:titleStyle>
    <a:lvl1pPr algn="ctr" rtl="0" latinLnBrk="0">
      <a:spcBef>
        <a:spcPct val="0"/>
      </a:spcBef>
      <a:buNone/>
      <a:defRPr sz="4400" kern="1200">
        <a:solidFill>
          <a:schemeClr val="tx1"/>
        </a:solidFill>
        <a:latin typeface="+mj-lt"/>
        <a:ea typeface="+mj-ea"/>
        <a:cs typeface="+mj-cs"/>
      </a:defRPr>
    </a:lvl1pPr>
  </p:titleStyle>
</p:txStyles>
```

In the above example the title text will be set according to the above formatting for all related slides within the presentation. *end example*]

Parent Elements
sldMaster (§4.4.1.39)

Child Elements	Subclause
bodyStyle (Slide Master Body Text Style)	§4.4.1.5

Child Elements	Subclause
extLst (Extension List)	§4.2.5
otherStyle (Slide Master Other Text Style)	§4.4.1.32
titleStyle (Slide Master Title Text Style)	§4.4.1.45

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideMasterTextStyles">
   <sequence>
      <element name="titleStyle" type="a:CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="bodyStyle" type="a:CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="otherStyle" type="a:CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.4.1.49 xfrm (2D Transform for Graphic Frame)

This element specifies the transform to be applied to the corresponding graphic frame. This transformation will be applied to the graphic frame just as it would be for a shape or group shape.

Parent Elements
graphicFrame (§4.4.1.18)

Child Elements	Subclause
ext (Extents)	§5.1.9.3
off (Offset)	§5.1.9.4

Attributes	Description
flipH (Horizontal Flip) Namespace: .../drawingml/2006/main	Specifies a horizontal flip. When true, this attribute defines that the shape will be flipped horizontally about the center of its bounding box. [*Example*: The following illustrates the effect of a horizontal flip.  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
flipV (Vertical Flip)	Specifies a vertical flip. When true, this attribute defines that the group will be flipped vertically about the center of its bounding box.

Attributes	Description
Namespace: .../drawingml/2006/main	[*Example*: The following illustrates the effect of a vertical flip.  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
rot (Rotation) Namespace: .../drawingml/2006/main	Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Transform2D">
   <sequence>
      <element name="off" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
      <element name="ext" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rot" type="ST_Angle" use="optional" default="0"/>
   <attribute name="flipH" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="flipV" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.2 Embedded Objects

Within the slides portion of PresentationML, there are the embedded elements. These are objects that can be embedded within a slide. As we defined a slide to be a container it can be seen that it does not just contain shapes, pictures and text but embedded objects as well that are not necessarily native to the PresentationML platform.

4.4.2.1 control (Embedded Control)

This element specifies the existence of an embedded control in the slide.

Parent Elements
controls (§4.4.1.14)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
id (Relationship ID) Namespace: .../officeDocument/2006/relationships	Specifies the relationship id that is used to identify this Embedded object from within a slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
imgH (Image Height)	Specifies the height of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).
imgW (Image Width)	Specifies the width of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).
name (Embedded Object Name)	Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name. The possible values for this attribute are defined by the XML Schema string datatype.
showAsIcon (Show Embedded Object As Icon)	Specifies whether the Embedded object will be shows as an icon or using its native representation. The possible values for this attribute are defined by the XML Schema boolean datatype.
spid (Embedded object Shape ID)	Specifies the identifier of the shape associated with this Embedded object. The shape will contain all coordinate anchoring information. The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Control">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_Ole"/>
</complexType>
```

4.4.2.2 embed (Embedded Object or Control)

This element specifies an Embedded object or Control that is embedded within the presentation.

Parent Elements
oleObj (§4.4.2.4)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
followColorScheme (Color Scheme Properties for Embedded object)	Specifies the Color Scheme Properties for the corresponding Embedded object being specified. The possible values for this attribute are defined by the ST_OleObjectFollowColorScheme simple type (§4.8.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleObjectEmbed">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="followColorScheme" type="ST_OleObjectFollowColorScheme" use="optional"
     default="none"/>
</complexType>
```

4.4.2.3 link (Linked Object or Control)

This element specifies a link to an external Embedded object or Control.

Parent Elements
oleObj (§4.4.2.4)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
updateAutomatic (Update Linked Embedded Objects Automatically)	This attribute determines if linked embedded objects will be automatically updated when the presentation is opened or printed. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleObjectLink">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="updateAutomatic" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.4.2.4 oleObj (Global Element for Embedded objects and Controls)

This element specifies a global element to be used for an Embedded object and Control.

Child Elements	Subclause
embed (Embedded Object or Control)	§4.4.2.2
link (Linked Object or Control)	§4.4.2.3

Attributes	Description
id (Relationship ID) Namespace: .../officeDocument/2006/relationships	Specifies the relationship id that is used to identify this Embedded object from within a slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
imgH (Image Height)	Specifies the height of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).
imgW (Image Width)	Specifies the width of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).
name (Embedded Object Name)	Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name. The possible values for this attribute are defined by the XML Schema string datatype.
progId (Embedded Object ProgID)	Specifies the progid for an Embedded object. The possible values for this attribute are defined by the XML Schema string datatype.
showAsIcon (Show Embedded Object As Icon)	Specifies whether the Embedded object will be shows as an icon or using its native representation. The possible values for this attribute are defined by the XML Schema boolean datatype.
spid (Embedded object Shape ID)	Specifies the identifier of the shape associated with this Embedded object. The shape will contain all coordinate anchoring information. The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OleObject">
   <choice minOccurs="1" maxOccurs="1">
      <element name="embed" type="CT_OleObjectEmbed"/>
      <element name="link" type="CT_OleObjectLink"/>
   </choice>
   <attributeGroup ref="AG_Ole"/>
   <attribute name="progId" type="xsd:string" use="optional"/>
</complexType>
```

4.4.3 Programmable Tags

Within the slides portion of PresentationML there are the tag elements. These are extensibility names and values that assist in the storage of legacy variables from older file formats.

4.4.3.1 tag (Programmable Extensibility Tag)

This element specifies a programmable extensibility tag to be used for storage of legacy variables.

Parent Elements
tagLst (§4.4.3.2)

Attributes	Description
name (Name)	Specifies the name associated with this specific programmable tag. The possible values for this attribute are defined by the XML Schema string datatype.
val (Value)	Specifies the value associated with this specific programmable tag. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StringTag">
   <attribute name="name" type="xsd:string"/>
   <attribute name="val" type="xsd:string"/>
</complexType>
```

4.4.3.2 tagLst (Programmable Tab List)

This element specifies the list of programmable extensibility tags that will be used to store variables from legacy file formats.

Parent Elements
Root element of PresentationML User-Defined Tags part

Child Elements	Subclause

Child Elements	Subclause
tag (Programmable Extensibility Tag)	§4.4.3.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TagList">
   <sequence>
      <element name="tag" type="CT_StringTag" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.5 Comments

A comment is a text note attached to a slide, with the primary purpose of allowing readers of a presentation to provide feedback to the presentation author. Each comment contains an unformatted text string and information about its author, and is attached to a particular location on a slide. Comments may be visible while editing the presentation, but do not appear when a slide show is given. The displaying application decides when to display comments and determines their visual appearance.

4.5.1 cm (Comment)

This element specifies a single comment attached to a slide. It contains the text of the comment, its position on the slide, and attributes referring to its author and date.

[*Example:*

```
<p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">
  <p:pos x="10" y="10"/>
  <p:text>Add diagram to clarify.</p:text>
</p:cm>
```

End example]

Parent Elements
cmLst (§4.5.4)

Child Elements	Subclause
extLst (Extension List with Modification Flag)	§4.2.4
pos (Comment Position)	§4.5.5
text (Comment's Text Content)	§4.5.6

Attributes	Description
authorId (Comment Author ID)	This attribute specifies the author of the comment. It refers to the ID of an author in the comment author list for the document.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
dt (Comment Date/Time)	This attribute specifies the date and time this comment was last modified. The possible values for this attribute are defined by the XML Schema dateTime datatype.
idx (Comment Index)	This attribute specifies an identifier for this comment that is unique within a list of all comments by this author in this document. An author's first comment in a document has index 1. [*Note:* Because the index is unique only for the comment author, a document may contain multiple comments with the same index created by different authors. *End note*] The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Comment">
   <sequence>
      <element name="pos" type="a:CT_Point2D" minOccurs="1" maxOccurs="1"/>
      <element name="text" type="xsd:string" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionListModify" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="authorId" type="xsd:unsignedInt" use="required"/>
   <attribute name="dt" type="xsd:dateTime" use="optional"/>
   <attribute name="idx" type="ST_Index" use="required"/>
</complexType>
```

4.5.2 cmAuthor (Comment Author)

This element specifies a single author with comments in the document. It contains a unique author ID, the author's name and initials, the index of the author's last comment, and the index of a color associated with the author.

[*Example:*

```
<p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
```

End example]

Parent Elements
cmAuthorLst (§4.5.3)

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
clrIdx (Comment Author Color Index)	This attribute specifies an index into the generating application's comments color table to allow for visual (color) differentiation of different author's comments. This color is used for all comments by this author. If more authors exist than there are entries in the color table, the color index wraps around to the beginning of the table. [*Note:* It is left entirely up to the generating application to determine the amount of colors used in the comments color table and in what order these will be used when rendering comments on a slide surface. *End note*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (Comment Author ID)	This attribute specifies a unique (within the document) zero-based identifier that refers to a single comment author. [*Note:* The method of generating an author id is determined by the application and need not be sequential, provided each id is unique within the list of comment authors for the document. *End note*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
initials (Comment Author Initials)	This attribute specifies a string that represents the initials of this particular author. The value is not necessarily unique. It is intended for use by the application as an abbreviated version of the comment author's name. The possible values for this attribute are defined by the ST_Name simple type (§4.8.9).
lastIdx (Index of Comment Author's last comment)	Index of the last comment added to this document by this author. New comments by this author are counted starting with the value one greater than this index. [*Note:* The index of a deleted comment is not reused; therefore, this value is not an accurate count of the total number of comments by the author. *End note*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
name (Comment Author Name)	This attribute specifies the full name of this particular author. As a string, it has no security or authentication data. This value is not guaranteed to be unique across all document authors. The possible values for this attribute are defined by the ST_Name simple type (§4.8.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommentAuthor">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="xsd:unsignedInt" use="required"/>
   <attribute name="name" type="ST_Name" use="required"/>
   <attribute name="initials" type="ST_Name" use="required"/>
   <attribute name="lastIdx" type="xsd:unsignedInt" use="required"/>
   <attribute name="clrIdx" type="xsd:unsignedInt" use="required"/>
</complexType>
```

4.5.3 cmAuthorLst (List of Comment Authors)

This element specifies a list of authors with comments in the current document. Each comment in a document must refer to an author in this list. To determine if a new author is in this list, the author's name and initials must both match; otherwise, the new author is considered unique and a separate cmAuthor element is added.

[*Example:* A document contains comments left by two authors.

```
<p:cmAuthorLst>
    <p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
    <p:cmAuthor id="1" name="Fred Jones" initials="FJ" lastIdx="2" clrIdx="1"/>
</p:cmAuthorLst>
```

End example]

Parent Elements
Root element of PresentationML Comment Authors part

Child Elements	Subclause
cmAuthor (Comment Author)	§4.5.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommentAuthorList">
   <sequence>
      <element name="cmAuthor" type="CT_CommentAuthor" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.5.4 cmLst (Comment List)

This element specifies a list of comments for a particular slide.

[*Example:* A slide contains two comments, each left by a different author. This example demonstrates that two comments may have the same index if they are created by different authors.

```
<p:cmLst>
    <p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">
        <p:pos x="10" y="10"/>
        <p:text>Add diagram to clarify.</p:text>
    </p:cm>
    <p:cm authorId="1" dt="2006-08-28T17:44:19.679" idx="1">
        <p:pos x="1426" y="660"/>
        <p:text>Clean up this text.</p:text>
    </p:cm>
</p:cmLst>
```

End example]

Parent Elements
Root element of PresentationML Comments part

Child Elements	Subclause
cm (Comment)	§4.5.1

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CommentList">
   <sequence>
      <element name="cm" type="CT_Comment" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.5.5 pos (Comment Position)

This element specifies the positioning information for the placement of a comment on a slide surface. In LTR versions of the generating application, this position information should refer to the upper left point of the comment shape. In RTL versions of the generating application, this position information should refer to the upper right point of the comment shape.

[*Note:* The anchoring point on the slide surface is unaffected by a right-to-left or left-to-right layout change. That is the anchoring point remains the same for all language versions. *End note*]

[*Note:* Because there is no specified size or formatting for comments, this UI widget used to display a comment can be any size and thus the lower right point of the comment shape is determined by how the viewing application chooses to display comments. *End note*]

[*Example:*

```
<p:pos x="1426" y="660"/>
```

End example]

Parent Elements
cm (§4.5.1)

Attributes	Description
x (X-Axis Coordinate) Namespace: .../drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate) Namespace: .../drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
   <attribute name="x" type="ST_Coordinate" use="required"/>
   <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

4.5.6 text (Comment's Text Content)

This element specifies the content of a comment. This is the text with which the author has annotated the slide.

[*Example:*

```
<p:text>Add diagram to clarify.</p:text>
```

End example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
cm (§4.5.1)

4.6 Animation

The Animation section of the PresentationML framework stores the movement and related information of objects.

This schema is loosely based on the syntax and concepts from the Synchronized Multimedia Integration Language (SMIL), a W3C Recommendation for describing multimedia presentations using XML.

The schema describes all the animations effects on that reside on a slide and also the animation that occurs when going from slide to slide (slide transition).

Animations on a slide are inherently time-based and consists of an animation effects on an object or text.. Slide transitions however do not follow this concept and always appear before any animation on a slide.

All elements described in this schema are contained within the slide XML file. More superficially they are in the <transition> and the <timing> element as shown below:

```
<p:sld>
  <p:cSld>...
  <p:clrMapOvr>...
  <p:transition>...
  <p:timing>...
</p:sld>
```

4.6.1 anim (Animate)

This element is a generic animation element that requires little or no semantic understanding of the attribute being animated. It can animate text within a shape or even the shape itself.

[*Example*: Consider trying to emphasize text within a shape by changing the size of its font by 150%. The <anim> element should be used as follows:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1">
        <p:txEl>
          <p:charRg st="1" end="4"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
```

```
          <p:attrName>style.fontSize</p:attrName>
        </p:attrNameLst>
      </p:cBhvr>
    </p:anim>
```

end example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§4.6.22
tavLst (Time Animated Value List)	§4.6.80

Attributes	Description
by (By)	This attribute specifies a relative offset value for the animation with respect to its position before the start of the animation. The possible values for this attribute are defined by the XML Schema string datatype.
calcmode (Calculation Mode)	This attribute specifies the interpolation mode for the animation. The possible values for this attribute are defined by the ST_TLAnimateBehaviorCalcMode simple type (§4.8.24).
from (From)	This attribute specifies the starting value of the animation. The possible values for this attribute are defined by the XML Schema string datatype.
to (To)	This attribute specifies the ending value for the animation as a percentage. The possible values for this attribute are defined by the XML Schema string datatype.
valueType (Value Type)	This attribute specifies the type of property value. The possible values for this attribute are defined by the ST_TLAnimateBehaviorValueType simple type (§4.8.25).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimateBehavior">
   <sequence>
      <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
      <element name="tavLst" type="CT_TLTimeAnimateValueList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="by" type="xsd:string" use="optional"/>
   <attribute name="from" type="xsd:string" use="optional"/>
   <attribute name="to" type="xsd:string" use="optional"/>
   <attribute name="calcmode" type="ST_TLAnimateBehaviorCalcMode" use="optional"/>
   <attribute name="valueType" type="ST_TLAnimateBehaviorValueType" use="optional"/>
</complexType>
```

4.6.2 animClr (Animate Color Behavior)

This animation element is responsible for animating the color of an object.

[*Example*: Consider trying to emphasize a shape by changing its fill color to scheme color accent2. The <animClr> element should be used as follows:

```
<p:animClr clrSpc="rgb">
  <p:cBhvr>
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>fillcolor</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:to>
    <a:schemeClr val="accent2"/>
  </p:to>
</p:animClr>
```

end example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
by (By)	§4.6.21
cBhvr (Common Behavior)	§4.6.22
from (From)	§4.6.44
to (To)	§4.6.90

Attributes	Description
clrSpc (Color Space)	This attribute specifies the color space in which to interpolate the animation. Valid values for example can be HSL & RGB. The values for from/to/by/etc. can still be specified in any supported color format without affecting the color space within which the animation happens. The RGB color space is best used for doing animations between two different colors since it doesn't require going through any other hues between the two colors specified. The HSL space is useful for animating through a rainbow of colors or for modifying just the saturation by 30% for example. The possible values for this attribute are defined by the ST_TLAnimateColorSpace simple type (§4.8.27).
dir (Direction)	This attribute specifies which direction to cycle the hue around the color wheel. Valid values are clockwise or counter clockwise. Default is clockwise. The possible values for this attribute are defined by the ST_TLAnimateColorDirection simple type (§4.8.26).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimateColorBehavior">
   <sequence>
      <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
      <element name="by" type="CT_TLByAnimateColorTransform" minOccurs="0" maxOccurs="1"/>
      <element name="from" type="a:CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="to" type="a:CT_Color" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="clrSpc" type="ST_TLAnimateColorSpace" use="optional"/>
   <attribute name="dir" type="ST_TLAnimateColorDirection" use="optional"/>
</complexType>
```

4.6.3 animEffect (Animate Effect)

This animation behavior provides the ability to do image transform/filter effects on elements. Some visual effects are dynamic in nature and have a progress that animates from 0 to 1 over a period of time to do visual transitions between hidden and visible states. Other filters are static and apply a effects like a blur or drop-shadow which aren't inherently time-based.

[*Example*: Consider trying to emphasize a shape by creating an entrance animation using a "blinds" motion.

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
```

```
      </p:tgtEl>
    </p:cBhvr>
  </p:animEffect>
```

end example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§4.6.22
progress (Progress)	§4.6.57

Attributes	Description
filter (Filter)	This attribute specifies the named transitions for the effect. It allows specifying multiple down-level transition types to use. The runtime will try to use the first type listed and if that one is not supported, will try the next until it either finds one it supports or there are no more in the list. The syntax used for the filter attribute value is as follows: "type(subtype);type(subtype)". Subtype may be a string value such as "fromLeft" or a numerical value depending on the type specified. The possible values for this attribute are defined by the XML Schema string datatype.
prLst (Property List)	This attribute describes a list of properties that coincide with the effect specified in the filter attribute. These properties can be set by providing a name:value pairs in a semicolon-separated list. When multiple types are listed in the filter attribute, the runtime will attempt to apply each property value even though some may not apply to it. The possible values for this attribute are defined by the XML Schema string datatype.
transition (Transition)	This attribute specifies whether to transition the element in or out or treat it as a static filter. The valid values are none, in and out and the default value is in. When a value of "in" is specified, the element will not be visible at the start of the animation and will become completely visible be the end of the duration. When "out" is specified, the element will be visible at the start and not visible at the end of the effect. This visibility is in addition to the effect of setting CSS visibility or display attributes. The possible values for this attribute are defined by the ST_TLAnimateEffectTransition simple type (§4.8.28).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimateEffectBehavior">
   <sequence>
      <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
      <element name="progress" type="CT_TLAnimVariant" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="transition" type="ST_TLAnimateEffectTransition" use="optional"/>
   <attribute name="filter" type="xsd:string" use="optional"/>
   <attribute name="prLst" type="xsd:string" use="optional"/>
</complexType>
```

4.6.4 animMotion (Animate Motion)

Animate motion provides an abstracted way to move positioned elements. It provides the ability to specify from/to/by type motion as well as to use more detailed path descriptions for motion over polylines or bezier curves.

[Example: Consider animating a shape from its original position to the right.. The <animMotion> element should be used as follows:

```
<p:animMotion origin="layout" path="M 0 0 L 0.25 0 E" pathEditMode="relative">
  <p:cBhvr>
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:animMotion>
```

End example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
by (By)	§4.6.20
cBhvr (Common Behavior)	§4.6.22
from (From)	§4.6.43
rCtr (Rotation Center)	§4.6.62
to (To)	§4.6.88

Attributes	Description
origin (Origin)	Specifies what the origin of the motion path is relative to such as the layout of the slide, or the parent. The possible values for this attribute are defined by the ST_TLAnimateMotionBehaviorOrigin simple type (§4.8.29).
path (Path)	Specifies the path primitive followed by coordinates for the animation motion. The allowed values that are understood within a path are as follows: M = move to, L = line to, C = curve to, Z=close loop, E=end UPPERCASE = absolute coords, lowercase = relative coords Thus total allowed set = {M,L,C,Z,E,m,l,c,z,e) [*Example*: The following string is a sample path. path: "M 0 0 L 1 1 c 1 2 3 4 4 4 Z" *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
pathEditMode (Path Edit Mode)	This attribute specifies how the motion path moves when the target element is moved. The possible values for this attribute are defined by the ST_TLAnimateMotionPathEditMode simple type (§4.8.30).
ptsTypes (Points Types)	This attribute describes the type of the points in the path attribute. The allowed values that are understood for the ptsTypes attribute are as follows: A = Auto, F = Corner, T = Straight, S = Smooth UPPERCASE = Straight Line follows point, lowercase = curve follows point. Thus, the total allowed set = {A,F,T,S,a,f,t,s} The possible values for this attribute are defined by the XML Schema string datatype.
rAng (Relative Angle)	The attribute describes the relative angle of the motion path. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimateMotionBehavior">
   <sequence>
      <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
      <element name="by" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
      <element name="from" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
      <element name="to" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
      <element name="rCtr" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="origin" type="ST_TLAnimateMotionBehaviorOrigin" use="optional"/>
   <attribute name="path" type="xsd:string" use="optional"/>
   <attribute name="pathEditMode" type="ST_TLAnimateMotionPathEditMode" use="optional"/>
   <attribute name="rAng" type="a:ST_Angle" use="optional"/>
   <attribute name="ptsTypes" type="xsd:string" use="optional"/>
</complexType>
```

4.6.5 animRot (Animate Rotation)

This animation element is responsible for animating the rotation of an object. Rotation values set in the "by" , "to, and "from" attributes are specified in degrees measured to a 60,000th, i.e 1 degree is 60,000. Rotation values can be larger than 360°.

The sign of the rotation angle specifies the direction for rotation. A negative rotation specifies that the rotation should appear in the host to go counter-clockwise".

[Example: Consider trying to emphasize a shape by rotating it 360 degrees clockwise. The <animRot> element should be used as follows:

```
<p:animRot by="21600000">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="5"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>r</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:animRot>
```

End example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause

Child Elements	Subclause
cBhvr (Common Behavior)	§4.6.22

Attributes	Description
by (By)	This attribute describes the relative offset value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).
from (From)	This attribute describes the starting value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).
to (To)	This attribute describes the ending value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimateRotationBehavior">
   <sequence>
      <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="by" type="a:ST_Angle" use="optional"/>
   <attribute name="from" type="a:ST_Angle" use="optional"/>
   <attribute name="to" type="a:ST_Angle" use="optional"/>
</complexType>
```

4.6.6 animScale (Animate Scale)

This animation element is responsible for animating the scale of an object. When animating the scale, the element must scale around the reference point of the element and the positioning system used should be consistent with the one used for motion paths. When animating the width and height of an element, all of the width/height animation values are calculated first then the scale animations are applied on top of that. So for example, an animation from 0 to 100 of the width with a concurrent scale from 100% to 200% would result in the element appearing to scale from 0 to 200.

[Example: Consider trying to emphasize a shape by scaling it larger by 150%. The <animScale> element should be used as follows:

```
<p:childTnLst>
  <p:animScale>
    <p:cBhvr>
      <p:cTn id="6" dur="2000" fill="hold"/>
      <p:tgtEl>
        <p:spTgt spid="5"/>
      </p:tgtEl>
    </p:cBhvr>
```

```
      <p:by x="150000" y="150000"/>
    </p:animScale>
  </p:childTnLst>
```

End example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
by (By)	§4.6.20
cBhvr (Common Behavior)	§4.6.22
from (From)	§4.6.43
to (To)	§4.6.88

Attributes	Description
zoomContents (Zoom Content)	This attribute specifies whether to zoom the contents of an object when doing a scaling animation. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimateScaleBehavior">
   <sequence>
      <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
      <element name="by" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
      <element name="from" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
      <element name="to" type="CT_TLPoint" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="zoomContents" type="xsd:boolean" use="optional"/>
</complexType>
```

4.6.7 attrName (Attribute Name)

This element is used to contain an attribute value for an Attribute Name List. This value defines the specific attribute that an animation should be applied to, such as fill, style, and shadow, etc. A specific property is defined by using a "property.sub-property" format which is often extended to multiple sub properties as seen in the allowed values below.

Allowed property values:

style.opacity, style.rotation, style.visibility, style.color, style.fontSize, style.fontWeight, style.fontStyle, style.fontFamily, style.textEffectEmboss, style.textShadow, style.textTransform, style.textDecorationUnderline, style.textEffectOutline, style.textDecorationLineThrough, style.sRotation, imageData.cropTop, imageData.cropBottom, imageData.cropLeft, imageData.cropRight, imageData.cropRight, imageData.gain, imageData.blacklevel, imageData.gamma, imageData.grayscale, imageData.chromakey, fill.on, fill.type, fill.color, fill.opacity, fill.color2, fill.method, fill.opacity2, fill.angle, fill.focus, fill.focusposition.x, fill.focusposition.y, fill.focussize.x, fill.focussize.y, stroke.on, stroke.color, stroke.weight, stroke.opacity, stroke.linestyle, stroke.dashstyle, stroke.filltype, stroke.src, stroke.color2, stroke.imagesize.x, stroke.imagesize.y, stroke.startArrow, stroke.endArrow, stroke.startArrowWidth, stroke.startArrowLength, stroke.endArrowWidth, stroke.endArrowLength, shadow.on, shadow.type, shadow.color, shadow.color2, shadow.opacity, shadow.offset.x, shadow.offset.y, shadow.offset2.x, shadow.offset2.y, shadow.origin.x, shadow.origin.y, shadow.matrix.xtox, shadow.matrix.ytox, shadow.matrix.xtox, shadow.matrix.ytoy, shadow.matrix.perspectiveX, shadow.matrix.perspectiveY, skew.on, skew.offset.x, skew.offset.y, skew.origin.x, skew.origin.y, skew.matrix.xtox, skew.matrix.ytox, skew.matrix.xtox, skew.matrix.ytoy, skew.matrix.perspectiveX, skew.matrix.perspectiveY, extrusion.on, extrusion.type, extrusion.render, extrusion.viewpointorigin.x, extrusion.viewpointorigin.y, extrusion.viewpoint.x, extrusion.viewpoint.y, extrusion.viewpoint.z, extrusion.plane, extrusion.skewangle, extrusion.skewamt, extrusion.backdepth, extrusion.foredepth, extrusion.orientation.x, extrusion.orientation.y, extrusion.orientation.z, extrusion.orientationangle, extrusion.color, extrusion.rotationangle.x, extrusion.rotationangle.y, extrusion.lockrotationcenter, extrusion.autorotationcenter, extrusion.rotationcenter.x, extrusion.rotationcenter.y, extrusion.rotationcenter.z, and extrusion.colormode.

[*Example*: Consider trying to emphasize the txt font size within the body of a shape. The attribute would be 'style.fontSize' and this can be done by doing the following:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
```

```
      <p:attrNameLst>
        <p:attrName>style.fontSize</p:attrName>
      </p:attrNameLst>
    </p:cBhvr>
  </p:anim>
```

end example]

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
attrNameLst (§4.6.8)

4.6.8 attrNameLst (Attribute Name List)

This element is used to describe a list of attributes in which to apply an animation to.

[Example: Consider trying to emphasize the txt font size within the body of a shape. The attribute would be 'style.fontSize' and this can be done by doing the following:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>
```

End example]

Parent Elements
cBhvr (§4.6.22)

Child Elements	Subclause
attrName (Attribute Name)	§4.6.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLBehaviorAttributeNameList">
   <sequence>
      <element name="attrName" type="xsd:string" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.6.9 audio (Audio)

This element is used to include audio during an animation.

[Example: Consider adding applause sound to an animation sequence. The <audio> element is used as follows:

```
<p:cTn>
  <p:stCondLst>...
  <p:childTnLst>...
  <p:subTnLst>
    <p:audio>
      <p:cMediaNode vol="11000">...
    </p:audio>
  </p:subTnLst>
</p:cTn>
```

End example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cMediaNode (Common Media Node Properties)	§4.6.29

Attributes	Description
isNarration (Is Narration)	This attribute indicates whether the audio is a narration for the slide. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLMediaNodeAudio">
   <sequence>
      <element name="cMediaNode" type="CT_TLCommonMediaNodeData" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="isNarration" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.6.10 bg (Background)

This element is used to specify animating the background of an object.

[Example: Consider adding animation to the background of Shape Id 3. The <bg> tag can be used as follows:

```
<p:tgtEl>
  <p:spTgt spid="3">
    <p:bg/>
  </p:spTgt>
</p:tgtEl>
```

End example]

Parent Elements
spTgt (§4.6.72)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.11 bldAsOne (Build As One)

This element specifies in the build list to build the entire graphical object as one entity.

[Example: Consider having a graph appear as on entity as opposed to by category. The <bldAsOne> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldAsOne/>
  </p:bldGraphic>
</p:bldLst>
```

End example]

Parent Elements
bldGraphic (§4.6.13)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.12 bldDgm (Build Diagram)

This element specifies how to build the animation for a diagram.

[Example: Consider the following example where a chart is specified to be animated by category rather than as one entity. Thus, the bldChart element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

End example]

Parent Elements
bldLst (§4.6.14)

Attributes	Description
bld (Diagram Build Types)	This attribute describes how the diagram will be built. The animation will animate the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_TLDiagramBuildType simple type (§4.8.37).
grpId (Group ID)	This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
spid (Shape ID)	This attribute describes the shape to which the build applies. The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLBuildDiagram">
   <attributeGroup ref="AG_TLBuild"/>
   <attribute name="bld" type="ST_TLDiagramBuildType" use="optional" default="whole"/>
</complexType>
```

4.6.13 bldGraphic (Build Graphics)

This element specifies how to build a graphical element.

[Example: Consider having a chart graphical element appear as a whole as opposed to by a category. The <bldGraphic> element should be used as follows:

```
<p:bldLdst>
  <p:bldGraphic spid="3" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

End example]

Parent Elements
bldLst (§4.6.14)

Child Elements	Subclause
bldAsOne (Build As One)	§4.6.11
bldSub (Build Sub Elements)	§4.6.17

Attributes	Description
grpId (Group ID)	This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
spid (Shape ID)	This attribute describes the shape to which the build applies. The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded. The possible values for this attribute are defined by the XML Schema boolean datatype.

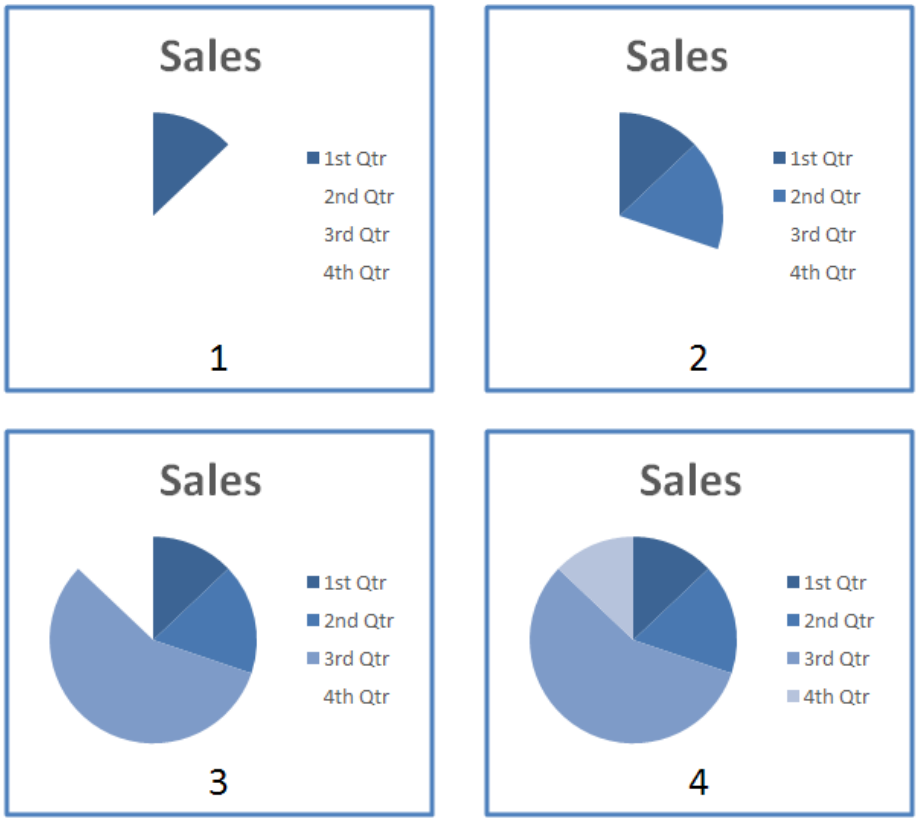
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLGraphicalObjectBuild">
   <choice minOccurs="1" maxOccurs="1">
      <element name="bldAsOne" type="CT_Empty"/>
      <element name="bldSub" type="a:CT_AnimationGraphicalObjectBuildProperties"/>
   </choice>
   <attributeGroup ref="AG_TLBuild"/>
</complexType>
```

4.6.14 bldLst (Build List)

This element specifies the list of graphic elements to build. This refers to how the different sub-shapes or sub-components of a object are displayed. The different objects that can have build properties are text, diagrams, and charts.

[Example: Consider animating a pie chart but based on category as shown below:



The <bldList> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="1" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
```

```
    </p:bldGraphic>
  </p:bldLst>
```

End example]

Parent Elements
timing (§4.4.1.44)

Child Elements	Subclause
bldDgm (Build Diagram)	§4.6.12
bldGraphic (Build Graphics)	§4.6.13
bldOleChart (Build Embedded Chart)	§4.6.15
bldP (Build Paragraph)	§4.6.16

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BuildList">
   <choice minOccurs="1" maxOccurs="unbounded">
      <element name="bldP" type="CT_TLBuildParagraph"/>
      <element name="bldDgm" type="CT_TLBuildDiagram"/>
      <element name="bldOleChart" type="CT_TLOleBuildChart"/>
      <element name="bldGraphic" type="CT_TLGraphicalObjectBuild"/>
   </choice>
</complexType>
```

4.6.15 bldOleChart (Build Embedded Chart)

This element describes animation an a embedded Chart.

[Example: Consider displaying animation on a embedded graphical chart. The <bldOleChart>element should be use as follows:

```
  <p:bldLst>
    <p:bldOleChart spid="1025" grpId="0"/>
  </p:bldLst>
```

End example]

Parent Elements
bldLst (§4.6.14)

Attributes	Description
animBg (Animate Background)	This attribute describes whether to animate the background of the shape.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
bld (Build)	This attribute describes how the diagram will be built. The animation will animate the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_TLOleChartBuildType simple type (§4.8.39).
grpId (Group ID)	This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
spid (Shape ID)	This attribute describes the shape to which the build applies. The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLOleBuildChart">
   <attributeGroup ref="AG_TLBuild"/>
   <attribute name="bld" type="ST_TLOleChartBuildType" use="optional" default="allAtOnce"/>
   <attribute name="animBg" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.6.16 bldP (Build Paragraph)

This element specifies how to build paragraph level properties.

[Example: Consider having animation applied only to 1st level paragraphs. The <bldP> element should be used as follows:

```
<p:bldLst>
  <p:bldP spid="3" grpId="0" build="p"/>
</p:bldLst>
```

End example]

Parent Elements
bldLst (§4.6.14)

Child Elements	Subclause
tmplLst (Template effects)	§4.6.85

Attributes	Description
advAuto (Auto Advance Time)	This attribute specifies time after which to automatically advance the build to the next step. The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).
animBg (Animate Background)	This attribute indicates whether to animate the background of the shape associated with the text. The possible values for this attribute are defined by the XML Schema boolean datatype.
autoUpdateAnimBg (Auto Update Animation Background)	This attribute indicates whether to automatically update the "animateBg" setting to true when the shape associated with the text has a fill or line. The possible values for this attribute are defined by the XML Schema boolean datatype.
bldLvl (Build Level)	This attribute describes the build level for the paragraph. It is only supported in paragraph type builds i.e the build attribute must also be set to "byParagraph" for this attribute to apply. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
build (Build Types)	This attribute describe the build types. The possible values for this attribute are defined by the ST_TLParaBuildType simple type (§4.8.40).
grpId (Group ID)	This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rev (Reverse)	This attribute is only supported in paragraph type builds. This specifies the direction of the build relative to the order of the elements in the container. When this is set to "true", the animations for the paragraphs will be persisted in reverse order to the order of the paragraphs themselves such that the last paragraph animates first. Default value is "false". The possible values for this attribute are defined by the XML Schema boolean datatype.
spid (Shape ID)	This attribute describes the shape to which the build applies.

Attributes	Description
	The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).
uiExpand (Expand UI)	This attribute describes the view option indicating if the build should be displayed expanded. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLBuildParagraph">
   <sequence>
      <element name="tmplLst" type="CT_TLTemplateList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_TLBuild"/>
   <attribute name="build" type="ST_TLParaBuildType" use="optional" default="whole"/>
   <attribute name="bldLvl" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute name="animBg" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="autoUpdateAnimBg" type="xsd:boolean" default="true" use="optional"/>
   <attribute name="rev" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="advAuto" type="ST_TLTime" use="optional" default="indefinite"/>
</complexType>
```

4.6.17 bldSub (Build Sub Elements)

This element specifies the animation properties of a graphical object's sub-elements.

[Example: Consider applying animation to a graphical element consisting of a diagram. The <bldSub> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="5" grpId="0">
    <p:bldSub>
      <a:bldDgm bld="one"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

End example]

Parent Elements
bldGraphic (§4.6.13)

Child Elements	Subclause
bldChart (Build Chart)	§5.1.2.1.1

Child Elements	Subclause
bldDgm (Build Diagram)	§5.1.2.1.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimationGraphicalObjectBuildProperties">
   <choice>
      <element name="bldDgm" type="CT_AnimationDgmBuildProperties"/>
      <element name="bldChart" type="CT_AnimationChartBuildProperties"/>
   </choice>
</complexType>
```

4.6.18 blinds (Blinds Slide Transition)

This element describes the a "Blinds" slide transition effect.

[Example: Consider we have a slide with a "blind" style transition. The <blinds> element should be used as follows:

```
<p:transition>
    <p:blinds/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OrientationTransition">
   <attribute name="dir" type="ST_Direction" use="optional" default="horz"/>
</complexType>
```

4.6.19 boolVal (Boolean Variant)

This element describes a Boolean Variant.

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

Attributes	Description
val (Value)	This attribute describes the boolean value for this element. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariantBooleanVal">
   <attribute name="val" type="xsd:boolean" use="required"/>
</complexType>
```

4.6.20 by (By)

This element describes the relative offset value for the animation.

[Example: Consider a shape with an animation effect that scales the size of an object by 150%. The <by> element should be used as follows:

```
<p:animScale>
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:by x="150000" y="150000"/>
</p:animScale>
```

End Example]

Parent Elements
animMotion (§4.6.4); animScale (§4.6.6)

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
y (Y coordinate)	This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLPoint">
   <attribute name="x" type="a:ST_Percentage" use="required"/>
   <attribute name="y" type="a:ST_Percentage" use="required"/>
</complexType>
```

4.6.21 by (By)

This element describes the relative offset value for the color animation.

[Example: Consider a shape with a lightening emphasis animation applied to it. The <by> element should be used as follows:

```
<p:animClr clrSpc="hsl">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
    <p:hsl h="0" s="0" l="0"/>
  </p:by>
</p:animClr>
```

End Example]

Parent Elements
animClr (§4.6.2)

Child Elements	Subclause
hsl (HSL)	§4.6.46
rgb (RGB)	§4.6.63

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLByAnimateColorTransform">
   <choice minOccurs="1" maxOccurs="1">
      <element name="rgb" type="CT_TLByRgbColorTransform"/>
      <element name="hsl" type="CT_TLByHslColorTransform"/>
   </choice>
</complexType>
```

4.6.22 cBhvr (Common Behavior)

This element describes the common behaviors of animations.

[Example: Consider trying to emphasize text within a shape by changing the size of its font. The <anim> element should be used as follows:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>
```

End example]

Parent Elements
anim (§4.6.1); animClr (§4.6.2); animEffect (§4.6.3); animMotion (§4.6.4); animRot (§4.6.5); animScale (§4.6.6); cmd (§4.6.28); set (§4.6.66)

Child Elements	Subclause
attrNameLst (Attribute Name List)	§4.6.8
cTn (Common Time Node Properties)	§4.6.33
tgtEl (Target Element)	§4.6.81

Attributes	Description
accumulate (Accumulate)	This attribute makes a repeating animation build with each iteration when set to "always." The possible values for this attribute are defined by the ST_TLBehaviorAccumulateType simple type (§4.8.31).
additive (Additive)	This attribute specifies how to apply the animation values to the original value for the property.

Attributes	Description
	The possible values for this attribute are defined by the ST_TLBehaviorAdditiveType simple type (§4.8.32).
by (By)	This attribute specifies a relative offset value for the animation.. The possible values for this attribute are defined by the XML Schema string datatype.
from (From)	This attribute specifies the starting value of the animation. The possible values for this attribute are defined by the XML Schema string datatype.
override (Override)	This attribute specifies how a behavior should override values of the attribute being animated on the target element. The "childStyle" will clear the attributes on the children contained inside the target element. The possible values for this attribute are defined by the ST_TLBehaviorOverrideType simple type (§4.8.33).
rctx (Runtime Context)	This attribute describes the runtime context of the animation. The currently-understood values are “PPT” and “IE.” This is used to specify the behavior used when animating in the PPT slideshow vs. IE HTML runtime. An example can be seen with the transparency effect. In IE, the transparency is animated as a bitmap, where in PPT, the style.opacity property of a shape is used to animate the transparency. The possible values for this attribute are defined by the XML Schema string datatype.
to (To)	This attribute specifies the ending value of the animation. The possible values for this attribute are defined by the XML Schema string datatype.
xfrmType (Transform Type)	This attribute specifies the type of transform to be used. The possible values for this attribute are defined by the ST_TLBehaviorTransformType simple type (§4.8.34).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLCommonBehaviorData">
   <sequence>
      <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
      <element name="tgtEl" type="CT_TLTimeTargetElement" minOccurs="1" maxOccurs="1"/>
      <element name="attrNameLst" type="CT_TLBehaviorAttributeNameList" minOccurs="0"
        maxOccurs="1"/>
   </sequence>
   <attribute name="additive" type="ST_TLBehaviorAdditiveType" use="optional"/>
   <attribute name="accumulate" type="ST_TLBehaviorAccumulateType" use="optional"/>
   <attribute name="xfrmType" type="ST_TLBehaviorTransformType" use="optional"/>
   <attribute name="from" type="xsd:string" use="optional"/>
   <attribute name="to" type="xsd:string" use="optional"/>
   <attribute name="by" type="xsd:string" use="optional"/>
   <attribute name="rctx" type="xsd:string" use="optional"/>
   <attribute name="override" type="ST_TLBehaviorOverrideType" use="optional"/>
</complexType>
```

4.6.23 charRg (Character Range)

This element specifies animation on a character range defined by a start and end character position.

[Example: Consider animating the first word (characters 1 through 9) within a sentence. The <charRg> element should be used as follows:

```
<p:animMotion>
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="0" end="9"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:animMotion>
```

End example]

Parent Elements
txEl (§4.6.91)

Attributes	Description
end (End)	This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).
st (Start)	This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IndexRange">
   <attribute name="st" type="ST_Index" use="required"/>
   <attribute name="end" type="ST_Index" use="required"/>
</complexType>
```

4.6.24 checker (Checker Slide Transition)

This element describes the Checker slide transition effect.

[Example: Consider we have a slide with a "checker" slide transition animated vertically. The <checker> element should be used as follows:

```
<p:transition>
    <p:checker dir="vert"/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OrientationTransition">
   <attribute name="dir" type="ST_Direction" use="optional" default="horz"/>
</complexType>
```

4.6.25 childTnLst (Children Time Node List)

This element describes the list of time nodes that have a fixed location in the timing tree based on their parent time node. The children's start time is defined relative to their parent time node’s start.

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
anim (Animate)	§4.6.1
animClr (Animate Color Behavior)	§4.6.2
animEffect (Animate Effect)	§4.6.3
animMotion (Animate Motion)	§4.6.4
animRot (Animate Rotation)	§4.6.5
animScale (Animate Scale)	§4.6.6
audio (Audio)	§4.6.9
cmd (Command)	§4.6.28
excl (Exclusive)	§4.6.40
par (Parallel Time Node)	§4.6.53
seq (Sequence Time Node)	§4.6.65
set (Set Time Node Behavior)	§4.6.66
video (Video)	§4.6.93

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeNodeList">
   <choice minOccurs="1" maxOccurs="unbounded">
      <element name="par" type="CT_TLTimeNodeParallel"/>
      <element name="seq" type="CT_TLTimeNodeSequence"/>
      <element name="excl" type="CT_TLTimeNodeExclusive"/>
      <element name="anim" type="CT_TLAnimateBehavior"/>
      <element name="animClr" type="CT_TLAnimateColorBehavior"/>
      <element name="animEffect" type="CT_TLAnimateEffectBehavior"/>
      <element name="animMotion" type="CT_TLAnimateMotionBehavior"/>
      <element name="animRot" type="CT_TLAnimateRotationBehavior"/>
      <element name="animScale" type="CT_TLAnimateScaleBehavior"/>
      <element name="cmd" type="CT_TLCommandBehavior"/>
      <element name="set" type="CT_TLSetBehavior"/>
      <element name="audio" type="CT_TLMediaNodeAudio"/>
      <element name="video" type="CT_TLMediaNodeVideo"/>
   </choice>
</complexType>
```

4.6.26 circle (Circle Slide Transition)

This element describes the Circle transition effect..

[Example: Consider we have a slide with a "circle" style transition. The <circle> element should be used as follows:

```
<p:transition>
    <p:circle/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.27 clrVal (Color Value)

This element describes the color variant. This is used to specify a color that we will use for animating the color property of an object.

[Example: Consider trying to emphasize text within a shape by changing the color its font.

```
<p:set>
  <p:cBhvr override="childStyle">
    ...
  </p:cBhvr>
  <p:to>
    <p:clrVal>
      <a:schemeClr val="accent2"/>
    </p:clrVal>
  </p:to>
</p:set>
```

End example]

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

4.6.28 cmd (Command)

This element describes the several non-durational type of commands that can be executed within a timeline. This can be used to send events, call functions on elements, and send verbs to embedded objects. For example “Object Action” effects for Embedded objects and Media commands for sounds/movies such as "PlayFrom(0.0)" and "togglePause".

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§4.6.22

Attributes	Description
cmd (Command)	This is a string used to define the actual command. When an event is specified, in IE, the runtime will register the specific event and make sure that time conditions (begin/end/etc.) elsewhere on the page which listen for the event get hooked up correctly. The possible values for this attribute are defined by the XML Schema string datatype.
type (Command Type)	This attribute is required and defines the type of command. When the value is set to "event", the "cmd" attribute string is used to send out an event to the target element. When the value is set to "call", the "cmd" string is used to call a method or function on the target element. When the value is set to "verb", the "cmd" string is treated as an verb on the element. When the value is set to "script", the cmd will be interpreted in the IE runtime as a string containing javascript statements. Note that this may cause a runtime script error if the script is invalid at the time it's called. If the targetElement is not found, the command will not execute. The possible values for this attribute are defined by the ST_TLCommandType simple

Attributes	Description
	type (§4.8.36).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLCommandBehavior">
   <sequence>
      <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute type="ST_TLCommandType" name="type" use="optional"/>
   <attribute name="cmd" type="xsd:string" use="optional"/>
</complexType>
```

4.6.29 cMediaNode (Common Media Node Properties)

This element is used to describe behavior of media elements, such as sound or movies, in an animation.

[Example: Consider a shape with a sound effect attached to its animation. The <cMediaNode> element should be used as follows:

```
<p:audio>
  <p:cMediaNode mute="1">
    <p:cTn display="0" masterRel="sameClick">
      <p:stCondLst>...
      <p:endCondLst>..
    </p:cTn>
    <p:tgtEl>..
  </p:cMediaNode>
</p:audio>
```

End Example]

Parent Elements
audio (§4.6.9); video (§4.6.93)

Child Elements	Subclause
cTn (Common Time Node Properties)	§4.6.33
tgtEl (Target Element)	§4.6.81

Attributes	Description
mute (Mute)	This attribute describes whether the media should be mute. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
numSld (Number of Slides)	This attribute describes the numbers of slides across which the media should play. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
showWhenStopped (Show When Stopped)	This attribute describes whether the media should be displayed when it is stopped. The possible values for this attribute are defined by the XML Schema boolean datatype.
vol (Volume)	This attribute describes the volume of the media element. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLCommonMediaNodeData">
   <sequence>
      <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
      <element name="tgtEl" type="CT_TLTimeTargetElement" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="vol" type="a:ST_PositiveFixedPercentage" default="50000" use="optional"/>
   <attribute name="mute" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="numSld" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute name="showWhenStopped" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

4.6.30 comb (Comb Slide Transition)

This element describes a comb slide transition effect.

[Example: Consider we have a slide with a comb slide transition animated vertically. The <comb> element should be used as follows:

```
<p:transition>
    <p:comb/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Transition	This attribute specifies a horizontal or vertical transition.

Attributes	Description
Direction)	The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OrientationTransition">
   <attribute name="dir" type="ST_Direction" use="optional" default="horz"/>
</complexType>
```

4.6.31 cond (Condition)

This element specifies conditions on time nodes in a timeline. It is used within a list of start condition or list of end condition elements.

[Example: For example, suppose we have a shape with a two second delay after the animation is started.

```
<p:cTn>
  <p:stCondLst>
    <p:cond delay="2000"/>
  </p:stCondLst>
  <p:childTnLst>
    <p:set>...
    <p:animEffect transition="in" filter="blinds(horizontal)">
      <p:cBhvr>
        <p:cTn id="7" dur="1000"/>
        <p:tgtEl>
          <p:spTgt spid="4"/>
        </p:tgtEl>
      </p:cBhvr>
    </p:animEffect>
  </p:childTnLst>
</p:cTn>
```

End Example]

Parent Elements
endCondLst (§4.6.37); nextCondLst (§4.6.51); prevCondLst (§4.6.55); stCondLst (§4.6.73)

Child Elements	Subclause
rtn (Runtime Node Trigger Choice)	§4.6.64
tgtEl (Target Element)	§4.6.81
tn (Time Node)	§4.6.86

Attributes	Description
delay (Trigger Delay)	This attribute describes the delay after an animation is triggered. The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).
evt (Trigger Event)	This attribute describes the event that triggers an animation. The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§4.8.52).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeCondition">
   <choice minOccurs="0" maxOccurs="1">
      <element name="tgtEl" type="CT_TLTimeTargetElement"/>
      <element name="tn" type="CT_TLTriggerTimeNodeID"/>
      <element name="rtn" type="CT_TLTriggerRuntimeNode"/>
   </choice>
   <attribute name="evt" use="optional" type="ST_TLTriggerEvent"/>
   <attribute name="delay" type="ST_TLTime" use="optional"/>
</complexType>
```

4.6.32 cover (Cover Slide Transition)

This element describes a cover slide transition effect.

[Example: Consider we have a slide with a cover slide transition animated vertically. The <cover> element should be used as follows:

```
<p:transition>
    <p:cover/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition. The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§4.8.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EightDirectionTransition">
   <attribute name="dir" type="ST_TransitionEightDirectionType" use="optional" default="l"/>
</complexType>
```

4.6.33 cTn (Common Time Node Properties)

This element describes the properties that are common for time nodes.

Parent Elements
cBhvr (§4.6.22); cMediaNode (§4.6.29); excl (§4.6.40); par (§4.6.53); seq (§4.6.65)

Child Elements	Subclause
childTnLst (Children Time Node List)	§4.6.25
endCondLst (End Conditions List)	§4.6.37
endSync (EndSync)	§4.6.39
iterate (Iterate)	§4.6.49
stCondLst (Start Conditions List)	§4.6.73
subTnLst (Sub-TimeNodes List)	§4.6.78

Attributes	Description
accel (Acceleration)	This attribute describes the percentage of specified duration over which the element's time will take to accelerate from 0 up to the "run rate." The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).
afterEffect (After Effect)	This attribute specifies whether there is an after effect applied to the time node. The possible values for this attribute are defined by the XML Schema boolean datatype.
autoRev (Auto Reverse)	This attribute describes whether to automatically play the animation in reverse after playing it in the forward direction. The possible values for this attribute are defined by the XML Schema boolean datatype.
bldLvl (Build level)	This attribute describes the build level of the animation. The possible values for this attribute are defined by the XML Schema int datatype.
decel (Deceleration)	This attribute describes the percentage of specified duration over which the element's time will take to decelerate from the "run rate" down to 0. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

Attributes	Description
display (Display)	This attribute describes whether the state of the time node is visible or hidden. The possible values for this attribute are defined by the XML Schema boolean datatype.
dur (Duration)	This attribute describes the duration of the time node, expressed as unit time. The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).
evtFilter (Event Filter)	This attribute describes the event filter for this time node. The possible values for this attribute are defined by the XML Schema string datatype.
fill (Fill)	This attribute describes the fill type for the time node. The possible values for this attribute are defined by the ST_TLTimeNodeFillType simple type (§4.8.45).
grpId (Group ID)	This attribute describes the Group ID of the time node. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
id (ID)	This attribute specifies the identifier for the timenode. The possible values for this attribute are defined by the ST_TLTimeNodeID simple type (§4.8.46).
masterRel (Master Relation)	This attribute specifies how the time node plays back relative to its master time node. The possible values for this attribute are defined by the ST_TLTimeNodeMasterRelation simple type (§4.8.47).
nodePh (Node Placeholder)	This attribute describes whether this node is a placeholder. The possible values for this attribute are defined by the XML Schema boolean datatype.
nodeType (Node Type)	This attribute specifies the type of time node. The possible values for this attribute are defined by the ST_TLTimeNodeType simple type (§4.8.51).
presetClass (Preset Types)	This attribute descries the class of effect in which it belongs. The possible values for this attribute are defined by the ST_TLTimeNodePresetClassType simple type (§4.8.48).
presetID (Preset ID)	This attribute describes the preset identifier for the time node. The possible values for this attribute are defined by the XML Schema int datatype.
presetSubtype	This attribute is a bitflag that specifies a direction or some other attribute of the effect.

Attributes	Description
(Preset SubType)	For example it can be set to specify a “From Bottom” for the Fly In effect, or “Bold” for the Change Font Style effect. The possible values for this attribute are defined by the XML Schema int datatype.
repeatCount (Repeat Count)	This attribute describes the number of times the element should repeat, in units of thousandths. The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).
repeatDur (Repeat Duration)	This attribute describes the amount of time over which the element should repeat. If absent, the attribute is taken to be the same as the specified duration. The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).
restart (Restart)	This attribute specifies if a node is to restart when it completes its action. The possible values for this attribute are defined by the ST_TLTimeNodeRestartType simple type (§4.8.49).
spd (Speed)	This attribute specifies the percentage by which to speed up (or slow down) the timing. If negative, the timing will be reversed. Example: if speed is 200% and the specified duration is 10 seconds, the actual duration will be 5 seconds. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
syncBehavior (Synchronization Behavior)	This attribute specifies how the time node synchronizes to its group. The possible values for this attribute are defined by the ST_TLTimeNodeSyncType simple type (§4.8.50).
tmFilter (Time Filter)	This attribute specifies the time filter for the time node. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLCommonTimeNodeData">
    <sequence>
        <element name="stCondLst" type="CT_TLTimeConditionList" minOccurs="0" maxOccurs="1"/>
        <element name="endCondLst" type="CT_TLTimeConditionList" minOccurs="0" maxOccurs="1"/>
        <element name="endSync" type="CT_TLTimeCondition" minOccurs="0" maxOccurs="1"/>
        <element name="iterate" type="CT_TLIterateData" minOccurs="0" maxOccurs="1"/>
        <element name="childTnLst" type="CT_TimeNodeList" minOccurs="0" maxOccurs="1"/>
        <element name="subTnLst" type="CT_TimeNodeList" minOccurs="0" maxOccurs="1"/>
    </sequence>
    <attribute name="id" type="ST_TLTimeNodeID" use="optional"/>
    <attribute name="presetID" type="xsd:int" use="optional"/>
    <attribute name="presetClass" type="ST_TLTimeNodePresetClassType" use="optional"/>
    <attribute name="presetSubtype" type="xsd:int" use="optional"/>
    <attribute name="dur" type="ST_TLTime" use="optional"/>
    <attribute name="repeatCount" type="ST_TLTime" use="optional" default="1000"/>
    <attribute name="repeatDur" type="ST_TLTime" use="optional"/>
    <attribute name="spd" type="a:ST_Percentage" use="optional" default="100000"/>
    <attribute name="accel" type="a:ST_PositiveFixedPercentage" use="optional" default="0"/>
    <attribute name="decel" type="a:ST_PositiveFixedPercentage" use="optional" default="0"/>
    <attribute name="autoRev" type="xsd:boolean" use="optional" default="false"/>
    <attribute name="restart" type="ST_TLTimeNodeRestartType" use="optional"/>
    <attribute name="fill" type="ST_TLTimeNodeFillType" use="optional"/>
    <attribute name="syncBehavior" type="ST_TLTimeNodeSyncType" use="optional"/>
    <attribute name="tmFilter" type="xsd:string" use="optional"/>
    <attribute name="evtFilter" type="xsd:string" use="optional"/>
    <attribute name="display" type="xsd:boolean" use="optional"/>
    <attribute name="masterRel" type="ST_TLTimeNodeMasterRelation" use="optional"/>
    <attribute name="bldLvl" type="xsd:int" use="optional"/>
    <attribute name="grpId" type="xsd:unsignedInt" use="optional"/>
    <attribute name="afterEffect" type="xsd:boolean" use="optional"/>
    <attribute name="nodeType" type="ST_TLTimeNodeType" use="optional"/>
    <attribute name="nodePh" type="xsd:boolean" use="optional"/>
</complexType>
```

4.6.34 cut (Cut Slide Transition)

This element describes a cut slide transition effect.

[Example: Consider we have a slide with a cut slide transition animated vertically. The <cut>element should be used as follows:

```
<p:transition>
    <p:cut/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
thruBlk (Transition Through Black)	This attribute specifies if the transition will start from a black screen (and then transition the new slide over black). The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OptionalBlackTransition">
   <attribute name="thruBlk" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.6.35 diamond (Diamond Slide Transition)

This element describes a diamond slide transition effect.

[Example: Consider we have a slide with a diamond slide transition animated vertically. The <diamond> element should be used as follows:

```
<p:transition>
    <p:diamond/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.36 dissolve (Dissolve Slide Transition)

This element describes a dissolve slide transition effect.

[Example: Consider we have a slide with a dissolve slide transition animated vertically. The <dissolve> element should be used as follows:

```
<p:transition>
    <p:dissolve/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.37 endCondLst (End Conditions List)

This element describes a list of the end conditions that must be met in order to stop the time node.

[Example: Consider a shape a shape with an audio attached to the animation. The <endCondList> element should be used as follows to specifies when the sound is done:

```
<p:audio>
  <p:cMediaNode>
    <p:cTn display="0" masterRel="sameClick">
      <p:stCondLst>...
      <p:endCondLst>
        <p:cond evt="onStopAudio" delay="0">
          <p:tgtEl>
            <p:sldTgt/>
          </p:tgtEl>
        </p:cond>
      </p:endCondLst>
    </p:cTn>
    <p:tgtEl>...
  </p:cMediaNode>
</p:audio>
```

End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
cond (Condition)	§4.6.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeConditionList">
   <sequence>
      <element name="cond" type="CT_TLTimeCondition" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.6.38 endSnd (Stop Sound Action)

This element will stops all previous sounds during a slide transition.

[Example: Consider a slide transition that stops all previous sounds. The<endSnd> element should be used as follows:

```
<p:transition>
    <p:sndAc>
        <p:endSnd/>
    </p:sndAc>
</p:transition>
```

End Example]

Parent Elements
sndAc (§4.6.69)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.39 endSync (EndSync)

This element is used to synchronizes the stopping of parallel elements in the timing tree. It is used on interactive timeline sequences to specify that the interactive sequence's duration ends when all of the child timenodes have ended. It is also used to make interactive sequences restart-able (so that the entire interactive sequence can be repeated if the trigger object is clicked on repeatedly).

[Example: Consider a shape with a fill change animation. The <endSync> element should be used as follows:

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn>
    <p:stCondLst/>
    <p:endSync evt="end" delay="0">
      <p:rtn val="all"/>
    </p:endSync>
    <p:childTnLst/>
  </p:cTn>
  <p:nextCondLst/>
</p:seq>
```

End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
rtn (Runtime Node Trigger Choice)	§4.6.64

Child Elements	Subclause
tgtEl (Target Element)	§4.6.81
tn (Time Node)	§4.6.86

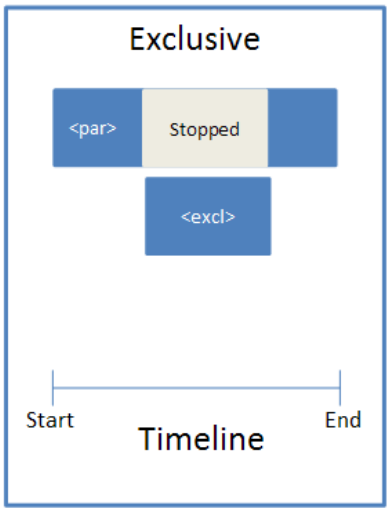
Attributes	Description
delay (Trigger Delay)	This attribute describes the delay after an animation is triggered. The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).
evt (Trigger Event)	This attribute describes the event that triggers an animation. The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§4.8.52).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeCondition">
   <choice minOccurs="0" maxOccurs="1">
      <element name="tgtEl" type="CT_TLTimeTargetElement"/>
      <element name="tn" type="CT_TLTriggerTimeNodeID"/>
      <element name="rtn" type="CT_TLTriggerRuntimeNode"/>
   </choice>
   <attribute name="evt" use="optional" type="ST_TLTriggerEvent"/>
   <attribute name="delay" type="ST_TLTime" use="optional"/>
</complexType>
```

4.6.40 excl (Exclusive)

This element describes the Exclusive time node. This time node is used to pause all other timelines when it is activated. Conceptually it can be though of as follows:



Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cTn (Common Time Node Properties)	§4.6.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeNodeExclusive">
   <sequence>
      <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.6.41 fade (Fade Slide Transition)

This element describes a fade slide transition effect.

[Example: Consider we have a slide with a fade slide transition animated vertically. The <fade> element should be used as follows:

```
<p:transition>
    <p:fade/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
thruBlk (Transition Through Black)	This attribute specifies if the transition will start from a black screen (and then transition the new slide over black). The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OptionalBlackTransition">
   <attribute name="thruBlk" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.6.42 fltVal (Float Value)

This element describes a float variant.

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

Attributes	Description
val (Value)	This attribute specifies the value of this element as a floating point. The possible values for this attribute are defined by the XML Schema float datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariantFloatVal">
   <attribute name="val" type="xsd:float" use="required"/>
</complexType>
```

4.6.43 from (From)

This element specifies an x/y co-ordinate to start the animation from.

[Example: Consider a shape with an animation sequence that needs to start at a certain coordinate. The <from> element should be used as follows:

```
<p:animScale>
  <p:cBhvr>
    <p:cTn>…
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:from x="100000" y="100000"/>
  <p:to x="80000" y="100000"/>
</p:animScale>
```

End Example]

Parent Elements
animMotion (§4.6.4); animScale (§4.6.6)

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
y (Y coordinate)	This attribute describes the Y coordinate.

Attributes	Description
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLPoint">
   <attribute name="x" type="a:ST_Percentage" use="required"/>
   <attribute name="y" type="a:ST_Percentage" use="required"/>
</complexType>
```

4.6.44 from (From)

This element is used to specify the starting color of the target element.

[Example: Consider a shape with an animation fill change from one accent color to another. The <from> element should be used as follows:

```
<p:animClr clrSpc="rgb" dir="cw">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>...
    <p:attrNameLst>
      <p:attrName>fillcolor</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:from>
    <a:schemeClr val="accent3"/>
  </p:from>
  <p:to>
    <a:schemeClr val="accent2"/>
  </p:to>
</p:animClr>
```

End Example]

Parent Elements
animClr (§4.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30

Child Elements	Subclause
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

4.6.45 graphicEl (Graphic Element)

This element specifies a graphical element which to animate.

[Example: Consider a diagram with an animation effect applied to it. The <graphicEl> element should be used as follows:

```
<p:set>
  <p:cBhvr>
    <p:cTn id="6" dur="1" fill="hold">...
    <p:tgtEl>
      <p:spTgt spid="4">
        <p:graphicEl>
          <a:dgm id="{87C2C707-C3F4-4E81-A967-A8B8AE13E575}"/>
        </p:graphicEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>...
  </p:cBhvr>
  <p:to>
</p:set>
```

End Example]

Parent Elements
spTgt (§4.6.72)

Child Elements	Subclause
chart (Chart to Animate)	§5.1.2.1.3
dgm (Diagram to Animate)	§5.1.2.1.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimationElementChoice">
   <choice minOccurs="1" maxOccurs="1">
      <element name="dgm" type="CT_AnimationDgmElement"/>
      <element name="chart" type="CT_AnimationChartElement"/>
   </choice>
</complexType>
```

4.6.46 hsl (HSL)

This element specifies an incremental HSL (Hue, Saturation, Lightness) value to add to a color animation.

[Example: Consider a shape with a lightening emphasis animation. The <hsl> element should be used as follows:

```
<p:animClr clrSpc="hsl">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
    <p:hsl h="0" s="0" l="0"/>
  </p:by>
</p:animClr>
```

End Example]

Parent Elements
by (§4.6.21)

Attributes	Description
h (Hue)	Specifies hue as an angle. The valid values range from [0, 360] degrees. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).
l (Lightness)	Specifies a lightness as fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
s (Saturation)	Specifies a saturation as a fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%].

Attributes	Description
	The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLByHslColorTransform">
   <attribute name="h" type="a:ST_Angle" use="required"/>
   <attribute name="s" type="a:ST_FixedPercentage" use="required"/>
   <attribute name="l" type="a:ST_FixedPercentage" use="required"/>
</complexType>
```

4.6.47 inkTgt (Ink Target)

This element specifies an animation target element that is represented by a sub-shape in a legacy graphical object.

[Example: Consider an ink diagram with an animation blinds transition effect applied to it. The <inkTgt> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:inkTgt spid="_x0000_s2057"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

End Example]

Parent Elements
tgtEl (§4.6.81)

Attributes	Description
spid (Shape ID)	This attribute specifies the shape identifier. The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLSubShapeId">
   <attribute name="spid" type="a:ST_ShapeID" use="required"/>
</complexType>
```

4.6.48 intVal (Integer)

This element describes an integer variant.

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

Attributes	Description
val (Value)	This attribute specifies the value of this element as a floating point. The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariantIntegerVal">
   <attribute name="val" type="xsd:int" use="required"/>
</complexType>
```

4.6.49 iterate (Iterate)

This element specifies how the animation should be successively applied to sub elements of the target element for a repeated effect. It can be applied to contained timing and animation structures over the letters, words, or shapes within a target element.

[Example: Consider a text animation where the words appear letter by letter. The <iterate> element should be used as follows:

```
<p:par>
  <p:cTn id="1" >
    <p:stCondLst>...
    <p:iterate type="lt">
      <p:tmPct val="10000"/>
    </p:iterate>
    <p:childTnLst>...
  </p:cTn>
</p:par>
```

End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
tmAbs (Time Absolute)	§4.6.82

Child Elements	Subclause
tmPct (Time Percentage)	§4.6.83

Attributes	Description
backwards (Backwards)	This attribute specifies whether to go backwards in the timeline to the previous node. The possible values for this attribute are defined by the XML Schema boolean datatype.
type (Iterate Type)	This attribute specifies the iteration behavior and applies it to each letter, word or shape within a container element. Valid values are by word, by letter, or by element. If there is no text or block elements such as shapes within the container or a single word, letter, or shape (depending on iterate type) then no iteration will happen and the behavior is applied to the element itself instead. The possible values for this attribute are defined by the ST_IterateType simple type (§4.8.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLIterateData">
   <choice minOccurs="1" maxOccurs="1">
      <element name="tmAbs" type="CT_TLIterateIntervalTime"/>
      <element name="tmPct" type="CT_TLIterateIntervalPercentage"/>
   </choice>
   <attribute name="type" type="ST_IterateType" use="optional" default="el"/>
   <attribute name="backwards" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.6.50 newsflash (Newsflash Slide Transition)

This element describes a newsflash slide transition effect.

[Example: Consider we have a slide with a newsflash slide transition animated vertically. The <newsflash> element should be used as follows:

```
<p:transition>
    <p:newsflash/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.51 nextCondLst (Next Conditions List)

This element describes a list of conditions that must be met to advance to the next animation sequence.

[Example: Consider a shape with a text emphasis changing the size of its font.

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq">...
  <p:prevCondLst>...
  <p:nextCondLst>
    <p:cond evt="onNext" delay="0">
      <p:tgtEl>
        <p:sldTgt/>
      </p:tgtEl>
    </p:cond>
  </p:nextCondLst>
</p:seq>
```

End example]

Parent Elements
seq (§4.6.65)

Child Elements	Subclause
cond (Condition)	§4.6.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeConditionList">
   <sequence>
      <element name="cond" type="CT_TLTimeCondition" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.6.52 oleChartEl (Embedded Chart Element)

This element specifies the subelement of an embedded chart to animate.

[Example: Consider an embedded Chart with a entrance animation effect applied to each of the graph's categories. The <oldChartEl> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="12" dur="500"/>
```

```
      <p:tgtEl>
        <p:spTgt spid="19460">
          <p:oleChartEl type="category" lvl="1"/>
        </p:spTgt>
      </p:tgtEl>
    </p:cBhvr>
  </p:animEffect>
```

End Example]

Parent Elements
spTgt (§4.6.72)

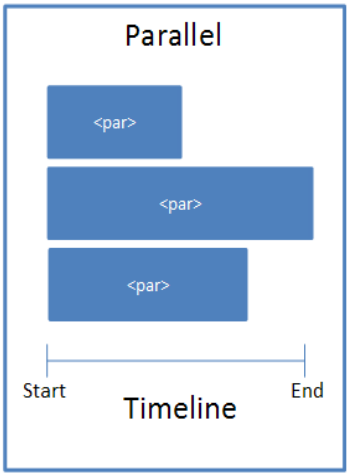
Attributes	Description
lvl (Level)	This attribute describes the element levels to animate. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
type (Type)	This attribute specifies how to chart should be built during its animation. The possible values for this attribute are defined by the ST_TLChartSubelementType simple type (§4.8.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLOleChartTargetElement">
   <attribute name="type" type="ST_TLChartSubelementType" use="required"/>
   <attribute name="lvl" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

4.6.53 par (Parallel Time Node)

This element describes the Parallel time node which can be activated along with other parallel time node containers. Conceptually it can be thought of as follows:



[Example: Consider a simple animation with a blind entrance. The <par> element should be used as follows:

```
<p:timing>
  <p:tnLst>
    <p:par>
      <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
        <p:childTnLst>
          <p:seq concurrent="1" nextAc="seek">
            ...
          </p:seq>
        </p:childTnLst>
      </p:cTn>
    </p:par>
  </p:tnLst>
</p:timing>
```

End Example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cTn (Common Time Node Properties)	§4.6.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeNodeParallel">
   <sequence>
      <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.6.54 plus (Plus Slide Transition)

This element describes a plus slide transition effect.

[Example: Consider we have a slide with a plus slide transition animated vertically. The <plus> element should be used as follows:

```
<p:transition>
    <p:plus/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.55 prevCondLst (Previous Conditions List)

This element describes a list of conditions that must be met in order to go backwards in an animation sequence.

[Example: Consider trying to emphasize text within a shape by changing the size of its font.

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq">
  </p:cTn>
  <p:prevCondLst>
    <p:cond evt="onPrev" delay="0">
      <p:tgtEl>
        <p:sldTgt/>
      </p:tgtEl>
    </p:cond>
  </p:prevCondLst>
  <p:nextCondLst>
  </p:nextCondLst>
</p:seq>
```

End example]

Parent Elements
seq (§4.6.65)

Child Elements	Subclause

Child Elements	Subclause
cond (Condition)	§4.6.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeConditionList">
   <sequence>
      <element name="cond" type="CT_TLTimeCondition" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.6.56 pRg (Paragraph Text Range)

This element specifies a text range to animate based on starting and ending paragraph number.

[Example: Consider an animation entrance of the first 3 text paragraphs. The <pRg> element should be used as follows:

```
<p:animEffect transition="in" filter="checkerboard(across)">
  <p:cBhvr>
    <p:cTn id="12" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:pRg st="0" end="2"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

End Example]

Parent Elements
txEl (§4.6.91)

Attributes	Description
end (End)	This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).
st (Start)	This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§4.8.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_IndexRange">
   <attribute name="st" type="ST_Index" use="required"/>
   <attribute name="end" type="ST_Index" use="required"/>
</complexType>
```

4.6.57 progress (Progress)

This element defines the animation's overall progress that remains throughout the entire animation.

Parent Elements
animEffect (§4.6.3)

Child Elements	Subclause
boolVal (Boolean Variant)	§4.6.19
clrVal (Color Value)	§4.6.27
fltVal (Float Value)	§4.6.42
intVal (Integer)	§4.6.48
strVal (String Value)	§4.6.75

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariant">
   <choice minOccurs="1" maxOccurs="1">
      <element name="boolVal" type="CT_TLAnimVariantBooleanVal"/>
      <element name="intVal" type="CT_TLAnimVariantIntegerVal"/>
      <element name="fltVal" type="CT_TLAnimVariantFloatVal"/>
      <element name="strVal" type="CT_TLAnimVariantStringVal"/>
      <element name="clrVal" type="a:CT_Color"/>
   </choice>
</complexType>
```

4.6.58 pull (Pull Slide Transition)

This element describes a pull slide transition effect.

[Example: Consider we have a slide with a pull slide transition. The <pull> element should be used as follows:

```
<p:transition>
    <p:pull/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition. The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§4.8.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EightDirectionTransition">
   <attribute name="dir" type="ST_TransitionEightDirectionType" use="optional" default="l"/>
</complexType>
```

4.6.59 push (Push Slide Transition)

This element describes a push slide transition effect.

[Example: Consider we have a slide with a push slide transition. The <push> element should be used as follows:

```
<p:transition>
  <p:push dir="r"/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	This attribute specifies the direction of the slide transition. The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§4.8.57).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SideDirectionTransition">
   <attribute name="dir" type="ST_TransitionSideDirectionType" use="optional" default="l"/>
</complexType>
```

4.6.60 random (Random Slide Transition)

This element describes a random slide transition effect.

[Example: Consider we have a slide with a random slide transition. The <random> element should be used as follows:

```
<p:transition>
    <p:random/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.61 randomBar (Random Bar Slide Transition)

This element describes a random bar slide transition effect.

[Example: Consider we have a slide with a random bar slide transition. The <randomBar> element should be used as follows:

```
<p:transition>
    <p:randomBar/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Transition Direction)	This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OrientationTransition">
   <attribute name="dir" type="ST_Direction" use="optional" default="horz"/>
</complexType>
```

4.6.62 rCtr (Rotation Center)

This element describes the center of the rotation used to rotate a motion path by X angle.

[*Example*: For example, suppose we have a simple animation with a checkerbox text entrance.

```
<p:animMotion origin="layout" path="M 0 0  L 0.25 0.33333  E"
pathEditMode="relative" rAng="0" ptsTypes="">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:rCtr x="457200" y="274638"/>
</p:animMotion>
```

end example]

Parent Elements
animMotion (§4.6.4)

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
y (Y coordinate)	This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLPoint">
   <attribute name="x" type="a:ST_Percentage" use="required"/>
   <attribute name="y" type="a:ST_Percentage" use="required"/>
</complexType>
```

4.6.63 rgb (RGB)

The element specifies an incremental RGB value to add to the color property.

[Example: Consider a shape with a color emphasis animation. The <rgb> element should be used as follows:

```
<p:animClr clrSpc="rgb">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
```

```
      <p:tgtEl>
        <p:spTgt spid="4"/>
      </p:tgtEl>
      <p:attrNameLst>
        <p:attrName>stroke.color</p:attrName>
      </p:attrNameLst>
    </p:cBhvr>
    <p:by>
      <p:rgb r="10" g="20" b="30"/>
    </p:by>
  </p:animClr>
```

End Example]

Parent Elements
by (§4.6.21)

Attributes	Description
b (Blue)	This attribute specifies a blue as a fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
g (Green)	This attribute specifies a green as a fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
r (Red)	This attribute specifies a red as a fixed percentage in 1000ths of a percent. The valid values range from [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLByRgbColorTransform">
   <attribute name="r" type="a:ST_FixedPercentage" use="required"/>
   <attribute name="g" type="a:ST_FixedPercentage" use="required"/>
   <attribute name="b" type="a:ST_FixedPercentage" use="required"/>
</complexType>
```

4.6.64 rtn (Runtime Node Trigger Choice)

This element specifies the child time node that triggers a time condition. References a child time node or all child nodes. Order is based on the child's end time.

[Example: Consider an animation which will end the synchronization of all parallel time nodes when all the child nodes have ended their animation. The <rtn> element should be used as follows:

```
<p:cTn>
  <p:stCondLst>...
  <p:endSync evt="end" delay="0">
    <p:rtn val="all"/>
  </p:endSync>
  <p:childTnLst>...
</p:cTn>
```

End Example]

Parent Elements
cond (§4.6.31); endSync (§4.6.39)

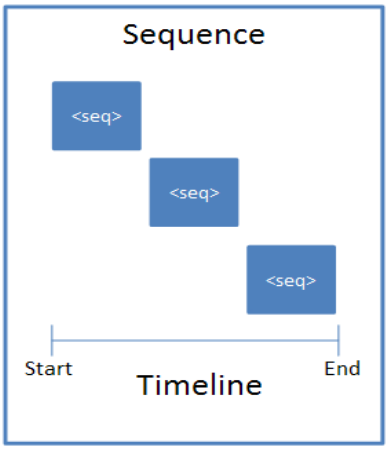
Attributes	Description
val (Value)	This attribute describes the value that will trigger the runtime node. The possible values for this attribute are defined by the ST_TLTriggerRuntimeNode simple type (§4.8.53).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTriggerRuntimeNode">
   <attribute name="val" type="ST_TLTriggerRuntimeNode" use="required"/>
</complexType>
```

4.6.65 seq (Sequence Time Node)

This element describes the Sequence time node and it can only be activated when the one before it finishes. Conceptually it can be though of as follows:



[Example: For example, suppose we have a simple animation with a blind entrance.

```
<p:timing>
  <p:tnLst>
    <p:par>
      <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
        <p:childTnLst>
          <p:seq concurrent="1" nextAc="seek">
            ...
          </p:seq>
        </p:childTnLst>
      </p:cTn>
    </p:par>
  </p:tnLst>
</p:timing>
```

End Example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cTn (Common Time Node Properties)	§4.6.33
nextCondLst (Next Conditions List)	§4.6.51
prevCondLst (Previous Conditions List)	§4.6.55

Attributes	Description
concurrent (Concurrent)	This attribute specifies if concurrency is enabled or disabled. By default this attribute has a value of "disabled". When the value is set to "enabled", the previous element is left

Attributes	Description
	enabled when advancing to the next element in a sequence instead of being ended. This is only relevant for advancing via the next condition element being triggered. The only other way to advance to the next element would be to have the current element end, which implies it is no longer concurrent. The possible values for this attribute are defined by the XML Schema boolean datatype.
nextAc (Next Action)	This attribute specifies what to do when going forward in sequence. By default this attribute has a value of "none". When this is set to seek it will seek the element to a natural end time (not necessarily the actual end time). The natural end position is defined as the latest non-infinite end time of the children. If a child loops forever, the end of its first loop is used as its "end time" for the purposes of this calculation. Some container elements may have infinite durations due to an infinite-duration child element. The engine needs to recurse down through all infinite duration containers to calculate their natural duration in case a child might have non-infinite duration within it that needs to be taken into account. The possible values for this attribute are defined by the ST_TLNextActionType simple type (§4.8.38).
prevAc (Previous Action)	This attribute specifies what to do when going backwards in a sequence. By default it is set to "none" and nothing special is done. When the value is "skipTimed", the sequence will continue to go backwards until it reaches a sequence element that was defined to begin only on the next condition element. The possible values for this attribute are defined by the ST_TLPreviousActionType simple type (§4.8.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeNodeSequence">
   <sequence>
      <element name="cTn" type="CT_TLCommonTimeNodeData" minOccurs="1" maxOccurs="1"/>
      <element name="prevCondLst" type="CT_TLTimeConditionList" minOccurs="0" maxOccurs="1"/>
      <element name="nextCondLst" type="CT_TLTimeConditionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="concurrent" type="xsd:boolean" use="optional"/>
   <attribute name="prevAc" type="ST_TLPreviousActionType" use="optional"/>
   <attribute name="nextAc" type="ST_TLNextActionType" use="optional"/>
</complexType>
```

4.6.66 set (Set Time Node Behavior)

This element allows the setting of a particular property value to a fixed value while the behavior is active and restores the value when the behavior is reset or turned off.

[Example: For example, suppose we want to set certain properties during an animation effect. The <set> element should be used as follows:

```
<p:childTnLst>
  <p:set>
    <p:cBhvr>
      <p:cTn id="6" dur="1" fill="hold">...
      <p:tgtEl>
        <p:spTgt spid="4"/>
      </p:tgtEl>
      <p:attrNameLst>
        <p:attrName>style.visibility</p:attrName>
      </p:attrNameLst>
    </p:cBhvr>
    <p:to>
      <p:strVal val="visible"/>
    </p:to>
  </p:set>
  <p:animEffect transition="in" filter="blinds(horizontal)">...
</p:childTnLst>
```

End Example]

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cBhvr (Common Behavior)	§4.6.22
to (To)	§4.6.89

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLSetBehavior">
   <sequence>
      <element name="cBhvr" type="CT_TLCommonBehaviorData" minOccurs="1" maxOccurs="1"/>
      <element name="to" type="CT_TLAnimVariant" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

4.6.67 sldTgt (Slide Target)

This element specifies the slide as the target element.

[Example: For example, suppose we have a simple animation with a blind entrance.

```
<p:seq concurrent="1" nextAc="seek">
```

```
<p:cTn id="2" dur="indefinite" nodeType="mainSeq">...
<p:prevCondLst>...
<p:nextCondLst>
  <p:cond evt="onNext" delay="0">
    <p:tgtEl>
      <p:sldTgt/>
    </p:tgtEl>
  </p:cond>
</p:nextCondLst>
</p:seq>
```

End Example]

Parent Elements
tgtEl (§4.6.81)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.68 snd (Sound)

This element specifies the audio information to play during a slide transition.

[Example: Consider a slide transition with an audio effect. The <snd> element should be used as follows:

```
<p:transition>
    <p:sndAc>
        <p:stSnd>
            <p:snd r:embed="rId2" r:link="rId3"/>
        </p:stSnd>
    </p:sndAc>
</p:transition>
```

End Example]

Parent Elements
stSnd (§4.6.76)

Attributes	Description
builtIn (Recognized Built-In Sound) Namespace: .../drawingml/200	Specifies whether or not this sound is a built-in sound. If this attribute is set to true then the generating application is alerted to check the name attribute specified for this sound in it's list of built-in sounds and can then surface a custom name or UI as needed. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
6/main	
embed (Embedded Audio File Relationship ID) Namespace: .../officeDocument/2006/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Sound Name) Namespace: .../drawingml/2006/main	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedWAVAudioFile">
   <attribute ref="r:embed" use="required"/>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
   <attribute name="builtIn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.6.69 sndAc (Sound Action)

This element describes the Sound Action for slide transition.

[Example: Consider a slide transition with a sound effect. The <sndAc> element should be used as follows:

```
<p:transition>
    <p:sndAc>
        <p:stSnd>
            <p:snd r:embed="rId2" r:link="rId3"/>
        </p:stSnd>
    </p:sndAc>
</p:transition>
```

End Example]

Parent Elements
transition (§4.4.1.46)

Child Elements	Subclause
endSnd (Stop Sound Action)	§4.6.38

Child Elements	Subclause
stSnd (Start Sound Action)	§4.6.76

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TransitionSoundAction">
   <choice minOccurs="1" maxOccurs="1">
      <element name="stSnd" type="CT_TransitionStartSoundAction"/>
      <element name="endSnd" type="CT_Empty"/>
   </choice>
</complexType>
```

4.6.70 sndTgt (Sound Target)

This element describes the sound information for a target object.

[Example: Consider a shape with a sound effect animation. The <sndTgt> element should be used as follows:

```
<p:subTnLst>
  <p:audio>
    <p:cMediaNode>
      <p:cTn display="0" masterRel="sameClick">...
      <p:tgtEl>
        <p:sndTgt r:embed="rId2" r:link="rId3"/>
      </p:tgtEl>
    </p:cMediaNode>
  </p:audio>
</p:subTnLst>
```

End Example]

Parent Elements
tgtEl (§4.6.81)

Attributes	Description
builtIn (Recognized Built-In Sound) Namespace: .../drawingml/2006/main	Specifies whether or not this sound is a built-in sound. If this attribute is set to true then the generating application is alerted to check the name attribute specified for this sound in it's list of built-in sounds and can then surface a custom name or UI as needed. The possible values for this attribute are defined by the XML Schema boolean datatype.
embed (Embedded Audio File Relationship ID) Namespace:	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

Attributes	Description
.../officeDocument/2006/relationships	
name (Sound Name) Namespace: .../drawingml/2006/main	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedWAVAudioFile">
   <attribute ref="r:embed" use="required"/>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
   <attribute name="builtIn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.6.71 split (Split Slide Transition)

This element describes a split slide transition effect.

[Example: Consider we have a slide with a split slide transition. The <split> element should be used as follows:

```
<p:transition>
    <p:split dir="in"/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	This attribute specifies the direction of a "split" slide transition. The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§4.8.56).
orient (Orientation)	This attribute specifies the orientation of a "split" slide transition. The possible values for this attribute are defined by the ST_Direction simple type (§4.8.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SplitTransition">
   <attribute name="orient" type="ST_Direction" use="optional" default="horz"/>
   <attribute name="dir" type="ST_TransitionInOutDirectionType" use="optional" default="out"/>
</complexType>
```

4.6.72 spTgt (Shape Target)

The element specifies the shape in which to apply a certain animation to.

[Example: Consider a shape whose id is 3 in which we want to apply a fade animation effect. The <spTgt> should be used as follows:

```
<p:animEffect transition="in" filter="fade">
  <p:cBhvr>
    <p:cTn id="7" dur="2000"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

End Example]

Parent Elements
tgtEl (§4.6.81)

Child Elements	Subclause
bg (Background)	§4.6.10
graphicEl (Graphic Element)	§4.6.45
oleChartEl (Embedded Chart Element)	§4.6.52
subSp (Subshape)	§4.6.77
txEl (Text Element)	§4.6.91

Attributes	Description
spid (Shape ID)	This attribute specifies the shape identifier. The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLShapeTargetElement">
   <choice minOccurs="0" maxOccurs="1">
      <element name="bg" type="CT_Empty"/>
      <element name="subSp" type="CT_TLSubShapeId"/>
      <element name="oleChartEl" type="CT_TLOleChartTargetElement"/>
      <element name="txEl" type="CT_TLTextTargetElement"/>
      <element name="graphicEl" type="a:CT_AnimationElementChoice"/>
   </choice>
   <attribute name="spid" type="a:ST_ShapeID" use="required"/>
</complexType>
```

4.6.73 stCondLst (Start Conditions List)

This element contains a list conditions that must be met for a time node to be activated.

[Example: For example, suppose we have a shape with an entrance appearance after 5 seconds. The <stCondLst>element should be used as follows:

```
<p:par>
  <p:cTn id="5" nodeType="clickEffect">
    <p:stCondLst>
      <p:cond delay="5000"/>
    </p:stCondLst>
    <p:childTnLst>...
  </p:cTn>
</p:par>
```

End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
cond (Condition)	§4.6.31

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeConditionList">
   <sequence>
      <element name="cond" type="CT_TLTimeCondition" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.6.74 strips (Strips Slide Transition)

This element describes a strips slide transition effect.

[Example: Consider we have a slide with a strips slide transition. The <strips> element should be used as follows:

```
<p:transition>
    <p:strips/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	This attribute specifies if the direction of the transition. The possible values for this attribute are defined by the ST_TransitionCornerDirectionType simple type (§4.8.54).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CornerDirectionTransition">
   <attribute name="dir" type="ST_TransitionCornerDirectionType" use="optional" default="lu"/>
</complexType>
```

4.6.75 strVal (String Value)

This element describes a string variant.

Parent Elements
progress (§4.6.57); to (§4.6.89); val (§4.6.92)

Attributes	Description
val (Value)	This attribute specifies the value of this element as a string The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariantStringVal">
   <attribute name="val" type="xsd:string" use="required"/>
</complexType>
```

4.6.76 stSnd (Start Sound Action)

This element describes the sound that will start playing during a slide transition.

[Example: Consider a slide transition that starts with a sound effect. The <stSnd> element should be used as follows:

```
<p:transition>
    <p:sndAc>
        <p:stSnd>
            <p:snd r:embed="rId2" r:link="rId3"/>
        </p:stSnd>
    </p:sndAc>
</p:transition>
```

End Example]

Parent Elements
sndAc (§4.6.69)

Child Elements	Subclause
snd (Sound)	§4.6.68

Attributes	Description
loop (Loop Sound)	This attribute specifies if the sound will loop until the next sound event occurs in slideshow. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TransitionStartSoundAction">
   <sequence>
      <element minOccurs="1" maxOccurs="1" name="snd" type="a:CT_EmbeddedWAVAudioFile"/>
   </sequence>
   <attribute name="loop" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.6.77 subSp (Subshape)

This element specifies the subshape of a legacy graphical object to animate.

[Example: Consider adding animation to a legacy diagram. The <subSp> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="2053">
```

```
            <p:subSp spid="_x0000_s70664"/>
          </p:spTgt>
        </p:tgtEl>
      </p:cBhvr>
    </p:animEffect>
```

End Example]

Parent Elements
spTgt (§4.6.72)

Attributes	Description
spid (Shape ID)	This attribute specifies the shape identifier. The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLSubShapeId">
   <attribute name="spid" type="a:ST_ShapeID" use="required"/>
</complexType>
```

4.6.78 subTnLst (Sub-TimeNodes List)

This element describes time nodes that have a start time which is not based on the containing timenode. It is instead based on their master relationship (masterRel). At runtime, they are inserted dynamically into the timing tree as child timenodes for playback, based on the logic defined by the master relationship. These elements are used for animations such as "dim after" and "play sound effects"

[Example: Consider an animation with a "Fly In" effect on paragraphs so that each paragraph flies in on a separate click. Then the "Dim After" effect for paragraph 1 doe not happen until paragraph 2 flies in. The <subTnLst> element should be used as follows:

```
<p:par>
  <p:cTn id="5" grpId="0" nodeType="clickEffect">
    <p:stCondLst>...
    <p:childTnLst>...
    <p:subTnLst>
      <p:set>
        <p:cBhvr override="childStyle">
          <p:cTn fill="hold" masterRel="nextClick" afterEffect="1"/>
          <p:tgtEl>...
          <p:attrNameLst>...
        </p:cBhvr>
```

```
          <p:to>...
        </p:set>
      </p:subTnLst>
    </p:cTn>
  </p:par>
```

End Example]

Parent Elements
cTn (§4.6.33)

Child Elements	Subclause
anim (Animate)	§4.6.1
animClr (Animate Color Behavior)	§4.6.2
animEffect (Animate Effect)	§4.6.3
animMotion (Animate Motion)	§4.6.4
animRot (Animate Rotation)	§4.6.5
animScale (Animate Scale)	§4.6.6
audio (Audio)	§4.6.9
cmd (Command)	§4.6.28
excl (Exclusive)	§4.6.40
par (Parallel Time Node)	§4.6.53
seq (Sequence Time Node)	§4.6.65
set (Set Time Node Behavior)	§4.6.66
video (Video)	§4.6.93

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeNodeList">
   <choice minOccurs="1" maxOccurs="unbounded">
      <element name="par" type="CT_TLTimeNodeParallel"/>
      <element name="seq" type="CT_TLTimeNodeSequence"/>
      <element name="excl" type="CT_TLTimeNodeExclusive"/>
      <element name="anim" type="CT_TLAnimateBehavior"/>
      <element name="animClr" type="CT_TLAnimateColorBehavior"/>
      <element name="animEffect" type="CT_TLAnimateEffectBehavior"/>
      <element name="animMotion" type="CT_TLAnimateMotionBehavior"/>
      <element name="animRot" type="CT_TLAnimateRotationBehavior"/>
      <element name="animScale" type="CT_TLAnimateScaleBehavior"/>
      <element name="cmd" type="CT_TLCommandBehavior"/>
      <element name="set" type="CT_TLSetBehavior"/>
      <element name="audio" type="CT_TLMediaNodeAudio"/>
      <element name="video" type="CT_TLMediaNodeVideo"/>
   </choice>
</complexType>
```

4.6.79 tav (Time Animate Value)

This element defines a "keypoint" in animation interpolation.

[Example: Consider a shape with a "fly-in" animation. The <tav> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base">...
  <p:tavLst>
    <p:tav tm="0">
      <p:val>
        <p:strVal val="1+#ppt_h/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100000">
      <p:val>
        <p:strVal val="#ppt_y"/>
      </p:val>
    </p:tav>
  </p:tavLst>
</p:anim>
```

End Example]

Parent Elements
tavLst (§4.6.80)

Child Elements	Subclause
val (Value)	§4.6.92

Attributes	Description
fmla (Formula)	This attribute allows for a specific formula to be used during the animation. This is specified in a semicolon-separated list of formulas. The value generated by interpolating the values list will be fed into the formula as an input. The resulting value is used to set the property being animated. There should be n-1 number of formulas for n values in the values list. The formula is applied starting at the corresponding time in the keyTimes list and up to the next time in the list. Formulas can only support a calcMode (Calculation Mode) of linear or discrete. If another calcMode is specified or no calcMode is specified then a calcMode of linear will be assumed. Formulas must be written using the elements defined below. When a formula is used in an attribute that takes more than one parameter (such as for animateScale or animateMotion), a space will be taken as a delimiter between parameter values. To work around this, either don't put spaces in the formula or include parentheses around the formula. Formulas within values, from, to, by attributes can be made up of these: • Standard arithmetic operators: ‘+’, ‘-‘, ‘*’, ‘/’, ‘^’, ‘%’ (mod) • Constants: ‘pi’ ‘e’ • Conditional operators: ‘abs’, ‘min’, ‘max’, ‘?’ (if) • Comparison operators: '==', '>=', '<=', '!=', '!' • Trigonometric operators: ‘sin()’, ‘cos()’, ‘tan()’, ‘asin()’, ‘acos()’, ‘atan()’ • Natural logarithm ‘ln()’ • Property references (host supported properties) [Note: The above formula elements are different than those used in javascript expressions. For example "cos()" used in formulas would be "Math.cos()" in javascript. end note] The possible values for this attribute are defined by the XML Schema string datatype.
tm (Time)	This attribute specifies the time at which the attribute being animated will take on the value. The possible values for this attribute are defined by the ST_TLTimeAnimateValueTime simple type (§4.8.43).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeAnimateValue">
   <sequence>
      <element name="val" type="CT_TLAnimVariant" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="tm" type="ST_TLTimeAnimateValueTime" use="optional" default="indefinite"/>
   <attribute name="fmla" type="xsd:string" use="optional" default=""/>
</complexType>
```

4.6.80 tavLst (Time Animated Value List)

This element specifies a list of time animated value elements.

[Example: Consider a shape with a "fly-in" animation. The <tav> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base">...
  <p:tavLst>
    <p:tav tm="0">
      <p:val>
        <p:strVal val="1+#ppt_h/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100000">
      <p:val>
        <p:strVal val="#ppt_y"/>
      </p:val>
    </p:tav>
  </p:tavLst>
</p:anim>
```

End Example]

Parent Elements
anim (§4.6.1)

Child Elements	Subclause
tav (Time Animate Value)	§4.6.79

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeAnimateValueList">
   <sequence>
      <element name="tav" type="CT_TLTimeAnimateValue" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

4.6.81 tgtEl (Target Element)

This element specifies the target children elements which will have the animation effects applied to.

[Example: Consider a shape with ID 3 with a fade effect animation applied to it. The <tgtEl> element should be used as follows:

```
<p:animEffect transition="in" filter="fade">
  <p:cBhvr>
    <p:cTn id="7" dur="2000"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

End Example]

Parent Elements
cBhvr (§4.6.22); cMediaNode (§4.6.29); cond (§4.6.31); endSync (§4.6.39)

Child Elements	Subclause
inkTgt (Ink Target)	§4.6.47
sldTgt (Slide Target)	§4.6.67
sndTgt (Sound Target)	§4.6.70
spTgt (Shape Target)	§4.6.72

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTimeTargetElement">
   <choice minOccurs="1" maxOccurs="1">
      <element name="sldTgt" type="CT_Empty"/>
      <element name="sndTgt" type="a:CT_EmbeddedWAVAudioFile"/>
      <element name="spTgt" type="CT_TLShapeTargetElement"/>
      <element name="inkTgt" type="CT_TLSubShapeId"/>
   </choice>
</complexType>
```

4.6.82 tmAbs (Time Absolute)

This element describes the duration of the iteration interval in absolute time.

[Example: Consider a text animation where the words appear letter by letter every 10 seconds. The <tmAbs> element should be used as follows:

```
<p:par>
```

```
    <p:cTn id="5" >
      <p:stCondLst>...
      <p:iterate type="lt">
        <p:tmAbs val="10000"/>
      </p:iterate>
      <p:childTnLst>...
    </p:cTn>
  </p:par>
```

End Example]

Parent Elements
iterate (§4.6.49)

Attributes	Description
val (Time)	This attribute describes an amount of time, in milliseconds. The possible values for this attribute are defined by the ST_TLTime simple type (§4.8.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLIterateIntervalTime">
   <attribute name="val" type="ST_TLTime" use="required"/>
</complexType>
```

4.6.83 tmPct (Time Percentage)

This element describes the duration of the iteration interval in a percentage of time.

[Example: Consider a text animation where the words appear letter by letter every 10th of the animation duration. The <tmPct> element should be used as follows:

```
  <p:par>
    <p:cTn id="5" >
      <p:stCondLst>...
      <p:iterate type="lt">
        <p:tmPct val="10000"/>
      </p:iterate>
      <p:childTnLst>...
    </p:cTn>
  </p:par>
```

End Example]

Parent Elements
iterate (§4.6.49)

Attributes	Description
val (Value)	This attribute specifies the time expressed as a percentage. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLIterateIntervalPercentage">
   <attribute name="val" type="a:ST_PositivePercentage" use="required"/>
</complexType>
```

4.6.84 tmpl (Template Effects)

This element specifies the "template" effects that are used by the build element. Template effects are used in text builds on the master slide. They define the rules of what effect should be applied to the 1st level paragraph, 2nd level paragraph, etc.

[Example: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
  <p:tnLst>...
  <p:bldLst>
    <p:bldP spid="3" grpId="0" build="p">
      <p:tmplLst>
        <p:tmpl lvl="1">
        </p:tmpl>
      </p:tmplLst>
    </p:bldP>
  </p:bldLst>
</p:timing>
```

End Example]

Parent Elements
tmplLst (§4.6.85)

Child Elements	Subclause
tnLst (Time Node List)	§4.6.87

Attributes	Description
lvl (Level)	This attribute describes the paragraph indent level to which this template effect applies. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTemplate">
   <sequence>
      <element name="tnLst" type="CT_TimeNodeList" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="lvl" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

4.6.85 tmplLst (Template effects)

This element describes a list of template effects that describe what kind of effects should be applied to a paragraph level properties.

[Example: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
  <p:tnLst>...
  <p:bldLst>
    <p:bldP spid="3" grpId="0" build="p">
      <p:tmplLst>
        <p:tmpl lvl="1">
        </p:tmpl>
      </p:tmplLst>
    </p:bldP>
  </p:bldLst>
</p:timing>
```

End Example]

Parent Elements
bldP (§4.6.16)

Child Elements	Subclause
tmpl (Template Effects)	§4.6.84

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTemplateList">
   <sequence>
      <element name="tmpl" type="CT_TLTemplate" minOccurs="0" maxOccurs="9"/>
   </sequence>
</complexType>
```

4.6.86 tn (Time Node)

This element describes the time node trigger choice.

[Example: Consider a time node with an event condition. The <tn> element should be used as follows:

```
<p:par>
  <p:cTn id="5">
    <p:stCondLst>
      <p:cond delay="0"/>
    </p:stCondLst>
    <p:endCondLst>
      <p:cond evt="begin" delay="0">
        <p:tn val="5"/>
      </p:cond>
    </p:endCondLst>
    <p:childTnLst>...
  </p:cTn>
</p:par>
```

End Example]

Parent Elements
cond (§4.6.31); endSync (§4.6.39)

Attributes	Description
val (Value)	This attribute specifies a time node identifier. The possible values for this attribute are defined by the ST_TLTimeNodeID simple type (§4.8.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTriggerTimeNodeID">
   <attribute name="val" type="ST_TLTimeNodeID" use="required"/>
</complexType>
```

4.6.87 tnLst (Time Node List)

This element specifies a list of time node elements used in an animation sequence.

[Example: Consider a simple animation sequence. The <tnLst> element should be used as follows:

```
<p:timing>
  <p:tnLst>
    <p:par>...
  </p:tnLst>
</p:timing>
```

End Example]

Parent Elements
timing (§4.4.1.44); tmpl (§4.6.84)

Child Elements	Subclause
anim (Animate)	§4.6.1
animClr (Animate Color Behavior)	§4.6.2
animEffect (Animate Effect)	§4.6.3
animMotion (Animate Motion)	§4.6.4
animRot (Animate Rotation)	§4.6.5
animScale (Animate Scale)	§4.6.6
audio (Audio)	§4.6.9
cmd (Command)	§4.6.28
excl (Exclusive)	§4.6.40
par (Parallel Time Node)	§4.6.53
seq (Sequence Time Node)	§4.6.65
set (Set Time Node Behavior)	§4.6.66
video (Video)	§4.6.93

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeNodeList">
   <choice minOccurs="1" maxOccurs="unbounded">
      <element name="par" type="CT_TLTimeNodeParallel"/>
      <element name="seq" type="CT_TLTimeNodeSequence"/>
      <element name="excl" type="CT_TLTimeNodeExclusive"/>
      <element name="anim" type="CT_TLAnimateBehavior"/>
      <element name="animClr" type="CT_TLAnimateColorBehavior"/>
      <element name="animEffect" type="CT_TLAnimateEffectBehavior"/>
      <element name="animMotion" type="CT_TLAnimateMotionBehavior"/>
      <element name="animRot" type="CT_TLAnimateRotationBehavior"/>
      <element name="animScale" type="CT_TLAnimateScaleBehavior"/>
      <element name="cmd" type="CT_TLCommandBehavior"/>
      <element name="set" type="CT_TLSetBehavior"/>
      <element name="audio" type="CT_TLMediaNodeAudio"/>
      <element name="video" type="CT_TLMediaNodeVideo"/>
   </choice>
</complexType>
```

4.6.88 to (To)

This element specifies the target location for an animation motion or animation scale effect

[Example: Consider an animation with a "light speed" entrance effect.

```
<p:animScale>
  <p:cBhvr>
    <p:cTn id="9" dur="200" decel="100000" autoRev="1" fill="hold">
      <p:stCondLst>
        <p:cond delay="600"/>
      </p:stCondLst>
    </p:cTn>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:from x="100000" y="100000"/>
  <p:to x="80000" y="100000"/>
</p:animScale>
```

End Example]

Parent Elements
animMotion (§4.6.4); animScale (§4.6.6)

Attributes	Description

Attributes	Description
x (X coordinate)	This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
y (Y coordinate)	This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLPoint">
   <attribute name="x" type="a:ST_Percentage" use="required"/>
   <attribute name="y" type="a:ST_Percentage" use="required"/>
</complexType>
```

4.6.89 to (To)

The element specifies the certain attribute of a time node after an animation effect.

[Example: Consider an animation effect that leaves a string value visible afterwards. The <to> element should be used as follows:

```
<p:childTnLst>
  <p:set>
    <p:cBhvr>...
    <p:to>
      <p:strVal val="visible"/>
    </p:to>
  </p:set>
  <p:anim calcmode="lin" valueType="num">...
  <p:anim calcmode="lin" valueType="num">...
</p:childTnLst>
```

End Example]

Parent Elements
set (§4.6.66)

Child Elements	Subclause
boolVal (Boolean Variant)	§4.6.19
clrVal (Color Value)	§4.6.27

Child Elements	Subclause
fltVal (Float Value)	§4.6.42
intVal (Integer)	§4.6.48
strVal (String Value)	§4.6.75

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariant">
   <choice minOccurs="1" maxOccurs="1">
      <element name="boolVal" type="CT_TLAnimVariantBooleanVal"/>
      <element name="intVal" type="CT_TLAnimVariantIntegerVal"/>
      <element name="fltVal" type="CT_TLAnimVariantFloatVal"/>
      <element name="strVal" type="CT_TLAnimVariantStringVal"/>
      <element name="clrVal" type="a:CT_Color"/>
   </choice>
</complexType>
```

4.6.90 to (To)

This element specifies the resulting color for the animation color change.

[Example: Consider emphasize a shape by changing its fill color from blue to red. The <to> element should be used as follows:

```
<p:childTnLst>
  <p:animClr clrSpc="rgsb">
    <p:cBhvr>...
    <p:to>
      <a:schemeClr val="accent2"/>
    </p:to>
  </p:animClr>
</p:childTnLst>
```

End example]

Parent Elements
animClr (§4.6.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32

Child Elements	Subclause
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

4.6.91 txEl (Text Element)

This element specifies a text element to animate.

[Example: Consider a shape containing text to be animated. The <txEl> should be used as follows:

```
<p:tgtEl>
  <p:spTgt spid="5">
    <p:txEl>
      <p:pRg st="1" end="1"/>
    </p:txEl>
  </p:spTgt>
</p:tgtEl>
```

End Example]

Parent Elements
spTgt (§4.6.72)

Child Elements	Subclause
charRg (Character Range)	§4.6.23
pRg (Paragraph Text Range)	§4.6.56

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLTextTargetElement">
   <choice minOccurs="0" maxOccurs="1">
      <element name="charRg" type="CT_IndexRange"/>
      <element name="pRg" type="CT_IndexRange"/>
   </choice>
</complexType>
```

4.6.92 val (Value)

The element specifies a value for a time animate.

[Example: Consider a shape with a fade in animation effect. The <val> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base">...
  <p:tavLst>
    <p:tav tm="0">
      <p:val>
        <p:strVal val="0-#ppt_w/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100000">
      <p:val>
        <p:strVal val="#ppt_x"/>
      </p:val>
    </p:tav>
  </p:tavLst>
</p:anim>
```

End Example]

Parent Elements
tav (§4.6.79)

Child Elements	Subclause
boolVal (Boolean Variant)	§4.6.19
clrVal (Color Value)	§4.6.27
fltVal (Float Value)	§4.6.42
intVal (Integer)	§4.6.48
strVal (String Value)	§4.6.75

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLAnimVariant">
   <choice minOccurs="1" maxOccurs="1">
      <element name="boolVal" type="CT_TLAnimVariantBooleanVal"/>
      <element name="intVal" type="CT_TLAnimVariantIntegerVal"/>
      <element name="fltVal" type="CT_TLAnimVariantFloatVal"/>
      <element name="strVal" type="CT_TLAnimVariantStringVal"/>
      <element name="clrVal" type="a:CT_Color"/>
   </choice>
</complexType>
```

4.6.93 video (Video)

This element specifies video information in an animation sequence.

[Example: Consider a slide with an animated video content. The <video> element should be used as follows:

```
<p:childTnLst>
  <p:seq concurrent="1" nextAc="seek">...
  <p:video>
    <p:cMediaNode>...
  </p:video>
</p:childTnLst>
End Example]
```

Parent Elements
childTnLst (§4.6.25); subTnLst (§4.6.78); tnLst (§4.6.87)

Child Elements	Subclause
cMediaNode (Common Media Node Properties)	§4.6.29

Attributes	Description
fullScrn (Full Screen)	This attribute specifies if the video will be displayed in full-screen. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TLMediaNodeVideo">
   <sequence>
      <element name="cMediaNode" type="CT_TLCommonMediaNodeData" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="fullScrn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

4.6.94 wedge (Wedge Slide Transition)

This element describes a wedge slide transition effect.

[Example: Consider we have a slide with a wedge slide transition. The <wedge> element should be used as follows:

```
<p:transition>
    <p:wedge/>
</p:transition>
```

End example]

Parent Elements

Parent Elements
transition (§4.4.1.46)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Empty"/>
```

4.6.95 wheel (Wheel Slide Transition)

This element describes a wheel slide transition effect.

[Example: Consider we have a slide with a wheel slide transition. The <wheel> element should be used as follows:

```
<p:transition>
    <p:wheel/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
spokes (Spokes)	This attributes specifies the number of spokes ("pie pieces") in the wheel The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WheelTransition">
   <attribute name="spokes" type="xsd:unsignedInt" use="optional" default="4"/>
</complexType>
```

4.6.96 wipe (Wipe Slide Transition)

This element describes a wipe slide transition effect.

[Example: Consider we have a slide with a wipe slide transition. The <wipe> element should be used as follows:

```
<p:transition>
    <p:wipe/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	This attribute specifies the direction of the slide transition. The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§4.8.57).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SideDirectionTransition">
   <attribute name="dir" type="ST_TransitionSideDirectionType" use="optional" default="l"/>
</complexType>
```

4.6.97 zoom (Zoom Slide Transition)

This element describes a zoom slide transition effect.

[Example: Consider we have a slide with a zoom slide transition. The <zoom> element should be used as follows:

```
<p:transition>
    <p:zoom/>
</p:transition>
```

End example]

Parent Elements
transition (§4.4.1.46)

Attributes	Description
dir (Direction)	This attribute specifies the direction of an "in/out" slide transition. The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§4.8.56).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_InOutTransition">
   <attribute name="dir" type="ST_TransitionInOutDirectionType" use="optional" default="out"/>
</complexType>
```

4.7 Slide Synchronization Data

It is often desired to allow a user to pull slides from a library of pre-existing content. In order to facilitate synchronization of this content with a server, the sldSyncPr element exists to store modification/insertion time properties to enable this synchronization. The sldSyncPr element lives in the slideUpdateInfo directory of the PowerPoint file container.

4.7.1 sldSyncPr (Slide Synchronization Properties)

This element specifies the properties associated with the slide synchronization specified for the current slide.

Parent Elements
Root element of PresentationML Slide Synchronization Data part

Child Elements	Subclause
extLst (Extension List)	§4.2.5

Attributes	Description
clientInsertedTime (Client Slide Insertion date/time)	The date and time that the server-based slide was inserted into the client presentation. This field is used purely for informative purposes so that the user may know when the slide was inserted. The date/time is stored in ISO 8061 format. [Example: Notice the use of clientInsertedTime in this UI to provide users information on when the slide was inserted from the slide library.

Attributes	Description
	 End Example] The possible values for this attribute are defined by the XML Schema dateTime datatype.
serverSldId (Server's Slide File ID)	Identifier of the slide file on the server. This ID is unrelated to the Slide's ID, and is a unique identifier for the slide in the slide library. The possible values for this attribute are defined by the XML Schema string datatype.
serverSldModifiedTime (Server's Slide File's modification date/time)	The last modification date and time for the slide file that is located on the server. This date, when compared with the last modification date and time on the server, determines whether an update of this slide is necessary. The date and time are stored in ISO 8061 format. The possible values for this attribute are defined by the XML Schema dateTime datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SlideSyncProperties">
   <sequence>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="serverSldId" type="xsd:string" use="required"/>
   <attribute name="serverSldModifiedTime" type="xsd:dateTime" use="required"/>
   <attribute name="clientInsertedTime" type="xsd:dateTime" use="required"/>
</complexType>
```

4.8 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/presentationml/2006/main namespace.

4.8.1 ST_AlgClass (Cryptographic Algorithm Classes)

This simple type specifies the possible classes of cryptographic algorithm used by protection. [*Note*: The initial version of this Office Open XML Standard only supports a single version - hash - but future versions may expand this as necessary. *end note*]

[*Example*: Consider a PresentationML document with the following information stored in its protection element:

```
<p:… p:cryptAlgorithmClass="hash"
  p:cryptAlgorithmType="typeAny"
  p:cryptAlgorithmSid="1"
  p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The cryptAlgorithmClass attribute value of hash specifies that the algorithm used for the password is a hashing algorithm. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hash (Hash Algorithm Class)	A hash class algorithm is used.
invalid (Invalid Algorithm Class)	An algorithm with an invalid class is used.

Referenced By
modifyVerifier@cryptAlgorithmClass (§4.3.1.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AlgClass">
   <restriction base="xsd:string">
      <enumeration value="hash"/>
      <enumeration value="invalid"/>
   </restriction>
</simpleType>
```

4.8.2 ST_AlgType (Cryptographic Algorithm Type)

This simple type specifies the possible values for the type of cryptographic algorithm used by protection. [*Note*: The initial version of this Office Open XML Standard only supports a single type - typeAny - but future versions may expand this as necessary. *end note*]

[*Example*: Consider a PresentationML document with the following information stored in its protection element:

```
<p:… p:cryptAlgorithmClass="hash"
  p:cryptAlgorithmType="typeAny"
  p:cryptAlgorithmSid="1"
  p:hashData="9oN7nWkCAyEZib1RomSJTjmPpCY=" />
```

The cryptAlgorithmType attribute value of typeAny specifies that any type of algorithm may have been used for the password. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
invalid (Invalid Algorithm Type)	An invalid algorithm type is used.
typeAny (Any Algorithm Type)	Any algorithm type is used.

Referenced By
modifyVerifier@cryptAlgorithmType (§4.3.1.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AlgType">
   <restriction base="xsd:string">
      <enumeration value="typeAny"/>
      <enumeration value="invalid"/>
   </restriction>
</simpleType>
```

4.8.3 ST_BookmarkIdSeed (Bookmark ID Seed)

This type specifies constraints for value of the Bookmark ID seed.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than 2147483648.

Referenced By
presentation@bookmarkIdSeed (§4.3.1.24)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BookmarkIdSeed">
   <restriction base="xsd:unsignedInt">
      <minInclusive value="1"/>
      <maxExclusive value="2147483648"/>
   </restriction>
</simpleType>
```

4.8.4 ST_CryptProv (Cryptographic Provider Type)

This simple type specifies the possible types of cryptographic providers which may be used.

[*Example*: Consider a PresentationML document with the following information stored in one of its protection elements:

```
<p:modifyVerifier p:cryptProviderType="rsaAES" ... />
```

The cryptProviderType attribute value of `rsaAES` specifies that the cryptographic provider type shall be an Advanced Encryption Standard provider. *end example*]

This simple type's contents are a restriction of the XML Schema string datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
invalid (Invalid Encryption Scheme)	Invalid Encryption scheme provided.
rsaAES (RSA AES Encryption Scheme)	Specifies that the provider shall support the Advanced Encryption Algorithm standard.
rsaFull (RSA Full Encryption Scheme)	Specifies that any suitable provider shall be used.

Referenced By
modifyVerifier@cryptProviderType (§4.3.1.17)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_CryptProv">
   <restriction base="xsd:string">
      <enumeration value="rsaAES"/>
      <enumeration value="rsaFull"/>
      <enumeration value="invalid"/>
   </restriction>
</simpleType>
```

4.8.5 ST_Direction (Direction)

This simple type defines a direction of either horizontal or vertical.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
horz (Horizontal)	Defines a horizontal direction.
vert (Vertical)	Defines a vertical direction.

Referenced By
blinds@dir (§4.6.18); checker@dir (§4.6.24); comb@dir (§4.6.30); guide@orient (§4.3.2.4); ph@orient (§4.4.1.33); randomBar@dir (§4.6.61); split@orient (§4.6.71)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Direction">
   <restriction base="xsd:token">
      <enumeration value="horz"/>
      <enumeration value="vert"/>
   </restriction>
</simpleType>
```

4.8.6 ST_HtmlPublishWebBrowserSupport (Web browsers supported for HTML output)

This type specifies the Web Browsers supported for output to HTML.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
v3 (Browser v3)	Generate HTML optimized for Netscape Navigator 3.0, Microsoft Internet Explorer 3, and equivalent browsers.
v3v4 (Browser v3v4)	Generate HTML optimized for Netscape Navigator 3.0 and 4.0, Microsoft Internet Explorer 3 and 4, and equivalent browsers.
v4 (Browser v4)	Generate HTML optimized for Netscape Navigator 4.0, Microsoft Internet Explorer 4, and equivalent browsers.

Referenced By
htmlPubPr@pubBrowser (§4.3.1.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_HtmlPublishWebBrowserSupport">
   <restriction base="xsd:token">
      <enumeration value="v4"/>
      <enumeration value="v3"/>
      <enumeration value="v3v4"/>
   </restriction>
</simpleType>
```

4.8.7 ST_Index (Index)

This type defines the position of an object in an ordered list.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
charRg@end (§4.6.23); charRg@st (§4.6.23); cm@idx (§4.5.1); pRg@end (§4.6.56); pRg@st (§4.6.56); sldRg@end (§4.2.8); sldRg@st (§4.2.8)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Index">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

4.8.8 ST_IterateType (Iterate Type)

This type specifies how the animation will be applied over subelements of the target element.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
el (Element)	Iterate by element.
lt (Letter)	Iterate by Letter.
wd (Word)	Iterate by Word.

Referenced By
iterate@type (§4.6.49)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_IterateType">
   <restriction base="xsd:token">
      <enumeration value="el"/>
      <enumeration value="wd"/>
      <enumeration value="lt"/>
   </restriction>
</simpleType>
```

4.8.9 ST_Name (Name string)

This type specifies a name, such as for a comment author or custom show.

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
cmAuthor@initials (§4.5.2); cmAuthor@name (§4.5.2); custShow@name (§4.3.1.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Name">
   <restriction base="xsd:string"/>
</simpleType>
```

4.8.10 ST_OleObjectFollowColorScheme (Embedded object to Follow Color Scheme)

This simple type determines if the Embedded object will be re-colored to reflect changes to the color schemes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
full (Full)	Setting this enumeration causes the Embedded object to respond to all changes in the color scheme in the presentation.
none (None)	Setting this enumeration causes the Embedded object to not respond to changes in the color scheme in the presentation.
textAndBackground (Text and Background)	Setting this enumeration causes the Embedded object to respond only to changes in the text and background colors of the color scheme in the presentation.

Referenced By
embed@followColorScheme (§4.4.2.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OleObjectFollowColorScheme">
    <restriction base="xsd:token">
        <enumeration value="none"/>
        <enumeration value="full"/>
        <enumeration value="textAndBackground"/>
    </restriction>
</simpleType>
```

4.8.11 ST_PhotoAlbumFrameShape (Photo Album Shape for Photo Mask)

This type specifies the values for photo frame types within a photo album presentation.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
frameStyle1 (Rectangle Photo Frame)	
frameStyle2 (Rounded Rectangle Photo Frame)	
frameStyle3 (Simple White Photo Frame)	
frameStyle4 (Simple Black Photo Frame)	
frameStyle5 (Compound Black Photo Frame)	
frameStyle6 (Center Shadow Photo Frame)	
frameStyle7 (Soft Edge Photo Frame)	

Referenced By
photoAlbum@frame (§4.3.1.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PhotoAlbumFrameShape">
   <restriction base="xsd:token">
      <enumeration value="frameStyle1"/>
      <enumeration value="frameStyle2"/>
      <enumeration value="frameStyle3"/>
      <enumeration value="frameStyle4"/>
      <enumeration value="frameStyle5"/>
      <enumeration value="frameStyle6"/>
      <enumeration value="frameStyle7"/>
   </restriction>
</simpleType>
```

4.8.12 ST_PhotoAlbumLayout (Photo Album Layout Definition)

This type specifies the values for photo layouts within a photo album presentation.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1pic (1 Photo per Slide)	 Specifies that photo album slides should have a single picture, centered horizontally and vertically, on the slide with no title.
1picTitle (1 Photo per Slide with Titles)	 Specifies that photo album slides should have a single picture and a single title text box, centered horizontally and vertically, on the slide.
2pic (2 Photos per Slide)	 Specifies that photo album slides should have two pictures of the same size, positioned side-by-side, centered horizontally and vertically, on the slide with no title.

Enumeration Value	Description
2picTitle (2 Photos per Slide with Titles)	 Specifies that photo album slides should have two pictures of the same size, positioned side-by-side, with a single title text box centered over them, collectively centered horizontally and vertically, on the slide.
4pic (4 Photos per Slide)	 Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, centered horizontally and vertically, on the slide with no title.
4picTitle (4 Photos per Slide with Titles)	 Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, with a single title text box centered over the matrix, centered horizontally and vertically, on the slide.
fitToSlide (Fit Photos to Slide)	 Specifies that photo album slides should have a single picture, stretched to fit the entire slide size, with no title.

Referenced By
photoAlbum@layout (§4.3.1.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PhotoAlbumLayout">
   <restriction base="xsd:token">
      <enumeration value="fitToSlide"/>
      <enumeration value="1pic"/>
      <enumeration value="2pic"/>
      <enumeration value="4pic"/>
      <enumeration value="1picTitle"/>
      <enumeration value="2picTitle"/>
      <enumeration value="4picTitle"/>
   </restriction>
</simpleType>
```

4.8.13 ST_PlaceholderSize (Placeholder Size)

This simple type facilitates the storing of the size of the placeholder. This size is described relative to the body placeholder on the master.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
full (Full)	Specifies that the placeholder should take the full size of the body placeholder on the master.
half (Half)	Specifies that the placeholder should take the half size of the body placeholder on the master. Half size vertically or horizontally? Needs a picture.
quarter (Quarter)	Specifies that the placeholder should take a quarter of the size of the body placeholder on the master. Picture would be helpful

Referenced By
ph@sz (§4.4.1.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PlaceholderSize">
   <restriction base="xsd:token">
      <enumeration value="full"/>
      <enumeration value="half"/>
      <enumeration value="quarter"/>
   </restriction>
</simpleType>
```

4.8.14 ST_PlaceholderType (Placeholder IDs)

This simple type facilitates the storing of the type of content a placeholder should contain.

[Note: Some types are not valid for all types of SlideBase. End note]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
body (Body)	Contains body text. Valid for Slide, Slide Layout, Slide Master, Notes, Notes Master. Can be horizontal or vertical on Slide and Slide Layout.
chart (Chart)	Contains a chart or graph. Special type. Valid for Slide and Slide Layout.
clipArt (Clip Art)	Contains a single clip art image. Special type. Valid for Slide and Slide Layout.
ctrTitle (Centered Title)	Contains a title intended to be centered on the slide. Valid for Slide and Slide Layout.
dgm (Diagram)	Contains a diagram. Special type. Valid for Slide and Slide Layout.
dt (Date and Time)	Contains the date and time. Valid for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
ftr (Footer)	Contains text to be used as a footer in the document. Valid for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
hdr (Header)	Contains text to be used as a header for the document. Valid for Notes, Notes Master, Handout Master .
media (Media)	Contains multimedia content such as audio or a movie clip. Special type. Valid for Slide and Slide Layout.
obj (Object)	Contains any type of content. Special type. Valid for Slide and Slide Layout.
pic (Picture)	Contains a picture. Special type. Valid for Slide and Slide Layout.
sldImg (Slide Image)	Contains an image of the slide. Valid for Notes and Notes Master.
sldNum (Slide Number)	Contains the number of a slide. Valid for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master
subTitle (Subtitle)	Contains a subtitle. Valid for Slide and Slide Layout.
tbl (Table)	Contains a table. Special type. Valid for Slide and Slide Layout.
title (Title)	Contains a slide title. Valid for Slide, Slide Layout and

Enumeration Value	Description
	Slide Master. Can be horizontal or vertical on Slide and Slide Layout.

Referenced By
ph@type (§4.4.1.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PlaceholderType">
   <restriction base="xsd:token">
      <enumeration value="title"/>
      <enumeration value="body"/>
      <enumeration value="ctrTitle"/>
      <enumeration value="subTitle"/>
      <enumeration value="dt"/>
      <enumeration value="sldNum"/>
      <enumeration value="ftr"/>
      <enumeration value="hdr"/>
      <enumeration value="obj"/>
      <enumeration value="chart"/>
      <enumeration value="tbl"/>
      <enumeration value="clipArt"/>
      <enumeration value="dgm"/>
      <enumeration value="media"/>
      <enumeration value="sldImg"/>
      <enumeration value="pic"/>
   </restriction>
</simpleType>
```

4.8.15 ST_PrintColorMode (Print Color Mode)

This type specifies the color mode that should be used when printing a presentation document.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bw (Black and White Mode)	Print should be in Black and White only
clr (Color Mode)	Print should be in Full Color
gray (Grayscale Mode)	Print should be in Grayscale only

Referenced By
prnPr@clrMode (§4.3.1.26)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PrintColorMode">
   <restriction base="xsd:token">
      <enumeration value="bw"/>
      <enumeration value="gray"/>
      <enumeration value="clr"/>
   </restriction>
</simpleType>
```

4.8.16 ST_PrintWhat (Default print output)

This type specifies the default print layout that should be used when printing

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
handouts1 (1 Slide / Handout Page)	1 Slide and Handout Page layout should be used.
handouts2 (2 Slides / Handout Page)	2 Slides and Handout Page layout should be used.
handouts3 (3 Slides / Handout Page)	3 Slides and Handout Page layout should be used.
handouts4 (4 Slides / Handout Page)	4 Slides and Handout Page layout should be used.
handouts6 (6 Slides / Handout Page)	6 Slides and Handout Page layout should be used.
handouts9 (9 Slides / Handout Page)	9 Slides and Handout Page layout should be used.
notes (Notes)	Notes layout should be used.
outline (Outline)	Outline layout should be used.
slides (Slides)	Slides layout should be used.

Referenced By
prnPr@prnWhat (§4.3.1.26)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PrintWhat">
   <restriction base="xsd:token">
      <enumeration value="slides"/>
      <enumeration value="handouts1"/>
      <enumeration value="handouts2"/>
      <enumeration value="handouts3"/>
      <enumeration value="handouts4"/>
      <enumeration value="handouts6"/>
      <enumeration value="handouts9"/>
      <enumeration value="notes"/>
      <enumeration value="outline"/>
   </restriction>
</simpleType>
```

4.8.17 ST_SlideId (Slide Identifier)

This type specifies the allowed numbering for the slide identifier.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 256.
- This simple type has a maximum value of less than 2147483648.

Referenced By
sldId@id (§4.3.1.29)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideId">
   <restriction base="xsd:unsignedInt">
      <minInclusive value="256"/>
      <maxExclusive value="2147483648"/>
   </restriction>
</simpleType>
```

4.8.18 ST_SlideLayoutId (Slide Layout ID)

This simple type sets the bounds for the slide layout id value. This layout id is used to identify the different slide layout designs.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

Referenced By
sldLayoutId@id (§4.4.1.37)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideLayoutId">
   <restriction base="xsd:unsignedInt">
      <minInclusive value="2147483648"/>
   </restriction>
</simpleType>
```

4.8.19 ST_SlideLayoutType (Slide Layout Type)

This simple type defines an arrangement of content on a slide. Each layout type is not tied to an exact positioning of placeholders, but rather provides a higher-level description of the type of content and positioning

of placeholders. This information may be used by the application to aid in mapping between different layouts. The application may choose which, if any, of these layouts to make available through its user interface.

Each layout contains zero or more placeholders, each with a specific content type. An "object" placeholder may contain any type of data. Media placeholders are intended to hold video or audio clips. The enumeration value descriptions include illustrations of sample layouts for each value of the simple type.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
blank (Slide Layout Type Enumeration (Blank))	 Blank
chart (Chart)	 Title and chart
chartAndTx (Slide Layout Type Enumeration (Chart and Text))	 Title, chart on left and text on right
clipArtAndTx (Clip Art and Text)	 Title, clipart on left, text on right
clipArtAndVertTx (Clip Art and Vertical Text)	 Title, clip art on left, vertical text on right
cust (Slide Layout Type Enumeration (Custom))	Custom layout defined by user
dgm (Slide Layout Type Enumeration (Diagram))	 Title and diagram
fourObj (Four Objects)	 Title and four objects
mediaAndTx (Slide Layout Type Enumeration (Media and Text))	 Title, media on left, text on right
obj (Title and Object)	 Title and object
objAndTwoObj (Object and Two Object)	Title, one object on left, two objects on right

Enumeration Value	Description
	
objAndTx (Slide Layout Type Enumeration (Object and Text))	 Title, object on left, text on right
objOnly (Object)	 Object only
objOverTx (Slide Layout Type Enumeration (Object over Text))	 Title, object on top, text on bottom
objTx (Title, Object, and Caption)	 Title, object and caption text
picTx (Picture and Caption)	 Title, picture, and caption text
secHead (Section Header)	 Section header title and subtitle text
tbl (Slide Layout Type Enumeration (Table))	 Title and table
title (Slide Layout Type Enumeration (Title))	 Title layout with centered title and subtitle placeholders
titleOnly (Slide Layout Type Enumeration (Title Only))	 Title only
twoColTx (Slide Layout Type Enumeration (Two Column Text))	 Title, text on left, text on right
twoObj (Two Objects)	 Title, object on left, object on right
twoObjAndObj (Two Objects and Object)	Title, two objects on left, one object on right

Enumeration Value	Description
	
twoObjAndTx (Two Objects and Text)	 Title, two objects on left, text on right
twoObjOverTx (Two Objects over Text)	 Title, two objects on top, text on bottom
twoTxTwoObj (Two Text and Two Objects)	 Title, two objects each with text
tx (Slide Layout Type Enumeration (Text))	 Title and text
txAndChart (Slide Layout Type Enumeration (Text and Chart))	 Title, text on left and chart on right
txAndClipArt (Text and Clip Art)	 Title, text on left, clip art on right
txAndMedia (Slide Layout Type Enumeration (Text and Media))	 Title, text on left, media on right
txAndObj (Slide Layout Type Enumeration (Text and Object))	 Title, text on left, object on right
txAndTwoObj (Text and Two Objects)	 Title, text on left, two objects on right
txOverObj (Slide Layout Type Enumeration (Text over Object))	 Title, text on top, object on bottom
vertTitleAndTx (Vertical Title and Text)	 Vertical title on right, vertical text on left
vertTitleAndTxOverChart (Vertical Title and Text Over Chart)	Vertical title on right, vertical text on top, chart on bottom

Enumeration Value	Description
	vertTx (Vertical Text)	 Title and vertical text body

Referenced By
sldLayout@type (§4.4.1.36)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideLayoutType">
   <restriction base="xsd:token">
      <enumeration value="title"/>
      <enumeration value="tx"/>
      <enumeration value="twoColTx"/>
      <enumeration value="tbl"/>
      <enumeration value="txAndChart"/>
      <enumeration value="chartAndTx"/>
      <enumeration value="dgm"/>
      <enumeration value="chart"/>
      <enumeration value="txAndClipArt"/>
      <enumeration value="clipArtAndTx"/>
      <enumeration value="titleOnly"/>
      <enumeration value="blank"/>
      <enumeration value="txAndObj"/>
      <enumeration value="objAndTx"/>
      <enumeration value="objOnly"/>
      <enumeration value="obj"/>
      <enumeration value="txAndMedia"/>
      <enumeration value="mediaAndTx"/>
      <enumeration value="objOverTx"/>
      <enumeration value="txOverObj"/>
      <enumeration value="txAndTwoObj"/>
      <enumeration value="twoObjAndTx"/>
      <enumeration value="twoObjOverTx"/>
      <enumeration value="fourObj"/>
      <enumeration value="vertTx"/>
      <enumeration value="clipArtAndVertTx"/>
      <enumeration value="vertTitleAndTx"/>
      <enumeration value="vertTitleAndTxOverChart"/>
      <enumeration value="twoObj"/>
      <enumeration value="objAndTwoObj"/>
      <enumeration value="twoObjAndObj"/>
      <enumeration value="cust"/>
      <enumeration value="secHead"/>
      <enumeration value="twoTxTwoObj"/>
      <enumeration value="objTx"/>
      <enumeration value="picTx"/>
   </restriction>
</simpleType>
```

4.8.20 ST_SlideMasterId (Slide Master ID)

This type specifies the allowed numbering for the slide master identifier.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

Referenced By
sldMasterId@id (§4.3.1.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideMasterId">
   <restriction base="xsd:unsignedInt">
      <minInclusive value="2147483648"/>
   </restriction>
</simpleType>
```

4.8.21 ST_SlideSizeCoordinate (Slide Size Coordinate)

This type specifies the slide size coordinate in EMUs (English Metric Units).

This simple type's contents are a restriction of the ST_PositiveCoordinate32 simple type (§5.1.12.43).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 914400.
- This simple type has a maximum value of less than or equal to 51206400.

Referenced By
sldSz@cx (§4.3.1.34); sldSz@cy (§4.3.1.34)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideSizeCoordinate">
   <restriction base="a:ST_PositiveCoordinate32">
      <minInclusive value="914400"/>
      <maxInclusive value="51206400"/>
   </restriction>
</simpleType>
```

4.8.22 ST_SlideSizeType (Slide Size Type)

This type specifies the type of slide size that the slide should be optimized for.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
35mm (35mm Film)	Slide size should be optimized for 35mm film output
A3 (A3)	Slide size should be optimized for A3 output
A4 (A4)	Slide size should be optimized for A4 output
B4ISO (B4ISO)	Slide size should be optimized for B4ISO output
B4JIS (B4JIS)	Slide size should be optimized for B4JIS output

Enumeration Value	Description
B5ISO (B5ISO)	Slide size should be optimized for B5ISO output
B5JIS (B5JIS)	Slide size should be optimized for B5JIS output
banner (Banner)	Slide size should be optimized for banner output
custom (Custom)	Slide size should be optimized for custom output
hagakiCard (Hagaki Card)	Slide size should be optimized for hagaki card output
ledger (Ledger)	Slide size should be optimized for ledger output
letter (Letter)	Slide size should be optimized for letter output
overhead (Overhead)	Slide size should be optimized for overhead output
screen16x10 (Screen 16x10)	Slide size should be optimized for 16x10 screen output
screen16x9 (Screen 16x9)	Slide size should be optimized for 16x9 screen output
screen4x3 (Screen 4x3)	Slide size should be optimized for 4x3 screen output

Referenced By
sldSz@type (§4.3.1.34)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SlideSizeType">
   <restriction base="xsd:token">
      <enumeration value="screen4x3"/>
      <enumeration value="letter"/>
      <enumeration value="A4"/>
      <enumeration value="35mm"/>
      <enumeration value="overhead"/>
      <enumeration value="banner"/>
      <enumeration value="custom"/>
      <enumeration value="ledger"/>
      <enumeration value="A3"/>
      <enumeration value="B4ISO"/>
      <enumeration value="B5ISO"/>
      <enumeration value="B4JIS"/>
      <enumeration value="B5JIS"/>
      <enumeration value="hagakiCard"/>
      <enumeration value="screen16x9"/>
      <enumeration value="screen16x10"/>
   </restriction>
</simpleType>
```

4.8.23 ST_SplitterBarState (Splitter Bar State)

This type specifies the state that the splitter bar should be shown in. The splitter bar separates a primary and secondary region within a viewing area.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
maximized (Max)	The primary region occupies the greatest amount of the viewing area allowed by the application.
minimized (Min)	The primary region occupies the least amount of the viewing area allowed by the application.
restored (Restored)	The primary region has a specific intermediate size.

Referenced By
normalViewPr@horzBarState (§4.3.2.6); normalViewPr@vertBarState (§4.3.2.6)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_SplitterBarState">
   <restriction base="xsd:token">
      <enumeration value="minimized"/>
      <enumeration value="restored"/>
      <enumeration value="maximized"/>
   </restriction>
</simpleType>
```

4.8.24 ST_TLAnimateBehaviorCalcMode (Time List Animate Behavior Calculate Mode)

This type specifies how the animation flows from point to point.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
discrete (Calc Mode Enum (Discrete))	Descrete
fmla (Calc Mode Enum (Formula))	Formula
lin (Calc Mode Enum (Linear))	Linear

Referenced By
anim@calcmode (§4.6.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLAnimateBehaviorCalcMode">
   <restriction base="xsd:token">
      <enumeration value="discrete"/>
      <enumeration value="lin"/>
      <enumeration value="fmla"/>
   </restriction>
</simpleType>
```

4.8.25 ST_TLAnimateBehaviorValueType (Time List Animate Behavior Value Types)

This type specifies the type of property value.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clr (Value Type Enum (Color))	Color
num (Value Type Enum (Number))	Number
str (Value Type Enum (String))	String

Referenced By
anim@valueType (§4.6.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLAnimateBehaviorValueType">
   <restriction base="xsd:token">
      <enumeration value="str"/>
      <enumeration value="num"/>
      <enumeration value="clr"/>
   </restriction>
</simpleType>
```

4.8.26 ST_TLAnimateColorDirection (Time List Animate Color Direction)

This type specifies the direction in which to interpolate the animation (clockwise or counterclockwise).

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ccw (Counter-Clockwise)	Counter-Clockwise
cw (Direction Enum (Clockwise))	Clockwise

Referenced By
animClr@dir (§4.6.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLAnimateColorDirection">
   <restriction base="xsd:token">
      <enumeration value="cw"/>
      <enumeration value="ccw"/>
   </restriction>
</simpleType>
```

4.8.27 ST_TLAnimateColorSpace (Time List Animate Color Space)

This type specifies the color space of the animation.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
hsl (Color Space Enum (HSL))	Hue, Saturation, Luminance
rgb (Color Space Enum (RGB))	Red, Green, Blue

Referenced By
animClr@clrSpc (§4.6.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLAnimateColorSpace">
   <restriction base="xsd:token">
      <enumeration value="rgb"/>
      <enumeration value="hsl"/>
   </restriction>
</simpleType>
```

4.8.28 ST_TLAnimateEffectTransition (Time List Animate Effect Transition)

This type specifies whether the effect is a transition in, transition out, or neither.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
in (Transition Enum (In))	In

Enumeration Value	Description
none (Transition Enum (None))	None
out (Transition Enum (Out))	Out

Referenced By
animEffect@transition (§4.6.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLAnimateEffectTransition">
   <restriction base="xsd:token">
      <enumeration value="in"/>
      <enumeration value="out"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

4.8.29 ST_TLAnimateMotionBehaviorOrigin (Time List Animate Motion Behavior Origin)

This type specifies what the origin of the motion path is relative to.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
layout (Origin Enum (Layout))	Layout
parent (Origin Enum (Parent))	Parent

Referenced By
animMotion@origin (§4.6.4)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLAnimateMotionBehaviorOrigin">
   <restriction base="xsd:token">
      <enumeration value="parent"/>
      <enumeration value="layout"/>
   </restriction>
</simpleType>
```

4.8.30 ST_TLAnimateMotionPathEditMode (Time List Animate Motion Path Edit Mode)

This type specifies how the motion path moves when the target element is moved.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fixed (Path Edit Mode Enum (Fixed))	Fixed
relative (Path Edit Mode Enum (Relative))	Relative

Referenced By
animMotion@pathEditMode (§4.6.4)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLAnimateMotionPathEditMode">
   <restriction base="xsd:token">
      <enumeration value="relative"/>
      <enumeration value="fixed"/>
   </restriction>
</simpleType>
```

4.8.31 ST_TLBehaviorAccumulateType (Behavior Accumulate Type)

This type makes a repeating animation build with each iteration when set to "always."

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
always (Accumulate Enum (Always))	Always
none (Accumulate Enum (None))	None

Referenced By
cBhvr@accumulate (§4.6.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLBehaviorAccumulateType">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="always"/>
   </restriction>
</simpleType>
```

4.8.32 ST_TLBehaviorAdditiveType (Behavior Additive Type)

This type specifies how to apply the animation values to the original value for the property.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
base (Additive Enum (Base))	Base
mult (Additive Enum (Multiply))	Multiply
none (None)	None
repl (Additive Enum (Replace))	Replace
sum (Additive Enum (Sum))	Sum

Referenced By
cBhvr@additive (§4.6.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLBehaviorAdditiveType">
   <restriction base="xsd:token">
      <enumeration value="base"/>
      <enumeration value="sum"/>
      <enumeration value="repl"/>
      <enumeration value="mult"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

4.8.33 ST_TLBehaviorOverrideType (Behavior Override Type)

This type specifies how a behavior should override values of the attribute being animated on the target element. The "childStyle" will clear the attributes on the children contained inside the target element.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
childStyle (Override Enum (Child Style))	Child Style
normal (Override Enum (Normal))	Normal

Referenced By
cBhvr@override (§4.6.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLBehaviorOverrideType">
   <restriction base="xsd:token">
      <enumeration value="normal"/>
      <enumeration value="childStyle"/>
   </restriction>
</simpleType>
```

4.8.34 ST_TLBehaviorTransformType (Behavior Transform Type)

This type specifies how the behavior animates the target element.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
img (Image)	Image transform
pt (Point)	Point transform

Referenced By
cBhvr@xfrmType (§4.6.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLBehaviorTransformType">
   <restriction base="xsd:token">
      <enumeration value="pt"/>
      <enumeration value="img"/>
   </restriction>
</simpleType>
```

4.8.35 ST_TLChartSubelementType (Chart Subelement Type)

This type defines an animation target element that is represented by a subelement of a chart.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
category (Chart Build Element Type Enum (Category))	Category
gridLegend (Chart Build Element Type Enum (Grid Legend))	Background Element (Grid and Legend)
ptInCategory (Chart Build Element Type Enum (Point in Cat))	Category Element
ptInSeries (Chart Build Element Type Enum (Point in	Series Element

Enumeration Value	Description
Series))	
series (Chart Build Element Type Enum (Series))	Series

Referenced By
oleChartEl@type (§4.6.52)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLChartSubelementType">
   <restriction base="xsd:token">
      <enumeration value="gridLegend"/>
      <enumeration value="series"/>
      <enumeration value="category"/>
      <enumeration value="ptInSeries"/>
      <enumeration value="ptInCategory"/>
   </restriction>
</simpleType>
```

4.8.36 ST_TLCommandType (Command Type)

This type specifies a command type.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
call (Command Type Enum (Call))	Call
evt (Command Type Enum (Event))	Event
verb (Command Type Enum (Verb))	Verb

Referenced By
cmd@type (§4.6.28)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLCommandType">
   <restriction base="xsd:token">
      <enumeration value="evt"/>
      <enumeration value="call"/>
      <enumeration value="verb"/>
   </restriction>
</simpleType>
```

4.8.37 ST_TLDiagramBuildType (Diagram Build Types)

This type specifies the different diagram build types.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allAtOnce (Diagram Build Type Enum (All At Once))	All At Once
breadthByLvl (Diagram Build Type Enum (Breadth By Level))	Breadth By Level
breadthByNode (Diagram Build Type Enum (Breadth By Node))	Breadth By Node
ccw (Diagram Build Type Enum (Counter-Clockwise))	Counter-Clockwise
ccwIn (Diagram Build Type Enum (Counter-Clockwise-In))	Counter-Clockwise-In
ccwOut (Diagram Build Type Enum (Counter-Clockwise-Out))	Counter-Clockwise-Out
cust (Diagram Build Type Enum (Custom))	Custom
cw (Diagram Build Type Enum (Clockwise))	Clockwise
cwIn (Diagram Build Type Enum (Clockwise-In))	Clockwise-In
cwOut (Diagram Build Type Enum (Clockwise-Out))	Clockwise-Out
depthByBranch (Diagram Build Type Enum (Depth By Branch))	Depth By Branch
depthByNode (Diagram Build Type Enum (Depth By Node))	Depth By Node
down (Diagram Build Type Enum (Down))	Down
inByRing (Diagram Build Type Enum (In-By-Ring))	In-By-Ring
outByRing (Diagram Build Type Enum (Out-By-Ring))	Out-By-Ring
up (Diagram Build Type Enum (Up))	Up
whole (Diagram Build Type Enum (Whole))	Whole

Referenced By
bldDgm@bld (§4.6.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLDiagramBuildType">
   <restriction base="xsd:token">
      <enumeration value="whole"/>
      <enumeration value="depthByNode"/>
      <enumeration value="depthByBranch"/>
      <enumeration value="breadthByNode"/>
      <enumeration value="breadthByLvl"/>
      <enumeration value="cw"/>
      <enumeration value="cwIn"/>
      <enumeration value="cwOut"/>
      <enumeration value="ccw"/>
      <enumeration value="ccwIn"/>
      <enumeration value="ccwOut"/>
      <enumeration value="inByRing"/>
      <enumeration value="outByRing"/>
      <enumeration value="up"/>
      <enumeration value="down"/>
      <enumeration value="allAtOnce"/>
      <enumeration value="cust"/>
   </restriction>
</simpleType>
```

4.8.38 ST_TLNextActionType (Next Action Type)

This type specifies what to do when going forward in a sequence. When the value is "seek," it will seek the current child element to its natural end time before advancing to the next element.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
none (Next Action Type Enum (None))	None
seek (Next Action Type Enum (Seek))	Seek

Referenced By
seq@nextAc (§4.6.65)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLNextActionType">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="seek"/>
   </restriction>
</simpleType>
```

4.8.39 ST_TLOleChartBuildType (Embedded Chart Build Type)

This type describes how to build an embedded Chart.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allAtOnce (Chart Build Type Enum (All At Once))	All At Once
category (Chart Build Type Enum (Category))	By Category
categoryEl (Chart Build Type Enum (Category Element))	By Category Element
series (Chart Build Type Enum (Series))	By Series
seriesEl (Chart Build Type Enum (Series Element))	By Series Element

Referenced By
bldOleChart@bld (§4.6.15)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLOleChartBuildType">
   <restriction base="xsd:token">
      <enumeration value="allAtOnce"/>
      <enumeration value="series"/>
      <enumeration value="category"/>
      <enumeration value="seriesEl"/>
      <enumeration value="categoryEl"/>
   </restriction>
</simpleType>
```

4.8.40 ST_TLParaBuildType (Paragraph Build Type)

This type describes how to build a paragraph.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allAtOnce (All At Once)	Specifies to animate all paragraphs at once.
cust (Custom)	Specifies the build has custom user settings.
p (Paragraph)	Specifies to animate paragraphs grouped by bullet level.
whole (Whole)	Specifies to animate the entire body of text as one

Enumeration Value	Description
	block.

Referenced By
bldP@build (§4.6.16)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLParaBuildType">
   <restriction base="xsd:token">
      <enumeration value="allAtOnce"/>
      <enumeration value="p"/>
      <enumeration value="cust"/>
      <enumeration value="whole"/>
   </restriction>
</simpleType>
```

4.8.41 ST_TLPreviousActionType (Previous Action Type)

This type specifies what to do when going backwards in a sequence. When the value is "skipTimed," the sequence will continue to go backwards until it reaches a sequence element that was defined to being only on a "next" event.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
none (Previous Action Type Enum (None))	None
skipTimed (Previous Action Type Enum (Skip Timed))	Skip Timed

Referenced By
seq@prevAc (§4.6.65)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLPreviousActionType">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="skipTimed"/>
   </restriction>
</simpleType>
```

4.8.42 ST_TLTime (Time)

This type specifies time after which to automatically advance the build to the next step. An amount of time, in milliseconds.

This simple type is defined as a union of the following types:

- TheXML Schema unsignedInt datatype.
- TheST_TLTimeIndefinite simple type (§4.8.44).

Referenced By
bldP@advAuto (§4.6.16); cond@delay (§4.6.31); cTn@dur (§4.6.33); cTn@repeatCount (§4.6.33); cTn@repeatDur (§4.6.33); endSync@delay (§4.6.39); tmAbs@val (§4.6.82)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTime">
   <union memberTypes="xsd:unsignedInt ST_TLTimeIndefinite"/>
</simpleType>
```

4.8.43 ST_TLTimeAnimateValueTime (Animation Time)

This type specifies a percentage within the time span of the element. A value of indefinite means the attribute should be ignored.

This simple type is defined as a union of the following types:

- TheST_PositiveFixedPercentage simple type (§5.1.12.45).
- TheST_TLTimeIndefinite simple type (§4.8.44).

Referenced By
tav@tm (§4.6.79)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeAnimateValueTime">
   <union memberTypes="a:ST_PositiveFixedPercentage ST_TLTimeIndefinite"/>
</simpleType>
```

4.8.44 ST_TLTimeIndefinite (Indefinite Time Declaration)

This type specifies a value that designates an "indefinite" amount time -- typically means this property is subordinate to other, defined properties.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
indefinite (Indefinite Type Enum)	Specifies Indefinite Time

Referenced By

Referenced By
ST_TLTime (§4.8.42); ST_TLTimeAnimateValueTime (§4.8.43)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeIndefinite">
   <restriction base="xsd:token">
      <enumeration value="indefinite"/>
   </restriction>
</simpleType>
```

4.8.45 ST_TLTimeNodeFillType (Time Node Fill Type)

This type specifies what modifications the effect leaves on the target element's properties when the effect ends.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
freeze (Freeze)	Freeze
hold (TimeNode Fill Type Enum (Hold))	Hold
remove (Remove)	Remove
transition (Transition)	Transition

Referenced By
cTn@fill (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeFillType">
   <restriction base="xsd:token">
      <enumeration value="remove"/>
      <enumeration value="freeze"/>
      <enumeration value="hold"/>
      <enumeration value="transition"/>
   </restriction>
</simpleType>
```

4.8.46 ST_TLTimeNodeID (Time Node ID)

This type represents a node or event on the timeline by its identifier.

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
cTn@id (§4.6.33); tn@val (§4.6.86)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeID">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

4.8.47 ST_TLTimeNodeMasterRelation (Time Node Master Relation)

This type specifies how the time node plays back relative to its master time node.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
lastClick (TimeNode Master Relation Enum (Last Click))	Last Click
nextClick (TimeNode Master Relation Enum (Next Click))	Next Click
sameClick (TimeNode Master Relation Enum (Same Click))	Same Click

Referenced By
cTn@masterRel (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeMasterRelation">
   <restriction base="xsd:token">
      <enumeration value="sameClick"/>
      <enumeration value="lastClick"/>
      <enumeration value="nextClick"/>
   </restriction>
</simpleType>
```

4.8.48 ST_TLTimeNodePresetClassType (Time Node Preset Class Type)

This type specifies the class of effect in which this effect belongs.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
emph (Preset Type Enum (Emphasis))	Emphasis Preset
entr (Preset Type Enum (Entrance))	Entrance Preset
exit (Exit)	Exit Preset

Enumeration Value	Description
mediacall (Preset Type Enum (Media Call))	Media Call Preset
path (Preset Type Enum (Path))	Path Preset
verb (Preset Type Enum (Verb))	Verb Preset

Referenced By
cTn@presetClass (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodePresetClassType">
   <restriction base="xsd:token">
      <enumeration value="entr"/>
      <enumeration value="exit"/>
      <enumeration value="emph"/>
      <enumeration value="path"/>
      <enumeration value="verb"/>
      <enumeration value="mediacall"/>
   </restriction>
</simpleType>
```

4.8.49 ST_TLTimeNodeRestartType (Time Node Restart Type)

This type determines whether an effect can play more than once.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
always (Restart Enum (Always))	Always restart node
never (Restart Enum (Never))	Never restart node
whenNotActive (Restart Enum (When Not Active))	Restart when node is not active

Referenced By
cTn@restart (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeRestartType">
   <restriction base="xsd:token">
      <enumeration value="always"/>
      <enumeration value="whenNotActive"/>
      <enumeration value="never"/>
   </restriction>
</simpleType>
```

4.8.50 ST_TLTimeNodeSyncType (Time Node Sync Type)

This type specifies how the time node synchronizes to its group.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
canSlip (TimeNode Sync Enum (Can Slip))	Can Slip
locked (TimeNode Sync Enum (Locked))	Locked

Referenced By
cTn@syncBehavior (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeSyncType">
   <restriction base="xsd:token">
      <enumeration value="canSlip"/>
      <enumeration value="locked"/>
   </restriction>
</simpleType>
```

4.8.51 ST_TLTimeNodeType (Time Node Type)

This type specifies time node types.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
afterEffect (Node Type Enum (After Effect))	After Effect
afterGroup (Node Type Enum (After Group))	After Group
clickEffect (Node Type Enum (Click Effect))	Click Effect
clickPar (Node Type Enum (Click Paragraph))	Click Paragraph
interactiveSeq (Node Type Enum (Interactive Sequence))	Interactive Sequence
mainSeq (Node Type Enum (Main Sequence))	Main Sequence
tmRoot (Node Type Enum (Timing Root))	Timing Root
withEffect (Node Type Enum (With Effect))	With Effect
withGroup (Node Type Enum (With Group))	With Group

Referenced By
cTn@nodeType (§4.6.33)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTimeNodeType">
   <restriction base="xsd:token">
      <enumeration value="clickEffect"/>
      <enumeration value="withEffect"/>
      <enumeration value="afterEffect"/>
      <enumeration value="mainSeq"/>
      <enumeration value="interactiveSeq"/>
      <enumeration value="clickPar"/>
      <enumeration value="withGroup"/>
      <enumeration value="afterGroup"/>
      <enumeration value="tmRoot"/>
   </restriction>
</simpleType>
```

4.8.52 ST_TLTriggerEvent (Trigger Event)

This type specifies a particular event that causes the time condition to be true.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
begin (Trigger Event Enum (Begin))	Fire trigger at the beginning
end (Trigger Event Enum (End))	Fire trigger at the end
onBegin (Trigger Event Enum (On Begin))	Fire trigger at the beginning
onClick (Trigger Event Enum (On Click))	Fire trigger on a mouse click
onDblClick (Trigger Event Enum (On Double Click))	Fire trigger on double-mouse click
onEnd (Trigger Event Enum (On End))	Fire trigger at the end
onMouseOut (Trigger Event Enum (On Mouse Out))	Fire trigger on mouse out
onMouseOver (Trigger Event Enum (On Mouse Over))	Fire trigger on mouse over
onNext (Trigger Event Enum (On Next))	Fire trigger on next node
onPrev (Trigger Event Enum (On Previous))	Fire trigger on previous node
onStopAudio (Trigger Event Enum (On Stop Audio))	Fire trigger on stop audio

Referenced By
cond@evt (§4.6.31); endSync@evt (§4.6.39)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTriggerEvent">
   <restriction base="xsd:token">
      <enumeration value="onBegin"/>
      <enumeration value="onEnd"/>
      <enumeration value="begin"/>
      <enumeration value="end"/>
      <enumeration value="onClick"/>
      <enumeration value="onDblClick"/>
      <enumeration value="onMouseOver"/>
      <enumeration value="onMouseOut"/>
      <enumeration value="onNext"/>
      <enumeration value="onPrev"/>
      <enumeration value="onStopAudio"/>
   </restriction>
</simpleType>
```

4.8.53 ST_TLTriggerRuntimeNode (Trigger RunTime Node)

This type specifies the child time node that triggers a time condition. References a child TimeNode or all child nodes. Order is based on the child's end time.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (Trigger RunTime Node Enum (All))	All
first (Trigger RunTime Node (First))	First
last (Trigger RunTime Node (Last))	Last

Referenced By
rtn@val (§4.6.64)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TLTriggerRuntimeNode">
   <restriction base="xsd:token">
      <enumeration value="first"/>
      <enumeration value="last"/>
      <enumeration value="all"/>
   </restriction>
</simpleType>
```

4.8.54 ST_TransitionCornerDirectionType (Transition Corner Direction Type)

This type specifies diagonal directions for slide transitions.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ld (Transition Corner Direction Enum (Left-Down))	Specifies the slide transition direction of left-down
lu (Transition Corner Direction Enum (Left-Up))	Specifies the slide transition direction of left-up
rd (Transition Corner Direction Enum (Right-Down))	Specifies the slide transition direction of right-down
ru (Transition Corner Direction Enum (Right-Up))	Specifies the slide transition direction of right-up

Referenced By
ST_TransitionEightDirectionType (§4.8.55); strips@dir (§4.6.74)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TransitionCornerDirectionType">
   <restriction base="xsd:token">
      <enumeration value="lu"/>
      <enumeration value="ru"/>
      <enumeration value="ld"/>
      <enumeration value="rd"/>
   </restriction>
</simpleType>
```

4.8.55 ST_TransitionEightDirectionType (Transition Eight Direction)

This type specifies the direction of an animation.

This simple type is defined as a union of the following types:

- TheST_TransitionSideDirectionType simple type (§4.8.57).
- TheST_TransitionCornerDirectionType simple type (§4.8.54).

Referenced By
cover@dir (§4.6.32); pull@dir (§4.6.58)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TransitionEightDirectionType">
   <union memberTypes="ST_TransitionSideDirectionType ST_TransitionCornerDirectionType"/>
</simpleType>
```

4.8.56 ST_TransitionInOutDirectionType (Transition In/Out Direction Type)

This type specifies if a slide transition should go in or out.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
in (Transition In/Out Direction Enum (In))	Specifies the slide transition should go in
out (Transition In/Out Direction Enum (Out))	Specifies the slide transition should go out

Referenced By
split@dir (§4.6.71); zoom@dir (§4.6.97)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TransitionInOutDirectionType">
   <restriction base="xsd:token">
      <enumeration value="out"/>
      <enumeration value="in"/>
   </restriction>
</simpleType>
```

4.8.57 ST_TransitionSideDirectionType (Transition Slide Direction Type)

This type defines a set of slide transition directions.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
d (Transition Slide Direction Enum (Down))	Specifies that the transition direction is down
l (Transition Slide Direction Enum (Left))	Specifies that the transition direction is left
r (Transition Slide Direction (Right))	Specifies that the transition direction is right
u (Transition Slide Direction Enum (Up))	Specifies that the transition direction is up

Referenced By
push@dir (§4.6.59); ST_TransitionEightDirectionType (§4.8.55); wipe@dir (§4.6.96)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TransitionSideDirectionType">
   <restriction base="xsd:token">
      <enumeration value="l"/>
      <enumeration value="u"/>
      <enumeration value="r"/>
      <enumeration value="d"/>
   </restriction>
</simpleType>
```

4.8.58 ST_TransitionSpeed (Transition Speed)

This simple type defines the allowed transition speeds for transitioning from the current slide to the next.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
fast (Fast)	Fast slide transition.
med (Medium)	Medium slide transition.
slow (low)	Slow slide transition.

Referenced By
transition@spd (§4.4.1.46)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TransitionSpeed">
   <restriction base="xsd:token">
      <enumeration value="slow"/>
      <enumeration value="med"/>
      <enumeration value="fast"/>
   </restriction>
</simpleType>
```

4.8.59 ST_ViewType (List of View Types)

This type specifies the type of view that should be used when displaying the presentation document to the user.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
handoutView (Handout View)	Handout View mode should be used.
notesMasterView (Notes Master View)	Notes Master View mode should be used.
notesView (Notes View)	Notes View mode should be used.
outlineView (Outline View)	Outline View mode should be used.
sldMasterView (Slide Master View)	Slide Master View mode should be used.
sldSorterView (Slide Sorter View)	Slide Sorter View mode should be used.
sldThumbnailView (Slide Thumbnail View)	Slide Thumbnail View mode should be used.
sldView (Normal Slide View)	Normal Slide View mode should be used.

Referenced By
viewPr@lastView (§4.3.2.18)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ViewType">
   <restriction base="xsd:token">
      <enumeration value="sldView"/>
      <enumeration value="sldMasterView"/>
      <enumeration value="notesView"/>
      <enumeration value="handoutView"/>
      <enumeration value="notesMasterView"/>
      <enumeration value="outlineView"/>
      <enumeration value="sldSorterView"/>
      <enumeration value="sldThumbnailView"/>
   </restriction>
</simpleType>
```

4.8.60 ST_WebColorType (HTML Slide Navigation Control Colors)

This type specifies the coloring that should be used when outputting to web formats.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
blackTextOnWhite (Black Text on White Colors)	Black Text on White coloring should be used.
browser (Browser Colors)	Browser coloring should be used.
none (Non-specific Colors)	No specific coloring has been specified.
presentationAccent (Presentation Accent Colors)	Presentation accent coloring should be used.
presentationText (Presentation Text Colors)	Presentation text coloring should be used.
whiteTextOnBlack (White Text on Black Colors)	White text on black coloring should be used.

Referenced By
webPr@clr (§4.3.1.36)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WebColorType">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="browser"/>
      <enumeration value="presentationText"/>
      <enumeration value="presentationAccent"/>
      <enumeration value="whiteTextOnBlack"/>
      <enumeration value="blackTextOnWhite"/>
   </restriction>
</simpleType>
```

4.8.61 ST_WebEncoding (Web Encoding)

This type specifies a string representing the HTML character set used when outputting to web formats.

This simple type's contents are a restriction of the XML Schema string datatype.

Referenced By
webPr@encoding (§4.3.1.36)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WebEncoding">
   <restriction base="xsd:string"/>
</simpleType>
```

4.8.62 ST_WebScreenSize (HTML/Web Screen Size Target)

This type specifies the intended screen resolution for output to web formats.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
1024x768 (HTML/Web Size Enumeration 1024x768)	Screen size is 1024x768 pixels
1152x882 (HTML/Web Size Enumeration 1152x882)	Screen size is 1152x882 pixels
1152x900 (HTML/Web Size Enumeration 1152x900)	Screen size is 1152x900 pixels
1280x1024 (HTML/Web Size Enumeration 1280x1024)	Screen size is 1280x1024 pixels
1600x1200 (HTML/Web Size Enumeration 1600x1200)	Screen size is 1600x1200 pixels
1800x1400 (HTML/Web Size Enumeration 1800x1400)	Screen size is 1800x1400 pixels
1920x1200 (HTML/Web Size Enumeration 1920x1200)	Screen size is 1920x1200 pixels

Enumeration Value	Description
544x376 (HTML/Web Size Enumeration 544x376)	Screen size is 544x376 pixels
640x480 (HTML/Web Size Enumeration 640x480)	Screen size is 640x480 pixels
720x512 (HTML/Web Size Enumeration 720x515)	Screen size is 720x512 pixels
800x600 (HTML/Web Size Enumeration 800x600)	Screen size is 800x600 pixels

Referenced By
webPr@imgSz (§4.3.1.36)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WebScreenSize">
   <restriction base="xsd:token">

      <enumeration value="1920x1200"/>
   </restriction>
</simpleType>
```

5. DrawingML Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising DrawingML content, which may be used within the contents of WordprocessingML, SpreadsheetML, or PresentationML documents.

5.1 DrawingML - Main

The DrawingML Main namespace defines all of the base constructs for all types of DrawingML objects (charts, diagrams, shapes, pictures, and so on). These constructs and primitives are defined below.

5.1.1 Table of Contents

This subclause is informative.

End of informative text.

5.1.2 Basics

This section describes all the basic common elements associated with the DrawingML framework.

5.1.2.1 Core Drawing Object Information

Within DrawingML, there is the notion of core drawing elements. These are elements that both are vital to and common across the DrawingML framework. These elements denote the most integral pieces of the DrawingML document structure and thus are among the most widely used.

[*Note*: Measurement Units - Length units shall be expressed in device-independent physical units: English Metric units (EMUs), points, picas, and inches. Device-dependent units such as pixels shall not be used. *end note*]

5.1.2.1.1 bldChart (Build Chart)

This element specifies how to build the animation for a diagram.

[*Example*: Consider the following example where a chart is specified to be animated by category rather than as one entity. Thus, the bldChart element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bdldLst>
```

end example]

Parent Elements
bldSub (§4.6.17)

Attributes	Description
animBg (Animate Background)	Specifies whether or not the chart background elements should be animated as well. An example of background elements are grid lines and the chart legend. The possible values for this attribute are defined by the XML Schema boolean datatype.
bld (Build)	Specifies how the chart will be built. The animation will animate the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_AnimationChartBuildType simple type (§5.1.12.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimationChartBuildProperties">
   <attribute name="bld" type="ST_AnimationChartBuildType" use="optional" default="allAtOnce"/>
   <attribute name="animBg" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.1.2.1.2 bldDgm (Build Diagram)

This element specifies how to build the animation for a diagram.

[*Example*: Consider having a diagram appear as on entity as opposed to by section. The bldDgm element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldDgm bld="one"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bdldLst>
```

end example]

Parent Elements
bldSub (§4.6.17)

Attributes	Description
bld (Build)	Specifies how the chart will be built. The animation will animate the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_AnimationDgmBuildType simple type (§5.1.12.7).
rev (Reverse Animation)	Specifies whether the animation of the objects in this diagram should be reversed or not. If this attribute is not specified, a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimationDgmBuildProperties">
   <attribute name="bld" type="ST_AnimationDgmBuildType" use="optional" default="allAtOnce"/>
   <attribute name="rev" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.3 chart (Chart to Animate)

This element specifies a reference to a chart that should be animated within a sequence of slide animations. In addition to simply acting as a reference to a chart there is also animation build steps defined.

Parent Elements
graphicEl (§4.6.45)

Attributes	Description
bldStep (Animation Build Step)	Specifies which step this part of the chart should be built using. For instance the chart can be built as one object meaning it will be animated as a single graphic. Alternatively the chart can be animated, or built as separate pieces. The possible values for this attribute are defined by the ST_ChartBuildStep simple type (§5.1.12.13).
categoryIdx (Category Index)	Specifies the index of the category within the corresponding chart that should be animated. The possible values for this attribute are defined by the XML Schema int datatype.
seriesIdx (Series Index)	Specifies the index of the series within the corresponding chart that should be animated.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimationChartElement">
   <attribute name="seriesIdx" type="xsd:int" use="optional" default="-1"/>
   <attribute name="categoryIdx" type="xsd:int" use="optional" default="-1"/>
   <attribute name="bldStep" type="ST_ChartBuildStep" use="required"/>
</complexType>
```

5.1.2.1.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties for a connector shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvCxnSpPr (§5.1.2.1.25)

Child Elements	Subclause
cxnSpLocks (Connection Shape Locks)	§5.1.2.1.11
endCxn (Connection End)	§5.1.2.1.13
extLst (Extension List)	§5.1.2.1.15
stCxn (Connection Start)	§5.1.2.1.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualConnectorProperties">
   <sequence>
      <element name="cxnSpLocks" type="CT_ConnectorLocking" minOccurs="0" maxOccurs="1"/>
      <element name="stCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
      <element name="endCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGraphicFramePr (§5.1.2.1.26)

Child Elements	Subclause

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGraphicFrameProperties">
   <sequence>
      <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
        maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

Parent Elements
nvGrpSpPr (§5.1.2.1.27)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
grpSpLocks (Group Shape Locks)	§5.1.2.1.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGroupDrawingShapeProps">
   <sequence>
      <element name="grpSpLocks" type="CT_GroupLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.7 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  …
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <p:nvPr/>
  </p:nvPicPr>
  …
</p:pic>
```

end example]

Parent Elements
nvPicPr (§5.1.2.1.28)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
picLocks (Picture Locks)	§5.1.2.1.31

Attributes	Description
preferRelativeResize (Relative Resize Preferred)	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be relative to the original picture size as opposed to the current picture size. [*Example*: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked. If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualPictureProperties">
   <sequence>
      <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.1.2.1.8 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  …
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  </p:nvPicPr>
  …
</p:pic>
```

end example]

Parent Elements
nvCxnSpPr (§5.1.2.1.25); nvGraphicFramePr (§5.1.2.1.26); nvGrpSpPr (§5.1.2.1.27); nvPicPr (§5.1.2.1.28); nvSpPr (§5.1.2.1.29)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

Attributes	Description
descr (Alternative Text for Object)	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">`

Attributes	Description
	The descr attribute contains alternative text which may be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hidden (Hidden)	Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [*Note*: An application may have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden). [*Example*: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Unique Identifier)	Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant. [*Example*: Consider a DrawingML object defined as follows: `<… id="10" … >` The id attribute has a value of 10, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
name (Name)	Specifies the name of the object. [*Note*: Typically, this will be used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: `< … name="foo.jpg" >`

Attributes	Description
	The name attribute has a value of foo.jpg, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingProps">
   <sequence>
      <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_DrawingElementId" use="required"/>
   <attribute name="name" type="xsd:string" use="required"/>
   <attribute name="descr" type="xsd:string" use="optional" default=""/>
   <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.9 cNvSpPr (Non-Visual Shape Drawing Properties)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with

[*Example*: Consider the shape that has a shape lock applied to it.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 1"/>
    <p:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </p:cNvSpPr>
  </p:nvSpPr>
…
</p:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *end example*]

Parent Elements
nvSpPr (§5.1.2.1.29)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Child Elements	Subclause
spLocks (Shape Locks)	§5.1.2.1.34

Attributes	Description
txBox (Text Box)	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box. [*Note*: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingShapeProps">
   <sequence>
      <element name="spLocks" type="CT_ShapeLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="txBox" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.10 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector will take. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[*Example*: Consider the following connector shape that connects two regular shapes.

```
<p:spTree>
```

```
…
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="1" name="Rectangle 1"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  …
</p:sp>
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 2"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  …
</p:sp>
<p:cxnSp>
  <p:nvCxnSpPr>
    <p:cNvPr id="3" name="Elbow Connector 3"/>
    <p:cNvCxnSpPr>
      <a:stCxn id="1" idx="3"/>
      <a:endCxn id="2" idx="1"/>
    </p:cNvCxnSpPr>
    <p:nvPr/>
  </p:nvCxnSpPr>
  …
</p:cxnSp>
</p:spTree>
```

end example]

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
nvCxnSpPr (Non-Visual Properties for a Connection Shape)	§5.1.2.1.25
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlConnector">
   <sequence>
      <element name="nvCxnSpPr" type="CT_GvmlConnectorNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.11 cxnSpLocks (Connection Shape Locks)

This element specifies all locking properties for a connection shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvCxnSpPr (§5.6.2.4); cNvCxnSpPr (§4.4.1.8); cNvCxnSpPr (§5.8.2.3); cNvCxnSpPr (§5.1.2.1.4)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeArrowheads (Disallow Arrowhead Changes)	Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeShapeType (Disallow Shape Type Change)	Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noEditPoints	Specifies that the generating application should not allow shape point changes for the

Attributes	Description
(Disallow Shape Point Editing)	corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noMove (Disallow Shape Movement)	Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noResize (Disallow Shape Resize)	Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noRot (Disallow Shape Rotation)	Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConnectorLocking">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_Locking"/>
</complexType>
```

5.1.2.1.12 dgm (Diagram to Animate)

This element specifies a reference to a diagram that should be animated within a sequence of slide animations. In addition to simply acting as a reference to a diagram there is also animation build steps defined.

Parent Elements

Parent Elements
graphicEl (§4.6.45)

Attributes	Description
bldStep (Animation Build Step)	Specifies which step this part of the diagram should be built using. For instance the diagram can be built as one object meaning it will be animated as a single graphic. Alternatively the diagram can be animated, or built as separate pieces. The possible values for this attribute are defined by the ST_DgmBuildStep simple type (§5.1.12.18).
id (Identifier)	Specifies the GUID of the shape for this build step in the animation. The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnimationDgmElement">
   <attribute name="id" type="ST_Guid" use="optional" default="{00000000-0000-0000-0000-
     000000000000}"/>
   <attribute name="bldStep" type="ST_DgmBuildStep" use="optional" default="sp"/>
</complexType>
```

5.1.2.1.13 endCxn (Connection End)

This element specifies the ending connection that should be made by the corresponding connector shape. This connects the end tail of the connector to the final destination shape.

Parent Elements
cNvCxnSpPr (§5.6.2.4); cNvCxnSpPr (§4.4.1.8); cNvCxnSpPr (§5.8.2.3); cNvCxnSpPr (§5.1.2.1.4)

Attributes	Description
id (Identifier)	Specifies the id of the shape to make the final connection to. The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
idx (Index)	Specifies the index into the connection site table of the final connection shape. That is there are many connection sites on a shape and it must be specified which connection site the corresponding connector shape should connect to. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connection">
   <attribute name="id" type="ST_DrawingElementId" use="required"/>
   <attribute name="idx" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.1.2.1.14 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that will be used for later versions of generating applications.

Parent Elements
extLst (§5.1.2.1.15); extLst (§5.9.2.13)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OfficeArtExtension">
   <sequence>
      <any processContents="lax"/>
   </sequence>
   <attribute name="uri" type="xsd:token"/>
</complexType>
```

5.1.2.1.15 extLst (Extension List)

This element specifies the extension list within which all future extensions of type ext will be defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the DrawingML framework. This allows for various new types of data to be stored natively within the framework.

Parent Elements

Child Elements	Subclause
ext (Extension)	§5.1.2.1.14

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OfficeArtExtensionList">
   <sequence>
      <group ref="EG_OfficeArtExtensionList" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.16 graphic (Graphic Object)

This element specifies the existence of a single graphic object. Document authors should refer to this element when they wish to persist a graphical object of some kind. The specification for this graphical object will be provided entirely by the document author and referenced within the graphicData child element.

Parent Elements
anchor (§5.5.2.3); graphicFrame (§5.1.2.1.18); graphicFrame (§5.8.2.12); graphicFrame (§5.6.2.15); graphicFrame (§4.4.1.18); inline (§5.5.2.8)

Child Elements	Subclause

Child Elements	Subclause
graphicData (Graphic Object Data)	§5.1.2.1.17

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObject">
   <sequence>
      <element name="graphicData" type="CT_GraphicalObjectData"/>
   </sequence>
</complexType>
```

5.1.2.1.17 graphicData (Graphic Object Data)

This element specifies the reference to a graphic object within the document. This graphic object is provided entirely by the document authors who choose to persist this data within the document.

[*Note*: Depending on the type of graphical object used not every generating application that supports the OOXML framework will have the ability to render the graphical object. *end note*]

Parent Elements
graphic (§5.1.2.1.16)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectData">
   <sequence>
      <any minOccurs="0" maxOccurs="unbounded" processContents="strict"/>
   </sequence>
   <attribute name="uri" type="xsd:token"/>
</complexType>
```

5.1.2.1.18 graphicFrame (Graphic Frame)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphic (Graphic Object)	§5.1.2.1.16
nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)	§5.1.2.1.26
xfrm (2D Transform for Individual Objects)	§5.1.9.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlGraphicalObjectFrame">
   <sequence>
      <element name="nvGraphicFramePr" type="CT_GvmlGraphicFrameNonVisual" minOccurs="1"
        maxOccurs="1"/>
      <element ref="graphic" minOccurs="1" maxOccurs="1"/>
      <element name="xfrm" type="CT_Transform2D" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.19 graphicFrameLocks (Graphic Frame Locks)

This element specifies all locking properties for a graphic frame. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvGraphicFramePr (§4.4.1.9); cNvGraphicFramePr (§5.5.2.4); cNvGraphicFramePr (§5.8.2.4); cNvGraphicFramePr (§5.6.2.5); cNvGraphicFramePr (§5.1.2.1.5)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noDrilldown (Disallow Selection of Child Shapes)	Specifies that the generating application should not allow selecting of objects within the corresponding graphic frame but allow selecting of the graphic frame itself. If this attribute is not specified, then a value of false is assumed.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the generating application should not allow shape grouping for the corresponding graphic frame. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noMove (Disallow Shape Movement)	Specifies that the corresponding graphic frame cannot be moved. Objects that reside within the graphic frame can still be moved unless they also have been locked. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noResize (Disallow Shape Resize)	Specifies that the generating application should not allow size changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the generating application should not allow selecting of the corresponding picture. That means also that no picture, shapes or text attached to this picture can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. [*Note*: If this attribute is specified to be true then the graphic frame cannot be selected and the objects within the graphic frame cannot be selected as well. That is the entire graphic frame including all sub-parts are considered un-selectable. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectFrameLocking">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="noGrp" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noDrilldown" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noSelect" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noChangeAspect" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noMove" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noResize" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.20 grpSp (Group shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are

specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[*Example*: Consider the following group shape.

```
<p:grpSp>
  <p:nvGrpSpPr>
    <p:cNvPr id="10" name="Group 9"/>
    <p:cNvGrpSpPr/>
    <p:nvPr/>
  </p:nvGrpSpPr>
  <p:grpSpPr>
    <a:xfrm>
      <a:off x="838200" y="990600"/>
      <a:ext cx="2426208" cy="978408"/>
      <a:chOff x="838200" y="990600"/>
      <a:chExt cx="2426208" cy="978408"/>
    </a:xfrm>
  </p:grpSpPr>
  <p:sp>
  …
  </p:sp>
  <p:sp>
  …
  </p:sp>
  <p:sp>
  …
  </p:sp>
</p:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
cxnSp (Connection Shape)	§5.1.2.1.10
extLst (Extension List)	§5.1.2.1.15
graphicFrame (Graphic Frame)	§5.1.2.1.18
grpSp (Group shape)	§5.1.2.1.20

Child Elements	Subclause
grpSpPr (Visual Group Shape Properties)	§5.1.2.1.22
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§5.1.2.1.27
pic (Picture)	§5.1.2.1.30
sp (Shape)	§5.1.2.1.33
txSp (Text Shape)	§5.1.2.1.41

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlGroupShape">
   <sequence>
      <element name="nvGrpSpPr" type="CT_GvmlGroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="grpSpPr" type="CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
      <choice minOccurs="0" maxOccurs="unbounded">
         <element name="txSp" type="CT_GvmlTextShape"/>
         <element name="sp" type="CT_GvmlShape"/>
         <element name="cxnSp" type="CT_GvmlConnector"/>
         <element name="pic" type="CT_GvmlPicture"/>
         <element name="graphicFrame" type="CT_GvmlGraphicalObjectFrame"/>
         <element name="grpSp" type="CT_GvmlGroupShape"/>
      </choice>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.21 grpSpLocks (Group Shape Locks)

This element specifies all locking properties for a connection shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvGrpSpPr (§5.1.2.1.6); cNvGrpSpPr (§5.8.2.5); cNvGrpSpPr (§5.6.2.6); cNvGrpSpPr (§4.4.1.10)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the corresponding group shape cannot be grouped. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified,

Attributes	Description
	then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noMove (Disallow Moving Shape)	Specifies that the corresponding graphic frame cannot be moved. Objects that reside within the graphic frame can still be moved unless they also have been locked. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noResize (Disallow Shape Resizing)	Specifies that the corresponding group shape cannot be resized. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noRot (Disallow Shape Rotation)	Specifies that the corresponding group shape cannot be rotated Objects that reside within the group can still be rotated unless they also have been locked. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the corresponding group shape cannot have any part of it be selected. That means that no picture, shapes or attached text can be selected either if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. [*Note*: This property is inherited by sub-elements and thus all shapes within the group shape cannot be selected when this attribute is set to a value of true. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
noUngrp (Disallow Shape Ungrouping)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupLocking">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="noGrp" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noUngrp" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noSelect" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noRot" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noChangeAspect" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noMove" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="noResize" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.22 grpSpPr (Visual Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
xfrm (2D Transform for Grouped Objects)	§5.1.9.5

Attributes	Description
bwMode (Black and White Mode)	Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes will use when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_GroupTransform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

5.1.2.1.23 hlinkHover (Hyperlink for Hover)

This element specifies the hyperlink information to be activated when the user's mouse is hovered over the corresponding object. The operation of the hyperlink is to have the specified action be activated when the mouse of the user hovers over the object. When this action is activated then additional attributes can be used to specify other tasks that should be performed along with the action.

Parent Elements
cNvPr (§5.2.2.3); cNvPr (§5.8.2.7); cNvPr (§4.4.1.12); cNvPr (§5.6.2.8); cNvPr (§5.1.2.1.8); docPr (§5.5.2.5)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
snd (Hyperlink Sound)	§5.1.2.1.32

Attributes	Description
action (Action Setting)	Specifies an action that is to be taken when this hyperlink is activated. This may be used to specify a slide to be navigated to or a script of code to be run. The possible values for this attribute are defined by the XML Schema string datatype.
endSnd (End Sounds)	Specifies if the URL in question should stop all sounds that are playing when it is clicked. The possible values for this attribute are defined by the XML Schema boolean datatype.
highlightClick (Highlight Click)	Specifies if this attribute has already been used within this document. That is when a hyperlink has already been visited that this attribute would be utilized so the generating application may determine the color of this text. If this attribute is omitted, then a value of 0 or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.
history (Add Hyperlink to Page History)	Specifies whether to add this URI to the history when navigating to it. This allows for the viewing of this presentation without the storing of history information on the viewing machine. If this attribute is omitted, then a value of 1, or true is assumed.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Drawing Object Hyperlink Target) Namespace: .../officeDocument/2006/relationships	Specifies the relationship id that when looked up in this slides relationship file will contain the target of this hyperlink. This attribute cannot be omitted. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
invalidUrl (Invalid URL)	Specifies the URL when it has been determined by the generating application that the URL is invalid. That is the generating application may still store the URL but it is known that this URL is not correct. The possible values for this attribute are defined by the XML Schema string datatype.
tgtFrame (Target Frame)	Specifies the target frame that is to be used when opening this hyperlink. When the hyperlink is activated this attribute will be used to determine if a new window must be launched for viewing or if an existing one may be used. If this attribute is omitted, than a new window will be opened. The possible values for this attribute are defined by the XML Schema string datatype.
tooltip (Hyperlink Tooltip)	Specifies the tooltip that should be displayed when the hyperlink text is hovered over with the mouse. If this attribute is omitted, than the hyperlink text itself may be displayed. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlink">
   <sequence>
      <element name="snd" type="CT_EmbeddedWAVAudioFile" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:id" use="optional"/>
   <attribute name="invalidUrl" type="xsd:string" use="optional" default=""/>
   <attribute name="action" type="xsd:string" use="optional" default=""/>
   <attribute name="tgtFrame" type="xsd:string" use="optional" default=""/>
   <attribute name="tooltip" type="xsd:string" use="optional" default=""/>
   <attribute name="history" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="highlightClick" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="endSnd" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.24 ln (Outline)

This element specifies an outline style that can be applied to a number of different objects such as shapes and text. The line allows for the specifying of many different types of outlines including even line dashes and bevels.

Parent Elements
bottom (§5.1.4.2.6); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); insideH (§5.1.4.2.14); insideV (§5.1.4.2.15); left (§5.1.4.2.18); lnStyleLst (§5.1.4.1.21); right (§5.1.4.2.22); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tl2br (§5.1.4.2.31); top (§5.1.4.2.32); tr2bl (§5.1.4.2.33); whole (§5.9.3.9)

Child Elements	Subclause
bevel (Line Join Bevel)	§5.1.10.9
custDash (Custom Dash)	§5.1.10.21
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
headEnd (Line Head/End Style)	§5.1.10.38
miter (Miter Line Join)	§5.1.10.43
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstDash (Preset Dash)	§5.1.10.48
round (Round Line Join)	§5.1.10.52
solidFill (Solid Fill)	§5.1.10.54
tailEnd (Tail line end style)	§5.1.10.57

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type

Attributes	Description
	(§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
   <sequence>
      <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
      <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="w" type="ST_LineWidth" use="optional"/>
   <attribute name="cap" type="ST_LineCap" use="optional"/>
   <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
   <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

5.1.2.1.25 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

Parent Elements
cxnSp (§5.1.2.1.10)

Child Elements	Subclause
cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)	§5.1.2.1.4
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlConnectorNonVisual">
   <sequence>
      <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvCxnSpPr" type="CT_NonVisualConnectorProperties" minOccurs="1"
        maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.26 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic

frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

Parent Elements
graphicFrame (§5.1.2.1.18)

Child Elements	Subclause
cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)	§5.1.2.1.5
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlGraphicFrameNonVisual">
   <sequence>
      <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGraphicFramePr" type="CT_NonVisualGraphicFrameProperties" minOccurs="1"
        maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.27 nvGrpSpPr (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)	§5.1.2.1.6
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlGroupShapeNonVisual">
   <sequence>
      <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGrpSpPr" type="CT_NonVisualGroupDrawingShapeProps" minOccurs="1"
        maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.28 nvPicPr (Non-Visual Properties for a Picture)

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following PresentationML.

```
<p:pic>
  …
  <p:nvPicPr>
    …
  </p:nvPicPr>
  …
</p:pic>
```

end example]

Parent Elements
pic (§5.1.2.1.30)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§5.1.2.1.7
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlPictureNonVisual">
   <sequence>
      <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvPicPr" type="CT_NonVisualPictureProperties" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.29 nvSpPr (Non-Visual Properties for a Shape)

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

Parent Elements
sp (§5.1.2.1.33)

Child Elements	Subclause
cNvPr (Non-Visual Drawing Properties)	§5.1.2.1.8

Child Elements	Subclause
cNvSpPr (Non-Visual Shape Drawing Properties)	§5.1.2.1.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlShapeNonVisual">
   <sequence>
      <element name="cNvPr" type="CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvSpPr" type="CT_NonVisualDrawingShapeProps" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.30 pic (Picture)

This element specifies the existence of a picture object within the document.

[*Example*: Consider the following PresentationML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <p:nvPr/>
  </p:nvPicPr>
  <p:blipFill>
  …
  </p:blipFill>
  <p:spPr>
  …
  </p:spPr>
</p:pic>
```

end example]

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
extLst (Extension List)	§5.1.2.1.15
nvPicPr (Non-Visual Properties for a Picture)	§5.1.2.1.28

Child Elements	Subclause
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlPicture">
   <sequence>
      <element name="nvPicPr" type="CT_GvmlPictureNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="blipFill" type="CT_BlipFillProperties" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.31 picLocks (Picture Locks)

This element specifies all locking properties for a graphic frame. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvPicPr (§5.6.2.7); cNvPicPr (§4.4.1.11); cNvPicPr (§5.2.2.2); cNvPicPr (§5.1.2.1.7); cNvPicPr (§5.8.2.6)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeArrowheads (Disallow Arrowhead Changes)	Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeShapeTy	Specifies that the generating application should not allow shape type changes for the

Attributes	Description
pe (Disallow Shape Type Change)	corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noCrop (Disallow Crop Changes)	Specifies that the generating application should not allow cropping for the corresponding picture. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noEditPoints (Disallow Shape Point Editing)	Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noMove (Disallow Shape Movement)	Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noResize (Disallow Shape Resize)	Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noRot (Disallow Shape Rotation)	Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureLocking">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_Locking"/>
   <attribute name="noCrop" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.32 snd (Hyperlink Sound)

This element specifies a sound to be played when a hyperlink within the document is activated. This sound is specified from within the parent hyperlink element.

Parent Elements
hlinkClick (§5.1.5.3.5); hlinkHover (§5.1.2.1.23); hlinkMouseOver (§5.1.5.3.6)

Attributes	Description
builtIn (Recognized Built-In Sound)	Specifies whether or not this sound is a built-in sound. If this attribute is set to true then the generating application is alerted to check the name attribute specified for this sound in it's list of built-in sounds and can then surface a custom name or UI as needed. The possible values for this attribute are defined by the XML Schema boolean datatype.
embed (Embedded Audio File Relationship ID) Namespace: .../officeDocument/2006/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Sound Name)	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedWAVAudioFile">
   <attribute ref="r:embed" use="required"/>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
   <attribute name="builtIn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.33 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[*Note*: Shapes are the preferred mechanism for specifying text on a slide. *end note*]

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
nvSpPr (Non-Visual Properties for a Shape)	§5.1.2.1.29
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37
txSp (Text Shape)	§5.1.2.1.41

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlShape">
   <sequence>
      <element name="nvSpPr" type="CT_GvmlShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="txSp" type="CT_GvmlTextShape" minOccurs="0" maxOccurs="1"/>
      <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.34 spLocks (Shape Locks)

This element specifies all locking properties for a shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

Parent Elements
cNvSpPr (§5.1.2.1.9); cNvSpPr (§5.8.2.8); cNvSpPr (§5.6.2.9); cNvSpPr (§4.4.1.13)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description

Attributes	Description
noAdjustHandles (Disallow Showing Adjust Handles)	Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeArrowheads (Disallow Arrowhead Changes)	Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeAspect (Disallow Aspect Ratio Change)	Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noChangeShapeType (Disallow Shape Type Change)	Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noEditPoints (Disallow Shape Point Editing)	Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noGrp (Disallow Shape Grouping)	Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noMove (Disallow Shape Movement)	Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noResize (Disallow Shape Resize)	Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noRot (Disallow Shape Rotation)	Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.
noSelect (Disallow Shape Selection)	Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
noTextEdit (Disallow Shape Text Editing)	Specifies that the generating application should not allow editing of the shape text for the corresponding shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeLocking">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_Locking"/>
   <attribute name="noTextEdit" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.2.1.35 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a shape.

Parent Elements
cxnSp (§5.1.2.1.10); lnDef (§5.1.4.1.20); pic (§5.1.2.1.30); sp (§5.1.2.1.33); spDef (§5.1.4.1.27); txDef (§5.1.4.1.28)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44

Child Elements	Subclause
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

Attributes	Description
bwMode (Black and White Mode)	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

5.1.2.1.36 stCxn (Connection Start)

This element specifies the starting connection that should be made by the corresponding connector shape. This connects the head of the connector to the first shape.

Parent Elements
cNvCxnSpPr (§5.6.2.4); cNvCxnSpPr (§4.4.1.8); cNvCxnSpPr (§5.8.2.3); cNvCxnSpPr (§5.1.2.1.4)

Attributes	Description
id (Identifier)	Specifies the id of the shape to make the final connection to. The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
idx (Index)	Specifies the index into the connection site table of the final connection shape. That is there are many connection sites on a shape and it must be specified which connection site the corresponding connector shape should connect to. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connection">
   <attribute name="id" type="ST_DrawingElementId" use="required"/>
   <attribute name="idx" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.1.2.1.37 style (Shape Style)

This element specifies the style information for a shape.

Parent Elements
cxnSp (§5.1.2.1.10); lnDef (§5.1.4.1.20); pic (§5.1.2.1.30); sp (§5.1.2.1.33); spDef (§5.1.4.1.27); txDef (§5.1.4.1.28)

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeStyle">
   <sequence>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.38 sx (Horizontal Ratio)

This element specifies the horizontal ratio for use within a scaling calculation.

Parent Elements
scale (§4.3.2.13)

Attributes	Description
d (Denominator)	Specifies the denominator to be used within the equation. The possible values for this attribute are defined by the XML Schema long datatype.
n (Numerator)	Specifies the numerator to be used within the equation. The possible values for this attribute are defined by the XML Schema long datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Ratio">
   <attribute name="n" type="xsd:long" use="required"/>
   <attribute name="d" type="xsd:long" use="required"/>
</complexType>
```

5.1.2.1.39 sy (Vertical Ratio)

This element specifies the vertical ratio for use within a scaling calculation.

Parent Elements
scale (§4.3.2.13)

Attributes	Description
d (Denominator)	Specifies the denominator to be used within the equation. The possible values for this attribute are defined by the XML Schema long datatype.
n (Numerator)	Specifies the numerator to be used within the equation. The possible values for this attribute are defined by the XML Schema long datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Ratio">
   <attribute name="n" type="xsd:long" use="required"/>
   <attribute name="d" type="xsd:long" use="required"/>
</complexType>
```

5.1.2.1.40 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

Parent Elements
tc (§5.1.6.14); txSp (§5.1.2.1.41)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
   <sequence>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.2.1.41 txSp (Text Shape)

This element specifies the existence of a text shape within a parent shape. This text shape is specifically used for displaying text as it has only text related child elements.

Parent Elements
grpSp (§5.1.2.1.20); lockedCanvas (§5.4.2.1); sp (§5.1.2.1.33)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
txBody (Shape Text Body)	§5.1.2.1.40
useSpRect (Use Shape Text Rectangle)	§5.1.2.1.42
xfrm (2D Transform for Individual Objects)	§5.1.9.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlTextShape">
   <sequence>
      <element name="txBody" type="CT_TextBody" minOccurs="1" maxOccurs="1"/>
      <choice>
         <element name="useSpRect" type="CT_GvmlUseShapeRectangle" minOccurs="1" maxOccurs="1"/>
         <element name="xfrm" type="CT_Transform2D" minOccurs="1" maxOccurs="1"/>
      </choice>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.2.1.42 useSpRect (Use Shape Text Rectangle)

This element specifies that the text rectangle from the parent shape should be used for this text shape. If this attribute is specified then the text rectangle, or text bounding box as it is also called should have the same dimensions as the text bounding box of the parent shape within which this text shape resides.

Parent Elements
txSp (§5.1.2.1.41)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlUseShapeRectangle"/>
```

5.1.2.2 Colors

Given its own section within DrawingML Basics, colors are an integral part of the DrawingML framework. Colors are used in virtually every object to help describe it's appearance when it is rendered on the screen. Since not every generating application wishes to represent color in the same manner, it is possible to specify color in a number of different ways.

5.1.2.2.1 alpha (Alpha)

This element specifies its input color with the specific opacity, but with its color unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the opacity as expressed by a percentage value.
	
	[*Example*: The following represents a green solid fill which is 50% opaque
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:alpha val="50000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveFixedPercentage">
   <attribute name="val" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

5.1.2.2.2 alphaMod (Alpha Modulation)

This element specifies a more or less opaque version of its input color. An alpha modulate never increases the alpha beyond 100%. A 200% alpha modulate makes a input color twice as opaque as before. A 50% alpha modulate makes a input color half as opaque as before.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the opacity as expressed by a percentage relative to the input color.
	
	[*Example*: The following represents a green solid fill which is 50% opaque
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:alphaMod val="50000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositivePercentage">
   <attribute name="val" type="ST_PositivePercentage" use="required"/>
</complexType>
```

5.1.2.2.3 alphaOff (Alpha Offset)

This element specifies a more or less opaque version of its input color. Increases or decreases the input alpha percentage by the specified percentage offset. A 10% alpha offset increases a 50% opacity to 60%. A -10% alpha offset decreases a 50% opacity to 40%. The transformed alpha values are limited to a range of 0 to 100%. A 10% alpha offset increase to a 100% opaque object still results in 100% opacity.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the opacity as expressed by a percentage offset increase or decrease relative to the input color. Increases will never increase the opacity beyond 100%, decreases will never decrease the opacity below 0%.
	
	[*Example*: The following represents a green solid fill which is 90% opaque
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:alphaOff val="-10000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FixedPercentage">
   <attribute name="val" type="ST_FixedPercentage" use="required"/>
</complexType>
```

5.1.2.2.4 blue (Blue)

This element specifies the input color with the specific blue component, but with the red and green color components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.5 blueMod (Blue Modification)

This element specifies the input color with its blue component modulated by the given percentage. A 50% blue modulate will reduce the blue component by half. A 200% blue modulate will double the blue component.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.6 blueOff (Blue Offset)

This element specifies the input color with its blue component shifted, but with its red and green color components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.7 comp (Complement)

This element specifies that the color rendered should be the complement of its input color with the complement being defined as such. Two colors are called complementary if, when mixed they produce a shade of grey. For instance, the complement of red which is RGB (255, 0, 0) is cyan which is RGB (0, 255, 255).

Primary colors and secondary colors are typically paired in this way:

- red and cyan (where cyan is the mixture of green and blue)
- green and magenta (where magenta is the mixture of red and blue)
- blue and yellow (where yellow is the mixture of red and green)

[*Example*:

The following represents the complement of red:

```
<a:solidFill>
  <a:srgbClr val="FF0000">
    <a:comp/>
  </a:srgbClr>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ComplementTransform"/>
```

5.1.2.2.8 gamma (Gamma)

This element specifies that the output color rendered by the generating application should be the sRGB gamma shift of the input color.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GammaTransform"/>
```

5.1.2.2.9 gray (Gray)

This element specifies a grayscale of its input color, taking into relative intensities of the red, green, and blue primaries.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GrayscaleTransform"/>
```

5.1.2.2.10 green (Green)

This elements specifies the input color with the specified green component, but with its red and blue color components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32);

Parent Elements
sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.11 greenMod (Green Modification)

This element specifies the input color with its green component modulated by the given percentage. A 50% green modulate will reduce the green component by half. A 200% green modulate will double the green component.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue. [*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF) `<a:solidFill>`

Attributes	Description
	<a:srgbClr val="00FF00"> <a:blue val="100000"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.12 greenOff (Green Offset)

This element specifies the input color with its green component shifted, but with its red and blue color components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue. [*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF) <a:solidFill> <a:srgbClr val="00FF00"> <a:blue val="100000"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.13 hslClr (Hue, Saturation, Luminance Color Model)

This element specifies a color using the HSL color model. A perceptual gamma of 2.2 is assumed.

Hue refers to the dominant wavelength of color, saturation refers to the purity of its hue, and luminance refers to its lightness or darkness.

As with all colors, colors defined with the HSL color model may have color transforms applied to it.

[*Example*:

The color blue having RGB value RRGGBB = (00, 00, 80) is equivalent to

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100000" lum="50000">
</a:solidFill>
```

end example]

Parent Elements
accent1 (§5.1.4.1.1); accent2 (§5.1.4.1.2); accent3 (§5.1.4.1.3); accent4 (§5.1.4.1.4); accent5 (§5.1.4.1.5); accent6 (§5.1.4.1.6); alphaInv (§5.1.10.4); bgClr (§5.1.10.10); bgRef (§4.4.1.3); buClr (§5.1.5.4.4); clrFrom (§5.1.10.17); clrMru (§4.3.1.4); clrRepl (§5.1.10.18); clrTo (§5.1.10.19); clrVal (§4.6.27); contourClr (§5.1.7.6); custClr (§5.1.4.1.8); dk1 (§5.1.4.1.9); dk2 (§5.1.4.1.10); duotone (§5.1.10.23); effectClrLst (§5.9.4.7); effectRef (§5.1.4.2.8); extrusionClr (§5.1.7.7); fgClr (§5.1.10.27); fillClrLst (§5.9.4.8); fillRef (§5.1.4.2.10); folHlink (§5.1.4.1.15); fontRef (§5.1.4.1.17); from (§4.6.44); glow (§5.1.10.32); gs (§5.1.10.36); highlight (§5.1.5.3.4); hlink (§5.1.4.1.19); innerShdw (§5.1.10.40); linClrLst (§5.9.4.9); lnRef (§5.1.4.2.19); lt1 (§5.1.4.1.22); lt2 (§5.1.4.1.23); outerShdw (§5.1.10.45); penClr (§4.3.1.21); prstShdw (§5.1.10.49); solidFill (§5.1.10.54); tcTxStyle (§5.1.4.2.30); to (§4.6.90); txEffectClrLst (§5.9.4.12); txFillClrLst (§5.9.4.13); txLinClrLst (§5.9.4.14)

Child Elements	Subclause
alpha (Alpha)	§5.1.2.2.1
alphaMod (Alpha Modulation)	§5.1.2.2.2

satMod (Saturation Modulation)	§5.1.2.2.27
satOff (Saturation Offset)	§5.1.2.2.28
shade (Shade)	§5.1.2.2.31
tint (Tint)	§5.1.2.2.34

Attributes	Description
hue (Hue)	Specifies the angular value describing the wavelength. Expressed in 1/6000ths of a degree. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
lum (Luminance)	Specifies the luminance referring to the lightness or darkness of the color. Expressed as a percentage with 0% referring to maximal dark (black) and 100% referring to maximal white. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
sat (Saturation)	Specifies the saturation referring to the purity of the hue. Expressed as a percentage with 0% referring to grey, 100% referring to the purest form of the hue. The possible values for this attribute are defined by the ST_Percentage simple type

Attributes	Description
	(§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HslColor">
   <sequence>
      <group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="hue" type="ST_PositiveFixedAngle" use="required"/>
   <attribute name="sat" type="ST_Percentage" use="required"/>
   <attribute name="lum" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.14 hue (Hue)

This element specifies the input color with the specified hue, but with its saturation and luminance unchanged.

[*Example*: The following two solid fills are equivalent.

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100000" lum="50000">
</a:solidFill>
<a:solidFill>
  <a:hslClr hue="0" sat="100000" lum="50000">
    <a:hue val="14400000"/>
  <a:hslClr/>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	Specifies the actual angle value to be used with the input color's hue component. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveFixedAngle">
   <attribute name="val" type="ST_PositiveFixedAngle" use="required"/>
</complexType>
```

5.1.2.2.15 hueMod (Hue Modulate)

This element specifies the input color with its hue modulated by the given percentage. A 50% hue modulate decreases the angular hue value by half. A 200% hue modulate doubles the angular hue value.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the opacity as expressed by a percentage relative to the input color.
	
	[*Example*: The following represents a green solid fill which is 50% opaque
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:alphaMod val="50000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositivePercentage">
   <attribute name="val" type="ST_PositivePercentage" use="required"/>
</complexType>
```

5.1.2.2.16 hueOff (Hue Offset)

This element specifies the input color with its hue shifted, but with its saturation and luminance unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	Specifies the actual angular value of the shift. The result of the shift must be between 0 and 360 degrees. Shifts resulting in angular values less than 0 will be treated as 0. Shifts resulting in angular values greater than 360 will be treated as 360. [*Example*: The following increases the hue angular value by 10 degrees.

Attributes	Description
	<a:solidFill> <a:hslClr hue="0" sat="100000" lum="50000"/> <a:hueOff val="600000"/> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Angle">
   <attribute name="val" type="ST_Angle" use="required"/>
</complexType>
```

5.1.2.2.17 inv (Inverse)

This element specifies the inverse of its input color. For example, the inverse of red (1, 0, 0) is cyan (0, 1, 1).

[*Example*:

The following represents cyan, the inverse of red:

```
<a:solidFill>
  <a:srgbClr val="FF0000">
    <a:inv/>
  </a:srgbClr>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_InverseTransform"/>
```

5.1.2.2.18 invGamma (Inverse Gamma)

This element specifies that the output color rendered by the generating application should be the inverse sRGB gamma shift of the input color.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_InverseGammaTransform"/>
```

5.1.2.2.19 lum (Luminance)

This element specifies the input color with the specified luminance, but with its hue and saturation unchanged. Typically luminance values fall in the range [0%, 100%].

[*Example*:

The following two solid fills are equivalent:

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100000" lum="50000">
</a:solidFill>
<a:solidFill>
  <a:hslClr hue="14400000" sat="100000" lum="0">
    <a:lum val="50000"/>
  <a:hslClr/>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.20 lumMod (Luminance Modulation)

This element specifies the input color with its luminance modulated by the given percentage. A 50% luminance modulate will reduce the luminance by half. A 200% luminance modulate will double the luminance.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.21 lumOff (Luminance Offset)

This element specifies the input color with its luminance shifted, but with its hue and saturation unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.22 prstClr (Preset Color)

This element specifies a color which is bound to one of a predefined collection of colors.

[*Example*:

The following defines a solid fill bound to the "black" preset color.

```
<a:solidFill>
  <a:prstClr val="black">
</a:solidFill>
```

end example]

Parent Elements

satOff (Saturation Offset)	§5.1.2.2.28
shade (Shade)	§5.1.2.2.31
tint (Tint)	§5.1.2.2.34

Attributes	Description
val (Value)	Specifies the actual preset color value. The possible values for this attribute are defined by the ST_PresetColorVal simple type (§5.1.12.48).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PresetColor">
   <sequence>
      <group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="val" type="ST_PresetColorVal"/>
</complexType>
```

5.1.2.2.23 red (Red)

This element specifies the input color with the specified red component, but with its green and blue color components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.24 redMod (Red Modulation)

This element specifies the input color with its red component modulated by the given percentage. A 50% red modulate will reduce the red component by half. A 200% red modulate will double the red component.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32);

Parent Elements
sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.25 redOff (Red Offset)

This element specifies the input color with its red component shifted, but with its green and blue color components unchanged.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`

Attributes	Description
	<a:blue val="100000"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.26 sat (Saturation)

This element specifies the input color with the specified saturation, but with its hue and luminance unchanged. Typically saturation values fall in the range [0%, 100%].

[*Example*:

The following two solid fills are equivalent:

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100000" lum="50000">
</a:solidFill>
<a:solidFill>
  <a:hslClr hue="14400000" sat="0" lum="50000">
    <a:sat val="100000"/>
  <a:hslClr/>
</a:solidFill>
```

end example]

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue. [*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)

Attributes	Description
	<a:solidFill> <a:srgbClr val="00FF00"> <a:blue val="100000"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.27 satMod (Saturation Modulation)

This element specifies the input color with its saturation modulated by the given percentage. A 50% saturation modulate will reduce the saturation by half. A 200% saturation modulate will double the saturation.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue. [*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF) <a:solidFill> <a:srgbClr val="00FF00"> <a:blue val="100000"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.28 satOff (Saturation Offset)

This element specifies the input color with its saturation shifted, but with its hue and luminance unchanged. A 10% offset to 20% saturation yields 30% saturation.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.
	
	[*Example*: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:blue val="100000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Percentage">
   <attribute name="val" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.29 schemeClr (Scheme Color)

This element specifies a color bound to a user's theme. As with all elements which define a color, it is possible to apply a list of color transforms to the base color defined.

Parent Elements
accent1 (§5.1.4.1.1); accent2 (§5.1.4.1.2); accent3 (§5.1.4.1.3); accent4 (§5.1.4.1.4); accent5 (§5.1.4.1.5); accent6 (§5.1.4.1.6); alphaInv (§5.1.10.4); bgClr (§5.1.10.10); bgRef (§4.4.1.3); buClr (§5.1.5.4.4); clrFrom (§5.1.10.17); clrMru (§4.3.1.4); clrRepl (§5.1.10.18); clrTo (§5.1.10.19); clrVal (§4.6.27); contourClr (§5.1.7.6);

Parent Elements

shade (Shade)	§5.1.2.2.31

Child Elements	Subclause
tint (Tint)	§5.1.2.2.34

Attributes	Description

val (Value)	Specifies the desired scheme.
	
	[*Example*: The following represents a color bound to the "lt1" theme color
	
	`<a:solidFill>`
	`  <a:schemeClr val="lt1"/>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_SchemeColorVal simple type (§5.1.12.54).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SchemeColor">
   <sequence>
      <group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="val" type="ST_SchemeColorVal" use="required"/>
</complexType>
```

5.1.2.2.30 scrgbClr (RGB Color Model - Percentage Variant)

This element specifies a color using the red, green, blue RGB color model. Each component, red, green, and blue is expressed as a percentage from 0% to 100%. A linear gamma of 1.0 is assumed.

Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

[*Example*: The following represent the same color

```
<a:solidFill>
  <a:scrgbClr r="50000" g="50000" b="50000"/>
</a:solidFill>
<a:solidFill>
  <a:srgbClr val="BCBCBC"/>
</a:solidFill>
```

end example]

Parent Elements
accent1 (§5.1.4.1.1); accent2 (§5.1.4.1.2); accent3 (§5.1.4.1.3); accent4 (§5.1.4.1.4); accent5 (§5.1.4.1.5);

Parent Elements

Child Elements	Subclause
satOff (Saturation Offset)	§5.1.2.2.28
shade (Shade)	§5.1.2.2.31
tint (Tint)	§5.1.2.2.34

Attributes	Description
b (Blue)	Specifies the percentage of blue. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
g (Green)	Specifies the percentage of green. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Red)	Specifies the percentage of red. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ScRgbColor">
   <sequence>
      <group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="r" type="ST_Percentage" use="required"/>
   <attribute name="g" type="ST_Percentage" use="required"/>
   <attribute name="b" type="ST_Percentage" use="required"/>
</complexType>
```

5.1.2.2.31 shade (Shade)

This element specifies a darker version of its input color. A 10% shade is 10% of the input color combined with 90% black.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description
val (Value)	Specifies the opacity as expressed by a percentage value. [*Example*: The following represents a green solid fill which is 50% opaque

Attributes	Description
	<a:solidFill> <a:srgbClr val="00FF00"> <a:alpha val="50000"/> </a:srgbClr> </a:solidFill> *end example*] The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveFixedPercentage">
   <attribute name="val" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

5.1.2.2.32 srgbClr (RGB Color Model - Hex Variant)

This element specifies a color using the red, green, blue RGB color model. Red, green, and blue is expressed as sequence of hex digits, RRGGBB. A perceptual gamma of 2.2 is used.

Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

[*Example*: The following represent the same color

```
<a:solidFill>
  <a:scrgbClr r="50000" g="50000" b="50000"/>
</a:solidFill>
<a:solidFill>
  <a:srgbClr val="BCBCBC"/>
</a:solidFill>
```

end example]

Parent Elements

satOff (Saturation Offset)	§5.1.2.2.28
shade (Shade)	§5.1.2.2.31
tint (Tint)	§5.1.2.2.34

Attributes	Description
lastClr (Last Color)	Specifies the color value that was last computed by the generating application. The possible values for this attribute are defined by the ST_HexBinary3 simple type (§5.1.12.28).
val (Value)	Specifies the system color value. The possible values for this attribute are defined by the ST_SystemColorVal simple type (§5.1.12.58).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SystemColor">
   <sequence>
      <group ref="EG_ColorTransform" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="val" type="ST_SystemColorVal" use="required"/>
   <attribute name="lastClr" type="ST_HexBinary3" use="optional"/>
</complexType>
```

5.1.2.2.34 tint (Tint)

This element specifies a lighter version of its input color. A 10% tint is 10% of the input color combined with 90% white.

Parent Elements
hslClr (§5.1.2.2.13); prstClr (§5.1.2.2.22); schemeClr (§5.1.2.2.29); scrgbClr (§5.1.2.2.30); srgbClr (§5.1.2.2.32); sysClr (§5.1.2.2.33)

Attributes	Description

val (Value)	Specifies the opacity as expressed by a percentage value.
	
	[*Example*: The following represents a green solid fill which is 50% opaque
	
	`<a:solidFill>`
	`  <a:srgbClr val="00FF00">`
	`  <a:alpha val="50000"/>`
	`  </a:srgbClr>`
	`</a:solidFill>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveFixedPercentage">
   <attribute name="val" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

5.1.3 Audio and Video

The Audio and Video portion of the DrawingML framework deals with all media of these two types that can be attached to objects within a document. Types of audio that can be represented within a file are CD audio, QuickTime audio, and any other generic audio. When dealing with generic audio there is the option for embedding it within the file and also linking it. The linking option is preferable if the size of the audio file is too large and will thus increase the size of the document by an undesirable amount. For video there are two types that can be represented and that is either a QuickTime movie or any other generic movie. When dealing with generic video there is only the option of linking to the media as video is too large to embed within a document.

5.1.3.1 audioCd (Audio from CD)

This element specifies the existence of Audio from a CD. This element is specified within the non-visual properties of an object. The audio must be attached to an object as this is how it is represented within the document. The actual playing of the sound however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has an audio from a CD attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:audioCd>
        <a:st track="1"/>
        <a:end track="3" time="65"/>
      </a:audioCd>
    </p:nvPr>
  </p:nvPicPr>
  …
</p:pic>
```

In the above example, we see that there is a single audioCD element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this audioCD element from within the timing node list. For this example we see that the audio for this CD will start playing at the 0 second mark on the first track and will end on the 1 minute 5 second mark of the third track. *end example*]

Parent Elements
nvPr (§4.4.1.30)

Child Elements	Subclause
end (Audio End Time)	§5.1.3.3
extLst (Extension List)	§5.1.2.1.15
st (Audio Start Time)	§5.1.3.5

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AudioCD">
   <sequence>
      <element name="st" type="CT_AudioCDTime" minOccurs="1" maxOccurs="1"/>
      <element name="end" type="CT_AudioCDTime" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.3.2 audioFile (Audio from File)

This element specifies the existence of an audio file. This element is specified within the non-visual properties of an object. The audio must be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has an audio file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:audioFile r:link="rId1"/>
    </p:nvPr>
  </p:nvPicPr>
  …
</p:pic>
```

In the above example, we see that there is a single audioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this audioFile element from within the timing node list. The Linked relationship id will be used to retrieve the actual audio file for playback purposes. *end example*]

Parent Elements
nvPr (§4.4.1.30)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
link (Linked Relationship ID) Namespace: …/officeDocument/2006/relationships	Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AudioFile">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:link" use="required"/>
</complexType>
```

5.1.3.3 end (Audio End Time)

This element specifies the end point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should halt its playback. This element will be used in conjunction with an Audio Start Time element to specify the time span for an entire audioCD sound element.

[*Example*: Consider the following DrawingML.

```
<a:audioCd>
  <a:st track="1" time="2"/>
  <a:end track="3" time="65"/>
</a:audioCd>
```

In the above example, the audioCD sound element shown will specify for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*]

Parent Elements
audioCd (§5.1.3.1)

Attributes	Description
time (Time)	Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
track (Track)	Specifies which track of the CD this Audio will begin playing on. This attribute is required and cannot be omitted. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AudioCDTime">
   <attribute name="track" type="xsd:unsignedByte" use="required"/>
   <attribute name="time" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

5.1.3.4 quickTimeFile (QuickTime from File)

This element specifies the existence of a QuickTime file. This element is specified within the non-visual properties of an object. The QuickTime file must be attached to an object as this is how it is represented within the document. The actual playing of the QuickTime however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has a QuickTime file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:quickTimeFile r:link="rId1"/>
    </p:nvPr>
  </p:nvPicPr>
  …
</p:pic>
```

In the above example, we see that there is a single quickTimeFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this quickTimeFile element from within the timing node list. The Linked relationship id will be used to retrieve the actual video file for playback purposes. *end example*]

Parent Elements
nvPr (§4.4.1.30)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
link (Linked Relationship ID) Namespace: …/officeDocument/2006/relationships	Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_QuickTimeFile">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:link" use="required"/>
</complexType>
```

5.1.3.5 st (Audio Start Time)

This element specifies the start point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should begin its playback. This element will be used in conjunction with an Audio End Time element to specify the time span for an entire audioCD sound element.

[*Example*: Consider the following DrawingML.

```
<a:audioCd>
  <a:st track="1" time="2"/>
  <a:end track="3" time="65"/>
</a:audioCd>
```

In the above example, the audioCD sound element shown will specify for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*]

Parent Elements
audioCd (§5.1.3.1)

Attributes	Description
time (Time)	Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
track (Track)	Specifies which track of the CD this Audio will begin playing on. This attribute is required and cannot be omitted. The possible values for this attribute are defined by the XML Schema unsignedByte datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AudioCDTime">
   <attribute name="track" type="xsd:unsignedByte" use="required"/>
   <attribute name="time" type="xsd:unsignedInt" use="optional" default="0"/>
</complexType>
```

5.1.3.6 videoFile (Video from File)

This element specifies the existence of a video file. This element is specified within the non-visual properties of an object. The video must be attached to an object as this is how it is represented within the document. The actual playing of the video however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has a video attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:videoFile r:link="rId1"/>
    </p:nvPr>
  </p:nvPicPr>
  …
</p:pic>
```

In the above example, we see that there is a single videoFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this videoFile element from within the timing node list. The Linked relationship id will be used to retrieve the actual video file for playback purposes. *end example*]

Parent Elements
nvPr (§4.4.1.30)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
link (Linked Relationship ID) Namespace: …/officeDocument/2006/relationships	Specifies the identification information for a linked video file. This attribute is used to specify the location of an object that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_VideoFile">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:link" use="required"/>
</complexType>
```

5.1.3.7 wavAudioFile (Audio from WAV File)

This element specifies the existence of an audio WAV file. This element is specified within the non-visual properties of an object. The audio must be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[*Example*: Consider the following picture object that has an audio WAV file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:wavAudioFile r:embed="rId2"/>
    </p:nvPr>
  </p:nvPicPr>
  …
</p:pic>
```

In the above example, we see that there is a single wavAudioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, will be used to refer to this wavAudioFile element from within the timing node list. The Embedded relationship id will be used to retrieve the actual audio file for playback purposes. *end example*]

[*Note*: This element is generally used for the purposes of embedding audio files within the document. For linking to generic audio files the audioFile element should be used. *end note*]

Parent Elements
nvPr (§4.4.1.30)

Attributes	Description
builtIn (Recognized	Specifies whether or not this sound is a built-in sound. If this attribute is set to true then

Attributes	Description
Built-In Sound)	the generating application is alerted to check the name attribute specified for this sound in it's list of built-in sounds and can then surface a custom name or UI as needed. The possible values for this attribute are defined by the XML Schema boolean datatype.
embed (Embedded Audio File Relationship ID) Namespace: .../officeDocument/2006/relationships	Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
name (Sound Name)	Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmbeddedWAVAudioFile">
   <attribute ref="r:embed" use="required"/>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
   <attribute name="builtIn" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.4 Styles

Styles within DrawingML refer to the way a particular object (be it text or a shape, or anything else) is formatted. Different aspects, ranging from color, line type, fill, and effects applied to the object can be predefined within a theme. The main purpose of a theme is to define a style matrix from which a document can pull style information from in order to format the visual look of objects in a document.

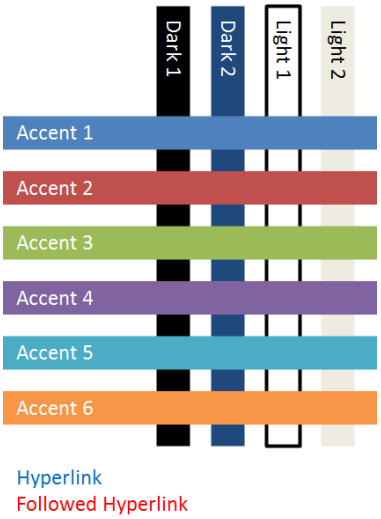
5.1.4.1 Styles

The elements in this section compose the basic definition of a style, including its associated colors, effect styles, line styles, fill styles, background styles, and font scheme.

5.1.4.1.1 accent1 (Accent 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

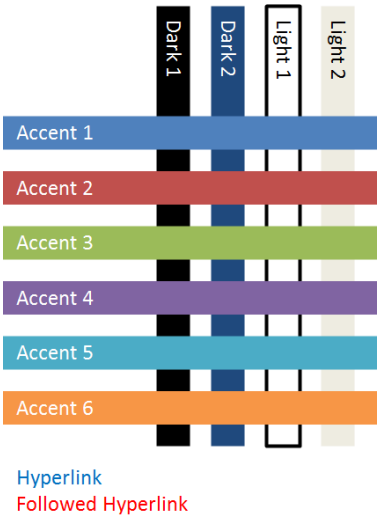
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.2 accent2 (Accent 2)

This element defines a color that happens to be the accent 2 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

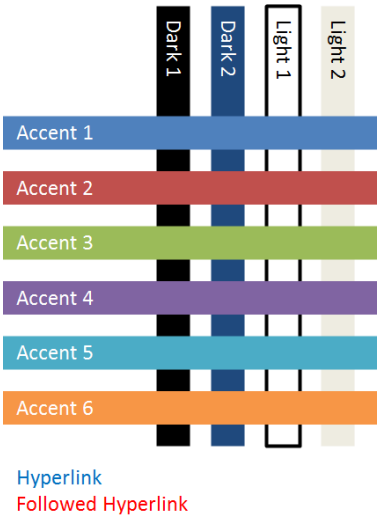
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.3 accent3 (Accent 3)

This element defines a color that happens to be the accent 3 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

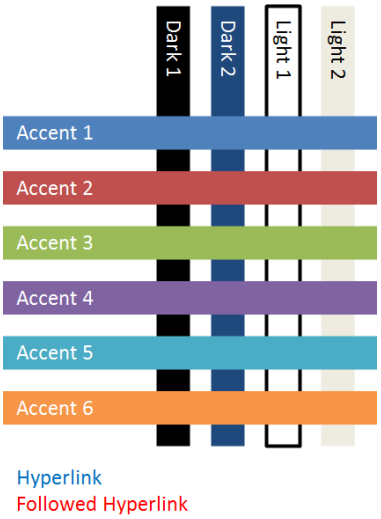
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.4 accent4 (Accent 4)

This element defines a color that happens to be the accent 4 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

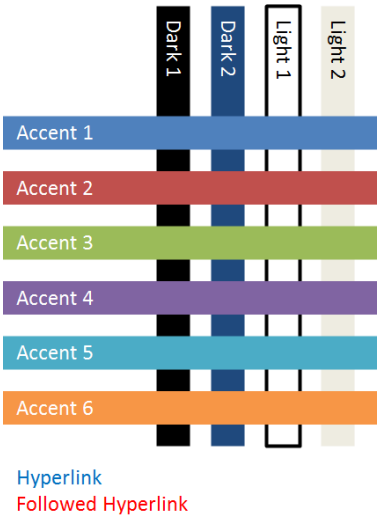
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.5 accent5 (Accent 5)

This element defines a color that happens to be the accent 5 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

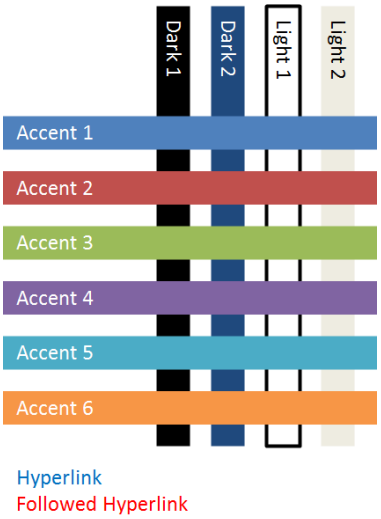
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.6 accent6 (Accent 6)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.7 bgFillStyleLst (Background Fill Style List)

This element defines a list of background fills that are used within a theme. The background fills consist of three fills, arranged in order from subtle to moderate to intense.

[*Example*: Consider the following example of a background fill style list within DrawingML:

```
<bgFillStyleLst>
  <solidFill>
…
  </solidFill>
  <gradFill rotWithShape="1">
…
  </gradFill>
  <blipFill>
…
  </blipFill>
</bgFillStyleLst>
```

In this example, we see that the list contains a solid fill for the subtle fill, a gradient fill for the moderate fill and an image fill for the intense background fill. *end example*]

Parent Elements
fmtScheme (§5.1.4.1.14)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BackgroundFillStyleList">
   <sequence>
      <group ref="EG_FillProperties" minOccurs="3" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.4.1.8 custClr (Custom color)

This element defines a custom color. The custom colors are used within a custom color list to define custom colors that are extra colors that can be appended to a theme. This is useful within corporate scenarios where there is a set corporate color palette from which to work.

Parent Elements
custClrLst (§5.1.8.3)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
name (Name)	The name of the color shown in the color picker. The possible values for this attribute are defined by the XML Schema string datatype.

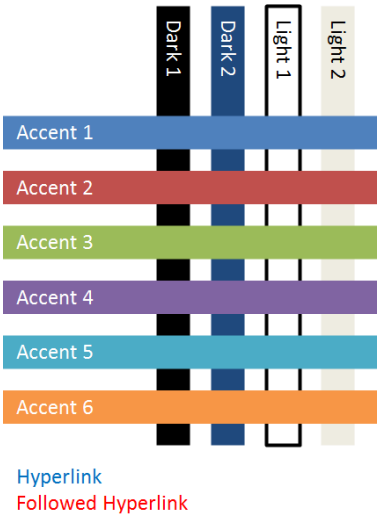
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomColor">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
</complexType>
```

5.1.4.1.9 dk1 (Dark 1)

This element defines a color that happens to be the dark 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

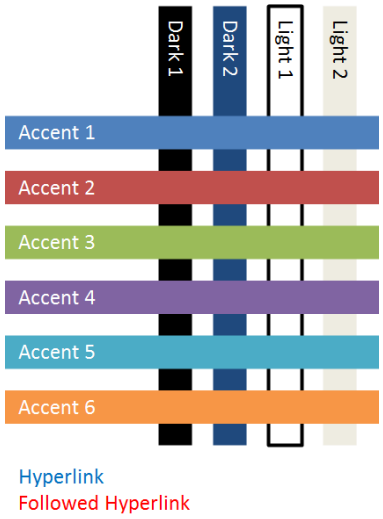
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.10 dk2 (Dark 2)

This element defines a color that happens to be the dark 2 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.11 effectStyle (Effect Style)

This element defines a set of effects and 3D properties that can be applied to an object.

[*Example*: Consider the following example of an effect style within DrawingML:

```
<effectStyle>
  <effectLst>
    <outerShdw blurRad="57150" dist="38100" dir="5400000" algn="ctr"
      rotWithShape="0">
      <schemeClr val="phClr">
        <shade val="9000"/>
        <satMod val="105000"/>
        <alpha val="48000"/>
      </schemeClr>
    </outerShdw>
  </effectLst>
</effectStyle>
```

In this example, an outer shadow is being applied to a shape as the moderate effect. *end example*]

Parent Elements

Parent Elements
effectStyleLst (§5.1.4.1.12)

Child Elements	Subclause
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
scene3d (3D Scene Properties)	§5.1.4.1.26
sp3d (Apply 3D shape properties)	§5.1.7.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EffectStyleItem">
   <sequence>
      <group ref="EG_EffectProperties" minOccurs="1" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.1.12 effectStyleLst (Effect Style List)

This element defines a set of three effect styles that create the effect style list for a theme. The effect styles are arranged in order of subtle to moderate to intense.

[*Example*: Consider the following example of an effect style list within DrawingML:

```
<effectStyleLst>
  <effectStyle>
    <effectLst>
      <outerShdw blurRad="57150" dist="38100" dir="5400000"
        algn="ctr" rotWithShape="0">
…
      </outerShdw>
    </effectLst>
  </effectStyle>
  <effectStyle>
    <effectLst>
      <outerShdw blurRad="57150" dist="38100" dir="5400000"
        algn="ctr" rotWithShape="0">
…
      </outerShdw>
    </effectLst>
  </effectStyle>
```

```
    <effectStyle>
      <effectLst>
        <outerShdw blurRad="57150" dist="38100" dir="5400000"
          algn="ctr" rotWithShape="0">
…
        </outerShdw>
      </effectLst>
      <scene3d>
…
      </scene3d>
      <sp3d prstMaterial="powder">
…
      </sp3d>
    </effectStyle>
  </effectStyleLst>
```

In this example, we see three effect styles defined. The first two (subtle and moderate) define an outer shadow as the effect, while the third effect style (intense) defines an outer shadow along with 3D properties which are to be applied to the object as well. *end example*]

Parent Elements
fmtScheme (§5.1.4.1.14)

Child Elements	Subclause
effectStyle (Effect Style)	§5.1.4.1.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EffectStyleList">
   <sequence>
      <element name="effectStyle" type="CT_EffectStyleItem" minOccurs="3" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.4.1.13 fillStyleLst (Fill Style List)

This element defines a set of three fill styles that are used within a theme. The three fill styles are arranged in order from subtle to moderate to intense.

[*Example*: Consider the following example of a fill style list within DrawingML:

```
  <fillStyleLst>
    <solidFill>
…
    </solidFill>
```

```
    <gradFill rotWithShape="1">
  …
    </gradFill>
    <gradFill rotWithShape="1">
  …
    </gradFill>
  </fillStyleLst>
```

In this example, we see three fill styles being defined within the fill style list. The first style is the subtle style and defines simply a solid fill. The second and third styles (moderate and intense fills respectively) define gradient fills. *end example*]

Parent Elements
fmtScheme (§5.1.4.1.14)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FillStyleList">
   <sequence>
      <group ref="EG_FillProperties" minOccurs="3" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.4.1.14 fmtScheme (Format Scheme)

This element contains the background fill styles, effect styles, fill styles, and line styles which define the style matrix for a theme. The style matrix consists of subtle, moderate, and intense fills, lines, and effects. The background fills are not generally thought of to directly be associated with the matrix, but do play a role in the style of the overall document. Usually, a given object will choose a single line style, a single fill style, and a single effect style in order to define the overall final look of the object.

[*Example*: Consider the following example of the style matrix in use within DrawingML:

	Line	Fill	Effect
Subtle			
Moderate			Intense			

In this example, we see a shape styled which utilizes different aspects from the above defined style matrix. *end example*]

Parent Elements
themeElements (§5.1.8.10); themeOverride (§5.1.8.12)

Child Elements	Subclause
bgFillStyleLst (Background Fill Style List)	§5.1.4.1.7
effectStyleLst (Effect Style List)	§5.1.4.1.12
fillStyleLst (Fill Style List)	§5.1.4.1.13
lnStyleLst (Line Style List)	§5.1.4.1.21

Attributes	Description
name (Name)	Defines the name for the format scheme. The name is simply a human readable string which identifies the format scheme in the user interface. The possible values for this attribute are defined by the XML Schema string datatype.

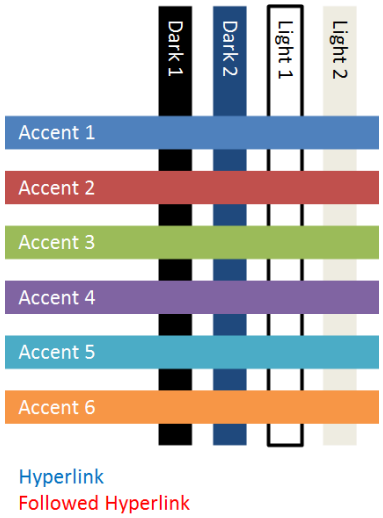
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleMatrix">
    <sequence>
        <element name="fillStyleLst" type="CT_FillStyleList" minOccurs="1" maxOccurs="1"/>
        <element name="lnStyleLst" type="CT_LineStyleList" minOccurs="1" maxOccurs="1"/>
        <element name="effectStyleLst" type="CT_EffectStyleList" minOccurs="1" maxOccurs="1"/>
        <element name="bgFillStyleLst" type="CT_BackgroundFillStyleList" minOccurs="1" maxOccurs="1"/>
    </sequence>
    <attribute name="name" type="xsd:string" use="optional" default=""/>
</complexType>
```

5.1.4.1.15 folHlink (Followed Hyperlink)

This element defines a color that happens to be the followed hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.16 font (Font)

This element defines a font within the styles area of DrawingML. A font is defined by a script along with a typeface.

[*Example*: Consider the following example of a font in DrawingML:

```
<font script="Thai" typeface="Cordia New"/>
```

In this example, we see that the script 'Thai' is supposed to use the font face 'Cordia New'. *end example*]

Parent Elements
font (§5.1.4.2.13); majorFont (§5.1.4.1.24); minorFont (§5.1.4.1.25)

Attributes	Description
script (Script)	Specifies the script, or language, in which the typeface is supposed to be used. The possible values for this attribute are defined by the XML Schema string datatype.
typeface (Typeface)	Specifies the font face to use. The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SupplementalFont">
   <attribute name="script" type="xsd:string" use="required"/>
   <attribute name="typeface" type="ST_TextTypeface" use="required"/>
</complexType>
```

5.1.4.1.17 fontRef (Font Reference)

This element represents a reference to a themed font. When used it specifies which themed font to use along with a choice of color.

[*Example*: Consider the following example of a font reference within DrawingML:

```
<fontRef idx="minor">
  <schemeClr val="tx1"/>
</fontRef>
```

In this example, we see a font referencing the minor font defined within the theme. *end example*]

Parent Elements
style (§5.6.2.30); style (§5.9.2.28); style (§4.4.1.43); style (§5.8.2.24); style (§5.1.2.1.37); tcTxStyle (§5.1.4.2.30)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
idx (Identifier)	Specifies the identifier of the font to reference. The possible values for this attribute are defined by the ST_FontCollectionIndex simple type (§5.1.12.23).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontReference">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="idx" type="ST_FontCollectionIndex" use="required"/>
</complexType>
```

5.1.4.1.18 fontScheme (Font Scheme)

This element defines the font scheme within the theme. The font scheme consists of a pair of major and minor fonts for which to use in a document. The major font corresponds well with the heading areas of a document, and the minor font corresponds well with the normal text or paragraph areas.

[*Example*: Consider the following example of a font scheme within DrawingML:

```
<fontScheme name="sample">
  <majorFont>
…
  </majorFont>
```

```
    <minorFont>
  …
    </minorFont>
  </fontScheme>
```

In this example, we see the major and minor font lists within the font scheme that is named 'sample'. *end example*]

Parent Elements
themeElements (§5.1.8.10); themeOverride (§5.1.8.12)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
majorFont (Major Font)	§5.1.4.1.24
minorFont (Minor fonts)	§5.1.4.1.25

Attributes	Description
name (Name)	The name of the font scheme shown in the user interface. The possible values for this attribute are defined by the XML Schema string datatype.

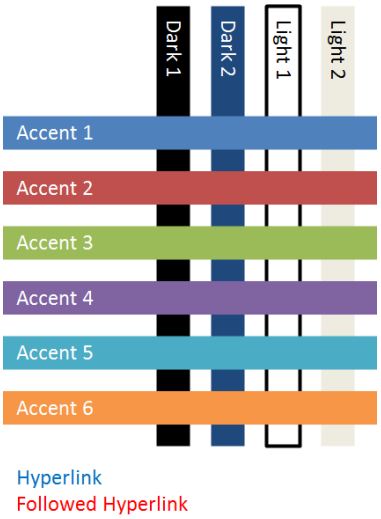
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontScheme">
   <sequence>
      <element name="majorFont" type="CT_FontCollection" minOccurs="1" maxOccurs="1"/>
      <element name="minorFont" type="CT_FontCollection" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="xsd:string" use="required"/>
</complexType>
```

5.1.4.1.19 hlink (Hyperlink)

This element defines a color that happens to be the hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.20 lnDef (Line Default)

This element defines a default line that is used within a document.

[*Example*: Consider the following example of a default line defined in DrawingML:

```
<lnDef>
  <spPr/>
  <bodyPr/>
  <lstStyle/>
  <style>
    <lnRef idx="1">
      <schemeClr val="accent2"/>
    </lnRef>
    <fillRef idx="0">
      <schemeClr val="accent2"/>
    </fillRef>
    <effectRef idx="0">
      <schemeClr val="accent2"/>
    </effectRef>
    <fontRef idx="minor">
      <schemeClr val="tx1"/>
    </fontRef>
  </style>
</lnDef>
```

In this example, we see that the default line for the document is being defined as a themed line which references the subtle line style with idx equal to 1. *end example*]

Parent Elements
objectDefaults (§5.1.8.7)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
extLst (Extension List)	§5.1.2.1.15
lstStyle (Text List Styles)	§5.1.5.4.12
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DefaultShapeDefinition">
   <sequence>
      <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.1.21 lnStyleLst (Line Style List)

This element defines a list of three line styles for use within a theme. The three line styles are arranged in order from subtle to moderate to intense versions of lines. This list makes up part of the style matrix.

[*Example*: Consider the following example of a line style list within DrawingML:

```
<lnStyleLst>
  <ln w="9525" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr">
        <shade val="50000"/>
        <satMod val="103000"/>
      </schemeClr>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
  <ln w="25400" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr"/>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
  <ln w="38100" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr"/>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
</lnStyleLst>
```

In this example, we see three lines defined within a line style list. The first line corresponds to the subtle line, the second to the moderate, and the third corresponds to the intense line defined in the theme. *end example*]

Parent Elements
fmtScheme (§5.1.4.1.14)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24

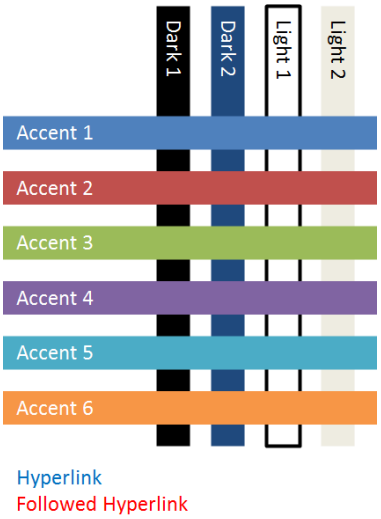
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineStyleList">
    <sequence>
        <element name="ln" type="CT_LineProperties" minOccurs="3" maxOccurs="unbounded"/>
    </sequence>
</complexType>
```

5.1.4.1.22 lt1 (Light 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

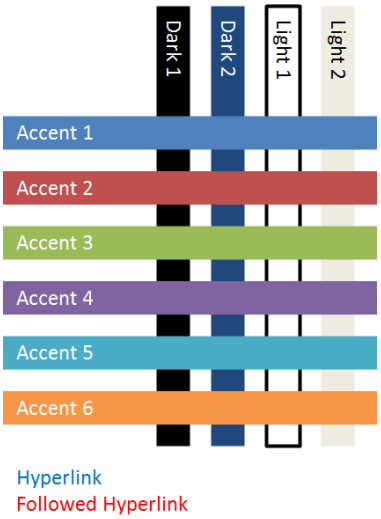
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.23 lt2 (Light 2)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:



end example]

Parent Elements
clrScheme (§5.1.8.2)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.4.1.24 majorFont (Major Font)

This element defines the set of major fonts which are to be used under different languages or locals.

[*Example*: Consider the following example of the major fonts being defined within DrawingML:

```
<majorFont>
  <latin typeface="Calibri"/>
  <ea typeface="Arial"/>
  <cs typeface="Arial"/>
  <font script="Jpan" typeface="ＭＳ Ｐゴシック"/>
  <font script="Hang" typeface="HY중고딕"/>
  <font script="Hans" typeface="隶书"/>
  <font script="Hant" typeface="微軟正黑體"/>
  <font script="Arab" typeface="Traditional Arabic"/>
  <font script="Hebr" typeface="Arial"/>
  <font script="Thai" typeface="Cordia New"/>
  <font script="Ethi" typeface="Nyala"/>
  <font script="Beng" typeface="Vrinda"/>
  <font script="Gujr" typeface="Shruti"/>
  <font script="Khmr" typeface="DaunPenh"/>
  <font script="Knda" typeface="Tunga"/>
</majorFont>
```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*]

Parent Elements
fontScheme (§5.1.4.1.18)

Child Elements	Subclause
cs (Complex Script Font)	§5.1.5.3.1
ea (East Asian Font)	§5.1.5.3.3
extLst (Extension List)	§5.1.2.1.15
font (Font)	§5.1.4.1.16

Child Elements	Subclause
latin (Latin Font)	§5.1.5.3.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontCollection">
   <sequence>
      <element name="latin" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="ea" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="cs" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="font" type="CT_SupplementalFont" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.1.25 minorFont (Minor fonts)

This element defines the set of minor fonts that are to be used under different languages or locals.

[*Example*: Consider the following example of the minor fonts being defined within DrawingML:

```
<minorFont>
  <latin typeface="Calibri"/>
  <ea typeface="Arial"/>
  <cs typeface="Arial"/>
  <font script="Jpan" typeface="ＭＳ Ｐゴシック"/>
  <font script="Hang" typeface="HY중고딕"/>
  <font script="Hans" typeface="隶书"/>
  <font script="Hant" typeface="微軟正黑體/>
  <font script="Arab" typeface="Traditional Arabic"/>
  <font script="Hebr" typeface="Arial"/>
  <font script="Thai" typeface="Cordia New"/>
  <font script="Ethi" typeface="Nyala"/>
  <font script="Beng" typeface="Vrinda"/>
  <font script="Gujr" typeface="Shruti"/>
  <font script="Khmr" typeface="DaunPenh"/>
  <font script="Knda" typeface="Tunga"/>
</minorFont>
```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*]

Parent Elements
fontScheme (§5.1.4.1.18)

Child Elements	Subclause
cs (Complex Script Font)	§5.1.5.3.1
ea (East Asian Font)	§5.1.5.3.3
extLst (Extension List)	§5.1.2.1.15
font (Font)	§5.1.4.1.16
latin (Latin Font)	§5.1.5.3.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontCollection">
   <sequence>
      <element name="latin" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="ea" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="cs" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="font" type="CT_SupplementalFont" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.1.26 scene3d (3D Scene Properties)

This element defines optional scene-level 3D properties to apply to an object.

Parent Elements
bodyPr (§5.1.5.1.1); effectStyle (§5.1.4.1.11); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6)

Child Elements	Subclause
backdrop (Backdrop Plane)	§5.1.7.2
camera (Camera)	§5.1.7.5
extLst (Extension List)	§5.1.2.1.15
lightRig (Light Rig)	§5.1.7.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Scene3D">
   <sequence>
      <element name="camera" type="CT_Camera" minOccurs="1" maxOccurs="1"/>
      <element name="lightRig" type="CT_LightRig" minOccurs="1" maxOccurs="1"/>
      <element name="backdrop" type="CT_Backdrop" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.1.27 spDef (Shape Default)

This element defines the formatting that is associated with the default shape. The default formatting can be applied to a shape when it is initially inserted into a document.

[*Example*: Consider the following example of a shape default being used within DrawingML:

```
<spDef>
  <spPr>
    <solidFill>
      <schemeClr val="accent2">
        <shade val="75000"/>
      </schemeClr>
    </solidFill>
  </spPr>
  <bodyPr rtlCol="0" anchor="ctr"/>
  <lstStyle>
    <defPPr algn="ctr">
      <defRPr/>
    </defPPr>
  </lstStyle>
  <style>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
    <fillRef idx="2">
      <schemeClr val="accent1"/>
    </fillRef>
    <effectRef idx="1">
      <schemeClr val="accent1"/>
    </effectRef>
    <fontRef idx="minor">
      <schemeClr val="dk1"/>
    </fontRef>
  </style>
</spDef>
```

In this example, we see a default shape which references a certain themed fill, line, effect, and font along with an override fill to these. *end example*]

Parent Elements
objectDefaults (§5.1.8.7)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
extLst (Extension List)	§5.1.2.1.15
lstStyle (Text List Styles)	§5.1.5.4.12
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DefaultShapeDefinition">
   <sequence>
      <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.1.28 txDef (Text Default)

This element defines the default formatting which is applied to text in a document by default. The default formatting can and should be applied to the shape when it is initially inserted into a document.

[*Example*: Consider the following example of a text default being used within DrawingML:

```
<txDef>
  <spPr>
    <solidFill>
      <schemeClr val="accent2">
        <shade val="75000"/>
      </schemeClr>
    </solidFill>
  </spPr>
  <bodyPr rtlCol="0" anchor="ctr"/>
  <lstStyle>
    <defPPr algn="ctr">
      <defRPr/>
    </defPPr>
  </lstStyle>
  <style>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
```

```
      <fillRef idx="2">
        <schemeClr val="accent1"/>
      </fillRef>
      <effectRef idx="1">
        <schemeClr val="accent1"/>
      </effectRef>
      <fontRef idx="minor">
        <schemeClr val="dk1"/>
      </fontRef>
    </style>
  </txDef>
```

In this example, we see a default text which references a certain themed fill, line, effect, and font along with an override fill to these. *end example*]

Parent Elements
objectDefaults (§5.1.8.7)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
extLst (Extension List)	§5.1.2.1.15
lstStyle (Text List Styles)	§5.1.5.4.12
spPr (Shape Properties)	§5.1.2.1.35
style (Shape Style)	§5.1.2.1.37

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DefaultShapeDefinition">
   <sequence>
      <element name="spPr" type="CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2 Table Styles

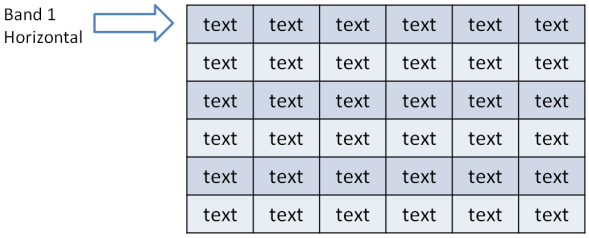
Table styles are responsible for the rapid formatting that can be applied to a table. This rapid formatting takes different parts of a table into account, such as if the first row or last row should be emphasized, or if there is some type of banding (row for example) present on the table. All of these different types of formatting can be defined within a table style

5.1.4.2.1 band1H (Band 1 Horizontal)

This element describes the formatting for the first row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example*: Consider the following example of band 1 horizontal being used within DrawingML:

```
<band1H>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band1H>
```



In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.2 band1V (Band 1 Vertical)

This element describes the formatting for the first row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example*: Consider the following example of band 1 vertical being used within DrawingML:

```
<band1V>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band1V>
```

Band 1 Vertical

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

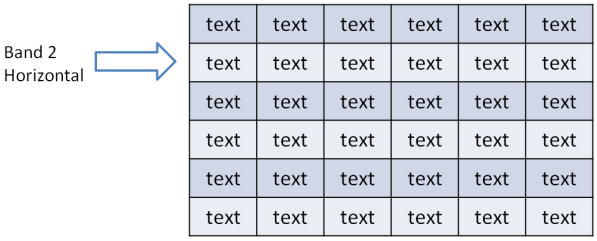
```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.3 band2H (Band 2 Horizontal)

This element describes the formatting for the second row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example*: Consider the following example of band 2 horizontal being used within DrawingML:

```
<band2H>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent2">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band2H>
```



In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

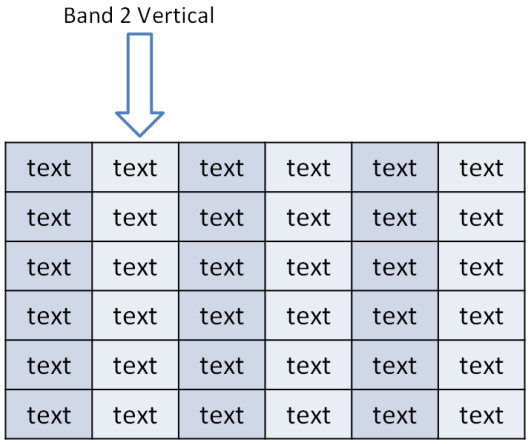
```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.4 band2V (Band 2 Vertical)

This element describes the formatting for the second row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example*: Consider the following example of band 2 vertical being used within DrawingML:

```
<band2V>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent2">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band2V>
```



In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.5 bevel (Bevel)

This element defines the properties of the bevel associated with the 3D effect applied to a cell in a table.

Parent Elements
cell3D (§5.1.6.1)

Attributes	Description
h (Height)	Specifies the height of the bevel, or how far above the shape it is applied. [*Example*: Consider the following example bevel  In this example, we see the height of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
prst (Preset Bevel)	Specifies the preset bevel type which defines the look of the bevel. The possible values for this attribute are defined by the ST_BevelPresetType simple type (§5.1.12.9).
w (Width)	Specifies the width of the bevel, or how far into the shape it is applied.

Attributes	Description
	[*Example*: Consider the following example bevel  Bevel Width In this example, we see the width of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Bevel">
   <attribute name="w" type="ST_PositiveCoordinate" use="optional" default="76200"/>
   <attribute name="h" type="ST_PositiveCoordinate" use="optional" default="76200"/>
   <attribute name="prst" type="ST_BevelPresetType" use="optional" default="circle"/>
</complexType>
```

5.1.4.2.6 bottom (Bottom Border)

This element defines the line properties associated with the bottom border in a table cell.

[*Example*: Consider the following example of the bottom border in use within DrawingML:

```
<bottom>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</bottom>
```

In this example, we see the bottom border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
   <choice>
      <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
   </choice>
</complexType>
```

5.1.4.2.7 effect (Effect)

This element defines the effect that can be applied to a table as a whole through a table style.

[*Example*: Consider the following example of an effect in use within DrawingML:

```
<effect>
  <effectLst>
    <glow rad="228600">
      <schemeClr val="accent1">
        <satMod val="175000"/>
        <alpha val="40000"/>
      </schemeClr>
    </glow>
  </effectLst>
</effect>
```

In this example, we see a glow being defined within the table style that will be applied to the table as a whole. *end example*]

Parent Elements
tblBg (§5.1.4.2.25)

Child Elements	Subclause
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EffectProperties">
   <sequence>
      <group ref="EG_EffectProperties" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.8 effectRef (Effect Reference)

This element defines a reference to an effect style within the style matrix. The idx attribute refers the index of an effect style within the effectStyleLst element.

Parent Elements
style (§5.6.2.30); style (§5.9.2.28); style (§4.4.1.43); style (§5.8.2.24); style (§5.1.2.1.37); tblBg (§5.1.4.2.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
idx (Style Matrix Index)	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§5.1.12.57).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleMatrixReference">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="idx" type="ST_StyleMatrixColumnIndex" use="required"/>
</complexType>
```

5.1.4.2.9 fill (Fill)

This element defines the fill that is applied to the table as a whole. The background of the table can contain a single fill that is the entire size of the table. This can allow for gradient fills, or image fills, which span the entire size of the table.

[*Example*: Consider the following example of a fill on a table background in DrawingML:

```
<fill>
  <gradFill flip="none" rotWithShape="1">
    <gsLst>
      <gs pos="0">
        <schemeClr val="accent2">
          <shade val="75000"/>
        </schemeClr>
      </gs>
      <gs pos="100000">
        <schemeClr val="accent2">
          <shade val="75000"/>
          <tint val="20000"/>
        </schemeClr>
      </gs>
    </gsLst>
    <lin ang="2700000" scaled="1"/>
    <tileRect/>
  </gradFill>
</fill>
```

In this example, we apply a gradient fill to the entire table on the background shape of the table. *end example*]

Parent Elements
tblBg (§5.1.4.2.25); tcStyle (§5.1.4.2.29)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FillProperties">
   <sequence>
      <group ref="EG_FillProperties" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.10 fillRef (Fill Reference)

This element defines a reference to a fill style within the style matrix. The idx attribute refers to the index of a fill style or background fill style within the presentation's style matrix, defined by the fmtScheme element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style within the fillStyleLst element, and values 1001 and above refer to the index of a background fill style within the bgFillStyleLst element. The value 1001 corresponds to the first background fill style, 1002 to the second background fill style, and so on.

[*Example*:

```
<a:fillRef idx="2">
  <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's second fill style using the accent2 color of the color scheme.

end example]

[*Example*:

```
<a:fillRef idx="1001">
  <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's first background fill style using the accent2 color of the color scheme.

end example]

Parent Elements
style (§5.6.2.30); style (§5.9.2.28); style (§4.4.1.43); style (§5.8.2.24); style (§5.1.2.1.37); tblBg (§5.1.4.2.25); tcStyle (§5.1.4.2.29)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
idx (Style Matrix Index)	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§5.1.12.57).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleMatrixReference">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="idx" type="ST_StyleMatrixColumnIndex" use="required"/>
</complexType>
```

5.1.4.2.11 firstCol (First Column)

This element defines the cell formatting which can be applied to the first column of the table.

[*Example*: Consider the following example of first column formatting within DrawingML:

```
<firstCol>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</firstCol>
```

First Column

text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text
text	text	text	text	text	text

In this example, we define the first column cell fills to be accent 1 along with the text properties to be bold when first column formatting is enabled through the user interface. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.12 firstRow (First Row)

This element defines the cell formatting which can be applied to the first row of the table.

[*Example*: Consider the following example of first row formatting within DrawingML:

```
<firstRow>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
```

```
    <tcStyle>
      <tcBdr/>
      <fill>
        <solidFill>
          <schemeClr val="accent1"/>
        </solidFill>
      </fill>
    </tcStyle>
  </firstRow>
```

In this example, we define the first row cell fills to be accent 1 along with the text properties to be bold when first row formatting is enabled through the user interface. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.13 font (Font)

This element defines the font to be used within a given table cell text style. This element allows for exact definition of the font within the table style instead of referencing a themed font.

Parent Elements
tcTxStyle (§5.1.4.2.30)

Child Elements	Subclause
cs (Complex Script Font)	§5.1.5.3.1
ea (East Asian Font)	§5.1.5.3.3
extLst (Extension List)	§5.1.2.1.15
font (Font)	§5.1.4.1.16
latin (Latin Font)	§5.1.5.3.7

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FontCollection">
   <sequence>
      <element name="latin" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="ea" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="cs" type="CT_TextFont" minOccurs="1" maxOccurs="1"/>
      <element name="font" type="CT_SupplementalFont" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.14 insideH (Inside Horizontal Border)

This element defines the line properties associated with the inner horizontal borders in a table.

[*Example*: Consider the following example of the inner horizontal borders in use within DrawingML:

```
<insideH>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</insideH>
```

In this example, we see the inner horizontal borders in a table to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
   <choice>
      <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
   </choice>
</complexType>
```

5.1.4.2.15 insideV (Inside Vertical Border)

This element defines the line properties associated with the inner vertical borders in a table.

[*Example*: Consider the following example of the inside vertical borders in use within DrawingML:

```
<insideV>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</insideV>
```

In this example, we see the inner vertical borders in a table to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

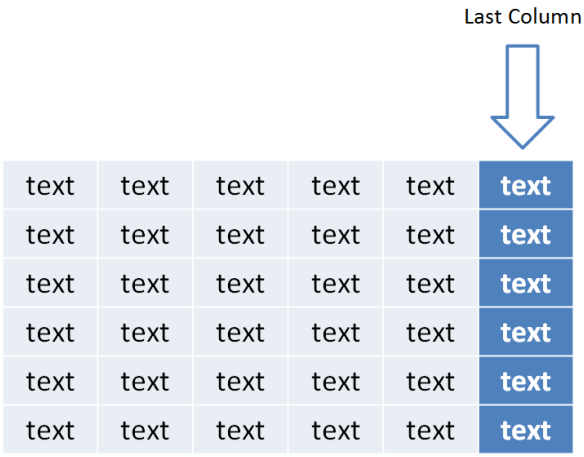
```
<complexType name="CT_ThemeableLineStyle">
   <choice>
      <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
   </choice>
</complexType>
```

5.1.4.2.16 lastCol (Last Column)

This element defines the cell formatting which can be applied to the last column of the table.

[*Example*: Consider the following example of last column formatting within DrawingML:

```
<lastCol>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</lastCol>
```



In this example, we define the last column cell fills to be accent 1 along with the text properties to be bold when last column formatting is enabled through the user interface. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.17 lastRow (Last Row)

This element defines the cell formatting which can be applied to the last row of the table.

[*Example*: Consider the following example of last row formatting within DrawingML:

```
<lastRow>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</lastRow>
```

In this example, we define the last row cell fills to be accent 1 along with the text properties to be bold when last row formatting is enabled through the user interface. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.18 left (Left Border)

This element defines the line properties associated with the left border in a table cell.

[*Example*: Consider the following example of the left border in use within DrawingML:

```
<left>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</left>
```

In this example, we see the left border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
   <choice>
      <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
   </choice>
</complexType>
```

5.1.4.2.19 lnRef (Line Reference)

This element defines a reference to a line style within the style matrix. The idx attribute refers the index of a line style within the fillStyleLst element.

Parent Elements
bottom (§5.1.4.2.6); insideH (§5.1.4.2.14); insideV (§5.1.4.2.15); left (§5.1.4.2.18); right (§5.1.4.2.22); style (§5.6.2.30); style (§5.9.2.28); style (§4.4.1.43); style (§5.8.2.24); style (§5.1.2.1.37); tl2br (§5.1.4.2.31); top (§5.1.4.2.32); tr2bl (§5.1.4.2.33)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
idx (Style Matrix Index)	Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§5.1.12.57).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StyleMatrixReference">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="idx" type="ST_StyleMatrixColumnIndex" use="required"/>
</complexType>
```

5.1.4.2.20 neCell (Northeast Cell)

This element defies the formatting for the cell in the northeast corner of a table when both the first row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example*: Consider the following example of the northeast cell formatting within DrawingML:

```
<neCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</neCell>
```

In this example, we specifically set the northeast cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.21 nwCell (Northwest Cell)

This element defies the formatting for the cell in the northwest corner of a table when both the first row formatting and first column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example*: Consider the following example of the northwest cell formatting within DrawingML:

```
<nwCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</nwCell>
```

In this example, we specifically set the northwest cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.22 right (Right Border)

This element defines the line properties associated with the right border in a table cell.

[*Example*: Consider the following example of the right border in use within DrawingML:

```
<right>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</right>
```

In this example, we see the right border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
   <choice>
      <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
   </choice>
</complexType>
```

5.1.4.2.23 seCell (Southeast Cell)

This element defies the formatting for the cell in the southeast corner of a table when both the last row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example*: Consider the following example of the southeast cell formatting within DrawingML:

```
<seCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
```

```
    <tcStyle>
      <tcBdr/>
      <fill>
        <solidFill>
          <schemeClr val="accent1"/>
        </solidFill>
      </fill>
    </tcStyle>
  </seCell>
```

In this example, we specifically set the southeast cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.24 swCell (Southwest Cell)

This element defies the formatting for the cell in the southwest corner of a table when both the last row formatting and first column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example*: Consider the following example of the southwest cell formatting within DrawingML:

```
  <swCell>
    <tcTxStyle b="on">
      <fontRef idx="minor">
        <scrgbClr r="0" g="0" b="0"/>
      </fontRef>
      <schemeClr val="lt1"/>
    </tcTxStyle>
```

```
    <tcStyle>
      <tcBdr/>
      <fill>
        <solidFill>
          <schemeClr val="accent1"/>
        </solidFill>
      </fill>
    </tcStyle>
  </swCell>
```

In this example, we specifically set the southwest cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.25 tblBg (Table Background)

This element defines the formatting options which can be applied to the table background shape. The background shape is the same size as the entire table and can hold a fill or an effect which spans the entire table.

[*Example*: Consider the following example of a table background in use within DrawingML:

```
  <tblBg>
    <fillRef idx="2">
      <schemeClr val="accent1"/>
    </fillRef>
    <effectRef idx="1">
      <schemeClr val="accent1"/>
    </effectRef>
  </tblBg>
```

In this example, we see that there is a themed fill and themed effect being applied to the table background through the table style. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
effect (Effect)	§5.1.4.2.7
effectRef (Effect Reference)	§5.1.4.2.8
fill (Fill)	§5.1.4.2.9
fillRef (Fill Reference)	§5.1.4.2.10

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableBackgroundStyle">
   <sequence>
      <group ref="EG_ThemeableFillStyle" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_ThemeableEffectStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.26 tblStyle (Table Style)

This is the root element for a table style. Within the table style are different formatting options available in order to apply a table.

Parent Elements
tblStyleLst (§5.1.4.2.27)

Child Elements	Subclause
band1H (Band 1 Horizontal)	§5.1.4.2.1
band1V (Band 1 Vertical)	§5.1.4.2.2
band2H (Band 2 Horizontal)	§5.1.4.2.3
band2V (Band 2 Vertical)	§5.1.4.2.4
extLst (Extension List)	§5.1.2.1.15
firstCol (First Column)	§5.1.4.2.11
firstRow (First Row)	§5.1.4.2.12
lastCol (Last Column)	§5.1.4.2.16
lastRow (Last Row)	§5.1.4.2.17
neCell (Northeast Cell)	§5.1.4.2.20

Child Elements	Subclause
nwCell (Northwest Cell)	§5.1.4.2.21
seCell (Southeast Cell)	§5.1.4.2.23
swCell (Southwest Cell)	§5.1.4.2.24
tblBg (Table Background)	§5.1.4.2.25
wholeTbl (Whole Table)	§5.1.4.2.34

Attributes	Description
styleId (Style ID)	Specifies a GUID identifying the table style in a unique manner. The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).
styleName (Name)	Specifies the name of the table style which can show up in the user interface identifying the style to a user. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyle">
   <sequence>
      <element name="tblBg" type="CT_TableBackgroundStyle" minOccurs="0" maxOccurs="1"/>
      <element name="wholeTbl" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="band1H" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="band2H" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="band1V" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="band2V" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="lastCol" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="firstCol" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="lastRow" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="seCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="swCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="firstRow" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="neCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="nwCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="styleId" type="ST_Guid" use="required"/>
   <attribute name="styleName" type="xsd:string" use="required"/>
</complexType>
```

5.1.4.2.27 tblStyleLst (Table Style List)

This element is simply a list of table styles which are used within a document.

[*Example*: Consider the following example of a table style list within DrawingML:

```
<tblStyleLst def="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}">
  <tblStyle styleId="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}"
    styleName="Medium Style 2 - Accent 1">
    …
  </tblStyle>
  <tblStyle styleId="{3C2FFA5D-87B4-456A-9821-1D502468CF0F}"
    styleName="Themed Style 1 - Accent 1">
    …
  </tblStyle>
</tblStyleLst>
```

In this example, we see two table styles defined along with the default being specified. *end example*]

Parent Elements
Root element of DrawingML Table Styles part

Child Elements	Subclause
tblStyle (Table Style)	§5.1.4.2.26

Attributes	Description
def (Default)	The GUID corresponding to the default table style in the list of table styles. This default can be used when a table is initially inserted into a document. The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyleList">
   <sequence>
      <element name="tblStyle" type="CT_TableStyle" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="def" type="ST_Guid" use="required"/>
</complexType>
```

5.1.4.2.28 tcBdr (Table Cell Borders)

This element defines the borders for the cells within a table.

[*Example*: Consider the following example of table cell borders being used within DrawingML:

```
<tcBdr>
  <left>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </left>
  <right>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </right>
  <top>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </top>
  <bottom>
    <lnRef idx="2">
      <schemeClr val="lt1"/>
    </lnRef>
  </bottom>
  <insideH>
    <ln>
      <noFill/>
    </ln>
  </insideH>
  <insideV>
    <ln>
      <noFill/>
    </ln>
  </insideV>
</tcBdr>
```

In this example, we define borders for the bottom, top, right, and left borders of the table cells. *end example*]

Parent Elements
tcStyle (§5.1.4.2.29)

Child Elements	Subclause
bottom (Bottom Border)	§5.1.4.2.6
extLst (Extension List)	§5.1.2.1.15
insideH (Inside Horizontal Border)	§5.1.4.2.14

Child Elements	Subclause
insideV (Inside Vertical Border)	§5.1.4.2.15
left (Left Border)	§5.1.4.2.18
right (Right Border)	§5.1.4.2.22
tl2br (Top Left to Bottom Right Border)	§5.1.4.2.31
top (Top Border)	§5.1.4.2.32
tr2bl (Top Right to Bottom Left Border)	§5.1.4.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableCellBorderStyle">
   <sequence>
      <element name="left" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
      <element name="right" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
      <element name="top" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
      <element name="bottom" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
      <element name="insideH" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
      <element name="insideV" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tl2br" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tr2bl" type="CT_ThemeableLineStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.29 tcStyle (Table Cell Style)

This element defines the style for a give cell in a table.

[*Example*: Consider the following example of a table cell style in use within DrawingML:

```
<tcStyle>
  <tcBdr>
    …
  </tcBdr>
  <fill>
    …
  </fill>
</tcStyle>
```

In this example, we see that a set of borders for the cell along with a cell fill are being defined. *end example*]

Parent Elements
band1H (§5.1.4.2.1); band1V (§5.1.4.2.2); band2H (§5.1.4.2.3); band2V (§5.1.4.2.4); firstCol (§5.1.4.2.11); firstRow (§5.1.4.2.12); lastCol (§5.1.4.2.16); lastRow (§5.1.4.2.17); neCell (§5.1.4.2.20); nwCell (§5.1.4.2.21); seCell (§5.1.4.2.23); swCell (§5.1.4.2.24); wholeTbl (§5.1.4.2.34)

Child Elements	Subclause
cell3D (Cell 3-D)	§5.1.6.1
fill (Fill)	§5.1.4.2.9
fillRef (Fill Reference)	§5.1.4.2.10
tcBdr (Table Cell Borders)	§5.1.4.2.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyleCellStyle">
   <sequence>
      <element name="tcBdr" type="CT_TableCellBorderStyle" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_ThemeableFillStyle" minOccurs="0" maxOccurs="1"/>
      <element name="cell3D" type="CT_Cell3D" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.4.2.30 tcTxStyle (Table Cell Text Style)

This element defines the text properties associated with the text contained within a table cell.

[*Example*: Consider the following example of a table cell text style in use within DrawingML:

```
<tcTxStyle b="on">
  <fontRef idx="minor">
    <scrgbClr r="0" g="0" b="0"/>
  </fontRef>
  <schemeClr val="lt1"/>
</tcTxStyle>
```

In this example, we define the text within the cell to be bold and reference the themed minor font and to also be the light 1 color. *end example*]

Parent Elements
band1H (§5.1.4.2.1); band1V (§5.1.4.2.2); band2H (§5.1.4.2.3); band2V (§5.1.4.2.4); firstCol (§5.1.4.2.11); firstRow (§5.1.4.2.12); lastCol (§5.1.4.2.16); lastRow (§5.1.4.2.17); neCell (§5.1.4.2.20); nwCell (§5.1.4.2.21); seCell (§5.1.4.2.23); swCell (§5.1.4.2.24); wholeTbl (§5.1.4.2.34)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
font (Font)	§5.1.4.2.13
fontRef (Font Reference)	§5.1.4.1.17
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29

Child Elements	Subclause
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
b (Bold)	Specifies if the text is to be bolded. The possible values for this attribute are defined by the ST_OnOffStyleType simple type (§5.1.12.36).
i (Italic)	Specifies if the text is to be italicized. The possible values for this attribute are defined by the ST_OnOffStyleType simple type (§5.1.12.36).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyleTextStyle">
   <sequence>
      <group ref="EG_ThemeableFontStyles" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="b" type="ST_OnOffStyleType" use="optional" default="def"/>
   <attribute name="i" type="ST_OnOffStyleType" use="optional" default="def"/>
</complexType>
```

5.1.4.2.31 tl2br (Top Left to Bottom Right Border)

This element defines the line properties associated with the border which goes from the top-left to the bottom-right corner in a table cell.

[*Example*: Consider the following example of the top border in use within DrawingML:

```
<tl2br>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</tl2br>
```

In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
   <choice>
      <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
   </choice>
</complexType>
```

5.1.4.2.32 top (Top Border)

This element defines the line properties associated with the top border in a table cell.

[*Example*: Consider the following example of the top border in use within DrawingML:

```
<top>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</top>
```

In this example, we see the top border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
   <choice>
      <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
   </choice>
</complexType>
```

5.1.4.2.33 tr2bl (Top Right to Bottom Left Border)

This element defines the line properties associated with the border which goes from the top-right to the bottom-left corner in a table cell.

[*Example*: Consider the following example of the top border in use within DrawingML:

```
<tr2bl>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</tr2bl>
```

In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

Parent Elements
tcBdr (§5.1.4.2.28)

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ThemeableLineStyle">
   <choice>
      <element name="ln" type="CT_LineProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
   </choice>
</complexType>
```

5.1.4.2.34 wholeTbl (Whole Table)

This element contains formatting options which are applied to the table as a whole when it is in its default state with no formatting options (first row, last row, etc) enabled.

[*Example*: Consider the following example of whole table being used within DrawingML:

```
<wholeTbl>
  <tcTxStyle>
    …
  </tcTxStyle>
  <tcStyle>
    …
  </tcStyle>
</wholeTbl>
```

In this example, we see definitions for the text and the cells within the table. *end example*]

Parent Elements
tableStyle (§5.1.6.9); tblStyle (§5.1.4.2.26)

Child Elements	Subclause
tcStyle (Table Cell Style)	§5.1.4.2.29
tcTxStyle (Table Cell Text Style)	§5.1.4.2.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TablePartStyle">
   <sequence>
      <element name="tcTxStyle" type="CT_TableStyleTextStyle" minOccurs="0" maxOccurs="1"/>
      <element name="tcStyle" type="CT_TableStyleCellStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.5 Paragraphs and Rich Formatting

The Paragraphs and Rich Formatting portion of the DrawingML framework stores text and related formatting information for a text body contained within a shape. Formatting for text within a shape can be broken down into three levels of precision, namely body, paragraph, and run formatting properties.

5.1.5.1 Body Formatting

Being the highest level of formatting available within a shape, the body properties allow for the manipulation of the text area as a whole. This means that all paragraphs and runs of text for the shape in question would be encompassed within here and, therefore, follow the text body style defined here.

[*Example*: Consider a shape that has three paragraphs within it, each with a different sized text. If this shape is resized to be smaller, then the text will no longer fit the same way within the shape. Thus, we see that to maintain visual quality the size must be changed.

Rather than try to change each of the paragraphs to a smaller font size to fit in the shape, just use a body-level format property such as the normAutofit. This will apply to all text within the shape and scale the text by a certain percentage in order to fit within the shape.

```
<p:txBody>
  <a:bodyPr>
    <a:normAutofit fontScale="20000" lnSpcReduction="20000"/>
  </a:bodyPr>
  …
  <a:p>
  …
  </a:p>
  <a:p>
  …
  </a:p>
  <a:p>
  …
  </a:p>
</p:txBody>
```

end example]

5.1.5.1.1 bodyPr (Body Properties)

This element defines the body properties for the text body within a shape.

[*Example*: Consider a shape with a text body that has some formatting properties associated with it. For the formatting of text body properties, the bodyPr element should be used as follows:

```
<p:sp>
  …
  <p:txBody>
    <a:bodyPr>
      (text body properties)
    </a:bodyPr>
  …
  </p:txBody>
</p:sp>
```

end example]

Parent Elements
lnDef (§5.1.4.1.20); rich (§5.7.2.157); spDef (§5.1.4.1.27); t (§5.9.3.8); txBody (§5.8.2.26); txBody (§5.1.2.1.40); txBody (§5.6.2.33); txBody (§4.4.1.47); txDef (§5.1.4.1.28); txPr (§5.7.2.217)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
flatTx (No text in 3D scene)	§5.1.7.8

Child Elements	Subclause
noAutofit (No AutoFit)	§5.1.5.1.2
normAutofit (Normal AutoFit)	§5.1.5.1.3
prstTxWarp (Preset Text Warp)	§5.1.11.19
scene3d (3D Scene Properties)	§5.1.4.1.26
sp3d (Apply 3D shape properties)	§5.1.7.12
spAutoFit (Shape AutoFit)	§5.1.5.1.4

Attributes	Description

anchor (Anchor)	Specifies the anchoring position of the txBody within the shape. If this attribute is omitted, then a value of t, or top is implied.
	
	[*Example*: Consider the following DrawingML:
	
	`<p:txBody>`
	`  <a:bodyPr anchor="ctr" … />`
	`  …`
	`</p:txBody>`
	
	Here the text is vertically aligned in the center of the shape within which it is contained. *end example*]
	
	The possible values for this attribute are defined by the ST_TextAnchoringType simple type (§5.1.12.60).

anchorCtr (Anchor Center)	Specifies the centering of the text box. The way it works fundamentally is to determine the smallest possible "bounds box" for the text and then to center that "bounds box" accordingly. Note that this is different than paragraph alignment, which aligns the text within the "bounds box" for the text. This flag is compatible with all of the different types of anchoring. If this attribute is omitted, then a value of 0, or off is implied.
	
	[*Example*: The text within this shape has been both vertically centered with the anchor attribute and horizontally centered with the anchorCtr attribute.
	
	`<p:txBody>`
	`  <a:bodyPr anchor="ctr" anchorCtr="1" … />`
	`  …`
	`</p:txBody>`
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

bIns (Bottom Inset)	Specifies the bottom inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, a value of 45720 or 0.05 inches is implied.

Attributes	Description

	[*Example*: Consider the following DrawingML:
	`<p:txBody>`
	`<a:bodyPr lIns="91440" tIns="91440"`
	`rIns="91440" bIns="91440" … />`
	`…`
	`</p:txBody>`
	
	The text box having the above body properties will have inset margins of 91440 or 0.1 inches on all four sides. *end example*]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

compatLnSpc (Compatible Line Spacing)	Specifies that the line spacing for this text body will be decided in a simplistic manner using the font scene. If this attribute is omitted, a value of 0 or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.
forceAA (Force Anti-Alias)	Forces the text to be rendered anti-aliased regardless of the font size. Certain fonts may appear grainy around their edges unless they are anti-aliased. Therefore this attribute allows for the specifying of which bodies of text should always be anti-aliased and which ones should not. If this attribute is omitted, then a value of 0, or off is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.

fromWordArt (From WordArt)	Specifies that text within this textbox is converted text from a WordArt object. This is more of a backwards compatibility attribute that is useful to the application from a tracking perspective. WordArt was the former way to apply text effects and therefore this attribute is useful in document conversion scenarios. If this attribute is omitted, then a value of 0, or off is implied.
	
	[*Example*: Consider the following DrawingML:
	`<p:txBody>`
	`<a:bodyPr wrap="none" fromWordArt="1" …`
	`/>`
	`…`
	`</p:txBody>`
	end example]
	Because of the presence of the fromWordArt attribute the text within this shape can be mapped back to the corresponding WordArt during document conversion. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

horzOverflow (Text Horizontal Overflow)	Determines whether the text can flow out of the bounding box horizontally. This is used to determine what will happen in the event that the text within a shape is too large for the bounding box it is contained within. If this attribute is omitted, then a value of overflow is implied.

Attributes	Description

	[*Example*: Consider the case where we have multiply paragraphs within a shape and the second is greater in length and causes text to flow outside the shape. By applying the clip value of the horzOverflow attribute as a body property this overflowing text will now be cut off instead of extending beyond the bounds of the shape.
	
	`<p:txBody>`
	`  <a:bodyPr horzOverflow="clip" … />`
	`  …`
	`  <a:p>`
	`  …`
	`  (Some text)`
	`  …`
	`  </a:p>`
	`  <a:p>`
	`  …`
	`  (Some more text)`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TextHorzOverflowType simple type (§5.1.12.69).

lIns (Left Inset)	Specifies the left inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 91440 or 0.1 inches is implied.
	
	[*Example*: Consider the following DrawingML:
	
	`<p:txBody>`
	`  <a:bodyPr lIns="91440" tIns="91440" rIns="91440"`
	`  bIns="91440" … />`
	`  …`
	`</p:txBody>`
	
	The text box having the above body properties will have inset margins of 91440 or 0.1 inches on all four sides. *end example*]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

numCol (Number of Columns)	Specifies the number of columns of text in the bounding rectangle. When applied to a text run this property takes the width of the bounding box for the text and divides it by the number of columns specified. These columns are then treated as overflow containers in that when the previous column has been filled with text the next column will act as the repository for additional text. When all columns have been filled and text still remains

Attributes	Description

	then the overflow properties set for this text body will be used and the text will be reflowed to make room for additional text. If this attribute is omitted, then a value of 1 is implied.
	
	[*Example*: Consider the case where a text area would need to be split up into four separate columns. Then simply specifying one paragraph with one run of text is enough to describe four columns of text here.
	
	`<p:txBody>`
	`  <a:bodyPr numCol="4" … />`
	`  <a:p>`
	`  <a:r>`
	`  …`
	`  (Some text)`
	`  …`
	`  </a:r>`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TextColumnCount simple type (§5.1.12.65).

rIns (Right Inset)	Specifies the right inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 91440 or 0.1 inches is implied.
	
	[*Example*: Consider the following DrawingML:
	
	`<p:txBody>`
	`  <a:bodyPr lIns="91440" tIns="91440"`
	`  rIns="91440" bIns="91440" … />`
	`  …`
	`</p:txBody>`
	
	The text box having the above body properties will have inset margins of 91440 or 0.1 inches on all four sides. *end example*]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

rot (Rotation)	Specifies the rotation that is being applied to the text within the bounding box. If it not specified, the rotation of the accompanying shape is used. If it is specified, then this is applied independently from the shape. That is the shape can have a rotation applied in addition to the text itself having a rotation applied to it. If this attribute is omitted, then a value of 0, is implied.

Attributes	Description

	[*Example*: Consider the case where a shape has a rotation of 5400000, or 90 degrees clockwise applied to it. In addition to this, the text body itself has a rotation of -5400000, or 90 degrees counter-clockwise applied to it. Then the resulting shape would appear to be rotated but the text within it would appear as though it had not been rotated at all. The DrawingML specifying this would look like the following:
	
	`<p:sp>`
	`  <p:spPr>`
	`  <a:xfrm rot="5400000">`
	`  …`
	`  </a:xfrm>`
	`  </p:spPr>`
	`  …`
	`  <p:txBody>`
	`  <a:bodyPr rot="-5400000" … />`
	`  …`
	`  (Some text)`
	`  …`
	`  </p:txBody>`
	`</p:sp>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

rtlCol (Columns Right-To-Left)	Specifies whether columns are used in a right-to-left or left-to-right order. The usage of this attribute only sets the column order that is used to determine which column overflow text should go to next. If this attribute is omitted, then a value of 0, or off is implied in which case text will start in the leftmost column and flow to the right. [*Note*: This attribute in no way determines the direction of text but merely the direction in which multiple columns are used. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.
spcCol (Space Between Columns)	Specifies the space between text columns in the text area. This should only apply when there is more than 1 column present. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§5.1.12.43).
spcFirstLastPara (Paragraph Spacing)	Specifies whether the before and after paragraph spacing defined by the user is to be respected. While the spacing between paragraphs is helpful, it is additionally useful to be able to set a flag as to whether this spacing is to be followed at the edges of the text body, in other words the first and last paragraphs in the text body. More precisely since this is a text body level property it should only effect the before paragraph spacing of the first paragraph and the after paragraph spacing of the last paragraph for a given text body. If this attribute is omitted, then a value of 0, or false is implied.

Attributes	Description

	[*Example*: Consider the case where spacing has been defined between multiple paragraphs within a text body using the spcBef and spcAft paragraph spacing attributes. For this text body however the user would like to not have this followed for the edge paragraphs and thus we have the following DrawingML.
	
	`<p:txBody>`
	`  <a:bodyPr spcFirstLastPara="0" … />`
	`  …`
	`  <a:p>`
	`  <a:pPr>`
	`  <a:spcBef>`
	`  <a:spcPts val="1800"/>`
	`  </a:spcBef>`
	`  <a:spcAft>`
	`  <a:spcPts val="600"/>`
	`  </a:spcAft>`
	`  </a:pPr>`
	`  …`
	`  (Some text)`
	`  …`
	`  </a:p>`
	`  <a:p>`
	`  <a:pPr>`
	`  <a:spcBef>`
	`  <a:spcPts val="1800"/>`
	`  </a:spcBef>`
	`  <a:spcAft>`
	`  <a:spcPts val="600"/>`
	`  </a:spcAft>`
	`  </a:pPr>`
	`  …`
	`  (Some text)`
	`  …`
	`  </a:p>`
	`  …`
	`  </p:txBody>`
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

tIns (Top Inset)	Specifies the top inset of the bounding rectangle. Insets are used just as internal margins for text boxes within shapes. If this attribute is omitted, then a value of 45720 or 0.05 inches is implied. [*Example*: Consider the following DrawingML: `  <p:txBody>`

Attributes	Description
	<a:bodyPr lIns="91440" tIns="91440" rIns="91440" bIns="91440" … /> … </p:txBody> The text box having the above body properties will have inset margins of 91440 or 0.1 inches on all four sides. *end example*] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).
upright (Text Upright)	Specifies whether text should remain upright, regardless of the transform applied to it and the accompanying shape transform. If this attribute is omitted, then a value of 0, or false will be implied. [*Example*: Consider text that has been rotated within the text body but has the upright flag set. <p:txBody> <a:bodyPr upright="1" rot="5400000" …/> … (Some text) … </p:txBody> This text will appear as though no transform has been applied to it. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
vert (Vertical Text)	Determines if the text within the given text body should be displayed vertically. If this attribute is omitted, then a value of horz, or no vertical text is implied. [*Example*: Consider the case where the user needs to display text that appears vertical and has a right to left flow with respect to its columns. <p:txBody> <a:bodyPr vert="wordArtVertRtl" … /> … <a:p> … <a:t>This is</a:t> … </a:p> <a:p> … <a:t>some text.</a:t> … </a:p>

Attributes	Description
	</p:txBody> In the above sample DrawingML there are two paragraphs denoting a separation between the text otherwise which are known as either a line or paragraph break. Because wordArtVertRtl is used here this text will not only be displayed in a stacked manner flowing from top to bottom but also have the first paragraph be displayed to the right of the second. This is because it is both vertical text and right to left. *end example*] The possible values for this attribute are defined by the ST_TextVerticalType simple type (§5.1.12.83).
vertOverflow (Text Vertical Overflow)	Determines whether the text can flow out of the bounding box vertically. This is used to determine what will happen in the event that the text within a shape is too large for the bounding box it is contained within. If this attribute is omitted, then a value of overflow is implied. [*Example*: Consider the case where we have multiply paragraphs within a shape and the second causes text to flow outside the shape. By applying the clip value of the vertOverflow attribute as a body property this overflowing text will now be cut off instead of extending beyond the bounds of the shape. <p:txBody> <a:bodyPr vertOverflow="clip" … /> … <a:p> … (Some text) … </a:p> <a:p> … (Some longer text) … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_TextVertOverflowType simple type (§5.1.12.84).
wrap (Text Wrapping Type)	Specifies the wrapping options to be used for this text body. If this attribute is omitted, then a value of square is implied which will wrap the text using the bounding text box. The possible values for this attribute are defined by the ST_TextWrappingType simple type (§5.1.12.85).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBodyProperties">
   <sequence>
      <element name="prstTxWarp" type="CT_PresetTextShape" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextAutofit" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_Text3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rot" type="ST_Angle" use="optional"/>
   <attribute name="spcFirstLastPara" type="xsd:boolean" use="optional"/>
   <attribute name="vertOverflow" type="ST_TextVertOverflowType" use="optional"/>
   <attribute name="horzOverflow" type="ST_TextHorzOverflowType" use="optional"/>
   <attribute name="vert" type="ST_TextVerticalType" use="optional"/>
   <attribute name="wrap" type="ST_TextWrappingType" use="optional"/>
   <attribute name="lIns" type="ST_Coordinate32" use="optional"/>
   <attribute name="tIns" type="ST_Coordinate32" use="optional"/>
   <attribute name="rIns" type="ST_Coordinate32" use="optional"/>
   <attribute name="bIns" type="ST_Coordinate32" use="optional"/>
   <attribute name="numCol" type="ST_TextColumnCount" use="optional"/>
   <attribute name="spcCol" type="ST_PositiveCoordinate32" use="optional"/>
   <attribute name="rtlCol" type="xsd:boolean" use="optional"/>
   <attribute name="fromWordArt" type="xsd:boolean" use="optional"/>
   <attribute name="anchor" type="ST_TextAnchoringType" use="optional"/>
   <attribute name="anchorCtr" type="xsd:boolean" use="optional"/>
   <attribute name="forceAA" type="xsd:boolean" use="optional"/>
   <attribute name="upright" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="compatLnSpc" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.5.1.2 noAutofit (No AutoFit)

This element specifies that text within the text body should not be auto-fit to the bounding box. Auto-fitting is when text within a text box is scaled in order to remain inside the text box. If this element is omitted, then noAutofit or auto-fit off is implied.

[*Example*: Consider a text box where the user wishes to have the text extend outside the bounding box. The following DrawingML would describe this.

```
<p:txBody>
  <a:bodyPr wrap="none" rtlCol="0">
    <a:noAutofit/>
  </a:bodyPr>
  <a:p>
    …
    <a:t>Some text</a:t>
    …
  </a:p>
</p:txBody>
```

end example]

Parent Elements
bodyPr (§5.1.5.1.1)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextNoAutofit"/>
```

5.1.5.1.3 normAutofit (Normal AutoFit)

This element specifies that text within the text body should be normally auto-fit to the bounding box. Auto-fitting is when text within a text box is scaled in order to remain inside the text box. If this element is omitted, then noAutofit or auto-fit off is implied.

[*Example*: Consider the situation where a user is building a diagram and needs to have the text for each shape that they are using stay within the bounds of the shape. An easy way this might be done is by using normAutofit. The following DrawingML will illustrate how this might be accomplished.

```
<p:sp>
  <p:txBody>
    <a:bodyPr rtlCol="0" anchor="ctr">
      <a:normAutofit fontScale="92000" lnSpcReduction="20000"/>
    </a:bodyPr>
    …
    <a:p>
      …
      <a:t>Diagram Object 1</a:t>
      …
    </a:p>
  </p:txBody>
</p:sp>
<p:sp>
  <p:txBody>
    <a:bodyPr rtlCol="0" anchor="ctr">
      <a:normAutofit fontScale="92000" lnSpcReduction="20000"/>
    </a:bodyPr>
    …
    <a:p>
      …
      <a:t>Diagram Object 2</a:t>
      …
    </a:p>
  </p:txBody>
</p:sp>
```

In the above example there are two shapes that have normAutofit turned on so that when the user types more text within the shape that the text will actually resize to accommodate the new data. For the application to know how and to what degree the text should be resized two attributes are set for the auto-fit resize logic. *end example*]

Parent Elements
bodyPr (§5.1.5.1.1)

Attributes	Description
fontScale (Font Scale)	Specifies the percentage of the original font size to which each run in the text body is scaled. In order to auto-fit text within a bounding box it is sometimes necessary to decrease the font size by a certain percentage. Using this attribute the font within a text box can be scaled based on the value provided. A value of 100000 is treated as 100% while a value of 1000 is consequently 1%. If this attribute is omitted, then a value of 100000 or 100% is implied. The possible values for this attribute are defined by the ST_TextFontScalePercent simple type (§5.1.12.67).
lnSpcReduction (Line Space Reduction)	Specifies the percentage amount by which the line spacing of each paragraph in the text body is reduced. The reduction is applied by subtracting it from the original line spacing value. Using this attribute the vertical spacing between the lines of text can be scaled by a percent amount. A value of 100000 is treated as 100% while a value of 1000 is consequently 1%. If this attribute is omitted, then a value of 0 or 0% is implied. [*Note*: This attribute applies only to paragraphs with percentage line spacing. *end note*] The possible values for this attribute are defined by the ST_TextSpacingPercent simple type (§5.1.12.77).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextNormalAutofit">
   <attribute name="fontScale" type="ST_TextFontScalePercent" use="optional" default="100000"/>
   <attribute name="lnSpcReduction" type="ST_TextSpacingPercent" use="optional" default="0"/>
</complexType>
```

5.1.5.1.4 spAutoFit (Shape AutoFit)

This element specifies that a shape should be auto-fit to fully contain the text described within it. Auto-fitting is when text within a shape is scaled in order to contain all the text inside. If this element is omitted, then noAutofit or auto-fit off is implied.

[*Example*: Consider the situation where a user is building a diagram and needs to have the text for each shape that they are using stay within the bounds of the shape. An easy way this might be done is by using spAutofit. The following DrawingML will illustrate how this might be accomplished.

```
<p:sp>
  <p:txBody>
    <a:bodyPr rtlCol="0" anchor="ctr">
      <a:spAutoFit/>
    </a:bodyPr>
    …
    <a:p>
      …
      <a:t>Diagram Object 1</a:t>
      …
    </a:p>
  </p:txBody>
</p:sp>
<p:sp>
  <p:txBody>
    <a:bodyPr rtlCol="0" anchor="ctr">
      <a:spAutoFit/>
    </a:bodyPr>
    …
    <a:p>
      …
      <a:t>Diagram Object 2</a:t>
      …
    </a:p>
  </p:txBody>
</p:sp>
```

In the above example there are two shapes that have spAutoFit turned on so that when the user types more text within the shape that the shape will actually resize to accommodate the new data. *end example*]

Parent Elements
bodyPr (§5.1.5.1.1)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextShapeAutofit"/>
```

5.1.5.2 Paragraph Formatting

This level of formatting allows for more granular control of text within a shape. Properties here apply to all text residing within the corresponding paragraph. This intermediate property level allows freedom to assign what would seem like lower level properties to a larger group of text. Along with this the paragraph property level also allows what would seem like larger group properties to a more granular set of text. This makes for a property level that is quite versatile in its ability to define formatting on text within a shape.

[*Example*: For instance consider the case where a paragraph of text would need to have bullets applied to it. At first one might think that this formatting must be done at the text run level as it may seem run specific. Much to the contrary this is a paragraph level property and is applied to multiple runs of text. As an example we have once again our three paragraphs with the second having bullets applied to it.

```
<a:p>
…
</a:p>
<a:p>
  <a:pPr>
    <a:buFont typeface="Wingdings"/>
    <a:buChar typeface="ü"/>
  <a:pPr>
  <a:r>
    <a:rPr lang="en-US" dirty="0" smtClean="0"/>
    <a:t>This Paragraph of Text Will Have a Bullet.</a:t>
  </a:r>
</a:p>
<a:p>
…
</a:p>
```

Here we see that the paragraph will be formatted to have character bullets for each new line of text that is encountered. In particular this paragraph will have the "ü" character applied which in the "Wingdings" font is the checkmark character. The other paragraphs will not be effected by this paragraph's bullet formatting and should have their text remain unformatted.

end example]

5.1.5.2.1 br (Text Line Break)

This element specifies the existence of a vertical line break between two runs of text within a paragraph. In addition to specifying a vertical space between two runs of text, this element may also have run properties specified via the rPr child element. This sets the formatting of text for the line break so that if text is later inserted there that a new run can be generated with the correct formatting.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:r>
      …
      <a:t>Text Run 1.</a:t>
      …
    </a:r>
    <a:br/>
    <a:r>
      …
      <a:t>Text Run 2.</a:t>
      …
    </a:r>
  </a:p>
</p:txBody>
```

This paragraph will have two runs of text laid out in a vertical fashion with a line break in between them. This line break acts much like a carriage return would within a normal run of text. *end example*]

Parent Elements
p (§5.1.5.2.6)

Child Elements	Subclause
rPr (Text Run Properties)	§5.1.5.3.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextLineBreak">
   <sequence>
      <element name="rPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.5.2.2 defPPr (Default Paragraph Style)

This element specifies the paragraph properties that are to be applied when no other paragraph properties have been specified. If this attribute is omitted, then it is left to the application to decide the set of default paragraph properties that should be applied.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:lstStyle>
    <a:defPPr>
      <a:buNone/>
    </a:defPPr>
  </a:lstStyle>
  <a:p>
    …
    <a:t>Sample Text</a:t>
    …
  </a:p>
</p:txBody>
```

The above paragraph will follow the properties described in defPPr if no overriding properties are specified within the pPr element. *end example*]

Parent Elements
bodyStyle (§4.4.1.5); defaultTextStyle (§4.3.1.7); lstStyle (§5.1.5.4.12); notesStyle (§4.4.1.25); otherStyle (§4.4.1.32); titleStyle (§4.4.1.45)

Child Elements	Subclause
buAutoNum (Auto-Numbered Bullet)	§5.1.5.4.1
buBlip (Picture Bullet)	§5.1.5.4.2
buChar (Character Bullet)	§5.1.5.4.3
buClr (Color Specified)	§5.1.5.4.4
buClrTx (Follow Text)	§5.1.5.4.5
buFont (Specified)	§5.1.5.4.6
buFontTx (Follow text)	§5.1.5.4.7
buNone (No Bullet)	§5.1.5.4.8
buSzPct (Bullet Size Percentage)	§5.1.5.4.9
buSzPts (Bullet Size Points)	§5.1.5.4.10
buSzTx (Bullet Size Follows Text)	§5.1.5.4.11
defRPr (Default Text Run Properties)	§5.1.5.3.2
extLst (Extension List)	§5.1.2.1.15
lnSpc (Line Spacing)	§5.1.5.2.5
spcAft (Space After)	§5.1.5.2.8
spcBef (Space Before)	§5.1.5.2.9
tabLst (Tab List)	§5.1.5.2.13

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td>algn (Alignment)</td><td>

Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.

Sample text Sample text

[*Example*: Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.

```
<p:txBody>
  <a:bodyPr numCol="2" spcCol="914400"…/>
    <a:normAutofit/>
    </a:bodyPr>
  …
  <a:p>
    <a:pPr marL="0" algn="just">
      <a:buNone/>
    </a:pPr>
    …
    <a:t>Sample Text …</a:t>
    …
  </a:p>
</p:txBody>
```

end example]

The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).

</td></tr>
<tr><td>defTabSz (Default Tab Size)</td><td>Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.</td></tr>
</table>

Attributes	Description

	[*Example*: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr defTabSz="376300" …/>`
	`  …`
	`  <a:t>Sample Text …</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

eaLnBrk (East Asian Line Break)	Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.
	
	[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr eaLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	Sample text Sample text Sample text supercalifr
	agilisticexpialidocious

Attributes	Description
	Sample text Sample text Sample text supercalifragilisticexpialidocious *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

fontAlgn (Font Alignment)	Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.
	
	[*Example*: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.
	
	 	
	`<a:txtBody>`
	`…`
	`<a:pPr fontAlgn="b" …/>`
	`…`
	`<a:r>`
	`<a:rPr …/>`
	`<a:t>H </a:t>`
	`</a:r>`
	`<a:r>`
	`<a:rPr sz="1200" …/>`
	`<a:t>2</a:t>`
	`</a:r>`
	`<a:r>`
	`<a:rPr …/>`
	`<a:t>O</a:t>`
	`</a:r>`

Attributes	Description
	… </p:txBody> *end example*] The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).
hangingPunct (Hanging Punctuation)	Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.

indent (Indent)	Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.
	
	Here is some Sample text
	
	[*Example*: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.
	
	<p:txBody>
	  <a:bodyPr numCol="2" spcCol="914400"…/>
	    <a:normAutofit/>
	    </a:bodyPr>
	  …
	  <a:p>
	    <a:pPr marL="0" indent="571500" algn="just">
	      <a:buNone/>
	    </a:pPr>
	    …

Attributes	Description
	<a:t>Here is some…</a:t> … </a:p> </p:txBody> By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. *end example*] The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).
latinLnBrk (Latin Line Break)	Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied. [*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows. <p:txBody> … <a:p> <a:pPr latinLnBrk="0" …/> … <a:t>Sample text (Long word)</a:t> … </a:p> </p:txBody> Sample text Sample text Sample text supercalifr agilisticexpialidocious Sample text Sample text Sample text supercalifragilisticexpialidocious *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine

Attributes	Description

	separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.
	
	[*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr lvl="1" …/>`
	`…`
	`<a:t>Sample text</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]
	
	The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).

marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.

Attributes	Description

	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextParagraphProperties">
   <sequence>
      <element name="lnSpc" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcBef" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcAft" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletColor" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletSize" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletTypeface" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBullet" minOccurs="0" maxOccurs="1"/>
      <element name="tabLst" type="CT_TextTabStopList" minOccurs="0" maxOccurs="1"/>
      <element name="defRPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="marL" type="ST_TextMargin" use="optional"/>
   <attribute name="marR" type="ST_TextMargin" use="optional"/>
   <attribute name="lvl" type="ST_TextIndentLevelType" use="optional"/>
   <attribute name="indent" type="ST_TextIndent" use="optional"/>
   <attribute name="algn" type="ST_TextAlignType" use="optional"/>
   <attribute name="defTabSz" type="ST_Coordinate32" use="optional"/>
   <attribute name="rtl" type="xsd:boolean" use="optional"/>
   <attribute name="eaLnBrk" type="xsd:boolean" use="optional"/>
   <attribute name="fontAlgn" type="ST_TextFontAlignType" use="optional"/>
   <attribute name="latinLnBrk" type="xsd:boolean" use="optional"/>
   <attribute name="hangingPunct" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.5.2.3 endParaRPr (End Paragraph Run Properties)

This element specifies the text run properties that are to be used if another run is inserted after the last run specified. This effectively saves the run property state so that it may be applied when the user enters additional text. If this element is omitted, then the application may determine which default properties to apply. It is recommended that this element be specified at the end of the list of text runs within the paragraph so that an orderly list is maintained.

Parent Elements
p (§5.1.5.2.6)

uLnTx (Underline Follows Text)	§5.1.5.3.15

Attributes	Description
altLang (Alternative Language)	Specifies the alternate language to use when the generating application is displaying the user interface controls. If this attribute is omitted, than the lang attribute will be used

Attributes	Description
	here. The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).

b (Bold)	Specifies whether a run of text will be formatted as bold text. If this attribute is omitted, than a value of 0, or false is assumed.
	[*Example*: Consider the DrawingML shown below.
	`<a:p>`
	`…`
	`<a:rPr b="1"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	The above run of text will be formatted as bold text. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

baseline (Baseline)	Specifies the baseline for both the superscript and subscript fonts. The size is specified using a percentage where 1000 is equal to 1 percent of the font size and 100000 is equal to 100 percent font of the font size. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
bmk (Bookmark Link Target)	Specifies the link target name that is used to reference to the proper link properties in a custom XML part within the document. The possible values for this attribute are defined by the XML Schema string datatype.
cap (Capitalization)	Specifies the capitalization that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. The possible values for this attribute are defined by the ST_TextCapsType simple type (§5.1.12.64).
dirty (Dirty)	Specifies that the content of a text run has changed since the proofing tools have last been run. Effectively this flags text that must be checked again by the generating application for mistakes such as spelling, grammar, etc. The possible values for this attribute are defined by the XML Schema boolean datatype.
err (Spelling Error)	Specifies that when this run of text was checked for spelling, grammar, etc. that a mistake was indeed found. This allows the generating application to effectively save the state of the mistakes within the document instead of having to perform a full pass check upon opening the document.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema boolean datatype.

i (Italics)	Specifies whether a run of text will be formatted as italic text. If this attribute is omitted, than a value of 0, or false is assumed.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr i="1"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	
	The above run of text will be formatted as italic text. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

kern (Kerning)	Specifies the minimum font size at which character kerning will occur for this text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than kerning will occur for all font sizes down to a 0 point font. The possible values for this attribute are defined by the ST_TextNonNegativePoint simple type (§5.1.12.74).
kumimoji (Kumimoji)	Specifies whether the numbers contained within vertical text will continue vertically with the text or whether they are to be displayed horizontally while the surrounding characters continue in a vertical fashion. If this attribute is omitted, than a value of 0, or false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
lang (Language ID)	Specifies the language to be used when the generating application is displaying the user interface controls. If this attribute is omitted, than the generating application may select a language of its choice. The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).
noProof (No Proofing)	Specifies that a run of text has been selected by the user to not be checked for mistakes. Therefore if there are spelling, grammar, etc mistakes within this text the generating application should ignore them. The possible values for this attribute are defined by the XML Schema boolean datatype.
normalizeH (Normalize Heights)	Specifies the normalization of height that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This

Attributes	Description
	attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. If this attribute is omitted, than a value of 0, or false will be assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
smtClean (SmartTag Clean)	Specifies whether or not a text run has been checked for smart tags. This attribute acts much like the dirty attribute dose for the checking of spelling, grammar, etc. A value of true here indicates to the generating application that this text run should be checked for smart tags. If this attribute is omitted, than a value of 0, or false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
smtId (SmartTag ID)	Specifies the reference id for the smart tag. This id corresponds to a link within this slides relationship file. The following of this link within the relationship file will result in the actual smart tag information for this piece of text. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
spc (Spacing)	Specifies the spacing between characters within a text run. This spacing is specified numerically and should be consistently applied across the entire run of text by the generating application. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted than a value of 0 or no adjustment is assumed. The possible values for this attribute are defined by the ST_TextPoint simple type (§5.1.12.75).

strike (Strikethrough)	Specifies whether a run of text will be formatted as strikethrough text. If this attribute is omitted, than no strikethrough is assumed.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr strike="sngStrike"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	
	The above run of text will be formatted as single strikethrough text. *end example*]
	
	The possible values for this attribute are defined by the ST_TextStrikeType simple type (§5.1.12.79).

sz (Font Size)	Specifies the size of text within a text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be

Attributes	Description

	1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than the value in defRPr should be used.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`  …`
	`  <a:rPr sz="1200"/>`
	`  …`
	`  <a:t>Some Text</a:t>`
	`  …`
	`</a:p>`
	
	The above run of text will be formatted with a 12 point text size. *end example*]
	
	The possible values for this attribute are defined by the ST_TextFontSize simple type (§5.1.12.68).

u (Underline)	Specifies whether a run of text will be formatted as underlined text. If this attribute is omitted, than no underline is assumed.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`  …`
	`  <a:rPr u="sng"/>`
	`  …`
	`  <a:t>Some Text</a:t>`
	`  …`
	`</a:p>`
	
	The above run of text will be formatted as single underline text. *end example*]
	
	The possible values for this attribute are defined by the ST_TextUnderlineType simple type (§5.1.12.82).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextCharacterProperties">
   <sequence>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="highlight" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextUnderlineLine" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextUnderlineFill" minOccurs="0" maxOccurs="1"/>

      <element name="cs" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="sym" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkMouseOver" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="kumimoji" type="xsd:boolean" use="optional"/>
   <attribute name="lang" type="ST_TextLanguageID" use="optional"/>
   <attribute name="altLang" type="ST_TextLanguageID" use="optional"/>
   <attribute name="sz" type="ST_TextFontSize" use="optional"/>
   <attribute name="b" type="xsd:boolean" use="optional"/>
   <attribute name="i" type="xsd:boolean" use="optional"/>
   <attribute name="u" type="ST_TextUnderlineType" use="optional"/>
   <attribute name="strike" type="ST_TextStrikeType" use="optional"/>
   <attribute name="kern" type="ST_TextNonNegativePoint" use="optional"/>
   <attribute name="cap" type="ST_TextCapsType" use="optional"/>
   <attribute name="spc" type="ST_TextPoint" use="optional"/>
   <attribute name="normalizeH" type="xsd:boolean" use="optional"/>
   <attribute name="baseline" type="ST_Percentage" use="optional"/>
   <attribute name="noProof" type="xsd:boolean" use="optional"/>
   <attribute name="dirty" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="err" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="smtClean" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="smtId" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="bmk" type="xsd:string" use="optional"/>
</complexType>
```

5.1.5.2.4 fld (Text Field)

This element specifies a text field which contains generated text that the application should update periodically. Each piece of text when it is generated is given a unique identification number that is used to refer to a specific field. At the time of creation the text field is also specified to be of a certain type which indicates the type of text that should be used to update this field. This update type is used so that all applications that did not create this text field may still know what type of text it should be updated with. Thus the new application can then attach an update type to the text field id for continual updating.

[*Example*: Consider a slide within a presentation that needs to have the slide number placed on the slide. The following DrawingML may be used to describe such a situation.

```
<p:txBody>
  <a:bodyPr/>
    <a:lstStyle/>
    <a:p>
      <a:fld id="{424CEEAC-8F67-4238-9622-1B74DC6E8318}" type="slidenum">
      <a:rPr lang="en-US" smtClean="0"/>
      <a:pPr/>
      <a:t>3</a:t>
    </a:fld>
    <a:endParaRPr lang="en-US"/>
  </a:p>
</p:txBody>
```

end example]

Parent Elements
p (§5.1.5.2.6)

Child Elements	Subclause
pPr (Text Paragraph Properties)	§5.1.5.2.7
rPr (Text Run Properties)	§5.1.5.3.9
t (Text String)	§5.1.5.3.11

Attributes	Description
id (Field ID)	Specifies the unique to this document, host specified token that is used to identify the field. This token is generated when the text field is created and persists in the file as the same token until the text field is removed. Any application should check the document for conflicting tokens before assigning a new token to a text field. The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).
type (Field Type)	Specifies the type of update text that should be used within this text field. This is needed in addition to the text field id because a new application that did not create this document must be able to know what update should be assigned to a specific text field id. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextField">
   <sequence>
      <element name="rPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
      <element name="pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="t" type="xsd:string" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_Guid" use="required"/>
   <attribute name="type" type="xsd:string" use="optional"/>
</complexType>
```

5.1.5.2.5 lnSpc (Line Spacing)

This element specifies the vertical line spacing that is to be used within a paragraph. This may be specified in two different ways, percentage spacing and font point spacing. If this element is omitted then the spacing between two lines of text should be determined by the point size of the largest piece of text within a line.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  <a:p>
    <a:pPr>
      <a:lnSpc>
        <a:spcPct val="200000"/>
      </a:lnSpc>
    </a:pPr>
    <a:r>
      <a:rPr lang="en-US" dirty="0" smtClean="0"/>
      <a:t>Some</a:t>
    </a:r>
    <a:br>
      <a:rPr lang="en-US" smtClean="0"/>
    </a:br>
    <a:r>
      <a:rPr lang="en-US" dirty="0" smtClean="0"/>
      <a:t>Text</a:t>
    </a:r>
  </a:p>
</p:txBody>
```

This paragraph will have two lines of text that will have percentage based vertical spacing. This kind of spacing should change based on the size of the text involved as its size is calculated as a percentage of this. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16);

Parent Elements
lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
spcPct (Spacing Percent)	§5.1.5.2.10
spcPts (Spacing Points)	§5.1.5.2.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextSpacing">
   <choice>
      <element name="spcPct" type="CT_TextSpacingPercent"/>
      <element name="spcPts" type="CT_TextSpacingPoint"/>
   </choice>
</complexType>
```

5.1.5.2.6 p (Text Paragraphs)

This element specifies the presence of a paragraph of text within the containing text body. The paragraph is the highest level text separation mechanism within a text body. A paragraph may contain text paragraph properties associated with the paragraph. If no properties are listed then properties specified in the defPPr element are used.

[*Example*: Consider the case where the user would like to describe a text body that will contain two paragraphs. The requirement for these paragraphs is that one be right aligned and the other left aligned. The following DrawingML would specify a text body such as this.

```
<p:txBody>
    …
    <a:p>
    <a:pPr algn="r">
    </a:pPr>
    …
    <a:t>Some text</a:t>
    …
  </a:p>
  <a:p>
    <a:pPr algn="l">
    </a:pPr>
    …
    <a:t>Some text</a:t>
    …
  </a:p>
</p:txBody>
```

end example]

Parent Elements
rich (§5.7.2.157); t (§5.9.3.8); txBody (§5.8.2.26); txBody (§5.1.2.1.40); txBody (§5.6.2.33); txBody (§4.4.1.47); txPr (§5.7.2.217)

Child Elements	Subclause
br (Text Line Break)	§5.1.5.2.1
endParaRPr (End Paragraph Run Properties)	§5.1.5.2.3
fld (Text Field)	§5.1.5.2.4
pPr (Text Paragraph Properties)	§5.1.5.2.7
r (Text Run)	§5.1.5.3.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextParagraph">
   <sequence>
      <element name="pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextRun" minOccurs="0" maxOccurs="unbounded"/>
      <element name="endParaRPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.5.2.7 pPr (Text Paragraph Properties)

This element contains all paragraph level text properties for the containing paragraph. These paragraph properties should override any and all conflicting properties that are associated with the paragraph in question.

[*Example*: Consider the DrawingML shown below.

```
<a:p>
  <a:pPr marL="0" algn="ctr">
    <a:buNone/>
  </a:pPr>
  …
  <a:t>Some Text</a:t>
  …
</a:p>
```

The paragraph described above will be formatting with a left margin of 0 and will have all of text runs contained within it centered about the horizontal median of the bounding box for the text body. *end example*]

[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr

elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Parent Elements
fld (§5.1.5.2.4); p (§5.1.5.2.6)

Child Elements	Subclause
buAutoNum (Auto-Numbered Bullet)	§5.1.5.4.1
buBlip (Picture Bullet)	§5.1.5.4.2
buChar (Character Bullet)	§5.1.5.4.3
buClr (Color Specified)	§5.1.5.4.4

extLst (Extension List)	§5.1.2.1.15
lnSpc (Line Spacing)	§5.1.5.2.5
spcAft (Space After)	§5.1.5.2.8
spcBef (Space Before)	§5.1.5.2.9
tabLst (Tab List)	§5.1.5.2.13

Attributes	Description
algn (Alignment)	Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.

Attributes	Description
	Sample text [*Example*: Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this. `<p:txBody>` `  <a:bodyPr numCol="2" spcCol="914400"…/>` `    <a:normAutofit/>` `    </a:bodyPr>` `  …` `  <a:p>` `    <a:pPr marL="0" algn="just">` `      <a:buNone/>` `    </a:pPr>` `    …` `    <a:t>Sample Text …</a:t>` `    …` `  </a:p>` `</p:txBody>` *end example*] The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).

defTabSz (Default Tab Size)	Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.
	
	[*Example*: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.
	
	`<p:txBody>`
	`  …`

Attributes	Description
	<a:p> <a:pPr defTabSz="376300" …/> … <a:t>Sample Text …</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).
eaLnBrk (East Asian Line Break)	Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied. [*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows. <p:txBody> … <a:p> <a:pPr eaLnBrk="0" …/> … <a:t>Sample text (Long word)</a:t> … </a:p> </p:txBody> Sample text Sample text Sample text supercalifr agilisticexpialidocious Sample text Sample text Sample text supercalifragilisticexpialidocious *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description

fontAlgn (Font Alignment)	Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.
	
	[*Example*: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.
	
	 	
	`<a:txtBody>`
	`…`
	`<a:pPr fontAlgn="b" …/>`
	`…`
	`<a:r>`
	`<a:rPr …/>`
	`<a:t>H </a:t>`
	`</a:r>`
	`<a:r>`
	`<a:rPr sz="1200" …/>`
	`<a:t>2</a:t>`
	`</a:r>`
	`<a:r>`
	`<a:rPr …/>`
	`<a:t>O</a:t>`
	`</a:r>`
	`…`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).

Attributes	Description
hangingPunct (Hanging Punctuation)	Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.

indent (Indent)	Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.
	
	Here is some text Sample text
	
	[*Example*: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.
	
	`<p:txBody>`
	`<a:bodyPr numCol="2" spcCol="914400"…/>`
	`<a:normAutofit/>`
	`</a:bodyPr>`
	`…`
	`<a:p>`
	`<a:pPr marL="0" indent="571500" algn="just">`
	`<a:buNone/>`
	`</a:pPr>`
	`…`
	`<a:t>Here is some…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).

latinLnBrk (Latin Line Break)	Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.
	
	[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr latinLnBrk="0" …/>`
	`…`
	`<a:t>Sample text (Long word)</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	Sample text Sample text Sample text supercalifr agilisticexpialidocious
	
	Sample text Sample text Sample text supercalifragilisticexpialidocious
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values. [*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2. `<p:txBody>`

Attributes	Description
	… <a:p> <a:pPr lvl="1" …/> … <a:t>Sample text</a:t> … </a:p> </p:txBody> *end example*] [*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*] The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).
marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied. [*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows. <p:txBody> … <a:p>

Attributes	Description
	<a:pPr rtl="1" …/> … <a:t>Sample text…</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextParagraphProperties">
   <sequence>
      <element name="lnSpc" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcBef" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcAft" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletColor" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletSize" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletTypeface" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBullet" minOccurs="0" maxOccurs="1"/>
      <element name="tabLst" type="CT_TextTabStopList" minOccurs="0" maxOccurs="1"/>
      <element name="defRPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="marL" type="ST_TextMargin" use="optional"/>
   <attribute name="marR" type="ST_TextMargin" use="optional"/>
   <attribute name="lvl" type="ST_TextIndentLevelType" use="optional"/>
   <attribute name="indent" type="ST_TextIndent" use="optional"/>
   <attribute name="algn" type="ST_TextAlignType" use="optional"/>
   <attribute name="defTabSz" type="ST_Coordinate32" use="optional"/>
   <attribute name="rtl" type="xsd:boolean" use="optional"/>
   <attribute name="eaLnBrk" type="xsd:boolean" use="optional"/>
   <attribute name="fontAlign" type="ST_TextFontAlignType" use="optional"/>
   <attribute name="latinLnBrk" type="xsd:boolean" use="optional"/>
   <attribute name="hangingPunct" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.5.2.8 spcAft (Space After)

This element specifies the amount of vertical white space that will be present after a paragraph. This space is specified in either percentage or points via the child elements spcPct and spcPts.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:spcBef>
        <a:spcPts val="1800"/>
      </a:spcBef>
      <a:spcAft>
        <a:spcPts val="600"/>
      </a:spcAft>
    </a:pPr>
    …
    <a:t>Sample Text</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The above paragraph of text will be formatted to have a spacing both before and after the paragraph text. The spacing before will be a size of 18 points, or value=1800 and the spacing after will be a size of 6 points, or value=600. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
spcPct (Spacing Percent)	§5.1.5.2.10
spcPts (Spacing Points)	§5.1.5.2.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextSpacing">
   <choice>
      <element name="spcPct" type="CT_TextSpacingPercent"/>
      <element name="spcPts" type="CT_TextSpacingPoint"/>
   </choice>
</complexType>
```

5.1.5.2.9 spcBef (Space Before)

This element specifies the amount of vertical white space that will be present before a paragraph. This space is specified in either percentage or points via the child elements spcPct and spcPts.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:spcBef>
        <a:spcPts val="1800"/>
      </a:spcBef>
      <a:spcAft>
        <a:spcPts val="600"/>
      </a:spcAft>
    </a:pPr>
    …
    <a:t>Sample Text</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The above paragraph of text will be formatted to have a spacing both before and after the paragraph text. The spacing before will be a size of 18 points, or value=1800 and the spacing after will be a size of 6 points, or value=600. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
spcPct (Spacing Percent)	§5.1.5.2.10
spcPts (Spacing Points)	§5.1.5.2.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextSpacing">
   <choice>
      <element name="spcPct" type="CT_TextSpacingPercent"/>
      <element name="spcPts" type="CT_TextSpacingPoint"/>
   </choice>
</complexType>
```

5.1.5.2.10 spcPct (Spacing Percent)

This element specifies the amount of white space that is to be used between lines and paragraphs in the form of a percentage of the text size. The text size that is used to calculate the spacing here is the text for each run, with the largest text size having precedence. That is if there is a run of text with 10 point font and within the same paragraph on the same line there is a run of text with a 12 point font size then the 12 point should be used to calculate the spacing to be used.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:spcBef>
        <a:spcPct val="200000"/>
      </a:spcBef>
    </a:pPr>
    …
    <a:t>Sample Text</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The above paragraph of text will be formatted to have a spacing before the paragraph text. This spacing will be 200% of the size of the largest text on each line. *end example*]

Parent Elements
lnSpc (§5.1.5.2.5); spcAft (§5.1.5.2.8); spcBef (§5.1.5.2.9)

Attributes	Description
val (Value)	Specifies the percentage of the size that the white space should be. It is specified here in terms of 100% being equal to 100000 and 1% being specified in increments of 1000. The possible values for this attribute are defined by the ST_TextSpacingPercent simple type (§5.1.12.77).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextSpacingPercent">
   <attribute name="val" type="ST_TextSpacingPercent" use="required"/>
</complexType>
```

5.1.5.2.11 spcPts (Spacing Points)

This element specifies the amount of white space that is to be used between lines and paragraphs in the form of a text point size. The size is specified using points where 100 is equal to 1 point font and 1200 is equal to 12 point.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:spcBef>
        <a:spcPts val="1400"/>
      </a:spcBef>
    </a:pPr>
    …
    <a:t>Sample Text</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The above paragraph of text will be formatted to have a spacing before the paragraph text. This spacing will be a size of 14 points due to val="1400". *end example*]

Parent Elements
lnSpc (§5.1.5.2.5); spcAft (§5.1.5.2.8); spcBef (§5.1.5.2.9)

Attributes	Description
val (Value)	Specifies the size of the white space in point size. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. The possible values for this attribute are defined by the ST_TextSpacingPoint simple type (§5.1.12.78).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextSpacingPoint">
   <attribute name="val" type="ST_TextSpacingPoint" use="required"/>
</complexType>
```

5.1.5.2.12 tab (Tab Stop)

This element specifies a single tab stop to be used on a line of text when there are one or more tab characters present within the text. When there is more than one present than they should be utilized in increasing position order which is specified via the pos attribute.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:tabLst>
        <a:tab pos="2292350" algn="l"/>
        <a:tab pos="2627313" algn="l"/>
        <a:tab pos="2743200" algn="l"/>
        <a:tab pos="2974975" algn="l"/>
      </a:tabLst>
    </a:pPr>
    …
    <a:t>Sample Text</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The paragraph within which this <a:tab> information resides will have a total of 4 unique tab stops that should be listed in order of increasing position. Along with specifying the tab position each tab allows for the specifying of an alignment. *end example*]

Parent Elements
tabLst (§5.1.5.2.13)

Attributes	Description
algn (Tab Alignment)	Specifies the alignment that is to be applied to text using this tab stop. If this attribute is omitted then the application default for the generating application. The possible values for this attribute are defined by the ST_TextTabAlignType simple type (§5.1.12.80).
pos (Tab Position)	Specifies the position of the tab stop relative to the left margin. If this attribute is omitted then the application default for tab stops will be used. The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextTabStop">
   <attribute name="pos" type="ST_Coordinate32" use="optional"/>
   <attribute name="algn" type="ST_TextTabAlignType" use="optional"/>
</complexType>
```

5.1.5.2.13 tabLst (Tab List)

This element specifies the list of all tab stops that are to be used within a paragraph. These tabs should be used when describing any custom tab stops within the document. If these are not specified then the default tab stops of the generating application should be used.

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
tab (Tab Stop)	§5.1.5.2.12

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextTabStopList">
   <sequence>
      <element name="tab" type="CT_TextTabStop" minOccurs="0" maxOccurs="32"/>
   </sequence>
</complexType>
```

5.1.5.3 Run Formatting

Run level formatting is the most granular property level and allows for the specifying of all low level text properties. The text run is what all paragraphs are derived from and thus specifying various properties per run will allow for a diversely formatted text paragraph.

[*Example*: Consider the case where have multiple runs within a paragraph and you wish to apply bold to only one of them without having to split up the text into higher level XML groups. To do this we would simply apply the bold run property to the text run that we wish to format as shown below.

```
<a:r>
…
</a:r>
<a:r>
  <a:rPr lang="en-US" b="1" dirty="0" smtClean="0"/>
  <a:t>This text will be bold</a:t>
</a:r>
```

```
<a:r>
…
</a:r>
```

end example]

5.1.5.3.1 cs (Complex Script Font)

This element specifies that a complex script font be used for a specific run of text. This font will be specified with a typeface attribute much like the others but will specifically be classified as a complex script font.

[*Example*: Consider the DrawingML shown below.

```
<a:r>
  <a:rPr …>
    <a:cs typeface="Sample Font"/>
  </a:rPr>
  <a:t>Sample Text</a:t>
</a:r>
```

The above run of text will be rendered using the complex script font "Sample Font". *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); font (§5.1.4.2.13); majorFont (§5.1.4.1.24); minorFont (§5.1.4.1.25); rPr (§5.1.5.3.9)

Attributes	Description
charset (Similar Character Set)	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
panose (Panose Setting)	Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method. The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family)	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application. The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFont">
   <attribute name="typeface" type="ST_TextTypeface"/>
   <attribute name="panose" type="ST_Panose" use="optional"/>
   <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
   <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
</complexType>
```

5.1.5.3.2 defRPr (Default Text Run Properties)

This element contains all default run level text properties for the text runs within a containing paragraph. These properties are to be used when overriding properties have not been defined within the rPr element.

[*Example*: Consider the DrawingML shown below.

```
<a:p>
  …
  <a:rPr u="sng"/>
  …
  <a:t>Some Text</a:t>
  …
</a:p>
```

The run of text described above will be formatting with a single underline of text matching color. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
cs (Complex Script Font)	§5.1.5.3.1
ea (East Asian Font)	§5.1.5.3.3
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35

hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkMouseOver (Mouse-Over Hyperlink)	§5.1.5.3.6

Child Elements	Subclause
latin (Latin Font)	§5.1.5.3.7
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54
sym (Symbol Font)	§5.1.5.3.10
uFill (Underline Fill)	§5.1.5.3.12
uFillTx (Underline Fill Properties Follow Text)	§5.1.5.3.13
uLn (Underline Stroke)	§5.1.5.3.14
uLnTx (Underline Follows Text)	§5.1.5.3.15

Attributes	Description
altLang (Alternative Language)	Specifies the alternate language to use when the generating application is displaying the user interface controls. If this attribute is omitted, than the lang attribute will be used here. The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).

b (Bold)	Specifies whether a run of text will be formatted as bold text. If this attribute is omitted, than a value of 0, or false is assumed.
	[*Example*: Consider the DrawingML shown below.
	`<a:p>`
	`…`
	`<a:rPr b="1"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	The above run of text will be formatted as bold text. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

baseline (Baseline)	Specifies the baseline for both the superscript and subscript fonts. The size is specified using a percentage where 1000 is equal to 1 percent of the font size and 100000 is equal to 100 percent font of the font size. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
bmk (Bookmark Link Target)	Specifies the link target name that is used to reference to the proper link properties in a custom XML part within the document.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema string datatype.
cap (Capitalization)	Specifies the capitalization that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. The possible values for this attribute are defined by the ST_TextCapsType simple type (§5.1.12.64).
dirty (Dirty)	Specifies that the content of a text run has changed since the proofing tools have last been run. Effectively this flags text that must be checked again by the generating application for mistakes such as spelling, grammar, etc. The possible values for this attribute are defined by the XML Schema boolean datatype.
err (Spelling Error)	Specifies that when this run of text was checked for spelling, grammar, etc. that a mistake was indeed found. This allows the generating application to effectively save the state of the mistakes within the document instead of having to perform a full pass check upon opening the document. The possible values for this attribute are defined by the XML Schema boolean datatype.

i (Italics)	Specifies whether a run of text will be formatted as italic text. If this attribute is omitted, than a value of 0, or false is assumed.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr i="1"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	
	The above run of text will be formatted as italic text. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

kern (Kerning)	Specifies the minimum font size at which character kerning will occur for this text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than kerning will occur for all font sizes down to a 0 point font. The possible values for this attribute are defined by the ST_TextNonNegativePoint simple type (§5.1.12.74).
kumimoji	Specifies whether the numbers contained within vertical text will continue vertically with

Attributes	Description
(Kumimoji)	the text or whether they are to be displayed horizontally while the surrounding characters continue in a vertical fashion. If this attribute is omitted, than a value of 0, or false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
lang (Language ID)	Specifies the language to be used when the generating application is displaying the user interface controls. If this attribute is omitted, than the generating application may select a language of its choice. The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).
noProof (No Proofing)	Specifies that a run of text has been selected by the user to not be checked for mistakes. Therefore if there are spelling, grammar, etc mistakes within this text the generating application should ignore them. The possible values for this attribute are defined by the XML Schema boolean datatype.
normalizeH (Normalize Heights)	Specifies the normalization of height that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. If this attribute is omitted, than a value of 0, or false will be assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
smtClean (SmartTag Clean)	Specifies whether or not a text run has been checked for smart tags. This attribute acts much like the dirty attribute dose for the checking of spelling, grammar, etc. A value of true here indicates to the generating application that this text run should be checked for smart tags. If this attribute is omitted, than a value of 0, or false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
smtId (SmartTag ID)	Specifies the reference id for the smart tag. This id corresponds to a link within this slides relationship file. The following of this link within the relationship file will result in the actual smart tag information for this piece of text. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
spc (Spacing)	Specifies the spacing between characters within a text run. This spacing is specified numerically and should be consistently applied across the entire run of text by the generating application. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted than a value of 0 or no adjustment is assumed. The possible values for this attribute are defined by the ST_TextPoint simple type (§5.1.12.75).

Attributes	Description

strike (Strikethrough)	Specifies whether a run of text will be formatted as strikethrough text. If this attribute is omitted, than no strikethrough is assumed.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr strike="sngStrike"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	
	The above run of text will be formatted as single strikethrough text. *end example*]
	
	The possible values for this attribute are defined by the ST_TextStrikeType simple type (§5.1.12.79).

sz (Font Size)	Specifies the size of text within a text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than the value in defRPr should be used.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr sz="1200"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	
	The above run of text will be formatted with a 12 point text size. *end example*]
	
	The possible values for this attribute are defined by the ST_TextFontSize simple type (§5.1.12.68).

u (Underline)	Specifies whether a run of text will be formatted as underlined text. If this attribute is omitted, than no underline is assumed.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr u="sng"/>`
	`…`
	`<a:t>Some Text</a:t>`

Attributes	Description
	… </a:p> The above run of text will be formatted as single underline text. *end example*] The possible values for this attribute are defined by the ST_TextUnderlineType simple type (§5.1.12.82).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextCharacterProperties">
   <sequence>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="highlight" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextUnderlineLine" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextUnderlineFill" minOccurs="0" maxOccurs="1"/>
      <element name="latin" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="ea" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="cs" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="sym" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkMouseOver" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="kumimoji" type="xsd:boolean" use="optional"/>
   <attribute name="lang" type="ST_TextLanguageID" use="optional"/>
   <attribute name="altLang" type="ST_TextLanguageID" use="optional"/>
   <attribute name="sz" type="ST_TextFontSize" use="optional"/>
   <attribute name="b" type="xsd:boolean" use="optional"/>
   <attribute name="i" type="xsd:boolean" use="optional"/>
   <attribute name="u" type="ST_TextUnderlineType" use="optional"/>
   <attribute name="strike" type="ST_TextStrikeType" use="optional"/>
   <attribute name="kern" type="ST_TextNonNegativePoint" use="optional"/>
   <attribute name="cap" type="ST_TextCapsType" use="optional"/>
   <attribute name="spc" type="ST_TextPoint" use="optional"/>
   <attribute name="normalizeH" type="xsd:boolean" use="optional"/>
   <attribute name="baseline" type="ST_Percentage" use="optional"/>
   <attribute name="noProof" type="xsd:boolean" use="optional"/>
   <attribute name="dirty" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="err" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="smtClean" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="smtId" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="bmk" type="xsd:string" use="optional"/>
</complexType>
```

5.1.5.3.3 ea (East Asian Font)

This element specifies that an East Asian font be used for a specific run of text. This font will be specified with a typeface attribute much like the others but will specifically be classified as an East Asian font.

[*Example*: Consider the DrawingML shown below.

```
<a:r>
  <a:rPr …>
    <a:ea typeface="Sample Font"/>
  </a:rPr>
  <a:t>Sample Text</a:t>
</a:r>
```

The above run of text will be rendered using the East Asian font "Sample Font". *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); font (§5.1.4.2.13); majorFont (§5.1.4.1.24); minorFont (§5.1.4.1.25); rPr (§5.1.5.3.9)

Attributes	Description
charset (Similar Character Set)	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
panose (Panose Setting)	Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method. The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family)	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application. The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFont">
   <attribute name="typeface" type="ST_TextTypeface"/>
   <attribute name="panose" type="ST_Panose" use="optional"/>
   <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
   <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
</complexType>
```

5.1.5.3.4 highlight (Highlight Color)

This element specifies the highlight color that will be present for a run of text.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:r>
      <a:rPr …>
        <a:highlight>
          <a:srgbClr val="FFFF00"/>
        </a:highlight>
      </a:rPr>
      …
      <a:t>Sample Text</a:t>
      …
    </a:r>
  </a:p>
  …
</p:txBody>
```

The above run of text will have a yellow highlight color as specified by the srgbClr child element. *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.5.3.5 hlinkClick (Click Hyperlink)

Specifies the on-click hyperlink information to be applied to a run of text. When the hyperlink text is clicked the link will be fetched.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:r>
      <a:rPr …>
        <a:hlinkClick r:id="rId2" tooltip="Some Sample Text"/>
      </a:rPr>
      …
      <a:t>Sample Text</a:t>
      …
    </a:r>
  </a:p>
  …
</p:txBody>
```

The above run of text will be a hyperlink that points to the resource pointed at by rId2 within this slides relationship file. Additionally this text should display a tooltip when the mouse is hovered over the run of text. *end example*]

Parent Elements
cNvPr (§5.2.2.3); cNvPr (§5.8.2.7); cNvPr (§4.4.1.12); cNvPr (§5.6.2.8); cNvPr (§5.1.2.1.8); defRPr (§5.1.5.3.2); docPr (§5.5.2.5); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
snd (Hyperlink Sound)	§5.1.2.1.32

Attributes	Description
action (Action Setting)	Specifies an action that is to be taken when this hyperlink is activated. This may be used to specify a slide to be navigated to or a script of code to be run. The possible values for this attribute are defined by the XML Schema string datatype.
endSnd (End Sounds)	Specifies if the URL in question should stop all sounds that are playing when it is clicked. The possible values for this attribute are defined by the XML Schema boolean datatype.

Attributes	Description
highlightClick (Highlight Click)	Specifies if this attribute has already been used within this document. That is when a hyperlink has already been visited that this attribute would be utilized so the generating application may determine the color of this text. If this attribute is omitted, then a value of 0 or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.
history (Add Hyperlink to Page History)	Specifies whether to add this URI to the history when navigating to it. This allows for the viewing of this presentation without the storing of history information on the viewing machine. If this attribute is omitted, then a value of 1, or true is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Drawing Object Hyperlink Target) Namespace: .../officeDocument/2006/relationships	Specifies the relationship id that when looked up in this slides relationship file will contain the target of this hyperlink. This attribute cannot be omitted. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
invalidUrl (Invalid URL)	Specifies the URL when it has been determined by the generating application that the URL is invalid. That is the generating application may still store the URL but it is known that this URL is not correct. The possible values for this attribute are defined by the XML Schema string datatype.
tgtFrame (Target Frame)	Specifies the target frame that is to be used when opening this hyperlink. When the hyperlink is activated this attribute will be used to determine if a new window must be launched for viewing or if an existing one may be used. If this attribute is omitted, than a new window will be opened. The possible values for this attribute are defined by the XML Schema string datatype.
tooltip (Hyperlink Tooltip)	Specifies the tooltip that should be displayed when the hyperlink text is hovered over with the mouse. If this attribute is omitted, than the hyperlink text itself may be displayed. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlink">
   <sequence>
      <element name="snd" type="CT_EmbeddedWAVAudioFile" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:id" use="optional"/>
   <attribute name="invalidUrl" type="xsd:string" use="optional" default=""/>
   <attribute name="action" type="xsd:string" use="optional" default=""/>
   <attribute name="tgtFrame" type="xsd:string" use="optional" default=""/>
   <attribute name="tooltip" type="xsd:string" use="optional" default=""/>
   <attribute name="history" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="highlightClick" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="endSnd" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.5.3.6 hlinkMouseOver (Mouse-Over Hyperlink)

Specifies the mouse-over hyperlink information to be applied to a run of text. When the mouse is hovered over this hyperlink text the link will be fetched.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:r>
      <a:rPr …>
        <a:hlinkMouseOver r:id="rId2" tooltip="Some Sample Text"/>
      </a:rPr>
      …
      <a:t>Sample Text</a:t>
      …
    </a:r>
  </a:p>
  …
</p:txBody>
```

The above run of text will be a hyperlink that points to the resource pointed at by rId2 within this slides relationship file. Additionally this text should display a tooltip when the mouse is hovered over the run of text. *end example*]

Parent Elements

Attributes	Description
	displayed. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Hyperlink">
   <sequence>
      <element name="snd" type="CT_EmbeddedWAVAudioFile" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:id" use="optional"/>
   <attribute name="invalidUrl" type="xsd:string" use="optional" default=""/>
   <attribute name="action" type="xsd:string" use="optional" default=""/>
   <attribute name="tgtFrame" type="xsd:string" use="optional" default=""/>
   <attribute name="tooltip" type="xsd:string" use="optional" default=""/>
   <attribute name="history" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="highlightClick" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="endSnd" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.5.3.7 latin (Latin Font)

This element specifies that a Latin font be used for a specific run of text. This font will be specified with a typeface attribute much like the others but will specifically be classified as a Latin font.

[*Example*: Consider the DrawingML shown below.

```
<a:r>
  <a:rPr …>
    <a:latin typeface="Sample Font"/>
  </a:rPr>
  <a:t>Sample Text</a:t>
</a:r>
```

The above run of text will be rendered using the Latin font "Sample Font". *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); font (§5.1.4.2.13); majorFont (§5.1.4.1.24); minorFont (§5.1.4.1.25); rPr (§5.1.5.3.9)

Attributes	Description
charset (Similar Character Set)	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.

Attributes	Description
panose (Panose Setting)	Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method. The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family)	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application. The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFont">
   <attribute name="typeface" type="ST_TextTypeface"/>
   <attribute name="panose" type="ST_Panose" use="optional"/>
   <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
   <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
</complexType>
```

5.1.5.3.8 r (Text Run)

This element specifies the presence of a run of text within the containing text body. The run element is the lowest level text separation mechanism within a text body. A text run may contain text run properties associated with the run. If no properties are listed then properties specified in the defRPr element are used.

[*Example*: Consider the case where the user would like to describe a text body that will contain two runs of text and would like one to be bold and the other not. The following DrawingML would specify such a text body.

```
<p:txBody>
  …
  <a:r>
    <a:rPr b="1">
    </a:rPr>
    <a:t>Some text</a:t>
  </a:r>
  …
  <a:r>
    <a:rPr/>
    <a:t>Some text</a:t>
  </a:r>
</p:txBody>
```

The above text body will have the first run be formatted bold and the second normally. *end example*]

Parent Elements
p (§5.1.5.2.6)

Child Elements	Subclause
rPr (Text Run Properties)	§5.1.5.3.9
t (Text String)	§5.1.5.3.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RegularTextRun">
   <sequence>
      <element name="rPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
      <element name="t" type="xsd:string" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.5.3.9 rPr (Text Run Properties)

This element contains all run level text properties for the text runs within a containing paragraph.

[*Example*: Consider the DrawingML shown below.

```
<a:p>
  …
  <a:rPr u="sng"/>
  …
  <a:t>Some Text</a:t>
  …
</a:p>
```

The run of text described above will be formatting with a single underline of text matching color. *end example*]

Parent Elements
br (§5.1.5.2.1); fld (§5.1.5.2.4); r (§5.1.5.3.8)

Child Elements	Subclause

grpFill (Group Fill)	§5.1.10.35
highlight (Highlight Color)	§5.1.5.3.4
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkMouseOver (Mouse-Over Hyperlink)	§5.1.5.3.6
latin (Latin Font)	§5.1.5.3.7
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54
sym (Symbol Font)	§5.1.5.3.10
uFill (Underline Fill)	§5.1.5.3.12
uFillTx (Underline Fill Properties Follow Text)	§5.1.5.3.13
uLn (Underline Stroke)	§5.1.5.3.14
uLnTx (Underline Follows Text)	§5.1.5.3.15

Attributes	Description
altLang (Alternative Language)	Specifies the alternate language to use when the generating application is displaying the user interface controls. If this attribute is omitted, than the lang attribute will be used here. The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).

b (Bold)	Specifies whether a run of text will be formatted as bold text. If this attribute is omitted, than a value of 0, or false is assumed.
	[*Example*: Consider the DrawingML shown below.
	`<a:p>`
	`…`
	`<a:rPr b="1"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	The above run of text will be formatted as bold text. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

baseline (Baseline)	Specifies the baseline for both the superscript and subscript fonts. The size is specified using a percentage where 1000 is equal to 1 percent of the font size and 100000 is equal

Attributes	Description
	to 100 percent font of the font size. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
bmk (Bookmark Link Target)	Specifies the link target name that is used to reference to the proper link properties in a custom XML part within the document. The possible values for this attribute are defined by the XML Schema string datatype.
cap (Capitalization)	Specifies the capitalization that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. The possible values for this attribute are defined by the ST_TextCapsType simple type (§5.1.12.64).
dirty (Dirty)	Specifies that the content of a text run has changed since the proofing tools have last been run. Effectively this flags text that must be checked again by the generating application for mistakes such as spelling, grammar, etc. The possible values for this attribute are defined by the XML Schema boolean datatype.
err (Spelling Error)	Specifies that when this run of text was checked for spelling, grammar, etc. that a mistake was indeed found. This allows the generating application to effectively save the state of the mistakes within the document instead of having to perform a full pass check upon opening the document. The possible values for this attribute are defined by the XML Schema boolean datatype.

i (Italics)	Specifies whether a run of text will be formatted as italic text. If this attribute is omitted, than a value of 0, or false is assumed.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr i="1"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	
	The above run of text will be formatted as italic text. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

kern (Kerning)	Specifies the minimum font size at which character kerning will occur for this text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1.

Attributes	Description
	For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than kerning will occur for all font sizes down to a 0 point font. The possible values for this attribute are defined by the ST_TextNonNegativePoint simple type (§5.1.12.74).
kumimoji (Kumimoji)	Specifies whether the numbers contained within vertical text will continue vertically with the text or whether they are to be displayed horizontally while the surrounding characters continue in a vertical fashion. If this attribute is omitted, than a value of 0, or false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
lang (Language ID)	Specifies the language to be used when the generating application is displaying the user interface controls. If this attribute is omitted, than the generating application may select a language of its choice. The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.1.12.72).
noProof (No Proofing)	Specifies that a run of text has been selected by the user to not be checked for mistakes. Therefore if there are spelling, grammar, etc mistakes within this text the generating application should ignore them. The possible values for this attribute are defined by the XML Schema boolean datatype.
normalizeH (Normalize Heights)	Specifies the normalization of height that is to be applied to the text run. This is a render-only modification and does not affect the actual characters stored in the text run. This attribute is also distinct from the toggle function where the actual characters stored in the text run are changed. If this attribute is omitted, than a value of 0, or false will be assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
smtClean (SmartTag Clean)	Specifies whether or not a text run has been checked for smart tags. This attribute acts much like the dirty attribute dose for the checking of spelling, grammar, etc. A value of true here indicates to the generating application that this text run should be checked for smart tags. If this attribute is omitted, than a value of 0, or false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
smtId (SmartTag ID)	Specifies the reference id for the smart tag. This id corresponds to a link within this slides relationship file. The following of this link within the relationship file will result in the actual smart tag information for this piece of text. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
spc (Spacing)	Specifies the spacing between characters within a text run. This spacing is specified numerically and should be consistently applied across the entire run of text by the

Attributes	Description
	generating application. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted than a value of 0 or no adjustment is assumed. The possible values for this attribute are defined by the ST_TextPoint simple type (§5.1.12.75).

strike (Strikethrough)	Specifies whether a run of text will be formatted as strikethrough text. If this attribute is omitted, than no strikethrough is assumed.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr strike="sngStrike"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	
	The above run of text will be formatted as single strikethrough text. *end example*]
	
	The possible values for this attribute are defined by the ST_TextStrikeType simple type (§5.1.12.79).

sz (Font Size)	Specifies the size of text within a text run. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. If this attribute is omitted, than the value in defRPr should be used.
	
	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr sz="1200"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	
	The above run of text will be formatted with a 12 point text size. *end example*]
	
	The possible values for this attribute are defined by the ST_TextFontSize simple type (§5.1.12.68).

u (Underline)	Specifies whether a run of text will be formatted as underlined text. If this attribute is omitted, than no underline is assumed.

Attributes	Description

	[*Example*: Consider the DrawingML shown below.
	
	`<a:p>`
	`…`
	`<a:rPr u="sng"/>`
	`…`
	`<a:t>Some Text</a:t>`
	`…`
	`</a:p>`
	
	The above run of text will be formatted as single underline text. *end example*]
	
	The possible values for this attribute are defined by the ST_TextUnderlineType simple type (§5.1.12.82).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextCharacterProperties">
   <sequence>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="highlight" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextUnderlineLine" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextUnderlineFill" minOccurs="0" maxOccurs="1"/>
      <element name="latin" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="ea" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="cs" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="sym" type="CT_TextFont" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkMouseOver" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="kumimoji" type="xsd:boolean" use="optional"/>
   <attribute name="lang" type="ST_TextLanguageID" use="optional"/>
   <attribute name="altLang" type="ST_TextLanguageID" use="optional"/>
   <attribute name="sz" type="ST_TextFontSize" use="optional"/>
   <attribute name="b" type="xsd:boolean" use="optional"/>
   <attribute name="i" type="xsd:boolean" use="optional"/>
   <attribute name="u" type="ST_TextUnderlineType" use="optional"/>
   <attribute name="strike" type="ST_TextStrikeType" use="optional"/>
   <attribute name="kern" type="ST_TextNonNegativePoint" use="optional"/>
   <attribute name="cap" type="ST_TextCapsType" use="optional"/>
   <attribute name="spc" type="ST_TextPoint" use="optional"/>
   <attribute name="normalizeH" type="xsd:boolean" use="optional"/>
   <attribute name="baseline" type="ST_Percentage" use="optional"/>
   <attribute name="noProof" type="xsd:boolean" use="optional"/>
   <attribute name="dirty" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="err" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="smtClean" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="smtId" type="xsd:unsignedInt" use="optional" default="0"/>
   <attribute name="bmk" type="xsd:string" use="optional"/>
</complexType>
```

5.1.5.3.10 sym (Symbol Font)

This element specifies that a symbol font be used for a specific run of text. This font will be specified with a typeface attribute much like the others but will specifically be classified as a symbol font.

[*Example*: Consider the DrawingML shown below.

```
<a:r>
  <a:rPr …>
    <a:sym typeface="Sample Font"/>
  </a:rPr>
  <a:t>Sample Text</a:t>
</a:r>
```

The above run of text will be rendered using the symbol font "Sample Font". *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

Attributes	Description
charset (Similar Character Set)	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
panose (Panose Setting)	Specifies the panose standard setting that will be used to determine the closest matching font by any generating application that employs this method. The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family)	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application. The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFont">
   <attribute name="typeface" type="ST_TextTypeface"/>
   <attribute name="panose" type="ST_Panose" use="optional"/>
   <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
   <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
</complexType>
```

5.1.5.3.11 t (Text String)

This element specifies the actual text for this text run. This is the text that will be formatted using all specified body, paragraph and run properties. This element must be present within a run of text.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    …
    <a:r>
      …
      <a:t>Sample Text</a:t>
      …
    </a:r>
    …
  </a:p>
  …
</p:txBody>
```

The above DrawingML specifies a text body containing a single paragraph, containing a single run which contains the actual text specified with the <a:t> element.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
fld (§5.1.5.2.4); r (§5.1.5.3.8)

5.1.5.3.12 uFill (Underline Fill)

This element specifies the fill color of an underline for a run of text.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:r>
      <a:rPr …>
        <a:uFill>
          <a:solidFill>
            <a:srgbClr val="FFFF00"/>
          </a:solidFill>
        </a:uFill>
      </a:rPr>
```

```
        …
        <a:t>Sample Text</a:t>
        …
      </a:r>
    </a:p>
    …
  </p:txBody>
```

The underline color of the above text will be yellow specified by the srgbClr child element. *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextUnderlineFillGroupWrapper">
   <group ref="EG_FillProperties" minOccurs="1" maxOccurs="1"/>
</complexType>
```

5.1.5.3.13 uFillTx (Underline Fill Properties Follow Text)

This element specifies that the fill color of an underline for a run of text should be of the same color as the text run within which it is contained.

[*Example*: Consider the DrawingML shown below.

```
  <p:txBody>
    …
    <a:p>
      <a:r>
        <a:rPr …>
          <a:uFillTx>
        </a:rPr>
        …
```

```
        <a:t>Sample Text</a:t>
        …
      </a:r>
    </a:p>
    …
  </p:txBody>
```

The underline color of the above text will follow the color of the text run within which it resides. *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextUnderlineFillFollowText"/>
```

5.1.5.3.14 uLn (Underline Stroke)

This element specifies the properties for the stroke of the underline that will be present within a run of text.

[*Example*: Consider the DrawingML shown below.

```
  <p:txBody>
    …
    <a:p>
      <a:r>
        <a:rPr …>
          <a:uLn algn="r">
        </a:rPr>
        …
        <a:t>Sample Text</a:t>
        …
      </a:r>
    </a:p>
    …
  </p:txBody>
```

The underline alignment of the above text will be right aligned. *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

Child Elements	Subclause
bevel (Line Join Bevel)	§5.1.10.9
custDash (Custom Dash)	§5.1.10.21

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
headEnd (Line Head/End Style)	§5.1.10.38
miter (Miter Line Join)	§5.1.10.43
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstDash (Preset Dash)	§5.1.10.48
round (Round Line Join)	§5.1.10.52
solidFill (Solid Fill)	§5.1.10.54
tailEnd (Tail line end style)	§5.1.10.57

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
   <sequence>
      <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
      <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="w" type="ST_LineWidth" use="optional"/>
   <attribute name="cap" type="ST_LineCap" use="optional"/>
   <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
   <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

5.1.5.3.15 uLnTx (Underline Follows Text)

This element specifies that the stroke style of an underline for a run of text should be of the same as the text run within which it is contained.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:r>
      <a:rPr …>
        <a:uLnTx>
      </a:rPr>
      …
      <a:t>Sample Text</a:t>
      …
    </a:r>
  </a:p>
  …
</p:txBody>
```

The underline stroke of the above text will follow the stroke of the run text within which it resides. *end example*]

Parent Elements
defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); rPr (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextUnderlineLineFollowText"/>
```

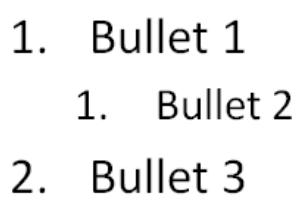
5.1.5.4 Bullets and Numbering

In addition to the above body, paragraph and text run properties there can also be a structure of bullets and numbering that can be defined by utilizing a few of these layers. Since Bullet and Numbering does span multiple formatting levels it will be described on it's own in the following section.

5.1.5.4.1 buAutoNum (Auto-Numbered Bullet)

This element specifies that automatic numbered bullet points should be applied to a paragraph. These are not just numbers used as bullet points but instead automatically assigned numbers that are based on both buAutoNum attributes and paragraph level.

[*Example*: Consider the DrawingML content shown below.



```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buAutoNum type="arabicPeriod"/>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  <a:p>
    <a:pPr lvl="1"…>
      <a:buAutoNum type="arabicPeriod"/>
    </a:pPr>
    …
    <a:t>Bullet 2</a:t>
    …
  </a:p>
```

```
    <a:p>
      <a:pPr …>
        <a:buAutoNum type="arabicPeriod"/>
      </a:pPr>
      …
      <a:t>Bullet 3</a:t>
      …
    </a:p>
    …
  </p:txBody>
```

For the above text there are a total of three bullet points. Two of which are at lvl="0" and one at lvl="1". Due to this breakdown of levels, the numbering sequence that should be automatically applied will be 1, 1, 2 as is shown in the picture above. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Attributes	Description
startAt (Start Numbering At)	Specifies the number that will start number for a given sequence of automatically numbered bullets. When the numbering is alphabetical, the number should map to the appropriate letter. For instance 1 will map to 'a', 2 to 'b' and so on. If the numbers are larger than 26, then multiple letters should be used. For instance 27 should be represented as 'aa' and similarly 53 should be 'aaa'. The possible values for this attribute are defined by the ST_TextBulletStartAtNum simple type (§5.1.12.63).
type (Bullet Autonumbering Type)	Specifies the numbering scheme that is to be used. This allows for the describing of formats other than strictly numbers. For instance a set of bullets may need to be represented by a series of Roman numerals instead of the standard 1,2,3,etc. number set. The possible values for this attribute are defined by the ST_TextAutonumberScheme simple type (§5.1.12.61).

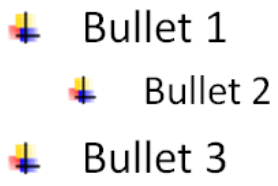
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextAutonumberBullet">
   <attribute name="type" type="ST_TextAutonumberScheme" use="required"/>
   <attribute name="startAt" type="ST_TextBulletStartAtNum" use="optional" default="1"/>
</complexType>
```

5.1.5.4.2 buBlip (Picture Bullet)

This element specifies that a picture be applied to a set of bullets. This element allows for any standard picture format graphic to be used instead of the typical bullet characters. This opens up the possibility for bullets to be anything the generating application would seek to apply.

[*Example*: Consider the DrawingML shown below.



```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buBlip>
        <a:blip r:embed="rId2"/>
      </a:buBlip>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  <a:p>
    <a:pPr lvl="1"…>
      <a:buBlip>
        <a:blip r:embed="rId2"/>
      </a:buBlip>
    </a:pPr>
    …
    <a:t>Bullet 2</a:t>
    …
  </a:p>
```

```
    <a:p>
      <a:pPr …>
        <a:buBlip>
          <a:blip r:embed="rId2"/>
        </a:buBlip>
      </a:pPr>
      …
      <a:t>Bullet 3</a:t>
      …
    </a:p>
    …
  </p:txBody>
```

For the above text there are a total of three bullet points. Two of which are at lvl="0" and one at lvl="1". Because the same picture is specified for each bullet the levels do not stand out here. The only difference is the indentation as shown in the picture above. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
blip (Blip)	§5.1.10.13

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBlipBullet">
   <sequence>
      <element name="blip" type="CT_Blip" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.5.4.3 buChar (Character Bullet)

This element specifies that a character be applied to a set of bullets. These bullets are allowed to be any character in any font that the system is able to support. If no bullet font is specified along with this element then the paragraph font will be used.

[*Example*: Consider the DrawingML shown below.

g Bullet 1

g Bullet 2

g Bullet 3

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buFont typeface="Calibri"/>
      <a:buChar char="g"/>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  <a:p>
    <a:pPr lvl="1"…>
      <a:buFont typeface="Calibri"/>
      <a:buChar char="g"/>
    </a:pPr>
    …
    <a:t>Bullet 2</a:t>
    …
  </a:p>
  <a:p>
    <a:pPr …>
      <a:buFont typeface="Calibri"/>
      <a:buChar char="g"/>
    </a:pPr>
    …
    <a:t>Bullet 3</a:t>
    …
  </a:p>
  …
</p:txBody>
```

For the above text there are a total of three bullet points. Two of which are at lvl="0" and one at lvl="1". Because the same character is specified for each bullet the levels do not stand out here. The only difference is the indentation as shown in the picture above. *end example*]

Parent Elements

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Attributes	Description
char (Bullet Character)	Specifies the character to be used in place of the standard bullet point. This character may be any character for the specified font that will be supported by the system upon which this document is being viewed. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextCharBullet">
   <attribute name="char" type="xsd:string" use="required"/>
</complexType>
```

5.1.5.4.4 buClr (Color Specified)

This element specifies the color to be used on bullet characters within a given paragraph. The color is specified using the numerical RGB color format.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buClr>
        <a:srgbClr val="FFFF00"/>
      </a:buClr>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The color of the above bullet will not follow the text color but instead will have a yellow color specified by val="FFFF00". This color should only apply to the actual bullet character and not to the text within the bullet. *end example*]

Parent Elements

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.5.4.5 buClrTx (Follow Text)

This element specifies that the color of the bullets for a paragraph should be of the same color as the text run within which each bullet is contained.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buClrTx>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The color of the above bullet will follow the default text color of the text for the run of text shown above since no specific text color was specified. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBulletColorFollowText"/>
```

5.1.5.4.6 buFont (Specified)

This element specifies the font to be used on bullet characters within a given paragraph. The font is specified using the typeface that it is registered as within the generating application.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buFont typeface="Arial"/>
      <a:buChar char="g"/>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The font of the above bullet will not follow the text font but instead will have Arial font specified by typeface="Arial". This font should only apply to the actual bullet character and not to the text within the bullet. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Attributes	Description
charset (Similar Character Set)	Specifies the most similar character set to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
panose (Panose	Specifies the panose standard setting that will be used to determine the closest matching

Attributes	Description
Setting)	font by any generating application that employs this method. The possible values for this attribute are defined by the ST_Panose simple type (§5.1.12.37).
pitchFamily (Similar Font Family)	Specifies the most similar font family to the one being used. This is useful if the generating application cannot use the current font and must choose a similar one. The possible values for this attribute are defined by the XML Schema byte datatype.
typeface (Text Typeface)	Specifies the typeface, or name of the font that is to be used for a bullet. The typeface used here should be selected from the font list of the generating application. The possible values for this attribute are defined by the ST_TextTypeface simple type (§5.1.12.81).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextFont">
   <attribute name="typeface" type="ST_TextTypeface"/>
   <attribute name="panose" type="ST_Panose" use="optional"/>
   <attribute name="pitchFamily" type="xsd:byte" use="optional" default="0"/>
   <attribute name="charset" type="xsd:byte" use="optional" default="1"/>
</complexType>
```

5.1.5.4.7 buFontTx (Follow text)

This element specifies that the font of the bullets for a paragraph should be of the same font as the text run within which each bullet is contained.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buFontTx>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The font of the above bullet will follow the default text font of the text for the run of text shown above since no specific text font was specified. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBulletTypefaceFollowText"/>
```

5.1.5.4.8 buNone (No Bullet)

This element specifies that the paragraph within which it is applied is to have no bullet formatting applied to it. That is to say that there should be no bulleting found within the paragraph where this element is specified.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buNone/>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The above paragraph will be formatted with no bullets. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextNoBullet"/>
```

5.1.5.4.9 buSzPct (Bullet Size Percentage)

This element specifies the size in percentage of the surrounding text to be used on bullet characters within a given paragraph. The size is specified using a percentage where 1000 is equal to 1 percent of the font size and 100000 is equal to 100 percent font of the font size.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buSzPct val="111000"/>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The size of the above bullet will follow the text size in that it will always be rendered at 111% the size of the text within the given text run. This is specified by val="111000", with a restriction on the values not being less than 25% or more than 400%. A value of 100000 is equal to 100%, similarly a value of 1000 is equal to 1%. This percentage size should only apply to the actual bullet character and not to the text within the bullet. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Attributes	Description
val (Value)	Specifies the percentage of the text size that this bullet should be. It is specified here in terms of 100% being equal to 100000 and 1% being specified in increments of 1000. This attribute should not be lower than 25%, or 25000 and not be higher than 400%, or 400000. The possible values for this attribute are defined by the ST_TextBulletSizePercent simple type (§5.1.12.62).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBulletSizePercent">
   <attribute name="val" type="ST_TextBulletSizePercent"/>
</complexType>
```

5.1.5.4.10 buSzPts (Bullet Size Points)

This element specifies the size in points to be used on bullet characters within a given paragraph. The size is specified using the points where 100 is equal to 1 point font and 1200 is equal to 12 point font.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buSzPts val="1400"/>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The size of the above bullet will not follow the text size of the text within the given text run. The bullets size is specified by val="1400", which corresponds to a point size of 14. This bullet size should only apply to the actual bullet character and not to the text within the bullet. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

Attributes	Description
val (Value)	Specifies the size of the bullets in point size. Whole points are specified in increments of 100 starting with 100 being a point size of 1. For instance a font point size of 12 would be 1200 and a font point size of 12.5 would be 1250. The possible values for this attribute are defined by the ST_TextFontSize simple type (§5.1.12.68).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBulletSizePoint">
   <attribute name="val" type="ST_TextFontSize"/>
</complexType>
```

5.1.5.4.11 buSzTx (Bullet Size Follows Text)

This element specifies that the size of the bullets for a paragraph should be of the same point size as the text run within which each bullet is contained.

[*Example*: Consider the DrawingML shown below.

```
<p:txBody>
  …
  <a:p>
    <a:pPr …>
      <a:buSzTx>
    </a:pPr>
    …
    <a:t>Bullet 1</a:t>
    …
  </a:p>
  …
</p:txBody>
```

The size of the above bullet will follow the default text size of the text for the run of text shown above since no specific text size was specified. *end example*]

Parent Elements
defPPr (§5.1.5.2.2); lvl1pPr (§5.1.5.4.13); lvl2pPr (§5.1.5.4.14); lvl3pPr (§5.1.5.4.15); lvl4pPr (§5.1.5.4.16); lvl5pPr (§5.1.5.4.17); lvl6pPr (§5.1.5.4.18); lvl7pPr (§5.1.5.4.19); lvl8pPr (§5.1.5.4.20); lvl9pPr (§5.1.5.4.21); pPr (§5.1.5.2.7)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBulletSizeFollowText"/>
```

5.1.5.4.12 lstStyle (Text List Styles)

This element specifies the list of styles associated with this body of text.

Parent Elements
lnDef (§5.1.4.1.20); rich (§5.7.2.157); spDef (§5.1.4.1.27); t (§5.9.3.8); txBody (§5.8.2.26); txBody (§5.1.2.1.40); txBody (§5.6.2.33); txBody (§4.4.1.47); txDef (§5.1.4.1.28); txPr (§5.7.2.217)

Child Elements	Subclause
defPPr (Default Paragraph Style)	§5.1.5.2.2
extLst (Extension List)	§5.1.2.1.15
lvl1pPr (List Level 1 Text Style)	§5.1.5.4.13
lvl2pPr (List Level 2 Text Style)	§5.1.5.4.14
lvl3pPr (List Level 3 Text Style)	§5.1.5.4.15
lvl4pPr (List Level 4 Text Style)	§5.1.5.4.16
lvl5pPr (List Level 5 Text Style)	§5.1.5.4.17
lvl6pPr (List Level 6 Text Style)	§5.1.5.4.18

Child Elements	Subclause
lvl7pPr (List Level 7 Text Style)	§5.1.5.4.19
lvl8pPr (List Level 8 Text Style)	§5.1.5.4.20
lvl9pPr (List Level 9 Text Style)	§5.1.5.4.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextListStyle">
   <sequence>
      <element name="defPPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl1pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl2pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl3pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl4pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl5pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl6pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl7pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl8pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lvl9pPr" type="CT_TextParagraphProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.5.4.13 lvl1pPr (List Level 1 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute lvl="0". There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is lvl2pPr should come before lvl3pPr. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example*: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in lvl1pPr and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
  …
  <a:lstStyle>
    <a:lvl1pPr algn="r">
      <a:buNone/>
    </a:lvl1pPr>
  </a:lstStyle>
  <a:p>
    <a:pPr lvl="0">
    </a:pPr>
    …
    <a:t>Some text</a:t>
    …
  </a:p>
</p:txBody>
```

end example]

[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Parent Elements
bodyStyle (§4.4.1.5); defaultTextStyle (§4.3.1.7); lstStyle (§5.1.5.4.12); notesStyle (§4.4.1.25); otherStyle (§4.4.1.32); titleStyle (§4.4.1.45)

Child Elements	Subclause
defRPr (Default Text Run Properties)	§5.1.5.3.2
extLst (Extension List)	§5.1.2.1.15
lnSpc (Line Spacing)	§5.1.5.2.5
spcAft (Space After)	§5.1.5.2.8
spcBef (Space Before)	§5.1.5.2.9
tabLst (Tab List)	§5.1.5.2.13

Attributes	Description

algn (Alignment)	Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied.
	
	 	
	[*Example*: Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this.
	
	`<p:txBody>`
	`<a:bodyPr numCol="2" spcCol="914400"…/>`
	`<a:normAutofit/>`
	`</a:bodyPr>`
	`…`
	`<a:p>`
	`<a:pPr marL="0" algn="just">`
	`<a:buNone/>`
	`</a:pPr>`
	`…`
	`<a:t>Sample Text …</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`

Attributes	Description
	end example] The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).

defTabSz (Default Tab Size)	Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.
	
	[*Example*: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr defTabSz="376300" …/>`
	`  …`
	`  <a:t>Sample Text …</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

eaLnBrk (East Asian Line Break)	Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.
	
	[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr eaLnBrk="0" …/>`

Attributes	Description
	… <a:t>Sample text (Long word)</a:t> … </a:p> </p:txBody> Sample text Sample text Sample text supercalifr agilisticexpialidocious Sample text Sample text Sample text supercalifragilisticexpialidocious *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
fontAlgn (Font Alignment)	Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied. [*Example*: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.  fontAlgn="t" fontAlgn="ctr" fontAlgn="base" fontAlgn="b" <a:txtBody> … <a:pPr fontAlgn="b" …/> … <a:r> <a:rPr …/> <a:t>H </a:t>

Attributes	Description
	</a:r> <a:r> <a:rPr sz="1200" …/> <a:t>2</a:t> </a:r> <a:r> <a:rPr …/> <a:t>O</a:t> </a:r> … </p:txBody> *end example*] The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).
hangingPunct (Hanging Punctuation)	Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.
indent (Indent)	Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied. Here is some Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text Sample text [*Example*: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book. <p:txBody>

Attributes	Description
	<a:bodyPr numCol="2" spcCol="914400"…/> <a:normAutofit/> </a:bodyPr> … <a:p> <a:pPr marL="0" indent="571500" algn="just"> <a:buNone/> </a:pPr> … <a:t>Here is some…</a:t> … </a:p> </p:txBody> By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. *end example*] The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).
latinLnBrk (Latin Line Break)	Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied. [*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows. <p:txBody> … <a:p> <a:pPr latinLnBrk="0" …/> … <a:t>Sample text (Long word)</a:t> … </a:p> </p:txBody> Sample text Sample text Sample text supercalifr agilisticexpialidocious

Attributes	Description
	Sample text Sample text Sample text supercalifragilisticexpialidocious *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.
	
	[*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr lvl="1" …/>`
	`  …`
	`  <a:t>Sample text</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]
	
	The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).

marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR

Attributes	Description
	attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).

rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.
	
	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

```

5.1.5.4.14 lvl2pPr (List Level 2 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute lvl="1". There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is lvl2pPr should come before lvl3pPr. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example*: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in lvl2pPr and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
  …
  <a:lstStyle>
    <a:lvl2pPr algn="r">
      <a:buNone/>
    </a:lvl2pPr>
  </a:lstStyle>
```

```
    <a:p>
      <a:pPr lvl="1">
      </a:pPr>
      …
      <a:t>Some text</a:t>
      …
    </a:p>
  </p:txBody>
```

end example]

[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

tabLst (Tab List)	§5.1.5.2.13

Attributes	Description
algn (Alignment)	Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied. Sample text [*Example*: Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this. `<p:txBody>` `  <a:bodyPr numCol="2" spcCol="914400"…/>` `    <a:normAutofit/>` `    </a:bodyPr>` `  …` `  <a:p>` `    <a:pPr marL="0" algn="just">` `      <a:buNone/>` `    </a:pPr>` `    …` `    <a:t>Sample Text …</a:t>` `    …` `  </a:p>` `</p:txBody>` *end example*] The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).
defTabSz (Default Tab Size)	Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.

Attributes	Description

	[*Example*: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr defTabSz="376300" …/>`
	`  …`
	`  <a:t>Sample Text …</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

eaLnBrk (East Asian Line Break)	Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.
	
	[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr eaLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	Sample text Sample text Sample text supercalifr
	agilisticexpialidocious

Attributes	Description
	Sample text Sample text Sample text supercalifragilisticexpialidocious *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

fontAlgn (Font Alignment)	Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.
	
	[*Example*: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.
	
	 	
	`<a:txtBody>`
	`…`
	`<a:pPr fontAlgn="b" …/>`
	`…`
	`<a:r>`
	`<a:rPr …/>`
	`<a:t>H </a:t>`
	`</a:r>`
	`<a:r>`

	`<a:t>2</a:t>`
	`</a:r>`
	`<a:r>`
	`<a:rPr …/>`
	`<a:t>O</a:t>`
	`</a:r>`

Attributes	Description
	… </p:txBody> *end example*] The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).
hangingPunct (Hanging Punctuation)	Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.

indent (Indent)	Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.
	
	Here is some Sample text
	
	[*Example*: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.
	
	<p:txBody>
	  <a:bodyPr numCol="2" spcCol="914400"…/>
	    <a:normAutofit/>
	    </a:bodyPr>
	  …
	  <a:p>
	    <a:pPr marL="0" indent="571500" algn="just">
	      <a:buNone/>
	    </a:pPr>
	    …

Attributes	Description
	<a:t>Here is some…</a:t> … </a:p> </p:txBody> By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. *end example*] The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).
latinLnBrk (Latin Line Break)	Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied. [*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows. <p:txBody> … <a:p> <a:pPr latinLnBrk="0" …/> … <a:t>Sample text (Long word)</a:t> … </a:p> </p:txBody> Sample text Sample text Sample text supercalifr agilisticexpialidocious Sample text Sample text Sample text supercalifragilisticexpialidocious *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine

Attributes	Description

	separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.
	
	[*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr lvl="1" …/>`
	`…`
	`<a:t>Sample text</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]
	
	The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).

marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.

Attributes	Description

	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

5.1.5.4.15 lvl3pPr (List Level 3 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute lvl="2". There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is lvl2pPr should come before lvl3pPr. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example*: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in lvl3pPr and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
  …
  <a:lstStyle>
    <a:lvl3pPr algn="r">
      <a:buNone/>
    </a:lvl3pPr>
  </a:lstStyle>
  <a:p>
    <a:pPr lvl="2">
    </a:pPr>
    …
    <a:t>Some text</a:t>
    …
  </a:p>
</p:txBody>
```

end example]

[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

tabLst (Tab List)	§5.1.5.2.13

Attributes	Description
algn (Alignment)	Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied. Sample text [*Example*: Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this. `<p:txBody>` `  <a:bodyPr numCol="2" spcCol="914400"…/>`

Attributes	Description
	<a:normAutofit/> </a:bodyPr> … <a:p> <a:pPr marL="0" algn="just"> <a:buNone/> </a:pPr> … <a:t>Sample Text …</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).
defTabSz (Default Tab Size)	Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this. [*Example*: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this. <p:txBody> … <a:p> <a:pPr defTabSz="376300" …/> … <a:t>Sample Text …</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).
eaLnBrk (East Asian Line Break)	Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.

Attributes	Description

	[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr eaLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

fontAlgn (Font Alignment)	Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied. [*Example*: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.

Attributes	Description

		
	``
	<a:txtBody>
	  …
	  <a:pPr fontAlgn="b" …/>
	  …
	  <a:r>
	  <a:rPr …/>
	  <a:t>H </a:t>
	  </a:r>
	  <a:r>
	  <a:rPr sz="1200" …/>
	  <a:t>2</a:t>
	  </a:r>
	  <a:r>
	  <a:rPr …/>
	  <a:t>O</a:t>
	  </a:r>
	  …
	</p:txBody>
	``
	
	end example]
	
	The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).

hangingPunct (Hanging Punctuation)	Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.
indent (Indent)	Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.

Attributes	Description

	Here is some Sample text
	
	[*Example*: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.
	
	`<p:txBody>`
	`  <a:bodyPr numCol="2" spcCol="914400"…/>`
	`    <a:normAutofit/>`
	`    </a:bodyPr>`
	`  …`
	`  <a:p>`
	`    <a:pPr marL="0" indent="571500" algn="just">`
	`      <a:buNone/>`
	`    </a:pPr>`
	`    …`
	`    <a:t>Here is some…</a:t>`
	`    …`
	`  </a:p>`
	`</p:txBody>`
	
	By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. *end example*]
	
	The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).

latinLnBrk (Latin Line Break)	Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied. [*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it

Attributes	Description

	may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr latinLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.
	
	[*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr lvl="1" …/>`
	`  …`
	`  <a:t>Sample text</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph

Attributes	Description
	properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*] The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).
marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).

rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.
	
	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextParagraphProperties">
   <sequence>
      <element name="lnSpc" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcBef" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcAft" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletColor" minOccurs="0" maxOccurs="1"/>

   <attribute name="rtl" type="xsd:boolean" use="optional"/>
   <attribute name="eaLnBrk" type="xsd:boolean" use="optional"/>
   <attribute name="fontAlgn" type="ST_TextFontAlignType" use="optional"/>
   <attribute name="latinLnBrk" type="xsd:boolean" use="optional"/>
   <attribute name="hangingPunct" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.5.4.16 lvl4pPr (List Level 4 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute lvl="3". There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is lvl2pPr should come before lvl3pPr. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example*: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in lvl4pPr and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
  …
  <a:lstStyle>
    <a:lvl4pPr algn="r">
      <a:buNone/>
    </a:lvl4pPr>
  </a:lstStyle>
```

```
    <a:p>
      <a:pPr lvl="3">
      </a:pPr>
      …
      <a:t>Some text</a:t>
      …
    </a:p>
  </p:txBody>
```

end example]

[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Attributes	Description
algn (Alignment)	Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied. Sample text [*Example*: Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this. `<p:txBody>` `<a:bodyPr numCol="2" spcCol="914400"…/>` `<a:normAutofit/>` `</a:bodyPr>` `…` `<a:p>` `<a:pPr marL="0" algn="just">` `<a:buNone/>` `</a:pPr>` `…` `<a:t>Sample Text …</a:t>` `…` `</a:p>` `</p:txBody>` *end example*] The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).
defTabSz (Default Tab Size)	Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this.

Attributes	Description

	[*Example*: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr defTabSz="376300" …/>`
	`  …`
	`  <a:t>Sample Text …</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

eaLnBrk (East Asian Line Break)	Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.
	
	[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr eaLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	Sample text Sample text Sample text supercalifr
	agilisticexpialidocious

Attributes	Description
	Sample text Sample text Sample text supercalifragilisticexpialidocious *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

fontAlgn (Font Alignment)	Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied.
	
	[*Example*: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.
	
	 	
	`<a:txtBody>`
	`…`
	`<a:pPr fontAlgn="b" …/>`
	`…`
	`<a:r>`
	`<a:rPr …/>`
	`<a:t>H </a:t>`
	`</a:r>`
	`<a:r>`
	`<a:rPr sz="1200" …/>`
	`<a:t>2</a:t>`
	`</a:r>`
	`<a:r>`
	`<a:rPr …/>`
	`<a:t>O</a:t>`
	`</a:r>`

Attributes	Description
	… </p:txBody> *end example*] The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).
hangingPunct (Hanging Punctuation)	Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.

indent (Indent)	Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.
	
	Here is some Sample text
	
	[*Example*: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.
	
	<p:txBody>
	  <a:bodyPr numCol="2" spcCol="914400"…/>
	    <a:normAutofit/>
	    </a:bodyPr>
	  …
	  <a:p>
	    <a:pPr marL="0" indent="571500" algn="just">
	      <a:buNone/>
	    </a:pPr>
	    …

Attributes	Description
	<a:t>Here is some…</a:t> … </a:p> </p:txBody> By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. *end example*] The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).
latinLnBrk (Latin Line Break)	Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied. [*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows. <p:txBody> … <a:p> <a:pPr latinLnBrk="0" …/> … <a:t>Sample text (Long word)</a:t> … </a:p> </p:txBody> Sample text Sample text Sample text supercalifr agilisticexpialidocious Sample text Sample text Sample text supercalifragilisticexpialidocious *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine

Attributes	Description

	separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.
	
	[*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr lvl="1" …/>`
	`…`
	`<a:t>Sample text</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]
	
	The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).

marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.

Attributes	Description

	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```

5.1.5.4.17 lvl5pPr (List Level 5 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute lvl="4". There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is lvl2pPr should come before lvl3pPr. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example*: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in lvl5pPr and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
  …
  <a:lstStyle>
    <a:lvl5pPr algn="r">
      <a:buNone/>
    </a:lvl5pPr>
  </a:lstStyle>
  <a:p>
    <a:pPr lvl="4">
    </a:pPr>
    …
    <a:t>Some text</a:t>
    …
  </a:p>
</p:txBody>
```

end example]

[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Attributes	Description
algn (Alignment)	Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied. Sample text [*Example*: Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this. `<p:txBody>` `<a:bodyPr numCol="2" spcCol="914400"…/>`

Attributes	Description
	<a:normAutofit/> </a:bodyPr> … <a:p> <a:pPr marL="0" algn="just"> <a:buNone/> </a:pPr> … <a:t>Sample Text …</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).
defTabSz (Default Tab Size)	Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this. [*Example*: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this. <p:txBody> … <a:p> <a:pPr defTabSz="376300" …/> … <a:t>Sample Text …</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).
eaLnBrk (East Asian Line Break)	Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.

Attributes	Description

	[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr eaLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

fontAlgn (Font Alignment)	Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied. [*Example*: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.

Attributes	Description
	 ``` <a:txtBody> … <a:pPr fontAlgn="b" …/> … <a:r> <a:rPr …/> <a:t>H </a:t> </a:r> <a:r> <a:rPr sz="1200" …/> <a:t>2</a:t> </a:r> <a:r> <a:rPr …/> <a:t>O</a:t> </a:r> … </p:txBody> ``` *end example*] The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).
hangingPunct (Hanging Punctuation)	Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.
indent (Indent)	Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.

Attributes	Description
	Here is some Sample text [*Example*: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book. `<p:txBody>` `  <a:bodyPr numCol="2" spcCol="914400"…/>` `    <a:normAutofit/>` `    </a:bodyPr>` `  …` `  <a:p>` `    <a:pPr marL="0" indent="571500" algn="just">` `      <a:buNone/>` `    </a:pPr>` `    …` `    <a:t>Here is some…</a:t>` `    …` `  </a:p>` `</p:txBody>` By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. *end example*] The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).
latinLnBrk (Latin Line Break)	Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied. [*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it

Attributes	Description

	may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr latinLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	Sample text Sample text Sample text supercalifr agilisticexpialidocious
	
	Sample text Sample text Sample text supercalifragilisticexpialidocious
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.
	
	[*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr lvl="1" …/>`
	`  …`
	`  <a:t>Sample text</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph

Attributes	Description
	properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*] The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).
marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).

rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.
	
	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

5.1.5.4.18 lvl6pPr (List Level 6 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute lvl="5". There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is lvl2pPr should come before lvl3pPr. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example*: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in lvl6pPr and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
  …
  <a:lstStyle>
    <a:lvl6pPr algn="r">
      <a:buNone/>
    </a:lvl6pPr>
  </a:lstStyle>
```

```
    <a:p>
      <a:pPr lvl="5">
      </a:pPr>
      …
      <a:t>Some text</a:t>
      …
    </a:p>
  </p:txBody>
```

end example]

[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine

Attributes	Description

	separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.
	
	[*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr lvl="1" …/>`
	`…`
	`<a:t>Sample text</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]
	
	The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).

marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.

Attributes	Description

	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextParagraphProperties">

5.1.5.4.19 lvl7pPr (List Level 7 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute lvl="6". There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is lvl2pPr should come before lvl3pPr. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example*: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in lvl7pPr and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
  …
  <a:lstStyle>
    <a:lvl7pPr algn="r">
      <a:buNone/>
    </a:lvl7pPr>
  </a:lstStyle>
  <a:p>
    <a:pPr lvl="6">
    </a:pPr>
    …
    <a:t>Some text</a:t>
    …
  </a:p>
</p:txBody>
```

end example]

[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Parent Elements
bodyStyle (§4.4.1.5); defaultTextStyle (§4.3.1.7); lstStyle (§5.1.5.4.12); notesStyle (§4.4.1.25); otherStyle (§4.4.1.32); titleStyle (§4.4.1.45)

tabLst (Tab List)	§5.1.5.2.13

Attributes	Description
algn (Alignment)	Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied. Sample text [*Example*: Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this. `<p:txBody>` `  <a:bodyPr numCol="2" spcCol="914400"…/>`

Attributes	Description
	<a:normAutofit/> </a:bodyPr> … <a:p> <a:pPr marL="0" algn="just"> <a:buNone/> </a:pPr> … <a:t>Sample Text …</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).
defTabSz (Default Tab Size)	Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this. [*Example*: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this. <p:txBody> … <a:p> <a:pPr defTabSz="376300" …/> … <a:t>Sample Text …</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).
eaLnBrk (East Asian Line Break)	Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.

Attributes	Description

	[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr eaLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

fontAlgn (Font Alignment)	Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied. [*Example*: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.

Attributes	Description
	 ``` <a:txtBody> … <a:pPr fontAlgn="b" …/> … <a:r> <a:rPr …/> <a:t>H </a:t> </a:r> <a:r> <a:rPr sz="1200" …/> <a:t>2</a:t> </a:r> <a:r> <a:rPr …/> <a:t>O</a:t> </a:r> … </p:txBody> ``` *end example*] The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).
hangingPunct (Hanging Punctuation)	Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.
indent (Indent)	Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.

<table>
<tr><th>Attributes</th><th>Description</th></tr>
<tr><td></td><td>

Here is some Sample text

[*Example*: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book.

```
<p:txBody>
  <a:bodyPr numCol="2" spcCol="914400"…/>
    <a:normAutofit/>
    </a:bodyPr>
  …
  <a:p>
    <a:pPr marL="0" indent="571500" algn="just">
      <a:buNone/>
    </a:pPr>
    …
    <a:t>Here is some…</a:t>
    …
  </a:p>
</p:txBody>
```

By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. *end example*]

The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).

</td></tr>
<tr><td>latinLnBrk (Latin Line Break)</td><td>

Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.

[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it

	Sample text Sample text Sample text supercalifragilisticexpialidocious
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.
	
	[*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr lvl="1" …/>`
	`  …`
	`  <a:t>Sample text</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph

Attributes	Description
	properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*] The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).
marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).

rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.
	
	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]
	
	The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).

marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.

Attributes	Description

	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextParagraphProperties">
   <sequence>
      <element name="lnSpc" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcBef" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcAft" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletColor" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletSize" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletTypeface" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBullet" minOccurs="0" maxOccurs="1"/>
      <element name="tabLst" type="CT_TextTabStopList" minOccurs="0" maxOccurs="1"/>
      <element name="defRPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="marL" type="ST_TextMargin" use="optional"/>
   <attribute name="marR" type="ST_TextMargin" use="optional"/>
   <attribute name="lvl" type="ST_TextIndentLevelType" use="optional"/>
   <attribute name="indent" type="ST_TextIndent" use="optional"/>
   <attribute name="algn" type="ST_TextAlignType" use="optional"/>
   <attribute name="defTabSz" type="ST_Coordinate32" use="optional"/>
   <attribute name="rtl" type="xsd:boolean" use="optional"/>
   <attribute name="eaLnBrk" type="xsd:boolean" use="optional"/>
   <attribute name="fontAlgn" type="ST_TextFontAlignType" use="optional"/>
   <attribute name="latinLnBrk" type="xsd:boolean" use="optional"/>
   <attribute name="hangingPunct" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.5.4.21 lvl9pPr (List Level 9 Text Style)

This element specifies all paragraph level text properties for all elements that have the attribute lvl="8". There are a total of 9 level text property elements allowed, levels 0-8. It is recommended that the order in which this and other level property elements are specified be in order of increasing level. That is lvl2pPr should come before lvl3pPr. This allows the lower level properties to take precedence over the higher level ones because they are parsed first.

[*Example*: Consider the following DrawingML code that would specify a paragraph to follow the level style defined in lvl9pPr and thus create a paragraph of text that has no bullets and is right aligned.

```
<p:txBody>
  …
  <a:lstStyle>
    <a:lvl9pPr algn="r">
      <a:buNone/>
    </a:lvl9pPr>
  </a:lstStyle>
  <a:p>
    <a:pPr lvl="8">
    </a:pPr>
    …
    <a:t>Some text</a:t>
    …
  </a:p>
</p:txBody>
```

end example]

[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*]

Parent Elements
bodyStyle (§4.4.1.5); defaultTextStyle (§4.3.1.7); lstStyle (§5.1.5.4.12); notesStyle (§4.4.1.25); otherStyle (§4.4.1.32); titleStyle (§4.4.1.45)

Child Elements	Subclause
buAutoNum (Auto-Numbered Bullet)	§5.1.5.4.1
buBlip (Picture Bullet)	§5.1.5.4.2
buChar (Character Bullet)	§5.1.5.4.3

Child Elements	Subclause
buClr (Color Specified)	§5.1.5.4.4
buClrTx (Follow Text)	§5.1.5.4.5
buFont (Specified)	§5.1.5.4.6
buFontTx (Follow text)	§5.1.5.4.7
buNone (No Bullet)	§5.1.5.4.8
buSzPct (Bullet Size Percentage)	§5.1.5.4.9
buSzPts (Bullet Size Points)	§5.1.5.4.10
buSzTx (Bullet Size Follows Text)	§5.1.5.4.11
defRPr (Default Text Run Properties)	§5.1.5.3.2
extLst (Extension List)	§5.1.2.1.15
lnSpc (Line Spacing)	§5.1.5.2.5
spcAft (Space After)	§5.1.5.2.8
spcBef (Space Before)	§5.1.5.2.9
tabLst (Tab List)	§5.1.5.2.13

Attributes	Description
algn (Alignment)	Specifies the alignment that is to be applied to the paragraph. Possible values for this include left, right, centered, justified and distributed. If this attribute is omitted, then a value of left is implied. Sample text [*Example*: Consider the case where the user wishes to have two columns of text that have a justified alignment, much like text within a book. The following DrawingML could describe this. `<p:txBody>` `<a:bodyPr numCol="2" spcCol="914400"…/>`

Attributes	Description
	<a:normAutofit/> </a:bodyPr> … <a:p> <a:pPr marL="0" algn="just"> <a:buNone/> </a:pPr> … <a:t>Sample Text …</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_TextAlignType simple type (§5.1.12.59).
defTabSz (Default Tab Size)	Specifies the default size for a tab character within this paragraph. This attribute should be used to describe the spacing of tabs within the paragraph instead of a leading indentation tab. For indentation tabs there are the marL and indent attributes to assist with this. [*Example*: Consider the case where a paragraph contains numerous tabs that need to be of a specific size. The following DrawingML would describe this. <p:txBody> … <a:p> <a:pPr defTabSz="376300" …/> … <a:t>Sample Text …</a:t> … </a:p> </p:txBody> *end example*] The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).
eaLnBrk (East Asian Line Break)	Specifies whether an East Asian word can be broken in half and wrapped onto the next line without a hyphen being added. To determine whether an East Asian word can be broken the presentation application would use the kinsoku settings here. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable East Asian words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied.

Attributes	Description

	[*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr eaLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

fontAlgn (Font Alignment)	Determines where vertically on a line of text the actual words are positioned. This deals with vertical placement of the characters with respect to the baselines. For instance having text anchored to the top baseline, anchored to the bottom baseline, centered in between, etc. To understand this attribute and it's use it is helpful to understand what baselines are. A diagram describing these different cases is shown below. If this attribute is omitted, then a value of base is implied. [*Example*: Consider the case where the user wishes to represent the chemical compound of a water molecule. For this they will need to make sure the H, the 2, and the O are all in the correct position and are of the correct size. The results below can be achieved through the DrawingML shown below.

Attributes	Description
	 ``` <a:txtBody> … <a:pPr fontAlgn="b" …/> … <a:r> <a:rPr …/> <a:t>H </a:t> </a:r> <a:r> <a:rPr sz="1200" …/> <a:t>2</a:t> </a:r> <a:r> <a:rPr …/> <a:t>O</a:t> </a:r> … </p:txBody> ``` *end example*] The possible values for this attribute are defined by the ST_TextFontAlignType simple type (§5.1.12.66).
hangingPunct (Hanging Punctuation)	Specifies whether punctuation is to be forcefully laid out on a line of text or put on a different line of text. That is, if there is punctuation at the end of a run of text that should be carried over to a separate line does it actually get carried over. A true value will allow for hanging punctuation forcing the punctuation to not be carried over and a value of false will allow the punctuation to be carried onto the next text line. If this attribute is omitted, then a value of 0, or false is implied. The possible values for this attribute are defined by the XML Schema boolean datatype.
indent (Indent)	Specifies the indent size that will be applied to the first line of text in the paragraph. An indentation of 0 will be considered to be at the same location as marL attribute. If this attribute is omitted, then a value of -342900 is implied.

Attributes	Description
	Here is some Sample text [*Example*: Consider the scenario where the user now wanted to add a paragraph indentation to the first line of text in their two column format book. `<p:txBody>` `  <a:bodyPr numCol="2" spcCol="914400"…/>` `    <a:normAutofit/>` `    </a:bodyPr>` `  …` `  <a:p>` `    <a:pPr marL="0" indent="571500" algn="just">` `      <a:buNone/>` `    </a:pPr>` `    …` `    <a:t>Here is some…</a:t>` `    …` `  </a:p>` `</p:txBody>` By adding the indent attribute the user has effectively added a first line indent to this paragraph of text. *end example*] The possible values for this attribute are defined by the ST_TextIndent simple type (§5.1.12.70).
latinLnBrk (Latin Line Break)	Specifies whether a Latin word can be broken in half and wrapped onto the next line without a hyphen being added. This attribute is to be used specifically when there is a word that cannot be broken into multiple pieces without a hyphen. That is it will not be present within the existence of normal breakable Latin words but will when a special case word arises that should not be broken for a line break. If this attribute is omitted, then a value of 1, or true is implied. [*Example*: Consider the case where the presentation contains a long word that must not be divided with a line break. Instead it should be placed, in whole on a new line so that it

Attributes	Description

	may fit. The picture below shows a normal paragraph where a long word has been broken for a line break. The second picture shown below shows that same paragraph with the long word specified to not allow a line break. The resulting DrawingML is as follows.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr latinLnBrk="0" …/>`
	`  …`
	`  <a:t>Sample text (Long word)</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	 
	
	 	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

lvl (Level)	Specifies the particular level text properties that this paragraph will follow. The value for this attribute is numerical and formats the text according to the corresponding level paragraph properties that are listed within the lstStyle element. Since there are nine separate level properties defined, this tag will have an effective range of 0-8 = 9 available values.
	
	[*Example*: Consider the following DrawingML. This would specify that this paragraph should follow the lvl2pPr formatting style because once again lvl="1" is considered to be level 2.
	
	`<p:txBody>`
	`  …`
	`  <a:p>`
	`  <a:pPr lvl="1" …/>`
	`  …`
	`  <a:t>Sample text</a:t>`
	`  …`
	`  </a:p>`
	`</p:txBody>`
	
	end example]
	
	[*Note*: To resolve conflicting paragraph properties the linear hierarchy of paragraph

Attributes	Description
	properties should be examined starting first with the pPr element. The rule here is that properties that are defined at a level closer to the actual text should take precedence. That is if there is a conflicting property between the pPr and lvl1pPr elements then the pPr property should take precedence because in the property hierarchy it is closer to the actual text being represented. *end note*] The possible values for this attribute are defined by the ST_TextIndentLevelType simple type (§5.1.12.71).
marL (Left Margin)	Specifies the left margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marL attributes are additive with respect to the text position. If this attribute is omitted, then a value of 347663 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).
marR (Right Margin)	Specifies the right margin of the paragraph. This is specified in addition to the text body inset and applies only to this text paragraph. That is the text body inset and the marR attributes are additive with respect to the text position. If this attribute is omitted, then a value of 0 is implied. The possible values for this attribute are defined by the ST_TextMargin simple type (§5.1.12.73).

rtl (Right To Left)	Specifies whether the text is right-to-left or left-to-right in its flow direction. If this attribute is omitted, then a value of 0, or left-to-right is implied.
	
	[*Example*: Consider the scenario where the user wanted text to flow from right to left. That is within the bounding text box the first word would be right aligned with each additional word being written to the left of the previous while continuing to flow top to bottom. The DrawingML to describe this might be as follows.
	
	`<p:txBody>`
	`…`
	`<a:p>`
	`<a:pPr rtl="1" …/>`
	`…`
	`<a:t>Sample text…</a:t>`
	`…`
	`</a:p>`
	`</p:txBody>`
	
	end example]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextParagraphProperties">
   <sequence>
      <element name="lnSpc" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcBef" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <element name="spcAft" type="CT_TextSpacing" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletColor" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletSize" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBulletTypeface" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_TextBullet" minOccurs="0" maxOccurs="1"/>
      <element name="tabLst" type="CT_TextTabStopList" minOccurs="0" maxOccurs="1"/>
      <element name="defRPr" type="CT_TextCharacterProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>

   <attribute name="fontAlgn" type="ST_TextFontAlignType" use="optional"/>
   <attribute name="latinLnBrk" type="xsd:boolean" use="optional"/>
   <attribute name="hangingPunct" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.6 Tables

This section contains information regarding the definition of a table within DrawingML. The following image is an example table within DrawingML.

text	text	text	text	text
text	text	text	text	text
text	text	text	text	text
text	text	text	text	text
text	text	text	text	text

5.1.6.1 cell3D (Cell 3-D)

This element specifies a set of properties which dictate the 3-D appearance of a given cell in a table. Collectively, these properties are referred to as a cell 3-D. The application of these properties occurs on a per-cell basis in the table.

Parent Elements
tcPr (§5.1.6.15); tcStyle (§5.1.4.2.29)

Child Elements	Subclause
bevel (Bevel)	§5.1.4.2.5
extLst (Extension List)	§5.1.2.1.15
lightRig (Light Rig)	§5.1.7.9

Attributes	Description
prstMaterial (Preset Material)	Specifies a material type which will be used to define the material characteristics of the cell. The material properties, combined with the lighting characteristics of the scene in define the final look and feel of the 3-D appearance of the cell. The possible values for this attribute are defined by the ST_PresetMaterialType simple type (§5.1.12.50).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Cell3D">
   <sequence>
      <element name="bevel" type="CT_Bevel" minOccurs="1" maxOccurs="1"/>
      <element name="lightRig" type="CT_LightRig" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="prstMaterial" type="ST_PresetMaterialType" use="optional" default="plastic"/>
</complexType>
```

5.1.6.2 gridCol (Table Grid Column)

This element specifies the width of a given column within a table. For each column in a table, there will be an associated table grid column defining the width of the column.

[*Example*: Consider the following example of a table grid containing widths defined for three table grid columns:

```
<a:tblGrid>
  <a:gridCol w="1117600"/>
  <a:gridCol w="1117600"/>
```

```
  <a:gridCol w="1117600"/>
</a:tblGrid>
```

end example]

Parent Elements
tblGrid (§5.1.6.12)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
w (Width)	The width of the column in EMUs. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableCol">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="w" type="ST_Coordinate" use="required"/>
</complexType>
```

5.1.6.3 lnB (Bottom Border Line Properties)

This element defines the line properties associated with the bottom border of a given cell.

[*Example*: Consider the following example of a bottom border line properties element within DrawingML:

```
<a:lnB w="38100" cap="flat" cmpd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnB>
```

In this example, one can see that the bottom border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*]

Parent Elements
tcPr (§5.1.6.15)

Child Elements	Subclause
bevel (Line Join Bevel)	§5.1.10.9
custDash (Custom Dash)	§5.1.10.21
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
headEnd (Line Head/End Style)	§5.1.10.38
miter (Miter Line Join)	§5.1.10.43
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstDash (Preset Dash)	§5.1.10.48
round (Round Line Join)	§5.1.10.52
solidFill (Solid Fill)	§5.1.10.54
tailEnd (Tail line end style)	§5.1.10.57

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type

Attributes	Description
	(§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
   <sequence>
      <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
      <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="w" type="ST_LineWidth" use="optional"/>
   <attribute name="cap" type="ST_LineCap" use="optional"/>
   <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
   <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

5.1.6.4 lnBlToTr (Bottom-Left to Top-Right Border Line Properties)

This element defines the line properties associated with the diagonal line from the bottom left corner of the cell to the top right corner.

[*Example*: Consider the following example of a lnBlToTr within DrawingML:

```
<a:lnBlToTr w="38100" cap="flat" cmpd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnBlToTr >
```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*]

Parent Elements
tcPr (§5.1.6.15)

Child Elements	Subclause
bevel (Line Join Bevel)	§5.1.10.9
custDash (Custom Dash)	§5.1.10.21

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
headEnd (Line Head/End Style)	§5.1.10.38
miter (Miter Line Join)	§5.1.10.43
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstDash (Preset Dash)	§5.1.10.48
round (Round Line Join)	§5.1.10.52
solidFill (Solid Fill)	§5.1.10.54
tailEnd (Tail line end style)	§5.1.10.57

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
   <sequence>
      <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
      <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="w" type="ST_LineWidth" use="optional"/>
   <attribute name="cap" type="ST_LineCap" use="optional"/>
   <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
   <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

5.1.6.5 lnL (Left Border Line Properties)

This element defines the line properties associated with the left border of a cell

[*Example*: Consider the following example of a lnL within DrawingML:

```
<a:lnL w="38100" cap="flat" cmpd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnL >
```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*]

Parent Elements
tcPr (§5.1.6.15)

Child Elements	Subclause
bevel (Line Join Bevel)	§5.1.10.9
custDash (Custom Dash)	§5.1.10.21
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
headEnd (Line Head/End Style)	§5.1.10.38
miter (Miter Line Join)	§5.1.10.43

noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstDash (Preset Dash)	§5.1.10.48
round (Round Line Join)	§5.1.10.52
solidFill (Solid Fill)	§5.1.10.54
tailEnd (Tail line end style)	§5.1.10.57

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
   <sequence>
      <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
      <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="w" type="ST_LineWidth" use="optional"/>
   <attribute name="cap" type="ST_LineCap" use="optional"/>
   <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
   <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

5.1.6.6 lnR (Right Border Line Properties)

This element defines the line properties associated with right border of a cell.

[*Example*: Consider the following example of a lnR within DrawingML:

```
<a:lnR w="38100" cap="flat" cmpd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnR >
```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*]

Parent Elements

tailEnd (Tail line end style)	§5.1.10.57

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type

Attributes	Description
	(§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
   <sequence>
      <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
      <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="w" type="ST_LineWidth" use="optional"/>
   <attribute name="cap" type="ST_LineCap" use="optional"/>
   <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
   <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

5.1.6.7 lnT (Top Border Line Properties)

This element defines the line properties associated with the top border of a cell.

[*Example*: Consider the following example of a lnT within DrawingML:

```
<a:lnT w="38100" cap="flat" cmpd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
```

```
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnT >
```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*]

round (Round Line Join)	§5.1.10.52
solidFill (Solid Fill)	§5.1.10.54
tailEnd (Tail line end style)	§5.1.10.57

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a

Attributes	Description
	value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
   <sequence>
      <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
      <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="w" type="ST_LineWidth" use="optional"/>
   <attribute name="cap" type="ST_LineCap" use="optional"/>
   <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
   <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

5.1.6.8 lnTlToBr (Top-Left to Bottom-Right Border Line Properties)

This element defines the line properties associated with the diagonal line from the top left corner of the cell to the bottom right corner.

[*Example*: Consider the following example of a lnTlToBr within DrawingML:

```
<a:lnTlToBr w="38100" cap="flat" cmpd="sng" algn="ctr">
  <a:solidFill>
    <a:schemeClr val="accent2"/>
  </a:solidFill>
  <a:prstDash val="solid"/>
  <a:round/>
  <a:headEnd type="none" w="med" len="med"/>
  <a:tailEnd type="none" w="med" len="med"/>
</a:lnTlToBr>
```

In this example, one can see that the border line style defined with certain properties, such as a flat end line cap, a given width, head and tail end, color, etc. *end example*]

Parent Elements
tcPr (§5.1.6.15)

Attributes	Description
algn (Stroke Alignment)	Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§5.1.12.40).
cap (Line Ending Cap Type)	Specifies the ending caps that should be used for this line. Examples of cap types are rounded, flat, etc. If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§5.1.12.31).
cmpd (Compound Line Type)	Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§5.1.12.15).
w (Line Width)	Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§5.1.12.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineProperties">
   <sequence>
      <group ref="EG_LineFillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineDashProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_LineJoinProperties" minOccurs="0" maxOccurs="1"/>
      <element name="headEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tailEnd" type="CT_LineEndProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="w" type="ST_LineWidth" use="optional"/>
   <attribute name="cap" type="ST_LineCap" use="optional"/>
   <attribute name="cmpd" type="ST_CompoundLine" use="optional"/>
   <attribute name="algn" type="ST_PenAlignment" use="optional"/>
</complexType>
```

5.1.6.9 tableStyle (Table Style)

This element specifies a particular table style. Fourteen elements make up the styling information of a given table style. These fourteen elements work together to provide visual formatting options for on/off states of the following toggles:

- First row on/off - Associated element: firstRow
- Last row on/off - Associated element: lastRow
- First column on/off - Associated element: firstCol
- Last column on/off - Associated element: lastCol
- Row banding on/off - Associated elements: band1H, band2H
- Column banding on/off - Associated elements: band1V, band2V

The formatting associated with the wholeTbl element defines the table formatting when all options are off. When an option is turned on, the formatting for that particular option is applied to the table. The four cell specific formatting options are enabled when overlapping options are toggled on. For example, when the first row, and first column formatting options are enabled, any formatting within the northwest cell will also be applied since that is the overlapping table cell when both first column and first row formatting options are on.

[*Example*: Consider the following partial example of a tblStyle within DrawingML:

```
<a:tblStyle styleId="{5940675A-B579-460E-94D1-54222C63F5DA}"
  styleName="No Style, Table Grid">
  <a:wholeTbl>
    <a:tcTxStyle>
      <a:fontRef idx="minor">
        <a:scrgbClr r="0" g="0" b="0"/>
      </a:fontRef>
```

```
        <a:schemeClr val="tx1"/>
      </a:tcTxStyle>
      <a:tcStyle>
        <a:tcBdr>
          <a:left>
            <a:ln w="12700" cmpd="sng">
              <a:solidFill>
                <a:schemeClr val="tx1"/>
              </a:solidFill>
            </a:ln>
          </a:left>
```

…right, top, bottom, insideH, insideV border information is defined just as the 'left' tag…

```
        </a:tcBdr>
        <a:fill>
          <a:noFill/>
        </a:fill>
      </a:tcStyle>
    </a:wholeTbl>
    <a:band1H>
      <a:tcStyle>
        <a:tcBdr/>
      </a:tcStyle>
    </a:band1H>
```

…band2H, band1V, band2V, firstCol, firstRow, lastCol, lastRow, neCell, nwCell, seCell, swCell tags are all defined just as the 'band1H' tag

```
  </a:tblStyle>
```

In this example, one can get an idea for the definition of a table style in its entirety. The above defined table style will create a style with only 1pt line formatting applied to all of the cells in a table. Notice that the on/off toggle formatting (band1H, band2H, firstCol, etc) do not define any formatting and therefore have no effect to the table when toggled. *end example*]

Parent Elements
tblPr (§5.1.6.13)

Child Elements	Subclause
band1H (Band 1 Horizontal)	§5.1.4.2.1
band1V (Band 1 Vertical)	§5.1.4.2.2
band2H (Band 2 Horizontal)	§5.1.4.2.3

Child Elements	Subclause
band2V (Band 2 Vertical)	§5.1.4.2.4
extLst (Extension List)	§5.1.2.1.15
firstCol (First Column)	§5.1.4.2.11
firstRow (First Row)	§5.1.4.2.12
lastCol (Last Column)	§5.1.4.2.16
lastRow (Last Row)	§5.1.4.2.17
neCell (Northeast Cell)	§5.1.4.2.20
nwCell (Northwest Cell)	§5.1.4.2.21
seCell (Southeast Cell)	§5.1.4.2.23
swCell (Southwest Cell)	§5.1.4.2.24
tblBg (Table Background)	§5.1.4.2.25
wholeTbl (Whole Table)	§5.1.4.2.34

Attributes	Description
styleId (Style ID)	Specifies a GUID identifying the table style in a unique manner. The possible values for this attribute are defined by the ST_Guid simple type (§5.1.12.27).
styleName (Name)	Specifies the name of the table style which can show up in the user interface identifying the style to a user. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableStyle">
   <sequence>
      <element name="tblBg" type="CT_TableBackgroundStyle" minOccurs="0" maxOccurs="1"/>
      <element name="wholeTbl" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="band1H" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="band2H" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="band1V" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="band2V" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="lastCol" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="firstCol" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="lastRow" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="seCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="swCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="firstRow" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="neCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="nwCell" type="CT_TablePartStyle" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="styleId" type="ST_Guid" use="required"/>
   <attribute name="styleName" type="xsd:string" use="required"/>
</complexType>
```

5.1.6.10 tableStyleId (Table Style ID)

This element defines the table style which is currently applied to the table by referencing the styleId attribute of the tableStyle element.

[*Example*: Consider the following example of a tableStyleId within DrawingML:

```
<a:tblPr firstRow="1" bandRow="1">
  <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId>
</a:tblPr>
```

In this example, we see a reference to a table style being specified in the tableStyleId element. *end example*]

The possible values for this element are defined by the ST_Guid simple type (§5.1.12.27).

Parent Elements
tblPr (§5.1.6.13)

5.1.6.11 tbl (Table)

This element is the root element for a table. Within this element is contained everything that one would need to define a table within DrawingML.

[*Example*: Consider the following example of a tbl within DrawingML:

```
<a:tbl>
  <a:tblPr firstRow="1" bandRow="1">
  …
  <a:tblPr>
  <a:tblGrid>
  …
  </a:tblGrid>
  <a:tr h="419100">
  …
  </a:tr>
</a:tbl>
```

In this example, we see can see the definition of a table within DrawingML. *end example*]

Child Elements	Subclause
tblGrid (Table Grid)	§5.1.6.12
tblPr (Table Properties)	§5.1.6.13
tr (Table Row)	§5.1.6.16

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Table">
   <sequence>
      <element name="tblPr" type="CT_TableProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tblGrid" type="CT_TableGrid" minOccurs="1" maxOccurs="1"/>
      <element name="tr" type="CT_TableRow" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.6.12 tblGrid (Table Grid)

This element defines a list of table column (§5.1.6.2) elements. There should be a table column (§5.1.6.2) element for every column held within the table.

[*Example*: Consider the following example of a tblGrid within DrawingML:

```
<a:tblGrid>
  <a:gridCol w="1117600"/>
  <a:gridCol w="1117600"/>
  <a:gridCol w="1117600"/>
</a:tblGrid>
```

In this example, we have a tblGrid defined that holds three columns, therefore the table will have three columns. *end example*]

Parent Elements
tbl (§5.1.6.11)

Child Elements	Subclause
gridCol (Table Grid Column)	§5.1.6.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableGrid">
   <sequence>
      <element name="gridCol" type="CT_TableCol" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.6.13 tblPr (Table Properties)

This element defines the properties of a table on the whole. Within this element are many visual modifications that can be applied to the table.

[*Example*: Consider the following example of a tblPr within DrawingML:

```
<a:tblPr firstRow="1" bandRow="1">
  <a:tableStyleId>{5940675A-B579-460E-94D1-54222C63F5DA}</a:tableStyleId>
</a:tblPr>
```

In this example, we see that there is a link to a table style id (§5.1.6.10) which is defined elsewhere and that the first column formatting and banded row formatting has been enabled. The table style defines the formatting applied with the two formatting options enabled. *end example*]

Parent Elements
tbl (§5.1.6.11)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15

grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54
tableStyle (Table Style)	§5.1.6.9
tableStyleId (Table Style ID)	§5.1.6.10

Attributes	Description

bandCol (Banded Columns)	Enables or disables the banded column formatting for a table style. A value of on, 1 or true will enable the banded column formatting defined in the table style. The attribute will default to off if it is not specified.
	
	[*Example*: Consider the following run:
	
	`<a:tblPr bandCol="1">`
	`  <a:tableStyleId>{5940675A-B579-460E-94D1-`
	`  54222C63F5DA}</a:tableStyleId>`
	`</a:tblPr>`
	
	In this example, we can see the banded column formatting is enabled for the table. When applied, the linked table style defines the formatting for banded columns. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

bandRow (Banded Rows)	Enables or disables the banded row formatting for a table style. A value of on, 1 or true will enable the banded row formatting defined in the table style. The attribute will default to off if it is not specified.
	
	[*Example*: Consider the following run:
	
	`<a:tblPr bandRow="1">`
	`  <a:tableStyleId>{5940675A-B579-460E-94D1-`
	`  54222C63F5DA}</a:tableStyleId>`
	`</a:tblPr>`
	
	In this example, we can see the banded row formatting is enabled for the table. When applied, the linked table style defines the formatting for banded rows. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

firstCol (First Column)	Enables or disables the first column formatting for a table style. A value of on, 1 or true will enable the first column formatting defined in the table style. The attribute will default to off if it is not specified.
	
	[*Example*: Consider the following run:
	
	`<a:tblPr firstCol="1">`
	`  <a:tableStyleId>{5940675A-B579-460E-94D1-`
	`  54222C63F5DA}</a:tableStyleId>`
	`</a:tblPr>`
	
	In this example, we can see the first column formatting is enabled for the table. When

Attributes	Description
	applied, the linked table style defines the formatting for the first column. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

firstRow (First Row)	Enables or disables the first row formatting for a table style. A value of on, 1 or true will enable the first row formatting defined in the table style. The attribute will default to off if it is not specified.
	
	[*Example*: Consider the following run:
	
	`<a:tblPr firstRow="1">`
	`  <a:tableStyleId>{5940675A-B579-460E-94D1-`
	`  54222C63F5DA}</a:tableStyleId>`
	`</a:tblPr>`
	
	In this example, we can see the first row formatting is enabled for the table. When applied, the linked table style defines the formatting for the first row. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

lastCol (Last Column)	Enables or disables the last column formatting for a table style. A value of on, 1 or true will enable the last column formatting defined in the table style. The attribute will default to off if it is not specified.
	
	[*Example*: Consider the following run:
	
	`<a:tblPr lastCol="1">`
	`  <a:tableStyleId>{5940675A-B579-460E-94D1-`
	`  54222C63F5DA}</a:tableStyleId>`
	`</a:tblPr>`
	
	In this example, we can see the last column formatting is enabled for the table. When applied, the linked table style defines the formatting for the last column. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

lastRow (Last Row)	Enables or disables the last row formatting for a table style. A value of on, 1 or true will enable the last row formatting defined in the table style. The attribute will default to off if it is not specified.
	
	[*Example*: Consider the following run:
	
	`<a:tblPr lastRow="1">`
	`  <a:tableStyleId>{5940675A-B579-460E-94D1-`
	`  54222C63F5DA}</a:tableStyleId>`

Attributes	Description
	</a:tblPr> In this example, we can see the last row formatting is enabled for the table. When applied, the linked table style defines the formatting for the last row. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
rtl (Right-to-Left)	Defines enables the right-to-left settings of a table. If the value of rtl is on, 1 or true, then the table will be laid out from the right-to-left rather than the default left-to-right. [*Example*: Consider the following run: <a:tblPr rtl="1"> <a:tableStyleId>{5940675A-B579-460E-94D1- 54222C63F5DA}</a:tableStyleId> </a:tblPr> In this example, we can see that the table is to be created in a right-to-left direction. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableProperties">
   <sequence>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <choice minOccurs="0" maxOccurs="1">
         <element name="tableStyle" type="CT_TableStyle"/>
         <element name="tableStyleId" type="ST_Guid"/>
      </choice>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rtl" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="firstRow" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="firstCol" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="lastRow" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="lastCol" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="bandRow" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="bandCol" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.6.14 tc (Table Cell)

This element defines a cell within the table. The table cell holds a text body that actually contains the data held within the cell along with the properties of the table cell which hold formatting options associated with the cell.

[*Example*: Consider the following example of a tc within DrawingML:

```
<a:tc>
  <a:txBody>
    <a:bodyPr/>
    <a:lstStyle/>
    <a:p>
      <a:pPr marL="0" algn="ctr" rtl="0"/>
      <a:r>
        <a:rPr lang="en-US" dirty="0" smtClean="0"/>
        <a:t>data</a:t>
      </a:r>
      <a:endParaRPr lang="en-US" dirty="0"/>
    </a:p>
  </a:txBody>
  <a:tcPr/>
</a:tc>
```

In this example, we see a single cell in a table being defined with the default cell properties and a text body which contains the word "data". The text "data" will be the only text in the cell. *end example*]

Parent Elements
tr (§5.1.6.16)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
tcPr (Table Cell Properties)	§5.1.6.15
txBody (Shape Text Body)	§5.1.2.1.40

Attributes	Description

gridSpan (Grid Span)	Specifies the number of columns that a merged cell spans. This is used in combination with the hMerge attribute on other cells in order to specify the beginning cell of a horizontal merge.
	
	[*Example*: Consider the following example:
	
	`<a:tc gridSpan="3">`
	…
	`/a:tc>`
	`<a:tc hMerge="1">`
	…
	`/a:tc>`

Attributes	Description
	<a:tc hMerge="1"> … /a:tc> In this example, we can define what looks like a single cell in the table as a group of three cells merged together. The merged cell spans three columns of the table. *end example*] The possible values for this attribute are defined by the XML Schema int datatype.
hMerge (Horizontal Merge)	When this attribute is set to on, 1 or true, then this table cell is to be merged with the previous horizontal table cell when the table is created. [*Example*: Consider the following example: <a:tc hMerge="1"> … </a:tc> In this example, we see the hMerge attribute set to on which signifies that this cell is to be merged with the previous horizontal cell in the table. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
rowSpan (Row Span)	Specifies the number of rows that a merged cell spans. This is used in combination with the vMerge attribute on other cells in order to specify the beginning cell of a horizontal merge. [*Example*: Consider the following example: <a:tc rowSpan="3"> … /a:tc> <a:tc vMerge="1"> … /a:tc> <a:tc vMerge="1"> … /a:tc> In this example, we can define what looks like a single cell in the table as a group of three cells merged together. The merged cell spans three rows of the table. *end example*] The possible values for this attribute are defined by the XML Schema int datatype.
vMerge (Vertical Merge)	When this attribute is set to on, 1 or true, then this table cell is to be merged with the previous vertical table cell when the table is created. [*Example*: Consider the following example:

Attributes	Description
	<a:tc vMerge="1"> … /a:tc> In this example, we see the vMerge attribute set to on which signifies that this cell is to be merged with the previous vertical cell in the table. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableCell">
   <sequence>
      <element name="txBody" type="CT_TextBody" minOccurs="0" maxOccurs="1"/>
      <element name="tcPr" type="CT_TableCellProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rowSpan" type="xsd:int" use="optional" default="1"/>
   <attribute name="gridSpan" type="xsd:int" use="optional" default="1"/>
   <attribute name="hMerge" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="vMerge" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.6.15 tcPr (Table Cell Properties)

This element defines the formatting properties associated with a cell. The formatting options which are available to be adjusted range from the line types used for the borders to the cell fill to the margins associated with the layout of the text in the cell.

[*Example*: Consider the following example of a tcPr within DrawingML:

```
<a:tcPr marL="45720" marR="45720">
  <a:lnL w="38100" cap="flat" cmpd="sng" algn="ctr">
    <a:solidFill>
      <a:schemeClr val="accent2"/>
    </a:solidFill>
    <a:prstDash val="solid"/>
    <a:round/>
    <a:headEnd type="none" w="med" len="med"/>
    <a:tailEnd type="none" w="med" len="med"/>
  </a:lnL>
</a:tcPr>
```

In this example, we have a solid line defined as the left border of the cell along with left and right margin adjustments being made from the default margins. *end example*]

Parent Elements
tc (§5.1.6.14)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
cell3D (Cell 3-D)	§5.1.6.1
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
lnB (Bottom Border Line Properties)	§5.1.6.3
lnBlToTr (Bottom-Left to Top-Right Border Line Properties)	§5.1.6.4
lnL (Left Border Line Properties)	§5.1.6.5
lnR (Right Border Line Properties)	§5.1.6.6
lnT (Top Border Line Properties)	§5.1.6.7
lnTlToBr (Top-Left to Bottom-Right Border Line Properties)	§5.1.6.8
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

Attributes	Description
anchor (Anchor)	Defines the alignment of the text vertically within the cell. [*Example*: Consider the following example: `<a:tcPr marL="45720" anchor="ctr"/>` In this example, the text in the cell will be anchored to the center of the cell vertically. *end example*] The possible values for this attribute are defined by the ST_TextAnchoringType simple type (§5.1.12.60).
anchorCtr (Anchor Center)	When this attribute is on, 1 or `true`, it modifies the anchor attribute. This attribute will center align the text box itself which will allow for text to be left aligned along the center of the cell for example. The possible values for this attribute are defined by the XML Schema boolean datatype.
horzOverflow (Horizontal	Specifies the clipping behavior of the cell. The two options here allow for the text to be clipped and out of view when outside of the bounds of the cell, or for the text to remain

Attributes	Description

Overflow)	visible and overflow outside of the cell.
	
	[*Example*: Consider the following example:
	
	`<a:tcPr horzOverflow="overflow">`
	`…`
	`</a:tcPr>`
	
	In this example, the text in the cell will freely overflow outside of the cell boundaries and will always remain visible. *end example*]
	
	The possible values for this attribute are defined by the ST_TextHorzOverflowType simple type (§5.1.12.69).

marB (Bottom Margin)	Specifies the bottom margin of the cell. The value specified in this attribute is the distance to offset from the bottom of the cell.
	
	[*Example*: Consider the following example:
	
	`<a:tcPr marB="45720" anchor="ctr">`
	`…`
	`</a:tcPr>`
	
	In this example, we have specified a value for the margin on the bottom of the cell. *end example*]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

marL (Left Margin)	This attribute specifies the left margin of the cell. The value specified in this attribute is the distance to offset from the left of the cell in EMU's.
	
	[*Example*: Consider the following example:
	
	`<a:tcPr marL="45720" anchor="ctr">`
	`…`
	`</a:tcPr>`
	
	In this example, we have specified a value for the margin on the left of the cell. *end example*]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

marR (Right Margin)	This attribute specifies the right margin of the cell. The value specified in this attribute is the distance to offset from the right of the cell in EMU's.

Attributes	Description

	[*Example*: Consider the following example:
	
	`<a:tcPr marR="45720" anchor="ctr">`
	`…`
	`</a:tcPr>`
	
	In this example, we have specified a value for the margin on the right of the cell. *end example*]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

marT (Top Margin)	This attribute specifies the top margin of the cell. The value specified in this attribute is the distance to offset from the top of the cell in EMU's.
	
	[*Example*: Consider the following example:
	
	`<a:tcPr marT="45720" anchor="ctr">`
	`…`
	`</a:tcPr>`
	
	In this example, we have specified a value for the margin on the top of the cell. *end example*]
	
	The possible values for this attribute are defined by the ST_Coordinate32 simple type (§5.1.12.17).

vert (Text Direction)	Defines the text direction within the cell.
	
	[*Example*: Consider the following example:
	`<a:tcPr vert="vert270">`
	`…`
	`</a:tcPr>`
	
	In this example, we have rotated the layout of the text 270 degrees so that it starts at the bottom of the cell and goes upward toward the top of the cell. *end example*]
	
	The possible values for this attribute are defined by the ST_TextVerticalType simple type (§5.1.12.83).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableCellProperties">
   <sequence>
      <element name="lnL" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lnR" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lnT" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lnB" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lnTlToBr" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <element name="lnBlToTr" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <element name="cell3D" type="CT_Cell3D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="marL" type="ST_Coordinate32" use="optional" default="91440"/>
   <attribute name="marR" type="ST_Coordinate32" use="optional" default="91440"/>
   <attribute name="marT" type="ST_Coordinate32" use="optional" default="45720"/>
   <attribute name="marB" type="ST_Coordinate32" use="optional" default="45720"/>
   <attribute name="vert" type="ST_TextVerticalType" use="optional" default="horz"/>
   <attribute name="anchor" type="ST_TextAnchoringType" use="optional" default="t"/>
   <attribute name="anchorCtr" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="horzOverflow" type="ST_TextHorzOverflowType" use="optional" default="clip"/>
</complexType>
```

5.1.6.16 tr (Table Row)

This element defines a row in a table. A row as defined in a table is simply a listing of table cells (§5.1.6.14). There will be a table row element defined for every row in the table.

[*Example*: Consider the following example of a tr within DrawingML:

```
<a:tr h="774700">
  <a:tc>
    <a:txBody>
      <a:bodyPr/>
      <a:lstStyle/>
      <a:p>
        <a:endParaRPr lang="en-US" dirty="0"/>
      </a:p>
    </a:txBody>
    <a:tcPr/>
  </a:tc>
…
</a:tr>
```

In this example, we see a table row defined with an example table cell (§5.1.6.14) defined within it. The height of the row has been specified and in real use, there will be a table cell defined in this row for each grid column (§5.1.6.2) defined in the table. *end example*]

Parent Elements

Parent Elements
tbl (§5.1.6.11)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
tc (Table Cell)	§5.1.6.14

Attributes	Description
h (Height)	Defines the height of the row in the table. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TableRow">
   <sequence>
      <element name="tc" type="CT_TableCell" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="h" type="ST_Coordinate" use="required"/>
</complexType>
```

5.1.7 3D

The 3D portion of the DrawingML framework allows for the describing of a 3D scene to be placed within a document. This 3D scene can be described using text and shape objects along with various lighting, material and camera settings.

5.1.7.1 anchor (Anchor Point)

This element specifies a point in 3D space. This point is the point in space that anchors the backdrop plane. Please see the example in the backdrop (§5.1.7.2) definition for an in depth explanation of this element.

Parent Elements
backdrop (§5.1.7.2)

Attributes	Description
x (X-Coordinate in 3D)	X-Coordinate in 3D space. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Coordinate in	Y-Coordinate in 3D space.

Attributes	Description
3D)	The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
z (Z-Coordinate in 3D)	Z-Coordinate in 3D space. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

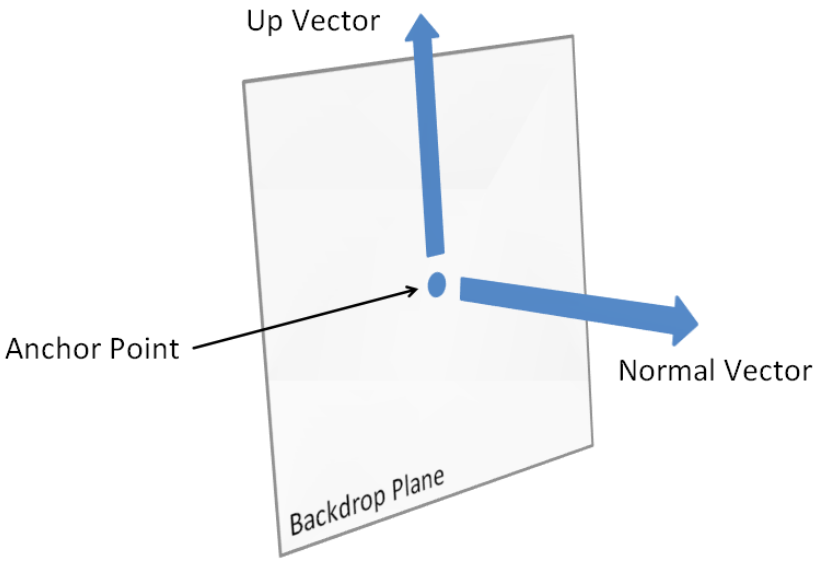
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point3D">
   <attribute name="x" type="ST_Coordinate" use="required"/>
   <attribute name="y" type="ST_Coordinate" use="required"/>
   <attribute name="z" type="ST_Coordinate" use="required"/>
</complexType>
```

5.1.7.2 backdrop (Backdrop Plane)

This element defines a plane in which effects, such as glow and shadow, are applied in relation to the shape they are being applied to. The points and vectors contained within the backdrop define a plane in 3D space.

[*Example*: Consider the following image as an explanation of the backdrop plane definition:



In this image we see a plane being defined by an anchor point, the vector normal to the face of the plane and a vector pointing up in relation to the plane. *end example*]

Parent Elements
scene3d (§5.1.4.1.26); scene3d (§5.9.5.5)

Child Elements	Subclause
anchor (Anchor Point)	§5.1.7.1
extLst (Extension List)	§5.1.2.1.15
norm (Normal)	§5.1.7.10
up (Up Vector)	§5.1.7.13

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Backdrop">
   <sequence>
      <element name="anchor" type="CT_Point3D" minOccurs="1" maxOccurs="1"/>
      <element name="norm" type="CT_Vector3D" minOccurs="1" maxOccurs="1"/>
      <element name="up" type="CT_Vector3D" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.7.3 bevelB (Bottom Bevel)

This element holds the properties associated with defining a bevel on the bottom or back face of a shape.

[*Example*: Consider the following example of an sp3d containing a bottom bevel.

```
<a:sp3d>
  <a:bevelB w="139700" h="127000" prst="coolSlant"/>
</a:sp3d>
```

In this example, we see a bottom bevel being defined with a preset bevel type along with a custom width and height. *end example*]

Parent Elements
sp3d (§5.1.7.12); sp3d (§5.9.5.6)

Attributes	Description
h (Height)	Specifies the height of the bevel, or how far above the shape it is applied. [*Example*: Consider the following example bevel 
Attributes	Description
	In this example, we see the height of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
prst (Preset Bevel)	Specifies the preset bevel type which defines the look of the bevel. The possible values for this attribute are defined by the ST_BevelPresetType simple type (§5.1.12.9).
w (Width)	Specifies the width of the bevel, or how far into the shape it is applied. [*Example*: Consider the following example bevel  Bevel Width In this example, we see the width of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Bevel">
   <attribute name="w" type="ST_PositiveCoordinate" use="optional" default="76200"/>
   <attribute name="h" type="ST_PositiveCoordinate" use="optional" default="76200"/>
   <attribute name="prst" type="ST_BevelPresetType" use="optional" default="circle"/>
</complexType>
```

5.1.7.4 bevelT (Top Bevel)

This element holds the properties associated with defining a bevel on the top or front face of a shape.

[*Example*: Consider the following example of an sp3d containing a top bevel.

```
<a:sp3d>
  <a:bevelT w="139700" h="127000" prst="coolSlant"/>
</a:sp3d>
```

In this example, we see a top bevel being defined with a preset bevel type along with a custom width and height. *end example*]

Parent Elements
sp3d (§5.1.7.12); sp3d (§5.9.5.6)

Attributes	Description
h (Height)	Specifies the height of the bevel, or how far above the shape it is applied. [*Example*: Consider the following example bevel  In this example, we see the height of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
prst (Preset Bevel)	Specifies the preset bevel type which defines the look of the bevel. The possible values for this attribute are defined by the ST_BevelPresetType simple type (§5.1.12.9).
w (Width)	Specifies the width of the bevel, or how far into the shape it is applied. [*Example*: Consider the following example bevel  In this example, we see the width of an example bevel on a shape. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Bevel">
   <attribute name="w" type="ST_PositiveCoordinate" use="optional" default="76200"/>
   <attribute name="h" type="ST_PositiveCoordinate" use="optional" default="76200"/>
   <attribute name="prst" type="ST_BevelPresetType" use="optional" default="circle"/>
</complexType>
```

5.1.7.5 camera (Camera)

This element defines the placement and properties of the camera in the 3D scene. The camera position and properties modify the view of the scene.

[*Example*: Consider the following example of a camera in DrawingML:

```
<a:camera prst="orthographicFront">
  <a:rot lat="19902513" lon="17826689" rev="1362739"/>
</a:camera>
```

In this example, we see a preset camera being defined along with a rotation containing latitude, longitude, and revolution overrides provided that further rotate the camera around the scene. The effect of this camera can be seen on the following shape:

end example]

Parent Elements
scene3d (§5.1.4.1.26); scene3d (§5.9.5.5)

Child Elements	Subclause
rot (Rotation)	§5.1.7.11

Attributes	Description
fov (Field of View)	Provides an override for the default field of view for the camera. Different perspectives can be obtained by modifying this attribute. [*Example*: Consider the following example of a fov in DrawingML:

Attributes	Description
	<a:camera prst="perspectiveContrastingRightFacing" fov="6900000"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> </a:camera> In this example, we see a fov being defined which modifies the default fov for the preset camera. *end example*] The possible values for this attribute are defined by the ST_FOVAngle simple type (§5.1.12.24).
prst (Preset Camera Type)	Defines the preset camera that is being used by the camera element. The preset camera defines a starting point for common preset rotations in space. [*Example*: Consider the following example of a prst in DrawingML: <a:camera prst="perspectiveContrastingRightFacing" fov="6900000"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> </a:camera> In this example, we see a prst being defined as perspectiveContrastingRightFacing. *end example*] The possible values for this attribute are defined by the ST_PresetCameraType simple type (§5.1.12.47).
zoom (Zoom)	Defines the zoom factor of a given camera element. The zoom modifies the scene as a whole and zooms in or out accordingly. [*Example*: Consider the following example of a zoom in DrawingML: <a:camera prst="perspectiveContrastingRightFacing" fov="6900000" zoom="200000"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> /a:camera> In this example, we see a zoom being used which will zoom the scene by 200%. *end example*] The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Camera">
   <sequence>
      <element name="rot" type="CT_SphereCoords" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="prst" type="ST_PresetCameraType" use="required"/>
   <attribute name="fov" type="ST_FOVAngle" use="optional"/>
   <attribute name="zoom" type="ST_PositivePercentage" use="optional" default="100000"/>
</complexType>
```

5.1.7.6 contourClr (Contour Color)

This element defines the color for the contour on a shape. The contour of a shape is a solid filled line which surrounds the outer edges of the shape.

[*Example*: Consider the following example of a contour defined on a shape which includes a contourClr. Lighting characteristics applied to the shape are ignored when it comes to the contour on the shape.

```
<a:sp3d contourW="101600" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:contourClr>
    <a:schemeClr val="bg1"/>
  </a:contourClr>
</a:sp3d>
```

In this example, we see a contour defined on a shape with a top and bottom bevel defined. In the image below, the contour is the white ring around the shape.

end example]

Parent Elements
sp3d (§5.1.7.12); sp3d (§5.9.5.6)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

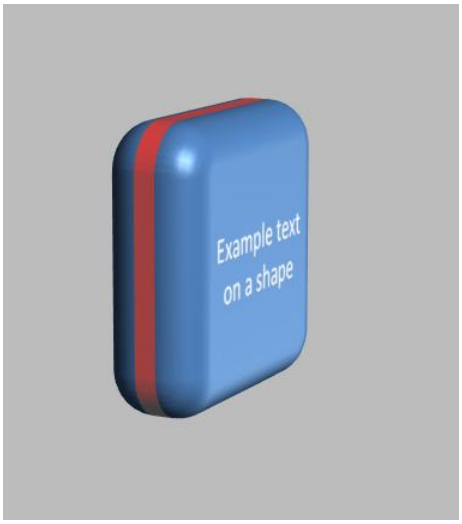
5.1.7.7 extrusionClr (Extrusion Color)

This element defines the color of the extrusion applied to a shape. The extrusion on a shape is an artificial height applied to the geometry.

[*Example*: Consider the following example of an extrusion which takes advantage of the extrusionClr. Lighting characteristics that are applied to the shape are also applied to the extrusion on the shape.

```
<a:sp3d extrusionH="139700" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:extrusionClr>
  <a:srgbClr val="FF0000"/>
  </a:extrusionClr>
</a:sp3d>
```

In this example, we see the extrusion color defined as red which can also be shown applied to the shape in the following image:



end example]

Parent Elements
sp3d (§5.1.7.12); sp3d (§5.9.5.6)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.7.8 flatTx (No text in 3D scene)

Keep text out of 3D scene entirely.

Parent Elements
bodyPr (§5.1.5.1.1); txPr (§5.9.5.12)

Attributes	Description
z (Z Coordinate)	Specifies the Z coordinate to be used in positioning the flat text within the 3D scene. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FlatText">
   <attribute name="z" type="ST_Coordinate" use="optional" default="0"/>
</complexType>
```

5.1.7.9 lightRig (Light Rig)

This element defines the light rig associated with the table. The light rig comes into play when there is a 3D bevel applied to a cell. When 3D is used, the light rig defines the lighting properties associated with the scene.

Parent Elements
cell3D (§5.1.6.1); scene3d (§5.1.4.1.26); scene3d (§5.9.5.5)

Child Elements	Subclause
rot (Rotation)	§5.1.7.11

Attributes	Description
dir (Direction)	Defines the direction from which the light rig is oriented in relation to the scene. [*Example*: Consider the following example of dir being used in a light rig: `<a:lightRig rig="threePt" dir="t"/>` In this example, we define the direction to be `top`. *end example*] The possible values for this attribute are defined by the ST_LightRigDirection simple type (§5.1.12.29).
rig (Rig Preset)	Defines the preset type of light rig which is to be applied to the scene. [*Example*: Consider the following example of rig being used in a light rig: `<a:lightRig rig="threePt" dir="t"/>` In this example, we define the rig to be a `threePt` rig. *end example*] The possible values for this attribute are defined by the ST_LightRigType simple type (§5.1.12.30).

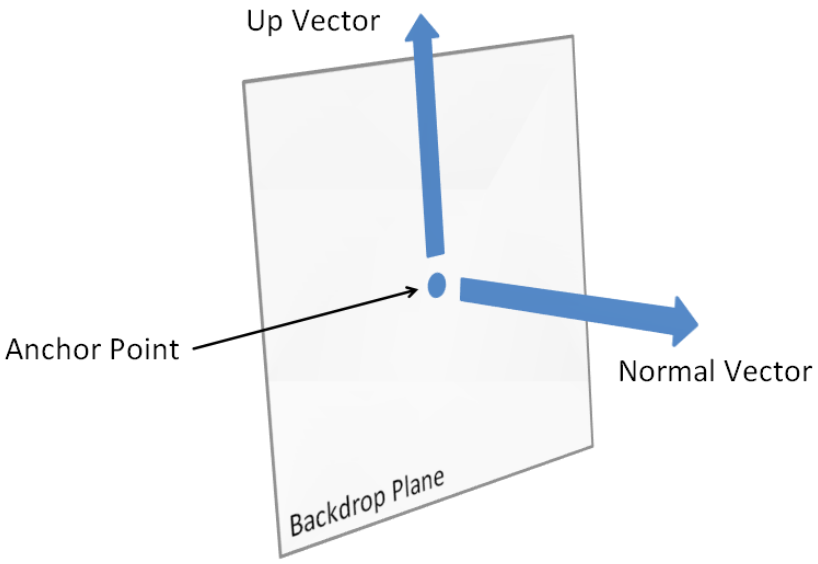
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LightRig">
   <sequence>
      <element name="rot" type="CT_SphereCoords" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rig" type="ST_LightRigType" use="required"/>
   <attribute name="dir" type="ST_LightRigDirection" use="required"/>
</complexType>
```

5.1.7.10 norm (Normal)

This element defines a normal vector. To be more precise, this attribute defines a vector normal to the face of the backdrop plane.

[*Example*: Consider the following image as an example of what a normal vector is in relation to the backdrop plane:



end example]

Parent Elements
backdrop (§5.1.7.2)

Attributes	Description
dx (Distance along X-axis in 3D)	Distance along X-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
dy (Distance along Y-axis in 3D)	Distance along Y-axis in 3D

Attributes	Description
	The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
dz (Distance along Z-axis in 3D)	Distance along Z-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Vector3D">
   <attribute name="dx" type="ST_Coordinate" use="required"/>
   <attribute name="dy" type="ST_Coordinate" use="required"/>
   <attribute name="dz" type="ST_Coordinate" use="required"/>
</complexType>
```

5.1.7.11 rot (Rotation)

This element defines a rotation in 3D space. A rotation in DrawingML is defined through the use of a latitude coordinate, a longitude coordinate, and a revolution about the axis as the latitude and longitude coordinates.

[*Example*: Consider the following example of a rotation defined by the rot elements being used in a lightRig in DrawingML:

```
<a:lightRig rig="twoPt" dir="t">
  <a:rot lat="0" lon="0" rev="6000000"/>
</a:lightRig>
```

In this example, we have only a revolution applied to the light rig rich rotates it around it's center axis. *end example*]

Parent Elements
camera (§5.1.7.5); lightRig (§5.1.7.9)

Attributes	Description
lat (Latitude)	Defines the latitude value of the rotation. [*Example*: Consider the following example of a rot in DrawingML: `<a:rot lat="0" lon="0" rev="6000000"/>` In this example, we set the lat to be equal to `0`. *end example*] The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
lon (Longitude)	Defines the longitude value of the rotation.

Attributes	Description
	[*Example*: Consider the following example of a rot in DrawingML: `<a:rot lat="0" lon="0" rev="6000000"/>` In this example, we set the lon to be equal to `0`. *end example*] The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
rev (Revolution)	This attributes defines the revolution around the central axis in the rotation. [*Example*: Consider the following example of a rot in DrawingML: `<a:rot lat="0" lon="0" rev="6000000"/>` In this example, we set the rev to be equal to `6000000`. *end example*] The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SphereCoords">
   <attribute name="lat" type="ST_PositiveFixedAngle" use="required"/>
   <attribute name="lon" type="ST_PositiveFixedAngle" use="required"/>
   <attribute name="rev" type="ST_PositiveFixedAngle" use="required"/>
</complexType>
```

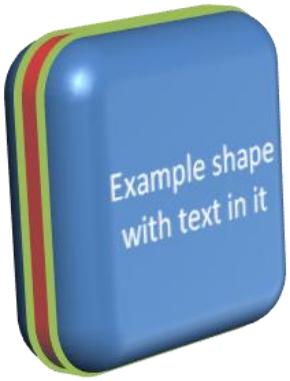
5.1.7.12 sp3d (Apply 3D shape properties)

This element defines the 3D properties associated with a particular shape in DrawingML. The 3D properties which can be applied to a shape are top and bottom bevels, a contour and an extrusion.

[*Example*: Consider the following example of an sp3d in DrawingML:

```
<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:extrusionClr>
    <a:srgbClr val="FF0000"/>
  </a:extrusionClr>
  <a:contourClr>
    <a:schemeClr val="accent3"/>
  </a:contourClr>
</a:sp3d>
```

In this example, we see an sp3d defined which contains information defining both a top and bottom bevel, along with an extrusion and contour on the shape. The following image illustrates a shape with the applied sp3d:



end example]

Parent Elements
bodyPr (§5.1.5.1.1); effectStyle (§5.1.4.1.11); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); txPr (§5.9.5.12)

Child Elements	Subclause
bevelB (Bottom Bevel)	§5.1.7.3
bevelT (Top Bevel)	§5.1.7.4
contourClr (Contour Color)	§5.1.7.6
extLst (Extension List)	§5.1.2.1.15
extrusionClr (Extrusion Color)	§5.1.7.7

Attributes	Description
contourW (Contour Width)	Defines the width of the contour on the shape. [*Example*: Consider the following example of a contourW in use within the sp3d element: `<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"><a:bevelT w="254000" h="254000"/><a:bevelB w="254000" h="254000"/><a:extrusionClr><a:srgbClr val="FF0000"/></a:extrusionClr>`

Attributes	Description
	<a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> >/a:sp3d> In this example, we see a countourW defined as 50800. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
extrusionH (Extrusion Height)	Defines the height of the extrusion applied to the shape. [*Example*: Consider the following example of an extrusionH in use within the sp3d element: <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> < <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </a:sp3d> In this example, we see a extrusionH defined as 165100. *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
prstMaterial (Preset Material Type)	Defines the preset material which is combined with the lighting properties to give the final look and feel of a shape. [*Example*: Consider the following example of a prstMaterial in use within the sp3d element: <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr>

Attributes	Description
	</a:sp3d> In this example, we see a prstMaterial defined as `plastic`. *end example*] The possible values for this attribute are defined by the ST_PresetMaterialType simple type (§5.1.12.50).
z (Shape Depth)	Defines the z coordinate for the 3D shape. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

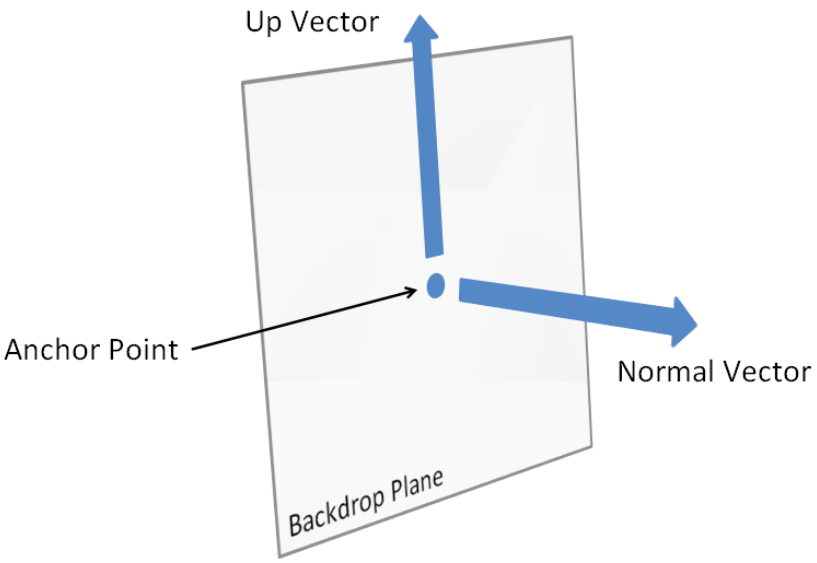
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape3D">
   <sequence>
      <element name="bevelT" type="CT_Bevel" minOccurs="0" maxOccurs="1"/>
      <element name="bevelB" type="CT_Bevel" minOccurs="0" maxOccurs="1"/>
      <element name="extrusionClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="contourClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="z" type="ST_Coordinate" use="optional" default="0"/>
   <attribute name="extrusionH" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="contourW" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="prstMaterial" type="ST_PresetMaterialType" use="optional" default="warmMatte"/>
</complexType>
```

5.1.7.13 up (Up Vector)

This element defines a vector representing up. To be more precise, this attribute defines a vector representing up in relation to the face of the backdrop plane.

[*Example*: Consider the following image as an example of what an up vector is in relation to the backdrop plane:



end example]

Parent Elements
backdrop (§5.1.7.2)

Attributes	Description
dx (Distance along X-axis in 3D)	Distance along X-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
dy (Distance along Y-axis in 3D)	Distance along Y-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
dz (Distance along Z-axis in 3D)	Distance along Z-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Vector3D">
   <attribute name="dx" type="ST_Coordinate" use="required"/>
   <attribute name="dy" type="ST_Coordinate" use="required"/>
   <attribute name="dz" type="ST_Coordinate" use="required"/>
</complexType>
```

5.1.8 Shared Style Sheet

The shared style sheet aspects contained within DrawingML are responsible for containing formatting options and styles which can be used by applications to define a certain look or feel to documents. The shared style sheet can be used by any document type (for example, a presentation) to pull visual information from which formats the document in a certain way, or theme. The shared style sheet contains information that is not document type specific.

5.1.8.1 clrMap (Color Map)

This element specifics the color mapping layer which allows a user to define colors for background and text. This allows for swapping out of light/dark colors for backgrounds and the text on top of the background in order to maintain readability of the text On a deeper level, this specifies exactly which colors the first 12 values refer to in the color scheme.

[*Example*: Consider the following example of a color map in use:

```
<clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
  accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
  accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

In this example, we see that bg1 is mapped to lt1, tx1 is mapped to dk1, and so on. *end example*]

Parent Elements
extraClrScheme (§5.1.8.4)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
accent1 (Accent 1)	Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent2 (Accent 2)	Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent3 (Accent 3)	Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent4 (Accent 4)	Specifies a color defined which is associated as the accent 4 color.

Attributes	Description
	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent5 (Accent 5)	Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent6 (Accent 6)	Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg1 (Background 1)	A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg2 (Background 2)	Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
folHlink (Followed Hyperlink)	Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
hlink (Hyperlink)	Specifies a color defined which is associated as the color for a hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx1 (Text 1)	Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx2 (Text 2)	Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMapping">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bg1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="tx1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="bg2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="tx2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent3" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent4" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent5" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent6" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="hlink" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="folHlink" type="ST_ColorSchemeIndex" use="required"/>
</complexType>
```

5.1.8.2 clrScheme (Color Scheme)

This element defines a set of colors which are referred to as a color scheme. The color scheme is responsible for defining a list of twelve colors. The twelve colors consist of six accent colors, two dark colors, two light colors and a color for each of a hyperlink and followed hyperlink.

[*Example*: Consider the following example of a color scheme defined in DrawingML:

```
<clrScheme name="sample">
  <dk1>
    <sysClr val="windowText"/>
  </dk1>
  <lt1>
    <sysClr val="window"/>
  </lt1>
  <dk2>
    <srgbClr val="04617B"/>
  </dk2>
  <lt2>
    <srgbClr val="DBF5F9"/>
  </lt2>
  <accent1>
    <srgbClr val="0F6FC6"/>
  </accent1>
  <accent2>
    <srgbClr val="009DD9"/>
  </accent2>
```

```
    <accent3>
      <srgbClr val="0BD0D9"/>
    </accent3>
    <accent4>
      <srgbClr val="10CF9B"/>
    </accent4>
    <accent5>
      <srgbClr val="7CCA62"/>
    </accent5>
    <accent6>
      <srgbClr val="A5C249"/>
    </accent6>
    <hlink>
      <srgbClr val="FF9800"/>
    </hlink>
    <folHlink>
      <srgbClr val="F45511"/>
    </folHlink>
  </clrScheme>
```

In this example, are defined the 12 theme colors in the sample color scheme. *end example*]

Parent Elements
extraClrScheme (§5.1.8.4); themeElements (§5.1.8.10); themeOverride (§5.1.8.12)

Child Elements	Subclause
accent1 (Accent 1)	§5.1.4.1.1
accent2 (Accent 2)	§5.1.4.1.2
accent3 (Accent 3)	§5.1.4.1.3
accent4 (Accent 4)	§5.1.4.1.4
accent5 (Accent 5)	§5.1.4.1.5
accent6 (Accent 6)	§5.1.4.1.6
dk1 (Dark 1)	§5.1.4.1.9
dk2 (Dark 2)	§5.1.4.1.10
extLst (Extension List)	§5.1.2.1.15
folHlink (Followed Hyperlink)	§5.1.4.1.15
hlink (Hyperlink)	§5.1.4.1.19
lt1 (Light 1)	§5.1.4.1.22
lt2 (Light 2)	§5.1.4.1.23

Attributes	Description
name (Name)	The common name for this color scheme. This name can show up in the user interface in a list of color schemes. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorScheme">
   <sequence>
      <element name="dk1" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="lt1" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="dk2" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="lt2" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="accent1" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="accent2" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="accent3" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="accent4" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="accent5" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="accent6" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="hlink" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="folHlink" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="xsd:string" use="required"/>
</complexType>
```

5.1.8.3 custClrLst (Custom Color List)

This element allows for a custom color palette to be created and which shows up alongside other color schemes. This can be very useful, for example, when someone would like to maintain a corporate color palette.

Parent Elements
theme (§5.1.8.9)

Child Elements	Subclause
custClr (Custom color)	§5.1.4.1.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomColorList">
   <sequence>
      <element name="custClr" type="CT_CustomColor" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.8.4 extraClrScheme (Extra Color Scheme)

This element defines an auxiliary color scheme, which includes both a color scheme and color mapping. This is mainly used for backward compatibility concerns and roundtrips information required by earlier versions.

[*Example*: Consider the following example of an extra color scheme in use in DrawingML:

```
<extraClrScheme>
  <clrScheme name="extraColorSchemeSample">
    <dk1>
      <sysClr val="windowText"/>
    </dk1>
    <lt1>
      <sysClr val="window"/>
    </lt1>
    <dk2>
      <srgbClr val="04617B"/>
    </dk2>
    <lt2>
      <srgbClr val="DBF5F9"/>
    </lt2>
    <accent1>
      <srgbClr val="0F6FC6"/>
    </accent1>
    <accent2>
      <srgbClr val="009DD9"/>
    </accent2>
    <accent3>
      <srgbClr val="0BD0D9"/>
    </accent3>
    <accent4>
      <srgbClr val="10CF9B"/>
    </accent4>
    <accent5>
      <srgbClr val="7CCA62"/>
    </accent5>
    <accent6>
      <srgbClr val="A5C249"/>
    </accent6>
    <hlink>
      <srgbClr val="FF9800"/>
    </hlink>
    <folHlink>
      <srgbClr val="F45511"/>
    </folHlink>
```

```
    </clrScheme>
    <clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
    accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
    accent6="accent6" hlink="hlink" folHlink="folHlink"/>
  </extraClrScheme>
```

In this example, the extra color scheme contains a color scheme and a color map for that color scheme. *end example*]

Parent Elements
extraClrSchemeLst (§5.1.8.5)

Child Elements	Subclause
clrMap (Color Map)	§5.1.8.1
clrScheme (Color Scheme)	§5.1.8.2

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorSchemeAndMapping">
   <sequence>
      <element name="clrScheme" type="CT_ColorScheme" minOccurs="1" maxOccurs="1"/>
      <element name="clrMap" type="CT_ColorMapping" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.8.5 extraClrSchemeLst (Extra Color Scheme List)

This element is a container for the list of extra color schemes present in a document.

Parent Elements
theme (§5.1.8.9)

Child Elements	Subclause
extraClrScheme (Extra Color Scheme)	§5.1.8.4

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorSchemeList">
   <sequence>
      <element name="extraClrScheme" type="CT_ColorSchemeAndMapping" minOccurs="0"
        maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.8.6 masterClrMapping (Master Color Mapping)

This element is a part of a choice for which color mapping is used within the document. There is also defined an overrideClrMapping (§1.1.8) element which, when specified, the override is used rather than the color mapping defined in the master. If this element is specified, then we specifically use the color mapping defined in the master.

Parent Elements
clrMapOvr (§4.4.1.7)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmptyElement"/>
```

5.1.8.7 objectDefaults (Object Defaults)

This element allows for the definition of default shape, line, and textbox formatting properties. An application can use this information to format a shape (or text) initially on insertion into a document.

Parent Elements
theme (§5.1.8.9)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
lnDef (Line Default)	§5.1.4.1.20
spDef (Shape Default)	§5.1.4.1.27
txDef (Text Default)	§5.1.4.1.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ObjectStyleDefaults">
   <sequence>
      <element name="spDef" type="CT_DefaultShapeDefinition" minOccurs="0" maxOccurs="1"/>
      <element name="lnDef" type="CT_DefaultShapeDefinition" minOccurs="0" maxOccurs="1"/>
      <element name="txDef" type="CT_DefaultShapeDefinition" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.8.8 overrideClrMapping (Override Color Mapping)

This element provides an override for the color mapping in a document. When defined, this color mapping is used in place of the already defined color mapping, or master color mapping. This color mapping is defined in the same manner as the other mappings within this document.

[*Example*: Consider the following example of an override color mapping in DrawingML:

```
<overrideClrMapping bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
  accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
  accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

end example]

Parent Elements
clrMapOvr (§4.4.1.7)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
accent1 (Accent 1)	Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent2 (Accent 2)	Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent3 (Accent 3)	Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent4 (Accent 4)	Specifies a color defined which is associated as the accent 4 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent5 (Accent 5)	Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent6 (Accent 6)	Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg1 (Background 1)	A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

Attributes	Description
bg2 (Background 2)	Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
folHlink (Followed Hyperlink)	Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
hlink (Hyperlink)	Specifies a color defined which is associated as the color for a hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx1 (Text 1)	Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx2 (Text 2)	Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

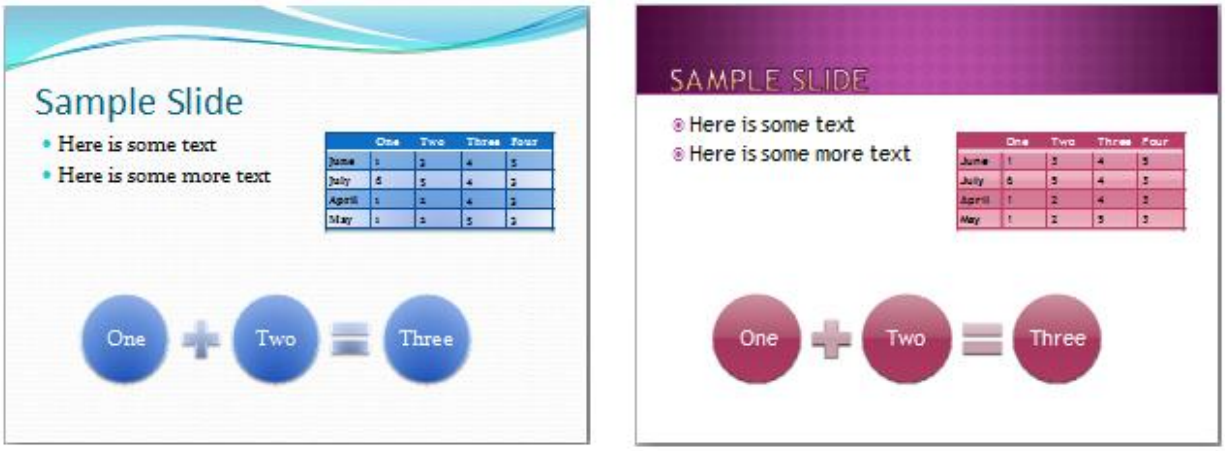
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMapping">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bg1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="tx1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="bg2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="tx2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent3" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent4" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent5" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent6" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="hlink" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="folHlink" type="ST_ColorSchemeIndex" use="required"/>
</complexType>
```

5.1.8.9 theme (Theme)

This element defines the root level complex type associated with a shared style sheet (or theme). This element holds all the different formatting options available to a document through a theme and defines the overall look and feel of the document when themed objects are used within the document.

[*Example*: Consider the following image as an example of different themes in use applied to a presentation:



In this example, we see how a theme can affect font, colors, backgrounds, fills, and effects for different objects in a presentation. *end example*]

Parent Elements
Root element of DrawingML Theme part

Child Elements	Subclause
custClrLst (Custom Color List)	§5.1.8.3
extLst (Extension List)	§5.1.2.1.15
extraClrSchemeLst (Extra Color Scheme List)	§5.1.8.5
objectDefaults (Object Defaults)	§5.1.8.7
themeElements (Theme Elements)	§5.1.8.10

Attributes	Description
name (Name)	Specifies the name given to the theme. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OfficeStyleSheet">
   <sequence>
      <element name="themeElements" type="CT_BaseStyles" minOccurs="1" maxOccurs="1"/>
      <element name="objectDefaults" type="CT_ObjectStyleDefaults" minOccurs="0" maxOccurs="1"/>
      <element name="extraClrSchemeLst" type="CT_ColorSchemeList" minOccurs="0" maxOccurs="1"/>
      <element name="custClrLst" type="CT_CustomColorList" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="name" type="xsd:string" use="optional" default=""/>
</complexType>
```

5.1.8.10 themeElements (Theme Elements)

This element defines the theme formatting options for the theme and is the workhorse of the theme. This is where the bulk of the shared theme information is contained and used by a document. This element contains the color scheme, font scheme, and format scheme elements which define the different formatting aspects of what a theme defines.

[*Example*: Consider the following example of a theme elements defined in DrawingML:

```
<themeElements>
  <clrScheme name="sample">
…
  </clrScheme>
  <fontScheme name="sample">
…
  </fontScheme>
  <fmtScheme name="sample">
    <fillStyleLst>
…
    </fillStyleLst>
    <lnStyleLst>
…
    </lnStyleLst>
    <effectStyleLst>
…
    </effectStyleLst>
    <bgFillStyleLst>
…
    </bgFillStyleLst>
  </fmtScheme>
</themeElements>
```

In this example, we see the basic structure of how a theme elements is defined and have left out the true guts of each individual piece to save room. Each part (color scheme, font scheme, format scheme) is defined elsewhere within DrawingML. *end example*]

Parent Elements
theme (§5.1.8.9)

Child Elements	Subclause
clrScheme (Color Scheme)	§5.1.8.2
extLst (Extension List)	§5.1.2.1.15
fmtScheme (Format Scheme)	§5.1.4.1.14

Child Elements	Subclause
fontScheme (Font Scheme)	§5.1.4.1.18

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BaseStyles">
   <sequence>
      <element name="clrScheme" type="CT_ColorScheme" minOccurs="1" maxOccurs="1"/>
      <element name="fontScheme" type="CT_FontScheme" minOccurs="1" maxOccurs="1"/>
      <element name="fmtScheme" type="CT_StyleMatrix" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.8.11 themeManager (Theme Manager)

The starting part for a theme file.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EmptyElement"/>
```

5.1.8.12 themeOverride (Theme Override)

This element allows for an override which changes just the colors, fonts, or effects of a single object, like a table for example. Currently it is used only to control overrides on the non-top-level masters within a presentation.

Parent Elements
Root element of DrawingML Theme Override part

Child Elements	Subclause
clrScheme (Color Scheme)	§5.1.8.2
fmtScheme (Format Scheme)	§5.1.4.1.14
fontScheme (Font Scheme)	§5.1.4.1.18

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BaseStylesOverride">
   <sequence>
      <element name="clrScheme" type="CT_ColorScheme" minOccurs="0" maxOccurs="1"/>
      <element name="fontScheme" type="CT_FontScheme" minOccurs="0" maxOccurs="1"/>
      <element name="fmtScheme" type="CT_StyleMatrix" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.9 Coordinate Systems and Transformations

The following elements are used to reflect dimensions, scaling, location, rotation, and flip information on groups and individual shapes respectively.

5.1.9.1 chExt (Child Extents)

This element specifies the size dimensions of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

Parent Elements
xfrm (§5.1.9.5)

Attributes	Description
cx (Extent Length)	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of `1828800` EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
cy (Extent Width)	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of `200000` EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveSize2D">
   <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
   <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

5.1.9.2 chOff (Child Offset)

This element specifies the location of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

Parent Elements

Parent Elements
xfrm (§5.1.9.5)

Attributes	Description
x (X-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
   <attribute name="x" type="ST_Coordinate" use="required"/>
   <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

5.1.9.3 ext (Extents)

This element specifies the size of the bounding box enclosing the referenced object.

Parent Elements
xfrm (§4.4.1.49); xfrm (§5.1.9.6); xfrm (§5.6.2.35); xfrm (§5.8.2.28); xfrm (§5.1.9.5)

Attributes	Description
cx (Extent Length)	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size

Attributes	Description
	of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
cy (Extent Width)	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveSize2D">
   <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
   <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

5.1.9.4 off (Offset)

This element specifies the location of the bounding box of an object. Effects on an object are not included in this bounding box.

Parent Elements
xfrm (§4.4.1.49); xfrm (§5.1.9.6); xfrm (§5.6.2.35); xfrm (§5.8.2.28); xfrm (§5.1.9.5)

Attributes	Description
x (X-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object:

Attributes	Description
	<wp:… x="0" y="100" /> The x attribute defines an x-coordinate of 0. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate)	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: <wp:… x="0" y="100" /> The y attribute defines a y-coordinate of 100. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
   <attribute name="x" type="ST_Coordinate" use="required"/>
   <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

5.1.9.5 xfrm (2D Transform for Grouped Objects)

This element is nearly identical to the representation of 2-D transforms for ordinary shapes (§5.1.9.6). The only addition is a member to represent the Child offset and the Child extents.

Parent Elements
grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17)

Child Elements	Subclause
chExt (Child Extents)	§5.1.9.1
chOff (Child Offset)	§5.1.9.2
ext (Extents)	§5.1.9.3
off (Offset)	§5.1.9.4

Attributes	Description

Attributes	Description
flipH (Horizontal Flip)	Horizontal flip. When true, this attribute defines that the group will be flipped horizontally about the center of its bounding box. [*Example* -- The following illustrates the effect of a horizontal flip.  end example] The possible values for this attribute are defined by the XML Schema boolean datatype.
flipV (Vertical Flip)	Vertical flip. When true, this attribute defines that the group will be flipped vertically about the center of its bounding box. [*Example* -- The following illustrates the effect of a vertical flip.  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
rot (Rotation)	Rotation. Specifies the clockwise rotation of a group in 1/64000 of a degree. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupTransform2D">
   <sequence>
      <element name="off" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
      <element name="ext" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
      <element name="chOff" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
      <element name="chExt" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rot" type="ST_Angle" use="optional" default="0"/>
   <attribute name="flipH" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="flipV" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.9.6 xfrm (2D Transform for Individual Objects)

This element represents 2-D transforms for ordinary shapes.

Parent Elements
graphicFrame (§5.1.2.1.18); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); txSp (§5.1.2.1.41)

Child Elements	Subclause
ext (Extents)	§5.1.9.3
off (Offset)	§5.1.9.4

Attributes	Description
flipH (Horizontal Flip)	Specifies a horizontal flip. When true, this attribute defines that the shape will be flipped horizontally about the center of its bounding box. [*Example*: The following illustrates the effect of a horizontal flip.  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
flipV (Vertical Flip)	Specifies a vertical flip. When true, this attribute defines that the group will be flipped vertically about the center of its bounding box. [*Example*: The following illustrates the effect of a vertical flip.  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
rot (Rotation)	Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Transform2D">
   <sequence>
      <element name="off" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
      <element name="ext" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rot" type="ST_Angle" use="optional" default="0"/>
   <attribute name="flipH" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="flipV" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.1.10 Shape Fills, Effects, and Line Properties

This portion of the DrawingML framework describes effects defining the visual appearance of shapes and lines. Shapes may be filled in a variety of ways, with images, solid colors, gradients, or pattern fills. In addition, several visual effects may alter the appearance of a shape, and multiple effects may be combined together. Lines also may have special properties defining how they are rendered, included a dashed appearance or decorations at the line ends. This section documents the elements that define these properties and effects for shapes and lines.

5.1.10.1 alphaBiLevel (Alpha Bi-Level Effect)

This element represents an Alpha Bi-Level Effect.

Alpha (Opacity) values less than the threshold are changed to 0 (fully transparent) and alpha values greater than or equal to the threshold are changed to 100% (fully opaque).

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
thresh (Threshold)	Specifies the threshold value for the alpha bi-level effect. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaBiLevelEffect">
   <attribute name="thresh" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

5.1.10.2 alphaCeiling (Alpha Ceiling Effect)

This element represents an alpha ceiling effect.

Alpha (opacity) values greater than zero are changed to 100%. In other words, anything partially opaque becomes fully opaque.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaCeilingEffect"/>
```

5.1.10.3 alphaFloor (Alpha Floor Effect)

This element represents an alpha floor effect.

Alpha (opacity) values less than 100% are changed to zero. In other words, anything partially transparent becomes fully transparent.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaFloorEffect"/>
```

5.1.10.4 alphaInv (Alpha Inverse Effect)

This element represents an alpha inverse effect.

Alpha (opacity) values are inverted by subtracting from 100%.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaInverseEffect">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.10.5 alphaMod (Alpha Modulate Effect)

This element represents an alpha modulate effect.

Effect alpha (opacity) values are multiplied by a fixed percentage. The effect container specifies an effect containing alpha values to modulate.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
cont (Effect Container)	§5.1.10.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaModulateEffect">
   <sequence>
      <element name="cont" type="CT_EffectContainer" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.10.6 alphaModFix (Alpha Modulate Fixed Effect)

This element represents an alpha modulate fixed effect.

Effect alpha (opacity) values are multiplied by a fixed percentage.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
amt (Amount)	Specifies the percentage amount to scale the alpha. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaModulateFixedEffect">
   <attribute name="amt" type="ST_PositivePercentage" use="optional" default="100000"/>
</complexType>
```

5.1.10.7 alphaOutset (Alpha Inset/Outset Effect)

This element specifies an alpha outset/inset effect.

This is equivalent to an alpha ceiling, followed by alpha blur, followed by either an alpha ceiling (positive radius) or alpha floor (negative radius).

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
rad (Radius)	Specifies the radius of outset/inset. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaOutsetEffect">
   <attribute name="rad" type="ST_Coordinate" use="optional" default="0"/>
</complexType>
```

5.1.10.8 alphaRepl (Alpha Replace Effect)

This element specifies an alpha replace effect.

Effect alpha (opacity) values are replaced by a fixed alpha.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
a (Alpha)	Specifies the new opacity value. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AlphaReplaceEffect">
   <attribute name="a" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

5.1.10.9 bevel (Line Join Bevel)

This element specifies a Bevel Line Join.

A bevel joint specifies that an angle joint is used to connect lines.

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineJoinBevel"/>
```

5.1.10.10 bgClr (Background color)

This element specifies the background color of a Pattern fill.

Parent Elements
pattFill (§5.1.10.47)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.10.11 biLevel (Bi-Level (Black/White) Effect)

This element specifies a bi-level (black/white) effect. Input colors whose luminance is less than the specified threshold value are changed to black. Input colors whose luminance are greater than or equal the specified value are set to white. The alpha effect values are unaffected by this effect.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
thresh (Threshold)	Specifies the luminance threshold for the Bi-Level effect. Values greater than or equal to the threshold are set to white. Values lesser than the threshold are set to black. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BiLevelEffect">
   <attribute name="thresh" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

5.1.10.12 blend (Blend Effect)

This element specifies a blend of several effects. The container specifies the raw effects to blend while the blend mode specifies how the effects are to be blended.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
cont (Effect Container)	§5.1.10.20

Attributes	Description
blend (Blend Mode)	Specifies how to blend the two effects. The possible values for this attribute are defined by the ST_BlendMode simple type (§5.1.12.11).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlendEffect">
   <sequence>
      <element name="cont" type="CT_EffectContainer" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="blend" type="ST_BlendMode" use="required"/>
</complexType>
```

5.1.10.13 blip (Blip)

This element specifies the existence of an image (binary large image or picture) and contains a reference to the image data.

Parent Elements
blipFill (§5.8.2.2); blipFill (§5.1.10.14); blipFill (§5.6.2.2); blipFill (§5.2.2.1); blipFill (§4.4.1.4); buBlip

Parent Elements
(§5.1.5.4.2)

Child Elements	Subclause
alphaBiLevel (Alpha Bi-Level Effect)	§5.1.10.1
alphaCeiling (Alpha Ceiling Effect)	§5.1.10.2
alphaFloor (Alpha Floor Effect)	§5.1.10.3
alphaInv (Alpha Inverse Effect)	§5.1.10.4
alphaMod (Alpha Modulate Effect)	§5.1.10.5
alphaModFix (Alpha Modulate Fixed Effect)	§5.1.10.6
alphaRepl (Alpha Replace Effect)	§5.1.10.8
biLevel (Bi-Level (Black/White) Effect)	§5.1.10.11
blur (Blur Effect)	§5.1.10.15
clrChange (Color Change Effect)	§5.1.10.16
clrRepl (Solid Color Replacement)	§5.1.10.18
duotone (Duotone Effect)	§5.1.10.23
extLst (Extension List)	§5.1.2.1.15
fillOverlay (Fill Overlay Effect)	§5.1.10.29
grayscl (Gray Scale Effect)	§5.1.10.34
hsl (Hue Saturation Luminance Effect)	§5.1.10.39
lum (Luminance Effect)	§5.1.10.42
tint (Tint Effect)	§5.1.10.60

Attributes	Description
cstate (Compression State)	Specifies the compression state with which the picture is stored. This allows the application to specify the amount of compression that has been applied to a picture. The possible values for this attribute are defined by the ST_BlipCompression simple type (§5.1.12.12).
embed (Embedded Picture Reference) Namespace: .../officeDocument/2006/relationships	Specifies the identification information for an embedded picture. This attribute is used to specify an image that resides locally within the file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).
link (Linked Picture	Specifies the identification information for a linked picture. This attribute is used to

Attributes	Description
Reference) Namespace: .../officeDocument/2006/relationships	specify an image that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Blip">
   <sequence>
      <choice minOccurs="0" maxOccurs="unbounded">
         <element name="alphaBiLevel" type="CT_AlphaBiLevelEffect" minOccurs="1" maxOccurs="1"/>
         <element name="alphaCeiling" type="CT_AlphaCeilingEffect" minOccurs="1" maxOccurs="1"/>
         <element name="alphaFloor" type="CT_AlphaFloorEffect" minOccurs="1" maxOccurs="1"/>
         <element name="alphaInv" type="CT_AlphaInverseEffect" minOccurs="1" maxOccurs="1"/>
         <element name="alphaMod" type="CT_AlphaModulateEffect" minOccurs="1" maxOccurs="1"/>
         <element name="alphaModFix" type="CT_AlphaModulateFixedEffect" minOccurs="1"
           maxOccurs="1"/>
         <element name="alphaRepl" type="CT_AlphaReplaceEffect" minOccurs="1" maxOccurs="1"/>
         <element name="biLevel" type="CT_BiLevelEffect" minOccurs="1" maxOccurs="1"/>
         <element name="blur" type="CT_BlurEffect" minOccurs="1" maxOccurs="1"/>
         <element name="clrChange" type="CT_ColorChangeEffect" minOccurs="1" maxOccurs="1"/>
         <element name="clrRepl" type="CT_ColorReplaceEffect" minOccurs="1" maxOccurs="1"/>
         <element name="duotone" type="CT_DuotoneEffect" minOccurs="1" maxOccurs="1"/>
         <element name="fillOverlay" type="CT_FillOverlayEffect" minOccurs="1" maxOccurs="1"/>
         <element name="grayscl" type="CT_GrayscaleEffect" minOccurs="1" maxOccurs="1"/>
         <element name="hsl" type="CT_HSLEffect" minOccurs="1" maxOccurs="1"/>
         <element name="lum" type="CT_LuminanceEffect" minOccurs="1" maxOccurs="1"/>
         <element name="tint" type="CT_TintEffect" minOccurs="1" maxOccurs="1"/>
      </choice>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attributeGroup ref="AG_Blob"/>
   <attribute name="cstate" type="ST_BlipCompression" use="optional" default="none"/>
</complexType>
```

5.1.10.14 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example*: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<p:pic>
  …
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  …
</p:pic>
```

The above picture object is shown as an example of this fill type. *end example*]

[*Example*: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<p:pic>
  …
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  <p:spPr>
    <a:gradFill>
      <a:gsLst>
        <a:gs pos="0">
          <a:schemeClr val="tx2">
            <a:shade val="50000"/>
          </a:schemeClr>
        </a:gs>
```

```
        <a:gs pos="39999">
          <a:schemeClr val="tx2">
            <a:tint val="20000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="70000">
          <a:srgbClr val="C4D6EB"/>
        </a:gs>
        <a:gs pos="100000">
          <a:schemeClr val="bg1"/>
        </a:gs>
      </a:gsLst>
    </a:gradFill>
  </p:spPr>
  …
</p:pic>
```

The above picture object is shown as an example of this double fill type. *end example*]

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); pic (§5.1.2.1.30); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12)

Child Elements	Subclause
blip (Blip)	§5.1.10.13
srcRect (Source Rectangle)	§5.1.10.55
stretch (Stretch)	§5.1.10.56

Child Elements	Subclause
tile (Tile)	§5.1.10.58

Attributes	Description
dpi (DPI Setting)	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [*Note*: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. *end note*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape)	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlipFillProperties">
   <sequence>
      <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
      <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
   <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.10.15 blur (Blur Effect)

This element specifies a blur effect that is applied to the entire shape, including its fill. All color channels, including alpha, are affected.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Attributes	Description
grow (Grow Bounds)	Specifies whether the bounds of the object should be grown as a result of the blurring. True indicates the bounds are grown while false indicates that they are not. [*Example*:

Attributes	Description
	With grow set to false, the blur effect does not extend beyond the original bounds of the object:  With grow set to true, the blur effect may extend beyond the original bounds of the object:  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
rad (Radius)	Specifies the radius of blur. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlurEffect">
   <attribute name="rad" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="grow" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.1.10.16 clrChange (Color Change Effect)

This element specifies a Color Change Effect. Instances of clrFrom are replaced with instances of clrTo.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
clrFrom (Change Color From)	§5.1.10.17

Child Elements	Subclause
clrTo (Change Color To)	§5.1.10.19

Attributes	Description
useA (Consider Alpha Values)	Specifies whether alpha values are considered for the effect. Effect alpha values are considered if useA is true, else they are ignored. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorChangeEffect">
   <sequence>
      <element name="clrFrom" type="CT_Color" minOccurs="1" maxOccurs="1"/>
      <element name="clrTo" type="CT_Color" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="useA" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.1.10.17 clrFrom (Change Color From)

This element specifies a color getting removed in a color change effect. It is the "from" or source input color.

Parent Elements
clrChange (§5.1.10.16)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.10.18 clrRepl (Solid Color Replacement)

This element specifies a solid color replacement value. All effect colors are changed to a fixed color. Alpha values are unaffected.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorReplaceEffect">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.10.19 clrTo (Change Color To)

This element specifies the color which replaces the clrFrom in a clrChange effect. This is the "target" or "to" color in the color change effect.

Parent Elements
clrChange (§5.1.10.16)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.10.20 cont (Effect Container)

This element specifies an Effect Container. It is a list of effects.

Parent Elements
alphaMod (§5.1.10.5); blend (§5.1.10.12); cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
alphaBiLevel (Alpha Bi-Level Effect)	§5.1.10.1
alphaCeiling (Alpha Ceiling Effect)	§5.1.10.2
alphaFloor (Alpha Floor Effect)	§5.1.10.3
alphaInv (Alpha Inverse Effect)	§5.1.10.4
alphaMod (Alpha Modulate Effect)	§5.1.10.5
alphaModFix (Alpha Modulate Fixed Effect)	§5.1.10.6
alphaOutset (Alpha Inset/Outset Effect)	§5.1.10.7
alphaRepl (Alpha Replace Effect)	§5.1.10.8
biLevel (Bi-Level (Black/White) Effect)	§5.1.10.11
blend (Blend Effect)	§5.1.10.12
blur (Blur Effect)	§5.1.10.15
clrChange (Color Change Effect)	§5.1.10.16
clrRepl (Solid Color Replacement)	§5.1.10.18
cont (Effect Container)	§5.1.10.20
duotone (Duotone Effect)	§5.1.10.23
effect (Effect)	§5.1.10.24
fill (Fill)	§5.1.10.28
fillOverlay (Fill Overlay Effect)	§5.1.10.29
glow (Glow Effect)	§5.1.10.32
grayscl (Gray Scale Effect)	§5.1.10.34
hsl (Hue Saturation Luminance Effect)	§5.1.10.39
innerShdw (Inner Shadow Effect)	§5.1.10.40
lum (Luminance Effect)	§5.1.10.42

Child Elements	Subclause
outerShdw (Outer Shadow Effect)	§5.1.10.45
prstShdw (Preset Shadow)	§5.1.10.49
reflection (Reflection Effect)	§5.1.10.50
relOff (Relative Offset Effect)	§5.1.10.51
softEdge (Soft Edge Effect)	§5.1.10.53
tint (Tint Effect)	§5.1.10.60
xfrm (Transform Effect)	§5.1.10.61

Attributes	Description
name (Name)	Specifies an optional name for this list of effects, so that it can be referred to later. Must be unique across all effect trees and effect containers. The possible values for this attribute are defined by the XML Schema token datatype.
type (Effect Container Type)	Specifies the type of container, either sibling or tree. The possible values for this attribute are defined by the ST_EffectContainerType simple type (§5.1.12.20).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EffectContainer">
   <group ref="EG_Effect" minOccurs="0" maxOccurs="unbounded"/>
   <attribute name="type" type="ST_EffectContainerType" use="optional" default="sib"/>
   <attribute name="name" type="xsd:token" use="optional"/>
</complexType>
```

5.1.10.21 custDash (Custom Dash)

This element specifies a custom dashing scheme. It is a list of dash stop elements which represent building block atoms upon which the custom dashing scheme is built.

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

Child Elements	Subclause
ds (Dash Stop)	§5.1.10.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DashStopList">
   <sequence>
      <element name="ds" type="CT_DashStop" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.10.22 ds (Dash Stop)

This element specifies a dash stop primitive. Dashing schemes are built by specifying an ordered list of dash stop primitive. A dash stop primitive consists of a dash and a space.

Parent Elements
custDash (§5.1.10.21)

Attributes	Description
d (Dash Length)	Specifies the length of the dash relative to the line width. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).
sp (Space Length)	Specifies the length of the space relative to the line width. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DashStop">
   <attribute name="d" type="ST_PositivePercentage" use="required"/>
   <attribute name="sp" type="ST_PositivePercentage" use="required"/>
</complexType>
```

5.1.10.23 duotone (Duotone Effect)

This element specifies a duotone effect.

For each pixel, combines clr1 and clr2 through a linear interpolation to determine the new color for that pixel.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22

Child Elements	Subclause
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DuotoneEffect">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="2" maxOccurs="2"/>
   </sequence>
</complexType>
```

5.1.10.24 effect (Effect)

This element specifies a reference to an existing effect container.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
ref (Reference)	Specifies the reference. Its value may be the name of an effect container, or one of four special references: fill - refers to the fill effect line - refers to the line effect fillLine - refers to the combined fill and line effects children - refers to the combined effects from logical child shapes or text The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EffectReference">
   <attribute name="ref" type="xsd:token"/>
</complexType>
```

5.1.10.25 effectDag (Effect Container)

This element specifies a list of effects. Effects are applied in the order specified by the container type (sibling or tree).

[*Note:* An effectDag element may contain multiple effect containers as child elements. Effect containers with different types may be combined in an effectDag to define a directed acyclic graph (DAG) that specifies the order in which all effects are applied. *end note*]

softEdge (Soft Edge Effect)	§5.1.10.53

Child Elements	Subclause
tint (Tint Effect)	§5.1.10.60
xfrm (Transform Effect)	§5.1.10.61

Attributes	Description
name (Name)	Specifies an optional name for this list of effects, so that it can be referred to later. Must be unique across all effect trees and effect containers. The possible values for this attribute are defined by the XML Schema token datatype.
type (Effect Container Type)	Specifies the type of container, either sibling or tree. The possible values for this attribute are defined by the ST_EffectContainerType simple type (§5.1.12.20).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EffectContainer">
   <group ref="EG_Effect" minOccurs="0" maxOccurs="unbounded"/>
   <attribute name="type" type="ST_EffectContainerType" use="optional" default="sib"/>
   <attribute name="name" type="xsd:token" use="optional"/>
</complexType>
```

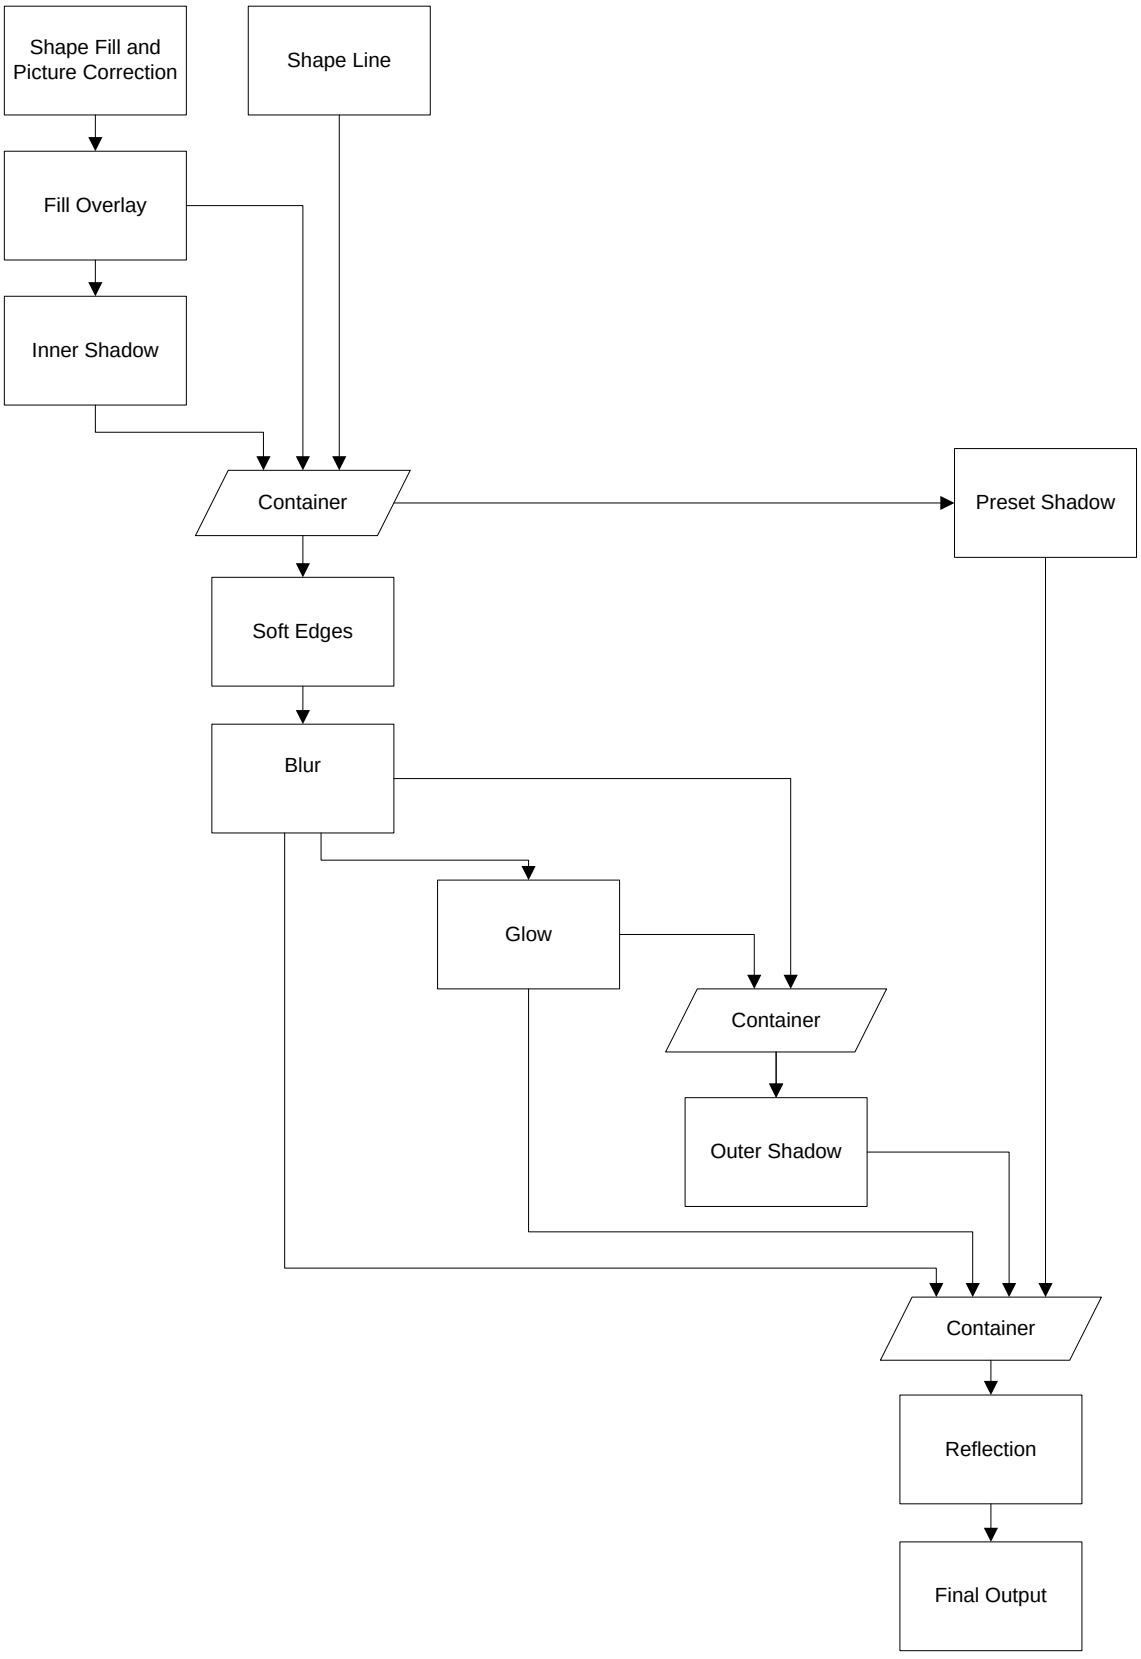
5.1.10.26 effectLst (Effect Container)

This element specifies a list of effects. Effects in an effectLst are applied in the default order by the rendering engine. The following diagrams illustrate the order in which effects are to be applied, both for shapes and for group shapes.

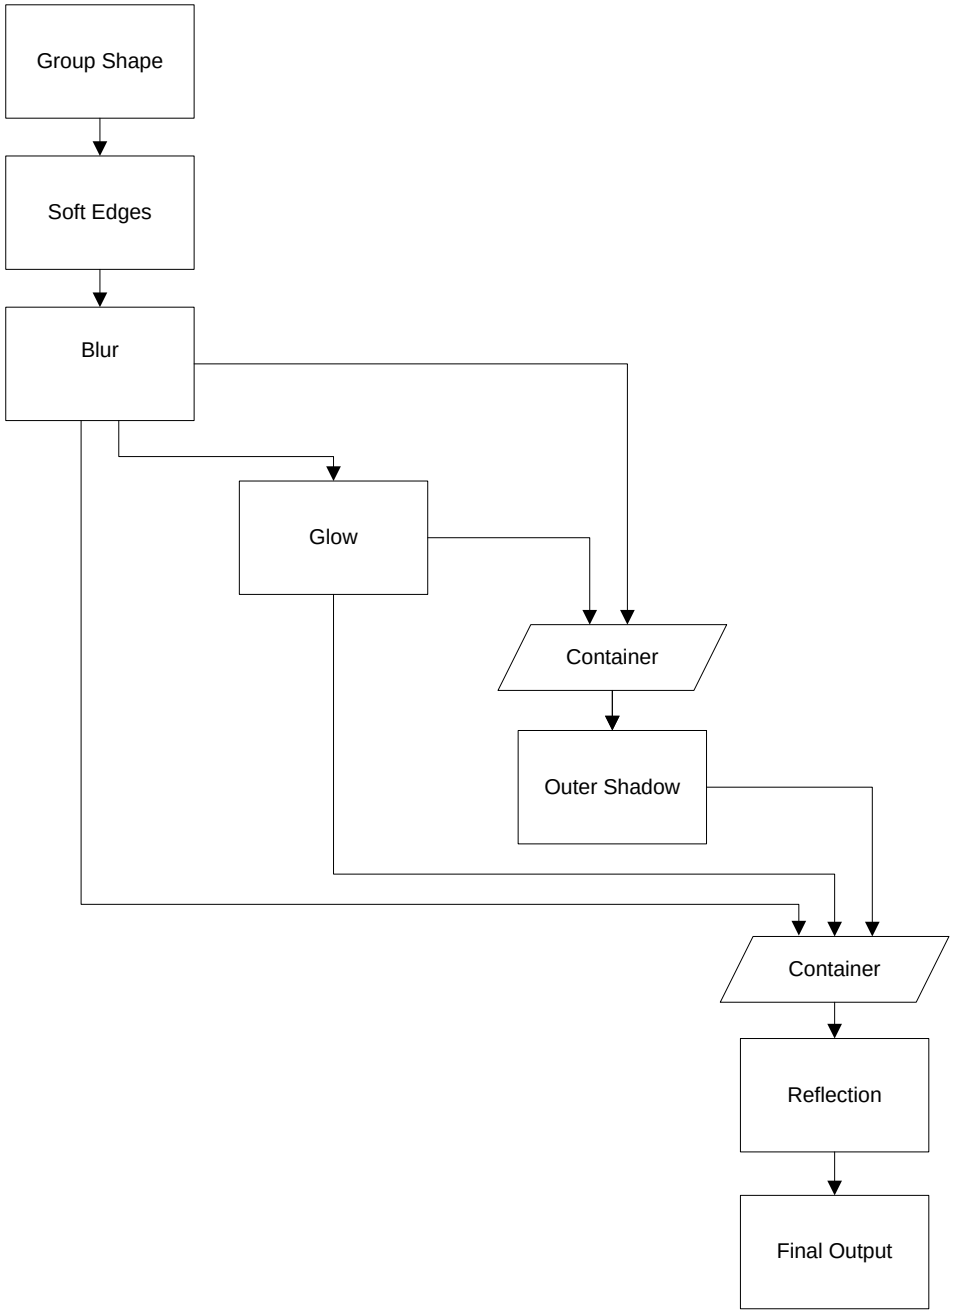
[*Note:* The output of many effects does not include the input shape. For effects that should be applied to the result of previous effects as well as the original shape, a container is used to group the inputs together. *end note*]

[*Example:* Outer Shadow is applied both to the original shape and the original shape's glow. The result of blur contains the original shape, while the result of glow contains only the added glow. Therefore, a container that groups the blur result with the glow result is used as the input to Outer Shadow. *end example*]

effectLst Processing for Shapes



effectLst Processing for Group Shapes



Parent Elements
bg (§5.9.3.1); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); effect (§5.1.4.2.7); effectStyle (§5.1.4.1.11); endParaRPr (§5.1.5.2.3); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); whole (§5.9.3.9)

   </sequence>
</complexType>
```

5.1.10.27 fgClr (Foreground color)

This element specifies the foreground color of a pattern fill.

Parent Elements
pattFill (§5.1.10.47)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Color">
   <sequence>
      <group ref="EG_ColorChoice"/>
   </sequence>
</complexType>
```

5.1.10.28 fill (Fill)

This element specifies a fill which is one of blipFill, gradFill, grpFill, noFill, pattFill or solidFill.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FillEffect">
   <sequence>
      <group ref="EG_FillProperties" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.10.29 fillOverlay (Fill Overlay Effect)

This element specifies a fill overlay effect. A fill overlay may be used to specify an additional fill for an object and blend the two fills together.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44

Child Elements	Subclause
pattFill (Pattern Fill)	§5.1.10.47
solidFill (Solid Fill)	§5.1.10.54

Attributes	Description
blend (Blend)	Specifies how to blend the fill with the base effect. The possible values for this attribute are defined by the ST_BlendMode simple type (§5.1.12.11).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FillOverlayEffect">
   <sequence>
      <group ref="EG_FillProperties" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="blend" type="ST_BlendMode" use="required"/>
</complexType>
```

5.1.10.30 fillRect (Fill Rectangle)

This element specifies a fill rectangle. When stretching of an image is specified, a source rectangle, srcRect, is scaled to fit the specified fill rectangle.

Each edge of the fill rectangle is defined by a percentage offset from the corresponding edge of the shape's bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. For example, a left offset of 25% specifies that the left edge of the fill rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width.

[*Example*:

```
<a:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
      <a:fillRect b="10000" r="25000"/>
  </a:stretch>
</a:blipFill>
```

The above image is stretched to fill the entire rectangle except for the bottom 10% and rightmost 25%.

end example]

Parent Elements
stretch (§5.1.10.56)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

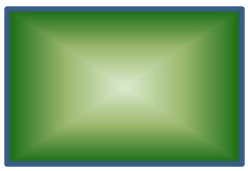
```
<complexType name="CT_RelativeRect">
    <attribute name="l" type="ST_Percentage" use="optional" default="0"/>
    <attribute name="t" type="ST_Percentage" use="optional" default="0"/>
    <attribute name="r" type="ST_Percentage" use="optional" default="0"/>
    <attribute name="b" type="ST_Percentage" use="optional" default="0"/>
</complexType>
```

5.1.10.31 fillToRect (Fill To Rectangle)

This element defines the "focus" rectangle for the center shade, specified relative to the fill tile rectangle. The center shade fills the entire tile except the margins specified by each attribute.

Each edge of the center shade rectangle is defined by a percentage offset from the corresponding edge of the tile rectangle. A positive percentage specifies an inset, while a negative percentage specifies an outset. For example, a left offset of 25% specifies that the left edge of the center shade rectangle is located to the right of the tile rectangle's left edge by an amount equal to 25% of the tile rectangle's width.

[*Example*:



```
<a:path path="rect">
  <a:fillToRect l="50000" r="50000" t="50000" b="50000"/>
</a:path>
```

In the above shape, the rectangle defined by fillToRect is a single point in the center of the shape. This creates the effect of the center shade focusing at a point in the center of the region.

end example]

[*Example*:

```
<a:path path="rect">
  <a:fillToRect l="25000" t="25000" r="25000" b="0"/>
</a:path>
```

The center shade occupies the rectangle defined by excluding the topmost, leftmost, and rightmost 25% of the region. Therefore, the gradient fills the remaining leftmost 25%, topmost 25%, and rightmost 25% of the region.

end example]

Parent Elements
path (§5.1.10.46)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Right Offset)	Specifies the right edge of the rectangle.

Attributes	Description
	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelativeRect">
   <attribute name="l" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="t" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="r" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="b" type="ST_Percentage" use="optional" default="0"/>
</complexType>
```

5.1.10.32 glow (Glow Effect)

This element specifies a glow effect, in which a color blurred outline is added outside the edges of the object.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
rad (Radius)	Specifies the radius of the glow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GlowEffect">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="rad" type="ST_PositiveCoordinate" use="optional" default="0"/>
</complexType>
```

5.1.10.33 gradFill (Gradient Fill)

This element defines a gradient fill.

A gradient fill is a fill which is characterized by a smooth gradual transition from one color to the next. At its simplest, it is a fill which transitions between two colors; or more generally, it may be a transition of any number of colors.

The desired transition colors and locations are defined in the gradient stop list (gsLst) child element.

The other child element defines the properties of the gradient fill (there are two styles-- a linear shade style as well as a path shade style)

[*Example*:

The following is a sample gradient fill, varying from blue to white:

end example]

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12); uLn (§5.1.5.3.14)

Child Elements	Subclause
gsLst (Gradient Stop List)	§5.1.10.37
lin (Linear Gradient Fill)	§5.1.10.41
path (Path Gradient)	§5.1.10.46

Child Elements	Subclause
tileRect (Tile Rectangle)	§5.1.10.59

Attributes	Description
flip (Tile Flip)	Specifies the direction(s) in which to flip the gradient while tiling. Normally a gradient fill encompasses the entire bounding box of the shape which contains the fill. However, with the tileRect element, it is possible to define a "tile" rectangle which is smaller than the bounding box. In this situation, the gradient fill is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area. The possible values for this attribute are defined by the ST_TileFlipMode simple type (§5.1.12.86).
rotWithShape (Rotate With Shape)	Specifies if a fill will rotate along with a shape when the shape is rotated. [*Example*: The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GradientFillProperties">
   <sequence>
      <element name="gsLst" type="CT_GradientStopList" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_ShadeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="tileRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="flip" type="ST_TileFlipMode" use="optional"/>
   <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.10.34 grayscl (Gray Scale Effect)

This element specifies a gray scale effect. Converts all effect color values to a shade of gray, corresponding to their luminance. Effect alpha (opacity) values are unaffected.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GrayscaleEffect"/>
```

5.1.10.35 grpFill (Group Fill)

This element specifies a group fill. When specified, this setting indicates that the parent element is part of a group and should inherit the fill properties of the group.

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupFillProperties"/>
```

5.1.10.36 gs (Gradient stops)

This element defines a gradient stop. A gradient stop consists of a position where the stop appears in the color band.

Parent Elements
gsLst (§5.1.10.37)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
pos (Position)	Specifies where this gradient stop should appear in the color band. This position is specified in the range [0%, 100%], which corresponds to the beginning and the end of the color band respectively. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GradientStop">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="pos" type="ST_PositiveFixedPercentage" use="required"/>
</complexType>
```

5.1.10.37 gsLst (Gradient Stop List)

The list of gradient stops that specifies the gradient colors and their relative positions in the color band.

Parent Elements
gradFill (§5.1.10.33)

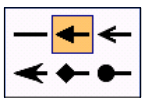
Child Elements	Subclause
gs (Gradient stops)	§5.1.10.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GradientStopList">
   <sequence>
      <element name="gs" type="CT_GradientStop" minOccurs="2" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.10.38 headEnd (Line Head/End Style)

This element specifies decorations which can be added to the head of a line.



Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

Attributes	Description
len (Length of Head/End)	Specifies the line end length in relation to the line width. The possible values for this attribute are defined by the ST_LineEndLength simple type (§5.1.12.32).
type (Line Head/End Type)	Specifies the line end decoration, such as a triangle or arrowhead. The possible values for this attribute are defined by the ST_LineEndType simple type (§5.1.12.33).
w (Width of Head/End)	Specifies the line end width in relation to the line width. The possible values for this attribute are defined by the ST_LineEndWidth simple type (§5.1.12.34).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineEndProperties">
   <attribute name="type" type="ST_LineEndType" use="optional"/>
   <attribute name="w" type="ST_LineEndWidth" use="optional"/>
   <attribute name="len" type="ST_LineEndLength" use="optional"/>
</complexType>
```

5.1.10.39 hsl (Hue Saturation Luminance Effect)

This element specifies a hue/saturation/luminance effect. The hue, saturation, and luminance may each be adjusted relative to its current value.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
hue (Hue)	Specifies the number of degrees by which the hue is adjusted. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
lum (Luminance)	Specifies the percentage by which the luminance is adjusted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
sat (Saturation)	Specifies the percentage by which the saturation is adjusted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HSLEffect">
   <attribute name="hue" type="ST_PositiveFixedAngle" use="optional" default="0"/>
   <attribute name="sat" type="ST_FixedPercentage" use="optional" default="0"/>
   <attribute name="lum" type="ST_FixedPercentage" use="optional" default="0"/>
</complexType>
```

5.1.10.40 innerShdw (Inner Shadow Effect)

This element specifies an inner shadow effect. A shadow is applied within the edges of the object according to the parameters given by the attributes.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
blurRad (Blur Radius)	Specifies the blur radius. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
dir (Direction)	Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
dist (Distance)	Specifies how far to offset the shadow.

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_InnerShadowEffect">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="blurRad" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="dist" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="dir" type="ST_PositiveFixedAngle" use="optional" default="0"/>
</complexType>
```

5.1.10.41 lin (Linear Gradient Fill)

This element specifies a linear gradient.

Parent Elements
gradFill (§5.1.10.33)

Attributes	Description
ang (Angle)	Specifies the direction of color change for the gradient. To define this angle, let its value be x measured clockwise. Then (-sin x, cos x) is a vector parallel to the line of constant color in the gradient fill. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
scaled (Scaled)	Whether the gradient angle scales with the fill region. Mathematically, if this flag is true, then we scale the gradient vector (cos x , sin x) by the width (w) and height (h) of the fill region, so that the vector becomes (w cos x, h sin x) (before normalization). Observe that now if the gradient angle is 45 degrees, the gradient vector is (w, h), which goes from top-left to bottom-right of the fill region. If this flag is false, the gradient angle is independent of the fill region and will not be scaled using the manipulation described above. So a 45-degree gradient angle always give a gradient band whose line of constant color is parallel to the vector (1, -1). The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LinearShadeProperties">
   <attribute name="ang" type="ST_PositiveFixedAngle" use="optional"/>
   <attribute name="scaled" type="xsd:boolean" use="optional"/>
</complexType>
```

5.1.10.42 lum (Luminance Effect)

This element specifies a luminance effect. Brightness linearly shifts all colors closer to white or black. Contrast scales all colors to be either closer or further apart.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
bright (Brightness)	Specifies the percent to change the brightness. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
contrast (Contrast)	Specifies the percent to change the contrast. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LuminanceEffect">
   <attribute name="bright" type="ST_FixedPercentage" use="optional" default="0"/>
   <attribute name="contrast" type="ST_FixedPercentage" use="optional" default="0"/>
</complexType>
```

5.1.10.43 miter (Miter Line Join)

This element specifies that a line join shall be mitered.

[*Example*: The following sample illustrated two lines which are joined using a mitered style

end example]

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

Attributes	Description
lim (Miter Join Limit)	Specifies the amount by which lines will be extended to form a miter join - otherwise miter joins can extend infinitely far (for lines which are almost parallel).

Attributes	Description
	The possible values for this attribute are defined by the ST_PositivePercentage simple type (§5.1.12.46).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineJoinMiterProperties">
   <attribute name="lim" type="ST_PositivePercentage" use="optional"/>
</complexType>
```

5.1.10.44 noFill (No Fill)

This element specifies that no fill will be applied to the parent element.

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12); uLn (§5.1.5.3.14)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NoFillProperties"/>
```

5.1.10.45 outerShdw (Outer Shadow Effect)

This element specifies an Outer Shadow Effect.

[*Example*: The following is an example of an outer shadow effect.

end example]

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13

Child Elements	Subclause
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
algn (Shadow Alignment)	Specifies shadow alignment; alignment happens first, effectively setting the origin for scale, skew, and offset. The possible values for this attribute are defined by the ST_RectAlignment simple type (§5.1.12.53).
blurRad (Blur Radius)	Specifies the blur radius of the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
dir (Shadow Direction)	Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
dist (Shadow Offset Distance)	Specifies the how far to offset the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
kx (Horizontal Skew)	Specifies the horizontal skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
ky (Vertical Skew)	Specifies the vertical skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
rotWithShape (Rotate With Shape)	Specifies whether the shadow should rotate with the shape if the shape is rotated. The possible values for this attribute are defined by the XML Schema boolean datatype.
sx (Horizontal Scaling Factor)	Specifies the horizontal scaling factor; negative scaling causes a flip. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
sy (Vertical Scaling	Specifies the vertical scaling factor; negative scaling causes a flip.

Attributes	Description
Factor)	The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OuterShadowEffect">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="blurRad" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="dist" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="dir" type="ST_PositiveFixedAngle" use="optional" default="0"/>
   <attribute name="sx" type="ST_Percentage" use="optional" default="100000"/>
   <attribute name="sy" type="ST_Percentage" use="optional" default="100000"/>
   <attribute name="kx" type="ST_FixedAngle" use="optional" default="0"/>
   <attribute name="ky" type="ST_FixedAngle" use="optional" default="0"/>
   <attribute name="algn" type="ST_RectAlignment" use="optional" default="b"/>
   <attribute name="rotWithShape" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.1.10.46 path (Path Gradient)

This element defines that a gradient fill will follow a path vs. a linear line.

[*Example*:

The examples above illustrate gradient fills following a circular, rectangular or shape path.

end example]

Parent Elements
gradFill (§5.1.10.33)

Child Elements	Subclause
fillToRect (Fill To Rectangle)	§5.1.10.31

Attributes	Description
path (Gradient Fill Path)	Specifies the shape of the path to follow. The possible values for this attribute are defined by the ST_PathShadeType simple type (§5.1.12.39).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PathShadeProperties">
    <sequence>
        <element name="fillToRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
    </sequence>
    <attribute name="path" type="ST_PathShadeType" use="optional"/>
</complexType>
```

5.1.10.47 pattFill (Pattern Fill)

This element specifies a pattern fill. A repeated pattern is used to fill the object.

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12); uLn (§5.1.5.3.14)

Child Elements	Subclause
bgClr (Background color)	§5.1.10.10
fgClr (Foreground color)	§5.1.10.27

Attributes	Description
prst (Preset Pattern)	Specifies one of a set of preset patterns to fill the object. The possible values for this attribute are defined by the ST_PresetPatternVal simple type (§5.1.12.51).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PatternFillProperties">
    <sequence>
        <element name="fgClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
        <element name="bgClr" type="CT_Color" minOccurs="0" maxOccurs="1"/>
    </sequence>
    <attribute name="prst" type="ST_PresetPatternVal" use="optional"/>
</complexType>
```

5.1.10.48 prstDash (Preset Dash)

This element specifies that a preset line dashing scheme should be used.

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr

Parent Elements
(§5.1.6.8); uLn (§5.1.5.3.14)

Attributes	Description
val (Value)	Specifies which preset dashing scheme is to be used. The possible values for this attribute are defined by the ST_PresetLineDashVal simple type (§5.1.12.49).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PresetLineDashProperties">
   <attribute name="val" type="ST_PresetLineDashVal" use="optional"/>
</complexType>
```

5.1.10.49 prstShdw (Preset Shadow)

This element specifies that a preset shadow is to be used. Each preset shadow is equivalent to a specific outer shadow effect. For each preset shadow, the color element, direction attribute, and distance attribute represent the color, direction, and distance parameters of the corresponding outer shadow. Additionally, the rotateWithShape attribute of corresponding outer shadow is always false. Other non-default parameters of the outer shadow are dependent on the prst attribute.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

Attributes	Description
dir (Direction)	Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
dist (Distance)	Specifies how far to offset the shadow.

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
prst (Preset Shadow)	Specifies which preset shadow to use. The possible values for this attribute are defined by the ST_PresetShadowVal simple type (§5.1.12.52).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PresetShadowEffect">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="prst" type="ST_PresetShadowVal" use="required"/>
   <attribute name="dist" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="dir" type="ST_PositiveFixedAngle" use="optional" default="0"/>
</complexType>
```

5.1.10.50 reflection (Reflection Effect)

This element specifies a reflection effect.

[*Example*:

end example]

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Attributes	Description
algn (Shadow Alignment)	Specifies shadow alignment. The possible values for this attribute are defined by the ST_RectAlignment simple type

Attributes	Description
	(§5.1.12.53).
blurRad (Blur Radius)	Specifies the blur radius. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
dir (Direction)	Specifies the direction of the alpha gradient ramp relative to the shape itself. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
dist (Distance)	Specifies how far to distance the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
endA (End Alpha)	Specifies the ending reflection opacity. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).
endPos (End Position)	Specifies the end position (along the alpha gradient ramp) of the end alpha value. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).
fadeDir (Fade Direction)	Specifies the direction to offset the reflection. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).
kx (Horizontal Skew)	Specifies the horizontal skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
ky (Vertical Skew)	Specifies the vertical skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
rotWithShape (Rotate With Shape)	Specifies if the reflection should rotate with the shape. The possible values for this attribute are defined by the XML Schema boolean datatype.
stA (Start Opacity)	starting reflection opacity. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).
stPos (Start Position)	Specifies the start position (along the alpha gradient ramp) of the start alpha value.

Attributes	Description
	The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§5.1.12.45).
sx (Horizontal Ratio)	Specifies the horizontal scaling factor. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
sy (Vertical Ratio)	Specifies the vertical scaling factor. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ReflectionEffect">
    <attribute name="blurRad" type="ST_PositiveCoordinate" use="optional" default="0"/>
    <attribute name="stA" type="ST_PositiveFixedPercentage" use="optional" default="100000"/>
    <attribute name="stPos" type="ST_PositiveFixedPercentage" use="optional" default="0"/>
    <attribute name="endA" type="ST_PositiveFixedPercentage" use="optional" default="0"/>
    <attribute name="endPos" type="ST_PositiveFixedPercentage" use="optional" default="100000"/>
    <attribute name="dist" type="ST_PositiveCoordinate" use="optional" default="0"/>
    <attribute name="dir" type="ST_PositiveFixedAngle" use="optional" default="0"/>
    <attribute name="fadeDir" type="ST_PositiveFixedAngle" use="optional" default="5400000"/>
    <attribute name="sx" type="ST_Percentage" use="optional" default="100000"/>
    <attribute name="sy" type="ST_Percentage" use="optional" default="100000"/>
    <attribute name="kx" type="ST_FixedAngle" use="optional" default="0"/>
    <attribute name="ky" type="ST_FixedAngle" use="optional" default="0"/>
    <attribute name="algn" type="ST_RectAlignment" use="optional" default="b"/>
    <attribute name="rotWithShape" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.1.10.51 relOff (Relative Offset Effect)

This element specifies a relative offset effect. Sets up a new origin by offsetting relative to the size of the previous effect.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
tx (Offset X)	Specifies the X offset. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
ty (Offset Y)	Specifies the Y offset. The possible values for this attribute are defined by the ST_Percentage simple type

Attributes	Description
	(§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelativeOffsetEffect">
   <attribute name="tx" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="ty" type="ST_Percentage" use="optional" default="0"/>
</complexType>
```

5.1.10.52 round (Round Line Join)

This element specifies that lines joined together will have a round join.

[*Example*:

end example]

Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineJoinRound"/>
```

5.1.10.53 softEdge (Soft Edge Effect)

This element specifies a soft edge effect. The edges of the shape are blurred, while the fill is not affected.

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25); effectLst (§5.1.10.26)

Attributes	Description
rad (Radius)	Specifies the radius of blur to apply to the edges. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SoftEdgesEffect">
   <attribute name="rad" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

5.1.10.54 solidFill (Solid Fill)

This element specifies a solid color fill. The shape is filled entirely with the specified color.

Parent Elements
bg (§5.9.3.1); bgFillStyleLst (§5.1.4.1.7); bgPr (§4.4.1.2); defRPr (§5.1.5.3.2); endParaRPr (§5.1.5.2.3); fill (§5.1.10.28); fill (§5.1.4.2.9); fillOverlay (§5.1.10.29); fillStyleLst (§5.1.4.1.13); grpSpPr (§5.8.2.14); grpSpPr (§4.4.1.20); grpSpPr (§5.1.2.1.22); grpSpPr (§5.6.2.17); ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); rPr (§5.1.5.3.9); spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6); tblPr (§5.1.6.13); tcPr (§5.1.6.15); uFill (§5.1.5.3.12); uLn (§5.1.5.3.14)

Child Elements	Subclause
hslClr (Hue, Saturation, Luminance Color Model)	§5.1.2.2.13
prstClr (Preset Color)	§5.1.2.2.22
schemeClr (Scheme Color)	§5.1.2.2.29
scrgbClr (RGB Color Model - Percentage Variant)	§5.1.2.2.30
srgbClr (RGB Color Model - Hex Variant)	§5.1.2.2.32
sysClr (System Color)	§5.1.2.2.33

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SolidColorFillProperties">
   <sequence>
      <group ref="EG_ColorChoice" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.10.55 srcRect (Source Rectangle)

This element specifies the portion of the blip used for the fill.

Each edge of the source rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. For example, a left offset of 25% specifies that the left edge of the source rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width.

Parent Elements
blipFill (§5.8.2.2); blipFill (§5.1.10.14); blipFill (§5.6.2.2); blipFill (§5.2.2.1); blipFill (§4.4.1.4)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type

Attributes	Description
	(§5.1.12.41).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelativeRect">
   <attribute name="l" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="t" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="r" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="b" type="ST_Percentage" use="optional" default="0"/>
</complexType>
```

5.1.10.56 stretch (Stretch)

This element specifies that a BLIP should be stretched to fill the target rectangle. The other option is a tile where a BLIP is tiled to fill the available area.

Parent Elements
blipFill (§5.8.2.2); blipFill (§5.1.10.14); blipFill (§5.6.2.2); blipFill (§5.2.2.1); blipFill (§4.4.1.4)

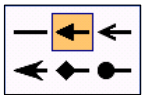
Child Elements	Subclause
fillRect (Fill Rectangle)	§5.1.10.30

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StretchInfoProperties">
   <sequence>
      <element name="fillRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.10.57 tailEnd (Tail line end style)

This element specifies decorations which can be added to the tail of a line.



Parent Elements
ln (§5.1.2.1.24); lnB (§5.1.6.3); lnBlToTr (§5.1.6.4); lnL (§5.1.6.5); lnR (§5.1.6.6); lnT (§5.1.6.7); lnTlToBr (§5.1.6.8); uLn (§5.1.5.3.14)

Attributes	Description
len (Length of Head/End)	Specifies the line end length in relation to the line width. The possible values for this attribute are defined by the ST_LineEndLength simple type (§5.1.12.32).
type (Line Head/End Type)	Specifies the line end decoration, such as a triangle or arrowhead. The possible values for this attribute are defined by the ST_LineEndType simple type (§5.1.12.33).
w (Width of Head/End)	Specifies the line end width in relation to the line width. The possible values for this attribute are defined by the ST_LineEndWidth simple type (§5.1.12.34).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineEndProperties">
   <attribute name="type" type="ST_LineEndType" use="optional"/>
   <attribute name="w" type="ST_LineEndWidth" use="optional"/>
   <attribute name="len" type="ST_LineEndLength" use="optional"/>
</complexType>
```

5.1.10.58 tile (Tile)

This element specifies that a BLIP should be tiled to fill the available space. This element defines a "tile" rectangle within the bounding box. The image is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area.

[*Example*:

The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.

end example]

Parent Elements
blipFill (§5.8.2.2); blipFill (§5.1.10.14); blipFill (§5.6.2.2); blipFill (§5.2.2.1); blipFill (§4.4.1.4)

Attributes	Description
algn (Alignment)	Specifies where to align the first tile with respect to the shape. Alignment happens after the scaling, but before the additional offset. The possible values for this attribute are defined by the ST_RectAlignment simple type (§5.1.12.53).
flip (Tile Flipping)	Specifies the direction(s) in which to flip the source image while tiling. Images may be flipped horizontally, vertically, or in both directions to fill the entire region. The possible values for this attribute are defined by the ST_TileFlipMode simple type (§5.1.12.86).
sx (Horizontal Ratio)	Specifies the amount to horizontally scale the srcRect. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
sy (Vertical Ratio)	Specifies the amount to vertically scale the srcRect. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
tx (Horizontal Offset)	Specifies additional horizontal offset after alignment. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
ty (Vertical Offset)	Specifies additional vertical offset after alignment. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TileInfoProperties">
   <attribute name="tx" type="ST_Coordinate" use="optional"/>
   <attribute name="ty" type="ST_Coordinate" use="optional"/>
   <attribute name="sx" type="ST_Percentage" use="optional"/>
   <attribute name="sy" type="ST_Percentage" use="optional"/>
   <attribute name="flip" type="ST_TileFlipMode" use="optional"/>
   <attribute name="algn" type="ST_RectAlignment" use="optional"/>
</complexType>
```

5.1.10.59 tileRect (Tile Rectangle)

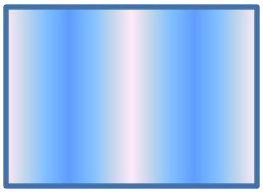
This element specifies a rectangular region of the shape to which the gradient is applied. This region is then tiled across the remaining area of the shape to complete the fill. The tile rectangle is defined by percentage offsets from the sides of the shape's bounding box.

Each edge of the tile rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. For example, a left offset of 25% specifies that the left edge of the tile rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width.

[*Example*:

The image above depicts a horizontal gradient with no tileRect element.

The image above depicts the same gradient with a tileRect element specifying l="50000" (50%). The right half of the shape is the tile to which the gradient is applied, and the left half of the shape contains a tiled copy of that gradient fill.



The image above depicts the same gradient with a tileRect element specifying l="75000" (75%). The rightmost 25% of the shape contains the tile rectangle to which the gradient is applied. This gradient is tiled three times to

cover the leftmost 75% of the shape. Note that the tile rectangle is flipped horizontally when covering the shape.

end example]

Parent Elements
gradFill (§5.1.10.33)

Attributes	Description
b (Bottom Offset)	Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
l (Left Offset)	Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
r (Right Offset)	Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
t (Top Offset)	Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelativeRect">
   <attribute name="l" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="t" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="r" type="ST_Percentage" use="optional" default="0"/>
   <attribute name="b" type="ST_Percentage" use="optional" default="0"/>
</complexType>
```

5.1.10.60 tint (Tint Effect)

This element specifies a tint effect. Shifts effect color values towards/away from hue by the specified amount.

Parent Elements
blip (§5.1.10.13); cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
amt (Amount)	Specifies by how much the color value is shifted.

Attributes	Description
	The possible values for this attribute are defined by the ST_FixedPercentage simple type (§5.1.12.22).
hue (Hue)	Specifies the hue towards which to tint. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§5.1.12.44).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TintEffect">
   <attribute name="hue" type="ST_PositiveFixedAngle" use="optional" default="0"/>
   <attribute name="amt" type="ST_FixedPercentage" use="optional" default="0"/>
</complexType>
```

5.1.10.61 xfrm (Transform Effect)

This element specifies a transform effect. The transform is applied to each point in the shape's geometry using the following matrix:

$$\begin{bmatrix} sx & \tan(kx) & tx \\ \tan(ky) & sy & ty \\ 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Parent Elements
cont (§5.1.10.20); effectDag (§5.1.10.25)

Attributes	Description
kx (Horizontal Skew)	Specifies the horizontal skew angle, defined as the agnle between the top-left corner and bottom-left corner of the object's original bounding box. If positive, the bottom edge of the shape will be positioned to the right relative to the top edge. The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
ky (Vertical Skew)	Specifies the vertical skew angle, defined as the angle between the top-left corner and top-right corner of the object's original bounding box. If positive, the right edge of the object will be positioned lower relative to the left edge. The possible values for this attribute are defined by the ST_FixedAngle simple type (§5.1.12.21).
sx (Horizontal Ratio)	Specifies a percentage by which to horizontally scale the object. The possible values for this attribute are defined by the ST_Percentage simple type

Attributes	Description
	(§5.1.12.41).
sy (Vertical Ratio)	Specifies a percentage by which to vertically scale the object. The possible values for this attribute are defined by the ST_Percentage simple type (§5.1.12.41).
tx (Horizontal Shift)	Specifies an amount by which to shift the object along the x-axis. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
ty (Vertical Shift)	Specifies an amount by which to shift the object along the y-axis. The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TransformEffect">
   <attribute name="sx" type="ST_Percentage" use="optional" default="100000"/>
   <attribute name="sy" type="ST_Percentage" use="optional" default="100000"/>
   <attribute name="kx" type="ST_FixedAngle" use="optional" default="0"/>
   <attribute name="ky" type="ST_FixedAngle" use="optional" default="0"/>
   <attribute name="tx" type="ST_Coordinate" use="optional" default="0"/>
   <attribute name="ty" type="ST_Coordinate" use="optional" default="0"/>
</complexType>
```

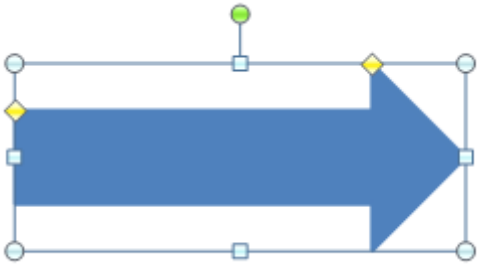
5.1.11 Shape Definitions and Attributes

The Shape Definitions and Attributes portion of the DrawingML framework deals with all geometric properties for shapes within a document. This includes both preset geometries that publicly are interpreted by the generating application and custom geometries that have their points and curves explicitly specified. In addition to the underlying geometry of the shape there are also other coordinate-based properties for each shape that this framework describes.

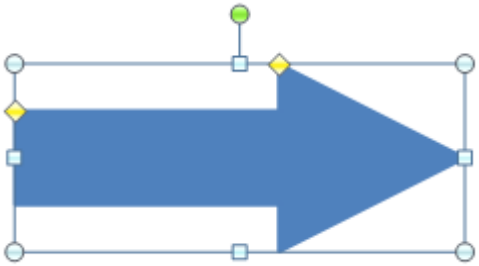
5.1.11.1 ahLst (List of Shape Adjust Handles)

This element specifies the adjust handles that will be applied to a custom geometry. These adjust handles will specify points within the geometric shape that can be used to perform certain transform operations on the shape.

[*Example*: Consider the scenario where a custom geometry, an arrow in this case, has been drawn and adjust handles have been placed at the top left corner of both the arrow head and arrow body. The user interface can then be made to transform only certain parts of the shape by using the corresponding adjust handle.



For instance if the user wished to change only the width of the arrow head then they would use the adjust handle located on the top left of the arrow head. The result of adjusting this will transform the shape as shown below.



end example]

Parent Elements
custGeom (§5.1.11.8)

Child Elements	Subclause
ahPolar (Polar Adjust Handle)	§5.1.11.2
ahXY (XY Adjust Handle)	§5.1.11.3

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AdjustHandleList">
   <choice minOccurs="0" maxOccurs="unbounded">
      <element name="ahXY" type="CT_XYAdjustHandle" minOccurs="1" maxOccurs="1"/>
      <element name="ahPolar" type="CT_PolarAdjustHandle" minOccurs="1" maxOccurs="1"/>
   </choice>
</complexType>
```

5.1.11.2 ahPolar (Polar Adjust Handle)

This element specifies a polar adjust handle for a custom shape. The position of this adjust handle will be specified by the corresponding pos child element. The allowed adjustment of this adjust handle are specified via it's min and max type attributes. Based on the adjustment of this adjust handle certain corresponding guides will be updated to contain these values.

Parent Elements
ahLst (§5.1.11.1)

Child Elements	Subclause
pos (Shape Position Coordinate)	§5.1.11.17

Attributes	Description
gdRefAng (Angle Adjustment Guide)	Specifies the name of the guide that will be updated with the adjustment angle from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§5.1.12.26).
gdRefR (Radial Adjustment Guide)	Specifies the name of the guide that will be updated with the adjustment radius from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§5.1.12.26).
maxAng (Maximum Angle Adjustment)	Specifies the maximum angle position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move angularly. That is the maxAng and minAng will be equal. The possible values for this attribute are defined by the ST_AdjAngle simple type (§5.1.12.1).
maxR (Maximum Radial Adjustment)	Specifies the maximum radial position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move radially. That is the maxR and minR will be equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).
minAng (Minimum Angle Adjustment)	Specifies the minimum angle position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move angularly. That is the maxAng and minAng will be equal. The possible values for this attribute are defined by the ST_AdjAngle simple type (§5.1.12.1).
minR (Minimum Radial Adjustment)	Specifies the minimum radial position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move radially. That is the maxR and minR will be equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PolarAdjustHandle">
   <sequence>
      <element name="pos" type="CT_AdjPoint2D" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="gdRefR" type="ST_GeomGuideName" use="optional"/>
   <attribute name="minR" type="ST_AdjCoordinate" use="optional"/>
   <attribute name="maxR" type="ST_AdjCoordinate" use="optional"/>
   <attribute name="gdRefAng" type="ST_GeomGuideName" use="optional"/>
   <attribute name="minAng" type="ST_AdjAngle" use="optional"/>
   <attribute name="maxAng" type="ST_AdjAngle" use="optional"/>
</complexType>
```

5.1.11.3 ahXY (XY Adjust Handle)

This element specifies an XY-based adjust handle for a custom shape. The position of this adjust handle will be specified by the corresponding pos child element. The allowed adjustment of this adjust handle are specified via it's min and max type attributes. Based on the adjustment of this adjust handle certain corresponding guides will be updated to contain these values.

Parent Elements
ahLst (§5.1.11.1)

Child Elements	Subclause
pos (Shape Position Coordinate)	§5.1.11.17

Attributes	Description
gdRefX (Horizontal Adjustment Guide)	Specifies the name of the guide that will be updated with the adjustment x position from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§5.1.12.26).
gdRefY (Vertical Adjustment Guide)	Specifies the name of the guide that will be updated with the adjustment y position from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§5.1.12.26).
maxX (Maximum Horizontal Adjustment)	Specifies the maximum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move in the x direction. That is the maxX and minX will be equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).
maxY (Maximum	Specifies the maximum vertical position that is allowed for this adjustment handle. If this

Attributes	Description
Vertical Adjustment)	attribute is omitted, then it will be assumed that this adjust handle cannot move in the y direction. That is the maxY and minY will be equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).
minX (Minimum Horizontal Adjustment)	Specifies the minimum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move in the x direction. That is the maxX and minX will be equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).
minY (Minimum Vertical Adjustment)	Specifies the minimum vertical position that is allowed for this adjustment handle. If this attribute is omitted, then it will be assumed that this adjust handle cannot move in the y direction. That is the maxY and minY will be equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).

The following XML Schema fragment defines the contents of this element:

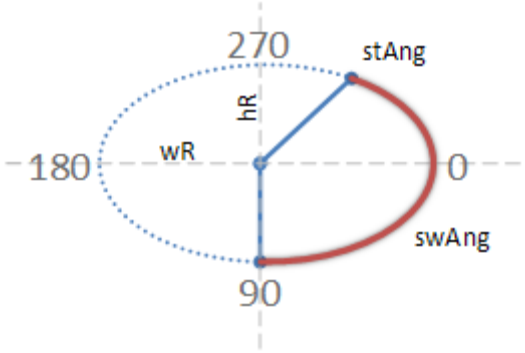
```
<complexType name="CT_XYAdjustHandle">
   <sequence>
      <element name="pos" type="CT_AdjPoint2D" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="gdRefX" type="ST_GeomGuideName" use="optional"/>
   <attribute name="minX" type="ST_AdjCoordinate" use="optional"/>
   <attribute name="maxX" type="ST_AdjCoordinate" use="optional"/>
   <attribute name="gdRefY" type="ST_GeomGuideName" use="optional"/>
   <attribute name="minY" type="ST_AdjCoordinate" use="optional"/>
   <attribute name="maxY" type="ST_AdjCoordinate" use="optional"/>
</complexType>
```

5.1.11.4 arcTo (Draw Arc To)

This element specifies the existence of an arc within a shape path. It draws an arc with the specified parameters from the current pen position to the new point specified. An arc is a line that is bent based on the shape of a supposed circle. The length of this arc is determined by specifying both a start angle and an ending angle that act together to effectively specify an end point for the arc.

[*Example*: The diagram shown below represents a single arc that has a start angle of 300 degrees and a swing angle of 150 degrees. This arc will be drawn using the supposed circle that is described using the hR and wR attributes as shown below. The degrees by which the stAng must abide is shown along the circumference of the circle. These degrees are to be specified in 60,000ths of a degree. If this arc were part of a shape the start angle point along the circle would be the starting point along the path and the ending point would be the ending of the angle swing along this supposed circle. That is any shape geometry coming before this arc in the shape path

would be joined with the upper point of this arc and consequently any geometry coming after this arc in the path would be joined with the lower point of this arc.



end example]

Parent Elements
path (§5.1.11.15)

Attributes	Description
hR (Shape Arc Height Radius)	This attribute will specify the height radius of the supposed circle being used to draw the arc. This will give the circle a total height of (2 * hR). This total height could also be called it's vertical diameter as it is the diameter for the y axis only. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).
stAng (Shape Arc Start Angle)	Specifies the start angle for an arc. This angle will specify what angle along the supposed circle path will be used as the start position for drawing the arc. This start angle will be locked to the last known pen position in the shape path. Thus guaranteeing a continuos shape path. The possible values for this attribute are defined by the ST_AdjAngle simple type (§5.1.12.1).
swAng (Shape Arc Swing Angle)	Specifies the swing angle for an arc. This angle will specify how far angle-wise along the supposed cicle path the arc will be extended. The extension from the start angle will always be in the clockwise direction around the supposed circle. The possible values for this attribute are defined by the ST_AdjAngle simple type (§5.1.12.1).
wR (Shape Arc Width Radius)	This attribute will specify the width radius of the supposed circle being used to draw the arc. This will give the circle a total width of (2 * wR). This total width could also be called it's horizontal diameter as it is the diameter for the x axis only. The possible values for this attribute are defined by the ST_AdjCoordinate simple type

Attributes	Description
	(§5.1.12.2).

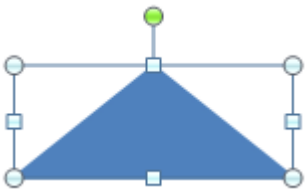
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DArcTo">
   <attribute name="wR" type="ST_AdjCoordinate" use="required"/>
   <attribute name="hR" type="ST_AdjCoordinate" use="required"/>
   <attribute name="stAng" type="ST_AdjAngle" use="required"/>
   <attribute name="swAng" type="ST_AdjAngle" use="required"/>
</complexType>
```

5.1.11.5 avLst (List of Shape Adjust Values)

This element specifies the adjust values that will be applied to the specified shape. An adjust value is simply a guide that has a value based formula specified. That is, no calculation takes place for an adjust value guide. Instead, this guide specifies a parameter value that is used for calculations within the shape guides.

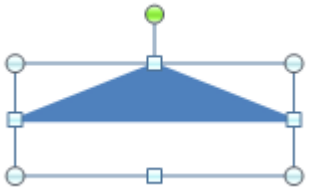
[*Example*: Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely an adjust value. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the height, namely 2. Thus we see in the figure below that the bottom of the triangle matches the bottom of the shape bounding box.



```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst>
    <a:gd name="myGuide" fmla="val 2"/>
  </a:avLst>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2" h="2">
      <a:moveTo>
        <a:pt x="0" y="myGuide"/>
      </a:moveTo>
```

```
        <a:lnTo>
          <a:pt x="2" y="myGuide"/>
        </a:lnTo>
        <a:lnTo>
          <a:pt x="1" y="0"/>
        </a:lnTo>
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

If however we change the adjust value to half that, namely 1. Then we see the entire bottom edge of the triangle move to now be placed along the vertical midpoint within the shape bounding box. This is because both of the bottom points in this triangle depend on this adjust value for their coordinate positions. The triangle and corresponding DrawingML shown below illustrate this point.



```
  <a:avLst>
    <a:gd name="myGuide" fmla="val 1"/>
  </a:avLst>
```

end example]

Parent Elements
custGeom (§5.1.11.8); prstGeom (§5.1.11.18); prstTxWarp (§5.1.11.19)

Child Elements	Subclause
gd (Shape Guide)	§5.1.11.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GeomGuideList">
   <sequence>
      <element name="gd" type="CT_GeomGuide" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.11.6 close (Close Shape Path)

This element specifies the ending of a series of lines and curves in the creation path of a custom geometric shape. When this element is encountered, the generating application should consider the corresponding path closed. That is, any further lines or curves that follow this element should be ignored.

[*Note*: It is valid to have a path be specified and not closed. A path such as this cannot however have any fill associated with it as it has not been considered a closed geometric path.

[*Example*: Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

[*Note*: When the last point in the creation path does not meet with the first point in the creation path the generating application should connect the last point with the first via a straight line, thus creating a closed shape geometry. *end note*]

Parent Elements
path (§5.1.11.15)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DClose"/>
```

5.1.11.7 cubicBezTo (Draw Cubic Bezier Curve To)

This element specifies to draw a cubic bezier curve along the specified points. To specify a cubic bezier curve there needs to be 3 points specified. The first two are control points used in the cubic bezier calculation and the last is the ending point for the curve. The coordinate system used for this type of curve is the path coordinate system as this element is path specific.

Parent Elements
path (§5.1.11.15)

Child Elements	Subclause
pt (Shape Path Point)	§5.1.11.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DCubicBezierTo">
   <sequence>
      <element name="pt" type="CT_AdjPoint2D" minOccurs="3" maxOccurs="3"/>
   </sequence>
</complexType>
```

5.1.11.8 custGeom (Custom Geometry)

This element specifies the existence of a custom geometric shape. This shape will consist of a series of lines and curves described within a creation path. In addition to this there may also be adjust values, guides, adjust handles, connection sites and an inscribed rectangle specified for this custom geometric shape.

[*Example*: Consider the scenario when a preset geometry does not accurately depict what must be displayed in the document. For this a custom geometry can be used to define most any 2-dimensional geometric shape. Shown below is an example of such a custom geometry.

```
<a:custGeom>
  <a:avLst/>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2650602" h="1261641">
      <a:moveTo>
        <a:pt x="0" y="1261641"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="2650602" y="1261641"/>
      </a:lnTo>
```

```
      <a:lnTo>
        <a:pt x="1226916" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

The custom geometry above is drawn by first moving to a specific starting point with the moveTo element. Then a series of lnTo elements in the creation path specify the lines that make up the borders of the shape and finally a close element is used to specify the end of the creation path. The resulting shape is shown above. *end example*]

Parent Elements
spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6)

Child Elements	Subclause
ahLst (List of Shape Adjust Handles)	§5.1.11.1
avLst (List of Shape Adjust Values)	§5.1.11.5
cxnLst (List of Shape Connection Sites)	§5.1.11.10
gdLst (List of Shape Guides)	§5.1.11.12
pathLst (List of Shape Paths)	§5.1.11.16
rect (Shape Text Rectangle)	§5.1.11.22

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustomGeometry2D">
   <sequence>
      <element name="avLst" type="CT_GeomGuideList" minOccurs="0" maxOccurs="1"/>
      <element name="gdLst" type="CT_GeomGuideList" minOccurs="0" maxOccurs="1"/>
      <element name="ahLst" type="CT_AdjustHandleList" minOccurs="0" maxOccurs="1"/>
      <element name="cxnLst" type="CT_ConnectionSiteList" minOccurs="0" maxOccurs="1"/>
      <element name="rect" type="CT_GeomRect" minOccurs="0" maxOccurs="1"/>
      <element name="pathLst" type="CT_Path2DList" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.11.9 cxn (Shape Connection Site)

This element specifies the existence of a connection site on a custom shape. A connection site allows a cxnSp to be attached to this shape. This connection will be maintined when the shape is repositioned within the document. It should be noted that this connection is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[*Note*: The transform coordinate system is different from a path coordinate system as it is per shape instead of per path within the shape. *end note*]

[*Example*: Consider the following custom geometry that has two connection sites specified. One connection is located at the bottom left of the shape and the other at the bottom right. The following DrawingML would describe such a custom geometry.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst>
    <a:cxn ang="0">
      <a:pos x="0" y="679622"/>
    </a:cxn>
```

```
      <a:cxn ang="0">
        <a:pos x="1705233" y="679622"/>
      </a:cxn>
    </a:cxnLst>
    <a:rect l="0" t="0" r="0" b="0"/>
    <a:pathLst>
      <a:path w="2" h="2">
        <a:moveTo>
          <a:pt x="0" y="2"/>
        </a:moveTo>
        <a:lnTo>
          <a:pt x="2" y="2"/>
        </a:lnTo>
        <a:lnTo>
          <a:pt x="1" y="0"/>
        </a:lnTo>
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

end example]

Parent Elements
cxnLst (§5.1.11.10)

Child Elements	Subclause
pos (Shape Position Coordinate)	§5.1.11.17

Attributes	Description
ang (Connection Site Angle)	Specifies the incoming connector angle. This angle is the angle around the connection site that an incoming connector will try to be routed to. This allows connectors to know where the shape is in relation to the connection site and route connectors so as to avoid any overlap with the shape. [*Example*: Consider a simple square. In order to not have any connectors routed over the shape, the collowing angles would be specified for their respective connection sites.

Attributes	Description
	 *end example*] The possible values for this attribute are defined by the ST_AdjAngle simple type (§5.1.12.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConnectionSite">
    <sequence>
        <element name="pos" type="CT_AdjPoint2D" minOccurs="1" maxOccurs="1"/>
    </sequence>
    <attribute name="ang" type="ST_AdjAngle" use="required"/>
</complexType>
```

5.1.11.10 cxnLst (List of Shape Connection Sites)

This element specifies all the connection sites that will be used for this shape. A connection site is specified by defining a point within the shape bounding box that can have a cxnSp element attached to it. These connection sites are specified using the shape coordinate system that is specified within the ext transform element.

Parent Elements
custGeom (§5.1.11.8)

Child Elements	Subclause
cxn (Shape Connection Site)	§5.1.11.9

The following XML Schema fragment defines the contents of this element:

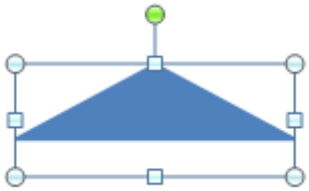
```
<complexType name="CT_ConnectionSiteList">
    <sequence>
        <element name="cxn" type="CT_ConnectionSite" minOccurs="0" maxOccurs="unbounded"/>
    </sequence>
</complexType>
```

5.1.11.11 gd (Shape Guide)

This element specifies the precense of a shape guide that will be used to govern the geometry of the specified shape. A shape guide consists of a formula and a name that the result of the formula is assigned to. Recognized formulas are listed with the fmla attribute documentation for this element.

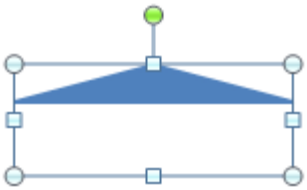
[*Note*: The order in which guides are specified determines the order in which their values will be calculated. For instance it is not possible to specify a guide that uses another guides result when that guide has not yet been calculated. *end note*]

[*Example*: Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely an guide. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the 2/3 the value of the shape height. Thus we see in the figure below that the triangle appears to occupy 2/3 of the vertical space within the shape bounding box.



```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
  <a:gdLst>
    <a:gd name="myGuide" fmla="*/ h 2 3"/>
  </a:gdLst>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="1705233" h="679622">
      <a:moveTo>
        <a:pt x="0" y="myGuide"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1705233" y="myGuide"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="852616" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

If however we change the guide to half that, namely 1/3. Then we see the entire bottom edge of the triangle move to now only occupy 1/3 of the toal space within the shape bounding box. This is because both of the bottom points in this triangle depend on this guide for their coordinate positions. The triangle and corresponding DrawingML shown below illustrate this point.



```
<a:gdLst>
  <a:gd name="myGuide" fmla="*/ h 1 3"/>
</a:gdLst>
```

end example]

Parent Elements
avLst (§5.1.11.5); gdLst (§5.1.11.12)

Attributes	Description
fmla (Shape Guide Formula)	Specifies the formula that will be used to calculate the value for a guide. Each formula has a certain number of arguments and a specific set of operations to perform on these arguments in order to generate a value for a guide. There are a total of 17 different formulas available. These are shown below with the usage for each defined. **('*/') - Multiply Divide Formula** Arguments: 3 (fmla="*/ x y z") Usage: "*/ x y z" = ((x * y) / z) = value of this guide **('+-') - Add Subtract Formula** Arguments: 3 (fmla="+- x y z") Usage: "+- x y z" = ((x + y) - z) = value of this guide **('+/') - Add Divide Formula** Arguments: 3 (fmla="+/ x y z") Usage: "+/ x y z" = ((x + y) / z) = value of this guide **('?:') - If Else Formula** Arguments: 3 (fmla="?: x y z") Usage: "?: x y z" = if (x > 0), then y = value of this guide, else z = value of this guide **('abs') - Absolute Value Formula** Arguments: 1 (fmla="abs x") Usage: "abs x" = if (x < 0), then (-1) * x = value of this guide else x = value of this guide

Attributes	Description
	('at2') - ArcTan Formula Arguments: 2 (fmla="at2 x y") Usage: "at2 x y" = arctan(y / x) = value of this guide **('cat2') - Cosine ArcTan Formula** Arguments: 3 (fmla="cat2 x y z") Usage: "cat2 x y z" = (x*(cos(arctan(z / y))) = value of this guide **('cos') - Cosine Formula** Arguments: 2 (fmla="cos x y") Usage: "cos x y" = (x * cos(y)) = value of this guide **('max') - Maximum Value Formula** Arguments: 2 (fmla="max x y") Usage: "max x y" = if (x > y), then x = value of this guide else y = value of this guide **('min') - Minimum Value Formula** Arguments: 2 (fmla="min x y") Usage: "min x y" = if (x < y), then x = value of this guide else y = value of this guide **('mod') - Modulo Formula** Arguments: 3 (fmla="mod x y z") Usage: "mod x y z" = sqrt(x^2 + b^2 + c^2) = value of this guide **('pin') - Pin To Formula** Arguments: 3 (fmla="pin x y z") Usage: "pin x y z" = if (y < x), then x = value of this guide else if (y > z), then z = value of this guide else y = value of this guide **('sat2') - Sine ArcTan Formula** Arguments: 3 (fmla="sat2 x y z") Usage: "sat2 x y z" = (x*sin(arctan(z / y))) = value of this guide **('sin') - Sine Formula** Arguments: 2 (fmla="sin x y") Usage: "sin x y" = (x * sin(y)) = value of this guide **('sqrt') - Square Root Formula** Arguments: 1 (fmla="sqrt x") Usage: "sqrt x" = sqrt(x) = value of this guide **('tan') - Tangent Formula** Arguments: 2 (fmla="tan x y") Usage: "tan x y" = (x * tan(y)) = value of this guide **('val') - Literal Value Formula** Arguments: 1 (fmla="val x") Usage: "val x" = x = value of this guide

Attributes	Description
	[*Note*: Guides that have a literal value formula specified via fmla="val x" above should only be used within the avLst as an adjust value for the shape. This however is not strictly enforced. *end note*] The possible values for this attribute are defined by the ST_GeomGuideFormula simple type (§5.1.12.25).
name (Shape Guide Name)	Specifies the name that will be used to reference to this guide. This name may be used just as a variable would within an equation. That is this name may be substituted for literal values within other guides or the specification of the shape path. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§5.1.12.26).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GeomGuide">
   <attribute name="name" type="ST_GeomGuideName" use="required"/>
   <attribute name="fmla" type="ST_GeomGuideFormula" use="required"/>
</complexType>
```

5.1.11.12 gdLst (List of Shape Guides)

This element specifies all the guides that will be used for this shape. A guide is specified by the gd element and defines a calculated value that may be used for the construction of the corresponding shape.

[*Note*: Guides that have a literal value formula specified via fmla="val x" above should only be used within the avLst as an adjust value for the shape. This however is not strictly enforced. *end note*]

Parent Elements
custGeom (§5.1.11.8)

Child Elements	Subclause
gd (Shape Guide)	§5.1.11.11

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GeomGuideList">
   <sequence>
      <element name="gd" type="CT_GeomGuide" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.11.13 lnTo (Draw Line To)

This element specifies the drawing of a straight line from the current pen position to the new point specified. This line becomes part of the shape geometry, representing a side of the shape. The coordinate system used when specifying this line is the path coordinate system.

Parent Elements
path (§5.1.11.15)

Child Elements	Subclause
pt (Shape Path Point)	§5.1.11.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DLineTo">
   <sequence>
      <element name="pt" type="CT_AdjPoint2D" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.11.14 moveTo (Move Path To)

This element specifies a set of new coordinates to move the shape cursor to. This element is only used for drawing a custom geometry. When this element is utilized the pt element is used to specify a new set of shape coordinates that the shape cursor should be moved to. This will not draw a line or curve to this new position from the old position but simply move the cursor to a new starting position. It is only when a path drawing element such as lnTo is used that a portion of the path will be drawn.

[*Example*: Consider the case where a user wishes to begin drawing a custom geometry not at the default starting coordinates of x=0 , y=0 but at coordinates further inset into the shape coordinate space. The following DrawingML would specify such a case.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

Notice the moveTo element advances the y coordinates before any actual lines are drawn. *end example*]

Parent Elements
path (§5.1.11.15)

Child Elements	Subclause
pt (Shape Path Point)	§5.1.11.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DMoveTo">
   <sequence>
      <element name="pt" type="CT_AdjPoint2D" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.1.11.15 path (Shape Path)

This element specifies a creation path consisting of a series of moves, lines and curves that when combined will form a geometric shape. This element will only be utilized if a custom geometry is specified.

[*Note*: Since multiple paths are allowed the rules for drawing are that the path specified later in the pathLst will be drawn on top of all previous paths. *end note*]

[*Example*: Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

Parent Elements
pathLst (§5.1.11.16)

Child Elements	Subclause
arcTo (Draw Arc To)	§5.1.11.4
close (Close Shape Path)	§5.1.11.6
cubicBezTo (Draw Cubic Bezier Curve To)	§5.1.11.7
lnTo (Draw Line To)	§5.1.11.13
moveTo (Move Path To)	§5.1.11.14
quadBezTo (Draw Quadratic Bezier Curve To)	§5.1.11.21

Attributes	Description
extrusionOk (3D Extrusion Allowed)	Specifies that the use of 3D extrusions are possible on this path. This allows the generating application to know whether 3D extrusion can be applied in any form. If this attribute is omitted then a value of 0, or false is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
fill (Path Fill)	Specifies how the corresponding path should be filled. If this attribute is omitted, a value of "norm" is assumed. The possible values for this attribute are defined by the ST_PathFillMode simple type (§5.1.12.38).
h (Path Height)	Specifies the height, or maximum y coordinate that should be used for within the path coordinate system. This value determines the vertical placement of all points within the corresponding path as they will all be calculated using this height attribute as the max y coordinate. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
stroke (Path Stroke)	Specifies if the corresponding path should have a path stroke shown. This is a boolean value that will effect on the outline of the path. If this attribute is omitted, a value of true is assumed. The possible values for this attribute are defined by the XML Schema boolean datatype.
w (Path Width)	Specifies the width, or maximum x coordinate that should be used for within the path coordinate system. This value determines the horizontal placement of all points within

Attributes	Description
	the corresponding path as they will all be calculated using this width attribute as the max x coordinate. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2D">
   <choice minOccurs="0" maxOccurs="unbounded">
      <element name="close" type="CT_Path2DClose" minOccurs="1" maxOccurs="1"/>
      <element name="moveTo" type="CT_Path2DMoveTo" minOccurs="1" maxOccurs="1"/>
      <element name="lnTo" type="CT_Path2DLineTo" minOccurs="1" maxOccurs="1"/>
      <element name="arcTo" type="CT_Path2DArcTo" minOccurs="1" maxOccurs="1"/>
      <element name="quadBezTo" type="CT_Path2DQuadBezierTo" minOccurs="1" maxOccurs="1"/>
      <element name="cubicBezTo" type="CT_Path2DCubicBezierTo" minOccurs="1" maxOccurs="1"/>
   </choice>
   <attribute name="w" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="h" type="ST_PositiveCoordinate" use="optional" default="0"/>
   <attribute name="fill" type="ST_PathFillMode" use="optional" default="norm"/>
   <attribute name="stroke" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="extrusionOk" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.1.11.16 pathLst (List of Shape Paths)

This element specifies the entire path that is to make up a single geometric shape. The pathLst can consist of many individual paths within it.

[*Example*: Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
```

```
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

[*Note*: A geometry with multiple paths within it should be treated visually as if each path were a distinct shape. That is each creation path will have its first point and last point joined to form a closed shape. However, the generating application should then connect the last point to the first point of the new shape. If a close element is encountered at the end of the previous creation path then this joining line should not be rendered by the generating application. The rendering should resume with the first line or curve on the new creation path. *end note*]

Parent Elements
custGeom (§5.1.11.8)

Child Elements	Subclause
path (Shape Path)	§5.1.11.15

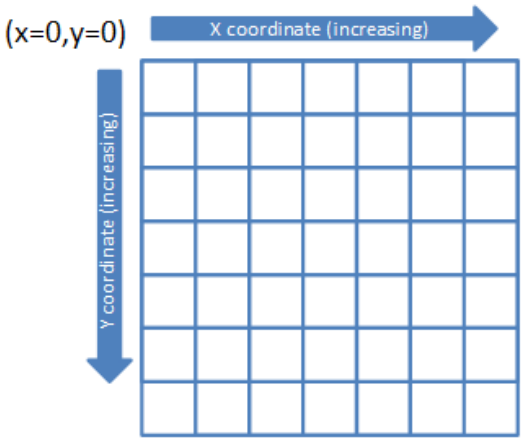
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DList">
   <sequence>
      <element name="path" type="CT_Path2D" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.1.11.17 pos (Shape Position Coordinate)

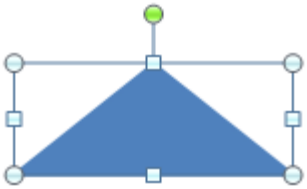
Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[*Note*: When specifying a point coordinate in path coordinate space it should be noted that the top left of the coordinate space is x=0, y=0 and the coordinate points for x grow to the right and for y grow down. This is illustrated in the diagram below.



end note]

[*Example*: To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and 2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system will specify a y coordinate of 679622 within the shape coordinate system for this particular case.



```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
    <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
```

```
    <a:pathLst>
      <a:path w="2" h="2">
        <a:moveTo>
          <a:pt x="0" y="2"/>
        </a:moveTo>
        <a:lnTo>
          <a:pt x="2" y="2"/>
        </a:lnTo>
        <a:lnTo>
          <a:pt x="1" y="0"/>
        </a:lnTo>
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

end example]

Parent Elements
ahPolar (§5.1.11.2); ahXY (§5.1.11.3); cxn (§5.1.11.9)

Attributes	Description
x (X-Coordinate)	Specifies the x coordinate for this position coordinate. The units for this coordinate space are defined by the width of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).
y (Y-Coordinate)	Specifies the y coordinate for this position coordinate. The units for this coordinate space are defined by the height of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AdjPoint2D">
   <attribute name="x" type="ST_AdjCoordinate" use="required"/>
   <attribute name="y" type="ST_AdjCoordinate" use="required"/>
</complexType>
```

5.1.11.18 prstGeom (Preset geometry)

This element specifies when a preset geometric shape should be used instead of a custom geometric shape. The generating application should be able to render all preset geometries enumerated in the ST_ShapeType list.

[*Example*: Consider the scenario when a user does not wish to specify all the lines and curves that make up the desired shape but instead chooses to use a preset geometry. The following DrawingML would specify such a case.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="4" name="My Preset Shape"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  <p:spPr>
    <a:xfrm>
      <a:off x="1981200" y="533400"/>
      <a:ext cx="1143000" cy="1066800"/>
    </a:xfrm>
    <a:prstGeom prst="heart">
    </a:prstGeom>
  </p:spPr>
</p:sp>
```

The output shape rendered by this DrawingML is shown above. *end example*]

Parent Elements
spPr (§5.6.2.29); spPr (§5.7.2.198); spPr (§5.8.2.23); spPr (§5.1.2.1.35); spPr (§4.4.1.41); spPr (§5.9.3.7); spPr (§5.2.2.6)

Child Elements	Subclause
avLst (List of Shape Adjust Values)	§5.1.11.5

Attributes	Description
prst (Preset Shape)	Specifies the preset geometry that will be used for this shape. This preset can have any of

Attributes	Description

	the values in the enumerated list for ST_ShapeType. This attribute is required in order for a preset geometry to be rendered.
	
	[*Example*: Consider the sample DrawingML below.
	
	`<p:sp>`
	`  <p:nvSpPr>`
	`  <p:cNvPr id="4" name="Sun 3"/>`
	`  <p:cNvSpPr/>`
	`  <p:nvPr/>`
	`  </p:nvSpPr>`
	`  <p:spPr>`
	`  <a:xfrm>`
	`  <a:off x="1981200" y="533400"/>`
	`  <a:ext cx="1143000" cy="1066800"/>`
	`  </a:xfrm>`
	`  <a:prstGeom prst="sun">`
	`  </a:prstGeom>`
	`  </p:spPr>`
	`</p:sp>`
	
	In the above example a preset geometry has been used to define a shape. The shape utilized here is the sun shape. *end example*]
	
	The possible values for this attribute are defined by the ST_ShapeType simple type (§5.1.12.56).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PresetGeometry2D">
   <sequence>
      <element name="avLst" type="CT_GeomGuideList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="prst" type="ST_ShapeType" use="required"/>
</complexType>
```

5.1.11.19 prstTxWarp (Preset Text Warp)

This element specifies when a preset geometric shape should be used to transform a piece of text. This operation is known formally as a text warp. The generating application should be able to render all preset geometries enumerated in the ST_TextShapeType list.

[*Example*: Consider the case where the user wishes to accent a piece of text by warping it's shape. For this to occur a preset shape will be chosen from the ST_TextShapeType list and applied to the entire body of text.

```
<p:sp>
  <p:txBody>
    <a:bodyPr wrap="none" rtlCol="0">
      <a:prstTxWarp prst="textInflate">
      </a:prstTxWarp>
      <a:spAutoFit/>
    </a:bodyPr>
    <a:lstStyle/>
    <a:p>
…
      <a:t>Sample Text</a:t>
…
    </a:p>
  </p:txBody>
</p:sp>
```

The resulting text that has now had the Inflate text warp applied to it is shown above. *end example*]

Using any of the presets listed under the ST_TextShapeType list below it is possible to apply a text warp to a run of DrawingML text via the following steps.

If you look at any of the text warps in the file format you will notice that each consists of two paths. This corresponds to a top path (first one specified) and a bottom path (second one specified). Now the top path and the bottom path represent the top line and base line that the text needs to be warped to. How this is done is in the following way.

22. Compute the rectangle that the unwarped text resides in. (tightest possible rectangle around text, no white space except for “space characters”)
23. Take each of the quadratic and cubic Bezier curves that are used to calculate the original character and change their end points and control points by the following method…
24. Move a vertical line horizontally along the original text rectangle and find the horizontal percentage that a given end point or control point lives at. (.5 for the middle for instance)
25. Now do the same thing for this point vertically. Find the vertical percentage that this point lives at with the top and bottom of this text rectangle being the respective top and bottom bounds. (0.0 and 1.0 respectively)
26. Now that we have the percentages for a given point in a Bezier equation we can map that to the new point in the warped text environment.

27. Going back to the top and bottom paths specified in the file format we can take these and flatten them out to a straight arc (top and bottom might be different lengths)
28. After they are straight we can measure them both horizontally to find the same percentage point that we found within the original text rectangle. (0.5 let's say)
29. So then we measure 50% along the top path and 50% along the bottom path, putting the paths back to their original curvy shapes.
30. Once we have these two points we can draw a line between them that will serve as our vertical line in the original text rectangle (note: this might not be truly vertical as 50% on the top does not always line up with 50% on the bottom)
31. Taking this new line we then follow it from top to bottom the vertical percentage amount that we got from step 4.
32. This is then the new point that should be used in place of the old point in the original text rectangle.
33. We will then continue doing these same steps for each of the end points and control points within the body of text. (is applied to a whole body of text only)

[*Note*: Horizxontal percentages begin at 0.0 and continue to 1.0, left to right. Vertical percentages begin at 0.0 and continue to 1.0, top to bottom. *end note*]

[*Note*: Since this is a shape it does have both a shape coordinate system and a path coordinate system. *end note*]

Parent Elements
bodyPr (§5.1.5.1.1)

Child Elements	Subclause
avLst (List of Shape Adjust Values)	§5.1.11.5

Attributes	Description

prst (Preset Warp Shape)	Specifies the preset geometry that will be used for a shape warp on a piece of text. This preset can have any of the values in the enumerated list for ST_TextShapeType. This attribute is required in order for a text warp to be rendered.
	
	[*Example*: Consider the sample DrawingML below.
	
	`<p:sp>`
	`  <p:txBody>`
	`  <a:bodyPr wrap="none" rtlCol="0">`
	`  <a:prstTxWarp prst="textInflate">`
	`  </a:prstTxWarp>`
	`  <a:spAutoFit/>`
	`  </a:bodyPr>`
	`  <a:lstStyle/>`
	`  <a:p>`

Attributes	Description
	… <a:t>Sample Text</a:t> … </a:p> </p:txBody> </p:sp> In the above example a preset text shape geometry has been used to define the warping shape. The shape utilized here is the sun shape. *end example*] The possible values for this attribute are defined by the ST_TextShapeType simple type (§5.1.12.76).

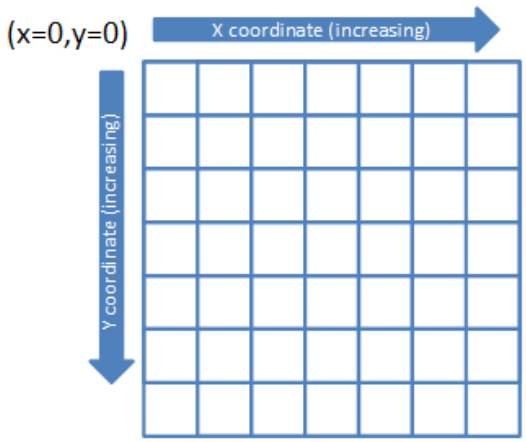
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PresetTextShape">
   <sequence>
      <element name="avLst" type="CT_GeomGuideList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="prst" type="ST_TextShapeType" use="required"/>
</complexType>
```

5.1.11.20 pt (Shape Path Point)

This element specifies an x-y coordinate within the path coordinate space. This coordinate space is determined by the width and height attributes defined within the path element. A point is utilized by one of it's parent elements to specify the next point of interest in custom geometry shape. Depending on the parent element used the point may either have a line drawn to it or the cursor may simply be moved to this new location.

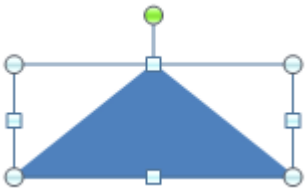
[*Note*: When specifying a point coordinate in path coordinate space it should be noted that the top left of the coordinate space is x=0, y=0 and the coordinate points for x grow to the right and for y grow down. This is illustrated in the diagram below.



end note]

Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[*Example*: To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and 2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system will specify a y coordinate of 679622 within the shape coordinate system for this particular case.



```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>

    <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2" h="2">
      <a:moveTo>
        <a:pt x="0" y="2"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="2" y="2"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1" y="0"/>
      </a:lnTo>
```

```
        <a:close/>
      </a:path>
    </a:pathLst>
  </a:custGeom>
```

end example]

Parent Elements
cubicBezTo (§5.1.11.7); lnTo (§5.1.11.13); moveTo (§5.1.11.14); quadBezTo (§5.1.11.21)

Attributes	Description
x (X-Coordinate)	Specifies the x coordinate for this position coordinate. The units for this coordinate space are defined by the width of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).
y (Y-Coordinate)	Specifies the y coordinate for this position coordinate. The units for this coordinate space are defined by the height of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AdjPoint2D">
   <attribute name="x" type="ST_AdjCoordinate" use="required"/>
   <attribute name="y" type="ST_AdjCoordinate" use="required"/>
</complexType>
```

5.1.11.21 quadBezTo (Draw Quadratic Bezier Curve To)

This element specifies to draw a quadratic bezier curve along the specified points. To specify a quadratic bezier curve there needs to be 2 points specified. The first is a control point used in the quadratic bezier calculation and the last is the ending point for the curve. The coordinate system used for this type of curve is the path coordinate system as this element is path specific.

Parent Elements
path (§5.1.11.15)

Child Elements	Subclause
pt (Shape Path Point)	§5.1.11.20

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Path2DQuadBezierTo">
   <sequence>
      <element name="pt" type="CT_AdjPoint2D" minOccurs="2" maxOccurs="2"/>
   </sequence>
</complexType>
```

5.1.11.22 rect (Shape Text Rectangle)

This element specifies the rectangular bounding box for text within a custGeom shape. The default for this rectangle is the bounding box for the shape. This can be modified using this elements four attributes to inset or extend the text bounding box.

[*Note*: Text specified to reside within this shape text rectangle may flow outside this bounding box. Depending on the autofit options within the txBody element the text may or may not entirely reside within this shape text rectangle. *end note*]

Parent Elements
custGeom (§5.1.11.8)

Attributes	Description
b (Bottom Position)	Specifies the y coordinate of the bottom edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).
l (Left)	Specifies the x coordinate of the left edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).
r (Right)	Specifies the x coordinate of the right edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element. The possible values for this attribute are defined by the ST_AdjCoordinate simple type

Attributes	Description
	(§5.1.12.2).
t (Top)	Specifies the y coordinate of the top edge for a shape text rectangle. The units for this edge is specified in EMUs as the positioning here is based on the shape coordinate system. The width and height for this coordinate system are specified within the ext transform element. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§5.1.12.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GeomRect">
   <attribute name="l" type="ST_AdjCoordinate" use="required"/>
   <attribute name="t" type="ST_AdjCoordinate" use="required"/>
   <attribute name="r" type="ST_AdjCoordinate" use="required"/>
   <attribute name="b" type="ST_AdjCoordinate" use="required"/>
</complexType>
```

5.1.12 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/drawingml/2006/main namespace.

5.1.12.1 ST_AdjAngle (Adjustable Angle Methods)

This simple type is an adjustable angle, either an absolute angle or a reference to a geometry guide. The units for an adjustable angle are 60,000ths of a degree.

This simple type is defined as a union of the following types:

- TheST_Angle simple type (§5.1.12.3).
- TheST_GeomGuideName simple type (§5.1.12.26).

Referenced By
ahPolar@maxAng (§5.1.11.2); ahPolar@minAng (§5.1.11.2); arcTo@stAng (§5.1.11.4); arcTo@swAng (§5.1.11.4); cxn@ang (§5.1.11.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AdjAngle">
   <union memberTypes="ST_Angle ST_GeomGuideName"/>
</simpleType>
```

5.1.12.2 ST_AdjCoordinate (Adjustable Coordinate Methods)

This simple type is an adjustable coordinate is either an absolute coordinate position or a reference to a geometry guide.

This simple type is defined as a union of the following types:

- TheST_Coordinate simple type (§5.1.12.16).
- TheST_GeomGuideName simple type (§5.1.12.26).

Referenced By
ahPolar@maxR (§5.1.11.2); ahPolar@minR (§5.1.11.2); ahXY@maxX (§5.1.11.3); ahXY@maxY (§5.1.11.3); ahXY@minX (§5.1.11.3); ahXY@minY (§5.1.11.3); arcTo@hR (§5.1.11.4); arcTo@wR (§5.1.11.4); pos@x (§5.1.11.17); pos@y (§5.1.11.17); pt@x (§5.1.11.20); pt@y (§5.1.11.20); rect@b (§5.1.11.22); rect@l (§5.1.11.22); rect@r (§5.1.11.22); rect@t (§5.1.11.22)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AdjCoordinate">
   <union memberTypes="ST_Coordinate ST_GeomGuideName"/>
</simpleType>
```

5.1.12.3 ST_Angle (Angle)

This simple type represents an angle in 60,000ths of a degree. Positive angles are clockwise (i.e., towards the positive y axis); negative angles are counter-clockwise (i.e., towards the negative y axis).

This simple type's contents are a restriction of the XML Schema int datatype.

Referenced By
animMotion@rAng (§4.6.4); animRot@by (§4.6.5); animRot@from (§4.6.5); animRot@to (§4.6.5); bodyPr@rot (§5.1.5.1.1); hsl@h (§4.6.46); hueOff@val (§5.1.2.2.16); ST_AdjAngle (§5.1.12.1); ST_FixedAngle (§5.1.12.21); ST_FOVAngle (§5.1.12.24); ST_PositiveFixedAngle (§5.1.12.44); xfrm@rot (§4.4.1.49); xfrm@rot (§5.1.9.6); xfrm@rot (§5.6.2.35); xfrm@rot (§5.8.2.28); xfrm@rot (§5.1.9.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Angle">
   <restriction base="xsd:int"/>
</simpleType>
```

5.1.12.4 ST_AnimationBuildType (Animation Build Type)

This simple type specifies the ways that an animation can be built, or animated.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allAtOnce (Animate At Once)	Animate all objects as one.

Referenced By
ST_AnimationChartBuildType (§5.1.12.5); ST_AnimationDgmBuildType (§5.1.12.7)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimationBuildType">
   <restriction base="xsd:token">
      <enumeration value="allAtOnce"/>
   </restriction>
</simpleType>
```

5.1.12.5 ST_AnimationChartBuildType (Chart Animation Build Type)

This simple type specifies the ways that a chart animation can be built. That is, it specifies the way in which the objects within the chart should be animated.

This simple type is defined as a union of the following types:

- TheST_AnimationBuildType simple type (§5.1.12.4).
- TheST_AnimationChartOnlyBuildType simple type (§5.1.12.6).

Referenced By
bldChart@bld (§5.1.2.1.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimationChartBuildType">
   <union memberTypes="ST_AnimationBuildType ST_AnimationChartOnlyBuildType"/>
</simpleType>
```

5.1.12.6 ST_AnimationChartOnlyBuildType (Chart only Animation Types)

This simple type specifies the build options available only for animating a chart. These options specify the manner in which the objects within the chart should be grouped and animated.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
category (Catefory)	Animate by each category
categoryEl (Category Element)	Animate by each element within the category
series (Series)	Animate by each series.
seriesEl (Series Element)	Animate by each element within the series

Referenced By
ST_AnimationChartBuildType (§5.1.12.5)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimationChartOnlyBuildType">
   <restriction base="xsd:token">
      <enumeration value="series"/>
      <enumeration value="category"/>
      <enumeration value="seriesEl"/>
      <enumeration value="categoryEl"/>
   </restriction>
</simpleType>
```

5.1.12.7 ST_AnimationDgmBuildType (Diagram Animation Build Type)

This simple type specifies the ways that a diagram animation can be built. That is, it specifies the way in which the objects within the diagram graphical object should be animated.

This simple type is defined as a union of the following types:

- TheST_AnimationBuildType simple type (§5.1.12.4).
- TheST_AnimationDgmOnlyBuildType simple type (§5.1.12.8).

Referenced By
bldDgm@bld (§5.1.2.1.2)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimationDgmBuildType">
   <union memberTypes="ST_AnimationBuildType ST_AnimationDgmOnlyBuildType"/>
</simpleType>
```

5.1.12.8 ST_AnimationDgmOnlyBuildType (Diagram only Animation Types)

This simple type specifies the build options available only for animating a diagram. These options specify the manner in which the objects within the chart should be grouped and animated.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
lvlAtOnce (Each Level at Once)	Animate the diagram one level at a time, animating the whole level as one object
lvlOne (Level One-by-One)	Animate the diagram by the elements within a level, animating them one level element at a time.
one (Elements One-by-One)	Animate the diagram by elements. For a tree diagram the animation will occur by branch within the diagram tree.

Referenced By
ST_AnimationDgmBuildType (§5.1.12.7)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_AnimationDgmOnlyBuildType">
   <restriction base="xsd:token">
      <enumeration value="one"/>
      <enumeration value="lvlOne"/>
      <enumeration value="lvlAtOnce"/>
   </restriction>
</simpleType>
```

5.1.12.9 ST_BevelPresetType (Bevel Presets)

Represents a preset for a type of bevel which can be applied to a shape in 3D. The bevel properties are applied differently depending on the type of bevel defined for a shape.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
angle (Angle)	[*Example*: Consider the following example of an `angle` bevel type applied to a shape:  *end example*]
artDeco (Art Deco)	[*Example*: Consider the following example of an `artDeco` bevel type applied to a shape:

Enumeration Value	Description
	 *end example*]
circle (Circle)	[*Example*: Consider the following example of an `circle` bevel type applied to a shape:  *end example*]
convex (Convex)	[*Example*: Consider the following example of an `convex` bevel type applied to a shape:  *end example*]
coolSlant (Cool Slant)	[*Example*: Consider the following example of an `coolSlant` bevel type applied to a shape:

Enumeration Value	Description
	 *end example*]
cross (Cross)	[*Example*: Consider the following example of an `cross` bevel type applied to a shape:  *end example*]
divot (Divot)	[*Example*: Consider the following example of an `divot` bevel type applied to a shape:  *end example*]
hardEdge (Hard Edge)	[*Example*: Consider the following example of an `hardEdge` bevel type applied to a shape:

Enumeration Value	Description
	 *end example*]
relaxedInset (Relaxed Inset)	[*Example*: Consider the following example of an `relaxedInset` bevel type applied to a shape:  *end example*]
riblet (Riblet)	[*Example*: Consider the following example of an `riblet` bevel type applied to a shape:  *end example*]
slope (Slope)	[*Example*: Consider the following example of an

Enumeration Value	Description
	`slope` bevel type applied to a shape:  *end example*]
softRound (Soft Round)	[*Example*: Consider the following example of an `softRound` bevel type applied to a shape:  *end example*]

Referenced By
bevel@prst (§5.1.4.2.5); bevelB@prst (§5.1.7.3); bevelT@prst (§5.1.7.4)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BevelPresetType">
   <restriction base="xsd:token">
      <enumeration value="relaxedInset"/>
      <enumeration value="circle"/>
      <enumeration value="slope"/>
      <enumeration value="cross"/>
      <enumeration value="angle"/>
      <enumeration value="softRound"/>
      <enumeration value="convex"/>
      <enumeration value="coolSlant"/>
      <enumeration value="divot"/>
      <enumeration value="riblet"/>
      <enumeration value="hardEdge"/>
      <enumeration value="artDeco"/>
   </restriction>
</simpleType>
```

5.1.12.10 ST_BlackWhiteMode (Black and White Mode)

This simple type specifies how an object should be rendered when specified to be in black and white mode.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Automatic)	Object rendered with automatic coloring
black (Black)	Object rendered with black-only coloring
blackGray (Black and Gray)	Object rendered with black and gray coloring
blackWhite (Black and White)	Object rendered within black and white coloring
clr (Color)	Object rendered with normal coloring
gray (Gray)	Object rendered with gray coloring
grayWhite (Gray and White)	Object rendered within gray and white coloring
hidden (Hidden)	Object rendered with hidden coloring
invGray (Inverse Gray)	Object rendered with inverse gray coloring
ltGray (Light Gray)	Object rendered with light gray coloring
white (White)	Object rendered within white coloirng

Referenced By
bg@bwMode (§4.4.1.1); grpSpPr@bwMode (§5.8.2.14); grpSpPr@bwMode (§4.4.1.20); grpSpPr@bwMode (§5.1.2.1.22); grpSpPr@bwMode (§5.6.2.17); spPr@bwMode (§5.6.2.29); spPr@bwMode (§5.7.2.198); spPr@bwMode (§5.8.2.23); spPr@bwMode (§5.1.2.1.35); spPr@bwMode (§4.4.1.41); spPr@bwMode (§5.9.3.7); spPr@bwMode (§5.2.2.6)

      <enumeration value="blackWhite"/>
      <enumeration value="black"/>
      <enumeration value="white"/>
      <enumeration value="hidden"/>
   </restriction>
</simpleType>
```

5.1.12.11 ST_BlendMode (Blend Mode)

This simple type describes how to render effects one on top of another.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
darken (Darken)	Darken
lighten (Lighten)	Lighten
mult (Multiply)	Multiply
over (Overlay)	Overlay
screen (Screen)	Screen

Referenced By
blend@blend (§5.1.10.12); fillOverlay@blend (§5.1.10.29)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BlendMode">
   <restriction base="xsd:token">
      <enumeration value="over"/>
      <enumeration value="mult"/>
      <enumeration value="screen"/>
      <enumeration value="darken"/>
      <enumeration value="lighten"/>
   </restriction>
</simpleType>
```

5.1.12.12 ST_BlipCompression (Blip Compression Type)

This type specifies the amount of compression that has been used for a particular binary large image or picture (blip).

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
email (Email Compression)	Compression size suitable for inclusion with email
hqprint (High Quality Printing Compression)	Compression size suitable for high quality printing
none (No Compression)	No compression was used
print (Printing Compression)	Compression size suitable for printing
screen (Screen Viewing Compression)	Compression size suitable for viewing on screen

Referenced By
blip@cstate (§5.1.10.13)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_BlipCompression">
   <restriction base="xsd:token">
      <enumeration value="email"/>
      <enumeration value="screen"/>
      <enumeration value="print"/>
      <enumeration value="hqprint"/>
      <enumeration value="none"/>
   </restriction>
</simpleType>
```

5.1.12.13 ST_ChartBuildStep (Chart Animation Build Step)

This simple type specifies an animation build step within a chart animation.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
allPts (All Points)	Animate all points within the chart for this animation build step
category (Category)	Animate a chart category for this animation build step
gridLegend (Grid and Legend)	Animate the chart grid and legend for this animation build step

Enumeration Value	Description
ptInCategory (Category Points)	Animate a point in a chart category for this animation build step
ptInSeries (Series Points)	Animate a point in a chart series for this animation build step
series (Series)	Animate a chart series for this animation build step

Referenced By
chart@bldStep (§5.1.2.1.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_ChartBuildStep">
   <restriction base="xsd:token">
      <enumeration value="category"/>
      <enumeration value="ptInCategory"/>
      <enumeration value="series"/>
      <enumeration value="ptInSeries"/>
      <enumeration value="allPts"/>
      <enumeration value="gridLegend"/>
   </restriction>
</simpleType>
```

5.1.12.14 ST_ColorSchemeIndex (Theme Color Reference)

A reference to a color in the color scheme.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
accent1 (Accent 1)	Represents the accent 1 color.
accent2 (Accent 2)	Represents the accent 2 color.
accent3 (Accent 3)	Represents the accent 3 color.
accent4 (Accent 4)	Represents the accent 4 color.
accent5 (Accent 5)	Represents the accent 5 color.
accent6 (Accent 6)	Represents the accent 6 color.
dk1 (Dark 1)	Represents the first dark color.
dk2 (Dark 2)	Represents the second dark color.
folHlink (Followed Hyperlink)	Represents the followed hyperlink color.
hlink (Hyperlink)	Represents the hyperlink color.
lt1 (Light 1)	Represents the first light color.

Enumeration Value	Description
lt2 (Light 2)	Represents the second light color.

   </restriction>
</simpleType>
```

5.1.12.15 ST_CompoundLine (Compound Line Type)

This type specifies the compound line type that is to be used for lines with text such as underlines.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dbl (Double Lines)	Double lines of equal width
sng (Single Line)	Single line: one normal width
thickThin (Thick Thin Double Lines)	Double lines: one thick, one thin
thinThick (Thin Thick Double Lines)	Double lines: one thin, one thick
tri (Thin Thick Thin Triple Lines)	Three lines: thin, thick, thin

      <enumeration value="thickThin"/>
      <enumeration value="thinThick"/>
      <enumeration value="tri"/>
   </restriction>
</simpleType>
```

5.1.12.16 ST_Coordinate (Coordinate)

This simple type represents a one dimensional position or length in EMUs. EMUs (English Metric Units) are a high precision coordinate space (914400 dpi / 360000 dpc).

This simple type's contents are a restriction of the XML Schema long datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -27273042329600.
- This simple type has a maximum value of less than or equal to 27273042316900.

   </restriction>
</simpleType>
```

5.1.12.17 ST_Coordinate32 (Coordinate Point)

This type specifies a coordinate within the document. This may be used for measurements or spacing with the maximum size requirement being a 32 bit integer.

NOTE: The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the XML Schema int datatype.

   <restriction base="xsd:int"/>
</simpleType>
```

5.1.12.18 ST_DgmBuildStep (Diagram Animation Build Steps)

This simple type specifies an animation build step within a diagram animation.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bg (Background)	Animate the diagram background for this animation build step
sp (Shape)	Animate a diagram shape for this animation build step

Referenced By
dgm@bldStep (§5.1.2.1.12)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_DgmBuildStep">
   <restriction base="xsd:token">

</simpleType>
```

5.1.12.20 ST_EffectContainerType (Effect Container Type)

This simple type determines the relationship between effects in a container, either sibling or tree.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
sib (Sibling)	Each effect is separately applied to the parent object. [*Example*: If the parent element contains an outer shadow and a reflection, the resulting effect will be a shadow around the parent object and a reflection of the object. The reflection will not have a shadow. *end example*]
tree (Tree)	Each effect is applied to the result of the previous effect. [*Example*: If the parent element contains an outer shadow followed by a glow, the shadow will first be applied to the parent object. Then, the glow will be applied to the shadow (rather than the original object). The resulting effect would be a glowing shadow. *end example*]

Referenced By
cont@type (§5.1.10.20); effectDag@type (§5.1.10.25)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_EffectContainerType">

      <enumeration value="tree"/>
   </restriction>
</simpleType>
```

5.1.12.21 ST_FixedAngle (Fixed Angle)

This simple type represents a fixed range angle in 60000ths of a degree. Range from (-90, 90 degrees).

This simple type's contents are a restriction of the ST_Angle simple type (§5.1.12.3).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than -5400000.
- This simple type has a maximum value of less than 5400000.

Referenced By
outerShdw@kx (§5.1.10.45); outerShdw@ky (§5.1.10.45); reflection@kx (§5.1.10.50); reflection@ky (§5.1.10.50); xfrm@kx (§5.1.10.61); xfrm@ky (§5.1.10.61)

      <maxExclusive value="5400000"/>
   </restriction>
</simpleType>
```

5.1.12.22 ST_FixedPercentage (Fixed Percentage)

This simple type represents a fixed percentage in 1000ths of a percent. Range from [-100%, 100%].

This simple type's contents are a restriction of the ST_Percentage simple type (§5.1.12.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -100000.
- This simple type has a maximum value of less than or equal to 100000.

</simpleType>
```

5.1.12.23 ST_FontCollectionIndex (Font Collection Index)

This simple type represents one of the fonts associated with the style.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
major (Major Font)	The major font of the style's font scheme.
minor (Minor Font)	The minor font of the style's font scheme.
none (None)	No font reference.

Referenced By
fontRef@idx (§5.1.4.1.17)

   </restriction>
</simpleType>
```

5.1.12.24 ST_FOVAngle (Field of View Angle)

Represents a positive angle in 60000ths of a degree. Range from [0, 180] degrees.

This simple type's contents are a restriction of the ST_Angle simple type (§5.1.12.3).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

- This simple type has a maximum value of less than or equal to 10800000.

Referenced By
camera@fov (§5.1.7.5)

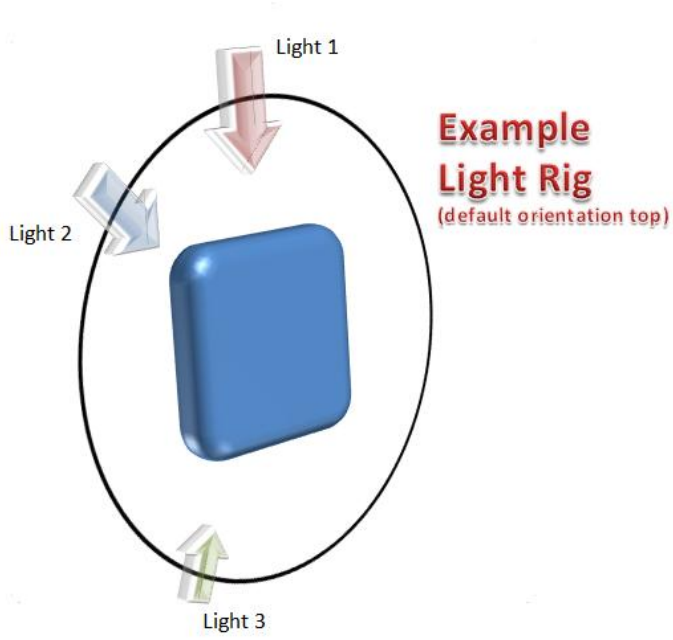
   <restriction base="xsd:hexBinary">
      <length value="3"/>
   </restriction>
</simpleType>
```

5.1.12.29 ST_LightRigDirection (Light Rig Direction)

Represents the direction from which the light rig is positioned relative to the scene. The light rig, itself, can be made up of multiple lights in any orientation around a given shape. This simple type defines the orientation of the light rig as a whole, and not the individual lights within the rig. This means that because the direction of the light rig is left, that does not guarantee the light will be coming from the left side of the shape, but rather the orientation of the rig as a whole is rotated to the left.

[*Example*: Consider the following example as a visual representation of a light rig oriented from the top of the shape in the center:



In this example we see that the light rig defines three lights (all in a single plane as represented by the black circular line). The lights defined in this representation can all have different intensities, which means, for this example, Light 3 and Light 2 look to have a more intense effect (or could even be a different color) than Light 1. One can image rotating this rig to the so that Light 1 is to the right of the shape when the light rig direction is defined to be right. *end example*]

The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Three Point light rig type
- Circle bevel type
- Plastic material type
- Camera type defined by the `orthographicFront` preset
- Bevel width and height each equal to `190500`

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Bottom)	[*Example*: Consider the following example of a light direction from the bottom:

Enumeration Value	Description
	 *end example*]
bl (Bottom Left)	[*Example*: Consider the following example of a light direction from the bottom left:  *end example*]
br (Bottom Right)	[*Example*: Consider the following example of a light direction from the bottom right:  *end example*]
l (Left)	[*Example*: Consider the following example of a light direction from the left:

Enumeration Value	Description
	 *end example*]
r (Right)	[*Example*: Consider the following example of a light direction from the right:  *end example*]
t (Top)	[*Example*: Consider the following example of a light direction from the top:  *end example*]
tl (Top Left)	[*Example*: Consider the following example of a light

Enumeration Value	Description
	direction from the top left:  *end example*]
tr (Top Right)	[*Example*: Consider the following example of a light direction from the top right:  *end example*]

Referenced By
lightRig@dir (§5.1.7.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LightRigDirection">
   <restriction base="xsd:token">

      <enumeration value="t"/>
      <enumeration value="tr"/>
      <enumeration value="l"/>
      <enumeration value="r"/>
      <enumeration value="bl"/>
      <enumeration value="b"/>
      <enumeration value="br"/>
   </restriction>
</simpleType>
```

5.1.12.30 ST_LightRigType (Light Rig Type)

Represents a preset light right that can be applied to a shape. The light rig represents a group of lights oriented in a specific way relative to a 3D scene. The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Circle bevel type
- Warm Matte material type
- Camera type defined by the `perspectiveContrastingRightFacing` preset
- Bevel width and height each equal to `190500`

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
balanced (Light Rig Enum (Balanced))	Balanced
brightRoom (Bright Room)	[*Example*: Consider the following example of the `brightRoom` light rig applied to a basic shape: 

Enumeration Value	Description
	end example]
chilly (Chilly)	[*Example*: Consider the following example of the `chilly` light rig applied to a basic shape:  *end example*]
contrasting (Contrasting)	[*Example*: Consider the following example of the `contrasting` light rig applied to a basic shape:  *end example*]
flat (Flat)	[*Example*: Consider the following example of the `flat` light rig applied to a basic shape: 

Enumeration Value	Description
	end example]
flood (Flood)	[*Example*: Consider the following example of the `flood` light rig applied to a basic shape:  *end example*]
freezing (Freezing)	[*Example*: Consider the following example of the `freezing` light rig applied to a basic shape:  *end example*]
glow (Glow)	[*Example*: Consider the following example of the `glow` light rig applied to a basic shape:

Enumeration Value	Description
	 *end example*]
harsh (Harsh)	[*Example*: Consider the following example of the `harsh` light rig applied to a basic shape:  *end example*]
legacyFlat1 (Legacy Flat 1)	[*Example*: Consider the following example of the `legacyFlat1` light rig applied to a basic shape:  *end example*]
legacyFlat2 (Legacy Flat 2)	[*Example*: Consider the following example of the `legacyFlat2` light rig applied to a basic shape:

Enumeration Value	Description
	 *end example*]

      <enumeration value="brightRoom"/>
   </restriction>
</simpleType>
```

5.1.12.31 ST_LineCap (End Line Cap)

This type specifies how to cap the ends of lines. This also affects the ends of line segments for dashed lines.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
flat (Flat Line Cap)	Line ends at end point.
rnd (Round Line Cap)	Rounded ends. Semi-circle protrudes by half line width.
sq (Square Line Cap)	Square protrudes by half line width.

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LineCap">
   <restriction base="xsd:token">
      <enumeration value="rnd"/>
      <enumeration value="sq"/>
      <enumeration value="flat"/>
   </restriction>
</simpleType>
```

5.1.12.32 ST_LineEndLength (Line End Length)

This simple type represents the length of the line end decoration (e.g., arrowhead) relative to the width of the line itself.

[*Example:* See the example images below. These samples have an arrow line end type and medium line end width. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
lg (Large)	Large
med (Medium)	Medium
sm (Small)	Small

Referenced By
headEnd@len (§5.1.10.38); tailEnd@len (§5.1.10.57)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LineEndLength">
   <restriction base="xsd:token">
      <enumeration value="sm"/>
      <enumeration value="med"/>
      <enumeration value="lg"/>
   </restriction>
</simpleType>
```

5.1.12.33 ST_LineEndType (Line End Type)

This simple type represents the shape decoration that appears at the ends of lines. For example, one choice is an arrow head.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
arrow (Arrow Head)	 Line arrow head
diamond (Diamond)	 Diamond
none (None)	No end
oval (Oval)	 Oval
stealth (Stealth Arrow)	 Stealth arrow head
triangle (Triangle Arrow Head)	 Triangle arrow head

Referenced By
headEnd@type (§5.1.10.38); tailEnd@type (§5.1.10.57)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LineEndType">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="triangle"/>
      <enumeration value="stealth"/>
      <enumeration value="diamond"/>
      <enumeration value="oval"/>
      <enumeration value="arrow"/>
   </restriction>
</simpleType>
```

5.1.12.34 ST_LineEndWidth (Line End Width)

This simple type represents the width of the line end decoration (e.g., arrowhead) relative to the width of the line itself.

[*Example:* See the example images below. These samples have an arrow line end type and medium line end length. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
lg (Large)	→ Large
med (Medium)	→ Medium
sm (Small)	→ Small

Referenced By
headEnd@w (§5.1.10.38); tailEnd@w (§5.1.10.57)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LineEndWidth">
   <restriction base="xsd:token">
      <enumeration value="sm"/>
      <enumeration value="med"/>
      <enumeration value="lg"/>
   </restriction>
</simpleType>
```

5.1.12.35 ST_LineWidth (Line Width)

This type specifies the width of a line in EMUs. 1 pt = 12700 EMUs.

This simple type's contents are a restriction of the ST_Coordinate32 simple type (§5.1.12.17).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 20116800.

Referenced By
ln@w (§5.1.2.1.24); lnB@w (§5.1.6.3); lnBlToTr@w (§5.1.6.4); lnL@w (§5.1.6.5); lnR@w (§5.1.6.6); lnT@w (§5.1.6.7); lnTlToBr@w (§5.1.6.8); uLn@w (§5.1.5.3.14)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_LineWidth">
   <restriction base="ST_Coordinate32">
      <minInclusive value="0"/>
      <maxInclusive value="20116800"/>
   </restriction>
</simpleType>
```

5.1.12.36 ST_OnOffStyleType (On/Off Style Type)

This simple type represents whether a style property should be applied.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
def (Default)	Follow parent settings. For a themed property, follow the theme settings. For an unthemed property, follow the parent setting in the property inheritance chain.
off (Off)	Property is off.
on (On)	Property is on.

Referenced By
tcTxStyle@b (§5.1.4.2.30); tcTxStyle@i (§5.1.4.2.30)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_OnOffStyleType">
   <restriction base="xsd:token">
      <enumeration value="on"/>
      <enumeration value="off"/>
      <enumeration value="def"/>
   </restriction>
</simpleType>
```

5.1.12.37 ST_Panose (Panose Type)

This type specifies the Panose setting for this font so that generating applications using this Office Open XML Standard may determine the closest font type if necessary.

This simple type's contents are a restriction of the XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents must have a length of exactly 10 characters.

Referenced By
buFont@panose (§5.1.5.4.6); cs@panose (§5.1.5.3.1); ea@panose (§5.1.5.3.3); font@panose (§4.3.1.10); latin@panose (§5.1.5.3.7); sym@panose (§5.1.5.3.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_Panose">
   <restriction base="xsd:hexBinary">
      <length value="10"/>
   </restriction>
</simpleType>
```

5.1.12.38 ST_PathFillMode (Path Fill Mode)

This simple type specifies the manner in which a path should be filled. The lightening and darkening of a path allow for certain parts of the shape to be colored lighter of darker depending on user preference.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
darken (Darken Path Fill)	This specifies that the corresponding path should have a darker shaded color applied to it's fill.
darkenLess (Darken Path Fill Less)	This specifies that the corresponding path should have a slightly darker shaded color applied to it's fill.
lighten (Lighten Path Fill)	This specifies that the corresponding path should have a lightly shaded color applied to it's fill.
lightenLess (Lighten Path Fill Less)	This specifies that the corresponding path should have a slightly lighter shaded color applied to it's fill.
none (No Path Fill)	This specifies that the corresponding path should have no fill.
norm (Normal Path Fill)	This specifies that the corresponding path should have a normally shaded color applied to it's fill.

Referenced By
path@fill (§5.1.11.15)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PathFillMode">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="norm"/>
      <enumeration value="lighten"/>
      <enumeration value="lightenLess"/>
      <enumeration value="darken"/>
      <enumeration value="darkenLess"/>
   </restriction>
</simpleType>
```

5.1.12.39 ST_PathShadeType (Path Shade Type)

This simple type describes the shape of path to follow for a path gradient shade.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
circle (Circle)	Gradient follows a circular path
rect (Rectangle)	Gradient follows a rectangular path
shape (Shape)	Gradient follows the shape

Referenced By
path@path (§5.1.10.46)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PathShadeType">
   <restriction base="xsd:token">
      <enumeration value="shape"/>
      <enumeration value="circle"/>
      <enumeration value="rect"/>
   </restriction>
</simpleType>
```

5.1.12.40 ST_PenAlignment (Alignment Type)

This type specifies the Pen Alignment type for use within a text body.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Center Alignment)	Center pen (line drawn at center of path stroke).
in (Inset Alignment)	Inset pen (the pen is aligned on the inside of the edge of the path).

Referenced By
ln@algn (§5.1.2.1.24); lnB@algn (§5.1.6.3); lnBlToTr@algn (§5.1.6.4); lnL@algn (§5.1.6.5); lnR@algn (§5.1.6.6); lnT@algn (§5.1.6.7); lnTlToBr@algn (§5.1.6.8); uLn@algn (§5.1.5.3.14)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_PenAlignment">
   <restriction base="xsd:token">
      <enumeration value="ctr"/>
      <enumeration value="in"/>
   </restriction>
</simpleType>
```

5.1.12.41 ST_Percentage (Percentage)

This simple type represents a percentage in 1000ths of a percent, e.g., a value of 1 represents 0.001% == 0.00001; a value of 100000 is equal to 100%. Percentages have no intrinsic units, but are used to scale other values with units.

This simple type's contents are a restriction of the XML Schema int datatype.

Referenced By

   <restriction base="xsd:int"/>
</simpleType>
```

5.1.12.42 ST_PositiveCoordinate (Positive Coordinate)

This simple type represents a positive position or length in EMUs.

This simple type's contents are a restriction of the XML Schema long datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 27273042316900.

</simpleType>
```

5.1.12.43 ST_PositiveCoordinate32 (Positive Coordinate Point)

This type specifies the a positive coordinate point that has a maximum size of 32 bits.

NOTE: The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the ST_Coordinate32 simple type (§5.1.12.17).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

Referenced By
bodyPr@spcCol (§5.1.5.1.1); control@imgH (§4.4.2.1); control@imgW (§4.4.2.1); oleObj@imgH (§4.4.2.4); oleObj@imgW (§4.4.2.4); ST_SlideSizeCoordinate (§4.8.21)

5.1.12.47 ST_PresetCameraType (Preset Camera Type)

These enumeration values represent different algorithmic methods for setting all camera properties, including position. The following example images below are all based off the following shape:

In this image, we can see the shape has a camera pointing directly at the front face.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
isometricBottomDown (Isometric Bottom Down)	[*Example*: Consider the following example of the camera preset type:  *end example*]
isometricBottomUp (Isometric Bottom Up)	[*Example*: Consider the following example of the

5.1.12.48 ST_PresetColorVal (Preset Color Value)

This simple type represents a preset color value.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
aliceBlue (Alice Blue Preset Color)	Specifies a color with RGB value (240,248,255)
antiqueWhite (Antique White Preset Color)	Specifies a color with RGB value (250,235,215)
aqua (Aqua Preset Color)	Specifies a color with RGB value (0,255,255)
aquamarine (Aquamarine Preset Color)	Specifies a color with RGB value (127,255,212)
azure (Azure Preset Color)	Specifies a color with RGB value (240,255,255)
beige (Beige Preset Color)	Specifies a color with RGB value (245,245,220)
bisque (Bisque Preset Color)	Specifies a color with RGB value (255,228,196)
black (Black Preset Color)	Specifies a color with RGB value (0,0,0)
blanchedAlmond (Blanched Almond Preset Color)	Specifies a color with RGB value (255,235,205)
blue (Blue Preset Color)	Specifies a color with RGB value (0,0,255)
blueViolet (Blue Violet Preset Color)	Specifies a color with RGB value (138,43,226)
brown (Brown Preset Color)	Specifies a color with RGB value (165,42,42)
burlyWood (Burly Wood Preset Color)	Specifies a color with RGB value (222,184,135)
cadetBlue (Cadet Blue Preset Color)	Specifies a color with RGB value (95,158,160)
chartreuse (Chartreuse Preset Color)	Specifies a color with RGB value (127,255,0)
chocolate (Chocolate Preset Color)	Specifies a color with RGB value (210,105,30)
coral (Coral Preset Color)	Specifies a color with RGB value (255,127,80)
cornflowerBlue (Cornflower Blue Preset Color)	Specifies a color with RGB value (100,149,237)
cornsilk (Cornsilk Preset Color)	Specifies a color with RGB value (255,248,220)

Enumeration Value	Description
crimson (Crimson Preset Color)	Specifies a color with RGB value (220,20,60)
cyan (Cyan Preset Color)	Specifies a color with RGB value (0,255,255)
deepPink (Deep Pink Preset Color)	Specifies a color with RGB value (255,20,147)
deepSkyBlue (Deep Sky Blue Preset Color)	Specifies a color with RGB value (0,191,255)
dimGray (Dim Gray Preset Color)	Specifies a color with RGB value (105,105,105)
dkBlue (Dark Blue Preset Color)	Specifies a color with RGB value (0,0,139)
dkCyan (Dark Cyan Preset Color)	Specifies a color with RGB value (0,139,139)
dkGoldenrod (Dark Goldenrod Preset Color)	Specifies a color with RGB value (184,134,11)
dkGray (Dark Gray Preset Color)	Specifies a color with RGB value (169,169,169)
dkGreen (Dark Green Preset Color)	Specifies a color with RGB value (0,100,0)
dkKhaki (Dark Khaki Preset Color)	Specifies a color with RGB value (189,183,107)
dkMagenta (Dark Magenta Preset Color)	Specifies a color with RGB value (139,0,139)
dkOliveGreen (Dark Olive Green Preset Color)	Specifies a color with RGB value (85,107,47)
dkOrange (Dark Orange Preset Color)	Specifies a color with RGB value (255,140,0)
dkOrchid (Dark Orchid Preset Color)	Specifies a color with RGB value (153,50,204)
dkRed (Dark Red Preset Color)	Specifies a color with RGB value (139,0,0)
dkSalmon (Dark Salmon Preset Color)	Specifies a color with RGB value (233,150,122)
dkSeaGreen (Dark Sea Green Preset Color)	Specifies a color with RGB value (143,188,139)
dkSlateBlue (Dark Slate Blue Preset Color)	Specifies a color with RGB value (72,61,139)
dkSlateGray (Dark Slate Gray Preset Color)	Specifies a color with RGB value (47,79,79)
dkTurquoise (Dark Turquoise Preset Color)	Specifies a color with RGB value (0,206,209)
dkViolet (Dark Violet Preset Color)	Specifies a color with RGB value (148,0,211)
dodgerBlue (Dodger Blue Preset Color)	Specifies a color with RGB value (30,144,255)
firebrick (Firebrick Preset Color)	Specifies a color with RGB value (178,34,34)
floralWhite (Floral White Preset Color)	Specifies a color with RGB value (255,250,240)
forestGreen (Forest Green Preset Color)	Specifies a color with RGB value (34,139,34)
fuchsia (Fuchsia Preset Color)	Specifies a color with RGB value (255,0,255)
gainsboro (Gainsboro Preset Color)	Specifies a color with RGB value (220,220,220)
ghostWhite (Ghost White Preset Color)	Specifies a color with RGB value (248,248,255)
gold (Gold Preset Color)	Specifies a color with RGB value (255,215,0)
goldenrod (Goldenrod Preset Color)	Specifies a color with RGB value (218,165,32)
gray (Gray Preset Color)	Specifies a color with RGB value (128,128,128)
green (Green Preset Color)	Specifies a color with RGB value (0,128,0)
greenYellow (Green Yellow Preset Color)	Specifies a color with RGB value (173,255,47)

Enumeration Value	Description
honeydew (Honeydew Preset Color)	Specifies a color with RGB value (240,255,240)
hotPink (Hot Pink Preset Color)	Specifies a color with RGB value (255,105,180)
indianRed (Indian Red Preset Color)	Specifies a color with RGB value (205,92,92)
indigo (Indigo Preset Color)	Specifies a color with RGB value (75,0,130)
ivory (Ivory Preset Color)	Specifies a color with RGB value (255,255,240)
khaki (Khaki Preset Color)	Specifies a color with RGB value (240,230,140)
lavender (Lavender Preset Color)	Specifies a color with RGB value (230,230,250)
lavenderBlush (Lavender Blush Preset Color)	Specifies a color with RGB value (255,240,245)
lawnGreen (Lawn Green Preset Color)	Specifies a color with RGB value (124,252,0)
lemonChiffon (Lemon Chiffon Preset Color)	Specifies a color with RGB value (255,250,205)
lime (Lime Preset Color)	Specifies a color with RGB value (0,255,0)
limeGreen (Lime Green Preset Color)	Specifies a color with RGB value (50,205,50)
linen (Linen Preset Color)	Specifies a color with RGB value (250,240,230)
ltBlue (Light Blue Preset Color)	Specifies a color with RGB value (173,216,230)
ltCoral (Light Coral Preset Color)	Specifies a color with RGB value (240,128,128)
ltCyan (Light Cyan Preset Color)	Specifies a color with RGB value (224,255,255)
ltGoldenrodYellow (Light Goldenrod Yellow Preset Color)	Specifies a color with RGB value (250,250,120)
ltGray (Light Gray Preset Color)	Specifies a color with RGB value (211,211,211)
ltGreen (Light Green Preset Color)	Specifies a color with RGB value (144,238,144)
ltPink (Light Pink Preset Color)	Specifies a color with RGB value (255,182,193)
ltSalmon (Light Salmon Preset Color)	Specifies a color with RGB value (255,160,122)
ltSeaGreen (Light Sea Green Preset Color)	Specifies a color with RGB value (32,178,170)
ltSkyBlue (Light Sky Blue Preset Color)	Specifies a color with RGB value (135,206,250)
ltSlateGray (Light Slate Gray Preset Color)	Specifies a color with RGB value (119,136,153)
ltSteelBlue (Light Steel Blue Preset Color)	Specifies a color with RGB value (176,196,222)
ltYellow (Light Yellow Preset Color)	Specifies a color with RGB value (255,255,224)
magenta (Magenta Preset Color)	Specifies a color with RGB value (255,0,255)
maroon (Maroon Preset Color)	Specifies a color with RGB value (128,0,0)
medAquamarine (Medium Aquamarine Preset Color)	Specifies a color with RGB value (102,205,170)
medBlue (Medium Blue Preset Color)	Specifies a color with RGB value (0,0,205)
medOrchid (Medium Orchid Preset Color)	Specifies a color with RGB value (186,85,211)
medPurple (Medium Purple Preset Color)	Specifies a color with RGB value (147,112,219)
medSeaGreen (Medium Sea Green Preset Color)	Specifies a color with RGB value (60,179,113)

Enumeration Value	Description
medSlateBlue (Medium Slate Blue Preset Color)	Specifies a color with RGB value (123,104,238)
medSpringGreen (Medium Spring Green Preset Color)	Specifies a color with RGB value (0,250,154)
medTurquoise (Medium Turquoise Preset Color)	Specifies a color with RGB value (72,209,204)
medVioletRed (Medium Violet Red Preset Color)	Specifies a color with RGB value (199,21,133)
midnightBlue (Midnight Blue Preset Color)	Specifies a color with RGB value (25,25,112)
mintCream (Mint Cream Preset Color)	Specifies a color with RGB value (245,255,250)
mistyRose (Misty Rose Preset Color)	Specifies a color with RGB value (255,228,225)
moccasin (Moccasin Preset Color)	Specifies a color with RGB value (255,228,181)
navajoWhite (Navajo White Preset Color)	Specifies a color with RGB value (255,222,173)
navy (Navy Preset Color)	Specifies a color with RGB value (0,0,128)
oldLace (Old Lace Preset Color)	Specifies a color with RGB value (253,245,230)
olive (Olive Preset Color)	Specifies a color with RGB value (128,128,0)
oliveDrab (Olive Drab Preset Color)	Specifies a color with RGB value (107,142,35)
orange (Orange Preset Color)	Specifies a color with RGB value (255,165,0)
orangeRed (Orange Red Preset Color)	Specifies a color with RGB value (255,69,0)
orchid (Orchid Preset Color)	Specifies a color with RGB value (218,112,214)
paleGoldenrod (Pale Goldenrod Preset Color)	Specifies a color with RGB value (238,232,170)
paleGreen (Pale Green Preset Color)	Specifies a color with RGB value (152,251,152)
paleTurquoise (Pale Turquoise Preset Color)	Specifies a color with RGB value (175,238,238)
paleVioletRed (Pale Violet Red Preset Color)	Specifies a color with RGB value (219,112,147)
papayaWhip (Papaya Whip Preset Color)	Specifies a color with RGB value (255,239,213)
peachPuff (Peach Puff Preset Color)	Specifies a color with RGB value (255,218,185)
peru (Peru Preset Color)	Specifies a color with RGB value (205,133,63)
pink (Pink Preset Color)	Specifies a color with RGB value (255,192,203)
plum (Plum Preset Color)	Specifies a color with RGB value (221,160,221)
powderBlue (Powder Blue Preset Color)	Specifies a color with RGB value (176,224,230)
purple (Purple Preset Color)	Specifies a color with RGB value (128,0,128)
red (Red Preset Color)	Specifies a color with RGB value (255,0,0)
rosyBrown (Rosy Brown Preset Color)	Specifies a color with RGB value (188,143,143)
royalBlue (Royal Blue Preset Color)	Specifies a color with RGB value (65,105,225)
saddleBrown (Saddle Brown Preset Color)	Specifies a color with RGB value (139,69,19)
salmon (Salmon Preset Color)	Specifies a color with RGB value (250,128,114)
sandyBrown (Sandy Brown Preset Color)	Specifies a color with RGB value (244,164,96)
seaGreen (Sea Green Preset Color)	Specifies a color with RGB value (46,139,87)

Enumeration Value	Description
seaShell (Sea Shell Preset Color)	Specifies a color with RGB value (255,245,238)
sienna (Sienna Preset Color)	Specifies a color with RGB value (160,82,45)
silver (Silver Preset Color)	Specifies a color with RGB value (192,192,192)
skyBlue (Sky Blue Preset Color)	Specifies a color with RGB value (135,206,235)
slateBlue (Slate Blue Preset Color)	Specifies a color with RGB value (106,90,205)
slateGray (Slate Gray Preset Color)	Specifies a color with RGB value (112,128,144)
snow (Snow Preset Color)	Specifies a color with RGB value (255,250,250)
springGreen (Spring Green Preset Color)	Specifies a color with RGB value (0,255,127)
steelBlue (Steel Blue Preset Color)	Specifies a color with RGB value (70,130,180)
tan (Tan Preset Color)	Specifies a color with RGB value (210,180,140)
teal (Teal Preset Color)	Specifies a color with RGB value (0,128,128)
thistle (Thistle Preset Color)	Specifies a color with RGB value (216,191,216)
tomato (Tomato Preset Color)	Specifies a color with RGB value (255,99,71)
turquoise (Turquoise Preset Color)	Specifies a color with RGB value (64,224,208)
violet (Violet Preset Color)	Specifies a color with RGB value (238,130,238)
wheat (Wheat Preset Color)	Specifies a color with RGB value (245,222,179)
white (White Preset Color)	Specifies a color with RGB value (255,255,255)
whiteSmoke (White Smoke Preset Color)	Specifies a color with RGB value (245,245,245)
yellow (Yellow Preset Color)	Specifies a color with RGB value (255,255,0)
yellowGreen (Yellow Green Preset Color)	Specifies a color with RGB value (154,205,50)

5.1.12.49 ST_PresetLineDashVal (Preset Line Dash Value)

This simple type represents preset line dash values. The description for each style shows an illustration of the line style. Each style also contains a precise binary representation of the repeating dash style. Each 1 corresponds to a line segment of the same length as the line width, and each 0 corresponds to a space of the same length as the line width.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
dash (Dash)	 1111000
dashDot (Dash Dot)	 11110001000

```

5.1.12.50 ST_PresetMaterialType (Preset Material Type)

Describes surface appearance of a shape. The material type combines with lighting characteristics to create the final look and feel of a shape. The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Circle bevel type
- Three Point light rig type
- Camera type defined by the `perspectiveContrastingRightFacing` preset
- Bevel width and height each equal to `190500`

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clear (Clear)	[*Example*: Consider the following example of the `clear` material type:  *end example*]

Enumeration Value	Description
dkEdge (Dark Edge)	[*Example*: Consider the following example of the `dkEdge` material type:  *end example*]
flat (Flat)	[*Example*: Consider the following example of the `flat` material type:  *end example*]
legacyMatte (Legacy Matte)	[*Example*: Consider the following example of the `legacyMatte` material type: 

Enumeration Value	Description
	end example]
legacyMetal (Legacy Metal)	[*Example*: Consider the following example of the `legacyMetal` material type:  *end example*]
legacyPlastic (Legacy Plastic)	[*Example*: Consider the following example of the `legacyPlastic` material type:  *end example*]
legacyWireframe (Legacy Wireframe)	[*Example*: Consider the following example of the `legacyWireframe` material type: 
Enumeration Value	Description
	end example]
matte (Matte)	[*Example*: Consider the following example of the `matte` material type:  *end example*]
metal (Metal)	[*Example*: Consider the following example of the `warmMatte` material type:  *end example*]
plastic (Plastic)	[*Example*: Consider the following example of the `warmMatte` material type:

Enumeration Value	Description
	 *end example*]
powder (Powder)	[*Example*: Consider the following example of the `warmMatte` material type:  *end example*]
softEdge (Soft Edge)	[*Example*: Consider the following example of the `warmMatte` material type:  *end example*]
softmetal (Soft Metal)	[*Example*: Consider the following example of the `softmetal` material type:

Enumeration Value	Description
	 *end example*]
translucentPowder (Translucent Powder)	[*Example*: Consider the following example of the `warmMatte` material type:  *end example*]
warmMatte (Warm Matte)	[*Example*: Consider the following example of the `warmMatte` material type:  *end example*]

5.1.12.52 ST_PresetShadowVal (Preset Shadow Type)

This simple type indicates one of 20 preset shadow types. Each enumeration value description illustrates the type of shadow represented by the value. Each description contains the parameters to the outer shadow effect represented by the preset, in addition to those attributes common to all prstShdw effects.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
shdw1 (Top Left Drop Shadow)	 No additional attributes specified.
shdw10 (Top Left Large Drop Shadow)	 align = "br" sx = 125% sy = 125%
shdw11 (Back Left Long Perspective Shadow)	 align = "b" kx = 40.89° sy = 50%
shdw12 (Back Right Long Perspective Shadow)	 align = "b" kx = -40.89° sy = 50%
shdw13 (Top Left Double Drop Shadow)	 Equivalent to two outer shadow effects. Shadow 1: No additional attributes specified. Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dist = 2 * shadow 1's distance
shdw14 (Bottom Right Small Drop Shadow)	

Enumeration Value	Description
	No additional attributes specified.
shdw15 (Front Left Long Perspective Shadow)	 align = "b" kx = 40.89° sy = -50%
shdw16 (Front Right LongPerspective Shadow)	 align = "b" kx = -40.89° sy = -50%
shdw17 (3D Outer Box Shadow)	 Equivalent to two outer shadow effects. Shadow 1: No additional attributes specified. Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dir = shadow 1's direction + 180°
shdw18 (3D Inner Box Shadow)	 Equivalent to two outer shadow effects. Shadow 1: No additional attributes specified. Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dir = shadow 1's direction + 180°
shdw19 (Back Center Perspective Shadow)	 align = "b" sy = 50°
shdw2 (Top Right Drop Shadow)	 No additional attributes specified.
shdw20 (Front Bottom Shadow)	 align = "b"

Enumeration Value	Description
	sy = -100°
shdw3 (Back Left Perspective Shadow)	 align = "b" ky = 40.89° sy = 50%
shdw4 (Back Right Perspective Shadow)	 align = "b" kx = -40.89° sy = 50%
shdw5 (Bottom Left Drop Shadow)	 No additional attributes specified.
shdw6 (Bottom Right Drop Shadow)	 No additional attributes specified.
shdw7 (Front Left Perspective Shadow)	 align = "b" kx = 40.89° sy = -50%
shdw8 (Front Right Perspective Shadow)	 align = "b" kx = -40.89° sy = -50%
shdw9 (Top Left Small Drop Shadow)	 align = "tl" sx = 75% sy = 75%

5.1.12.53 ST_RectAlignment (Rectangle Alignments)

This simple type describes how to position two rectangles relative to each other.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Rectangle Alignment Enum (Bottom))	Bottom
bl (Rectangle Alignment Enum (Bottom Left))	Bottom Left
br (Rectangle Alignment Enum (Bottom Right))	Bottom Right
ctr (Rectangle Alignment Enum (Center))	Center
l (Rectangle Alignment Enum (Left))	Left
r (Rectangle Alignment Enum (Right))	Right
t (Rectangle Alignment Enum (Top))	Top
tl (Rectangle Alignment Enum (Top Left))	Top Left
tr (Rectangle Alignment Enum (Top Right))	Top Right

5.1.12.54 ST_SchemeColorVal (Scheme Color)

This simple type represents a scheme color value.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
accent1 (Accent Color 1)	Extra scheme color 1
accent2 (Accent Color 2)	Extra scheme color 2
accent3 (Accent Color 3)	Extra scheme color 3
accent4 (Accent Color 4)	Extra scheme color 4
accent5 (Accent Color 5)	Extra scheme color 5
accent6 (Accent Color 6)	Extra scheme color 6
bg1 (Background Color 1)	Semantic background color
bg2 (Background Color 2)	Semantic additional background color
dk1 (Dark Color 1)	Main dark color 1
dk2 (Dark Color 2)	Main dark color 2
folHlink (Followed Hyperlink Color)	Followed Hyperlink Color
hlink (Hyperlink Color)	Regular Hyperlink Color
lt1 (Light Color 1)	Main Light Color 1
lt2 (Light Color 2)	Main Light Color 2
phClr (Style Color)	A color used in theme definitions which means to use the color of the style.

Enumeration Value	Description
tx1 (Text Color 1)	Semantic text color
tx2 (Text Color 2)	Semantic additional text color

```
<simpleType name="ST_ShapeID">
   <restriction base="xsd:token"/>
</simpleType>
```

5.1.12.56 ST_ShapeType (Preset Shape Types)

This simple type specifies the preset shape geometry that is to be used for a shape. An enumeration of this type is used so that a custom geometry does not have to be specified but instead can be constructed automatically by the generating application. For each enumeration listed there is also the corresponding DrawingML code that would be used to construct this shape were it a custom geometry. Within the construction code for each of these preset shapes there are predefined guides that the generating application must maintain for calculation purposes at all times. The necessary guides should have the following values.

3/4 of a Circle ('3cd4') - Constant value of "16200000.0"

The units here are in 60,000ths of a degree. This is equivalent to 270 degrees.

3/8 of a Circle ('3cd8') - Constant value of "8100000.0"

The units here are in 60,000ths of a degree. This is equivalent to 135 degrees.

5/8 of a Circle ('5cd8') - Constant value of "13500000.0"

The units here are in 60,000ths of a degree. This is equivalent to 225 degrees.

7/8 of a Circle ('7cd8') - Constant value of "18900000.0"

The units here are in 60,000ths of a degree. This is equivalent to 315 degrees.

Shape Bottom Edge ('b') - Constant value of "h"

This is the bottom edge of the shape and since the top edge of the shape is considered the 0 point, the bottom edge is thus the shape height.

1/2 of a Circle ('cd2') - Constant value of "10800000.0"

The units here are in 60,000ths of a degree. This is equivalent to 180 degrees.

1/4 of a Circle ('cd4') - Constant value of "5400000.0"

The units here are in 60,000ths of a degree. This is equivalent to 90 degrees.

1/8 of a Circle ('cd8') - Constant value of "2700000.0"

The units here are in 60,000ths of a degree. This is equivalent to 45 degrees.

Shape Height ('h')

This is the variable height of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

Horizontal Center ('hc') - Calculated value of "*/ w 1.0 2.0"

This is the horizontal center of the shape which is just the width divided by 2.

1/2 of Shape Height ('hd2') - Calculated value of "*/ h 1.0 2.0"

This is 1/2 the shape height.

1/4 of Shape Height ('hd4') - Calculated value of "*/ h 1.0 4.0"

This is 1/4 the shape height.

1/5 of Shape Height ('hd5') - Calculated value of "*/ h 1.0 5.0"

This is 1/5 the shape height.

1/6 of Shape Height ('hd6') - Calculated value of "*/ h 1.0 6.0"

This is 1/6 the shape height.

1/8 of Shape Height ('hd8') - Calculated value of "*/ h 1.0 8.0"

This is 1/8 the shape height.

Shape Left Edge ('l') - Constant value of "0"

This is the left edge of the shape and the left edge of the shape is considered the horizontal 0 point.

Longest Side of Shape ('ls') - Calculated value of "max w h"

This is the longest side of the shape. This value is either the width or the height depending on which is greater.

Shape Right Edge ('r') - Constant value of "w"

This is the right edge of the shape and since the left edge of the shape is considered the 0 point, the right edge is thus the shape width.

Shortest Side of Shape ('ss') - Calculated value of "min w h"

This is the shortest side of the shape. This value is either the width or the height depending on which is smaller.

1/2 Shortest Side of Shape ('ssd2') - Calculated value of "*/ ss 1.0 2.0"

This is 1/2 the shortest side of the shape.

1/4 Shortest Side of Shape ('ssd4') - Calculated value of "*/ ss 1.0 4.0"

This is 1/4 the shortest side of the shape.

1/6 Shortest Side of Shape ('ssd6') - Calculated value of "*/ ss 1.0 6.0"

This is 1/6 the shortest side of the shape.

1/8 Shortest Side of Shape ('ssd8') - Calculated value of "*/ ss 1.0 8.0"

This is 1/8 the shortest side of the shape.

Shape Top Edge ('t') - Constant value of "0"

This is the top edge of the shape and the top edge of the shape is considered the vertical 0 point.

Vertical Center of Shape ('vc') - Calculated value of "*/ h 1.0 2.0"

This is the vertical center of the shape which is just the height divided by 2.

Shape Width ('w')

This is the variable width of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

1/2 of Shape Width ('wd2') - Calculated value of "*/ w 1.0 2.0"

This is 1/2 the shape width.

1/4 of Shape Width ('wd4') - Calculated value of "*/ w 1.0 4.0"

This is 1/4 the shape width.

1/5 of Shape Width ('wd5') - Calculated value of "*/ w 1.0 5.0"

This is 1/5 the shape width.

1/6 of Shape Width ('wd6') - Calculated value of "*/ w 1.0 6.0"

This is 1/6 the shape width.

1/8 of Shape Width ('wd8') - Calculated value of "*/ w 1.0 8.0"

This is 1/8 the shape width.

1/10 of Shape Width ('wd10') - Calculated value of "*/ w 1.0 10.0"

This is 1/10 the shape width.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
accentBorderCallout1 (Callout 1 with Border and Accent Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the accentBorderCallout1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

The constants used in that markup are guides that are described in further detail above. *end note*] 
actionButtonBlank (Blank Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the actionButtonBlank element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
actionButtonDocument (Document Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the actionButtonDocument element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
actionButtonEnd (End Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the actionButtonEnd element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
actionButtonForwardNext (Forward or Next Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the actionButtonForwardNext element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
actionButtonHelp (Help Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the actionButtonHelp element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
actionButtonHome (Home Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the actionButtonHome element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
actionButtonInformation (Information Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the actionButtonInformation element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
actionButtonMovie (Movie Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the actionButtonMovie element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
actionButtonReturn (Return Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the actionButtonReturn element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
actionButtonSound (Sound Button Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the actionButtonSound element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
arc (Curved Arc Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the arc element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
bentArrow (Bent Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the bentArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
bentConnector2 (Bent Connector 2 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the bentConnector2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
bentConnector3 (Bent Connector 3 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the bentConnector3 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
bentConnector4 (Bent Connector 4 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the bentConnector4 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
bentConnector5 (Bent Connector 5 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the bentConnector5 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
bentUpArrow (Bent Up Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the bentUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
bevel (Bevel Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the bevel element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
blockArc (Block Arc Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the blockArc element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
borderCallout1 (Callout 1 with Border Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
	be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the borderCallout1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
borderCallout2 (Callout 2 with Border Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the borderCallout2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
borderCallout3 (Callout 3 with Border Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the borderCallout3 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 

Enumeration Value	Description
bracePair (Brace Pair Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the bracePair element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
bracketPair (Bracket Pair Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the bracketPair element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
callout1 (Callout 1 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the callout1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
callout2 (Callout 2 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the callout2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
callout3 (Callout 3 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the callout3 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
can (Can Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the can element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
chartPlus (Chart Plus Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the chartPlus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
chartStar (Chart Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the chartStar element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
chartX (Chart X Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the chartX element in the preset shape geometries

Enumeration Value	Description
	electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
chevron (Chevron Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the chevron element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
chord (Chord Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the chord element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
circularArrow (Circular Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the circularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
cloud (Cloud Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the cloud element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
cloudCallout (Callout Cloud Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the cloudCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
corner (Corner Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the corner element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
cornerTabs (Corner Tabs Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the cornerTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
cube (Cube Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the cube element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
curvedConnector2 (Curved Connector 2 Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
	be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedConnector2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
curvedConnector3 (Curved Connector 3 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedConnector3 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
curvedConnector4 (Curved Connector 4 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedConnector4 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 

Enumeration Value	Description
curvedConnector5 (Curved Connector 5 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedConnector5 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
curvedDownArrow (Curved Down Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedDownArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
curvedLeftArrow (Curved Left Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedLeftArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
curvedRightArrow (Curved Right Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
curvedUpArrow (Curved Up Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the curvedUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
decagon (Decagon Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the decagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
diagStripe (Diagonal Stripe Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the diagStripe element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
diamond (Diamond Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the diamond element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 

Enumeration Value	Description
dodecagon (Dodecagon Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the dodecagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
donut (Donut Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the donut element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
doubleWave (Double Wave Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the doubleWave element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
downArrow (Down Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the downArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
downArrowCallout (Callout Down Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the downArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
ellipse (Ellipse Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the ellipse element in the preset shape geometries

Enumeration Value	Description
	electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
ellipseRibbon (Ellipse Ribbon Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the ellipseRibbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
ellipseRibbon2 (Ellipse Ribbon 2 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the ellipseRibbon2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartAlternateProcess (Alternate Process Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartAlternateProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] flowChartCollate (Collate Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartCollate element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartConnector (Connector Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartConnector element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartDecision (Decision Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartDecision element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartDelay (Delay Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartDelay element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartDisplay (Display Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartDisplay element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartDocument (Document Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the flowChartDocument element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartExtract (Extract Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartExtract element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartInputOutput (Input Output Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartInputOutput element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartInternalStorage (Internal Storage Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the flowChartInternalStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartMagneticDisk (Magnetic Disk Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartMegneticDisk element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartMagneticDrum (Magnetic Drum Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartMagneticDrum element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartMagneticTape (Magnetic Tape Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the flowChartMagneticTape element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartManualInput (Manual Input Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartManualInput element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartManualOperation (Manual Operation Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartManualOperation element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartMerge (Merge Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the flowChartMerge element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartMultidocument (Multi-Document Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartMultidocument element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartOfflineStorage (Offline Storage Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartOfflineStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartOffpageConnector (Off-Page Connector Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the flowChartOffpageConnector element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartOnlineStorage (Online Storage Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartOnlineStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartOr (Or Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartOr element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartPredefinedProcess (Predefined Process Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the flowChartPredefinedProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartPreparation (Preparation Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartPreparation element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartProcess (Process Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] flowChartPunchedCard (Punched Card Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the flowChartPunchedCard element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartPunchedTape (Punched Tape Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartPunchedTape element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartSort (Sort Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartSort element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartSummingJunction (Summing Junction Flow	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
Shape)	be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartSummingJunction element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
flowChartTerminator (Terminator Flow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the flowChartTerminator element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] foldedCorner (Folded Corner Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the foldedCorner element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
frame (Frame Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the frame element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
funnel (Funnel Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the funnel element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
gear6 (Gear 6 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the gear6 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
gear9 (Gear 9 Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
	be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the gear9 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
halfFrame (Half Frame Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the halfFrame element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
heart (Heart Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the heart element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
heptagon (Heptagon Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the heptagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
hexagon (Hexagon Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the hexagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
homePlate (Home Plate Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the homePlate element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
horizontalScroll (Horizontal Scroll Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the horizontalScroll element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
irregularSeal1 (Irregular Seal 1 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the irregularSeal1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
irregularSeal2 (Irregular Seal 2 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the irregularSeal2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftArrow (Left Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftArrowCallout (Callout Left Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftBrace (Left Brace Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftBrace element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftBracket (Left Bracket Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftBracket element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftCircularArrow (Left Circular Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftCircularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftRightArrow (Left Right Arrow Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
	be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] leftRightArrowCallout (Callout Left Right Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftRightArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftRightCircularArrow (Left Right Circular Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftRightCircularArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftRightRibbon (Left Right Ribbon Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used

Enumeration Value	Description
	to generate this preset shape definition is contained in the leftRightRibbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftRightUpArrow (Left Right Up Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftRightUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
leftUpArrow (Left Up Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the leftUpArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
lightningBolt (Lightning Bolt Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the lightningBolt element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
line (Line Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the line element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
lineInv (Line Inverse Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the lineInv element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 

Enumeration Value	Description
mathDivide (Divide Math Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the mathDivide element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
mathEqual (Equal Math Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the mathEqual element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] mathMinus (Minus Math Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the mathMinus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] mathMultiply (Multiply Math Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the mathMultiply element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
mathNotEqual (Not Equal Math Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the mathNotEqual element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
mathPlus (Plus Math Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the mathPlus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
moon (Moon Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
	be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the moon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
nonIsoscelesTrapezoid (Non-Isosceles Trapezoid Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the nonIsocelesTrapezoid element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
noSmoking (No Smoking Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the noSmoking element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
notchedRightArrow (Notched Right Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the notchedRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
octagon (Octagon Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the octagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
parallelogram (Parallelogram Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the parallelogram element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are

Enumeration Value	Description
	described in further detail above. *end note*] 
pentagon (Pentagon Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the pentagon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
pie (Pie Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the pie element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
pieWedge (Pie Wedge Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the pieWedge element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
plaque (Plaque Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the plaque element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
plaqueTabs (Plaque Tabs Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the plaqueTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
plus (Plus Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the plus element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
quadArrow (Quad-Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the quadArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
quadArrowCallout (Callout Quad-Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the quadArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
rect (Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the rect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
ribbon (Ribbon Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the ribbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
ribbon2 (Ribbon 2 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the ribbon2 element in the preset shape geometries

Enumeration Value	Description
	electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
rightArrow (Right Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the rightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
rightArrowCallout (Callout Right Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the rightArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
rightBrace (Right Brace Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the rightBrace element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
rightBracket (Right Bracket Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the rightBracket element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
round1Rect (One Round Corner Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the round1Rect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] round2DiagRect (Two Diagonal Round Corner Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the round2DiagRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] round2SameRect (Two Same-side Round Corner Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the round2SameRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] roundRect (Round Corner Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the roundRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
rtTriangle (Right Triangle Shape)	Specifies a preset shape geometry. This geometry shall

Enumeration Value	Description
	be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the rtTriangle element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
smileyFace (Smiley Face Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the smileyFace element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
snip1Rect (One Snip Corner Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the snip1Rect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
snip2DiagRect (Two Diagonal Snip Corner Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the snip2DiagRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
snip2SameRect (Two Same-side Snip Corner Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the snip2SameRect element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
snipRoundRect (One Snip One Round Corner Rectangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the snipRoundRect element in the preset shape geometries electronic addenda of Annex D. The

Enumeration Value	Description
	constants used in that markup are guides that are described in further detail above. *end note*] 
squareTabs (Square Tabs Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the squareTabs element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
star10 (Ten Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the star10 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
star12 (Twelve Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the star12 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
star16 (Sixteen Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the star16 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
star24 (Twenty Four Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the star24 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
star32 (Thirty Two Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the star32 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] star4 (Four Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the star4 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
star5 (Five Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the star5 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
star6 (Six Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the star6 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
star7 (Seven Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the star7 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
star8 (Eight Pointed Star Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the star8 element in the preset shape geometries electronic addenda of Annex D. The constants used in

Enumeration Value	Description
	that markup are guides that are described in further detail above. *end note*] 
straightConnector1 (Straight Connector 1 Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the straightConnector1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
stripedRightArrow (Striped Right Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the stripedRightArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
sun (Sun Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the sun element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
swooshArrow (Swoosh Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the swooshArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
teardrop (Teardrop Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the teardrop element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
trapezoid (Trapezoid Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.

Enumeration Value	Description
	[*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the trapezoid element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
triangle (Triangle Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the triangle element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
upArrow (Up Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the upArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
	
upArrowCallout (Callout Up Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the upArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
upDownArrow (Up Down Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the upDownArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
upDownArrowCallout (Callout Up Down Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in

Enumeration Value	Description
	the upDownArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] uturnArrow (U-Turn Arrow Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the uturnArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] 
verticalScroll (Vertical Scroll Shape)	Specifies a preset shape geometry. This geometry shall be designed to match the normative image below. [*Note*: An example of DrawingML which may be used to generate this preset shape definition is contained in the verticalScroll element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*] wave (Wave Shape)	Specifies a preset shape geometry. This geometry shall

5.1.12.57 ST_StyleMatrixColumnIndex (Style Matrix Column Index)

This simple type specifies an index into one of the lists in the style matrix specified by the fmtScheme element (bgFillStyleLst, effectStyleLst, fillStyleLst, or lnStyleLst).

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
bgRef@idx (§4.4.1.3); effectRef@idx (§5.1.4.2.8); fillRef@idx (§5.1.4.2.10); lnRef@idx (§5.1.4.2.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_StyleMatrixColumnIndex">
    <restriction base="xsd:unsignedInt"/>
</simpleType>
```

5.1.12.58 ST_SystemColorVal (System Color Value)

This simple type specifies a system color value. This color is based upon the value that this color currently has within the system on which the document is being viewed.

Applications shall use the lastClr attribute to determine the absolute value of the last color used if system colors are not supported.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
3dDkShadow (3D Dark System Color)	Specifies a Dark shadow color for three-dimensional display elements.
3dLight (3D Light System Color)	Specifies a Light color for three-dimensional display elements (for edges facing the light source).
activeBorder (Active Border System Color)	Specifies an Active Window Border Color.
activeCaption (Active Caption System Color)	Specifies the active window title bar color. In particular the left side color in the color gradient of an active window's title bar if the gradient effect is enabled.
appWorkspace (Application Workspace System Color)	Specifies the Background color of multiple document interface (MDI) applications.
background (Background System Color)	Specifies the desktop background color.
btnFace (Button Face System Color)	Specifies the face color for three-dimensional display elements and for dialog box backgrounds.
btnHighlight (Button Highlight System Color)	Specifies the highlight color for three-dimensional display elements (for edges facing the light source).
btnShadow (Button Shadow System Color)	Specifies the shadow color for three-dimensional display elements (for edges facing away from the light source).
btnText (Button Text System Color)	Specifies the color of text on push buttons.
captionText (Caption Text System Color)	Specifies the color of text in the caption, size box, and scroll bar arrow box.
gradientActiveCaption (Gradient Active Caption System Color)	Specifies the right side color in the color gradient of an active window's title bar.
gradientInactiveCaption (Gradient Inactive Caption System Color)	Specifies the right side color in the color gradient of an inactive window's title bar.
grayText (Gray Text System Color)	Specifies a grayed (disabled) text. This color is set to 0 if the current display driver does not support a solid gray color.
highlight (Highlight System Color)	Specifies the color of Item(s) selected in a control.

Enumeration Value	Description
highlightText (Highlight Text System Color)	Specifies the text color of item(s) selected in a control.
hotLight (Hot Light System Color)	Specifies the color for a hyperlink or hot-tracked item.
inactiveBorder (Inactive Border System Color)	Specifies the color of the Inactive window border.
inactiveCaption (Inactive Caption System Color)	Specifies the color of the Inactive window caption. Specifies the left side color in the color gradient of an inactive window's title bar if the gradient effect is enabled.
inactiveCaptionText (Inactive Caption Text System Color)	Specifies the color of text in an inactive caption.
infoBk (Info Back System Color)	Specifies the background color for tooltip controls.
infoText (Info Text System Color)	Specifies the text color for tooltip controls.
menu (Menu System Color)	Specifies the menu background color.
menuBar (Menu Bar System Color)	Specifies the background color for the menu bar when menus appear as flat menus.
menuHighlight (Menu Highlight System Color)	Specifies the color used to highlight menu items when the menu appears as a flat menu.
menuText (Menu Text System Color)	Specifies the color of Text in menus.
scrollBar (Scroll Bar System Color)	Specifies the scroll bar gray area color.
window (Window System Color)	Specifies window background color.
windowFrame (Window Frame System Color)	Specifies the window frame color.
windowText (Window Text System Color)	Specifies the color of text in windows.

   </restriction>
</simpleType>
```

5.1.12.59 ST_TextAlignType (Text Alignment Types)

This type specifies the text alignment types

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Text Alignment Enum (Center))	Align text in the center.
dist (Text Alignment Enum (Distributed))	Distributes the text words across an entire text line.
just (Text Alignment Enum (Justified))	Align text so that it is justified across the whole line. It is smart in the sense that it will not justify sentences which are short.

Enumeration Value	Description
justLow (Text Alignment Enum (Justified Low))	Aligns the text with an adjusted kashida length for Arabic text.
l (Text Alignment Enum (Left))	Align text to the left margin.
r (Text Alignment Enum (Right))	Align text to the right margin.
thaiDist (Text Alignment Enum (Thai Distributed))	Distributes Thai text specially, because each character is treated as a word.

Referenced By

   </restriction>
</simpleType>
```

5.1.12.60 ST_TextAnchoringType (Text Anchoring Types)

This type specifies a list of available anchoring types for text.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
b (Text Anchor Enum (Bottom))	Anchor the text at the bottom of the bounding rectangle.
ctr (Text Anchor Enum (Center))	Anchor the text at the middle of the bounding rectangle.
dist (Text Anchor Enum (Distributed))	Anchor the text so that it is distributed vertically. When text is horizontal, this spaces out the actual lines of text and is almost always identical in behavior to anchorJustified (special case: if only 1 line, then anchored in middle). When text is vertical, then it distributes the letters vertically. This is different than

Enumeration Value	Description
	anchorJustified, because it always forces distribution of the words, even if there are only one or two words in a line.
just (Text Anchor Enum (Justified))	Anchor the text so that it is justified vertically. When text is horizontal, this spaces out the actual lines of text and is almost always identical in behavior to 'distrib' (special case: if only 1 line, then anchored at top). When text is vertical, then it justifies the letters vertically. This is different than anchorDistributed, because in some cases such as very little text in a line, it will not justify.
t (Text Anchoring Type Enum (Top))	Anchor the text at the top of the bounding rectangle.

   </restriction>
</simpleType>
```

5.1.12.61 ST_TextAutonumberScheme (Text Auto-number Schemes)

This type specifies a list of automatic numbering schemes.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
alphaLcParenBoth (Autonumber Enum (alphaLcParenBoth))	(a), (b), (c), …
alphaLcParenR (Autonumbering Enum (alphaLcParenR))	a), b), c), …
alphaLcPeriod (Autonumbering Enum (alphaLcPeriod))	a., b., c., …
alphaUcParenBoth (Autonumbering Enum (	(A), (B), (C), …

Enumeration Value	Description
alphaUcParenBoth))	
alphaUcParenR (Autonumbering Enum (alphaUcParenR))	A), B), C), …
alphaUcPeriod (Autonumbering Enum (alphaUcPeriod))	A., B., C., …
arabic1Minus (Autonumbering Enum (arabic1Minus))	Bidi Arabic 1 (AraAlpha) with ANSI minus symbol
arabic2Minus (Autonumbering Enum (arabic2Minus))	Bidi Arabic 2 (AraAbjad) with ANSI minus symbol
arabicDbPeriod (Autonumbering Enum (arabicDbPeriod))	Dbl-byte Arabic numbers w/ double-byte period
arabicDbPlain (Autonumbering Enum (arabicDbPlain))	Dbl-byte Arabic numbers
arabicParenBoth (Autonumbering Enum (arabicParenBoth))	(1), (2), (3), …
arabicParenR (Autonumbering Enum (arabicParenR))	1), 2), 3), …
arabicPeriod (Autonumbering Enum (arabicPeriod))	1., 2., 3., …
arabicPlain (Autonumbering Enum (arabicPlain))	1, 2, 3, …
circleNumDbPlain (Autonumbering Enum (circleNumDbPlain))	Dbl-byte circle numbers (1-10 circle[0x2460-], 11- arabic numbers)
circleNumWdBlackPlain (Autonumbering Enum (circleNumWdBlackPlain))	Wingdings black circle numbers
circleNumWdWhitePlain (Autonumbering Enum (circleNumWdWhitePlain))	Wingdings white circle numbers (0-10 circle[0x0080-], 11- arabic numbers)
ea1ChsPeriod (Autonumbering Enum (ea1ChsPeriod))	EA: Simplified Chinese w/ single-byte period
ea1ChsPlain (Autonumbering Enum (ea1ChsPlain))	EA: Simplified Chinese (TypeA 1-99, TypeC 100-)
ea1ChtPeriod (Autonumbering Enum (ea1ChtPeriod))	EA: Traditional Chinese w/ single-byte period
ea1ChtPlain (Autonumbering Enum (ea1ChtPlain))	EA: Traditional Chinese (TypeA 1-19, TypeC 20-)
ea1JpnChsDbPeriod (Autonumbering Enum (ea1JpnChsDbPeriod))	EA: Japanese w/ double-byte period
ea1JpnKorPeriod (Autonumbering Enum (ea1JpnKorPeriod))	EA: Japanese/Korean w/ single-byte period
ea1JpnKorPlain (Autonumbering Enum (ea1JpnKorPlain))	EA: Japanese/Korean (TypeC 1-)
hebrew2Minus (Autonumbering Enum (hebrew2Minus))	Bidi Hebrew 2 with ANSI minus symbol

Enumeration Value	Description
hindiAlpha1Period (Autonumbering Enum (hindiAlpha1Period))	Hindi alphabet period - consonants
hindiAlphaPeriod (Autonumbering Enum (hindiAlphaPeriod))	Hindi alphabet period - vowels
hindiNumParenR (Autonumbering Enum (hindiNumParenR))	Hindi numerical parentheses - right
hindiNumPeriod (Autonumbering Enum (hindiNumPeriod))	Hindi numerical period
romanLcParenBoth (Autonumbering Enum (romanLcParenBoth))	(i), (ii), (iii), …
romanLcParenR (Autonumbering Enum (romanLcParenR))	i), ii), iii), …
romanLcPeriod (Autonumbering Enum (romanLcPeriod))	i., ii., iii., …

      <enumeration value="hindiAlphaPeriod"/>
      <enumeration value="hindiNumPeriod"/>
      <enumeration value="hindiNumParenR"/>
      <enumeration value="hindiAlpha1Period"/>
   </restriction>
</simpleType>
```

5.1.12.62 ST_TextBulletSizePercent (Bullet Size Percentage)

This type specifies the range that the bullet percent can be. A bullet percent is the size of the bullet with respect to the text that should follow it. 25000 = 25 %400000 = 400 %

This simple type's contents are a restriction of the ST_Percentage simple type (§5.1.12.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 25000.
- This simple type has a maximum value of less than or equal to 400000.

Referenced By
buSzPct@val (§5.1.5.4.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextBulletSizePercent">
   <restriction base="ST_Percentage">
      <minInclusive value="25000"/>
      <maxInclusive value="400000"/>
   </restriction>
</simpleType>
```

5.1.12.63 ST_TextBulletStartAtNum (Start Bullet At Number)

This type specifies the range that the start at number for a bullet's auto-numbering sequence can begin at. When the numbering is alphabetical, then the numbers map to the appropriate letter. 1->a, 2->b, etc. If the numbers go above 26, then the numbers begin to double up. For example, 27->aa and 53->aaa.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 32767.

Referenced By
buAutoNum@startAt (§5.1.5.4.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextBulletStartAtNum">
   <restriction base="xsd:int">
      <minInclusive value="1"/>
      <maxInclusive value="32767"/>
   </restriction>
</simpleType>
```

5.1.12.64 ST_TextCapsType (Text Cap Types)

This type specifies the cap types of the text.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
all (Text Caps Enum (All))	Apply all caps on the text. All lower case letters are converted to upper case even though they are stored differently in the backing store.
none (Text Caps Enum (None))	The reason we cannot implicitly have noCaps be the scenario where capitalization is not specified is because not being specified implies deriving from a particular style and the user might want to override that and make some text not have a capitalization scheme even though the style says otherwise.
small (Text Caps Enum (Small))	Apply small caps to the text. All letters are converted to lower case.

Referenced By
defRPr@cap (§5.1.5.3.2); endParaRPr@cap (§5.1.5.2.3); rPr@cap (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextCapsType">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="small"/>
      <enumeration value="all"/>
   </restriction>
</simpleType>
```

5.1.12.65 ST_TextColumnCount (Text Column Count)

This type specifies the number of columns.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than or equal to 16.

Referenced By
bodyPr@numCol (§5.1.5.1.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextColumnCount">
   <restriction base="xsd:int">
      <minInclusive value="1"/>
      <maxInclusive value="16"/>
   </restriction>
</simpleType>
```

5.1.12.66 ST_TextFontAlignType (Font Alignment Types)

This type specifies the different types of font alignment.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
auto (Font Alignment Enum (Automatic))	When the text flow is horizontal or simple vertical same as fontBaseline but for other vertical modes same as fontCenter.
b (Font Alignment Enum (Bottom))	The letters are anchored to the very bottom of a single line. This is different than the bottom baseline because of letters such as "g," "q," "y," etc.
base (Font Alignment Enum (Baseline))	The letters are anchored to the bottom baseline of a single line.
ctr (Font Alignment Enum (Center))	The letters are anchored between the two baselines of a single line.
t (Font Alignment Enum (Top))	The letters are anchored to the top baseline of a single line.

Referenced By

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextFontAlignType">
   <restriction base="xsd:token">
      <enumeration value="auto"/>
      <enumeration value="t"/>
      <enumeration value="ctr"/>
      <enumeration value="base"/>
      <enumeration value="b"/>
   </restriction>
</simpleType>
```

5.1.12.67 ST_TextFontScalePercent (Text Font Scale Percentage)

This type specifies the percentage range text can be scaled to in order to fit.

This simple type's contents are a restriction of the ST_Percentage simple type (§5.1.12.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1000.
- This simple type has a maximum value of less than or equal to 100000.

Referenced By
normAutofit@fontScale (§5.1.5.1.3)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextFontScalePercent">
   <restriction base="ST_Percentage">
      <minInclusive value="1000"/>
      <maxInclusive value="100000"/>
   </restriction>
</simpleType>
```

5.1.12.68 ST_TextFontSize (Text Font Size)

This type specifies the size of any text in hundredths of a point. Must be at least 1 point.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 100.
- This simple type has a maximum value of less than or equal to 400000.

Referenced By
buSzPts@val (§5.1.5.4.10); defRPr@sz (§5.1.5.3.2); endParaRPr@sz (§5.1.5.2.3); rPr@sz (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextFontSize">
   <restriction base="xsd:int">
      <minInclusive value="100"/>
      <maxInclusive value="400000"/>
   </restriction>
</simpleType>
```

5.1.12.69 ST_TextHorzOverflowType (Text Horizontal Overflow Types)

This type specifies the text horizontal overflow types

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clip (Text Horizontal Overflow Enum (Clip))	When a big character does not fit into a line, clip it at the proper horizontal overflow.
overflow (Text Horizontal Overflow Enum (Overflow	When a big character does not fit into a line, allow a

Enumeration Value	Description
))	horizontal overflow.

Referenced By
bodyPr@horzOverflow (§5.1.5.1.1); tcPr@horzOverflow (§5.1.6.15)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextHorzOverflowType">
    <restriction base="xsd:token">
        <enumeration value="overflow"/>
        <enumeration value="clip"/>
    </restriction>
</simpleType>
```

5.1.12.70 ST_TextIndent (Text Indentation)

This type specifies the text indentation amount to be used.

NOTE: The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the ST_Coordinate32 simple type (§5.1.12.17).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -51206400.
- This simple type has a maximum value of less than or equal to 51206400.

Referenced By
defPPr@indent (§5.1.5.2.2); lvl1pPr@indent (§5.1.5.4.13); lvl2pPr@indent (§5.1.5.4.14); lvl3pPr@indent (§5.1.5.4.15); lvl4pPr@indent (§5.1.5.4.16); lvl5pPr@indent (§5.1.5.4.17); lvl6pPr@indent (§5.1.5.4.18); lvl7pPr@indent (§5.1.5.4.19); lvl8pPr@indent (§5.1.5.4.20); lvl9pPr@indent (§5.1.5.4.21); pPr@indent (§5.1.5.2.7)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextIndent">
    <restriction base="ST_Coordinate32">
        <minInclusive value="-51206400"/>
        <maxInclusive value="51206400"/>
    </restriction>
</simpleType>
```

5.1.12.71 ST_TextIndentLevelType (Text Indent Level Type)

This type specifies the indent level type. We support list level 0 to 8, and we use -1 and -2 for outline mode levels that should only exist in memory.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 8.

Referenced By
defPPr@lvl (§5.1.5.2.2); lvl1pPr@lvl (§5.1.5.4.13); lvl2pPr@lvl (§5.1.5.4.14); lvl3pPr@lvl (§5.1.5.4.15); lvl4pPr@lvl (§5.1.5.4.16); lvl5pPr@lvl (§5.1.5.4.17); lvl6pPr@lvl (§5.1.5.4.18); lvl7pPr@lvl (§5.1.5.4.19); lvl8pPr@lvl (§5.1.5.4.20); lvl9pPr@lvl (§5.1.5.4.21); pPr@lvl (§5.1.5.2.7)

```
<simpleType name="ST_TextLanguageID">
   <restriction base="xsd:string"/>
</simpleType>
```

5.1.12.73 ST_TextMargin (Text Margin)

This type specifies the margin that will be used and its corresponding size.

This simple type's contents are a restriction of the ST_Coordinate32 simple type (§5.1.12.17).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 51206400.

Referenced By
defPPr@marL (§5.1.5.2.2); defPPr@marR (§5.1.5.2.2); lvl1pPr@marL (§5.1.5.4.13); lvl1pPr@marR (§5.1.5.4.13); lvl2pPr@marL (§5.1.5.4.14); lvl2pPr@marR (§5.1.5.4.14); lvl3pPr@marL (§5.1.5.4.15); lvl3pPr@marR (§5.1.5.4.15); lvl4pPr@marL (§5.1.5.4.16); lvl4pPr@marR (§5.1.5.4.16); lvl5pPr@marL

      <minInclusive value="0"/>
      <maxInclusive value="51206400"/>
   </restriction>
</simpleType>
```

5.1.12.74 ST_TextNonNegativePoint (Text Non-Negative Point)

This type specifies a non-negative font size in hundredths of a point. This is restricted to the range [0, 400000].

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 400000.

Referenced By
defRPr@kern (§5.1.5.3.2); endParaRPr@kern (§5.1.5.2.3); rPr@kern (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextNonNegativePoint">
   <restriction base="xsd:int">
      <minInclusive value="0"/>
      <maxInclusive value="400000"/>
   </restriction>
</simpleType>
```

5.1.12.75 ST_TextPoint (Text Point)

This type specifies a font size in hundredths of a point. This is restricted to the range [-400000, 400000], i.e from -4000 pt to 4000 pt.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -400000.
- This simple type has a maximum value of less than or equal to 400000.

Referenced By
defRPr@spc (§5.1.5.3.2); endParaRPr@spc (§5.1.5.2.3); rPr@spc (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextPoint">
   <restriction base="xsd:int">
      <minInclusive value="-400000"/>
      <maxInclusive value="400000"/>
   </restriction>
</simpleType>
```

5.1.12.76 ST_TextShapeType (Preset Text Shape Types)

This simple type specifies the preset text shape geometry that is to be used for a shape. An enumeration of this type is used so that a custom geometry does not have to be specified but instead can be constructed automatically by the generating application. For each enumeration listed there is also the corresponding DrawingML code that would be used to construct this shape were it a custom geometry. Within the construction code for each of these preset text shapes there are predefined guides that the generating application must maintain for calculation purposes at all times. The necessary guides should have the following values.

3/4 of a Circle ('3cd4') - Constant value of "16200000.0"

The units here are in 60,000ths of a degree. This is equivalent to 270 degrees.

3/8 of a Circle ('3cd8') - Constant value of "8100000.0"

The units here are in 60,000ths of a degree. This is equivalent to 135 degrees.

5/8 of a Circle ('5cd8') - Constant value of "13500000.0"

The units here are in 60,000ths of a degree. This is equivalent to 225 degrees.

7/8 of a Circle ('7cd8') - Constant value of "18900000.0"

The units here are in 60,000ths of a degree. This is equivalent to 315 degrees.

Shape Bottom Edge ('b') - Constant value of "h"

This is the bottom edge of the shape and since the top edge of the shape is considered the 0 point, the bottom edge is thus the shape height.

1/2 of a Circle ('cd2') - Constant value of "10800000.0"

The units here are in 60,000ths of a degree. This is equivalent to 180 degrees.

1/4 of a Circle ('cd4') - Constant value of "5400000.0"

The units here are in 60,000ths of a degree. This is equivalent to 90 degrees.

1/8 of a Circle ('cd8') - Constant value of "2700000.0"

The units here are in 60,000ths of a degree. This is equivalent to 45 degrees.

Shape Height ('h')

This is the variable height of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

Horizontal Center ('hc') - Calculated value of "*/ w 1.0 2.0"

This is the horizontal center of the shape which is just the width divided by 2.

1/2 of Shape Height ('hd2') - Calculated value of "*/ h 1.0 2.0"

This is 1/2 the shape height.

1/4 of Shape Height ('hd4') - Calculated value of "*/ h 1.0 4.0"

This is 1/4 the shape height.

1/5 of Shape Height ('hd5') - Calculated value of "*/ h 1.0 5.0"

This is 1/5 the shape height.

1/6 of Shape Height ('hd6') - Calculated value of "*/ h 1.0 6.0"

This is 1/6 the shape height.

1/8 of Shape Height ('hd8') - Calculated value of "*/ h 1.0 8.0"

This is 1/8 the shape height.

Shape Left Edge ('l') - Constant value of "0"

This is the left edge of the shape and the left edge of the shape is considered the horizontal 0 point.

Longest Side of Shape ('ls') - Calculated value of "max w h"

This is the longest side of the shape. This value is either the width or the height depending on which is greater.

Shape Right Edge ('r') - Constant value of "w"

This is the right edge of the shape and since the left edge of the shape is considered the 0 point, the right edge is thus the shape width.

Shortest Side of Shape ('ss') - Calculated value of "min w h"

This is the shortest side of the shape. This value is either the width or the height depending on which is smaller.

1/2 Shortest Side of Shape ('ssd2') - Calculated value of "*/ ss 1.0 2.0"

This is 1/2 the shortest side of the shape.

1/4 Shortest Side of Shape ('ssd4') - Calculated value of "*/ ss 1.0 4.0"

This is 1/4 the shortest side of the shape.

1/6 Shortest Side of Shape ('ssd6') - Calculated value of "*/ ss 1.0 6.0"

This is 1/6 the shortest side of the shape.

1/8 Shortest Side of Shape ('ssd8') - Calculated value of "*/ ss 1.0 8.0"

This is 1/8 the shortest side of the shape.

Shape Top Edge ('t') - Constant value of "0"

This is the top edge of the shape and the top edge of the shape is considered the vertical 0 point.

Vertical Center of Shape ('vc') - Calculated value of "*/ h 1.0 2.0"

This is the vertical center of the shape which is just the height divided by 2.

Shape Width ('w')

This is the variable width of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

1/2 of Shape Width ('wd2') - Calculated value of "*/ w 1.0 2.0"

This is 1/2 the shape width.

1/4 of Shape Width ('wd4') - Calculated value of "*/ w 1.0 4.0"

This is 1/4 the shape width.

1/5 of Shape Width ('wd5') - Calculated value of "*/ w 1.0 5.0"

This is 1/5 the shape width.

1/6 of Shape Width ('wd6') - Calculated value of "*/ w 1.0 6.0"

This is 1/6 the shape width.

1/8 of Shape Width ('wd8') - Calculated value of "*/ w 1.0 8.0"

This is 1/8 the shape width.

1/10 of Shape Width ('wd10') - Calculated value of "*/ w 1.0 10.0"

This is 1/10 the shape width.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
textArchDown (Downward Arch Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textArchDown element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textArchDownPour (Downward Pour Arch Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textArchDownPour element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textArchUp (Upward Arch Text Shape)	
Enumeration Value	Description
	Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textArchUp element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textArchUpPour (Upward Pour Arch Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textArchUpPour element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textButton (Button Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textButton element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textButtonPour (Button Pour Text Shape)	 Specifies a text shape that shall match the normative shape shown above.

Enumeration Value	Description
	[*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textButtonPour element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textCanDown (Downward Can Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textCanDown element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textCanUp (Upward Can Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textCanUp element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textCascadeDown (Downward Cascade Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textCascadeDown element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
textCascadeUp (Upward Cascade Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textCascadeUp element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textChevron (Chevron Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textChevron element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textChevronInverted (Inverted Chevron Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textChevronInverted element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textCircle (Circle Text Shape)	Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textCircle element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
textCirclePour (Circle Pour Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textCirclePour element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textCurveDown (Downward Curve Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textCurveDown element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textCurveUp (Upward Curve Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textCurveUp element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textDeflate (Deflate Text Shape)	 Specifies a text shape that shall match the normative

Enumeration Value	Description
	shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textDeflate element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textDeflateBottom (Bottom Deflate Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textDeflateBottom element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textDeflateInflate (Deflate-Inflate Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textDeflateInflate element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textDeflateInflateDeflate (Deflate-Inflate-Deflate Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the

Enumeration Value	Description
	textDeflateInflateDeflate element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textDeflateTop (Top Deflate Text Shape)	Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textDeflateTop element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textDoubleWave1 (Double Wave 1 Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textDoubleWave1 element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textFadeDown (Downward Fade Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textFadeDown element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textFadeLeft (Left Fade Text Shape)	 Specifies a text shape that shall match the normative shape shown above.

Enumeration Value	Description
	[*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textFadeLeft element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textFadeRight (Right Fade Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textFadeRight element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textFadeUp (Upward Fade Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textFadeUp element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textInflate (Inflate Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textInflate element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

Enumeration Value	Description
textInflateBottom (Bottom Inflate Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textInflateBottom element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textInflateTop (Top Inflate Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textInflateTop element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textNoShape (No Text Shape)	Specifies that the text will have no associated shape with it and thus the text should not be warped but instead be constrained by the normal text bounding box.
textPlain (Plain Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textPlain element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textRingInside (Inside Ring Text Shape)	

Enumeration Value	Description
	Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textRingInside element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textRingOutside (Outside Ring Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textRingOutside element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above
textSlantDown (Downward Slant Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textSlantDown element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textSlantUp (Upward Slant Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textSlantUp element in the preset text warp electronic addenda of Annex D. The constants used in that

Enumeration Value	Description
	markup are guides that are described in further detail above. *end note*]
textStop (Stop Sign Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textStop element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textTriangle (Triangle Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textTriangle element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textTriangleInverted (Inverted Triangle Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textTriangleInverted element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textWave1 (Wave 1 Text Shape)	 Specifies a text shape that shall match the normative shape shown above.

Enumeration Value	Description
	[*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textWave1 element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textWave2 (Wave 2 Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textWave2 element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]
textWave4 (Wave 4 Text Shape)	 Specifies a text shape that shall match the normative shape shown above. [*Note*: An example of DrawingML markup which may be used to achieve this effect is contained in the textWave4 element in the preset text warp electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. *end note*]

5.1.12.77 ST_TextSpacingPercent (Text Spacing Percent)

This type specifies the range that the spacing percent, in terms of a line. Represented in the file format from 0-1000 line hundredths, maps to 0.00-10.00 lines.

This simple type's contents are a restriction of the ST_Percentage simple type (§5.1.12.41).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 13200000.

Referenced By
normAutofit@lnSpcReduction (§5.1.5.1.3); spcPct@val (§5.1.5.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextSpacingPercent">
   <restriction base="ST_Percentage">
      <minInclusive value="0"/>
      <maxInclusive value="13200000"/>
   </restriction>
</simpleType>
```

5.1.12.78 ST_TextSpacingPoint (Text Spacing Point)

This type specifies the Text Spacing that will be used in terms of font point size.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 158400.

Referenced By
spcPts@val (§5.1.5.2.11)

<simpleType name="ST_TextSpacingPoint">
   <restriction base="xsd:int">
      <minInclusive value="0"/>
      <maxInclusive value="158400"/>
   </restriction>
</simpleType>
```

5.1.12.79 ST_TextStrikeType (Text Strike Type)

This type specifies the strike type.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
dblStrike (Text Strike Enum (Double Strike))	A double strikethrough applied on the text
noStrike (Text Strike Enum (No Strike))	No strike is applied to the text
sngStrike (Text Strike Enum (Single Strike))	A single strikethrough is applied to the text

Referenced By
defRPr@strike (§5.1.5.3.2); endParaRPr@strike (§5.1.5.2.3); rPr@strike (§5.1.5.3.9)

```
<simpleType name="ST_TextStrikeType">
   <restriction base="xsd:token">
      <enumeration value="noStrike"/>
      <enumeration value="sngStrike"/>
      <enumeration value="dblStrike"/>
   </restriction>
</simpleType>
```

5.1.12.80 ST_TextTabAlignType (Text Tab Alignment Types)

This type specifies the text tab alignment types.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
ctr (Text Tab Alignment Enum (Center))	The text at this tab stop is center aligned.
dec (Text Tab Alignment Enum (Decimal))	At this tab stop, the decimals are lined up. From a user's point of view, the text here behaves as right aligned until the decimal, and then as left aligned after the decimal.
l (Text Tab Alignment Enum (Left))	The text at this tab stop is left aligned.
r (Text Tab Alignment Enum (Right))	The text at this tab stop is right aligned.

Referenced By
tab@algn (§5.1.5.2.12)

```
<simpleType name="ST_TextTypeface">
   <restriction base="xsd:string"/>
</simpleType>
```

5.1.12.82 ST_TextUnderlineType (Text Underline Types)

This type specifies the text underline types that will be used.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
dash (Text Underline Enum (Dashed))	Underline the text with a single, dashed line of normal thickness.
dashHeavy (Text Underline Enum (Heavy Dashed))	Underline the text with a single, dashed, thick line.
dashLong (Text Underline Enum (Long Dashed))	Underline the text with a single line consisting of long dashes of normal thickness.
dashLongHeavy (Text Underline Enum (Heavy Long Dashed))	Underline the text with a single line consisting of long, thick dashes.
dbl (Text Underline Enum (Double))	Underline the text with two lines of normal thickness.
dotDash (Text Underline Enum (Dot Dash))	Underline the text with a single line of normal thickness consisting of repeating dots and dashes.
dotDashHeavy (Text Underline Enum (Heavy Dot Dash))	Underline the text with a single, thick line consisting of repeating dots and dashes.

Enumeration Value	Description
dotDotDash (Text Underline Enum (Dot Dot Dash))	Underline the text with a single line of normal thickness consisting of repeating two dots and dashes.
dotDotDashHeavy (Text Underline Enum (Heavy Dot Dot Dash))	Underline the text with a single, thick line consisting of repeating two dots and dashes.
dotted (Text Underline Enum (Dotted))	Underline the text with a single, dotted line of normal thickness.
dottedHeavy (Text Underline Enum (Heavy Dotted))	Underline the text with a single, thick, dotted line.
heavy (Text Underline Enum (Heavy))	Underline the text with a single, thick line.
none (Text Underline Enum (None))	The reason we cannot implicitly have noUnderline be the scenario where underline is not specified is because not being specified implies deriving from a particular style and the user might want to override that and make some text not be underlined even though the style says otherwise.
sng (Text Underline Enum (Single))	Underline the text with a single line of normal thickness.
wavy (Text Underline Enum (Wavy))	Underline the text with a single wavy line of normal thickness.
wavyDbl (Text Underline Enum (Double Wavy))	Underline the text with two wavy lines of normal thickness.
wavyHeavy (Text Underline Enum (Heavy Wavy))	Underline the text with a single, thick wavy line.
words (Text Underline Enum (Words))	Underline just the words and not the spaces between them.

Referenced By
defRPr@u (§5.1.5.3.2); endParaRPr@u (§5.1.5.2.3); rPr@u (§5.1.5.3.9)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextUnderlineType">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="words"/>
      <enumeration value="sng"/>
      <enumeration value="dbl"/>
      <enumeration value="heavy"/>
      <enumeration value="dotted"/>
      <enumeration value="dottedHeavy"/>

      <enumeration value="wavyHeavy"/>
      <enumeration value="wavyDbl"/>
   </restriction>
</simpleType>
```

5.1.12.83 ST_TextVerticalType (Vertical Text Types)

If there is vertical text, determines what type of vertical text is going to be used.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
eaVert (Vertical Text Type Enum (East Asian Vertical))	A special version of vertical text, where some fonts are displayed as if rotated by 90 degrees while some fonts (mostly East Asian) are displayed vertical.
horz (Vertical Text Type Enum (Horizontal))	Horizontal text. This should be default.
mongolianVert (Vertical Text Type Enum (Mongolian Vertical))	A special version of vertical text, where some fonts are displayed as if rotated by 90 degrees while some fonts (mostly East Asian) are displayed vertical. The difference between this and the eastAsianVertical is the text flows top down then LEFT RIGHT, instead of RIGHT LEFT
vert (Vertical Text Type Enum (Vertical))	Determines if all of the text is vertical orientation (each line is 90 degrees rotated clockwise, so it goes from top to bottom; each next line is to the left from the previous one).
vert270 (Vertical Text Type Enum (Vertical 270))	Determines if all of the text is vertical orientation

Enumeration Value	Description
	(each line is 270 degrees rotated clockwise, so it goes from bottom to top; each next line is to the right from the previous one).
wordArtVert (Vertical Text Type Enum (WordArt Vertical))	Determines if all of the text is vertical ("one letter on top of another").
wordArtVertRtl (Vertical WordArt Right to Left)	Specifies that vertical WordArt should be shown from right to left rather than left to right.

Referenced By
bodyPr@vert (§5.1.5.1.1); tcPr@vert (§5.1.6.15)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextVerticalType">
   <restriction base="xsd:token">
      <enumeration value="horz"/>
      <enumeration value="vert"/>
      <enumeration value="vert270"/>
      <enumeration value="wordArtVert"/>
      <enumeration value="eaVert"/>
      <enumeration value="mongolianVert"/>
      <enumeration value="wordArtVertRtl"/>
   </restriction>
</simpleType>
```

5.1.12.84 ST_TextVertOverflowType (Text Vertical Overflow)

This type specifies the text vertical overflow.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
clip (Text Overflow Enum (Clip))	Pay attention to top and bottom barriers. Provide no indication that there is text which is not visible.
ellipsis (Text Overflow Enum (Ellipsis))	Pay attention to top and bottom barriers. Use an ellipsis to denote that there is text which is not visible.
overflow (Text Overflow Enum (Overflow))	Overflow the text and pay no attention to top and bottom barriers.

Referenced By
bodyPr@vertOverflow (§5.1.5.1.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextVertOverflowType">
   <restriction base="xsd:token">
      <enumeration value="overflow"/>
      <enumeration value="ellipsis"/>
      <enumeration value="clip"/>
   </restriction>
</simpleType>
```

5.1.12.85 ST_TextWrappingType (Text Wrapping Types)

Text Wrapping Types

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
none (Text Wrapping Type Enum (None))	No wrapping will occur on this text body. Words will spill out without paying attention to the bounding rectangle boundaries.
square (Text Wrapping Type Enum (Square))	Determines whether we wrap words within the bounding rectangle.

Referenced By
bodyPr@wrap (§5.1.5.1.1)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TextWrappingType">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="square"/>
   </restriction>
</simpleType>
```

5.1.12.86 ST_TileFlipMode (Tile Flip Mode)

This simple type indicates whether/how to flip the contents of a tile region when using it to fill a larger fill region.

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description

Enumeration Value	Description
none (None)	 Tiles are not flipped.
x (Horizontal)	 Tiles are flipped horizontally.
xy (Horizontal and Vertical)	 Tiles are flipped both horizontally and vertically.

Enumeration Value	Description
y (Vertical)	 Tiles are flipped vertically.

Referenced By
gradFill@flip (§5.1.10.33); tile@flip (§5.1.10.58)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_TileFlipMode">
   <restriction base="xsd:token">
      <enumeration value="none"/>
      <enumeration value="x"/>
      <enumeration value="y"/>
      <enumeration value="xy"/>
   </restriction>
</simpleType>
```

5.2 DrawingML - Picture

These elements encompass the definition of pictures within the DrawingML framework. While pictures are in many ways very similar to shapes they have specific properties that are unique in order to optimize for picture-specific scenarios. Some of these properties include Fill behavior, Border behavior and Resize behavior.

5.2.1 Table of Contents

This subclause is informative.

End of informative text.

5.2.2 Elements

The following section defines the Picture portion of the DrawingML framework.

5.2.2.1 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example*: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<p:pic>
  ..
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  ..
</p:pic>
```

The above picture object is shown as an example of this fill type. *end example*]

[*Example*: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<p:pic>
  ..
  <p:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </p:blipFill>
  <p:spPr>
    <a:gradFill>
      <a:gsLst>
        <a:gs pos="0">
          <a:schemeClr val="tx2">
            <a:shade val="50000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="39999">
          <a:schemeClr val="tx2">
            <a:tint val="20000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="70000">
          <a:srgbClr val="C4D6EB"/>
        </a:gs>
        <a:gs pos="100000">
          <a:schemeClr val="bg1"/>
        </a:gs>
      </a:gsLst>
    </a:gradFill>
  </p:spPr>
  ..
</p:pic>
```

The above picture object is shown as an example of this double fill type. *end example*]

Parent Elements
pic (§5.2.2.5)

Child Elements	Subclause
blip (Blip)	§5.1.10.13
srcRect (Source Rectangle)	§5.1.10.55
stretch (Stretch)	§5.1.10.56
tile (Tile)	§5.1.10.58

Attributes	Description
dpi (DPI Setting) Namespace: .../drawingml/2006/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [*Note*: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. *end note*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: .../drawingml/2006/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlipFillProperties">
   <sequence>
      <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
      <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
   <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
</complexType>
```

5.2.2.2 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  ..
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly.jpg"/>
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <p:nvPr/>
  </p:nvPicPr>
  ..
</p:pic>
```

end example]

Parent Elements
nvPicPr (§5.2.2.4)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
picLocks (Picture Locks)	§5.1.2.1.31

Attributes	Description
preferRelativeResize (Relative Resize Preferred)	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be relative to the original picture size as opposed to the current picture size.

Attributes	Description
Namespace: .../drawingml/2006/main	[*Example*: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked. If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualPictureProperties">
   <sequence>
      <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.2.2.3 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  ..
  <p:nvPicPr>
    <p:cNvPr id="4" name="Lilly.jpg"/>
  </p:nvPicPr>
  ..
</p:pic>
```

end example]

Parent Elements
nvPicPr (§5.2.2.4)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

Attributes	Description
descr (Alternative Text for Object) Namespace: .../drawingml/2006/main	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which may be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hidden (Hidden) Namespace: .../drawingml/2006/main	Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [*Note*: An application may have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden). [*Example*: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Unique Identifier) Namespace: .../drawingml/2006/main	Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant. [*Example*: Consider a DrawingML object defined as follows: `<… id="10" … >` The id attribute has a value of `10`, which is the unique identifier for this DrawingML object. *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
name (Name) Namespace: .../drawingml/2006/main	Specifies the name of the object. [*Note*: Typically, this will be used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: `< … name="foo.jpg" >` The name attribute has a value of `foo.jpg`, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingProps">
   <sequence>
      <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_DrawingElementId" use="required"/>
   <attribute name="name" type="xsd:string" use="required"/>
   <attribute name="descr" type="xsd:string" use="optional" default=""/>
   <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.2.2.4 nvPicPr (Non-Visual Picture Properties)

This element specifies the non visual properties for a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<p:pic>
  ..
  <p:nvPicPr>
    ..
  </p:nvPicPr>
  ..
</p:pic>
```

end example]

Parent Elements
pic (§5.2.2.5)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§5.2.2.2
cNvPr (Non-Visual Drawing Properties)	§5.2.2.3

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvPicPr" type="a:CT_NonVisualPictureProperties" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.2.2.5 pic (Picture)

This element specifies the existence of a picture object within the document.

[*Example*: Consider the following DrawingML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
    <p:nvPr/>
  </p:nvPicPr>
  <p:blipFill>
  ...
  </p:blipFill>
  <p:spPr>
  ...
  </p:spPr>
</p:pic>
```

end example]

Child Elements	Subclause
blipFill (Picture Fill)	§5.2.2.1
nvPicPr (Non-Visual Picture Properties)	§5.2.2.4
spPr (Shape Properties)	§5.2.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Picture">
   <sequence minOccurs="1" maxOccurs="1">
      <element name="nvPicPr" type="CT_PictureNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="blipFill" type="a:CT_BlipFillProperties" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.2.2.6 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe the visual appearance of a picture within a document. This allows for a picture to have both the properties of a shape as well as picture specific properties that are allowed under the pic element.

Parent Elements
pic (§5.2.2.5)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

Attributes	Description
bwMode (Black and White Mode)	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white

Attributes	Description
Namespace: .../drawingml/2006/main	when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

5.3 DrawingML - Legacy Compatibility

Within the context of DrawingML, it must be possible (for considerations to legacy compatibility) to be able to include explicit references to specific shapes within VML Drawing parts.

[*Example*: A VML Drawing part is used to define ink on a PresentationML slide, but the resulting ink is referenced from the slide by its shape ID using the elements of this namespace. *end example*]

5.3.1 Table of Contents

This subclause is informative.

End of informative text.

5.3.2 Basics

Legacy Compatibility is part of the shape definitions and properties of the DrawingML framework.

5.3.2.1 legacyDrawing (Legacy Drawing Object)

This element specifies the shape ID for a legacy drawing object. These legacy drawing objects all have a shape ID associated with them that is unique across the entire document. In order to store these legacy shape IDs as well as new shape IDs this legacyDrawing element should be used.

Attributes	Description
spid (Shape ID)	Legacy Shape ID that is unique throughout the entire document. Legacy shape IDs should be assigned based on which portion of the document the drawing resides on. The assignment of these ids is broken down into clusters of 1024 values. The first cluster is 1-1024, the second 1025-2048 and so on. [*Example*: Within a word processing application the spid should be assigned based on the page that the drawing resides on. If the drawing resides on the second page then the assigned spid should be a value between 1025 and 2048. *end example*] [*Example*: Within a spreadsheet application the spid should be assigned based on the sheet that the drawing resides on. If the drawing resides on the second sheet then the assigned spid should be a value between 1025 and 2048. *end example*] [*Example*: Within a presentation application the spid should be assigned based on the slide that the drawing resides on. If the drawing resides on the second slide then the assigned spid should be a value between 1025 and 2048. *end example*] The possible values for this attribute are defined by the ST_ShapeID simple type (§5.1.12.55).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Compat">
   <attribute name="spid" type="a:ST_ShapeID" use="required"/>
</complexType>
```

5.4 DrawingML - Locked Canvas

Within a DrawingML object, a *locked canvas* allows DrawingML objects to be placed in a format where they can be viewed but not edited by the hosting application. This allows DrawingML objects not supported by an application to be included and viewed in applications where they cannot be edited.

5.4.1 Table of Contents

This subclause is informative.

End of informative text.

5.4.2 Basics

This section specifies a locked canvas within the basic DrawingML framework.

5.4.2.1 lockedCanvas (Locked Canvas Container)

The locked canvas element acts as a container for more advanced drawing objects. The notion of a locked canvas comes from the fact that the generating application opening the file cannot create this object and can thus not perform edits either. Thus the drawing object is locked from all UI adjustments that would normally take place.

Child Elements	Subclause
cxnSp (Connection Shape)	§5.1.2.1.10
extLst (Extension List)	§5.1.2.1.15
graphicFrame (Graphic Frame)	§5.1.2.1.18
grpSp (Group shape)	§5.1.2.1.20
grpSpPr (Visual Group Shape Properties)	§5.1.2.1.22
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§5.1.2.1.27
pic (Picture)	§5.1.2.1.30
sp (Shape)	§5.1.2.1.33
txSp (Text Shape)	§5.1.2.1.41

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GvmlGroupShape">
   <sequence>
      <element name="nvGrpSpPr" type="CT_GvmlGroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="grpSpPr" type="CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
      <choice minOccurs="0" maxOccurs="unbounded">
         <element name="txSp" type="CT_GvmlTextShape"/>
         <element name="sp" type="CT_GvmlShape"/>
         <element name="cxnSp" type="CT_GvmlConnector"/>
         <element name="pic" type="CT_GvmlPicture"/>
         <element name="graphicFrame" type="CT_GvmlGraphicalObjectFrame"/>
         <element name="grpSp" type="CT_GvmlGroupShape"/>
      </choice>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.5 DrawingML - WordprocessingML Drawing

Within a WordprocessingML document, it is possible to include graphical DrawingML objects:

- Pictures (§5.2)
- Locked Canvases (§5.4)
- Diagrams (§5.9)

- Charts (§5.7)

When these objects are present in a word processing document, it is necessary to include information which specifies how the objects shall be positioned relative to the paginated document. [*Example*: Whether the object is displayed in line with text. *end example*]

The WordprocessingML Drawing namespace acts in this capacity, specifying all information necessary to anchor and display DrawingML objects within a word processing document.

[*Example*: Consider a DrawingML picture which shall be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<w:r>
  <w:drawing>
    <wp:anchor relativeHeight="10" allowOverlap="true">
      <wp:positionH relativeFrom="margin">
        <wp:align>center</wp:align>
      </wp:positionH>
      <wp:positionV relativeFrom="margin">
        <wp:align>center</wp:align>
      </wp:positionV>
      <wp:extent cx="2441542" cy="1828800"/>
      <wp:wrapSquare wrapText="bothSides"/>
      <a:graphic>
        …
      </a:graphic>
    </wp:anchor>
  </w:drawing>
</w:r>
```

The anchor element (§5.5.2.3) specifies that this object is not positioned in line with text, and its child elements specify that the object is centered on the page horizontally and vertically (§5.5.2.10; §5.5.2.11), and that text can wrap around it in a square (§5.5.2.17). *end example*]

5.5.1 Table of Contents

This subclause is informative.

End of informative text.

5.5.2 Elements

The following elements define the contents of the WordprocessingML Drawing namespace:

5.5.2.1 align (Relative Horizontal Alignment)

This element specifies how a DrawingML object shall be horizontally aligned relative to the horizontal alignment base defined by the parent element. Once an alignment base is defined, this element shall determine how the DrawingML object shall be aligned relative to that location.

[*Example*: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="page">
    <wp:align>left</wp:align>
  </wp:positionH>
  …
</wp:anchor>
```

The align element with a value of `left` specifies that for the horizontal positioning defined by the parent element (in this case, positioning relative to the page), the picture shall be aligned to the left edge of the page. *end example*]

The possible values for this element are defined by the ST_AlignH simple type (§5.5.3.1).

Parent Elements
positionH (§5.5.2.10)

5.5.2.2 align (Relative Vertical Alignment)

This element specifies how a DrawingML object shall be vertically aligned relative to the vertical alignment base defined by the parent element. Once an alignment base is defined, this element shall determine how the DrawingML object shall be aligned relative to that location.

[*Example*: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor … >
  <wp:positionV relativeFrom="page">
    <wp:align>top</wp:align>
  </wp:positionH>
  …
</wp:anchor>
```

The align element with a value of `top` specifies that for the vertical positioning defined by the parent element (in this case, positioning relative to the page), the picture shall be aligned to the top edge of the page. *end example*]

The possible values for this element are defined by the ST_AlignV simple type (§5.5.3.2).

Parent Elements
positionV (§5.5.2.11)

5.5.2.3 anchor (Anchor for Floating DrawingML Object)

This element specifies that the DrawingML object located at this position in the document is a floating object. Within a WordprocessingML document, drawing objects can exist in two states:

- *Inline* - The drawing object is in line with the text, and affects the line height and layout of its line (like a character glyph of similar size).
- *Floating* - The drawing object is anchored within the text, but may be absolutely positioned in the document relative to the page.

When this element encapsulates the DrawingML object's information, then all child elements shall dictate the positioning of this object as a floating object on the page.

[*Example*: Consider a WordprocessingML document where the anchor for a floating DrawingML object shall be the first piece of run content within a paragraph. That paragraph's content would be specified as follows:

```
<w:p>
  <w:r>
    <w:drawing>
      <wp:anchor … >
        …
      </wp:anchor>
    </w:drawing>
  </w:r>
</w:p>
```

The anchor element, when present as the child element of the drawing element, specifies that this DrawingML object shall be positioned as a floating object based on the values of its child elements. *end example*]

Parent Elements
drawing (§2.3.3.9)

Child Elements	Subclause
cNvGraphicFramePr (Common DrawingML Non-Visual Properties)	§5.5.2.4
docPr (Drawing Object Non-Visual Properties)	§5.5.2.5
effectExtent (Object Extents Including Effects)	§5.5.2.6
extent (Drawing Object Size)	§5.5.2.7
graphic (Graphic Object)	§5.1.2.1.16
positionH (Horizontal Positioning)	§5.5.2.10
positionV (Vertical Positioning)	§5.5.2.11
simplePos (Simple Positioning Coordinates)	§5.5.2.13
wrapNone (No Text Wrapping)	§5.5.2.15
wrapSquare (Square Wrapping)	§5.5.2.17
wrapThrough (Through Wrapping)	§5.5.2.18
wrapTight (Tight Wrapping)	§5.5.2.19
wrapTopAndBottom (Top and Bottom Wrapping)	§5.5.2.20

Attributes	Description
allowOverlap	Specifies whether a DrawingML object which intersects another DrawingML object at

Attributes	Description

(Allow Objects to Overlap)	display time shall be allowed to overlap the contents of the other DrawingML object. If a DrawingML object cannot overlap other DrawingML object, it shall be repositioned when displayed to prevent this overlap as needed.
	
	If this element is omitted on a given DrawingML object, then overlap shall not be allowed between a DrawingML object which intersects another DrawingML object displayed at the same location.
	
	[*Example*: Consider a document with two DrawingML objects which are allowed to overlap each other. This would be specified as follows within each object's anchor markup:
	
	`<wp:anchor allowOverlap="true" … >`
	`  …`
	`</wp:anchor>`
	
	The allowOverlap attribute has a value of `true`, which specifies that this object shall be allowed to overlap other objects when it is displayed on the document. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

behindDoc (Display Behind Document Text)	Specifies whether this floating DrawingML object shall be displayed behind the text of the document when the document is displayed. When a DrawingML object is displayed within a WordprocessingML document, that object may intersect with text in the document. This attribute shall determine whether the text or the object shall be rendered on top in case of overlapping.
	
	If this attribute is omitted, then the parent DrawingML object shall be displayed in front of the text content of the document in cases of overlapping.
	
	[*Example*: Consider a floating DrawingML object which shall be displayed above any text which it intersects within the document's content. This setting would be specified as follows:
	
	`<wp:anchor behindDoc="false" … >`
	`  …`
	`</wp:anchor>`
	
	The behindDoc attribute has a value of `false`, which specifies that the DrawingML object is displayed above the text of the document in z-order. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

distB (Distance From Text on Bottom Edge)	Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents. The distance shall be measured in EMUs (English Metric Units).

Attributes	Description

	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distB="457200" … >`
	`  …`
	`</wp:anchor>`
	
	The distB attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distL (Distance From Text on Left Edge)	Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which shall have one-quarter of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distL="228600" … >`
	`  …`
	`</wp:anchor>`
	
	The distL attribute specifies that the padding distance shall be 228600 EMUs or one-quarter of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distR (Distance	Specifies the minimum distance which shall be maintained between the right edge of this

Attributes	Description

From Text on Right Edge)	drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which shall have one-quarter of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distR="228600" … >`
	`  …`
	`</wp:anchor>`
	
	The distR attribute specifies that the padding distance shall be 228600 EMUs or one-quarter of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distT (Distance From Text on Top Edge)	Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distT="457200" … >`
	`  …`
	`</wp:anchor>`
	
	The distT attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

hidden (Hidden)	Specifies whether this floating DrawingML object shall be displayed. When a DrawingML object is displayed within a WordprocessingML document, that object may be hidden (i.e. present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [*Note*: An application may have settings which allow this object to be viewed. *end note*]
	
	If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e. not hidden).
	
	[*Example*: Consider a floating DrawingML object which shall be hidden within the document's content. This setting would be specified as follows:
	
	`<wp:anchor hidden="true" … >`
	`…`
	`</wp:anchor>`
	
	The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

layoutInCell (Layout In Table Cell)	Specifies how this DrawingML object shall behave when its anchor is located in a table cell; and its specified position would cause it to intersect with a table cell displayed in the document. That behavior shall be as follows:
	• When this attribute has a value of `true`, then the object shall be positioned within the existing table cell, causing the cell to be resized as needed. This means that all positioning shall be relative to the cell and not the line on which the table appears.
	• When this attribute has a value of false, then the object shall be positioned as specified, but the table shall be resized and/or relocated within the document as needed to accommodate the object. This means that all positioning shall be relative to the line on which the table appears and not the cell in which the anchor is present.
	
	If this attribute is omitted, then its default value shall be considered to be `false`.
	
	[*Example*: Consider a DrawingML picture which shall be displayed in the center of the document. If the object is contained within a table and is defined as follows:
	
	`<wp:anchor layoutInCell="true" … >`
	`…`
	`</wp:anchor>`

Attributes	Description
	The layoutInCell attribute has a value of `true`, which specifies that the object can be placed within the cell if needed, for example:  If the layoutInCell attribute was now set to `false`, the object shall be laid out outside of the cell, causing the table to be repositioned:  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
locked (Lock Anchor)	Specifies that the anchor location for this object shall not be modified at runtime when an application edits the contents of this document. [*Guidance*: An application might have automatic behaviors which reposition the anchor for a DrawingML object based on user interaction - for example, moving it from one page to another as needed. This element shall tell applications not to perform any such behaviors. *end guidance*] If this attribute is omitted, then the anchor shall not be locked for the parent DrawingML object (i.e. a default value of `false`). [*Example*: Consider a floating DrawingML object which shall have its anchor locked at the current location. This setting would be specified as follows:

Attributes	Description
	<wp:anchor locked="true" … > … </wp:anchor> The locked attribute has a value of true, which specifies that the DrawingML object's current anchor location shall not be changed by applications editing this content. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
relativeHeight (Relative Z-Ordering Position)	Specifies the relative Z-ordering of all DrawingML objects in this document. Each floating DrawingML object shall have a Z-ordering value, which determines which object is displayed when any two objects intersect. Higher values shall indicate higher Z-order; lower values shall indicate lower Z-order. This attribute shall only indicate the Z-order with respect to other objects in the document which have an identical behindDoc attribute value. All objects with a behindDoc value of false shall be displayed above elements with a value of true. [*Example*: Consider two floating DrawingML objects as follows: <wp:anchor relativeHeight="5" … > … </wp:anchor> … <wp:anchor relativeHeight="8" … > … </wp:anchor> The relativeHeight attribute of the second object is 8, which specifies that the second DrawingML object shall be at a higher Z-order than the first and shall be displayed whenever the two overlap. *end example*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
simplePos (Page Positioning)	Specifies that this object shall be positioned using the positioning information in the simplePos child element (§5.5.2.13). This positioning, when specified, will position the object on the page by placing its top left point at the x-y coordinates specified by that element. If this element is omitted, then this object shall not use the simple positioning information in the simplePos element, even when present. [*Example*: Consider a floating DrawingML object which shall be positioned at the top left corner of the page using simple positioning. This setting would be specified as follows:

Attributes	Description
	<wp:anchor simplePos="true" … > <wp:simplePos x="0" y="0" /> … </wp:anchor> The simplePos attribute has a value of true, which specifies that the DrawingML object's current position shall be dictated by the simplePos element, and hence placed at 0,0. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Anchor">
   <sequence>
      <element name="simplePos" type="a:CT_Point2D"/>
      <element name="positionH" type="CT_PosH"/>
      <element name="positionV" type="CT_PosV"/>
      <element name="extent" type="a:CT_PositiveSize2D"/>
      <element name="effectExtent" type="CT_EffectExtent" minOccurs="0"/>
      <group ref="EG_WrapType"/>
      <element name="docPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGraphicFramePr" type="a:CT_NonVisualGraphicFrameProperties" minOccurs="0"
        maxOccurs="1"/>
      <element ref="a:graphic" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="distT" type="ST_WrapDistance" use="optional"/>
   <attribute name="distB" type="ST_WrapDistance" use="optional"/>
   <attribute name="distL" type="ST_WrapDistance" use="optional"/>
   <attribute name="distR" type="ST_WrapDistance" use="optional"/>
   <attribute name="simplePos" type="xsd:boolean"/>
   <attribute name="relativeHeight" type="xsd:unsignedInt" use="required"/>
   <attribute name="behindDoc" type="xsd:boolean" use="required"/>
   <attribute name="locked" type="xsd:boolean" use="required"/>
   <attribute name="layoutInCell" type="xsd:boolean" use="required"/>
   <attribute name="hidden" type="xsd:boolean" use="optional"/>
   <attribute name="allowOverlap" type="xsd:boolean" use="required"/>
</complexType>
```

5.5.2.4 cNvGraphicFramePr (Common DrawingML Non-Visual Properties)

This element specifies common non-visual DrawingML object properties for the parent DrawingML object. These properties are specified as child elements of this element.

[*Example*: Consider a DrawingML object in a WordprocessingML document defined as follows:

```
<wp:inline>
  …
  <wp:cNvGraphicFramePr>
    <a:graphicFrameLocks … />
  </wp:cNvGraphicFramePr>
</wp:inline>
```

The cNvGraphicFramePr element contains a set of common non-visual properties as defined by DrawingML. *end example*]

Parent Elements
anchor (§5.5.2.3); inline (§5.5.2.8)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGraphicFrameProperties">
   <sequence>
      <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
        maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.5.2.5 docPr (Drawing Object Non-Visual Properties)

This element specifies non-visual object properties for the parent DrawingML object. These properties are specified as child elements of this element.

[*Example*: Consider a DrawingML object in a WordprocessingML document defined as follows:

```
<wp:inline>
  …
  <wp:docPr id="1" name="Example Object">
    <a:hlinkClick … />
    <a:hlinkHover … />
  </wp:docPr>
</wp:inline>
```

The docPr element contains a set of common non-visual properties for this object. *end example*]

Parent Elements
anchor (§5.5.2.3); inline (§5.5.2.8)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

Attributes	Description
descr (Alternative Text for Object) Namespace: .../drawingml/2006/main	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which may be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hidden (Hidden) Namespace: .../drawingml/2006/main	Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [*Note*: An application may have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden). [*Example*: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Unique Identifier) Namespace: .../drawingml/2006/main	Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.

Attributes	Description
	[*Example*: Consider a DrawingML object defined as follows: `<… id="10" … >` The id attribute has a value of 10, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
name (Name) Namespace: …/drawingml/2006/main	Specifies the name of the object. [*Note*: Typically, this will be used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: `< … name="foo.jpg" >` The name attribute has a value of foo.jpg, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

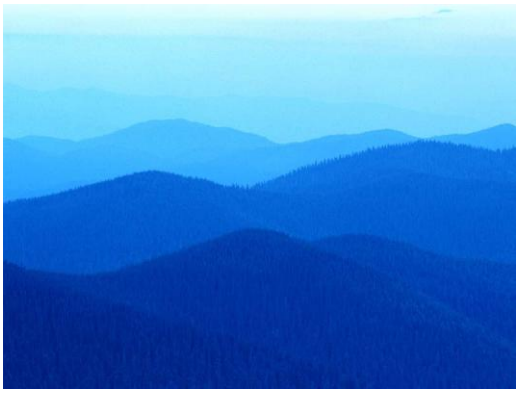
```
<complexType name="CT_NonVisualDrawingProps">
   <sequence>
      <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_DrawingElementId" use="required"/>
   <attribute name="name" type="xsd:string" use="required"/>
   <attribute name="descr" type="xsd:string" use="optional" default=""/>
   <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.5.2.6 effectExtent (Object Extents Including Effects)

This element specifies the additional extent which shall be added to each edge of the image (top, bottom, left, right) in order to compensate for any drawing effects applied to the DrawingML object.

The extent element (§5.5.2.7) specifies the size of the actual DrawingML object; however, an object may have effects applied which change its overall size [*Example*: A reflection and/or shadow effect. *end example*]. The additional size for each edge of the shape shall be stored on this element, and used to calculate the appropriate wrapping for wrap types without a wrapping polygon and the appropriate line height for inline objects.

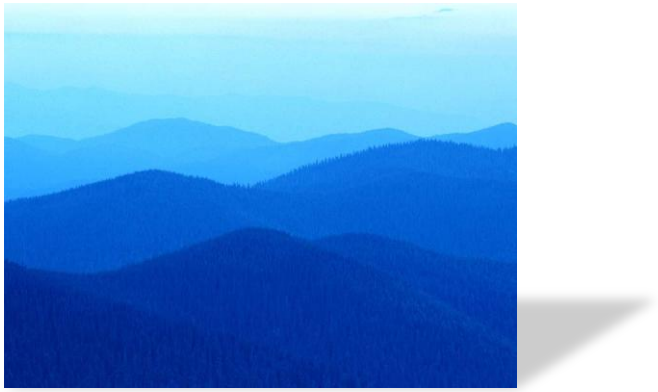
[*Example*: Consider the following DrawingML image:



This object has no effects, and hence would have the following effect extents:

```
<wp:effectExtents b="0" t="0" l="0" r="0" />
```

However, if a shadow effect was applied which added effects to the right of the image:



Then the additional extent the right side would be specified in the r attribute on this element:

```
<wp:effectExtents b="0" t="0" l="0" r="695325" />
```

The r attribute has a value of 695325, specifying that that 695325 EMUs shall be added to the right side of the image. *end example*]

Parent Elements
anchor (§5.5.2.3); inline (§5.5.2.8); wrapSquare (§5.5.2.17); wrapTopAndBottom (§5.5.2.20)

Attributes	Description
b (Additional Extent on Bottom Edge)	Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects. [Example: Consider the following DrawingML image:

Attributes	Description
	 This image has an effect on all four sides, resulting in the following markup: `<wp:effectExtent l="504825" t="447675" r="771525" b="809625" />` The b attribute value of 809625 specifies that 809625 additional EMUs shall be added to the bottom of the image to compensate for the effects on the image. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
l (Additional Extent on Left Edge)	Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects. [Example: Consider the following DrawingML image:  This image has an effect on all four sides, resulting in the following markup:

Attributes	Description
	<wp:effectExtent l="504825" t="447675" r="771525" b="809625" /> The l attribute value of 504825 specifies that 504825 additional EMUs shall be added to the bottom of the image to compensate for the effects on the image. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
r (Additional Extent on Right Edge)	Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects. [Example: Consider the following DrawingML image:  This image has an effect on all four sides, resulting in the following markup: <wp:effectExtent l="504825" t="447675" r="771525" b="809625" /> The r attribute value of 771525 specifies that 771525 additional EMUs shall be added to the bottom of the image to compensate for the effects on the image. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
t (Additional Extent on Top Edge)	Specifies the additional length, in EMUs, which shall be added to the bottom edge of the DrawingML object to determine its actual bottom edge including effects. [Example: Consider the following DrawingML image:

Attributes	Description
	 This image has an effect on all four sides, resulting in the following markup: `<wp:effectExtent l="504825" t="447675" r="771525" b="809625" />` The t attribute value of 447675 specifies that 447675 additional EMUs shall be added to the bottom of the image to compensate for the effects on the image. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_EffectExtent">
    <attribute name="l" type="a:ST_Coordinate" use="required"/>
    <attribute name="t" type="a:ST_Coordinate" use="required"/>
    <attribute name="r" type="a:ST_Coordinate" use="required"/>
    <attribute name="b" type="a:ST_Coordinate" use="required"/>
</complexType>
```

5.5.2.7 extent (Drawing Object Size)

This element specifies the extents of the parent DrawingML object within the document (i.e. its final height and width).

[*Example*: Consider a DrawingML picture which is present in a WordprocessingML document and has an equal height and width. This object would be specified as follows:

```
<wp:anchor relativeHeight="10" allowOverlap="true">
  …
  <wp:extent cx="1828800" cy="1828800"/>
  …
</wp:anchor>
```

The extent element specifies via its attributes that this object has a height and width of 1828800 EMUs (English Metric Units). *end example*]

Parent Elements
anchor (§5.5.2.3); inline (§5.5.2.8)

Attributes	Description
cx (Extent Length) Namespace: .../drawingml/2006/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: <… cx="1828800" cy="200000"/> The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
cy (Extent Width) Namespace: .../drawingml/2006/main	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: < … cx="1828800" cy="200000"/> The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveSize2D">
   <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
   <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

5.5.2.8 inline (Inline DrawingML Object)

This element specifies that the DrawingML object located at this position in the document is an inline object. Within a WordprocessingML document, drawing objects can exist in two states:

- *Inline* - The drawing object is in line with the text, and affects the line height and layout of its line (like a character glyph of similar size).

- *Floating* - The drawing object is anchored within the text, but may be absolutely positioned in the document relative to the page.

When this element encapsulates the DrawingML object's information, then all child elements shall dictate the positioning of this object in line with text.

[*Example*: Consider a WordprocessingML document where an inline DrawingML object shall be the first piece of run content within a paragraph. That paragraph's content would be specified as follows:

```
<w:p>
  <w:r>
    <w:drawing>
      <wp:inline>
        …
      </wp:inline>
    </w:drawing>
  </w:r>
</w:p>
```

The inline element, when present as the child element of the drawing element, specifies that this DrawingML object shall be positioned in line with the text of this paragraph, modifying line heights, etc. as necessary. *end example*]

Parent Elements
drawing (§2.3.3.9)

Child Elements	Subclause
cNvGraphicFramePr (Common DrawingML Non-Visual Properties)	§5.5.2.4
docPr (Drawing Object Non-Visual Properties)	§5.5.2.5
effectExtent (Object Extents Including Effects)	§5.5.2.6
extent (Drawing Object Size)	§5.5.2.7
graphic (Graphic Object)	§5.1.2.1.16

Attributes	Description
distB (Distance From Text on Bottom Edge)	Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents. The distance shall be measured in EMUs (English Metric Units). If this object is an inline object (i.e. has a parent element of inline), then this value shall

Attributes	Description

	not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distB="457200" … >`
	`  …`
	`</wp:anchor>`
	
	The distB attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distL (Distance From Text on Left Edge)	Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which shall have one-quarter of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distL="228600" … >`
	`  …`
	`</wp:anchor>`
	
	The distL attribute specifies that the padding distance shall be 228600 EMUs or one-quarter of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distR (Distance From Text on Right Edge)	Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.

Attributes	Description

	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which shall have one-quarter of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distR="228600" … >`
	`  …`
	`</wp:anchor>`
	
	The distR attribute specifies that the padding distance shall be 228600 EMUs or one-quarter of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distT (Distance From Text on Top Edge)	Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	If this object is an inline object (i.e. has a parent element of inline), then this value shall not have any effect when displaying the object in line with text, but may be maintained and used if the object is subsequently changed to floating. If the wrapping element [*Example*: wrapThrough or wrapSquare *end example*] present as a child element also has a distance from text, then this value shall be ignored.
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor distT="457200" … >`
	`  …`
	`</wp:anchor>`
	
	The distT attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type

Attributes	Description
	(§5.5.3.6).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Inline">
   <sequence>
      <element name="extent" type="a:CT_PositiveSize2D"/>
      <element name="effectExtent" type="CT_EffectExtent" minOccurs="0"/>
      <element name="docPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGraphicFramePr" type="a:CT_NonVisualGraphicFrameProperties" minOccurs="0"
        maxOccurs="1"/>
      <element ref="a:graphic" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="distT" type="ST_WrapDistance" use="optional"/>
   <attribute name="distB" type="ST_WrapDistance" use="optional"/>
   <attribute name="distL" type="ST_WrapDistance" use="optional"/>
   <attribute name="distR" type="ST_WrapDistance" use="optional"/>
</complexType>
```

5.5.2.9 lineTo (Wrapping Polygon Line End Position)

This element specifies a single point on the wrapping polygon for a DrawingML object. This point shall be the termination of the edge of the wrapping polygon started by the previous start or lineTo element in document order, and shall be the origin of the next edge on the same polygon.

The attributes on this element shall dictate the position of the point relative to the upper-left corner of the actual object.

[*Example*: Consider the following basic wrapping polygon for a DrawingML object:

```
<wp:wrapPolygon>
  <wp:start x="0" y="0" />
  <wp:lineTo x="0" y="100" />
  <wp:lineTo x="100" y="100" />
  <wp:lineTo x="100" y="0" />
  <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The lineTo element defines each point of the wrapping polygon (in this case, the four points of the wrapping square). *end example*]

Parent Elements
wrapPolygon (§5.5.2.16)

Attributes	Description
x (X-Axis	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified

Attributes	Description
Coordinate) Namespace: .../drawingml/2006/main	by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate) Namespace: .../drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
   <attribute name="x" type="ST_Coordinate" use="required"/>
   <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

5.5.2.10 positionH (Horizontal Positioning)

This element specifies the horizontal positioning of a floating DrawingML object within a WordprocessingML document. This positioning is specified in two parts:

- Positioning Base - The relativeFrom attribute on this element specifies the part of the document from which the positioning shall be calculated.
- Positioning - The child element of this element (align or posOffset) specifies how the object is positioned relative to that base.

[*Example*: Consider a DrawingML picture which shall be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionH>
  <wp:positionV relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionV>
</wp:anchor>
```

The positionH element specifies that the object is horizontally positioned relative to the margin via the relativeFrom attribute; and that the alignment relative to the margin is centered via the align element. *end example*]

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
align (Relative Horizontal Alignment)	§5.5.2.1
posOffset (Absolute Position Offset)	§5.5.2.12

Attributes	Description
relativeFrom (Horizontal Position Relative Base)	Specifies the base to which the relative horizontal positioning of this object shall be calculated. [*Example*: Consider a DrawingML picture which shall be displayed at the bottom center of the page. This object would be specified as follows: `<wp:anchor … > <wp:positionH relativeFrom="page"> <wp:align>center</wp:align> </wp:positionH> … </wp:anchor>` The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. *end example*] The possible values for this attribute are defined by the ST_RelFromH simple type (§5.5.3.4).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PosH">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="align" type="ST_AlignH" minOccurs="1" maxOccurs="1"/>
         <element name="posOffset" type="ST_PositionOffset" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
   <attribute name="relativeFrom" type="ST_RelFromH" use="required"/>
</complexType>
```

5.5.2.11 positionV (Vertical Positioning)

This element specifies the vertical positioning of a floating DrawingML object within a WordprocessingML document. This positioning is specified in two parts:

- Positioning Base - The relativeFrom attribute on this element specifies the part of the document from which the positioning shall be calculated.
- Positioning - The child element of this element (align or posOffset) specifies how the object is positioned relative to that base.

[*Example*: Consider a DrawingML picture which shall be displayed in the center of the printed page on which it appears, modifying the flow of text as necessary. This object would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionH>
  <wp:positionV relativeFrom="margin">
    <wp:align>center</wp:align>
  </wp:positionV>
</wp:anchor>
```

The positionV element specifies that the object is vertically positioned relative to the margin via the relativeFrom attribute; and that the alignment relative to the margin is centered via the align element. *end example*]

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
align (Relative Vertical Alignment)	§5.5.2.2
posOffset (Absolute Position Offset)	§5.5.2.12

Attributes	Description
relativeFrom (Vertical Position Relative Base)	Specifies the base to which the relative vertical positioning of this object shall be calculated. [*Example*: Consider a DrawingML picture which shall be displayed at the bottom center of the page margins. This object would be specified as follows: `<wp:anchor … > … <wp:positionV relativeFrom="margin"> <wp:align>bottom</wp:align> </wp:positionV> </wp:anchor>` The relativeFrom attribute specifies that the object is horizontally positioned relative to the margin. *end example*] The possible values for this attribute are defined by the ST_RelFromV simple type (§5.5.3.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PosV">
    <sequence>
        <choice minOccurs="1" maxOccurs="1">
            <element name="align" type="ST_AlignV" minOccurs="1" maxOccurs="1"/>
            <element name="posOffset" type="ST_PositionOffset" minOccurs="1" maxOccurs="1"/>
        </choice>
    </sequence>
    <attribute name="relativeFrom" type="ST_RelFromV" use="required"/>
</complexType>
```

5.5.2.12 posOffset (Absolute Position Offset)

This element specifies an absolute measurement for the positioning of a floating DrawingML object within a WordprocessingML document. This measurement shall be calculated relative to the top left edge of the positioning base specified by the parent element's relativeFrom attribute.

[*Example*: Consider a DrawingML picture which shall be displayed one inch from the top of the page, and one-half of an inch from the left edge of the page. This object would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="page">
    <wp:posOffset>914400</wp:posOffset>
  </wp:positionH>
  <wp:positionV relativeFrom="page">
    <wp:posOffset>457200</wp:posOffset>
  </wp:positionV>
</wp:anchor>
```

The posOffset element specifies the absolute positioning of the object relative to the top-left edge of the page in EMUs. *end example*]

The possible values for this element are defined by the ST_PositionOffset simple type (§5.5.3.3).

Parent Elements
positionH (§5.5.2.10); positionV (§5.5.2.11)

5.5.2.13 simplePos (Simple Positioning Coordinates)

This element specifies the coordinates at which a DrawingML object shall be positioned relative to the top-left edge of its page, when the simplePos attribute is specified on the anchor element (§5.5.2.3).

[*Example*: Consider a floating DrawingML object which shall be positioned at the top left corner of the page using simple positioning. This setting would be specified as follows:

```
<wp:anchor simplePos="true" … >
  <wp:simplePos x="0" y="0" />
  …
</wp:anchor>
```

The simplePos attribute has a value of `true`, which specifies that the DrawingML object's current position shall be dictated by the simplePos element, and hence placed at `0`,`0`. *end example*]

Parent Elements
anchor (§5.5.2.3)

Attributes	Description
x (X-Axis Coordinate) Namespace: …/drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate) Namespace: …/drawingml/200	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object:

Attributes	Description
6/main	<wp:… x="0" y="100" /> The y attribute defines a y-coordinate of 100. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
   <attribute name="x" type="ST_Coordinate" use="required"/>
   <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

5.5.2.14 start (Wrapping Polygon Start)

This element specifies the starting point on the wrapping polygon for a DrawingML object. This point shall be the start and termination of the wrapping polygon for the parent object.

The attributes on this element shall dictate the position of the point relative to the upper-left corner of the actual object.

[*Example*: Consider the following basic wrapping polygon for a DrawingML object:

```
<wp:wrapPolygon>
  <wp:start x="0" y="0" />
  <wp:lineTo x="0" y="100" />
  <wp:lineTo x="100" y="100" />
  <wp:lineTo x="100" y="0" />
  <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The start element defines the start and end of the wrapping polygon (in this case, the four points of the wrapping square). *end example*]

Parent Elements
wrapPolygon (§5.5.2.16)

Attributes	Description
x (X-Axis Coordinate) Namespace: …/drawingml/200	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object:

Attributes	Description
6/main	<wp:… x="0" y="100" /> The x attribute defines an x-coordinate of 0. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate) Namespace: …/drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: <wp:… x="0" y="100" /> The y attribute defines a y-coordinate of 100. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
   <attribute name="x" type="ST_Coordinate" use="required"/>
   <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

5.5.2.15 wrapNone (No Text Wrapping)

This element specifies that the parent DrawingML object shall not cause any text wrapping within the contents of the host WordprocessingML document based on its display location. In effect, this setting shall place the object in one of two locations:

- If the behindDoc attribute on the parent element is true, then the object shall be positioned behind the text as it is normally displayed.
- If the behindDoc attribute on the parent element is false, then the object shall be positioned in front of the text as it is normally displayed.

[*Example*: Consider a DrawingML picture which shall be displayed in front of any text on the page. This object would be specified as follows:

```
<wp:anchor relativeHeight="10" behindDoc="false">
  …
  <wp:wrapNone/>
</wp:anchor>
```

The wrapNone element specifies that the DrawingML object shall not cause any text wrapping, and since the behindDoc attribute is `false`, the object shall be displayed in front of the text of the document. *end example*]

Parent Elements
anchor (§5.5.2.3)

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WrapNone"/>
```

5.5.2.16 wrapPolygon (Wrapping Polygon)

This element specifies the wrapping polygon which shall be used to determine the extents to which text may wrap around the specified object in the document. This polygon shall be defined by the following:

- The start element defines the coordinates of the origin of the wrap polygon
- Two or more lineTo elements define the point of the wrap polygon

If the set of child elements does not result in a closed polygon (the last lineTo element does not return to the position specified by the start element), then a single additional line shall be inferred as needed to close the wrapping polygon.

[*Example*: Consider the following basic wrapping polygon for a DrawingML object:

```
<wp:wrapPolygon>
  <wp:start x="0" y="0" />
  <wp:lineTo x="0" y="100" />
  <wp:lineTo x="100" y="100" />
  <wp:lineTo x="100" y="0" />
  <wp:lineTo x="0" y="0" />
</wp:wrapPolygon>
```

The wrapPolygon element defines the object's text wrapping polygon (in this case, the four points of a square). *end example*]

Parent Elements
wrapThrough (§5.5.2.18); wrapTight (§5.5.2.19)

Child Elements	Subclause
lineTo (Wrapping Polygon Line End Position)	§5.5.2.9
start (Wrapping Polygon Start)	§5.5.2.14

Attributes	Description

Attributes	Description

edited (Wrapping Points Modified)	Specifies that the wrap points for the wrapping polygon have been edited, and the resulting extents shall be recalculated to compensate when the document is next opened.
	
	[*Example*: Consider the following basic wrapping polygon for a DrawingML object:
	
	`<wp:wrapPolygon edited="true">`
	`<wp:start x="0" y="0" />`
	`<wp:lineTo x="0" y="100" />`
	`<wp:lineTo x="50" y="50" />`
	`<wp:lineTo x="0" y="0" />`
	`</wp:wrapPolygon>`
	
	The edited attribute specifies that these wrap points have been changed since the document was last rendered. *end example*]
	
	The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WrapPath">
   <sequence>
      <element name="start" type="a:CT_Point2D" minOccurs="1" maxOccurs="1"/>
      <element name="lineTo" type="a:CT_Point2D" minOccurs="2" maxOccurs="unbounded"/>
   </sequence>
   <attribute name="edited" type="xsd:boolean" use="optional"/>
</complexType>
```

5.5.2.17 wrapSquare (Square Wrapping)

This element specifies that text shall wrap around a virtual rectangle bounding this object. The bounds of the wrapping rectangle shall be dictated by the extents including the addition of the effectExtent element as a child of this element (if present) or the effectExtent present on the parent element.

[*Example*: Consider a DrawingML object using square wrapping and defined as follows:

```
<wp:anchor … >
  …
  <wp:wrapSquare wrapText="bothSides" />
</wp:anchor>
```

The wrapSquare element specifies that text shall wrap around both sides of a rectangle around this object which includes its effect extents. *end example*]

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
effectExtent (Object Extents Including Effects)	§5.5.2.6

Attributes	Description

distB (Distance From Text on Bottom Edge)	Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapSquare distB="457200" … />`
	`</wp:anchor>`
	
	The distB attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distL (Distance From Text on Left Edge)	Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapSquare distL="457200" … />`
	`</wp:anchor>`
	
	The distL attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distR (Distance	Specifies the minimum distance which shall be maintained between the right edge of this

Attributes	Description

From Text on Right Edge)	drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapSquare distR="457200" … />`
	`</wp:anchor>`
	
	The distR attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distT (Distance From Text (Top))	Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapSquare distT="457200" … />`
	`</wp:anchor>`
	
	The distT attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

wrapText (Text Wrapping Location)	Specifies how text shall wrap around the object's left and right sides.
	
	[*Example*: Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`

Attributes	Description
	<wp:wrapSquare wrapText="left" … /> </wp:anchor> The wrapText attribute value of `left` specifies that text shall only wrap around the let side of the object. *end example*] The possible values for this attribute are defined by the ST_WrapText simple type (§5.5.3.7).

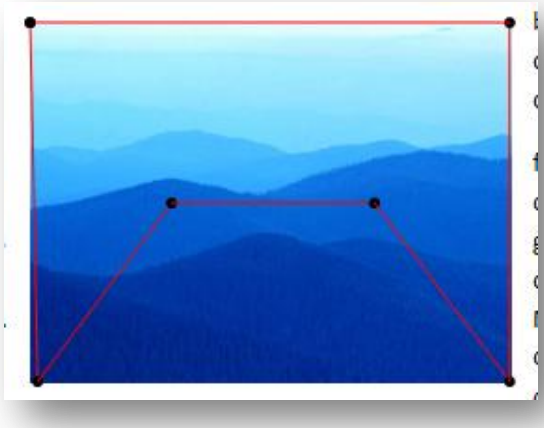
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WrapSquare">
   <sequence>
      <element name="effectExtent" type="CT_EffectExtent" minOccurs="0"/>
   </sequence>
   <attribute name="wrapText" type="ST_WrapText" use="required"/>
   <attribute name="distT" type="ST_WrapDistance" use="optional"/>
   <attribute name="distB" type="ST_WrapDistance" use="optional"/>
   <attribute name="distL" type="ST_WrapDistance" use="optional"/>
   <attribute name="distR" type="ST_WrapDistance" use="optional"/>
</complexType>
```

5.5.2.18 wrapThrough (Through Wrapping)

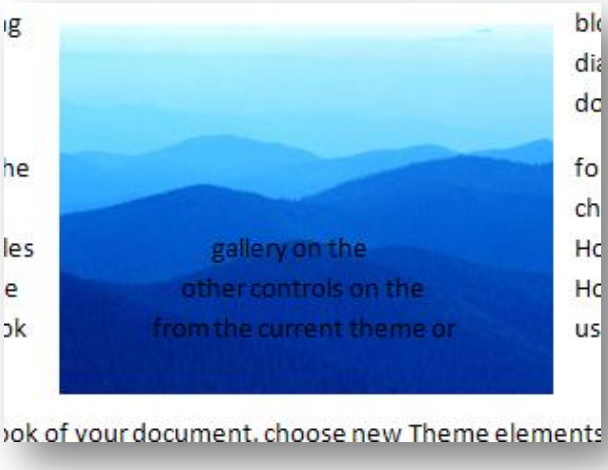
This element specifies that text shall wrap around the wrapping polygon bounding this object as defined by the child wrapPolygon element. When this element specifies a wrapping polygon, it shall allow text to wrap within the object's maximum left and right extents.

[*Example*: Consider an object with the following wrap points:



If this object uses tight wrapping, then text cannot be placed within the maximum left and right extents of the wrap polygon at any location:

However, with through wrapping:



end example]

[*Example*: Consider a DrawingML object using through wrapping and defined as follows:

```
<wp:anchor … >
  …
  <wp:wrapThrough wrapText="bothSides">
    …
  </wp:wrapThrough>
</wp:anchor>
```

The wrapThrough element specifies that text shall wrap through this object as defined by its wrap polygon. *end example*]

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
wrapPolygon (Wrapping Polygon)	§5.5.2.16

Attributes	Description

distL (Distance From Text on Left Edge)	Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapThrough distL="457200" … />`
	`</wp:anchor>`
	
	The distL attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distR (Distance From Text on Right Edge)	Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapThrough distR="457200" … />`
	`</wp:anchor>`
	
	The distR attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

wrapText (Text Wrapping Location)	Specifies how text shall wrap around the object's left and right sides.
	
	[*Example*: Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapThrough wrapText="left" … />`
	`</wp:anchor>`
	
	The wrapText attribute value of `left` specifies that text shall only wrap around the let side of the object. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapText simple type (§5.5.3.7).

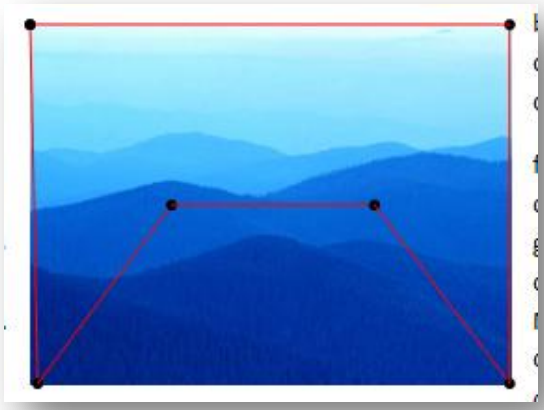
The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WrapThrough">
   <sequence>
      <element name="wrapPolygon" type="CT_WrapPath" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="wrapText" type="ST_WrapText" use="required"/>
   <attribute name="distL" type="ST_WrapDistance" use="optional"/>
   <attribute name="distR" type="ST_WrapDistance" use="optional"/>
</complexType>
```

5.5.2.19 wrapTight (Tight Wrapping)

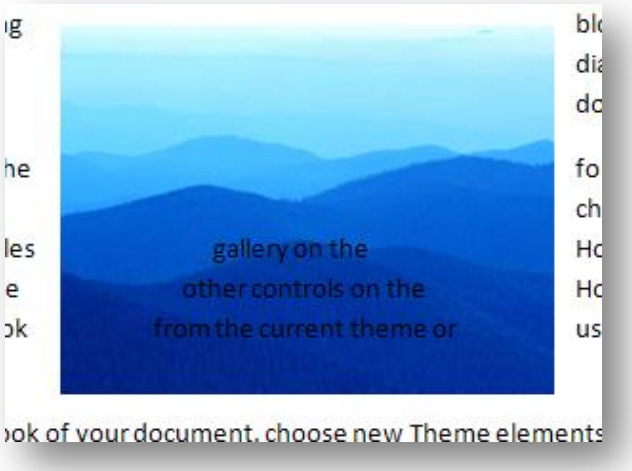
This element specifies that text shall wrap around the wrapping polygon bounding this object as defined by the child wrapPolygon element. When this element specifies a wrapping polygon, it shall not allow text to wrap within the object's maximum left and right extents.

[*Example*: Consider an object with the following wrap points:



If this object uses tight wrapping, then text cannot be placed within the maximum left and right extents of the wrap polygon at any location:

However, with through wrapping:



end example]

[*Example*: Consider a DrawingML object using tight wrapping and defined as follows:

```
<wp:anchor … >
  …
  <wp:wrapTight wrapText="bothSides">
    …
  </wp:wrapTight>
</wp:anchor>
```

The wrapTight element specifies that text shall wrap through this object as defined by its wrap polygon. *end example*]

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
wrapPolygon (Wrapping Polygon)	§5.5.2.16

Attributes	Description
distL (Distance From Test on Left Edge)	Specifies the minimum distance which shall be maintained between the left edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents. The distance shall be measured in EMUs (English Metric Units). [*Example*: Consider a floating DrawingML object which shall have one-half of an inch of

Attributes	Description

	padding between its left edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapTight distL="457200" … />`
	`</wp:anchor>`
	
	The distL attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

distR (Distance From Text on Right Edge)	Specifies the minimum distance which shall be maintained between the right edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents.
	
	The distance shall be measured in EMUs (English Metric Units).
	
	[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its right edge and the nearest text. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapTight distR="457200" … />`
	`</wp:anchor>`
	
	The distR attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*]
	
	The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

wrapText (Text Wrapping Location)	Specifies how text shall wrap around the object's left and right sides.
	
	[*Example*: Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows:
	
	`<wp:anchor … >`
	`  …`
	`  <wp:wrapTight wrapText="left" … />`
	`</wp:anchor>`
	
	The wrapText attribute value of `left` specifies that text shall only wrap around the let side of the object. *end example*]

Attributes	Description
	The possible values for this attribute are defined by the ST_WrapText simple type (§5.5.3.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WrapTight">
   <sequence>
      <element name="wrapPolygon" type="CT_WrapPath" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="wrapText" type="ST_WrapText" use="required"/>
   <attribute name="distL" type="ST_WrapDistance" use="optional"/>
   <attribute name="distR" type="ST_WrapDistance" use="optional"/>
</complexType>
```

5.5.2.20 wrapTopAndBottom (Top and Bottom Wrapping)

This element specifies that text shall wrap around the top and bottom of this object, but not its left or right edges.

[*Example*: Consider a DrawingML object using top and bottom wrapping and defined as follows:

```
<wp:anchor … >
  …
  <wp:wrapTopAndBottom />
</wp:anchor>
```

The wrapTopAndBottom element specifies that text shall wrap around neither side of this object. *end example*]

Parent Elements
anchor (§5.5.2.3)

Child Elements	Subclause
effectExtent (Object Extents Including Effects)	§5.5.2.6

Attributes	Description
distB (Distance From Text on Bottom Edge)	Specifies the minimum distance which shall be maintained between the bottom edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents. The distance shall be measured in EMUs (English Metric Units). [*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its bottom edge and the nearest text. This setting would be specified as follows:

Attributes	Description
	<wp:anchor … > … <wp:wrapTopAndBottom distB="457200" … /> </wp:anchor> The distB attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*] The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).
distT (Distance From Text on Top Edge)	Specifies the minimum distance which shall be maintained between the top edge of this drawing object and any subsequent text within the document when this graphical object is displayed within the document's contents. The distance shall be measured in EMUs (English Metric Units). [*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its top edge and the nearest text. This setting would be specified as follows: <wp:anchor … > … <wp:wrapTopAndBottom distT="457200" … /> </wp:anchor> The distT attribute specifies that the padding distance shall be 457200 EMUs or one-half of an inch. *end example*] The possible values for this attribute are defined by the ST_WrapDistance simple type (§5.5.3.6).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_WrapTopBottom">
   <sequence>
      <element name="effectExtent" type="CT_EffectExtent" minOccurs="0"/>
   </sequence>
   <attribute name="distT" type="ST_WrapDistance" use="optional"/>
   <attribute name="distB" type="ST_WrapDistance" use="optional"/>
</complexType>
```

5.5.3 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/drawingml/2006/wordprocessingDrawing namespace.

5.5.3.1 ST_AlignH (Relative Horizontal Alignment Positions)

This simple type contains the possible settings specifying how a DrawingML object may be horizontally aligned relative to the horizontal alignment base defined by the parent element.

[*Example*: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="page">
    <wp:align>left</wp:align>
  </wp:positionH>
  …
</wp:anchor>
```

The align element with a value of `left` specifies that for the horizontal positioning defined by the parent element (in this case, positioning relative to the page), the picture shall be aligned to the left edge of the page. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
center (Center Alignment)	Specifies that the object shall be centered with respect to the horizontal alignment base. [*Example*: Centered on the page. *end example*]
inside (Inside)	Specifies that the object shall be inside of the horizontal alignment base. [*Example*: Inside the outside margin. *end example*]
left (Left Alignment)	Specifies that the object shall be left aligned to the horizontal alignment base. [*Example*: Left aligned relative to the margins. *end example*]
outside (Outside)	Specifies that the object shall be outside of the horizontal alignment base. [*Example*: Outside the left margin. *end example*]
right (Right Alignment)	Specifies that the object shall be right aligned to the horizontal alignment base.

Enumeration Value	Description
	[*Example*: Right aligned relative to the margins. *end example*]

Referenced By
align (§5.5.2.1)

5.5.3.2 ST_AlignV (Vertical Alignment Definition)

This simple type contains the possible settings specifying how a DrawingML object may be vertically aligned relative to the vertical alignment base defined by the parent element.

[*Example*: Consider a picture in a WordprocessingML document which has been aligned relative to the edge of the page - the left of the page horizontally, and the top of the page vertically. This alignment would be specified as follows:

```
<wp:anchor … >
  <wp:positionV relativeFrom="page">
    <wp:align>top</wp:align>
  </wp:positionH>
  …
</wp:anchor>
```

The align element with a value of top specifies that for the vertical positioning defined by the parent element (in this case, positioning relative to the page), the picture shall be aligned to the top edge of the page. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bottom (Bottom)	Specifies that the object shall be at the bottom of the vertical alignment base. [*Example*: Bottom of the page. *end example*]
center (Center Alignment)	Specifies that the object shall be centered with respect to the vertical alignment base. [*Example*: Centered on the page. *end example*]
inside (Inside)	Specifies that the object shall be inside of the horizontal alignment base. [*Example*: Inside the top margin. *end example*]

Enumeration Value	Description
outside (Outside)	Specifies that the object shall be outside of the vertical alignment base. [*Example*: Outside the top margin. *end example*]
top (Top)	Specifies that the object shall be at the top of the vertical alignment base. [*Example*: Top of the page. *end example*]

Referenced By
align (§5.5.2.2)

5.5.3.3 ST_PositionOffset (Absolute Position Offset Value)

This simple type represents a one dimensional distance which shall be used to offset an objet from its base positioning location stored in EMUs.

[*Example*: Consider a DrawingML picture which shall be displayed one inch from the top of the page, and one-half of an inch from the left edge of the page. This object would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="page">
    <wp:posOffset>914400</wp:posOffset>
  </wp:positionH>
  <wp:positionV relativeFrom="page">
    <wp:posOffset>457200</wp:posOffset>
  </wp:positionV>
</wp:anchor>
```

The posOffset element specifies the absolute positioning of the object relative to the top-left edge of the page in EMUs. *end example*]

This simple type's contents are a restriction of the XML Schema int datatype.

Referenced By
posOffset (§5.5.2.12)

5.5.3.4 ST_RelFromH (Horizontal Relative Positioning)

This simple type specifies the possible values for the base from which the relative horizontal positioning of an object shall be calculated.

[*Example*: Consider a DrawingML picture which shall be displayed at the bottom center of the page. This object would be specified as follows:

```
<wp:anchor … >
  <wp:positionH relativeFrom="page">
    <wp:align>center</wp:align>
  </wp:positionH>
  …
</wp:anchor>
```

The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
character (Character)	Specifies that the horizontal positioning shall be relative to the position of the anchor within its run content.
column (Column)	Specifies that the horizontal positioning shall be relative to the extents of the column which contains its anchor.
insideMargin (Inside Margin)	Specifies that the horizontal positioning shall be relative to the inside margin of the current page (the left margin on odd pages, right on even pages).
leftMargin (Left Margin)	Specifies that the horizontal positioning shall be relative to the left margin of the page.
margin (Page Margin)	Specifies that the horizontal positioning shall be relative to the page margins.
outsideMargin (Outside Margin)	Specifies that the horizontal positioning shall be relative to the outside margin of the current page (the right margin on odd pages, left on even pages).
page (Page Edge)	Specifies that the horizontal positioning shall be relative to the edge of the page.
rightMargin (Right Margin)	Specifies that the horizontal positioning shall be relative to the right margin of the page.

Referenced By
positionH@relativeFrom (§5.5.2.10)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RelFromH">
   <restriction base="xsd:token">
      <enumeration value="margin"/>
      <enumeration value="page"/>
      <enumeration value="column"/>
      <enumeration value="character"/>
      <enumeration value="leftMargin"/>
      <enumeration value="rightMargin"/>
      <enumeration value="insideMargin"/>
      <enumeration value="outsideMargin"/>
   </restriction>
</simpleType>
```

5.5.3.5 ST_RelFromV (Vertical Relative Positioning)

This simple type specifies the possible values for the base from which the relative vertical positioning of an object shall be calculated.

[*Example*: Consider a DrawingML picture which shall be displayed at the bottom center of the page. This object would be specified as follows:

```
<wp:anchor … >
  <wp:positionV relativeFrom="page">
    <wp:align>bottom</wp:align>
  </wp:positionV>
  …
</wp:anchor>
```

The relativeFrom attribute specifies that the object is horizontally positioned relative to the page. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bottomMargin (Bottom Margin)	Specifies that the vertical positioning shall be relative to the bottom margin of the current page.
insideMargin (Inside Margin)	Specifies that the vertical positioning shall be relative to the inside margin of the current page.
line (Line)	Specifies that the vertical positioning shall be relative to the line containing the anchor character.
margin (Page Margin)	Specifies that the vertical positioning shall be relative to the page margins.
outsideMargin (Outside Margin)	Specifies that the vertical positioning shall be relative to the outside margin of the current page.

Enumeration Value	Description
page (Page Edge)	Specifies that the vertical positioning shall be relative to the edge of the page.
paragraph (Paragraph)	Specifies that the vertical positioning shall be relative to the paragraph which contains the drawing anchor.
topMargin (Top Margin)	Specifies that the vertical positioning shall be relative to the top margin of the current page.

Referenced By
positionV@relativeFrom (§5.5.2.11)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_RelFromV">
   <restriction base="xsd:token">
      <enumeration value="margin"/>
      <enumeration value="page"/>
      <enumeration value="paragraph"/>
      <enumeration value="line"/>
      <enumeration value="topMargin"/>
      <enumeration value="bottomMargin"/>
      <enumeration value="insideMargin"/>
      <enumeration value="outsideMargin"/>
   </restriction>
</simpleType>
```

5.5.3.6 ST_WrapDistance (Distance from Text)

This simple type represents a one dimensional distance which shall be used to offset an object from text, stored in EMUs.

[*Example*: Consider a floating DrawingML object which shall have one-half of an inch of padding between its left edge and the nearest text. This setting would be specified as follows:

```
<wp:anchor … >
  …
  <wp:wrapThrough distL="457200" … />
</wp:anchor>
```

The distL attribute specifies that the padding distance shall be `457200` EMUs or one-half of an inch. *end example*]

This simple type's contents are a restriction of the XML Schema unsignedInt datatype.

Referenced By
anchor@distB (§5.5.2.3); anchor@distL (§5.5.2.3); anchor@distR (§5.5.2.3); anchor@distT (§5.5.2.3);

Referenced By
inline@distB (§5.5.2.8); inline@distL (§5.5.2.8); inline@distR (§5.5.2.8); inline@distT (§5.5.2.8); wrapSquare@distB (§5.5.2.17); wrapSquare@distL (§5.5.2.17); wrapSquare@distR (§5.5.2.17); wrapSquare@distT (§5.5.2.17); wrapThrough@distL (§5.5.2.18); wrapThrough@distR (§5.5.2.18); wrapTight@distL (§5.5.2.19); wrapTight@distR (§5.5.2.19); wrapTopAndBottom@distB (§5.5.2.20); wrapTopAndBottom@distT (§5.5.2.20)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WrapDistance">
   <restriction base="xsd:unsignedInt"/>
</simpleType>
```

5.5.3.7 ST_WrapText (Text Wrapping Location)

This simple type specifies the possible settings for how text may wrap around the object's left and right sides.

[*Example*: Consider a floating DrawingML object which shall allow text to wrap around its left side only. This setting would be specified as follows:

```
<wp:anchor … >
  …
  <wp:wrapTight wrapText="left" … />
</wp:anchor>
```

The wrapText attribute value of `left` specifies that text shall only wrap around the let side of the object. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
bothSides (Both Sides)	Specifies that text shall wrap around both sides of the object.
largest (Largest Side Only)	Specifies that text shall only wrap around the largest side of the object. If the object is positioned in the exact center of the page, the text shall wrap around the side on which text is first encountered: • If the first line of text intersecting the object is using left-to-right reading order, the text shall wrap to the object's left. • If the first line of text intersecting the object is using right-to-left reading order, the text shall wrap to the object's right.

Enumeration Value	Description
left (Left Side Only)	Specifies that text shall only wrap around the left side of the object.
right (Right Side Only)	Specifies that text shall only wrap around the right side of the object.

Referenced By
wrapSquare@wrapText (§5.5.2.17); wrapThrough@wrapText (§5.5.2.18); wrapTight@wrapText (§5.5.2.19)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_WrapText">
   <restriction base="xsd:token">
      <enumeration value="bothSides"/>
      <enumeration value="left"/>
      <enumeration value="right"/>
      <enumeration value="largest"/>
   </restriction>
</simpleType>
```

5.6 DrawingML - SpreadsheetML Drawing

Within a SpreadsheetML document, it is possible to include graphical DrawingML objects:

- Pictures (§5.2)
- Locked Canvases (§5.4)
- Diagrams (§5.9)
- Charts (§5.7)

When these objects are present in a spreadsheet document, it is necessary to include information which specifies how the objects shall be positioned relative to the parent worksheet. [*Example*: Whether the object is anchored to a specific row, whether it resizes with cells, and so on. *end example*]

The SpreadsheetML Drawing namespace acts in this capacity, specifying all information necessary to anchor and display DrawingML objects within a spreadsheet document.

[*Example*: Consider a DrawingML picture which shall be anchored to a specific cell for its top left and bottom right corners, resizing as those cells are relocated. This object would be specified as follows:

```
<xdr:twoCellAnchor>
  <xdr:from>
    ...
  </xdr:from>
  <xdr:to>
    ...
  </xdr:to>
```

```
    <xdr:graphicFrame>
      ...
      <a:graphic>
        <a:graphicData
           uri="http://schemas.openxmlformats.org/drawingml/2006/diagram">
          <dgm:relIds xmlns:dgm="..." xmlns:r="..." r:dm="rId1" r:lo="rId2"
             r:qs="rId3" r:cs="rId4" />
        </a:graphicData>
      </a:graphic>
    </xdr:graphicFrame>
  </xdr:twoCellAnchor>
```

The twoCellAnchor element (§5.6.2.32) specifies that this object anchored to the cells specified by the to (§5.6.2.31) and from (§5.6.2.14) elements. *end example*]

5.6.1 Table of Contents

This subclause is informative.

End of informative text.

5.6.2 Elements

The following elements define the contents of the Spreadsheet Drawing namespace:

5.6.2.1 absoluteAnchor (Absolute Anchor Shape Size)

This element is used as an anchor placeholder for a shape or group of shapes. It will anchor the object in the same position relative to sheet position and its extents are in EMU unit.

Parent Elements
wsDr (§5.6.2.34)

Child Elements	Subclause
clientData (Client Data)	§5.6.2.3
cxnSp (Connection Shape)	§5.6.2.12
ext (Shape Extent)	§5.6.2.13
graphicFrame (Graphic Frame)	§5.6.2.15
grpSp (Group Shape)	§5.6.2.16
pic (Picture)	§5.6.2.24
pos (Position)	§5.6.2.25
sp (Shape)	§5.6.2.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AbsoluteAnchor">
   <sequence>
      <element name="pos" type="a:CT_Point2D"/>
      <element name="ext" type="a:CT_PositiveSize2D"/>
      <group ref="EG_ObjectChoices"/>
      <element name="clientData" type="CT_AnchorClientData" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.2 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object will have. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<xdr:pic>
  ..
  <xdr:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </xdr:blipFill>
  ..
</xdr:pic>
```

The above picture object is shown as an example of this fill type. End example]

[Example: Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```
<xdr:pic>
  ..
  <xdr:blipFill>
    <a:blip r:embed="rId2"/>
    <a:stretch>
      <a:fillRect/>
    </a:stretch>
  </xdr:blipFill>
  <xdr:spPr>
    <a:gradFill>
      <a:gsLst>
        <a:gs pos="0">
          <a:schemeClr val="tx2">
            <a:shade val="50000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="39999">
          <a:schemeClr val="tx2">
            <a:tint val="20000"/>
          </a:schemeClr>
        </a:gs>
        <a:gs pos="70000">
          <a:srgbClr val="C4D6EB"/>
        </a:gs>
        <a:gs pos="100000">
          <a:schemeClr val="bg1"/>
        </a:gs>
      </a:gsLst>
    </a:gradFill>
  </xdr:spPr>
  ..
</xdr:pic>
```

The above picture object is shown as an example of this double fill type. End example]

Parent Elements
pic (§5.6.2.24)

Child Elements	Subclause
blip (Blip)	§5.1.10.13
srcRect (Source Rectangle)	§5.1.10.55
stretch (Stretch)	§5.1.10.56
tile (Tile)	§5.1.10.58

Attributes	Description
dpi (DPI Setting) Namespace: .../drawingml/2006/main	Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used. [*Note*: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. *end note*] The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
rotWithShape (Rotate With Shape) Namespace: .../drawingml/2006/main	Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill will be transformed with the same rotation. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BlipFillProperties">
   <sequence>
      <element name="blip" type="CT_Blip" minOccurs="0" maxOccurs="1"/>
      <element name="srcRect" type="CT_RelativeRect" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillModeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="dpi" type="xsd:unsignedInt" use="optional"/>
   <attribute name="rotWithShape" type="xsd:boolean" use="optional"/>
</complexType>
```

5.6.2.3 clientData (Client Data)

This element is used to set certain properties related to a drawing element on the client spreadsheet application.

Parent Elements
absoluteAnchor (§5.6.2.1); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Attributes	Description
fLocksWithSheet (Locks With Sheet Flag)	This attribute indicates whether to disable selection on drawing elements when the sheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
fPrintsWithSheet (Prints With Sheet Flag)	This attribute indicates whether to print drawing elements when printing the sheet. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AnchorClientData">
   <attribute name="fLocksWithSheet" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="fPrintsWithSheet" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.6.2.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual properties for a connector shape. These are the set of properties on a shape which do not affect its display within a spreadsheet.

Parent Elements
nvCxnSpPr (§5.6.2.18)

Child Elements	Subclause
cxnSpLocks (Connection Shape Locks)	§5.1.2.1.11

Child Elements	Subclause
endCxn (Connection End)	§5.1.2.1.13
extLst (Extension List)	§5.1.2.1.15
stCxn (Connection Start)	§5.1.2.1.36

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualConnectorProperties">
   <sequence>
      <element name="cxnSpLocks" type="CT_ConnectorLocking" minOccurs="0" maxOccurs="1"/>
      <element name="stCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
      <element name="endCxn" type="CT_Connection" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual properties for a single graphical object frame within a spreadsheet. These are the set of properties of a frame which do not affect its display within a spreadsheet.

Parent Elements
nvGraphicFramePr (§5.6.2.19)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
graphicFrameLocks (Graphic Frame Locks)	§5.1.2.1.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGraphicFrameProperties">
   <sequence>
      <element name="graphicFrameLocks" type="CT_GraphicalObjectFrameLocking" minOccurs="0"
        maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual properties of a hierarchical grouping of shapes, graphical object frames, and child groups. These are the set of properties of a group which do not affect its display within a spreadsheet.

Parent Elements
nvGrpSpPr (§5.6.2.20)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
grpSpLocks (Group Shape Locks)	§5.1.2.1.21

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualGroupDrawingShapeProps">
   <sequence>
      <element name="grpSpLocks" type="CT_GroupLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.7 cNvPicPr (Non-Visual Picture Drawing Properties)

This element describes the non-visual properties of a picture within a spreadsheet. These are the set of properties of a picture which do not affect its display within a spreadsheet.

[Example: Consider the following SpreadsheetDrawingML.

```
<xdr:pic>
  ..
  <xdr:nvPicPr>
    <xdr:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
    <xdr:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </xdr:cNvPicPr>
    <xdr:nvPr/>
  </xdr:nvPicPr>
  ..
</xdr:pic>
```

The above example defines some non-visual picture drawing properties for the inserted picture. End example]

Parent Elements
nvPicPr (§5.6.2.21)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
picLocks (Picture Locks)	§5.1.2.1.31

Attributes	Description
preferRelativeResize (Relative Resize	Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling will be

Attributes	Description
Preferred) Namespace: .../drawingml/2006/main	relative to the original picture size as opposed to the current picture size. [*Example*: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked. If this attribute is set to true then a value of 50% will be shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualPictureProperties">
   <sequence>
      <element name="picLocks" type="CT_PictureLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="preferRelativeResize" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.6.2.8 cNvPr (Non-Visual Drawing Properties)

This element specifies the set of non-visual properties for the parent element. These properties specify all the data about the parent which does not affect its display within the spreadsheet.

[Example: Consider the following SpreadSheetDrawingML.

```
<xdr:pic>
  ..
  <xdr:nvPicPr>
    <xdr:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  </xdr:nvPicPr>
  ..
</xdr:pic>
```

The above example defines some non-visual drawing properties for the inserted picture. End example]

Parent Elements
nvCxnSpPr (§5.6.2.18); nvGraphicFramePr (§5.6.2.19); nvGrpSpPr (§5.6.2.20); nvPicPr (§5.6.2.21); nvSpPr (§5.6.2.22)

Child Elements	Subclause

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
hlinkClick (Click Hyperlink)	§5.1.5.3.5
hlinkHover (Hyperlink for Hover)	§5.1.2.1.23

Attributes	Description
descr (Alternative Text for Object) Namespace: .../drawingml/2006/main	Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which will not display the current object. If this element is omitted, then no alternative text is present for the parent object. [*Example*: Consider a DrawingML object defined as follows: `<… descr="A picture of a bowl of fruit">` The descr attribute contains alternative text which may be used in place of the actual DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
hidden (Hidden) Namespace: .../drawingml/2006/main	Specifies whether this DrawingML object shall be displayed. When a DrawingML object is displayed within a document, that object may be hidden (i.e., present, but not visible). This attribute shall determine whether the object shall be rendered or made hidden. [*Note*: An application may have settings which allow this object to be viewed. *end note*] If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden). [*Example*: Consider an inline DrawingML object which shall be hidden within the document's content. This setting would be specified as follows: `<… hidden="true" />` The hidden attribute has a value of `true`, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
id (Unique Identifier) Namespace: .../drawingml/2006/main	Specifies a unique identifier for the current DrawingML object within the current document. This ID may be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document. If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant. [*Example*: Consider a DrawingML object defined as follows:

Attributes	Description
	<… id="10" … > The id attribute has a value of 10, which is the unique identifier for this DrawingML object. *end example*] The possible values for this attribute are defined by the ST_DrawingElementId simple type (§5.1.12.19).
name (Name) Namespace: …/drawingml/2006/main	Specifies the name of the object. [*Note*: Typically, this will be used to store the original file name of a picture object. *end note*] [*Example*: Consider a DrawingML object defined as follows: < … name="foo.jpg" > The name attribute has a value of foo.jpg, which is the name of this DrawingML object. *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingProps">
   <sequence>
      <element name="hlinkClick" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="hlinkHover" type="CT_Hyperlink" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="id" type="ST_DrawingElementId" use="required"/>
   <attribute name="name" type="xsd:string" use="required"/>
   <attribute name="descr" type="xsd:string" use="optional" default=""/>
   <attribute name="hidden" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.6.2.9 cNvSpPr (Connection Non-Visual Shape Properties)

This element specifies the set of non-visual properties for a connection shape. These properties specify all data about the connection shape which do not affect its display within a spreadsheet.

[Example: Consider the shape that has a shape lock applied to it.

```
<xdr:sp>
  <xdr:nvSpPr>
    <xdr:cNvPr id="2" name="Rectangle 1"/>
    <xdr:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </xdr:cNvSpPr>
  </xdr:nvSpPr>
```

```
    ..
</xdr:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. End example]

Parent Elements
nvSpPr (§5.6.2.22)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15
spLocks (Shape Locks)	§5.1.2.1.34

Attributes	Description
txBox (Text Box) Namespace: .../drawingml/2006/main	Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box. [*Note*: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. *end note*] The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NonVisualDrawingShapeProps">
   <sequence>
      <element name="spLocks" type="CT_ShapeLocking" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="txBox" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.6.2.10 col (Column))

This element specifies the column that will be used within the from and to elements to specify anchoring information for a shape within a spreadsheet

The possible values for this element are defined by the ST_ColID simple type (§5.6.3.1).

Parent Elements
from (§5.6.2.14); to (§5.6.2.31)

5.6.2.11 colOff (Column Offset)

This element is used to specify the column offset within a cell. The units for which this attribute is specified in reside within the simple type definition referenced below.

The possible values for this element are defined by the ST_Coordinate simple type (§5.1.12.16).

Parent Elements
from (§5.6.2.14); to (§5.6.2.31)

5.6.2.12 cxnSp (Connection Shape)

This element specifies the properties for a connection shape drawing element. A connection shape is a line, etc. that connects two other shapes in this drawing.

Parent Elements
absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
nvCxnSpPr (Non-Visual Properties for a Connection Shape)	§5.6.2.18
spPr (Shape Properties)	§5.6.2.29
style (Shape Style)	§5.6.2.30

Attributes	Description
fPublished (Publish to Server Flag)	This attribute indicates whether the shape shall be published with the worksheet when sent to the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
macro (Reference to Custom Function)	This element specifies the custom function associated with the object. [*Example*: A macro script, add-in function, and so on. *end example*] The format of this string shall be application-defined, and should be ignored if not understood. [*Example*: `< ... macro="DoWork()" />` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Connector">
   <sequence>
      <element name="nvCxnSpPr" type="CT_ConnectorNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="macro" type="xsd:string" use="optional"/>
   <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.6.2.13 ext (Shape Extent)

This element describes the length and width properties for how far a drawing element should extend for.

Parent Elements
absoluteAnchor (§5.6.2.1); oneCellAnchor (§5.6.2.23)

Attributes	Description
cx (Extent Length) Namespace: .../drawingml/2006/main	Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `<… cx="1828800" cy="200000"/>` The cx attributes specifies that this object has a height of `1828800` EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).
cy (Extent Width) Namespace: .../drawingml/2006/main	Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [*Example*: Consider a DrawingML object specified as follows: `< … cx="1828800" cy="200000"/>` The cy attribute specifies that this object has a width of `200000` EMUs (English Metric Units). *end example*] The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§5.1.12.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PositiveSize2D">
   <attribute name="cx" type="ST_PositiveCoordinate" use="required"/>
   <attribute name="cy" type="ST_PositiveCoordinate" use="required"/>
</complexType>
```

5.6.2.14 from (Starting Anchor Point)

This element specifies the first anchor point for the drawing element. This will be used to anchor the top and left sides of the shape within the spreadsheet. That is when the cell that is specified in the from element is adjusted, the shape will also be adjusted.

[Example: Consider the following SpreadsheetDrawingML

```
<xdr:twoCellAnchor>
  <xdr:from>
    <xdr:col>3</xdr:col>
    <xdr:colOff>447675</xdr:colOff>
    <xdr:row>8</xdr:row>
    <xdr:rowOff>28575</xdr:rowOff>
  </xdr:from>
  <xdr:to>
    <xdr:col>5</xdr:col>
    <xdr:colOff>466725</xdr:colOff>
    <xdr:row>14</xdr:row>
    <xdr:rowOff>9525</xdr:rowOff>
  </xdr:to>
  <xdr:sp macro="" textlink="">
  ...
  </xdr:sp>
  <xdr:clientData/>
</xdr:twoCellAnchor>
```

The above example shows the first anchor point being specified via the from element. End example]

Parent Elements
oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
col (Column))	§5.6.2.10
colOff (Column Offset)	§5.6.2.11
row (Row)	§5.6.2.26
rowOff (Row Offset)	§5.6.2.27

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
   <sequence>
      <element name="col" type="ST_ColID"/>
      <element name="colOff" type="a:ST_Coordinate"/>
      <element name="row" type="ST_RowID"/>
      <element name="rowOff" type="a:ST_Coordinate"/>
   </sequence>
</complexType>
```

5.6.2.15 graphicFrame (Graphic Frame)

This element describes a single graphical object frame for a spreadsheet which contains a graphical object.

Parent Elements
absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
graphic (Graphic Object)	§5.1.2.1.16
nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)	§5.6.2.19
xfrm (2D Transform for Graphic Frames)	§5.6.2.35

Attributes	Description
fPublished (Publish to Server Flag)	This attribute indicates whether the shape shall be published with the worksheet when sent to the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
macro (Reference To Custom Function)	This element specifies the custom function associated with the object. [*Example*: A macro script, add-in function, and so on. *end example*] The format of this string shall be application-defined, and should be ignored if not understood. [*Example*: `< ... macro="DoWork()" />` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectFrame">
   <sequence>
      <element name="nvGraphicFramePr" type="CT_GraphicalObjectFrameNonVisual" minOccurs="1"
        maxOccurs="1"/>
      <element name="xfrm" type="a:CT_Transform2D" minOccurs="1" maxOccurs="1"/>
      <element ref="a:graphic" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="macro" type="xsd:string" use="optional"/>
   <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.6.2.16 grpSp (Group Shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[Example: Consider the following group shape.

```
<xdr:grpSp>
  <xdr:nvGrpSpPr>
    <xdr:cNvPr id="10" name="Group 9"/>
    <xdr:cNvGrpSpPr/>
    <xdr:nvPr/>
  </xdr:nvGrpSpPr>
  <xdr:grpSpPr>
    <a:xfrm>
      <a:off x="838200" y="990600"/>
      <a:ext cx="2426208" cy="978408"/>
      <a:chOff x="838200" y="990600"/>
      <a:chExt cx="2426208" cy="978408"/>
   </a:xfrm>
  </xdr:grpSpPr>
  <xdr:sp>
  ..
  </xdr:sp>
  <xdr:sp>
  ..
  </xdr:sp>
  <xdr:sp>
  ..
  </xdr:sp>
</xdr:grpSp>
```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. End example]

Parent Elements
absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
cxnSp (Connection Shape)	§5.6.2.12
graphicFrame (Graphic Frame)	§5.6.2.15
grpSp (Group Shape)	§5.6.2.16
grpSpPr (Group Shape Properties)	§5.6.2.17
nvGrpSpPr (Non-Visual Properties for a Group Shape)	§5.6.2.20
pic (Picture)	§5.6.2.24
sp (Shape)	§5.6.2.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShape">
   <sequence>
      <element name="nvGrpSpPr" type="CT_GroupShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="grpSpPr" type="a:CT_GroupShapeProperties" minOccurs="1" maxOccurs="1"/>
      <choice minOccurs="0" maxOccurs="unbounded">
         <element name="sp" type="CT_Shape"/>
         <element name="grpSp" type="CT_GroupShape"/>
         <element name="graphicFrame" type="CT_GraphicalObjectFrame"/>
         <element name="cxnSp" type="CT_Connector"/>
         <element name="pic" type="CT_Picture"/>
      </choice>
   </sequence>
</complexType>
```

5.6.2.17 grpSpPr (Group Shape Properties)

This element specifies the properties that are to be common across all of the shapes within the corresponding group. If there are any conflicting properties within the group shape properties and the individual shape properties then the individual shape properties should take precedence.

Parent Elements
grpSp (§5.6.2.16)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14

Child Elements	Subclause
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
xfrm (2D Transform for Grouped Objects)	§5.1.9.5

Attributes	Description
bwMode (Black and White Mode) Namespace: .../drawingml/2006/main	Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes will use when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_GroupTransform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

5.6.2.18 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a

connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

Parent Elements
cxnSp (§5.6.2.12)

Child Elements	Subclause
cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)	§5.6.2.4
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ConnectorNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvCxnSpPr" type="a:CT_NonVisualConnectorProperties" minOccurs="1"
        maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.19 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

Parent Elements
graphicFrame (§5.6.2.15)

Child Elements	Subclause
cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)	§5.6.2.5
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GraphicalObjectFrameNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGraphicFramePr" type="a:CT_NonVisualGraphicFrameProperties" minOccurs="1"
        maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.20 nvGrpSpPr (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

Parent Elements
grpSp (§5.6.2.16)

Child Elements	Subclause
cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)	§5.6.2.6
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GroupShapeNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvGrpSpPr" type="a:CT_NonVisualGroupDrawingShapeProps" minOccurs="1"
        maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.21 nvPicPr (Non-Visual Properties for a Picture)

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following SpreadsheetDrawingML.

```
<xdr:pic>
  ..
  <xdr:nvPicPr>
    ..
  </xdr:nvPicPr>
  ..
</xdr:pic>
```

The above example shows the defining of non-visual picture properties. End example]

Parent Elements
pic (§5.6.2.24)

Child Elements	Subclause
cNvPicPr (Non-Visual Picture Drawing Properties)	§5.6.2.7
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvPicPr" type="a:CT_NonVisualPictureProperties" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.22 nvSpPr (Non-Visual Properties for a Shape)

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

Parent Elements
sp (§5.6.2.28)

Child Elements	Subclause
cNvPr (Non-Visual Drawing Properties)	§5.6.2.8
cNvSpPr (Connection Non-Visual Shape Properties)	§5.6.2.9

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeNonVisual">
   <sequence>
      <element name="cNvPr" type="a:CT_NonVisualDrawingProps" minOccurs="1" maxOccurs="1"/>
      <element name="cNvSpPr" type="a:CT_NonVisualDrawingShapeProps" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.23 oneCellAnchor (One Cell Anchor Shape Size)

This element specifies a one cell anchor placeholder for a group, a shape, or a drawing element. It moves with the cell and its extents is in EMU units.

Parent Elements
wsDr (§5.6.2.34)

Child Elements	Subclause
clientData (Client Data)	§5.6.2.3

Child Elements	Subclause
cxnSp (Connection Shape)	§5.6.2.12
ext (Shape Extent)	§5.6.2.13
from (Starting Anchor Point)	§5.6.2.14
graphicFrame (Graphic Frame)	§5.6.2.15
grpSp (Group Shape)	§5.6.2.16
pic (Picture)	§5.6.2.24
sp (Shape)	§5.6.2.28

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OneCellAnchor">
   <sequence>
      <element name="from" type="CT_Marker"/>
      <element name="ext" type="a:CT_PositiveSize2D"/>
      <group ref="EG_ObjectChoices"/>
      <element name="clientData" type="CT_AnchorClientData" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.24 pic (Picture)

This element specifies the existence of a picture object within the spreadsheet.

[Example: Consider the following SpreadsheetDrawingML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<xdr:pic>
  <xdr:nvPicPr>
    <xdr:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <xdr:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </xdr:cNvPicPr>
    <xdr:nvPr/>
  </xdr:nvPicPr>
  <xdr:blipFill>
  ...
  </xdr:blipFill>
  <xdr:spPr>
  ...
  </xdr:spPr>
</xdr:pic>
```

End example]

Parent Elements

Parent Elements
absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
blipFill (Picture Fill)	§5.6.2.2
nvPicPr (Non-Visual Properties for a Picture)	§5.6.2.21
spPr (Shape Properties)	§5.6.2.29
style (Shape Style)	§5.6.2.30

Attributes	Description
fPublished (Publish to Server Flag)	This attribute indicates whether the shape shall be published with the worksheet when sent to the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
macro (Reference To Custom Function)	This element specifies the custom function associated with the object. [*Example*: A macro script, add-in function, and so on. *end example*] The format of this string shall be application-defined, and should be ignored if not understood. [*Example*: `< ... macro="DoWork()" />` *end example*] The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Picture">
   <sequence>
      <element name="nvPicPr" type="CT_PictureNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="blipFill" type="a:CT_BlipFillProperties" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="macro" type="xsd:string" use="optional" default=""/>
   <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.6.2.25 pos (Position)

This element describes the position of a drawing element within a spreadsheet.

Parent Elements
absoluteAnchor (§5.6.2.1)

Attributes	Description
x (X-Axis Coordinate) Namespace: .../drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The x attribute defines an x-coordinate of `0`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).
y (Y-Axis Coordinate) Namespace: .../drawingml/2006/main	Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [*Example*: Consider the following point on a basic wrapping polygon for a DrawingML object: `<wp:… x="0" y="100" />` The y attribute defines a y-coordinate of `100`. *end example*] The possible values for this attribute are defined by the ST_Coordinate simple type (§5.1.12.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Point2D">
   <attribute name="x" type="ST_Coordinate" use="required"/>
   <attribute name="y" type="ST_Coordinate" use="required"/>
</complexType>
```

5.6.2.26 row (Row)

This element specifies the row that will be used within the from and to elements to specify anchoring information for a shape within a spreadsheet.

The possible values for this element are defined by the ST_RowID simple type (§5.6.3.3).

Parent Elements
from (§5.6.2.14); to (§5.6.2.31)

5.6.2.27 rowOff (Row Offset)

This element is used to specify the row offset within a cell. The units for which this attribute is specified in reside within the simple type definition referenced below.

The possible values for this element are defined by the ST_Coordinate simple type (§5.1.12.16).

Parent Elements
from (§5.6.2.14); to (§5.6.2.31)

5.6.2.28 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the SpreadsheetDrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

Parent Elements
absoluteAnchor (§5.6.2.1); grpSp (§5.6.2.16); oneCellAnchor (§5.6.2.23); twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
nvSpPr (Non-Visual Properties for a Shape)	§5.6.2.22
spPr (Shape Properties)	§5.6.2.29
style (Shape Style)	§5.6.2.30
txBody (Shape Text Body)	§5.6.2.33

Attributes	Description
fLocksText (Lock Text Flag)	This attribute indicates whether to allow text editing within this drawing object when the parent worksheet is protected. The possible values for this attribute are defined by the XML Schema boolean datatype.
fPublished (Publish to Server Flag)	This attribute indicates whether the shape shall be published with the worksheet when sent to the server. The possible values for this attribute are defined by the XML Schema boolean datatype.
macro (Reference to Custom Function)	This element specifies the custom function associated with the object. [*Example*: A macro script, add-in function, and so on. *end example*] The format of this string shall be application-defined, and should be ignored if not understood. [*Example*:

Attributes	Description
	< ... macro="DoWork()" /> *end example*] The possible values for this attribute are defined by the XML Schema string datatype.
textlink (Text Link)	This attribute specifies a formula linking to spreadsheet cell data. The possible values for this attribute are defined by the XML Schema string datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape">
   <sequence>
      <element name="nvSpPr" type="CT_ShapeNonVisual" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="1" maxOccurs="1"/>
      <element name="style" type="a:CT_ShapeStyle" minOccurs="0" maxOccurs="1"/>
      <element name="txBody" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="macro" type="xsd:string" use="optional"/>
   <attribute name="textlink" type="xsd:string" use="optional"/>
   <attribute name="fLocksText" type="xsd:boolean" use="optional" default="true"/>
   <attribute name="fPublished" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.6.2.29 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a special shape such as a connector shape or picture. These are the same properties that are allowed to describe the visual properties of a shape but are used here to describe additional object-specific properties within a document. This allows for these shapes to have both the properties of a shape as well as specific properties that are unique to only them.

Parent Elements
cxnSp (§5.6.2.12); pic (§5.6.2.24); sp (§5.6.2.28)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35

Child Elements	Subclause
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

Attributes	Description
bwMode (Black and White Mode) Namespace: .../drawingml/2006/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

5.6.2.30 style (Shape Style)

The element specifies the style that will be applied to a shape and the corresponding references for each of the style components such as lines and fills.

Parent Elements
cxnSp (§5.6.2.12); pic (§5.6.2.24); sp (§5.6.2.28)

Child Elements	Subclause
effectRef (Effect Reference)	§5.1.4.2.8
fillRef (Fill Reference)	§5.1.4.2.10
fontRef (Font Reference)	§5.1.4.1.17
lnRef (Line Reference)	§5.1.4.2.19

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeStyle">
   <sequence>
      <element name="lnRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fillRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="effectRef" type="CT_StyleMatrixReference" minOccurs="1" maxOccurs="1"/>
      <element name="fontRef" type="CT_FontReference" minOccurs="1" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.6.2.31 to (Ending Anchor Point)

This element specifies the second anchor point for the drawing element. This will be used to anchor the bottom and right sides of the shape within the spreadsheet. That is when the cell that is specified in the to element is adjusted, the shape will also be adjusted.

[Example: Consider the following SpreadsheetDrawingML

```
<xdr:twoCellAnchor>
  <xdr:from>
    <xdr:col>3</xdr:col>
    <xdr:colOff>447675</xdr:colOff>
    <xdr:row>8</xdr:row>
    <xdr:rowOff>28575</xdr:rowOff>
  </xdr:from>
  <xdr:to>
    <xdr:col>5</xdr:col>
    <xdr:colOff>466725</xdr:colOff>
    <xdr:row>14</xdr:row>
    <xdr:rowOff>9525</xdr:rowOff>
  </xdr:to>
  <xdr:sp macro="" textlink="">
  ...
  </xdr:sp>
  <xdr:clientData/>
```

```
</xdr:twoCellAnchor>
```

The above example shows the second anchor point being specified via the to element. End example]

Parent Elements
twoCellAnchor (§5.6.2.32)

Child Elements	Subclause
col (Column))	§5.6.2.10
colOff (Column Offset)	§5.6.2.11
row (Row)	§5.6.2.26
rowOff (Row Offset)	§5.6.2.27

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
   <sequence>
      <element name="col" type="ST_ColID"/>
      <element name="colOff" type="a:ST_Coordinate"/>
      <element name="row" type="ST_RowID"/>
      <element name="rowOff" type="a:ST_Coordinate"/>
   </sequence>
</complexType>
```

5.6.2.32 twoCellAnchor (Two Cell Anchor Shape Size)

This element specifies a two cell anchor placeholder for a group, a shape, or a drawing element. It moves with cells and its extents are in EMU units.

Parent Elements
wsDr (§5.6.2.34)

Child Elements	Subclause
clientData (Client Data)	§5.6.2.3
cxnSp (Connection Shape)	§5.6.2.12
from (Starting Anchor Point)	§5.6.2.14
graphicFrame (Graphic Frame)	§5.6.2.15
grpSp (Group Shape)	§5.6.2.16
pic (Picture)	§5.6.2.24
sp (Shape)	§5.6.2.28
to (Ending Anchor Point)	§5.6.2.31

Attributes	Description

editAs (Positioning and Resizing Behaviors)	Specifies how the DrawingML contents shall be moved and/or resized when the rows and columns between its start and ending anchor (the from and to child elements) are resized, or have additional rows/columns inserted within them, or additional row/columns are added before them. The behaviors are discussed in the simple type referenced below.
	
	If this attribute is omitted, then its default value shall be assumed to be `twoCell`.
	
	[*Example*: Consider a drawing defined as follows:
	
	`<ws:twoCellAnchor editAs="absolute">`
	`...`
	`</ws:twoCellAnchor>`
	
	The editAs attribute has a value of `absolute`, which specifies that the sizing of this object shall not change, instead the anchor locations should be moved as needed to maintain the same size and position. *end example*]
	
	The possible values for this attribute are defined by the ST_EditAs simple type (§5.6.3.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TwoCellAnchor">
   <sequence>
      <element name="from" type="CT_Marker"/>
      <element name="to" type="CT_Marker"/>
      <group ref="EG_ObjectChoices"/>
      <element name="clientData" type="CT_AnchorClientData" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="editAs" type="ST_EditAs" use="optional" default="twoCell"/>
</complexType>
```

5.6.2.33 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

Parent Elements
sp (§5.6.2.28)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
   <sequence>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.6.2.34 wsDr (Worksheet Drawing)

This element specifies all drawing objects within the worksheet. It acts much like the spTree element within the DrawingML framework. Allowing for the specification of all shapes for a given part of a document, in this case a single Worksheet.

Parent Elements
Root element of SpreadsheetML Drawing part

Child Elements	Subclause
absoluteAnchor (Absolute Anchor Shape Size)	§5.6.2.1
oneCellAnchor (One Cell Anchor Shape Size)	§5.6.2.23
twoCellAnchor (Two Cell Anchor Shape Size)	§5.6.2.32

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Drawing">
   <sequence>
      <group ref="EG_Anchor" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.6.2.35 xfrm (2D Transform for Graphic Frames)

This element specifies a two dimensional transform for a Graphic Frame.

Parent Elements
graphicFrame (§5.6.2.15)

Child Elements	Subclause
ext (Extents)	§5.1.9.3
off (Offset)	§5.1.9.4

Attributes	Description

Attributes	Description
flipH (Horizontal Flip) Namespace: .../drawingml/2006/main	Specifies a horizontal flip. When true, this attribute defines that the shape will be flipped horizontally about the center of its bounding box. [*Example*: The following illustrates the effect of a horizontal flip.  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
flipV (Vertical Flip) Namespace: .../drawingml/2006/main	Specifies a vertical flip. When true, this attribute defines that the group will be flipped vertically about the center of its bounding box. [*Example*: The following illustrates the effect of a vertical flip.  *end example*] The possible values for this attribute are defined by the XML Schema boolean datatype.
rot (Rotation) Namespace: .../drawingml/2006/main	Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below. The possible values for this attribute are defined by the ST_Angle simple type (§5.1.12.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Transform2D">
   <sequence>
      <element name="off" type="CT_Point2D" minOccurs="0" maxOccurs="1"/>
      <element name="ext" type="CT_PositiveSize2D" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="rot" type="ST_Angle" use="optional" default="0"/>
   <attribute name="flipH" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="flipV" type="xsd:boolean" use="optional" default="false"/>
</complexType>
```

5.6.3 Simple Types

This is the complete list of simple types in the http://schemas.openxmlformats.org/drawingml/2006/spreadsheetDrawing namespace.

5.6.3.1 ST_ColID (Column ID)

This type specifies a column identification. The numerical value used for the column id should be non-negative and never exceed the number of total columns within the spreadsheet document.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

Referenced By
col (§5.6.2.10)

5.6.3.2 ST_EditAs (Resizing Behaviors)

This simple type specifies all possible settings for how DrawingML contents shall be resized when the rows and columns between its start and ending anchor (the from and to child elements) are resized, or have additional rows/columns inserted within them.

[*Example*: Consider a drawing defined as follows:

```
<ws:twoCellAnchor editAs="absolute">
  ...
</ws:twoCellAnchor>
```

The editAs attribute has a value of absolute, which specifies that the sizing of this object shall not change, instead the anchor locations should be moved as needed to maintain the same size. *end example*]

This simple type's contents are a restriction of the XML Schema token datatype.

The following are possible enumeration values for this type:

Enumeration Value	Description
absolute (Do Not Move or Resize With Underlying Rows/Columns)	Specifies that the current start and end positions shall be maintained with respect to the distances from the absolute start point of the worksheet. If additional rows/columns are added before the drawing, the drawing shall move its anchors as needed to maintain this same absolute position.
oneCell (Move With Cells but Do Not Resize)	Specifies that the current drawing shall move with its row and column (i.e. the object is anchored to the actual from row and column), but that the size shall remain absolute. If additional rows/columns are added between the from and to locations of the drawing, the drawing

Enumeration Value	Description
	shall move its to anchors as needed to maintain this same absolute size.
twoCell (Move and Resize With Anchor Cells)	Specifies that the current drawing shall move and resize to maintain its row and column anchors (i.e. the object is anchored to the actual from and to row and column).

Referenced By
twoCellAnchor@editAs (§5.6.2.32)

The following XML Schema fragment defines the contents of this simple type:

```
<simpleType name="ST_EditAs">
   <restriction base="xsd:token">
      <enumeration value="twoCell"/>
      <enumeration value="oneCell"/>
      <enumeration value="absolute"/>
   </restriction>
</simpleType>
```

5.6.3.3 ST_RowID (Row ID)

This type specifies a row identification. The numerical value used for the row id should be non-negative and never exceed the number of total rows within the spreadsheet document.

This simple type's contents are a restriction of the XML Schema int datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.

Referenced By
row (§5.6.2.26)

5.7 DrawingML - Charts

The chart namespace in DrawingML is for representing visualizations of numeric data with column charts, pie charts, scatter charts, or other types of charts.

5.7.1 Table of Contents

This subclause is informative.

End of informative text.

5.7.2 Elements

In DrawingML, charts define a visualization of numeric data. The definition includes where the data shall come from, a cache of the data, and how the data shall be represented graphically. Other DrawingML elements are reused to define aspects of the formatting of the visualization.

See the informative material in Part 3 for a description and overview of the basic chart types and chart components.

5.7.2.1 applyToEnd (Apply to End)

This element specifies the picture shall be applied to the end of the point or series.

Parent Elements
pictureOptions (§5.7.2.139)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.2 applyToFront (Apply To Front)

This element specifies the picture shall be applied to the front of the point or series.

Parent Elements
pictureOptions (§5.7.2.139)

Attributes	Description

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.3 applyToSides (Apply To Sides)

This element specifies the picture shall be applied to the sides of the point or series.

Parent Elements
pictureOptions (§5.7.2.139)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.4 area3DChart (3D Area Charts)

This element specifies the 3-D area series on this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
dLbls (Data Labels)	§5.7.2.49
dropLines (Drop Lines)	§5.7.2.53
extLst (Chart Extensibility)	§5.7.2.64
gapDepth (Gap Depth)	§5.7.2.74
grouping (Grouping)	§5.7.2.76
ser (Area Chart Series)	§5.7.2.174
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Area3DChart">
   <sequence>
      <group ref="EG_AreaChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="gapDepth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="3"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.5 areaChart (Area Charts)

This element specifies the 2-D area series on this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
dLbls (Data Labels)	§5.7.2.49
dropLines (Drop Lines)	§5.7.2.53
extLst (Chart Extensibility)	§5.7.2.64
grouping (Grouping)	§5.7.2.76
ser (Area Chart Series)	§5.7.2.174
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AreaChart">
   <sequence>
      <group ref="EG_AreaChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.6 auto (Automatic Category Axis)

This element specifies that this axis is a date or text axis based on the data that is used for the axis labels, not a specific choice.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.7 autoTitleDeleted (Auto Title Is Deleted)

This element specifies the title shall not be shown for this chart.

Parent Elements
chart (§5.7.2.27)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is

Attributes	Description
	omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.8 autoUpdate (Update Automatically)

This element specifies the external data shall be updated automatically when the document containing the chart is opened.

Parent Elements
externalData (§5.7.2.63)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, `1`, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.9 axId (Axis ID)

When specified as a child element of valAx, dateAx, catAx, or serAx, this element specifies the identifier for the axis. When specified as a child element of a chart, this element specifies the identifier of an axis that defines the coordinate space of the chart.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); bar3DChart (§5.7.2.15); barChart (§5.7.2.16); bubbleChart (§5.7.2.20); catAx (§5.7.2.25); dateAx (§5.7.2.39); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); radarChart

Parent Elements
(§5.7.2.154); scatterChart (§5.7.2.162); serAx (§5.7.2.176); stockChart (§5.7.2.199); surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205); valAx (§5.7.2.227)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.10 axPos (Axis Position)

This element specifies the position of the axis on the chart.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Axis Position Value)	Specifies the position of the axis on the chart. The possible values for this attribute are defined by the ST_AxPos simple type (§5.7.3.2).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AxPos">
   <attribute name="val" type="ST_AxPos" use="required"/>
</complexType>
```

5.7.2.11 backWall (Back Wall)

This element specifies the back wall of the chart.

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198
thickness (Thickness)	§5.7.2.207

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Surface">
   <sequence>
      <element name="thickness" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.12 backward (Backward)

This element specifies the number of categories (or units on a scatter chart) that the trend line extends before the data for the series that is being trended. On non-scatter charts, the value shall be 0 or 0.5.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.13 bandFmt (Band Format)

This element specifies the formatting band of a surface chart.

Parent Elements
bandFmts (§5.7.2.14)

Child Elements	Subclause
idx (Index)	§5.7.2.84
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BandFmt">
   <sequence>
      <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.14 bandFmts (Band Formats)

This element contains a collection of formatting bands for a surface chart indexed from low to high.

Parent Elements
surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205)

Child Elements	Subclause
bandFmt (Band Format)	§5.7.2.13

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BandFmts">
   <sequence>
      <element name="bandFmt" type="CT_BandFmt" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.7.2.15 bar3DChart (3D Bar Charts)

This element contains the 3-D bar or column series on this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
barDir (Bar Direction)	§5.7.2.17
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
gapDepth (Gap Depth)	§5.7.2.74

Child Elements	Subclause
gapWidth (Gap Width)	§5.7.2.75
grouping (Bar Grouping)	§5.7.2.77
ser (Bar Chart Series)	§5.7.2.175
shape (Shape)	§5.7.2.178
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Bar3DChart">
   <sequence>
      <group ref="EG_BarChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="gapWidth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
      <element name="gapDepth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
      <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="3"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.16 barChart (Bar Charts)

This element contains the 2-D bar or column series on this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
barDir (Bar Direction)	§5.7.2.17
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
gapWidth (Gap Width)	§5.7.2.75
grouping (Bar Grouping)	§5.7.2.77
overlap (Overlap)	§5.7.2.132
ser (Bar Chart Series)	§5.7.2.175
serLines (Series Lines)	§5.7.2.177
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BarChart">
   <sequence>
      <group ref="EG_BarChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="gapWidth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
      <element name="overlap" type="CT_Overlap" minOccurs="0" maxOccurs="1"/>
      <element name="serLines" type="CT_ChartLines" minOccurs="0" maxOccurs="unbounded"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.17 barDir (Bar Direction)

This element specifies whether the series form a bar (horizontal) chart or a column (vertical) chart

Parent Elements
bar3DChart (§5.7.2.15); barChart (§5.7.2.16)

Attributes	Description
val (Bar Direction Value)	Specifies the direction of the series. The possible values for this attribute are defined by the ST_BarDir simple type (§5.7.3.3).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BarDir">
   <attribute name="val" type="ST_BarDir" default="col"/>
</complexType>
```

5.7.2.18 baseTimeUnit (Base Time Unit)

This element specifies the smallest time unit that is represented on the date axis.

Parent Elements
dateAx (§5.7.2.39)

Attributes	Description
val (Time Unit Value)	Specifies the time unit for the tick marks. The possible values for this attribute are defined by the ST_TimeUnit simple type (§5.7.3.50).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeUnit">
   <attribute name="val" type="ST_TimeUnit" default="days"/>
</complexType>
```

5.7.2.19 bubble3D (3D Bubble)

This element specifies that the bubbles have a 3-D effect applied to them.

Parent Elements
bubbleChart (§5.7.2.20); dPt (§5.7.2.52); ser (§5.7.2.168)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.20 bubbleChart (Bubble Charts)

This element contains the bubble series on this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
bubble3D (3D Bubble)	§5.7.2.19
bubbleScale (Bubble Scale)	§5.7.2.21
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
ser (Bubble Chart Series)	§5.7.2.168

Child Elements	Subclause
showNegBubbles (Show Negative Bubbles)	§5.7.2.186
sizeRepresents (Size Represents)	§5.7.2.194
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BubbleChart">
   <sequence>
      <element name="varyColors" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="ser" type="CT_BubbleSer" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="bubble3D" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="bubbleScale" type="CT_BubbleScale" minOccurs="0" maxOccurs="1"/>
      <element name="showNegBubbles" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="sizeRepresents" type="CT_SizeRepresents" minOccurs="0" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.21 bubbleScale (Bubble Scale)

This element specifies the scale factor for the bubble chart. This element can be an integer value from 0 to 300, corresponding to a percentage of the default size.

Parent Elements
bubbleChart (§5.7.2.20)

Attributes	Description
val (Bubble Scale Value)	Specifies how to scale bubbles on a bubble chart. The possible values for this attribute are defined by the ST_BubbleScale simple type (§5.7.3.5).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BubbleScale">
   <attribute name="val" type="ST_BubbleScale" default="100"/>
</complexType>
```

5.7.2.22 bubbleSize (Bubble Size)

This element specifies the data for the sizes of the bubbles on the bubble chart.

Parent Elements
ser (§5.7.2.168)

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumDataSource">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
         <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
</complexType>
```

5.7.2.23 builtInUnit (Built in Display Unit Value)

This element specifies the display unit is one of the built in values.

Parent Elements
dispUnits (§5.7.2.45)

Attributes	Description
val (Built In Unit Value)	Specifies the type of display unit scaling applied to the axis. The possible values for this attribute are defined by the ST_BuiltInUnit simple type (§5.7.3.6).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BuiltInUnit">
   <attribute name="val" type="ST_BuiltInUnit" default="thousands"/>
</complexType>
```

5.7.2.24 cat (Category Axis Data)

This element specifies the data used for the category axis.

Parent Elements
ser (§5.7.2.174); ser (§5.7.2.171); ser (§5.7.2.175); ser (§5.7.2.170); ser (§5.7.2.169); ser (§5.7.2.173)

Child Elements	Subclause
multiLvlStrRef (Multi Level String Reference)	§5.7.2.116
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

Child Elements	Subclause
strLit (String Literal)	§5.7.2.201
strRef (String Reference)	§5.7.2.202

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AxDataSource">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="multiLvlStrRef" type="CT_MultiLvlStrRef" minOccurs="1" maxOccurs="1"/>
         <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
         <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
         <element name="strRef" type="CT_StrRef" minOccurs="1" maxOccurs="1"/>
         <element name="strLit" type="CT_StrData" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
</complexType>
```

5.7.2.25 catAx (Category Axis Data)

This element specifies the category axis of the chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
auto (Automatic Category Axis)	§5.7.2.6
axId (Axis ID)	§5.7.2.9
axPos (Axis Position)	§5.7.2.10
crossAx (Crossing Axis ID)	§5.7.2.31
crosses (Crosses)	§5.7.2.33
crossesAt (Crossing Value)	§5.7.2.34
delete (Delete)	§5.7.2.40
extLst (Chart Extensibility)	§5.7.2.64
lblAlgn (Label Alignment)	§5.7.2.90
lblOffset (Label Offset)	§5.7.2.91
majorGridlines (Major Gridlines)	§5.7.2.101
majorTickMark (Major Tick Mark)	§5.7.2.102
minorGridlines (Minor Gridlines)	§5.7.2.110
minorTickMark (Minor Tick Mark)	§5.7.2.111
noMultiLvlLbl (No Multi-level Labels)	§5.7.2.120
numFmt (Number Format)	§5.7.2.122

Child Elements	Subclause
scaling (Scaling)	§5.7.2.161
spPr (Shape Properties)	§5.7.2.198
tickLblPos (Tick Label Position)	§5.7.2.208
tickLblSkip (Tick Label Skip)	§5.7.2.209
tickMarkSkip (Tick Mark Skip)	§5.7.2.210
title (Title)	§5.7.2.211
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CatAx">
   <sequence>
      <group ref="EG_AxShared" minOccurs="1" maxOccurs="1"/>
      <element name="auto" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="lblAlgn" type="CT_LblAlgn" minOccurs="0" maxOccurs="1"/>
      <element name="lblOffset" type="CT_LblOffset" minOccurs="0" maxOccurs="1"/>
      <element name="tickLblSkip" type="CT_Skip" minOccurs="0" maxOccurs="1"/>
      <element name="tickMarkSkip" type="CT_Skip" minOccurs="0" maxOccurs="1"/>
      <element name="noMultiLvlLbl" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.26 chart (Reference to Chart Part)

This element specifies the chart.

Attributes	Description
id (Relationship Reference) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the relationship for this Chart, Chart Drawing, or VML Drawing part. The type of relationship needed is specified by the parent element. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelId">
   <attribute ref="r:id" use="required"/>
</complexType>
```

5.7.2.27 chart (Chart)

This element specifies the chart.

Parent Elements

Parent Elements
chartSpace (§5.7.2.29)

Child Elements	Subclause
autoTitleDeleted (Auto Title Is Deleted)	§5.7.2.7
backWall (Back Wall)	§5.7.2.11
dispBlanksAs (Display Blanks As)	§5.7.2.42
extLst (Chart Extensibility)	§5.7.2.64
floor (Floor)	§5.7.2.69
legend (Legend)	§5.7.2.94
pivotFmts (Pivot Formats)	§5.7.2.144
plotArea (Plot Area)	§5.7.2.146
plotVisOnly (Plot Visible Only)	§5.7.2.147
showDLblsOverMax (Show Data Labels over Maximum)	§5.7.2.181
sideWall (Side Wall)	§5.7.2.192
title (Title)	§5.7.2.211
view3D (View In 3D)	§5.7.2.229

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Chart">
   <sequence>
      <element name="title" type="CT_Title" minOccurs="0" maxOccurs="1"/>
      <element name="autoTitleDeleted" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="pivotFmts" type="CT_PivotFmts" minOccurs="0" maxOccurs="1"/>
      <element name="view3D" type="CT_View3D" minOccurs="0" maxOccurs="1"/>
      <element name="floor" type="CT_Surface" minOccurs="0" maxOccurs="1"/>
      <element name="sideWall" type="CT_Surface" minOccurs="0" maxOccurs="1"/>
      <element name="backWall" type="CT_Surface" minOccurs="0" maxOccurs="1"/>
      <element name="plotArea" type="CT_PlotArea" minOccurs="1" maxOccurs="1"/>
      <element name="legend" type="CT_Legend" minOccurs="0" maxOccurs="1"/>
      <element name="plotVisOnly" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="dispBlanksAs" type="CT_DispBlanksAs" minOccurs="0" maxOccurs="1"/>
      <element name="showDLblsOverMax" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.28 chartObject (Chart Object)

This element specifies that the chart cannot be edited by the user

Parent Elements
protection (§5.7.2.150)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.29 chartSpace (Chart Space)

This element specifies overall settings for a single chart, and is the root node for the chart part.

Parent Elements
Root element of DrawingML Chart part

Child Elements	Subclause
chart (Chart)	§5.7.2.27
clrMapOvr (Color Map Override)	§5.7.2.30
date1904 (1904 Date System)	§5.7.2.38
externalData (External Data Relationship)	§5.7.2.63
extLst (Chart Extensibility)	§5.7.2.64
lang (Editing Language)	§5.7.2.87
pivotSource (Pivot Source)	§5.7.2.145
printSettings (Print Settings)	§5.7.2.149
protection (Protection)	§5.7.2.150
roundedCorners (Rounded Corners)	§5.7.2.160
spPr (Shape Properties)	§5.7.2.198
style (Style)	§5.7.2.203
txPr (Text Properties)	§5.7.2.217
userShapes (Reference to Chart Drawing Part)	§5.7.2.222

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartSpace">
   <sequence>
      <element name="date1904" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="lang" type="CT_TextLanguageID" minOccurs="0" maxOccurs="1"/>
      <element name="roundedCorners" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="style" type="CT_Style" minOccurs="0" maxOccurs="1"/>
      <element name="clrMapOvr" type="a:CT_ColorMapping" minOccurs="0" maxOccurs="1"/>
      <element name="pivotSource" type="CT_PivotSource" minOccurs="0" maxOccurs="1"/>
      <element name="protection" type="CT_Protection" minOccurs="0" maxOccurs="1"/>
      <element name="chart" type="CT_Chart" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
      <element name="externalData" type="CT_ExternalData" minOccurs="0" maxOccurs="1"/>
      <element name="printSettings" type="CT_PrintSettings" minOccurs="0" maxOccurs="1"/>
      <element name="userShapes" type="CT_RelId" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.30 clrMapOvr (Color Map Override)

This element represents color mapping information. It is used to override the applications color mapping if the user has selected keep source formatting after a copy-paste.

Parent Elements
chartSpace (§5.7.2.29)

Child Elements	Subclause
extLst (Extension List)	§5.1.2.1.15

Attributes	Description
accent1 (Accent 1) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent2 (Accent 2) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent3 (Accent 3) Namespace:	Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple

Attributes	Description
.../drawingml/2006/main	type (§5.1.12.14).
accent4 (Accent 4) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 4 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent5 (Accent 5) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
accent6 (Accent 6) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg1 (Background 1) Namespace: .../drawingml/2006/main	A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
bg2 (Background 2) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
folHlink (Followed Hyperlink) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
hlink (Hyperlink) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the color for a hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx1 (Text 1) Namespace: .../drawingml/2006/main	Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).
tx2 (Text 2)	Specifies a color defined which is associated as the second text color.

Attributes	Description
Namespace: .../drawingml/2006/main	The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§5.1.12.14).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ColorMapping">
   <sequence>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bg1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="tx1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="bg2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="tx2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent1" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent2" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent3" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent4" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent5" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="accent6" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="hlink" type="ST_ColorSchemeIndex" use="required"/>
   <attribute name="folHlink" type="ST_ColorSchemeIndex" use="required"/>
</complexType>
```

5.7.2.31 crossAx (Crossing Axis ID)

This element specifies the ID of axis that this axis crosses. For instance, a category axis may cross a value axis, and the category axis's crossAx would contain the ID of the value axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.32 crossBetween (Cross Between)

This element specifies whether the value axis crosses the category axis between categories.

If not specified, then the application should choose an appropriate behavior.

Parent Elements
valAx (§5.7.2.227)

Attributes	Description
val (Cross Between Value)	Specifies whether the value axis crosses the category axis between categories or on categories. The possible values for this attribute are defined by the ST_CrossBetween simple type (§5.7.3.7).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CrossBetween">
   <attribute name="val" type="ST_CrossBetween" use="required"/>
</complexType>
```

5.7.2.33 crosses (Crosses)

This element specifies how this axis crosses the perpendicular axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Crosses Value)	Specifies where the axis crosses its perpendicular axis. The possible values for this attribute are defined by the ST_Crosses simple type (§5.7.3.8).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Crosses">
   <attribute name="val" type="ST_Crosses" use="required"/>
</complexType>
```

5.7.2.34 crossesAt (Crossing Value)

This element specifies where on the axis the perpendicular axis crosses. The units are dependent on the type of axis.

When specified as a child element of valAx, the value is a decimal number on the value axis. When specified as a child element of dateAx, the date is defined as a integer number of days since Dec. 31, 1899, unless date1904 is set, in which case they are defined as an integer number of days since Dec. 31, 1903. When specified as a child element of catAx, the value is an integer category number, starting with 1 as the first category.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.35 custSplit (Custom Split)

This element contains the custom split information for a pie-of-pie or bar-of-pie chart with a custom split type.

Parent Elements
ofPieChart (§5.7.2.127)

Child Elements	Subclause
secondPiePt (Second Pie Point)	§5.7.2.164

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_CustSplit">
   <sequence>
      <element name="secondPiePt" type="CT_UnsignedInt" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.7.2.36 custUnit (Custom Display Unit)

This element specifies a custom value for the display unit.

Parent Elements
dispUnits (§5.7.2.45)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.37 data (Data Cannot Be Changed)

This element specifies that the user cannot change the choice of data used for the chart

Parent Elements
protection (§5.7.2.150)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.38 date1904 (1904 Date System)

This element specifies that the chart uses the 1904 date system. If the 1904 date system is used, then all dates and times shall be specified as a decimal number of days since Dec. 31, 1903. If the 1904 date system is not used, then all dates and times shall be specified as a decimal number of days since Dec. 31, 1899.

Parent Elements

Parent Elements
chartSpace (§5.7.2.29)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.39 dateAx (Date Axis)

This element specifies a date axis for the chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
auto (Automatic Category Axis)	§5.7.2.6
axId (Axis ID)	§5.7.2.9
axPos (Axis Position)	§5.7.2.10
baseTimeUnit (Base Time Unit)	§5.7.2.18
crossAx (Crossing Axis ID)	§5.7.2.31
crosses (Crosses)	§5.7.2.33
crossesAt (Crossing Value)	§5.7.2.34
delete (Delete)	§5.7.2.40
extLst (Chart Extensibility)	§5.7.2.64
lblOffset (Label Offset)	§5.7.2.91
majorGridlines (Major Gridlines)	§5.7.2.101
majorTickMark (Major Tick Mark)	§5.7.2.102
majorTimeUnit (Major Time Unit)	§5.7.2.103

Child Elements	Subclause
majorUnit (Major Unit)	§5.7.2.104
minorGridlines (Minor Gridlines)	§5.7.2.110
minorTickMark (Minor Tick Mark)	§5.7.2.111
minorTimeUnit (Minor Time Unit)	§5.7.2.112
minorUnit (Minor Unit)	§5.7.2.113
numFmt (Number Format)	§5.7.2.122
scaling (Scaling)	§5.7.2.161
spPr (Shape Properties)	§5.7.2.198
tickLblPos (Tick Label Position)	§5.7.2.208
title (Title)	§5.7.2.211
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DateAx">
   <sequence>
      <group ref="EG_AxShared" minOccurs="1" maxOccurs="1"/>
      <element name="auto" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="lblOffset" type="CT_LblOffset" minOccurs="0" maxOccurs="1"/>
      <element name="baseTimeUnit" type="CT_TimeUnit" minOccurs="0" maxOccurs="1"/>
      <element name="majorUnit" type="CT_AxisUnit" minOccurs="0" maxOccurs="1"/>
      <element name="majorTimeUnit" type="CT_TimeUnit" minOccurs="0" maxOccurs="1"/>
      <element name="minorUnit" type="CT_AxisUnit" minOccurs="0" maxOccurs="1"/>
      <element name="minorTimeUnit" type="CT_TimeUnit" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.40 delete (Delete)

This element specifies that the chart element specified by its containing element shall be deleted from the chart.

This should be set to true if the application adds these elements by default even after the user has specified that they should be removed from the chart.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); dLbl (§5.7.2.47); dLbls (§5.7.2.49); legendEntry (§5.7.2.95); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or `true` specifies that the property is applied. This is the default value for

Attributes	Description
	this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.41 depthPercent (Depth Percent)

This element specifies the depth of a 3-D chart as a percentage of the chart width (between 20 and 2000 percent).

Parent Elements
view3D (§5.7.2.229)

Attributes	Description
val (Depth Percent Value)	Specifies an integer value for the property defined by the parent XML element. The possible values for this attribute are defined by the ST_DepthPercent simple type (§5.7.3.9).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DepthPercent">
   <attribute name="val" type="ST_DepthPercent" default="100"/>
</complexType>
```

5.7.2.42 dispBlanksAs (Display Blanks As)

This element specifies how blank cells shall be plotted on a chart .

Parent Elements
chart (§5.7.2.27)

Attributes	Description
val (Display Blanks As Value)	Specifies how blank cells are plotted on the chart. The possible values for this attribute are defined by the ST_DispBlanksAs simple type (§5.7.3.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DispBlanksAs">
   <attribute name="val" type="ST_DispBlanksAs" default="zero"/>
</complexType>
```

5.7.2.43 dispEq (Display Equation)

This element specifies that the equation for the trendline is displayed on the chart (in the same label as the R-squared value).

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.44 dispRSqr (Display R Squared Value)

This element specifies that the R-squared value of the trendline is displayed on the chart (in the same label as the equation).

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

Attributes	Description
	A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.45 dispUnits (Display Units)

This element specifies the scaling value of the display units for the value axis.

Parent Elements
valAx (§5.7.2.227)

Child Elements	Subclause
builtInUnit (Built in Display Unit Value)	§5.7.2.23
custUnit (Custom Display Unit)	§5.7.2.36
dispUnitsLbl (Display Units Label)	§5.7.2.46
extLst (Chart Extensibility)	§5.7.2.64

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DispUnits">
   <sequence>
      <choice>
         <element name="custUnit" type="CT_Double" minOccurs="1" maxOccurs="1"/>
         <element name="builtInUnit" type="CT_BuiltInUnit" minOccurs="1" maxOccurs="1"/>
      </choice>
      <element name="dispUnitsLbl" type="CT_DispUnitsLbl" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.46 dispUnitsLbl (Display Units Label)

This element specifies the display unit label for the value axis in the specified chart.

Parent Elements
dispUnits (§5.7.2.45)

Child Elements	Subclause
layout (Layout)	§5.7.2.88

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198
tx (Chart Text)	§5.7.2.215
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DispUnitsLbl">
   <sequence>
      <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
      <element name="tx" type="CT_Tx" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.47 dLbl (Data Label)

This element specifies a data label.

Parent Elements
dLbls (§5.7.2.49); pivotFmt (§5.7.2.143)

Child Elements	Subclause
delete (Delete)	§5.7.2.40
dLblPos (Data Label Position)	§5.7.2.48
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
layout (Layout)	§5.7.2.88
numFmt (Number Format)	§5.7.2.122
separator (Separator)	§5.7.2.167
showBubbleSize (Show Bubble Size)	§5.7.2.179
showCatName (Show Category Name)	§5.7.2.180
showLegendKey (Show Legend Key)	§5.7.2.185
showPercent (Show Percent)	§5.7.2.188
showSerName (Show Series Name)	§5.7.2.189
showVal (Show Value)	§5.7.2.190
spPr (Shape Properties)	§5.7.2.198
tx (Chart Text)	§5.7.2.215
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DLbl">
   <sequence>
      <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
      <choice>
         <element name="delete" type="CT_Boolean" minOccurs="1" maxOccurs="1"/>
         <group ref="Group_DLbl" minOccurs="1" maxOccurs="1"/>
      </choice>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.48 dLblPos (Data Label Position)

This element specifies the position of the data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

Attributes	Description
val (Data Label Position Value)	Specifies how the data label is positioned on the chart. The possible values for this attribute are defined by the ST_DLblPos simple type (§5.7.3.11).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DLblPos">
   <attribute name="val" type="ST_DLblPos" use="required"/>
</complexType>
```

5.7.2.49 dLbls (Data Labels)

This element serves as a root element that specifies the settings for the data labels for an entire series or the entire chart. It contains child elements that specify the specific formatting and positioning settings.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); bar3DChart (§5.7.2.15); barChart (§5.7.2.16); bubbleChart (§5.7.2.20); doughnutChart (§5.7.2.50); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); ofPieChart (§5.7.2.127); pie3DChart (§5.7.2.141); pieChart (§5.7.2.142); radarChart (§5.7.2.154); scatterChart (§5.7.2.162); ser (§5.7.2.168); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175); ser (§5.7.2.172); ser (§5.7.2.169); ser (§5.7.2.170); stockChart (§5.7.2.199)

Child Elements	Subclause
delete (Delete)	§5.7.2.40
dLbl (Data Label)	§5.7.2.47

Child Elements	Subclause
dLblPos (Data Label Position)	§5.7.2.48
extLst (Chart Extensibility)	§5.7.2.64
leaderLines (Leader Lines)	§5.7.2.92
numFmt (Number Format)	§5.7.2.122
separator (Separator)	§5.7.2.167
showBubbleSize (Show Bubble Size)	§5.7.2.179
showCatName (Show Category Name)	§5.7.2.180
showLeaderLines (Show Leader Lines)	§5.7.2.184
showLegendKey (Show Legend Key)	§5.7.2.185
showPercent (Show Percent)	§5.7.2.188
showSerName (Show Series Name)	§5.7.2.189
showVal (Show Value)	§5.7.2.190
spPr (Shape Properties)	§5.7.2.198
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DLbls">
   <sequence>
      <element name="dLbl" type="CT_DLbl" minOccurs="0" maxOccurs="unbounded"/>
      <choice>
         <element name="delete" type="CT_Boolean" minOccurs="1" maxOccurs="1"/>
         <group ref="Group_DLbls" minOccurs="1" maxOccurs="1"/>
      </choice>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.50 doughnutChart (Doughnut Charts)

This element contains the doughnut chart series.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
firstSliceAng (First Slice Angle)	§5.7.2.68
holeSize (Hole Size)	§5.7.2.82

Child Elements	Subclause
ser (Pie Chart Series)	§5.7.2.170
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DoughnutChart">
   <sequence>
      <group ref="EG_PieChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="firstSliceAng" type="CT_FirstSliceAng" minOccurs="0" maxOccurs="1"/>
      <element name="holeSize" type="CT_HoleSize" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.51 downBars (Down Bars)

This element specifies the down bars.

Parent Elements
upDownBars (§5.7.2.219)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UpDownBar">
   <sequence>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.52 dPt (Data Point)

This element specifies a single data point.

Parent Elements
ser (§5.7.2.172); ser (§5.7.2.170); ser (§5.7.2.174); ser (§5.7.2.173); ser (§5.7.2.169); ser (§5.7.2.175); ser (§5.7.2.168)

Child Elements	Subclause
bubble3D (3D Bubble)	§5.7.2.19
explosion (Explosion)	§5.7.2.61
extLst (Chart Extensibility)	§5.7.2.64

Child Elements	Subclause
idx (Index)	§5.7.2.84
invertIfNegative (Invert if Negative)	§5.7.2.86
marker (Marker)	§5.7.2.106
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DPt">
    <sequence>
        <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
        <element name="invertIfNegative" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
        <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
        <element name="bubble3D" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
        <element name="explosion" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
        <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
        <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
        <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
    </sequence>
</complexType>
```

5.7.2.53 dropLines (Drop Lines)

This element specifies drop lines.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); stockChart (§5.7.2.199)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartLines">
    <sequence>
        <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
    </sequence>
</complexType>
```

5.7.2.54 dTable (Data Table)

This element specifies a data table.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
showHorzBorder (Show Horizontal Border)	§5.7.2.182
showKeys (Show Legend Keys)	§5.7.2.183
showOutline (Show Outline Border)	§5.7.2.187
showVertBorder (Show Vertical Border)	§5.7.2.191
spPr (Shape Properties)	§5.7.2.198
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_DTable">
   <sequence>
      <element name="showHorzBorder" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="showVertBorder" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="showOutline" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="showKeys" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.55 errBars (Error Bars)

This element specifies error bars. The errValType element controls whether the minus, plus, or val elements are used.

Parent Elements
ser (§5.7.2.172); ser (§5.7.2.168); ser (§5.7.2.174); ser (§5.7.2.169); ser (§5.7.2.175)

Child Elements	Subclause
errBarType (Error Bar Type)	§5.7.2.56
errDir (Error Bar Direction)	§5.7.2.57
errValType (Error Bar Value Type)	§5.7.2.58
extLst (Chart Extensibility)	§5.7.2.64
minus (Minus)	§5.7.2.114
noEndCap (No End Cap)	§5.7.2.119
plus (Plus)	§5.7.2.148
spPr (Shape Properties)	§5.7.2.198

Child Elements	Subclause
val (Error Bar Value)	§5.7.2.226

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ErrBars">
   <sequence>
      <element name="errDir" type="CT_ErrDir" minOccurs="0" maxOccurs="1"/>
      <element name="errBarType" type="CT_ErrBarType" minOccurs="1" maxOccurs="1"/>
      <element name="errValType" type="CT_ErrValType" minOccurs="1" maxOccurs="1"/>
      <element name="noEndCap" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="plus" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="minus" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="val" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.56 errBarType (Error Bar Type)

This element specifies the type of the error bars - positive, negative, or both.

Parent Elements
errBars (§5.7.2.55)

Attributes	Description
val (Error Bar Type Value)	Specifies the type of error bars. The possible values for this attribute are defined by the ST_ErrBarType simple type (§5.7.3.12).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ErrBarType">
   <attribute name="val" type="ST_ErrBarType" default="both"/>
</complexType>
```

5.7.2.57 errDir (Error Bar Direction)

This element specifies the direction of the error bars.

Parent Elements
errBars (§5.7.2.55)

Attributes	Description
val (Error Bar	Specifies the direction of the error bars.

Attributes	Description
Direction Value)	The possible values for this attribute are defined by the ST_ErrDir simple type (§5.7.3.13).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ErrDir">
   <attribute name="val" type="ST_ErrDir" use="required"/>
</complexType>
```

5.7.2.58 errValType (Error Bar Value Type)

This element specifies the type of values used to determine the length of the error bars.

Parent Elements
errBars (§5.7.2.55)

Attributes	Description
val (Error Bar Type Value)	Specifies the type of values of the error bars. The possible values for this attribute are defined by the ST_ErrValType simple type (§5.7.3.14).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ErrValType">
   <attribute name="val" type="ST_ErrValType" default="fixedVal"/>
</complexType>
```

5.7.2.59 evenFooter (Even Footer)

This element specifies the footer to use on even numbered pages.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

5.7.2.60 evenHeader (Even Header)

This element specifies the header to use on even numbered pages.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

5.7.2.61 explosion (Explosion)

This element specifies the amount the data point shall be moved from the center of the pie.

Parent Elements
dPt (§5.7.2.52); ser (§5.7.2.170)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.62 ext (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that will be used for later versions of generating applications.

Parent Elements
extLst (§5.7.2.64)

Child Elements	Subclause
Any element from any namespace	n/a

Attributes	Description
uri (Uniform Resource Identifier)	Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the XML Schema token datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Extension">
   <sequence>
      <any processContents="lax"/>
   </sequence>
   <attribute name="uri" type="xsd:token"/>
</complexType>
```

5.7.2.63 externalData (External Data Relationship)

This element specifies the relationship to the data for this chart.

The data may be linked, pointing to a spreadsheet in another file. Or, the data may be embedded, contained in a separate part within the same xml package containing the chart. In this case, it shall be stored as an embedded Spreadsheet object in Open XML format.

This is not used by a spreadsheet application as the spreadsheet application can maintain its own reference to the data in the spreadsheet via the formula <f> element.

Parent Elements
chartSpace (§5.7.2.29)

Child Elements	Subclause
autoUpdate (Update Automatically)	§5.7.2.8

Attributes	Description
id (Relationship Reference) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the relationship for this chart. The relationship explicitly targeted by this attribute shall be of type http://schemas.openxmlformats.org/officeDocument/2006/relationships/package. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExternalData">
   <sequence>
      <element name="autoUpdate" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute ref="r:id" use="required"/>
</complexType>
```

5.7.2.64 extLst (Chart Extensibility)

This element contains tags used for future extensibility of the file format.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); backWall (§5.7.2.11); bar3DChart (§5.7.2.15); barChart (§5.7.2.16); bubbleChart (§5.7.2.20); catAx (§5.7.2.25); chart (§5.7.2.27); chartSpace (§5.7.2.29); dateAx (§5.7.2.39); dispUnits (§5.7.2.45); dLbl (§5.7.2.47); dLbls (§5.7.2.49); doughnutChart (§5.7.2.50); dPt (§5.7.2.52); dTable (§5.7.2.54); errBars (§5.7.2.55); floor (§5.7.2.69); layout (§5.7.2.88); legend (§5.7.2.94); legendEntry (§5.7.2.95); line3DChart (§5.7.2.97); lineChart (§5.7.2.98); manualLayout (§5.7.2.105); marker (§5.7.2.106); multiLvlStrCache (§5.7.2.115); multiLvlStrRef (§5.7.2.116); numCache (§5.7.2.121); numLit (§5.7.2.123); numRef (§5.7.2.124); ofPieChart (§5.7.2.127); pie3DChart (§5.7.2.141); pieChart (§5.7.2.142); pivotFmt (§5.7.2.143); pivotSource (§5.7.2.145); plotArea (§5.7.2.146); radarChart (§5.7.2.154); scaling (§5.7.2.161); scatterChart (§5.7.2.162); ser (§5.7.2.174); ser (§5.7.2.170); ser (§5.7.2.172); ser (§5.7.2.175); ser (§5.7.2.169); ser (§5.7.2.168); ser (§5.7.2.173); ser (§5.7.2.171); serAx (§5.7.2.176); sideWall (§5.7.2.192); stockChart (§5.7.2.199); strCache (§5.7.2.200); strLit (§5.7.2.201); strRef (§5.7.2.202); surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205); title (§5.7.2.211); trendline (§5.7.2.212); trendlineLbl (§5.7.2.213); upDownBars (§5.7.2.219); valAx (§5.7.2.227); view3D (§5.7.2.229)

Child Elements	Subclause
ext (Extension)	§5.7.2.62

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ExtensionList">
   <sequence>
      <element name="ext" type="CT_Extension" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.7.2.65 f (Formula)

This element specifies a reference to source of the data contained in this chart. This shall be used by the spreadsheet application only. A presentation, or word processing application should use the `externalData` element.

This reference is in the form of a book, sheet, and cell reference or a book, optional sheet, and defined name reference. This reference does not include the equals sign. [*Example*:

```
<c:cat>
  <c:strRef>
    <c:f>Sheet1!$A$1:$C$1</c:f>
    <c:strCache>
…
    </c:strCache>
  </c:strRef>
</c:cat>
```

The above example shows a formula reference used for the string cahce. In this case the series names, which are referenced by the formula element, are in cells A1, B1, and C1.

end example

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
multiLvlStrRef (§5.7.2.116); numRef (§5.7.2.124); strRef (§5.7.2.202)

5.7.2.66 firstFooter (First Footer)

This element specifies the footer to use on the first page.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

5.7.2.67 firstHeader (First Header)

This element specifies the header to use on the first page.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

5.7.2.68 firstSliceAng (First Slice Angle)

This element specifies the angle of the first pie or doughnut chart slice, in degrees (clockwise from up).

Parent Elements
doughnutChart (§5.7.2.50); pieChart (§5.7.2.142)

Attributes	Description
val (First Slice Angle Value)	Specifies the angle of the first slice. The possible values for this attribute are defined by the ST_FirstSliceAng simple type (§5.7.3.15).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_FirstSliceAng">
   <attribute name="val" type="ST_FirstSliceAng" default="0"/>
</complexType>
```

5.7.2.69 floor (Floor)

This element specifies the floor of a 3D chart.

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198
thickness (Thickness)	§5.7.2.207

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Surface">
   <sequence>
      <element name="thickness" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.70 fmtId (Format ID)

This element represents a pivot format ID. It serves as a link back to the correct pivotTable which in turn specifies a link that then defines which set of chart format rules apply to this chart.

This ID shall match the chartFormat element, `chart` attribute, described in §3.10.1.12 of the SpreadsheetML reference material. The chartFormat element also contains a `format` attribute which is used to index into the pivotFmts collection (§5.7.2.144).

Parent Elements
pivotSource (§5.7.2.145)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.71 formatCode (Format Code)

This element specifies a string representing the format code to apply. For more information see the SpreadsheetML numFmt element's (§3.8.30) formatCode attribute.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
numCache (§5.7.2.121); numLit (§5.7.2.123)

5.7.2.72 formatting (Formatting)

This element specifies that a user cannot change formatting on chart elements.

Parent Elements
protection (§5.7.2.150)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.73 forward (Forward)

This element specifies the number of categories (or units on a scatter chart) that the trendline extends after the data for the series that is being trended. On non-scatter charts, the value must be a multiple of 0.5.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.74 gapDepth (Gap Depth)

This element specifies the space between bar or column clusters, as a percentage of the bar or column width.

Parent Elements
area3DChart (§5.7.2.4); bar3DChart (§5.7.2.15); line3DChart (§5.7.2.97)

Attributes	Description
val (Gap Size Value)	Specifies that the contents of this attribute will contain a gap amount between 0 and 500. The possible values for this attribute are defined by the ST_GapAmount simple type (§5.7.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GapAmount">
   <attribute name="val" type="ST_GapAmount" default="150"/>
</complexType>
```

5.7.2.75 gapWidth (Gap Width)

This element specifies the space between bar or column clusters, as a percentage of the bar or column width.

Parent Elements
bar3DChart (§5.7.2.15); barChart (§5.7.2.16); ofPieChart (§5.7.2.127); upDownBars (§5.7.2.219)

Attributes	Description
val (Gap Size Value)	Specifies that the contents of this attribute will contain a gap amount between 0 and 500. The possible values for this attribute are defined by the ST_GapAmount simple type

Attributes	Description
	(§5.7.3.16).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_GapAmount">
   <attribute name="val" type="ST_GapAmount" default="150"/>
</complexType>
```

5.7.2.76 grouping (Grouping)

This element specifies the type of grouping for a column, line, or area chart.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5); line3DChart (§5.7.2.97); lineChart (§5.7.2.98)

Attributes	Description
val (Grouping Value)	Specifies the grouping value. The possible values for this attribute are defined by the ST_Grouping simple type (§5.7.3.17).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Grouping">
   <attribute name="val" type="ST_Grouping" default="standard"/>
</complexType>
```

5.7.2.77 grouping (Bar Grouping)

This element specifies the type of grouping for a bar chart.

Parent Elements
bar3DChart (§5.7.2.15); barChart (§5.7.2.16)

Attributes	Description
val (Bar Grouping Value)	Specifies the bar grouping value. The possible values for this attribute are defined by the ST_BarGrouping simple type (§5.7.3.4).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BarGrouping">
   <attribute name="val" type="ST_BarGrouping" default="clustered"/>
</complexType>
```

5.7.2.78 h (Height)

This element specifies the height (if Height Mode is Factor) or bottom (if Height Mode is edge) of the chart element as a fraction of the height of the chart.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.79 headerFooter (Header and Footer)

This element specifies the headers and footers that shall be used when the chart is printed.

Parent Elements
printSettings (§5.7.2.149)

Child Elements	Subclause
evenFooter (Even Footer)	§5.7.2.59
evenHeader (Even Header)	§5.7.2.60
firstFooter (First Footer)	§5.7.2.66
firstHeader (First Header)	§5.7.2.67
oddFooter (Odd Footer)	§5.7.2.125
oddHeader (Odd Header)	§5.7.2.126

Attributes	Description
alignWithMargins (Align With Margins)	Specifies the header and footer should align with the left and right margins of the chart. A value of on, 1, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is

Attributes	Description
	omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
differentFirst (Different First)	Specifies the header and footer are different for the first page. A value of on, `1`, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.
differentOddEven (Different Odd Even)	Specifies the header and footer are different on odd-numbered pages and even-numbered pages. A value of on, `1`, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HeaderFooter">
   <sequence>
      <element name="oddHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="oddFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="evenHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="evenFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="firstHeader" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="firstFooter" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="alignWithMargins" type="xsd:boolean" default="true"/>
   <attribute name="differentOddEven" type="xsd:boolean" default="false"/>
   <attribute name="differentFirst" type="xsd:boolean" default="false"/>
</complexType>
```

5.7.2.80 hiLowLines (High Low Lines)

This element specifies the high-low lines for the series.

Parent Elements
lineChart (§5.7.2.98); stockChart (§5.7.2.199)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartLines">
   <sequence>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.81 hMode (Height Mode)

This element specifies how to interpret the Height element for this manual layout.

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Layout Mode Value)	Specifies the layout mode for the width. The possible values for this attribute are defined by the ST_LayoutMode simple type (§5.7.3.20).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutMode">
   <attribute name="val" type="ST_LayoutMode" default="factor"/>
</complexType>
```

5.7.2.82 holeSize (Hole Size)

This element specifies the size of the hole in a doughnut chart group.

Parent Elements
doughnutChart (§5.7.2.50)

Attributes	Description
val (Hole Size Value)	Specifies that the contents of this attribute will contain a hole size between 10 and 90 that is measured as a percentage of the size of the plot area. The possible values for this attribute are defined by the ST_HoleSize simple type (§5.7.3.18).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HoleSize">
   <attribute name="val" type="ST_HoleSize" default="10"/>
</complexType>
```

5.7.2.83 hPercent (Height Percent)

This element specifies the height of a 3-D chart as a percentage of the chart width.

Parent Elements
view3D (§5.7.2.229)

Attributes	Description
val (Height Percent Value)	Specifies that the contents of this attribute will contain a height percent between 5 and 500. The possible values for this attribute are defined by the ST_HPercent simple type (§5.7.3.19).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_HPercent">
   <attribute name="val" type="ST_HPercent" default="100"/>
</complexType>
```

5.7.2.84 idx (Index)

This element specifies the index of the containing element. This index shall determine which of the parent's children collection this element applies to.

Parent Elements
bandFmt (§5.7.2.13); dLbl (§5.7.2.47); dPt (§5.7.2.52); legendEntry (§5.7.2.95); pivotFmt (§5.7.2.143); ser (§5.7.2.168); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.171); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.85 intercept (Intercept)

This element specifies the value where the trendline shall cross the y axis. This property shall be supported only when the trendline type is exp, linear, or poly.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.86 invertIfNegative (Invert if Negative)

This element specifies the parent element shall invert its colors if the value is negative.

Parent Elements
dPt (§5.7.2.52); ser (§5.7.2.175); ser (§5.7.2.168)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of `on`, `1`, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.87 lang (Editing Language)

This element specifies the primary editing language which was use when this chart was last modified.

Parent Elements
chartSpace (§5.7.2.29)

Attributes	Description
val (Language Code)	Specifies a language tag as defined by RFC 3066. See simple type for additional information. The possible values for this attribute are defined by the ST_TextLanguageID simple type (§5.7.3.47).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextLanguageID">
   <attribute name="val" type="ST_TextLanguageID" use="required"/>
</complexType>
```

5.7.2.88 layout (Layout)

This element specifies how the chart element is placed on the chart.

Parent Elements
dispUnitsLbl (§5.7.2.46); dLbl (§5.7.2.47); legend (§5.7.2.94); plotArea (§5.7.2.146); title (§5.7.2.211); trendlineLbl (§5.7.2.213)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
manualLayout (Manual Layout)	§5.7.2.105

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Layout">
   <sequence>
      <element name="manualLayout" type="CT_ManualLayout" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.89 layoutTarget (Layout Target)

This element specifies whether to layout the plot area by its inside (not including axis and axis labels) or outside (including axis and axis labels).

Parent Elements
manualLayout (§5.7.2.105)

Attributes	Description
val (Layout Target Value)	Specifies the layout target value. The possible values for this attribute are defined by the ST_LayoutTarget simple type (§5.7.3.21).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LayoutTarget">
   <attribute name="val" type="ST_LayoutTarget" default="outer"/>
</complexType>
```

5.7.2.90 lblAlgn (Label Alignment)

This element specifies the text alignment for the tick labels on the axis.

Parent Elements
catAx (§5.7.2.25)

Attributes	Description
val (Label Alignment Value)	Specifies the label alignment. The possible values for this attribute are defined by the ST_LblAlgn simple type (§5.7.3.22).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LblAlgn">
   <attribute name="val" type="ST_LblAlgn" use="required"/>
</complexType>
```

5.7.2.91 lblOffset (Label Offset)

This element specifies the distance of labels from the axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39)

Attributes	Description
val (Label Offset Value)	Specifies the contents of this attribute will contain an integer between 0 and 1000. The possible values for this attribute are defined by the ST_LblOffset simple type (§5.7.3.23).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LblOffset">
   <attribute name="val" type="ST_LblOffset" default="100"/>
</complexType>
```

5.7.2.92 leaderLines (Leader Lines)

This element specifies the leader lines for data labels.

Parent Elements
dLbls (§5.7.2.49)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartLines">
   <sequence>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.93 legacyDrawingHF (Legacy Drawing for Headers and Footers)

This element specifies the VML Drawing part that contains any pictures used in the header or footer of the chart.

Parent Elements
printSettings (§5.7.2.149)

Attributes	Description
id (Relationship Reference) Namespace: .../officeDocument/2006/relationships	Specifies the relationship ID for the relationship for this Chart, Chart Drawing, or VML Drawing part. The type of relationship needed is specified by the parent element. The possible values for this attribute are defined by the ST_RelationshipId simple type (§7.8.2.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RelId">
   <attribute ref="r:id" use="required"/>
</complexType>
```

5.7.2.94 legend (Legend)

This element specifies the legend.

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
layout (Layout)	§5.7.2.88
legendEntry (Legend Entry)	§5.7.2.95
legendPos (Legend Position)	§5.7.2.96
overlay (Overlay)	§5.7.2.133
spPr (Shape Properties)	§5.7.2.198
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Legend">
   <sequence>
      <element name="legendPos" type="CT_LegendPos" minOccurs="0" maxOccurs="1"/>
      <element name="legendEntry" type="CT_LegendEntry" minOccurs="0" maxOccurs="unbounded"/>
      <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
      <element name="overlay" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.95 legendEntry (Legend Entry)

This element specifies a legend entry.

Parent Elements
legend (§5.7.2.94)

Child Elements	Subclause
delete (Delete)	§5.7.2.40

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LegendEntry">
   <sequence>
      <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
      <choice>
         <element name="delete" type="CT_Boolean" minOccurs="1" maxOccurs="1"/>
         <group ref="EG_LegendEntryData" minOccurs="1" maxOccurs="1"/>
      </choice>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.96 legendPos (Legend Position)

This element specifies the position of the legend.

Parent Elements
legend (§5.7.2.94)

Attributes	Description
val (Legend Position Value)	Specifies the position of the legend. The possible values for this attribute are defined by the ST_LegendPos simple type (§5.7.3.24).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LegendPos">
   <attribute name="val" type="ST_LegendPos" default="r"/>
</complexType>
```

5.7.2.97 line3DChart (3D Line Charts)

This element contains the 3-D line chart series.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
dropLines (Drop Lines)	§5.7.2.53
extLst (Chart Extensibility)	§5.7.2.64
gapDepth (Gap Depth)	§5.7.2.74
grouping (Grouping)	§5.7.2.76
ser (Line Chart Series)	§5.7.2.169
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Line3DChart">
   <sequence>
      <group ref="EG_LineChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="gapDepth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="3" maxOccurs="3"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.98 lineChart (Line Charts)

This element contains the 2-D line chart series.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
dLbls (Data Labels)	§5.7.2.49
dropLines (Drop Lines)	§5.7.2.53
extLst (Chart Extensibility)	§5.7.2.64
grouping (Grouping)	§5.7.2.76
hiLowLines (High Low Lines)	§5.7.2.80
marker (Show Marker)	§5.7.2.107
ser (Line Chart Series)	§5.7.2.169
smooth (Smoothing)	§5.7.2.195
upDownBars (Up/Down Bars)	§5.7.2.219
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineChart">
   <sequence>
      <group ref="EG_LineChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="hiLowLines" type="CT_ChartLines" minOccurs="0" maxOccurs="1"/>
      <element name="upDownBars" type="CT_UpDownBars" minOccurs="0" maxOccurs="1"/>
      <element name="marker" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="smooth" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.99 logBase (Logarithmic Base)

This element specifies the logarithmic base for a logarithmic axis.

Parent Elements
scaling (§5.7.2.161)

Attributes	Description
val (Logarithmic Base Value)	Specifies the contents of this attribute will contain a floating point value greater than or equal to 2. The possible values for this attribute are defined by the ST_LogBase simple type (§5.7.3.25).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LogBase">
   <attribute name="val" type="ST_LogBase" use="required"/>
</complexType>
```

5.7.2.100 lvl (Level)

This element specifies data for a single level of labels for a category axis.

Parent Elements
multiLvlStrCache (§5.7.2.115)

Child Elements	Subclause
pt (String Point)	§5.7.2.152

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Lvl">
   <sequence>
      <element name="pt" type="CT_StrVal" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.7.2.101 majorGridlines (Major Gridlines)

This element specifies major gridlines.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartLines">
   <sequence>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.102 majorTickMark (Major Tick Mark)

This element specifies the major tick marks.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Tick Mark Value)	Specifies the minor tick mark position. The possible values for this attribute are defined by the ST_TickMark simple type (§5.7.3.49).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TickMark">
   <attribute name="val" type="ST_TickMark" default="cross"/>
</complexType>
```

5.7.2.103 majorTimeUnit (Major Time Unit)

This element specifies the time unit for major tick marks.

Parent Elements
dateAx (§5.7.2.39)

Attributes	Description
val (Time Unit Value)	Specifies the time unit for the tick marks. The possible values for this attribute are defined by the ST_TimeUnit simple type (§5.7.3.50).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeUnit">
   <attribute name="val" type="ST_TimeUnit" default="days"/>
</complexType>
```

5.7.2.104 majorUnit (Major Unit)

This element specifies the distance between major ticks.

Parent Elements
dateAx (§5.7.2.39); valAx (§5.7.2.227)

Attributes	Description
val (Major Unit Value)	Specifies the contents of this attribute will contain a positive floating point number. The possible values for this attribute are defined by the ST_AxisUnit simple type (§5.7.3.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AxisUnit">
   <attribute name="val" type="ST_AxisUnit" use="required"/>
</complexType>
```

5.7.2.105 manualLayout (Manual Layout)

This element specifies the exact position of a chart element.

Parent Elements
layout (§5.7.2.88)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
h (Height)	§5.7.2.78

Child Elements	Subclause
hMode (Height Mode)	§5.7.2.81
layoutTarget (Layout Target)	§5.7.2.89
w (Width)	§5.7.2.230
wMode (Width Mode)	§5.7.2.232
x (Left)	§5.7.2.233
xMode (Left Mode)	§5.7.2.234
y (Top)	§5.7.2.236
yMode (Top Mode)	§5.7.2.237

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ManualLayout">
   <sequence>
      <element name="layoutTarget" type="CT_LayoutTarget" minOccurs="0" maxOccurs="1"/>
      <element name="xMode" type="CT_LayoutMode" minOccurs="0" maxOccurs="1"/>
      <element name="yMode" type="CT_LayoutMode" minOccurs="0" maxOccurs="1"/>
      <element name="wMode" type="CT_LayoutMode" minOccurs="0" maxOccurs="1"/>
      <element name="hMode" type="CT_LayoutMode" minOccurs="0" maxOccurs="1"/>
      <element name="x" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="y" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="w" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="h" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.106 marker (Marker)

This element specifies a data marker.

Parent Elements
dPt (§5.7.2.52); pivotFmt (§5.7.2.143); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.169)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
size (Size)	§5.7.2.193
spPr (Shape Properties)	§5.7.2.198
symbol (Symbol)	§5.7.2.206

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Marker">
   <sequence>
      <element name="symbol" type="CT_MarkerStyle" minOccurs="0" maxOccurs="1"/>
      <element name="size" type="CT_MarkerSize" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.107 marker (Show Marker)

This element is a Boolean that, when `true`, specifies that the marker shall be shown.

Parent Elements
lineChart (§5.7.2.98)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, `1`, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.108 max (Maximum)

This element specifies the maximum value of the axis.

Parent Elements
scaling (§5.7.2.161)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element.

Attributes	Description
	The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.109 min (Minimum)

This element specifies the minimum value of the axis.

Parent Elements
scaling (§5.7.2.161)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.110 minorGridlines (Minor Gridlines)

This element specifies the minor gridlines.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartLines">
   <sequence>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.111 minorTickMark (Minor Tick Mark)

This element specifies the minor tick marks for the axis.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Attributes	Description
val (Tick Mark Value)	Specifies the minor tick mark position. The possible values for this attribute are defined by the ST_TickMark simple type (§5.7.3.49).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TickMark">
   <attribute name="val" type="ST_TickMark" default="cross"/>
</complexType>
```

5.7.2.112 minorTimeUnit (Minor Time Unit)

This element specifies the time unit for the minor tick marks.

Parent Elements
dateAx (§5.7.2.39)

Attributes	Description
val (Time Unit Value)	Specifies the time unit for the tick marks. The possible values for this attribute are defined by the ST_TimeUnit simple type (§5.7.3.50).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TimeUnit">
   <attribute name="val" type="ST_TimeUnit" default="days"/>
</complexType>
```

5.7.2.113 minorUnit (Minor Unit)

This element specifies the distance between minor tick marks.

Parent Elements
dateAx (§5.7.2.39); valAx (§5.7.2.227)

Attributes	Description
val (Major Unit Value)	Specifies the contents of this attribute will contain a positive floating point number. The possible values for this attribute are defined by the ST_AxisUnit simple type (§5.7.3.1).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AxisUnit">
   <attribute name="val" type="ST_AxisUnit" use="required"/>
</complexType>
```

5.7.2.114 minus (Minus)

This element specifies the error bar value in the negative direction. It shall be used only when the errValType is cust.

Parent Elements
errBars (§5.7.2.55)

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumDataSource">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
         <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
</complexType>
```

5.7.2.115 multiLvlStrCache (Multi Level String Cache)

This element specifies the last data shown on the chart for a category axis.

Parent Elements
multiLvlStrRef (§5.7.2.116)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
lvl (Level)	§5.7.2.100
ptCount (Point Count)	§5.7.2.153

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MultiLvlStrData">
    <sequence>
        <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
        <element name="lvl" type="CT_Lvl" minOccurs="0" maxOccurs="unbounded"/>
        <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
    </sequence>
</complexType>
```

5.7.2.116 multiLvlStrRef (Multi Level String Reference)

This element specifies a reference to data for the category axis with a cache of the last values used.

Parent Elements
cat (§5.7.2.24); xVal (§5.7.2.235)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
f (Formula)	§5.7.2.65
multiLvlStrCache (Multi Level String Cache)	§5.7.2.115

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MultiLvlStrRef">
    <sequence>
        <element name="f" type="xsd:string" minOccurs="1" maxOccurs="1"/>
        <element name="multiLvlStrCache" type="CT_MultiLvlStrData" minOccurs="0" maxOccurs="1"/>
        <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
    </sequence>
</complexType>
```

5.7.2.117 name (Trendline Name)

This element specifies the name of the trendline.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
trendline (§5.7.2.212)

5.7.2.118 name (Pivot Name)

This element specifies the name of the pivot table to get the data for the chart from.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
pivotSource (§5.7.2.145)

5.7.2.119 noEndCap (No End Cap)

This element specifies an end cap is not drawn on the error bars.

Parent Elements
errBars (§5.7.2.55)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.120 noMultiLvlLbl (No Multi-level Labels)

This element specifies the labels shall be shown as flat text. If this element is not included or is set to false, then the labels shall be drawn as a hierarchy.

Parent Elements
catAx (§5.7.2.25)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is

Attributes	Description
	omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.121 numCache (Number Cache)

This element specifies the last data shown on the chart for a series.

Parent Elements
numRef (§5.7.2.124)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
formatCode (Format Code)	§5.7.2.71
pt (Numeric Point)	§5.7.2.151
ptCount (Point Count)	§5.7.2.153

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumData">
   <sequence>
      <element name="formatCode" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
      <element name="pt" type="CT_NumVal" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.122 numFmt (Number Format)

This element specifies number formatting for the parent element.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); dLbl (§5.7.2.47); dLbls (§5.7.2.49); serAx (§5.7.2.176); trendlineLbl (§5.7.2.213); valAx (§5.7.2.227)

Attributes	Description

Attributes	Description
formatCode (Number Format Code)	This element specifies a string representing the format code to apply. For more information see the SpreadsheetML numFmt element's (§3.8.30) formatCode attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§5.7.3.52).
sourceLinked (Linked to Source)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumFmt">
   <attribute name="formatCode" type="ST_Xstring" use="required"/>
   <attribute name="sourceLinked" type="xsd:boolean"/>
</complexType>
```

5.7.2.123 numLit (Number Literal)

This element specifies a set of numbers used for the parent element.

Parent Elements
bubbleSize (§5.7.2.22); cat (§5.7.2.24); minus (§5.7.2.114); plus (§5.7.2.148); val (§5.7.2.225); xVal (§5.7.2.235); yVal (§5.7.2.238)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
formatCode (Format Code)	§5.7.2.71
pt (Numeric Point)	§5.7.2.151
ptCount (Point Count)	§5.7.2.153

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumData">
   <sequence>
      <element name="formatCode" type="ST_Xstring" minOccurs="0" maxOccurs="1"/>
      <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
      <element name="pt" type="CT_NumVal" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.124 numRef (Number Reference)

This element specifies a reference to numeric data with a cache of the last values used.

Parent Elements
bubbleSize (§5.7.2.22); cat (§5.7.2.24); minus (§5.7.2.114); plus (§5.7.2.148); val (§5.7.2.225); xVal (§5.7.2.235); yVal (§5.7.2.238)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
f (Formula)	§5.7.2.65
numCache (Number Cache)	§5.7.2.121

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumRef">
   <sequence>
      <element name="f" type="xsd:string" minOccurs="1" maxOccurs="1"/>
      <element name="numCache" type="CT_NumData" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.125 oddFooter (Odd Footer)

This element specifies the footer to use on odd numbered pages.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

5.7.2.126 oddHeader (Odd Header)

This element specifies the header to use on odd numbered pages.

The possible values for this element are defined by the ST_Xstring simple type (§5.7.3.52).

Parent Elements
headerFooter (§5.7.2.79)

5.7.2.127 ofPieChart (Pie of Pie or Bar of Pie Charts)

This element contains the pie of pie or bar of pie series on this chart. Only the first series shall be displayed. The splitType element shall determine whether the splitPos and custSplit elements apply.

Parent Elements

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
custSplit (Custom Split)	§5.7.2.35
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
gapWidth (Gap Width)	§5.7.2.75
ofPieType (Pie of Pie or Bar of Pie Type)	§5.7.2.128
secondPieSize (Second Pie Size)	§5.7.2.165
ser (Pie Chart Series)	§5.7.2.170
serLines (Series Lines)	§5.7.2.177
splitPos (Split Position)	§5.7.2.196
splitType (Split Type)	§5.7.2.197
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OfPieChart">
   <sequence>
      <element name="ofPieType" type="CT_OfPieType" minOccurs="1" maxOccurs="1"/>
      <group ref="EG_PieChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="gapWidth" type="CT_GapAmount" minOccurs="0" maxOccurs="1"/>
      <element name="splitType" type="CT_SplitType" minOccurs="0" maxOccurs="1"/>
      <element name="splitPos" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="custSplit" type="CT_CustSplit" minOccurs="0" maxOccurs="1"/>
      <element name="secondPieSize" type="CT_SecondPieSize" minOccurs="0" maxOccurs="1"/>
      <element name="serLines" type="CT_ChartLines" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.128 ofPieType (Pie of Pie or Bar of Pie Type)

This element specifies whether this chart is pie of pie or bar of pie.

Parent Elements
ofPieChart (§5.7.2.127)

Attributes	Description
val (Pie of Pie or Bar of Pie Type Value)	Specifies the type of pie of pie or bar of pie chart.

Attributes	Description
	The possible values for this attribute are defined by the ST_OfPieType simple type (§5.7.3.28).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_OfPieType">
   <attribute name="val" type="ST_OfPieType" default="pie"/>
</complexType>
```

5.7.2.129 order (Order)

This element specifies the order of the series in the collection. It is 0 based.

Parent Elements
ser (§5.7.2.168); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.171); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.130 order (Polynomial Trendline Order)

This element specifies the order of the polynomial trend line. It is ignored for other trend line types.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Order Value)	Specifies that the contents of this attribute will contain an integer between 2 and 6. The possible values for this attribute are defined by the ST_Order simple type (§5.7.3.29).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Order">
   <attribute name="val" type="ST_Order" default="2"/>
</complexType>
```

5.7.2.131 orientation (Axis Orientation)

This element specifies the stretching and stacking of the picture on the data point, series, wall, or floor.

Parent Elements
scaling (§5.7.2.161)

Attributes	Description
val (Orientation Value)	Specifies the orientation of the axis. The possible values for this attribute are defined by the ST_Orientation simple type (§5.7.3.30).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Orientation">
   <attribute name="val" type="ST_Orientation" default="minMax"/>
</complexType>
```

5.7.2.132 overlap (Overlap)

This element specifies how much bars and columns shall overlap on 2-D charts.

Parent Elements
barChart (§5.7.2.16)

Attributes	Description
val (Overlap Value)	Specifies the contents of this attribute will contain an integer between -100 and 100. The possible values for this attribute are defined by the ST_Overlap simple type (§5.7.3.31).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Overlap">
   <attribute name="val" type="ST_Overlap" default="0"/>
</complexType>
```

5.7.2.133 overlay (Overlay)

This element specifies that other chart elements shall be allowed to overlap this chart element.

Parent Elements
legend (§5.7.2.94); title (§5.7.2.211)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.134 pageMargins (Page Margins)

This element specifies the page margins for a chart.

Parent Elements
printSettings (§5.7.2.149)

Attributes	Description
b (Bottom)	Specifies the contents of this attribute will contain the bottom page margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
footer (Footer)	Specifies the contents of this attribute will contain the footer margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
header (Header)	Specifies the contents of this attribute will contain the header margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
l (Left)	Specifies the contents of this attribute will contain the left page margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.
r (Right)	Specifies the contents of this attribute will contain the right page margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.

Attributes	Description
t (Top)	Specifies the contents of this attribute will contain the top page margin in inches. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageMargins">
   <attribute name="l" type="xsd:double" use="required"/>
   <attribute name="r" type="xsd:double" use="required"/>
   <attribute name="t" type="xsd:double" use="required"/>
   <attribute name="b" type="xsd:double" use="required"/>
   <attribute name="header" type="xsd:double" use="required"/>
   <attribute name="footer" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.135 pageSetup (Page Setup)

This element defines the page setup for the chart.

Parent Elements
printSettings (§5.7.2.149)

Attributes	Description
blackAndWhite (Black and White)	Specifies the page shall print in black and white. The possible values for this attribute are defined by the XML Schema boolean datatype.
copies (Copies)	Specifies the number of copies that shall be printed. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
draft (Draft)	Specifies the page shall be printed in draft mode. The possible values for this attribute are defined by the XML Schema boolean datatype.
firstPageNumber (First Page Number)	Specifies the page number. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.
horizontalDpi (Horizontal DPI)	Specifies the horizontal resolution to print in dots per inch. The possible values for this attribute are defined by the XML Schema int datatype.
orientation (Orientation)	Specifies the orientation of the paper. The possible values for this attribute are defined by the ST_PageSetupOrientation simple type (§5.7.3.32).

Attributes	Description
paperSize (Page Size)	Specifies the paper size according to the following table.

Paper Size	Width	Height	Value
Letter paper	8.5 in.	11 in.	1
Legal paper	8.5 in.	14 in.	5
Standard paper	10 in.	11 in.	45
Standard paper	10 in.	14 in.	16
Standard paper	11 in.	17 in.	17
Standard paper	15 in.	11 in.	46
Standard paper	9 in.	11 in.	44
SuperA/SuperA/A4 paper	227 mm	356 mm	57
A2 paper	420 mm	594 mm	66
A3 paper	297 mm	420 mm	8
A3 extra paper	322 mm	445 mm	63
A3 extra transverse paper	322 mm	445 mm	68
A3 transverse paper	297 mm	420 mm	67
A4 paper	210 mm	297 mm	9
A4 extra paper	236 mm	322 mm	53
A4 plus paper	210 mm	330 mm	60
A4 transverse paper	210 mm	297 mm	55
A4 small paper	210 mm	297 mm	10
A5 paper	148 mm	210 mm	11
A5 extra paper	174 mm	235 mm	64
A5 transverse paper	148 mm	210 mm	61
SuperB/SuperB/A3 paper	305 mm	487 mm	58
B4 paper	250 mm	353 mm	12

Attributes	Description			
	B5 paper	176 mm	250 mm	13
	ISO B5 extra paper	201 mm	276 mm	65
	JIS B5 transverse paper	182 mm	257 mm	62
	C paper	17 in.	22 in.	24
	D paper	22 in.	34 in.	25
	#10 envelope	4.125 in.	9.5 in.	20
	#11 envelope	4.5 in.	10.375 in.	21
	#12 envelope	4.75 in.	11 in.	22
	#14 envelope	5 in.	11.5 in.	23
	#9 envelope	3.875 in.	8.875 in.	19
	B4 envelope	250 mm	353 mm	33
	B5 envelope	176 mm	250 mm	34
	B6 envelope	176 mm	125 mm	35
	C3 envelope	324 mm	458 mm	29
	C4 envelope	229 mm	324 mm	30
	C5 envelope	162 mm	229 mm	28
	C6 envelope	114 mm	162 mm	31
	C65 envelope	114 mm	229 mm	32
	DL envelope	110 mm	220 mm	27
	Invite envelope	220 mm	220 mm	47
	Italy envelope	110 mm	230 mm	36
	Monarch envelope	3.875 in.	7.5 in.).	37
	6 3/4 envelope	3.625 in.	6.5 in.	38
	E paper	34 in.	44 in.	26

Attributes	Description			
	Executive paper	7.25 in.	10.5 in.	7
	German legal fanfold	8.5 in.	13 in.	41
	German standard fanfold	8.5 in.	12 in.	40
	US standard fanfold	14.875 in.	11 in.	39
	Folio paper	8.5 in.	13 in.	14
	ISO B4	250 mm	353 mm	42
	Japanese double postcard	200 mm	148 mm	43
	Ledger paper	17 in.	11 in.	4
	Legal extra paper	9.275 in.	15 in.	51
	Letter extra paper	9.275 in.	12 in.	50
	Letter extra transverse paper	9.275 in.	12 in.	56
	Letter plus paper	8.5 in.	12.69 in.	59
	Letter transverse paper	8.275 in.	11 in.	54
	Letter small paper	8.5 in.	11 in.	2
	Note paper	8.5 in.	11 in.	18
	Quarto paper	215 mm	275 mm	15
	Statement paper	5.5 in.	8.5 in.	6
	Tabloid paper	11 in.	17 in.	3
	Tabloid extra paper	11.69 in.	18 in.	52
	The possible values for this attribute are defined by the XML Schema unsignedInt datatype.			
useFirstPageNumber (Use First Page Number)	Specifies to use the first page number instead of automatically generating a page number. The possible values for this attribute are defined by the XML Schema boolean datatype.			
verticalDpi	Specifies the vertical resolution to print in dots per inch.			

Attributes	Description
(Vertical DPI)	The possible values for this attribute are defined by the XML Schema int datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PageSetup">
   <attribute name="paperSize" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute name="firstPageNumber" type="xsd:unsignedInt" use="optional" default="1"/>
   <attribute name="orientation" type="ST_PageSetupOrientation" use="optional" default="default"/>
   <attribute name="blackAndWhite" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="draft" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="useFirstPageNumber" type="xsd:boolean" use="optional" default="false"/>
   <attribute name="horizontalDpi" type="xsd:int" use="optional" default="600"/>
   <attribute name="verticalDpi" type="xsd:int" use="optional" default="600"/>
   <attribute name="copies" type="xsd:unsignedInt" use="optional" default="1"/>
</complexType>
```

5.7.2.136 period (Period)

This element specifies the period of the trend line for a moving average trend line. It is ignored for other trend line types.

Parent Elements
trendline (§5.7.2.212)

Attributes	Description
val (Period Value)	Specifies the contents of this attribute will contain an integer between 2 and 255. The possible values for this attribute are defined by the ST_Period simple type (§5.7.3.33).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Period">
   <attribute name="val" type="ST_Period" default="2"/>
</complexType>
```

5.7.2.137 perspective (Perspective)

This element specifies the field of view angle for the 3-D chart. This element is ignored if Right Angle Axes is true.

Parent Elements
view3D (§5.7.2.229)

Attributes	Description

Attributes	Description
val (Perspective Value)	Specifies the contents of this attribute will contain an integer between 0 and 100. The possible values for this attribute are defined by the ST_Perspective simple type (§5.7.3.34).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Perspective">
   <attribute name="val" type="ST_Perspective" default="30"/>
</complexType>
```

5.7.2.138 pictureFormat (Picture Format)

This element specifies the stretching and stacking of the picture on the data point, series, wall, or floor.

Parent Elements
pictureOptions (§5.7.2.139)

Attributes	Description
val (Picture Format Value)	Specifies the stretching and stacking of the picture. The possible values for this attribute are defined by the ST_PictureFormat simple type (§5.7.3.35).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureFormat">
   <attribute name="val" type="ST_PictureFormat" use="required"/>
</complexType>
```

5.7.2.139 pictureOptions (Picture Options)

This element specifies the picture to be used on the data point, series, wall, or floor.

Parent Elements
backWall (§5.7.2.11); dPt (§5.7.2.52); floor (§5.7.2.69); ser (§5.7.2.175); ser (§5.7.2.174); sideWall (§5.7.2.192)

Child Elements	Subclause
applyToEnd (Apply to End)	§5.7.2.1
applyToFront (Apply To Front)	§5.7.2.2
applyToSides (Apply To Sides)	§5.7.2.3
pictureFormat (Picture Format)	§5.7.2.138
pictureStackUnit (Picture Stack Unit)	§5.7.2.140

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureOptions">
   <sequence>
      <element name="applyToFront" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="applyToSides" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="applyToEnd" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="pictureFormat" type="CT_PictureFormat" minOccurs="0" maxOccurs="1"/>
      <element name="pictureStackUnit" type="CT_PictureStackUnit" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.140 pictureStackUnit (Picture Stack Unit)

This element specifies the unit for each picture on the chart. This element applies only if the Picture Format is Stack and Scale.

Parent Elements
pictureOptions (§5.7.2.139)

Attributes	Description
val (Picture Stack Unit)	Specifies the contents of this attribute will contain a floating point number. The possible values for this attribute are defined by the ST_PictureStackUnit simple type (§5.7.3.36).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PictureStackUnit">
   <attribute name="val" type="ST_PictureStackUnit" use="required"/>
</complexType>
```

5.7.2.141 pie3DChart (3D Pie Charts)

This element contains the 3-D pie series for this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
ser (Pie Chart Series)	§5.7.2.170
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Pie3DChart">
   <sequence>
      <group ref="EG_PieChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.142 pieChart (Pie Charts)

This element contains the 2-D pie series for this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
firstSliceAng (First Slice Angle)	§5.7.2.68
ser (Pie Chart Series)	§5.7.2.170
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PieChart">
   <sequence>
      <group ref="EG_PieChartShared" minOccurs="1" maxOccurs="1"/>
      <element name="firstSliceAng" type="CT_FirstSliceAng" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.143 pivotFmt (Pivot Format)

This element contains a set of formatting to be applied to the chart that is based on a pivotTable.

Parent Elements
pivotFmts (§5.7.2.144)

Child Elements	Subclause
dLbl (Data Label)	§5.7.2.47
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
marker (Marker)	§5.7.2.106

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotFmt">
   <sequence>
      <element name="idx" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="txPr" type="a:CT_TextBody" minOccurs="0" maxOccurs="1"/>
      <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
      <element name="dLbl" type="CT_DLbl" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.144 pivotFmts (Pivot Formats)

This element contains a collection of formatting bands for a surface chart indexed from low to high.

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause
pivotFmt (Pivot Format)	§5.7.2.143

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotFmts">
   <sequence>
      <element name="pivotFmt" type="CT_PivotFmt" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.7.2.145 pivotSource (Pivot Source)

This element specifies the source pivot table for a pivot chart.

Parent Elements
chartSpace (§5.7.2.29)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
fmtId (Format ID)	§5.7.2.70
name (Pivot Name)	§5.7.2.118

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PivotSource">
   <sequence>
      <element name="name" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
      <element name="fmtId" type="CT_UnsignedInt" minOccurs="1" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.7.2.146 plotArea (Plot Area)

This element specifies the plot area of the chart.

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause
area3DChart (3D Area Charts)	§5.7.2.4
areaChart (Area Charts)	§5.7.2.5
bar3DChart (3D Bar Charts)	§5.7.2.15
barChart (Bar Charts)	§5.7.2.16
bubbleChart (Bubble Charts)	§5.7.2.20
catAx (Category Axis Data)	§5.7.2.25
dateAx (Date Axis)	§5.7.2.39
doughnutChart (Doughnut Charts)	§5.7.2.50
dTable (Data Table)	§5.7.2.54
extLst (Chart Extensibility)	§5.7.2.64
layout (Layout)	§5.7.2.88
line3DChart (3D Line Charts)	§5.7.2.97
lineChart (Line Charts)	§5.7.2.98
ofPieChart (Pie of Pie or Bar of Pie Charts)	§5.7.2.127
pie3DChart (3D Pie Charts)	§5.7.2.141
pieChart (Pie Charts)	§5.7.2.142
radarChart (Radar Charts)	§5.7.2.154
scatterChart (Scatter Charts)	§5.7.2.162
serAx (Series Axis)	§5.7.2.176
spPr (Shape Properties)	§5.7.2.198
stockChart (Stock Charts)	§5.7.2.199
surface3DChart (3D Surface Charts)	§5.7.2.204

Child Elements	Subclause
surfaceChart (Surface Charts)	§5.7.2.205
valAx (Value Axis)	§5.7.2.227

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PlotArea">
   <sequence>
      <element name="layout" type="CT_Layout" minOccurs="0" maxOccurs="1"/>
      <choice minOccurs="1" maxOccurs="unbounded">
         <element name="areaChart" type="CT_AreaChart" minOccurs="1" maxOccurs="1"/>
         <element name="area3DChart" type="CT_Area3DChart" minOccurs="1" maxOccurs="1"/>
         <element name="lineChart" type="CT_LineChart" minOccurs="1" maxOccurs="1"/>
         <element name="line3DChart" type="CT_Line3DChart" minOccurs="1" maxOccurs="1"/>
         <element name="stockChart" type="CT_StockChart" minOccurs="1" maxOccurs="1"/>
         <element name="radarChart" type="CT_RadarChart" minOccurs="1" maxOccurs="1"/>
         <element name="scatterChart" type="CT_ScatterChart" minOccurs="1" maxOccurs="1"/>
         <element name="pieChart" type="CT_PieChart" minOccurs="1" maxOccurs="1"/>
         <element name="pie3DChart" type="CT_Pie3DChart" minOccurs="1" maxOccurs="1"/>
         <element name="doughnutChart" type="CT_DoughnutChart" minOccurs="1" maxOccurs="1"/>
         <element name="barChart" type="CT_BarChart" minOccurs="1" maxOccurs="1"/>
         <element name="bar3DChart" type="CT_Bar3DChart" minOccurs="1" maxOccurs="1"/>
         <element name="ofPieChart" type="CT_OfPieChart" minOccurs="1" maxOccurs="1"/>
         <element name="surfaceChart" type="CT_SurfaceChart" minOccurs="1" maxOccurs="1"/>
         <element name="surface3DChart" type="CT_Surface3DChart" minOccurs="1" maxOccurs="1"/>
         <element name="bubbleChart" type="CT_BubbleChart" minOccurs="1" maxOccurs="1"/>
      </choice>
      <choice minOccurs="0" maxOccurs="unbounded">
         <element name="valAx" type="CT_ValAx" minOccurs="1" maxOccurs="1"/>
         <element name="catAx" type="CT_CatAx" minOccurs="1" maxOccurs="1"/>
         <element name="dateAx" type="CT_DateAx" minOccurs="1" maxOccurs="1"/>
         <element name="serAx" type="CT_SerAx" minOccurs="1" maxOccurs="1"/>
      </choice>
      <element name="dTable" type="CT_DTable" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.147 plotVisOnly (Plot Visible Only)

This element specifies that only visible cells should be plotted on the chart.

Parent Elements
chart (§5.7.2.27)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element.

Attributes	Description
	A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.148 plus (Plus)

This element specifies the error bar value in the positive direction. It shall be used only when the errValType is cust.

Parent Elements
errBars (§5.7.2.55)

Child Elements	Subclause
numLit (Number Literal)	§5.7.2.123
numRef (Number Reference)	§5.7.2.124

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumDataSource">
   <sequence>
      <choice minOccurs="1" maxOccurs="1">
         <element name="numRef" type="CT_NumRef" minOccurs="1" maxOccurs="1"/>
         <element name="numLit" type="CT_NumData" minOccurs="1" maxOccurs="1"/>
      </choice>
   </sequence>
</complexType>
```

5.7.2.149 printSettings (Print Settings)

This element specifies the print settings for the chart.

Parent Elements
chartSpace (§5.7.2.29)

Child Elements	Subclause

Child Elements	Subclause
headerFooter (Header and Footer)	§5.7.2.79
legacyDrawingHF (Legacy Drawing for Headers and Footers)	§5.7.2.93
pageMargins (Page Margins)	§5.7.2.134
pageSetup (Page Setup)	§5.7.2.135

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PrintSettings">
   <sequence>
      <element name="headerFooter" type="CT_HeaderFooter" minOccurs="0" maxOccurs="1"/>
      <element name="pageMargins" type="CT_PageMargins" minOccurs="0" maxOccurs="1"/>
      <element name="pageSetup" type="CT_PageSetup" minOccurs="0" maxOccurs="1"/>
      <element name="legacyDrawingHF" type="CT_RelId" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.150 protection (Protection)

This element specifies protection for the chart. If the chart is on a protected worksheet or chart sheet, then these settings shall control how a user is able to interact with the chart.

Parent Elements
chartSpace (§5.7.2.29)

Child Elements	Subclause
chartObject (Chart Object)	§5.7.2.28
data (Data Cannot Be Changed)	§5.7.2.37
formatting (Formatting)	§5.7.2.72
selection (Selection)	§5.7.2.166
userInterface (User Interface)	§5.7.2.220

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Protection">
   <sequence>
      <element name="chartObject" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="data" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="formatting" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="selection" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="userInterface" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.151 pt (Numeric Point)

This element specifies data for a particular data point.

Parent Elements
numCache (§5.7.2.121); numLit (§5.7.2.123)

Child Elements	Subclause
v (Numeric Value)	§5.7.2.224

Attributes	Description
formatCode (Number Format)	A string representing the format code to apply. For more information see see the SpreadsheetML numFmt element's (§3.8.30) formatCode attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§5.7.3.52).
idx (Index)	The index of the series in the collection The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_NumVal">
   <sequence>
      <element name="v" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="idx" type="xsd:unsignedInt" use="required"/>
   <attribute name="formatCode" type="ST_Xstring" use="optional"/>
</complexType>
```

5.7.2.152 pt (String Point)

This element specifies string data for a specific data point.

Parent Elements
lvl (§5.7.2.100); strCache (§5.7.2.200); strLit (§5.7.2.201)

Child Elements	Subclause
v (Text Value)	§5.7.2.223

Attributes	Description
idx (Index)	A 0 based index into a set of points. Represents the data point number this data is for. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrVal">
   <sequence>
      <element name="v" type="ST_Xstring" minOccurs="1" maxOccurs="1"/>
   </sequence>
   <attribute name="idx" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.153 ptCount (Point Count)

This element contains the number of values in the cache.

Parent Elements
multiLvlStrCache (§5.7.2.115); numCache (§5.7.2.121); numLit (§5.7.2.123); strCache (§5.7.2.200); strLit (§5.7.2.201)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number. The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.154 radarChart (Radar Charts)

This element contains the radar chart series on this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
radarStyle (Radar Style)	§5.7.2.155
ser (Radar Chart Series)	§5.7.2.173

Child Elements	Subclause
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RadarChart">
   <sequence>
      <element name="radarStyle" type="CT_RadarStyle" minOccurs="1" maxOccurs="1"/>
      <element name="varyColors" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="ser" type="CT_RadarSer" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.155 radarStyle (Radar Style)

This element specifies what type of radar chart shall be drawn.

Parent Elements
radarChart (§5.7.2.154)

Attributes	Description
val (Radar Style Value)	Specifies the style of the radar chart. The possible values for this attribute are defined by the ST_RadarStyle simple type (§5.7.3.37).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RadarStyle">
   <attribute name="val" type="ST_RadarStyle" default="standard"/>
</complexType>
```

5.7.2.156 rAngAx (Right Angle Axes)

This element specifies that the chart axes are at right angles, rather than drawn in perspective. Applies only to 3-D charts.

Parent Elements
view3D (§5.7.2.229)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or `true` specifies that the property is applied. This is the default value for

Attributes	Description
	this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.157 rich (Rich Text)

This element contains a string with rich text formatting.

Parent Elements
tx (§5.7.2.215)

Child Elements	Subclause
bodyPr (Body Properties)	§5.1.5.1.1
lstStyle (Text List Styles)	§5.1.5.4.12
p (Text Paragraphs)	§5.1.5.2.6

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_TextBody">
   <sequence>
      <element name="bodyPr" type="CT_TextBodyProperties" minOccurs="1" maxOccurs="1"/>
      <element name="lstStyle" type="CT_TextListStyle" minOccurs="0" maxOccurs="1"/>
      <element name="p" type="CT_TextParagraph" minOccurs="1" maxOccurs="unbounded"/>
   </sequence>
</complexType>
```

5.7.2.158 rotX (X Rotation)

This element specifies the amount a 3-D chart shall be rotated in the X direction.

Parent Elements
view3D (§5.7.2.229)

Attributes	Description
val (X Rotation Value)	Specifies the contents of this attribute will contain an integer between -90 and 90.

Attributes	Description
	The possible values for this attribute are defined by the ST_RotX simple type (§5.7.3.38).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RotX">
   <attribute name="val" type="ST_RotX" default="0"/>
</complexType>
```

5.7.2.159 rotY (Y Rotation)

This element specifies the amount a 3-D chart shall be rotated in the Y direction.

Parent Elements
view3D (§5.7.2.229)

Attributes	Description
val (Y Rotation Value)	Specifies the contents of this attribute will contain an integer between 0 and 360. The possible values for this attribute are defined by the ST_RotY simple type (§5.7.3.39).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RotY">
   <attribute name="val" type="ST_RotY" default="0"/>
</complexType>
```

5.7.2.160 roundedCorners (Rounded Corners)

This element specifies the chart area shall have rounded corners.

Parent Elements
chartSpace (§5.7.2.29)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.161 scaling (Scaling)

This element contains additional axis settings.

Parent Elements
catAx (§5.7.2.25); dateAx (§5.7.2.39); serAx (§5.7.2.176); valAx (§5.7.2.227)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
logBase (Logarithmic Base)	§5.7.2.99
max (Maximum)	§5.7.2.108
min (Minimum)	§5.7.2.109
orientation (Axis Orientation)	§5.7.2.131

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Scaling">
   <sequence>
      <element name="logBase" type="CT_LogBase" minOccurs="0" maxOccurs="1"/>
      <element name="orientation" type="CT_Orientation" minOccurs="0" maxOccurs="1"/>
      <element name="max" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="min" type="CT_Double" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.162 scatterChart (Scatter Charts)

This element contains the scatter chart series for this chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
dLbls (Data Labels)	§5.7.2.49
extLst (Chart Extensibility)	§5.7.2.64
scatterStyle (Scatter Style)	§5.7.2.163

Child Elements	Subclause
ser (Scatter Chart Series)	§5.7.2.172
varyColors (Vary Colors by Point)	§5.7.2.228

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ScatterChart">
   <sequence>
      <element name="scatterStyle" type="CT_ScatterStyle" minOccurs="1" maxOccurs="1"/>
      <element name="varyColors" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="ser" type="CT_ScatterSer" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.163 scatterStyle (Scatter Style)

This element specifies the type of lines for the scatter chart.

Parent Elements
scatterChart (§5.7.2.162)

Attributes	Description
val (Scatter Style Value)	Specifies the style of the scatter chart. The possible values for this attribute are defined by the ST_ScatterStyle simple type (§5.7.3.40).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ScatterStyle">
   <attribute name="val" type="ST_ScatterStyle" default="marker"/>
</complexType>
```

5.7.2.164 secondPiePt (Second Pie Point)

This element specifies a data point that shall be drawn in the second pie or bar in a pie of pie or bar of pie chart.

Parent Elements
custSplit (§5.7.2.35)

Attributes	Description
val (Integer Value)	Specifies that the contents of this attribute will contain an integer number.

Attributes	Description
	The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema unsignedInt datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_UnsignedInt">
   <attribute name="val" type="xsd:unsignedInt" use="required"/>
</complexType>
```

5.7.2.165 secondPieSize (Second Pie Size)

This element specifies the size of the second pie or bar of a pie of pie chart or a bar of pie chart, as a percentage of the size of the first pie.

Parent Elements
ofPieChart (§5.7.2.127)

Attributes	Description
val (Second Pie Size Value)	Specifies the contents of this attribute will contain an integer between 5 and 200. The possible values for this attribute are defined by the ST_SecondPieSize simple type (§5.7.3.41).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SecondPieSize">
   <attribute name="val" type="ST_SecondPieSize" default="75"/>
</complexType>
```

5.7.2.166 selection (Selection)

This element specifies the chart elements are protected from selection.

Parent Elements
protection (§5.7.2.150)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted.

Attributes	Description
	A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.167 separator (Separator)

This element specifies text that shall be used to separate the parts of a data label. The default is a comma, except for pie charts showing only category name and percentage, when a line break shall be used instead.

The possible values for this element are defined by the XML Schema string datatype.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

5.7.2.168 ser (Bubble Chart Series)

This element specifies a series on a bubble chart.

Parent Elements
bubbleChart (§5.7.2.20)

Child Elements	Subclause
bubble3D (3D Bubble)	§5.7.2.19
bubbleSize (Bubble Size)	§5.7.2.22
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
invertIfNegative (Invert if Negative)	§5.7.2.86
order (Order)	§5.7.2.129
spPr (Shape Properties)	§5.7.2.198
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216

Child Elements	Subclause
xVal (X Values)	§5.7.2.235
yVal (Y Values)	§5.7.2.238

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BubbleSer">
   <sequence>
      <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
      <element name="invertIfNegative" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
      <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="2"/>
      <element name="xVal" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="yVal" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="bubbleSize" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="bubble3D" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.169 ser (Line Chart Series)

This element specifies a series on a line chart.

Parent Elements
line3DChart (§5.7.2.97); lineChart (§5.7.2.98); stockChart (§5.7.2.199)

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
marker (Marker)	§5.7.2.106
order (Order)	§5.7.2.129
smooth (Smoothing)	§5.7.2.195
spPr (Shape Properties)	§5.7.2.198
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_LineSer">
   <sequence>
      <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
      <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
      <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
      <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="1"/>
      <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="smooth" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.170 ser (Pie Chart Series)

This element specifies a series on a doughnut or pie chart.

Parent Elements
doughnutChart (§5.7.2.50); ofPieChart (§5.7.2.127); pie3DChart (§5.7.2.141); pieChart (§5.7.2.142)

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
explosion (Explosion)	§5.7.2.61
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
order (Order)	§5.7.2.129
spPr (Shape Properties)	§5.7.2.198
tx (Series Text)	§5.7.2.216
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_PieSer">
   <sequence>
      <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
      <element name="explosion" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
      <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.171 ser (Surface Chart Series)

This element specifies a series on a surface chart.

Parent Elements
surface3DChart (§5.7.2.204); surfaceChart (§5.7.2.205)

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
order (Order)	§5.7.2.129
spPr (Shape Properties)	§5.7.2.198
tx (Series Text)	§5.7.2.216
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SurfaceSer">
   <sequence>
      <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
      <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.172 ser (Scatter Chart Series)

This element specifies a series on a scatter chart.

Parent Elements
scatterChart (§5.7.2.162)

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
marker (Marker)	§5.7.2.106
order (Order)	§5.7.2.129
smooth (Smoothing)	§5.7.2.195
spPr (Shape Properties)	§5.7.2.198
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216
xVal (X Values)	§5.7.2.235
yVal (Y Values)	§5.7.2.238

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ScatterSer">
   <sequence>
      <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
      <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
      <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
      <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="2"/>
      <element name="xVal" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="yVal" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="smooth" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.173 ser (Radar Chart Series)

This element specifies a series on a radar chart.

Parent Elements
radarChart (§5.7.2.154)

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24

Child Elements	Subclause
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
marker (Marker)	§5.7.2.106
order (Order)	§5.7.2.129
spPr (Shape Properties)	§5.7.2.198
tx (Series Text)	§5.7.2.216
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_RadarSer">
   <sequence>
      <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
      <element name="marker" type="CT_Marker" minOccurs="0" maxOccurs="1"/>
      <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.174 ser (Area Chart Series)

This element specifies a series on an area chart.

Parent Elements
area3DChart (§5.7.2.4); areaChart (§5.7.2.5)

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
order (Order)	§5.7.2.129
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198

Child Elements	Subclause
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_AreaSer">
   <sequence>
      <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
      <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
      <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
      <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="2"/>
      <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.175 ser (Bar Chart Series)

This element specifies a series on a bar chart.

Parent Elements
bar3DChart (§5.7.2.15); barChart (§5.7.2.16)

Child Elements	Subclause
cat (Category Axis Data)	§5.7.2.24
dLbls (Data Labels)	§5.7.2.49
dPt (Data Point)	§5.7.2.52
errBars (Error Bars)	§5.7.2.55
extLst (Chart Extensibility)	§5.7.2.64
idx (Index)	§5.7.2.84
invertIfNegative (Invert if Negative)	§5.7.2.86
order (Order)	§5.7.2.129
pictureOptions (Picture Options)	§5.7.2.139
shape (Shape)	§5.7.2.178
spPr (Shape Properties)	§5.7.2.198
trendline (Trendlines)	§5.7.2.212
tx (Series Text)	§5.7.2.216

Child Elements	Subclause
val (Values)	§5.7.2.225

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_BarSer">
   <sequence>
      <group ref="EG_SerShared" minOccurs="1" maxOccurs="1"/>
      <element name="invertIfNegative" type="CT_Boolean" minOccurs="0" maxOccurs="1"/>
      <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
      <element name="dPt" type="CT_DPt" minOccurs="0" maxOccurs="unbounded"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="trendline" type="CT_Trendline" minOccurs="0" maxOccurs="unbounded"/>
      <element name="errBars" type="CT_ErrBars" minOccurs="0" maxOccurs="1"/>
      <element name="cat" type="CT_AxDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="val" type="CT_NumDataSource" minOccurs="0" maxOccurs="1"/>
      <element name="shape" type="CT_Shape" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.176 serAx (Series Axis)

This element specifies a series axis for the chart.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
axPos (Axis Position)	§5.7.2.10
crossAx (Crossing Axis ID)	§5.7.2.31
crosses (Crosses)	§5.7.2.33
crossesAt (Crossing Value)	§5.7.2.34
delete (Delete)	§5.7.2.40
extLst (Chart Extensibility)	§5.7.2.64
majorGridlines (Major Gridlines)	§5.7.2.101
majorTickMark (Major Tick Mark)	§5.7.2.102
minorGridlines (Minor Gridlines)	§5.7.2.110
minorTickMark (Minor Tick Mark)	§5.7.2.111
numFmt (Number Format)	§5.7.2.122
scaling (Scaling)	§5.7.2.161
spPr (Shape Properties)	§5.7.2.198

Child Elements	Subclause
tickLblPos (Tick Label Position)	§5.7.2.208
tickLblSkip (Tick Label Skip)	§5.7.2.209
tickMarkSkip (Tick Mark Skip)	§5.7.2.210
title (Title)	§5.7.2.211
txPr (Text Properties)	§5.7.2.217

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SerAx">
   <sequence>
      <group ref="EG_AxShared" minOccurs="1" maxOccurs="1"/>
      <element name="tickLblSkip" type="CT_Skip" minOccurs="0" maxOccurs="1"/>
      <element name="tickMarkSkip" type="CT_Skip" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.177 serLines (Series Lines)

This element specifies series lines for the chart.

Parent Elements
barChart (§5.7.2.16); ofPieChart (§5.7.2.127)

Child Elements	Subclause
spPr (Shape Properties)	§5.7.2.198

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ChartLines">
   <sequence>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.178 shape (Shape)

This element specifies the shape of a series or a 3-D bar chart.

Parent Elements
bar3DChart (§5.7.2.15); ser (§5.7.2.175)

Attributes	Description
val (Shape Value)	Specifies the shape of the series.

Attributes	Description
	The possible values for this attribute are defined by the ST_Shape simple type (§5.7.3.42).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Shape">
   <attribute name="val" type="ST_Shape" default="box"/>
</complexType>
```

5.7.2.179 showBubbleSize (Show Bubble Size)

This element specifies the bubble size shall be shown in a data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.180 showCatName (Show Category Name)

This element specifies that the category name shall be shown in the data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for

Attributes	Description
	this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.181 showDLblsOverMax (Show Data Labels over Maximum)

This element specifies data labels over the maximum of the chart shall be shown.

Parent Elements
chart (§5.7.2.27)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, `1`, or `true` specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of `off`, `0`, or `false` specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.182 showHorzBorder (Show Horizontal Border)

This element specifies the horizontal borders shall be shown in a data table.

Parent Elements
dTable (§5.7.2.54)

Attributes	Description

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.183 showKeys (Show Legend Keys)

This element specifies the legend keys shall be shown in a data table.

Parent Elements
dTable (§5.7.2.54)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.184 showLeaderLines (Show Leader Lines)

This element specifies leader lines shall be shown for data labels.

Parent Elements
dLbls (§5.7.2.49)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.185 showLegendKey (Show Legend Key)

This element specifies legend keys shall be shown in data labels.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.186 showNegBubbles (Show Negative Bubbles)

This element specifies negative sized bubbles shall be shown on a bubble chart.

Parent Elements
bubbleChart (§5.7.2.20)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.187 showOutline (Show Outline Border)

This element specifies the outline shall be shown on a data table.

Parent Elements
dTable (§5.7.2.54)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.188 showPercent (Show Percent)

This element specifies that the percentage shall be shown in a data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.189 showSerName (Show Series Name)

This element specifies that the series name shall be shown in a data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.190 showVal (Show Value)

This element specifies that the value shall be shown in a data label.

Parent Elements
dLbl (§5.7.2.47); dLbls (§5.7.2.49)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.191 showVertBorder (Show Vertical Border)

This element specifies the vertical border shall be shown in a data table.

Parent Elements
dTable (§5.7.2.54)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.192 sideWall (Side Wall)

This element specifies the side wall.

Parent Elements
chart (§5.7.2.27)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pictureOptions (Picture Options)	§5.7.2.139
spPr (Shape Properties)	§5.7.2.198
thickness (Thickness)	§5.7.2.207

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Surface">
   <sequence>
      <element name="thickness" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
      <element name="spPr" type="a:CT_ShapeProperties" minOccurs="0" maxOccurs="1"/>
      <element name="pictureOptions" type="CT_PictureOptions" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.193 size (Size)

This element specifies the size of the marker in points.

Parent Elements
marker (§5.7.2.106)

Attributes	Description
val (Marker Size Value)	Specifies the contents of this attribute will contain an integer between 2 and 72. The possible values for this attribute are defined by the ST_MarkerSize simple type (§5.7.3.26).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_MarkerSize">
   <attribute name="val" type="ST_MarkerSize" default="5"/>
</complexType>
```

5.7.2.194 sizeRepresents (Size Represents)

This element specifies how the bubble size values are represented on the chart.

Parent Elements
bubbleChart (§5.7.2.20)

Attributes	Description
val (Size Represents	Specifies how the bubble sizes represent the values.

Attributes	Description
Value)	The possible values for this attribute are defined by the ST_SizeRepresents simple type (§5.7.3.43).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SizeRepresents">
   <attribute name="val" type="ST_SizeRepresents" default="area"/>
</complexType>
```

5.7.2.195 smooth (Smoothing)

This element specifies the line connecting the points on the chart shall be smoothed using Catmull-Rom splines.

Parent Elements
lineChart (§5.7.2.98); ser (§5.7.2.172); ser (§5.7.2.169)

Attributes	Description
val (Boolean Value)	Specifies a boolean value for the property defined by the parent XML element. A value of on, 1, or true specifies that the property is applied. This is the default value for this attribute, and is implied when the parent element is present, but this attribute is omitted. A value of off, 0, or false specifies that the property is not applied. The possible values for this attribute are defined by the XML Schema boolean datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Boolean">
   <attribute name="val" type="xsd:boolean" use="optional" default="true"/>
</complexType>
```

5.7.2.196 splitPos (Split Position)

This element specifies a value that shall be used to determine which data points are in the second pie or bar on a pie of pie or bar of pie chart.

Parent Elements
ofPieChart (§5.7.2.127)

Attributes	Description
val (Floating Point Value)	Specifies that the contents of this attribute will contain a floating point number.

Attributes	Description
	The contents of this number are interpreted based on the context of the parent XML element. The possible values for this attribute are defined by the XML Schema double datatype.

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_Double">
   <attribute name="val" type="xsd:double" use="required"/>
</complexType>
```

5.7.2.197 splitType (Split Type)

This element specifies how to determine which data points are in the second pie or bar on a pie of pie or bar of pie chart.

Parent Elements
ofPieChart (§5.7.2.127)

Attributes	Description
val (Split Type Value)	Specifies how to split the data points between the first pie and second pie or bar. The possible values for this attribute are defined by the ST_SplitType simple type (§5.7.3.45).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_SplitType">
   <attribute name="val" type="ST_SplitType" default="auto"/>
</complexType>
```

5.7.2.198 spPr (Shape Properties)

This element specifies the formatting for the parent chart element. The custGeom, prstGeom, scene3d, and xfrm elements are not supported. The bwMode attribute is not supported.

Parent Elements
backWall (§5.7.2.11); bandFmt (§5.7.2.13); catAx (§5.7.2.25); chartSpace (§5.7.2.29); dateAx (§5.7.2.39); dispUnitsLbl (§5.7.2.46); dLbl (§5.7.2.47); dLbls (§5.7.2.49); downBars (§5.7.2.51); dPt (§5.7.2.52); dropLines (§5.7.2.53); dTable (§5.7.2.54); errBars (§5.7.2.55); floor (§5.7.2.69); hiLowLines (§5.7.2.80); leaderLines (§5.7.2.92); legend (§5.7.2.94); majorGridlines (§5.7.2.101); marker (§5.7.2.106); minorGridlines (§5.7.2.110); pivotFmt (§5.7.2.143); plotArea (§5.7.2.146); ser (§5.7.2.168); ser (§5.7.2.169); ser (§5.7.2.170); ser (§5.7.2.171); ser (§5.7.2.172); ser (§5.7.2.173); ser (§5.7.2.174); ser (§5.7.2.175); serAx (§5.7.2.176); serLines (§5.7.2.177); sideWall (§5.7.2.192); title (§5.7.2.211); trendline (§5.7.2.212); trendlineLbl (§5.7.2.213); upBars (§5.7.2.218); valAx (§5.7.2.227)

Child Elements	Subclause
blipFill (Picture Fill)	§5.1.10.14
custGeom (Custom Geometry)	§5.1.11.8
effectDag (Effect Container)	§5.1.10.25
effectLst (Effect Container)	§5.1.10.26
extLst (Extension List)	§5.1.2.1.15
gradFill (Gradient Fill)	§5.1.10.33
grpFill (Group Fill)	§5.1.10.35
ln (Outline)	§5.1.2.1.24
noFill (No Fill)	§5.1.10.44
pattFill (Pattern Fill)	§5.1.10.47
prstGeom (Preset geometry)	§5.1.11.18
scene3d (3D Scene Properties)	§5.1.4.1.26
solidFill (Solid Fill)	§5.1.10.54
sp3d (Apply 3D shape properties)	§5.1.7.12
xfrm (2D Transform for Individual Objects)	§5.1.9.6

Attributes	Description
bwMode (Black and White Mode) Namespace: .../drawingml/2006/main	Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture. No gray is to be used in rendering this image, only stark black and stark white. [*Note*: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture will have applied to when rendering. *end note*] The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§5.1.12.10).

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_ShapeProperties">
   <sequence>
      <element name="xfrm" type="CT_Transform2D" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_Geometry" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_FillProperties" minOccurs="0" maxOccurs="1"/>
      <element name="ln" type="CT_LineProperties" minOccurs="0" maxOccurs="1"/>
      <group ref="EG_EffectProperties" minOccurs="0" maxOccurs="1"/>
      <element name="scene3d" type="CT_Scene3D" minOccurs="0" maxOccurs="1"/>
      <element name="sp3d" type="CT_Shape3D" minOccurs="0" maxOccurs="1"/>
      <element name="extLst" type="CT_OfficeArtExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
   <attribute name="bwMode" type="ST_BlackWhiteMode" use="optional"/>
</complexType>
```

5.7.2.199 stockChart (Stock Charts)

This element contains the collection of stock chart series.

Parent Elements
plotArea (§5.7.2.146)

Child Elements	Subclause
axId (Axis ID)	§5.7.2.9
dLbls (Data Labels)	§5.7.2.49
dropLines (Drop Lines)	§5.7.2.53
extLst (Chart Extensibility)	§5.7.2.64
hiLowLines (High Low Lines)	§5.7.2.80
ser (Line Chart Series)	§5.7.2.169
upDownBars (Up/Down Bars)	§5.7.2.219

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StockChart">
   <sequence>
      <element name="ser" type="CT_LineSer" minOccurs="3" maxOccurs="4"/>
      <element name="dLbls" type="CT_DLbls" minOccurs="0" maxOccurs="1"/>
      <element name="dropLines" type="CT_ChartLines" minOccurs="0" maxOccurs="1"/>
      <element name="hiLowLines" type="CT_ChartLines" minOccurs="0" maxOccurs="1"/>
      <element name="upDownBars" type="CT_UpDownBars" minOccurs="0" maxOccurs="1"/>
      <element name="axId" type="CT_UnsignedInt" minOccurs="2" maxOccurs="2"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.200 strCache (String Cache)

This element specifies the last string data used for a chart.

Parent Elements
strRef (§5.7.2.202)

Child Elements	Subclause
extLst (Chart Extensibility)	§5.7.2.64
pt (String Point)	§5.7.2.152
ptCount (Point Count)	§5.7.2.153

The following XML Schema fragment defines the contents of this element:

```
<complexType name="CT_StrData">
   <sequence>
      <element name="ptCount" type="CT_UnsignedInt" minOccurs="0" maxOccurs="1"/>
      <element name="pt" type="CT_StrVal" minOccurs="0" maxOccurs="unbounded"/>
      <element name="extLst" type="CT_ExtensionList" minOccurs="0" maxOccurs="1"/>
   </sequence>
</complexType>
```

5.7.2.201 strLit (String Literal)

This element specifies a set of strings used for a chart
