

Principles of Network Security

Kai Shen

12/9/2013

CSC 257/457 - Fall 2013

1

The Network Security Model

- Bob and Alice want to communicate "securely".
- Trudy (the adversary) has access to the channel.

12/9/2013

CSC 257/457 - Fall 2013

2

Who might Bob and Alice be?

- Web browser/server for electronic transactions (e.g., on-line purchases/banking)
- DNS servers
- Routers exchanging routing table updates
- ... well, *real-life* Bobs and Alices!

12/9/2013

CSC 257/457 - Fall 2013

3

What can an adversary do?

- Eavesdrop:** understand the content of messages
- Actively **changing** messages
- Impersonation:** fake (spoof) identity
- Denial of service:** prevent service from being used by others (e.g., by overloading resources)

12/9/2013

CSC 257/457 - Fall 2013

4

What is Network Security?

- Confidentiality:** only sender, intended receiver should "understand" message contents.
- Authentication:** sender, receiver want to confirm identity of each other.
- Message Integrity:** sender, receiver want to ensure message not altered (in transit, or afterwards).
- Access and Availability:** services must be accessible and available to (and only to) legitimate users.

12/9/2013 CSC 257/457 - Fall 2013 5

Principles of Network Security

- Confidentiality: cryptography
- Authentication
- Integrity

12/9/2013 CSC 257/457 - Fall 2013 6

The Language of Cryptography

First goal of cryptography: confidentiality.

```

    graph LR
        P1[plaintext] --> E[encryption algorithm]
        KA[Alice's encryption key KA] --> E
        E --> C[ciphertext]
        C --> D[decryption algorithm]
        KB[Bob's decryption key KB] --> D
        D --> P2[plaintext]
    
```

- **Symmetric key** crypto: encryption and decryption keys are identical. (both are **secret**)
- **Public key** crypto: encryption key is **public**, decryption key is **secret**.

12/9/2013 CSC 257/457 - Fall 2013 7

Symmetric Key Cryptography: Monoalphabetic Cipher

Monoalphabetic cipher: substitute one letter for another.

```

    plaintext:  abcdefghijklmnopqrstuvwxyz
                ↓                               ↓
    ciphertext: mnbvcxzasdfghjklpoiuytrewq
    
```

Example: Plaintext: bob. i love you. alice
 ciphertext: nkn. s gktc wky. mgsbc

Q1: How hard to break this simple cipher?

- brute force?
- other?

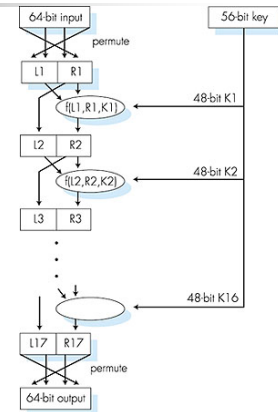

Q2: How to make it more difficult to break?

12/9/2013 CSC 257/457 - Fall 2013 8

Symmetric Key Cryptography: DES

DES: Data Encryption Standard

- US encryption standard [NIST 1993]
- 56-bit symmetric key, 64-bit plaintext input
- encryption**: initial permutation \Rightarrow 16 "rounds", each using different 48 bits of key \Rightarrow final permutation
- decryption**: reverse operation using the same key
- How secure is DES?
 - DES Challenge (1999): 56-bit-key-encrypted phrase decrypted (brute force) in 22 hours 15 minutes
- Making DES more secure:
 - use three keys sequentially (3-DES)
 - use more bits

12/9/2013

CSC 257/457 - Fall 2013

9

AES: Advanced Encryption Standard

- Newer (Nov. 2001) symmetric-key NIST standard, replacing DES
- Processes data in 128 bit blocks
- 128, 192, or 256 bit keys
- Brute force decryption (try each key) taking 1 sec on DES, takes 149 trillion years for 128-bit AES

12/9/2013

CSC 257/457 - Fall 2013

10

Stream Cipher

- Fixed-size key K expanded to an infinite random stream $C(K)$
- For data X , it uses an portion of the key stream (equal length to data X), then xor the data to produce encrypted data
- Same key cannot be used twice, otherwise
 - Encrypted(X) = $X \text{ xor } C(K)$
 - Encrypted(Y) = $Y \text{ xor } C(K)$
 - \Rightarrow Encrypted(X) xor Encrypted(Y) = $X \text{ xor } Y$
 - \Rightarrow If you know X (or Y), then you know the other
 - \Rightarrow Even if you know neither, you can guess X and Y quite well from $X \text{ xor } Y$ if X and Y are in a natural language
- Sources: http://en.wikipedia.org/wiki/Stream_cipher_attack
- Used in the WEP wireless encryption
 - Employ an initialization vector of 24-bit, but insufficient

12/9/2013

CSC 257/457 - Fall 2013

11

Public Key Cryptography

Symmetric key cryptography

- requires sender, receiver know shared secret key
- Q: how to agree on key in the first place? (particularly difficult if Trudy is eavesdropping on all communication)

Public key cryptography

- encryption key is different from decryption key
- encryption key is **public**, known to **everyone**, also called **public key**
- decryption key is **secret**, known only to **receiver**, also called **private key**

12/9/2013

CSC 257/457 - Fall 2013

12

Public Key Cryptography

Principle for choosing the public/private key pair:
One should not be able to derive the private key from the public key.

12/9/2013 CSC 257/457 - Fall 2013 13

Public Key Cryptography: RSA

(Ron Rivest, Adi Shamir and Len Adleman)

- Choosing keys:
 - Choose two large prime numbers p, q . (e.g., 1024 bits each)
 - Compute $n = pq, z = (p-1)(q-1)$
 - Choose e (with $e < n$) that has no common factors with z
 - Choose d such that $ed-1$ is exactly divisible by z
 - Public key is (n, e) . Private key is (n, d)
- To encrypt a message, m ($< n$): do $c = m^e \bmod n$
- To decrypt a received ciphertext, c : do $m = c^d \bmod n$
- Reason: for any m (relatively prime with n)
 - $m^z \bmod n = 1$; therefore $m^{ed-1} \bmod n = 1$
- Another property: $(m^d \bmod n)^e \bmod n = m$
- RSA is much slower than the symmetric key cryptos

12/9/2013 CSC 257/457 - Fall 2013 14

Principles of Network Security

- Confidentiality: cryptography
- Authentication
- Integrity

12/9/2013 CSC 257/457 - Fall 2013 15

Authentication: version 1.0

Authentication: Bob wants Alice to "prove" her identity to him.

Protocol ap1.0: Alice says "I am Alice".

Failure scenario??
Trudy can simply declare herself to be Alice

12/9/2013 CSC 257/457 - Fall 2013 16

Authentication: version 2.0

Protocol ap2.0: Alice says "I am Alice" and sends her secret password to "prove" it.

Failure scenario??

playback attack: Trudy records Alice's packet and later plays it back to Bob

12/9/2013 CSC 257/457 - Fall 2013 17

Authentication: version 3.0

Goal: avoid playback attack

Nonce: number (R) used only *once-in-a-lifetime*

ap3.0: Bob sends Alice a nonce, R. Alice must return R, encrypted with shared secret key

only Alice knows key to encrypt nonce, so it must be Alice!

12/9/2013 CSC 257/457 - Fall 2013 18

Authentication: version 4.0

ap3.0 requires shared symmetric key. Key distribution can be a problem.

ap4.0: use nonce, public key cryptography.

Bob computes $K_A^+(K_A^-(R)) = R$ and knows only Alice could have the private key, that encrypted R such that $K_A^+(K_A^-(R)) = R$

12/9/2013 CSC 257/457 - Fall 2013 19

Principles of Network Security

- Confidentiality: cryptography
- Authentication
- Integrity**

12/9/2013 CSC 257/457 - Fall 2013 20

Integrity

- Digital Signatures:
 - cryptographic technique to ensure document integrity.
 - analogous to hand-written signatures.
- Sender (Bob) digitally signs document, establishing he is document owner/creator.
- The recipient (Alice) receives the document and the digital signature.
- The recipient can be sure that the document is
 - **verifiable**: Bob signed the document.
 - **nonforgeable**: the document hasn't been changed since Bob signed it.

12/9/2013 CSC 257/457 - Fall 2013 21

Digital Signatures

- Bob signs m by encrypting with his private key, creating a digital signature $K_B^-(m)$

Bob's message, m

Dear Alice
Oh, how I have missed you. I think of you all the time! ... (blah blah blah)
Bob

Public key encryption algorithm

Bob's message, m , signed (encrypted) with his private key

$K_B^-(m)$

- Suppose Alice receives msg m and its digital signature $K_B^-(m)$
- Alice applies Bob's public key K_B^+ to $K_B^-(m)$ then checks whether $K_B^+(K_B^-(m)) = m$.
- If so, whoever signed m must have used Bob's private key.

Problem: computationally expensive to public-key-encrypt long messages.

12/9/2013 CSC 257/457 - Fall 2013 22

Signed Message Digest

Bob sends digitally signed (small) message digest:

large message m → H: Hash function → $H(m)$

Bob's private key K_B^- → digital signature (encrypt) → encrypted msg digest $K_B^-(H(m))$

+

Alice verifies signature and integrity of digitally signed message:

large message m → H: Hash function → $H(m)$

encrypted msg digest $K_B^-(H(m))$ → Bob's public key K_B^+ → digital signature (decrypt) → $H(m)$

equal ?

12/9/2013 CSC 257/457 - Fall 2013 23

Message Digests

- Apply a hash function H to m , get a much smaller message digest $H(m)$.
- Public-key-encrypt the message digest to generate the digital signature $K_B^-(H(m))$.

Good/bad hash functions?

- **Hint**: given a hash function, it is possible for many messages sharing the same digest.

12/9/2013 CSC 257/457 - Fall 2013 24

Internet Checksum: Poor Hash Function for Generating Message Digests

Given a message and its Internet checksum, it is easy to find another message with same checksum.

message	ASCII format	message	ASCII format
I O U 1	49 4F 55 31	I O U <u>9</u>	49 4F 55 <u>39</u>
0 0 . 9	30 30 2E 39	0 0 . <u>1</u>	30 30 2E <u>31</u>
9 B O B	39 42 D2 42	9 B O B	39 42 D2 42
	B2 C1 D2 AC		B2 C1 D2 AC

different messages but identical checksums!

Hash function property: given digest x for message m , computationally infeasible to find another message m' that shares the same digest.

12/9/2013

CSC 257/457 - Fall 2013

25

Good Hash Functions for Generating Message Digests

- MD5
 - computes 128-bit message digest in 4-step process.
 - appears difficult to construct message m whose MD5 hash is equal to x .
- SHA-1
 - [NIST, FIPS PUB 180-1]
 - 160-bit message digest

http://en.wikipedia.org/wiki/Cryptographic_hash_function

12/9/2013

CSC 257/457 - Fall 2013

26

Summary: Principles of Network Security

Cryptography:

- symmetric keys: protocols? weakness?
- public keys: protocol? weakness?

Confidentiality:

- only sender, intended receiver should "understand" message contents

Authentication:

- sender, receiver want to confirm identity of each other

Message Integrity:

- sender, receiver want to ensure message not altered (in transit, or afterwards)
